INTRODUCTION

The Deer property hosts sedimentary rocks that are locally enriched with nickel, molybdenum and zinc. It is located in north-central Yukon and is owned 100% by Strategic Metals Ltd. This property and seven others in northern Yukon are under option to Southampton Ventures Inc. as part of the NiMo Project.

This report describes exploration work that was conducted on July 11 and August 4, 2007 by Archer, Cathro & Associates (1981) Limited on behalf of Southampton Ventures. The work was supervised by the author and consisted of prospecting, mapping, geochemical sampling and diamond drilling. The author's statement of qualifications appears in Appendix I.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Deer property comprises 49 contiguous mineral claims located in north-central Yukon Territory on NTS map sheet 116B/09 at latitude 64°44'N and longitude 138°12'W (Figure 1). The claims are registered with the Dawson Mining Recorder in the name of Archer Cathro, which holds them in trust for Strategic Metals. Claim data are listed below while the locations of individual claims are shown on Figure 2.

Claim Number	Grant Number	Expiry Date*
Deer 1-20	YC54938-YC54957	February 22, 2012
21-38	YC56685-YC56702	February 22, 2012
39-49	YC56976-YC56986	February 22, 2012

* Expiry dates include 2007 work which has been filed for assessment credit but not yet accepted.

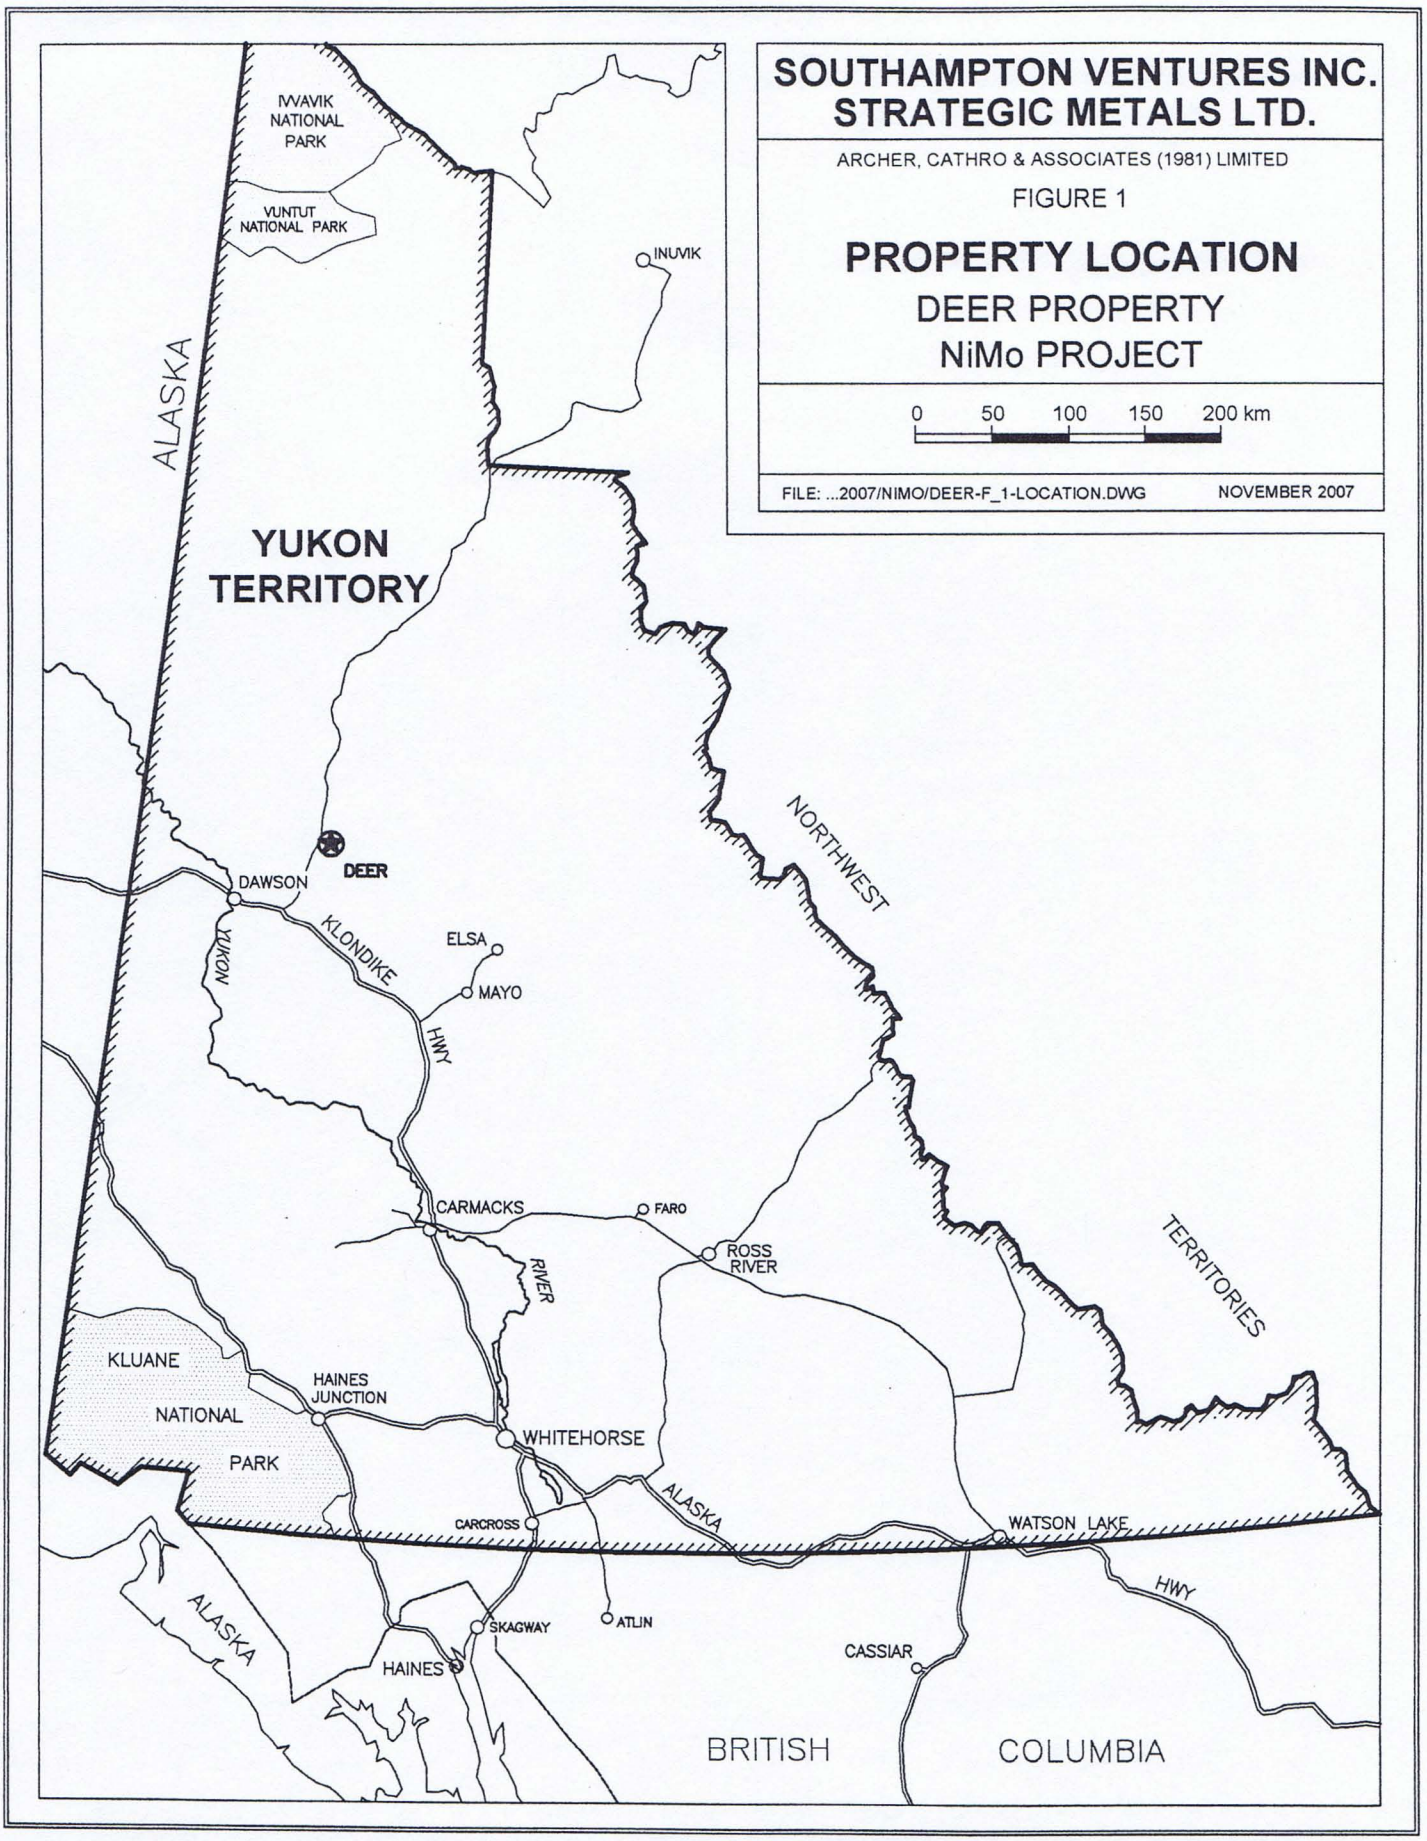

The Deer property is located 88 km northeast of Dawson City and is accessible via helicopter. Dawson City is situated 536 km by road north of Whitehorse.

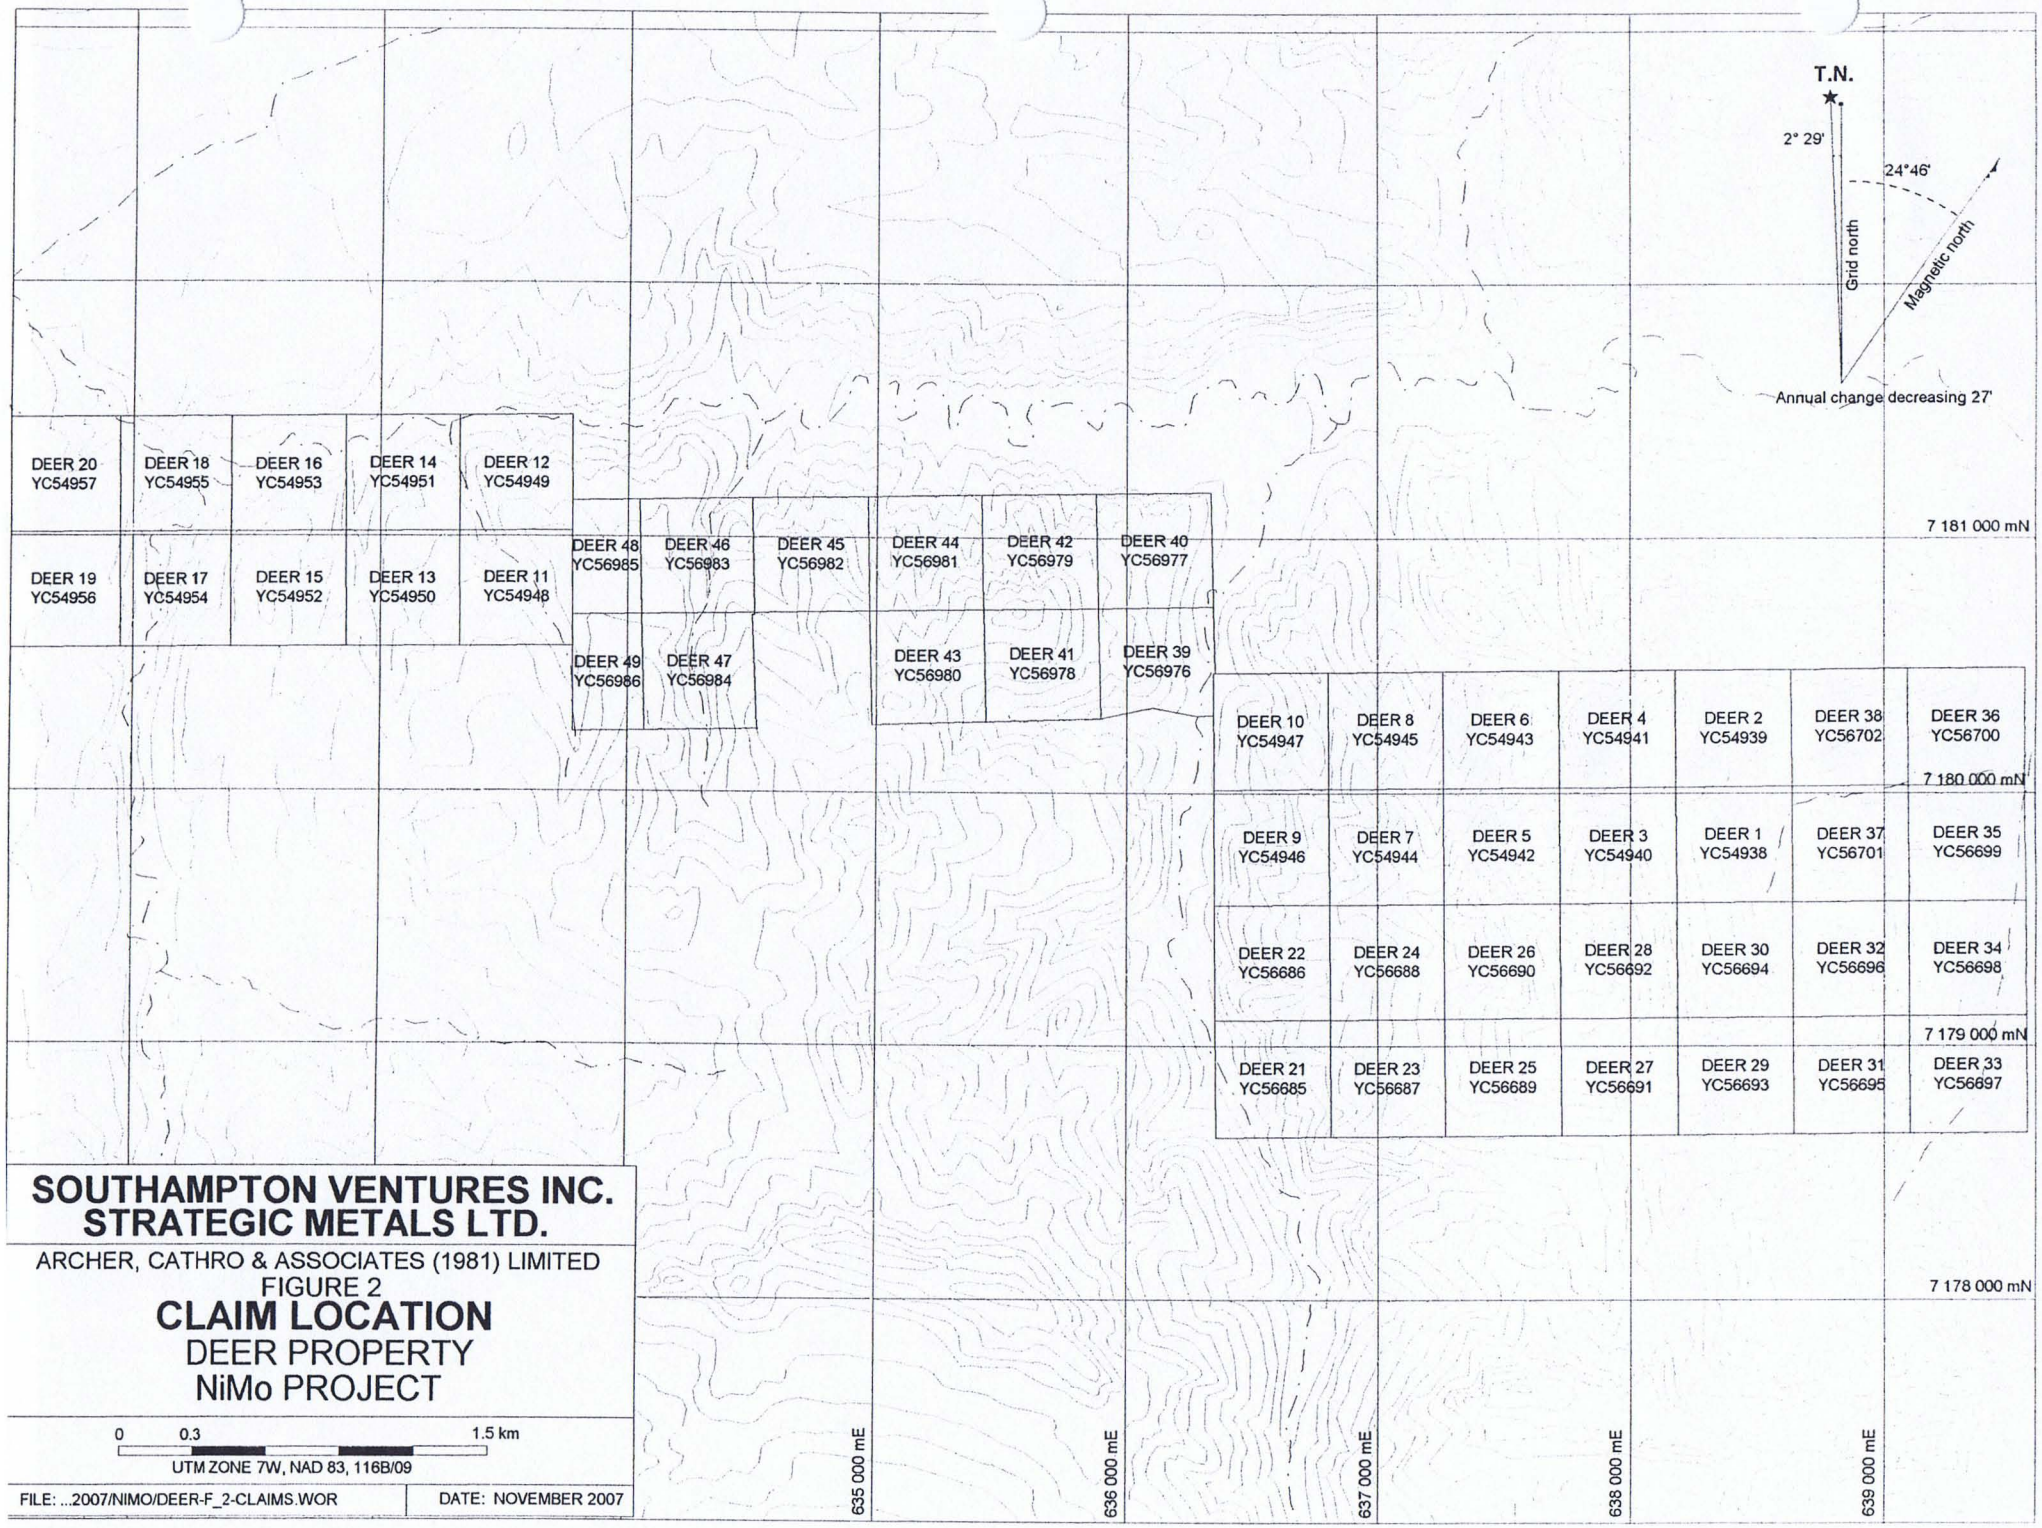

In 2007, daily access to the property was provided by a Bell 206B helicopter operated by Fireweed Helicopters Ltd. from a temporary base at the Cache Creek camp located at km 131 on the Dempster Highway. Drill equipment was mobilized to and from the property with a Bell 204 helicopter, also operated by Fireweed Helicopters.

HISTORY

The area currently covered by the Deer property was originally staked as the Rein claims by the Blackstone Project (Union Miniere Explorations and Mining Corporation Ltd. and Shell Canada Resources Ltd.). That project conducted soil sampling and mapping between 1976 and 1978.

Milchem Inc. optioned the Rein claims in 1979 and built a road to the property. In 1980 it trenched, completed 21 percussion holes totalling 906 m and collected two 1300 kg bulk samples. Milchem's work focussed on barite mineralization and evaluated it's suitability for use as a drill mud additive by the oil industry.

In 1994 Pendisle Resources Inc. (a predecessor to Blackstone Resources Ltd.) optioned the Rein claims. Equity Engineering Ltd. carried out a small exploration program on behalf of Pendisle.

In 1995 Blackstone Resources Ltd. reanalyzed 2195 soil sample and 62 rock sample pulps that had been collected and archived by a previous owner. Based on the results from those reanalyses, Blackstone staked additional claims around its original 16 claim block. In 1996 it conducted an extensive program comprising geological mapping, prospecting and soil sampling.

Glenhaven Resources Ltd. optioned 60% of the property in 1997 and completed 12 diamond drill holes totalling 587 m later that year. In 1998 Blackstone carried out additional geological mapping, prospecting and soil sampling and completed 14 diamond drill holes totalling 832.2 m. The primary focus of many of these holes was the barite that had previously been examined by Milchem. The barite horizon is located along the contact between the Earn and Road River Groups.

No further work was completed on the property and many of the claims were allowed to lapse before Strategic Metals Ltd. staked the Deer claims in December 2006.

GEOMORPHOLOGY

The Deer property covers a north facing slope within the Ogilvie Mountains. The property is drained by tributaries of Lomond Creek, which ultimately flows into the Arctic Ocean via the Hart, Peel and Mackenzie Rivers.

Local elevations range from 1095 m to 1675 m. Outcrop is found along steep hillsides and deeply incised canyons. Vegetation consists of stunted spruce, buckbrush, moss and grass below 1400 m and open slopes at higher elevations.

REGIONAL GEOLOGY

The Deer property lies within an east-west trending band of Proterozoic to Devonian sedimentary rocks that are a part of the Mackenzie Platform tectonic element. Rocks in the area are deformed by a series of east-west trending, south dipping thrust faults and related open folds. Approximately 5 km south of the property, the Dawson Fault, places Upper Proterozoic to Lower Cambrian Hyland Group rocks against Ordovician to Silurian Road River Group strata.

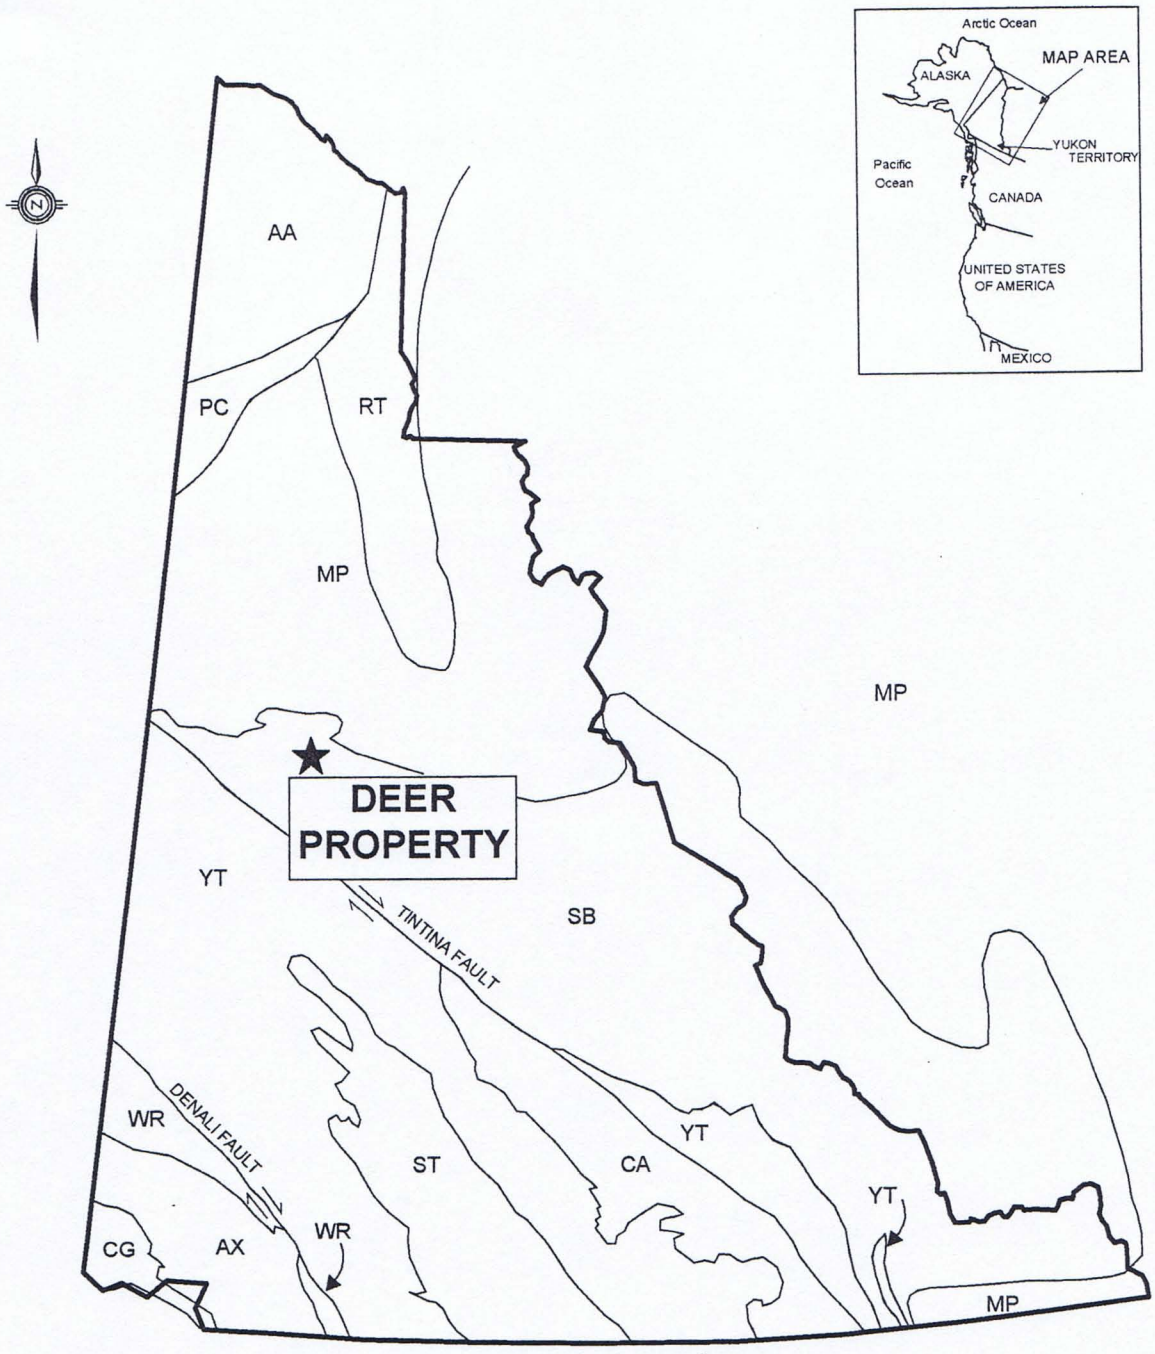

The following table summarizes the main lithologies in the Deer area from youngest to oldest.

DATE: NOVEMBER 2007

-UNCONFORMITY-

MIDDLE TO UPPER DEVONIAN
Earn Group: a conformable marine sequence consisting of upper Imperial Formation and basal Canol Formation. Imperial Formation consists of sandstone, siltstone and shale. The Canol Formation is a sequence of siliceous shale representing a rapid rise of sea level in early Late Devonian.

-UNCONFORMITY-

ORDOVICIAN TO SILURIAN
Road River Group: a 150 to 750 m thick sequence of fossiliferous limestone and calcareous shale.

-UNCONFORMITY-

UPPER PROTEROZOIC TO LOWER CAMBRIAN
Hyland Group: limestone and marble.

-UNCONFORMITY-

LOWER PROTEROZOIC
Wernecke Supergroup: – a conformable marine sequence approximately 13 km thick consisting of basal Fairchild Lake Group, middle Quartet Group and upper Gillespie Lake Group. Fairchild Lake Group is predominantly siltstone and limy siltstone with minor slate and dolostone. Quartet Group is deeper water shale, siltstone and very fine sandstone. Gillespie Lake Group is dolostone and silty dolostone with minor shale and siltstone.

PROPERTY GEOLOGY

The Deer property covers a shallowly to moderately (20-60°), south dipping sequence of shales belonging to the Middle to Upper Devonian Earn Group and the Ordovician to Silurian Road River Group (Figure 4). The stratigraphy is locally displaced by several thrust faults that parallel the nearby Dawson Fault.

Elsewhere in the district, the contact between the Earn and Road River Groups is marked by a distinct sequence of limestone balls, nodular shale and massive sulphide (Figure 5), but at the Deer property this contact features a barite-rich unit described in the following section.

MINERALIZATION AND GEOCHEMISTRY

A thin, nickeliferous, massive sulphide layer, known as the NiMo horizon is often present within the contact zone between the Earn and Road River Groups. At the Deer property, an east striking, south dipping, 3 cm to 30 m thick barite and barium carbonate horizon is found where the prospective contact is observed. Past exploration has traced this horizon for at least 6 km along strike. Diamond drilling in 1997 and 1998 focussed primarily on this horizon at the MM Showing, located near the centre of the eastern cluster of Deer claims (Figure 4). One of these drill holes (REN97-08) intersected 0.39% nickel and 0.41% zinc over 25.50 m, including 1.37% nickel and 0.70% zinc over 5.30 m (Harris et al., 1999).

The nickel-enriched intersection consisted of bedded barite and barium carbonate that is brecciated and partially replaced by white cryptocrystalline quartz. The breccia matrix is bitumen and dark brown oxide(?) minerals, which presumably carry the anomalous nickel and other metals.

The type model for the current exploration program at the Deer property is based upon a massive sulphide horizon reported at the same stratigraphic location at the Nick property, 133 km to the northeast. The Nick massive sulphide horizon covers an area greater than 80 km^2 and comprises pyrite, vaesite, melnikovite-type pyrite, sphalerite and wurtzite hosted in a gangue of phosphatic-carbonaceous chert, silica and bitumen (Hulbert et al, 1992). Assays from the Nick horizon average 3.01% nickel, 0.20% molybdenum, 0.82% zinc, 0.82% vanadium, 310 ppb platinum and 150 ppb palladium. Anomalous rhenium (up to 61 ppm), uranium (up to 107.7 ppm), barium (up to 4300 ppm), selenium (up to 2400 ppm) and arsenic (up to 4200 ppm) were also reported.

A total of 3280 soil samples were collected by previous workers on and around what are now the Deer claims. These samples yielded an average of 163 ppm nickel, 37 ppm molybdenum and 1232 ppm zinc, with maximum values of 1855 ppm nickel, 963 ppm molybdenum and 3.62% zinc.

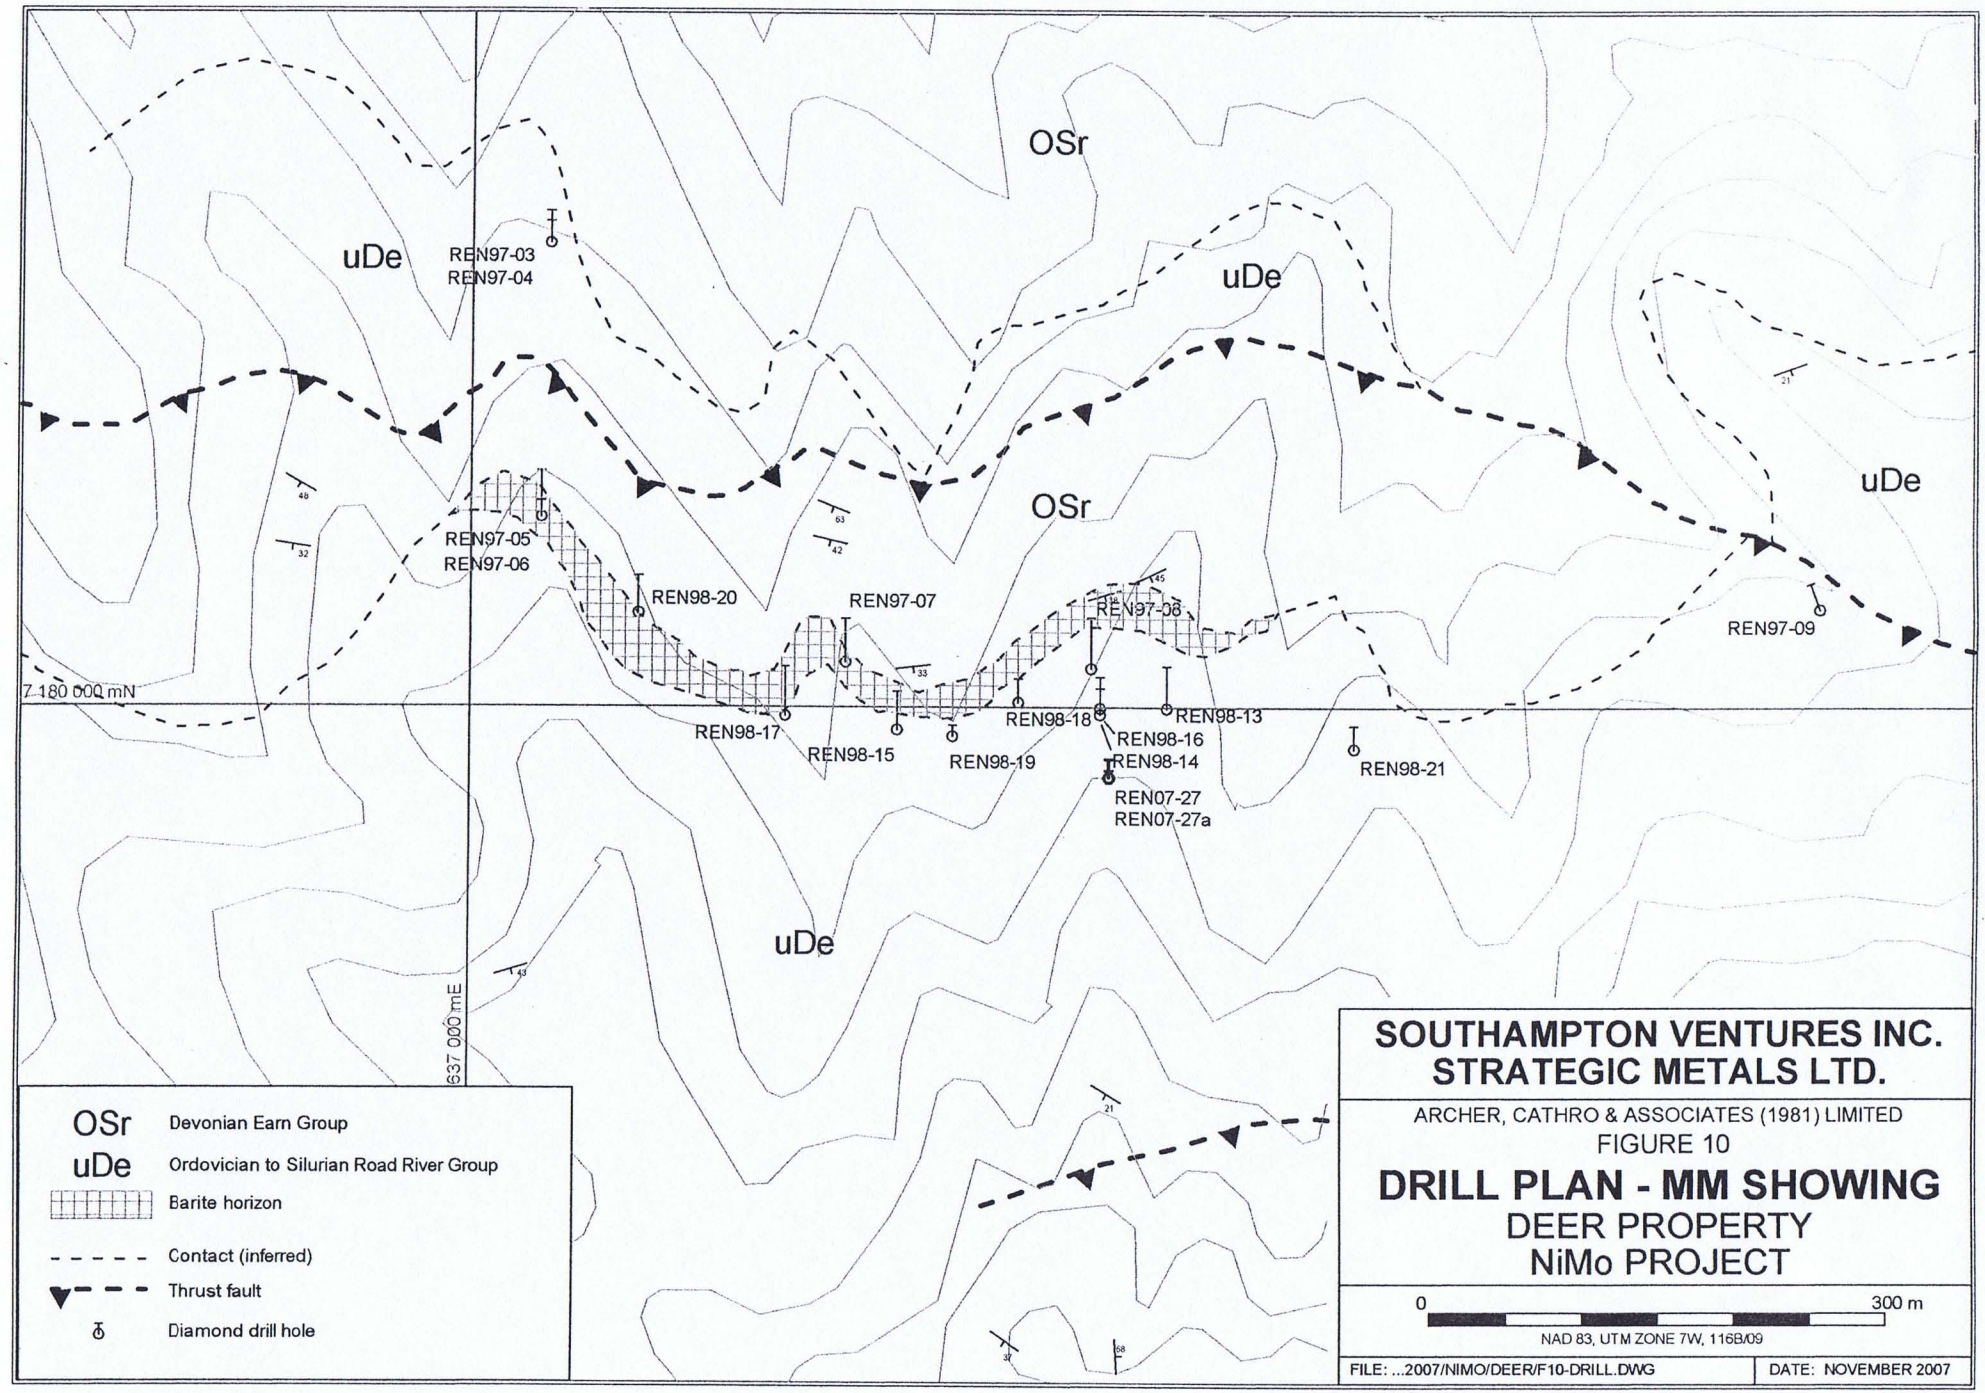

In 2007, three rock, one silt and 160 soil samples were collected on the property. An additional two rock and 139 soil samples were collected immediately adjacent to the property. All samples were sent to ALS Chemex in North Vancouver, where they were mostly analyzed using the inductively coupled plasma technique for 49 elements (ME-MS61). Some soil samples were analyzed using the inductively coupled plasma for 32 elements (ME-MS41). Sample locations are illustrated on Figure 6 while nickel, molybdenum and zinc geochemistry is shown on Figures 7 through 9, respectively.

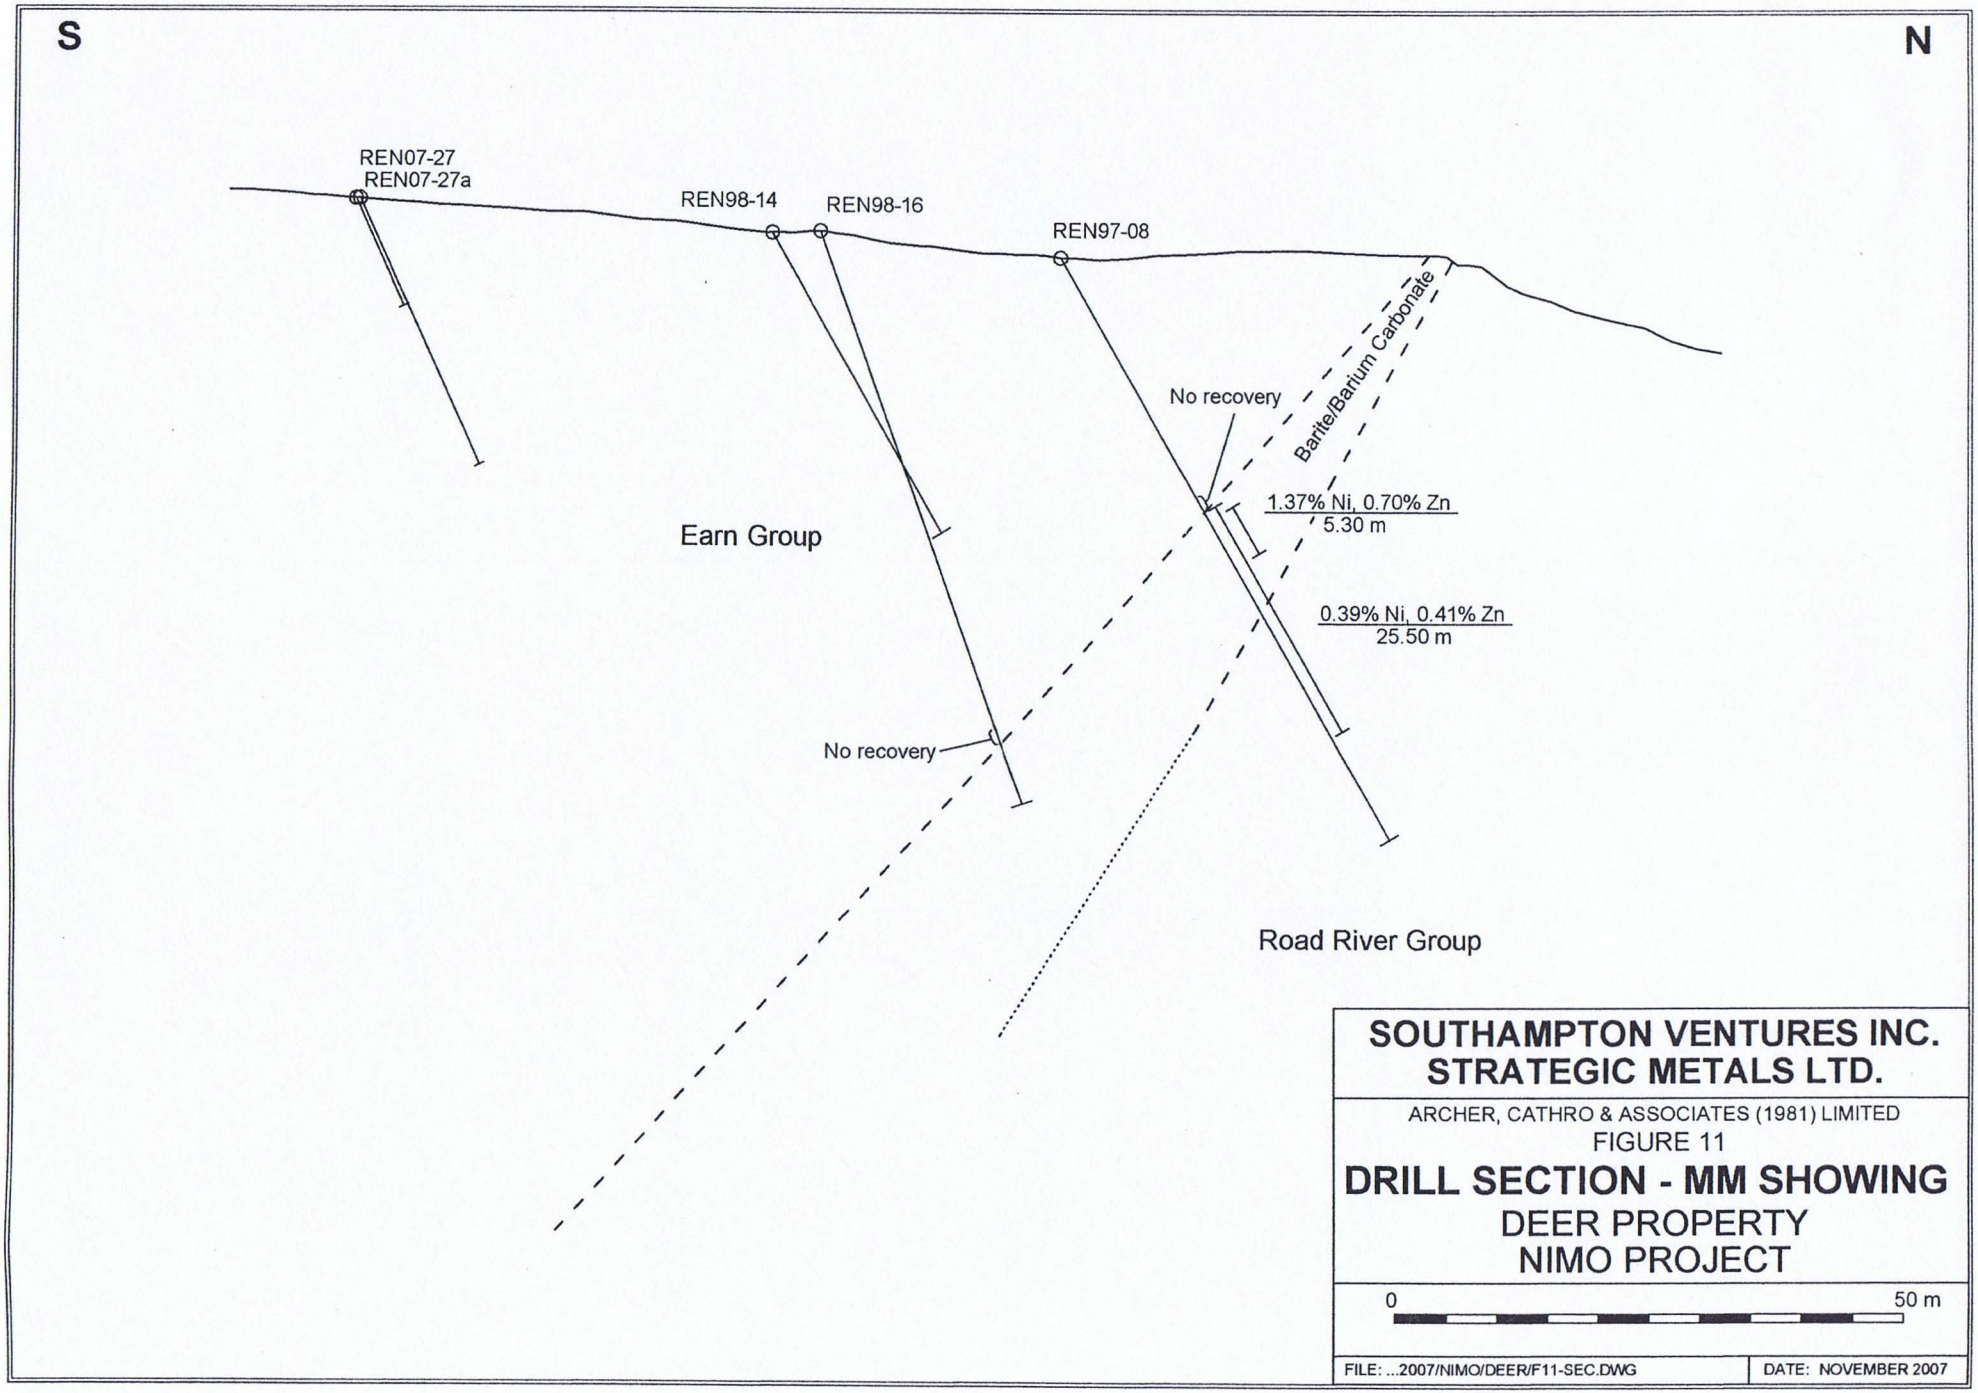

Soil samples collected in 2007 averaged 70 ppm nickel, 35 ppm molybdenum and 325 ppm zinc with maximum values of 1420 ppm nickel, 259 ppm molybdenum and 6410 ppm zinc. The silt sample yielded 174 ppm nickel, 29 ppm molybdenum and 1260 ppm zinc. The most anomalous rock sample consisted of cherty breccia and yielded 2040 ppm nickel, 73.1 ppm molybdenum and 2.86% zinc from. Another sample, collected from a quartz vein, returned 572 ppm nickel, 208 ppm molybdenum and 3710 ppm zinc.

DIAMOND DRILLING

Drilling was done between August 1 and 4, 2007 by Elite Diamond Drilling of Revelstoke, B. C. The work was completed with a unitized JKS Super-300 diesel powered drills using BTW equipment. A total of 40.54 m of diamond drilling were completed in 2 holes (Figure 10). Drilling was supported by a helicopter based at the Cache Creek camp site, located 26 km to the north on the Dempster Highway.

The 2007 holes were designed to test the barite horizon along a section line that included previously drilled holes (Figure 11). Both of the 2007 holes were abandoned short of their target depth. It was then decided that the drill was not suited for the very poor ground conditions and

REN07-27a	637428	7179954	000°	-65°	28.96

DISCUSSION AND CONCLUSIONS

Regionally, the nickel-rich, NiMo horizon occurs at a predictable stratigraphic location and has demonstrated considerable lateral continuity. These factors coupled with the horizon's diverse metal suite and consistently high metal value makes it an attractive exploration target.

The favourable horizon has been traced by mapping and sampling for over 6 km along strike on the Deer property. Several thrust faults have been mapped on the property, some of which cut the NiMo horizon. One of these faults is located immediately north of the barite horizon at the MM Showing. Rock and soil samples, which returned anomalous values, were all collected north of this fault. It is likely that the stratigraphy is repeated to the north of the fault and that the source of the anomalous values is from a portion of the favourable contact that has not yet been observed in outcrop or tested by drilling.

Geochemical samples collected in 2007 typically returned more subdued values than samples collected in the past. The earlier samples were analyzed at ALS Chemex in North Vancouver using a 32 element, triple acid digestion and atomic absorption (ICP-AES) technique. Although the analytical techniques used in 2007 and by previous operators are comparable, the data does not correlate. It is recommended that additional systematic soil sampling be carried out over the primary areas of interest outlined by pre-2007 soil samples in order to confirm the validity of the historical data.

Due to the limited outcrop exposure, surface mapping of the NiMo horizon is difficult. Instead silt and soil sampling must be used to identify the surface trace of the horizon. Unfortunately, work elsewhere in the region has shown that sampling of surficial material is not a reliable method for predicting the thickness of the NiMo horizon. Thus, further drilling is recommended to test down dip and along strike of the MM Showing and to explore other geochemically anomalous areas.

Respectfully submitted,

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

CERTIFICATE VA07083175

Project: NIMO

P.O. No.:

This report is for 5 Rock samples submitted to our lab in Vancouver, BC, Canada on 31-JUL-2007.

The following have access to data associated with this certificate:

AL ARCHER VANCOUVER OFFICE	DOUG EATON BILL WENGZYNOWSKI	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-32	Pulverize 1000g to 85% < 75 um
BAG-01	Bulk Master for Storage

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
PGM-ICP23	Pt, Pd, Au 30g FA ICP	ICP-AES
ME-MS61	48 element four acid ICP-MS	

To: STRATEGIC METALS LTD.

CERTIFICATE VA07083174

Project: NIMO

P.O. No.:

This report is for 21 Soil samples submitted to our lab in Vancouver, BC, Canada on 31-JUL-2007.

The following have access to data associated with this certificate:

JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION
ME-MS41	51 anal. aqua regia ICPMS

To: **STRATEGIC METALS LTD.**
ATTN: JOAN MARIACHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VA07077760

Project: NIMO

P.O. No.:

This report is for 27 Soil samples submitted to our lab in Vancouver, BC, Canada on 18-JUL-2007.

The following have access to data associated with this certificate:

JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION
ME-MS41	51 anal. aqua regia ICPMS

To: **STRATEGIC METALS LTD.**
ATTN: JOAN MARIACHER

APPENDIX III

ROCK SAMPLE DESCRIPTIONS

Rock Sample Descriptions

Project: NiMo Property: Deer

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375601	UTM: 638060	E	UTM: 7180206	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: calcite vein with 3 x 2 cm crystals and hemetitic limonization along fractures

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375602	UTM: 638292	E	UTM: 7180378	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: massive barite-calcite with minor limonization and sulphide casts ~3 mm in diametre and <1% of rock. Heavy sample

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375603	UTM: 638378	E	UTM: 7180411	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Quartz vein material with 3 cm long bladed quartz crystals with intensive hemetitic limonization (up to 40% of rock) and ~5% pore space

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375604	UTM: 637989	E	UTM: 7180936	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Dark grey cherty, weakly calcarous shale with ~2% blebby pyrite

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375605	UTM: 637255	E	UTM: 7180772	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: dark brown breccia with ~15% sub angular ~3 to 5 mm diameter cherty clasts in a dark grey brown matrix. Matrix can be scratched with metal ~2% sulphide clasts. High density.

APPENDIX IV

GEOLOGICAL AND GEOTECHNICAL LOGS
