I	Stratigraphic Column - Harlow Claims	3

INTRODUCTION

The Harlot claims were staked in summer 2007 to cover geochemical anomalies outlined on the lapsed Jet claims by previous operators. The stratigraphy and geochemical signature are analogous to that of the NiMo massive sulphide horizon found on the Nick property in central Yukon.

This report describes work that was conducted on August 16, 2007 by Archer, Cathro & Associates (1981) Limited on behalf of Strategic Metals Ltd. The 2007 field program consisted of geological mapping, prospecting, soil sampling and preparing drill sites for future diamond drilling. The author's Statement of Qualifications is located in Appendix I.

PROPERTY LOCATION AND ACCESS

The Harlot property is comprised of 64 contiguous mineral claims located 7 km south of Niddery Lake in eastern Yukon, approximately 35 km northwest of the North Canol Road and 140 km northeast of the community of Ross River (Figure 1). The property lies near an established winter road route through the Selwyn Mountains. The property trends roughly northwest to southeast, centred at latitude 63°13´ north and 131°18´ west on map sheet 105O/3. The claims are registered with the Mayo Mining Recorder in the name of Archer Cathro, which holds them in trust for Strategic. Claim data are listed below while locations of individual claims are shown in Figure 2.

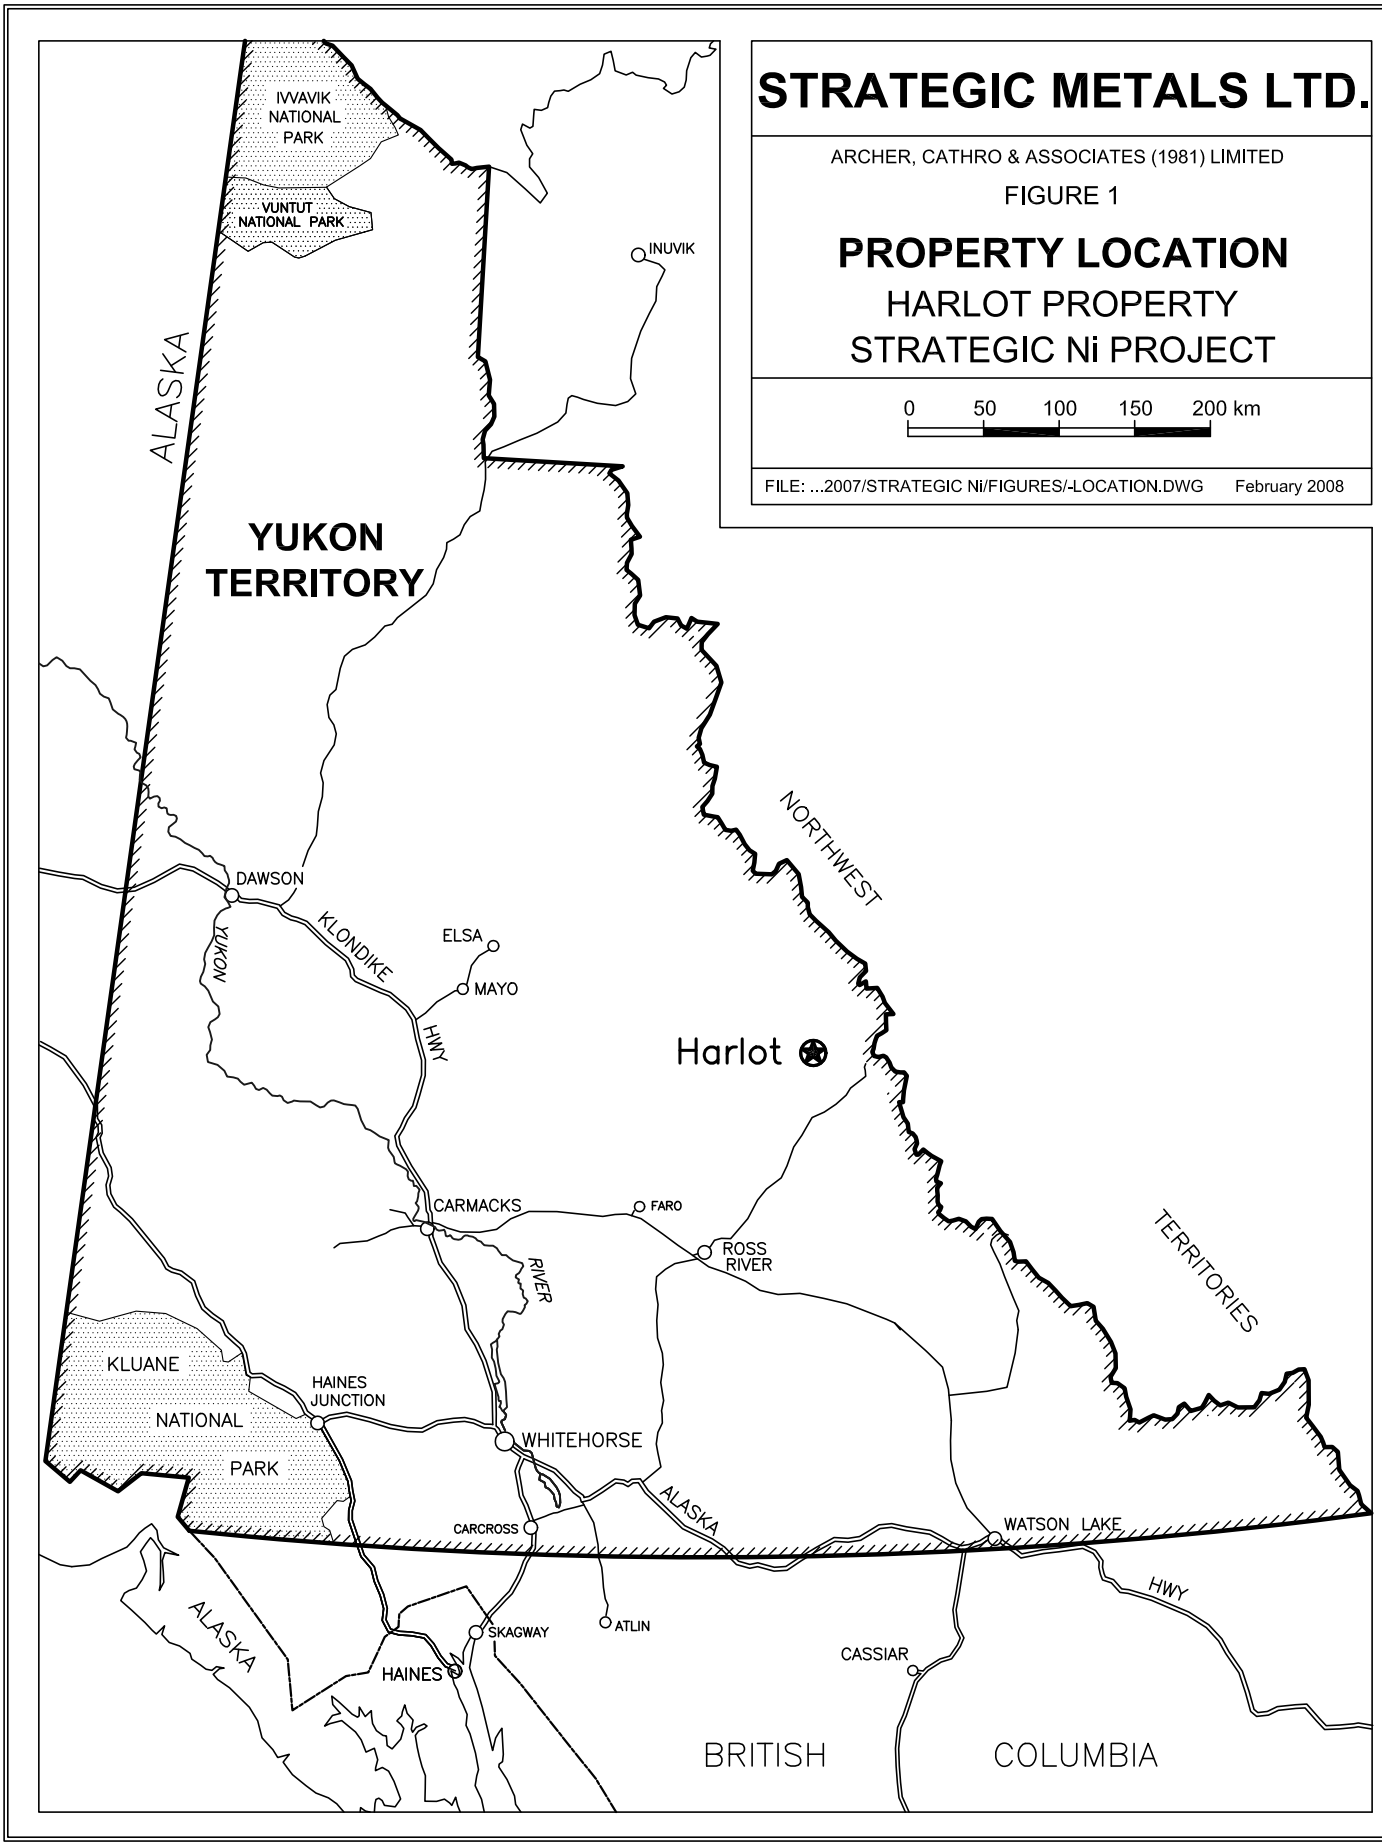

Claim Name	Grant Numbers	Expiry Date*
Harlot 1-32	YC57040-YC57071	August 13, 2008
33-64	YC57430-YC57461	September 27, 2008

* Expiry dates do not include 2007 work which has not yet been filed for assessment credit

In 2007, access to property was provided by a Bell 206 helicopter operated from a temporary base at a field camp near Jeff Lake on the North Canol road (Figure 3).

HISTORY

The Harlot target was first staked and explored by Atlas Exploration Ltd. in 1967-70. It was again explored by Itsi Joint Venture (Union Oil Ltd., Aquitaine Company of Canada Ltd. and St. Joseph Explorations Ltd.) in 1976, Hudson Bay Exploration & Development Co. Ltd. in 1981-82 and AGIP Canada Ltd. in 1983. These operators were attracted by highly anomalous values of zinc and silver in silt and water samples of local drainages. The lack of supportive lead geochemistry and the inability of prospectors to find a source for the anomalies led early workers to abandon the properties, attributing the geochemical response to high metal backgrounds in supposed Silurian Road River shales. Later the area was mapped by the Geological Survey of Canada (GSC). This, along with fossil evidence, led to the reassignment of the country rocks to the Lower Devonian Road River Group-Earn Group contact.

ACCESS

HARLOT PROPERTY

STRATEGIC Ni PROJECT

...2007/Strat Ni/Harlot/Harlot Access February 2008

The Jet claims were staked to cover the exploration target by NDU Resources Ltd. in April, 1990 based on geochemical and geological similarities with the Nick nickel-zinc sedex deposit in north-central Yukon. This work returned soil samples that often exceeded 1% Zn and Ni that ranged up to 3160 ppm near the contact between the Road River Group and Earn Group shales.

In 1998 Expatriate Resources conducted a hand trenching program on the Jet claims; three trenches were dug over what is now the Harlot property. The best results came from Trench 98-04, which returned a chip sample of 5680 ppm Zn and 223 ppm Ni across 3 m.

In summer 2007 the area was staked as the Harlot claims by Strategic.

GEOMORPHOLOGY

The Harlot property straddles a southeast trending ridge in the Hess Mountains. The property drains into Hess River to the north and the North Macmillan River to the south, both of which are part of the Yukon River watershed.

Local elevations range from 1450 m above sea level in creek valleys to a maximum of 2050 m on top of the main ridge. Topographic relief is steep on the flanks of the ridge coming to a sharp crest at the top.

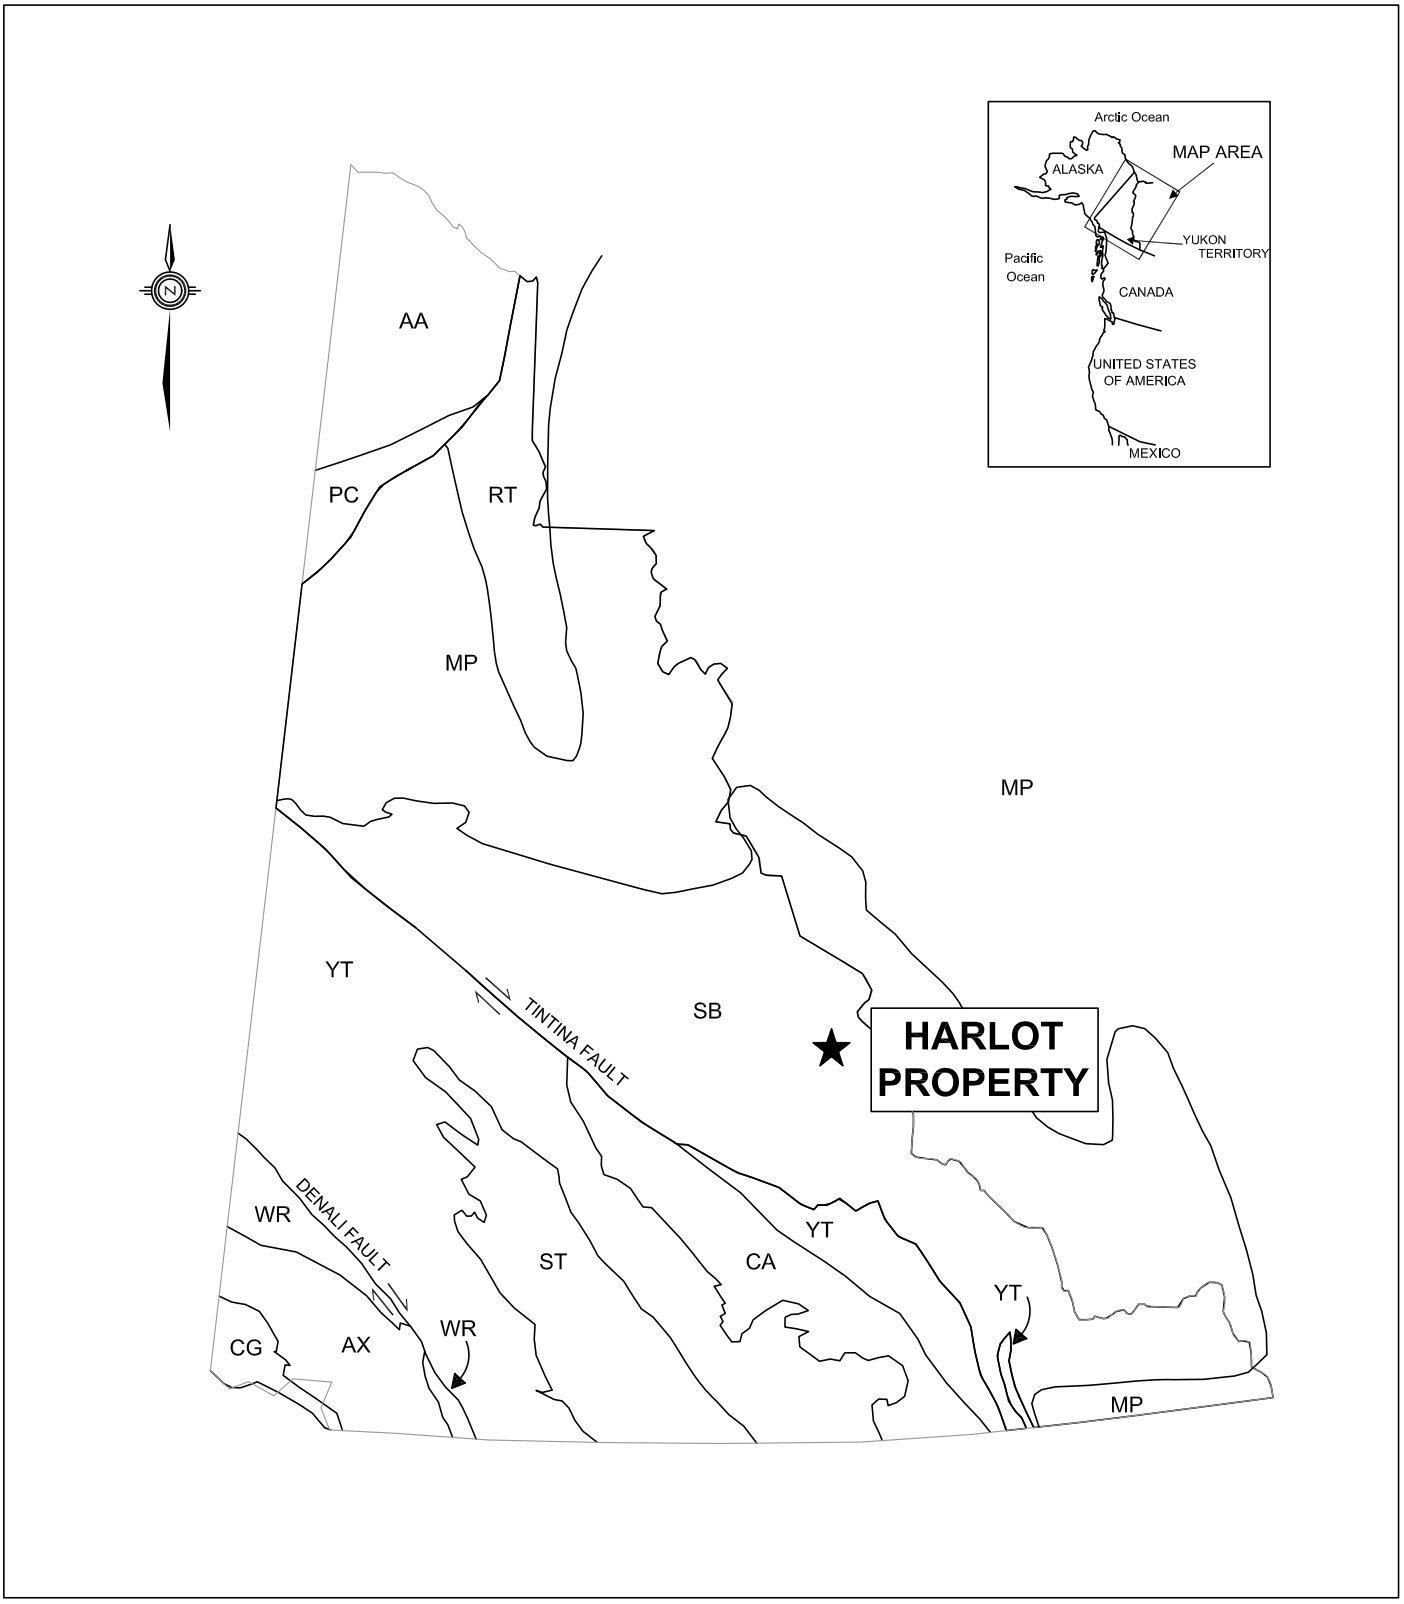

Vegetation on the property is sparse with minor grass in sheltered areas on the ridge and nearly complete grass cover in the valley bottoms, with occasional bushes of arctic black birch along creeks.

REGIONAL GEOLOGY

The Harlot property lies within Selwyn Basin, a northwest trending belt of deep water off-shelf sedimentation that formed from Lower Ordovician to Lower Devonian time. This basin is bounded to the north and east by Mackenzie Platform, to the south by Macdonald Platform, and to the west by Cassiar Platform and Tintina Fault (Figure 4).

Selwyn Basin stratigraphy consists of a Lower Ordovician to Lower Devonian succession of shale, basinal limestone, chert and gritty turbiditic sandstone of the Road River Group. Lower Silurian siliceous and carbonaceous mudstones host the world class Howard's Pass stratiform zinc and lead sulphide deposits. From Lower Devonian to Middle Mississippian time, Earn Group turbiditic chert rich clastic rocks were deposited from uplifted portions of west and central Selwyn Basin. These uplifts are related to a rift event that produced local, felsic volcanism and widespread bedded barite mineralization with localized barite hosted zinc-lead sedex deposits. Lower Devonian shales in central Yukon also host the Nick nickel-zinc massive sulphide mineralization as well as a number of other economically significant occurrences of a similar nature.

Early Cretaceous northeast-southwest compression led to northwest trending decollement style folds and minor thrust faults. Middle to Late Cretaceous intrusions which intrude all lithologies

are responsible for localization of tungsten skarns (notably at Cantung and Mactung) as well as intrusive hosted and hornfels gold vein and stockwork mineralization in the Macmillan Pass area.

PROPERTY GEOLOGY

Stratigraphy on the property is broken into two main sequences. The Lower Ordovician to Upper Silurian Road River Group comprises a variably calcareous or dolomitic starved basin shale, mudstone and chert assemblage. The overlying Early to Middle Devonian Lower Earn Group consists of fine grained siliceous argillite and black shale interfingered with coarse grained siliciclastic rocks deposited as turbidites and debris flows (Figure 5).

The Road River Group hosts the 500+ million tonne Howard's Pass zinc-lead sedex deposit 140 km southeast of the Harlot property while the unique stratiform shale hosted, nickel zinc-platinum group element bearing Nick massive sulphide mineralization in central Yukon occurs at the base of Earn Group. The Tom and Jason barite-hosted lead-zinc-silver sedex deposits occur in Upper Devonian Earn Group siliceous argillites at Macmillan Pass, 45 km to the southeast.

Structural geology of the Harlot property area is relatively simple at a large scale. The underlying strata have an overall dip of 30 to 70° southwest and are exposed along the rugged face of a southeast-trending ridge. However, the structural geology is more complex in detail. Numerous small scale faults and upright, isoclinal, low amplitude folds locally modify the essentially homoclinal strata. Normal faults and fold axes strike northeast paralleling regional structural trends.

LOWER ORDOVICIAN TO UPPER SILURIAN

ROAD RIVER GROUP

OSDu undivided Road River Group

Duo Lake Formation

OSDsc calcareous, sooty black mudstone; discontinuous

OSDca calcareous black shale, siliceous argillite and chert

OSDsm tan-brown weathering dolomitic siltstone, limestone, calcareous mudstone

OSDgc black and grey banded chert; rusty brown weathering grey pyretic chert; minor chert nodule limestone

OSDcg thin bedded calcareous mudstone and silty shale

OSDls grey weathering, black to grey pyritic chert; discontinuous grey fossiliferous limestone lenses and pods

On the Harlot property, the generally recessive Road River Group consists of five units of the Duo Lake Formation and one unit of the overlying Steel Formation. Road River Group rocks to the south and north of the property were not mapped in detail and are referred to as undivided Road River Group.

The oldest rocks exposed on the property are thin bedded calcareous mudstones and silty shales (Unit OSCcm) of the Duo Lake Formation. This unit is overlain by black and grey banded chert and rusty brown weathering pyritic grey chert with minor chert nodule limestone intervals (Unit OSDgc). Tan-brown weathering dolomitic siltstone, limestone and calcareous mudstone (Unit OSDsm) forms a reliable marker horizon within the Road River Assemblage. A calcareous black shale, siliceous argillite and chert sequence (Unit OSDca) overlies the dolomitic marker unit. These rocks may display a high degree of internal structural complexity, probably due to abrupt changes in ductility between the chert and argillite members. The uppermost member of the Duo Lake Formation is poorly exposed, relatively recessive, discontinuous, calcareous sooty black mudstone unit (Unit OSDsc).

The Steel Formation is comprised of grey weathering, black to grey pyritic chert and discontinuous grey fossiliferous limestone lenses and pods (Unit OSDls). This is the youngest unit of the Road River Group.

Geological mapping has confirmed that anomalous geochemical response is possibly related to an intermittent metaliferous horizon located stratigraphically above the discontinuous limestone unit in a setting similar to the Nick mineralization. Unlike the latter occurrence, which has carbonate concretions in the footwall, the Harlot limestone is generally bedded or podiform carrying a diverse assortment of macrofossils, including trilobite carapaces, single and double ossicle crinoid fragments, as well as bryozoan and coral debris. The faunal assemblage is indicative of an upper Early Devonian (Emsian) age of deposition in a relatively shallow water environment. This is in contrast to the apparently deep water shale facies which enclose the limestone. In addition to the unusual faunal assemblage, the carbonate is often sulphide rich with irregular pyrite masses distributed throughout. Vug fillings and scattered disseminations of

bituminous material are also often present. Lenses of grey weathering, black to grey pyritic chert occasionally occur as lateral equivalents to limestone bodies

The unusual association of a metaliferous horizon with a sulphide rich, yet biologically diverse limestone/chert unit, might be indicative of proximity to hydrothermal vent areas in a manner analogous to present day "shallow water" biota that exist in deep water by deriving energy from oxidation of sulphide sulphur near hydrothermal vent areas rather than depending on a food chain based on photosynthesis.

Lower Earn Group

The Early to Middle Devonian Lower Earn Group on the property consists of seven units of variably fine to coarse grained siliciclastic rocks of the Portrait Lake Formation. This stratigraphy is relatively well defined because these resistant lithologies occur at higher elevations on the property. The lowest member (Unit DPbm) of the Earn Group consists of a thin, dark grey weathering, sooty, black, non-siliceous silty mudstone which overlies the Road River Group stratigraphy. Dark grey laminated barite, nodular barite and barium carbonate lenses (Unit DPba) and lenses or mounds of fossiliferous, grey, pyritic limestone, often with irregular masses of bitumen (Unit DPls) occur above the sooty black mudstone unit. Although this barite is probably correlative with baritic lead-zinc-silver sedex deposits at Macmillan Pass, results of geochemical surveys suggest that similar mineralization is not present on the Harlot property. Overlying these units is a black chert and cherty argillite sequence (Unit DPca). Minor lenses of buff to grey weathering, massive to laminated, bioclastic to micritic limestone (Unit DPgl) appear stratigraphically above the chert and cherty argillite. Resistant, massive chert pebble conglomerate and thick bedded chert with silty shale interbeds (Unit DPcg) were deposited as debris flows and proximal facies turbidites, respectively, from topographic highs to the northwest. The uppermost member of the Lower Earn Group and Portrait Lake Formation is a bluish white weathering, black siliceous shale and chert (Unit DPsc).

GEOCHEMISTRY

Soil Sampling

Eighty seven soil samples were taken on the Harlot property in 2007. All soil samples were sent to ALS Chemex where they were dried and sieved to -180 microns. A portion of the sample was then digested in aqua-regia acid and analyzed for 34 elements by inductively coupled plasma with atomic emission spectroscopy (ME- ICP41).

The samples were taken along contour lines that ran the length of the property to define areas of highest geochemical response in preparation for drilling. Closely spaced soil samples were taken across favourable stratigraphy during prospecting. Results were encouraging with several samples between 1000 and 4000 ppm zinc and 100 and 400 ppm nickel. The best soil sample taken in 2007 was taken at the recessive contact between the Road River and Earn Group shales, and returned 54900 ppm zinc and 4400 ppm nickel. The highest zone of geochemical response was defined on the southeast side of the claim block (Figures 6 to 8).

Rock Sampling

A total of four rock samples were taken during prospecting and mapping in summer 2007 on the Harlot property. Two samples were taken from the contact between the Earn Group and Road River Group shales on the northeast side of the claims. These returned values of 5740 ppm and 5590 ppm Zn and 351 ppm and 341 ppm Ni. A drill pad was partially completed to test this stratigraphy. The best rock sample is coincident with the best soil samples and returned 9410 ppm Zn and 492 ppm Ni (Figures 6 to 8).

DISCUSSION AND CONCLUSIONS

In other areas in the Yukon, the zinc and nickel rich NiMo horizon occurs at a predictable stratigraphic location with considerable lateral continuity. These factors, coupled with the diverse and consistently high metal value, make it an attractive exploration target. Though the NiMo horizon has not yet been definitively observed in outcrop on the Harlot property, the host stratigraphy has been observed near high zinc and nickel soil sample anomalies suggesting that the NiMo horizon is present but has been weathered out at surface.

Future work should include diamond drilling in the areas with the strongest soil geochemical response. These drill holes should be oriented to intersect the contact between the Road River Group and Earn Group to determine whether the NiMo horizon exists on the Harlot property. One drill pad has been started to accommodate this work.

Respectfully submitted,

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

Daniel Gregory, B.Sc.

APPENDIX I

STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Daniel Gregory, geologist, with business addresses in Vancouver, British Columbia and Whitehorse, Yukon Territory and residential address in Vancouver, British Columbia, do hereby certify that:

1. I graduated from the University of British Columbia in 2007 with a B.Sc. (Hons.) in Honours Geology.

2. From 2004 to present, I have been actively engaged in mineral exploration in the Yukon Territory.

3. I have personally participated in the fieldwork reported herein.

Daniel Gregory, B.Sc.

Comments: Interference: Ca>10% on ICP-MS As,ICP-AES results shown. Gold determinations by ME-MS41 are semi-quantitative due to the small sample weight used (0.5g).

APPENDIX III

ROCK SAMPLE DESCRIPTIONS

Rock Sample Descriptions Project: Strategic Ni Property: Harlot

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
C384971	UTM:	383391	E	UTM:	7010933	N	Sample Width: 10cm	Abundance:
	Elevation:		m					

Comments: At contact btwn DMe and Osr. Med. GY clayey material with a GN tinge and thin whispy white layers.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
C384972	UTM:	383391	E	UTM:	7010933	N	Sample Width: 35cm	Abundance:
	Elevation:		m					

Comments: At contact btwn DMe and Osr. Gaugey, heavily fractured carbonaceous shale

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
C384976	UTM:	383812	E	UTM:	7010435	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: At contact btwn DMe and Osr. Black Shale

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
C384977	UTM:	383812	E	UTM:	7010435	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Baritic? Light grey limestone (possibly analogous to limestone ball member.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
	UTM:		E	UTM:		N	Sample Width:	Abundance:
	Elevation:		m					

Comments:
