INTRODUCTION

The Rau property is located in central Yukon along the northern edge of the Tintina Gold Belt, a band of intrusion-related gold deposits that extends across Yukon and Alaska. The property is primarily of interest for carbonate hosted gold but also hosts lead-zinc-silver and tungsten mineralization, which are often associated with intrusion-related gold elsewhere within the belt. The property is owned 100% by ATAC Resources Ltd.

This report describes an exploration program that was conducted on the majority of the claims comprising the property between June 4 and October 17, 2009 by Archer, Cathro & Associates (1981) Limited on behalf of ATAC. The authors participated in and supervised that program, which consisted of geological mapping, prospecting, soil geochemical sampling, stream sediment sampling, ground geophysical surveys and 9578.30 m of diamond drilling in 58 holes. The authors' Statement of Qualifications appears in Appendix I.

PROPERTY LOCATION, CLAIM DATA, ACCESS AND INFRASTRUTURE

The Rau property consists of 2701 contiguous mineral claims which are located in central Yukon at latitude 64°11´N and longitude 134°22´W on NTS map sheets 105M/15, 106C/04, 106D/01, 106D/02, 106D/03, 106D/06, 106D/07 & 106D/08 (Figure 1). Collectively, the property covers an area of approximately 54,807 hectares (548 km^2). The claims are all registered with the Mayo Mining Recorder in the name of Archer Cathro, which holds them in trust for ATAC. Specifics concerning claim registration are tabulated below while the locations of individual claims are shown on Figures 2 through 5.

Claim Name	Grant Number	Expiry Date*
Rau 1-64	YC50268-YC50331	April 28, 2024

1296-1337	YC70595-YC70636	April 28, 2014
S 1-700	YC90801-YC91500	April 28, 2015
701-1154	YC91901-YC92354	April 28, 2015

* Expiry dates include 2009 work which has been filed for assessment credit but not yet accepted.

The property lies 100 km northeast of Mayo, the nearest supply centre. The closest road access is to the community of Keno City, situated about 49 km by road northeast of Mayo and 55 km by air southwest of the property. Mayo and Keno City can be reached in all seasons by two wheel drive vehicles using the Yukon highway system. The Wind River trail is also accessible via the

Yukon highway system from McQuesten Lake near Keno City and crosses the western portion of the property (Figure 6). This winter trail has been used intermittently by various exploration companies since it was built in the late 1960s.

In 2009, access to the property and daily logistical support were accomplished using Bell 206L4 and Hughes 500D helicopters based on the property and operated by Fireweed Helicopters Ltd. of Whitehorse. A large clearing located at McQuesten Lake served as a staging area. If required, fixed wing aircraft can land at the Kathleen Lakes airstrip along the northeastern boundary of the property. These lakes are also suitable for float equipped aircraft.

In response to continuously encouraging drill results, a John Deer 450 bulldozer was mobilized to the property by a Bell 204 operated by Fireweed Helicopters in fall 2009. A local road system was constructed down through the main drill area and into the valley to a new camp location. The road system is accessible with the use of four wheel drive ATV from camp to the main drill area.

In fall 2009, additional claims were staked to cover a proposed 48 km pioneer road route connecting the property to the Yukon Highway system near McQuesten Lake. EBA Engineering Consultants Ltd. was contracted to conduct a preliminary route selection and terrain assessment. Results of this survey are contained in Appendix II.

Three separate baseline water quality surveys were completed by J. Gibson Environmental Consulting of Whitehorse in June, July and October, 2009. All three reported neutral to slightly alkaline waters and low dissolved metal contents in all streams. The results of these surveys were comparable to those obtained in 2008 (Dumala, 2009). In addition to baseline water quality surveys, a stream profile of the Beaver River at a proposed road crossing was also created by J. Gibson in July 2009. Copies of Gibson's reports can be found in Appendix III. In addition to these surveys Laberge Environmental Services commenced wildlife and benthic studies within the core portion of the claim block and along the proposed pioneer road route which appear in Appendix IV. Similarly, heritage assessment along the proposed route was conducted by Matrix Research Ltd which can be found in Appendix V.

EXPLORATION HISTORY

The approximate locations of various showings referred to in this section are shown on Figures 2 through 5.

The earliest reported exploration within the area now covered by the Rau property occurred in 1922 following the discovery of silver mineralization at Keno Hill when prospectors first identified and staked mineralized float occurrences at Carpenter Ridge in the far northwest corner of the current property. In 1924, reconnaissance work conducted by the Geological Survey of Canada discovered galena-calcite-siderite in float on the southwest end of Carpenter Ridge. A sample of this float returned 8.75 oz silver and 56.0% lead (Cockfield, 1925); however, the source of this mineralization was not found. Hand pits were dug in 1927 and 1928 but little record remains of the work completed during this period. All claims were ultimately dropped.

FILE: ...2009\RAU\F_6-ACCESS.WOR | DATE: MARCH 2010

Nearby at Grey Copper Hill, 9 km to the southeast, silver-rich tetrahedrite float was discovered in 1923 by an independent prospector. This showing and other nearby prospects were staked later that year. Several investigatory adits were dug into the hillside during follow up exploration but eventually all claim holdings lapsed.

Between 1930 and 1974 Grey Copper Hill was staked several times by independent prospectors and exploration companies, including Cypress Resources Limited and United Keno Hill Mines Limited. Little work was reported (Hilker, 1969) and all claims ultimately expired.

Hesca Resources Corporation Ltd restaked Grey Copper Hill in 1974 and conducted prospecting, soil sampling, hand trenching and adit maintenance. In addition, two shallow, small diameter diamond drill holes totaling 56.3 m were drilled; however, the results from this drilling are not documented. No further work was done by Hesca and the claims were dropped (Deklerk and Traynor, 2004).

In spring 1978 Prism Resources Limited restaked the area and conducted prospecting and geochemical sampling later that year. Soil sampling identified several lead and silver anomalies; however, follow up prospecting failed to explain them (Sivertz, 1979). A sample collected from an outcrop of dolomite yielded 0.60% lead and 51.43 g/t silver, while a tetrahedrite sample collected near an old adit assayed 7000 g/t silver (Sivertz, 1980). Prism allowed the claims to lapse.

Grey Copper Hill was again restaked in 1983 by a prospector who conducted grid soil sampling later that year. This program delineated silver anomalies coincident with surface lineations. No further work was completed and the claims expired.

In 1988 Bonventures Limited staked the area and conducted limited blast trenching, prospecting, mapping plus soil and rock sampling. A gossan zone with pyrite and strong fracture filling malachite and azurite was identified between two collapsed adits (Carlyle, 1989). These claims eventually lapsed.

The area remained open until August of 2005 when an independent prospector staked four claims over the Grey Copper Hill showing. No work on these claims has been reported and they are now surrounded by the Rau property.

In the central part of the current Rau property, Cominco Limited staked the Beaver claims in 1968 based on results of regional geochemical sampling done the year before. Later that year, L. Elliott staked the nearby Now claims and optioned them to Cominco, which completed mapping and soil sampling in 1968 and 1969 (Johnson and Richardson, 1969a and b).

In 1977, Prism Joint Venture (Asamera Oil Corp, Chieftain Development Company Limited, Prism Resources Ltd, Siebens Oil & Gas Limited and E & B Exploration Limited) restaked Cominco's claims as part of a larger block that extended for about 20 km along the north side of the Beaver River. In 1979, Dome Petroleum Ltd replaced Siebens in the joint venture.

Prism conducted most of its activities around the original Beaver claims. Soil sampling and mapping were performed in 1977 (Montgomery and Dewonck, 1978) and additional soil sampling and trenching were done in 1978 (Prism Joint Venture, 1979a). In 1979 Prism completed six diamond drill holes totaling 610 m (Dewonck, 1980). This work focused primarily on sedimentary exhalite and Mississippi Valley type lead-zinc mineralization, but resulted in the discovery of a narrow gold-rich vein material (the Now Showing).

NDU Resources Ltd. staked claims over the Now Showing in 1987 to cover the lead, zinc and silver soil geochemical anomalies identified by Cominco and Prism. The following year, NDU conducted a geochemical sampling program which focused on the gold vein mineralization at the Now Showing (Cathro, 1989). Regional prospecting at the south end of the current proposed Rau access corridor identified a 20 cm wide vein cutting Mississippian Keno Hill quartzite that had been intruded by Mesozoic greenstone sills. Two old shafts and a collapsed adit were also located at this location, referred to as the Zahn Showing. A specimen assaying 435.4 g/t silver, 18.3% lead, and 1.4% zinc was collected but no claims were staked.

In 1977, 6.25 km further to the northwest, Prism conducted mapping, soil sampling and electromagnetic surveys. Numerous samples from that program returned high zinc-in-soil values ranging from 2100 ppm to 12.2%. One sample collected from a large transported gossan (EL Showing) yielded 3.8 g/t silver, 800 ppm lead and 12.2% zinc (Montgomery and Cavey, 1978), suggesting the metals were leached and remobilized in acidic groundwater before being reprecipitated when the fluids were neutralized. These promising results were not followed up. In 1977, Prism also performed minor soil sampling near a strong gossan developed along the eastern edge of the current Rau property (Kathy Showing) (Prism Joint Venture, 1979b).

In 1979 and 1980, Prism explored in two areas in the north central part of the current Rau property and conducted prospecting, soil geochemical sampling and one diamond drill hole. This work led to the discovery of scheelite mineralization at the Blue Lite and Flat Top Showings. Well mineralized tremolite skarn specimens from the Flat Top Showing assayed up to 8.4% WO_3, but most material graded below 0.04% (Churchill, 1980). No further work was done at either showing.

ATAC's interest in the area was prompted by an isolated, high gold value (150 ppb) reported by a regional-scale stream sediment geochemical survey, conducted by the Geological Survey of Canada (Hornbrook, et al 1990). This value is in the 99th percentile of gold results from the survey and is supported by a 99th percentile tungsten value (25 ppm). The approximate location of the anomalous sample site is shown on Figure 2.

In summer 2006, ATAC staked 64 claims to cover the anomalous drainage. During the staking, a number of rock and soil samples were collected, many of which returned anomalous values for tungsten and a few were notably enriched in gold, lead, zinc, silver and copper. Cursory prospecting relocated scheelite-bearing tremolite skarn (Flat Top Showing) and discovered tungsten in diopside-actinolite skarn and highly fractionated intrusive rocks, about 1500 m to the south.

In 2007 ATAC completed geological mapping, prospecting, grid soil sampling and helicopter-borne variable time-domain electromagnetic (VTEM) surveys (Eaton and Panton, 2008). This work partially delineated a large hydrothermal system centered on the largely buried Rackla Pluton. Following that program, ATAC staked an additional 32 claims, mostly to improve coverage around a very strong gold-in-soil anomaly outlined on the western edge of the grid.

ATAC and Yankee Hat Minerals Limited signed an option agreement in spring 2008 concerning 40 claims that covered the Rackla Pluton and the tungsten-bearing skarns. During the summer of 2008 Yankee Hat conducted prospecting and a total of 437.38 m of diamond drilling in three holes (Dumala, 2008). Several narrow skarn bands with weak to moderate tungsten mineralization were identified within the carbonate host rocks. The option agreement was terminated in late 2008 following poor results and the claims were returned to ATAC.

Also in the summer of 2008, ATAC conducted geological mapping, prospecting, soil and stream sediment geochemical sampling, 3423.21 m of diamond drilling in 18 holes and property-wide helicopter-borne magnetic variable time-domain electromagnetic (VTEM) surveys on the claims not covered by the Yankee Hat option agreement. Drilling identified three stacked, gold-bearing horizons in what is now known as the Tiger Zone. The central horizon contains gold in iron carbonate replacement and hosts the most abundant mineralization. In 2008 grid soil sampling and stream sediment sampling was extended to the northwest. Property wide geophysical and geochemical surveys completed later in the season suggested the trend extends for as much as 22 km (Dumala, 2009). In response to positive results, ATAC added 1340 claims to cover the favourable stratigraphy along the anomalous trend.

GEOMORPHOLOGY

The Rau property is roughly 180 km long and covers a diverse geomorphological setting. Much of the claim block covers low lying vegetated valley bottom and similarly covered low elevation ridge systems.

The core portion of the Rau property is situated in the Nadeleen Range of the Selwyn Mountains and is drained by creeks that flow into the Rackla and Beaver Rivers, which are both part of the Yukon River watershed. Local topography is alpine to subalpine and features north and south-trending rocky spurs and valleys that flank a main east-west trending ridge. Elevations range from 725 m alongside the Beaver River in the centre of the claim block to 1800 m atop a peak, referred to as Monument Hill. Outcrop is most abundant near ridge crests and in actively eroding creek beds. Most hillsides are talus covered at higher elevations and are blanketed by glacial till at lower elevations. Soil development is moderate to poor in most areas.

Treeline in the vicinity of the property is at about 1500 m. Slopes above that elevation are unvegetated. The density and size of vegetation gradually increases on lower slopes, and the valley floors are well treed with mature black spruce. Understorey typically consists of low shrubs and moss. Moderately steep, south facing slopes are well drained and are often lightly forested with poplar. Steep, north facing slopes are usually unvegetated. Gentler, spruce- and moss-covered terrain likely exhibits widespread permafrost.

GEOLOGY

Regional Geology

The Geological Survey of Canada performed geological mapping in the vicinity of the Rau property at 1:250,000 scale in the 1960s (Green, 1972) and 1970s (Blusson, 1978). More recent mapping in the area was completed at 1:50,000 scale by Indian and Northern Affairs Canada (Abbott, 1990 and Roots, 1990).

The Rau property lies within a band of regional-scale thrust and high angle reverse faults that imbricate rocks of Selwyn Basin and Mackenzie Platform (Figure 7). Selwyn Basin stratigraphy consists of regionally metamorphosed, basinal sediments of Neoproterozoic to Paleozoic age. Mackenzie Platform stratigraphy comprises dominantly shallow water carbonate and clastic sediments that were deposited from Mid-Proterozoic through Paleozoic times. Both packages of sediments were deposited on the western margin of ancestral North America.

The thrust faults were active during Jurassic to Cretaceous times (160 to 130 Ma), when the area underwent compressional orogenesis related to large-scale plate convergence (Fingler, 2005). During Late Cretaceous (94-90 Ma), intermediate to felsic plutons of the Tombstone Suite were emplaced (Mortensen et al, 2000). Another compressional orogenic event, which occurred about 65 Ma, was accompanied by emplacement of felsic intrusions assigned to the McQuesten Suite.

Figure 8 shows regional geology in central Yukon. It is a geological compilation that takes into account recent age dating and new unit correlations, which Charlie Roots prepared for the Yukon Geological Survey (Cathro, 2006).

The Tombstone, Dawson and Robert Service thrust faults plus a number of lesser thrust faults affect stratigraphy along the trend of the Rau claim block. All thrusts verge northeasterly and predate emplacement of the Tombstone Suite intrusions. The thrust panel that contains the Rau property approximately straddles the boundary between Selwyn Basin and Mackenzie Platform and includes units belonging to both tectonic elements.

Table I contains a brief summary of the main lithologies in the area of the Rau property.

Table I: Regional Lithological Units (after Roots *in* Cathro, 2006)

Tectonic Element	Age (Ma)	Unit and Lithologies
Rocks of Ancestral North America		
Mackenzie Platform	1700 - 1800	Gillespie Lake Group: orange-brown dolostone and sandstone.
Mackenzie Platform	540 - 390	Bouvette Formation: white and grey limestone with rare black shale.
Mackenzie Platform	540 - 420	Marmot Formation: dark green to brown mafic, vesicular and amygdaloidal volcanic flows.

REGIONAL GEOLOGY

RAU PROPERTY

0 50 km

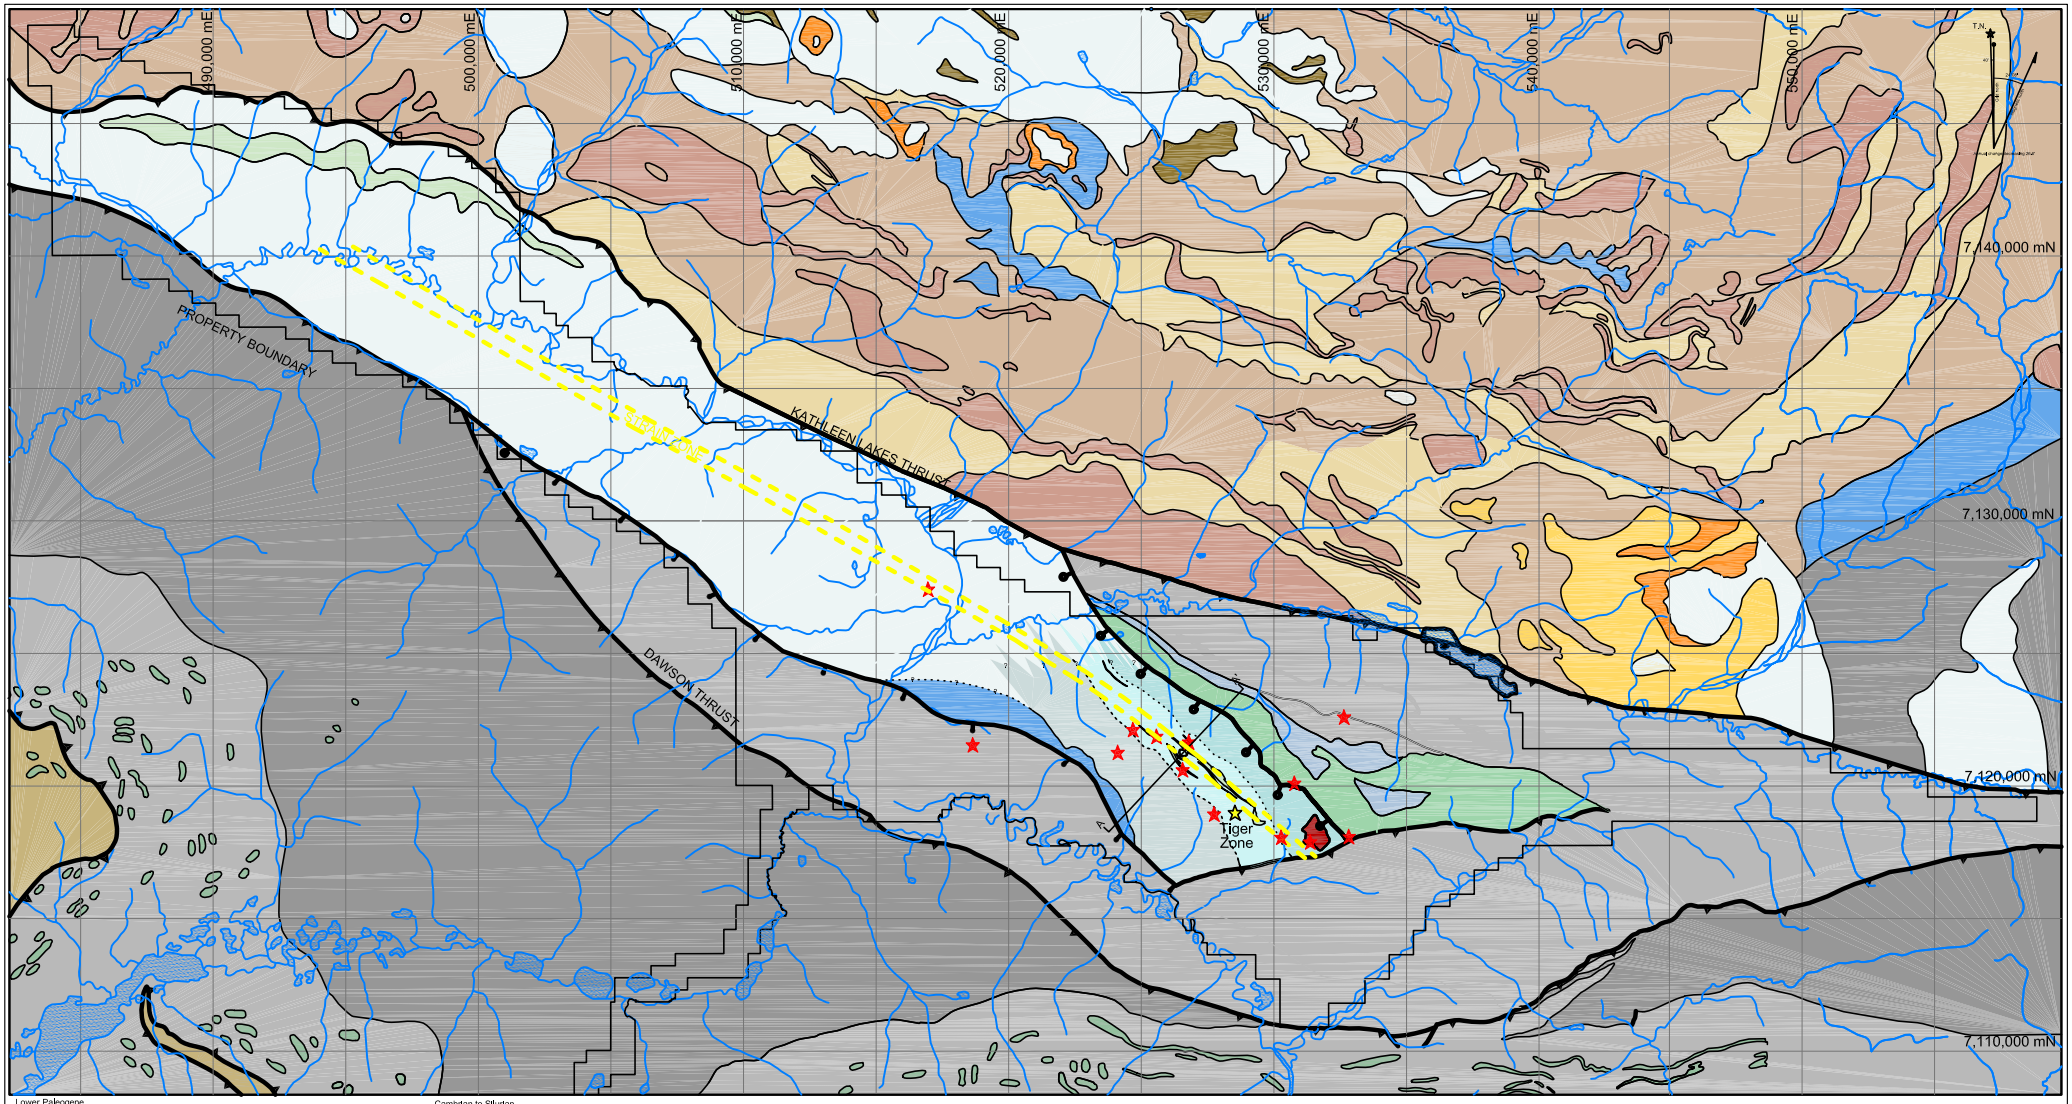
FILE: ...2009/RAU/F_8-REGIONAL.WOR | DATE: MARCH 2010

Selwyn Basin	750? - 530	Hyland Group: brown quartz-mica schist, with rare limestone.
Selwyn Basin	530 - 500	Gull Lake Formation: brown and green shale, sandstone, conglomerate and volcanic tuff.
Selwyn Basin	500 - 480	Rabbitkettle Formation: dark silty limestone and limy mica-rich conglomerate.
Selwyn Basin	480 - 390	Road River Group: black shale, chert and limy siltstone.
Rock formed before orogenic event		
	390 - 350	Earn Group: black shale and chert with lesser pebble conglomerate, sandstone and grit.
	340	Keno Hill Quartzite: grey metamorphosed sandstone, minor black shale and phyllite.
Rocks formed during orogenic event		
	225	Galena Suite intrusions: brown and green diorite and gabbro.
	200 - 250	Jones Lake and Mt. Christie Formations: sandstone, brown shale and dark limestone.
Rocks formed after orogenic event		
	90 - 94	Tombstone Suite intrusions: granite and granodiorite.
	62 - 67	McQuesten Suite intrusions: granite with two types of mica.
Sediments younger than 3 Ma		
	0 - 3	Overburden: ice-deposited sand and gravel; river silt.

Property Geology

Very little detail geological mapping has been conducted within the current property boundary. Most work has focused within the favourable Bourette Formation stratigraphy in close proximity to the Tiger Zone mineralization. The following descriptions are taken largely from previously documented government and historical mapping.

The Rau property lies within a northwest trending thrust package bound to the south by the Dawson Thrust and to the north by the Kathleen Lakes Fault. Property scale geology is illustrated on Figure 9. Stratigraphy within this package forms open folds that are aligned parallel to the thrusts and plunge gently to the southeast. Several high angle faults, which parallel the general structural trend, are inferred on the property and others could be present. One or more of these faults may have acted as a conduit for mineralizing fluids.



Lower Paleogene
- Rackla Pluton: granite with two types of mica.

Triassic
- TrG: Galena Suite: brown and green diorite and gabbro.

Carboniferous to Permian
- CPps: Skolai Group: dark grey slate interbedded with laminated quartz sandstone and thick bedded massive, fine grained quartzite; buff and green phyllite.

Carboniferous to Permian
- CPI: Icefield Ranges Suite: thick bedded, buff and grey weathering, dark grey limestone.

Mississippian
- MK: Keno Hill Quartzite: grey metamorphosed sandstone, minor black shale and phyllite.

Devonian and Mississippian
- DME: Earn Group: black shale and chert with lesser pebble conglomerate, sandstone and grit.

Devonian
- DG: Gossage Formation: limestone and dolostone with lesser black limestone and shale.

Upper Cambrian to Lower Devonian
- CDB: Bouvette Formation: white and grey limestone with rare black shale.
- €DC: Cambrian to Devonian: massive pale grey dolostone, oncolitic dolostone, minor quartzite, sandy dolostone.
- OSc: Ordovician to Silurian: thin to medium bedded grey and buff weathering silty limestone with massive white limestone and well bedded tan grey limestone in the upper part of the unit.
- SDc: Silurian and Devonian: thick bedded to massive light grey dolostone and limestone.

Cambrian to Silurian
- CSM: Marmot Formation: dark green to brown mafic, vesicular and amygdaloidal volcanic flows.

Lower and Middle Cambrian
- lmCs: Slats Creek Formation: rusty brown turbiditc quartz sandstone, minor shale and siltstone.
- lCl: Illyd Formation: light grey, medium bedded dolostone and limestone.

Upper Proterozoic to Lower Cambrian
- PCH: Hyland Group: brown quartz-mica schist with rare limestone.

Middle Proterozoic
- mPPFl: Fifteen Mile Group: red, green and grey shale to silty dolomite.
- mPH: Hart River Formation: dark weathering mafic volcanic flows.

Lower Proterozoic
- lPG: Gillespie Lake Group: orange-brown dolostone and sandstone.
- lPQ: Quartet Group: black shale and siltstone.

PROPERTY GEOLOGY

RAU PROPERTY

0 1 3 10 km

FILE: ...2009\RAU\F_9-PROPERTY_GEOLOGY.DWG | DATE: MARCH 2010

The **Bouvette Formation** is the most abundant inferred rock type shown on government based maps and is the principal focus of ATAC's exploration. It can be divided into three main units which young to the northeast. In order from oldest to youngest:

1) **Cambrian and Ordovician** – massive pale grey dolostone, oncolitic dolostone, minor quartzite and sandy dolostone.

2) **Ordovician and/or Silurian** – thin to medium bedded grey and buff weathering silty limestone; massive white limestone, well bedded tan and grey limestone in the upper part of the unit.

3) **Silurian and Devonian** – thick bedded to massive light grey dolostone and limestone. Dark grey, fetid limestone containing "two hole" and "star" crinoids at the top of the unit.

The thickness of the Bouvette Formation on the property is estimated to be at least 1400 m. The primary focus of mapping in 2009 was limited to the area around Monument Hill and the Tiger Zone within the Ordovician-Silurian strata hosting carbonate gold replacement mineralization Elsewhere the Bouvette Formation has not been mapped in detail and remains undifferentiated.

A narrow sliver of Middle Proterozoic **Fifteen Mile Group** dolostone lies beneath the Bouvette Formation, to the southwest. This unit is composed of chocolate to orange brown weathering, cryptalgal laminated, medium to thick bedded dolostone, overlain by rusty brown weathering, olive green siltstone and shale with lesser maroon black and buff shale.

The **Marmot Formation** consists of thin volcaniclastic horizons that are interbedded with the Ordovician and/or Silurian Bouvette Formation. The horizons range from a few metres to about 20 m thick and comprise dark green to brown weathering mafic, vesicular volcanic flows, carbonate-cemented hyaloclastic breccias and volcanic-derived sandstone, grit and pebble and cobble conglomerate. Locally these horizons are magnetic. Although the Marmot Formation is volumetrically insignificant, it appears to have played an important role in localizing mineralization in the underlying carbonate by acting as an impermeable cap.

Devonian and Mississippian **Earn Group** is located in the southern half of the property and bounds the Bouvette Formation to the south, east and north. This unit is generally recessive weathering and is mostly composed of black shale and chert. To the south a high angle normal fault places Earn Group against Bouvette Formation, while a thrust fault marks the southeastern contact. To the north, the Earn Group conformably lies above Cambrian to Permian shale and limestone, which has been placed against the Bouvette Formation by another high angle fault.

The central part of the property hosts numerous dykes and sills believed to represent a roughly 1000 m diameter granitic plug referred to as the "**Rackla Pluton**". The plug is mostly composed of coarse grained, equigranular, biotite-and muscovite-bearing granite that is locally miarolitic (Panton 2008). The dykes and sills typically range between 30 cm and 7 m in thickness. They are often more fractionated than the plug and include garnet bearing aplite and coarse pegmatite that locally features beryl, amazonite (a green variety of feldspar) and one or more tourmaline

minerals (rubellite, indigolite and schorl). The pegmatite bodies comprise mainly orthoclase and quartz but often exhibit abundant lithium-and vanadium-rich micas on their margins.

On surface, the Rackla Pluton is mostly covered by glacial till and only aplite and pegmatite sills and dykes are visible. The pluton is best delineated by its airborne magnetic signature (Figure 10). At the property scale the pluton is represented by a strong magnetic high. When the data is collapsed to the area immediately surrounding the pluton and a high-pass filter is applied, the signature shows a core magnetic low with a fringing magnetic high.

Analysis of several small bodies of granitic aplite and pegmatite have yielded 40Ar/39Ar muscovite ages of 62.3 ± 0.7 Ma, 62.4 ± 1.8 Ma and 59.1 ± 2.0 Ma (Kingston, 2009 and Kingston et al., 2010). Based on this data and the composition of the intrusion, Kingston concludes that the Rackla Pluton does not likely belong to the McQuesten Suite (65.2 ± 2.0 Ma).

Skarn and minor hornfels are developed locally within the Bouvette Formation proximal to the intrusions. Skarn grades from distal tremolite-rich (iron-deficient) facies, which are most abundant near the Flat Top Showing (about 1000 m northwest of the pluton), to proximal actinolite-diopside ± garnet ± pyrrhotite (iron-rich) facies, which are found closer to the pluton and on the margins of some dykes and sills. Massive skarns are mostly developed at contacts between limestone and volcaniclastic horizons. Hornfels is restricted to thin volcaniclastic layers within the Marmot Formation. It is normally rusty weathering and often contains disseminated to semi-massive pyrrhotite. Limestone and dolomite are locally altered to marble and often contain disseminated, light grey scapolite crystals. The scapolite is difficult to recognize on freshly broken surfaces but stands out on weathered surfaces as prismatic randomly orientated crystals.

MINERALIZATION

Several types of mineralization are known to occur on the Rau property including: **1)** sediment-hosted replacement-style gold; **2)** zinc±silver±lead±gold±bismuth in limonite-rich veins and replacement bodies; **3)** scheelite in tremolite skarns; **4)** pyrrhotite±scheelite±chalcopyrite in actinolite-diopside±garnet skarns; **5)** wolframite± tantalite in granite; and **6)** gold bearing quartz-boulangerite veins. **7)** iron±zinc in hydromorphically transported gossans.

Rock samples were collected from several parts of the property during prospecting traverses completed in 2009. They were sent to ALS Chemex in North Vancouver, B.C. where they were fine crushed before a 250 g split was pulverized to better than 85% passing 75 microns. Splits of the pulverized fraction were routinely dissolved in aqua regia and analyzed for 48 elements using inductively coupled plasma (ICP) together with mass spectroscopy (MS) or atomic emission spectroscopy (AES). The samples were also routinely assayed for gold by Au-AA26, which takes a 50 g charge and prepares it by fire assay before being finished by atomic absorption spectroscopy.

Appendix VI contains Certificates of Analysis and Appendix VII comprises rock sample descriptions. Rock sample locations are shown on Figure 11. Figures 12 to 15 illustrate data for gold/silver, arsenic/bismuth, lead/zinc and tungsten, respectively.

Replacement Style Gold Mineralization

Replacement style gold mineralization has been the primary focus of exploration in 2008 and 2009. To date several showings have been identified with the Tiger Zone being the best understood and most aggressively explored.

The **Tiger Zone** is located 3 km west-northwest of the Rackla Pluton in a moderate to steep walled valley.

The Tiger Zone is a thick northwesterly trending body of carbonate replacement style gold mineralization hosted by a moderately northeast dipping horizon. It is currently 650 m long, 100 to 200 m wide and up to 96 m thick. Mineralization is developed within and adjacent to a regionally extensive corridor of highly strained rocks that are manifested as a 40 to 150 m wide zone of small scale folding and shearing. The geometry of the mineralized system is defined by a series of stacked and folded limestone horizons intercalated with locally extensive mafic flows and volcaniclastic units.

Most of the exploration has been directed toward the Discovery Horizon, although there is evidence for at least two additional stratabound intervals of gold mineralization occurring above and below the Discovery Horizon.

Due to a combination of topography, overburden and stratigraphic orientation, the Discovery Horizon is the only mineralized horizon observed at surface. It is exposed over a 75 m long by 10 m wide area on the east side of Tiger Creek. In 2009 a hand trench was dug at the northeast end of this exposure where oxidized limonite boulders and subcrop occur. The trench contains moderately oxidized limonite boxwork with remnant sulphide mineralization, capped by highly sericite altered volcaniclastic. Two samples of subcrop were collected in 2008 from the area near this trench. They returned 22.5 g/t gold, greater than 1% arsenic, 415 ppm bismuth and 116 ppm tungsten; and 13.6 g/t gold, greater than 1% arsenic, 410 ppm bismuth and 51.9 ppm tungsten.

Gold occurs in both sulphide and oxide facies mineralization. Sulphide mineralization is accompanied by, and developed within, limestone which is replaced by ferruginous dolomite and iron carbonate minerals. Sulphide species consist of disseminated to banded pyrite, with subordinate arsenopyrite and pyrrhotite and minor bismuthinite and sphalerite. Small amounts of disseminated scheelite are also present. The main sulphide minerals exhibit at least three stages of mineralization. The best intersection from sulphide bearing mineralization averaged 4.04 g/t gold over 96.01 m from hole Rau-09-66.

Oxide mineralization is completely devoid of sulphide minerals and ranges from very competent, weakly porous limonitic mud to rubbly porous limonitic grit. The oxide appears texturally amorphous within most intersections but occasionally exhibits residual color banding that may represent relict sulphide textures. Complete oxidation extends up to 150 m from surface. The best oxide grades (e.g. hole Rau-09-19 which assayed 24.07 g/t gold across 28.04 m) and deepest oxidation occur where northerly trending extensional faults intersect the regional structure. The nature of the contacts between the oxide and sulphide facies is poorly understood, as is the gold

distribution within the mineralized horizon and within individual sulphide species. Mineralization at the Tiger Zone remains open to extension along strike and down dip at both ends of the known zone, as well as at depth across a normal fault that locally defines the southwest margin of the favourable structural corridor.

Mineralization hosted within the lower horizon is also referred to as the East Zone. If is diagnostic from Tiger Zone mineralization as it contains proportionally more quartz in the hydrothermal dolomite and iron carbonate replacement assemblage and contains mostly pyrite with very little arsenopyrite.

Big Creek Resources explored and conducted a 610 m diamond drill program on Carpenter Ridge from 1990 to 1991. Drilling intersected a vein grading 9.5% combined lead-zinc over 5 m, and another grading 4.5% combined lead-zinc over 9.3 m (INAC, 1992). Trenching during this period yielded 64 g/t with 39% combined lead-zinc over 7.5 m. Mapping by the Yukon Geological Survey in the 1990's interpreted these veins as being related to Proterozoic aged Mississippi-Valley type replacement, similar to those of the Blende deposit 32 km to the east (Abbott, 1990). The claims were eventually abandoned and no further work was recorded at Carpenter Ridge.

Several other showings containing mineralization similar to that found at the Tiger Zone have been identified on the property. These include the Cub, Lion, Jaguar, Panther, Cougar, Puma, Cheetah and Lynx Showings. All of the showings are occurrences of mineralized float found on grassy or talus covered slopes and ridges.

The **Cub Showing** occurs 575 m to the east of the Tiger Zone. Mineralized float was found in a 110 m wide by 250 m long area on a south facing talus covered slope. The showing coincides with a strong bismuth-in-soil anomaly (>200 ppm). Float samples typically yielded greater than 200 ppm bismuth and include peak values of 1645 ppm, 1990 ppm and 6160 ppm. Rock samples returned peak gold values of 1.08 g/t and 1.15 g/t. A float sample taken from the southeastern edge of the showing contained 18.15 g/t silver, 4630 ppm lead and greater than 1% zinc. The sample that contained 1990 ppm bismuth also produced the highest tungsten value (223 ppm).

The **Lion Showing** was discovered while surveying the Tiger Zone drill access road. Here, strongly pitted orange-black limonite and orange-red limonitic siderite and dolomite cobbles were found 770 m west of the Tiger Zone. A sample of this material returned 0.17 g/t gold, greater than 1% arsenic, 2000 ppm lead, 2080 ppm tungsten and 1.36% zinc.

The **Jaguar Showing** is located on a grassy spur radiating outwards from the south side of Monument Hill. Thirteen samples were collected within a 400 m by 300 m area. Float samples generally consisted of dense, rusty purple, goethite-rich limonite with rare patches of quartz.

Two samples taken from this showing returned 1.57 g/t and 2.81 g/t gold. The remainder of the samples returned values less than 1.0 g/t gold. Silver values ranged from 0.81 g/t to 7.08 g/t with most samples yielding between 1.0 g/t and 3.0 g/t. Lead was generally below 0.07% and peaks at 0.2%, while zinc has a peak value of 5930 ppm but typically ranges from 200 ppm to 1000

ppm. Only cursory prospecting has been performed at this locale and the source of mineralization has yet to be identified.

The **Panther Showing** is situated along a ridge on the north side of Monument Hill. Limonite float was found within a north northeast trending recessive linear feature that marks the contact between limestone to the south and volcaniclastic to the north. A specimen returned 5.72 g/t gold, 5.01 g/t silver, 9460 ppm arsenic, 61.7 ppm bismuth, 94.9 ppm lead and 1070 ppm zinc. Limonitic float was also found downhill, to the north and yielded 0.06 g/t gold, 11.05 g/t silver, 6200 ppm arsenic, 47.3 ppm bismuth, 2100 ppm lead and 1.29% zinc. To the south, a purple limonite stained siderite fragment yielded gold below the detection limit, 0.36 g/t silver, 7 ppm arsenic, 0.58 ppm bismuth, 383 ppm lead, and 1.5% zinc. The source of mineralization has not yet been located.

The **Cougar Showing** is located in a north facing cirque, along the northwest slope of Monument Hill. Mineralized float is found in an avalanche chute which stretches approximately 600 m from the base of the hill to the ridge. This float train continues over the ridge and into the valley to the southeast. Cobbles of dense rusty limonite with rare blebby bismuthinite and galena in quartz occur in a talus field comprising mostly limestone with volcaniclastic material to the east and west. Mineralized float becomes more concentrated near the ridge, although no outcrop was located.

A number of samples collected from this float train produced elevated gold (1.57 g/t and 3.13 g/t) and silver values (483 g/t). Three samples taken near the ridge yielded greater than 1% bismuth; however, these samples were only slightly elevated for other elements. Arsenic values throughout the Cougar Showing were elevated and include peak values of 1.2% and 2.1%. Four samples yielded greater than 10% lead with a peak of 35.7%, while most samples contained below 5000 ppm lead. The sample yielding 1.57 g/t gold also contained 19.4% lead. Almost all samples ranged between 0.2% and 1.1% zinc with a peak value of 1.38%.

The **Puma Showing** is located on an east-facing slope approximately 750 m northwest of the Cougar Showing. Oxidized cobbles were found scattered along a grassy hillside in a 250 m by 450 m area. Many of the samples collected from this showing are dense, rusty, dark purple siderite and goethite containing patches of boxwork limonite. Other samples consisted of limonite or altered carbonate, with occasional narrow quartz veins containing bismuthinite and galena. Bismuthinite crystals, up to 3 cm long, were observed in one sample.

A total of 39 samples were collected from this showing and submitted for analysis, six of which were goethite or goethite rich limonite that returned gold values greater than 1.0 g/t including a peak value of 18.45 g/t gold. Silver ranged between 0.2 g/t and 68.8 g/t with four samples exceeding 100 g/t to a maximum of 241 g/t silver.

Twelve of the samples contain greater than 1000 ppm arsenic with a peak of 6230 ppm. Most of the bismuth results were less than 400 ppm, with only five samples greater than 1000 ppm bismuth, two of which are greater than 1%.

Six samples returned lead values greater than 1%, including one containing 10.6 %. These samples were collected downhill, on the eastern slope of the Puma Showing. Zinc values range from 100 ppm to 9000 ppm, with five samples yielding greater than 1% zinc, up to a maximum of 2.7 %. These five samples are also anomalous for lead.

The **Cheetah Showing** is located approximately 800 m west northwest of the Puma Showing. A 500 m long by 100 m wide float train extends up a south facing slope to a ridge which is cut by a northeast trending linear. The linear was traced for approximately 30 m to the northeast until becoming buried in limestone talus. Samples collected from this showing were predominately composed of goethite and limonite float.

A sample of a purple brown, goethite rich boxwork limonite returned 3.06 g/t gold, while all other samples contained less than 0.24 g/t gold. Silver values ranged from 0.73 g/t to 34.4 g/t. Most arsenic values were below 300 ppm with five samples greater than 1000 ppm including one sample that yielded 1.3%. While most bismuth results ranged from 0.12 ppm to 578 ppm, five samples yielded values greater than 1000 ppm bismuth, up to a peak of 2640 ppm. Two distinct populations of zinc values occur at this showing. Half of the samples contain less than 300 ppm zinc, while the other half have greater than 1000 ppm zinc and peaks at 1.4%.

A ten metre long trench was dug across the ridge in an attempt to locate the source of mineralization. Five chip samples were taken from this trench, returning only background values for all elements. The trench was located approximately 50 m downhill from the mineralized float and did not expose any mineralization.

The **Lynx Showing** is located 2.3 km west of Monument Hill and consists of isolated limonite float within a limestone talus field. This showing is located on the opposite side of the valley as the Cheetah Showing. A sample collected at the Lynx returned 0.24 g/t gold, 7290 ppm arsenic, 789 ppm lead and 5970 ppm zinc. A similar sample, collected 700 m to the east, yielded 1.45 g/t gold.

Scheelite Tremolite-Actinolite Skarns

Four known tungsten skarn showings occur on the Rau property. Three of these are located less than 1.5 km from the Rackla Pluton, while the fourth is located 4.8 km to the north. They are a combination of scheelite-tremolite and actinolite skarns containing varying concentrations of pyrite, pyrrhotite and rare chalcopyrite. These showings have associated moderate to strong tungsten, gold and copper soil geochemical anomalies (Dumala, 2009).

The **Hogs Back Showing** is located 800 m southwest of the pluton. This showing is exposed on the north and south side of a northwest trending gully. It was first identified in 2006 and followed up in 2007. The showing consists of three actinolite skarn layers occurring conformably within a portion of the Bourette limestone sequence. Mineralization comprises finely disseminated to patchy pyrrhotite, pyrite and lesser chalcopyrite. Marbleisation of the surrounding limestone is variable but extends up to 5 m in areas. The skarn layers have been traced to the northwest for over 750 m and vary in thickness from 0.3 m to 6 m, averaging 0.8 m. The thickest and best mineralized exposure occurs at the southeast edge of a crosscutting

drainage before disappearing to the southeast beneath cover. In general the exposed skarn horizons appear too thin to the northwest.

The two thickest packages of mineralization appear proximal to a pair of southwest striking, quartz muscovite pegmatite dykes. The northwesterly dyke is one metre wide and exposed along strike for only two metres, while the dyke to the southwest is three metres wide and exposed for ten metres. No direct contact was observed between the dykes and the skarns.

Select rock samples collected from this showing in 2006 and 2007 yielded peak values of 4010 ppm tungsten and 1.24 g/t gold from the north side of the showing (Dumala, 2008), while chip samples collected in 2009 from the south side returned gold values less than 0.05 g/t, and a peak tungsten result of 3110 ppm. A one metre chip sample of sugary weathered limestone containing fine grained pyrite that was taken between two skarn layers returned 0.45 g/t gold. A single diamond drill hole tested this showing in 2008; however, it was collared too far forward to test the skarn mineralization.

The **Ridge Crest Showing**, located on the southwest side of the Rackla Pluton, was discovered in 2009 while following up a gold-in-soil anomaly (990 ppb) within the 2007 sample grid. A 70 cm deep hand pit dug at this location revealed glacial till and grey limestone fragments. Two cobbles of rusty dark green pyroxene skarn and several oxidized skarn fragments were also extracted from this pit. Samples of the skarn yielded 0.02 g/t gold and 850 ppm tungsten. A dyke containing equigranular coarse grained white to smoky quartz and minor muscovite with occasional patches of chlorite and trace fine grained sulphides occurs 15 m to the west. A float sample collected nearby returned 1060 ppm tungsten.

The **Flat Top Showing** occurs along a north trending ridge approximately 1.3 km northwest of the Rackla Pluton. It is localized along the contact between the Bouvette Formation and Earn Group strata. The showing is marked by approximately coincident, moderately to strongly anomalous gold, copper and tungsten soil geochemical values approximately 600 m long and up to 300 m wide. Scheelite in tremolite skarn was first found at this locale in 1979 by Prism. Prospecting in 2009 traced skarn mineralization around the nose of the ridge for 400 m.

Four types of skarn mineralization occur across a stratigraphic thickness of about 40 m. The first, found immediately above the contact, occurs as felted to radiating masses of acicular tremolite/actinolite or wollastonite/actinolite localized in a band that ranges from a few 10's of cm to a few metres thick. The second, found within unaltered carbonate rock, are masses of tremolite mixed with calcite found in 0.5 mm to 2 cm thick veinlets. Thirdly, an iron rich skarn consisting of coalescing aggregates of radiating acicular masses of tremolite/actinolite preferentially replaces the host carbonate. Rare interstitial green tourmaline or vesuvianite, calcite and quartz also occur with this skarn type. Finally extending upward from the contact is the most iron rich species. It contains felted masses of light green actinolite with local black tourmaline, biotite books, light grey to smoky quartz and patches of massive medium brown limonite.

Prism Resources reported rock samples assaying up to 8.38% WO_3 but most samples collected from the area grade less than 0.04% WO_3 (Churchill, 1980). One sample consisting of a quartz

fragment surrounded by green actinolite with black tourmaline and traces of pyrrhotite returned 0.127 g/t gold. A single diamond drill hole tested the area in 2008 but it was collared too far downhill and only intersected shale belonging to the Earn Group.

The **Blue Lite Showing,** first discovered by Prism in 1979, is a scheelite tremolite skarn located 4.8 km northeast of the Rackla Pluton. The skarn mineralization is well exposed on a cliffy outcrop on the north side of a prominent peak. Mineralization consists of scheelite as disseminations with massive pyrrhotite and minor chalcopyrite. The skarn horizon disappears under talus to the east and grass to the west. The Blue Lite Showing is located along a high angle normal fault that dips to the south. This fault marks the contact between Devo-Mississippian clastics to the north and Devonian to Jurassic clastics to the south.

Samples collected by Prism in 1979 from this showing returned between 0.02% and 4.3% WO_3. A drill hole completed later that year yielded between 0.02% and 0.08% WO_3 in drill core across narrow widths. Three samples taken at the Blue Lite Showing in 2009 returned greater than 0.10% tungsten with a peak of 0.34%. Most of the other samples ranged from 200 to 950 ppm tungsten. Gold values were all below background, with a peak of 9 ppb.

Gold-Bearing Quartz-Boulangerite Vein

The **Now Showing** is situated within a pronounced northwest trending gully located approximately 8 km west of Monument Hill. Little outcrop is exposed here but abundant float occurs along more than 400 m of the gully. Mineralization was first discovered in 1969 by Cominco. Lead, zinc and copper anomalies were identified but no clear relationship between them was determined (Johnston and Richardson, 1969).

In the late 1970's Prism conducted soil sampling, mapping, trenching and diamond drilling. Results of this soil sampling included values up to 7.4 g/t silver, 2.51 % lead and 790 ppm zinc within extensive northwest trending anomalies. A rock sample collected from a hand dug pit graded 74 g/t silver, 2.15% lead and 790 ppm zinc (Montgomery and Dewonck, 1977). Two samples of quartz rubble containing boulangerite were retrieved from a partially completed trench. The trench failed to reach bedrock due to permafrost but the samples returned 38.06 g/t gold, 343.55 g/t silver, 47.2% lead and 0.01% zinc and 39.43 g/t gold, 581.49 g/t silver, 23.26% lead and 0.06% zinc.

The most encouraging drill results obtained by Prism were from two holes that tested beneath this trench. The first of these holes intersected boulangerite and sphalerite in a narrow quartz vein. A narrow interval yielded 1.51 g/t gold, 54.5 g/t silver, 2.74% lead and 5.26% zinc over 0.5 m. The second hole, drilled at a steeper angle from the same pad, intersected the mineralized quartz vein that assayed 3.50 g/t gold, 60.3 g/t silver, 4.64% lead and 0.04% zinc over 1.1 m. The other four drill holes were either not sampled or contained no significant intersections.

In 1988, NDU Resources collected rock samples in the areas identified by Cominco and Prism as being anomalous for zinc. Samples were collected from two blocky quartz veins, one with blebby galena and the other with jamesonite and boulangerite. The sample containing blebby

galena graded greater than 1% lead while the sample containing jamesonite boulangerite contained greater than 1% lead and greater than 100 g/t silver (Cathro, 1989).

Prospecting by ATAC in 2009 revealed that these anomalies appears to follow stratigraphy but are locally overprinted by one or more vein faults. The deep gully located near the Now Showing trends slightly oblique to bedding and corresponds to a main fault. Three of the six holes drilled by Prism are believed to have intersected this and are represented by gougy intervals surrounded by zones of intense veining. These intervals were not sampled. No outcrops of the vein were observed on surface but samples of float yielded encouraging results. A composite sample was made from chips collected from several mineralized coarse grained, white quartz vein boulders which contain up to 10 % galena and boulangerite aggregates along late fractures. This sample returned 0.02 g/t gold, 78.9 g/t silver, 1.84 % lead, and 412 ppm zinc. Another float sample collected nearby graded 1.03 g/t gold, 447 g/t silver, 13.45 % lead, and 350 ppm zinc.

Transported Gossans

Two transported gossans occur on the Rau Property separated by approximately eighteen kilometers. The **Kathy Showing** comprises a 40 m wide by 30 m long brick red gossanous ferricrete slab, located approximately 750 m southeast of the Rackla Pluton. The gossan is situated downhill of a thrust fault that places Earn Group shale, to the south, over Bouvette Formation carbonates to the north. It is believed that the gossan is formed by fluids traveling along this thrust fault. Soil samples collected by Prism in 1978 returned silver values between 0.08 g/t and 25 g/t, lead values ranging from 32 to 90 ppm and zinc values ranging from 95 to 3900 ppm. Results for other elements were not reported.

The **EL Showing** (also referred to as Ocelot is located 11.5 km northwest of Monument Hill and was first identified by Prism in 1978. The showing is marked by a 110 m long by 25 m wide gossan, which formed by the precipitation of iron oxides containing silver, lead and zinc from solutions traveling along a permeable horizon (Montgomery and Cavey, 1978). The gossan has a northwest orientation and parallels an adjacent topographic linear feature. The showing is most pronounced in a kill zone to the northwest, which originates at a weakly flowing spring.

The gossan is predominately dolomite rubble cemented by iron oxides and is surrounded by buff to orange weathering dolomite and limestone. Soil samples collected by Prism returned peak values of 3.8 g/t silver, 800 ppm lead and 12.2% zinc.

In 2008, ATAC established a small soil grid over the gossan. Samples from this program returned peak values of 345 ppm lead and 4860 ppm zinc, while a nearby stream sediment sample returned 306 ppm lead and 1.8% zinc (Dumala, 2009).

Other

Prospecting in the Grey Copper Hill area was limited to a single day in 2009 and comprised quick stops along prominent ridges. One ridge, located approximately 7.5 km east of Grey Copper Hill contained abundant limonite float within a gully known as the ***** Showing**. One

sample returned 186 g/t silver, >1% arsenic, 0.287% zinc, 0.176% lead and 0.895% copper. Three other limonite samples ranged from 0.92 to 3.92 g/t silver and had a peak arsenic value of 2740 ppm. Altered volcaniclastic float was also found and yielded 2.91 g/t silver.

GEOCHEMISTRY

General

In 2009, crews performed grid and contour sampling along the favourable structural corridor defining the Tiger Zone mineralization and at the Now and Blue Lite showings. Samples were also taken along a 20 km long trend encompassing the central ridge system located to the southwest of the structural corridor, and from a line running along the crest of this ridge system. Soil sample locations are shown on Figures 16 to 18, while results for gold, silver, arsenic, bismuth, lead, zinc and tungsten are shown on Figures 19 to 25, respectively.

At the northwest end of the trend where topography permitted, grid samples were collected at 50 m intervals along lines spaced 200 m apart. Samples taken around the existing 2008 soil grids were completed on a 50 m by 50 m grid. Around Monument Hill, steep terrain required sampling to be done along contours. These samples were collected at 50 m intervals along lines spaced 100 m to 200 m apart. The relative line positions were established using handheld GPS, while sample spacing was maintained using compass and topofil. Sample sites are marked by wooden lath bearing aluminum tags inscribed with the corresponding sample number and the grid coordinates, where appropriate.

All soil samples were collected from holes, which were dug with a mattock or augered to depths of 20 to 50 cm below surface. The soil was taken from the bottom of the holes and placed in pre-numbered Kraft paper bags. Above treeline, the samples consisted of immature soils mixed with talus fines. At lower elevations, the sampled material mostly comprised residual soils mixed with glacially transported material.

The samples were transported from the property to Whitehorse in the custody of Archer Cathro employees. From there, they were shipped to ALS Chemex in North Vancouver. At the lab, soil samples were dried and screened to -35 mesh to produce a fine fraction, which was then pulverized to 85% passing 75 microns. Splits of the pulverized fraction were routinely dissolved in aqua regia and analyzed for 35 elements using the ICP-AES technique (ME-ICP41). All samples were also analyzed for gold using fire assay and ICP-AES (Au-ICP21). Certificates of Analysis appear in Appendix VI.

Results

Background and anomalous values for gold, silver, arsenic, bismuth, lead, zinc and tungsten were calculated for the 2674 soil samples collected from the property in 2009. Background averages, weak, moderate, strong and very strong anomalous thresholds approximately correspond to the 50^{th}, 90^{th}, 98^{th}, 99^{th} and 99.9^{th} percentiles. The geochemical characteristics are summarized in the following table.

Table II: Geochemical Characteristics for 2009 Soil Samples

Level	Gold	Silver	Arsenic	Bismuth	Lead	Zinc	Tungsten
Background	3	0.3	17	1	32	182	5
Weak	24	1.9	106	8	367	1154	10
Moderate	86	3.8	255	30	782	2106	30
Strong	175	5.4	514	72	1207	3624	70
Very Strong	1062	13.6	3821	328	7624	1.25%	629
Peak	9880	102	>1%	699	2.15%	2.3%	1830

(all values are ppm except gold which is ppb)

Grid samples and adjoining contour samples collected from a south facing cirque, 1.7 km northwest of the Tiger Zone, yielded moderately to strongly anomalous lead, zinc and silver. Peak values include 2570 ppm lead and 1.44% zinc from a sample collected along the ridge at the northern edge of the sample grid. While a sample 350 m to the south produced 10.3 g/t silver. These samples lie within a 600 m long, north striking anomalous trend that cuts obliquely across the hillside. A second group of weakly to moderately anomalous samples occur along the western edge of the sample grid. Gold values within this valley are mostly background level with the exception of two values yielding 88 ppb and 127 ppb.

At the Cheetah Showing, a 310 m long string of samples returned moderately to strongly anomalous values for gold, silver, arsenic, bismuth, lead, zinc and tungsten. This corresponds to a distinctive gossanous float train that originates along the ridge. The highest values for all elements came from a select soil sample collected from a distinct northwest trending lineament on the ridge, near the apparent source. This sample returned 3.62 g/t gold, 16.10 g/t silver, 3020 ppm arsenic, 339 ppm bismuth, 6130 ppm lead, 4640 ppm zinc and 230 ppm tungsten.

Samples taken at the Puma Showing outlined a 120 m by 120 m area, near the base of a slope, with moderately anomalous gold, silver, arsenic and bismuth. Lead and zinc response is weakly to moderately anomalous over a slightly broader area. Samples collected from a sample line 300 m uphill also returned similarly anomalous results. The highest values at the Puma Showing came from an isolated sample located uphill along the ridge. This sample yielded 1.495 g/t gold, 8.1 g/t silver, 1270 ppm arsenic, 323 ppm bismuth, 1365 ppm lead, 2590 ppm zinc and 500 ppm tungsten.

Contour sampling at the Cougar Showing produced moderately anomalous gold results over a 250 m wide area that cuts across the hillside. Here, the peak gold value was 221 ppb. Bismuth values are moderately anomalous, with a peak of 123 ppm, and correlate well with gold. Lead and zinc both yielded weak to moderately anomalous results over a slightly broader area and have peak values of 1020 ppm and 1565 ppm, respectively.

Weak to moderately anomalous gold, arsenic, bismuth, lead and zinc values were obtained from samples taken from the ridge and valley at the Jaguar Showing. A peak value of 489 ppb gold was obtained from a soil taken near this showing, while a sample collected from the valley below produced 334 ppb gold. Samples collected to the west, along the ridge above the Cougar Showing, yielded 14.6 g/t silver and 1.19 % lead. The peak zinc value (2.30%) in this cirque

was derived from a sample collected along a ridge southeast of Monument Hill. This sample also returned 225 ppb gold, 287 ppm bismuth and 8180 ppm arsenic.

Grid samples collected further to the northwest, along the structural corridor, revealed a number of weakly anomalous areas. Because of the gentler terrain and deeper soil cover the results are generally more subdued, however, peak values include 851 ppb gold and 3.3 g/t silver from samples collected towards the western part of the grid and 2310 ppm zinc and 877 ppm lead from samples on the eastern part of the grid. A peak arsenic value of 212 ppm came from a sample taken near the centre of the grid.

At the Now Showing, grid sampling delineated an anomalous trend that coincides with a dominant northwest trending gully. Moderately anomalous gold and moderately to strongly anomalous silver and lead were also highlighted along this trend. Peak values include 712 ppb gold, 102 g/t silver 539 ppm arsenic and 2.15% lead, all from one sample located near the southeast edge of the grid. Zinc returned a peak value of 1.06% from a sample nearby. To the west of the gully, arsenic and lead are weakly anomalous, while only background values were identified to the east.

The most anomalous tungsten results in 2009, which include a peak value of 1830 ppm, came from samples collected around the Blue Lite showing. Gold and bismuth results are also strongly anomalous at this showing and reach peak values of 403 ppb and 699 ppm, respectively.

Samples collected along the central ridge, west of Monument Hill, and the encompassing 20 km reconnaissance sample line yielded mostly background gold, arsenic and bismuth results. Peak values were 63 ppb gold, 96 ppm arsenic and 18 ppm bismuth. A 2.7 km long string of samples, located east of the Now Showing, returned weakly to moderately anomalous silver results, with a peak of 10.8 g/t. Samples taken from a 1.1 km long segment of the reconnaissance line, east of the silver anomaly, show slightly elevated levels of lead. Most of these samples returned between 50 and 100 ppm lead and have a peak value of 532 ppm. Zinc values are slightly elevated along the line segments with anomalous silver and the lead. A peak value of 2400 ppm zinc was produced from the sample with the highest lead. Further to the east, south of the Lynx Showing, another short string of samples yielded slightly elevated zinc values. No other elements appear to be enriched here.

Samples collected from the El Gossan in 2009 returned only background gold values, with a peak of 8 ppb. Lead and zinc yielded the most anomalous results. Peak lead values include 596 ppm and 452 ppm, while zinc reached a peak of 1.195%. Other elements only produced isolated anomalies. These include 2.9 g/t silver, 502 ppm arsenic and 40 ppm tungsten.

A total of eleven reconnaissance soil samples were taken within and around the Kathy Gossan. These returned moderate to strongly anomalous zinc and tungsten values, with peaks of 7980 ppm zinc and 60 ppm tungsten. Arsenic, silver and bismuth results were slightly elevated to weakly anomalous. Peak values for these elements are 1490 ppm arsenic, 3.7 g/t silver and 8 ppm bismuth. Samples collected from a moderately flowing spring on the southeastern edge of the gossan produced peak gold, silver and zinc results.

DIAMOND DRILLING

General

Drilling was done between June 12 and September 25 and was contracted to Superior Diamond Drilling of Kelowna, BC. The work was completed with a Mandrill 1200 and two B-15 diesel-powered drills using BTW, NQ2 and HQ3 equipment. A total of 9578.30 m of diamond drilling were completed in 58 holes.

Most of the 2009 holes were located in and around the Tiger Zone and tested along a structural corridor over a strike length of 800 m (Figure 26). Individual drill sections are shown on Figures 27 to 45. Three scout holes were also located within the structural corridor, further along strike to the northwest and southeast, while a fourth scout hole tested a VTEM anomaly at the Cub Showing, northwest of the Tiger Zone.

To provide local survey control, a baseline was established through the drill area, parallel to the structural corridor. Control points were located at either end (10+550NW and 09+650NW) and in the middle (10+000NW) of the baseline using a Trimble Real Time Kinematic GPS unit. A Trimble Total Station was then used to locate section lines perpendicular to the base line and new drill sites. The baseline and each section line is marked by a one metre wide clearing through the bush with pickets located every 50 m along their length.

Once each drill hole was completed, the GPS was used to locate and record the final collar position. Collars are marked by scrap drill rods cemented into the hole, steel tag showing the hole number is affixed to each. All drill sites were constructed by hand using rock, soil and timber found nearby. Drill data for the holes is listed in Table III.

Table III: Drill Hole Data

*** hole Rau-08-18 was extended in 2009, drilling resumed at 233.78 m**
**** UTC – unable to continue**

Core was transported by helicopter from the drill sites to a logging area on the property, where recovery was measured and geological and geotechnical logging was performed. Geologically and mineralogically favourable intervals from each hole were split with one-half bagged and sent for analysis and the other half returned to the core box. All of the core is stored on the property. Appendix VIII contains the geological and geotechnical logs. In addition, core from 2008 was re-logged using current conventions. Revised logs for the 2008 diamond drill holes can also be found in Appendix VIII.

Core samples were flown by helicopter from the property to a staging area at McQuesten Lake, then transported to Whitehorse by truck, escorted by a representative of Archer Cathro. The

samples were shipped from Whitehorse to ALS Chemex in North Vancouver. Core samples were dried and crushed to 70% minus 2 mm, before a 1.5 kg split was taken and pulverized to better than 85% minus 75 microns. To reduce cross contamination between samples during preparation, the equipment was washed twice with quartz silica sand. Splits of the pulverized fraction were routinely dissolved in aqua regia and analyzed for 49 elements using technique ME-MS61m, which combined inductively coupled plasma (ICP) with mass spectroscopy (MS) and atomic emission spectroscopy (AES). Samples were analyzed for gold by fire assay finished with atomic absorption spectroscopy (Au-AA26). Certificates of Analysis are found in Appendix VI.

Results

Drilling in the vicinity of the Tiger Zone intersected a stacked sequence of hydrothermally dolomitized limestone and volcaniclastic rocks that have been polyphase folded into a series of relatively complex synforms and antiforms. Sulphide mineralization is hosted within stratigraphically conformable layers of replacement hydrothermal dolomite and iron carbonate bound between volcaniclastic and siltstone beds. In 2009, the majority of drilling focused on oxide mineralization which occurs in the northwestern half of the Tiger Zone.

Mineralization occurs within a 150 to 200 m wide northwest trending corridor of highly strained carbonate strata that has been traced by diamond drilling over a strike length of 650 m. Regional mapping and prospecting suggests that this structural corridor is a high angle feature that extends for another 20 km or more along strike to the northwest. High grade oxide mineralization appears to occur where north trending high angle subordinate faults cut obliquely across this corridor.

Individual dolomite horizons range from 40 to 120 m thick. Gold occurs with sulphide minerals that wholly or partially replace the dolomite near the crest of local antiform. The sulphide minerals are locally concentrated beneath sericitized volcaniclastic beds, which may have acted as impermeable caps. To date, three mineralized horizons have been identified. The middle horizon (Discovery Horizon), which ranges in thickness from about 40 to 96 m, hosts the most continuous mineralization within the Tiger Zone.

The Discovery Horizon has been the primary focus of drilling to date and has produced the most significant intersections. This horizon is dominantly comprised of coarse grain dolomite and iron carbonates. The main sulphide minerals are pyrite and arsenopyrite while accessory minerals include pyrrhotite, bismuthinite, scheelite and sphalerite. The thickest intersection came from hole Rau-09-66, which averaged 4.04 g/t over 96.01 m. Gold values and sulphide abundance in this horizon are highest near the centre of the structural corridor and gradually decrease down dip to the northeast.

To the northwest, the Discovery Horizon (host and mineralization) is completely oxidized. The transition between oxidized and unoxidized material is relatively sharp, occurring over several metres. Oxidation is most intense around hole Rau-09-19 where subordinate north trending structures are interpreted to intersect the northwest trending strain corridor. Holes along this subordinate structural trend intersected 43.89 m of oxide material grading 15.52 g/t gold from

Rau-09-19 while hole Rau-09-41 located 50 m northwest intersected 24.47 m of oxide material grading 19.58 g/t gold. Other holes drilled northwest of Rau-09-19 off this subordinate structural trend encountered lower grade intersections ranging between 1.0 and 3 g/t Au.

Oxide mineralization comprises coarse grain quartz fragments. The colour of the oxide mineralization is also quite variable. The most common end members are light yellowish orange, bright orange-brown and dark reddish brown. Textures are often obscured on the core surface but sometimes visible on split surfaces. Typical textures include honeycomb, banded, patchy and rare breccia.

To the southwest, the Discovery Horizon mineralization appears to truncate against a high-angle reverse fault that parallels the structural corridor. The structure is poorly understood and coarse white marble is typically found to the southwest in the footwall of the fault. Only a limited number of holes have tested the southwest side of the fault and none have drilled deep enough to test for the potentially displaced Tiger Zone mineralization.

The Upper Horizon comprises medium to coarse grain, disseminated pyrite often with quartz, pyrrhotite and lesser arsenopyrite. This horizon typically yielded low gold values; however, a number of short gold-enriched intervals were intersected, including 8.13 g/t gold over 3.05 m from hole Rau-08-11.

The Lower Horizon hosts the East Zone mineralization and is pyrite dominant with only minor arsenopyrite. Accessory minerals include sphalerite, bismuthinite, galena and scheelite. Hole Rau-08-18 intersected 62.03 m of very coarse grain, semi-massive to massive pyrite with minor sphalerite, including 60.03 m grading 0.18 g/t gold, 28.30 g/t silver, 1829 ppm lead and 1.09% zinc.

Coarse grain iron carbonate with pyrite was intersected in Rau-09-44 and Rau-09-61. These two intersections are also part of the East Zone. Arsenopyrite is absent in both intersections. Rau-09-44 graded 3.71 g/t gold over 36.78 m, while Rau-09-61 graded 3.36 g/t over 23.06 m.

A plan view showing major intersections converted to gram-metres (interval grade multiplied by interval width) is shown on Figure 46. The locations shown on this figure represent the centre and highlight the north trending control associated with high-grade mineralization.

A long section (Figure 47) constructed through the Tiger Zone illustrates how the East Zone intersections occur stratigraphically below the Discovery Horizon. Most of the drilling done to date has not extended deep enough to reach this horizon. As a result these intersections are spaced far apart making it difficult to understand the connections between them.

Significant intersections from both the 2008 and 2009 diamond drilling are listed on the next page.

Significant intervals were calculated using strict criteria. For unoxidized, sulphide intervals, a cut-off grade of 0.50 g/t was used with a minimum interval width of 6.00 m and maximum internal waste block of 6.00 m. The minimum interval width for oxidized core was 6.00 m with a cut-off grade of 0.25 g/t gold, while the maximum internal waste block was 6.00 m with a cut-off grade of 0.20 g/t gold.

Typical unmineralized intersections comprised grey limestone with varying degrees of brecciation and dolomitization. Fossils (crinoids and coral) are often visible in the more massive intervals. Fluid collapse breccia is the most common form of brecciation and is more frequent nearer to the structural corridor.

In drill core, the volcaniclastic horizons are visually and geochemically distinguishable from the surrounding limestone and dolomite. Unaltered, they consist of a dark forest green groundmass enclosing calcite amygdules; and where altered, they exhibit strong foliation and sericitiziation, which imparts a buff to tan colour. Geochemically they can be distinguished from the surrounding units by elevated values of the following elements: aluminum, barium, cobalt, chromium, gallium, potassium, lithium, niobium, nickel, phosphorus, tantalum, thallium, vanadium and yttrium. Narrow intervals of marble, up to approximately 5 m wide, sometimes occur adjacent to volcaniclastic layers.

A magnetite pebble conglomerate occurs along Tiger Creek, approximately 100 m south of Rau-09-14. A similar unit was also intersected in holes Rau-09-64, Rau-09-69 and Rau-SC09-04. In drill core this unit comprises well rounded carbonate and magnetite clasts, ranging in size from a few millimeters to 5 cm within a fine grain magnetite matrix. Where observed, this conglomerate unit often occurs within or adjacent to volcaniclastic intervals. In holes Rau-09-64 and -69 it is located stratigraphically above the Discovery Horizon. The relative stratigraphic position of this unit in hole Rau-SC09-04 is uncertain due to the limited data available in this area.

A brown and white spotted unit, referred to as the “Leopard Unit”, occurs beneath the Discovery Horizon. Geochemically this unit is similar to the volcaniclastic; however, it has a high calcium content and reacts vigorously with hydrochloric acid. This unit is almost always underlain by a narrow (less than 1 m) wide interval of black, pyritic shale.

Drilling at the Panther Showing, 500 m northeast of Monument Hill (Figure 48), intersected lithological units similar to those found within the Tiger Zone. At the Panther Showing, two diamond drill holes targeted the downdip extension of mineralization found within a shear zone. The first hole (Rau-SC09-02) was unable to continue after the rods froze into the ground. The second hole (Rau-SC09-03) twinned the first and was able to reach the target depth. Drilling intersected mostly brecciated limestone containing calcite veins and a narrow volcaniclastic interval. No significant mineralization was encountered.

Petrographic Samples

Representative samples of each major lithological unit were collected and submitted to Vancouver Petrographics Ltd. where thin sections were prepared and petrographic analysis was completed. Table V contains a list of samples while Appendix IX contains the petrographic report with detailed descriptions of the samples.

Table V: Petrographic Samples

Sample	Hole	Depth (m)	Field Description

24	Rau-09-40	143.50	Pyritic shale (beneath leopard)
25	Rau-09-44	190.50	Brecciated quartz and pyrite
26	Rau-09-44	154.45	Foliated non-calcareous volcaniclastic

Many of the samples can be classified as typical of shallow, distal, marine environments. Four main litho types were identified: a) shallow water dirty dolomitic limestone; b) stratified calcareous to non-calcarous siltites and lithic wackes; c) pebble conglomerates; d) intrusive (dykes-sills) or flows.

The unit described in the field as the “Leopard Unit” can be classified as a stratified calcareous to non-calcareous siltites and lithic wackes. The volcaniclastics have been categorized as intrusive (dykes-sills) or flows and in some cases as altered lithic wackes and siltites. The lack

of deformation in some of these samples suggests that they were emplaced post-deformation and supports the intrusive interpretation. The origin of the pebble conglomerate is still uncertain. It is thought that these could also represent an intrusion breccia or pebble dyke.

Almost all of the samples display a strong S1 (D1) fabric and several show a weak S2 (D2) fabric. Both appear to be related to regional scale shortening or compression and are generally non-rotational. A final, post D2 extension is also represented in these samples by veins (often calcite) cutting all previous fabrics and lithologies.

Metallurgical

In August, 2009, six composite samples were created from coarse reject material of oxide intervals from hole Rau-09-19. A 50 g split was taken from each composite and analyzed by the Au-AA26 technique, described above. A 1 kg split was then analyzed using a cyanide leach technique (Au-AA14) with an atomic absorption spectroscopy (AAS) finish. The table below lists the conventional and cyanide leach results for each sample. The Certificate of Analysis is contained in Appendix VI.

Table VI: Metallurgical Test Results

Sample	Au-AA26	Au-AA14	% Cyanide Recovery
Rau-CY-A	85.70	82.60	96.4
Rau-CY-B	7.76	7.50	96.6
Rau-CY-C	4.69	4.51	96.2
Rau-CY-D	2.70	2.68	99.3
Rau-CY-E	0.83	0.77	92.8
Rau-CY-F	0.25	0.26	104.0

The high recovery obtained from this preliminary leach test demonstrates how readily extractable the gold in the oxide material is using low cost, conventional techniques. Additional metallurgical and mineralogical studies are pending.

QAQC

During the field season, samples were divided into batches, each containing 31 core samples, 2 standards, 2 blanks and 1 duplicate. A total of 155 standards and 151 blanks were inserted into the sample sequences. Blank samples each comprise 4 kg of landscaping marble obtained from a garden centre in Whitehorse. Samples of this material were randomly selected and analyzed prior to the field season in order to use as a "blank". Tables summarizing QAQC results are contained in Appendix X.

Prior to the field season, three standard samples were prepared by CDN Resource Laboratories Ltd. from core collected in 2008. Two additional gold standards, obtained from CDN Resource Laboratories and a tungsten standard from the Canada Centre for Mineral and Energy Technology were used for check analysis performed following the field season. Certificates for each of the standard samples are also contained in Appendix X, while Table VII summarizes the

consensus and two standard deviation values for each of the standard samples used during the program.

Table VII: Standard Sample Consensus Values

Sample	Consensus Value	2δ
STD-1	0.514 g/t Au	0.058
STD-2	1.527 g/t Au	0.134
STD-3	5.705 g/t Au	0.498
CDN-GS-1D	1.05 g/t Au	0.10
CDN-GS-3F	3.10 g/t Au	0.24
BH-1	0.422% W	0.008

Gold values from all but five of the blank samples were within acceptable range (≤0.05 ppm). The failed samples were from batches 1 (0.15 g/t), 35 (0.06 g/t and 0.13 g/t), 53 (0.23 g/t) and 55 (0.08 g/t). All samples from batch 35 were reanalyzed by the laboratory to ensure the results were accurate. The remaining samples were found to be within the ALS Chemex's accepted "carry-over" limit given the high gold values of the proceeding samples.

All but nine of the standard sample values are within the acceptable range. Gold values from seven of the sample batches (5, 23, 39, 46, 52, 68 and 76) that included failed standards were reanalyzed by the laboratory to ensure results were accurate. Results from the reanalysis were typically consistent with the original values. The most notable variations came from thirteen samples with values greater than 1.5 g/t gold, suggesting a small nugget effect occurs with higher grade samples.

A total of 76 duplicate samples, prepared from quarter core, were collected and analyzed throughout the program. In general, there was a small decrease in gold values but otherwise little variation between the initial and duplicate samples. The most notable difference was from hole Rau-09-19. The initial sample yielded 162.00 g/t, while the duplicate returned 84.50 g/t. This implies that there is some nugget effect present, particularly in the higher grade samples. The smaller size of the duplicate sample may also account for the general decrease in gold grade in these samples.

In December 2009, 132 pulps and 137 coarse rejects were randomly selected from the 2359 core samples collected in the summer. In order to remove any bias, pulps and coarse rejects were selected from a Microsoft Excel spreadsheet using a random number generator. These samples were renumbered and submitted to ACME Analytical Laboratories in Vancouver, BC for reanalysis for gold and tungsten.

At ACME, coarse reject material was pulverized to better than 85% minus 75 microns. Equipment was washed twice with glass between samples to reduce the possibility of cross contamination. A 50 g split was taken and analyzed for gold by fire assay and finished with atomic inductively coupled plasma (ICP) with emission spectroscopy (ES). Tungsten was analyzed for using the Group-7KP technique, which dissolves the sample in phosphoric acid and

completes the analysis using a combination of inductively coupled plasma (ICP) and emission spectroscopy (ES). Certificates of Analysis are found in Appendix VI.

These samples were arranged in batches of 35 samples and include 2 standard samples. Two blank samples were also included in each batch of coarse rejects. Table VIII lists the results of these QAQC samples.

Table VIII: ACME QAQC Standard and Blank Samples

Batch	Standard	Sample	Au (g/t)	W (%)
Reject-1	Blank	E687006	<0.01	<0.005
Reject-1	BH-1	E687010		0.435
Reject-1	STD-3	E687015	5.53	
Reject-1	Blank	E687034	<0.01	<0.005
Reject-2	BH-1	E687044	0.04	0.423
Reject-2	Blank	E687051	0.02	<0.005
Reject-2	Blank	E687056	<0.01	<0.005
Reject-2	STD-1	E687063	0.48	
Reject-3	Blank	E687082	0.02	<0.005
Reject-3	Blank	E687083	0.01	<0.005
Reject-3	STD-2	E687084	1.43	
Reject-3	STD-1	E687100	0.47	
Reject-4	Blank	E687110	<0.01	<0.005
Reject-4	BH-1	E687118		0.417
Reject-4	Blank	E687124	0.01	<0.005
Reject-4	STD-1	E687125	0.5	
Reject-5	STD-2	E687145	1.5	
Reject-5	Blank	E687148	<0.01	<0.005
Reject-5	Blank	E687152	15.55	<0.005
Reject-5	STD-1	E687157	0.48	
Pulp-1	BH-1	E687168		0.427
Pulp-1	GS-3F	E687183	2.77	
Pulp-2	GS-3F	E687202	2.97	
Pulp-2	GS-1D	E687222	1.04	
Pulp-3	GS-1D	E687246	1.12	
Pulp-3	GS-1D	E687252	1.07	
Pulp-4	GS-3F	E687268	3.05	
Pulp-4	BH-1	E687279		0.415

One standard and one blank sample did not meet the QAQC criteria. The standard sample (E687010) returned the maximum allowable value before resulting in an automatic failure. Blank sample E687152 yielded 15.55 g/t gold. Despite a maximum allowable carry over of 1% from the preceding sample (41.20 g/t) this sample is a clear failure. These blank samples consisted of coarse marble aggregate and first needed to be crushed to 70% passing 2 mm. Because these samples had to be removed from the sample stream to accommodate this extra step, it is not clear as to where the contamination would have occurred and whether or not other samples could have been affected.

On average, gold results were similar. The greatest variability occurs in samples that initially yielded greater than 10.0 g/t. Of the 269 pulp and coarse reject samples reanalyzed, 191 returned

gold values within 0.10 g/t of the original, 33 samples increased by more than 0.10 g/t and 46 decreased by more than 0.10 g/t. In general, tungsten results from ACME were higher than the original Chemex results. A total of 157 samples returned tungsten values below the detection limit and are consistent with the original values. Of the remaining 112 samples, 90 yielded values greater than the original. The greatest increase came from a sample that originally returned 1320 ppm tungsten, which increased to 1870 ppm tungsten. The general increase can be explained by the more complete digestion of the sample using the Group-7KP analytical technique.

Density

Systematic density measurements were taken on core produced in 2009. Several samples were taken from each lithological unit within each hole. Due to the competency and also low and variable recovery in the heavily oxidized intervals, it was not possible to obtain any accurate measurements of its density using conventional methods.

To determine the density, the sample was measured and the volume calculated. The ends of each sample were sawn to ensure it was cylindrical for accurate calculations. The samples were first weighed in air, then suspended beneath a scale in a pail of water and weighed again. The length of each sample was measured with a ruler and the volume was calculated using a core diameter of 4.2 cm for BTW, 5.1 cm for NQ and 6.1 cm for HQ. The density was calculated by dividing the weight in air by the volume of the core. This was checked against the specific gravity of each sample, which was calculated using Archimedes method (weight in air divided by the difference between weight in air and weight in water). Individual density measurements can be found with the geological logs in Appendix VIII.

The table below shows the average results for each of the major lithologies and the number of samples used to calculate each average.

Table IX: Average Unit Density

Unit	Density	#	S.G.	#
Dolomite	2.91	25	2.92	26
Altered Dolomite	2.71	12	2.72	10
Mineralized Dolomite	3.35	29	3.41	29
Limestone	2.79	40	2.81	44
Altered Limestone	2.80	84	2.77	85
Fossiliferous Limestone	2.73	48	2.69	46
Oxidized Limestone	2.51	8	2.61	8
Leopard Unit	2.93	19	2.88	19
Marble	2.73	28	2.75	27
Volcaniclastic	2.94	14	2.89	16
Altered Volcaniclastic	2.79	8	2.76	10

In general, the specific gravity measurements are comparable to the density measurements. Some of these minor variations can be attributed to porosity and inaccuracy while measuring the

volume of each sample. Also, Archimedes method assumes the measurements were taken at sea level, which was not the case in this situation. These measurements were made at approximately 1000 m above sea level. Archimedes method is also affected by temperature variations of both the water and the air. During the course of the project, the temperature varied dramatically and could have affected the specific gravity calculations.

For some of the later holes, a way to measure the approximate density of the oxide material was devised. The weight of the core was determined by measuring the total weight of each full box and subtracting the weight of an empty core box. In order to calculate volume, the interval width represented within the core box had to be corrected for recovery.

Unfortunately this process is subject to numerous errors and assumptions, therefore a larger data set would be needed before this data could be considered reliable. Although the data is not as accurate as a direct density measurement, some approximation can be made of the actual values. For calibration purposes, the same process was applied to lithological units with fairly well understood densities. The following table shows the average densities determined using this method. The average density of known units and the percentage difference is also shown for comparison.

Table X: Average Box Density

Unit	Density (box)	#	Density	% diff.
Mineralized Dolomite	3.04	11	3.35	9.3
Limestone	2.62	15	2.79	6.1
Leopard Unit	2.66	2	2.93	9.2
Oxide (clay rich)	2.17	23	N.A.	N.A.
Oxide (rubbly)	2.49	11	N.A.	N.A.
Oxide (general)	2.27	8	N.A.	N.A.
All Oxide	*2.31*	*42*	*N.A.*	*N.A.*

In general, the densities determined by measuring box weight are 6% to 9% lower than those determine by taking measurements directly from the core. Assuming this is also true for the oxide material, it would indicate that its density lies between 2.40 and 2.75. However, due to the small data set, these results can only be used as an approximation.

GEOPHYSICS

In spring 2009, Condor Consulting Inc., was asked to complete processing, analysis and interpretation on EM and magnetic data obtained from VTEM surveys completed in 2007 and 2008. A copy of Condor's report can be found in Appendix XI. Figure 10 shows the anomalies identified by Condor as well as outlines of areas chosen for Maxwell modeling.

Strings of VTEM conductors have been identified throughout the Rau Property. Many of these parallel to faults and bedding. An approximately 25 km long linear magnetic high, corresponding to the Marmot Formation can be traced through the centre of the property. Typically, conductors can be found along the south side of this magnetic feature.

A modified ground pole-dipole IP survey was completed at the Tiger Zone by Aurora Geoscience of Whitehorse. The survey was done using a four person crew based out of a lodge located north of Mayo between August 4 and 13, 2009. Three lines, totaling 4.2 line-km corresponding to section lines 10+400NW, 10+120NW and 09+650NW were tested by this survey. A copy of Aurora's report can be found in Appendix XII.

On section line 10+400NW, a well defined chargeability high is located to the southwest of the baseline. The lower portion of this anomaly would have been pierced by hole Rau-09-52, which intersected unmineralized, brecciated limestone in this area. Unfortunately noise on section line 10+120NW made interpretation at depth, near the massive pyrite intersection in hole Rau-08-18, unusable. Only the near surface data (<100 m) was usable in the area of interest. On section line 09+650NW, a chargeability high is located at surface at 10+1000NE and dips to the northeast at approximately 45°. While the anomaly is untested by drilling, this orientation is similar to bedding and could represent a mineralized horizon.

DISCUSSION AND CONCLUSIONS

The Rau property hosts a significant new carbonate replacement gold discovery in Yukon with many similarities to the prolific gold districts in the Great Basin of Nevada. Key controls upon which many of the carbonate hosted deposits in Nevada are modeled include:

Slope and basin facies carbonate and turbitditic calcareous silisiclastic strata with moderate to abundant organic carbon; intercalated stratigraphic aquitards including volcanic (igneous) sills; proximity to a regional scale thrust fault placing deep water upper plate clastic rocks atop platformal rocks; compressional orogenic events resulting in complex folding including antiformal traps, ground preparation of calcareous rocks by way of decarbonatization and subsequent silicification and the development of high angle strain zones to accommodate later fluid flow; and an influx of gold undersaturated bi-sulfide complex fluids during relaxation of the compressional event depositing gold in ground prepped host rocks by interaction with available iron in the system. The temperatures of sulphidation of the bi-sulfide complexes is purported to be tightly constrained between 180 and 240 °C at low salinity. Sulphur isotope data suggests the fluids were derived from a deep magmatic source but there is no evidence of metal zoning through increasing or decreasing temperature gradients.

Regionally, the Rau property shares many geological similarities to the Nevada deposit settings as demonstrated throughout the report. Some of the finer points highlighting these observations come from samples collected within the Tiger and East Zones. Petrographic studies indicate the iron carbonate-silica-sulphide replacement predates the D1 deformation event implying the Rackla Pluton is not likely associated with the gold mineralizing event but may have resulted in a high temperature post mineralizing alteration overprint. Calcite twins observed in a number of samples are indicative of low temperatures of formation <200 °C and two phase liquid dominant inclusions suggest a low salinity environment with temperatures ranging between 150 and 300 °C.

As there are many similarities to the Nevada deposits, there are also a number of key differences. In general, the carbaonate stratigraphy at Rau appears to be more representative of upper slope facies nearer the platform margin as indicated by the biotic distribution of crinoids, stromatoporoids and corals. This shallower regime is inherently associated with low levels of organic carbon which is absent in the mineralized horizons. The mineralized horizons at Rau also lack extensive silicification after decardonatization during ground preparation of the host rocks. It is postulated that decarbonitzation at Rau was followed by replacement of readily available iron carbonates and lesser silica. This development has a profound effect on the dynamics of the system as it provides a readily available source of iron to promote sulphidation of the bi-sulphide complexes and the deposition of gold. The abundance of available iron in the host carbonate rocks is partly attributable to the large quantities of sulphide development in the Rau mineralizing system.

Limited sulphide microscopy suggests gold is associated with arsenopyrite, pyrite, gold-bismuth alloys and free gold. The major carrier among the samples examined is arsenopyrite while pyrite is considered a minor carrier. Sulphide paragenesis indicates and early phase of coarse grained pyrite which may be diagenetic in origin and several later phases of fine grained pyrite and medium-to-fine grained arsenopyrite. The presence of arsenopyrite implies higher temperatures of formation satisfying the arsenopyrite stability field.

The distribution of oxide and sulphide mineralization within the Tiger Zone is believed to be attributed to structural influences as is the concentration of gold grades along north trending faults zones oblique to the trend of the main strain corridor. The kinematics of these subordinate structures and enhanced gold grades are not yet understood but will be a point of focus for future exploration.

A number of mineral occurrences and coincident gold-in soil geochemical anomalies have been identified up to 15 km along strike from the Tiger Zone along the surface trace of the main strain corridor. Surface oxide samples collected 2 to 5 km from the Tiger Zone exhibit three distinct populations of associated metals and accessory elements. Population 1 is gold-dominant with accessory arsenic while Population 2 is silver-lead dominant with accessory zinc and traces of arsenic. The third population is an overlap assemblage that contains gold-silver-lead all in moderate quantities with variable zinc and arsenic. These samples may represent high level leakage anomalies and may be the result of a younger mineralizing event overprinting an existing deposit such as a structurally related gold overprint on a silver-lead-zinc MVT type deposit or vice-versa.

The location of each of these occurrences coincides with a distinct break in a regional scale linear magnetic feature that extends from the Tiger Zone northwest to the Beaver River. The breaks in the magnetic signature are believed to be associated with magnetite destructive alteration in the vicinity of major structures. Only cursory work has been conducted in the vicinity of these occurrences.

The Rau project has the potential to host district-scale deposits akin to those in parts of the Great Basin of Nevada. An aggressive exploration campaign is recommended to delineate the mineralization associated with the Tiger and East Zones in the core portion of the property

including deep drilling at strategic locations to test for additional mineralized horizons beneath the Discovery and Lower Horizons in proximity to the strain corridor. Peripheral exploration should also be done to develop drill targets in the vicinity of the mineral occurrences along strike from the Tiger Zone. This work should be done in conjunction with systematic evaluation of the remainder of the claim block using Bulk Leach Extractable Gold (BLEG) sampling techniques in addition to stream sediment sampling, soil sampling and prospecting to identify focused target areas for additional follow up work in the fall.

STATEMENTS OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Matthew R. Dumala, geological engineer, with business addresses in Vancouver, British Columbia and Whitehorse, Yukon Territory and residential address in Vancouver, British Columbia, do hereby certify that:

1. I graduated from the University of British Columbia in 2002 with a B.A.Sc in Geological Engineering, Option l, mineral and fuel exploration.

2. I registered as a Professional Engineer in the Province of British Columbia on November 14, 2008 (License Number 32783).

3. From 2003 to present, I have been actively engaged in mineral exploration in the Yukon Territory.

4. I have personally participated in the fieldwork reported herein.

Matthew R. Dumala, P.Eng.

STATEMENT OF QUALIFICATIONS

I, Julia C. Lane, project geologist with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in Vancouver, British Columbia, hereby certify that:

1. I graduated from the University of British Columbia in 2008 with a B.Sc. in Earth and Ocean Sciences.

2. From 2006 to present, I have been actively engaged in mineral exploration in Yukon Territory, British Columbia and Ontario.

3. I have personally participated in the field work reported herein and have assisted in the interpretation of data resulting from this work.

APPENDICES

Appendix A General Conditions

1.0 INTRODUCTION

EBA Engineering Consultants Ltd. (EBA) was retained by Archer, Cathro and Associates Ltd. (Archer Cathro) to carry out a preliminary route selection and assessment of terrain for a suitable pioneer trail to the Rau Property, that could be upgraded to an all-weather road pending future mine development. The Rau Property is located in the Wernecke Mountains, about 50 km northeast of Keno City, Yukon and 385 km north of Whitehorse (Figure 1). This part of the central Yukon is included within the Na-cho Ny'a'k Dun (NND) First Nation traditional territory.

The preferred route (Option A – Figure 2) from the Hanson Lake Road, north of Keno City, Yukon follows the Rankin Creek valley and intersects the Wind River Trail (winter road) at Clark Lakes. The approximate centre of the study area is in UTM Zone 8 at 506000E and 7107000N and the route alignment is located on NTS maps 105M/14, 105M/15, 106D/1, 106D/2 and 106D/3. Stereoscopic air photograph interpretation and terrain mapping was undertaken by EBA Engineering Consultants Limited (EBA) for a minimum two kilometre wide corridor along the preferred access trail option in the Wernecke Mountains.

The Wernecke Mountains area has a long history of mining exploration. The Wind River Trail (winter road) was developed by Amerada Petroleum Corporation in 1959 to haul oil well drilling equipment and supplies to their camps on Eagle Plains. It has subsequently been used to service mining exploration projects.

2.0 METHODOLOGY

Terrain mapping was completed to characterize parent soils, drainage, genesis of surficial materials, slopes and geomorphological processes. This information is useful to identify favourable terrain, soils and environmental conditions for an access route. The following criteria were considered for the proposed route selection:

- minimize stream crossings;
- locate stream crossings in stable reaches with favourable surface conditions for bridge abutments and suitable approaches to minimize impacts;
- avoid areas with potential environmental concerns such as unfavourable soil conditions, permafrost and geomorphological processes such as flooding, landslides and avalanches;
- favourable construction materials;
- minimize environmental impact;
- locate the route in areas with favourable drainage; avoid lower hillslopes that are receiving areas for run-off and shallow groundwater. Locations with better drainage and soil conditions will require less water management and water control structures, and will require less maintenance.

NTS contour maps, geology mapping and air photographs for the study area were reviewed. 1:20,000 scale, black and white 1996 air photograph coverage for most of the route was used and is judged to be suitable for detailed terrain mapping with follow-up ground-truthing. Ground-truthing has not been completed to date and the mapping provided in this report remains at a general reconnaissance level of Terrain Survey Intensity (Level E-RIC, 1996[1]). Field-checking of up to 25% of the terrain polygons is planned for 2010 to increase the Terrain Survey Intensity to Level D, suitable for regional planning.

Stereographic review and interpretation of air photography was completed to map terrain and locate a probable route for a pioneer trail to the Rau Property. Consideration was given to a route that would be suitable for upgrading to an all-season road. Air photograph coverage at 1:20,000 is not available for the section of trail located in the Beaver River valley and terrain mapping in this section was completed at a reduced survey intensity level using 1:50,000 scale (approx.) air photographs. The results of the terrain mapping and route selection are preliminary and terrain soil conditions and water crossing locations cannot be verified until field checking and further aerial reconnaissance is completed.

Selection of the proposed access road alignment options (Figure 2) was guided by terrain conditions interpreted from review of air photographs including slope gradient, soil moisture and drainage, permafrost potential, erosion potential, overburden thickness, stream crossings, proximity to stream channels, assumed soil texture and geomorphological processes.

3.0 PHYSIOGRAPHY

The study area is located at the northern extent of the Stewart Plateau and Wernecke Mountains of the Mayo Lake-Ross River and Wernecke Mountains Ecoregions, and is largely glaciated by one or more glaciations. The area lies mostly within the Wernecke Mountains, which are characterized as steep, rugged topography with narrow valleys, although the valleys are wider in the southern part of this region where the access trail is proposed. Major watercourses in the area form the headwaters of the Stewart River, which flows to the Yukon River. The road corridor lies above 700 metres elevation above sea level with generally low relief. The maximum elevation is about 850 metres at the pass between Rankin and Scougale Creeks. The most common vegetation in valleys and on lower slopes is mixed spruce and aspen forest.

The area is predominantly underlain by metamorphic and sedimentary rocks. Valley floors and lower valley sideslopes are overlain by thick deposits of glaciofluvial material and glacial till. The proposed trail route is located within an area of discontinuous widespread permafrost. The full extent of the route is located on south and east-facing slopes, much of which appears to be in well-drained parent material, terrain conditions that are consistent

[1] Howes, D.E. and E. Kenk. Terrain Classification System for British Columbia. Version 2. Province of British Columbia. 1997.

with a low probability of permafrost. However, ground-truthing and more detailed evaluations are required to establish the extent of permafrost along the corridor.

4.0 SUMMARY OF RESULTS

Five route options were evaluated by stereoscopic air photograph interpretation. The results of the evaluation are summarized on Table 1.

The air photograph interpretation indicates that Option A contains suitable terrain for a pioneer trail that could be improved to construct an operative all-season road occurs throughout the length of the proposed route. A suitable access trail alignment, subject to ground-truthing, has been located through gentle to moderate terrain of suitable material to maximize cost-effective cut and fill methodology (Figures 1 to 12). The proposed pioneer trail is about 70 km in length from the Hanson Lake road to the cut-off for the active exploration site. A further 7 kilometres is proposed from the turn-off to the camp east to a proposed airstrip.

The proposed route from the Hanson Lake road via Gambler Lake and the Keno-Ladue River to Clark Lakes bypasses a section of the Wind River winter trail that is reported to be unsuitable for development as an all season road due to drainage, winter glaciation and overflow issues. The preferred route intersects the Wind River Trail (winter road) at Clark Lakes, following this existing trail to the Rau Property boundary at the Beaver River.

4.1 Surficial Geology

Surficial materials in the study area include fluvial material deposited by present streams and rivers, glacial till, glaciofluvial sands and gravels, and colluvium.

Fluvial plains (Fp) are typically sand and gravel with some silt and cobbles deposited in modern (Quaternary) drainages and include floodplain deposits subject to periodic floods. Till (moraine) deposits are deposited directly by glacier ice without modification by any other agent of transportation. Till (M) mapped in the study area includes Mv: till veneer (0-1m thick) that conforms to bedrock topography; and Mb: till blanket (>1m thick), a gently to moderately sloping plain controlled by bedrock.

Glaciofluvial deposits (FG) are stratified to massive, poorly to well sorted; gravel and sand with minor silt and occasional cobbles and boulders that are deposited by meltwater originating from glacial ice. Glaciofluvial deposits are generally preferred sources of granular material for road construction. A glaciofluvial terrace (FGt) is typically greater than 5 m to 10 m thick.

Colluvial deposits (C), common on all slopes in the region, include diamicton and gravel, shattered bedrock and lenses of sand and silt derived from bedrock and surficial materials by a variety of physical and chemical weathering processes. Transport of dislodged debris occurs as surface creep, sheetwash, or by mass wasting processes. In some sections the

proposed access trail route is located at the base of moderate gradient slopes where colluvium would be the dominant surficial material expected.

Morainal (till) deposits (M) are deposited directly by glacial ice. In the study area, till blanket (Mb; >1m thick) is mapped underlying lower valley slopes of the Beaver River.

4.2 Terrain Hazards

Throughout the study area, the geomorphological processes within the route corridor identified by stereoscopic air photograph interpretation were limited to two areas of potential avalanche (-A) hazard and a small, slow movement landslide about 1.5 km past the junction with the mine access trail. There is some potential for debris flow landslides (-Rd) in streams that drain mountain basins. No areas of potential rockfall were mapped within the road alignment corridor and, with the exception of some stream and river crossings, the proposed trail is located in areas judged to have a low probability of flooding.

Avalanche hazard in the study area is not extensive and is judged to be manageable if the access road was to be used in the winter period. The small landslide identified in the Beaver River valley is judged to be a slow moving and possibly inactive slide initiated on an escarpment from relic undercut by an abandoned river channel (Figure 11). Conscientious drainage management and location of the road corridor on gentle terrain upslope of this feature are judged to be adequate to have a low probability of impact. This area should be ground-truthed to assess terrain stability prior to construction.

Table 1: Summary of Alternate Route Assessments	
ROUTE OPTION	DESCRIPTION AND ASSESSMENT
Option A (Recommended)	From Hanson Lake Road about 12 km northwest of Keno City via Gambler Lake, Rankin Creek and Wind River Trail from Clark Lakes to Beaver River
▪ terrain conditions appear favourable throughout the area of the proposed route; ▪ avoids a potentially problematic section of the Wind River Trail with poor drainage conditions; ▪ optimizes a stable section of the existing Wind River Trail.	
Option B	Alternate access to Route A via Keno City and the Marg Winter Trail
▪ follows a narrow, steep-sided valley with an existing trail. A section of the most northerly part of the existing trail is located within the floodplain of the main stream; ▪ a 600 m section crosses slide debris from a relic landslide on the northwest valley hill slopes; ▪ central section appears to include some glaciofluvial terraces that may provide favourable construction material; ▪ southern section includes existing mining trails, however, many do not correspond to a direct route and may not be practical; ▪ access is through Keno City. Disturbance from commercial traffic was identified as an issue with recent mine access planning and development of the local Alexco Resources Bellekeno Mine; ▪ Conclusion: this is a feasible route; however, some existing trails along the route are pioneer trails that do not correspond to the most favourable alignment. Long sections, particularly in the north, follow narrow, steep-sided valley hillslopes that may limit road location to potentially imperfectly-drained lower slopes and/or the floodplain of the stream. The terrain is less favourable than that of other route options.	
Option C	Alternate access to Route A from the Hanson Lake Road via the north side of Ladue Lake
▪ Much of the route is located within NND Lands; ▪ About 3 km of the route follows close to the shore of Ladue Lake across low valley sideslopes that receive run-off from high mountain slopes with two stream crossings; drainage management and construction close to the lake may require strict environmental conditions; the alternate route by Gambler Lake is likely a more practical alternative; ▪ Conclusion: terrain, location and drainage issues present this route as less favourable than Option A.	

Table 1: Summary of Alternate Route Assessments	
ROUTE OPTION	DESCRIPTION AND ASSESSMENT
Option D	Wind River Trail (winter road) from Hanson Lake Road to Clarke Lakes
▪ much of this route is located in low elevation areas with poor drainage conditions reported; construction through these areas may present unfavourable environmental conditions and higher construction costs; ▪ follows the existing Hanson Lake Road to it's terminus ("km 0"); ▪ km 1 to km 24: the winter trail is located on lower hillslopes; much of this section of the route appears to have a high likelihood of imperfect drainage and it is the receiving area for run-off from upper hillslopes; upgrades to this section may be constrained by water issues that would require disproportionate water management and specialized construction; however, the winter route parallels a broad (FG) terrace with irregular terrain and numerous kettle lakes located within about 2 km north of the winter trail. Surficial materials in this area are more likely to be well drained sands and gravels providing favourable material for road construction and this may be a practical alternate route. ▪ km 24 to km 29 (Clark Lakes): the winter trail is located on lower hillslopes and flat valley floors, receiving considerable run-off drainage from upper hillslopes; in this area there doesn't appear to be a more favourable alternative for the route location; ▪ most of the route has a north-facing aspect with a high probability of permafrost; specialized construction in areas of permafrost would be required to reduce the possibility of permafrost degradation; ▪ new road construction distance (north of the terminus of Hanson Lake Road) is shorter than Option A (29 km verses 37 km for Alternative A); however, poor drainage and soil conditions on the Wind River Trail would likely necessitate relocation of the route through much of the area;	
Option E	Alternate access to Wind River Winter Road via southeast side of Scougale Creek within NND R-4A Settlement Lands
▪ most of the route is located within NND Lands; ▪ terrain along the route is favourable and the parent materials are likely suitable for road construction; ▪ there is no existing trail; the alternate route (Option A) on the northwest side of Scougale Creek follows the existing Wind River Trail; ▪ the south approach to the Beaver River crossing is not optimal (moderately steep, relatively long slope embankment; the south bank of the Beaver River channel is at the toe of the slope).	

5.0 DISCUSSION AND RECOMMENDATIONS

This reconnaissance level study is based solely on air photograph interpretation and the terrain mapping must be field-checked and revised prior to its use for development planning. EBA does not endorse the results of this preliminary study prior to field checking and subsequent mapping revisions.

Based on stereoscopic air photograph interpretation by EBA and an aerial reconnaissance completed by Archer Cathro in 2009, Option A (Table 1) is judged to be the preferred option for the proposed pioneer trail to the Rau Property for the following reasons:

- Favourable terrain conditions and surficial materials;
- optimizes a stable section of the existing Wind River Trail between Clark Lakes and the Beaver River;
- Abundant favourable granular borrow material for road construction is mapped throughout the route;
- Alternate route options include unfavourable terrain conditions in some sections or they are located on NND Settlement Lands.

Assessment of the terrain has been completed at a reconnaissance level with no field checking. Much of the terrain along the proposed route is generally characterized by glaciofluvial deposits with good drainage. Some sections with underlying till and colluvium appear to have favourable or manageable drainage conditions. The proposed route is located on south and east aspects with a resultant lower likelihood of permafrost. Field-checking is recommended to validate the terrain interpretation and confirm soil textures.

Prior to proceeding with advanced planning for construction, low level air photos (e.g., 1:20,000 scale) should be acquired along the Beaver River section of the proposed trail to permit detailed terrain mapping and development planning. Stream crossings should be assessed by a professional to design effective and adequate crossing structures. High energy mountain streams with active geomorphological processes such as debris flows may be encountered and will require specific assessment to select stable crossing locations and suitable structures. River crossings should be surveyed to aid in bridge design. Once access to the area has been established with the development of a pioneer trail, a geotechnical test pitting program is recommended to confirm sub-surface materials along the corridor, at major stream crossings and at potential borrow locations.

Where possible, slopes with less favourable drainage conditions (high soil moisture) (e.g., lower valley hillslopes) should be avoided. Once the results of field checking and revisions are integrated to complete this study, if actual terrain conditions encountered at any specific site do not conform to the broad mapping polygon, a qualified professional should be retained to provide a site specific assessment and to provide recommendations for construction and drainage management.

South-facing slopes are less likely to be underlain by permafrost and are generally preferred for road construction. Permafrost is also less likely in the fluvial plains of major streams and rivers. The presence of permafrost should be evaluated during ground-truthing. If permafrost is identified, alternate routes should be sought to avoid these areas or specific construction methods designed by a qualified professional should be applied for construction in these areas.

Active natural erosion, weathering and periglacial processes are expected to have minimal to negligible impact on the proposed trail alignment. Avalanche conditions were noted on an east-facing slope in the headwaters of Rankin Creek at about kilometer 31 of the proposed access trail and on some slopes in the Beaver River valley. Avalanche hazard should be considered when designing maintenance and safety protocols for an all-season road.

Sixteen potential borrow areas for construction material have been located as a preliminary guide for assessment. These sites require field assessment and testing, and if selected as a source of borrow material for future road construction, a borrow pit would be developed within the area, i.e., borrow material would be acquired from a small part of the exploration area shown. Borrow Areas have been located in gentle to moderate terrain with slopes of less than 30 % gradient and greater than 30 m from a watercourse. The borrow areas are judged to have favourable drainage and are located in areas that could be developed and managed with a low probability of environmental impact.

The airstrip is located on terrain mapped as a glaciofluvial terrace. This terrain type typically provides optimum conditions for development of an airstrip, namely flat topography slightly raised above adjacent terrain, loose sand and gravel parent materials and good drainage.

6.0 LIMITATIONS

The reconnaissance level terrain interpretation was completed by review of air photographs with no field checking. Terrain polygon boundaries were not georectified and all boundaries and access trail locations are approximate. Field checking of terrain must be completed before the surficial geology interpretation is used for development planning. Stream crossings cannot be adequately evaluated prior to an on-site assessment.

7.0 CLOSURE

This report has been prepared for the exclusive use of Archer Cathro and Associates (1981) and their agents for the specific application described in this report. It has been prepared in accordance with generally accepted geoscience practices, and geoscience judgement has been applied in developing the recommendations of this report. Further limitations on the use of this report are outlined in the General Conditions (Appendix A) that form a part of this report.

surficial material ↘ ↙ initiation zone
texture → **aCk - R"b** ← geomorphological process subclass
surface expression ↗ ↖ geomorphological process

Composite Units: Up to three letters may be used to describe any characteristic. Processes follow the dash "-" symbol.

e.g.	Mv•Rk	indicates "Mv" and "Rk" are roughly equal in extent
	Mv/Rk	indicates "Mv" is more extensive than "Rk" (about 2/1 or 3/2)
	Mv//Rk	indicates "Mv" is much more extensive than "Rk" (about 3/1 or 4/1)
	/Mw Rk	indicates "Rk" is partially buried by "Mw"

Stratigraphic Units: When one or more surficial materials overlie a different material or bedrock.

e.g.	Mw Rr	indicates that "Mw" overlies "Rr"

(2) TEXTURE

Specific Clastic Terms

c	clay	< 2 µm
z	silt	2 - 62.5 µm
s	sand	62.5 µm - 2 mm
p	pebbles	2 mm – 64 mm; rounded particles
k	cobbles	64 mm – 256 mm; rounded particles
b	boulders	> 256 mm; rounded particles
a	blocks	> 256 mm; angular particles

Common Clastic Terms

x	angular fragments	mixture of rubble (r) and blocks (a)
g	gravel	mixture of pebbles (p), cobbles (k), boulders (b) and up to 20% sand
r	rubble	angular particles < 64 mm

(3) MATERIALS

C	Colluvium	Products of gravitational slope movements; materials derived from local bedrock and major deposits derived from drift; includes talus and landslide deposits. Includes up to 20% bedrock.
F	Fluvial sediments	Sands and gravels transported and deposited by streams and rivers; floodplains, terraces and alluvial fans.
FG	Glaciofluvial sediments	Sands and gravels transported and deposited by meltwater streams; includes kames, eskers and outwash plains.
LG	Glaciolacustrine sediments	Fine sand, silt and clay deposited in ice-dammed lakes.
M	Till	Material deposited by glaciers without modification by flowing water. Typically consists of a mixture of pebbles, cobbles and boulders in a matrix of sand, silt and clay; diamicton. Includes up to 20% bedrock and/or colluvium.
O	Organic materials	Material resulting from the accumulation of decaying vegetative matter; includes peat and organic soils.
R	Bedrock	Outcrops and bedrock within a few centimetres of the surface. Includes up to 20% colluvium.

4) SURFACE EXPRESSION

a	moderate slope(s)	predominantly planar slopes; 15-26º (28 - 49%)
b	blanket	material >1-2 m thick with topography derived from underlying bedrock (which may not be mapped) or surficial material
d	discontinuous	used with FG where it indicates partial coverage due to erosion or interrupted deposition with exposure of underlying or secondary (M)
f	fan	a fan-shaped surface that is a sector of a cone; slopes 3-15º (5-27%)
h	hummocky	steep-sided hillocks and hollows; many slopes 15º (27%) and steeper
i	irregular	mostly used with FG; low to moderate relief (less than 10 m) irregularly shaped hummocks, low ridges, hollows, swales typically found in glacial ice-melt areas; may include kettled topography, discontinuous eskers, depressions and discontinuous glaciofluvial channels
j	gentle slope(s)	predominantly planar slopes; 4-15º (6 - 27%)
k	moderately steep slope	predominantly planar slopes; 26-35º (50 - 70%)
m	rolling topography	linear rises and depressions; < 15º (27%)
p	plain	0-3º (0-5%)
r	ridges	linear rises and depressions with many slopes 15º and steeper
s	steep slope(s)	slopes steeper than 35º (> 70%)
t	terrace(s)	stepped topography and benchlands
u	undulating topography	hillocks and hollows; slopes predominantly <15º
v	veneer	material <1-2 m thick with topography derived from underlying bedrock (may not be mapped) or surficial materials; may include outcrops of underlying material
w	mantle	surficial material of variable thickness
x	thin veneer	a subset of v (veneer), where there is a dominance of surficial materials about 10-25 centimetres thick

(5) GEOMORPHOLOGICAL PROCESSES

A	Avalanche	Slope or parts of slope affected by downhill transport of snow and resulting deposition
B	Braiding channel	Active channel zone is characterized by many diverging and converging channels separated by unvegetated bars. Many channels are dry at moderate and low flows, but during major floods, the entire channel zone may be occupied by flowing water.
E	Channelled by meltwater	Erosion and channel formation by meltwater alongside, beneath, or in front of a glacier or ice sheet.
F	Failing	Slope experiencing slow mass movement, such as sliding or slumping
R	Rapid mass movement	Slope or parts of slope affected by processes such as debris flows, debris slides and avalanches, and rockfall
V	Gullying	Slope affected by gully erosion.

Mass Movement Sub-Classes

-R	rapid mass movement
-R"	rapid mass movement - initiation zone
-Rb	rock fall
-Rs	debris slide

APPENDIX

APPENDIX A GENERAL CONDITIONS

GEOTECHNICAL REPORT – GENERAL CONDITIONS

This report incorporates and is subject to these "General Conditions".

1.0 USE OF REPORT AND OWNERSHIP

This geotechnical report pertains to a specific site, a specific development and a specific scope of work. It is not applicable to any other sites nor should it be relied upon for types of development other than that to which it refers. Any variation from the site or development would necessitate a supplementary geotechnical assessment.

This report and the recommendations contained in it are intended for the sole use of EBA's Client. EBA does not accept any responsibility for the accuracy of any of the data, the analyses or the recommendations contained or referenced in the report when the report is used or relied upon by any party other than EBA's Client unless otherwise authorized in writing by EBA. Any unauthorized use of the report is at the sole risk of the user.

This report is subject to copyright and shall not be reproduced either wholly or in part without the prior, written permission of EBA. Additional copies of the report, if required, may be obtained upon request.

2.0 ALTERNATE REPORT FORMAT

Where EBA submits both electronic file and hard copy versions of reports, drawings and other project-related documents and deliverables (collectively termed EBA's instruments of professional service), only the signed and/or sealed versions shall be considered final and legally binding. The original signed and/or sealed version archived by EBA shall be deemed to be the original for the Project.

Both electronic file and hard copy versions of EBA's instruments of professional service shall not, under any circumstances, no matter who owns or uses them, be altered by any party except EBA. EBA's instruments of professional service will be used only and exactly as submitted by EBA.

Electronic files submitted by EBA have been prepared and submitted using specific software and hardware systems. EBA makes no representation about the compatibility of these files with the Client's current or future software and hardware systems.

3.0 ENVIRONMENTAL AND REGULATORY ISSUES

Unless stipulated in the report, EBA has not been retained to investigate, address or consider and has not investigated, addressed or considered any environmental or regulatory issues associated with development on the subject site.

4.0 NATURE AND EXACTNESS OF SOIL AND ROCK DESCRIPTIONS

Classification and identification of soils and rocks are based upon commonly accepted systems and methods employed in professional geotechnical practice. This report contains descriptions of the systems and methods used. Where deviations from the system or method prevail, they are specifically mentioned.

Classification and identification of geological units are judgmental in nature as to both type and condition. EBA does not warrant conditions represented herein as exact, but infers accuracy only to the extent that is common in practice.

Where subsurface conditions encountered during development are different from those described in this report, qualified geotechnical personnel should revisit the site and review recommendations in light of the actual conditions encountered.

5.0 LOGS OF TESTHOLES

The testhole logs are a compilation of conditions and classification of soils and rocks as obtained from field observations and laboratory testing of selected samples. Soil and rock zones have been interpreted. Change from one geological zone to the other, indicated on the logs as a distinct line, can be, in fact, transitional. The extent of transition is interpretive. Any circumstance which requires precise definition of soil or rock zone transition elevations may require further investigation and review.

6.0 STRATIGRAPHIC AND GEOLOGICAL INFORMATION

The stratigraphic and geological information indicated on drawings contained in this report are inferred from logs of test holes and/or soil/rock exposures. Stratigraphy is known only at the locations of the test hole or exposure. Actual geology and stratigraphy between test holes and/or exposures may vary from that shown on these drawings. Natural variations in geological conditions are inherent and are a function of the historic environment. EBA does not represent the conditions illustrated as exact but recognizes that variations will exist. Where knowledge of more precise locations of geological units is necessary, additional investigation and review may be necessary.

7.0 SURFACE WATER AND GROUNDWATER CONDITIONS

Surface and groundwater conditions mentioned in this report are those observed at the times recorded in the report. These conditions vary with geological detail between observation sites; annual, seasonal and special meteorologic conditions; and with development activity. Interpretation of water conditions from observations and records is judgemental and constitutes an evaluation of circumstances as influenced by geology, meteorology and development activity. Deviations from these observations may occur during the course of development activities.

8.0 PROTECTION OF EXPOSED GROUND

Excavation and construction operations expose geological materials to climatic elements (freeze/thaw, wet/dry) and/or mechanical disturbance which can cause severe deterioration. Unless otherwise specifically indicated in this report, the walls and floors of excavations must be protected from the elements, particularly moisture, desiccation, frost action and construction traffic.

9.0 SUPPORT OF ADJACENT GROUND AND STRUCTURES

Unless otherwise specifically advised, support of ground and structures adjacent to the anticipated construction and preservation of adjacent ground and structures from the adverse impact of construction activity is required.

10.0 INFLUENCE OF CONSTRUCTION ACTIVITY

There is a direct correlation between construction activity and structural performance of adjacent buildings and other installations. The influence of all anticipated construction activities should be considered by the contractor, owner, architect and prime engineer in consultation with a geotechnical engineer when the final design and construction techniques are known.

11.0 OBSERVATIONS DURING CONSTRUCTION

Because of the nature of geological deposits, the judgmental nature of geotechnical engineering, as well as the potential of adverse circumstances arising from construction activity, observations during site preparation, excavation and construction should be carried out by a geotechnical engineer. These observations may then serve as the basis for confirmation and/or alteration of geotechnical recommendations or design guidelines presented herein.

12.0 DRAINAGE SYSTEMS

Where temporary or permanent drainage systems are installed within or around a structure, the systems which will be installed must protect the structure from loss of ground due to internal erosion and must be designed so as to assure continued performance of the drains. Specific design detail of such systems should be developed or reviewed by the geotechnical engineer. Unless otherwise specified, it is a condition of this report that effective temporary and permanent drainage systems are required and that they must be considered in relation to project purpose and function.

13.0 BEARING CAPACITY

Design bearing capacities, loads and allowable stresses quoted in this report relate to a specific soil or rock type and condition. Construction activity and environmental circumstances can materially change the condition of soil or rock. The elevation at which a soil or rock type occurs is variable. It is a requirement of this report that structural elements be founded in and/or upon geological materials of the type and in the condition assumed. Sufficient observations should be made by qualified geotechnical personnel during construction to assure that the soil and/or rock conditions assumed in this report in fact exist at the site.

14.0 SAMPLES

EBA will retain all soil and rock samples for 30 days after this report is issued. Further storage or transfer of samples can be made at the Client's expense upon written request, otherwise samples will be discarded.

APPENDIX III

BASELINE WATER QUALITY SURVEY REPORTS BY J. GIBSON

Atac Resources Ltd.

BEAVER RIVER STREAM PROFILE

July 2009

J.Gibson Environmental Consulting Whitehorse, Yukon

Introduction

In advance of a possible winter road access to the Rau Claims, Atac Resources requested a site identification, stream profile and stream flow measurement of the Beaver River in the area upstream of the Scougale Creek confluence with the Beaver River.

There is an existing limited use winter trail adjacent to the Beaver River.

Site Selection

The survey of July 31, 2009 identified a stable river crossing site adjacent to the existing limited use trail (see attached Water Quality / Hydrology Stations map). Site selection was based on the presence of stable river banks, uniform stream flow across the profile and relatively consistent water depths.

The Beaver River confluence with the Rackla River is located approximately 20 kilometers downstream.

Stream Profile

A stream cross sectional profile was done July 31, 2009.
Stream profile data was collected with a "Total Station and Prism Rod" instrument.
Profile data is attached in Table 1 and on profile graph.

Stream Flow Volume

Beaver River flow volume measurement was done in conjunction with the stream profile.
Stream velocity data was obtained with a Price Velocity meter and top set wading rod.
Horizontal distances for the stream flow measurement used survey data, with water depth measured using the top set wading rod.
Stream flow volume calculations are attached in the Stage/Discharge Calculation Sheet.

Flow volume in the Beaver River upstream of Scougale Creek was measured at 11.85 cubic meters per second on July 31, 2009. Mean velocity within the cross section was 0.635 meters per second with maximum depth measured at 0.70 meters.

Historical Data

Environment Canada – Water Survey of Canada maintains a water survey station on the Beaver River below Matson Creek, approximately 80 – 100 kilometers downstream of the confluence with Scougale Creek.
Water Survey of Canada data covers a 13 year period from December 1995 to December 2007. 2008 data is yet to be published and released on their web site.

Discharge Calculations

The July 31, 2009 measured volume at Beaver River upstream Scougale Creek is 13.3% of the July mean monthly discharge at the downstream Water Survey station.

Using the July 31 relationship between stations, the following data for Beaver River upstream Scougale Creek is calculated:

Month	**Maximum Monthly Mean**		**Minimum Monthly Mean**	
	(cms)		*(cms)*	
	D/S Matson	***U/S Scougale***	***D/S Matson***	***U/S Scougale***
Dec	19.6	*2.60*	10.3	*1.37*
Jan	15.8	*2.10*	4.14	*0.55*
Feb	13.3	*1.77*	5.22	*0.69*
Mar	11.4	*1.52*	5.61	*0.75*

The Beaver River crossing would be utilized within the period December to March.

The expected flow volumes during that time would be within the range of :

Maximum 1.52 to 2.60 cubic meters per second

Minimum 0.75 to 1.37 cubic meters per second

Water Survey of Canada data for Beaver Creek below Matson Creek is attached.

River crossing site photographs are attached.

June 2009

J.Gibson Env. Consulting ***Whitehorse, Yukon***

Atac Resources Ltd requested a baseline water quality / hydrology surveys be conducted on the surface water tributaries draining the area of the RAU Claims north of Keno City, Yukon.

The RAU Claims are located near the confluence of the Beaver River and the Rackla River. Streams draining south of the claims are tributaries to the Beaver River with streams draining north and west of the claims being tributaries to the Rackla River. Immediately north of the claims are the Kathleen Lakes as part of the Rackla River drainage.
The confluence of the Beaver and Rackla Rivers is located to the south of the claims.

An active big game outfitter's camp is located on the Kathleen Lake system.

Water quality / hydrology survey done in June 2009 is the third survey, following surveys in August and October, 2008.

Exploration activity on the RAU Claims in June 2009 consists of a 15 person exploration camp starting diamond drill set up and operations.
There was no exploration / camp activity during the October 2008 survey.
The exploration camp and all survey sites were accessed by helicopter.

The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals with field measurements for pH, water temperature and flow volumes. June 2009 survey includes the addition of Total Cyanide, Total Mercury and Total Organic Carbon at all stations with exception of RAU #6 (drinking water supply).

Sample Locations

Eight water quality sample sites were established in August, 2008 on tributary streams draining the RAU Claims (see attached locations map).

Sample station designations, coordinates and elevations are:

Station #	Lat/Long Coordinates	Elevation (m)
RAU #1	64 15.152 / 134 23.193	747
RAU #2	64 15.224 / 134 16.650	750
RAU #3	64 10.350 / 134 24.091	787
RAU #4	64 10.253 / 134 28.599	659
RAU #5	64 11.940 / 134 34.455	655
RAU #6	Upstream of Camp	
RAU #7	64 11.104 / 134 29.739	702
RAU #8	64 15.782 / 134 31.634	718

Station coordinates and elevations are for helicopter landing sites. Due to the topography and thick vegetation it was often necessary to located / construct landing sites up to100 meters distance from sample sites. Landing sites are marked by a large tree blaze, spray painted orange with sample designation number marked on the blaze.

Sample Analysis Parameters

Each station was sampled for routine chemistry, total metals, dissolved metals, total cyanide, total mercury and total organic carbon.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total mercury, total and dissolved metal samples were preserved with nitric acid immediately after sampling.

Total cyanide samples were preserved with sodium hydroxide immediately after sampling.

There were no quality control samples taken in June 2009.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Bodycote T.G. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH were taken with an Oakton 300M meter, water temperatures with an alcohol thermometer.

Stream flow volumes were measured with a Price AA velocity meter and cross sectional area calculations.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Table 1. Routine Chemistry, Total Cyanide, Total Organic Carbon – laboratory analysis and field measurement results

Table 2. Total Metals ICP and Total Mercury– MS laboratory analysis results

Table 3. Dissolved Metals ICP – MS laboratory analysis results

Listed with the analysis data are the laboratory detection limits for each parameter.

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic Guidelines for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to CCME – ***Canadian Water Quality Guidelines.***
All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by Bodycote Testing Group of Surrey B.C.

Laboratory Analytical Reports are attached in Appendix 1.

Flow volume calculation sheets are contained in Appendix 2.

A summary of water quality / hydrology data for each station is attached in Appendix 3.

Discussion

Hydrology

The June 2009 survey was done with tributary streams in decreasing flow stage from spring freshet. The Beaver River was in "bank full" stage with Rackla River decreasing from bank full stage. Differences in stage between rivers is likely due to lake storage in the Rackla River system.
Measured tributary flow volumes for the June 2009 survey are generally higher than those measured in August and October 2008.

Measured flow volumes for each station are listed below.

Measured Stream Flow Volumes – RAU Claims 2008/09

Station	Flow Volume (cubic meters/second)		
	August 2008	**October 2008**	**June 2009**
RAU #1	**0.502**	**0.734**	**0.747**
RAU #2	**0.234**	**0.430**	**0.287**
RAU #3	**0.493**	**0.690**	**0.461**
RAU #4	**0.043**		**0.066**
RAU #5	**0.038**		**0.023**
RAU #6	**0.025 Estimated**		**0.010 E**
RAU #7	**0.027**	**0.042**	**0.039**
RAU #8	**0.074**		**0.374**

Flow volume calculations are contained in Appendix 2.

Routine Chemistry

Field measurement and lab analysis results for routine chemistry are listed in Table 1.

Sampling and laboratory analysis for parameters total cyanide, total mercury and total organic carbon was begun in addition to parameters from previous events. Total cyanide and total organic carbon analysis results are listed with routine chemistry parameters in Table 1, total mercury analysis results with total metals in Table 2.

Analysis results for all stations for all parameters measured meet the *Drinking Water Guideline's MA*C's.

Analysis results for all parameters with the exception of Nitrite – N meet the *CCME Guidelines* for the protection of Aquatic Life.

Nitrite – N values in June 2009 were below *Aquatic Guideline* concentration (0.06 mg/L) at all stations with the exception of RAU #5. Station RAU #5 has Nitrite – N values above the *Aquatic Guideline* concentration for all three surveys (0.14 mg/L in June 2009, 0.16mg/L in October and 0.14 mg/L in August of 2008)
The presence of Nitrite – N in the absence of any industrial pollutants may be the result of nitrification, oxidation of ammonia by bacteria. The pH values for all sites are near/ above the optimum oxidation pH of 8.0. The rate of nitrification would be inhibited by the low water temperature.
Nitrate – N was also detected at all stations with values ranging from 0.08 to 0.26 mg/L in June 2009, 0.07 to 0.21 mg/L in August 2008, 0.1 to 0.34 mg/L in October 2008.

Total Hardness as CaC03 values range from 114 – 286 mg/L, giving a continued hardness rating of "hard to very hard".

Total cyanide was detected at all stations with the exception of RAU#7. Total cyanide concentrations were consistently at the detection limit of 0.001 mg/L. Station RAU#6 was not sampled for total cyanide. Total cyanide levels are well below Drinking Water and Aquatic Guideline levels.

Total organic carbon values range from 0.6 to 3.1 mg/L.

Metals

The laboratory analytical report notes that some total metal results are less than dissolved metal concentrations but are verified and are within the expected measurement uncertainty.

Total metals analysis results are listed in Table 2, dissolved metals analysis results in Table 3.

Total metals concentrations exceed the *Drinking Water Guidelines* for iron (*MAC* of 0.3 mg/L) at RAU#3 (0.39 mg/L) and RAU#5 (0.31 mg/L).

Total metals concentrations exceeded *Aquatic Guideline* levels for aluminum at RAU#1 and RAU#3, for iron at RAU#3 and RAU#5, for selenium at RAU#1, RAU#3 and RAU#5 and for zinc at RAU#5 and RAU#8.

Station RAU #1

Station RAU #1 is located on a tributary to Kathleen Lakes / Rackla River. The tributary is one of the larger watersheds draining the claim area with a measured stream flow volume in June 2009 of 0.747 cubic meters per second (cms), increased from 0.502 cms (August) and 0.734 cms (October). Stream flows are contained within a single channel with well defined banks and a rock and cobble channel base. Freshet 2009 flows exceed the channel capacity with high water marks an estimated 0.2 – 0.25 meters above channel banks at the station.
Total metals analysis at Station RAU #1 had no parameters exceeds the *Drinking Water Quality Guidelines (DWQ).*
Concentrations of total aluminum (0.126 mg/L) and total selenium (0.0014 mg/L) exceed the *CCME Aquatic Guidelines.* Both selenium and aluminum levels are approximately half the levels measured in October 2008.

Station RAU #2

Station RAU #2 is located on a tributary of the Rackla River that discharges directly into Kathleen Lakes. Measured stream flow volumes in June 2009 were 0.287 cms compared with 0.430 cms in October and 0.234 cms in August 2008.
Total metals analysis results show concentrations of total iron (0.016 mg/L are decreased from 0.27 mg/L in October and 0.34 mg/L in August. Previously elevated levels of total manganese (0.077 mg/L in October) now meet the *DWQ Guidelines MAC* of 0.05 mg/L. Concentrations of all parameters meet the *CCME – Aquatic Guidelines.*

Station RAU #3

Station RAU #3 is located on a tributary to the Beaver River. This tributary is the largest tributary to the Beaver River draining the claim area with a measured stream flow volume in June of 0.461 cms compared to 0.690 cms in October and 0.493 cms in August. The station is located approximately 2 km upstream of stream confluence with the Beaver River. The stream channel is contained within a canyon, stream bed consists of boulders, rock and cobbles.

The exploration camp is located near the headwaters of this tributary as is Station RAU#6.
Total metals analysis results show concentrations of total iron (0.39 mg/L) exceed the *DWQ Guideline MAC* of 0.3 mg/L.
Concentrations of total iron, total aluminum (0.195 mg/L) and total selenium (0.0012 mg/L) show decreases from August and October 2008 but continue to slightly exceed the *CCME – Aquatic Guidelines*.

Station RAU #4

Station RAU #4 is located on a tributary to the Beaver River. The station has a small lake/pond within the system that accounts for the elevated water temperature.

Measured flow volumes in June 2009 of 0.066 cms are higher than those measured in August 2008 of 0.043 cms. The station was not accessed during the October 2008 survey.

June 2009 analysis results, as those from August 2008 show no parameters exceed the *DWQ or CCME – Aquatic Guidelines.*

Station RAU #5

Station RAU #5 is located on a tributary to the Beaver River east of Station RAU #4. The station is located near the mouth, downstream of the break in slope.

Stream flow volumes were measured at 0.023 cms compared to 0.038 cms in August 2008. No flow measurement was done in October 2008.
Concentrations of total iron (0.31 mg/L) exceed *DWQ-Guideline MAC* of 0.3 mg/L
Total metals analysis results concentrations of total iron (0.31 mg/L), total selenium (0.0024mg/L) and total zinc (0.049 mg/L) exceed the *CCME – Aquatic Guidelines.*

Station RAU #6

Station RAU #6 is located on the same tributary as Station RAU #3 and represents the camp drinking water supply.
Concentrations of all parameters measured meet all *DWQ* and *Aquatic Guidelines*.
RAU#6 analysis results are also listed as camp supply in Table 4.

Station RAU #7

Station RAU #7 is located on a tributary to the Beaver River. The station is located approximately 1 kilometer upstream of the confluence with the Beaver River just

Table 4. RAU Claims - Camp Drinking Water Supply

Parameter		Camp Supply RAU #6	DWQ* Guideline MAC's
pH	ru	8.24	6 to 8.5
Chloride	mg/L	0.09	<250
Nitrite	mg/L	<0.01	1

Hardness as CaC03	mg/L	141	<500
Total Metals			
Aluminum	mg/L	<0.005	
Antimony	mg/L	<0.0002	0.006
Arsenic	mg/L	<0.0002	0.01
Barium	mg/L	0.065	1
Boron	mg/L	<0.005	5
Cadmium	mg/L	<0.00001	0.005
Calcium	mg/L	34.7	
Chromium	mg/L	0.0004	0.05
Cobalt	mg/L	<0.00002	
Copper	mg/L	<0.001	1
Iron	mg/L	0.01	0.3
Lead	mg/L	0.0003	0.01
Lithium	mg/L	<0.001	
Magnesium	mg/L	13.3	
Manganese	mg/L	0.0001	0.05
Molybdenum	mg/L	0.00158	
Sulfur	mg/L	2	
Selenium	mg/L	<0.0006	0.01
Strontium	mg/L	0.02	
Silicon	mg/L	1.07	
Sodium	mg/L	0.92	<200
Titanium	mg/L	0.0003	
Uranium	mg/L	0.002	0.02
Zinc	mg/L	0.007	<5

DWQ* = Canadian Drinking Water Quality Guideline
MAC = Maximum Acceptable Concentration

upstream of the break in slope. The stream is single channel contained within stable banks. Stream bed materials are rock and cobble with limited silt deposition.
June stream flow volumes were measured at 0.039 cms compared with 0.042 cms in October and 0.027 cms in August 2008.
Total metals analysis results for June 2009 show values for all parameters tested meet the *DWQ and CCME Aquatic Guidelines* as they did in August and October 2008.

Station RAU #8

Station RAU #8 is located on a tributary to the Rackla River upstream of Kathleen Lakes. Due to topography and vegetation, the survey site is located near the stream mouth / confluence with the Rackla River. The stream is confined to a single channel at medium to low volumes but during higher flows may be multi channeled. Stream channel characteristics are grass/ moss covered near vertical bank slopes with heavy silt deposition in channel base.
Measured flow volumes in June were 0.374 cms compared with 0.074 cms in August 2008. There was no flow volume measured in October, 2008.

Total metals analysis results show all parameters tested meet *DWQ – Guideline MAC's*.

Concentrations of total zinc (0.053 mg/L) continue to exceed the *CCME – Aquatic Guideline* value of 0.03 mg/L.

Concentrations of total mercury were below the detection limit of 0.01 mg/L at all stations.

Summary

The June 2009 baseline survey was conducted during a decreasing flow stage in tributary streams following spring freshet / runoff.

All stations were access during the June 2009 survey.

Routine chemistry, total metals and dissolved metals analysis indicate tributary streams draining the RAU claims have moderate to low concentrations for parameters tested.

June 2009 analysis results are consistent with those of August and October 2008 with minor variations in levels of aluminum and iron most evident.

Data summaries for each station are contained in Appendix 3.

Access to stations was improved with time spent on establishing better helicopter landing sites at or near the break in channel slope.

Comments:

- Upon receipt, samples 1-8 had exceeded recommended holding time for Ammonia analysis.
- Some total metal results were less than dissolved metal results for lot 687157. The results were verified and are within expected measurement uncertainty.

RAU CLAIMS

Baseline Water Quality Survey

July 2009

J.Gibson Env. Consulting ***Whitehorse, Yukon***

Atac Resources Ltd requested a baseline water quality / hydrology surveys be conducted on the surface water tributaries draining the area of the RAU Claims north of Keno City, Yukon.

The RAU Claims are located near the confluence of the Beaver River and the Rackla River. Streams draining south of the claims are tributaries to the Beaver River with streams draining north and west of the claims being tributaries to the Rackla River. Immediately north of the claims are the Kathleen Lakes as part of the Rackla River drainage.
The confluence of the Beaver and Rackla Rivers is located to the south of the claims.

An active big game outfitter's camp is located on the Kathleen Lake system.

Water quality / hydrology survey done in July 2009 is the fourth survey, following surveys in August and October, 2008 and June 2009.

Exploration activity on the RAU Claims in July 2009 consists of a 15 person exploration camp with two diamond drills in operation.

The exploration camp and all survey sites were accessed by helicopter.

The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals with field measurements for pH, water temperature and flow volumes.

June and July 2009 surveys include the addition of Total Cyanide, Total Mercury and Total Organic Carbon at all stations with exception of RAU #6 (drinking water supply).

Sample Locations

Nine water quality sample sites were active in July, 2009 on tributary streams draining the RAU Claims (see attached locations map).

Station RAU #9 was established July, 2009 to obtain water quality data closer to the mineralized zone and active exploration drilling. The station is located upstream of Station RAU #4 but below the stream forks. An active drill water sump is located 15 meters downstream of the site.

Updated Sample station designations, coordinates and elevations are:

Station #	UTM Coordinates	Elevation (m)
RAU #1	E 529734 N 7125299	747
RAU #2	E 535018 N 7125488	750
RAU #3	E 529092 N 7116373	787
RAU #4	E 525316 N 7116594	659
RAU #5	E 520576 N 7119159	655
RAU #6	E 530817 N 7118701	no data
RAU #7	E 524405 N 7117800	702
RAU #8	E 523448 N 7125565	718
RAU #9	E 527261 N 7118550	no data

UTM Zone 8 NAD83

Station coordinates and elevations are for helicopter landing sites. Due to the topography and thick vegetation it was often necessary to located / construct landing sites up to100 meters distance from sample sites.
Landing sites were re marked in July 2009 with numbered station signs visible from the air.

Sample Analysis Parameters

Each station was sampled for routine chemistry, total metals, dissolved metals, total cyanide, total mercury and total organic carbon.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total mercury, total and dissolved metal samples were preserved with nitric acid immediately after sampling.

Total cyanide samples were preserved with sodium hydroxide immediately after sampling.

Quality control samples (Duplicates) for total metals and dissolved metals were taken at Stations RAU #1 and RAU #3 in July, 2009.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Bodycote T.G. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH were not taken as instrument was not operating reliably. Water temperatures were taken with an alcohol thermometer.

Stream flow volumes were measured with a Price AA velocity meter and cross sectional area calculations.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Table 1. Routine Chemistry, Total Cyanide, Total Organic Carbon – laboratory analysis and field measurement results

Table 2. Total Metals ICP- MS and Total Mercury– laboratory analysis results

Table 3. Dissolved Metals ICP – MS laboratory analysis results

Table 4. Quality Control Samples – laboratory analysis results for Total Metals

Table 5. Quality Control Samples – laboratory analysis results for Dissolved Metals

Listed with the analysis data are the laboratory detection limits for each parameter.

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic ***Guidelines*** for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to CCME – ***Canadian Water Quality Guidelines.***
All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by Bodycote Testing Group of Surrey B.C. Laboratory Analytical Reports are issued under “EXOVA” – a recent purchaser of Bodycote TG.

Laboratory Analytical Reports are attached in Appendix 1.

Table 3. ATAC Resources - RAU Claims, July 2009.

Quality Control

Quality control duplicate samples at Station RAU #1 and RAU#1 are listed in Table 4 (Total Metals) and Table 5 (Dissolved Metals). Variations in analysis results between duplicate samples of greater than 10% are highlighted in yellow.

Discussion

Hydrology

The July 2009 survey was done with tributary streams in decreasing flow stage from spring freshet. Flows in the Beaver and Rackla Rivers decreased from June 2009 to near summer low flows with exposed sand/ gravel banks predominating.
Measured tributary flow volumes for the July 2009 survey are significantly lower than those measured previously, with the exception of RAU #4 and RAU#5 which remained similar to the June 2009 volumes.

Measured flow volumes for each station are listed below.

Measured Stream Flow Volumes – RAU Claims 2008/09

Station	Flow Volume (cubic meters/second)			
	Aug 2008	Oct 2008	Jun 2009	Jul 2009
RAU #1	0.502	0.734	0.747	0.129
RAU #2	0.234	0.430	0.287	0.053
RAU #3	0.493	0.690	0.461	0.129
RAU #4	0.043	nr	0.066	0.069
RAU #5	0.038	nr	0.023	0.022
RAU #6	0.025 Estimated		0.010 E	0.003
RAU #7	0.027	0.042	0.039	0.017
RAU #8	0.074	nr	0.374	0.087
RAU#9	-	-	-	0.019

Flow volume calculations are contained in Appendix 2.

Beaver River flow volume and cross sectional profile were measured for a winter road stream crossing upstream of the confluence of Scougale Creek and Beaver River at UTM coordinates **E** 514008 **N** 7121403. Flow volumes were calculated at 11.8 cubic meters per second.

Table 5. Quality Control Samples July 2009, Rau Claims

Routine Chemistry

Field measurement and lab analysis results for routine chemistry are listed in Table 1.

Sampling and laboratory analysis for parameters total cyanide, total mercury and total organic carbon was begun in June 2009 addition to parameters from previous events. Total cyanide and total organic carbon analysis results are listed with routine chemistry parameters in Table 1, total mercury analysis results with total metals in Table 2.

Analysis results for all stations for all parameters measured meet the *Drinking Water Guideline's MA*C's.

Analysis results for all parameters with the exception of Nitrite – N at Station RAU #2 and RAU #5 meet the *CCME Guidelines* for the protection of Aquatic Life.

Nitrite – N values in July 2009 were below *Aquatic Guideline* concentration (0.06 mg/L) at all stations with the exception of RAU #2 (0.12 mg/L) and RAU #5 (0.14 mg/L). Station RAU #5 has Nitrite – N values above the *Aquatic Guideline* concentration for all four surveys (0.14 mg/L in June 2009, 0.16mg/L in October and 0.14 mg/L in August of 2008)
The presence of Nitrite – N in the absence of any industrial pollutants may be the result of nitrification, oxidation of ammonia by bacteria. The pH values for all sites are near/ above the optimum oxidation pH of 8.0. The rate of nitrification would be inhibited by the low water temperature.
Nitrate – N was also detected at all stations with values ranging from 0.05 to 0.23 mg/L this survey, 0.08 to 0.26 mg/L in June 2009, 0.07 to 0.21 mg/L in August 2008, 0.1 to 0.34 mg/L in October 2008.

Total Hardness as CaC03 values range from 142 – 334 mg/L, giving a continued hardness rating of "hard to very hard". The range of hardness values has increased from June 2009, due to due to a decrease in surface flows resulting in an high proportion of groundwater flows.

Total cyanide was not detected at any stations this survey. During the June 2009 survey, total cyanide concentrations were consistently at the detection limit of 0.001 mg/L. Station RAU#6 (drinking water supply) was again not sampled for total cyanide. Total cyanide levels are well below ***Drinking Water*** and ***Aquatic Guideline*** levels.

Total organic carbon values range from 0.7 to 2.1 mg/L compared to a range of 0.6 to 3.1 mg/L in June 2009.

Metals

The laboratory analytical report notes that some total metal results are less than dissolved metal concentrations but are verified and are within the expected measurement uncertainty.

Total metals analysis results are listed in Table 2, dissolved metals analysis results in Table 3.

Total metals concentrations exceed the ***Drinking Water Guidelines*** for iron (*MAC* of 0.3 mg/L) at RAU#5 (0.55 mg/L).

Total metals concentrations exceeded ***Aquatic Guideline*** levels for aluminum at RAU#5 (0.174 mg/L), for iron at RAU#5 (0.55 mg/L), for selenium at RAU #1 (0.0026 mg/L) and RAU#5 (0.0019 mg/L), for silver at RAU #1 (0.00018 mg/L) and for zinc at RAU#5 (0.106 mg/KL) and RAU#8 (0.04 mg/L).

Station RAU #1

Station RAU #1 is located on a tributary to Kathleen Lakes / Rackla River. The tributary is one of the larger watersheds draining the claim area with a measured stream flow volume in July 2009 of 0.129 cms, decreased from June 2009 (0.747 cms). Stream flows are contained within a single channel with well defined banks and a rock and cobble channel base.
Total metals analysis at Station RAU #1 had no parameters exceeds the ***Drinking Water Quality Guidelines (DWQ)*.**
Concentrations of total selenium (0.0026 mg/L) and total silver (0.00018 mg/L) exceed the ***CCME Aquatic Guidelines***. .

Station RAU #2

Station RAU #2 is located on a tributary of the Rackla River that discharges directly into Kathleen Lakes. Measured stream flow volumes in July 2009 were 0.053 cms compared to 0.287 cms in June 2009, 0.430 cms in October and 0.234 cms in August 2008.

Total metals analysis results show concentrations of total iron 0.056 mg/L in July and 0.016 mg/L in June 2009 are decreased from 0.27 mg/L in October and 0.34 mg/L in August. Previously elevated levels of total manganese (0.077 mg/L in October 2008) have met the ***DWQ Guidelines MAC*** of 0.05 mg/L in both 2009 surveys..
Concentrations of all parameters meet the ***CCME – Aquatic Guidelines***.

Station RAU #3

Station RAU #3 is located on a tributary to the Beaver River. This tributary is the largest tributary to the Beaver River draining the claim area with a measured stream flow volume in July of 0.129 cms compared to 0.461 cms in June 2009, 0.690 cms in October and 0.493 cms in August. The station is located approximately 2 km upstream of stream confluence with the Beaver River. The stream channel is contained within a canyon, stream bed consists of boulders, rock and cobbles.

The exploration camp is located near the headwaters of this tributary as is Station RAU#6.
Total metals analysis results show concentrations of all parameters tested meet the ***DWQ Guideline MAC's*.**
Concentrations of total iron, total aluminum and total selenium continue to decrease from August and October 2008 and now meet the ***CCME – Aquatic Guidelines*.**

Station RAU #4

Station RAU #4 is located on a tributary to the Beaver River. This stream channel drains the mineral deposit area presently being diamond drilled. The drill water is obtained from this channel.

Measured flow volume in June (0.066 cms) and July (0.069 cms), 2009 are higher than those measured in August 2008 of 0.043 cms. The station was not accessed during the October 2008 survey.

July 2009 analysis results, as those from june 2009 and August 2008 show no metal parameters exceed the ***DWQ or CCME – Aquatic Guidelines.***

Station RAU #5

Station RAU #5 is located on a tributary to the Beaver River east of Station RAU #4. The station is located near the mouth, downstream of the break in slope.

Stream flow volumes were measured at 0.022 cms compared with 0.023 cms in June 2009, 0.038 cms in August 2008. No flow measurement was done in October 2008.
Concentrations of total iron (0.55 mg/L) exceed ***DWQ-Guideline MAC*** of 0.3 mg/L
Total metals analysis results concentrations of total iron (0.55 mg/L), total selenium (0.0019mg/L) and total zinc (0.106 mg/L) exceed the ***CCME – Aquatic Guidelines.***
Concentrations for iron and zinc have increased over June 2009, while selenium has decreased.

Station RAU #6

Station RAU #6 is located on the same tributary as Station RAU #3 and represents the camp drinking water supply.
Concentrations of all parameters measured meet all ***DWQ* and *Aquatic Guidelines***.

Station RAU #7

Station RAU #7 is located on a tributary to the Beaver River. The station is located approximately 1 kilometer upstream of the confluence with the Beaver River just upstream of the break in slope. The stream is single channel contained within stable banks. Stream bed materials are rock and cobble with limited silt deposition.
July stream flow volumes were measured at 0.017 cms compared to 0.039 cms in June 2009, 0.042 cms in October and 0.027 cms in August 2008.
Total metals analysis results for July 2009 show values for all parameters tested meet the ***DWQ and CCME Aquatic Guidelines*** as they did in June 2009, August and October 2008.

Station RAU #8

Station RAU #8 is located on a tributary to the Rackla River upstream of Kathleen Lakes. Due to topography and vegetation, the survey site is located near the stream mouth / confluence with the Rackla River. The stream is confined to a single channel at medium to low volumes but during higher flows may be multi channeled. Stream channel characteristics are grass/ moss covered near vertical bank slopes with heavy silt deposition in channel base.
Measured flow volumes in July were 0.087 cms compared to 0.374 cms in June 2009, 0.074 cms in August 2008. There was no flow volume measured in October, 2008.

Total metals analysis results show all parameters tested meet ***DWQ – Guideline MAC's*.**

Concentrations of total zinc (0.04 mg/L) continue to exceed the ***CCME – Aquatic Guideline*** value of 0.03 mg/L.

Station RAU #9

Station RAU #9 was established in July 2009 and is located on a Beaver River tributary upstream of Station RAU#4. The station is situated to obtain data closer to the mineralized zone. The site is located below the upper stream forks but above the drill water sump.
Stream flow volume was measured at 0.019 cms.
Total metals analysis results show all parameters tested meet the ***DWQ and CCME Aquatic Guidelines***.

Concentrations of total mercury were below the detection limit of 0.01 mg/L at all stations.

Summary

The July 2009 baseline survey was conducted during a decreasing flow stage in tributary streams and main stem rivers. Flow volumes were generally the lowest volumes measured during 2008 and 2009 surveys.

All stations were access during the July 2009 survey, with an additional station RAU #9 being established.

Routine chemistry, total metals and dissolved metals analysis indicate tributary streams draining the RAU claims have moderate to low concentrations for parameters tested.

July 2009 analysis results are consistent with those of August and October 2008 with minor variations in levels of total aluminum, iron and zinc most evident.

Concentrations of parameters that do exceed ***Drink Water Quality or CCME-Aquatic Guideline*** values are generally low level concentrations slightly elevated above ***Guideline*** levels.

An increase in total hardness values for most stations indicates an increase in anions as groundwater contributions increase as a proportion of total flow.

Laboratory Analytical Reports are attached in Appendix 1.

Flow volume discharge calculation sheets are attached in Appendix 2.

Data summaries for each station are contained in Appendix 3.

Further improvement to helicopter landing sites continues.

Station signs were installed at each landing site.

A flow volume measurement and river profile was done on the Beaver River upstream of Scougale Creek on July 31. Survey results were submitted under separate cover.

ATAC RESOURCES LTD

RAU CLAIMS

Baseline Water Quality Survey

October 2009

J.Gibson Env. Consulting ***Whitehorse, Yukon***

Atac Resources Ltd requested baseline water quality / hydrology surveys be conducted on the surface water tributaries draining the area of the RAU Claims north of Keno City, Yukon.

The RAU Claims are located near the confluence of the Beaver River and the Rackla River. Streams draining south of the claims are tributaries to the Beaver River with streams draining north and west of the claims being tributaries to the Rackla River. Immediately north of the claims are the Kathleen Lakes as part of the Rackla River drainage.
The confluence of the Beaver and Rackla Rivers is located to the south of the claims.

An active big game outfitter's camp is located on the Kathleen Lake system.

Water quality / hydrology survey done in October 2009 is the fifth survey, following surveys in August and October, 2008 and June and July, 2009.

Exploration activity on the RAU Claims in 2009 consists of a 15 person exploration camp with two diamond drills in operation. Operations had ceased before the October 28, 2009 survey.

The exploration camp and all survey sites were accessed by helicopter.

The exploration camp had been relocated from Station RAU #6 to a tributary to the west near Station RAU #9.

The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals with field measurements for pH, water temperature and flow volumes.

All 2009 surveys include the addition of Total Cyanide, Total Mercury and Total Organic Carbon at all stations with exception of RAU #6 (drinking water supply).

Sample Locations

Nine water quality sample sites were active in July, 2009 on tributary streams draining the RAU Claims (see attached locations map).

Station RAU #9 was established July, 2009 to obtain water quality data closer to the mineralized zone and active exploration drilling. The station is located upstream of Station RAU #4 but below the stream forks. An active drill water sump is located 15 meters downstream of the site.

With the exploration camp relocation from RAU #6 to near RAU #9 in September 2009, RAU #9 becomes the station monitored for drinking water quality. Station RAU #6 was not sampled in October, 2009 – for other than drinking water it is a duplication of RAU #3.

Station RAU #10 was established in October, 2009 on the Beaver River upstream of it's confluence with the Rackla River. This is a receiving water station downstream of the tributaries draining the south slope of the claim area.

Updated Sample station designations, coordinates and elevations are:

Station #	UTM Coordinates	Elevation (m)
RAU #1	E 529734 N 7125299	747
RAU #2	E 535018 N 7125488	750
RAU #3	E 529092 N 7116373	787
RAU #4	E 525316 N 7116594	659
RAU #5	E 520576 N 7119159	655
RAU #6	E 530817 N 7118701	no data
RAU #7	E 524405 N 7117800	702
RAU #8	E 523448 N 7125565	718
RAU #9	E 527261 N 7118550	792
RAU #10	Beaver River u/s confluence with Rackla River	
Beaver River Xing	E 514008 N 7121403	no data

UTM Zone 8 NAD83

An updated station site map is included.

Station coordinates and elevations are for helicopter landing sites. Due to the topography and thick vegetation it was often necessary to located / construct landing sites up to100 meters distance from sample sites.
Landing sites were re marked in July 2009 with numbered station signs visible from the air.

Sample Analysis Parameters

Stations RAU #1 through #9 were sampled for routine chemistry, total metals, dissolved metals, total cyanide, total mercury and total organic carbon.
Beaver River receiving waters station RAU #10 was sampled for routine chemistry, total and dissolved metals.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total mercury, total and dissolved metal samples were preserved with nitric acid immediately after sampling.

Total cyanide samples were preserved with sodium hydroxide, total organic carbon with hydrochloric immediately after sampling.

Quality control samples (Duplicates) for total metals and dissolved metals were taken at Station RAU #2 in October, 2009.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Bodycote T.G. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH were taken with an Oakton P35S multi parameter instrument. Water temperatures were taken with a digital thermometer.

Stream flow volumes were measured with a Price AA velocity meter and cross sectional area calculations.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Table 1. Routine Chemistry, Total Cyanide, Total Organic Carbon – laboratory analysis and field measurement results

Table 2. Total Metals ICP- MS and Total Mercury– laboratory analysis results

Table 3. Dissolved Metals ICP – MS laboratory analysis results

Table 4. Quality Control Samples – laboratory analysis results for Total and Dissolved Metals Duplicate Samples at Station RAU #2

DWQ* = Canadian Drinking Water Quality Guideline
MAC = Maximum Acceptable Concentration

Listed with the analysis data are the laboratory detection limits for each parameter.

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic ***Guidelines*** for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to CCME – ***Canadian Water Quality Guidelines.***

All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by EXOVA of Surrey B.C.

Laboratory Analytical Reports are attached in Appendix 1.

Quality Control

Quality control duplicate samples at Station RAU #2 are listed in Table 4 (total and dissolved metals). Variations in analysis results between duplicate samples of greater than 10% are highlighted.

Discussion

Hydrology

The October 2009 survey was done with tributary streams in a "maintenance" flow stage as a result of fall precipitation with increased volumes compared to flow measured in July 2009.

Flows in the Beaver and Rackla Rivers were also similar or slightly higher than measured in July 2009.

All tributary streams with exception of RAU#8 were under ice conditions. Ice conditions varied from minimal shore ice (RAU #4) to complete ice cover (RAU #2). Station RAU #1 had an ice shelf greater than 1 meter thick – possibly the result of downstream blockage / ice buildup and then thaw.

Measured flow volumes for 2008 and 2009 for each station are listed below.

Measured Stream Flow Volumes – RAU Claims 2008/09					
Station	**Flow Volume (cubic meters/second)**				
	Aug 2008	**Oct 2008**	**Jun 2009**	**Jul 2009**	**Oct2009**
RAU #1	**0.502**	**0.734**	**0.747**	**0.129**	**0.147**
RAU #2	**0.234**	**0.430**	**0.287**	**0.053**	**nr**
RAU #3	**0.493**	**0.690**	**0.461**	**0.129**	**0.192**
RAU #4	**0.043**	**nr**	**0.066**	**0.069**	**0.079**

Flow volume calculations are contained in Appendix 2.

Routine Chemistry

Field measurement and lab analysis results for routine chemistry are listed in Table 1.

Sampling and laboratory analysis for parameters total cyanide, total mercury and total organic carbon was begun in June 2009 addition to parameters from previous events.

Total cyanide and total organic carbon analysis results are listed with routine chemistry parameters in Table 1, total mercury analysis results with total metals in Table 2.

Analysis results for all stations for all parameters measured meet the ***Drinking Water Guideline's MA*C's.**

Analysis results for all parameters with the exception of Nitrite – N at all tributary stations RAU #1 - #5 and RAU #7 - #9 meet the ***CCME Guidelines*** for the Protection of Aquatic Life.

Nitrite – N values in October 2009 ranged from 0.12 mg/L to 0.23 mg/L against an ***Aquatic Guideline*** concentration of 0.06 mg/L. Station RAU #5 has Nitrite – N values above the ***Aquatic*** *Guideline* concentration for all five surveys.

The presence of Nitrite – N in the absence of any industrial pollutants may be the result of nitrification, oxidation of ammonia by bacteria. The pH values for all sites are near/ above the optimum oxidation pH of 8.0. The rate of nitrification would be inhibited by the low water temperature.
Nitrate – N was also detected at all stations with values ranging from 0.15 to 0.36 mg/L this survey. Nitrate levels show an increase in range over prior surveys.

Total Hardness as CaC03 values range from 196 – 326 mg/L, giving a continued hardness rating of "hard to very hard". The range of hardness values are consistent with previous results.

Total cyanide was measured at the detection limit (0.001 mg/L) at all stations this survey as they were in June 2009. The July 2009 survey had total cyanide below the detection limits at all stations.
Total cyanide levels are well below ***Drinking Water*** and ***Aquatic Guideline*** levels.

Total organic carbon values range from 0.8 to 2.1 mg/L. Levels are consistent with previous measurements.

Metals

The laboratory analytical report notes that some total metal results are less than dissolved metal concentrations but are verified and are within the expected measurement uncertainty.

Total metals analysis results are listed in Table 2, dissolved metals analysis results in Table 3.

Total metals concentrations do not exceed the ***Drinking Water Guidelines*** for any measured parameter.

Total metals concentrations exceeded ***Aquatic Guideline*** levels for selenium (0.001 mg/L) at RAU #1 (0.0039 mg/L), RAU #3 (0.0016 mg/L), RAU#5 (0.0032 mg/L), and RAU #8 (0.0014 mg/L).

Total metal concentrations exceed ***Aquatic Guideline*** levels for zinc (0.03 mg/L) at RAU#5 (0.077 mg/L) and RAU#8 (0.055 mg/L).

Beaver River receiving water station RAU #10 met all ***Drinking Water*** and ***Aquatic Guideline*** limits for all parameters measured.

Camp Drinking Water Supply

The exploration camp was relocated in late 2009 to the west fork above Station RAU #9. Water quality analysis results for Station RAU #9 along with ***Canadian Drinking Water Quality Guideline*** concentrations (maximum acceptable concentrations / MAC's) are listed in Table 5. Supply water meets all Guideline concentrations.

Summary

The October 2009 baseline survey was conducted at flow stage in tributary streams and the Beaver River slightly higher than those measured in July 2009. All sites with exception of RAU #8 were under ice conditions. The Beaver River downstream of Scougale Creek was under total ice cover (lower gradient), while upstream of Scougale creek was relatively ice free.

All stations were access during the October 2009 survey, with an addition of the Beaver River Receiving Water Station RAU #10 being established.

Routine chemistry, total metals and dissolved metals analysis indicate tributary streams draining the RAU claims continue to have moderate to low concentrations for parameters tested.

The October 2009 analysis results are consistent with those of prior survey with minor variations in levels of nitrite, total selenium and zinc most evident.

Concentrations of parameters that do exceed ***Drink Water Quality or CCME-Aquatic Guideline*** values are generally low level concentrations slightly elevated above ***Guideline*** levels.

Laboratory Analytical Reports are attached in Appendix 1.

Flow volume discharge calculation sheets are attached in Appendix 2.

Data summaries for each station are contained in Appendix 3. With a fifth survey completed parameter maximum, minimum and mean concentrations are now included.

Site photographs are included in Appendix 3.

- Samples 1,2,4, and 5-10 were analyzed for Ammonia after holding time had expired.
- Some total metal results were less than dissolved metal results for lot 710945. The results were verified and are within expected measurement uncertainty.

Please direct any inquiries regarding this report to our Client Services group.
Results relate only to samples as submitted.
The test report shall not be reproduced except in full, without the written approval of the laboratory.

Re: Atac Resources Ltd. – Rau Access Route Late Winter Wildlife Survey

Bill,

The results of the winter wildlife survey along the proposed Rau property access road corridor is presented below. The survey was carried out by Grant Lortie and myself on March 4, 2010.

Low winter flow discharge measurements were carried out using the salt dilution technique at four stream crossings along the proposed road. These include Faro Creek, Scougale Creek, Cameron Creek and the Beaver River. Other stream crossings were either frozen solid or glaciated, making the flows immeasurable, the exception being the Keno Ladue River which was open but with a velocity so minute that it was not measurable.

These flow measurements are included in a separate attachment. Also attached are track log of the wildlife survey and a map showing the boundaries of the Rankin Creek burn where most of the moose were observed.

Atac Resources Ltd. - Rau Access Route
Late Winter Wildlife Survey- 4 March 2010

Helicopter: Bell 206 | Pilot: Ben Drury

Observer: S. Withers | Observer Navigator: G. Lortie

Observation Conditions: Good - Excellent | Total Airtime: 6 Hrs. 10 mins.

Introduction:

The proposed Rau Access Route lies wholly within the Yukon Plateau North Ecoregion. A general descriptive overview of the bio-physical properties is found in reference (1), Ecoregions of the Yukon Territory (2006). More detailed biophysical information can be found in reference (2), Heart of the Yukon: A Natural and Cultural History of the Mayo Mining District.

No empirical government generated wildlife information is available along the proposed access (M. O'Donahue, Pers. Comm.), and no wildlife key areas were identified proximate to the route (M. Waterreus, pers. comm.)

Water quality and sampling work was conducted at five stations concurrent with the wildlife work.

Results:

Moose:

Moose were clearly the most conspicuous and abundant large mammal observed. The entire route, particularly that section between Gambler Lake and Lower Rankin Cr. was obviously an important wintering area. Recent helicopter and ground activity associated with route staking precluded our finding some moose along the route, but recent tracks, trails and visual observations confirm this assessment. Moose were especially evident on the lower slopes of the Davidson Range in the 1972 Burn (appendix 2)

Summary of Observed Moose:

Waypoint	Adult Female	Calf	Adult Male
011	7		
012			1
013			1
014	1		1
015			2
016	1		
021			2
025	1	1	
	10	1	7

In addition, an estimated further 15-20 moose of undetermined composition were not located from Waypoint 001-010 inclusive.

Results:

Moose (continued):

In general terms, population status can be surmised from repeated survey work on adjacent areas which indicates a stable, healthy moose population regionally that in recent years has reached maximum harvest levels (M. O'Donahue, Pers Comm.) However, the specifics of seasonal range use and timing of these events are not fully understood. For example, the known important rut; post rut aggregating areas in the subalpine zones on Keno Hill, Sourdough Hill and Bunker Hill suggest that similar habitats in the Davidson and Patterson Ranges immediately adjacent the route be investigated. Further, a determination of calving areas near the route be conducted. (See recommendations)

Woodland Caribou:

Caribou are presently not found in the immediate study area. (Ref. 2)

Cosewic Status: special concern

Mountain Sheep:

Formerly present on Keno Hill but hunted to extinction in the early 20th C. (Ref. 2)

Grizzly Bear:

Common in the region (Ref. 2)

Cosewic Status: special concern

Results:

Black Bear:

Common in the area (Ref. 2)

Fur Bearers:

Remaining large mammals, all carnivores are generally considered Fur Bearers: wolves, coyotes, foxes, marten, mink, lynx, wolverine and river otter are, to varying degrees, economically important to the registered trapline concessions and all are indigenous to the area. (Ref. 2)

Beaver and muskrat are also economically important and common in aquatic habitats in the region.

The presence of wolves are noted at Waypoint.

007 - tracks of 4-5 animals

017 - old kill site

019 - abundant older tracking of 8-10 wolves

Further at Waypoint 022 near open water, track of river otter

Trapping concessions: See recommendations

Outfitter concessions:

- Rouge River Outfitters have a voluntary No-Hunt agreement with the Mayo Regional Resources Council.

Birds:

A thorough and comprehensive narrative by O'Donahue (Ref.2) appends this report.

Three species of birds are cosewic listed. (T. Jung, pers. comm.)

- Common Nighthawk - threatened
- Rusty Blackbird - special concern
- Olive-sided Flycatcher - special concern

Water Stations: (photos)

Waypoint 020: Beaver River
023: Scougale Creek
024: Cameron Creek
026: Keno-Ladue River
027: Faro Gulch

Recommendations:

1. An appraisal of Moose Calving and use of the route by waterfowl and aquatic Fur Bearers should be conducted sometime during a 20 May - 10 June Window.
2. Early winter (November) examination of the route and immediately adjacent uplands in the Davidson and Patterson Ranges to confirm rut and post rut activities (Moose).
3. In Mayo, conduct an interview-mapping exercise regarding the trap line concessions with the Dept. of Environment, YTG.

ACKNOWLEDGEMENTS

Matrix Research Ltd. would like to thank all of the people from the various organizations who contributed to the project. The project proponent was Bill Wengzynowski of Archer, Cathro & Associates (1981) Limited, on behalf of ATAC Resources Ltd. Bill supplied information and mapping for the study area.

Joella Hogan, Manager of Heritage and Culture, First Nation of Na Cho Nyak Dun assisted the project by researching traditional use and known heritage values.

Ruth Gotthardt at the Cultural Services Branch, Department of Tourism and Culture, Government of Yukon, discussed the proposed development with us and provided information on past heritage resources work in the study area. We thank her for her input and comments.

The opinions, recommendations, omissions, and / or errors in this report are those of Matrix Research Ltd. alone and do not necessarily reflect the positions held by the Proponent, the First Nation of Na Cho Nyak Dun, or Government of Yukon.

MANAGEMENT SUMMARY

This report details the results of a Heritage Resources Overview Assessment (HROA) for the Rau Property Proposed Road Route.

The HROA was anticipated to be required as part of the Yukon Environmental and Socio-economic Assessment Board (YESAB) proposed development review process. The objective of this heritage study was to determine the precontact heritage potential within the proposed road route area. Based on the HROA findings, numerous areas associated with hydrological features or significant topographical features have been classified as moderate to high heritage potential. It is recommended that further heritage resources investigations be conducted within the areas classified as moderate or high heritage potential. Given the long mining history of the area, it is anticipated that post-contact heritage resources will also be encountered within the proposed road route.

Heritage resources are protected from non-permitted alterations or disturbance by the *Historic Resources Act* (Government of Yukon 2002) and the *Archaeological Sites Regulations* (Government of Yukon 2003). To ensure that the discovery of any unanticipated heritage resources is addressed, it is recommended that the Proponent inform their personnel and contractors that, in the event that heritage resources are encountered, all development activities in the vicinity of the heritage resources must be suspended immediately. In such cases the Cultural Services Branch, Department of Tourism and Culture, Government of Yukon must be contacted immediately with information on the heritage remains and the nature of the disturbance. Information on the identification of heritage resources can be found in a publication entitled *Handbook for the Identification of Heritage Sites and Features* (Gotthardt and Thomas 2005).

This study was designed as a heritage resources overview assessment and was not intended to evaluate or comment on Traditional Aboriginal use of the areas in which development is proposed. The results of this study, therefore, should not be considered valid for that purpose.

1.0 INTRODUCTION

This report details the results of a Heritage Resources Overview Assessment (HROA) for the proposed Rau Property Proposed Road Route. This study was conducted at the request of Archer, Cathro & Associates (1981) Limited on behalf of ATAC Resources Ltd.

ATAC Resources Ltd. is conducting mineral exploration within their Rau Property. To support these activities they are proposing a pioneer road route for fall and winter access to the property, with possible potential for upgrade to an all-season road should the need arise. The majority of the proposed route is located on ATAC Resources Ltd. quartz claims. The route begins at Hanson Lake Road, north of Keno, and follows the Keno-Ladue, Rankin Creek, and Scougale Lakes valleys to its terminus at the Beaver River.

The HROA was anticipated to be required as part of the Yukon Environmental and Socio-economic Assessment Board (YESAB) proposed development review process. The objective of this heritage study was to determine the heritage potential within the proposed road route.

1.1 Report Format and Distribution

This report is divided into seven sections and one appendix.

Section 1: Introduction

This section introduces the HROA, the relevant legislative references and definitions and a summary of contacts made with First Nations.

Section 2: Project Description

This section discusses the intent of the heritage assessment in relation to the proposed development.

Section 3: Project Area

This section describes the location of the HROA study area and contains a map showing its geographical setting. A brief overview of previous archaeology within the area is also presented.

Section 4: Methodology

This section discusses the methods used while conducting the heritage assessment.

Section 5: Results

This section summarizes the results of the HROA.

Section 6: Recommendations

This section provides recommendations for the management of heritage resources potential identified during the HROA.

Section 7: References Cited

This section lists bibliographic information for all references cited in this report.

Appendices

Included with this report is one appendix containing a glossary of archaeological terms.

1.2 Legislative References

Legislation that ensures the management and protection of archaeological and historical resources is found in the *Historic Resources Act* (Government of Yukon 2002) and *Archaeological Sites Regulations* (Government of Yukon 2003). This legislation applies to archaeological and historical sites older than 45 years whether they are located on public or private land.

1.3 First Nations Referral and Correspondence

The area assessed during this study is located within the First Nation of Na Cho Nyak Dun (FNNND) Traditional Territory. Matrix Research Ltd. contacted FNNND to initiate discussion concerning the heritage resources overview assessment and to obtain any existing traditional land use information or oral history pertinent to the study area. Joella Hogan, Manager of Heritage and Culture for FNNND researched and provided information on traditional use and known heritage values within the proposed development area.

2.0 PROJECT DESCRIPTION

The aim of a Heritage Resources Overview Assessment (HROA) is to assess the potential for heritage resources (such as archaeological or historic sites) within a proposed development area and to make recommendations concerning the need and scope for further heritage studies.

The Rau Property Proposed Pioneer Road Route is currently in the planning stage. The development consists of the proposed road route and surrounding claim corridor. This proposed road is to consist of a pioneer access road for fall and winter use, connecting the existing Hanson Lake Road to the Rau Property.

3.0 PROPOSED DEVELOPMENT AREA

3.1 Natural Setting

The proposed development area is located within the Yukon Plateau-North ecoregion of the Yukon, approximately 118 km northeast of Stewart Crossing and approximately 62 km northeast of the community of Mayo. The proposed road route is situated in the valley between the Davidson Range and Patterson Range approximately 4.0 km southwest of McQuesten Lakes.

The ecoregion is characterized by a series of plateaus and valleys located northeast of the Tintina Trench. Forest cover is comprised mainly of lodgepole pine and black and white spruce up to elevations of 1500 m. At higher elevations shrub birch, scattered pine, white spruce and subalpine fir form the forest cover with lichen understory. Vegetation turns to shrub and lichen tundra with increasing elevation. Temperatures in the ecoregion are the most extreme of the Yukon ranging from -62^{o}C to +36^{o}C in the valley areas, with higher terrain experiencing less extreme ranges in temperature. Annual average precipitation of the ecoregion is ~ 300 mm with areas in the east receiving upwards of 600 mm of precipitation (Smith *et al.*, 2004).

Permafrost is present in most of the ecoregion for 90% of the year with areas on southern slopes experiencing thaw during the summer months. The ecoregion was covered by the McConnell glaciations with some evidence for the presence of Reid and pre-Reid glaciations found above and beyond the western limit of the McConnell glaciations. Deglaciation occurred approximately 10,000 years ago, leaving extensive areas of kettle kame topography and glacial lakes in the many valleys of the region (Smith *et al.*, 2004).

Sediments in the higher elevations consist of thin blankets of weathered bedrock, with till found at middle to low elevations. On the valley floors glaciofluvial sand and gravel with glaciolacustrine deposits found in the west. The glaciofluvial sand and gravel have variable thickness and composition however they are usually stable surfaces. The glaciolacustrine sediments can be upwards of 18 m thick in areas such as the Keno-Ladue River valley and the Stewart River valley (Smith *et al.*, 2004).

3.2 Post-contact History

The ecoregion contains considerable potential for metallic mineral deposits and has had many mines throughout the region with more in the planning stages. Due to the high quality mineral deposits many non-aboriginals were drawn to the area. In the 1890s the first prospectors panned the McQuesten and Stewart Rivers, eventually moving northeast to the Sheep Mountain (later called Keno Hill) area. It was here in 1918 that Louis Bouvette found silver rich galena in loose rocks and staked a claim called

Roulette. Within a few years most of the Keno Hill area had been staked with claims and a town was established at Keno City. These claims were worked on and off until 1989 when the mine closed and the communities of Keno City and nearby Elsa all but disappeared. Remnants of the mining industry can still be seen on the landscape today with old roads, trails, tramways and buildings dotting the old mine area (Yukon Development Corporation 2004).

A portion of the Wind River Trail is located inside the northern extent of the Rau Property Proposed Road Route. The Wind River Trail, also known as the Amerada Road and Proctor's Trail was constructed in 1959 for the Amerada Petroleum Corporation as only 30 miles of the Dempster Highway had been completed at that time. The Wind River Trail initially consisted of a winter road of packed snow wide enough to haul oil well drilling equipment and supplies to their camps on Eagle Plains. The road was later upgraded to a summer use road as far as McQuesten Lakes (Yukon Heritage 2009).

3.3 Ethnography and Traditional Use

The area surrounding the proposed Rau Property Proposed Road Route is within the traditional territory of the First Nation of Na Cho Nyak Dun (FNNND), who are Northern Tutchone. The following brief review of Northern Tutchone ethnography is taken from McClellan (1981) and Thomas (2003). Emphasis has been placed on material culture, seasonal round and subsistence strategies as they relate to activities that are most likely to have left physical evidence of past human use.

The Northern Tutchone are members of the Athapaskan language family and are organized into two moieties, the Crow and the Wolf, with matrilineal inheritance. These moieties determined who people could marry and where they could fish or hunt as they were forbidden to marry people from within the same moiety. The primary political unit was the regional group made up of five to ten nuclear families sharing a common chief (*dän co*) however this group may not have lived together for the entire year (Thomas 2003). The Northern Tutchone seasonal subsistence round involved the summer aggregation of the group at selected fishing camps chosen for the availability of migrating salmon. Settlement near these locations involved several families who used the same fishing location each year. Berry gathering and preservation was also carried out at this time of year. A variety of berries and roots were available and constituted an important food source. By late summer there was a dispersal of the group into the upland region as food stores required additions or replenishment. Game was now sought to be dried for winter caches. Caribou, moose, mountain goat and sheep and bear were among the large game animals taken with hare and beaver also trapped / hunted for their fur and food. In December and January the people usually regrouped to share stored foods but once again dispersed by late winter to find game. Food storage was accomplished through the use of storage caches near the main dwellings. The food was generally dried or smoked on drying racks (McClellan 1981).

The Northern Tutchone built conical or rectangular lean-tos with a tied pole framework, brush walls, and roofs of moss, bark or skin. These structures would often house several families sharing a central fireplace. Near the main dwellings meat and fish drying racks would be erected, racks for boat frames and toboggans, frames for skin tanning and smoking, as well as small huts for menstruants and parturients nearby. No excavation was required for a main foundation and evidence of postholes and central hearths are the primary features most likely to be found archaeologically for such structures. During the winter when groups dispersed, domed winter tents of caribou or moose hide were stretched over frameworks of saplings.

A wide variety of implements were used for hunting, fishing, and plant food gathering. Stone tools (projectile points, knives, scrapers, and flaking debris) are implements commonly recovered in archaeological contexts. In some cases these hunting / fishing implements were made from antler, bone and native copper which are sometimes recovered on archaeological sites depending on preservation conditions. During ethnographic and historic times, many kinds of traps, snares, corrals and hunting blinds were used and still can be seen on the landscape today. Box and funnel traps were used in conjunction with weirs were used to catch salmon, trout, pike and large whitefish. Dip nets, gill nets, leisters, hooks, gaffs, spears and lines were also used to catch fish (McClellan, 1981).

Oral history from the Germaine family indicates that they trapped and hunted in the area surrounding Keno Hill and McQuesten Lakes for generations as the valley is rich in moose, beaver, martin and lynx. They also stated that the McQuesten Lakes have lingcod, whitefish, pike and inconnu and that the family set nets in the narrows of an emptying creek. The area was also a good source of blueberries in the summer. Later, after the prospectors started to settle, the Germaines provided fish and wild game to the mining camps (Yukon Development Corporation 2004).

Oral tradition also recounts that Fort Selkirk Indians traditionally travelled the Stewart River country to trap and hunt. Mayo Elder Sam Peter stated that from Fort Selkirk, they travelled up the McQuesten River (Et'O Nyak) to the Beaver River (Mayo Historical Society 1990).

Currently, members of the First Nation Na Cho Nyak Dun, have cabins in and around McQuesten Lakes and Clark Lakes. The region is known for good hunting and fishing (Joella Hogan, pers. comm.).

3.4 Previous Heritage Work

No information could be found for previous archaeological or heritage survey work that has been undertaken in the proposed development area.

One archaeological site, **LaTw-1**, located at the south end of McQuesten Lakes, consisting of lithic artifacts, debitage, bone and charcoal was incidentally identified and recorded in 1957 by MacNeish (57-2ASR). No further work has been completed at this site.

4.0 METHODOLOGY

The following section describes the methods used for the Heritage Resources Overview Assessment (HROA). The background information summarized in Section 3.0 was considered along with review of airphotographs and satellite imagery to produce a preliminary assessment of heritage resources potential in the study area. The results of the HROA are presented in Section 5.0.

4.1 Heritage Resources Overview Assessment

All available maps, digital elevation models, satellite imagery, airphotographs, ethnographies, histories, and archaeological reports for the study area were examined. Criteria used to determine potential for heritage resources included: proximity to streams and water bodies, known heritage sites, known aboriginal or historic trails, topography, vegetation cover, and presence of fish and wildlife habitat.

4.2 Limitations of the HROA

Given that there is only one previously recorded site within close proximity to the study area the criteria used to determine heritage resources potential during this study was primarily derived from previous experience in comparable areas throughout the Yukon. The lack of detailed information on environmental and geomorphological changes throughout the glacial and post-glacial periods, ethnographic data, the very few heritage studies conducted in this area, and the low number of known sites within the immediate study area, significantly limits our current understanding of past settlement patterns and land use of the area.

When viewing the HROA results it is important to note that low potential does not mean **no** potential. It is possible for heritage sites to be located outside of areas identified as having moderate or high heritage resources potential. To ensure that the discovery of any unanticipated heritage resources is addressed, it is recommended that the Proponent inform their personnel and contractors that, in the event that heritage resources are encountered, all development activities in the vicinity of the heritage resources must be suspended immediately. In such cases the Cultural Services Branch, Department of Tourism and Culture, Government of Yukon must be contacted immediately with information on the heritage remains and the nature of the disturbance.

5.0 RESULTS

5.1 HROA Results

The land base in the study area has been classified into zones of heritage potential. Heritage potential is rated as high, moderate, or low. It is important to note that low potential does not mean no potential and it is possible for heritage resources to be encountered anywhere in the study area. Zones of heritage potential are portrayed as polygons on the enclosed map (Map 3). GIS shapefiles are also provided so that these HROA polygons can be overlaid onto development planning maps.

The proposed pioneer road route is contained within the valley between the Davidson and Patterson Ranges providing a natural overland thoroughfare between McQuesten Lakes and Beaver River. Numerous unnamed drainages, small creeks, rivers and lakes are located within the Rau Property Proposed Road Route and claim corridor. Many of these small tributaries feed major creeks and rivers such as Rankin Creek, Keno Ladue River and Beaver River. These smaller tributaries and associated landforms have been given a rating of moderate heritage resource potential and have been buffered by a minimum of 50 m on either side of the drainage.

Larger waterways such as Keno Ladue River, Rankin Creek and Beaver River and their associated landforms have been buffered by a minimum 100 m and have been given a rating of high heritage resource potential due to their possible past use as fishing, hunting and trapping areas. In addition the area surrounding Clark Lakes and their associated wetlands, as well as large wetlands throughout the proposed development route have been highlighted as areas of high heritage potential due to the potential past use of these areas for hunting and trapping.

All other areas highlighted are of moderate heritage resource potential due to topographical features such as terraces, knolls and ridges associated with significant water features such as streams, wetlands and small lakes all of which are tributary to the main water systems: Rankin Creek, Beaver River, Keno Ladue River and the McQueston Lakes and wetlands. These areas are considered to have moderate precontact heritage resources potential as they are on well drained topographic features or are in upland areas on prominent landforms that provide good vantage points or strategic hunting positions.

6.0 HERITAGE RESOURCE MANAGEMENT RECOMMENDATIONS

This section provides recommendations, including a discussion of gaps in heritage data, a prediction of the type and number of sites expected, and a discussion of the options for managing heritage sites during development planning.

6.1 Gaps in the Heritage Resources Record of the Study Area

No systematic archaeological survey has been undertaken in and around the proposed road route. The lone previously identified archaeological site, **LaTw-1**, located at the southern end of the McQuesten Lakes in 1957 was incidentally discovered and has not been revisited. Consequently, regional site density and distribution is relatively unknown. Likewise, post-contact heritage resources have not been surveyed or documented in the study area.

6.2 Heritage Resource Potential and Resource Values

A significant portion of the study area is considered to have precontact heritage resources potential. Areas considered to have high to moderate precontact heritage resources potential are typically near hydrological features on distinct, well-drained topographic features or are in upland areas on prominent landforms that provide good vantage points or strategic hunting positions. Generally, moderate and high potential areas are more frequent along major water features, such as wetlands, creeks and rivers in the bottom of the valley. This is because the valley would have provided an easier route of travel through the mountain ranges and provided access to game and fish associated with numerous hydrological features along the valley floor. From the archaeological record, it is inferred that larger, more permanent sites will be positioned adjacent to the major hydrological features (i.e., McQuesten Lakes, Beaver River and Keno Ladue River).

It is expected that most precontact heritage sites in the proposed road route area will consist of small, short-term camps related to hunting, trapping, or travel activities. Sites resulting from these activities are normally manifested as small lithic scatters; however, local environmental and geological conditions such as frozen sediments may support the preservation of some organic materials. The remains of structures are not expected to be readily visible in this area given the short-term settlement occupation, but there may be evidence of cultural depressions.

In addition, it is expected that post-contact mining sites will be located within the proposed development area due to the numerous mines and mining related activity throughout the area since the 1890s. These sites may consist of tramways, buildings, roads and trails as well as mine sites and mining equipment.

6.3 Heritage Resource Management Options

Numerous areas within the Rau Property Proposed Road Route are assessed as having moderate to high heritage potential. A Heritage Resources Impact Assessment (HRIA) is recommended for these areas prior to any potentially ground-altering development activities. A HRIA offers the opportunity to ground-truth the heritage resources potential and can negate or confirm the presence of heritage resources. In the event that heritage resources are discovered in the development area, management options can be provided.

6.4 Recommendations

The areas identified as having moderate and high heritage resources potential are shown on Map 3 (Section 5).

It is recommended that a HRIA be carried out within the areas considered to have moderate and high heritage resources potential prior to the proponent undertaking any potentially land-altering development activities.

This study was designed solely as a Heritage Resources Overview Assessment and was not intended to evaluate or comment on Traditional Aboriginal use of the areas in which the development is proposed. The results of this study, therefore, should not be considered valid for that purpose.

APPENDIX A

Glossary of Archaeological Terms

ABORIGINAL; INDIGENOUS: Pertaining to the original occupants of a given region.

A-HORIZON: the uppermost, often dark-coloured natural level in a soil profile characterized by roots, humus, and a lack of clay, iron, carbonates and soluble salts which have leached to lower levels.

ARCHAEOLOGY: The science concerned with the recovery, analysis, description and explanation of the remains of past human cultures.

ARCHAEOLOGICAL SURVEY OR SITE INVENTORY: Examination of a locality for evidence of past human activity and the recording of that evidence to produce an inventory of sites in that locality.

ARTIFACT: Any manually portable product of human workmanship. In its broadest sense includes tools, weapons, ceremonial items, art objects, all industrial waste, and all floral and faunal remains modified by human activity. In the Yukon, an artifact is an object that is older than 45 years and has been abandoned.

BARK-STRIPPED TREE: A tree which has had bark removed by First Nations people for a number of possible purposes (i.e. fibre, food, medicine)

BASALT: A fine-grained volcanic rock used for the manufacture of chipped stone artifacts. Colour ranges from black to grey; texture granular to glass like.

B-HORIZON: That natural level within a soil profile which directly underlies the surficial A-horizon and which contains the clay, iron oxides and carbonates which have leached down from it.

BIFACE: A stone artifact flaked on both sides.

BORDEN NUMBER: A standardized number consisting of four letters and one number assigned to each archaeological site which identifies it and denotes its general location in Canada.

BORDEN SYSTEM: A code of 4 letters and a number used to designate archaeological sites in Canada (e.g. GtRx 7; FlJr 10 etc.). Proposed by Charles E. Borden, University of British Columbia, in 1954. The alphabetic prefix refers a block of l0 minutes by l0 minutes within a grid system which covers all of Canada south of 62 N latitude. The numerical suffix indicates the site within this block in numerical order of registration.

CACHE: A deliberate store of equipment, food, furs or other resources placed in, or on the ground (perhaps protected by a rock CAIRN), or raised above the ground on a platform.

CACHEPIT: Small circular depressions (less than 3 m) that were used to store food.

CHALCEDONY: A semi-translucent silicate (quartz) rock with a wax-like luster and a great range of colours, used as raw material for the manufacture of chipped stone artifacts. Commonly called agate.

CHERT: A mainly opaque, fairly granular, silicate rock with a dull shiny luster and a great range of colours, used as raw material for the manufacture of chipped stone artifacts. Varieties include jasper and flint.

CONCHOIDAL FLAKE: A type of spall resulting from the fracture of fine-grained, or glassy rocks. Characterized by a bulb of percussion, striking platform remnant, and extremely sharp edges. A predictable fracture pattern that allows the manufacture of predetermined tools from these materials.

CONTACT: The time of first prolonged direct contact between First Nations peoples and Europeans. The term is synonymous with the Historic period which is characterized by contemporary written works.

CONTEXT: The spatial relationships of archaeological items and samples within a site. "Primary Context" refers to materials found in their original position; "Secondary Context" refers to materials which have been displaced and redeposited by disturbance factors; "Geological Context" is the relationship of the archaeological finds to geological strata.

CONCENTRATION: A notable accumulation of archaeological materials in a small area, such as a "concentration of flakes" etc.

CORE: (1) A blocky nucleus of stone from which flakes or blades have been removed (see MICROBLADE CORE). (2) A column or lineal sample of materials obtained by "coring" the ground, trees, etc.

CORTEX: The naturally weathered outer surface of a pebble.

CULTURE: The distinctive lifeway – including language, technology, sustenance, social organization, customs, beliefs and rituals – practiced by a people. This term can also be used to refer to the culture of particular groups of people at a particular point in time. In and archaeological context, the term culture refers to materials or objects of human origin, in contract to natural.

CULTURAL DEPOSIT: Sediments and materials laid down by, or heavily modified by, human activity.

CULTURAL DEPRESSION: A pit excavated by people into natural sediments. Pits have been excavated for a variety of reasons including: houses (pithouses, house pit), food storage (cache, cache pit), food cooking (roasting pit, berry trenches, hearth) and burials.

CULTURALLY MODIFIED TREE (CMT): A tree that had been intentionally altered in some way. CMTs usually consists of bark-stripped trees, that is, trees that have had the bark to access the cambium for eating, for extracting tree sap, for manufacture, or for medicinal purposes, by First Nations people. Blazed trees may also be referred to as CMTs.

CULTURE SEQUENCE: The chronological succession of cultural traits, phases or traditions in a local area.

CULTURE TYPE: A chronologically limited cultural unit within a local culture sequence, characterized by sufficient descriptive traits to set it apart from all other units. A phase is generally represented by 2 or more components in several sites and is the basic classification of archaeological "cultures".

DACITE: Volcanic rock (or lava) that characteristically is light in color and contains 62% to 69% silica and moderate a mounts of sodium and potassium.

DATUM: A fixed reference point on an archaeological site from which measurements are taken.

DEBITAGE: Waste by-products from tool manufacture.

DETRITUS: Waste by-products from tool manufacture. Most frequently applied to chips and fragments resulting from stone flaking.

DISTURBANCE: A cultural deposit is said to be disturbed when the original sequence of deposition has been altered or upset by post-depositional factors. Agents of disturbance include

natural forces such as stream or wind erosion, plant or animal activity, land-slides etc.; and cultural forces such as later excavations.

ETHNOGRAPHIC ANALOGY: Interpretation of archaeological remains by comparison to historical cultures.

ETHNOGRAPHY: That aspect of cultural anthropology concerned with the descriptive documentation of living cultures.

ETHNO-HISTORY: The study of ethnographic cultures through historical records.

ETHNOLOGY: The aspect of cultural anthropology concerned with the comparative and processional analysis of ethnographic cultures.

FAUNAL REMAINS: Bones and other animal parts found in archaeological sites. Important in the reconstruction of past ecosystems and cultural subsistence patterns (see: MICROFAUNAL REMAINS).

FEATURE: A non-portable product of human workmanship. Usually clusters of associated objects; pit houses, structures, hearths, cache pits, mining activities, cooking ovens, etc.

FLAKE: A fragment removed from a core or nucleus of cryptocrystaline or fine-grained rock by percussion or pressure. May be used as a tool with no further deliberate modification, may be RETOUCHED, or may serve as a PREFORM for further reduction.

FLINT: A microcrystaline silicate rock similar to CHERT, used for the manufacture of flaked stone tools. Colour most commonly grey, honey-brown, or black.

GROUND STONE: Stone artifacts shaped by sawing, grinding, and/or polishing with abrasive materials (e.g. "ground slate knives", "polished soapstone pendants" etc.).

HEARTH: A fireplace, often circular and may be unlined, rock or clay-lined, or rock-filled. Minimally consists of fire-altered rock and charcoal.

HERITAGE RESOURCES IMPACT ASSESSMENT (HRIA): A study undertaken for a proposed development project to determine whether it will adversely affect historical, archaeological, or paleontological remains, generally indicated by the presence of shovel tests.

HERITAGE SITE: A location of archaeological or historical interest that contains evidence of past human activities. Heritage sites may consist of artifacts or features.

HISTORIC ARCHAEOLOGY: The archaeological investigation of POST-CONTACT sites.

HISTORIC PERIOD: The time after European contact or the beginning of written recording. In the Yukon, this period dates to the past 100 to 150 years.

HORIZON: Layers typical of the soil profile in a particular region.

HOUSE-PIT: An aboriginally excavated house floor. See PITHOUSE.

IN SITU: Archaeological items are said to be "in situ" when they are found in the location where they were last deposited.

LITHIC: Of/or pertaining to stone. A lithic artifact is one manufactured from stone.

LITHIC INDUSTRY: That part of an archaeological artifact assemblage manufactured of stone.

LITHIC SCATTER: An archaeological site consisting of two or more stone artifacts.

LITHIC TECHNOLOGY: The process of manufacturing tools etc., from stone. Most frequently refers to stone flaking.

LOCALITY: A very large site or site-area composed of 2 or more concentrations or clusterings of cultural remains.

MATRIX: An inclusive term for the natural and cultural sediments of an archaeological site.

MICROFAUNAL REMAINS: Very small animal remains, such as rodent bones, tiny bone fragments, insects, small molluscs, etc., discovered in an archaeological site.

MIDDEN: A deposit of camp refuse associated with human occupational sites. Most frequently refers to coastal SHELL-MIDDENS.

MUNSELL COLOUR CODE: A system of describing colours by a code of letters and numbers defining "hue", "value" and "chroma". Important in accurately describing the colours of archaeological soils and sediments.

OBSIDIAN: Natural volcanic glass. Colour ranges from nearly translucent through black, red and green. The most easily flaked raw material for the manufacture of flaked stone tools.

PALEOSOL: "Old Soil." Buried soil horizons indicative of past soil conditions different from that presently prevailing.

PETROGLYPH: Pictures, symbols, or other artwork pecked, carved or incised on natural rock surfaces.

PICTOGRAPH: Aboriginally painted designs on natural rock surfaces. Red ochre is the most frequently used pigment and natural or abstract designs may be represented.

PITHOUSE: A semi-subterranean "earth-lodge" winter dwelling. Usually consisted of an earth-covered log framework roof over a circular to rectangular excavation. The archaeological feature is called a housepit.

POST-CONTACT PERIOD (Also "Historic Period"): Refers to the period following the first arrival of Europeans.

POT-HUNTER: An "amateur archaeologist" who vandalizes and destroys sites to add to his private collection, or for monetary gain.

PRE-CONTACT: Refers to the period before the first arrival of Europeans in a given area.

PREHISTORIC: The period prior to written records for any given area. In North America synonymous with PRE-CONTACT.

PRELIMINARY FIELD RECONNAISSANCE (PFR): A study undertaken for a proposed development project to determine whether it will adversely affect heritage remains, generally indicated by the lack of need for shovel tests.

PROJECTILE POINT: An inclusive term for arrow, spear or dart-points. Characterized by a symmetrical point, a relatively thin cross-section and some element to allow attachment to the projectile shaft. Flaked stone projectile points are usually classified by their outline form: triangular, leaf-shaped, lanceolate, stemmed, corner-notched, and side-notched.

PROVENIENCE: The horizontal and/or vertical position of an object in relation to a set of spatial co-ordinates.

QUARTZ CRYSTAL: Pure silicate rock-crystal. Usually perfectly clear with six crystal surfaces. May be used as a raw material for lithic tool manufacture.

RETOUCH: The removal of small secondary flakes along the edge of a lithic artifact to improve or alter the cutting properties of that edge. Retouch flaking may be BIFACIAL or UNIFACIAL.

RETOUCHED FLAKE: A stone flake which has had one or more edges modified by the deliberate removal of secondary chips.

ROCK-SHELTER: A shallow cave or rock overhang large enough to have allowed human occupancy at some time.

SCRAPER: A tool presumably used in scraping, scouring, or planing functions. Most frequently refers to flaked stone artifacts with one or more steep UNIFACIALLY RETOUCHED edge(s).

SETTLEMENT PATTERN: The spatial distribution of cultural activities across a landscape at a given moment in time.

SHOVEL-SCREENING: A rapid excavation procedure in which the site matrix is shoveled directly through a screen (usually 1/4" mesh).

SHOVEL TEST: a small scale, generally informal test excavation to ascertain the nature of the deposits, to determine the presence or absence of a heritage site, or to delimit the boundaries of a known site.

SITE: Any location with detectable evidence of past human activity. Includes HISTORICAL SITES, HABITATION SITES, KILL-SITES, QUARRY SITES, ROCK-ART SITES, BURIAL SITES, etc. See HERITAGE SITE.

SITE SURVEY: The process of searching for and describing heritage sites in a given area.

SOIL-SAMPLE: A quantity of soil, site matrix, or sediments collected for physical, or chemical analysis.

STORAGE-PIT (Also called CACHE-PITS): Circular excavations usually less than 3 m in diameter assumed to have aboriginally functioned as storage "cellars".

STRATA: Depositional units or layers of sediment distinguished by composition or appearance. (Singular: "stratum").

STRATIGRAPHY: The study of various deposits, built up over time, which form delineated layers (such as ash, charcoal or crushed shell) in the earth walls of a pit.

SURVEY(ING): (1) In Archaeology, the process of locating archaeological sites. (2) More generally, the process of mapping and measuring points on the ground surface.

SURVEY AREA: The region within which heritage sites are to be located.

TOOL: An artifact that has been intentionally modified or formed for a specific purpose (i.e. projectile point, knife, scraper).

TYPE: A distinctive formal artifact class restricted in space and time, e.g. the "Folsom Point" is a projectile point "type".

TYPOLOGY: The classification of artifacts according to analytical criteria, to determine and define significant trends or variations in time and space.

UNIFACE: A stone artifact flaked only on one surface.

USE-WEAR: Polish, striations, breakage, or minor flaking which develop on a tool's edge during use. Microscopic examination and study of the wear may indicate the past function of tools.

WETLAND: Areas of land that are inundated by surface water or ground water sufficient to support the growth and reproduction of vegetative and aquatic life.

WORKED: Having chips, flakes, scratches or other evidence of deliberate modification on stone, bone, antler, shell, etc.

ZOOARCHAEOLOGY: The study of faunal remains found in archaeological sites and their cultural significance.

CERTIFICATE OF ANALYSIS VAN10000105R.1

CLIENT JOB INFORMATION

Project: RAU
Shipment ID: Batch 5
P.O. Number
Number of Samples: 17

SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage
DISP-RJT Dispose of Reject After 90 days

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
G601+G610	17	Fire Assay fusion Au by ICP-ES	50	Completed	VAN

ADDITIONAL COMMENTS

Re-analysis of Gold from original pulps.

Invoice To: Archer, Cathro & Assoc. (1981) Ltd.
1016 - 510 W. Hastings St.
Vancouver BC V6B 1L8
Canada

CERTIFICATE OF ANALYSIS VA09113008

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09111373

Project: RAU

P.O. No.: Batch 76

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 9-OCT-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09111373

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09111372

Project: RAU

P.O. No.: Batch 77

This report is for 13 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 9-OCT-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: **ATAC RESOURCES LTD.**

CERTIFICATE OF ANALYSIS VA09111372

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09109504

Project: RAU

P.O. No.: Batch 73

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 1-OCT-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: **ATAC RESOURCES LTD.**
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09109504

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09109503

Project: RAU

P.O. No.: Batch 72

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 1-OCT-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

CERTIFICATE VA09107971

Project: RAU

P.O. No.: Batch 74

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 1-OCT-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.

CERTIFICATE OF ANALYSIS VA09107971

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09107970

Project: RAU

P.O. No.: Batch 71

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 1-OCT-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE VA09107963

Project: RAU

P.O. No.: Batch 70

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 29-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09107963

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09107519

Project: RAU

P.O. No.: Batch 62

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 29-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09107519

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09107518

Project: RAU

P.O. No.: Batch 67

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 29-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09107518

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09107517

Project: RAU

P.O. No.: Batch 66

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 29-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09107517

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09107516

Project: RAU

P.O. No.: Batch 64

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 29-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09107516

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09105687

Project: RAU

P.O. No.:

This report is for 166 Soil samples submitted to our lab in Vancouver, BC, Canada on 29-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VA09105685

Project: RAU

P.O. No.: Batch 68

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 29-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09105685

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09105684

Project: RAU

P.O. No.: Batch 69

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 29-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09105684

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09105683

Project: RAU

P.O. No.: Batch 63

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 29-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.

CERTIFICATE OF ANALYSIS VA09105683

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

Finalized Date: 13-OCT-2009
Account: RCM

CERTIFICATE VA09105682

Project: RAU

P.O. No.: Batch 65

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 29-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09105682

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09104228

Project: RAU

P.O. No.: Batch 58

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 22-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09104228

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09104227

Project: RAU

P.O. No.: Batch 60

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 22-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE VA09104226

Project: RAU

P.O. No.: Batch 61

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 22-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE VA09104223

Project: RAU

P.O. No.: Batch 59

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 22-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: **ATAC RESOURCES LTD.**

CERTIFICATE VA09104222

Project: RAU

P.O. No.: Batch 57

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 22-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE VA09100782

Project: RAU

P.O. No.: Batch 49

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 15-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.

CERTIFICATE OF ANALYSIS VA09100782

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09100781

Project: RAU

P.O. No.: Batch 48

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 15-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09100781

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09100780

Project: RAU

P.O. No.: Batch 50

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 15-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE VA09100668

Project: RAU

P.O. No.: Batch 51

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 15-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09100668

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09100667

Project: RAU

P.O. No.: Batch 56

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 15-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS VA09100667

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09100666

Project: RAU

P.O. No.: Batch 54

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 15-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09100666

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09100665

Project: RAU

P.O. No.: Batch 52

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 15-SEP-2009. * CORRECTED COPY *

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09100665

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09100665

Project: RAU

P.O. No.: Batch 52

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 15-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09100665

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09100664

Project: RAU

P.O. No.: Batch 53

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 15-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09100664

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09100663

Project: RAU

P.O. No.: Batch 55

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 15-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
As-OG62	Ore Grade As - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.

CERTIFICATE VA09100631

Project: RAU

P.O. No.:

This report is for 65 Rock samples submitted to our lab in Vancouver, BC, Canada on 14-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
ME-MS61	48 element four acid ICP-MS	
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
Pb-VOL70	Pb by Titration

CERTIFICATE VA09100630

Project: RAU

P.O. No.:

This report is for 223 Soil samples submitted to our lab in Vancouver, BC, Canada on 14-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **ATAC RESOURCES LTD.**

CERTIFICATE VA09100029

Project: RAU

P.O. No.:

This report is for 230 Soil samples submitted to our lab in Vancouver, BC, Canada on 14-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

CERTIFICATE VA09100028

Project: RAU

P.O. No.:

This report is for 112 Soil samples submitted to our lab in Vancouver, BC, Canada on 14-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE VA09098645

Project: RAU

P.O. No.: Batch 45

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 10-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE VA09098644

Project: RAU

P.O. No.: Batch 46

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 10-SEP-2009. *CORRECTED COPY*

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09098644

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09098644

Project: RAU

P.O. No.: Batch 46

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 10-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09098644

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09098643

Project: RAU

P.O. No.: Batch 47

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 10-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.

CERTIFICATE VA09098640

Project: RAU

P.O. No.:

This report is for 70 Rock samples submitted to our lab in Vancouver, BC, Canada on 10-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09098640

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09097200

Project: RAU

P.O. No.: Batch 43

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 8-SEP-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09097200

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09094231

Project: RAU

P.O. No.: Batch 44

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 28-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.

CERTIFICATE OF ANALYSIS VA09094231

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09094230

Project: RAU

P.O. No.:

This report is for 31 Rock samples submitted to our lab in Vancouver, BC, Canada on 28-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
EXTRA-01	Extra Sample received in Shipment
CRU-QC	Crushing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: **ATAC RESOURCES LTD.**
ATTN: AL ARCHER

CERTIFICATE VA09090674

Project: RAU

P.O. No.: Batch 40

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 24-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09090674

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09090673

Project: RAU

P.O. No.: Batch 41

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 24-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE VA09090672

Project: RAU

P.O. No.: Batch 42

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 24-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09090672

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09089514

Project: RAU

P.O. No.: Batch 36

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 18-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09089514

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09089513

Project: RAU

P.O. No.: Batch 33

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 18-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09089513

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09089512

Project: RAU

P.O. No.: Batch 35

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 18-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE VA09088877

Project: RAU

P.O. No.: Batch 38

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 19-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
CRU-QC	Crushing QC Test
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE

CERTIFICATE VA09088876

Project: RAU

P.O. No.: Batch 39

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 19-AUG-2009. CORRECTED COPY

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.

CERTIFICATE OF ANALYSIS VA09088876

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09088876

Project: RAU

P.O. No.: Batch 39

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 19-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: **ATAC RESOURCES LTD.**
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09088876

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VO09088241

Project: RAU

P.O. No.: Batch 32

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 24-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: **ATAC RESOURCES LTD.**
ATTN: AL ARCHER

CERTIFICATE VO09088240

Project: RAU

P.O. No.: Batch 31

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 24-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: **ATAC RESOURCES LTD.**

CERTIFICATE OF ANALYSIS VO09088240

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09087329

Project: RAU

P.O. No.:

This report is for 17 Rock samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
ME-MS61	48 element four acid ICP-MS	
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: **ATAC RESOURCES LTD.**

CERTIFICATE VA09087328

Project: RAU

P.O. No.: Batch 37

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE

CERTIFICATE VO09087194

Project: RAU

P.O. No.: Batch 30

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

To: **ATAC RESOURCES LTD.**

CERTIFICATE OF ANALYSIS VO09087194

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VO09087193

Project: RAU

P.O. No.: Batch 29

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
PUL-QC	Pulverizing QC Test
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VO09087193

Method	CERTIFICATE COMMENTS
ALL METHODS	NSS is non-sufficient sample.
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.

CERTIFICATE VO09087192

Project: RAU

P.O. No.:

This report is for 115 Soil samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: ATAC RESOURCES LTD.

CERTIFICATE VO09087191

Project: RAU

P.O. No.:

This report is for 115 Soil samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: ATAC RESOURCES LTD.

CERTIFICATE VO09087190

Project: RAU

P.O. No.:

This report is for 115 Soil samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VO09087129

Project: RAU

P.O. No.:

This report is for 147 Soil samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: ATAC RESOURCES LTD.

CERTIFICATE VO09087128

Project: RAU

P.O. No.:

This report is for 169 Soil samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

CERTIFICATE VO09087127

Project: RAU

P.O. No.:

This report is for 108 Soil samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Zn-OG46	Ore Grade Zn - Aqua Regia	VARIABLE

CERTIFICATE VO09087126

Project: RAU

P.O. No.:

This report is for 155 Soil samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

CERTIFICATE VO09087125

Project: RAU

P.O. No.:

This report is for 34 Rock samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
ME-MS61	48 element four acid ICP-MS	
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.

CERTIFICATE VO09087124

Project: RAU

P.O. No.: Batch 27

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
As-OG62	Ore Grade As - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE VO09087123

Project: RAU

P.O. No.: Batch 26

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
As-OG62	Ore Grade As - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

Project: RAU

P.O. No.: Batch 28

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
As-OG62	Ore Grade As - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VO09087122

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09086498

Project: RAU

P.O. No.: Batch 34

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 17-AUG-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
LOG-24	Pulp Login - Rcd w/o Barcode
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09086498

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09081263

Project: RAU

P.O. No.:

This report is for 256 Soil samples submitted to our lab in Vancouver, BC, Canada on 27-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Zn-OG46	Ore Grade Zn - Aqua Regia	VARIABLE

CERTIFICATE VA09081262

Project: RAU

P.O. No.:

This report is for 201 Soil samples submitted to our lab in Vancouver, BC, Canada on 27-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Ag-OG46	Ore Grade Ag - Aqua Regia	VARIABLE
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES

Project: RAU

P.O. No.:

This report is for 200 Soil samples submitted to our lab in Vancouver, BC, Canada on 27-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
