CERTIFICATE VA09081260

Project: RAU

P.O. No.:

This report is for 225 Soil samples submitted to our lab in Vancouver, BC, Canada on 27-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Zn-OG46	Ore Grade Zn - Aqua Regia	VARIABLE

CERTIFICATE OF ANALYSIS VA09078188

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09078180

Project: RAU

P.O. No.: Batch 25

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 30-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VA09076284

Project: RAU

P.O. No.: Batch 23

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 27-JUL-2009. CORRECTED COPY

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE VA09076284

Project: RAU

P.O. No.: Batch 23

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 27-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VA09076283

Project: RAU

P.O. No.: Batch 22

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 27-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09076283

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09075566

Project: RAU

P.O. No.: Batch 21

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 27-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE VA09074779

Project: RAU

P.O. No.: Batch 20

This report is for 5 Rock samples submitted to our lab in Vancouver, BC, Canada on 21-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE VA09073353

Project: RAU

P.O. No.: Batch 18

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 20-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE VA09073352

Project: RAU

P.O. No.: Batch 17

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 20-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE VA09073272

Project: RAU

P.O. No.: Batch 15

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 16-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE VA09073271

Project: RAU

P.O. No.: Batch 14

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 16-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE

To: **ATAC RESOURCES LTD.**

CERTIFICATE VA09073270

Project: RAU

P.O. No.: Batch 16

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 16-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09073270

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09072703

Project: RAU

P.O. No.: Batch 8

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 13-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS

To: ATAC RESOURCES LTD.

CERTIFICATE OF ANALYSIS VA09072703

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09072702

Project: RAU

P.O. No.: Batch 12

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 14-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09072702

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09072701

Project: RAU

P.O. No.: Batch 13

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 14-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09072701

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09072700

Project: RAU

P.O. No.: Batch 7

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 13-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VA09072171

Project: RAU

P.O. No.: Batch 9

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 13-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS

CERTIFICATE OF ANALYSIS VA09072171

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09072170

Project: RAU

P.O. No.: Batch 11

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 13-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE OF ANALYSIS VA09072170

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09071909

Project: RAU

P.O. No.: Batch 10

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 13-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER

CERTIFICATE VA09071602

Project: RAU

P.O. No.:

This report is for 54 Soil samples submitted to our lab in Vancouver, BC, Canada on 13-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VA09071601

Project: RAU

P.O. No.:

This report is for 13 Rock samples submitted to our lab in Vancouver, BC, Canada on 13-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
ME-MS61	48 element four acid ICP-MS	
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE VA09068685

Project: RAU

P.O. No.: Batch 4

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 6-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
CRU-QC	Crushing QC Test
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
As-OG62	Ore Grade As - Four Acid	VARIABLE

CERTIFICATE OF ANALYSIS VA09068685

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09068430

Project: RAU

P.O. No.: Batch 19

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 21-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: **ATAC RESOURCES LTD.**

CERTIFICATE OF ANALYSIS VA09068430

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.

CERTIFICATE VA09068417

Project: RAU

P.O. No.: Batch 5

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 6-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
SPL-21	Split sample - riffle splitter
CRU-QC	Crushing QC Test
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
As-OG62	Ore Grade As - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.

CERTIFICATE OF ANALYSIS VA09068417

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09068417

Project: RAU

P.O. No.: Batch 5

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 6-JUL-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
SPL-21	Split sample - riffle splitter
CRU-QC	Crushing QC Test
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
As-OG62	Ore Grade As - Four Acid	VARIABLE
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE OF ANALYSIS VA09068417

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09064973

Project: RAU

P.O. No.: BATCH 3

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 29-JUN-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
CRU-QC	Crushing QC Test
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS

CERTIFICATE OF ANALYSIS VA09064973

Method	CERTIFICATE COMMENTS
ME-MS61	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS61	REE's may not be totally soluble in this method.
Hg-CV41	Detection limits on samples requiring dilutions due to interferences or high concentration levels have been increased according to the dilution factor.

CERTIFICATE VA09063940

Project: RAU

P.O. No.:

This report is for 39 Soil samples submitted to our lab in Vancouver, BC, Canada on 24-JUN-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
SCR-43	Screen to -500um, discard plus
PUL-31	Pulverize split to 85% <75 um
LOG-22	Sample login - Rcd w/o BarCode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VA09063409

Project: RAU

P.O. No.:

This report is for 33 Rock samples submitted to our lab in Vancouver, BC, Canada on 24-JUN-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA26	Ore Grade Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS

CERTIFICATE VA09063053

Project: RAU

P.O. No.: RAU09-19

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 22-JUN-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
LOG-23	Pulp Login - Rcvd with Barcode
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-GRA22	Au 50 g FA-GRAV finish	WST-SIM
ME-MS61	48 element four acid ICP-MS	
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.

CERTIFICATE VA09059962

Project: RAU

P.O. No.: RAU-08-09

This report is for 1 Sediment sample submitted to our lab in Vancouver, BC, Canada on 16-JUN-2009.

The following have access to data associated with this certificate:

AL ARCHER BILL WENGZYNOWSKI	DOUG EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Au-AA26	Ore Grade Au 50g FA AA finish	AAS

To: ATAC RESOURCES LTD.
ATTN: AL ARCHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

APPENDIX VII

ROCK SAMPLE DESCRIPTIONS

Rock Sample Descriptions Project: _____ Property: Rau

Sample Number:	Grid East:		E	Grid North:		N	Type:	Chip	Dimension:
B375651	UTM:	529995	E	UTM:	7118664	N	Sample Width:	30 cm	Abundance:
	Elevation:		m						

Comments: Rusty, slightly pyrititc horizon in LST. Strike extension of skarn mineralization. Minor green actinolite

Sample Number:	Grid East:		E	Grid North:		N	Type:	Chip	Dimension:
B375652	UTM:	530297	E	UTM:	7118005	N	Sample Width:	35 cm	Abundance:
	Elevation:		m						

Comments: Dark green, pyrrhotite rich (50%) rusty weathering skarn horizon. Part of a continuous chip sample from here to B375656. This sample was the top 35 cm of the sequence.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Chip	Dimension:
B375653	UTM:	530297	E	UTM:	7118005	N	Sample Width:	34 cm	Abundance:
	Elevation:		m						

Comments: 34 cm of grey LST/white MBL in between skarn horizons

Sample Number:	Grid East:		E	Grid North:		N	Type:	Chip	Dimension:
B375654	UTM:	530297	E	UTM:	7118005	N	Sample Width:	124 cm	Abundance:
	Elevation:		m						

Comments: 124 cm thickness of dark green, rusty weathering skarn with pyrite and lesser pyrrhotite. Locally coarse grain

Sample Number:	Grid East:		E	Grid North:		N	Type:	Chip	Dimension:
B375655	UTM:	530297	E	UTM:	7118005	N	Sample Width:	105 cm	Abundance:
	Elevation:		m						

Comments: ~1 m thickness of sugary, weathered LST with fine-grained pyrite

Sample Number:	Grid East:		E	Grid North:		N	Type:	Chip	Dimension:
B375656	UTM:	530297	E	UTM:	7118005	N	Sample Width:	315 cm	Abundance:
	Elevation:		m						

Comments: Dark green rusty weathering skarn, basal layers (3.15 m thick) of continuous chip. Quartz +/- actinolite. Surgary green appearance.

Rock Sample Descriptions Project: _____ Property: Rau

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
B375657	UTM:	530235	E	UTM:	7118091	N	Sample Width: 123 cm	Abundance:
	Elevation:		m					

Comments: Dark green pyrrhotite+/-pyrite bearing skarn horizon. Continuous sampling to B375659

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
B375658	UTM:	530235	E	UTM:	7118091	N	Sample Width: 26 cm	Abundance:
	Elevation:		m					

Comments: Beige marble/LST layer between the two skarn horizons. 26 cm thick minor pyrrhotite

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
B375659	UTM:	530235	E	UTM:	7118091	N	Sample Width: 276 cm	Abundance:
	Elevation:		m					

Comments: Very dark green to black (rusty weathering) skarn horizon possible black tourmaline with limonite

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
B375660	UTM:	530265	E	UTM:	7118034	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Sample from quartz muscovite pegmatite exposed over 3x10 m, near skarn horizons. Dyke that terminates in LST

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
B375661	UTM:		E	UTM:		N	Sample Width: 10 cm	Abundance: O/C
	Elevation:		m					

Comments: Flat Top A - Massive felted aggregate of golden tremolite needles with rusty (limonite?) interstitial material. Weathers medium to dark brown on exterior surfaces.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
B375662	UTM:		E	UTM:		N	Sample Width: 10x5x4 cm	Abundance: Rare
	Elevation:		m					

Comments: Flat Top B - aggregate of euhedral smoky quartz crystals to 5 mm diameter in groundmass of felted actinolite. Numerous pockets of limonite in groundmass. Occasional subhedral calcite crystals

Rock Sample Descriptions Project: _____ Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375663	UTM:	E	UTM:	N	Sample Width: 8x5x3 cm	Abundance: Common
	Elevation:	m				

Comments: Flat Top C - fragments of calcite or marble in matrix of dark green felted actinolite. Weathers medium brown but no rusty areas on freshly broken surfaces.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375664	UTM:	E	UTM:	N	Sample Width: 7x7x5 cm	Abundance: Rare
	Elevation:	m				

Comments: Flat Top D - massive to euhedral quartz to 1 cm diameter with 40% interstitial medium borwn limonite. Quartz milky white.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375665	UTM:	E	UTM:	N	Sample Width: 7x5x5 cm	Abundance: Common
	Elevation:	m				

Comments: Flat Top E - dark green to medium brown weathering, white quartz fragments surrounded by dark green actinolite. Pocket of coarse black tourmaline crystals, euhedral glassy quartz to 5 mm and white calcite. Traces of pyrrhotite along boundary between pocket and actinolite.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375666	UTM:	E	UTM:	N	Sample Width: 8x7x4 cm	Abundance: O/C
	Elevation:	m				

Comments: Flat Top F - light brown weathering mixture of quartz and calcite with abundant interstitial felted termolite, which imparts the tan colour.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375667	UTM:	E	UTM:	N	Sample Width: 10x5x5 cm	Abundance: O/C
	Elevation:	m				

Comments: Flat Top G - dark green weathering mixture of felted actinolite, white calcite and black tourmaline

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375668	UTM:	E	UTM:	N	Sample Width: 8x6x5 cm	Abundance:
	Elevation:	m				

Comments: Flat Top H - dark brown weathering mixture of calcite or partially skarnified marble surrounded by olive to dark green felted actinolite with interstitial dark brown limonite.

Rock Sample Descriptions Project: _____ Property: Rau

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
B375669	UTM:		E	UTM:		N	Sample Width: 12x10x10cm	Abundance:
	Elevation:		m					

Comments: Flat Top I - medium green weathering intergrown mixture of light grey clcite and dark green actinolite. Pocket of greenish grey crystals acocmpanied by smal black tourmaline crystals.

Sample Number:	Grid East:		E	Grid North:		N	Type: Float	Dimension: From boulder
B375670	UTM:		E	UTM:		N	Sample Width: 6x5x5 cm	Abundance: Common
	Elevation:		m					

Comments: Flat Top J - partially skarnified limestone fragments rimmed by 1-2 mm of tremolite surrounded by actinolite. Minor white calcite.

Sample Number:	Grid East:		E	Grid North:		N	Type: Float	Dimension: 20x10x10 cm cobble in soil
B375671	UTM:	531400	E	UTM:	7117900	N	Sample Width: 5x3x3 cm	Abundance: Rare
	Elevation:		m					

Comments: Skarn from soil pit CC24241=990 ppb Au, dark brown weathering felted massive actinolite with about 1% pyrrhotite and 1% black tourmaline. No residual limestone. Not radiating aligned type actinolite typically found as rind on narrow dykes.

Sample Number:	Grid East:		E	Grid North:		N	Type: Float	Dimension: Large boulder 70x50x40 cm?
B375672	UTM:	530878	E	UTM:	7118588	N	Sample Width: 15x10x5 cm	Abundance: Rare?
	Elevation:		m					

Comments: Skarn from hillside SE of camp. Float boulder but could be near source - transition mostly intrusive boulders to mostly limestone. Dark brown weathering. Mixture of felted actinolite and black tourmaline. Minor limonite near tourmaline may be after sulphides but none seen in fresh rock.

Sample Number:	Grid East:		E	Grid North:		N	Type: O/C	Dimension: A few cm wide band along margin of dyke
B375673	UTM:	531350	E	UTM:	7117860	N	Sample Width: 5x4x3 cm	Abundance: Common
	Elevation:		m					

Comments: Pegmatie from margine of dyke. Lite grey quartz with fractures filled with actinolite, black tourmaline, traces of pyrrhotite.

Sample Number:	Grid East:		E	Grid North:		N	Type: Float	Dimension: Large boulder
B375674	UTM:	531179	E	UTM:	7118628	N	Sample Width: 10x10x10cm	Abundance: Rare
	Elevation:		m					

Comments: Intrusive cream feldspar with anhedral blebs of quartz and minor black tourmaline.

Rock Sample Descriptions Project: _____ Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375675	UTM: 531350	E	UTM: 7117860	N	Sample Width: 10x8x5 cm	Abundance: Comprises much of large dyke
	Elevation:	m				

Comments: Medium grained groundmass of light to dark grey quartz, creamy feldspar and about 1% euhedral 1 mm diameter red garnets plus traces of biotite and muscovite and occasional up to 2 cm white feldspar phenocrysts. Fine black grains possibly tourmaline are scattered through the rock.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375676	UTM: 531344	E	UTM: 7118332	N	Sample Width: 15x5x2cm	Abundance: Rare
	Elevation:	m				

Comments: Fine grained quartz fragments surrounded by white tremolite that grades to blue-green locally. Very distinctive highly leucocratic rock.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375677	UTM: 531179	E	UTM: 7118628	N	Sample Width: 12x3x1 cm	Abundance: Common
	Elevation:	m				

Comments: Typical intrusive - coarse grained mixture of feldspar with various shades of quartz grains. Grey to black. Traces of biotite and black tourmaline.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375678	UTM: 531103	E	UTM: 7118674	N	Sample Width: 5x4x3 cm	Abundance: Common - typical of leucocratic boulders
	Elevation:	m				

Comments: Medium to coarse grained mixture of feldspar and quartz with minor institual muscovite and traces of euhedral red garnet

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
B375679	UTM: 531103	E	UTM: 7118674	N	Sample Width: 15x5x3 cm	Abundance: Common - typical of darker grading to pegmatite boulders
	Elevation:	m				

Comments: Coarse grained mixture of feldspar and light to dark grey quartz plus flakes and books of biotite and black tourmaline. Large (~2 cm) feldspar phenocryst.

Comments: Actinolite? Thin white fibrous needles, with surrounding matrix altered orange/black with limonite. Some brown also.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885018	UTM: 525694	E	UTM: 7121975	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (15 x 15 x 10 cm) of rusty-brown weathering, dominantly dense, pervasively rusty-brown altered dolomite?? with minor limonite-filled vugs. Limonite is orange to brown boxwork. Rock is very soft, does not react to HCl. Trace quartz. Found on grassy slope with minor talus (dominantly massive light grey limestone and knubbly weathering orange-brown dolomite).

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885019	UTM: 525746	E	UTM: 7121878	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (20 x 10 x 6 cm) of knubbly and rusty-brown weathering, strongly weathered, beige to rusty, weakly vuggy, limonitic volcanic? Fragile. In small talus train of knubbly dolomite (breccia?) > limestone > volcanic.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885020	UTM: 525769	E	UTM: 7121841	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (13 x 10 x 6 cm) of dark purple-rusty weathering, heavy, dense siderite/goethite with rare, small patches of boxwork limonite and rare calcite. Only piece this "juicy," but there are several pieces in this 2 x 1 m frost-heaved soil/float patch that are similar to H885019.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885021	UTM: 525770	E	UTM: 7121840	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (15 x 10 x 10 cm) of orange-brown weathering, strongly altered or weathered, orange-beige, non-reactive volcanic with appromately 6 x 6 x 6 cn pocket of purple ferricrete with small (< 5 mm) clasts of same rock type. Found in small soil exposure on moss, about 1-2 m above H885020. The part of the sample that is not ferricrete appears to be crackle brecciated on a larger scale. Also, there is a narrow (about 5 mm) quartz >> limonite filled fracture that cuts the rock.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885022	UTM: 525782	E	UTM: 7121811	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (15 x 15 x 6 cm) of weakly rusty-white weathering, weakly rusty quartz vein with minor orange-rusty boxwork limonite in patches and along narrow fracture. 3/4 of the surfaces are relatively smooth weathering, white the 4th has well developed quartz crystals (up to 1.3 cm in diameter) and a thin limonite coating. Sample was in float, 1 m below galena bearing limonite (H885025).

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885023	UTM: 525786	E	UTM: 7121824	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 7 fragments of dominantly fine ferricrete with rare quartz and rarer limonite. Taken from 10 x 5 m area of moderate float on grassy slope. These fragments are pervasive throughout area, but only minorly abundant. No rep.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885024	UTM: 525786	E	UTM: 7121824	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (15 x 15 x 6 cm) of rusty weathering, banded orange, altered volcanic (0.5 cm), dense quartz vein (5 mm), quartz/orange limonite (2 cm), dark purple dense limonite (1.5 mm), small quartz crystals with space between (1 cm) and dense quartz vein (5 mm).

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885025	UTM: 525780	E	UTM: 7121810	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Undifferentiated rusty sericitic? limonite with minor, small quartz crystals and blebs and same rock type with up to about 5% blebby galena. About half and half both types. 10 fragments collected from 40 x 40 cm area exposed in approximately 20 x 20 m patch of soil and float on dominantly grassy slope. No rep.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885026	UTM: 525780	E	UTM: 7121810	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (15 x 10 x 4 cm) of rusty, fairly dense limonite with blebby, white, opaque quartz and < 5% blebby galena. In same location as H885025.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885027	UTM: 525766	E	UTM: 7121806	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 10 fragments of ferricrete (rusty-purple, fine) and goethite-rich limonite collected from shallow depression on grassy slope. Majority of fragments were taken from piles of soil/rock at the mouths of several gopher holes. Popular spot to dig! Collected over 5 x 2 m area. No rep.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885028	UTM: 525768	E	UTM: 7121806	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble of dark purple to black to rusty weathering, goethite? rich ferricrete/limonite with rare to minor quartz clasts (about 1 cm diameter). 3 very similar cobbles found within 50 cm diameter area.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885029	UTM: 525753	E	UTM: 7121806	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 13 fragments of dominantly quartz vein, some with minor rusty limonite. All fragments exposed in piles at mouths of gopher holes. Collected above H885028, over an 8 x 2 m area. Still minor ferricrete/limonite in float, but mostly quartz.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885030	UTM: 525753	E	UTM: 7121810	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 block (30 x 20 x 15 cm) of rusty quartz vein with pods of rusty limonite and rare blebs of pyrite. Also, rare "clasts?" of a soft, light grey mineral or rock (does not look economic).

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885031	UTM: 525725	E	UTM: 7121825	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 3 small cobbles of dark purple, dense and heavy goethite in float with 3 cobbles/blocks of light yellowish-brown weathering, white quartz vein, which appears barren.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885032	UTM: 525698	E	UTM: 7121905	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 15 fragments of rusty-purple weathering, non-calcareous, rusty-black, very soft siderite/shale? with small areas of tiny white quartz crystals and limonite. Collected over 8 x 2 m area in talus train (8 m parallels contours).

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885033	UTM: 525695	E	UTM: 7121906	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 block (30 x 25 x 6 cm) of dense, rusty siderite? with narrow (< 5 mm) bands of black, weakly oily looking goethite?

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885034	UTM: 525688	E	UTM: 7121892	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 block (30 x 20 x 20 cm) and several smaller cobbles of rusty-purple-brown, heavy and dense siderite and goethite? If there is altered volcanic or sedimentary rock, cannot tell. 5 fragments sampled across 5 m width (parallel to countours). At break in slope (shallower uphill, steeper downhill).

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885035	UTM: 525647	E	UTM: 7121917	N	Sample Width:	Abundance:
		m				

Comments: 1 cobble (15 x 10 x 4 cm) of rusty-brown-grey weathering, light bluish-grey, non-calcareous, fine grained sedimentary rock with areas of greenish alteration and abundant pockets of rusty boxwork limonite. Several others like it in area, 1 of which is domantly ferricrete.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885036	UTM: 525578	E	UTM: 7121959	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 8 fragments of quartz +/- carbonate (orange-brown) +/- calcite vein with minor limonite patches and pockets in pseudo-creek to NW of anomalous soil location.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885037	UTM: 525580	E	UTM: 7121909	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (12 x 10 x 6 cm) of rusty, dense, siderite +/- goethite with minor boxwork limonite with trace, fine, residual pyrite. In dominantly limestone talus.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885038	UTM: 525467	E	UTM: 7121805	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (12 x 10 x 8 cm) of rusty-brown, heavy, limonite/calcite vein or pod. In float near base of massive tan-grey limestone outcrop. Several blocks near base have quartz +/= calcite veins (up to 2 cm wide) with adjacent carbonate replacement? limonitic pods. In general, this vein/pod material is smaller than the sample (best looking piece in area).

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885039	UTM: 525414	E	UTM: 7121869	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (16 x 10 x 10 cm) of rusty-brown weathering, calcite/carbonate/limonite. Can't tell how much is brown carbonate vs siderite/goethite. Lying in limestone talus. Very similar to H885039. Limestone almost has same textural appearance as at Michelle property. Very few cobbles of similar material in this talus train.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885040	UTM: 525390	E	UTM: 7121881	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Another cobble (12 x 8 x 8 cm) of same stuff as H885038 and 039. Within limestone talus train.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885041	UTM: 525379	E	UTM: 7121916	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (12 x 10 x 8 cm) of white and brown weathering, white quartz vein with limonite-healed seems and pockets. Lying in float on south side of small creek. Several other cobbles and blocks of quartz vein, some with minor limonite, in the area.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885042	UTM: 525517	E	UTM: 7121746	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 small cobble (10 x 6 x 4 cm) of orange-brown, fine ferricrete? (may be limonite, especially in part). Just poking out of moss where only minor talus is exposed. No rep. Parts react moderately to HCl (brown carbonate?).

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885043	UTM: 525546	E	UTM: 7121778	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 x 0.5 m area of moderately abundant, rusty-brown, limonite-altered carbonate fragments. 1 cobble (12 x 8 x 5 cm) of locally limonitic brown carbonate with 3 mm wide quartz vein was sampled.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885044	UTM: 525428	E	UTM: 7121952	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 6 fragments of rusty-orange-brown, dense to pseudo-boxwork limonite, rarely with strongly altered orange limestone. Taken from float on N band of creek. Largest cobble is 15 x 10 x 6 cm.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885045	UTM: 525435	E	UTM: 7121941	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (10 x 10 x 10 cm) of rusty-grey weathering, grey quartz vein with minor rusty limonite in pods and a grey-black, shiny rock clast (shale?). May also have trace residual sulphides - pyrite? Too fine to tell.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885046	UTM: 525557	E	UTM: 7121889	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (13 x 8 x 4 cm) and 1 fragment of rusty-purple, fairly dense goethite with trace boxwork limonite. In false drainage with dominantly limestone talus. Only pieces like this in area.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885047	UTM: 525606	E	UTM: 7121828	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 block (40 x 30 x 15 cm) of medium brown weathering, medium brown carbonate and maybe altered limestone? with galena, bismuthinite and quartz vein in irregular veins and pods. Barely exposed on mossy slope. Galena is about 20%, hard to tell due to irregularity. Smashed up the rock and randomly collected 10 fragments. Minor cerussite on galena. Reddish-brown crystal, weakly striated, more or less cubic - don't know what it is. Weak, pale greenish tinge on some weathered surfaces of galena - indicative of arsenopyrite? At N edge of shallow gully.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885048	UTM: 525611	E	UTM: 7121825	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (10 x 10 x 8 cm) of brown-white weathering, quartz vein with abundant pockets of brown carbonate and blebby galena *about 10%). Minor weakly limonitic vugs. Found just downhill of H885047. Only galena found in the area, other than H885047. At north edge of shallow gully.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885049	UTM: 525621	E	UTM: 7121822	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (10 x 8 x 6 cm) of rusty, moderately dense to boxworky limonite in brown carbonate and minor white calcite. Locally vuggy. Found downhill (E) and S of H885047. No rep. At N edge of shallow gully.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885050	UTM: 525625	E	UTM: 7121840	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (12 x 12 x 3 cm) of rusty-brown weathering, goethite-healed, clast-supported breccia with light orange, altered limestone? clasts. Clasts make up about 70% of sample while goethite is about 30%. In weakly orange-brown stained limestone talus train. 1 small fragment of quartz vein with blebby galena was also found at the head of this train - too small to sample.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885051	UTM: 525665	E	UTM: 7121832	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 2 fragments and 1 small cobble of rusty-purple, heavy, dominantly goethite in float. Cobble is vuggy. Colelcted in area of miner to moderate talus on grassy/mossy slope. No rep.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885052	UTM: 525648	E	UTM: 7121829	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 2 cobbles of purple-brown weathering, orange-rusty-black, moderately dense, almost sandy in texture, limonite-altered rock (can't tell parent) with shaley? (black, smooth) bits. In dominantly weakly orange weathering limestone talus train. Also found a small cobble (too small to sample) of heavy, dense goethite in float in area.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885053	UTM: 525376	E	UTM: 7121836	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (12 x 8 x 6 cm) of rusty-orange, moderately dense limonite (may be goethite in darker areas). In limestone talus train with minorly abundant fragments of limonitic brown carbonate and calcite veins and pods. Just to N side of weak bench, but likely source is limestone cliff to SW of bench tha has fractures/pits filled with calcite, brown carbonate and limonite.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885054	UTM: 525340	E	UTM: 7121821	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (15 x 10 x 12 cm) of medium brown weathering, white clacite and quartz with light brown, goethite-altered limestone? and pods of light orange and dark brown limonite. Within limestone talus, just N of weak bench (see sample H885053 description of location). Rare to minor limonitic bronw carbonate veins and pods in limestone float found between H885053 and here.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885055	UTM: 526062	E	UTM: 7121550	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Near base of extensive talus fan - 1 cobble (15 x 8 x 5 cm) of rusty-purple weathering, rusty, boxwork limonite with minor goethite. Nearby there are 1 cobble and 1 fragment of goethite. 10 steps west there is another, larger cobble of boxwork limonite with goethite and quartz vein.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885056	UTM: 526044	E	UTM: 7121481	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (20 x 10 x 10 cm) of rusty-brown weathering, relatively dense, rusty "limonite" (not goethite) in float within talus train. Rare, smaller fragments of same type in area. Has 2 cm wide layer of altered volcanic along 1 edge.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885057	UTM: 526049	E	UTM: 7121484	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 small cobble (8 x 6 x 4 cm) of rusty, dense limonite with 5-10% blebby galena (bismuthinite?) with rare cerussite on weathered surfaces and boxwork limonite in pockets. 5 or so small cobbles of non-galena bearing goethite and limonite also in area. In extensive talus train. No rep.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885058	UTM: 526030	E	UTM: 7121440	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (15 x 12 x 6 cm) of rusty weathering, weakly banded, vuggy, rusty limonite and rusty-purple, relatively dense goethite. 1 bleb (3 x 3 mm) of galena. In talus train.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885059	UTM: 525982	E	UTM: 7121386	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (20 x 12 x 7 cm) of rusty-grey weathering, grey to rusty, strongly limonite-altered volcanic? Doesn't look like classic boxwork limonite, nor is it dense - abundant small holes. In western talus train.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885060	UTM: 526071	E	UTM: 7121387	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (12 x 8 x 6 cm) of rusty to dark purple weathering, heavy, fairly dense goethite with trace orange boxwork limonite. In talus train, about 20 m from CC62408.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885061	UTM: 526024	E	UTM: 7121347	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (8 x 8 x 8 cm) of rusty weathering, minorly to moderately limonitic quartz vein in float within limestone talus train, about 20 m above CC62407. No rep.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885062	UTM: 526059	E	UTM: 7121302	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 6 fragments (about 5 x 3 x 3 cm) of rusty brown, some are weakly banded limonite and goethite. Locally vuggy. All within 2 x 1 m area on limestone talus slope. More, smaler fragments in area.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885063	UTM: 525970	E	UTM: 7121229	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (15 x 12 x 6 cm) of rusty weathering, strongly limonite-altered volcanic. Abundant rusty boxwork limonite-filled vugs within orange-altered host. Minor hairline fracture with limonite. Several smaller pieces also in float in the area. Dominantly limestone talus.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885064	UTM: 525966	E	UTM: 7121143	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 12 small chips of brown carbonate +/- goethite +/- boxwork limonite +/- calcite found over 15 x 2 m in talus.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885065	UTM: 525974	E	UTM: 7121145	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 75 cm chip sample across (apparent) thickness of massive, well fractured, orange and white weathering quartz vein with poddy and blebby bismuthinite (+ galena?) and limonite. Difficult to estimate overall bismuthinite percentage due to irregularity. Bolck is about 1.5 x 0.75 x 0.50 m. One other block (slightly smaller) 2 m uphill has minor bismuthinite. Several much smaller blocks and cobbles below here.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885066	UTM: 525994	E	UTM: 7121151	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (10 x 10 x 7 cm) of rusty-brown weathering, calcite + brown carbonate + quartz vein wtih orange-rusty limonite. In float with limestone talus.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885067	UTM: 526075	E	UTM: 7121163	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 6 fragments of rusty to dark purple, fairly dense sericitic and goethitic limonite in float within 2 x 2 m area in limestone talus.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885068	UTM: 526097	E	UTM: 7121185	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 10 fragments of rust to purple, locally goethitic, fairly heavy limonite in float around CC62482 (strongly anomalous Au soil). Collected within 3 x 3 m area.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885069	UTM: 526152	E	UTM: 7121178	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (12 x 10 x 7 cm) of rusty weathering, quartz >> brown carbonate > calcite vein with orange to rusty limonite (boxwork in places). In float within dominantly green volcanic talus.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885070	UTM: 526088	E	UTM: 7121125	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Top of mineralized talus train, 3 m wide at top, above this is limestone talus. Across this width is abundant dark purple goethitic limonite and quartz vein with pits and pockets of rusty limonite. 1 block (25 x 25 x 13 cm) of dark purple, goethitic limonite sampled. Contains minor quartz vein.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885071	UTM: 526081	E	UTM: 7121132	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 block (30 x 20 x 12 cm) of weakly rusty weathering quartz vein with about 5-10% bismuthinite (elongated, soft, silver crystals). In same mineralized talus train as H885070, near base of concentrated float.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885072	UTM: 526081	E	UTM: 7121130	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 8 fragments from cobbles of dark purple, heavy, very goethite-rich limonite within 3 x 2 m area. In same talus train as H885070 and 071.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885073	UTM: 526077	E	UTM: 7121131	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 9 randomly selected fragments from a large block (at least 1.5 x 0.6 x 0.3 m - can't tell exact dimensions because partially burried) of orange-white quartz vein with 2-5% (on exposed face) bismuthinite (elongated, soft, silver mineral). At western edge of same mineralized talus train as previous 3 samples.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885074	UTM: 526161	E	UTM: 7121088	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 2 cobbles of rusty, heavy, goethitic limonite in float (a few more downhill) within limestone talus. No rep.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885075	UTM: 524100	E	UTM: 7121252	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 block (30 x 30 x 8 cm) of rusty-purple-brown weathering, dark purple-brown, heavy, knubbly goethite with rare rusty boxwork limonite (particularly lining pits). Lying wihtin limestone talus blocks.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885076	UTM: 524089	E	UTM: 7121259	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: About 30 fragments of dominantly dark purple-brown, heavy and dense goethite with rare rusty boxwork limonite taken within approximately 30 x 30 m area. Limonite is hidden in amongst limestone blocks and is best exposed in soil/grass patches. No outcrop in area.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885077	UTM: 524170	E	UTM: 7121360	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: At soil sample CC62692 (strongly anomalous for gold). Very localized, weakly rusty-grey and rarely purple weathering, limonite and goethite altered limestone? (no reaction to HCl). Only rock of interest in the area. 4 small cobbles and several small fragments in area. 30 fragments collected in all.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885078	UTM: 524720	E	UTM: 7121660	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (12 x 10 x 5 cm) of rusty-purple, heavy goethite and limonite in float on grassy slope, about 40 m below distinct linear. Linear divides abundant limestone talus above from grass below. No outcrop in area.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885079	UTM: 524730	E	UTM: 7121657	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 block (30 x 12 x 9 cm) of dark purple, heavy and dense goethite.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885080	UTM: 524722	E	UTM: 7121650	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Composite sample of about 20 chips of goethite > dense limonite >> boxwork limonite taken from float over a 30 m width (by 10 m panel). Dominantly small fragments, though some pieces are from cobbles.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885081	UTM: 524723	E	UTM: 7121650	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 block (30 x 25 x 15 cm) of rusty-purple weathering, goethite > limonite with quartz vein. Mineralization cuts beige, fine grained, slightly shiny, non-calcareous siltstone.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885082	UTM: 524762	E	UTM: 7121661	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (8 x 8 x 5 cm) of dark purple, knubbly weathering, goethite in float on grass with limestone talus. Second cobble found nearby but not sampled. Float of all rock types is very rare above this.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885083	UTM: 524792	E	UTM: 7121651	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 8 fragments from cobbles of purple-brown to rusty goethite with minor limonite and quartz vein and rare boxwork limonite. All cobbles within 2 x 1 m area on bench of prominent linear.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885084	UTM: 524612	E	UTM: 7122000	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 3 small cobbles of purple-brown weathering, goethite "coated," rusty boxwork limonite in float on grassy slope. Very little rock exposure. Potential area of interest (as delineated by vegetation anomaly and rusty soil) is about 15 m wide at this point. No rep. 1 more cobble found nearby but not sampled.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885085	UTM: 524870	E	UTM: 7122145	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 5 small cobbles of rusty-brown weathering limestone with rusty-brown limonite?, brown carbonate, calcite and minor quartz in pods and pits.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885086	UTM: 524893	E	UTM: 7122147	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 6 small cobbles of rusty-purple-brown weathering, dominantly goethitic limonite, often with minor quartz vein and trace orange boxwork limonite. At base of 15-20 m wide gap between limestone outcrop (fault?).

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885087	UTM: 524907	E	UTM: 7122151	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (20 x 12 x 10 cm) of dark purple, goethite with light brown mud (soft) at centre and minor vug-lining quartz. Appears to have fallen down from structure at top of limestone outcrop, about 20 m uphill, where there is abundant material of this type.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885088	UTM: 524890	E	UTM: 7122111	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (15 x 9 x 4 cm) of purple-black weathering, dark brown and clear goethite/calcite vein with trace pockets of rusty limonite.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H885089	UTM: 525024	E	UTM: 7122155	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 5 pieces of strongly limonite-altered volcanic taken from upper (southern) contact of volcanic with limestone. Has typical limonite-filled pits.

Rock Sample Descriptions Project: Rau Property: Rau

Comments: Stop 4. Medium brown, limonite altered carbonate.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884952	UTM: 526208	E	UTM: 7121059	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 6 small cobbles of rusty-purple-brown weathering, heavy goethite and limonite with small holes. In float at margin of limestone/volcanic talus.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884953	UTM: 526186	E	UTM: 7121051	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (10 x 10 x 5 cm) of rusty limonite with 2 - 5% bismuthinite (may be galena?). Found within limestone blocks.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884954	UTM: 526170	E	UTM: 7121033	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (12 x 10 x 7 cm) of rusty-orange goethite and minor quartz in limonite-healed altered carbonate? (dominantly limonite/goethite). 1 bleb bismuthinite. In limestone talus with several cobbles of goethite-rich limonite.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884955	UTM: 526149	E	UTM: 7121017	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 5 cobbles of purple-brown, goethite-rich limonite in separate float train from previous 3 samples. Dominantly limestone talus. Mineralized float continues another 10 m to west.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884956	UTM: 526207	E	UTM: 7121019	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble and 3 fragments of rusty-purple-brown sericitic and goethitic limonite with minor clear quartz. In float with limestone blocks.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884957	UTM: 526212	E	UTM: 7120985	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 4 cobbles of orange limonite (with minor limonite-altered limestone) with 5 - 10% blebby bismuthinite. In float with limestone blocks.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884958	UTM: 526218	E	UTM: 7120985	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble orange limonite (with minor limonite-altered limestone) with 10 - 15% limonite. No rep.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884959	UTM: 526226	E	UTM: 7120975	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 block (40 x 25 x 20 cm) of rusty-purple-brown weathering, red-purple, heavy limonite in mineralized float train (which is getting more concentrated uphill). Dominantly limestone talus blocks.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884960	UTM: 526189	E	UTM: 7120953	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 12 fragments of rusty-brown weathering, rusty, sericitic > goethitic limonite with minor calcite. Gap between limestone outcrop is 8 m wide, limonite covers 4 m width.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884961	UTM: 526138	E	UTM: 7120963	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (16 x 8 x 5 cm) of goethitic > sericitic limonite. In mineralized float train with several similar cobbles and abundant limonite altered/discolored limestone. Limonite found over 4 m width.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884962	UTM: 526185	E	UTM: 7120930	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 large cobble (25 x 13 x 10 cm) of rusty-brown weathering, orange-rusty limonite with blebby bismuthinite (about 5%). Partially burried in grass. Several other cobbles of limonite (no bismuthinite) in area.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884963	UTM: 526184	E	UTM: 7120913	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 6 fragments from cobbles and small blocks of rusty-purple-brown weathering, rusty-brown limonite in brown carbonate and calcite. All blocks partly burried in grass.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884964	UTM:	526212	E	UTM:	7120870	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 2 small cobbles and several fragments of rusty-purple-brown weathering, rusty-brown goethite-rich limonite exposed on grassy slope within 1 diameter of each other.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884965	UTM:	526403	E	UTM:	7120832	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Fragments from 6 cobbles of purple weathering, weakly to strongly goethitic limonite with quartz in altered volcanic? Within 2 x 1 m area in volcanic talus.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884966	UTM:	526519	E	UTM:	7120701	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 7 fragments of orange, limonite-altered limestone? and dense sericitic limonite in orange-brown soil at contact between limestone (to south) and volcanic (to north). Orange soil is about 1 m wide.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884967	UTM:	526495	E	UTM:	7120638	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 4 m wide bench of weakly rusty-brown soil with rare fragments of shiny brown carbonate crystals with calcite and minor goethite. Definitely moreso a soil anomaly than rock.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884968	UTM:	526528	E	UTM:	7120921	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 25 or so fragments of limonite (2 main types - frusty, dense limonite and purple, heavy goethite) found within approximately 2 m wide zone of limonite float and altered limestone outcrop between 526517, 7120937 and 526549, 7120905. Structure is either bedding parallel or at shallow angle to bedding. Sight of RC09-02.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884969	UTM:	526392	E	UTM:	7120315	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 10 fragments from cobbles of dark purple goethite and goethite-healed breccia with clasts of orange, altered limestone within 5 x 2 m pod of orange soil and rusty-orange weathering, vuggy, altered limestone? Sight of RC09-14 and CC49717.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884970	UTM:	526373	E	UTM:	7120552	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 1 cobble (12 x 8 x 5 cm) of rusty-purple, heavy, dense goethitic limonite with rare quartz, barely exposed on grassy slope.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884971	UTM:	526375	E	UTM:	7120680	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 1 cobble (14 x 12 x 9 cm) of purple >> rusty weathering, heavy, "holey" goethite with minor calcite and clay-like (white to light orange, soft) altered limestone? or volcanic? Exposed as float on grassy slope with dominantly limestone talus and few localized limonite cobbles and fragments.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884972	UTM:	526373	E	UTM:	7120690	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 1 cobble (15 x 13 x 8 cm) of dark purple weathering, rusty-purple-brown, goethitic (locally glassy) limonite with minor vugs. In same area as H884971.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884973	UTM:	523190	E	UTM:	7121130	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 1 cobble of heavy, purple-grey weathering, goethite and limonite altered limestone. From float train with minor rock of this type. No rep.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884974	UTM:	523190	E	UTM:	7121130	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 1 fragment of strongly geothitic limonite - from area as H884073. No rep.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884975	UTM:	524724	E	UTM:	7121650	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 1 cobble (12 x 8 x 4 cm) of purple-brown weathering, rusty-purple, goethitic limonite. Moderately heavy.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884976	UTM: 524494	E	UTM: 7121997	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (12 x 10 x 5 cm) of orange-purple, heavy, goethite (locally glassy) rich limonite. Along linear below "Sarah's soil."

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884977	UTM: 524876	E	UTM: 7121531	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble (20 x 10 x 8 cm) of brown altered limestone with fracture controlled goethite.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884978	UTM: 524709	E	UTM: 7121373	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 small fragment of very heavy, orange-purple, geothite-rich limonite.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884979	UTM: 524717	E	UTM: 7122060	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 1 cobble of tan weathering limestone with pod of purple crystals (sphalerite?) in orange limonite. Not abundant in area. No rep.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884980	UTM: 532511	E	UTM: 7122720	N	Sample Width:	Abundance:

Comments: Coarsely crystalline, in part euhedral, white quartz with pale to dark brown limonite on fractures and interstitially.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884981	UTM: 532520	E	UTM: 7122718	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: 5 chips of medium to dark brown, ferricrete and limonite boxwork mixed with minor wallrock fragments.

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884982	UTM: 532520	E	UTM: 7122721	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Tremolite, actinolite and ? skarn partially replacing limestone (very difficult to get fresh surface) with pyrrhotite and/or pyrite pitting. Strongly limonitic on fractures.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884983	UTM: 532523	E	UTM: 7122724	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Massive pyrrhotite.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884984	UTM: 532436	E	UTM: 7122720	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Dense, fine grained, medium green skarn with disseminated pyrrhotite.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884985	UTM: 532607	E	UTM: 7122784	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Strongly weathered, pyrrhotite-bearing, quartz and garnet +/- actinolite skarn. Limonitic throughout.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884986	UTM: 532653	E	UTM: 7122773	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Actively forming ferricrete.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
H884987	UTM: 532708	E	UTM: 7122774	N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Euhedral, coarse grained quartz vein with minor limonite?

Rock Sample Descriptions Project: Rau Property: Rau

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884988	UTM:	532769	E	UTM:	7122747	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 1 cm euhedral quartz vein cutting medium green, chlorite-actinolite skarn with trace residual pyrite or pyrrhotite.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884989	UTM:	532873	E	UTM:	7122698	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Massive pyrrhotite.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884990	UTM:	532950	E	UTM:	7122612	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Mottled, siliceous (or albite) fine grained grey matrix, with diopside or hornblende crystals and fine disseminated pyrrhotite throughout.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884991	UTM:	533113	E	UTM:	7122459	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Clear to semi-opaque, euhedral quartz grains with abundant black crystals (striations) - black limonite?

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884992	UTM:	533058	E	UTM:	7122487	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Fine disseminated pyrrhotite or pyrite in limestone with shaley interbeds - likely against silty rocks, pseudo skarn/hornfels.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
H884993	UTM:	526422	E	UTM:	7120713	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 4 small cobbles of dark purple goethite in float with limestone talus.

GEOLOGY LOG

HOLE: Rau-SC09-01

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	29.60	29.60	LST		CR																	Medium grey limestone, varying from foliated and banded to heavily brecciated. 10-15% calcite flood/brecciation/veinlets. Mildly fossiliferous. Minor light orangey brown colouration on some fractured surfaces.
						BD	40															0.00-11.33 m: Fairly broken up (<5 cm pieces) and fractured limestone, moderately crackle brecciated with lighter grey clasts and dark grey matrix. Some remnant fossil fragments and occasional bedding at 40 deg to CA. Rare coral mound fragments occur.
						BD	90															11.33-14.93 m: Variably banded limestone, fossiliferous, more competent, and with around 10% calcite flood.
						BD	50															14.93-15.29 m: Limestone is altered to a tan colour and is slightly more gritty. Abundant calcite flood.
																						16.05-19.10 m: More patchy and brecciated with rusty colouration along fractures and carbonate vein margins.
						BD	45															19.10-21.10 m: Generally well foliated with prominent, up to 4 cm crosscutting calcite veinlets sporadically every 5-25cm. Veinlets occur at 250 degrees to the bedding while bedding is at 45 deg
						VN		250														
																						22.50-23.05 m and 24.10-24.70 m: Intense brecciation of more massive limestone. Up to 50% Ca matrix, angular limestone clasts up to 3cm. Appears to be a vein breccia.
29.60	33.85	4.25	VOL			FO	65															Light brownish tan, slightly crumbly and broken altered, foliated (65-70 degree) with Ca sweats, and minor spotted (Mn?) staining. A few blebs of garnet also occur.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																		Sp	t	Gn	t	31.86-33.23 m: Increase in the intensity of black-brown-red staining on fractures. Core also slightly softer/broken up. Trace small grains of garnet, and red-brown sphalerite.
33.85	51.87	18.02	LST			FR	40															Medium to dark grey limestone, fairly massive (except 33.85-34.35 m, which is banded at 70 deg to CA) and lightly to moderately crackled by two phases of brecciation. The first phase is <0.5 cm calcite, followed (?) by very fine thin black lines/cracks. Some blotchy and patchwork texture. The calcite in areas appears to follow the bedding at between 40-50 deg and BK lines do same as well as crosscutting at 90 deg. Trace pyrite in Ca veinlets/blebs.
															w							44.30-45.40 m: Irregular flood/breccia of Ca and fine black sediments within the same limestone. Disseminated pyrite content occurs weakly.
51.87	52.53	0.66	VOL	ALT		FO	60								w							Light brown to light greenish tan foliated, altered volcaniclastic layer. Elongate, stretched Ca amygdules. At upper contact, some large blebs and foliaform pyrite. Throughout the interval, Py occurs as thin stringers and foliaform blebs. 1 cm Qz, Ca, and Py veins crosscut at 180 deg to FO.
						VN		180														
52.53	73.63	21.10	LST			BD	60								t							Same medium to dark grey crackled, banded, patchy, brecciated limestone with a few small scattered blebs of pyrite. Where bedding remains, (light and dark foliated) it occurs at 60 deg to CA.
73.63	79.70	6.07	VOL			FO	45								t			Sp	t			Gradual transition into light brown tan layered volcaniclastic, interbedded with varyingly bleached, tan-brown limestone. Foliaform blebs of Py and fine-grained reddish blebs that may be sphalerite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						73.63-74.20 m: Almost all tan altered volcaniclastic, more broken up. Light to dark tan-grey limestone, generally more banded and less brecciated than previously. Several sections of darker tan (bleached?) limestone. Still minor crackle brecciated. Occasionally fossiliferous. Pyrite has all but disappeared.
																						77.86-79.70 m: Especially bleached dark tan section (at the volcaniclastic contact) a few thin interbeds of volcaniclastic. Trace crinoids.
79.70	79.94	0.24	CA			VN																Large Ca vein, a few other long/thin low angle Ca veinlets nearby.
79.94	112.74	32.80	LST			BD	60															Banded light and dark grey limestone. Fairly uniform. At ~84.00 m coarse grained Ca veinlets up to 8 cm thick occur at 45 deg to CA. The limestone seems to fold from 60 deg to CA to 60 deg to CA to the other way.
						VN	45															
																						84.35-87.30 m: Tan bleached layers interbedded. Often fine grained with some small crinoids. Gradually fades out.
																						87.30-91.58 m: Massive, fine grained homogeneous dark grey/tan limestone.
						BD	65								t							91.58 m: Back to well bedded, light and dark grey banded limestone. Quite uniformly bedded at 65-70degrees. <5% crinoids.
																						94.23-94.86 m and 95.60-95.90 m: Calcite flood (~5%) occurs subparallel to bedding.
																						99 m: Some fractures, on bedding planes are graphitic.
						BD	60															109 m: Bedding occurs at 60 deg to CA.
112.74	134.54	21.80	MBL																			Mainly light grey marble/marbleized limestone (75%) interbedded with 25% darker grey to black banded limestone. Local minor red-brown staining on fractures, and prominent planar crosscutting Ca veinlets.
						BD	65															113 m: Bedding occurs at 65 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						115-118 m: Massive marble, with darker grey stylolitic bands.
						BD	60															120.00-126.70 m: Uniformly banded light and dark grey limestone with a few small crinoid fossils and trace pyrite occurring as blebs replacing calcite. Bedding occurs at 60 deg to CA. Prominent calcite veinlets occur every 0.5-2 cm crosscutting at 40 deg to CA, and 180 deg to bedding.
						VN	40	180														
																						127.50-127.80m Light grey marbleized limestone with foliations bending (augen style) around 2-5 cm nodules of hematite stained Ca?
						BD	65															128.90-129.15m and 129.30-129.60m Ca veins, irregularly crosscutting, with some fine lighter brown (siderite? Throughout).
																						134.54 m: Grades into whitish tan marble.
134.54	143.26	8.72	VOL																			Dark green, chlorite altered volcaniclastic with up to 20% calcite filled amygdules, usually oval-shaped and aligned with the foliation. Irregular distribution with some sections almost massive and dark green in colour. Some irregular Qz/Ca veinlets/flood with chlorite alteration, and minor light pink blebs.
143.26	155.00	11.74	MBL			FO	60								t							White to light grey marble grading into marbleized limestone with interbedded darker grey limestone. Trace blebs of pyrite in the marble. Foliation occurs at 60 deg to CA.
																						143.20-146.30 m: Nearly pure white marble, mostly massive with a few dark grey bands.
																						145.20-145.60 m: Orange stained marble.
155.00	173.49	18.49	LST			BD	65								w							Interbedded light and dark grey limestone, fairly fossiliferous with corals and crinoids fragments. Minor Ca flood. Increase in pyrite as fine blebs and small foliaform stringers.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
															w							168.50-173.49m Especially fossiliferous (~10% crinoids) and banded with less light (MBL) layers, more DK LST and increase in fine DI/blebs Py, especially concentrated in darker layers.
173.49	182.51	9.02	VOL			FO	60								t		w					Interbedded light brown/tan volcaniclastic (50%) and grey to white sucrosic marble. Well banded with fine volcaniclastic layers and massive marble. Fine pyrrhotite concentrated in thin foliaform stingers and disseminated within volcaniclastic layers. Foliation varies from 50-65 deg to CA, usually quite continuously at 60. Remnant coral mound textures occasionally visible especially at 178.70 m. The last 5 cm are somewhat more crumbly and brownish orange in colour.
182.51	185.93	3.42	LST												w		f					Transitional banded limestone with fine, wispy banded tan layers (10%) of VOL and fine sericite. Fair foliaform stringers and fine blebs of pyrrhotite throughout. (Mag sus >1) Rarer associated fine Py.
185.93	194.76	8.83	LST			BD	70								t							The limestone loses the volcaniclastic layers gradually along with the associated pyrrhotite. By now only minor medium-grained concentrations of Py occur along a few fractures. Limestone is banded to brecciated light/dark grey with a few Qz and Ca flooded areas.
																						188.58-190.88 m: Very chaotic and somewhat brecciated, with no sense of foliation and increased crosscutting quartz-calcite veinlets (~5%). At 189.50 m, 20 cm jumbled/displaced pure Qz/Cb vein flood.
						FO	70															192.00 m: Foliation occurs at 70 deg to CA.
																						194.48-194.76 m: Slightly orange stain on fractures that cut the white marble.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
194.76	213.21	18.45	LST			BD	50								w		w	Cp	t			Same dark and light grey banded limestone, with increased Po, Py as small foliaform blebs/stringers. ~10% interbedded banded volcaniclastic as 10-60 cm layers, with associated marbleization of the surrounding limestone. Thin sericite laminations occur throughout.
						FO	70								t		f	Cp	w			198.42-198.62 m: Light brown volcaniclastic layers are surrounded by 5 cm of marble and are mineralized with fine Py/Po stringers. Large subrounded Ca/Qz blebs (1cm) occur with associated Po/Cp. Foliation occurs at 70 deg to CA.
						VN		260							w		w	Cp	t			201.55-201.98 m: Same light brown volcaniclastic layers with less mineralization occurring associated with the foliation. Crosscutting calcite veinlets cut the foliation at 260 deg, with blebs of Po and trace blebs of Cp.
															t		f					208.15-208.42 m: Thin volcaniclastic layers with occasional foliaform stringers and bands of fine grained pyrrhotite.
																						209-211 m: More marbleized massive limestone.
															t		f	Cp	t			212.82-213.21 m: Interbedded marble and volcaniclastic with a few tan sericite stringers and foliaform bands. Trace disseminated Cp.
213.21	271.27	58.06	LST												t		t	Cp	t			The limestone no longer contains volcaniclastic interlayers. It is variably banded with trace blebby pyrrhotite and pyrite. The unit has also become quite fossiliferous. Banding occurs at 60-65 deg to CA. There are up to 1% small, black, square crystals disseminated within the limestone. Trace small grains of chalcopyrite are associated on the margins of with blebs of pyrrhotite . After 260 m, banding is not as dominant but still quite fossiliferous. Pyrrhotite content slowly decreases as well, and pyrite is all but absent.
						BD	60															260.00 m: Bedding is at 60 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																	t					263.00-270.09 m: Generally lighter grey, more massive limestone. Characterized by 0.1 x 1 mm sub foliaform thin dark slivers, <3%. Unknown composition.
																	f					270.09-270.44 m: Darker, banded limestone with an increase in Po in foliaform blebs.
271.27	273.93	2.66	MBL			FO	70								w							Whitish marble interbedded with tan to maroon to grey thin volcaniclastic layers (30-40%) and stringers of pyrrhotite. Foliation occurs at 70 deg to CA.
273.93	288.56	14.63	VOL			FO	60										w					Fine-grained, dark green to slightly maroon, weakly foliated volcaniclastic with thin elongate blebs of chlorite altered calcite amygdules. A few thin Ca veinlets crosscut at various angles.
																	t					282.70-288.56 m: Whitish MBL w/interbedded thin MN/TN VOL layers.
																						286.30-288.56m Slightly darker and more greenish with tiny black spots.
288.56	306.32	17.76	VOL												t			Cp	t			Homogenous, dark green, fine-grained massive to slightly foliated volcaniclastic with light speckling of darker green grains. Small (<1 cm) Ca veinlets crosscut. There are a few specks of Py and Cp. Occasional regions of elongate calcite amygdules (which have been altered to chlorite ??).
																						288.87-289.12 m: Increase in the presence of amygdules (up to 50%), some up to 1-2cm. Most are Ca-filled but a few have associated disseminated Py within. Generally weakly foliated at 50 deg to CA. Calcite has been altered to chlorite on most of the fractures. Veinlets occur at 30-70 deg to CA. Minor pinkish red blobs occur near one of the fractures - hematite alteration?
																						306.32 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

COMMENTS

Rods froze in hole after mechanical failure, hole lost.

GEOLOGY LOG

HOLE: Rau-SC09-02

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	28.25	28.25	LST																			Light to medium grey limestone, ranging from fine-grained (micritic?) and massive, to quite well foliated. ~5% irregular crosscutting calcite +/- quartz veinlets, sometimes as bands up to 10 cm wide. A few small (<50 cm) areas of interbedded possible volcaniclastic, sometimes associated with bleaching of the limestone.
						FO	25															6.00 m: Foliation occurs at 25 deg to CA.
						FO	50															9.00 m: Minor bleaching of the limestone. 10 cm zone of interbedded, possibly volcaniclastic +/- quartz-carbonate vein.
																						13.50-15.00 m: A few thin layers of brown-orange and slightly clayey volcaniclastic(?) throughout this interval. Slightly greenish in colour with what looks like deformed calcite-filled amygdules.
						FO	50															20.00-23.00 m: Increased calcite veining and crackling of the limestone.
28.25	31.01	2.76	LST	MBL		FO	60															Orangey tan, bleached and marbleized (?) altered limestone (fizzes strongly). Seems like marbleized whitish limestone with sericitic stringers.
31.01	36.55	5.54	VOL			FO	65															Dark green amygdaloidal (calcite-filled) volcaniclastic. Thin (<1 mm), elongate amygdules define fairly strong foliation. Calcite veinlets (< 3 mm) crosscut obliquely, every 10-15 cm. (270 deg to foliation plane, 25 deg TCA)
						VN	25	270															
																						Some volcaniclastic is dark grey, magnetic, and overall the volcaniclastic layer is not very competent, quite fractured.
																						31.25-32.41 m: dark grey, moderately magnetic (very fine magnetite or pyrrhotite?) volcaniclastic layer. Minor hematite and chlorite alteration on a few fractures/carbonate veinlets.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						32.41-35.25 m: Green, foliated vesicular volcaniclastic.
																						35.25-35.55m: Light orangey tan rubble with minor <1 cm quartz fragments. Some brownish, clayey rubble at bottom contact.
36.55	97.23	60.68	LST		CR	FO	50															Light to medium grey crackled limestone. Varies from foliated to brecciated, but predominantly strongly crackled (with some foliation fabric) with thin black lines forming the matrix. Chaotic to evenly spaced thin calcite veinlets crosscut limestone foliation.
						VN	40	180														Foliation ~50 deg, veinlets crosscut at 40 deg, opposite to foliation.
																						52.00 m: Start seeing trace pyrite, usually rusty coloured in calcite veinlets. Also occasional flakes of muscovite.
															t							62.00-78.00 m: The core becomes highly fractured and broken. There are no fragments larger than 10-15 cm.
																				Sp	t	~59.00 m: Very thin Ca stringers with associated light orange blebs of sphalerite (?). Only observed in one veinlet.
																						56.55-56.67 m: Calcite veinlet with vugs and possible volcaniclastic layers (<10%)
						FO	40															80.00 m: Foliation occurs at 40 deg to CA. Crosscutting Ca veinlets cut at 40 deg to CA and 180 deg to FO.
						VN	40	180														
																						91.20-91.44 m light brown crumbly, gougey zone
																						After 92.00 m, core becomes quite well foliated, some augen style calcite sweats/nodules.
																						97.23 m: E.O.H. - The hole was ended early because the rods became frozen in place after a mechanical failure to the drill rig.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	0.71	0.71	OVB																			
0.71	14.40	13.69	LST		FO										t							Light to medium grey limestone with up to 10% calcite flood, especially concentrated in a few thick (10-15 cm) veins. Well foliated with a few orangey tan altered zones.
																						Before 9.00 m foliation occurs at 25 deg to CA, after quick change to 45-50 deg for remainder. Trace finely disseminated pyrite.
																						10.25-11.13 m: Slightly more orangey tan baked zone. Possibly thin sericitic stringers? May be brief volcaniclastic layers.
14.40	15.75	1.35	VOL		FO	FO	55															Light brown and dark green volcaniclastic, foliated, and conformable. Characterized by stretched and deformed calcite amygdules. Slight orange staining on fracture surfaces.
15.75	28.70	12.95	LST			FO	60								t							Light to medium grey limestone moderately foliated at 60 deg to CA with an increased crackle texture from chaotic crosscutting calcite veinlets. Some slightly more brownish layers (<30 cm) with possible volcaniclastic content. Several seemingly conformable calcite veins with irregular margins, up to 5 cm thick cut the limestone.
						BD	60															Foliation at 60 deg. Fairly uniform with occasional very faint trace pyrite.
28.70	31.27	2.57	LST	ALT		FO	60						MBL	f	t							White to slightly orangey strongly marbleized limestone. Foliation remains constant. Minor black speckling and minor pyrite blebs. Wispy stringer of orangey sericite and possible thin volcaniclastic interbeds. (Transitional layer)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
31.27	37.00	5.73	VOL			FO	45															Dark green, foliated volcaniclastic layer. Some sections darker/magnetic, some slightly orangey brown. Prominent thin calcite veinlets crosscutting the foliation. Foliation is sometimes defined by the stretched of amygdules. Calcite veinlets cross-cut at 90 deg to foliation, 40 deg to CA. Minor quartz flood is associated with calcite +/- chlorite alteration.
																						32.15-32.70 m: Highly magnetic, fine black layers within the volcanic. Possibly very fine magnetite or pyrrhotite grains? Also some associated chlorite alteration (of calcite?)
																						36.72-37.00 m: Quartz/calcite flood +/- soft dark brown alteration. Volcaniclastic on upper contact is stained orange.
37.00	149.35	112.35	LST	ALT	CR	FO	40		m													Light grey, heavily crackled moderately dolomitized limestone with dark grey stringers. Two fabrics are present, one aligning the crackling, and one crosscutting with thin planar calcite veinlets at 40 deg to CA and 180 deg to FO.
																						Some thin layers of dark grey to black (slightly shaley?) regions. Throughout the region, some foliated/banded regions occur. Crosscutting calcite veinlets are common.
						FO	35															47.00 m: Foliation occurs at 35 deg to CA. Crosscutting veinlets/fractures at 45 deg to CA and 270 deg to foliation.
						VN	45	270														
																						50.00-50.30 m and 51.75-52.75 m: Shale rich interbeds, dark grey to black, occur throughout. These beds appear to be somewhat more calcareous.
															t							52.00 m: Start seeing occasional traces of pyrite as rusty red cubes in calcite veinlets. Also some muscovite flakes (?) occur within these veinlets.
						FO	40															60.00 m: Foliation occurs at 40 deg to CA. Veinlets cut at 40 deg to CA and 270 deg to FO.
						VN	40	270														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						70.00-71.50 m: Slightly more tan, altered and crumbly. The foliated undulated slightly.
						FO	35															73.00 m: Foliation 35 deg to CA with minor pink (hematite) staining on veins that cut at 40 deg to CA, and 180 deg to foliation.
						VN	40	180														
						VN	10															82.50 m: Start seeing more crackle brecciation. Ca veinlets cut at ~ 10 and 40 deg to CA.
																						82.93-83.00 m: Slightly orangey-brown stained clayey flaky region. Possibly volcaniclastic or fault that appears to line up with the foliation.
																						88.00 m: Limestone has slowly become less altered and more calcareous (fizzes strongly).
																						92.50-93.00 m: More fissile, brown, altered region. Slightly more flooded (calcite/quartz) as well. Below this, a few <1 cm thin orangey sericite altered regions occur.
																						94.00-100.00 m: Quite fissile and well-foliated at 40-50 deg to CA. Characteristic cross-cutting calcite veinlets no longer occur.
																						100.00 m: Limestone is now variably crackle brecciated with only a weak foliation. The matrix is typically dark grey/black with some chaotic calcite flooding.
						FO	45															105.00 m: Foliation occurs at 45 deg to CA, and is slightly stylolitic.
				ALT		FO	40						MBL	s								Throughout interval and especially after 111.00 m, some areas are significantly marbleized, wiping out much of the texture in the core. Foliation ranges from 30-50 deg to CA.
																						116.50-117.00 m: Especially bleached/marbleized zone, with some orange staining.
																						119.05-119.75 m: The limestone is broken up by what appears to be dolomite +/- siderite (?) veins. Coarse crystalline calcite/dolomite occurs with brown carbonate on fractures.
						FR	75															Rubbly sometimes vuggy banded siderite appears to crackle the rock.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						119.75-124.24 m: Dolomite is still present, but quite fractured with pervasive brown carbonate (siderite?) staining fractures, which cut through limestone every 2-5 cm at 40-50 deg to the CA. Trace pyrite occurs on fractures, with rusty orange alteration around it. Fractures and veinlets 1-2 mm thick with siderite-calcite infilling are dominantly planar. Quite a lot of brecciation/crackling occurs throughout. Slightly orangey region on contact back to marbleized limestone.
																						After this point, slightly less marbleized, and limestone is moderately foliated, sometimes crackle brecciaed and deformation. Up to 10% calcite flood occurs. The foliation varies from 35-50 deg to CA.
						FO	60								t							136.00-137.00 m: A few thin brownish sericite stingers and very trace pyrite occur.
						FO	35															142.50-146.30 m: Increased calcite brecciation of limestone, sometimes calcite infills voids in a coliform banded nature, with slight orange staining. Foliation occurs at 30-40 deg between 137.00-141.00 m
																						149.35 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	4.27	4.27	OVB																			Fragments of brecciated limestone
4.27	12.70	8.43	LST												t		t					Beige to light brown, massive, irregularly bleached limestone. Fairly broken up until 9.00 m, then fairly competent.
						FR	35								t		f					Several fracture zones (11.00-11.15 m and11.80-12.19 m) with greyish colour and stringers of pyrrhotite. Pyrrhotite also increases in the last 5 cm before the lower contact.
12.70	13.97	1.27	VOL	ALT		FO	50								w		w					Weakly foliated, beige to tan altered volcaniclastic with sericitic layers and pyrite/pyrrhotite replacing calcite blobs (elongate)
																						12.70-12.90 m: Area with the strongest concentration of pyrrhotite mineralization as stringers and disseminations in browner layers. The bottom contact is at 60 deg to CA.
13.97	217.62	203.65	LST	FOS											t							Medium grey, fossiliferous limestone, ranging from massive to slightly foliated and lightly brecciated. 10% calcite flood occurs within the first 3.00 m, then 5-10% after that. Corals, crinoids (including star crinoids to 2 cm) and other fossils to a total of up to 40%. Thin stringers/bands of very fine pyrite - trace overall.
						FO	70															19.00 m: FO occurs at 70 deg to CA.
						FO	60															22.00 m: FO occurs at 60 deg to CA.
						FO	50															26.00 m: FO occurs at 50 deg to CA.
						VT	90															30.70 m: 5 cm wide calcite vein roughly perpendicular to CA.
						FO	60															34.00 m: FO occurs at 60 deg to CA.
						FO	50															41.00 m: Fossil content decreases to <5% and the limestone is now more brecciated, and slightly deformed.
																						46.00 m +/- 0.50 cm: 20% calcite flood, and increased breccation.
															f							50.00-51.00 m: Slight increase in pyrite as foliaform to convolute stringers. Very fine grained, partially replacing calcite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	60															After this point, limestone gradually becomes lighter grey, with darker grey lines forming rough irregular foliations.
																						58.11-59.55 m: Strange zone, with 15 cm band of massive, fine grained pyrite. Seems to cut the core at 40 deg (upper) to 20 deg (lower) to CA. Below this band is a fine, almost massive looking area of limestone. A 4 cm vein of calcite with blebs of pyrrhotite bisects this unit, but otherwise is very homogenous with blebs/disseminations of pyrrhotite. At the bottom of the zone, there seems to be a gradation back into foliated limestone with a few bands and stringers.
																						59.55-69.00 m: Grey, weakly fossiliferous, moderately foliated limestone with faint sericite +/- pyrite stringers.
						FO	50															69.00 m: FO occurs at 50 deg to CA.
																						71.60 m: Transition from more the more foliated limestone to a more strongly brecciated limestone. Occasional fossil fragments occur. Calcite flood increases slightly, with several up to 5 cm crosscutting veinlets.
						FO	55															73.00 m: FO occurs at 55 deg to CA.
						FO	65															80.00 m: FO occurs at 65 deg to CA.
															w							81.50 m: Some black, graphitic shaley stringers, deformed with increased pyrite.
						FO	40															89.00 m: Start seeing more black shaly clasts occurring in the breccia. Brecciation also increases, and varies from intense to crackled, to minor with camo overprint. The shale is non-calcareous.
																						After 102.50 m, black shale decreases again, along with the amount of breccation. The limestone is again more massive and fossiliferous.
						FO	70															123.00 m: FO occurs at 70 deg to CA.
						FO	60															127.00 m: Start seeing some darker, finer-grained calcareous laminations.

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						130.00-132.00 m: Foliation drops to 30 deg, a few thin brown and sericite stringers occur.
						FO	60															135.00 m: FO occurs at 60 deg to CA.
						FO	65															141.00 m: FO occurs at 65 deg to CA.
						FO	65								t		w					142.41-152.40 m: Limestone is whiter/grittier, and contains up to 30% light yellowish tan to brown sericite and biotite (after volcaniclastic?) layers. Pyrrhotite occurs as irregular stringers and patches, possibly associated with sericite/biotite and or fractures. Foliation is irregular, 60-70 degrees, and sericite and volcaniclastic layers are wispy, sometimes deformed, and non-continuous.
															t							152.40 m: Back to grey, fossiliferous limestone. Trace blebs/small stringers of pyrite, which become weaker with depth. Often coral/crinoid fragments up to 2 cm in diameter are found. Occasional patches of quartz in calcite flood.
						FO	55															158.00 m: FO occurs at 55 deg to CA.
						FO	60															170.00 m: FO occurs at 60 deg to CA.
																						171.50-180.20 m: Trace pyrrhotite in grittier/less fossiliferous limestone. Weak blebs. Token sericite stringers occur nearby.
															t		t					Below this, trace fine disseminated/blebs of pyrrhotite persist sporadically through limestone.
						FO	75															180.00 m: FO occurs at 75 deg to CA.
						FO	70										w					185.06 m: Up to 20% sericite/biotite stringers again. Irregular/wispy, with thin stringers of pyrrhotite. The surrounding limestone still contains fossil fragments. A few 1 cm clots of pyrrhotite occur, in a region of moderate stringers/foliation deformation.
						FO	65								t		w					193.13-198.12 m: Brown biotite stringers have all but disappeared, with sericite stringers and pyrrhotite remaining. The area is well foliated at 65 deg to CA.
																						198.12-200.00 m: Sericite stringers gradually disappear, but pyrrhotite remains. The last pyrrhotite mineralization occurs around 200.00 m.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	70															After this point, back to well-foliated, weakly fossiliferous limestone with foliation running at 70 deg to CA, and some fossil fragments. Calcite (+minor quartz) patches occur.
																						206.60-206.80 m: Narrow area of biotite/sericite stringer layers.
																						206.80-217.62 m: Slightly fossiliferous, foliated limestone.
217.62	218.18	0.56	VOL			FO	50								t			Fu	t			Light green, fine-grained, foliated volcaniclastic. 12 cm calcite vein +/- pyrite at top contact, then 5 cm of clay gouge (light green) may represent fault zone? Foliation is at 50 deg to CA. Trace foliaform pyrite and blebs of green fuchsite.
218.18	221.29	3.11	VOL	ALT																		Maroon/brown volcaniclastic, well foliated with up to 30% calcite as elongate amygdules. A few more greenish layers occur. Possible fold, since foliation changes quickly as follows
						FO	40															218.00 m: FO occurs at 40 deg to CA.
						FO	35															220.00 m: FO occurs at 35 deg to CA.
						FO	15															220.50 m: FO occurs at 15 deg to CA.
						FO	60															221.00 m: FO occurs at 60 deg to CA.
						VN	80															In the area of the low angle foliation, greasy grey clay occurs. Also appears to be displacement along foliation, as at 1 cm calcite veinlet running at 80 deg to CA is displaced 2-3 cm.
221.29	228.97	7.68	LST	FO																		Back to grey and white, foliated limestone, with no fossils or mineralization, and some deformation of layers in last 90 cm.
																						222.30 m: Patches (large clasts) of volcaniclastic (over 30 cm interval) are foliated at a different angle making them appear out of place.
						FO	60															224.00 m: FO occurs at 60 deg to CA.
						FO	35															225.00 m: FO occurs at 35 deg to CA.
						FO	45															227.00 m: FO occurs at 45 deg to CA.

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						Seems like folding (and faulting) are active near the bottom contact at 228.97 m. The foliation switches direction from one way at 70 deg to the other way at 50 deg and then back to 70 deg again. Several other changes appear throughout the region as well.
228.97	231.77	2.80	VOL	ALT											w		m	Cp	t			Altered volcaniclastic, yellow-tan to dark green, with some brown and maroon layers. Pyrrhotite mineralization is significant, as stringers, foliaform disseminations and blebs, fracture fill, and massive crosscutting veins, one of which (2 cm thick) marks the upper contact. Maybe more of a coarse crackling with pyrrhotite as the infill. A few specks chalcopyrite . In the middle of the interval in an area that is less altered the foliation occurs at 60 deg to the CA.
						VN	35	180														230.00-230.18 m: Massive pyrrhotite veins at 35 deg to CA crosscut the foliation at 180 deg. Calcite (brecciated) zones occur with minor patchy pyrite on the margins. Foliation of the host rock appears visible in pyrrhotite vein (stress fabric?)
						FO	70															Traces of chalcopyrite and fuchsite. Two small interbeds of grey foliated limestone occur, with some medium-coarse disseminated pyrite cubes. The lower horizon (230.60-231.04 m) shows a foliation shift from 70 degrees one way to 70 degrees to the other. Below this, back into volcaniclastic.
231.77	236.95	5.18	LST			CN	70								t							Conformable contact at 70 degrees, with calcite from limestone "reaching up" as a few stringers that crackle the volcanic. Foliation 70 deg at this point. Limestone is generally well-foliated though the foliation is not constant. Small areas of breccation.
																						234.70 m-236.95 m: Moderately brecciated zone. with different foliation direction on either side.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
236.95	251.96	15.01	MBL	LST											t		t					Foliated mixture of marble and marbleized limestone. A few areas of sericite/biotite stringers occur.
																						237.85-238.60 m: Brown foliations of sericite/biotite, with trace pyrrhotite. At 238.00 m, rock foliation changes, from 60 deg one way to 50 deg to the other. Small faulted contact.
																						240.09-240.85 m: Speckled region, formed by what looks like maroon-brown sericite/biotite stringers and regions brecciated by calcite.
						FO	60															239.00 m: FO occurs at 60 deg to CA.
																						241.00-244.00 m: Whiter, strongly marbleized interval.
						FO	65															245.00 m: FO occurs at 65 deg to CA.
																						249.50-250.50 m Tan-brown sericite stringers are more common, with trace pyrite and pyrrhotite.
251.96	278.89	26.93	VOL																			Well-foliated, variably altered light greyish-green to dark green volcaniclastic. Some intervals of stretched magnetite pebble conglomerate. Minor calcite sweats and thin crosscutting veinlets occur.
															t		t					252.00-256.75 m: Fairly dark green volcaniclastic, common chlorite alteration. A few stringers of pyrite, and small blebs of pyrrhotite along foliations.
																						256.75-257.30 m: Still dark green/grey, but now stretched magnetite pebble conglomerate. Clasts are stretched to 10x width, and matrix appears to be fine magnetite.
						FO	60								t		w					259.00-261.00 m More bleached, light grey, some foliated volcaniclastics, a few regions of stretched clasts. Speckled throughout with pyrrhotite. A few 20 deg thin calcite veinlets crosscutting at 180 deg to foliation.
						VN	20	180														
															w		t					265.00-266.50 m: Another bleached light grey region, non conglomeratic with a weak concentration of pyrite blebs.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						267.50-268.20 m: Crumbly flaky volcaniclastic with no fragments larger than 2 cm.
																						268.20-269.29 m: Highly fractured, with all pieces less than 5 cm.
																						269.29-278.89 m: Variable mix of dark grey to light greenish-tan volcaniclastic (and minor pebble conglomerate.)
						FO	60															275.75-277.00 m: Appears to be same bleached, stretched light green tan magnetite pebble conglomerate. A few blebs of fuchsite occur.
																						278.89 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: RAU-08-01

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	22.30	22.30	LST		BX	BD	50		f						t							Banded to fluid collapse brecciated, fossiliferous limestone with trace pyrite disseminated and foliaform Py. Rock is not very calcareous so has probably been fairly dolomitized, and is fairly hard. Weak banding occurs at 50 deg to CA. The banding sometimes contains stylolites which occur at 75 deg to CA
						BD	75															
																						17.57-22.30 m: limestone becomes more strongly solution collapse brecciated, with minor rusty alteration on fractures. This limestone is also moderately dolomitized zone.
22.30	23.49	1.19	LST	ALT	MA					w			MBL	f	m							Massive, marbleized grey limestone with weak sericite alteration. Increased pyrite to 5-10%, disseminated/patchy.
23.49	44.20	20.71	VOL	ALT											f		w					Foliated volcaniclastic, first 1.5m is beige tan, greenish colour, becoming more of a strong dark maroon colour (biotite or siderite). 7-10% disseminated, foliaform sulphides. Weakly magnetic, with fine-grained pyrrhotite and disseminated pyrite.
													CHL	f								30.26 m: Transition to more chlorite? altered material as it is a more green colour.
					AM	FO	50								ms							40.38 m: Large 1-2 cm Ca amygdules up to 30 %, with increased sericite alteration. 7-10% Pyrite occurs both fine to medium grained disseminations and replacing the Ca in the amygdules. Foliation occurs at 50 deg.
44.20	52.85	8.65	LST																			Medium grey, slightly calcareous fluid collapse brecciated limestone with irregular cross cutting weak crackle texture.
52.85	94.81	41.96	VOL	ALT																		Green to pinkish brown volcaniclastic, with variable alteration.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	15						CHL	s								52.85-55.52 m: Strongly chlorite altered, low angle foliation (15deg). Weakly pyrite mineralized. Slightly rusty on fractured surfaces.
																						55.52-57.96 m: Maroon (biotite?) alteration, coarse pyrite, cubic. Ca veinlets throughout.
						FO	55		m						ms							57.96-59.65 m: Foliated at 55 deg to Ca and sericite altered with moderately strong fine grained disseminated Py. Fewer amygdules occur. The last 30 cm of the interval is chlorite altered with less pyrite.
																						59.65 m: Medium grey limestone, with weak banding and stylolites.
																						67.00 m: Solution collapse brecciated limestone with Ca matrix and some minor some minor Qz flood. Pyrite still occurs at moderately strong disseminated Py.
						FO	60															75.15-75.50 m: Small Ca vein zone, with possible Sp, and reddish brown hematite alteration. The vein occurs at 30 deg to Ca. The last 15cm is siderite replaced +/- hematite staining at 60 deg.
																						Increased Py in last 30 cm, fine-grained.
																						94.81 m: E.O.H.

GEOLOGY LOG

HOLE: Rau-08-02

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	4.80	4.80	OVB	ALT																		Slightly orange stained, rubbly overburden.
4.80	7.40	2.60	LST		MO	BD	70		m													Mottled light and dark grey LST, moderately dolomitized. Occasional Qz-Ca veinlets cut at 30 and 80 deg to CA. Bedding fairly well defined at 70 deg to CA until 6.10 m.
						VN	80															
						VN	30															
7.40	11.05	3.65	SID		VU							f			w							Dark grey to rusty brown, vuggy siderite with disseminated to blebby Py. Occasional Ca patches. Within the siderite there are small zones of bright orange oxide powder coatings.
11.05	18.16	7.11	LST	ALT	BX				w													Medium grey, dolomitized fossiliferous limestone with solution collapse and overprinting crackle brecciation. The limestone is weakly carbonate altered giving it a slightly orange-brown altered and vuggy appearance. Later Ca veinlets cut the breccia at varying angles. Banding is moderately undulating. Coral mound fragments occurs within minor. There is a rubbly zone at end of interval.
18.16	20.37	2.21	DOL	ALT		VN	30								f		w	Sp	t			Medium to coarse grained dolomite with an altered yellowy orange-brown colouration. Rare black stylolitic bands occur at 60 deg to CA. Weak to fair finely disseminated pyrite and weak pyrrhotite occurs throughout. Pyrite also occurs in thin veinlets that run at 30 deg to CA. Possible trace fine grained red sphalerite.

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
20.37	28.05	7.68	LST	ALT	BN	BD	60		f						t							Medium grey fairly dolomitized brecciated limestone The brecciation is a clean, sharp mosaic style breccia with faint crackle overprint. There is weak orange-brown carbonate alteration on some fractured surfaces. There are occasional interbands of dark grey-black silty material. The contact with the upper unit is very sharp at 80 deg to CA. Trace fine grained disseminated pyrite occurs throughout.
						CN	80															
28.05	28.54	0.49	VOL	ALT		FO	55			s			CHL	w	m							Light green-grey weakly chlorite altered volcaniclastic with strong sericite alteration. Moderately disseminated Py occurs along the FO at 55 deg to CA, as well as in larger blebs and patches. Rare bands of talc. Overall the interval is moderately calcareous.
28.54	37.03	8.49	LST		BN	BD	60								t							Light grey moderately dolomitized limestone with several 20 cm wide, coarse grained Qz-Carbonate veins containing trace pyrite. Fine disseminations o pyrite occurs throughout. The lower contact is gradational, becoming interlayered with sericite bands.
						VN	50															
37.03	50.15	13.12	VOL	ALT	FO	FO	65			I					w							Light brown/purple volcaniclastic with strong foliation at 65 deg to CA. Thin sericite bands with Fine grained pyrite occurs disseminated throughout and along banding in thin bands. The interval becomes increasingly sericite altered at 45.54 m.
						VN	15	270														
															m							40.95-43.07m: increase in the concentration of pyrite which is more concentrated in blebs and overall coarser grained. At this point the core is very fissile.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
50.15	53.12	2.97	LST		BN	BD	50								w		t					Medium grey limestone with occasional gritty horizons, weakly crackle brecciated by Ca veinlets. Weak pyrite and trace pyrrhotite is disseminated throughout. Coarse grained creak dolomite veins cut the unit. Associated with these veins is moderate fine grained pyrite, and fair coarse grained arsenopyrite with patchy fine grained pyrrhotite.
						CN	55								m	f	w					52.55-52.93 m: interbedded dark grey-black volcaniclastic with calcite amygdules mostly to completely replaced by Py with minor As. Contacts with LST are well mineralized with Py and As. Coarse grained creak dolomite veins cut the unit. Associated with these veins is moderate fine grained pyrite, and fair coarse grained arsenopyrite with weak patchy fine grained pyrrhotite.
						CN	40															
53.12	53.98	0.86	VOL	AM	FO	FO	60								f	t	w					Dark grey to black volcaniclastic with calcite amygdules replaced by fine grained Py. Strongly foliated. Amygdules are 0.5-2.0 cm in size, elongated along foliation. Some relict Ca.
						VN	50															
53.98	77.58	23.60	DOL	MX	BN	BD	55								ms	f						Medium grained, creamy white dolomite with moderately to strong mineralization occurring in bands at 55 deg to CA. 17 cm of semi-massive arsenopyrite and pyrite occurs at the upper contact with the volcaniclastic. Weakly concentrated talc patches occur within. Pyrite is fine to medium grained while arsenopyrite is more typically coarse grained and most commonly occurs in 0.1-1 cm wide bands in the DOL. Qz+/- Dol veins cut the dolomite at 30 deg to CA
						VN	30															
						VN	45								t	w						55.97-56.57 m: much less sulphide, fewer Qz-Dol veins now occurring at 45 deg to CA. Pyrite is consistent throughout the interval, while arsenopyrit is more patchy.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	50								m	w	t					62.58-77.58 m: Decrease in the concentration and grain size of the mineralization within the entire interval.
						VN	5															64.45-65.35 m: Coarse grained white Qz-Dol vein, with minor Py blebs within. More Py and As at contact between vein and mineralized dolomite. Sulphides are less strongly concentrated in bands, more disseminated through core. Occasional 5 cm wide zones of coarser grained sulphide.
77.58	121.21	43.63	DOL	MX	BN	BD	65								ms	f	f					Increase in coarse grained As. Py more
																						commonly forms in thin bands parallel to
						VN	40															banding, while As occurs as medium to coarse
																						grained blebs and disseminations. Po occurs
																						with Py and as fine grained blebs. Occasional
																						2-5 cm wide shaly horizons. Still occasional
																						gypsum/talc patches, often more evident on
																						fractures.
						VN	65								f	w	t					85.45-97.09 m: Arsenopyrite increasingly occurs in bands as well as blebs. Less mineralization occurs near talc patches which occasionally rim Qz-Dol veins.
						VN	30	90							f	w	t					97.09-102.99 m: Decrease in sulphides.
						BD	55								f	f	t					102.99-108.79 m: Increase in coarse grained arsenopyrite occurring in both thin bands and disseminations to blebs. Pyrite is dominantly occurring in thin bands and patches. Banding occurs at 55 deg to CA.
						BD	70								f	w	t	Bi	t			108.79-121.21 m: Decrease in grain size and percentage of sulphides dominantly occurring as thin (0.2-0.5 cm) bands with rare blebs. Rare Bismuthanite occurs at 120.00 m. Late Qz+/- Dol veins cut the mineralization approximately 1-2 per metre at 50 deg to CA and 180 deg to banding.
						VN	50	180														
121.21	122.50	1.29	MBL		BN	BD	50											Ma	f			Fine grained wavy magnetite in bands within pure white marble.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-08-04

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	15.24	15.24	LST		CR	BD	75															Light to medium grey limestone with later calcite veining causing minor fluid collapse brecciation and later crackling. Multiple phases of calcite veining with latest phase as smaller (0.5-2 cm wide) quartz calcite. Thin stylolitic bands occur at 75 deg to CA.
					BX	VN	80															
						VN	30	180														9.60-10.85 m: Main area of brecciation. Limestone clasts are elongate, subrounded. NOTE: tfa attitude measured from vein to bedding.
																						11.73 m: 5 cm wide vuggy Qz-Ca vein.
15.24	31.25	16.01	LST		MO	BD	65		m						t							Mottled medium and dark grey limestone with weak brecciation texture. Dark grey thin stingers/bands in medium grey limestone, dark grey is moderately dolomitized. Minor argillite bands/impurities. Qz-Ca stringers/veinlets up to 2 cm wide.
						VN	30	110														
					BX	VN	10															19.89-23.26 m: Ca veining causing crackling-brecciation. Subrounded limestone clasts.
																						28.95-29.10 m: fine grained Py filling vugs in Qz-Ca flooded area.
31.25	44.53	13.28	LST		BN	BD	60		I			I										Dark grey fluid collapse brecciated limestone with a faint banding/mottled texture. Qz-Ca stringer veinlets cut the limestone at 35 deg to CA. Clasts in breccia are smaller, more angular that those in previous intervals.
						VN	35															
44.53	63.00	18.47	LST		MO	BD	45				DCA	s										Medium to dark grey mottled LST. Darker areas are decalcified. Frequent (10 per m) Qz-Ca veinlets, are now pale yellow colour, until 46.82m
						VN	20	180							t							52.10 m: Breccia clasts now rounded. Medium grey limestone, less mottled, more defined bending, more calcareous than previous. Brecciation less common (7-10%) Py disseminated along fractures.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
63.00	76.75	13.75	LST		BN	BD	50								t							Medium grey limestone, less mottled, more defined banding, more calcareous than previous. Brecciation less common (7-10%) Py disseminated along fractures.
															w		t	cp	t			72.48-73.11 m: Pale yellow - white calcite with minor Qz veining and green-grey volcaniclastic layers.
76.75	81.27	4.52	MBL		MA	VN	5								w		t					Light grey marble with a coarse grained, vuggy Ca vein at a low angle to the CA with minor orange-brown alteration stain on fractures. Pyrite is weakly disseminated throughout. Minor silty bands occur within marble.
						BD	60															
81.27	86.74	5.47	VOL		FO	FO	60			f					t							Dark brownish grey, very fine grained, with biotite. Pale yellow-green sericite altered at contact with marble and around calcite veins . Ca veins and sericitization roughly follow the foliation. The foliation is more defined in areas of veining and sericitization. Trace pyrite is disseminated throughout.
						VN	70															
						CN	66															
86.74	100.46	13.72	VOL		FO	FO	55			I					f		t					Fissile intensely sericite altered volcaniclastic. Sericite bands occur intermixed with purplish brown interbeds of biotite rich volcaniclastic. Fairly disseminated Py and trace Po occur throughout.
										s					f		t					93.22-98.69 m: Layers are less fissile than previous, unit is more calcareous, brownish interbands contain calcite and are dominant over sericite bands. Mineralization increases towards the bottom 1 m of interval.
						FO	55			I					m		t					98.69-100.46 m: Increase in the concentration of pyrite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
100.46	107.50	7.04	DOL		BN	BD	55			ms					ms		w	w				Fine to medium grained dolomite with later calcite veining ~ along bedding. Sulphides are disseminated - semi-massive, medium to coarse grained and ~ along banding. Occasional interbeds sericite altered volcaniclastic.
															w	ms						101.75-102.05 m : Very coarse grained As with disseminated Py following bedding
																	t					102.20-102.27 m: Semi-massive As occurrence is patchy, and often coarse grained.
															f	ms	t					103.85-104.10 m: Increased As concentration
															w	s	t					104.90-105.26 m: Coarse grained As
107.50	110.00	2.50	DOL	MX	BN	BD	55								w	t						Dark grey faintly banded dolomite with mineralization generally in occasional coarser grained patches and zones. Occasional Ca veining occurs along banding.
110.00	169.78	59.78	DOL	MX	BN	BD	55								ms	f	t					Pale yellow-light grey dolomite with later calcite veining with associated talc. Sulphides are predominantly fine grained and occur in bands at 55 deg to CA. Occasional patches of coarser grained sulphides occur. Pyrrhotite now occurs as trace fine disseminations.
						BD	60								m	w	w					117.46-138.04 m: Sulphides become fewer and predominantly along bedding at 60 deg to CA. Pyrite is still mainly fine grained with fair coarse grained arsenopyrite and trace coarse grained pyrrhotite. The pyrrhotite does not seem to follow the banding that the other sulphides do. Occasional interbeds of medium grey silty dolomite with trace fibrous talc.
						BD	60								m	w	t					138.04-150.58 m: Similar dolomite with an increase in the concentration of talc. Fewer patches of coarser grained sulphides, as well the sulphide bands are thinner.
						BD	65								ms	w	t	Mag	t			161.46-169.78 m: The dolomite has become coarser grained. Sulphides bands are again slightly thicker and the patches are coarse grained. Minor magnetite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	57.16	57.16	LST		BX	BD	65								t							Medium grey weakly solution collapse brecciated, weakly dolomitized limestone with zones of camo-spotted mottled textures. Stylolitic bands occur within more banded limestone at 65 deg to CA. The transitions between banded, mottled, and brecciated are indiscrete and occur often.
					MO																	
																						6.13-12.00 m: The limestone in this zone is slightly fractured up and has a weak brown weathering stain on the fractured surfaces.
																						15.50 m: Begin to get dolomite in irregular (generally low angle) veins.
															t							16.98 m: Gradually begin to get medium grained dolomite veins running roughly parallel to the core axis. Associated with these veins are trace concentrations of finely disseminated pyrite.
																						39.20-42.20 m: The limestone appears altered to a weak yellowy grey colour.
						BD	70															42.20-49.80 m: The core becomes more strongly solution collapse brecciated with camo-mottled interlayers. 60% breccia, 25% mottled, 15% banded. Banding is variable and occurs from 60-85 deg to CA. Pyrite is still trace.
																						49.80-55.45 m: The limestone becomes more banded than brecciated.
													MBL	w	w							55.45-57.24 m: The limestone becomes moderately marbleized. This contact is gradational. Within this zone, begin to pick up weak finely disseminated pyrite.
57.16	66.50	9.34	VOL	ALT		VN	80		m						f							Greenish grey moderately sericite altered volcaniclastic with moderate foliation occurring at 65 deg to CA. Fair fine grained disseminated pyrite occurs throughout. Calcite veins 0.5-1.5 cm in diameter cut the unit at 80 deg to CA (these veins are slightly variable though).
66.50	67.60	1.10	LST																			Zone of medium grey limestone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
67.60	73.45	5.85	MX												25		20					Semi massive pyrite (25%) and pyrrhotite (20%). The top 1 m is Po and then it becomes more disseminated Pyrite in sericite altered volcaniclastic then get into more semi-massive pyrite by 71.50 m.
73.45	150.42	76.97	DOL		BN	BD	65								20	m	t	Bi	t			Medium to coarse grained white to light grey and more commonly creamy yellow dolomite with fine to medium grained pyrite and coarse grained arsenopyrite. Banding of the Py occurs at 65 deg to CA. The Asp occasionally follows the banding but can also be patchy. Weak 5-15 cm thick interlayers of volcaniclastic (?) or silty layers occur. Overall Py 20%, Asp - 5-7%. A weak concentration of quartz veins/bands occur at 65 deg to CA. There is trace to no talc within the dolomite.
															w							79.07-85.89 m: Gradual transition into marbleized limestone and then into medium to dark grey limestone. Mineralization is trace until 81.20 m when you begin to see a weak concentration of fine-medium grained Py.
																						85.89-126.40 m: Gradual transition back into the mineralized dolomite. Trace patches of Po begin to occur at 89.50 m. Pyrite is fine to medium grained, banded at 15% concentration. Arsenopyrite occurs at medium to coarse grained patches at 2-5% concentration. Banding of the sulphides occurs at 65 deg to CA. Thin interlayers of VOL still occur within the dolomite.
															f	w	t					85.89-126.40 m: Gradual transition back into the mineralized dolomite. Trace patches of Po begin to occur at 89.50 m. Pyrite is fine to medium grained, banded at 15% concentration. Arsenopyrite occurs at medium to coarse grained patches at 2-5% concentration. Banding of the sulphides occurs at 65 deg to CA. Thin interlayers of VOL still occur within the dolomite.
																						119.00 m: The bands of mineralization are becoming thinner, averaging 0.5 cm thick.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

																						126.40 m: A coarse grained crystal of bismuthanite clearly occurs in the dolomite.
												ms										126.85 m: There is a 25 cm zone of moderately-strongly oxidized dolomite. The material is limonitic, reddish-orange in colour.
															f	w						132.50 m: The concentration of the coarse grained light to medium grey dolomite increases. Pyrite is very fine grained fair to moderate in concentration, while Asp is weak.
															m	w	t					142.50 m: Dustings and fine grained crystals of pyrite increase in concentration to moderate. Arsenopyrite is weak, and medium to coarse grained. Pyrrhotite is only trace fine grained disseminations.
150.42	156.00	5.58	LST		MA								MBL	w								There is a gradational transition into medium to dark grey rather massive limestone with weak marbleized appearance.
156.00	185.01	29.01	MBL		BN	BD									t			Mag	f			Gradational change into white marble with bands of semi-massive magnetite at 75 deg to CA. 5% magnetite occurs starting after 155.50 m and as swirly bands within the marble. Trace Py occurs as fine grained thin stringers.
																		Mag	w			At 159.50 m, the concentration of magnetite decreases slightly to 1-3%.
																						185.01 m: E.O.H.

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	5.70	5.70	LST	ALT																		Light grey, altered, massive limestone (fizzes strongly with acid).
5.70	21.00	15.30	LST		BN	BD	50						CHL	t	w	t		Bi	t	Sp	t	Foliated to brecciated grey limestone with significant (30%) Qz+/- Ca +/- DOL vein/flood. Minor talc and muscovite zones associated with quartz veining. Coarse stringers, blebs, and disseminations Py with trace coarse blebs of arsenopyrite. Faint banding occurs at 50 deg to CA.
																						Low angle Qz/Ca and significant coarse DOL veining. Mineralization increases after 15m.
																		Bi	w			13.01-13.15 m: Shiny, soft, coarse crystalline bismuthanite.
																		Sp	w			14.10 m and 15.20 m: blebs sphalerite.
													CHL	w								16.50-17.00 m: Begin to see faint chlorite alteration.
21.00	68.00	47.00	DOL	MX											20	ms						Mineralized coarse grained grey/creamy white dolomite with a faint banded texture. Up to 75% sulphides, but more typically 30%, with 15-20% Py, 10% As. Fine stringers and bands of pyrite, and more coarse grained clusters of arsenopyrite crystals.
															35	s						31.15-36.90 m: Mineralization increases to 40-50% sulphide, semi-massive Py/As.
															s	f						36.90 m: Begin to see more prominent quartz veining. With this there is a decrease in total sulphide percentage to 20%.
						BN	65								s	ms						54.15-68.05 m: mineralization continues, 15-35%, with 10-20% Py and 5-15% As. Less quartz but still occasional veins. Pyrite bands are roughly aligned at ~60-70 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
68.00	76.85	8.85	VOL			FO	60								ms							Strongly foliated, tan to beige volcaniclastic. Arsenopyrite mineralization ends but pyrite mineralization continues with Ca veinlets/stringers and amygdules? 10% Py. Foliation occurs at 50-70 deg to CA.
76.85	99.01	22.16	DOL	MX											s							Back to mineralized dolomite, almost all pyrite (15% total). Banding now occurs nearly perpendicular to core axis (80 deg to CA). A few volcaniclastic stringers occur within.
															ms							82.13-83.05 m: Maroon volcanic layer with 10% Py.
															s							83.05-89.02 m: Same mineralized dolomite as above, with more prominent banding of the pyrite.
															ms							89.02-99.01 m: A few thin sericite volcanic layers, overall still mineralized DOL, with 7-10% Pyrite. Some altered limonite zones and minor quartz veins occur.
																		Sp	w			98.00 m: Small red sphalerite crystals occur in a talc zone.
99.01	113.00	13.99	VOL	ALT	FO	FO	60			f												Foliated, variably sericite altered volcaniclastic. Foliation occurs at 60 deg to CA.
															f							99.01-100.00 m: Sericitic volcanic with finely disseminated fair pyrite
																						100.00-101.90 m: Maroon volcanic with disseminated pyrite.
																						101.90 m: Gradational change into greenish black, fairly chlorite altered foliated volcaniclastic.
113.00	152.40	39.40	LEP		FO	FO	65															113.00 m: Start getting elongated leopard printed texture. This change is gradational from the dark volcaniclastic non spotted volcaniclastic. This unit contains dark biotite, but the percentages are difficult to distinguish. Local stringers of sericite alteration occur throughout. A weak foliated texture occurs at 65 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

COMMENTS

Void spaces in hanging wall rock, rods dropped 1-2 ft. while drilling. Asp is present throughtout the mineralized zone, but only is significant at the top and bottom of the minerized interval. The top of the interval has stronger Asp then the bottom, relatively. It appears that Py and Asp crystallized synonymously, overgrowths of each on one another are present within the same vein.

HOLE: Rau-08-07

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	4.57	4.57	OVB																			
4.57	22.19	17.62	LST	FOS	BX	BD	40								t							Dark grey limestone that has become fluid collapse brecciated by carbonate flood. Clasts are 0.5-1.5 cm and angular. Later calcite veins cut the breccia at 50 deg to the CA. Limestone shows broken crinoid fragments along with other marine fossil fragments. In some areas original bedding is visible but not extremely clear. Rare stylolites represented by dark grey stylolitic bands occur at 40 deg to CA. Trace disseminated Py occurs throughout. The bottom 50 cm of the unit becomes quite gritty or micritic looking and is more massive in nature and less brecciated.
						VN	50															
22.19	27.47	5.28	VOL	ALT	FO	FO	70			m					w		t					Blackish grey, fine grained volcaniclastic with increasing sericite alteration starting at 23.60 m. From this point on the volcaniclastic shows medium green sericite layers bounded by the purplish brown bleached looking volcaniclastic. Pyrite replaces the calcite amygdules well as calcite veins that parallel foliation. Overall amygdales concentrations is low 2-3%.
						VN	70															
27.47	35.39	7.92	VOL		AM	FO	45								t							Black finely laminated volcaniclastic with increasing concentration of amygdules at 30.30 m. From this point slightly irregularly shaped vesicles and cross-cutting veins (60-80 deg to CA) are filled with calcite and rarely a greenish-grey mineral (Chlorite?) Py only occurs are rare specs.
						VN	70															
						VN	30															33.36-33.47 m: massive Qz-Ca vein with a very irregular contact.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						35.09-35.39 m: Slight bleaching of the volcaniclastic to a pale brown colour from the unit below.
35.39	40.80	5.41	VOL	ALT	AM	FO	60			m					w							Sericite altered amygdaloidal volcaniclastic, greenish pink in colour and more massive looking with a slight foliation defined by the amygdules. . Does not have the highly foliated texture that other altered volcanics have, only a weak one running at 60 deg to CA. Py replaces calcite veins that cut the unit. These veins are quite erratic in nature. 1-3 % smoky quartz also occurs scattered within the unit.
																						40.40-40.80 m: gradation in and out between altered amygdaloidal volcaniclastic to massive looking limestone.
40.80	43.24	2.44	LST		MA																	Massive, medium to dark grey limestone with slight fluid flow texture and very erratic looking.
43.24	48.03	4.79	LST		BX																	Matrix supported brecciated limestone with angular clasts 0.5-2 cm in diameter and a calcite matrix. Possible relict bedding at 55 deg to ca (although it is questionable if the limestone clast is in its original position).
												m	CL	s								47.00-48.03 m: Highly fractured slightly altered zone (FAULT??) The fractured surfaces have a strong red-orange alteration colouration. The limestone itself is strongly fluid collapse brecciated with a highly altered matrix.
48.03	53.00	4.97	LST		BN	BD	85								n							Thinly laminated light and dark grey limestone with dark grey stylolites throughout running at 85 deg to CA. Gritty horizons occur occasionally.
						VN	70															
53.00	57.80	4.80	LST		MO	VN	10															Gradual change into a more mottle looking limestone. Calcite veins cut the limestone but original bedding is masked by the mottled texture. There is no visible mineralization.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
57.80	76.15	18.35	LST		BN	BD	10															Collapse breccia represents now 20% or the core. The clasts are subrounded and 0.5-1.0 cm in diameter. The rest of the interval is disturbed but non brecciated limestone (50%) and non-disturbed bedded and stylolitic limestone (30%). The contacts between these three styles of limestone are gradual and frequent. The stylolites occur at 70 deg to CA
						BD	70															62.00 m: There is a zone if vuggy limestone filled with coarse grained sub to euhedral calcite.
76.15	100.60	24.45	LST		BX	VN	60								t							Extensive solution collapse breccia, with rounded to subrounded clasts. Rare pyrite occurs generally associated with later calcite veins that cut the breccia. Dark grey silty horizons also occur within.
100.60	111.47	10.87	LST		MO	BD	40															The limestone have again become mottled pale and medium grey in texture and colour. Brecciation still occurs, but it is a mosaic breccia, very clean looking with clean breaks of the limestone and only little calcite matrix. The clasts are angular and vary in size from <1 cm to 3-4 cm. Rare bedding occurs at 40 deg to CA. The contact with the above unit is sharp but not well defined.

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
111.47	136.85	25.38	LST		BX	BD	45															The breccia again appears to be more of a collapse breccia, with more rounded clasts, and increase in the calcite concentration. Clasts are smaller 1-2 cm and the zones of limestone that are non brecciated show a more fluid altered texture making bedding indistinguishable in many cases. In a few areas bedding is distinguishable at 45 deg to CA. Stylolites also occur throughout. Thick quartz carbonate veins 3-5 cm thick with a slight yellow hue cut the both the brecciated and non-brecciated limestone. In some areas coarse grained dolomite occurs with grains 2-3 mm in diameter and having a sugary texture.
						VN	60-70															
136.85	142.75	5.90	LST		BN	BD	70								w							Medium to dark grey bedded limestone with Py disseminated along bedding planes. Rare Qz-Ca veins cut bedding. Rare dark grey silty horizons up to 10 mm thick occur interbedded with the limestone. Weak pyrite is disseminated along bands at 70 deg to CA.
						VN	30															At 138.70 m: begin to get siderite alteration in thin bands cutting the unit.
			VOL																			139.70 m: Possible volcaniclastic layered within.
			VOL																			141.30-141.45 m: Sericite altered volcaniclastic bed.
142.75	145.53	2.78	MBL		MA	BD	60								t							Massive white marble with rare silty horizons and trace Py along faint relict bedding.
145.53	152.90	7.37	VOL		FO	FO	75			f					t							Black fine grained volcaniclastic with thin foliation and thin 2-5 mm thick calcite veinlets that follow foliation. Overall Py is rare but when seen it occurs as course grained crystals. Fair sericite alteration occurs with the contact of the marble.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
152.90	162.75	9.85	VOL	ALT	FO	FO	75			w					t							Slightly sericite altered volcaniclastic with a characteristic bleached pale greyish green colour. Very minor disseminated pyrite occurs.
162.75	166.85	4.10	VOL		FO	FO	70															Zone of less altered volcaniclastic with a very faint foliation.
166.85	172.20	5.35	VOL	ALT	FO	FO	75			ms					f							A gradual increase in the amount of sericite alteration until 169 m where the volcaniclastic shows the characteristic yellow green sericite alteration colour with faint thin layers of pale pinkish brown bleached volcaniclastic. Increase in the pyrite concentration to fair. The pyrite occurs as fine grained disseminations throughout.
172.20	181.30	9.10	DOL	MX	BN	BD	70								ms	30	f					Interval starts with a 20 cm massive quartz vein with associated Py and Po. Vein angle slightly obscured by mineralization diffusing from its boundary. Intensely mineralized coarse grained dolomite with faint banded texture. Asp is very coarse grained and overprints bedding. Py and Pyrrhotite are fine to medium grained and mainly constrained to banding. Fibrous green crystals quite soft with a radial nature (gypsum? or actinolite?) occur on the periphery of highly Asp mineralized zones.
						VN	70															
181.30	181.96	0.66	VOL		FO	FO	70			l												Black volcaniclastic with fine grained disseminated Py and faint foliated. Unit fizzes intensely when exposed with acid. Relict vesicles have been filled with pyrite and elongated in the direction of foliation. Ca veins cut the unit.
						VN	45															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
181.96	190.40	8.44	DOL		BN	BD	70								m	f	t					Decrease in sulphide content particularly that of Asp. Also the dolomite has become light to medium grey as well as cream coloured.
																						185.90-190.50 : Medium grey limestone with weakly disseminated pyrite and trace pyrrhotite. Small zones of coarse grained dolomite occur as well.
															w		t					186.30-186.87 m: Quartz vein with pyrite, pyrrhotite and rare grey talc.
																						Upper and lower contacts are sharp but undefined.
190.40	211.40	21.00	DOL		BN	BD	55								l	w	w					Mineralized dolomite with a decrease in Asp from the units above. Pyrrhotite and pyrite have increased in concentration and grain size but are still disseminated within bedding planes. Patches of white to light grey talc (3-5%) occur near areas of increased mineralization and increase in grain size of dolomite. Pyrite bands occur at 60 deg to CA but become concentrated in a few pockets within the interval.
211.40	239.70	28.30	DOL		BN	BD	70								ms	t	t	Bi	t			Mineralization habit has changed slightly; Py occurs as either semi-massive zones (211.22-212.17 m, 214.52-214.70 m, 216.61-216.84 m, and 222.30-223.95 m) or in very thing <1 mm bands within the coarse grained dolomite host. Overall the pyrite is fine to medium grained but large cubic crystal are occasionally associated with the semi-massive zones. Quartz occurs within the dolomite and seems to cut the mineralization. The concentration of talc has decreased slightly.
			VOL		FO	FO	55															236.22-236.55 m: Volcaniclastic layer. Purple brown in colour with sericite bands at 55 deg to CA following the FO.

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			VOL		FO	FO	55								w							237.56 -239.70 m: In and out of sericite altered volcaniclastic with a FO at 55 deg to CA. The volcaniclastic contains no mineralization, but the interlayered dolomite contains disseminated pyrite.
239.70	248.41	8.71	LST		FO	FO	70								t							Leopard print textured limestone with white calcite "clasts" and dark grey to black limestone "matrix". Mineralization has gradually decreased to nothing. A weak foliation occurs at 70 deg to CA. Following this FO, there are Ca bands 0.2-0.7 cm thick. Biotite is quite easily distinguishable within the unit, but overall it is a dark grey colour.
																						248.41 m: E.O.H.

COMMENTS
calcite amygduols are foliated, implying some replacement was synonymous or prior to structural deformation

GEOLOGY LOG

HOLE: RAU-08-08

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.26	3.26	OVB	RBL																		Rubbly Limestone overburden.
3.26	23.98	20.72	LST	FOS	MO	BD	35								t							Medium grey, fossiliferous LST with Ca veinlets. Mottled camo spotted light and dark grey LST texture. Very calcareous. Fluid crackling/breccias with angular LST clasts, calcite matrix. Trace disseminated Py. Some Ca veins are coarse grained. Fewer fossils towards the end of the interval. Weak banding occurs at 35 deg to CA. Thin Ca veinlets cut at 40 deg to CA and 180 deg to banding.
						VN	40	180														
																						23.56-23.98 m: Medium grey LST with gritty, rounded dolomite crystals. Very fine grained, disseminated Py occurs within. Massive, no bedding.
23.98	43.80	19.82	VOL	MX	FO	FO	45			f					w							Dark grey-black volcaniclastic with Ca amygdules from 24.75m onward. Amygdules are frequently replaced by Py, often Py is rimming Ca in vesicles. Py also occurs as blebs, patches, thin veinlets and smears. Zones of sericite alteration occur within. Some of the fractured surfaces have a weak orange alteration stain on them. Amygdules decrease in concentration at 36.23 m. Lower contact with limestone is gradational, Py increases toward contact. Py occurs as amygdule replacement and along foliation.
						VN	70															
43.80	167.69	123.89	LST		BN	BD	60								w							Medium grey banded limestone with occasional zones of angular, matrix supported brecciation. Occasional silty interbeds and frequent Ca veinlets occur throughout causing crackling in some areas. Weak pyrite is disseminated throughout.
					BX	VN	55	180														53.03-53.59 m: very calcareous sandy horizon.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									w													55.80-58.36 m: Limestone breccia with small, rounded clasts. Weak dolomitization of the limestone occurs in areas. Fine grained disseminated pyrite occurs throughout. In places these are partly weathered out leaving a slightly vuggy texture.
															w			Bi	t			58.36-72.88 m: Mottled light and medium grey with Ca veins that contain pyrite and rare bismuthanite. Occasional 5-10 cm wide coarser grained sandy horizons containing an increased concentration of pyrite. One Ca vein contains very coarse grained (up to 2 cm) pyrite crystals.
																						72.88-104.16 m: Brecciated zone with 2-5 cm long angular clasts and a Ca matrix and mainly matrix dominated. Overall 60% brecciated.
						VN	55															104.16-118.70 : Decrease in the amount of brecciation, now 30%. The clasts in the breccia are sub-rounded. Later Ca veins cut the breccia. Occasional 10-50 cm rubbly zones occur and are slightly weathered.
						BD	70															118.70-167.69 m: Further decrease in brecciation. Breccias now constitute 5-10%. Non-brecciated limestone has a mottled texture. Breccias are more clast-supported, and the clasts are more angular. Banding is fainter, dark bands are less calcareous than light bands
						VN	55															
						VN	10	320														147.52 m: several pale yellow coarse grained dolomite veins, 2-5 cm wide cut the limestone.
167.69	171.25	3.56	DOL	MX	BN	BD	65								w							Light green-grey medium grained dolomite with finely disseminated Py occasionally concentrated along thin bands. Banding occurs at 65 deg to CA. Rare 10-20 cm intervals of moderately strong Py occur.
															s							170.38-171.25 m: Coarse grained quartz-calcite vein with fine to medium grained, euhedral pyrite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
171.25	195.32	24.07	VOL	ALT	FO	FO	40			I					w							Pale green-purple-grey sericite altered volcaniclastic with a strong foliation running at 40 deg to CA. Py occurs as patches replacing Ca along the foliation. Occasional 2-5 cm zones with dark green felted masses that resemble actinolite.
																						186.62-192.81 m: Dark brown-grey, mildly sericite altered volcaniclastic. Foliation is not as strong as the rest of the interval. Occasional Qz-Ca veinlets occur both along and cross-cutting the foliation.
																		Mag	w			188.49 m: 1 cm wide Qz-Ca vein with coarse grained magnetite.
						FO	45								f		w					192.81-195.32 m: Intensely sericite altered, crumbly with a strong foliation occurring at 45 deg to CA. Coarse grained Py and Po occur throughout in 2-5 cm wide patches. This interval also contains three 5-10 cm wide, low angle Qz-Ca vein.
195.32	248.56	53.24	DOL	MX	BN	BD	70				I				m	m	w					Coarse grained, dolomite with medium to coarse grained Py, As in patches and 0.1-1 cm wide bands forming distinct bands. Occasional dark grey silty horizons 0.5-1.5 cm wide occur within the dolomite. These horizons are barren and increase slightly in concentration with depth. Talc and gypsum occur throughout
																						196.94 m: drastic decrease in As concentration
																						215.96-219.00 m, 219.50-220.98m, 221.80-223.76m: Ca veinlets occur within these zones.
248.56	274.32	25.76	LST		MA	VN	70		f						w	t	t					Medium to dark grey LST, slightly dolomitized with frequent Ca stringers. Stringers have a wide range of orientations. Occasionally there are zones of coarse grained dolomite within the limestone. Sulphides are medium grained, and occur mainly in patches associated with coarse DOL. These veins occasionally cause crackle texture. There are approximately 2-3 different veining events.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

COMMENTS

Encountered large voids (greater then 20 feet), while drilling hole, cord to 670', rods serpeated due to bad "faulted" ground. Acid test was conducted instead of IceField probe due to lack of hole stability and rod seperation.

GEOLOGY LOG

HOLE: RAU-08-09

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	51.60	51.60	LST	ALT	BX				w						t							Weakly dolomitized weakly to moderately fluid collapse brecciated with zones of non- brecciated banded and stylolitic with an orientation of 60 deg to CA. The very top of the unit is quite rubbly unit 15.50 m with moderate orange brown alteration of the carbonate (could be oxidizing since drilling - check with matt and check photo's of the core). Trace pyrite occurs in thin stringers and fine dissemination.
					BN	BD	60															25.91-29.15 m: Strongly stylolitic zone with orientation of 60 deg to CA.
																						34.50-35.30 m: Dark orange brown slightly rubbly siderite alteration of the carbonate.
51.60	53.81	2.21	DOL	ALT																		Strongly altered dolomite zone with strong siderite alteration of the Ca veins that cut the dolomite. The dolomite is reddish pink in colour with very dark brown, black siderite. The dolomite is coarse grained with weak sub-euhedral pyrite.
53.81	92.00	38.19	LST	ALT	BX	VN	60		w						t							Slightly pinkish dolomite veins 1-3 cm thick cut the fluid collapse brecciated weakly dolomitized limestone at 60 deg to CA. Fractured surfaces have orangey-brown rusty coatings on them.
																						67.73-68.58 m: Camo mottled limestone with light-medium and medium gray mottled patches.
																						86.63-87.45 m: Rubbly pinkish reddish brown alteration stain on the limestone (hematite?)
92.00	100.75	8.75	LST																			Moderately altered, strongly fractured limestone medium grey limestone with medium grained pink dolomite bands and minor graphitic laminations.
																						92.85-93.30 m: Extremely rubbly quartz (vein??)
																						93.30-96.01 m: Extremely rubbly limestone with minor fragments of dark brown siderite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						96.01-99.90 m: Moderately dolomitized medium to dark grey limestone with irregular Ca veins that cut the interval.
															w							99.90-100.75 m: White to cream, medium grained dolomite with weak medium to coarse grained Py (sub to euhedral) with moderate quartz throughout.
100.75	105.89	5.14	VOL		FO	FO	40															Strongly sericite altered greenish grey volcaniclastic. It is quite rubbly for the top 4 m with fair quartz rubble.
																						103.40 m: The unit becomes very fissile dominated by laminations of greenish grey siderite.
105.89	129.98	24.09	DOL		BN	BD	60															Coarse grained creamy white mineralized dolomite. Pyrrhotite is the dominant sulphide in the sequence with Py most concentrated within the top 1.5 m of the interval. The pyrrhotite occurs in bands running at 60 deg to CA.
																						105.89-107.00 m: The upper 1.5 m is dominated by semi-massive pyrite (40%).
																						107.00-110.40 m: Talc/muscovite rich dolomite with 15% Po, 5% Py and very rubbly overall.
															20							110.40-112.42 m: Semi-massive pyrrhotite zones within the dolomite.
															f		t					112.42-116.26 m: Fairly mineralized dolomite with patches and bands of Po and trace Py.
															w		m					116.26-129.85 m: Py and Po occurs disseminated and banded within the dolomite.
129.98	163.98	34.00	DOL	ALT																		Very rubbly med-dark brown strongly carbonate altered mineralized dolomite. The recovery is very poor in this zone.
			VOL	ALT																		143.26-160.02 m: Very fissile strongly sericite and carbonate altered medium green-grey volcaniclastic with a reddish brown overprint. The true thickness is probably much less than this but the recovery was extremely poor due to the extent of alteration of this and the below material.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			OX																			160.02-160.60 m: Dark brown oxide clay with minor small gritty oxidized fragments. The interval is most likely much larger than this but was NOT recovered. (COLOUR 5YR 3/2 - dark reddish brown)
163.98	184.40	20.42	DOL										SID	f								Coarse grained dolomite with trace Py and Po and abundant siderite on fractures and in an intense stronger network running roughly parallel to the CA from 171.00-184.40 m. Minor limonite rubble occurs.
184.40	190.50	6.10	MBL																			Dirty marble with black (argillaceous?) non-magnetic bands running at 75 deg to CA.
																						190.05m: The drillers reported a cavern but it was more likely just a mistake with oxide that fell into the bottom of the hole.
																						190.50 m: E.O.H. There was a 'cavern' which contained oxide at the bottom. This material however may have just fallen into the hole from above.

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	111.25	111.25	LST		BX	VN	40								w		t					Medium grey solution collapse brecciated dolomitized limestone. Overprinting the breccia is a fine crackle texture. There are also zones of camo-mottled light and medium grey limestone. This mottled texture has been later brecciated in zones. Pyrite occurs as fine to medium grained disseminated pyrite. Weak overall, but not particularly present until 26.20 m.
					CR																	0.00-5.80 m: The limestone has a bleached yellow-tan colouration.
																						30.70-38.00 m: Begin to get quartz dolomite veins that occur at 40 deg to CA. These veins are associated with an increase in Py mineralization, as well as cutting it.
																						38.00-41.65 m: The dolomitized limestone becomes bleached to light grey colour,
																						41.75-41.80 m: 4-5 cm medium grained pyrrhotite vein.
															f							48.00 m: Begin to get very fine grained powdery looking pyrite. Also more rare medium grained subhedral pyrite crystals.
															f		w					54.30-55.70 m: Quartz veins occur with weak to fair, medium grained, subhedral pyrite.
																						59.60-68.70 m: The dolomitized limestone has become bleached to a light grey colour. The concentration of pyrrhotite has increased to weak, while pyrite is still fair. Quartz veins cut at 25 deg to CA. They are on average 1-2 cm thick.
															w							68.70-73.60 m: Dolomitized limestone with rare quartz and weak disseminated pyrite.
															f							73.60-90.50 m: Quartz flood occurs in the limestone with a marked increase in disseminated pyrite. The limestone has a fairly bleached colour and contains fair mica/talc.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: RAU-08-11

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.05	3.05	OVB																			
3.05	24.50	21.45	LST		BN	BD	55															Medium grey banded limestone. Banding occurs at 55 deg to CA.
						BD	55						MBL	w	f							19.50-24.50 m: Begin to get a zone of weak marbleization of the limestone. Within there is calcite flood in some areas. Fair pyrite is disseminates and is associated commonly with silty bands in the marbleized limestone. These bands occur at 55 deg to CA.
24.50	41.15	16.65	VOL		AM																	Dark brownish grey volcaniclastic with trace pyrite. The upper contact is gradational. At 27.10 m begin to get 3-5% 0.5-1.5 cm rounded amygdules filled with calcite. Trace to no pyrite occurs . There are zones of amygdules and more massive black volcaniclastic. The lower contact is also relatively gradational.
41.15	127.09	85.94	LST		BX				f						t							Medium grey solution collapse brecciated fairly dolomitized limestone with zones of bands and stylolites occurring at 65 deg to CA. Trace to weak pyrite.
																						41.15-67.20 m: The dolomitized limestone is generally banded at 65 deg to CA.
				ALT																		57.00-60.00 m: The unit becomes strongly fractured up with fair orange red alteration stain on fractures.
																						At 63.53 begin to get weak to fair concentration of scattered talc flakes throughout the unit.
																						65.00m begin to get fractures with a red/purple hematite (?) alteration stain on the fractures.
															t							67.37-86.34 m: Begin to get strongly solution collapse brecciated limestone. Trace fine grained disseminated pyrite.
																						86.34-101.50 m: The brecciation becomes much less intense, only weak overall.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Other		Pyrite	Arsenopyrite	Pyrrhotite	Other		Other		
													Type	Intensity				Type	Intensity	Type	Intensity	
															t		t					101.50-105.00 m: Begin to get 10% yellowy fine grained dolomite layers/bands that run at 35 deg to CA. These bands contain coarse grained arsenopyrite and pyrite. Within this interval there is also minor quartz eyes.
						VN	50															105.00-127.09 m: medium to dark grey solution collapse brecciated limestone with zones of camo-mottled light and medium grey limestone. The breccia clasts are angular to sub-rounded. Minor creamy dolomite occurs in irregular fractures, and veins running at 50 deg to CA.
127.09	130.15	3.06	VOL	ALT	FO	FO	55			ms												Yellowish pinkish green sericite altered volcaniclastic with distinct foliation occurring at 55 deg to CA. The upper contact is very gradational until 128.20 m with interlayers 1-4 cm thick of volcaniclastic within the limestone. There is some evidence of soft sediment deformation of the limestone beds that occur within this zone.
130.15	135.80	5.65	LST	FOS	BN	BD	50															Medium to dark grey limestone with banding occurring at 70 deg to CA. Possible crinoid stem fragments occur with pyrite replacement. Overall pyrite is weakly disseminated throughout.
																						132.40 : Get a strange ripped looking texture between light-medium and dark grey limestone. The light/medium beds appear gritty. Thin irregular Ca stringers cut the unit.
																						133.96-135.80 m: Weakly calcareous bleached light grey limestone with stringer like irregular sericite bands that occur within. The sericite is yellowish green in colour. Banding occurs at 70 deg to CA. An overprinted crenulation texture occurs at 50 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Other		Pyrite	Arsenopyrite	Pyrrhotite	Other		Other		
													Type	Intensity				Type	Intensity	Type	Intensity	
135.80	163.97	28.17	VOL	ALT	BN	BD	50		f						t							Dark brownish grey volcaniclastic with foliation running at 50 deg to CA. Irregular sericite layers and stringers occur throughout. Weakly to fairly calcareous. Pyrite occurs as trace disseminations. Later irregular Ca-stringers cut the unit. Some of the lighter medium grey layers have a gritty texture.
						BD	60		m						t							141.00 m: the foliation runs at 60 deg to CA and is more easily defined. The sericite alteration has also increased to fair-moderate and seems to be selective, leaving pods of unaltered material.
						BD	50		w													149.80 m: The sericite alteration decreases significantly and the VOL is more of a dark grey/black than brown colour. Bedding with calcareous interlayers occurs at 50 deg to CA.
						BD	60		w											Act	t	149.90-150.00 m: There is a zone containing calcareous bands containing medium bluish-green fibrous mineral - actinolite(?). The mineral is confined to bands that run at 60 deg to CA.
									m													153.80 m: There is again an increase in the sericite alteration to moderate as well as an increase in the calcareous content of the rock. By 154.50 m the unit has a dark brown colouration (biotite?). Pyrite has increased to fair, and occurs replacing the Ca in patches and bands.
						FO	50		ms						m					Fu	t	159.65 -162.91 m: The sericite alteration becomes quite strong as a yellow/tan/green colour. The unit appear highly strained at 50 deg to CA. Trace fuchsite occurs as emerald green specks within the strongly altered zones. Pyrite is now fairly to moderately concentrated in large heavily disseminated patches.
			FLT?																			162.91-163.30 m: The core becomes highly fractured up. Possible fault zone (?) Minor light grey clay coats the fragment and fractures.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Other		Pyrite	Arsenopyrite	Pyrrhotite	Other		Other		
													Type	Intensity				Type	Intensity	Type	Intensity	
163.97	174.50	10.53	LST		BN	BD	55		w						f							Very dark grey to black weakly dolomitized limestone with large patches (up to 2 cm) of heavily disseminated fine grained pyrite up until 169.95 m. Clear banding occurs at 55 deg to CA.
									f						m							169.95-173.70 m: Begin to get an influx of very irregular coarse grained, cream and light grey dolomite veins. The pyrite concentration increases around these veins and becomes medium grained sub-hedral as dissemination and concentrated patches. Talc also occurs weak throughout and associated with the dolomite.
															t							173.70-174.50 m: Zone of thin deformed volcaniclastic bands. Pyrite is trace. No dolomite veins.
174.50	235.62	61.12	DOL		BN	BD	60								f	f	w	Sp	t			Medium to fine grained cream and light grey dolomite with mineralized bands occurring at 60 deg to CA. Pyrite is fine grained and fairly disseminated and concentrated in a banded texture. Pyrrhotite is weak in concentration and occurs as fine grained heavily disseminated patches that are often in a bended pattern. Coarse grained arsenopyrite occurs disseminated throughout, weak overall. The ASP concentration drops slightly in concentration becoming more widely scattered at 182.50 m. Trace quartz also occurs within this interval. Later dolomite veins cut the mineralization at 20 deg to CA. Trace medium to coarse grained red and black sphalerite occurs. Overall talc is trace. Pyrite and Arsenopyrite concentration drops off gradually at around 204 m.
						VN	20															220.60 m: The concentration of talc increases to fair. Pyrite becomes coarse grained to very coarse grained (up to 1 cm crystals) and cubic.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Other		Pyrite	Arsenopyrite	Pyrrhotite	Other		Other		
													Type	Intensity				Type	Intensity	Type	Intensity	
																						225.20-235.62 m: Brecciation of dolomite occurs along with a strong appearance of hairline fractures. Brown-red material (hematite/siderite?) fills these areas. Pyrite concentration is gradually dropping off to fair.
235.62	235.97	0.35	VOL		FO	FO	60			m												Strongly foliated sericite altered volcanic. FO occurs at 60 deg to CA. Sharp upper and lower contacts occur at 60 deg to CA.
						CN	60															
235.97	240.06	4.09	MBL		BN	BD	80															White marble with impure silty horizons occurring at 80 deg to CA. Rare purple and orange zones occur within the marble (hematite?).
240.06	278.89	38.83	LEP		FO	FO	60			w												Dark brown/grey/black leopard spotted volcaniclastic with a weak foliation occurring at 60 deg to CA. The beginning of the unit has a faint patterned spotted texture and towards the bottom it becomes more pronounced. Weak sericite alteration occurs as wispy patches within. Weak magnetite is scattered throughout the volcaniclastic.
						FO	55			m												253.00 m: The concentration of sericite increases to moderate, and follows a foliation of 55 deg to CA.
																						278.89 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: RAU-08-12

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.90	2.90	OVB	RBL	BN																	
2.90	14.05	11.15	LST	FOS	BN	BD	30								w							Light to medium grey fossiliferous limestone with crinoid and coral mound fragment. Limestone is finely laminated, but bedding is wavy, possible evidence of soft sediment slumping. Py rims crinoid stem fragments as well it is concentrated along banding. Frequent Ca veinlets occur throughout.
						VN	10	330														
																						9.56 m: Lighter colour limestone, wavier bedding.
14.05	35.41	21.36	LST		BN	BD	55								t					Sp	t	Medium grey banded and brecciated limestone. Ca veinlets causing brecciation and later yellow which to white Ca veinlets cut the breccia. Breccias are mainly clast-supported, with angular clasts. 30% Breccia. Brecciation gradually decreases with depth, begin to see occasional silty horizons.
					BX	VN	15															27.30 m: 2mm red sphalerite crystal in a Ca veinlet.
						VN	35															
						VN	80															
35.41	36.78	1.37	LST		BN	BD	20								t							Light and dark grey banded limestone. Banding now occurs at 20 deg to CA. Occasional fine grained Py blebs occurs along banding. The bottom 21 cm contains limonite boxwork texture.
36.78	37.42	0.64	MBL		BN	BD	10															Light grey to white banded marble.
37.42	40.81	3.39	QZ	MX	MA										50							Pyrite-Quartz-talc vein with coarse grained, euhedral pyrite. Talc is soft, pearly white. Vein is rubbly in places. A

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
40.81	46.88	6.07	LST		MA	VN	60								w							Medium grey, massive limestone with finely disseminated Py. Occasional orange brown alteration occurs along fractures and Ca veins. The veins run at 60 deg to CA.
															30							42.39-42.77 m: another Qz-talc vein with associated coarse grained Py. Occasional 10-20 cm wide Qz veins with rare Py crystals.
46.88	48.03	1.15	VOL	MX	MA						f				f							Dark green, fine grained volcaniclastic with finely disseminated Py. Mildly reactive with HCl. Bottom 30 cm of unit is massive Py.
48.03	52.75	4.72	LST		MA										t							Medium grey, massive limestone with trace finely disseminated Py. Occasional Ca stringers. Near lower contact LST develops wavy texture. Contact is difficult to define, mixed, partially brecciated.
52.75	59.21	6.46	VOL	ALT	FO	FO	10			s					f							Bleached and sericite altered volcaniclastic. Dark purple/brown, fine grained with thin sericite bands almost parallel to the core axis. Occasional bleached zones 1-2 m long. Occasional irregular coarse grained Ca veins.
59.21	76.20	16.99	VOL	ALT	FO	FO	10			I					f							Fine grained, dark green-grey with purple-brown sericite bands/stringers. Rare, <5mm calcite amygdules that are occasionally rimmed by Py. There are zones where the amygdules are more concentrated. Py mainly occurs as fine disseminations throughout. FO runs at 10 deg to CA. The lower contact is gradational.
76.20	185.60	109.40	LST		BX	BD	45			w					w							Medium to dark grey LST with 2.5 mm wide darker layers defining banding. Zones of the unit are brecciated. Medium grained blebs of Py are disseminated throughout. Occasional Ca veinlets cut the unit at 30-60 deg to CA.
						VN	30															79.25-98.05 m: The limestone is now 70% breccia. The clasts are angular to sub-rounded and in parts are both matrix and clast supported.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						98.05-185.60 m: The breccia is less intense, only accounting for 10% of the interval. There is also a weak crackle texture overprinting the unit.
						VN	60	180							m							124.70-124.87 m: Qz vein with very coarse grained Py.
																						141.12 m: 20 cm dark grey clay zone. Small fault??
185.60	187.76	2.16	DOL		MA										w			MAG	t			Creamy white, coarse grained dolomite. With minor disseminated Py and magnetite.
187.76	199.55	11.79	LST		BX	CN	10															Medium grey mosaic brecciated limestone with angular clasts. Contacts with surrounding units are sharp but irregular.
199.55	217.67	18.12	VOL		FO	FO	30								w							Grey brown weakly foliated biotite rich volcaniclastic with frequent Ca veinlets running at 60 deg to CA. Foliation occurs at 30 deg to CA. Weakly disseminated pyrite occurs scattered throughout. Lower contact is with marble.
						VN	60															
217.67	274.32	56.65	LST		BN	BD	30															20 cm of marble at volcanic contact. Below the marble there is medium grey weakly fluid collapse breccia limestone with irregular Ca veinlets running most commonly at 50 deg to CA. The limestone becomes more massive towards the bottom of the interval.
					BX																	
																						274.32 m: E.O.H.

did not extend deep enough to intersect discovery horizon

GEOLOGY LOG

HOLE: RAU-08-13

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	24.38	24.38	LST		BX																	Medium grey weakly dolomitized limestone with weak solution collapse brecciated texture. The interval is fairly to strongly rubbly with orange-red-brown alteration on some of the rubbly surfaces.
													MBL	f								22.00-24.30 m: Weakly to fairly marbleized limestone.
24.38	36.43	12.05	VOL	ALT	FO	FO	55			f												Brownish black and yellowish-tan-brown where sericite altered amygduloidal volcaniclastic with Ca infill. Weak to fair foliation occurs at 55 deg to CA. No mineralization occurs within.
					AM					ms												24.30-29.75 m: Moderately strong yellow tan sericite alteration.
36.43	222.81	186.38	LST	ALT	BN	BD	80		m						f		t					Medium to light grey moderately dolomitized limestone with a sharp upper contact with VOL at 80 deg to CA. Stylolitic banding occurs at between 70-90 deg to CA. A weak crackle texture overprints the banding. Weak patchy/disseminated pyrite. Weak mica/talc. There are zones of creamy yellow more strongly dolomitized limestone. Associated with this are thin pale yellow dolomite veinlets that cut the steeper stylolitic bands at 55 deg to CA. There is a weak concentration of quartz scattered throughout. Often associated with veining.
						VN	55															53.48-70.00 m: The dolomitized limestone is now becoming more solution collapse brecciated. There is weak to fair talc scattered throughout.
						VN	25										m					60.75-61.00 m: Veins containing Po occur at 25 deg to CA
						CN	80								m							66.70-66.73 m: Pyrite rubble zone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						70.00 m: The brecciation is increasingly to moderately strong. See more of a mosaic breccia with angular to subangular clasts with a white dolomitized matrix. Talc occurs on fractures, weak to fair overall. Coarse grained dolomite veins cut the breccia at 45 deg to CA.
						VN	40															74.00 m: Mineralized Py veins cut the breccia at 30-50 deg to CA.
																						75.05-77.00 m: Begin to get a zone of quite coarse grained dolomite.
						VN	45								40		10					85.03-83.25 m: Semi-massive pyrite with some pyrrhotite. Occurs in a vein (?).
															40							103.90 m: 75 cm zone of semi-massive pyrite
															w							104.85 m: The breccia now has a slightly preferred orientation at 15 deg to CA. Scattered fine grained strongly disseminated patches of pyrite occur, weak overall.
																						121.80-122.00 m: 20 cm zone of intense quartz flood.
						BN	65								s							129.54-133.00 m: Zone of strongly disseminated very fine grained powdery pyrite. Banding occurs at 65 deg to CA with Qz+/-Ca veins cutting at 15 deg to CA.
						VN	15															148.70-151.80 m: Strong concentration of quartz, probably associated with veining, but orientations are non-determinable.
															w							151.80 m: Return to medium to dark grey fairly dolomitized brecciated limestone with 55-60 deg preferred orientation of the dolomite matrix and veining. Weak finely disseminated pyrite occurs scattered throughout. There is a slight increase in the concentration of quartz at 141.50 m. Associated with this is medium grained pyrite.
						VN	35								t		w					185.00-186.20 m: Massive quartz with trace pyrite occurring within. A 10 cm zone of semi-massive pyrrhotite occurs at the upper contact with the limestone.
															w		w					198.10-201.00 m: Quartz vein with Py and Po (weak overall). Moderate talc within the upper 50 cm. Pyrite picks up at the lower contact.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: RAU-08-14

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.00	1.00	OVB																			
1.00	19.03	18.03	VOL	ALT	FO	FO	70			f					t							Greenish grey volcaniclastic showing small crystals of calcite faintly oriented forming a foliation. Thin 1-5mm Qz-Ca veinlets generally cutting at 70 deg to CA and 160 deg to FO. Fair sericite alteration. Trace fine grained disseminated pyrite.
						VN	70	180														
19.03	45.28	26.25	LST		BN	BD	50				m				t							Interbanded white and dark grey/black limestone with a slight marbleized appearance. Banding occurs at 50 deg to CA. Finely disseminated Py occurs mostly within the darker bands. 1-5 mm calcite veins cut bedding.
						VN	30	90							t		w					24.35-28.00 m: more pure looking limestone with an increase in the sulphide content and addition of pyrrhotite as small elongated blebs following bedding. The limestone has a slightly brownish tint to it, possibly sericite or biotite?
										w												Weak sericite alteration occurs near the lower contact of the unit.
45.28	49.20	3.92	MBL		BN	BD	55															Intermixed marble and dark grey silty limestone horizons.
49.20	113.60	64.40	MBL		MA	FX	50															Pure white marble with very faint peachy-orange-red alteration coming from thin veinlets (hematite?)
																						62.90-71.63 m: marble is stained orange-red colour, and has become quite a bit more rubbly particularly from 67-69 m. Fractured surfaces are coated in a red-orange coloured clay.
						BD	40-70															75.30-113.60 m: Begin to again see dark grey/black silty limestone horizons within the marble. Their nature seems to be bedded but they occur in a quite irregular - undulating bands.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
113.60	142.80	29.20	LST	FOS	BN	BD	60															Medium to dark grey limestone with banding defined by the darker grey silty horizons at 60 deg to CA. Crinoid stem fragments as well as other marine fossils occur and are particularly clear at 131 m. Zones of calcite flood occur in the limestone giving the core a faintly recrystallized breccia appearance. Very fine grained dark grey/black silty horizons are occasionally interbedded in the limestone. Upper contact is gradual with silty layers occurring within the marble.
																						123.5-128.5 m: White marbleized sections within the limestone.
142.80	164.59	21.79	LEP		MA	VN	60															Leopard print volcaniclastic. Dark grey/black spots that are subrounded 1-3mm in diameter with calcite matrix. Overall massive in appearance with no obvious foliation or banding. Thin Ca veins cut the unit at 60 deg to CA. The contact with the upper unit is gradual and interfingered.
																						164.59 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

Hole Rau-08-15A drilled at an angle of -60° was lost during drilling at 137.50 m. Hole Rau-09-15B is a redrill at the same location but at a dip of -55°.

GEOLOGY LOG

HOLE: RAU-08-15

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	70.44	70.44	LST	FOS	BX	FO	60		f						t							Medium grey, fossiliferous, fairly dolomitized limestone with moderate brecciation by calcite veinlets. Foliation is rare but does occur between 50-70 deg to CA. Trace disseminated pyrite. Interspersed Ca veins occur at 65 deg to CA. The interval is quite rubbly up until 9 m.
				ALT		VN	65															64.00 m: Zone of quite strongly fractured marbleized limestone.
70.44	91.76	21.32	VOL	ALT						f					f		t	Mag	t			Dark green to black fine grained volcaniclastic with weak to moderate sericite alteration along a foliation of 50 deg to CA. Trace pyrrhotite, magnetite, and fair finely disseminated pyrite occur scattered throughout.
91.76	227.08	135.32	LST		BN	BD	60		f						w			Sp	t			Medium grey fairly dolomitized fluid collapse brecciated limestone with stylolitic bands at 60 deg to CA. Pyrite is typically trace fine grained and disseminated by rarely occurs in larger patches and masses. Qz +/- Ca veins rarely cut the unit in varying orientations. Trace red sphalerite occurs within strongly brecciated and sometimes broken areas of the core.
				FLT																		154.00-158.90 m: Broken and rubbly.
						VN	40															182.83 m: Increase in the concentration of quartz veins running at 40 deg to CA.
																						190.00-193.20 m: Another rubbly zone occurs within the limestone. There is minor red (hematite?) coating on fractures.
																						198.58 m: 83 cm quartz vein with trace pyrite cuts the limestone. Surrounding the limestone there is a zone of crackle brecciation.
																						219.00 m: 1-2 cm quartz veins occur at 70 deg to CA.
																						224.00 m: 10 cm gouge zone occurs.
																						227.08 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

0.00	19.81	19.81	LST	ALT	BN	BD	70		w													Medium grey banded weakly dolomitized limestone. Banding runs at 70 deg to CA. Overall the recovery is quite poor.
19.81	82.30	62.49	OX																			Poorly recovered oxide. Generally a medium orange red brown colour. The oxide is a mixture of rubbly and gritty clay. Minor quartz grit occurs within.
																						19.81 m: COLOUR: 5YR 5/4 - reddish brown
																						36.58 m: COLOUR: 2.5YR 4/6 - red
																						54.50 m: COLOUR: 2.5YR 4/6 - red
																						68.20 m: COLOUR: 5YR 4/6 - yellowish red
																						74.70 m: COLOUR: 5YR 4/4 - reddish brown
																						76.20 m: COLOUR: 5YR 5/6 - yellowish red
																						NOTE: around 76 m, possible zone of altered volcaniclastic
																						82.30 m: E.O.H. - The hole was ended because the rods became stuck.

GEOLOGY LOG

HOLE: RAU-08-17

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	35.97	35.97	LST	FOS	BN	BD	50		w													Medium grey weakly dolomitized limestone with thin Ca veins cutting the unit at 65 deg to CA. Banding in the unit occurs at 50 deg to Ca. Trace crinoid stem fragments occur scattered throughout.
																						24.00-35.97 m: Banding steepens to 65 deg to CA.
35.97	50.28	14.31	MBL		BN	BD	70			w												Light to medium grey marble with banding occurring at 70 deg to CA. Sericite stringer bands occur at 15 deg to CA.
						VN	15															
50.28	50.60	0.32	VOL		FO	FO	70															Very fissile strongly altered yellowy tan volcaniclastic foliation running at 70 deg to CA.
50.60	66.80	16.20	LST	ALT	BN	BD	70															Weakly dolomite altered fluid collapse brecciated limestone with stylolitic bands running at 70 deg to CA. No mineralization is present in the unit.
66.80	80.16	13.36	DOL	ALT		CN	40						SID	ms								Coarse grained dolomite siderite vein. Yellowy cream and greyish white dolomite with dark slightly reddish brown siderite specifically coating fractures. Upper and lower contacts are sharp at 40 and 80 deg to CA.
						CN	80															
80.16	150.27	70.11	LST	ALT	BX				w													Medium grey strongly brecciated weakly dolomitized limestone with angular to subangular, 0.2-3 cm clasts. The breccia in zones is very clean and 'fresh' looking and matrix supported. Minor camo mottled textures occur in less brecciated zones.
													SID	ms								103.85-106.80 m: Dark chocolate brown medium grained siderite-dolomite vein. Quite irregular with clasts of limestone within.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	60.46	60.46	LST	ALT	BN	BD	70		m						t			Sp	t			Medium grey moderately dolomitized limestone with strong solution collapse brecciated texture with zones of camo-mottled limestone and stylolitic bands running at 70 deg to CA. Trace fine grained disseminated pyrite occurs throughout.
					BX																	15.95-16.10 m: Zone of more fractured limestone with slight orange-brown alteration stain on fractures.
																						19.63-25.63 m: Predominately camo-mottled dolomitized limestone.
						VN	25															25.63-32.92 m: Mixture of solution collapse breccia and stylolitic banding at 75 deg to CA. Prominent cross cutting fractures and thin veinlets cut the unit at 25 deg to CA.
																						32.92-37.00 m: The solution collapse brecciated texture becomes very prominent.
																						37.00-57.10 m: Begin to pick up fossils in the dolomitized limestone. Coral mound, chain coral, less common crinoid stem fragments.
																						57.10-64.99 m: Begin to get quite pronounced bedding with gritty dolomitized limestone interbedded at 60 deg to CA.
																		Hem	w			59.12-59.16 m: There is a coarse grained calcite vein with a purply-metallic crystal with reddish brown streak (hematite?) Pyrite concentration increasing slightly to weak.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
60.46	74.52	14.06	LST	ALT		BD	80		ms						w			Sp	t			60.46-74.52 m: Coarse grained dolomite veins begin cutting the unit at various orientation, commonly 15 deg to CA, as well as occurring in bands at 80 deg to CA. The textural patterns in the zone with black shaley beds interbanded with coarse grained dolomite slightly resembles the textures of the mineralization in the main zone. Minor orange sphalerite occurs trace overall. Pyrite occurs as fine to medium grained disseminations confined to a banded pattern. at 80 deg to CA.
						VN	15															70.10-74.52 m: Begin to get thin brownish purple interbands of volcaniclastic within the dolomitized limestone and dolomite. Also talc flakes occur scattered throughout the dolomite rich sections.
74.52	116.21	41.69	VOL	ALT	FO	FO	75			f					w							Weakly to strongly sericite altered volcaniclastic with a swaley texture in the zones of alteration. A faint original foliation occurs at 75 deg to CA. Weak fine grained pyrite is disseminated throughout.
															m							84.14 m - sericite alteration increases and by 86.42 m, the pyrite concentration increases to moderate disseminations in less sericite altered zones.
			DOL			VN	80								w							87.10-87.54 m: Coarse grained cream and light grey dolomite vein. Upper contact is sharp at 80 deg to CA. The lower contact is more diffuse. The vein contains only weak pyrite.
										ms					w							87.54-102.32 m: Back into thinly foliated volcaniclastic with moderately strong sericite alteration of the brownish volcaniclastic. Pyrite (weak) occurs as disseminations replacing Ca patches within the unit.
						VN	20															105.22 m: Talc vein cuts the volcaniclastic at 20 deg to CA.
						CN	70															The lower contact of the volcaniclastic is sharp at 70 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
116.21	153.68	37.47	DOL												f	t	w					Mixture of white to light grey medium grained dolomite with medium grey strongly crackled and dolomitized limestone. The dolomite is the dominant lithology in the unit, as the limestone is only present until 121 m. The dolomite contains fair concentrations of scattered talc. Pyrite is fine grained and fairly disseminated while trace arsenopyrite is coarser grained and pyrrhotite weakly occurs in small patches. Late stage dolomite veins cut the mineralization at 10 deg to CA. These veins contain trace pyrrhotite within them.
															40							128.02-128.23 m: Semi-massive very coarse grained section of pyrite with interstitial crack filling of fine grained pyrrhotite.
						VN	30															139.56-140.21 m: A coarse grained quartz vein cuts the cut at 30 deg to CA. This vein appears to cut the Py, but it also contains Py within it.
						VN	10								30							140.99-140.57 m: Two low angle 3-6 cm quartz veins cut a semi-massive zone of pyrite.
															m	w	t					146.30 m: Arsenopyrite concentration increases to weak. It occurs as fine grained euhedral crystals scattered throughout. The pyrite has increased to moderate. Overall the mineralization occurs in more of a disseminated pattern than in bands.
															35							149.25-153.68 m: Semi-massive fine to coarse grained pyrite with dark grey dolomite and dolomitized limestone. A few rubbly zones occur within.
153.68	196.64	42.96	VOL	ALT	FO	FO	70			w					f							Brownish grey volcaniclastic with black gritty fragments within. Weak to fair sericite alteration occurs. Foliation runs at 70 deg to CA. Medium grained white dolomite veins irregularly cut the unit. Pyrite is fairly disseminated and in semi-concentrated bands.
						VN	35								60							162.08-163.40: Semi-massive to massive pyrite. Fine grained with dolomite veins cutting at 35 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
															w							175.14 m: Pyrite concentration decreases to weak. At this point the pyrite s very speckles in appearance with wispy patches of creamy yellow brown sericite.
						VN	15															187.50-188.10 m: A thin low angle dolomite vein (0.5 cm thick) cuts the volcaniclastic at 15 deg to CA and has a dark green tinted colour to it.
196.64	211.01	14.37	LST	ALT	CR				m						t							Dark grey, rubbly graphitic limestone transitioning into strongly crackle brecciated moderately dolomitized limestone with trace fine grained disseminated pyrite.
211.01	234.69	23.68	MX												80			Sp	t			Gradual transition into semi-massive and then massive fine to very coarse grained pyrite with trace fine to coarse grained red sphalerite on some fractured surfaces.
																						217.45 m: The rock becomes very rubbly.
																						218.53-218.59 m: Silver coloured mineral (galena?, bismuthanite?). Very soft, scratches easily with thumb nail.
																						233.78 m: E.O.H. - The hole was ended because the drillers ran out of rods. The casing was left in and the hole was extended in Rau-09-18.
																						Beginning of 2009 extension
			MX		MA										80							233.78-234.69 m: Massive pyrite, coarse grained but not showing cubic crystal growth. Coarse grained quartz occurs interstitially between patches of Py, as well as in flood form in the last 75 cm
234.69	238.74	4.05	DOL		CR										f							Medium grey crackle brecciated dolomite. Py occurs as small patches and as fine grained disseminations and stringers. Some of the dolomite has a peachy hue (hematite?, rhochrosite?)
																						235.05-236.49 m: Moderately rubbly zone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
238.74	240.69	1.95	MX	MX											30							Semi massive pyrite in a quartz-dolomite host. Red patches (hematite?) ~ 5 cm in size occur scattered throughout. Pyrite is very coarse grained, with the crystals being more platy than euhedral.
240.69	252.39	11.70	MX	MX	MA	FO	30								80							Massive coarse grained pyrite. Appears to be slightly brecciated by quartz stringer veinlets (fracture fill?). A slight foliation occurs at 30 deg to CA. There appears to be two phases of Py, a coarse grained and a later fine grained disseminated phase.
																						241.69-243.72 m: Very rubbly and broken interval.
																						246.13-252.39 m: Very rubbly and broken interval.
252.39	255.12	2.73	MX	RBL	MA										70			Sp	w	Ga		Massive pyrite with some coarse grained sub to euhedral red sphalerite crystals. The pyrite is intermixed with quartz which may either be the host, or is filling fractures and voids. The sphalerite appears closely associated with the calcite. Also trace galena as small crystals.
																						252.82-252.89 m: The pyrite crystals are particularly well formed within this zone.
																						252.82-253.81 m: The core becomes more competent.
																						254.29-254.66 m: Small zone of marble with weak hematite (?) occurring as a peachy red stain within. Weak pyrite occurs in irregular patches concentrated in the darker siltier zones.
255.12	258.33	3.21	LST	ALT	BX	VN	50		s						w							Medium grey mottled strongly dolomitized limestone with a strongly clast supported fluid collapse brecciated texture with Qz/Ca flood. The unit is moderately fractured up. Ca stringer veinlets ~ 1 mm cut the breccia at 50 deg to the CA. Weak pyrite occurs as fine disseminations and small sub-hedral crystals at the end of the interval.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
258.33	260.89	2.56	MX	MX	MA	FO	15								70			Sp	w			Semi-massive to massive Py with thin Qz +/- Ca veinlets cutting mineralization and filling fractures at 15 and 40-45 deg to CA. There is a slight foliation at 15 deg to CA, highlighted by the alignment of the platy Py grains. The pyrite is medium to coarse grained. Red sphalerite occurs associated with the Ca veinlets.
						VN	15															
						VN	45															
260.89	265.09	4.20	MBL		CR	FR	15								w							Medium grey marble with occasional very dark grey silty horizons. There is a crackle texture that is generally aligned at 15 and 50 deg to CA. Two phases of Ca veining occur. Veins running at 40 deg are cut by veins running at 10 deg to CA. Pyrite occurs as isolated subhedral crystals as well as fracture fill.
						FR	50															
						VN	40															
						VN	10															
265.09	268.08	2.99	MX	MX	MA	FR	40															Massive pyrite zone. The pyrite is medium to coarse grained, subhedral and closely packed. Infill between pyrite grains consists of coarse grained Qz and Ca. Very thin fractures run at 40 deg to CA and may be representing a foliation.
																						267.44-267.57 m: There is a small zone of medium grey marble. The lower 20 cm shows a gradual decrease in the amount of Py with an increase in the concentration of marble.
268.08	271.12	3.04	DOL	MX	CR	FR	45								ms							Medium grey dolomite with zones of concentrated packed coarse grained pyrite crystals. The dolomite shows evidence of brecciation, but since that event some recrystallization has occurred as it looks quite washed out. There is also faint evidence of healed fractures.
						FR	20															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
271.12	273.04	1.92	MX	MX	FO	FO	15															Zone of massive pyrite. Pyrite occurs as tightly packed medium grained crystals. Fine grained crystalline pyrite is concentrated into zones 5-10 cm thick. Healed fractures and a slight foliation occurs at 15 deg to the Ca. Space between pyrite grains is filled with dolomitized limestone.
273.04	275.59	2.55	MBL			VN	30						Hem	w	m							Light grey marble with calcite veins running at 30, 45 and 70 deg to CA. Pyrite occurs as patches of packed medium grained crystals in isolated areas. Hematite occurs as a reddish pink stain in some of the calcite veins.
						VN	45															
						VN	70															
275.59	303.99	28.40	LST	ALT	BX	VN	30		s						f							Gradual contact into a dolomitized limestone. Medium grey in colour with fluid collapse breccia texture. Pyrite occurs occasionally as coarse grained crystals packed into patches and along thin fractures. In some cases the brecciation displaces calcite veinlets, suggesting it was a later event.
																						290.59-291.84 m: Rubble zone (fault ?). Sandy to cobbly nature , with weak disseminated pyrite.
						FR	40		m						w							295.69-303.99 m: The breccia becomes more of a mosaic style breccia. Clasts are angular. Pyrite occurs as medium grained subhedral crystals. Here is a faint orientation to the breccia at 40 deg to CA. Thin Ca veinlets cut the breccia at 30 deg to CA..
						VN	30															
303.99	322.93	18.94	DOL		MO	VN	40		m													Transition into a less brecciated more mottled moderately dolomitized limestone. Ca veins cut at 5 and 40 deg to CA. No visible mineralization occurs within the unit.
						BD	50															321.67-322.93 m: The limestone now have a banded texture that runs at 50 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-09-19

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	4.57	4.57	OVB																			
4.57	7.25	2.68	LST	RBL																		Light grey LST, dominantly rubble
7.25	23.16	15.91	LST	FOS	BN	BD	30					m										Light grey fossiliferous limestone, with crinoid stem fragments. Fiant banding runs at 30 deg to CA.
						VN	40															9.19-9.45 m: Qz-Ca vein
																						9.45-11.05 m: Fluid altered zone. Core is very fractured with frequent rubbly/clay zones. Oxidation mainly along fractures.
23.16	41.91	18.75	LST	FOS	CR	BD	30															Medium grey limestone, crackled by Ca veinlets, some areas where banding is preserved it runs at 30 deg to CA. Weak fine grained disseminated pyrite.
															w							27.90-38.52 m: begin to see medium grained Py, rusty coloured, and weathered out completely in some areas. Occasional rubbly, clay-altered zones (2-3 cm wide).
																						30.63 m: clay altered zones increase in frequency and intensity. Gouge zones? Clay altered matrix of breccia? Clay zones are 2-12 cm wide and contain limestone clasts.
41.91	53.95	12.04	OX	CLY	MA																	Highly oxidized zone with intermittent sandy zones. No solid rock.
																						41.91-48.59 m: yellowy-brown colour. (COLOUR: 2.5 YR 4/6 - dark red.)
																						48.59-53.40 m: reddish-brown colour. (COLOUR: 2.5 YR 3/3 - dark reddish brown.)
																						53.40-53.95 m: brownish-grey colour. The sandy areas are coarse grained with some small rock fragments.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
53.95	56.39	2.44	OX	ALT	BX							ms										Pale greenish grey to pale yellow, oxidized breccia? Possible relict brecciation texture, but core is very altered so it is difficult to be certain. Core appears solid, but fractures very easily. Non-calcareous. Last 5 cm of interval transitions back to reddish-brown colour. No visible sulphide.
56.39	73.15	16.76	OX	CLY	MA							I										Dark reddish brown oxide. Colour is uniform, very difficult to distinguish relict textures. Non-calcareous. The unit has quite purpleish tones to it. Also the material is quite competent as opposed to gritty.
																						56.39-59.44 m: core is more solid than in the rest of the interval, still mostly competent. Core is mostly fine to coarse grained sand mixed with clay. Either appears as rubble or in areas that look like solid core, but that crumble at a touch. Rare, 10-20 cm long pieces that are more solid than the surrounding rubble.
																						59.44-60.20 m: orangey-red (COLOUR: 2.5 YR 5/6 - Red).
																						60.20-61.72 m: grey-brown.
																						61.72-62.48 m: yellowy-brown. Faint banding occurs at 85 deg to CA.
																						62.48-63.25 m: yellowy-brown.
																						63.25-64.31 m: mix of yellowy-brown and reddish brown with light grey-white clay on some fractured surfaces. (COLOUR 7.5YR 6/8 - reddish yellow).
																						64.31-71.63 m: dark red-brown. (COLOUR: 5YR 5/6 - yellowish red).
																						71.63-73.15 m: orangey-brown. (COLOUR 2.5 YR 4/3 - reddish brown).

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
73.15	85.34	12.19	OX	RBL								I										Sand to rubble oxide. Rock fragments up to 5 cm long, commonly 0.5-2 cm long. Rubble ranges from yellowy-brown to dark red-brown. Different colours are jumbled together. Larger pieces of rock have open vug spaces and rarely show a breccia-like texture. (COLOUR: 2.5 YR 4/3 - reddish brown).
85.34	108.20	22.86	LST	OX	BN							s			m							Recrystallized, oxidized fine to medium grained dolomitized limestone with intergrown with fine to medium grained Py. Core is competent. Frequent vug spaces where sulphides have been weathered out. Oxidized to an orangey-brown colour. Frequent rubble zones with poor recovery.
																						101.80-108.20 m: core is stained red, hematite?
108.20	118.26	10.06	LST	ALT	BN	BD	45		f				MBL	m	t							Interbanded light grey limestone and mildly sericite altered marble. Trace Py blebs in marble, and occasional criniod fossils in LST bands. Minor oxidation along fractures.
																						E.O.H. 118.26 m.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: RAU-09-20

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	17.24	17.24	LST	FOS	BN	BD	70					t										Light and medium grey banded fossiliferous (crinoid fragments) limestone. Rare oxidation along fractures. Minor brown clay on some fracture surfaces.
17.24	24.38	7.14	LST	OX	BN	BD	70					ms										LST is more fractured and oxidized with two 15 cm long clay altered zones. Occasional brecciated zones with Ca matrix. Breccias are more oxidized than the surrounding LST.
24.38	33.53	9.15	LST	FOS	BN	BD	70					f										Light and medium grey banded LST with crinoid fragments. Occasional oxidation along fractures. Fracture density increases toward the end of the interval.
33.53	53.34	19.81	LST	FOS	BN	BD	70					ms										Same banded, fossiliferous LST, but fracture density has increased. (20-50 Fr per m). Most fractures are oxidized, occasional rubble zones. Rare fractures with brown clay.
53.34	78.00	24.66	LST	ALT	BX							s										Brecciated mix of volcaniclastic and LST. Rubble zones and brown clay.
78.00	91.07	13.07	VOL	ALT	CR	VN	40					l			f							Medium grey-green volcaniclastic with abundant Qz-Ca veining and frequent rubble/clay zones. Fine to medium grained Py, very oxidized. Lower contact is sharp at 80 deg to CA. Fair fine grained disseminated pyrite.
						CN	80															
91.07	158.50	67.43	LST	ALT	CR	VN	70					f			w							First 35 cm below contact is very oxidized and brecciated. Light to medium grey, fluid altered LST crackled by Qz-Ca veinlets. Wide variation in vein angles from 30-50 deg to CA. Rare zones of brecciation by Ca veinlets. Occasional oxidized zones are altered to clay (20-50 cm long).
						VN	30															114.91 m: brecciation increases.
						VN	50															125.60-125.75 m: limonite boxwork.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

																								Core has a mottled texture where it isn't brecciated.
						VN	20																	138 m: Ca vein, 10 cm wide, with oxidized black crystals on the edges.
158.50	162.61	4.11	LST	OX	BX								I											Crackled to brecciated, strongly oxidized LST. Vug spaces occur in more oxidized zones.
																								E.O.H. 162.61 m

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	5.49	5.49	OVB	SAN																		Volcaniclastic boulders at very top, then sand and limestone rubble.
5.49	20.73	15.24	MBL	RBL	BN	BD	60															White marble with rare banding defined by silty horizons (2-5 cm wide). Highly fractured, with brown clay on fractures, occasional rubble zones.
																						18.00 m: 15 cm wide oxide breccia.
20.73	22.25	1.52	OX	CLY								I										Brown oxide clay with rock fragments up to 2 cm long.
22.25	23.77	1.52	OX	CLY								I										Red-brown oxide clay with sand and rock fragments up to 10 cm in diameter.
23.77	25.30	1.53	OX	CLY								I										Dominantly red-brown clay oxide with 5-10 cm pieces of core.
25.30	26.82	1.52	OX	CLY								I										Sandy at beginning, transitioning to red-brown clay with 2-5 cm pieces of rock.
26.82	28.35	1.53	OX	CLY								I										Starts as 5-12 cm pieces of oxide covered in red-brown clay, then becomes entirely red-brown clay at the end of the interval.
28.35	29.87	1.52	OX	RBL								I										Orange-brown limonite boxwork rubble pieces up to 5 cm long.
29.87	31.39	1.52	OX	SAN																		Dark grey-brown sand, with last ~40 cm of interval as red-brown clay. Sand is FG to MG.
31.39	32.92	1.53	OX	CLY								I										Red-brown clay with 1-2 cm limonitic rock fragments.
32.92	34.44	1.52	OX	CLY								I										Red-brown clay with <1 cm limonitic rock fragments.
34.44	35.97	1.53	OX	CLY								I										Red-brown clay with 1-5 cm limonitic rock fragments.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
35.97	37.49	1.52	OX	CLY								I										Red-brown clay with rare 1-2 cm limonitic rock fragments.
37.49	39.01	1.52	OX	CLY								I										Reddish brown clay.
39.01	40.54	1.53	OX	CLY								I										Red-brown clay with darker brown-grey limonitic rock fragments up to 2 cm.
40.54	42.06	1.52	OX	CLY								I										Red-brown clay with minor sand and 2 X 5 cm long pieces of marble.
42.06	43.59	1.53	OX	CLY								I										Red-brown clay holding together medium to coarse grained sand and 0.5-6 cm limonite boxwork fragments.
43.59	45.11	1.52	OX	CLY								I										Red-brown clay with 0.1-2 cm limonitic rock fragments.
45.11	48.92	3.81	DOL	ALT	BN	BD	30					ms										Coarse grained dolomite, recrystallized in appearance. 10-15 cm long limonitic boxwork zone and 20-50 cm zones of red-brown clay with limonite fragments. Core is very vuggy.
48.92	77.47	28.55	LST	ALT	BX	VN	50		w			m			t							Fluid collapse brecciated weakly dolomitized limestone. Oxidation concentrated around fractures Breccia is mainly clast supported.
																						62.79-63.92 m: Strongly oxidized breccia with graphite on some fractured surfaces. Occasional bleached zones occur, occasional marbleized zones with sericite bands. Rare Py blebs. Occasional pinkish zones.
77.47	93.88	16.41	MBL		BN	BD	30															Interbanded marble and light grey limestone. Irregular banding occurs from 20-40 deg to CA. There appears to be a fold at 82.30 m.
																						87.00-93.88 m: Mostly massive white marble with intermittent silty bands.
93.88	95.40	1.52	OX	CLY								I										Yellowy brown clay with rare 1-2 cm limonite fragments at end of interval.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
95.40	96.93	1.53	OX	RBL								I										Yellowy to reddish brown to yellowy brown clay with 1-2 cm dark red brown limonite fragments and flakes of a steel grey mineral (galena?) at the end of the interval.
96.93	98.45	1.52	OX	CLY								I										Reddish brown to yellowy brown clay with occasional rock fragments <1 cm.
98.45	99.97	1.52	OX	RBL						m		I										Oxidized crackled limestone with sericite alteration.
99.97	100.36	0.39	OX	CLY																		Brown clay with 1-2 cm limonite rock fragments
100.36	104.96	4.60	VOL	ALT	FO	FO	60			f												Medium to dark grey volcaniclastic intermixed with 5 20 cm intervals of marble. Limestone shows sericite alteration as stingers of pinkish brown and brownish green areas. Alteration zones have a swirly appearance, but range from 50-70 deg to CA.
104.96	106.45	1.49	VOL		MA	VN	30											Mag	ms			Dark grey to black semi-massive magnetite in dark grey-black volcaniclastic with very thin <1 - 2 mm calcite stringers. Dry core shows a faint mottled texture. No visible mineralization.
106.45	149.31	42.86	LEP			FO	70			w					t							Leopard print volcaniclastic with patch sizes varying from 1-10 mm. Zones 2-10 cm thick of more massive dark grey volcaniclastic also occur. Foliation in general is faint, but occurs at 70 deg to CA. Trace fine grained pyrite. Weak sericite bands occur within the unit. Calcite veins cut the unit. Coarse grained quartz flood contains elongate medium to dark green crystals (actinolite?)
						VN	35															
			LEP		FO	FO	65															142.60-144.00 m: medium grey, aphanitic volcaniclastic. Thin Ca stringers cut at 25 deg to CA
						VN	25															NOTE! 142.65 m: appears to be 2 m of oxide, but this is not at the true depth, it fell down the hole from further up.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.13	2.13	OVB	RBL																		
2.13	64.31	62.18	LST	FOS	BN	BD	50					w										Light and medium grey banded LST with crinoid stem fragments. Occasional 5-15 cm wide marbleized zones. Rubble zones up to 15 cm long occur.
												f										25.70-31.00 m: dominantly rubble, with rare intact pieces of core. Some brown clay mixed in with the rubble.
												m										42.00 m: oxidation increases.
																						60.50 m: core becomes very fractured, with brown clay in fractures.
64.31	77.78	13.47	OX	RBL								l										Brown clay for first 10 cm, changing to a red-brown colour after. 5-10% medium to coarse grained quartz sand within the clay. Rare 1-4 cm limonite fragments occur mixed within the unit.
																						69.19-70.56 m: Quartz vein rubble, pieces up to 3 cm, with yellowy-brown clay. Mix of 1-4 cm quartz vein rubble with red-brown clay. Quartz vein rubble > clay.
																						71.63-72.54 m: First 5 cm is a chunk of Qz vein and the rest of the interval is reddish-brown clay.
																						72.54-73.46 m: Quartz vein rubble with occasional brown clay.
																						74.07-74.52 m: No recovery.
77.78	82.40	4.62	LST	ALT	BX							m										LST breccia rubble. Core is rubble and strongly oxidized, so it is difficult to see much detail. Also coated in brown to red-brown clay.
82.40	114.15	31.75	VOL	ALT	BN	BD	50					f										Green-grey volcaniclastic. Oxidized and coated in brown clay. Frequent Ca veining. Veins occasional have vug spaces, possibly where sulphides have weathered out.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	30					m										87.16-99.72 m: Oxidized, rubbly volcaniclastic, rubble is reddish-brown to dark green-brown. Rare red-brown clay intervals. Occasional zones where core is less oxidized, can see original composition. Rubble pieces are very vuggy.
					CR	VN	20					f										99.72-114.15 m: Greenish-grey limestone with a crackle texture created by <1-2 mm Ca veinlets. There are at least 3 phases of veining. Bleached zones occur around these veinlets. Oxidation of the veinlets makes them pale yellow to brown in colour. No mineralization is visible The limestone has very faint 1 mm Ca crystals giving the core a grainy appearance in the more unaltered zones.
						VN	80															
						VN	50															
114.15	114.75	0.60	LST	ALT	MA	VN	45					f			w							Medium to dark grey limestone with fractures filled with medium brown clay. Fair oxidation occurs surrounding thin Qz-Ca stringer veinlets. Pyrite occurs as fine to medium grained sub to euhedral crystals scattered throughout.
114.75	143.59	28.84	LST		BX	BD	30															Medium grey, gritty massive limestone with zones o fluid brecciation. 35% breccia overall. The breccia is clast supported. Non brecciated areas are slightly banded at 30 deg to CA. Qz-Ca veins cut the breccia at 35 deg to CA.
						VN	35															117.45-117.90 m: zone of moderately strong oxidation. Thin fractures are coated in clay. This zone is also quite rubbly.
																						138.20-143.59 m: Limestone has become darker grey in colour in some zones. Brecciation has become more intense.
																						134.44-134.55 m: zone of red hematite alteration.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
143.59	156.85	13.26	LST	FOS	BX	BN	60					w			t							Fossiliferous dark grey limestone. There appear to be almost graphitic lenses within the limestone. Trace very fine grained disseminated Py occurs. Core has become very rubbly with slight oxidation o some fractured surfaces. Red hematite also occurs on some of the surfaces as well as in layers in the core. Fluid brecciation is prevalent but relict banding can be measured at 60 deg to CA.
				ALT																		154.60-155.62 m: dark brown, rubbly, oxidized zone with blue-silver vitreous faces.
156.85	158.55	1.70	OX									I										Dark red-brown oxide zone with some very rubbly pieces of the limestone which are very oxidized.
158.55	192.96	34.41	LST	ALT	BD	BN	60		s						f							Very fine grained light bluish grey strongly dolomitized limestone. Faint compositional banding is visible at 60 deg to CA. Pyrite occurs in patches replacing white calcite patches and bands. Py is fine to medium grained. Qz-Ca veins cut the unit at 45 deg o CA.
						VN	45								w							161.49-164.49 m: Increase in less dolomitized limestone. 60% dolomitized, 40% non dolomitized.
										m					t							164.49-172.58 m: Light green (sericite) patches are replacing Ca patches within the limestone. Only trace disseminated pyrite.
																						171.20-172.58 m: Core becomes more broken up and weakly altered with orange brown stain on and surrounding fractured surfaces.
						BN	40															172.58-181.96 m: Some fractures have a bleached zone 1-4 cm surrounding the fractures that occur at 40 deg to CA.
																						181.96-189.70 m: The limestone has become more broken up with dark red hematite stain coating fractures within this zone. The limestone becomes slightly darker grey in colour further down the interval.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.37	2.37	OVB																			
2.37	25.55	23.18	LST	ALT	BD	BN	40															Thinly banded light to dark grey limestone The unit is quite broken up and rubbly. Fractured surfaces are weakly carbonate altered. Yellow brown clay occurs. It fizzes with acid and is likely a strongly clay altered limestone.
																						19.20-19.70 m: Yellowy brown clay zone. Clay contains quartz and limestone fragments, which are sub-angular to sub-rounded (FAULT??)
																						23.77-25.10 m: Very rubbly zone with limestone fragments held together by yellow-orange-brown clay (FAULT???)
25.55	26.10	0.55	MBL		BD	BN	20															Carbonate altered marble with medium grey silty beds running at 20 deg to CA.
26.10	34.44	8.34	LST	ALT	BD	BN	45															Very broken and rubbly , carbonate altered, medium grey limestone. Zones contain strongly altered limestone that has turned to clay. It fizzes with acid.
				CLY																		30.11- 30.28 m: Tan/brown clay with fragments of limestone
				CLY																		31.39-32.92 m: Tan/ brown clay with small ~1cm fragments of limestone.
34.44	51.39	16.95	LST	ALT	BD	BN	40															Moderately carbonate altered limestone. Can see faint bedding at 40 deg to Ca. Slightly brecciated. Thin black fractures run at 35 and 65 deg to CA.
					BX	FR	35															
						FR	65															
																						36.25-38.75 m: Zone of very rubbly altered limestone.
																						39.76-40.54m: Small rubbly zone of quartz/ marble (poor recovery)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
51.39	54.20	2.81	LST	CLY																		Yellow-brown carbonate clay with quartz fragments 0.5-2 cm in diameter and occasional fragments of limestone. Fragments are all angular. (FAULT ZONE???)
54.20	58.33	4.13	LST	ALT	BX					w												Mixed banded limestone and highly altered limestor clay. The limestone has a brecciated texture. ~40 % of the interval is slightly orange-brown clay with limestone fragments. Clay fizzes with acid.
58.33	77.11	18.78	OX	CLY		BD	90															Yellow brown grading to dark orange red brown clay with zones containing subrounded to subangular limestone rubbly fragments. Quartz grit and rubbly also occurs locally within. From 60-69 m faint bands occur roughly perpendicular to the core axis within the clay.
																						58.78-58.83 m: Piece of banded limestone.
																						58.83-60.35 m: Yellow brown grading to dark tan brown clay with 20 cm zone of cobbly limestone fragments.
																						60.35-61.87 m: Orange- brown to dark red brown clay with small (<5 cm) pieces of banded limestone.
																						61.87-63.84m: Orange-brown clay- very poor recovery. Small coarse grained sand sized quartz and limestone fragments.
																						63.84-64.92 m: Dark orange red clay with ~ 1 cm angular pieces of very dark red brown limonite.
																						64.92-66.45 m: Dark maroon brown clay with some angular limonite fragments.
																						66.45-67.97 m: Grey brown clay containing red-brown compact clay fragments. At the beginning there is a yellow clay coating.
						BD	90															67.97-69.49 m: Starts with 10 cm of grey quartz sand/grit containing 0.5 cm quartz fragments. Followed by orange-red clay the first 20 cm of which is more yellow in colour and harder. Different coloured (yellow, red, orange) bands run roughly perpendicular to the CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						69.49-71.02 m: Orange/red clay.
																						71.02-72.54 m: Orange/yellow clay with some 10 cm zones of more competent limonitic zones.
																						72.54-74.02 m: Orange brown clay with a fragment (5 cm) of limestone. (Poor recovery).
																						74.02-75.59 m: Orange brown clay with limonite fragments 5-10 cm.
																						75.59-77.11 m: Orange-brown clay. No visible fragments.
77.11	96.93	19.82	OX	RBL																		The oxide zone is becoming increasingly more limonitic in composition. It is typically a medium to dark reddish purplish brown still with a clay component, but more of a gritty rubble.
																						77.11-78.64 m: First 1 m is deep purple-brown gritty sand with 1/2 to 1 cm angular limonite fragments.
																						78.64-80.16 m: Orange-brown gritty clay with sand sized rock fragments.
																						80.16-81.69 m: Reddish-brown gritty oxide compacted clay. Gritty zones appear to be more limonitic.
																						81.69-83.21 m: Reddish-brown gritty limonitic oxide with some clay rich zones.
																						83.21-84.73 m: Reddish-purple-brown gritty limonitic oxide with minor interstitial clay holding grains together.
																						84.73-86.26 m: Reddish-purple-brown gritty limonitic oxide with clay holding grains together. Larger 1 cm angular fragments of limonite also occur.
																						86.26-87.78 m: Dirty brown gritty limonitic oxide with interstitial clay and 1-2 cm purple-brown limonitic fragments.
																						87.78-89.31 m: Dirty brown gritty limonitic oxide with interstitial clay and 2-3 cm limonite fragments.
																						89.31-90.83 m: Orange-red gritty clay oxide with some 1 cm angular limonite fragments.
																						90.83-93.88 m: Boxwork limonite almost black on fresh surfaces and very porous.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: RAU-09-24

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	5.18	5.18	OVB																			Overburden.
5.18	56.72	51.54	LST	ALT	BX	VN	50		m													Highly brecciated moderately dolomitized limestone with sub-rounded to sub-angular matrix supported clasts. Banding picks up later on in the interval. Thin calcite veinlets cut the unit at 50 deg to CA. Fractured surfaces have a slight orange brown alteration stain on them.
						BD	70															10.06-15.16 m: Banding is represented by thin dark grey stylolites running at 70 deg to CA.
																						15.16-42.60 m: The interval is becoming increasingly more (80%) brecciated. The clasts are more rounded in shape as though they have been milled or ground. Also this zone is becoming highly fractured.
																						21.64 m: 5 cm of silty sand. Medium brown in colour.
						VN	60															29.00 m: Classic open fill calcite veins cutting breccia 60 deg to CA. These veins are 2-5 mm thick and have a dark line in the middle. The calcite is quite coarse grained.
						BN	70															42.60-47.25 m: The limestone is now less brecciated (10%) with some evidence of open cavity calcite growth (very coarse subhedral crystals). The interval is still rather rubbly and the fractured surfaces are carbonate altered.
																						Mottled-camo textured limestone with a medium to dark grey texture.
																						48.39-51.19 m: Calcite vein brecciation. Clasts are sub-angular to angular and 1/2 to 3 cm in diameter and are matrix supported.
						VN	50															51.19-56.72 m: Medium to dark grey limestone with fluid alteration and Ca stockwork veining. Veining follows rough orientation between 50-65 deg. Moderate to strong carbonate alteration of the fractured surfaces.
						VN	65															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
56.72	59.48	2.76	OX	CLY																		Dark brown to orange brown oxide clay containing a few rubbly cobbles of limestone concentrated at the start of one of the drill runs.
59.48	71.47	11.99	LST		BX	VN	50															Fluid brecciated medium to dark grey limestone. Areas that are not as highly brecciated have a camo-mottled texture. Ca veins cut the limestone at 50 deg to CA.
																						65.03-65.72 m: Zone of fluid collapse breccia. Clasts are 3-5 mm and sub-rounded to sub-angular in shape.
																						65.72-71.47 m: Intensely altered fluid brecciated limestone, very rubbly with clay coatings on fractures.
71.47	72.85	1.38	OX	CLY																		Medium orange brown oxide clay with small (1-3 cm) fragments of intensely oxidized limestone. Contains very fine grained flakes of fine grained yellow mica.
72.85	74.52	1.67	VOL	ALT		FO	40															Yellowy orange strongly clay altered volcaniclastic with a faint foliation at 40 deg to CA. At the end of the interval there is a fragment of coarse crystalline quartz in a limonitic rock fragment 30 cm long.
74.52	75.00	0.48	OX	CLY																		Medium brown clay zone with small < 1 cm foliated fragments of dark grey limestone. (30%)
75.00	76.81	1.81	LST	ALT	BX	VN	40		s													Medium to dark grey fluid collapse brecciated strongly dolomitized limestone with Ca veinlets cutting at 40 deg to CA.
76.81	82.66	5.85	OX	CLY																		Light to medium orange brown oxidized clay with sand to grit sized fragments within.
																						79.86-81.69 m: Light yellowy orange highly oxidized volcaniclastic. Mostly just thin fragments mixed with clay.
						FO	50															80.31-81.40 m: Zone of thinly foliated extremely oxidized volcaniclastic (?)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
82.66	87.80	5.14	DOL	ALT	BX	VN	50								t							Dark grey/brown dolomite showing severe fluid collapse brecciation marked by brown altered stringer veinlets crackling the unit. Quartz carbonate replacement zones occur. Rare thin quartz veinlets with associated pyrite cut breccia at 62.80 m. Zones 5-10 cm long of oxidized clay are occasionally intermixed within the interval.
87.80	89.04	1.24	VOL		FO	FO	30															Extremely fissile volcaniclastic (?) with yellow oxidized colour.
89.04	90.60	1.56	MBL		FO	FO	65															Zone of white marble with 20 % thin 2-3 mm dark grey layers. Core is considerable more competent than surrounding units.
90.60	94.49	3.89	DOL	ALT		BD	50															Extremely carbonate altered deep chocolate brown clay with coarse crystalline fragments of dolomite. Dolomite fragments have a very vuggy texture interval has a vuggy appearance.
						VN	15	270														91.89-94.49 m: Extremely altered fine grained dolomite. Unit has green brown colour with dark speckles. The crosscutting veins seem more highly altered and fizz considerably more than surrounding rocks.
																						91.48-92.96 m: Very rubbly zone
																						93.55-94.49 m: Very rubbly zone with some yellowish orange brown clay coated fractures.
94.49	99.97	5.48	MBL		BD	BN	40			s												Light to medium grey banded marble with 60% medium grey bands and 40% whitish grey bands. The marble is intermixed with extremely sericite altered volcaniclastic. Overall 80% marble, 20% volcaniclastic.
99.97	100.12	0.15	OX	RBL																		Highly oxidized rubble mixed with tan brown clay. Rock fragments appear similar to the mixed interval above.
100.12	102.41	2.29	LST		CR	VN																Medium grey-brown to dark chocolate brown altered limestone. Thin intensely altered veinlets run at 20 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
102.41	114.10	11.69	MBL			BD	60															Light grey banded marble with thin < 1mm medium grey bands (~5%)
																						103.54-103.95 m: Greyish brown gritty oxide rubble
																						104.41-104.85 m: Medium to dark brown gritty oxide rubble.
																						106.67-07.37 m: Medium brown slightly sandy clay oxide.
																						109.71-111.04 m: Medium brown sandy rubbly clay rich oxide.
						BD	60															112.02-114.10 m: Medium and light grey banded marble 40% medium grey, 60 % white to light grey. Bands are not perfectly liner, more crackled looking
114.10	122.23	8.13	OX		BD	BN	60															Intermixed dark red and brown gritty rubble/clay with zones ~20 cm of dark grey limestone with cross cutting Ca veins.
122.23	207.27	85.04	MBL		BD	BN	60															Light grey marble (70%) with dark interlayers (30%) There appear to be relict crinoid stem fragments tha are resistant to the banding and occur <1%.
						BN	45															128.50-159.29 m: A more pure white marble with 5-10% medium grey interlayers.
						CN	85															149.82-149.98 m: Very sharp contact with a dark grey intrusive (?) Contains crystals that gradually become more concentrated at depth.
						BN	40															159.29-171.42 m: Increase in the medium to dark grey horizons in the marble to 40% Appears to be more structurally induced banding than sedimentation related layers. The banding gradually becomes more and more erratic towards the bottom of the interval. Crinoid fragments resist banding (~1%). Coarse grained dotted areas may represent coral masses.
																						171.42-176.89 m: More pure marble with only trace dark grey patches.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BN	30															176.89-177.55 m: Banded marble with crinoid stems 0.7 mm in diameter. 30% dark grey bands, 70% white marble.
						BN	40															177.55-181.10 m: More pure white marble, very faint banding. Slight orange tint.
																						181.10-183.65 m: Banded marble ~ 30% dark grey bands, 70 % white- light grey marble. Banding is slightly convoluted.
																						183.65-207.27 m: Pure white marble with weak orange stain in some areas. Almost no grey banding.
															f							200.65 - 200.85 m: Fair pyrite occurs as individual subhedral crystals within the white marble.
																						207.27 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: RAU-09-25

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.55	3.55	OVB																			
3.55	17.00	13.45	OX	RBL								I										Light orange-brown rubbly oxide clay containing limestone and limonite fragments.
																						11.58-17.00 m: Dark red-brown clay and limonite fragments.
17.00	56.00	39.00	LST	FOS		VN	50								f							Moderately altered fossiliferous limestone (10%) with crinoid and coral mound fragments. Ca veins cut the limestone in at least 3 phases. 1) An carbonate altered phase cuts at 40 deg to CA. 2) cu by a more plain Ca vein phase at 20 deg. The angle between the 1st phase and 2nd phase is 90 deg. 3) Coarse grained Ca vein phase - slightly more vuggy Oxidized pyrite blebs are scattered throughout. The limestone is variably brecciated and crackled.
						VN	20															
						VN	40															
													Cl	t								23.77-25.30 m: Intensely carbonate altered mediun brown crackle brecciated and vuggy limestone. A soft green mineral (chlorite?) occurs at 24.57 m.
						VN	30		s			m			w	t						25.30-56.00 m: Fossiliferous strongly dolomitized crackle brecciated limestone. Oxidized medium grained pyrite blebs occur from 25.75-25.97 m. Altered Ca veins and at 30 deg and later irregular, generally low angle coarse grained dolomite veins cut the breccia.
						VN	55					f										29.87-31.57 m: Less intensely dolomitized crackle brecciated limestone with fair oxidation and carbonate alteration. Thin oxidized Ca veinlets cut breccia at 55 deg to CA.
						VN	30								w	t						31.57-52.81 m: Intensely oxidized strongly dolomitized fluid collapse brecciated rubbly fossiliferous limestone. Very altered Ca veins cut at 30 deg to CA. Very fine grained Py and Asp appear on broken surfaces.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									I			m										52.81-56.00 m: Intensely dolomitized, moderately oxidized crackly fluid collapse brecciated limestone with cross cutting altered 1-3 mm thick Ca veins running at 25 and 1-2 cm thick veins at 50 deg to CA.
56.00	64.65	8.65	OX						s			l										Medium to dark orange brown oxide with rubbly/clay rich zones containing subangular quartz fragments.
64.65	69.83	5.18	LST		BX				s			f										Strongly dolomitized fluid crackle brecciated limestone with Ca veins 1-5 mm cutting breccia at 25 deg to CA.
																						65.98-69.83 m: Intensely carbonate altered rubbly dolomitized crackly brecciated limestone.
69.83	83.21	13.38	DOL		BN	BD	70		I			m				w						Coarse grained dolomite with very coarse grained oxidized Asp crystals particularly concentrated from 74.60 - 75.00 m. Possible relict banding at 70 deg to CA.
83.21	85.30	2.09	OX	RBL								l										Extremely oxidized rubble zone. Limonite chunks are mixed with orange-brown gritty clay.
85.30	92.59	7.29	DOL		CR	FR	40					S				w						Coarse grained dolomite with pinkish orange rhodochrosite alteration of the Mg in the dolomite. A thin fracture network runs at 40 deg to CA. Coarse grained oxidized euhedral Asp crystals are scattered throughout. In areas the core contains vugs between the coarse grained dolomite crystals.
92.59	95.20	2.61	OX	RBL								l										Rubbly oxidized limonitic interval. Some of the limonite pieces appear extremely vuggy.
95.20	118.26	23.06	MBL			BN	40															White to light grey marble with minor thin ~1 mm light to medium grey bands running at 40 deg to CA.
						CN	40															106.05 - 106.35 m: Zone of grey-tope coloured clay - FAULT??

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	5					w										106.35-108.61 m: Medium grey limestone with slightly irregular bedding close to parallel to the core axis. The limestone is quite rubbly and the fractured surfaces show slight carbonate alteration.
			MBL		BN	BD	25					f										108.61-118.26 m: White marble somewhat rubbly with slight oxidation on fractures surfaces. The marble is very pure with few grey layers.
118.26	122.85	4.59	OX	RBL								I										Rubbly vuggy limonite, almost looks like drift wood.
122.85	127.41	4.56	MBL	ALT								m										Dirty looking marble, fluid brecciated with a crackle texture.
127.41	132.60	5.19	OX	RBL																		Rubbly oxidized core with limonite on some fracture surfaces. Medium orange brown in colour.
132.60	143.45	10.85	VOL	ALT		FO	50					f										Dark grey foliated volcaniclastic with a vuggy texture as thought it has been fluid altered. Fractures surfaces are fairly altered. Foliation runs at 50 deg to CA.
						FO	45															134.75-135.67 m: The texture appears the same as the volcanic above but this interval has been intensely oxidized.
						FO	55			I												135.67-138.42 m: Intensely sericite altered and moderately oxidized volcaniclastic. Foliation appear almost crenulated.
						FO	50			m												138.42-140.00 m: Gradually decreasing in the amount of sericite alteration. One vein cuts the core at 0.5 deg to CA. 0.5 - 1.5 cm calcite amygdules 3%.
						VN	5															
																						Dark grey-black volcaniclastic with 0.5-2cm subrounded Ca rich vesicles (3% total). Ca veins cut at 45 deg to CA. The veins are quite wiggly as though they have been offset by a crenulation.
						VN	45															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.98	1.98	OVB																			
1.98	14.93	12.95	LST	FOS	MA	FR	50															Medium grey, fossiliferous, massive, banded and brecciated variably dolomitized limestone with thin fractures at 50 deg to CA. Thin Ca veinlets irregularly cut the limestone.
																						1.98-3.95 m: Fossiliferous limestone with crinoid fragments and coral mounds.
					BX	VN	15															5.88-11.62 m: Brecciated dark grey limestone. Breccia clasts are 0.5-4 cm in diameter and subrounded to subangular in shape. Starting at 9.5 m the breccia looks more fluid altered. Ca veins cut the breccia at 15 deg to CA.
					BN	BD	60		ms													11.62-14.93 m: Medium to dark grey banded dolomitized limestone with dark grey thin (~ 1 mm) crenulated layers. The crenulated layers displace calcite veins in a stepwise texture. Very coarse grained dolomite occurs in veins running at a similar orientation to the Ca ones.
						VN	30	90														
14.93	18.55	3.62	DOL		BN	BD	40					f			f							Coarse grained white-cream-grey dolomite with pyrite rich bands cutting the dolomite at 40 deg to CA. There is fair oxidation of the sulphides and on fractures.
																						16.92-17.02 m: very pyrite rich zone. Pyrite occurs in coarse grained subhedral patchy crystals.
18.55	30.47	11.92	LST			VN	45								w							Medium grey limestone with dark grey crenulated bands ~ 1mm thick at 65 deg to CA. Medium to coarse grained dolomite stockwork veins cut the limestone at 40-50 deg to CA but are often offset a few mm to ~1 cm.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	65			m					f							25.88-30.47 m: Thin ~1 mm dark grey intermixed layers 0.5-2cm thick of sericite altered volcaniclastic occur at 65 deg to CA. Pyrite occurs as disseminated patches as well as in very thin bands matching the bedding angle. 60% limestone, 40% volcaniclastic. Dolomite veins cut the limestone/volcaniclastic at 30 deg to CA.
						VN	30	100														
30.47	34.62	4.15	VOL	ALT	BN	BD	65			ms					f							Medium greyish-green sericite altered, fine grained volcaniclastic. The sericite is banded with the non-altered brownish tan volcaniclastic. Pyrite occurs as fine disseminations along layering. Upper contact is gradational, lower contact is quite sharp at 75 deg to the CA. There is a gradual decrease in the amount of sericite alteration towards the bottom of the interval.
						CN	75															
34.62	49.19	14.57	LST		BN	BD	65								f	w						Banded medium grey limestone with dolomite veins 1-3 cm thick cutting at 30 deg to CA and 90 deg to banding. Weak pyrite occurs as fine grained patches and disseminations in the limestone.
						VN	30	90														
															m	w						37.96-38.46 m: Coarse grained dolomitized vein (?). Moderate pyrite and weak arsenopyrite occur as fine grained disseminations throughout. Upper and lower contacts are relatively sharp.
															f	w						38.46-44.56 m: Medium grey limestone with 0.5-1 cm thick dolomite stockwork veins. Pyrite and arsenopyrite occur as fine grained disseminations and small patches.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	50								w	t						44.56-49.19 m: Medium to dark grey limestone with coarse grained dolomite patches. Slight brecciation occurs in top 15 cm of interval. Clasts are 0.5-1.5 cm in diameter and sub-rounded in shape. Dolomite vein concentration decreases around 47 m revealing original banded limestone.
49.19	90.73	41.54	LST	MX	VN	VN	45								f	w						Medium to dark grey fluid altered limestone with more concentrated patches and zones of coarse grained dolomite that appear to be vein controlled. Some veins can be measured at 45 deg to CA, but others are extremely irregular. Trace pyrite up until 62.12 m when it begins to appear in more concentrated 0.5-3 cm patches. Quartz flood is also quite common, up to 30% in some areas.
															w	t						49.19-57.05 m: Light grey, medium grained dolomite with pyrite and arsenopyrite patches occurring along crackle fractures. Coarse grained quartz floods the core from 55.90-56.30 m and contains no mineralization.
																						57.05-62.87 m: Medium to dark grey fluid altered limestone, containing irregular patches of dolomite. Contains irregular quartz flood.
																						62.87-66.42 m: Medium grained dolomite with quartz flood throughout. 30% quartz. Pyrite occurs in patches 0.5-3 cm diameter.
						VN	60								w							66.42-69.94 m: Medium to dark grey limestone with dolomite veins cut by a quartz vein. Mineralization is patchy and most concentrated around the dolomite. 1% quartz, 30% dolomite, 69% limestone.
						BD	40		f						m	f						69.94-78.26 m: Medium grey dolomitized limestone with quartz patches. Faint banding occurs at 40 deg to CA. Pyrite and arsenopyrite occur in coarse grained patches concentrated in zones of more intense dolomitization. The limestone itself appears fluid brecciated.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
															w	t	t					78.26-90.73 m: Medium grey limestone with quartz +/- carbonate +/- dolomite veins cutting it. There ar zones of more pure massive limestone and zones which are crackle fluid collapse brecciated.
90.73	105.30	14.57	DOL	MX	BN	BD	65								ms	f	w					Coarse grained patchy dolomite with a dramatic increase in the pyrite pyrrhotite and arsenopyrite concentrations. They both occur as medium to coarse grained patches scattered throughout. Banding occurs on average at 65 deg to CA.
						BD	60								f	f						95.50-98.15 m: Core shows a more banded appearance in this area, the pyrite and arsenopyrite are concentrated along thin bands at 60 deg to CA.
						BD	70								w	m						98.15-102.35 m: Increase in the amount of dolomite. The core is now almost white and quite coarse grained. A slight banded texture of medium grained pyrite and arsenopyrite occurs at 70 deg to CA.
						BD	50								f	t						102.35-105.30 m: Medium to coarse grained dolomite with an increase in medium to dark grey limestone intervals. Faint banding occurs. Pyrite is fine to medium grained, patchy and concentrated in bands at 50 deg to CA.
105.30	126.70	21.40	VOL	ALT	BN	FO	50			ms					w							Moderately foliated, sericite altered volcaniclastic, with bands of fine grained pyrite at 50 deg to CA. Alteration becomes less intense towards the end of the interval.
						CN	50															
						FO	85			w					w							107.81-111.72 m: Brownish medium grained volcaniclastic with a faint foliation represented by layers of beige-green sericite alteration. Pyrite occurs as fine grained often concentrated into faint bands. Veins of Qz+/- Ca cut the unit at 20, 40, and 80 deg to CA. These veins are 0.5-1.25 cm thick.
						VN	40	90														
						VN	20	270														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
															s							109.51-109.56m. Concentrated zone of massive pyrite.
						FO	50			m					t							111.72-126.70 m: Moderately sericite altered beige-grey volcaniclastic with a foliation at 50 deg to CA. Ca veins cut the foliation and are 0.2-0.5 cm thick. Trace pyrite occurs as very fine grained disseminations. The lower contact is gradational into leopard printed volcaniclastic.
126.70	192.40	65.70	LEP			FO	60															Medium grey leopard printed volcaniclastic with faint foliation at 60 deg to CA. Fizzes strongly with acid. There appears to be 5% evenly disseminated fine grained biotite crystals throughout.
						VN	45															132.31-162.60 m: Finer textured leopard print volcaniclastic gradually becoming coarser towards the bottom. Ca veins 0.2-1 cm thick cut the core at 45 deg to CA. Very faint foliation at 50 deg to CA.
						FO	50															
						VN	70															162.60-168.03 m: Increase in the concentration of veins. Now Qz+/- Ca veins occur in 2 phases. 1) Thicker 0.5-1.5 cm Qz +/- CA at 70 deg to CA these are cut by more irregular 2) thinner 0.2-0.5 cm Ca veins.
						VN	50															163.98m: Begin to see green/blue mineral (talc or chlorite?). In this location it occurs in a Qz +/- Ca vein, but it can also be seen dusting fractures. The volcaniclastic appears to be more biotite rich in this zone.
				ALT		VN	35			f					f							168.03-189.45 m: Ca veinlets cut at 35-65 deg to CA some of which have bleached/altered halos around them. Thin zones of sericite alteration occur within. Finely disseminated pyrite occurs within.
						VN	65															
				ALT		FO	60			w												189345-192.40 m: A gradual decreased grain size version of the unit above. Pyrite occurs as very fine grained disseminated layers. Sericite alteration occurs in patchy layers.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
192.40	292.76	100.36	LST	RBL	CR	BD	75		s						w			Sp	w			Strongly dolomitized faintly crackle brecciated limestone. Top of interval has black graphitic layers with very fine grained disseminated pyrite.
															f							196.88-197.25 m: banded graphitic finely disseminated pyrite zone. Bedding is slightly wavy.
						FR	30		s													197.25-199.00 m: Extremely crackle brecciated, strongly dolomitized limestone. Common crack orientations are 30 and 80 deg to CA. Core is very rubbly in zones.
						FR	80															
																		Sp	w	Gn	t	199.00-200.40 m: Crackle breccia has been brecciated further by Ca +/- Dol veins. Red and purple-brown sphalerite occurs sub to euhedral crystals on fractured surfaces. Trace fine grained galena (cubic shape and metallic colour) occurs adjacent to the sphalerite in a few places. Interval is particularly fractured and rubbly.
						BD	80		s						w							200.40-206.04 m: Extremely crackle brecciated strongly dolomitized limestone. Quartz veins occasionally erratically cut limestone. Thin 2-5 cm dark grey horizons appear less brecciated and have minor very finely disseminated pyrite along possible banding at 80 deg to CA.
			DOL																			206.04-211.23 m: Medium grained dolomite crackle breccia. Very rubbly over most of the interval. No obvious preferred crackle orientation. Crackle is significantly less intense then the zone above.
									t													211.23-211.70 m: Medium grey very fractured and rubbly limestone. Fizzes slightly with acid.
			DOL			VN	40															211.70-230.85 m: White, medium grained moderately crackle brecciated dolomite. Cracks are dark grey in colour. Thin dark grey veins cut the breccia very occasionally at 40 deg to CA. The core is fairly to strongly rubbly. Occasional blue-green dusting on fractured surfaces.
															f							224.50-225 m: Pyrite occurs in fairly concentrated patches surrounding cracks.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									m									Sp	f	Gn	t	230.85-232.26 m: Dark grey more intensely brecciated and quartz flooded dolomitized limestone The core is rubbly, but larger pieces are slightly vuggy. Within these vugs fine grained sub to euhedral sphalerite crystals occur. The sphalerite is red and dark red-brown. Weak galena occurs generally associated with the sphalerite.
						VN	30		m						w			Sp	w			232.26-238.66 m: Medium grey dolomitized crackle brecciated limestone, highly fractured up until 233.5 m. Ca veins cut breccia at 30 deg to CA. Sphalerite occurs in zones of highly fractured dolomite.
									m						f			Sp	w			236.18-236.80 m: The breccia clasts have become more milled. Clasts are ~1 cm, subrounded and matrix supported. Sphalerite occurs in the dolomite matrix. Pyrite occurs as scattered fine disseminations and patches.
					CR	FR	10		m						f							236.80-245.75 m: Medium grey dolomitized limestone with clear crackle texture. Cracks are dark grey while the rest of the core is light to medium grey. Common crack orientation is 10 and 80 deg to CA. Coarse grained quartz veins cut the unit at 65 deg to CA. Pyrite seems concentrated in the areas where quartz veins occur.
						FR	80															
						VN	65															
															m							242.32-245.75 m: Massive coarse grained quartz vein which contains thin veinlets of pyrite. Upper contact 70 deg, Lower contact 65 deg.
						VN	30		ms						w			Sp	w			245.75-261.00 m: More intensely dolomitized crackle brecciated limestone. Has a recrystallized appearance. Dominant crack orientation is 10 deg to CA. Qz +/- Dol veins cut the breccia at 30 deg to CA. Red sphalerite crystals occur within the dolomite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

															w							261.00-276.45 m: Very fractured and rubbly dolomitized brecciated limestone. At 270.05 m the breccia becomes more intense. Clasts are 0.5-2 cm in diameter and subrounded. Pyrite is finely disseminated.
									ms						w					Sp	f	276.45-292.76 m: Very fractured and rubbly oxidized limestone. Poor recovery in general. FAULT?? Fragments are angular to sub-rounded and are on average 2 cm in size (pea gravel size). The surfaces are fairly oxidized. Weak to fair sphalerite appears on fractured surfaces.
																						292.76 m: E.O.H.

GEOLOGY LOG

HOLE:Rau-09-27

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.60	3.60	OVB																			
3.60	7.46	3.86	LST	RBL	BN	BD	45															White-tan limestone. Quite broken up and rubbly. Fractured surfaces have a orange-brown alteration stain on them. Minor clay occurs in some rubbly zones. Faint banding occurs at 45 deg to CA. A broken up zone at 4 m fizzes strongly with acid, and may represent a Ca vein.
7.46	16.35	8.89	VOL		FO	FO	40			ms												Very clay altered, foliated medium grey volcaniclastic. Very rubbly and clay rich especially from 7.46 to ~ 12m. Recovery is poor. The core is quite vuggy and sericite altered.
16.35	46.60	30.25	OX	CLY								I										Medium yellow-orange-brown to dark orange brown oxide clay with angular sand sized fragments and rubbly oxide zones.
																						Orange-red-brown sandy clay. Angular 0.5 cm fragments of Qz occur within. Very poor recovery.
						BD	60															19.20-20.30 m: Dark orange-brown oxidized clay rich sand. Contains angular 0.1-0.5 cm fragments of limonite. Also contains coarse grained sand sized quartz fragments. Very faint band occurs at 60 deg to CA.
																						20.30-26.82 m: Orange-red-brown sand rich clay. Contains angular quartz fragments generally the size of coarse grained sand, but up to a 3 cm by 4 cm in size. Overall quartz represents 1-2 %.
																						28.35-31.39 m: Very coarse grained sand to gravel size fragments of quartz occur within a limonitic gritty interval. Gradually becomes less limonitic at 29 m. Becomes more of a green-grey colour. Quartz accounts for ~ 5%. FAULT ZONE???
																						31.39-31.88 m: Tan-brown soupy clay with very few rock fragments.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						31.88-32.92 m: Orange-red-brown clay with 1-3 % small rock fragments 1-3 mm in size. Outside of core is coated in quartz sand. Also have large limonite fragments 3 by 3 cm at 31.88 m.
																						32.92-33.94 m: Yellow-brown oxide clay with 0.2-1 cm angular quartz fragments ~ 5%.
																						33.94-38.47 m: Very rubbly rock fragments held together with gritty clay. In more clay rich zones angular quartz fragments occur.
																						38.47-39.53 m: Dark grey brown limonite rubble. Too oxidized to discern any original textures.
																						39.53-46.60 m: Intensely oxidized red/purple limonitic clay and rock fragments with sand to grit sized fragments of rock (mostly crumbly limonite). Faint banding occurs at 60 deg to CA within muddy clay.
																						~41.75 m: The limonite fragments have a crystalline appearance, glittering in the sun.
46.60	60.35	13.75	LST		BN	BD	60					s										Poorly recovered zone of oxidized limestone. Fizzes strongly with acid. Possible banding at 60 deg to CA. Very crackly texture. Farther in the interval the fragments are considerably more limonitic obscuring original textures. And oxide zones containing clay also occur.
																						48.16-49.63 m: No recovery
												l										49.63-51.21 m: Very small zone of gritty quartz and limonite, fragments in clay.
									w			f			t							51.21-58.00 m: Heavily oxidized slightly dolomitized crackle brecciated limestone. Very fractured and rubbly. Pyrite occurs as trace oxidized medium grained crystals.
																						58.00-60.35 m: Dark brown gritty sandy oxide zone with minor clay.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
60.35	70.75	10.40	DOL	ALT	MA	VN	70					ms			f	f						Very coarse grained dolomite with moderately stron oxidation stain. Small to medium grained pyrite occurs scattered throughout and are intensely oxidized. Arsenopyrite clots and subhedral crystals 0.5-1.5 cm in diameter occur scattered throughout and are strongly oxidized particularly from 64.70-64.92 m. Thin sulphide bearing veinlets cut the dolomite at 70 deg to CA.
																						63.00-63.25 m: 25 cm zone of medium orange brown gritty oxide clay
70.75	89.31	18.56	LST	ALT		VN	50		ms			m										Moderately dolomitized fluid collapse brecciated medium grey limestone. Slightly recessive Ca veins cut the breccia at 50 deg to CA.
																						Extremely oxidized fine grained pyrite crystals are concentrated in the more dolomitized zones, particularly from 72.29-72.40 m.
																						75.65-78.64 m: Very rubbly zone with intermixed dark brown rubbly sandy clay and some 2-10 cm fragments of dolomitized limestone.
																						89.21-89.31 m: Dark brown clay with a fragment (1.5 cm in diameter) of arsenopyrite.
																						89.31 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-09-28

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.60	2.60	OVB																			
2.60	69.49	66.89	LST	FOS	BN	BD	45															Faintly banded fossiliferous medium grey limestone with crinoid stem fragments and coral fragments. Camo-mottled texture occurs locally. Banding occurs between 40-50 deg to CA.
																						2.60-3.30 m: Medium to dark grey mottled/camo textured limestone.
						BD	40															3.30-9.45 m: Ca veinlets cut at 40 deg to CA, although from 5.40-6.20 Ca veins cut at 20 deg as does the bedding.
						VN	40	0														
						VN	20															
						BD	75															9.45-10.89 m: White and grey marble with medium grey banding at 75 deg to CA.
						BD	50															10.89-12.55 m: Medium grey fossiliferous, limestone with crinoid stem fragments. Looks like a slightly more turbulent environment. Faint banding occurs at 50 deg to CA.
						VN	75															12.55-17.45 m: Patchy white and grey limestone. White quartz stockwork veins (?) have flooded the core typically 70-80 deg to CA. Relict coral fragments.
						VN	30															17.45-20.01 m: Massive fossiliferous medium grey limestone with rare Ca veins cutting. Contains large >1cm crinoid stems well preserved both in plan and cross view. Ca veins cut at 30 deg to CA.
					BX								He	m								20.01-29.87Maroon/grey patchy brecciated limestone. Breccia is mosaic style with clean Ca veins cutting angular patchy limestone fragments. The maroon layers are slightly siltier (coarser grained) the colour probably comes from faint hematite alteration. Breccia accounts for 10-15% of the interval. Large 1-3 cm coral mounds occur clearly and are very well preserved.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
					BX	VN	50						He	m								29.87-46.18 m: Very fluid altered medium grey limestone with patches of silty porous hematite altered maroon/grey limestone. Two Ca veins cut the unit at 50 deg to the CA. (3-5 cm thick each).
						BD	20															46.18-69.49 m: Steeply bedded slightly hematite altered limestone with occasional coral fragments which are well preserved and are resistant to any structural events that may have folded the rock in this area.
																						48.00-50.75 m: The core is quite fractured and broken up.
						BD	35															58.80-60.39 m: Tan-pink bleached zone that is slightly more broken up than the surrounding core. It is particularly rubbly from 59.74-60.00 m.
						BD	45															60.39-69.69 m: The limestone has an altered look to it. The banding is still present but is much fainter The core is considerably fractured and rubbly in zones. Siderite alteration occurs along very thin healed fractures running at 10 deg to CA.
69.49	80.42	10.93	VOL	CLY																		Taupe-yellow-tan coloured highly clay altered volcaniclastic, with small 2-3 mm angular rock fragments.
						FR	40															71.02-72.54 m: Dark grey foliated volcaniclastic with orange-brown coating of fractures. Core is brittle and very soft.
																						72.54-74.22 m: Yellow-tan clay altered volcaniclastic with 2-3 mm thin angular platy white-very light grey non-calcareous fragments.
																						74.22-79.25 m: Tan grey clay altered volcaniclastic Appears to be quite a fresh clay. Contains platy, angular, 0.2-1 cm fragments of soft, light grey rock (talc ?). Predominantly clay.
						CN	65															79.25-80.42 m: Yellow-orange clay altered volcaniclastic. Some larger pieces show a platy foliation but it can not be measured. Lower contact is sharp at 65 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
80.42	88.39	7.97	LST	CLY	BX																	Medium grey limestone brecciated by irregular Ca veins. The matrix has orangy-yellow carbonate alteration colouration.
																						80.77-81.57 m: Light orange-brown clay altered limestone. Fizzes considerably with acid. Clay has a gritty texture with minor angular, medium grey, soft rock fragments 3-5 mm in diameter.
						BD	65															81.57-88.39 m: Intermixed medium grey thinly banded limestone with 5-10 cm medium orange-brown gritty clay zones. Clay zones fizz considerably with acid and are gritty with angular fragments and crystals of limestone and calcite. The limestone is thinly banded at 65 deg to CA.
																						33.20-33.39 m: Quartz-calcite vein. The limestone surrounding this vein is quite carbonate altered and brecciated.
88.39	96.47	8.08	OX	CLY																		Deep red-brown oxide zone. Mostly very fine oxide clay mixed with gritty limonite fragments. Quite good recovery. Occasional medium to coarse grained quartz crystals.
																						91.44-94.49 m: Much more quartz rich oxide zone. The oxide is limonite rich as opposed to clay rich. Very rubbly with larger limonite fragments. The colour of the oxide is medium brown (less red-rust coloured than above).
																						94.49-100.43 m: Less quartz rich oxide zone. Slightly more rusty red-orange-brown in colour. Mostly clay with some rough limonite fragments.
96.47	107.29	10.82	LST	ALT																		Intensely carbonate and clay altered limestone. The clay is a light orange-tan-brown colour and fizzes strongly with acid. Occasional small <5 mm angular quartz fragments occur within.
				CLY																		
						BD	60															100.43-103.94 m: Very altered looking banded limestone. Has a green/orange altered colour. Anchorite altered Ca veins cut the limestone at 35 deg to CA.
						VN	35	340														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						103.94-107.29 m: Dark red/brown carbonate and clay altered limestone. Clay slightly to strongly fizzes with acid. The carbonate altered fragments do not. Minor ~1 cm sub-angular quartz fragments occur within.
107.29	115.78	8.49	LST	ALT	BX	VN	15						SID	f								Moderately siderite altered limestone The siderite occurs pervasive along healed fractured. Overall the unit is very fractured and broken up. Ca-siderite veins run at ~15 deg to CA. Trace grains of pyrite occur in the more broken up areas. The limestone has a very fluid collapse brecciated texture.
115.78	121.92	6.14	LST		BX							w			w							Dark grey coarsely mosaic brecciated limestone. Clasts are < cm to 10 cm and angular. The matrix is very coarse grained calcite. Weak, fine grained oxidized pyrite cubes occur scattered throughout.
																						121.92 m: E.O.H.

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.55	2.55	OVB																			
2.55	23.97	21.42	LST	FOS	BN	BD	40															Medium grey thinly bedded fossiliferous limestone. Crinoid stem fragments 0.2-0.4 cm in diameter as well as large coral fragments 1-3 cm in size. All of these fossils look well preserved (not broken). Thin orange-brown layers 1-6 mm wide occur concordan to bedding as well as cutting it in small parasitic folds. (fracture fill???)
				ALT																		
						BD	45															7.01-11.30 m: Medium to dark grey, very thinly bedded limestone with rare coral and crinoid fragments. Pyrite and pyrrhotite occur as very fine grained patches dispersed throughout. Dark grey 1-3 mm elongate spots dot the unit and enhance the banding orientation. Very thin <1-2 mm Ca veinlets occur concordant to bedding.
						VN	45	0														10.36-10.49 m: Ca vein occurs at 30 deg to CA. On the edges of the vein, an inclusion of limestone has become enclosed within the vein. A 5-10 cm bleached halo occurs on either side of the vein.
						BD	50					m			w							11.30-14.63 m: Medium grey limestone with an orangy-green carbonate alteration tinge. Thin beds occur at 50 deg to CA. Small crinoid and coral fragments are scattered throughout, but are particularly concentrated from 13.64-14.05 m. Thin <1-2 mm oxidized Ca veinlets occur concordant to banding. Small oxidized cubes of pyrite occur scattered throughout.
						VN	50	0														
			CA	RBL	VN																	14.63-16.02 m: Strongly carbonate altered very rubbly, coarse grained calcite vein with vugs up to 1 cm deep. Has a mottled pink-white-grey colour.
				ALT																		

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	45					m			w							16.02-19.39 m: Medium grey, fossiliferous, very faintly banded limestone, with swirly 0.2-2 cm wide porous (almost clay) orange-brown carbonate altered bands. Medium grained Ca veins irregularly cut unit. In a few cases open cavity Ca fill has occurred leaving some vugs in the veins.
															w							17.77-18.20 m: Fine crackle textured Ca veinlets cut the core in numerous directions. All of these are ~ 2 mm thick and strongly altered. Fine grained cubes of pyrite occur in a scattered throughout.
						VN	40															19.39-20.28Intensely altered limestone zone. More rubbly than unit surrounding it. Some of the fractured surfaces have orange-brown clay coatings on them. Fragments appear to be extremely fossiliferous. Ca vein cuts at 40 deg to CA.
						VN	70					f			t							20.28-21.75 m: Medium grey very fossiliferous limestone 1-2 mm crinoid stem fragments are quite concentrated (5%). Very thin <1mm Ca crackle veinlets which have been quite strongly carbonate altered. Occasional oxidized Py cubes.
						VN	60					m	He	s								21.75-23.97 m: Medium grey fossiliferous limestone with moderately strong pink-red hematite overprint. Ca veins cut at 60 deg to CA. Thin < 1mm dark grey bands occur at 50 deg to CA. Might represent fracture fill rather than bedding. In general most textures and structures are obscured by the hematite overprint and the alteration.
						BD	60															
																						23.11-23.35 m: Rubbly medium to dark orange-brown interval.
23.97	26.12	2.15	OX	RBL									LIM	I								Extremely rubbly limonite zone. Fragments are in general 1-2 cm in size, but fine grained gritty zones also occur. The limonite fragments show some coarse grained crystal faces.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
26.12	49.52	23.40	LST	FOS	BN	BD	30															Extremely fossiliferous medium grey limestone with obvious signs of banding. Most of the fossils are crinoid stem fragments (including star crinoids) which are very well preserved.
				ALT		VN	30															Light orange-brown carbonate alteration and or bleaching surrounds thin irregular veins. The most common vein orientation is 30 deg to CA. Later Ca veins cut these altered zones at 5 deg to CA.
						VN	5															
					BN	BD	30	90			f											33.95-49.52 m: Start to get marbleisation of the limestone. All textures and structures are becoming more faint, the core is harder. The contact into and out of this zone is gradual (over 0.5-1 m). Relict bedding is 30 deg to CA.
													Sid	f								40.00-40.29 m: Dark orange-brown siderite vein. Somewhat rubbly but still rather competent
																						48.76-49.10 m: Thin 2-3 mm siderite altered Ca stringer veinlets run at 15 deg to CA.
49.52	86.12	36.60	LST	ALT	FO	FO	25						Sid	w	w							Dark grey moderately fossiliferous limestone with carbonate altered light green-orange brown beds that appear to be slightly siltier in texture. (Some characteristic of these beds allowed them to be preferentially altered.) Crinoid stem fragments occur rarely and are most commonly well preserved. Oxidized pyrite cubes are disseminated throughout (1-3%). There appears to be a foliation at 25 deg to CA. There is slight deformation of bands around the crinoid stems, suggesting some sort of structural deformation.
						FO	15								t							58.23-64.00 m: Thin <1 mm carbonate altered and non altered Ca stringer veinlets cut the foliation at 6 deg to the CA. Often see a thin 2-3 mm tan-bleached halo in the limestone surrounding these veinlets. Late stage patchy pyrite is associated with a Ca patches- trace overall. Area of high strain. In this zone the crinoids are beginning to show signs of deformation. Foliation occurs at 15 deg to CA

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	60	240														
						VN	60	80														Two fold noses occur; one at 60.45 m, the second at 60.60 m.
						BD	50	280														60.75-61.45 m: A zone of coarse grained Ca veins 2-6 cm in width. The foliation of the limestone that is cut in this zone follows the orientation of the veins at 60 deg; but based on the foliation of the peripher limestone, an angle to foliation can be determined. Possible bedding angle is 50 deg to CA. The angle from the foliation to the bedding is roughly 28 deg t CA. Pyrite (non-oxidized) occurs as trace patches scattered within this unit.
						FO	30															64.00-81.33 m: Foliated faintly bedded fossiliferous limestone with Ca veins cutting the unit. Bedding is represented by thin zones 2-3 cm wide of non-fossiliferous limestone. These have quite sharp contacts between the beds. This distinct bedding only occurs in a few places in the interval.
						BD	55	40														
						VN	40	180														
			FLT	CLY		CN	60															81.33-81.50 m: Tope-grey very clean clay gouge. I looks as though it could be used for pottery. Contains no rock fragments. Upper contact is sharp at 60 deg to CA.
						FO	45															81.50-86.12 m: Dark grey fossiliferous limestone with fewer fossils compared to the units above. Ca veins cut at 25 deg to Ca and occur at 90 deg to the foliation.
						VN	23	90														
86.12	94.63	8.51	LST	ALT	CR	VN	23					w	Sid	w	t							Intensely crackle brecciated limestone with slight siderite alteration associated with cutting Ca veins slight oxidation of trace pyrite fine grained cubes. Ca veins cut the brecciation at 25 deg to CA. The unit becomes increasingly dolomitized with depth.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	50		ms						w	t						89.00-94.63 m: Moderately strong dolomitized and slightly crackle brecciated fossiliferous limestone. Very few crinoid stems occur. Weak pyrite occurs as fine grained disseminations. Trace arsenopyrite also occurs as traces disseminations. Minor medium grained quartz occurs at 92 m.
																						89.15-89.41 m: Coarse grained dolomite zone occurs with a pink rhodochrosite alteration
																						94.15-94.63 m: A zone of light pink-orange rhodochrosite alteration of coarse grained dolomite.
94.63	96.93	2.30	LST	ALT		FR	30					ms										Intense oxidation of a dolomitized limestone. Contains medium grained sub-to anhedral patches of both pyrite and arsenopyrite. Both of these minerals show quite strong oxidation. The sulphides appear to occur surrounding highly altered fractures. Sections of the interval are quite rubbly with minor clay zones. Both upper and lower contacts show a gradual change into the less altered dolomite and limestone.
96.93	117.82	20.89	DOL	ALT		FR	5						Sid	ms	w							Coarse grained dolomite with quite strong orange brown siderite alteration concentrated in filled fractures. Fractures occur at 5 deg to CA. Parts of the core that are particularly altered are slightly vuggy and slightly rubble. Oxidized pyrite cubes are fine grained and weakly scattered throughout.
						FR	10					w	Sid	m	w	t						101.00-109.55 m: Less siderite altered coarse grained dolomite. Light grey in colour. Fractures are still coated in siderite which is dark brown in colour. Fractures occur at low angles to CA. Slightly oxidized pyrite occurs as small to medium grained subhedral cubes. Arsenopyrite also occurs but in a lower concentration.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	50								f	w						105.72-105.92 m: Increase in Py and Asp concentration. This core has a yellowy orange oxidized stain to it. Thin Ca veins also cut the dolomite at 50 deg to CA.
													Sid	ms								109.55-117.82 m: Dramatic increase in the siderite alteration of the coarse grained dolomite. Medium grained pyrite cubes which are strongly oxidized are weakly scattered but appear concentrated in the more altered zones. The core has an increase of crackle fractures at 110.70 m. Very strongly altered zones are generally 10-15 cm wide and slightly rubbly. Blood red hematite dills some fractures as well as forms small patches in some zones in the dolomite.
													He	w								
																						112.17-113.05 m: Zone of brecciated dolomite. The clasts are subrounded and the breccia is farthe crackled with thin siderite fracture gills.
																						114.00 m: There is a gradual change from coarse grained dolomite to dolomitized limestone.
117.82	120.00	2.18	LST	ALT	CR	CN	15		s				Sid	f								Medium grey strongly dolomitized limestone with zones of very vuggy siderite veins (?) First 75 cm o the interval is intensely altered dark brown-almost black. The limestone after this is quite vuggy. Lower contact is very sharp between vuggy siderite and marble.
120.00	123.40	3.40	MBL			BD	25															White marble with light grey thin impure layers at 25 deg to CA.
																						121.78 m: thin hematite filled fracture.
																						122.00-122.30 m: The marble contains 0.7 cm subhedral quartz crystals ~ 10%.
123.40	142.35	18.95	LST	ALT	BN	BD	70			w			Sid	w								Medium grey banded limestone with trace crinoid stem fragments. Green-yellow sericite alteration bands occur concordant to bedding. Siderite with minor hematite alteration occurs along a fracture at 126.15-126.35 m.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

				FOS									He	t								
									ms				Sid	m								126.40-133.70 m: Transition into dolomitized limestone with thin siderite filled fractures. Rubbly +/- vuggy dark red-brown siderite veins occur at 130 130.45 m, 132.55-133.70 m.
													He	w								
									ms				Sid	w								133.70-139.32 m: Medium grey dolomitized fluid brecciated limestone. Some fractures are filled with hematized siderite. Very occasional, small star crinoids occur- trace.
													He	w								
						BD	55		ms			w	Sid	I								139.32-142.35 m: Very strongly hematite siderite altered dolomitized limestone. Weak oxidation of relict pyrite occurs on some fractured surfaces. Siderite banding occurs at 55 deg to CA.
													He	s								
142.35	144.85	2.50	VOL	ALT	FO	FO	60															Intensely siderite altered volcaniclastic. Medium orange-red-brown quite soft, but not broken up. Contains altered fragments of limestone.
144.85	147.50	2.65	DOL	ALT	CR							f	Sid	ms	w							Very coarse grained dolomite with hematitic siderite filling cracks. Weak medium grained pyrite occurs within the dolomite. Often has a yellow-orange limonitic alteration on fractures associated with pyrite localization.
													He	ms								
147.50	150.27	2.77	VOL	ALT	BN	BD																Light cream yellow-brown altered volcaniclastic. Contains small siderite altered rock fragments. FAULT?? Very soft- but not quite clay.
						BD	40					w	Sid	s	t							148.90-150.27 m: Banded looking dark red-brown sericite veins cut the volcaniclastic. Trace oxidation occurs to relict pyrite.
150.27	154.84	4.57	LST	ALT		FO	65						Sid	I								Intensely siderite altered limestone, dark red-brown in colour with some patches of relict calcite. Fizzes moderately with acid. Foliation at 65 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.64	2.64	OVB																			
2.64	30.55	27.91	LST	ALT	BN	BD	50					t			m							Medium grey limestone with fine grained pyrite cubes disseminated throughout. Bedding runs at 50 deg to CA. Light tan-yellow bleached/carbonate altered zones occur commonly. Thin 3 mm Ca veins cut the core at 10 deg to CA.
						VN	10	50														
																						21.10-22.30 m: Core is very fractured.
						BD	45					w			m							26.03-30.55 m: Pyrite crystals are 1-3 mm and sub-hedral are disseminated throughout. Pyrite is moderately oxidized. A structural fabric runs at 45 deg to CA. Lower contact is quite sharp at 60 deg to CA.
						VN	10															
						CN	60															
30.55	110.75	80.20	LST	FOS	FO	FO	15					w			f							Medium to dark grey slightly fossiliferous pyritic limestone with foliation at 15 deg to CA. Trace to weak coral mound fragments and crinoid stem fragments. Very fine grained pyrite occurs as fine disseminations and patches. Occasional Ca veins occur at 60 deg to CA. Almost no alteration of core other than slight oxidation of pyrite at the top grading to progressively more carbonate alteration towards the bottom. Foliation folds around the crinoid fragments, does not deform them.
						BD	60	90														37.60 m: The contact between a fossiliferous and non fossiliferous bed in the limestone is at 60 deg to CA. Foliation occurs at 15 deg, and fractures occur at 30 deg.
						FR	30															41.00 m: There is a gradual steepening of the structural fabric so it is near parallel to CA.
						VN	60															
															f							43.67-48.77 m: Faintly altered grey-yellow pyritic fossiliferous limestone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						CN	60					w	HE	w	f							48.77-69.20 m: Medium to dark grey, very fossiliferous, structurally deformed limestone with 5% medium brown carbonate alteration zones. These zones are soft and scratch easily with a fingernail. The oxidized red-brown pyrite seems to be slightly more concentrated in these zones. Pyrite weakly occurs disseminated. The crinoid and coral fragments are quite broken up and appear to be slightly deformed by the structural overprint. The upper contact of the unit is sharp at 60 deg to CA. The altered zones have a general orientation of 40-60 deg to CA, but are highly variable. They contain small hematite patches- 3-5%, 2-3 mm.
																						66.53-66.80 m: Coarse grained slightly dolomitized white calcite vein.
																						67.00 m: the structural overprint becomes less intense and the fossils become less structurally broken up and deformed.
																						69.20-70.35 m: Slightly rubbly coarse grained calcite with slightly yellowy-orange alteration.
																						70.19-70.35 m: Yellowy-orange light brown clay gouge zone with a few angular fragments of medium grey limestone.
																						70.35-76.50 m: Slightly recrystallized medium grey fossiliferous limestone. Slightly fractured up with minor pale yellow orange alteration along the fractures. Structural fabric runs at 60 deg to CA. Slightly altered CA veins run at 30 deg to CA. Later healed fractures run at 30 deg to CA.
						FO	60															
						VN	30															
						FR	30															
					MA								HE	f								76.50-80.05 m: Pale purple-grey limestone grit with hematite occurring in very thin irregular fracture fills. The lower contact is bound by a 3 cm hematite-siderite alteration zone at 60 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	60															Medium to dark grey fossiliferous limestone with very faint bands represented by slightly darker grey limestone occurring at 60 deg to CA. Bands are 3-5 cm thick. Top 75 cm is a slightly altered (yellowy-orange-brown) zone that occurs in undulating patches. Pyrite occurs in 0.5-1 cm clotty patches as well as fine grained disseminations. No strong structural overprint occurs in this zone. Very thin <1mm Ca veinlets occur at 50 deg to CA and 260 deg to BD.
						FO	40															
						VN	50	260														
						FO	40								w							89.00 m there is a gradual increase in the concentration of fossils-crinoid stem fragments including star crinoids and coral fragments. The banding become slightly more obvious highlighted by non fossiliferous horizons. A faint structural overprint occurs at 40 deg to the CA.
110.75	156.20	45.45	LST		BX	VN	10								w							Medium-dark grey crackle brecciated limestone with 1-1.5 cm medium to coarse grained dolomite veins cutting at 10 deg to CA. Pyrite occurs in fine disseminations and small patches. In parts the limestone has a uniform coarse grained appearance.
					CR																	113.70-117.85 m: Marble zone.
				ALT		VN	70						HE	t								121.40-133.95 m: The unit have become more evenly and intensely crackle brecciated. Slight pale yellow-orange alteration cross cutting Ca veins. Also slight hematization occurs at 128.70 m.
																						133.95-136.40 m: The clasts are sub-angular to sub-rounded and up to 2 cm in size.
																						134.60-135.85 m: Fractured zone with medium brown dirty coating on fractures.
						VN	45								w							136.40-141.50 m: Medium grey gritty finely crackled limestone with Ca veins that cut 45 deg to CA. Sub-hedral pyrite cubes occur scattered up to 2 mm in size.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

			LST		BX							w			w							141.50-147.70 m: Medium grey fluid brecciated gritty limestone with 2 mm calcite veins occasionally occurring at 65 deg to CA. Pyrite occurs as small patches and disseminations throughout that are slightly oxidized.
																						145.60 m: 10 cm wide coarse grained dolomite vein cuts the limestone at 40 deg to CA.
				ALT		BD	60															147.70-149.58 m: Altered medium brown oxide stain and weak banded sericite alteration at 60 deg to CA. Large (up to 3 cm diameter) pyrite crystals occur scattered throughout along with fine grained subhedral crystals.
													HE	ms								149.58-152.99 m: Patchy fluid collapse and crackle brecciated limestone with minor zones of red-purple brown extremely hematite altered and slightly rubbly zones.
156.20	174.80	18.60	LST	ALT	BN	BD	40		m				SID	w								Banded, slightly fluid brecciated dolomitized limestone with coarser grained spotty limestone horizons. Bedding occurs at 40 deg to CA. Siderite veins at 60 deg to CA occur from 158.49-163.15 m, 163.53-163.60, 163.98, and 164.05 m
					BX																	169.12-170.10 m: There are black horizons at 40 deg to CA with thin cream layers within them. They seem to cut the limestone. VOLCANICLASTIC ??? - fractures are graphitic.
												w										170.53-171.35 m: Orange-brown altered zone. Possible oxide stain form a few pyrite grains that occur within.
174.80	177.09	2.29	LST	ALT	BN	BD	60						HE	w								Rubbly upper contact. Orange beige brown altered/bleached strongly altered limestone with banding at 60 deg to CA. Contains moderate (5-7%) cubic grains 2-4 mm disseminated throughout. Many of these grains are gone, but a pitted texture remains. Some of the bands are hematite rich. The lower contact is rubbly.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
177.09	187.54	10.45	LEP	ALT		FO	60			f												Light to medium grey leopard printed volcaniclastic. A faint foliation occurs at 60 deg to CA. Intervals of weakly to strongly bleached/altered zones give the core a light beige tan colour. These bleached zones are gradational and are typically 10-50 cm wide. The bleaching is concentrated around slightly vuggy hematite rich zones that parallel the foliation. The zones are 1-2 cm thick and occur at 179.11,181.65, 181.89, and 182.05 m. Weak sericite (pastel green) alteration occurs throughout. The unit fizzes strongly with acid.
						FR	30															
187.54	188.18	0.64	SID										SID	I								Intensely altered orange red-brown siderite altered limestone. (COLOUR: 2.5YR 4/6 - Red)
188.18	207.89	19.71	LEP	ALT		FO	45			m					t							Pale tanish grey-white leopard printed volcaniclastic with pale tan-greenish yellow sericite patches and stringers. Foliation runs at 45 deg to CA. Pale peachy-orange-tan bleached/altered zones occur surrounding some fractures and thin siderite veins. These bleached layered zones account for 20-30 % of the core. Trace very fine grained disseminated pyrite is scattered throughout.
						FR	20	275														
						FO	45			f					w							198.92-207.89 m: Less altered medium grey/brown leopard print limestone. Fizzes moderately with HC Foliation occurs at 45 deg to CA. Fairly concentrated tan-beige-grey sericite patches and stringers follow the foliation. Very fine grained disseminated pyrite occurs throughout. Fractured surfaces have orange-brown altered (oxidized) powdered coating.
																						206.32-206.64 m and 207.76-207.87 m: Combination of gritty orange-red-brown siderite clay with angular dark grey volcaniclastic fragments. Both the clay and the rock fragments fizz strongly with acid. (COLOUR: 5YR 4/6 - yellowish red)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
207.89	209.50	1.61	LST	ALT	FO	FO	50						He	w	t							Fine grained medium grey limestone with a purple/grey hematite alteration in zones. Foliation runs at 50 deg to CA.
209.50	210.82	1.32	SHL		FR										f							Black shale with moderately strong pyrite patches and disseminations. Quite fractured up. Fractured surfaces have dark grey powdery coating with a slightly metallic looking sheen- GRAPHITE. Pyrite appears most concentrated associated with calcite clots.
210.82	213.82	3.00	LST	ALT	BX				m						t							Medium grey brecciated dolomitized limestone with angular to subangular fragments 0.2-2 cm of black shale. Matrix appears to be speckly medium to light grey. Fine grained disseminated pyrite occurs throughout.
213.82	222.50	8.68	LST		BX	VN	30		s						w							Brecciated dolomitized limestone. The entire unit looks somewhat overprinted (dolomitized?). Clasts are more irregular. There appears to be much more fluid flow through the unit. Pyrite occurs in concentrated patches occurring in slightly vuggy zones.
					CR	VN	60															214.75-222.50 m: Crackle brecciated limestone. Thin calcite veinlets (1-3 mm) cut the crackle breccia at between 30-60 deg to CA. These veinlets show light yellowy alteration.
																						216.74-218.12 m: Highly fractured area with light medium orange siderite coating fractures. (5YR 6/6- reddish yellow)
																						222.50 m - E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

COMMENTS

The hole was ended at 80.50 m because the rods were beginning to get stuck in the clay rich ground.

GEOLOGY LOG

HOLE: Rau-09-31

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.05	3.05	OVB		RBL																	
3.05	7.03	3.98	LST																			Medium grey limestone, quite broken up and rubbly Slightly crackle brecciated with irregular Ca veinlets Weak hematite dusting occurs on some fractures.
7.03	13.11	6.08	OX	RBL																		Dark red-purple brown moderately rubbly limonite (?). Pieces are surprisingly heavy (residual sulphide). No visible sulphide. (COLOUR: 2.5Y 2.5/1 - reddish black)
																						12.67-13.11 m: Medium yellow-orange-brown gritty clay with medium grey angular fragments sand sized and up to 2 cm.
13.11	16.60	3.49	OX	CLY																		Green-tan-grey gritty clay with subangular medium grey very hard rubble fragments up to 5 cm in size. COLOUR: (10YR 4/6- DARK YELLOWISH BROWN)
																						13.00-16.50 m: COLOUR 2.5YR 5/2 - greyish brown.
																						14.00-14.63 m: COLOUR: 2.5 Y 5/2- light yellowish brown.
																						16.15-16.60 m: Grey-green-blue quartz rich gritty clay. Quartz fragments are sand sized to sub-angular fragments 1.5 cm.
16.60	39.01	22.41	OX	CLY																		Medium to dark orange-red-brown oxide clay with minor greenish tinted clay. The interval contains gritty fragments of limonite and subangular bull quartz. Yellow mica flakes occur locally within.
																						16.60-17.25 m: COLOUR: 2.5Y4/3-olive brown
																						17.25-18.50 m: COLOUR 2.5 YR 2.5/1 - reddish black.
																						18.85-19.20 m: Orange-brown gritty clay with minor sub-angular fragments 2-3 mm in size. (COLOUR: 10YR 5/8 - yellowish brown)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						19.20-20.73 m: Medium orange-red-brown gritty clay oxide with 3-5 % subangular quartz fragments up to 1 cm in size. (COLOUR: 10YR 5/8 - yellowish brown)
																						20.73-22.25 m: Orange-brown to dark brown gritty clay with some angular quartz fragments up to 2 cm. (COLOUR: 10 YR 3/2 - very dark grey brown)
																						22.25-23.77 m: Medium brown grit with occasional quartz fragments and tan-yellow mica flakes.
																						23.77-26.82 m: Yellow-brown to darker brown gritty sandy clay with subangular quartz fragments up to 3 cm. Yellow-tan mica flakes are prevalent from ~ 23.00-39.00 m. (COLOUR: 10 YR 3/2 - very dark grey brown)
																						26.82-28.35 m: Darker slightly reddish-brown gritty clay with rubbly fragments usually <2 cm in size. (COLOUR 10 YR 3/2 - very dark greyish brown)
																						28.35-29.87 m: Grey brown clay with some more competent sections. (COLOUR: 10 YR 5/8 yellowish brown)
						BD	60															29.87-31.39 m: Mixture of brown, orange-brown clay (with grit) and large white fractured quartz fragments up to 8 cm in size. Banding visible at 60 deg to CA. (COLOUR: 10 YR 5/8 yellowish brown)
			LST	ALT		m																31.39-31.95 m: Light grey dolomitized brecciated limestone with black material filling in fractures .
						BD	75															32.92-35.97 m: Yellowish-brown clay with a few reddish-brown stained angular quartz fragments (1-2 cm). At 34.44 m: 15 cm of dark reddish brown colour. Faint banding occurs at 75 deg to CA.
																						35.97-37.49 m: Yellowish brown sandy clay with greyish, finer sections, and angular quartz fragments up to 1 cm in size.
			QZ																			37.49-37.63 m: Fractured, white quartz pebbles 2-4 cm in size.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						37.63-39.01 m: Brown and yellow-brown clay with Qz grit and subangular fragments up to several cm.
39.01	43.00	3.99	LST	CLY																		Tan-green to brown, extremely altered and quite sof limestone. Patchy camo texture with some spots reacting to HCL. Mild yellow-red-brown fracture staining. (COLOUR 10YR 5/3 - brown)
43.00	78.35	35.35	OX	RBL																		Grey-brown to yellow brown rubbly oxide with sand sized grit, some reddish-brown limonite fragments up to 5 cm and quartz rubble.
																						43.59-46.63 m: Yellowish to greyish-brown with some orange-brown gritty crumbly material. Angula quartz fragments from 0.5-2 cm in size. (COLOUR 10YR 4/ Dark yellowish brown)
																						46.63-51.21 m: Mixture of crumbly brown sand/grit (30%) and grey slightly crackled 5-10 cm limestone chunks (70%). Some angular quartz fragments also occur.
																						51.21-54.25 m: Brown to yellow-brown clay/sand with fractured, subangular quartz chunks, usually ~ 1 cm thick but up to 5 cm. (COLOUR 10YR 4/ Dark yellowish brown)
						BD	55															54.25-69.49 m: Dark reddish-brown moderately competent oxidized unit with a vuggy appearance in zones. Rubbly zones are gritty with minor clay. Contains linear orange oxide zones 0.5 cm thick at 55 deg to CA. Originally sulphide bands ?? COLOUR 5 YR 4/6 - yellowish red.
						BD	50															69.49-78.35 m: Yellowish-orange oxide with distinct banding at 50 deg to CA. Oxide is probably after Ca and not sulphide. Slightly patchy vuggy bands suggest possible replacement of thin, fine grained pyrite bands similar to those seen in the lower part of the mineralized horizon. (COLOUR: 10 YR 5/8 Yellowish brown)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-09-32

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	0.85	0.85	OVB																			
0.85	11.28	10.43	LST		MO	BD	15															Very fractured dark grey to black limestone with a mottled/camo textured limestone. A few areas show bedding at 15 deg to CA. Ca veins 0.3-1 cm thick cut the first 1 m of the interval at 30 deg to CA. Contains irregular patches of medium tan-grey limestone. The contacts between the black and the tan-grey limestone are very sharp. While the patches themselves are very smooth and irregular.
						VN	30															
11.28	42.05	30.77	LST	FOS	BD	BD	5															Medium to light grey limestone with thin dark grey bands at 5 deg to CA. There is a slight crenulation offset of the bedding. The unit is fossiliferous in parts.
						BD	15															14.42-22.07 m: Trace crinoid stem fragments now occur in the unit which is a medium to dark grey colour. Bedding occurs at 15 deg to CA. There is a general mottled undertone to the interval with very dark grey-black and medium grey limestone.
						CN	15															22.07-26.36 m: Back into the light-medium grey limestone with thin 1-3 mm dark grey bands that define bedding at 15 deg to CA. Very strange sutured contact between the interval above and this one. Very thin Ca veinlets cut at 15 deg to CA and 120 deg to BD.
						VN	15	120														
						BD	30															26.36-42.05 m: Dark grey fossiliferous limestone with disturbed looking crinoid stem, and coral mound fragments. Bedding is very faint to invisible in many areas, and run at 30 deg to CA.
						VN	30															27.57 m: 2 cm wide Ca veins running at 30 deg to CA.
																						34.15-35.90 m: Very fractured, slightly rubbly zone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
42.05	52.10	10.05	LST		BX																	Medium to dark grey fluid collapse brecciated limestone with an overall irregular mottled texture. The unit has a high proportion of white calcite.
52.10	65.24	13.14	LST	ALT	BX	CN	35						He	f								Medium purplish grey (hematite altered?) limestone with coarse mosaic brecciation texture. Clasts are sub-angular and clast supported in white to light grey calcite. Upper contact is sharp at 35 deg to CA. Non-brecciated coarser grained fossiliferous zones occur within. The calcite contains black flakes that are very soft - some form of impurity. No late veins cut the breccia.
						BD	50															60.18-62.62 m: Banded (hematite altered?) limestone with irregular Ca stringer veinlets weathered to a pale yellow colour.
																						62.62-65.24 m: (Hematite altered?) brecciated limestone now contains non-altered zones of medium grey limestone. Clasts are very irregular, rounded to sub-rounded. In general the texture is very fluid. The matrix is white calcite. Overall 20% matrix, 80% clasts.
65.24	74.81	9.57	LST	FOS	BN	BD	60															Thinly laminated medium to dark grey limestone, with gritty interlayered tan-grey beds (20%). Crinoid stem fragments (including star crinoids) frequently occur. Also can see elongate rice shaped patches - burrows, or possibly some other form of trace fossil or fossil ???
																						65.30-67.20 m: Very fractured zone with 5 % sub rounded rubble fragments.
																						67.83-68.56 m: Irregularly bedded grit intervals with purple-red-grey colouration (hematite?)
74.81	76.78	1.97	MBL			BD	50															Very gradual upper contact, sharp lower contact. Top 1 m is marbleized banded limestone. By 75.50 m see light grey marble with a slight greenish tint and relict bedding at 50 deg to CA. A relict Ca veins occur at 30 deg to CA.
						VN	30															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-09-33

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.50	1.50	OVB																			
1.50	30.75	29.25	LST		BX	BD	10															Medium grey, weakly fossiliferous (1-3%), banded limestone with zones of fluid collapse breccia. The clasts are irregularly shaped, sub-rounded to rounded, 0.5-1.5 cm in diameter. The matrix is medium grained calcite and occurs in concentrations of approximately 50% where the breccia occurs. Bedding occurs as fine laminations 10 deg to CA, and are slightly crenulated. Mottled camo-print limestone generally occurs surrounding fluid brecciated zones. Thin Ca veinlets (1-3 mm) cut the limestone at 20-40 deg to CA.
						VN	30															1.50-5.30 m: Highly fractured zone.
																						5.30-16.67 m: Fluid collapse breccia.
					BN	BD	10															16.67-21.85 m: Bedded limestone.
																						21.85-24.29 m: Light grey zone of concentrated crinoid stem fragments and grit.
						VN	30															30.45-30.75 m: Rubbly coarse grained Ca vein.
30.75	55.62	24.87	LST		BN	BD	50															Predominately banded limestone with slight evidence of some fluid flow which makes the banding slightly irregular. Overall bedding occurs at 50 deg to CA
																						49.68-55.62 m: Banded limestone with thin 1-3 cm, taupe-brown clay bands filling fractures.
55.62	59.22	3.60	DOL	ALT	BN	BD	70															Dark brown altered fine to coarse grained dolomite extremely altered to dark (chocolate brown) clay like material. There appears to be a rough banded appearance with dolomite and dark alteration that looks similar to the banded texture of the sulphides in the main mineralized dolomite horizon. Banding occurs at 70 deg to CA. Overall, 10% dolomite, 90% dark brown alteration
				CLY																		58.62-59.22 m: Gradational addition of orange brown soft layers within the dark brown alteration. Lower contact is gradational.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Other		Pyrite	Arsenopyrite	Pyrrhotite	Other		Other		
													Type	Intensity				Type	Intensity	Type	Intensity	
59.22	67.00	7.78	VOL	ALT	FO	FO	60			I												Light yellow altered volcaniclastic. Predominant foliation occurs at 60 deg to CA. Competent clay (with relict textures) are intermixed with only moderately altered volcaniclastic (5-10 cm) long zones. Overall 70% clay, 30% rock. Upper contact is very gradational.
67.00	76.81	9.81	VOL		FO	FO	80															Medium to dark grey fissile volcaniclastic with grey talc-like coatings and yellow-orange powder coating on fractures. Unit is very soft.
76.81	79.20	2.39	OX																			Medium brown gritty/sandy oxide with clay holding fragments together. Angular quartz fragments 0.3-3 cm in diameter occur scattered throughout. Fragments are dark brown-black silty calcareous siderite fragments. These fragments seem particularly heavy.
79.20	84.12	4.92	VOL	ALT CLY	FO	FO	50			I												Extremely altered medium grey volcaniclastic with extremely altered light yellow-tan clay (sericite altered) intervals. Relict foliation is faintly distinguishable at 50 deg to CA.
84.12	105.95	21.83	OX																			Gradual change from above unit into orange-brown gritty oxide with 5% angular bull quartz fragments 0.2-3 cm in diameter. Minor clay holds the limonite grit together.
																						86.11-86.41 m: Bright orange oxide clay.
																						88.39-90.22 m: Yellow slightly vitreous mica flakes, 1 mm in diameter, are speckled throughout this clay rich interval.
																						90.22-92.20 m: 10-15 cm sections of dark purple brown pitted limonite fragments and grit mixed together within medium brown gritty clay.
																						92.20-99.21 m: Grit and fragments now appear more red-brown in colour. They seem rather heavy for their size. Small angular quartz fragments also occur throughout (1-2%).

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Other		Pyrite	Arsenopyrite	Pyrrhotite	Other		Other		
													Type	Intensity				Type	Intensity	Type	Intensity	
						BD	75															99.21-102.87 m: Medium orange-red-brown clay with angular bull quartz fragments 0.2-2 cm in diameter. Broken surfaces show a red clay stain, probably hematite. Possible brecciated texture and bedding at 75 deg to CA (only seen at 103.10-103.50 m).
						BD	80															102.87-105.95 m: Intermixed medium grey limestone with competent medium grey clay showing original bedding preserved at 80 deg to CA.
105.95	115.66	9.71	DOL	ALT	BX	BD	75															Very altered medium grey fine grained dolomite with slightly yellow stained Ca veins (0.1-1 cm) cutting it. The dolomite is highly brecciated. Zones of medium green-grey tinted volcaniclastic (?) have turned almost completely to clay. The original bedding is preserved at 75 deg to CA. Moderately altered dolomite fragments occasionally have orange-red alteration coating. This unit is highly fractured.
				CLY		BD	55															107.70 m: Bedding in the clay occurs at 55 deg to CA.
													HE	s								109.40-110.32 m: Zone of strong hematite alteration.
																						112.40-113.50 m: Zone of strong hematite alteration deep red in colour and slightly vuggy.
115.66	133.21	17.55	LST	ALT		BD	60		ms						w							Medium grey moderately to strongly dolomitized limestone bedded at 60 deg to CA. Ca veinlets irregularly cut the unit at 20 and 60 deg to CA. Medium to coarse grained dolomite veins 0.5-3 cm thick cut the unit irregularly at 30 deg to CA. Occasional fractured surfaces are smooth and graphitic. Pyrite occurs associated with the dolomite veins, trace to weak overall. Towards the bottom of the interval the concentration of dolomite veins increases.
						VN	20															
						VN	60															
						VN	30															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Other		Pyrite	Arsenopyrite	Pyrrhotite	Other		Other		
													Type	Intensity				Type	Intensity	Type	Intensity	
133.21	147.83	14.62	LEP		FO	FO	50								m							Light to medium grey finely spotted leopard volcaniclastic. Pyrite occurs as very fine grained disseminations and concentrated in bands following the foliation at 50 deg to CA.
															ms							133.21-140.21 m: pyrite occurs as semi-massive zones 1-10 cm wide. No sign of arsenopyrite. The pyrite is very fine grained.
															f							140.21-147.83 m: Gradual decrease in the pyrite concentration.
						VN	55	260														144.80-144.96 m: 7 cm thick medium grained dolomite vein.
																						147.83 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.15	3.15	OVB																			
3.15	45.00	41.85	LST	RBL	BN								MBL	m								Medium grey banded slightly marbleized limestone, very rubbly with rounded to sub-rounded fragments occurring with the maximum fragment length of ~45 cm. Possible very old landslide or fault??
																						Small zones of orange-brown clay (most likely altered carbonate) occur at 16.40-17.58 m, 20.42-20.45 m, 24.10-24.15 m, 24.46-24.48 m.
																						Bedding on fragments varies widely from 10, 35, 50 65, 70.
																						25.30-26.80 m: Zone of light yellow-brown clay coating fractures and the core.
																						43.30-43.65 m: Zone of medium brown clay gouge.
45.00	50.85	5.85	OX	CLY		CN	70															Medium brown to orange-brown clay encasing rare gritty fragments. All throughout there are light yellow-brown areas ~1 cm in diameter that possibly represent a brecciated mix of volcaniclastic and previously mineralized dolomite. Sharp contact with upper unit at 70 deg to CA.
																						45.22-46.63 m: Clay is medium brown with weak sand-grit sized fragments.
																						46.63 m: Orange-brown clay with trace to weak sand-grit sized pieces of bull quartz and a green-grey platy mineral (volcaniclastic?)
50.85	55.78	4.93	OX	RBL																		Dark reddish-brown oxide clay with fragments of limonite sand to 6 cm sized fragments. Very little clay holds the fragments together so the unit is quite rubbly in appearance.
																						52.50 m: Dark brown/black fragment with slightly yellow stained quartz. Volcaniclastic (?)
55.78	58.03	2.25	OX	ALT																		Yellow/green alteration of blue-grey rubble. The core is slightly heavier than expected. (COLOUR: 5Y 7/3 - pale yellow)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						57.30-58.03 m: There is a slight increase in the extent of alteration.
58.03	64.92	6.89	OX																			Medium to dark red-brown oxide mostly competent limonite fragments with zones of grit and clay. Fractured surfaces of the more competent limonite fragments show a banded texture between dark red-brown and black limonite fragments and medium orange-red-brown oxide powder. 35% limonite fragments, 65% oxide gritty clay and rubble. (COLOUR 5YR 5/6 - yellowish red).
																						58.03-59.10 m: Slightly yellow-orange-brown oxide fragments. Faint honey-comb texture and colouration on fractured surfaces suggests the protolith would be medium to course grained dolomite. The centre of the comb represents the dolomite crystal, and the outside may represent sulphide.
																						63.15m: 2 cm by 2 cm pocket filled with very dark brown/black slightly vitreous mineral with concoidal fracture (goethite?).
																						NOTE! At 63.40- there is 35 cm of limestone rubble mixed with light brown clay. This material most likely fell in from above when the rods were pulled. None of this material was sampled or taken into account during geotechnical measurements.
64.92	69.49	4.57	DOL	ALT	FO	FO	40								w							Medium to coarse grained dolomite with moderate light brown alteration and weak, medium grained, sub-euhedral, strongly oxidized pyrite crystals. Very faint foliation of the dolomite crystals occurs at 40 deg to CA. 2 mm Ca veins cut the dolomite at 15 and 55 deg to CA.
						VN	15															
						VN	55	350														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
69.49	84.73	15.24	OX			VN	60															Dark brown angular limonite fragments with an orange to orange-red powder coating of the fractures. Can see faint stockwork style texture at 60 deg to CA in the oxide, as well as other textures.
																						70.20 m: Soft brown fragment fizzes strongly with acid.
																						70.22 m: Angular quartz crystals occur in place.
																						73.15-73.79 m: Medium brown clay zone with mino grit and no sizable rock fragments. It is possible that this is not in place, that it may have fallen down the hole???? Was sampled anyway. (COLOUR 7.5YR 4/6 - strong brown.)
																						73.79-78.64 m: Medium to dark brown limonite fragments with yellowy-orange-brown and orange-red-brown oxide powder coatings on fractures. (COLOUR 5yr 3/3 dark reddish brown)
																						78.12-78.70 m: a zone of limonite fragments that are held together with yellowy-orange clay. Can see elongate pockets filled with bright orange powder within the dark red brown competent limonite/siderite. (COLOUR 10 YR 5/8 - yellow brown)
																						78.70-79.33 m: Very hard, dense limonite with yellowy-orange-brown powder coating fractures and also filling some vugs exposed where the core was broken.
																						79.33-81.69 m: Limonite rubble with medium red-brown clay and powder holding fragments together. Pockets of slightly pink-red-brown (hematite ?) powder occurs sporadically.
																						78.64-80.16 m: Very dark brown-black limonite zone. Quite rubbly and crumbly. (COLOUR 7.5 YR 2.5/1 - black). Pale greenish grey coloured coating occurs on some fractures. Can see faint honeycomb texture of the oxide.
																						80.16-81.82 m: Medium orange-red-brown oxide rubble with little to no clay. The fragments are all very rounded (COLOUR 7.5 YR 5/8 - Strong brown)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						81.82-83.21 m: Medium brown gritty clay (fizzes slightly with acid) with 2-3% sub-rounded banded limestone fragments *possibly was down the hole from above? Recovery in this interval was not >100% but it could be replacing a gap in recovery?* (COLOUR 7.5 YR 4/3 - brown)
																						83.21-84.73 m: Chocolate brown with a hint of red oxide clay with weak gritty fragments including quartz. Fizzes slightly with acid (COLOUR 7.5 YR 3/4)
84.73	95.54	10.81	OX	RBL																		Very dark red-brown-black siderite rich rubble zone. Fragments are very angular and vuggy/pitted and very hard. 6
																						84.25-84.50 m: Orange-brown with yellow-orange patches
																						90.83 m: Yellow-orange clay (5 cm)
																						93.88-95.54 m: Fractured surfaces have a green-grey colour outer surface is red-brown with some coarse grained quartz crystals intergrown. Can see a clear honeycomb texture between oxidized dolomite and sulphides.
95.54	112.17	16.63	DOL	ALT		BD	60					s			w							Oxidized dolomite. Coarse grained dolomite texture is present in some pieces, but others are more of a dark grey limestone or too altered to distinguish. All fizz fragments slightly with acid. Oxidized medium grained subhedral grains are visible in some dolomite fragments. Faint banding in the oxide occurs at 60 deg to CA. Overall chocolate brown in colour (COLOUR 7.5 YR 4/2 - brown)
112.17	118.26	6.09	OX																			Slightly yellow, orange-medium brown clay with minor red-brown, blue-grey fragments ~1 cm long and 1/2 cm wide. Yellow mica flakes are scattered throughout (COLOUR 7.5 YR 5/8 - strong brown)
118.26	121.31	3.05	OX	CLY																		Dark brown slightly gritty clay sections fizz slightly with acid. Altered carbonate.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: RAU-09-35

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.00	1.00	OVB																			
1.00	33.35	32.35	LST	FOS	BX MO																	Medium grey very slightly fossiliferous limestone with a mixture of solution collapse breccia, and mottled camo limestone. Fossils occur as trace crinoid stem fragments. The breccia has a solution texture with very irregular rounded to sub-angular clasts from 0.2-3 cm. The camo texture is created by irregular sub-rounded light and medium grey ~1 cm spots. It is possible that the spots represent minor alteration. Fractures occasionally have polished graphitic surfaces. At 28.22 m within a 10 cm calcite vein a pocket of black powdery carbon occurs.
33.35	77.62	44.27	LST	FOS	BN	BD	50								w							Medium grey banded limestone with intervals of ligh to medium grey (0.1-20 cm wide) gritty zones. Trace (<1 %) crinoid stem fragments occur. Graphitic zones occur throughout. The structural deformation appears to be the same as bedding.
										w												33.53-36.80 m: Brown-grey gritty limestone zone. When looked at closely there is fine grained patchy yellow-tan sericite patches that occur between the grains. At 35.50 m this brown grit becomes interlayered with dark grey fossiliferous limestone. Very fine grained pyrite is disseminated throughout.
																						36.90-37.00 m: There is a 10 cm zone of white rice shaped calcareous spots- fossils or trace fossils?? (a similar zone occurs in hole 33).
																						41.30-48.40 m: Black graphitic layers are intermixed with grey limestone and light grey gritty limestone. This zone appears to be strongly structurally deformed in roughly the same orientatio as bedding. Thicker graphitic zones (2-3 cm) are vuggy looking.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						53.20-55.37 m: Quite massive medium grey limestone with faint gritty pale grey zones. (5% overall).
																						55.30-58.00 m: Medium to dark grey banded limestone with graphitic layers 0.1-3 cm thick. These layers are slightly more recessive and vuggy
77.62	79.30	1.68	MBL			CN	60								w							Light grey marble. Most primary structures and textures have been wiped out. Slightly pink tinted beds occur at 60 deg to CA. The lower contact is very sharp at 60 deg to CA. Pyrite occurs as disseminations and patches within. Weak overall.
						BD	60															
79.30	101.41	22.11	VOL		FO	FO	40								t		ms					Grey-green volcaniclastic with a slightly spotted texture. Pyrrhotite occurs as very fine grained disseminations throughout. Some zones are more concentrated as the magnetic susceptibility reveals. Ca patches and zones range from 0.1-1.5 cm. Overall the unit has a strong banded fabric at 40 de to CA.
									f													86.75 m: Begin to get weak to moderate sericite alteration along bands. Very thin <1 mm Ca filled fractures occur until 88.50 m.
															w							93.40 m: Alteration/bleaching of the volcaniclastic introduces sericite bands as well as bleaches the core to a pale purple-brown colour. Pyrite starts occurring as fine disseminations and small patches at 100.17 m.
						CN	40															The lower contact is very sharp at 40 deg to CA.
101.41	129.54	28.13	LST	ALT	BN	BD	40		f						m							Medium grey fairly dolomitized limestone very faintly bedded at 40 deg to CA with coarse grained dolomite veins cutting most commonly at 40 deg to CA. These veins range in size from 0.5-10 cm wide. Pyrite occurs as very fine grained and disseminated and in more concentrated zones surrounding the dolomite veins.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
					BX	VN	40															109.72-111.40 m: Fluid collapse brecciated zone with a very irregular texture.
																						111.40-127.90 m: Begin to get Qz+/- Dol veins that are typically a mix of bull quartz and coarse grained dolomite. These veins are slightly stained pink/red via hematite fracture fill. The concentration of these veins increases towards the bottom of the interval.
																						127.90-129.54 m: Very rubbly zone.
129.54	131.30	1.76	OX	RBL																		Slightly orange medium brown oxide rubble with yellow-orange powdery coatings on some fractured surfaces. The zone is a mixture of brown gritty clay and almost black (limonite?) fragments.
131.30	148.60	17.30	LST	ALT	BX				m				He	f	m							Medium grey moderately dolomitized solution collapse/crackle brecciated limestone. Pyrite occurs as massive bands 1-2 cm thick as well as small patches and disseminations throughout.
																						131.30-133.15 m: Extremely rubbly zone with quite strong hematization on fractured surfaces as well as staining on the dolomite.
																						133.15-141.05 m: Strongly fluid collapse brecciated limestone with overprinting crackle breccia texture. Weak to strong orange-red to purple-red hematite occurs mostly on fractured surfaces, but as well as a faint tint of the dolomite.
																						141.05-143.20 m: Zone of only mild fluid brecciation. No hematite alteration.
148.60	153.92	5.32	QZ												f							Massive Qz-Dol vein. Quartz is white and very coarse grained. Dol is white to slightly peachy-orange tinted. 80% quartz, 20% dolomite. Pyrite occurs as medium to coarse grained sub to euhedral crystals as well as very concentrated patches.
																						150.60-153.92 m: Rubbly zone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
															ms							152.25-153.92 m: Pyrite dramatically increases in concentration as semi-massive to massive zones.
153.92	170.59	16.67	LST	ALT	BN	BD	60		m													Medium to dark grey thinly banded, moderately dolomitized limestone. The beds are 1-3 mm thick and are interbanded with white calcite at 60 deg to CA. Pyrite occur banded and as fine grained disseminations throughout. Thin 1-5 mm calcite veins cut bedding at 30-65 deg to CA.
						VN	30	350														Coarse grained Qz-Dol veins cut the limestone at low angles to the CA in the following locations: 158.35-159.05 m, 161.97-162.78 m, 163.08-163.30 m, 163.83-163.95 m, 164.40-166.08 m, and 166.90-169.46 m.
170.59	174.25	3.66	MX												70			Sp	f			Semi-massive to massive pyrite with a few 1 mm calcite veins with associated red sphalerite. The pyrite has a banded appearance.
						BD	60															170.59-172.51 m: Semi-massive pyrite banded with black muddy limestone. Bedding occurs at 60 deg to CA until 171.70 m when it becomes 20 deg.
						BD	10															172.36: Bedding is 10 deg to CA.
																						172.39: a 2 cm wide cherty horizon occurs.
						BD	40								85			Sp	w			172.51-174.25 m: Massive pyrite with cross cutting sphalerite-calcite veinlets at 40 deg to CA. Slight banded texture at 40 deg to CA. Pyrite is very fine to fine grained.
						VN	40															
174.25	185.95	11.70	SHL												f							Banded black shale (?) quite hard, does not fizz normally or when scratched as with dolomitized limestone (?) Pyrite occurs finely disseminated and in concentrated patches associated with the white calcite layers.
															f							174.25-180.31 m: Zone of fluid brecciation with a very irregular 'fluid' texture. It is very hard, just barely or not at all able to be scratched with a nail.
										f					f							177.50-178.20 m: Yellow-green (sericite?) crackle infilling.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	10								m							178.20-185.95 m: Strong structural fabric stretching the rock at 10 deg to CA. Pyrite concentration is higher in this zone than in the brecciated zone, and is concentrated in the white layers.
						FO	20															183.5 m: The foliation steepens slightly to 20 deg to CA.
185.95	221.28	35.33	LST	RBL	BX										f			Sp	w			Very dark grey to black quite hard fluid brecciated muddy limestone. Intervals within this unit are extremely rubbly. Pyrite occurs generally as patches associated around the white carbonate rich areas. Sphalerite occurs most commonly in rubbly zones where intense brecciation has occurred.
																						185.95-196.10 m: Intensely rubbly zone associated with strong fluid collapse brecciation. Dark grey clay occurs in some areas. Red sphalerite occurs on fractures and within the calcite matrix of the breccia.
																						Semi-massive-massive zones of pyrite occur (5-10 cm).
																						Lower 1.5 m fractures are very graphitic.
						FO	40															197.36 m: Foliation occurs at 40 deg to CA.
															w							Pyrite concentration decreases to weak around 200 m.
																						207.35-221.28 m: Rubbly zone with graphite on fractures. At 217.78 m, there is an increase in the amount of carbonated involved in the brecciation.
																						222.28 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-09-36

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.35	1.35	OVB																			
1.35	16.93	15.58	LST	FOS	BN	BD	50															Medium grey banded limestone with trace crinoid stem fragments. Lighter grey slightly gritty intervals occur within the interbands at 50 deg to CA. Occasional medium orange-brown gouge occurs on fractures.
																						11.54-16.00 m: The bedding becomes slightly convoluted.
16.93	18.14	1.21	LST	ALT																		Dark chocolate brown extremely iron carbonate altered fragments and grit limestone that fizz strongly with acid.
18.14	19.93	1.79	VOL	ALT	FO	FO	30			I												Intensely sericite altered yellow-orange volcaniclasti with strong foliation. Entire unit has pretty much turned to clay. Foliation occurs at 30 deg to CA. Gradational lower contact.
19.93	20.72	0.79	OX	RBL		BD	10															Medium to dark brown with orange-brown powder coatings replacing bands within the dark brown oxide. Orange - replaced sulphides, brown - replaced carbonate (?). (COLOUR - 7.5 5/6 - Strong brown).
20.72	46.03	25.31	LST	ALT		VN	50															Intermixed grey fluid brecciated limestone with varying degrees of alteration up to complete clay oxide that fizzes to varying degrees. Zones rich in quartz rubble occur.
																						20.72-21.47 m: Medium brown gritty clay with sub-angular fragments of very broken down limestone. Unit fizzes strongly with acid. (COLOUR: 10YR - 4/6 dark yellowish brown).

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	50															21.47-31.60 m: Medium grey limestone with an irregular fluid flow texture with altered grit and clay zones that fizz moderately with acid. The altered zones are medium grey-brown in colour. Begin to see quartz fragments, angular to sub-angular and sand sized to ~1.5 cm. At 30 cm see yellow mica flakes throughout. 35% unaltered, 65% altered. The limestone has irregular Ca veinlets cutting the breccia commonly at 50 deg to CA.
																						31.60-36.40 m: Zone rich in angular to sub-angular quartz fragments. Up to 6 cm long.
													SID	I								36.80-37.00 m: Dark red brown siderite rubble zone.
																						37.00-46.03 m: Increase in the carbonate alteration of the limestone. 25% unaltered, 75% altered.
46.03	61.05	15.02	OX	CLY																		Orange-red-brown oxide rubble and clay zone with goethite like crystals within. At 47.45 m occasional quartz crystal fragments, angular to sub-angular and occur as 5%.
				RBL																		49.50-50.29 m: Dark red-purple hematite rich zone.
																						51.60-52.27 m: Altered medium grey limestone breccia with clasts 0.3-2 cm, angular to sub-angular. Ca matrix is stained orange-red-brown in parts.
																						56.62-57.91 m: Medium orange-brown oxide rubble with 5% angular quartz fragments, sand sized to 1 cm. (COLOUR-7.5 YR 4/6).
																						58.06-58.60 m: Green-grey clay zone (volcaniclastic?) with red-brown limonite zone and bands of pink (hematization ?) (COLOUR 5 Y -olive)
																						60.90-61.05 m: Extremely quartz rich rubbly zone 60% angular quartz sand to 4 cm in size. 40% altered dolomite rubble.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
61.05	81.23	20.18	LST	ALT	BX	BD	50		m			I	He	m								Brecciated medium grey limestone and dolomitized limestone with varying degrees of alteration from moderately showing orange-brown alteration of carbonate to intensely altered orange-red-brown zones of rubbly and compacted clay. There appear to be a moderate amount of hematite as zones appear pink-red in colour. Few original structures and textures can be distinguished. At 66.40 m- bedding appears at 50 deg to CA. Thin layers of green-grey very altered volcaniclastic clay occur interfingered with the altered carbonates. Localized quartz fragments occur but overall - weak. The entire unit fizzes moderately to strongly with acid. Patches of red- hematite stained zones occur - 3%.
									m													61.05-64.60 m: Moderately dolomitized slightly green to medium grey brecciated limestone. Medium to dark brown rubbly more altered zone occurs from 63.63-63.35 m.
									m													64.60-69.78 m: Moderately to strongly carbonate altered dolomitized limestone. The zone is a mix of small (5-10 cm) sections of limestone (rock) 5% and gritty clay. Overall medium red-brown in colour. Fractured surfaces reveal some bands - represented by variations in the colour of the alteration. The bright orange-bands probably represent oxidized sulphides.
			VOL			FO	80															69.78-70.45 m: Intensely clay altered green-grey volcaniclastic with foliation at 80 deg to CA. Slight orange alteration in pockets.
					BX	CN	50															70.45-75.89 m: Brecciated limestone with varying degrees of alteration. Strong red/purple hematite alteration occurs from 71.17-71.70 m. Breccia clasts are angular to subangular up to 1.5 cm in diameter.
																						72.85-74.05 m: Very heavily altered but still fizzes strongly with acid. Medium to dark brown in colour. The entire interval is slightly rubbly.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			VOL			FO	70															75.89-76.62 m: Blue-green-grey highly altered volcaniclastic. Foliation recognizable on freshly fractured surfaces at 70 deg to CA.
81.23	93.36	12.13	OX	CLY																		Very uniform orange-red brown altered carbonate gritty clay. Entire unit fizzes moderately with acid. Fractured surfaces occasionally show spotted texture with dark brown spots (altered dolomite and yellow-orange infill - oxidized sulphides (?)) Variation in colour ranges from yellow-orange, orange-brown, to red-brown. Most commonly, medium orange-red-brown.
																						82.91-83.92 m: Yellow mica flakes scattered throughout slightly rubbly zone. (COLOUR 5 YR 3/4 - dark reddish brown).
93.36	97.34	3.98	DOL	MX											s	f						Coarse grained dolomite with medium to coarse grained crystals of arsenopyrite and pyrite. Semi-massive to massive bands occur typically 3-5 cm thick. The dolomite is fairly to moderately altered, probably more of a stain from slight oxidation of the sulphides and less dolomitization. Alteration of the dolomite is orange-brown in colour (COLOUR: 5YR-/6 - yellowish red). The higher the sulphide concentration the more altered the dolomite becomes. Transition between oxide and sulphide is quite quick and evenly gradational.
																						95.67-95.86 m: Semi-massive to massive zone of pyrite and minor arsenopyrite.
97.34	99.37	2.03	VOL			CN	60															Greenish-grey, gritty, very uniform volcaniclastic tuff. Upper contact is sharp at 60 deg to CA , lower contact is rubbly. Non altered

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
99.37	112.78	13.41	LST	ALT	BX										w							Medium grey fluid collapse brecciated limestone wit slight alteration of the unit to a orangy- brown tint. Gritty intervals exist, 10-15 cm wide, may be fingers of the volcaniclastic above. Overall the unit is moderately rubbly. Weak disseminated pyrite occurs scattered throughout, as well as within a few concentrated patches ~ 1/2 cm wide.
						VN	50		ms						t							101.35-106.80 m: Moderately fluid brecciated dolomitized limestone. Ca veins cutting at 50 deg to CA. Pyrite occurs as weak to trace disseminations and patches.
						FR	40															106.80-112.78 m: More massive dolomitized limestone with yellowish brown bleaching/alteration surrounding some fractures at 40 deg to CA.
112.78	123.73	10.95	LEP							w					w					Mag	w	Medium grey leopard printed volcaniclastic with a slight foliation at 60 deg to CA. Within the unit there are zones of concentrated magnetite grains while the rest of the unit has weak grains scattered throughout. Magnetic susceptibility log gives a good indication of where magnetite becomes more concentrated. Sericite alteration occurs as thin stringers and patches in some zones.
															f							112.78-117.72 m: Zones of quite concentrated sericite alteration. Light brown to greenish brown in colour. Pyrite occurs as fine disseminations and scattered patches throughout. Magnetite is weak.
																						117.72-123.73 m: Less altered leopard print limestone with fair very fine grained disseminated pyrite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
123.73	137.55	13.82	DOL	MX		BD	50								m					Mag	f	Coarse grained dolomite with zones of massive and semi-massive fine grained pyrite. Pyrite also occurs as medium to coarse grained disseminated crystals within the dolomite. Slight banded texture at 50 deg to CA. Zones of marble occur which contain mixed magnetite layers .
															25							123.73-132.43 m: Coarse grained dolomite with ~25% pyrite.
										s					f					Mag	w	132.43-133.63 m: Zones of quite intense sericite alteration
															w					Mag	ms	133.63-137.55 m: Zone with dominant marble horizons and swirly looking magnetite horizons.
137.55	153.07	15.52	LST	ALT	FO	FO	65			w										Mag	f	Medium grey limestone with patches and stringers of green-grey sericite. Fine grained magnetite flakes occur throughout but decrease in concentration towards the bottom of the interval as does the sericite. A very faint foliation occurs at 65 deg to CA. Occasional Ca veins cut at 70 deg to CA ~ parallel to CA.
																						140.91-141.01 m: Coarse grained calcite zone.
153.07	181.69	28.62	LEP			VN	40								t					Mag	t	Medium grained leopard print volcaniclastic. The texture of the spots when looked at closely appear to be medium and dark grey sub-angular to angular clasts in a calcite matrix ~ 50 % Ca, 50% Vol. The size of the 'clasts' varies from ~ 1-3 mm up to ~ 1 cm. Variations in these sizes are extremely gradational. Very small < 1mm dark brown to black biotite crystals occur scattered throughout ~ 10%. They are more concentrated in the zones with a fine texture. A faint foliation occurs at 60 deg represented by a slight elongation of the patches or as bands of different patch size. Trace pyrite occurs along with trace magnetite. 1-3 mm thick calcite veins cut at 40 deg to CA. A few of these veins have fine grained elongate crystals of black tremolite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: RAU-09-37

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.05	3.05	OVB																			
3.05	13.11	10.06	LST	RBL	BN	BD	50															Moderately rubbly, medium grey, banded limestone with 5-10 cm intervals with medium brown calcareous gritty clay. The rubbly fragments are 1-4 cm in diameter and sub-rounded to sub-angular.
13.11	22.11	9.00	OX	CLY									SID	I								Medium to dark orange-red-brown gritty oxide. Larger fragments are intensely siderite altered obliterating original structures and textures. (COLOUR 7.5 YR 3/4 - dark brown).
				RBL																		13.40-13.49 m: Bright yellow/slightly green clay interval with fragments of green-grey strongly clay altered rock.
																						13.49-20.52 m: Intensely siderite altered zone. Fragments are pitted.
																						15.50-15.61 m: Bull quartz rubble zone.
																						19.60-19.80 m: Rubbly zone of dark red-brown siderite fragments.
																						19.95 m: There is a patch of concentrated yellow mica flakes.
																						20.52-22.11 m: Oxide zone changes slightly to a gritty clay rich interval with yellow mica flakes and 1/2 cm diameter quartz grit.
22.11	40.73	18.62	DOL	ALT	BN	BD	65					f			f							Medium to coarse grained dolomite with pyrite occurring as medium to coarse grained sub-euhedral crystals scattered in a rough banded texture at 65 deg to CA. The entire unit is altered to varying degrees from weak oxidation of only sulphides to dark brown alteration of the carbonates to quite intense alteration of the carbonate resulting in a very rubbly zone. Most areas fizz at least slightly with acid. Contact with oxide is slightly gradational mostly resulting in oxidation of the dolomite over a few tens of metres.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						CN	50															22.11-23.56 m: Moderately to strongly carbonate alters zone. From 23.00 - 23.56 m orange red-brown rubbly zone (COLOUR 5 YR 2.5/2 - dark reddish brown). Lower contact is extremely sharp a 50 deg to CA.
						BD	70															23.56-24.78 m: Alteration is concentrated along sulphide bands, and around thin fractures at 30 deg to CA. The dolomite has a light yellowish tint to it.
						FR	30															
						BD	60															24.78-26.20 m: Dark brown, strongly altered dolomite. Faint banding of the sulphides occurs at 60 deg to CA.
						BD	70								w							26.20-33.49 m: Weakly to moderately altered zone with alteration concentrated around the sulphides. Overall pyrite is weak and occurs in bands at 70 deg to CA.
						BD	60															33.49-40.73 m: Zone of more strongly altered dolomite to the point where 15-20 cm sections are becoming rubbly. The surface of the dolomite is becoming pitted. Also some of the dolomite is so coarse grained that cavities exist between grains. Some areas are slightly banded at 60 deg to CA. The lower contact gradationally becomes extremely altered.
40.73	49.68	8.95	OX	RBL		BD	85															Dark orange-red-brown rubbly oxide with fragments up to 10 cm long of intensely altered dolomite. Other fragments are slightly more limonitic in nature with a pitted appearance. 2% fine grained quartz fragments, 2-3 mm, subangular, are scattered throughout. (COLOUR 7.5 YR3/4 - dark brown).
																						42.50-46.00 m: Banding is visible from and is roughly perpendicular to CA.
49.68	52.73	3.05																				NO RECOVERY - reaming zone. The core tube fell down the hole at this point.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
52.73	63.40	10.67	DOL	MX											m							Fine grained white dolomite (fizzes only faintly with acid) with common fracture network running at 35 deg to CA. Pyrite banding occurs at 50 deg to CA. Pyrite is oxidized but occurs in fine to medium grained patchy bands up to 0.7 cm thick. Rubbly siderite altered intervals occur often (but not always).
																						52.73-52.95 m: Semi-massive pyrite in dolomite. The more pyrite the more altered.
63.40	77.11	13.71	DOL	MX	BN	BD	75					w			m							Very coarse grained dolomite (possibly re-crystallized dolomite) with thin massive to semi-massive bands of heavily disseminated to patchy fine to medium grained pyrite. The dolomite is so coarse grained that in zones there are pits where th crystals didn't fit together. Slight yellow/orange alteration of the dolomite occurs surrounding the pyrite. Pyrite bands run at 75 deg to CA.
																						63.40-66.87m: Dolomite has a light pink tint. Rhodochrosite alteration??.
																						66.87-67.62 m: Semi-massive to massive heavily disseminated pyrite. The last 15 cm grades into dolomite. Bands occur at 70 deg to CA. The pyrite is very fresh with little to no signs of oxidation.
																						72.00-73.07 m: Gradual increase in the amount of alteration. In areas of concentrated pyrite the dolomite seems less resistant and is slightly weathered away. Fractures show dark brown alteration.
															35							73.07-73.98 m: Semi massive pyrite.
																						73.98-74.47 m: Yellow orange-brown alteration zone of the dolomite.
77.11	82.91	5.80																				No recovery- had to drill out the core barrel.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
82.91	120.00	37.09	DOL		CR										t							Medium grey, medium grained crackle brecciated dolomite with rubbly siderite zones. Pyrite occurs scattered throughout as fine to medium grained sub-euhedral crystals that have been strongly oxidized.
																						82.91-83.52 m: White massive aragonite vein. Chalk white in colour with radial fibrous texture in cavities and barely visible on freshly drilled surfaces.
																						83.52-86.26 m: Rubbly, slightly siderite altered dolomite with strongly oxidized pyrite crystals. The last 40 cm is medium brown highly calcareous clay with minor grit fragments.
																						88.20-88.50 m: Moderate red alteration stems from dense network of crackle fractures. The event slightly brecciated the core in a 2 cm zone.
																						88.90-93.52 m: Moderately to strongly crackle brecciated siderite altered dolomite with moderate hematite staining at 90.50-90.83 m.
						VN	40															94.00 m: By this point, begin to see coarse grained dolomite veins (that resemble snake skin) cutting the dolomite at 40 deg to CA.
																						107.59-110.00 m: there is a medium to dark grey zone of slightly more massive limestone.
					BN	BD	50															118.00 m: The dolomite takes on a banded texture running at 50 deg to CA. Bands appear to be more limestone in composition.
120.00	122.23	2.23	MBL			CN	40															Very light grey marble with patches of medium grey limestone. Banding occurs at 50 deg to CA. The lower contact between the limestone and the marble is sharp at 40 deg to CA.
																						122.83 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.00	3.00	OVB																			
3.00	27.35	24.35	LST	FOS	BN	BD	70															Medium grey banded limestone with 2-3% 1-2 mm crinoid stem fragments. Medium orange-brown clay bands occur within the limestone (0.2-4 cm). Overall the clay bands account for ~ 3%. The limestone is highly fractured along banding at 70 deg to CA. Within the interval there are rubbly zones that are only 10-15 cm long. Lower contact is very sharp at 70 deg to CA.
						CN	70															
27.35	49.75	22.40	OX	CLY		CN	20															Medium orange brown slightly gritty oxide clay with occasional zones of quartz fragments and as well as other zones with unaltered limestone. The oxide does not fizz with acid. (COLOUR - 7.5YR 4/6 - strong brown). Lower contact is very sharp but structurally irregular at ~ 20 deg to CA.
						BD	80															29.50 m: Bedding is distinguishable at 80 deg to CA.
																						31.74-32.32 m: banded limestone with some medium taupe-grey clay on the edges. The limestone itself is unaltered.
																						33.22-33.31 m: Cobbly limestone fragments that are unaltered. 34.50-34.75 m: Zone rich in quartz fragments up to 60% angular to sub-angular sand sized up to 1.5 cm.
																						35.03-35.58 m: Quartz rich zone with fragments sand sized up to 6 cm length pieces. 80% quartz in this interval.
																						39.95-41.15 m: Banded medium grey limestone with brown-taupe clay sections. 60% limestone, 40% clay.
																						44.48-44.81 m: Medium to dark green-grey clay with angular fragments of dark grey muddy limestone (?).
																						44.81-45.31 m: Dark red-brown limonite rubble/grit.
																						46.16-46.28 m: Siderite fragment.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
49.75	100.92	51.17	LST	ALT	CR	VN	40						Sid	f	t							Medium grey, gritty, crackle brecciated limestone. Ca veins cut at 40 deg to CA. The interval is generally rubbly and altered looking. Limonite rubbl zones occur from: 60.92-62.50 m, 67.51-67.76 m, 76.82-77.40 m. Oxidized pyrite cubes occur weakly. The pyrite is fine to medium grained and sub-euhedral.
																						68.34-71.20 m: Zone with medium to coarse grained siderite. Medium to dull brown in colour. With 20 cm lengths of dolomitized limestone.
																						76.82-77.78 m: Dark red-brown and orange brown gritty rubbly limestone transitioning into medium orange-brown siderite
																						78.80 m: Very faint bedding of the limestone occurs at 50 deg to CA.
																						85.69-89.92 m: Rubbly oxidized coarse grained dolomite with siderite alteration and minor limonite. Little dolomite is preserved, but where it is, it is coarse grained and crackled.
						VN	30						Sid	f								92.46-92.70 m: Area of dark brown siderite veinlets at 30 deg to CA, cut by Ca veinlets at 60 deg to CA.
						VN	60															
						VN	10															95.29-97.65 m: Very rubbly zone with coarse grained dolomite and siderite. Medium to dark brown with white dolomite. The siderite is slightly vuggy. One siderite vein occurs at 10 deg to CA.
															w							
																						97.65-100.92 m: Medium grey gritty limestone with a crackle texture, siderite veins and fracture fill. At 97.70 m there is a 15 cm of red-hematite fracture fill.
100.92	107.66	6.74	OX	RBL									Sid	ms								Medium orange-brown oxide grit with minor clay fragments of dark brown coarse grained crystalline siderite.
																						104.89-105.78 m: Very fluid brecciated limestone with Ca crackle veinlets cutting in all directions. The zone is moderately to strongly altered.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						106.05-107.66 m: Strong purple red hematite component to the interval.
107.66	124.14	16.48	LST	FOS	CR	VN	30						He	w								Medium grey very slightly fossiliferous crackled limestone with cross cutting Ca and Sid veins at 30 deg to CA.
																						107.66-209.59 m: There is a red hematite stain to the core. Hematite acts as fracture fill and residually stains the limestone.
																						108.30-108.4 m: Coarse mosaic breccia with large range in clast sizes from ~1mm up to 3 cm. The small clasts appear to fill in the void spaces between larger fragments. The area is strongly hematite stained.
124.14	124.97	0.83	VOL		FO	FO	30															Extremely altered orange-grey-brown foliated volcaniclastic- almost completely clay. (COLOUR 10YR 4/6 - dark yellowish brown)
124.97	126.03	1.06	OX	CLY																		Medium orange brown calcareous gritty clay containing indistinguishable sand sized fragments. (COLOUR 7.5 YR 4/6 - strong brown).
126.03	138.68	12.65	LST	FOS	BN	BD	55															Medium grey fossiliferous banded limestone. Fossils are crinoid stem fragments ~ 1-3%. Bedding is not always distinguishable but occurs at 55 deg to CA.
					BX																	128.50-132.80 m: Limestone becomes slightly fluid collapse brecciated.
						VN	60						SID	m								120.40-130.63 m: Coarse grained siderite occurs as a vuggy vein at 60 deg to CA.
			MBL		BN	BD	50			w												132.80-134.70 m: White marble with sericite bands at 50 deg to CA. The bottom 75 cm of the interval is banded with 2 cm layers of dark grey limestone. Upper contact is sharp at 60 deg to CA, 180 deg to BD.
						CN	60	180														
																						138.68 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-09-39

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.20	1.20	OVB																			
1.20	64.60	63.40	LST	FOS	FO	FO	25					t			w							Medium grey, fossiliferous, moderately fractured, strongly foliated, occasionally crackle brecciated, highly calcareous limestone. Crinoid stem fragments generally resist structural deformation. Trace to weak oxidized pyrite occurs as fine to medium grained sub-euhedral disseminated crystals. The foliation varies between 20-30 deg to CA.
						FO	30															1.20-6.10 m: Medium grey-taupe clay occurs on some of the fractured surfaces. Foliation at 30 deg to CA.
						FO	25															6.10-24.38 m: More irregular structural deformation with slightly crackle brecciated zones. Areas with increased pyrite content are slightly vuggy. The structural deformation seems stronger disturbing the crinoid stem fragments. The foliation oscillates between 20 and 30 deg to CA.
													MBL	w								47.75-64.40 m: Steady progression of the limestone becoming marbleized.
64.60	96.01	31.41	LST		FO	FO	30						MBL	s								Strongly marbleized foliated limestone with strong overprint the structural fabric. The foliation varies slightly as follows:
						FO	25															64.60-83.82 m: 25 deg to CA
						FO	30															83.82-89.00 m: 30 deg to CA
						FO	35															89.00-95.00 m: 35 deg to CA
						FO	25															95.00-96.01 m: 25 deg to CA
96.01	103.18	7.17	OX	CLY	MA	CN	25															Medium orange-brown slightly gritty competent clay. No structures or textures are distinguishable on the smeared cored surface, but the split surface appears quite massive. The upper contact is sharp but undulating at 25 deg to CA. The lower contact of the first oxide interval is 40 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			LST			CN	40															99.24-102.11 m: Fairly to strongly carbonate altered medium grey limestone with vuggy patches and medium brown calcareous clay coatings on the fractures. Sulphides have been oxidized. Parts of the interval are very rubbly. Upper contact with oxide is sharp at 40 deg to CA.
																						102.11-103.19 m: Dark orange-red-brown gritty oxide clay.
103.18	118.37	15.19	LST	RBL		VN	50					w			f	w						Beige-tan brown strongly carbonate altered limestone. The interval is very rubbly with medium brown clay coatings on fractures. The surface of the core is occasionally vuggy. Disseminated medium grained pyrite (fair) and arsenopyrite (weak) have been strongly oxidized. Altered Ca veins (0.2-2 cm) thick cut the limestone at 50 deg to CA. Few structures or textures are recognizable within the interval. The sulphides appear concentrated within veins.
				ALT																		
118.37	128.12	9.75	LST	ALT	CR	VN	10						HE	m	w	t						Medium grey crackle brecciated limestone with areas of pink/red hematite staining. There are areas that are more intensely brecciated than others. Thin Ca veinlets cut the breccia at 10, 30 and 40 deg to CA. Strongly oxidized medium grained anhedral sulphides weakly occur. Clasts within the breccia vary, but they can be sub-rounded and are typically 0.3-1 cm in size.
						VN	30															
						VN	40															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
128.12	139.00	10.88	LST	ALT		VN	40						MBL	m								Moderately marbleized rubbly limestone with zones and fracture coatings of bright orange brown moderately to strongly calcareous clay containing subrounded fragments of limestone. Rare very coarse grained calcite veins cut at 40 deg to CA, bu are quite rubbly. Overall recovery is not very good. 10% clay, 90% limestone in box, but poor recovery could be due to wash away of clay.
139.00	163.68	24.68	LST	ALT	BN	BD	55						MBL	f								Fairly marbleized, banded, medium grey limestone with fracture coating of bright orange-brown clay. Quite rubbly.

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.72	3.72	OVB																			
3.72	7.01	3.29	LST	RBL		BD	50															Medium grey rubbly limestone with quite poor recovery. Mostly just rounded cobbles.
																						4.15-5.49 m: Medium grey calcareous gritty clay with fragments of limonite and red-brown siderite. Medium orange-brown and red-brown gritty oxide clay. Yellow mica flakes occur scattered throughout (1%). A few competent fragments of very altered coarse grained dolomite occur.
7.01	22.38	15.37	OX	CLY									Sid	ms								Medium orange-brown and red-brown gritty oxide clay. Yellow mica flakes occur scattered throughout (1%). A few competent fragments of very altered coarse grained dolomite occur.
						BD	45															11.37-11.58 m: Coarse breccia texture occurs in oxide. Clasts are dark red-brown-angular 0.2-1.5 cm in diameter. The matrix is orange. Faint bedding orientation at 45 deg to Ca.
						BD	50															16.00-21.50 m: Faint bedding occurs at 50 deg to CA.
																						18.67-18.96 m: Very altered residual dolomite occurs. (colour 7.5 YR 3/4 - dark brown).
22.38	29.98	7.60	DOL	ALT		FR							Sid	ms	w							Medium beige-grey coarse grained dolomite with varying degrees of alteration from relatively fresh to strongly sideritic. Fracture sets run at 20 and 40 deg to CA. The ones at 40 deg have associated medium grained sub-euhedral pyrite grains scattered along them.
													Sid	I								24.27-25.30 m: Intensely siderite altered zone, slightly vuggy, and dark brown in colour.
																						25.50-26.55 m: Very rubbly/sandy zone of oxidized sulphide that is yellow-orange-brown and dark brown altered dolomite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
29.98	43.30	13.32	OX	RBL											w	w						Mixture of sandy clay oxide with limonite and siderit fragments and fairly to strongly altered dolomite. Residual sulphide patches in the dolomite still contain only weakly oxidized Asp, which is more resistant than the surrounding dolomite. The oxide is a mix of medium brown gritty/sandy clay covering limonite fragments, and medium orange-brown and red-brown vuggy limonite fragments. Can distinguish a honeycomb texture of bright orange spots in a dark red brown oxide clay.
43.30	63.70	20.40	DOL												w	w						Very coarse grained light grey to beige dolomite with weak small to medium sized patches of Py and As occur scattered throughout increasing in concentration to fair at 57.10 m.
			LST	ALT					m													43.30-43.47 m: Brecciated dolomitized limestone.
																						43.47-48.16 m: Crackle fractures cut the unit at many angles. They contain oxidized sulphides in some cases.
						FR	10															48.16-57.10 m: Fractured surfaces have a weak yellow-brown alteration colouration. Fractures commonly occur at 10 deg to CA.
						BD	30			w					f	w						57.10-63.70 m: Increase in the concentration of sulphides to fair. Sericite bands irregularly cut the dolomite at ~ 30 deg to CA. 4-20 cm thick.
63.70	81.92	18.22	LST	ALT		VN	45		f						w	t						Medium to dark grey fairly dolomitized limestone with white gritty zones and cross cutting very coarse grained (snake skin) dolomite veins 1-15 cm thick cutting at 45 deg to CA. Within these veins there is trace patchy Asp and weak patchy Py. Thin 0.3-1 cm fine grained dolomite veins cut at 10 deg to CA.
						VN	10															
						VN	60								t	t						68.26-67.03 m: Concentrated zone of dolomite flood. Coarse grained dolomite veins cut it at 60 de to CA. They are 3-6 mm thick and contain trace disseminated very fine grained pyrite and arsenopyrite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			LST	FOS		VN	30		w													67.03-74.87 m: Less dolomitized limestone with trace crinoid stem fragments. Occasional coarse grained dolomite veins cut at 30 deg to CA. No sign of any mineralization.
			LST	FOS	CR	FR	40															74.87-79.05 m: Zone of weak to moderately strong crackle brecciation of the weakly dolomitized weakly fossiliferous limestone. Tension cracks occur at 40 deg to CA. Weakly dolomitized Ca veins cut at 40-45 deg to CA. Weak yellowy-orange staining occurs on some fractured surfaces.
						VN	45															
			LST		BN	BD	30															79.05-81.92 m: Finely banded medium to dark grey limestone becoming weakly crackle brecciated toward the bottom of the interval.
81.92	105.75	23.83	DOL	ALT	CR	FR	20															Light to medium grey crackle brecciated fine grained dolomite with coarse grained dolomite veins cutting the interval. A second phase of fine crackle fractures overprints the dolomite veins at 20 deg to CA. Slight yellowy to pink alteration stains the dolomite (Rhodochrosite?). It becomes fairly altered from 80.50-82.35 m.
						VN	25															
						VN	15															101.10-101.65 m: 3-5 cm medium brown, altered very coarse grained Ca vein (vugs occur between crystals).
105.75	115.81	10.06	LST	ALT	CR	VN	45		ms													Medium to dark grey dolomitized limestone with fair crackle texture and complex suite of cross cutting calcite veins. These veins are slightly to fairly altered with light to medium brown alteration colouration. Vein orientations include 45,30,35 deg to CA with fine grained Ca veins at 45 deg, and medium grained dolomite veins at 35° to CA.
						VN	35															
																						108.25-108.40 m: Medium taupe-grey clay. It is a very clean, thick clay, similar to what a potter would use.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
115.81	126.00	10.19	FLT			FO	40															A very altered and in zones quite rubbly mixture of mudstone and medium grey fossiliferous limestone. The limestone has a strong structural fabric in zones. Parts of the interval are very rubbly.
																						115.81-117.05 m: Highly strained zone oriented at 40 deg to CA. The dark grey mudstone is strongly fluid altered almost to clay. Pink/red tinted layers occur within (hematite?).
															t							117.05-121.01 - Mainly medium grey fossiliferous limestone with a few 1-4 cm zones of highly foliated altered mudstone. Minor fine grained pyrite occurs in cross cutting fractures at 50 deg to CA in the more strongly altered zones.
						FO	60								w							121.10-126.00 m: Strongly structurally deformed mudstone with signs of crenulation cleavage at 60 deg to CA. Pyrite occurs along calcite rich bands. Weak (1-3 %) overall.
																						124.36-124.60 m: Very rubbly zone with clay coatings on the fractures.
126.00	143.80	17.80	LEP			FO	40								f							Medium grey leopard spotted volcaniclastic with moderate to strong concentration biotite. As the biotite content of the interval increases the colour of the rock becomes more brown. Pyrite occurs as disseminations to concentrated patches - fair overall. The unit has a weak to strong structural fabric at 40 deg to CA.
															ms							126.00-126.98 m: Concentrated zone of heavily disseminated pyrite.
															ms							126.00-1216.98 m: Concentrated zone of heavily disseminated pyrite.
																						126.98-131.14 m: The leopard volcaniclastic is interbanded with non-printed limestone. Bands occur at 40 deg to CA. 75% LEP, 25% LST.
						VN	40			f					w							131.14-134.34 m: Slight increase in the concentration of biotite. Thin (1-3 cm) sericite bands occur semi-frequently at 40 deg to CA. Pyrite is weakly disseminated throughout.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						134.34-135.33 m: Bleached slightly rubbly zone. Surface has a pitted appearance.
						VN	40			w					f							135.33-143.80 m: Greenish-grey moderately altered leopard print limestone with fair to moderate very fine grained pyrite disseminated throughout. Small patches of sericite alteration. The more altered zones contain less biotite and have a much fainter texture. Rare Ca veins cut the unit 40 deg to CA.
143.80	159.41	15.61	LST		BX																	Weakly dolomitized fluid collapse brecciated limestone with trace black, slightly soft (graphitic?) patches.
						FO	40								ms							143.80-144.40 m: Zone of black shale with concentrated pyrite replacing Ca zones. Strong structural fabric occurs at 40 deg to CA.
																						159.41 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.05	3.05	OVB																			
3.05	27.89	24.84	LST	RBL	BN	BD	15						MBL	m								Medium grey, moderately marbleized, banded, rubbly limestone with medium orange-brown, slightly gritty clay coating on some fractures. Banding of the limestone varies from 15 to 35 deg to CA.
				CLY																		3.05-14.80 m: Banding in the limestone at 15 deg to CA. Tan-beige clay coating, 1 mm-3 cm, on fractures. Clay is strongly altered carbonate. 15% clay, 85% LST.
				ALT		BD	25						He	w								14.80-20.82 m: Pink-red hematite (?) stain on fractures. Bedding occurs at 25 deg to CA.
						BD	30															20.82-27.89 m: Moderate recovery of rubbly limestone with thin layers of tan (altered carbonate) clay on fractures.
27.89	71.63	43.74	LST	FOS	BN	BD	20						MBL	m								Medium-grey, moderately marbleized, moderately fossiliferous, banded limestone with dustings of tan-beige altered carbonate clay on joints. Banding occurs at 20 deg to CA. (COLOUR OF CLAY: 7.5YR 7/6 - reddish yellow)
						BD	20															27.83-33.53 m: Increasing concentration of crinoids
						BD	5															33.53-35.20 m: Bedding shallows to 5 deg to CA.
						BD	30															35.20-37.20 m: Bedding steepens to 30 deg to CA.
						BD	0															37.30-44.04 m: Bedding is near parallel to CA with rubbly zones of fissile core, coated with gritty carbonate clay. Crinoids are 0.5-1 mm and are 5% abundant.
						BD	5															44.04 m: Grey fossiliferous limestone with shear/strain texture, near parallel to core axis. Fossils form resistive centres in foliation.
																						53.90-60.50 m: Muddy patches light brown clay. (COLOUR: 10YR-7/3 - very pale brown)
						BD	35															60.50-68.25 m: Less clay altered but still rubbly limestone with bedding at 35 deg to CA.
						BD	25						MBL	f								68.25-69.90 m: Slightly marbleized limestone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
													SID	m								69.90-71.63 m: Dark brown siderite rich clay zone.
71.63	95.80	24.17	OX	CLY																		Medium to dark red brown gritty clay oxide containing 5% sand sized quartz fragments. In general the clay is texturally quite massive.
																						71.63 m: COLOUR: 5YR 4/6 - yellowish red
																						74.00 m: COLOUR: 5YR 4/6 - yellowish red
																						76.20 m: COLOUR: 7.5YR 5/8 - strong brown
																						77.75 m: COLOUR: 7.5YR 4/6 - strong brown
																						79.25 m: COLOUR: 2.5YR 3/4 - dark reddish brown
																						80.77-89.92 m: About 1% quartz clasts. Orange brown. Trace vitreous yellow-silver mica flakes.
																						82.30 m: COLOUR: 5YR 4/6 - yellowish red
			VN	20																		83.00 m: Vein occurs at 20 deg to CA.
																						85.34 m: COLOUR: 7.5YR 5/8 - strong brown
			BD	35																		85.54 m: Faint banding in the oxide occurs at 35 deg to CA.
																						89.92-95.75 m: Strong red-brown with 1-2% quartz clasts. Trace mica occurs scattered throughout.
																						90.00 m: COLOUR: 5YR 5/8 - yellowish red
																						91.50 m: COLOUR: 2.5YR 4/6 - red
																						93.00 m: COLOUR: 2.5YR 3/6 - dark red
																						94.50 m: COLOUR: 2.5YR 2.5/4 - dark reddish brown
																						95.75 m: COLOUR: 7.5YR 4/6 - strong brown
95.80	96.10	0.30	VOL	ALT																		Very fissile and extremely broken up altered light yellow volcaniclastic. The interval contains rubbly quartz fragments.
96.10	97.54	1.44	LST		FO	FO	35		f	w												Grey, strongly foliated, fairly dolomitized limestone, with sericite along foliation at 35 deg to CA.
97.54	98.58	1.04	CLY																			Yellow-brown sandy clay with sand to pebble quartz fragments. (COLOUR: 10YR 6/6 - brownish yellow)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.70	3.70	OVB																			No Recovery.
3.70	3.96	0.26	LST	ALT	BN	BD	80						MBL	m								Medium-grey, slightly marbleized banded rubbly limestone. Possibly overburden. Angular 2 cm pieces dominate.
3.96	11.29	7.33	OX	RBL								I										Orange-red, slightly gritty clay with small 1 cm yellow (limonite) fragments.
																						3.96-5.49 m: Orange-brown clay with 1% yellow (limonite?), 2% pink-red (hematite?) fragile pebble clasts and 1% coarse sand sized quartz grains.
																						5.49-8.53 m: Increasing pink-red (hematite) of silt sized particles.
																						8.53-10.06 m: Medium grey, crackled, rubbly dolomite. Slightly oxidized/hematite staining on fracture surfaces, a mottled appearance.
																						10.06-11.29 m: Red-brown clay to sand sized, subrounded, 1 cm sized dolomite clasts. Polymictic pebble sized clasts surrounding the clay. (COLOUR: 7.5YR 4/6 - strong brown)
11.29	27.50	16.21	DOL	MX	BN	FO	60								f	m						Light grey, massive, medium grained dolomite with stringers of pyrite and arsenopyrite from trace to strongly abundant appearing along the foliation, ranging for fine to coarse grained. Occasional quartz and carbonate veinlets cross-cut the foliation.
						CN	50								m	f						11.29-15.94 m: sharp contact with above oxide unit at 50 deg to CA. 1 mm to 1 cm fine grained pyrite dominated veinlets (5%). Trace euhedral 2 mm to 1 cm solitary arsenopyrite grains in the dolomite. Orange-red oxide 2-10 mm coating on fractures. General abundance of veinlets decreases towards 15.94 m.
						FO	60															
															ms	w						15.94-17.68 m: Blotchy, irregular 1 cm to 3 cm pyrite dominate veins. Pyrite is medium to coarse grained, subhedral and interspersed with arsenopyrite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	65								ms	m						17.68-23.77 m: Zebra printed dolomite with abundant pyrite and arsenopyrite 1 mm to 1 cm stringers. Fair 0.5 to 2 mm euhedral arsenopyrite grains in dolomite matrix following foliation.
						VN	65								m	m						23.77-27.50 m: Trace healed carbonate stringers 5 deg to CA and trace 3 cm carbonate veins cross cutting mineralization.
27.50	32.42	4.92	VOL	MX	BN	FO	50			I	I				f	t						Heavily sericite altered volcaniclastic with 1-3 cm interlayers and patches of carbonate. Trace very fine grained biotite is "peppered" throughout. Medium grained subhedral pyrite and minor arsenopyrite occur along foliation and solitary within the sericite/carbonate. Sharp upper contact with dolomite occurs at 20 deg to CA.
						CN	20															
			VOL	ALT	BN					I		s										27.50-29.30 m: Moderately altered zone, showing dominantly green-brown sericite. Trace euhedral sulphides.
				MX		FO	60								m	f						29.30-32.42 m: 1-10 mm carbonate patches form a mosaic print pattern with weak pyrite and arsenopyrite stringers. Trace blotches of euhedral pyrite grains and 2-20 mm wide sericite bands along foliation increase to end of unit.
32.42	75.53	43.11	DOL	MX	BN	FO	60								ms	m						Light grey, coarse grained dolomite with moderate stringers of pyrite and arsenopyrite, and thin red-brown oxidation coating on joints.
						VN	25								t	w						32.42-36.18 m: Poorly mineralized zone with mostly 1-10 mm euhedral arsenopyrite grains. 1 mm healed calcite veinlets spaced roughly 6 per meter occur at 25 deg to CA.
															ms	m						36.18-40.42 m: Zebra striped pyrite and arsenopyrite veinlets 1 mm to 1 cm wide, fine to medium grained disseminated and trace solitary euhedral arsenopyrite grains.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
															f	m						40.42-43.13 m: 0.5-1 cm subhedral arsenopyrite grains in small clusters, randomly orientated. Rare pyrite stringers occur along foliation. Dolomite grain size increases down interval, up to 1 cm.
						VN	70								m	m						43.13-49.38 m: Cream coloured coarse grained dolomite. Pyrite and arsenopyrite veinlets, with weak 1 cm euhedral arsenopyrite patches and crystals.
					CR	VN	75								s	w						49.38-50.78 m: Strong pyrite bands and blotches 1-3 cm thick and 1 mm pyrite grains between coarse dolomite grains.
						VN	85								w	t						50.78-57.15 m: Weakly mineralized zone with 0.5-1 cm coarse grains of dolomite. Rare 2 cm bands of pyrite at 85 deg to CA, decreasing in abundance down section.
					CR										ms	w						57.18-66.45 m: 1 to 3 cm fine to medium grained pyrite bands and irregular patches amongst 0.5-1 cm dolomite grains. Weak arsenopyrite. Rare 1cm quartz and sericite veins cross-cutting the mineralization.
						VN	80								ms	w						66.45-69.49 m: Tiger striped 1 mm to 1 cm pyrite and sericite bands at 80 deg to CA, 30 per meter. 10% coarse grained quartz patches amongst dolomite.
						FO	60								w	t						69.49-75.53 m: Cream coloured, coarse grained dolomite with light oxidation around crystal boundaries. Medium grained pyrite and fine grained arsenopyrite form small patches and stringers along the foliation. Rare 2-5 cm quartz veins randomly cross-cut. Dolomite becomes more dirty grey down the interval.
75.53	80.58	5.05	LST	ALT	BN	FO	50		m													Coarse grained, weakly carbonate altered, moderately dolomitized limestone.
						FO	50		m						f	t						77.11-78.29 m: Heavily carbonate altered zone. 3% pyrite in 1 mm stringers along foliation.
												f										78.29-80.26 m: Pale pink, lightly rhodochrosite altered zone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
80.58	86.62	6.04	LST	ALT	BN	FO	50		w			w			t							Coarse grained, weakly dolomitized rhodochrosite altered limestone with some weak zones of brecciation. Trace pyrite rare 1 mm shallow angle healed carbonate stringers.
					CR																	
86.62	90.62	4.00	LST	ALT	BN	FO	40		ms			m			w	t						Pale pink, moderately carbonate altered, dolomitized limestone with weakly scattered medium grained pyrite veinlets 1mm wide at 80 deg to CA. Also trace 1 mm euhedral pyrite grains are distributed throughout. A thin orange-yellow clay coats joints.
90.62	100.19	9.57	LST		CR	VN	65					t			t							Medium grey, fine grained, lightly fluid-collapse brecciated zoned limestone. 2% 0.5 to 2 cm carbonate veins at 65 deg to CA. Trace 0.5 cm pyrite grains.
																						90.83-95.00 m: Trace 0.5 by 5 mm (rectangular) grains of dark black (biotite?), displaying local strain deformation along small carbonate flooding zones.
100.19	110.47	10.28	MBL		BN	FO	80															Light grey, medium grained, banded marble. The upper contact is gradational over about 1m.
															t	t						101.80-103.02 m: Trace euhedral, fine grained pyrite and arsenopyrite occurs peppered throughout
110.47	126.31	15.84	LST	FOS	BN	FO	55		w	t					t			Mag	w			Dark grey to black, mildly fossiliferous, strain-banded limestone with 2%, 1-5 mm crinoids, and trace disseminated pyrite. Aphanitic magnetite appears sporadically in zones.
						FO	60								w							110.47-114.34 m: Gradational contact, with 25% medium grained dolomite along foliation bands. Pyrite appears as fine disseminations to 1 cm blotches.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	5.20	5.20	OVB																			No Recovery
5.20	8.95	3.75	DOL	RBL	BN	FO	70															Medium grey, coarse grained, banded rubbly dolomite. Increasing slight oxidation on joints towards 8.95 m, and increasing brecciation/crackled appearance.
																						5.49-8.00 m: Grey, gritty homogeneous unaltered dolomite.
8.95	42.06	33.11	OX	CLY		CN	70					I										Orange-brown gritty clay, oxidized mineralized dolomite with intervals of 5-10 cm semi-intact banded dolomite to measure foliation. Unit reacts with acid.
						FO	70															8.95-13.00 m: Orange-brown clay/sand with red-brown patches and some intact core pieces. Sharp contact with above dolomite at 70 deg TCA. At 10.20 m: Clear banding occurs at 75 deg to CA. (COLOUR: 5YR 4/4 - reddish brown)
						FO	40															13.00-17.68 m: light brown silt sized, gradually more competent towards 17.68 m. Maroon-brown inside of the clay core. At 17m clear banding occurs at 55 deg to CA(COLOUR: 7.5YR 4/4 brown)
						BD	55															
																		Qz	t			17.68-22.10 m: Red-brown clay with trace fine sand quartz grains and mica grains. Faint banding occurs but its orientation is indistinguishable (COLOUR: 7.5YR 4/6 - strong brown)
																						22.10-29.20 m: Poor recovery of runny, medium brown fine clay. (COLOUR: 7.5YR 3/4 - dark brown)
																		Qz	t			29.20-34.44 m: Red-brown sandy clay with trace quartz sand grains. (COLOUR 2.5YR 4/6)
																						34.44-37.49 m: Yellow brown clay with trace "galena grey" patches and moderate pink-red (hematite?) patches. (COLOUR:10YR 5/6 - yellowish brown)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						37.49-40.54 m: Medium brown clay with patches of chocolate brown (siderite?) and maroon-brown. (COLOUR: 5YR 4/4 - reddish brown)
						FO	70											Qz	w			40.54-42.06 m: Light chocolate brown moderately oxidized sandy-clay with weak quartz and mica grains. (COLOUR: 7.5YR 4/3 - brown)
42.06	43.59	1.53	DOL	OX	CR	FO	45															Cream-brown, crackled, coarse grained dolomite with minor quartz veins and moderately-strong oxidized sulphides.
43.59	48.90	5.31	OX			FO	60					s						Qz	t			Rusty orange-brown strongly oxidized, pitted dolomite. This zone is in competent pieces, does no react with acid much and is composed of 5% pits from sulphides. Minor limonite, hematite and rare silver, vitreous, radiating As rich mineral.
																						47.25-48.90 m: Rubbly, crumbly zone of sand to pebble sized. Same rusty-orange colour. (COLOUR 2.5YR 4/4)
48.90	57.75	8.85	DOL	OX	CR	FO	40					m			w	t						Brown to light cream, variably oxidized coarse-grained, lightly mineralized dolomite. Weathering is sporadic, from light to strong, often leaving 5 mm pits(1-2%) from sulphides. 3% 1-5 mm disseminated euhedral pyrite grains, some along fractures. 1% 1 mm 10-25 deg TCA carbonate stringers cross-cutting, with 1 mm sulphide oxidation halos.
				MX																		
57.75	69.49	11.74	LST	OX	CR	FO	50		ms						t							Brown to medium grey, fairly oxidized, moderately dolomitized, crackled limestone. Oxidized trace 1 mm euhedral disseminated patches of pyrite remain Cross-cutting low angle (1% abundance) healed 1 mm carbonate veinlets host trace fine grained pyrite About 30% coarse grained dolomite veins with random orientations, decreasing in abundance dow section. This is a large gradational contact.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	4.35	4.35	OVB																			No recovery.
4.35	13.61	9.26	VOL	OX	BN	FO	30			s	s	w			w	t		Mag	f			Light brown to pale green, slightly oxidized, strained calcified volcaniclastic, with 40% sericite, 35% biotite, 20% calcite and 5% magnetite and sulphides. Increasing strained texture and calcification towards bottom of the unit. Unit is moderately magnetic, with aphanitic magnetite (refe to the magnetic susceptibility readings).
																						4.35-4.70 m: Pale orange, strongly oxidized, rubbly section, surficial weathering.
						FO	25								t	n						4.70-8.07 m: 60% sericite, 30% biotite and 10% calcite in a sericite matrix, with 1-5 mm biotite "polka dots" with strained foliation, also featuring 0.5-1 cm calcite clasts.
										s	w				ms							8.07-9.77 m: 7% 0.5-1 cm blotchy, strained, anhedral pyrite blobs encased in quartz, 0.5 mm bordering around the pyrite grains.
										s	s				n	n						9.77-12.60 m: highly strained biotite surrounding sericite bands with 25% calcite flooding patches. Rubbly 4 cm contact with limestone.
13.61	27.70	14.09	LST		CR							w			t							Medium grained, crackled limestone with trace pyrite. A variable crackled and patchy brecciated texture overprints the original banding, with oxidatio on the joints. Trace 1 mm randomly oriented healed carbonate stringers occur.
															s							15.70-15.80 m: Coarse pyrite almost dark brown, magnetic, aphanitic matrix and surrounding blobs.- magnetite?
						FO	30															15.80-17.80 m: Lightly crackled limestone with foliation at 30 deg to CA.
					BN	FO	50															26.00-27.70 m: Banded limestone at 50 deg to CA.
27.70	36.21	8.51	LST		BN																	Medium grey, variably oxidized, chloroform banded, mottled limestone with zones of crackled limestone. 3 mm to 1 cm chloroform bands with fibrous edges form this texture.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
												ms			t							29.90-31.09 m: Rusty brown, moderately weathered, slightly pitted zone
						FO	40					s										33.70-35.36 m: Highly weathered rusty brown, strongly (1mm) pitted, slightly rubbly oxidized zone.
36.21	67.63	31.42	LST		CR	FO	50					t			t							Medium grey, variably crackled, poorly mineralized limestone with slight oxidation on joints. A sporadic light crackle and fluid brecciation overprints the original banding. Rare 1-10 mm carbonate veinlets cross-cut the unit at random orientations.
						FO	50															37.80 m: Foliation at 50 deg to CA.
						FO	60															41.15 m: Foliation at 60 deg to CA.
						FO	40															45.30 m: Foliation at 40 deg to CA.
						FO	45								ms							44.58-44.73 m and 46.00-46.25 m: slightly altered, pyrite rich 1 cm foliaform bands.
						FO	50															54.86-67.63 m: Foliation at 50 deg to CA.
67.63	89.99	22.36	LST		BX	BN	50				ms				t							Medium grey and white fluid collapse brecciated limestone. Brecciated texture consists of medium grey 2-10 mm clasts with 60% matrix supported. Moderate 0.5-1 cm multigenerational carbonate veins foliaform and later cross-cutting at multiple angles.
																						70.91-71.00 m: Small rubbly, oxidized zone with 10% quartz on a plane at 30 deg to CA, and coarse sand-sized clasts - fault?
																						74.10 m: 2 cm of medium grained, subhedral pyrite on clay coated joint, 85 deg to CA.
						FO	20															82.40 m: Foliation at 20 deg to CA.
						FO	35															83.15 m: Foliation at 35 deg to CA.
						BN	55															86.96 m: Foliation at 55 deg to CA.
																						86.30-87.80 m: Darker grey carbonate breccia matrix around limestone pieces with thin white alteration rims - later or higher temperature.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
89.99	123.70	33.71	LST		CR	FO	50				f											Dark grey, poorly mineralized, hydrothermally disturbed, variable textured limestone. Some relict banding exists, overprinted by small, meter scaled events of fluid collapse breccia, crackled and mosai strained textured, with carbonate and quartz veining.
																						92.95-97.30 m: Grey, elongate mottled, camo-spotted limestone with minor brecciation.
												w			f							98.55-100.58 m: slight brecciation of lightly oxidized limestone, with 6% carbonate stringers containing pyrite rimmed quartz in larger veins.
																						101.80-102.27 m: 10% 1 cm carbonate rounded clasts containing pyrite and quartz inside. Looks almost amygdaloidal.
						FO	30				w											105.57-108.20 m: 5% carbonate nodules, becoming pyrite poor and more brecciated downhole.
																						108.20-113.00 m: Unique brecciation and convolute textures.
															f							118.20-120.00 m: 3% 1 cm anhedral pyrite blobs in fluid breccia.
123.70	138.20	14.50	LST		BN	FO	20						MBL	w	t							Dark grey strain banded limestone with strained carbonate fluid breccia zones. The unit becomes more strained, brecciated and marbleized at the end of the unit. Pinched carbonate clasts 4% occur along the foliation.
						FO	25															123.70-129.39 m: weak strain bands at 25 deg to CA.
						FO	0															129.39-130.40 m: change in foliation angle to 0 deg to CA.
						FO	20															130.40-132.44 m: Foliation at 20 deg to CA.
													MBL	w								132.44-137.83: Fluid collapse breccia, becoming slightly marbleized.
			MBL			FO	40								t							137.83-138.20 m: light grey, fine grained, recrystallized marble, gradational contact with volcaniclastic.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
138.20	141.73	3.53	VOL	MX	BN	FO	40			s					m							Pale green, mineralized sericite-rich volcaniclastic. Unit becomes more biotite rich at depth. Moderate fine grained pyrite occurs disseminated throughout.
															l							139.40-140.03 m: Massive fine-grained pyrite, thickly disseminated in sericite.
																						140.52-141.73 m: Moderately crackle brecciated with biotite towards a gradational contact.
141.73	166.28	24.55	VOL		FO	FO	30			s			Bio	I				Mag	m			Medium to dark grey, strain banded biotite rich volcaniclastic. This gradational unit begins with 1-4 cm biotite lenses (and peppered) that are moderately strained, poorly defining foliation, to gradually more peppered and banded with increasing sericite and magnetite. Pyrite is found along foliation, and subjected to the same strain.
						FO	35			t			Bio	60	t							141.73-153.92 m: Convolute 60% biotite strained lenses. Trace pyrite and sericite.
																						149.00-166.28 m: Gradational increase in the concentration of fine grained magnetite. The magnetic susceptibility is significantly increased in this zone.
						Of	35			f			Bio	40	t							153.92-158.85 m: Evenly banded volcaniclastic with strained biotite foliaforms.
						FO	30			m			Bio	I	t							158.85-166.28 m: Increasing sericite, biotite becoming less abundant and more fine grained.
166.28	183.59	17.31	VOL	ALT	BN	FO	40			l					w	t						Light green, banded, sericite-rich volcaniclastic with aphanitic magnetite, 5% "peppered" biotite, minor chlorite alteration and very trace fuchsite? (chrome mica, emerald green). Medium to coarse grained pyrite and trace arsenopyrite appear in foliaform 0.5-2 cm bands and in disseminated form. Strained in the foliation. Upper and lower contacts are gradational for a few meters.
						FO	40			s					f							170.69-176.95 m: Zone becoming more biotite rich with 1% chlorite alteration along bands and with pyrite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	75			n					s		t					176.95-179.00 m: Medium-grained dolomite with minor quartz intersection, hosting 13% pyrite as fine to medium grained bands 1-5 cm thick 75 deg to CA.
															ms							179.00-183.59 m: Cream-pale green sericite dominant with rare fuchsite? (emerald green grains) and moderate to strong pyrite content. Also, 30 cm quartz flooding zones, hosting moderate pyrite.
183.59	206.75	23.16	DOL	MX	BN	BD	45								s	t						Light grey, coarse grained, recrystallized, mineralized, quartz rich dolomite. 15% medium grained, subhedral pyrite forming 1 cm bands and disseminated patches. Some regions of smoky grey shattered quartz. 20 cm gradational contact with volcanic unit. Trace white, soft crystalline 0.5 mm sucrosic mineral, especially noticeable on fresh fractures - gypsum (Trace pale yellow UV-reactive grains - not scheelite)
																						189.70-191.69 m: 30-60% smoky grey "impact shattered" coarse grained quartz with an equal concentration of pyrite as the rest of the unit.
															f							197.82-199.55 m: 90% massive, coarse grained quartz with a 15 cm patch of pyrite in a chlorite altered carbonate fluid intrusion. Rare 0.5 mm carbonate stringers.
						BD	35								w							199.55-203.13 m: 2% pyrite. Banding occurs at 35 deg to CA.
206.75	208.45	1.70	LST		BN	BD	35															Alternating 1 mm swaley grey and black banded limestone, amongst the dolomite. Irregular 0 deg to CA contact with upper dolomite and 60 deg to CA irregular contact with lower dolomite.
						CN	0															
						CN	60															
208.45	231.83	23.38	DOL		CR	FO	35								w							Light to medium grey, slightly crackled coarse grained, slightly mineralized dolomite.
						FO	30								f							208.45-212.22 m: 4% pyrite.
						FO	35								n							212.22-212.95 m: 35 deg to CA 0.5 cm vugs in coarse grained quartz. (dissolved carbonate?)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

						FO	25															259.60 m: foliation at 25 deg to CA.
259.80	288.04	28.24	LST		BX										t							Medium grey, fine grained solution breccia. This reworked "milled" breccia contains 3% 1 mm subrounded, non-fissile black fragments (silicic material?) in a fine grained white and grey matrix. Rare 1 mm charcoal coloured bands reveal banding About 2 meter gradational contact with dolomitized limestone.
						FO	20															259.80-278.89 m: foliation at 20 deg to CA.
						FO	30															278.89-288.04 m: foliation at 30 deg to CA.
																						275.84-284.10 m: Not only a milled breccia, but increased centimetre scale carbonate veins, producing a crackled, mottled texture overprinting the milled breccia. Same texture, but to a lesser extent in other zones of this unit.
																						288.04 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.86	1.86	OVB																			
1.86	60.96	59.10	LST		BR	FR	40															Medium grey massive to banded limestone with varying degrees of solution collapse brecciation. The matrix of the breccia is fine to medium grained white calcite with occasional faint yellow stain on fractures.
																						6.40-9.45 m: Quite rubbly zone with yellow/brown stain alteration.
																						13.12-15.47 m: Within the breccia there are dark grey 1-2 mm rims that carefully surround the clasts (reaction rims??) In this interval calcite dominates over limestone 65 % Ca, 35% LST.
																						15.47-17.09 m: Very rubbly to clay altered interval.
						VN	40															28.02-31.80 m: Interval of more massive limestone with faint fluid alteration texture. Qz +/- Ca veins cu at 75 deg to CA.
						VN	75															
						VN	50															31.80-42.22 m: Light-medium and medium grey mottled camo-print limestone. The lighter camo patches are very rounded and may represent bleaches/altered patches. Brecciation overprints this texture. Ca veins also cut the texture at 50 deg to CA. Thin Ca filled fractures occur at 30 deg to CA. Late Qz +/- Ca veins 0.2-0.8 cm thick cut earlier Ca veins. Qz +/- Ca veins occur at 35 deg to CA.
						FR	30															
						VN	35															
				ALT		BD	60		m						t							42.22-60.96 m: Moderately - strongly fluid collapse brecciated dolomitized limestone with sections that are non-brecciated, banded dolomitized limestone. Bands occur at 60 deg to CA. Ca veins cut at 80 deg to CA. Trace pyrite occurs on some fractures as a sporadic dusting. At 53.20 m the limestone becomes less dolomitized.
						VN	80															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	80															
60.96	77.15	16.19	LST	FOS	BN	BD	55															Medium to dark grey banded, fossiliferous limestone. Contacts with upper and lower units are gradual. Banding is strong at 55 deg to CA. Fossils are weak to fair in concentration and include crinoid stem fragments and rare coral mound fragments. Banding is most defined in zones that have gritty interlayers.
																						60.96-61.98 m: Rubble zone with weak orange brown alteration stain on some fractured surfaces.
						BD	55								w							61.98-67.40 m: Dark grey limestone with crinoid stem and coral mound fragments. A fain banded texture occurs at 55 deg to CA. Very fine grained pyrite occurs disseminated throughout (weak). Ca patches and bands are concordant to banding in general. very thin Ca filled fractures occur at 5 deg to CA. Crinoid stem fragments are weakly deformed.
						FR	5															
						VN	65	90														
						BD	55															67.40-77.15 m: Light to dark grey strongly banded limestone. Bands are distinguished by light grey more gritty looking limestone banded with medium and dark grey micritic limestone. The gritty bands contain crinoid stem fragments. Banded in some areas is tightly convoluted (soft sediment deformation?) particularly at 73.60-74.50 m. Only rare very thin Ca veinlets cut the unit at 65 deg to CA. These veinlets cut the deformation. The lower contact with the volcaniclastic is gradual with the addition of sericite bands occurring in the bottom 50 cm.
						VN	65	35														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
77.15	88.24	11.09	VOL	ALT	FO	FO	55			ms							s					Light green strongly foliated sericite altered volcaniclastic with strong concentration of pyrrhotite occurring as small 1-22 mm patches scattered throughout the non-sericite altered bands. The bands within are not perfect, rather they feather in and out. Bright emerald green fuchsite occurs as small 1-2 mm specks within the sericite - weak to trace overall. The foliation occurs at 55 deg to CA most often but slight variation occurs from 50-65 deg to CA. Pyrrhotite veinlets cut the foliation at 40 to CA and 180 deg to FO. The fractured surfaces are soft and have a talc-like coating on them.
						VN	40	180							m							86.26-88.24 m: Begin to get concentrated disseminated pyrite zones - moderate overall.
88.24	181.90	93.66	DOL	MX	BN	BD	60								l	f	w					Medium grained dolomite with medium grained patchy bands of pyrite (~ 20% overall) and medium to coarse grained pyrrhotite that appears to cut the pyrite in some cases. The pyrrhotite occurs as more irregular patches. Arsenopyrite occurs as coarse to very coarse grained subhedral crystals and patches. Quartz occurs as patches within the dolomite.
																						88.24-102.50 m: Banding of sulphides is somewhat irregular and particularly patchy. The host rock is more medium grey crackled limestone. The bandin is variable from 30-60 deg to CA. Semi-massive zones of pyrite 10-20 cm occur. Qz patches are quite common (~5%).
															60							102.50-108.92 m: Semi-massive medium grained sub-anhedral pyrite with interstitial Qz +/- Ca. From 103.73 m the mineralization has a less semi-massive more heavily patchy banded texture.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BN	50								ms	f	w					108.92-160.54 m : Very coarse grained dolomite with thin 0.2-1 cm bands of pyrite +/- pyrrhotite +/- arsenopyrite. The pyrite is finer grained. Banding is variable but most commonly 50 deg to CA. At 118.23 m there is a cluster of very coarse grained pyrite (~ 2 cm in diameter). From 128.20-129.00 m there is an increase in the concentration of pyrrhotite to fair. Bright yellow-orange (school -bus orange) oxide power coats some of the fractured surfaces.
						CN	10															Within the unit zones of 5-15 cm ling semi-massive pyrite occur although infrequently. The pyrite in these zones is sometimes very coarse grained.
																						Medium grey banded limestone with varying degree of marbleization from weak to strong. Banding is variable and sometimes indistinguishable but commonly occurs at 40 deg to CA.
						BD	60								f	w	t					160.54-181.90 m: Decrease in the concentration of pyrite and pyrrhotite, with a slight increase in the concentration of arsenopyrite. Quartz appears to cut the pyrite bands (a photo was taken). The banding is much more faint at 60 deg to CA. No veins occur cutting the unit.
																						At 181.30 m: fractures begin to have an orange red alteration coating on them.
																						At 181.70 m: blood red hematite alteration occurs.
181.90	194.15	12.25	LST	ALT	BN	BD	40						MBL	m								Medium grey banded limestone with varying degree of marbleization, from weak to strong. Banding is variable and sometimes indistinguishable but commonly occurs at 40 deg to CA. Upper contact is sharp but undulating at ~10 deg to CA, also slightly rubbly.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	20															181.90-184.85 - poker chip fracturing. Banding occurs at 85 deg to CA. There is a gradual shallowing of the core axis until 186.60 m when banding becomes 40 deg then by 188 m it is 20 deg to CA. In this area the core is moderately to strongly marbleized.
													MBL	s								189.70-194.15 m - strongly marbleized limestone. In some cases completely recrystallized to white/light grey marble. Lower contact is gradual over 15 cm.
						CN	10															The lower contact is sharp but undulates at roughly 10 deg to CA with a slight rubble zone after it.
194.15	227.08	32.93	LEP	ALT	FO	FO	40					w	SID	w	t							Medium grey leopard printed volcaniclastic with calcite bands occurring throughout. The foliation runs at roughly 40 deg to CA. The white Ca bands 0.3-1 cm thick are concordant with foliation. The dark parts of the unit are rich in very fine grained biotite. Medium orange-red-brown gritty clay oxide i a few areas dark maroon-black siderite fragments occur. Yellow mica flakes also coat some areas.
										f												202.13-205.23 m: Wavy green-grey (sericite) bands cut the limestone at between 10-30 deg to CA. A very fine flow texture exists within these bands.
						FO	45			f												210.02-210.88 m: Medium grey with a brown green tint sericite altered zone. Original textures have been destroyed. Foliation occurs at 45 deg to CA. The contact with the leopard rock is sharp but undulating around 20 deg to CA. There is a 2 mm wide zone of selective alteration of the edge.
						CN	20															
						VN	60															217.26 m: 3 mm calcite vein containing patchy pyrite.
						FO	45															219.15 m - Foliation runs at 45 degrees to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.80	3.80	OVB																			
3.80	14.63	10.83	DOL	ALT	CR							ms										Coarse grained dolomite with strong crackle brecciation and moderately-strongly clay oxidation alteration. The entire interval, particularly the clay zones, fizz with acid.
																						8.53-10.06 m: medium brown clay - very poor recovery. (COLOUR: 10YR 4/3 - brown)
																						13.11 -14.63 m: Medium brown clay with 20 cm fragment of strongly altered dolomite. (COLOUR: 10YR 4/3 brown).
14.63	41.44	26.81	OX	RBL																		Intermixed strongly oxidized rubble/clay and moderately rubbly, slightly altered medium grey limestone 50% OX, 50 % LMST.
																						14.63-16.15 m: Poor recovery zone. 10 cm limestone fragment, 10 cm limonite fragment, limonite rubble and quartz rubble
																						16.15-18.14 m: Dark-red-brown limonite rubble (COLOUR: 5YR 2.5/1 - dark reddish brown).
																						18.14-20.73 m: Medium to dark orange-red brown oxide gritty rubbly with moderate yellow mica flakes scattered throughout. The bottom 30 cm had 5 % rounded quartz fragments up to 1 cm in diameter. (COLOUR - 7.5 YR 3/4 - dark brown).
																						20.73-22.25 m: Yellow-orange-brown oxide clay with moderate-strong yellow mica flakes and some green grey patches. Fine grained-pebble quartz occurs. Recovery very poor! (COLOUR: 10YR 5/8 - yellowish brown).
																						22.25-23.77 m: no recovery.
																						23.77-25.30 m: Quartz rubble with minor oxide fragments. Poor recovery 85% quartz.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
													Hem	f								25.30-37.49 m: Intermixed slightly to strongly altered grey solution collapse brecciated limestone. Entire zone is quite fractured/rubbly. Red hematite alteration coats many of the fractured surfaces. The most pure limestone (with visible fluid collapse brecciation) fizzes strongly with acid, while the rest fizzes fairly to not at all. Yellow mica flakes are scattered throughout but are more concentrated in zones of alteration.
																						37.49-40.54 m: Quartz rubble zone with 15 cm of dark brown gritty clay and a 5 cm fragment of siderite.
																						40.54-41.44 m: Dark brown gritty limonite with yellow mica flakes coating larger rubble fragments.
41.44	72.84	31.40	OX	CLY																		Medium orange-red-brown gritty clay oxide. In a few areas dark maroon-black siderite fragments occur. Yellow mica flakes coat some areas.
																						51.21-53.75 m: Siderite rubble/fracture zone. Competent core with some vuggy surfaces.
																						64.92-66.45 m: poor recovery.
																						66.45-69.49 m: NO recovery.
																						71.02-72.54 m: NO recovery.
72.84	77.12	4.28	LEP	ALT	FO	FO	60															Mixture of marble bands and leopard print volcaniclastic all of which have been moderately decalcified. The unit looks pure but barely fizzes with acid therefore the reasoning for it being dolomitized.
																						73.06-74.70 m: Leopard print decalcified volcaniclastic with FO at 60 deg to CA.
																						74.70-74.88 m: White dolomitized marble with slight yellow/orange alteration tint.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	75															74.88-76.62 m: Dark grey leopard unit with inter-patches of white dolomitized marble. Within the marble banding occurs at 75 deg to CA. Within the limestone the banding is slightly variable. Lower contact with the dolomite is very sharp at 60° to CA but occurs in the opposite quadrant to the FO in the limestone.
						FO	60															
						FO	55															74.50m: The FO in the limestone occurs at 55 deg to CA.
						CN	40															74.65-74.80 m: Marble horizon. Upper and lower contacts sharp at 40 deg to CA.
						FO	60															75.59 m the FO occurs at 60 deg to CA.
						FO	75															76.50 m: Banding of dark grey silty beds in the marble occurs at 75 deg to CA.
77.12	111.95	34.83	DOL	MX											f							Coarse grained dolomite with patches and bands of fine to medium grained eu-subhedral pyrite. Associated with the pyrite bands are purple/brown very fine grained (silty?) wavy bands. The dolomite appears to potentially be vein controlled in part.
						BD	65															78.20-78.60 m: Banded dolomitized limestone at 65 deg to CA. Upper and lower contacts are bound by a band of coarse grained subhedral pyrite. The lower contact is at 65 deg to CA, and occurs at 300 deg to bedding. Swirly 0.5-1.5 cm medium purple/grey silt horizons occurs within the dolomite. In some areas they are strongly structurally deformed. Their angles vary within the core as follows:
						CN	65	300														
																						80.65 m: FO is 50 deg to CA.
																						81.42 m: FO is 75 deg to CA.
																						86.60 m: FO is 60 deg to CA.
																						92.27 m: FO is 90 deg to CA.
																						82.69 m: There is a gradual darkening of the dolomite with the addition of dark grey interlayers. Some of these interlayers contain crinoid stem fragments.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
															w							84.35 m:-98.90 m: The coarse grained dolomitization becomes less intense. More intermixed dolomitized limestone and silty layers occur with fine to medium grained dolomite patches The concentration of pyrite has decreased to weak and mainly occurs as irregular fine grained patches and disseminations and rare bands.
						BD	60															93.83 m: Py bands occur at 60° to CA.
																						97.95 m: 10 cm zone of crackle brecciation.
						VN	15															94.20-94.33 m: Coarse grained while dolomite vein cuts at 15° to CA.
						VN	30															94.58-94.74 m: Coarse grained white dolomite vein cuts at 30° to CA.
						VN	10															95.98-96.38 Coarse grained while dolomite vein cut at 10° to CA.
																						98.90-111.95 m: Coarse grained white dolomite. Pyrite occurs as fine grained patches and bands, fair overall.
						CN	70															102.44-103.14 m: Interval of semi-massive fine to medium grained pyrite. The lower contact is sharp at 70 deg to CA.
																						103.35-104.00 m: Very coarse grained quartz veins cut the dolomite at 20 deg to CA.
																						Purple-grey silty horizons cut the dolomite at 70 deg to CA. They appear to be easily deformed, particularly from 110.95-111.55 m.
111.95	136.14	24.19	LST	ALT	BN	BD	60		ms						w	w						Medium to dark grey banded dolomitized weakly fossiliferous limestone. Bands include dark grey very fine grained grey limestone and medium grey medium grained limestone. Bands occur at 60 deg to CA. A faint structural fabric occurs at 55 deg to CA. Thin 1-3 mm Ca filled fractures (tension gashes(?)) occur at 35° to CA. Pyrite and pyrrhotite occur as fine grained disseminations and small patches throughout.
				FOS	FO	FO	55	270														
						FR	35															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						117.83-119.07 m: Coarse grained dolomite stockwork veins brecciate the limestone. This zones is quite fractured with orange brown alteration stains on the fractured surfaces.
			DOL	MX		BN	60								f	t						120.85-126.25 m: Coarse grained dolomite which has a pale pink/orange alteration tint. Bands of pyrite occur at 60 deg to CA with a fair concentration overall. Trace patchy pyrrhotite occurs scattered as small patches. Upper and lower contacts are not sharp but the limestone below appears lighter (possible more dolomitized).
						BN	50															126.25-135.22 m: Medium grey dolomitized limestone with crinoid stem fragments common (including star crinoids) which are quite broken up.
																						Dark grey bands occur at 50 deg to CA. Pyrite and pyrrhotite occur as fine grained disseminations and small patches. Minor purple/grey silty thin horizons occur.
																						133.55 m: Black slightly graphitic later - 20 cm thick caps 60 cm of white marble. Within the graphitic layer. There is a coarse grained vuggy calcite vein.
																						135.22-136.14 m: There is a transition into mixed dolomitized limestone and the leopard print rock.
136.14	148.74	12.60	LEP			FO	50															Medium grey-medium 'grained' leopard print unit. A very faint structural overprint occurs at 50 deg to CA.
						VN	50															0.2-1 cm calcite veins cut the unit at 50 deg to CA.
																						145.82-147.83 m: Dark grey interval with wispy layers of dark blue/grey silty material.
																						148.74 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.42	3.42	OVB																			
3.42	34.28	30.86	OX	CLY								s	SID	m								Very rubbly siderite and limonite fragments with minor gritty clay fragments. Some areas have rubbly quartz fragments sub-angular, up to 1 cm in diameter. Colour varies from dark brown-almost black to medium brown, and medium yellow-orange brown.
																						3.42-15.54 m: Dark brown- almost black siderite and dark grey moderately siderite altered limestone The siderite is slightly vuggy on the outer surface Within the limestone crackle brecciation occurs. (COLOUR: 7.5 YR 2.5/2 - very dark brown).
																						15.54-16.92 m: Medium orange brown gritty oxide clay. (COLOUR 7.5 YR 4/6 - strong brown)
																						16.92-18.59 m: Yellow orange-brown altered volcaniclastic(?). Very fissile in parts. Does contain 15 cm section of red-orange-brown oxide.
																						18.49-28.96 m: Medium orange-red-brown to dark red-orange-brown oxide with significant siderite rubble ~ 70%.
															f							28.96-34.28 m: Weakly to strongly oxidized dolomitized limestone. The less altered forms contain blebs and subhedral crystals or pyrite up to 0.3 cm.
																						31.25-31.75 m: Least altered dolomitized limestone Contains veinlets at 35 deg to CA.
34.28	41.60	7.32	MBL		BN	BD	40															White marble with a few silty bands running at 40 deg to CA. From 36.00-36.38 m a 14 cm irregular vein (?) that is medium grey brown with possible flecks of siderite (?) within it. There appears to be an interval foliation at 50 deg to CA.
						FO	50															38.50-38.86 m: Medium brown oxidized, rubbly clay with taupe patches.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

																						39.00-40.23 m: Orange brown oxide clay with gritty fragments.
41.60	88.39	46.79	OX	RBL																		Very dark red/purple brown limonite rubble with coatings of medium to dark orange brown oxide clay (COLOUR 5YR 2.5/1 - black). Larger more competent fragments of limonite have vuggy surfaces. Slight colour variations exist between mustard yellow, to green brown to bright orange brown clay oxide coatings.
																						60.43-61.47 m: Orange-red very gritty oxide clay. The broken surfaces have a patchy appearance witl medium to dark red brown more limonitic oxide and quite bright medium orange-brown more clay like oxide.
																						61.47-63.04 m: Mixture of very dark brown-black limonite with yellow-orange-brown (mustard yellow) gritty clay. There appears to be a layered relationship between the two. The yellow clay becomes less abundant towards the bottom.
																						63.04-64.60 m: Dark brown limonite with some areas that have a green grey-brown tinge to them. Some broken surfaces show bright orange-red brown oxide clay pockets and horizons.
																						64.40-67.51 m: Mainly rubbly dark brown limonite with some small pockets of bright orange-brown oxide clay.
						BD	75															67.51-74.07 m: Medium to dark reddish-brown limonite rubble with medium brown oxide clay coatings and small pockets of bright yellow-orange clay. Banding occurs at 75 deg to CA.
																						74.68-78.79 m: Dark to very dark reddish brown-black limonite rubble with very occasional pockets o bright orange brown oxide.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

																						78.79-83.53 m: Dark red-brown limonite oxide with very vuggy bauxite (?) texture with red-orange-brown oxide coating on drilled surface. Fractures surface has a bi-modal appearance with limonite with orange brown oxide clay filling many of the voids.
																						83.53-88.39 m: Rubbly limonite oxide with not as much of a vuggy texture and more rubbly.
																						88.39 m: E.O.H.

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.76	3.76	OVB																			
3.76	54.30	50.54	LST	FOS	BN																	Medium grey banded (probably a foliation) slightly fossiliferous limestone that is quite fractured and rubbly with some medium yellow brown clay coating on fractures. Banding occurs at between 20-40 deg to CA.
						FO	30															3.76-10.00 m: Banding occurs at 30 deg to CA.
						FO	25															10.00-12.00 m: Banding occurs at 25 deg to CA.
						FO	20															12.00-15.00 m: Banding occurs at 20 deg to CA.
						FO	40															15.00-17.97 m: Banding occurs at 40 deg to CA.
						VN	50															19.97-22.25 m: Zone of fluid collapse breccia. Ca veins up to 4 cm thick cut the limestone at 50 deg to CA. 19.01-19.13 m, yellow-orange-brown clay intervals with small angular limestone fragments occurs. This clay does not fizz with acid and appears to be of similar composition to the clay coating fractures. Much of this interval is rubbly.
						FO	5-															22.25 m: Begin to see small 2-4 mm crinoid stem fragments within the limestone. Fair to weak overall. Banding appears much more structurally controlled and runs at 50 deg to CA. Zones of very light grey marbleized (?) limestone 10-15 cm thick occasionally occur within the limestone. The contacts of these zones are relatively diffuse.
																						23.34-23.39 m: Zone of yellow-orange-brown clay with angular limestone fragments occurring within.
						FO	10															30.10-34.44 m: There is a gradual shallowing of the FO to 10 deg to CA by 30.50m. By 31.39 m the foliation returns to 30 deg to CA.
						FO	30															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	45															34.44-48.16 m: Rubbly limestone becoming extremely rubbly at 47 m. Foliation occurs at 45 deg to CA.
																						48.16-51.25 m: Quartz rubble up to 3 cm by > core diameter occurs. Poor recovery.
54.30	78.88	24.58	OX	RBL																		Medium orange-red-brown rubbly clay oxide with dark red-brown to black limonite fragments as well as strongly altered dark brown carbonate zones containing quartz clasts and rubble. (COLOUR - 7.5YR 5/6 - strong brown).
																						54.30-55.78 m: Very poor recovery. 3 cm of orange-brown clay with rubbly quartz fragments. NOTE: because the recovery is so poor this area has such poor recovery sampling was not conducted.
																						55.78-57.30 m: NO RECOVERY
				CLY																		54.25-55.78 m: Medium orange-brown gritty clay oxide with dark brown limonite fragments (5% overall) and minor (1%) angular to sub-angular quartz fragments up to ~ 1cm in diameter.
						FO	60															55.78-61.87 m: Dark brown strongly altered carbonate with orange-brown clay coatings on fractures and the chilled surface. On some of the pieces a brecciated texture occurs. Clasts are subangular and 0.3-2 cm in diameter. The clasts are various oxidized colours from light orange-brown to dark red-brown. The matrix is medium orange-brown. At 63.69 m a banded texture occurs at 60 deg to CA. Overall this interval is moderately rubbly. (COLOUR: 5YR 3/1 - dark grey).
																						61.43-61.87 m: Oxide breccia with quartz clasts up to 4 cm in diameter and angular to sub-angular.
																						61.87-71.02 m: Medium red-brown strongly oxidized carbonate. Rock is quite competent. Few textures are viable within the oxide. (COLOUR: 5YR 3/3 - Dark reddish brown.)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	30															64.55 m: There is a sharp band that occurs at 30 deg to CA. There are also some coarse grained (up to 1 cm) euhedral oxidized pyrite crystals that are dark brown in colour. Faint brecciation textures also occur on other pieces.
																						71.23 m: the interval becomes quite rubbly.
																						71.02-72.54 m: Very crumbly medium to dark red-brown oxide that is rubbly with fair intermixed clay. (COLOUR 7.5 YR 4/2)
																						72.54-74.48 m: Medium brown becoming orange-brown clay to gritty clay. (COLOUR 10YR 5/4-yellowish brown to 10YR 5/6-yellowish brown)
																						74.47-78.88 m: Medium to dark reddish brown gritty clay oxide with a 20 cm zone of yellow orange oxide clay at 75.40 m.
78.88	87.51	8.63	DOL	ALT	BX	VN	60															Very altered brecciated medium grained dolomite with cross cutting fractures and veins. Overall the unit is weakly to strongly altered to a medium red-brown to dark red-brown colour. No visible mineralization occurs. The white occurs with medium grey limestone (?) patches. May represent only partial coarser grained dolomite replacement. Slight red-purple staining occurs (hematite?) Veins cut at 60, 70 deg to CA. Fractures and fracture filling occurs at various angles, most commonly 30 and 80 deg.
						VN	70															83.00-83.61 m: Very rubbly and clay rich altered zone.
						FR	80															
						FR	30															
																						84.19-84.98 m: Dark grey-black very finely brecciated limestone (?) (DOES NOT FIZZ WITH ACID) Moderately to strongly altered with a fine crackled texture.
																						84.98-85.39 m: Medium orange-brown, taupe-brown rubbly clay.
																						85.39-87.51 m: Very rubbly dark red purple-brown limonite rubble with moderate bright yellow-orange-brown clay coatings and intervals.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
87.51	114.80	27.29	LST	ALT																		Medium grey dolomitized limestone (?) does not fizz strongly with acid, only fizzes partially or not at all. Has weak to moderate medium brown alteration with some red-purple (hematite) stained areas. Fractures are moderately oxidized with an orange-brown oxide coating.
																						105.98-110.97 m: the dolomitized limestone becomes more regular in appearance. Medium grey with crackle and mosaic brecciation by Ca veins. The core is fairly rubbly and fractured surfaces are oxidized orange-brown. There is weak brown staining along healed fractures within the breccia.
																						110.97-114.80 m: Medium orange-brown oxide with rubbly dolomitized limestone fragments. The fragments are in various stages of decomposition into clay.
114.80	129.35	14.55	VOL			FO	45															Dark grey green volcaniclastic? With strong foliation at 45 deg to CA. Weakly to strongly altered to a yellow-orange competent clay with relict foliation. Small amygdules (?) occur throughout, most of which form small depressions.
						FO	40															114.80-127.05 m: Weakly to moderately altered volcaniclastic. FO occurs at 45 deg to CA. 118.26-124.26 m, more crumbly-almost clay with slight greenish-orange alteration. 123.36-127.98 m: highly altered yellow-orange with relict foliation at 40 deg to CA.
						FO	40															127.05-127.98 m: Highly altered yellow-orange with relict foliation at 40 deg to CA.
						FO	40															127.98-129.35 m: Possibly interlayered volcaniclastic with limestone (?) Yellow orange fissile altered volcaniclastic with zones of darker red-brown more competent zones. FO occurs at 40 deg to CA

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
129.35	141.50	12.15	LST	ALT								s										Medium to dark orange-brown strongly altered limestone (???) FO occurs rarely but when it occurs it is at 40 deg to CA. Possible brecciated zones (based on texture of oxide colouration). Small intervals of salt and pepper sand with some magnetite grains and altered mica flakes - bottom of interval is marbleized light grey limestone.
																						133.50-133.88 m: Red-brown hematite (?) altered zone. Core is slightly vuggy. Quite crumbly and clay altered.
																						133.88-136.20 m: Possible highly altered breccia zone.
																						136.20-141.50 m: Predominantly strongly altered limestone with thin layers of yellow volcaniclastic overall very rubbly.
																						134.24-134.39 m, 139.60-139.90 m: Salt and pepper sand zones.
																						141.10-141.50 m: Strongly marbleized limestone. White-light grey in colour with banding at 50 deg to CA.
141.50	141.79	0.29	MAG			CN	60													Mag	100	Massive fine grained black magnetite. Upper contact is quite sharp, but too rubbly for orientation.
141.79	149.22	7.43	VOL			FO	55													MAG	s	Medium slightly green-grey fine grained volcaniclastic with 10-15% fine to medium grained magnetite grained scattered evenly throughout. Thin oxidized veinlets seem slightly more concentrated in magnetite. Occurs more commonly at 35 deg to CA. Foliation is at 55 deg to CA. By 144 m the foliation shallows to ~ 30 deg to CA. Concentrated patches of magnetite occur stretched slightly along the foliation up to 0.8 cm in diameter (weak concentration overall).

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	35															145.69 m: The oxide bands increase in concentration - although they no longer appear to be concentrated with magnetite. Foliation is at 40 deg to CA.
149.22	160.55	11.33	LST	ALT	FO	FO	45													Mag	f	Medium grey limestone (?) with pinkish-orange bleached zones. Magnetite still occurs but the concentration has decreased to fair (3-5 %). Sericite wispy stringers occur at the top of the interval. Within the altered zones there is some calcite flood. Upper contact is marked by a decrease in magnetite, a slight change in colour and an addition of calcite (fizzes weakly - moderately with acid). Orange oxidized veinlets run at 30 deg to CA and 200 deg to FO. Foliation occurs at 45 deg to CA.
						VN	35	200														
																						151.68-154.18 m: Pale pink-orange bleached zone with minor calcite flood (still contains magnetite).
																						158.68-160.55 m: Bleached pink/orange/grey zone is slightly less altered than above zone. Fractured have occasional orange-red stain.
160.55	160.93	0.38	LEP			FO	60															Red/pale orange altered leopard printed rock (?) Spotted with tan/white calcareous patches. The bleached, pale orange area alters the white calcareous patches as well. FO runs at 60 deg to CA.
																						160.93 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.90	2.90	OVB																			
2.90	4.00	1.10	LST	RBL																		Poorly recovered limestone rubble, with moderate alteration from 3.05-4.00 m (but only 3 cm of core occurs).
4.00	12.94	8.94	VOL	ALT	FO	FO	25					ms										Light to medium yellow-orange brown highly foliated strongly altered volcaniclastic. Within there are intervals of light grey limestone with stringers of the yellow-orange-clay filling them. Foliation occurs at 25 deg to CA. Within the unit 25% LST, 75% VOL. The main interval in which limestone occurs is from 9.45-10.36 m. There is a gradual lower contact with thin horizons of altered volcaniclastic within the limestone.
12.94	129.44	116.50	LST	FOS																		Medium grey fossiliferous limestone with weak to strong structural deformation. Ca +/- Qz veins cut the limestone. Two 5 cm Qz +/- Ca veins cut the limestone at 65 deg to CA. The outer 1.5 cm on either edge is Ca, while the middle is Qz. Both are quite coarse grained. Crinoid stem fragments occur. Weak to fair overall. Generally 2-4 mm in diameter.
						FO	20															12.94-24.99 m: Weak brecciation of the limestone occurs. Clasts are angular to sub-angular and 0.5-2 cm in diameter. Strong (but irregular) structural fabric occurs from 18.15-21.00 m at 20 deg to CA. The matrix of the breccia is not Ca, more like a slightly darker limestone.
																						24.99-29.66 m: More fossiliferous limestone with less obvious structural foliation.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						29.66-54.00 m: Moderate to weak crackle brecciation of the limestone. The brecciation ranges from non-existent to moderate with angular dark clasts and lighter limestone matrix. 40.30-42.00 m is a darker strain mosaic texture.
						FO	40															48.45-56.08 m: Brecciated with large, slightly siltier, more tan grey in colour.
																						56.08-57.00 m: Dark grey, more shaley foliated layers.
						FO	58															57.00-69.77 m: Light grey limestone, with thin wispy bands (FO?) of darker grey. Foliaform wisps are irregular and sometimes deformed around 1-5 mm augen like clusters of calcareous material. Between ~65 and 68 m, two planar orientations for these dark wispy bands are observed. Throughout interval, and especially after ~ 69 m, up to 3-4 mm Ca veinlets cross-cut at various angles.
						FO	45															
						FO	75															
						FO	40															69.77-83.02 m: Limestone takes on a more mosaic brecciation texture. Generally very fine Ca filled fractures cut the limestone, but in a few areas there is a coarse mosaic textured breccia within which there are angular clasts which are displaces by up to 1 cm by a Ca matrix. Based on the texture visible within the clasts they are pretty much in place with no dramatic rotation of displacement from one another. Dominant fracture orientation is 40 and 60 deg to CA. Original foliation runs at 40 deg to CA. Thicker Qz +/- Ca veins up to 1 cm in diameter cut the core at 30 deg to CA. From 78.35-80.47 m, siltier bands occur within the limestone. They are slightly darker grey and form a somewhat mottled

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FR	40	160														camo texture. Within this area slightly concoidal, knobbly calcite structures (fossils?) up to 3 cm long and 0.5 cm wide - a photo has been taken.
						FR	60															
						VN	30	170														
																						83.02-110.37 m: Increase in the concentration of crinoid stem fragments (up to fair to moderate). Overall the zone appears to be higher strain. The structural fabric appears more 'fluid' and many of the crinoids are broken up (could be per-deformation - high energy depositional environment.)
						BD	70															In two locations - 85.75-85.93 m and 87.10-87.37 m, strong crenulation cleavage texture overprints light/dark banding within the limestone.
						FO	45	30														
						BD	70															110.37-118.40 m: Strongly fossiliferous - gritty looking rather massive limestone with very faint bedding at 70 deg to CA. Thin Ca filled fractures occur at 45 deg to CA.
						FR	45	55														
						FO	60															118.40-129.44 m: Strongly foliated medium to dark grey limestone with weak to fair concentration of crinoid stem fragments. Within there are slightly graphitic.
129.44	142.69	13.25	LST	ALT																		Fairly to strongly altered limestone. Colour varies from orange-grey to yellow-orange-brown. Within there are thin moderate interlayers of volcaniclastic.
						BD	60					f										129.44-133.84 m: Weak to fair alteration of limestone with bedding at 60 deg to CA. Fizzes strongly with acid. Becomes slightly more altered near the bottom - more of a dark red-brown colour.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	60															133.84-138.45 m: Medium blue-green slightly altered volcaniclastic (?) with white regularly banded Ca veins at 60 deg to CA, as well as strongly oxidised dark red-brown stringer fracture fill at 55 deg to CA. This area fizzes only weakly with acid, except where the Ca bands occur. Overall the interval is quite soft.
						FR	55															
						FO	50															138.45-142.69 m: Spotted, strongly calcareous, highly altered limestone (?) Yellow-orange-brown in colour. FO runs at 50 deg to CA. (COLOUR - 10YR 5/6 - yellowish brown.)
142.69	156.84	14.15	VOL	ALT	FO	FO	55					s										Highly altered volcaniclastic. Quite fissile texture. Yellow-orange-brown colour. Does not fizz with acid. FO runs at 55 deg to CA. Almost clay in some areas.
																						153.45-156.84 m: Less altered volcaniclastic with strong structural foliation at 60 deg to CA. Green-yellow in colour.
156.84	162.75	5.91	LST	FLT	BX	FO	40															Possible fault zone (?) Cemented limestone breccia with zones of strong carbonate alteration (medium red-brown in colour). Clasts within the breccia are angular. Unbrecciated areas show a strong foliation at 40 deg to CA. Clasts within some zones of the breccia are quite variable in composition and texture.
162.75	267.00	104.25	LST	FOS	BN	BD	70															Medium grey slightly fossiliferous banded limestone with a strong structural fabric and zones of marbleization. True bedding is difficult to distinguish from the foliation. The structural foliation has a fluid texture with wispy bands and deflection around augen-like calcite rich masses (some of which show deformation tails) - as well as deflection around perfectly preserved crinoid stem fragments. Foliation occurs at 55 deg to CA. Bedding occurs in a few measurable spots at 70 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	55								w							162.75-172.21 m: The texture appears very distorted and at times quite faint. Oxidized pyrite sub-hedral to euhedral crystals up to 0.3 cm occur weakly scattered.
				ALT		FO	80						MBL	ms								177.21-191.98 m: The limestone no longer contains pyrite. It also becomes increasingly marbleized with a sugary re-crystallized appearance and a fading of colour and texture. Foliation gradually steepens to 80 deg to CA.
																						181.36-284.30 m: The marbleization is very patchy looking. There are irregular/structurally deformed white marble patches with deformed medium grey limestone between. The crinoid stem fragments are mostly broken up, but a few complete ones do occur. The texture looks a bit like marble cheese. (Photo taken)
																						184.30-191.98 m: The marbleization is more isolated within 30 cm zones. FO runs at 70 deg to CA, with small 2-4 mm crinoids acting like augens deflecting the deformation.
																						191.98-206.40 m: More regularly bedded limestone with moderate concentration of 0.2-0.4 cm diameter intact crinoid stem fragments. Bedding appears at the same angle to the foliation.
																						206.40-212.25 m: Strongly marbleized banded light and dark grey limestone. Banding is non-continuous - more whispy. Rare crinoid stem fragments occur, and are slightly deformed by the structural foliation at 60 deg to CA.
																						212.25-213.06 m: White marble with occasional dark grey bands and a slight orange tint.
																						217.17-229.87 m: White marble with a slight orange tint. Occasional thin bands of medium grained pyrite crystals that occur at 60 deg to CA. A few small gouge zones amongst otherwise competent marble.
																						220.95-221.15 m: Greyish brown clay gouge with angular marble fragments

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
															t							221.80-222.50 m: Light medium tan-orange/brown clay with small gritty LST fragments
																						222.50-224.03 m: Altered tan brown marble/LST zone with remnant Py (<2%) in crosscutting calcite veins at 40 degrees TCA
						BD	80															229.87-241.92 m: Grey, interbedded fossiliferous LST (80%) and dark grey black calcareous shale. In the LST, up to 10% crinoids usually not intact (broken fragments). Weak irregular banding, with only few crosscutting veins. Weak pyrite replacing calcite in patches and foliaform wisps.
						BD	85								w		t					242.92-250.20 m: Mostly weakly bedded dark grey to black shale (90%) with fossiliferous LST (10%). Thin fractures with Ca, 1-3mm thick, sometimes offset by bedding planes. Core quite broken along bedding planes, which are often graphitic. Py replacing Ca in beds, and increases to fair towards end of interval. (248.60 m onwards) Also at this point some trace pyrrhotite is associated with pyrite.
															w		w					250.20-252.60 m: medium to dark grey silty dolomite interbedded. Plasticy appearance.
															w		f					250.20-250.32 m: Qz+/-DOL vein w/patchy and fracture fill Py/Po. Also later fractures with Py and Po.
															w		f					250.20- 250.75 m: Increased Po, makes the rock more magnetic
															f		t					252.60- 265.52 m: light to medium grey, massive, gritty, sparkly LST w/finely DI Py +/- Po. Near 262, some GY silty interbeds.
																						259.30 m: Ca veinlet 1-2cm thick with coarse Py, minor rust.
															f							265.52-267.00 m: Gradual transition into dark grey to black, banded shale, variably brecciated and containing irregular patchy calcite replaced by pyrite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
267.00	306.32	39.32	DOL		BX										w							Light and dark grey, crackle to heavily brecciated dolomite. Quite massive, with stringers, blebs, and disseminations of Py.
						FO	70															273.10- 273.75 m: Increased Py mineralization (still <5%). Within the dolomite there is a dark grey botryoidal to amorphous to crystalline mineral (2-3%). Weak remnant foliation occurs at 70 deg at deg to CA at 280.75m.
																						288.60- 288.80 m: Rock is slightly decomposed with a sugary texture and yellowish colour.
																						294.80- 295.00 m: slightly banded with black layers forming stylolites at 70 deg to CA.
																						298.52- 298.80 m: sharp, irregular, contact into strange unit. Seems like a breccia of some sort with quite homogenous 0.5-1mm subangular square to rhombic crystals/clasts? Dolomite? Edge of unit has 2-5mm stringer of fine grey material. Fractures in dolomite within 1 m of this unit have minor orange-yellow coating, but otherwise surrounding rock seems the same.
																						300.30-300.50 m: Broken, crumbly yellowish-tan gouge region with dolomite fragments.
																						303.00-306.32 m: More white in colour, only slightly crackled with blue/grey on fractures/matrix.
																						306.32 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: RAU-09-50

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.61	3.61	OVB																			
3.61	7.01	3.40	LST	RBL																		Very rubbly, poorly recovered medium grey limestone with slightly weathered surfaces. The rubble is very rounded. Minor small quartz rubble fragments occurs within.
7.01	8.53	1.52	QZ	RBL																		Poorly recovered bull quartz rubble up to 4 cm in diameter.
8.53	11.00	2.47	OX	CLY																		Medium orange-red-brown gritty clay with minor grit to pebble sized quartz fragments as well as limonite fragments. Recovery is very poor. The interval fizzes moderately with acid. (COLOUR: 7.5 YR 4/6 - strong brown).
11.00	11.58	0.58	QZ	RBL																		Rubbly bull quartz fragments up to 3 cm in diameter.
11.58	31.85	20.27	DOL	ALT								m			w							Medium tan/grey fluid collapse brecciated limestone with weak to moderate alteration of the carbonate. Overall quite rubbly limonite fragments occur within the rubble. Minor fine to medium grained sulphides occur weak overall, and strongly oxidized.
31.85	57.40	25.55	DOL	ALT											w							Variably altered fine to medium grained dolomite with medium to dark chocolate brown carbonate alteration. The texture of the white medium to coarse grained dolomite is still visible in some areas. Quartz zones also occur. Near the bottom of the interval the host becomes more of a dolomitized limestone. Mineralization appears to be more patchy than banded based on the nature of the oxide colouration, as well as the positioning of the oxidized sulphides. They are typically fine to medium grained sub-hedral disseminations.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						36.50-37.49 m: Angular to subangular bull quartz rubble occurs.
																						37.49-39.01 m: Abundant vuggy limonite rubble occurs, along with some more siderite fragments.
						BD	70															39.30 m: Possible relict banding at 70 deg to CA.
																						41.14-41.36 m: Well preserved medium to coarse grained white dolomite.
																						48.35-49.40 m: Two large patches of quartz occur within the altered dolomite.
						VN	30															51.80-57.40 m: Medium grey dolomitized limestone with moderately-strong crackle brecciation. There appears to be medium to coarse grained dolomite veins at 30 deg to CA. These veins contain medium to coarse grained dark brown oxidized sulphides.
57.40	65.53	8.13	LST	FOS		VN	20															Very strongly fossiliferous medium grey limestone with crinoid stem fragments, mostly well intact but occasionally broken up (10-15%). Contact with upper unit is sharp, but undefined because it is slightly rubble over 10-15 cm. This limestone unit resembles the highly fossiliferous limestone units in holes 29 and 30 (on the other side of the 'fault')
				ALT		VN	20															61.38-64.82 m: Becomes slightly altered by patchy green-orange-brown alteration with a slightly defined orientation at 20 deg to CA.
																						65.53 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.80	3.80	OVB																			
3.80	3.96	0.16	LST	RBL																		Small interval of limestone rubble. Probably just overburden.
3.96	28.55	24.59	OX	CLY												t						Reddish-orange-brown oxide clay with rubbly limonitic and altered carbonate fragments. The colour is slightly variable from pink-red (hematite stained?) to dark brown/black limonite zones, to small isolated patches of yellow-green clay. Very few structures or textures are visible on the cored surface. Within the top ~ 12 m of the oxide there are fragments of oxide which have visible very fine grained arsenopyrite similar to that of the mineralization found in the discovery trench with a slight greenish-yellow-grey colour. These particular fragments are very heavy. Overall <1% of the oxide material in the first 12 m is this.
																						3.96-5.49 m: Poorly recovered dark reddish-orange-brown rubbly limonitic +/- sideritic fragments. Some of the fragments contain 'discovery trench' style mineralization. Most of the fragments are quite heavy for their size. (COLOUR 7.5 YR 3/4 - dark brown)
																						5.49-7.01 m: No recovery.
																						7.01-8.53 m: Poorly recovered soupy clay oxide with 30 % rubbly, heavy, oxide fragments. (COLOUR 7.5 YR 3/4 - dark brown)
																						8.53-10.06 m: Mostly rubbly strongly oxidized fragments (dark red-brown) with grit and clay coatings. (COLOUR 5YR 3/4 - dark reddish brown)
																						10.06-14.63 m: Medium red-orange-brown grit and rubble with only minor clay. Minor yellow-green clay at 15.20 m. (COLOUR 5YR 3/4 dark reddish brown) Bedding occurs at 75 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	70															14.63-20.05 m: Mixture of clay and oxidized grit and angular rubble. Clay is medium orange-brown to rarer pink-red brown. The clay is quite competent and may have preserved structures and textures on the split surface. ~50% clay 50% altered carbonate rubble (medium brown in colour NOT limonite). (COLOUR 10 YR 4/6 - dark yellowish brown). 16-18 m: Good bedding ranging between 60-80 deg to CA. At 18 m: there are angular red clasts 3 cm in diameter within the brown-orange-red oxide.
						BD	40															20.05-22.25m: Mixture of dark brown/black limonite rubble and pink/red clay with fragments of altered carbonate (?) - medium brown in colour. 30% clay, 70% limonite rubble. (COLOUR - 5YR 4/6 - yellowish red, and 5YR 3/4 - dark reddish brown) At 21 m: Bedding occurs at 40 deg to CA.
																						22.25-25.30 m: Rubbly vary dark brown/black limonite with very minor orange brown clay coating on some fractured surfaces. The fragments are mostly very porous (like the inside of a crunchie chocolate bar). More competent intervals occur particularly from 24.02-24.70 m. (COLOUR 10YR 3/6 - dark yellowish brown and 5YR - 3/4 dark reddish brown)
						BD	80															25.30-27.28 m: Mixture of medium brown clay and rubbly porous limonite fragments. 45% Clay, 55% Limonite. Bedding in the clay occurs at 80 deg to CA. Within the siderite altered limestone bedding occurs at 50 deg to CA.
						BD	50															
																						27.28-28.55 m: Strongly altered dolomite, medium to dark slightly greyish-brown. Strongly oxidized sulphides are visible on the cored surface. Medium grained subhedral and scattered throughout.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
28.55	78.16	49.61	DOL	ALT											w	t						Medium to coarse grained dolomite with faint banding in some zones and overprinting faint crackle texture. Overall the unit is weakly to strongly altered to medium orange-brown and medium to dark brown. Oxide zones up to ~2 m occur within the dolomite. They are typically medium to dark red-brown in colour and contain limonitic grit. Overall 20% oxide, 80% dolomite. Mineralization within the dolomite is weak overall and is mostly pyrite with trace coarse and very fine grained arsenopyrite. The pyrite is typically fine to medium grained with sub-hedral crystals scattered in a slightly banded texture and as disseminated patches. Most of the sulphides are
																						strongly oxidized with a thin oxide stain surrounding the crystals or patches.
																						28.55-36.91 m: Medium grained dolomite with weak pyrite in a patchy and faintly banded texture. Slight banding in the dolomite as slightly different coloured bands - light grey vs. light orange and occurs at 70 deg to CA. Overall the zone is fairly altered to a yellow-brown colour. With some patches of dark brown carbonate alteration.
																						36.91-40.82 m: Medium to dark red-brown sideritic oxide grading into a lighter medium orange-brown oxide - more of an altered carbonate ??
																						36.91-39.05 m: Siderite/oxide
																						39.05-40.82 m: Altered carbonate??
																						39.05-43.25 m: Fine grained medium grey dolomite with weak crackle texture. Overall quite fractured up with slight oxide clay coating on the fractures (could be just wash down from above??)
																						43.25-44.95 m: Intermixed dark red-brown clay, and a 15 cm piece of fine grained light to medium grey slightly crackled dolomite.

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						44.95-55.78 m: Medium to coarse grained light grey to pale tanish-orange dolomite with thin irregular stringers of oxidized sulphides - probably mostly pyrite with trace arsenopyrite. Overall the zone is relatively fresh with moderate to strong zones of alteration. Moderate alteration mostly comes from staining from oxidized sulphides. The stronger alteration is very rubbly clay rich carbonate alteration with minor yellow mica flakes. These zones occur from 47.75-48.16 m, 49.68-49.76 m, 51.65-52.49 m, 53.94-54.12 m.
																						By 51 m, start to get a slight pink tint in the dolomite - Mn replacement of Mg to a rhodochrosite type rock. Weak to fair overall.
						VN	40								f	t						55.78-66.15 m: Gradual increase in the concentration of pyrite and slightly more prominent arsenopyrite. The sulphides are no longer altered. The dolomite has a weak pink/orange tint (Mn replacement of Mg). At 61.50 m start to see ~1-3 cm clots of quartz within the dolomite. By 61.98 m, pyrite occurs as coarse grained pyrite cubes as well as large irregular veinlets and patches - almost flood like accumulations in the core. The dolomite is becoming very coarse grained.
															f	t				Qz	f	66.15-78.16 m: Coarse to very coarse grained dolomite with intergrown coarse grained quartz. There are some vuggy surfaces where perfect crystals of quartz and dolomite up to 2 cm in diameter occur. Pink/orange Mn replacement of Mg occurs in and out throughout. Pyrite occurs as anhedral patches +/- disseminations as well as euhedral crystals up to 0.8 cm scattered throughout. Concentration is fair overall. No arsenopyrite is visible. Rare 2 cm perfect cubic pyrite occurs at 73.82 m.
																						NOTE: quartz occurs until 70.60 where the very coarse grained dolomite occurs.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						74.20-74.80 m: zone of most intense replacement of Mg by Mn.
78.16	107.59	29.43	LST	ALT		VN	45		ms						w							Medium grey moderately to strongly dolomitized limestone with zones of coarse grained dolomite, which seem possibly vein controlled because they have very sharp contacts with the limestone in a few cases. In other cases, the dolomite seems more diagenetic within the limestone. Pyrite occurs as fine disseminations and small patches throughout. There are fine wispy stringers of a medium brown material that cuts at roughly 45 deg to CA. Thin healed fractures occurs at 45 deg to CA. Trace crinoid stem fragments occur.
				FOS		FR	45															80.00-80.75 m: Coarse grained dolomite.
																						82.98-83.50 m: Coarse grained dolomite.
																						89.51-90.21 m: Coarse grained dolomite.
						VN	30		w													90.21-98.20 m: Medium grey weakly dolomitized strongly crackle brecciated limestone. Other than the crackle brecciation the limestone is fairly massive. No visible FO or BD occurs. A few Ca veins cut at 30, 35, 60 deg to CA.
						VN	35															
						VN	60															
						BD	50															98.20- 107.59 m: Rather massive medium grey weakly dolomitized limestone. One bed of darker grey limestone with crinoid stem fragments occurs at 50 deg to CA. Trace quartz patches 1 cm in diameter occur. Trace pyrite occurs typically within the Ca veins but a tiny bit occurs within the limestone.
						VN	20

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	0.95	0.95	OVB																			
0.95	234.15	233.20	LST			FO	55															Medium grey fossiliferous, foliated limestone. Crinoid stem fragments (3-5%) up to 0.4 cm in diameter occur scattered throughout. The crinoid stem fragments resists the deformation for the most part. Thin Ca veins cut the foliation at 25 deg to CA. FO occurs at 55 deg to CA. A faint patchy tan-brown alteration overprint occurs throughout.
																						10.67-10.91 m: Tan-brown gritty clay zone. Clay probably represents altered carbonate as it fizzes strongly with acid and contains small gritty fragments of limestone. Some fractured surfaces have a bright orange stain on them.
																						21.34-21.40 m: Non calcareous taupe coloured clay.
						FR	10															21.40-27.00 m: Fractures cut the FO at 10 deg to CA.
																						27.00 m: The crinoid stem fragments are slightly larger (up to 0.7 cm), but overall the size of the crinoids remains quite small 0.2-0.4 cm. They are also becoming slightly more broken up. Rare star crinoids occur.
						FR	40	90														38.10-43.30 m: Bright orange-brown oxidized material fills fractures that occur at 10 and 40 deg to CA. Strongly oxidized sulphides occur scattered throughout. They are dark orange-red brown in colour. They are more concentrated near the altered brown patches as well as the fractures that are filled with oxidized material.
						FR	10	90														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	55						MBL	s								47.73-53.12 m: Strongly marbleized limestone with a foliation occurring at 55 deg to CA. Patchy orange-brown alteration occurs along bands parallel to the foliation. These bands are 1-4 mm thick and account for ~ 5% of the interval. At 50 m the zone becomes quite fractured up. The brown orange layers might by thin volcaniclastic layers??? Within the rubbly/fractured zone these layers appear quite fissile and resemble the altered volcaniclastic. (Fluids might preferentially be moving along these thin layers- and these fluids might be causing the marbleization).
						VN	10								w							53.12-67.06 m: Moderately fractured foliated limestone with 1-3% strongly oxidized sulphides (probably pyrite) up to 0.3 cm in diameter and sub-hedral. Sulphide veinlets which have been strongly oxidized occur at 10 deg to CA and are 0.3-0.5 cm thick. Foliation occurs at 55 deg to CA.
																						55 m: the core becomes less rubbly.
																						56.90-56.95 m: Quartz dolomite vein occurs at 65 deg to CA. This vein has a pinkish/orange colour. It is coarse grained and has a sharp, but irregular contact. The foliation within this zone is at 65 deg to CA.
						FO	65								w		w					75.59-87.75 m: Limestone no longer contains the altered patches and the sulphides. Instead there are fresh, weakly concentrated, fine grained, disseminated and small patches, pyrite and pyrrhotite. The foliation is sharp at 65 deg to CA. At 82 m, more quartz dolomite veins 2-5 cm thick occur at 70-80 deg to CA, their nature is very irregular, as they occur as more of an isolated flood than a clean cutting vein. These veins contain a small amount of a light green mineral (or possibly a stain), near a darker green mineral - chlorite??
						VN	70															87.75 m: Begin to get steep folding. The foliation changes as follows:

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	80															86.70 m: FO at 70 deg to CA
																						88.40 m: FO at 80 deg to CA
																						89.30 m: FO at 60 deg to CA
																						90.10 m: FO at 70 deg to CA
																						91.44 m: Tight fold hinge
																						91.60 m: FO at 90 deg to CA
																						94.50 m: FO at 75 deg to CA
																						100.57 m: FO at 80 deg to CA
																						105.16-106 m: No recovery, reduced to NQ. Core afterwards remains foliated, slightly fossiliferous LST with minor Py.
						FO	80															107m: FO at 80 deg to CA
						FO	70															111m: FO at 70 deg to CA
																						In general, irregular low angle (<15 deg) veinlets orange-white-brown calcite common. BD near vertical (75-85deg)
						FO	75															120m: FO at 75 deg to CA
						FO	70															136m: FO at 65-70 deg to CA
																						149-152.40 m: Bands/patches of yellowish brown alteration (mild) on LST.
						FO	60															152.40-160m Minor alteration/banding continues, subparallel to FO, with 10-30% of rock coloured, now a light reddish colour, presumably hematite staining. Bands of alteration somewhat regular, at 55-60 degrees. No change in fossils, py, etc.
																						169.50 m: Begin to get low angle calcite veins 2-4 mm thick at 15 and 30 deg to CA. Also, concentration of crinoid fragments decreases to weak.
																						174.05 Begin to get isolated zones of brecciation 5-15 cm thick with gradual upper and lower contacts.
																						180.41- 180.46m Patchy creamy yellow-green sericite altered zone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	55															182.99- 205.30m The fluid brecciation becomes more pronounced. It still occurs as zones as opposed to complete brecciation, but the brecciation accounts for 60% of the interval. The non-brecciated sections are quite gritty in texture. At 194.83-195.07 m, there is a highly altered zone surrounding a fracture filled with sparry calcite (radial mounds of fibrous calcite needles....could be aragonite?) Surrounding the vein is a dark brown heavily altered/oxidized zone
205.30			FLT?																			Drillers identified a fault.
																						205.30-211.15m Below this point the core is more rubbly but appears to be of similar lithology. Brecciated medium to dark grey limestone.
						BD	65								t							211.15-234.15 m: Dark grey to black shaley limestone with bedding at 65 deg to CA. No crinoids occur within. Quite heavily fractured surfaces are very smooth and occasionally graphitic. White calcite stringers roughly follow the bedding.
																						221.60-228.95 m: Thin Ca veins crackle/brecciate the black shaley limestone slightly. Trace pyrite is visible on some fractured surfaces.
234.15	237.05	2.90	LST	ALT		FR	50		m													Fine grained light to medium grey massive gritty (?) dolomitized limestone. The limestone fizzes only very weakly with acid (dolomitized?) In a few localized areas there appears to be a faint, fine breccia. Trace very fine grained pyrite occurs disseminated. Only a tiny bit overall. Thin healed fractures with a slight bleached halo occur at 50 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
237.05	355.63	118.58	DOL	ALT	BX										t							Generally a very strongly fluid collapse brecciated dolomitized limestone. Intervals of moderately hematized reddish-beige grit occur with fragments of black shale within. Trace to no mineralization occurs within this interval. Very trace disseminated pyrite.
																						237.05-238.78 m: Fine grained medium to dark grey highly ground breccia. Mainly fine grained with rare large (up to 4 cm) sub-rounded black shale clasts.
																						237.50-237.74 m: Slightly calcareous medium grey clay zone - fault???? Above this spot the rock is strongly fractured, below it is quite competent.
						VN	25								w							238.78-244.30 m: Mixed dark grey/light grey-white strongly fluid collapse brecciated, dolomitized limestone. The matrix appears to be medium to coarse grained dolomite (?) Very thin dark grey to black crackle texture overprints the breccia. 60% dark grey, 40% light grey/white. Patchy late pyrite veins cut at 25-30 deg to CA, weak overall and strongly oxidized. Other than the veins and crackle texture no other structure are identified.
																						244.30-238.27 m: Strongly altered mixed slightly carbonaceous beige grit with clasts of black shale. Interval has been oxidized slightly as well the grit and has a faint red colouration - hematite? This area may represent a strange brecciated horizon. The upper and lower contacts are gradational with no evidence of a fault. No evidence of any mineralization.

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						248.27-264.10 m: Strongly fluid collapse brecciated dolomitized limestone/dolomite. The matrix white (dolomite) while the clasts are dark grey (dolomitized limestone). There is a very faint (dark grey) crackle overprint . At 260.30 m, begin to become more dolomite dominated. Throughout but particularly within this more dolomite rich zone there are vugs containing medium - coarse grained dolomite +/- Ca crystals. Trace <1 cm patches of oxidizes sulphides (probably pyrite). The dolomite has a very faint tan tint to it.
																						264.10-276.10 m: Gradual transition into mainly medium to coarse grained dolomite with small relict patches of dark grey/black material (dolomitized limestone?) There are vuggy patches within the dolomite typically 1-1.5 cm in diameter filled with medium to coarse grained dolomite.
						FR	35															268.50-271.27 m: There is an orientation of the cracks at 35 deg to CA. These particular cracks contain dark red-brown oxidized material.
																						272.09-272.14 m: Band of speckled dark brown and beige gritty, non-calcareous material.
																						276.10-276.60 m: Zone of dark grey/black very fine grained dolomitized limestone brecciated on the outer contacts by the coarse grained dolomite. The clasts are angular and brecciated in a mosaic style.
						FR	35															280.00-294.00 m: The dominant fracture orientation is 25 deg to CA. This fracture phase seems to be the last phase of structure.
						VN	45															296.11-299.45 m: Zone of decreased dolomite brecciation. Coarse grained dolomite veins cut at 45 deg to CA. Slight banding within the dark grey dolomitized limestone occurs at 40 deg to CA. 70% dolomitized limestone, 30% dolomite.
						VN	60															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						305.50-307.85 m: Another zone of mainly dark grey/black limestone. Ca veins cut at 40 deg to CA.
						FR	25															307.85-312.35 m: Dominant fractures filled with oxidized material cut at 25 deg to CA.
																						319.01-320.70 m: Heavily fractured pinkish dolomite. There is high concentration of vugs, thin healed fractures and crackle networks that lead to the fracturing of the core. The fractures have a slight yellowy/brown alteration tint to them.
																						320.70-323.09 m: Within the dolomite there are zones of gritty looking material. The original limestone might have been gritty within this zone. Also vugs are filled with medium grained crystals that look like dolomite but have a dark grey-black colour - possibly just a staining???
															t							323.09-330.98 m: The dolomite appears to be more fine grained and more of a light grey in colour. Swirly irregular veinlets containing strongly oxidized material (pyrite?) occurs trace overall in this interval.
															w							330.98-332.23 m: Strongly fractured zone with slight orangeish tint to the dolomite and moderate concentration of very irregular strongly oxidized - limonitic - slightly hematized veinlets in no particular orientation.
																						336.18-336.80 m: Strongly altered zone. A hematized vein occurs at 10 deg to CA. The entire area is weakly to fairly hematite altered and quite crackle fractured.
					BX										w							336.80-341.50 m: Brecciated zone. The clasts are 0.2-1 cm in diameter crackled white/light grey dolomite, subrounded. The matrix is fine grained medium grey and supports the clasts. Coarse grained pyrite 2-4 mm in diameter - euhedral occurs scattered throughout, weak overall. The pyrite cubes are strongly oxidized and leach a rusty stain into the surrounding material.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

																						338.90-340.85 m: Very rubbly zone of moderately altered dolomitized breccia. The upper and lower contacts are gradual and seem roughly bounded by the rubbly altered zones.
						FR	30								w							341.50- 355.63 m: The dolomite is becoming increasingly almost bleached looking. Crackle texture is very faint, and there is a faint pinky brown coloured overprint. Dominant crackle fracture orientation occurs at 30 deg to CA. Pyrite occurs scattered throughout.
						VN																354.59 m: The core begins to have oxidized veinlets cross cutting at 30 deg to CA. Also at this point the core begins to have a pinkish/orange tint to it.
355.63	359.66	4.03	DOL	ALT																		Medium orange-brown to brown strongly altered very rubbly dolomite with minor quartz fragments.
359.66	377.95	18.29	DOL		CR	VN	10															Light grey dolomite with strong medium to dark grey crackle texture zones of slightly pinkish altered dolomite (possible Mn replacement of Mg to Rhodochrosite). Rare altered veinlets occur at 10 deg to CA. Overall the core is slightly more fractured up than usual.
																						377.95 m: E.O.H

COMMENTS

The hole was ended at 151.32 m because the drillers ran out of rods. The rods were reduced to NQ at 190 ft.

GEOLOGY LOG

HOLE: Rau-09-53

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.56	3.56	OVB																			
3.56	44.76	41.20	LST	RBL	BN	BD							MBL	w								Medium grey bedded weakly fossiliferous rubbly limestone. There are zones within that become weakly to strongly marbleized. Fractured surfaces often have medium-orange-brown coating on them. Crinoid stem fragments occur weakly and are 0.2-0.4 cm in diameter, and slightly broken up in some cases. Bedding occurs at 75 deg to CA.
			LST	FOS									He	m								3.50-5.00 m: The limestone has a purple/grey tint to it. Hematite alteration (?) Recovery in this zone in poor.
			LST	ALT																		5.00-10.06 m: Very rubbly fluid collapse brecciated limestone with a quartz vein at 10.00 m. The core is very rubbly.
						BD	75															10.06-24.08 m: Bedded limestone with medium greyish brown silty limestone beds. The bedding contacts with these silty layers is often very irregular/wavy. The bedding roughly occurs at 75 deg to CA. Ca veins rarely cut the bedding at 60 deg to CA. Begin to see weak orange-brown alteration on some of the fractured surfaces. Overall the unit is quite rubbly.
						VN	60															
						BD	75															14.08-20.62 m: Fossiliferous banded limestone with bedding at 75 deg to CA. Very occasional thin 0.2-0.4 cm beds of grey-brown silt occur. There appears to be slight structural deformation to some of the core. The unit is fairly rubbly.
				ALT		VN	20															20.62-23.46 m: Moderately to strongly altered zone. Overall the limestone has a slightly bleached appearance. Overall the core is a buff pink-beige colour. Thin Ca veins cut the units. Some of these appear to be pre-alteration, while others are post. They occur at 20 and 60 deg to CA.
						VN	60															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						18.17-18.36 m: A vein of pure white calcite. The contact with the altered limestone is very irregular. An angular clast of altered limestone 1 cm by 0.5 cm occurs within this vein.
																						23.46-44.76 m: Moderately to strongly rubbly limestone with small zones of orange-brown and medium brown gritty clay (~10% Clay, 90% limestone).
			OX																			28.57-29.03 m: Zone of red-brown gritty oxidized clay contain quartz grit as well as small fragments of limestone. (COLOUR 7.5 YR 4/6 - strong brown).
						BD	85															31.50-40.50 m: Moderately marbleized banded limestone. Bedding flattens to ~85 deg to CA until 32.61 m. Within the marbleized limestone there are patches of orange-brown gritty clay containing fragments of limestone This clay mostly acts as a thick coating of fractures - overall 8% Clay, 92% Limestone.
						BD	60															32.61-37.49 m: Bedding is at 40 deg to CA.
						BD	40															37.49-40.50 m: Bedding is at 60 deg to CA.
																						40.50-44.76 : Banded limestone, moderately fractured up with orange-brown clay coating some of the fractures 5% clay, 90% lst.
						BD	60															40.50-43.59 m: Bedding occurs at 60 deg to CA.
						BD	40															43.59-44.76 m: Bedding occurs at 40 deg to CA.
																						The limestone appears to be structurally deformed with some augen-like clusters of white limestone deflecting the deformation. This structure defines the bedding of the light medium and medium-dark limestone beds.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
44.76	95.40	50.64	OX																			The oxide zone is a mixture of medium orange-brown oxide to dark red-black more sideritic zones to green-grey strongly altered limestone to medium brown quartz rich gritty clay. (COLOUR - 10YR 6/6 - brownish-yellow) No structures or textures are visible on the cored surface.
																						44.76-49.38 m: Medium orange brown gritty clay oxide with dark brown-black altered carbonate or siderite fragments (?). The fragments are angular and generally <1 cm in diameter but rarely occur up to 3 cm. (COLOUR 7.5 YR 4/6 - strong brown).
																						49.38-51.80 m: Dark red-purple/black dense siderite rubble.
																						51.41-51.80 m: More of a medium red-brown rubbly oxide containing large, up to 5 cm fragments of dense siderite (?)
																						51.80-52.73 m: Grey-green grit interval with grit and rubbly sized fragments of quartz up to 1 cm in diameter and sub-rounded. This unit is very similar to horizons in numerous other oxidized holes. Does it conform (???). (COLOUR GREY 1 5/10GY - grey green)
																						52.73-57.37 m: Medium orange-red-brown oxide grit with minor interstitial clay. Minor quartz fragments occur within particularly from, 52.73-52.80 m and 55.78-56.05 m. Notably both of these sections occur at the beginning of intervals immediately after marker blocks. (COLOUR 5YR 4/6 - yellowish red).
																						57.20-57.40 m: Begin to see yellow mica flakes. 5%.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	70															57.37-61.87 m: Medium grey-green strongly altered fissile limestone (?) Does NOT fizz with acid. FO runs at 70 deg to CA. Small intervals of red-orange-brown oxide occur in the following locations. 57.65-57.81 m, 57.93-58.09 m, 58.23-58.34 m, 58.83-59.00 m, 59.11-59.21 m, 59.51-59.72 m.
																						Within the main intervals there are dustings of yellow-orange clay material on some of the fractured surfaces. This gives the whole interval a slight greenish colouration.
																						61.87-67.05 m: Dark red-purple siderite rich grit and rubble zones with small patches of bright yellow/orange oxide. Quartz rubble occurs throughout but is most concentrated from 64.92-67.05 m. Very fine grained flakes of yellow mica occur scattered throughout.
																						64.69-64.92 m: Zone of dark grey strongly altered limestone (?) with very fine grained mica flakes scattered throughout.
																						67.05- 75.37 m: Tan-orange-brown silty clay with minor rubbly fragments of quartz and siderite.
																						75.37-75.59 m: Red-brown siderite gritty rubbly zone with some patches of bright orange oxide.
																						78.64-81.69 - NO RECOVERY.
																						81.69-83.21 m: Very quartz rich interval with sub-rounded rubble up to 1.5 cm in diameter.
																						32.21-84.73 m: Green-grey and yellow-orange-taupe-brown clay. Possibly more of an altered limestone with less original sulphides. Does not fizz with acid. Within the grey coloured material there are small < 1 cm plate like fragments of medium grey limestone (?).
																						84.73-89.31 m: Medium orange-brown to brown quartz rubbly rich clay with flakes of yellow mica ~ 1% overall. Quartz ~ 15%.
																						87.78-89.31 m: Particularly quartz rich interval with poor recovery.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						89.73-90.83 m: Dark grey/black quartz grit clay with small patches of yellow/green clay material. Quartz grit up to small gravel ~ 1 cm in diameter occurs 10% overall.
																						90.83-95.40 m: Medium orange-red-brown clay with sericite grit throughout some zones.
																						90.83-91.50 m: Yellow-orange-brown clay oxide with minor medium brown gritty fragments.
																						91.50-92.35 m: Blood-red oxide clay with minor dark brown/black gritty fragments within.
																						92.35-95.40 m: Medium orange-brown sideritic gritty clay. Some of the siderite fragments have a bright yellow-orange clay coating on them.
95.40	101.50	6.10	DOL	ALT									Sid	m	w							Moderately altered zone of dolomite and more altered sideritic rubble. The dolomite does not appear to be very coarse grained and contains weak-fair, strongly oxidized sulphides. Other competent strongly altered dolomite (?) occurs as massive, dark red-brown with no visible structures or textures.
101.50	131.62	30.12	OX																			Interbanded zone of yellow/grey highly altered volcaniclastic (?) with medium yellow-orange-brown strongly altered carbonate (?). Recovery is not great.
																						101.50 -102.00 m: Volcaniclastic.
																						102.00-105.50 m: Carbonate.
																						105.50-106.50 m: Volcaniclastic.
																						106.50-107.59 m: Carbonate.
						BD	50															107.59-113.69 m: Medium yellow-brown and medium to dark red-brown highly altered dolomite. Fractured surfaces have a sort of pitted appearance with a mottled red-orange-brown colouration. Also a faint banding occurs in some of the fragments at 50 deg to CA.
																						111.35 m: Core has a vuggy texture on the outside.
																						111.35-111.60 m: Faint breccia texture occurs.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																						111.60-113.69 m: Dark brown strongly altered carbonate (?) with fine spots of creamy yellow mica or sericite (?).
																						113.69-114.34 m: Yellow-orange strongly altered volcaniclastic (?) with thin layers of dark red-brown altered carbonate (?) Some is very rubbly and broken up.
																						114.34-117.90 m: Dark brown altered carbonate with small 1-3 mm patches of creamy-yellow sericite (?).
						FO	80															117.90-128.93 m: Dark orange-red-brown strongly oxidized rock. Starting at 121.50 the rock becomes progressively vuggy/boxwork textured. FO runs at 80 deg to CA. Fractures and the cored surface have a bright orange oxide stain/coating on them.
						BD	80															128.93-131.62 m: Medium orange-brown clay oxide with relict banding at 80 deg to CA, and small zone of fine angular breccia and < 1 mm sparkly white mica flakes - 3% overall. Lower contact is extremely sharp
131.62	143.70	12.08	MBL			BD	70								t							White-light grey marble with silty bands at 70 deg to CA. Weak foliation runs at 50 deg to CA. Zones of more of a marbleized limestone occur. Also very fine grained pyrite occurs disseminated trace overall. Upper contact is very sharp at 80 deg to CA.
						FO	50															
						VN	80															
																						135.03-135.70 m: Marbleized medium grey brecciated limestone.
																						139.15-140.35 m: Marbleized brecciated limestone.
															w							140.35-143.70 m: A slightly orange-brown tint occurs in a banded manner within the marble at 50 deg to CA. Within this zone pyrite occurs weakly disseminated.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.40	1.40	OVB																			
1.40	24.45	23.05	LST		BX										t							Medium grey crackle to strongly fluid collapse brecciated limestone with trace pyrite. Occasionally there are rubbly moderately altered zones 10-20 cm thick. Fractured surfaces are yellow-orange-brown in colour. Pyrite is trace disseminated.
																						1.40-7.32 m: Massive medium grey limestone.
						VN	40															7.32-15.39 m: Medium grey and white fluid brecciated limestone. Ca veins 0.5-1 cm thick cut at 30-50 deg to CA.
						BD	60															15.39-16.02 m: White limestone banded by irregular feathery stringers of dark grey limestone. These bands run at 60 deg to CA, and are typically 1-3 mm thick. Possibly remobilized banding by fluids.
																						16.02-18.29 m: Medium to dark grey micaceous limestone (???) There appears to be thin flakes of muscovite. The whole interval is fluid collapse brecciated. At 18.29 m there is a 1 cm quartz veins.
																						18.29-24.45 m: Medium grey fluid collapse brecciated limestone.
													Sid	f	m							19.00-19.10 m: Oxidized looking zone possibly siderite containing moderate pyrite finely disseminated. Is quite heavy.
24.45	41.81	17.36	VOL	ALT						m					f		w					Mixture of altered and unaltered volcaniclastic with and without amygdules. Pyrite and pyrrhotite mostly confined to altered zones.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	60								m		w					24.45-29.39 m: Light green altered volcaniclastic with irregularly banded sericite alteration. Pyrite occurs as moderate stringers and veins, pyrrhotite occurs as weak patches. The pyrite stringers occur at 60 deg to CA. Amygdules occur weakly 0.2-0.8 cm in diameter only weakly deformed and filled by Ca and or Py. From 28.15-29.39 m there is a gradual decrease in the extent of alteration. The lower contact is gradual.
						FO	50								t		w					29.39-34.20 m: Dark greyish brown strongly amygduloidal volcaniclastic with calcite infilling of amygdules and moderate deformation. The structural fabric (FO) runs at 50 deg to CA and thin Ca veinlets follow this orientation. There is less pyrite and more pyrrhotite. Pyrite is trace-disseminated overall with a concentrated zone within the upper 50 cm of the interval. Pyrrhotite occurs as weakly to finely disseminations as well as concentrated in the Ca filled amygdules.
						VN	50	0														
						VN	60	180							35		35					29.62-29.70m : Band of semi-massive pyrrhotite surrounded by semi-massive pyrite running at 60 deg to CA. 4 cm of pyrrhotite is surrounded by 2 cm of pyrite on either side.
						VN	60								w		w					34.20-38.62 m: Pale brown moderately bleached looking weakly amgduloidal are weakly disseminated with the pyrite concentrated in rare bands. Quite coarse grained Ca veins occur at 60 deg to CA.
						FO	50								s		w					38.62-41.81 m: Yellowish-grey-green sericite altered volcaniclastic with strongly disseminated pyrite bands throughout and only weak patchy pyrrhotite. The structural FO occurs at 50 deg to CA. Pyrite bands are somewhat irregular and occur at 50 deg to CA following the foliation and are 0.1-1 cm thick.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
41.81	85.96	44.15	LST		CR										w							Medium grey crackled to strongly brecciated limestone with zones of more massive light grey marbleized limestone with rubbly orange-brown altered zones 5-10 cm thick. Pyrite occurs throughout weakly but there are zones where it is quite strongly disseminated. No visible pyrrhotite. Locally fossiliferous with crinoids and some chain corals. Sugary, flaky look of some brecciated regions likely due to muscovite.
																						44.50-48.00 m: Strongly marbleized limestone with rubbly orange-brown altered zones 5-10 cm thick.
															l	w						52.60-53.84 m: Medium grey strongly fluid collapse brecciated limestone with 15-20% heavily disseminated to patchy pyrite with large crystals up to 1.5 cm. Arsenopyrite crystals that appear to be in the process of being broken down and replaced by pyrite (weak overall).
						BD	70															67 m: Bedding occurs at 70 deg to CA.
																						72-73 m: Slightly whiter and more marbleized. Orangey-brown crumble occurs on fractures
																						82 m: Pyrite starts to pick up in calcite veinlets, stringers and disseminations nearby. Also after 85m, thin ca veins occur every 1-5cm at 30-40 degrees.
85.96	95.48	9.52	LST	MX											s		t					Generally medium to dark grey crackle brecciated limestone with "interbeds" of semi-massive to massive pyrite, with some intergrown Po in some sections. Perhaps 10% Py overall, 1-2% Po. Crosscutting Ca veinlets. Some quite coarse grained Py (up to 1cm cubes).
															70		10					87.35-87.76 m: Semi-massive to massive pyrite (70%), medium grained masses with finer grained Po (10%) infill between. First 20 cm (to 87.55 m) is a band of massive Py at around 20 degrees, 6 cm thick, surrounded by white talc.
															f							87.76-91.00 m: Non mineralized limestone.
															80							91.75-92.45 m: Semi-massive grading into massive, fine-grained Py.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
95.48	101.87	6.39	QZ												25		15					Mixture of Qz (60%) and heavily disseminated to massive sulphides. (40%) A few regions of thin calcite stringers and veinlets along with talc. Around 25% Py, 15% Po, generally in separate, massive bands, but also intermingled.
															60		20					99.95-101.87 m: Semi-massive sulphides.
															10		80					99.89-100.08 m, and 100.71-101.07 m: 70-90% Po, blotchy/semi-massive, with very little Py.
															65		5					100.30-100.70m and 101.07-101.87m Concentration of pyrite as semi-massive, with up to 5% Po.
																						97 m: acicular aragonite clusters
101.87	121.83	19.96	LST	ALT					m				MBL	f								Generally calcareous, softer (< 2.5 in places), white, coarse recrystallized dolomitized limestone? Stringers and bands of Py and Po associated with quartz veinlets at 70-80 deg to Ca. Po +/- Py bands, up to 5 cm thick, concentrated disseminations, sometimes associated with minor bluish-green chlorite alteration. Prevalent muscovite? white, soft flakes throughout. Some gradual interbeds of more dark grey, recrystallized, marbleized limestone breccia.
																						114 m: Ca +/- Po vein at 75 deg to CA.
						VN	75								10		40					116.49-116.58 m, 117.10-117.21 m: Bands of semi-massive Po (+ minor Py) seemingly infilling gaps in Cl altered zone.
						VN	45								60		30					120.07-120.12 m: Band of massive intergrown Po/Py at 45 deg to CA. Py slightly more coarse-grained around a core of finer Po.
121.83	128.12	6.29	LST	ALT	CR	FO	50						MBL	m								Grey to dark grey crackled to brecciated (and slightly foliated) weakly marbleized limestone. Stringers and disseminations of Py. Some variously crosscutting Ca +/- Qz veinlets up to 2 cm thick. Marbleization increases towards bottom contact (128.12 m).

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
128.12	128.93	0.81	VOL		FO	FO	30															Blue-green to yellowish-grey, foliated, crumbly, greasy volcaniclastic. Quite sericite altered. Poor recovery on next run? So end block might be further (thicker layer). First 10 cm is blue-green chlorite altered.
128.93	143.55	14.62	LST		CR	FO	35								w							Grey to dark grey Ca +/- Qz flood (15%) and crackled, foliated limestone with coarse calcite crystals and trace-weak fine scattered disseminated pyrite. Calcite flood/crackle infill seems based along banding.
															w							131.50-131.90 m and 128.93-129.05 m: Strongly (up to 70%) Qz flooded with minor increase in Py.
						FO	30															143.00-143.55 m: Sheared? or stepped at 30 deg (Ca veinlets offset). Py increases to 10% by end and seems to be secondary along shear fabric.
143.55	153.43	9.88	LST	MX											60							Banded or brecciated limestone with quartz and very heavily mineralized (Py) zone. There is a central massive pyrite section surrounded by alternating regions of semi-massive to massive Py.
															60							143.55-145.96m Mixture of pure white quartz and semi to massive fine (and occasionally medium) grained pyrite replacing greyish dolomite? (only slightly fizzy). Irregular replacement, patchwork pattern. 60% Py, 30% quartz, 10%DOL
															20							145.96-147.18 m: Wispy to heavy STR fine Py formed in weak ~50% FO of brecciated medium grey limestone.
															95+							147.18-150.03 m: Weakly foliated, fine-grained, nearly massive Py with only minor Qz/Ca. Foliation is variable, generally low angle.
						FO	0															147 m: FO at 0 deg to CA.
						FO	15															148 m: FO at 15 deg to CA.
						FO	25															148.00-149.00 m: FO at 25 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						150.03-153.45 m: Mix of semi-massive Py replacing dolomite, and interlayered limestone and pyrite stringers.
153.43	176.77	23.34	LST	ALT		VN	40		m						w		t	Sp	t	Gn	t	White to dark grey dolomitized limestone with intense fluid brecciation and quartz replacement. Crosscutting Ca and minor coarse grained Qz veins are 0.1-5 cm thick, running subparallel to foliation. One has blebs of reddish-yellow sphalerite . Blebs of sphalerite/galena in vuggy quartz/carbonate veinlets crosscutting at 20-50 deg to CA. After brecciation. Medium-semi massive pyrite intervals from 157.06-157.16 m and 172.70-172.76 m.
						FO	40															
176.77	197.62	20.85	VOL	MX											f		ms	Cp	t	Bi	t	Variably altered, variably mineralized amygduloidal volcaniclastic with Qz +/- Ca veining/flood. Colour varies from tan to dark green to brown. Sericite/chlorite alteration and bleaching. Also trace bismuthinite, chalcopyrite, and bronzy mineral.
						CN	50								ms		15			Bi	t	176.77-179.56m weakly foliated, chlorite altered, heavily mineralized volcaniclastic with 10% quartz flood. Patchy sericite alteration. Sharp upper contact at 50 deg to CA. Lower contact is gradational.
						VT	55								ms		ms					Py/Po mineralization varies from moderately - strongly disseminated to semi-massive banded. Some bands (178.42-178.65 m) of fine-grained, nearly massive pyrrhotite (75%) and pyrite (25%). Generally quartz veins are quite pure and mineralization is in the surrounding rock.
															m		m					After 178.78 m mineralization drops off, to moderately disseminated Po and some patchy Py

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			AM			FO	40		s													179.56-182.04 m: Light yellowish-green strongly sericite altered, amygdaloidal (usually quartz filled) 0.1-0.3cm) Weakly foliated (some stringers at start, then alignment of vesicles.) Peppered with rimmed small brown 1-2 mm squares (ex calcite?) Also thin, irregular stringers with Po. Qz 5%, Ca 3-5%. Less intense alteration towards lower contact.
															5		20	Bi	w	Cp	t	182.04-183.43m Mineralization is a mixture of chlorite/sericite altered volcaniclastic and Qz flood (30%). Po is most common sulphide, occurring as vesicle fill in1-5 mm blebs and as fine-grained, massive replacement, especially in vicinity of Qz flood. Weak occurrence of pinkish bronze, shiny soft, coarse-grained unidentified mineral, usually adjacent to Po/Bi and in the vicinity of Qz. Bismuthinite occurs as large, rectangular crystalline masses up to 1 cm, steely grey. Also yellowy white, matte colour geometric coarse-grained crystals. A few, 1 cm rhombic to triangular with flattened corners. Unknown. (1-3%)
															f		m					183.43-185.32m Dark greyish-brown, fairly massive, fine-grained, Po bearing volcaniclastic with crosscutting pyrite veins (replacing Ca?) at 30 and 50 deg to CA. Py occurs only within veins, and is medium grained.
										s					w		m					185.32-197.73 m: Tan to slightly greenish-brown, amygduloidal sericite altered volcaniclastic with zones of sericite alteration and/or bleaching. Generally fine-grained with a weak foliation at 40 deg to CA. Qz/Ca fills vesicles. Mineralization is weakening. Po occurs fine disseminations, as well as blotchy to semi-massive in a few places. Intensely altered zones highlight vesicles.
																						187.38-187.76m Bleached, "plasticy looking" sericite altered zones with irregular boundaries and inclusions/clasts of wallrock. Po replacing square (rimmed) crystals.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
197.62	212.30	14.68	LST	ALT					s								w					Light grey, massive to lightly brecciated, strongly dolomitized limestone (only slight fizz when scratched) with crosscutting veinlets Ca and altered bands/zones of semi-massive to massive Po with soft, slightly flaky, slightly greenish mineral, fibrous and almost acicular. Minor Py
						VN	40										s					200.20-200.36 m: Vein at 40 deg, 50% soft light green fibrous mineral described above, some chlorite alteration, 10% Po, calcite. Seems perpendicular to the very weak foliation in rock.
																	85					203.52- 204.20 m: Semi-massive to massive pyrrhotite with strong dark green chlorite alteration. Also light green feathery soft mineral. The Po has feathery texture as well. Trace pinkish bronze mineral described earlier (possible bornite?) also trace bismuthinite.
						VN	40								w		20					205.26-205.40 m and 208.65-208.79 m: Band of Po, fibrous light green mineral, pyrite. Second band is 40% Po
212.30	334.83	122.53	LST	ALT		FO	55		m						w							Dark grey, to medium grey, dolomitized limestone (slight fizz), generally foliated, and occasionally heavily brecciated. 5-10% Ca +/- Qz flood. Weak pyrite throughout, occurring as (occasionally foliaform) disseminations and occasional coarser bands. Po is absent. Ca veinlets crosscut at 25 and 60 deg to CA. Irregular and usually perpendicular to the foliation. The foliation is usually defined by thin black irregular, stylolite looking stringers. Thin stubby needles occur on fractures, and a prismatic to botryoidal mystery mineral observed elsewhere is dark greasy black, overall 1%.
						VN	25															
						VN	60															
						FO	60															218.00-222.00 m: Fine grained, light grey, and quite well foliated at 60 deg.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						225.60-225.85 m: Several clusters of thin black stubby needle crystals, randomly oriented, 0.5 x 2 mm.
																						230-242.80 m: Strongly brecciated, with slight alignment along foliation.
															t							235.20-235.50 m: Yellowish and reddish alteration occurs on fractures.
																						239 m: Breccia.
						FO	45															249 m: Foliation occurs at 45 deg to CA.
						FO	35															254 m: Foliation occurs at 35 deg to CA.
						FO	50															264 m: Foliation occurs at 50 deg to CA.
																						254.49-260.35 m: More broken up with yellowish alteration on fractures.
						FO	40															271.50-276.40 m: Fairly fine grained, non-brecciated and moderately foliated at 40 deg to CA.
															t							276.40-277.20 m: Mainly quartz flood, heavily brecciated limestone. Some yellow/red alteration textured areas. Also some have trace coarse pyrite crystals. Lots of quartz fragments.
																						278-282 m: Brecciated limestone with slightly brownish yellow/red oxidation on fractures.
						FO	30															282 m: Foliation from 25-40 deg to CA.
															t			Sp	t			285.75-286.05 m: Calcite flood with quartz and some coarse pyrite and small grains in structure of red sphalerite.
																						296 m : Trace sphalerite on thin Ca veinlets.
						FO	50								t			Sp	t			296-306 m: Fairly strongly brecciated with crosscutting Ca +/- Sp veinlets. Some crinoids and corals fragments. Trace disseminated pyrite occurs throughout. Foliation runs at 50 deg to CA.
						FO	30															312- 314 m: Generally more foliated and banded, and less brecciated. Foliation occurs at 30 deg to CA.
																						314-318 m: Coral mound fragments occur within the limestone. Foliation occurs at 30 deg to CA.
						FO	35															328 m: Foliation occurs at 35 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						328-331.13 m: Start seeing more coarse grained limestone, somewhat increased pyrite content, mainly in thin foliated/bands.
						FO	40								ms							331.13-331.70 m: Possible volcaniclastic layers? Increased pyrite and medium brown foliations. Trace brighter green fuchsite crystals.
334.83	338.95	4.12	LST	ALT									MBL	s	w		w					Strongly altered, marbleized (recrystallized coarse grained and fizzy) limestone. Very fluid affected, light grey with thin irregular strong green chlorite, sometimes associated with fine grained trace Po and Py present in weak concentrations as quite coarse disseminations.
338.95	341.79	2.84	Ca	MX	VN										s		s	Sp	w	Bi	t	Mineralized carbonate (calcite?) some banding occurs at 30 deg to CA separating zones of mineralization. Mineralization varies from weak blebs of Py/Po to strongly disseminated and banded Po, Py with rarer Sp, Bismuthanite. Chlorite alteration is still quite prevalent (patchy).
															t		t	Sp	t			338.95-339.63 m: Mostly brecciated Ca (and yellow Ca) with minor sphalerite (few blebs, stringer) and disseminated Po/Py.
																		Sp	f	Bi	w	339.63-340.55 m: Coarse crystalline white Ca flood with thick bands and large clusters of light to dark red sphalerite and soft flaky, steel grey bismthanite (first 40 cm 10% of each, overall less). Also dark blackish sphalerite?? Strong concentrations of dark green chlorite occurring in less well mineralized regions. Occasional bands of Py.
															s		ms	Sp	t			340.55-341.79 m: Generally dark green and altered, with much less Ca (<15%) and quite well mineralized with heavy disseminations to bands of Py and lesser Po. 20 cm of mildly altered Limestone occurs at 341.20-341.48 m. Sphalerite occurs as blebs and stringers.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
341.79	343.92	2.13	LST			FO	40								t		t					Very slightly altered limestone, Ca flooded (10%) and brecciated occasionally. Trace disseminated Py and Po.
343.92	347.00	3.08	LST	MBL																		Back to heavily marbleized, coarse-grained limestone, strongly fluid altered (recrystallized?) with lots of dark green chlorite stringers and fine Py and Po.
347.00	353.22	6.22	LST		BX	FO	30								t		t					Ca flooded (15%) brecciated limestone with minor marble alteration and small zones of pyrite and pyrrhotite.
																						350.41-353.22 m: Variably brecciated limestone with much less Ca flood (1-3%) and increased Py, especially in several intervals.
353.22	356.17	2.95	SHL												s							Dark grey to black, fine-grained, non calcareous shale, with increased pyrite occurring as fine disseminations and in Ca stringers to. Foliation is weak and quite variable from 20 deg at 352 m, to 0 deg at 354 m, to 35 deg at 357 m. Pyrite is also foliaform, extremely low angle but variable. Minor breccia occurs over small intervals. Some limestone clasts occur within.
356.17	361.94	5.77	LST												f							Black to dark grey, brecciated limestone with only minor Ca flood and a weak foliation. Breccia occurs throughout. Pyrite is concentrated within the matrix, while clasts are generally more pure limestone.
			DOL			BN	35															357.10-357.18 m: Coarse, recrystallized dolomite vein 35 deg to CA. It appears to follow the foliation, but it is difficult to tell. Pyrite is concentrated along the edges.
																						360.25-360.45 m: more irregular dolomite with pyrite on margins of the dolomite vein.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

GEOLOGY LOG

HOLE: Rau-09-55

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	6.00	6.00	OVR																			Overburden, limestone, dolomite, and quartz.
6.00	14.23	8.23	LST	ALT					m													Broken up, grey to brown dolomitized and brecciated limestone with some Qz/Ca vein material and a few oxidized looking regions. Locally vuggy and orange-brown in colour.
																						10 m: (+/-10cm) Quartz flood and orange-brown alteration.
14.23	31.39	17.16	DOL												w	t	t					Generally slightly brownish-white to tan, recrystallized, coarse dolomite with several regions (~10%) of oxidized rubbly material. Brown weathering around veins and fractures. 1-3% rusty red cubic weathered pyrite? Also trace disseminated Py/Po.
																						14.03-18.87 m: Orange-brown and minor limonite stained rubbly region.
						VN	25															19 m: Thin veinlets and fractures at 25 deg to CA.
						FR	25															28 m: prominent fracture every few centimetre at 25 deg to CA.
																						28.50-28.70, 32.02-32.80m: Crumbly LT BN to orangey brown gritty layer of dirt w/angular Qz fragments.
31.39	57.46	26.07	LST	ALT	CR				w						t							Medium grey, lightly brecciated and weakly dolomitized limestone with minor brown fracture coatings. Significant (10%) coarse, angular, crystalline dolomite veins irregularly crosscutting/flooding the limestone. Occasionally pinkish tinge to the dolomite. Several crumbly to sandy gougey intervals and fragments.
																						31.39-37.00 m: Especially crackled with thin black lines forming matrix.
																						33.25-33.50 m: Orangey-brown gougey zone with large (to several cm) angular quartz fragments.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						38-39 m: Softer broken and or crumbly gouge zone.
						VN	30															40.80-41.70 m: Dolomite vein at 35 deg to CA. Blebs of Py amongst very coarse, slightly yellow-pink stained dolomite crystals.
						VN	25															52-54m: Increased dolomite veining, at 20-30 deg to CA.
																						55.87-56.00m: Dolomite vein at 35 deg to CA, with orange to brown, crumbly nature, and weathered out oxides in the centre 10 cm. (13% As on XRF).
						VN	60															After this vein, bedding starts to steepen up to 60 deg to CA. By 56.30 m, limestone starts becoming quite foliated, but still has a weak bedded appearance.
57.46	59.28	1.82	MBL			FO	65								w							Quick gradation through marbleised foliated limestone into quite pure white marble. Minor rusty staining on fractures, and weak disseminations and blebs of fine grained pyrite.
59.28	95.40	36.12	LST	ALT					f				He	w	t							Light to medium grey fossiliferous limestone, ranging from foliated to weakly brecciated. Some sections are fizzy with acid, while others are slightly dolomitized. In general the interval is much more fossiliferous before 75 m, and much more brecciated (with minor hematite alteration) after 75 m.
						FO	60															59.28-64.12 m: Moderately foliated limestone at 60 deg to CA, with trace Py stringers.
						FO	45															62.82-63.00m: Calcite vein at 50 deg to CA. Foliation is weakly deformed in this area.
						VN	30															64.12-67.87 m: Especially fossiliferous limestone, with up to 10% crinoids most commonly 1 mm, but up to 1 cm.
										w												67.87-69.49m: Lighter grey, massive region, with irregular stringer veins of sericite and sericite alteration.
																						69.49-86 m: Irregularly brecciated interval, with rare foliation visible.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
													He	w								After 72.60 m, most fractures have minor hematite alteration. Occasionally thin dolomite veins are stained a pinkish colour.
																						79-79.50 m: Slightly more fractured zone. Weak hematite alteration occurs.
																						83-84 m: 2-10 cm pinkish dolomite veins occur at 60 deg to CA.
																						87 m: Bedding occurs at 65 deg to CA. Below this the limestone becomes much more brecciated.
															w							88-89 m: Slightly brownish altered, brecciated limestone with weak disseminated pyrite.
															t							89.30-89.90 m: 5 cm thick irregular coarse-grained dolomite vein with a faint yellow tint cuts along the core axis.
																						89.90-95.40 m: Crackle brecciated limestone, very calcareous w/ 5% irregular crosscutting Ca veins. Patchy brecciated texture with some "gritty" clasts. A couple red (Hematite) coated fractures occur.
																						95.40 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

The hole was ended at 125.88 m because the hole was caving in on the rods.

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.87	2.87	OVB																			
2.87	63.67	60.80	LST	FOS	BX	BD	70								t							Medium grey limestone with patches and layers of white calcite. There is a banded appearance but it is often deformed by stylolitic markings. There is a slightly coliform texture between the Ca and the limestone. There appears to be a strong event of irregular deformation of the limestone. Where banding is visible it occurs at 70 deg to CA. It appears that there has been 2 calcite events. A milky white one, and a clearer white. The clear one is inside the milky one. Overall the core is moderately blocky. Rare (trace) coral stems occur.
													He	t								18.92-34.50 m: Limestone has much less infiltration by Ca. The limestone itself has a purpley grey colour and is more massive with no banding and weak brecciation. Where the brecciation by Ca occurs, it is much cleaner and mosaic style with angular to subangular clasts. Where the multiphase calcite occurs there is often a thin border of fine grained black crystals (non-magnetic). Slight increase in the concentration of coral and crinoids (still trace). Trace patches of red hematite. Very
																						trace fine grained disseminated pyrite.
																						25.50-26.00 m: Massive creamy calcite vein. Fairly rubbly.
																						34.50-63.67 m: Medium grey banded limestone. Bands occur from 40-60 deg to CA. Fossils occur weakly concentrated in gritty looking zones as crinoid stem fragments up to 0.4 cm in diameter. These zones are slightly deformed. The interval is rather blocky with medium tan/brown clay coating many of the fractures. Banding varies as follows:
						BD	60															34.50-46.00 m: BD-60
						BD	55															46.00-54.00 m: BD-55

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	40															54.00-59.00 m: BD-40
						BD	45															59.00-63.67 m: BD-45
63.67	66.04	2.37	VOL	ALT	FO	FO	45															Light yellow extremely altered volcaniclastic. FO is faint but occurs at 45 deg to CA. A clast of limestone 4 cm long occurs within. Approximately 2/3 down the clayish alteration becomes gritty medium brown colour. Overall the interval has quite poor recovery.
				CLY																		
66.04	68.87	2.83	LST	ALT	BN	BD	55						MBL	w								Medium grey banded limestone with weak marbleization giving the core a weakly sugary texture. Banding occurs at 55 deg to CA. The interval is only weakly rubbly/blocky. Rare tan/brown clay occurs on fractures. Lower contact is very sharp at 30 deg to CA.
						CN	30															
68.87	83.35	14.48	OX	CLY																		Medium orange-brown clay with gritty dark brown limonite fragments. Overall the zone is quite homogeneous. (COLOUR 7.5 YR 4/6 - strong brown).
				RBL																		
			DOL	ALT	BN	BD	60					f										69.82-70.25 m: There is a fragment of medium grained weakly to strongly altered dolomite. Banding occurs at 60 deg to CA. Fine grained patchy sulphides occur in rough bands, weak overall.
			OX	CLY																		70.25-75.59 m: Medium orange-red-brown clay with limonitic rubbly and weak concentration of yellow mica flakes scattered throughout. (COLOUR 7.5 YR 4/4 - brown).
																						74.07-74.38 m: Clay is slightly more micacious and slightly greenish in colour. (COLOUR 2.5YR 5/4 - light olive brown).
				RBL																		75.59-80.16 m: The oxide gradually becomes less clay rich and limonitic rubble becomes more dominant. (COLOUR 5YR 4/4 0 reddish brown).

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						80.16-81.69 m: Medium orange brown oxide grit with fair amounts of clay and moderate quartz rubble. The quartz fragments are sub-rounded to sub-angular up to 6 cm in diameter but average 0.5-1 cm. The quartz is fairly evenly distributed throughout. (COLOUR 7.5 R 4/6 - strong brown).
																						81.69-83.35 m: Medium orange-brown to red-brown clay with limonitic fragments. Weak concentration of yellow micaceous flakes are scattered throughout. Quartz fragments (sub-angular) up to 1.5 cm occur in weak concentration (1-3 %). The latter half of the interval becomes increasingly limonitic.
83.35	83.88	0.53	VOL	CLY	FO	FO	60															Greenish-grey-brown clay with moderate to strong concentration of yellow mica flakes. A slight banding occurs at 60 deg to CA. The interval has a strong concentration of sand to gravel sized.
83.88	108.36	24.48	OX	CLY																		Medium orange-brown clay oxide with rubbly limonitic fragments up to 1.5 cm in diameter. (COLOUR 7.5 YR 4/4 - brown).
				RBL																		83.88-92.35 m: Orange-brown gritty clay oxide with limonitic fragments within.
																						92.35-97.14 m: Orange-brown gritty clay oxide with a 15 cm zone of green-grey-brown clay at 93.56-93.80 m. Also at 94.47-94.74 m, there is a zone of yellow-orange clay, possibly a thin volcaniclastic layer.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						97.14-108.34 m: Medium to dark red-orange-brown rubbly clay oxide with dark red-brown clay limonite rubble within. This zone appears to be a feathering out of the clay oxide zone. Within there are intervals of highly altered grey-brown altered limestone, as well as intervals of brecciated limestone. 65% oxide, 35% limestone. Within the limestone interval there is a 5 cm brecciated band that occurs at 55 deg to CA. Within the band there are orange-red strongly oxidized sulphides (trace). Within the oxide there are pockets that contain bright yellow clay oxide- overall 1-2 %.
108.36	125.88	17.52	LST			VN	10															Medium grey limestone with zones of coarse grained dolomite. These dolomite zones are often pink (Rhochrosite?) Overall the zone is quite blocky. Thin 0.2-0.4 cm calcite veins cut at 10, 30, 80 deg to CA. These veins are open filling (can see the coarse grained filling texture). Strongly oxidized pyrite, trace, occurs in a sub- to euhedral fashion throughout.
						VN	30															
						VN	80															
																						116.73-119.78 m: Particularly oxidized zone with a 15 cm clay zone.
																						125.88 m: E.O.H - the hole was ended because it was caving in on the rods.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-09-57

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.05	1.05	OVB																			
1.05	33.00	31.95	LST	FOS									MBL	w	t							Medium grey limestone, variably foliated and/or brecciated. Quite blocky and fractured with poor recovery in parts. Small intervals of rubbly limestone. Minor brownish weathering on fractures. A few tan/whitish intervals of marbleised limestone occur. Some small crinoid fragments.
				ALT		FO	40															5 m: foliations bend around augen-style calcite nodules.
																						10.5-12 m: More competent, brecciated region with increased (chaotic) calcite veins/flood.
																						Trace Py on some fractures, rusty cubes.
																						12.40-12.50 m: Light brown, clayey gouge region. Around this are the limestone is much more crumbly.
						FO	50															13 m: Foliation occurs at 50 deg to CA.
													MBL	m								21.34-22.86 m: Lighter coloured and more marbleized.
						FO	60															24 m: Increased black stringers veinlets.
						FO	50			w												27.60-28.96 m: Orangey-tan, marbleized limestone, moderately foliated with thin sericite stringers.
						FO	55															33 m: Foliation occurs at 55 deg to CA.
33.00	50.50	17.50	LST	ALT	BX	VT	25		w						t							Limestone is now dirty tan-grey in colour and crackled/brecciated, with a few small intervals of broken fragments (+/- Qz) and small clay/gouge intervals. Traces of rusty, weathered pyrite cubes. Weak foliation in places, with common low angle crosscutting DOL+/- Qz veins and minor brown alteration. Limestone is quite vuggy in places. Several <10 cm intervals of broken white quartz fragments 0.5-3cm in size occur.
						FO	45															48.50-50.50 m: Mixture of light brown clay oxide (25%) in with dirty limestone fragments (75%).

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
50.50	60.96	10.46	OX	CLY																		Brown clay rich oxide, with scattered white quartz fragments (sometimes concentrated). Oxide colour ranges from darker brown, through slightly lighter brown, to reddish brown. Flakes of sericite present in many places. (COLOUR: 7.5YR 4/4 - brown)
																						52.60-53.18 m: (poor recovery so interval vague). Mostly white Qz, fragments to core size.
																						53.34-56.39 m: Clay in this interval is slightly more yellowish in colour.
																						56.39-57.91 m: More liquid/soft, doesn't hold core shape
																						57.91-59.44 m: Slightly more competent and reddish brown, with prevalent quartz occurring predominantly as coarse sand sized grains throughout.
																						59.44-60.96 m: More tan-brown in colour with less quartz, some sericite flakes, and clay forming "faces"…smooth flat surfaces, but can still be indented by a finger.
60.96	71.63	10.67	LST		FO	FO	35								t							Same light brownish tan dirty LST, very calcareous slightly gritty/vuggy in appearance, with chaotic weathered calcite veinlets crosscutting the banding. Trace disseminated rusty red Py cubes. Generally fairly fractured with some rubbly zones. Weak foliation occurs at 35 deg. Rare alignment of veinlets and cracks occurs.
						FO	25															68 m: Foliation occurs at 25 deg to CA.
																						70.33-71.55 m: Void and clay (<5cm) some slightly orangey fracture staining at 70 m.
																						71.63 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-09-58

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.25	2.25	OVB																			
2.25	13.11	10.86	LST		BX																	Medium grey limestone with moderately strong brecciation by medium grained Ca veins. On top of the brecciation there is an overall weak crackle texture.
					CR																	
				ALT								w			f							7.85-8.30 m: Interval of moderately altered brecciated limestone with strongly oxidized sulphides (probable pyrite) fair.
																						10.06-13.11 m: The limestone becomes progressively more carbonate altered and slightly blocky.
13.11	25.53	12.42	DOL	ALT								f			w	t						Weak to strongly oxidized coarse grained dolomite with thin sections of limestone. The dolomite is coarse grained. Pyrite (weak) and Arsenopyrite (trace) occur scattered throughout as fine grained subhedral crystals.
				RBL																		13.11-14.63 m: Very poor recovery. Extremely carbonate altered limestone with trace limestone fragments. The zone is all rubble.
						BD	65															16.15-20.50 m: Coarse grained weakly to strongly oxidized dolomite with a tanish-orange colouration. Weak banding occurs at 65 deg to CA. Weak pyrite and trace arsenopyrite are widely disseminated.
																						16.15-16.53 m: The dolomite is strongly oxidized.
						VN	30															20.50-25.53 m: The dolomite becomes weaker with interzones of medium grey limestone. 60% dolomite 40% limestone. Ca veins occur in the limestone at 30 deg to CA.
25.53	27.90	2.37	MBL			VN	60			f					w							Very light grey marble with thin wispy stringers of yellow/orange sericite at 60 deg to CA. Weak pyrite occurs disseminated throughout.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
27.90	31.03	3.13	LST	FOS	MA																	Medium to dark grey fairly fossiliferous limestone. The limestone appears quite massive with a fine foliation at 50 deg to CA. Structural foliation deforms the crinoid stem fragments.
					FO	FO	50															Upper and lower contacts are gradational.
						VN	65															Thin Ca veinlets occur at 60-70 deg to CA.
31.03	34.78	3.75	MBL			BD	60								w	t						White to very light grey marble with thin beige-yellow-green sericite stringers. Patchy slightly banded pyrite (weak) and arsenopyrite (trace). Very weak banding occurs at 60 deg to CA.
34.78	38.16	3.38	DOL			VN	40															Medium grey limestone with tan-orange tinted medium to coarse grained dolomite that appears to be at least in part vein controlled at 40 deg to CA. Crackle fractures have a beige-brown stain surrounding them. Patchy arsenopyrite and pyrite occur weakly scattered throughout.
38.16	74.07	35.91	LST		BN	BD	50															38.16-45.11 m: Banded medium grey and medium-dark grey limestone with crinoid stem fragments occurring fairly scattered throughout and 0.2-0.4 cm in diameter. Pyrite occurs scattered throughout as trace fine to medium grained subhedral crystals.
						BD	40															44 m: The banding changes to 40 deg to CA.
						VN	25															45.11-60.03 m: Medium to dark limestone with crinoid stem fragments fair overall with zones of moderately strong concentration 0.2-0.4 cm in diameter. White calcite occurs in 0.3-1.5 cm veins that are at either 25 or 50 deg to CA.
						VN	50															
						FR	50															52.00-52.34 m: Zone of orange-tan-brown alteration staining in a healed fracture zone. Some of the stain is slightly redder in colour and is probably hematite.
													He	w								58.83-59.44 m: Crackle fractures and fractured surfaces are coated in hematite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

This hole contained interesting mineralizations with in the very coarse grained dolomite including very coarse grained euhedral pyrrhotite crystals (up to 2 cm in diameter).

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0	3.02	3.02	OVB																			
3.02	4.8	1.78	LST												t							Mixture of 50% fragments of limestone and 50% dark red gougey clayey regions. Limestone is bleached, crystalline with trace stringers and blebs of Py. Gouge ranges from brownish-red to dark red, soft to competent. (COLOUR: 10R 4/6 - dark yellowish brown)
4.8	7.31	2.51	LST		FO	FO	70								t							Medium to dark grey, foliated limestone with some rusty red soft layers weathering out. Trace pyrite disseminated throughout. Foliation occurs at 70 deg to CA. The foliation sometimes deforms around augen like clasts in the limestone.
7.31	13.11	5.8	VOL	ALT		FO	55															Strongly altered, weak, soft, fissile to crumbly, altered volcanic. Light brown (COLOUR 7.5YR 5/4 - brown) to more commonly pale yellow (COLOUR: 5Y 8/2 - pinkish white).
																						9.70-9.83 m: Competent pale yellow section with some quite bright green, slightly flaky layers following the foliation at 55 deg to CA (possibly fuchsite?)
																						11.58-12.95 m: very poor recovery, only some small limestone pebbles.
																						12.95-13.11 m: yellow-brown volcaniclastic, less obviously foliated.
13.11	21.65	8.54	OX	RBL											f							Predominantly crumbly, reddish brown (COLOUR: 5YR 5/4 - reddish brown) oxide fragments, variably limonitic. Also 40% interbeds of relatively unaltered limestone, doesn't fizz well but looks grey and is well-foliated. Limestone intervals occur from 16.42-16.79 and 17.68-18.05 m. They have fair concentrations of disseminated Py. Also a yellowish stain occurs on fractures.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						13.11-15.95 m: Darker red limonitic oxide fragments, gritty and often coated with a lighter yellowish brown clay.
						FO	50															15.95-19.20 m: Slightly lighter coloured and more competent, with lots of muscovite/sericite flakes. On margins of limestone there is an increased concentration of coarse grained disseminated and blebby to banded pyrite.
															f							19.20-21.65 m: Very soft, crumby brown oxide, quite clay rich containing notable sulphides. Py fragments are present throughout, often as Py sand clusters. One competent Py +/- scorodite chunk 10 cm long occurs within. (COLOUR: 7.5YR 5/8 - strong brown)
21.65	57.3	35.65	DOL	MX		FO	45								15	10	f					Well-mineralized white to grey, very to extremely coarse-grained dolomite with Py, As, Po throughout. Pyrite is the most common sulphide, present pervasively as strong disseminations to bands to semi-massive med-grained patchwork. Arsenopyrite occurs as quite coarse crystals associated with the pyrite, and is concentrated in semi-massive sections. Pyrrhotite is <5%, except for one interval (described below), where it is almost massive. Outside this interval it occurs as sporadic blotches, stringers, and rare disseminations.
																						A weak foliaform fabric is observed throughout, especially with pyrite banding. Some bright reds/yellows and other As/Po alteration products. Especially concentrated in a few more rusty, weathered regions.
															40	5						21.65-23.30 m: Fairly altered, more crumbly, and colourful (brown/white/red/yellow). Mineralization is mainly finer grained heavily disseminated to semi-massive pyrite with some rusty brown alteration around the grains. Some lesser Arsenopyrite +- scorodite. Dolomite is white-cream-yellow.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						23.30-23.40 m: Two rough irregular fractures coated with dark blood-red amorphous film of some alteration/weathering product. A light brownish-orange also coating. Nearby some very coarse >2 cm arsenopyrite crystals occur.
			LST			FO	35								t		t					28.49-29.00 m: Only weakly mineralized zone of grey limestone and what seems like siltstone? Fine-grained, soft grey, non-calcareous.
															w		85					29.00-31.18 m: Semi-massive to massive fine to medium-grained Po with minor coarse Py grains. Significant talc present between Po crystals, along with bright yellow alteration on rough fracture surfaces.
															m		10					31.18-32.89 m: Similar zone but less well-mineralized. Increased Py, and now coarse-grained dolomite defines the mineralization pattern.
																						In between dolomite crystals, large (up to 2 cm) perfect Po crystals have occasionally formed with shiny mirrored faces. After ~32.50 m, rock changes back to silty limestone with minor Po bands.
															20	20						36.88-38.14 m: Especially well mineralized zone with very coarse Asp crystals often up to 2 cm pyramids. Mineralization is coarsely disseminated throughout.
															15	5	5					38.14-40.54 m: More altered, sometimes crumbly dolomite with dark red on fractures. The dolomite is stained yellow, and increased (fair) Po, occurring as stringers and disseminations.
															10	5	f					After 40.54 m: slight decrease in amount of coarse-grained Asp, though it continues until the end of interval. The dolomite gradually becomes slightly more colourful (yellow/pink tinted) and vuggy.
						BD	60															50 m: Banding of the sulphides occurs at 60 deg to CA.
						BD	45															After 51.75 m: start seeing bands of fine grey possibly volcaniclastic, associated with strongly mineralized semi-massive Py/Asp.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						These mineralized volcaniclastic (?) layers occur from 51.75-52.00 m, 54.00-54.20 m and 54.20-55 m which is less well mineralized.
																						55-57.30 m: The dolomite is quite coarse-grained, more pink coloured and vuggy. Py often has orangey-brown alteration around it.
57.3	60.4	3.1	VOL	ALT		FO	40															Tan, altered volcaniclastic, somewhat fissile and well-foliated, with rusty fracture surfaces. Weathered out pyrite cubes occur along with foliaform pyrite patches. Trace fuchsite. Foliation occurs at 40 deg to CA.
60.4	79.86	19.46	OX																			Oxide, varies in colour slightly from lighter browns though to quite dark, limonitic browns. Generally moderately competent core, quite porous, sometimes crumbled away. Usually darker brown inside with light brown clay exterior. First half of interval is more yellow (COLOUR: 10YR 5/6 - yellowish brown), second half is more red(COLOUR: 2.5YR 4/6 - red) with dark brown/black fractured limonite stained surfaces.
																						60.40-61.87 m: lighter brown-yellow oxide, very poor recovery.
																						61.87-62.90 m: Dark red, soft clayey oxide.
																						62.90-63.40 m: Coarse dolomite chunks, with minor pyrite stringers and some red clay oxide.
																						63.40-64.35 m: Red-brown oxide with minor yellow patches.
						FO	50								50	15						64.35-64.95 m: Semi-competent, semi massive sulphides (Py), presumably after dolomite. Very rotted and rusty/oxidized, but visible sulphide banding at 50 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						64.95-79.86 m: Quite homogenous, semi-competent oxide, gradually changing colour from lighter yellow-brown (COLOUR: 10YR 5/6 - yellowish brown) to a slightly darker red-brown (COLOUR: 2.5YR 4/6 - red). Fracture surfaces seems very limonitic. Also occasional bright red-brown to red (Asp alteration ?) on surfaces.
						FO	55															66.50 m: Clear foliation occurs at 55 deg to CA.
																						71.00-78.50 m: Clear breccia texture in the oxide occurs.
						FO	35															78.50 -80.00 m: Clear foliation of 35 deg to CA occurs throughout.
79.86	80.95	1.09	DOL	ALT		FO	50					s										Transition zone of brownish crumbly oxide and variably altered white to pink stained dolomite.
80.95	87.44	6.49	DOL		BX										ms							Dolomite with some grey, brecciated limestone. Very chaotic Ca veinlets occur. Fair (5-7%) fine grained bands, as well as heavily disseminated stringers and patches of pyrite occur within.
															80							84.89-86.26 m: Band of semi-massive to massive, fine-grained Py, replacing dolomite, or brecciated dolomitized limestone.
87.44	88.95	1.51	VOL			FO	55								w							Light grey, foliated volcaniclastic layer with stringers of pyrite. Laminations of sericite occur at 55 deg to CA (defining the foliation). The first 20 cm of interval is blotchy, semi-massive Py.
88.95	111.21	22.26	DOL		BX																	Dolomite and dolomitized limestone, fairly coarse-grained and brecciated. Weak banding occurs at 65 deg to CA. Some orange staining occurs on fractures.
						FO	65								10	w						89.95-92.35 m: Well mineralized coarse dolomite with bands of Py and minor medium grained Asp.
															90	t						92.35-92.95 m: Fine-grained semi-massive to massive Py. A few small blebs Asp.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	50															After 92.95 m: Py/Asp mineralization gradually drop off, and by ~97 m, the last of the Asp has disappeared. Py at this point is down to fair, and after 99 m, becomes trace. Two dolomite phases may occur as it appears that a coarser, pinker dolomite cuts through less altered greyer, finer dolomite/dolomitized limestone.
																						After ~99 m: Dolomite is very brecciated, with no obvious banding or foliations, and increased red-pink staining (rhodochrosite?) Sometimes creeps out from fractures.
																						104.70-105.50 m: Medium to dark limestone clasts dominate, and pyrite higher in concentration and heavily disseminated. By 105 m +/-10 cm of semi-massive pyrite.
															f							After 107.59 m: grey limestone breccia pieces disappear, more pink/tan/white coarse dolomite texture. Locally vuggy and increased disseminated Py and STR.
																						110.64-111.21m: Very poor recovery, rubbly fault(?) zone contact between pinkish brown, fair Py mineralized dolomite, and white marble.
111.21	119.79	8.58	MBL			BD	45															Strikingly white, quite pure unaltered marble. First metre or so has 30% grey patches/stringers but after that it is >95% pure. Weak stringers of possible clay or sericite alteration, aligned at 45-50 deg occur within.
																						119.79 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

COMMENTS

The upper contact between the oxide and the dolomite is sharp, where as the lower contact is more gradational. The lower dolomite is fresh, while the upper dolomite is moderately altered.

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.05	3.05	OVB																			
3.05	6.10	3.05	VOL		AM																	Black amygdaloidal volcaniclastic with calcite infill of the amygdales. Recovery is very poor.
																						4.57-6.10 m: NO RECOVERY - possibly altered volcaniclastic that was washed away during drilling.
6.10	16.85	10.75	DOL	MX	BN	BD	60					w			m	m						Strongly mineralized dolomite with moderate pyrite and moderate arsenopyrite. Pyrite is fine to medium grained and occurs heavily disseminated as patches that are slightly banded at 60 deg to CA. The arsenopyrite is coarse grained to very coarse grained (up to 1 cm in diameter) on average 0.3 cm in diameter. In a few locations (16.40 m for example), the fine-medium grained pyrite appears to be replacing the coarse grained arsenopyrite. It appears to be quite a patchy style replacements. The dolomite is fine to coarse grained with large patches of quartz within (2-3%). The dolomite is fairly to moderately oxidized from a tinted orange brown to very dark brown in colour. Overall the zone is quite blocky with zones of extremely rubbly altered material.
				ALT																		
																						6.25-6.98 m: Poorly recovered fairly altered rubbly zone of mineralized dolomite.
																						7.82-8.35 m: Very rubbly fairly altered mineralized dolomite with medium to dark brown gritty alteration coating on it.
																						8.35-9.14 m: Medium mustard yellow brown gritty slightly clay rich rubble zone. A few fragments of fissile strongly altered volcaniclastic occur. Therefore this may be a thin layer of volcaniclastic within the oxide/sulphide zone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						9.14-10.67 m: Poorly recovered zone with rubbly strongly oxidized mineralized dolomite with rubbly oxidized zones. From 10.67-11.65 m a zone of brown highly altered dolomite rubble grading into grey gravelly clay. From 13.72-15.24 m: poorly recovered zone of strongly altered (not oxidized) dolomite with a very pale yellow green clay coating some of the surfaces.
																						15.24-16.34 m: Very poorly recovered oxidized rubble zones with sub-rounded limonite fragments up to 3 cm in diameter.
16.85	21.20	4.35	OX	RBL																		Sharp transition into medium orange brown clay with dark red-brown limonitic oxide fragments.
																						16.85-18.29 m: Rubbly dark orange red brown limonitic oxide fragments with medium orange-red oxide clay coatings.
																						18.29-18.50 m: Very altered fissile volcaniclastic with altered dolomite rubble. Probably represented a volcaniclastic layer within the mineralized dolomite.
																						18.50-19.81 m: reddish-orange-brown limonitic rubble with orange-brown clay coatings.
																						19.81-21.20 m: Medium slightly orangish-brown oxide clay with (3-5%) yellow mica flakes scattered throughout. Rare gritty fragments exist. The last 50 cm of the interval is rubbly and strongly oxidized mineralized dolomite.
21.20	22.35	1.15	DOL	MX											f	m						Transition zone between intensely oxidized rubbly and fresh mineralized dolomite. The dolomite contains moderate As and fair Py where the rock is clean enough to tell. The fragments are quite vuggy.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
22.35	67.65	45.30	DOL	MX	BN	BD	50								m	f						White and light grey faintly banded medium grained dolomite with bands of patchy and heavily disseminated pyrite and arsenopyrite. On some of the fractured surfaces a greenish- white talc like mineral occurs. The mineralized bands run at between 40-60 deg to CA. The most obvious banding is comprised of fine grained pyrite with arsenopyrite weakly associated with banding, but also occurs as coarse grained sub-hedral crystals scattered throughout.
						VN	30	230														At 27.45 m, there is a 0.5 cm wide pyrrhotite vein with associated coarse grained pyrite at 30 deg to CA. Pyrite also occurs as fine grained disseminated and irregular patches.
															m	f						Overall pyrite is greater in concentration to arsenopyrite. Pyrite is roughly moderate, arsenopyrite is fair.
						BD	40															22.35-30.60 m: Banding occurs at 40 deg to CA. Arsenopyrite is fairly concentrated and occurs as coarse grained crystals up to 1 cm in diameter fractured surfaces rarely show any sign of weathering, oxidation or alteration.
						BD	50															30.60-41.45 m: Arsenopyrite becomes less concentrated and where it does occur it is more commonly fine grained. The banding angle gradually increases to 50 deg to CA and 60 deg to CA at 38.50 m.
						BD	60															
						BD	50								m	m						41.45-45.25 m: The concentration of arsenopyrite increases to moderate in this interval. Banding occurs at 50 deg to CA.
															f	w						45.25- 54.34 m: Arsenopyrite concentration decreases again to weak and pyrite decreases to fair. Banding is slightly irregular, but most commonly occurs at 50 deg to CA. Silvery grey/white patches 0.3-1.5 cm in diameter of talc occur scattered throughout (1-3%). Fractures surfaces commonly have a yellow dark brown alteration stain on them.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	50								f	t						53.34-54.34 m: Slightly oxidized zone. A series of brown oxidized veins 0.2-1 cm thick with medium grained quartz and weak pyrite cuts at 20 deg to CA and 110 deg to the pyritic banding. The rest of the zone consists of a greenish to brownish tinted fine grained dolomite with alteration occurring along healed fractures and particularly intense around the pyrite. The last 15 cm of the interval grades into a progressively coarser grained dolomite. There is a stylolitic surface between beds of dolomite.
						VN	20	110														
						BD	50								s	m						54.34-65.53 m: Definite increase in the concentration of mineralization. To strong for Py and moderate for Asp. The dolomite is unique in that it varies widely from grained crystals up to coarse grained crystals (~1cm). There also appears to be 2 types of dolomite a creamy white dolomite a creamy white dolomite with very sharply defined crystals boundaries, and a light to medium grey typically coarser grained crystals with much less clearly defined crystal boundaries. It is possible that the yellowish dolomite is more hydrothermal and the grey is more digenetic?? Banding occurs at 50 deg to CA. Arsenopyrite generally occurs as coarse grained crystals (up to 1 cm in diameter) but more commonly a size of ~0.3 cm. The Asp occurs as individual crystals or groups of individual crystals, and rarely forms defined bands or large patches. Pyrite is generally fine to very fine grained and occurs as heavily disseminated patches, with zones of finer grained dolomite it is more common for the pyrite to be finely disseminated throughout with less well defined bands.
															75	m						64.54-64.76 m: Semi-massive zone of pyrite with moderate arsenopyrite
															60	l						65.30-65.53 m: Semi-massive zones of pyrite with moderate arsenopyrite .

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	60								f	t						65.53-67.65 m: Strongly altered zone. Varies from altered yellow brown mineralized dolomite to altered pink red altered dolomite. The red/pink altered area runs high for Mn on the XRF therefore is probably Rhodochrosite. The pyrite in this zone is more patchy than banded, but bands do occur at 60 deg to CA.
67.65	70.53	2.88	VOL	ALT						m					w							Grey-green sericite altered volcaniclastic which contains quite high density of strongly altered and recessively weathered dark brown stringer veinlets, that run at 35 and 50 deg to CA. The sericite alteration occurs from 67.65-69.20 m and progressively becomes unaltered.
						BD	50								w							69.20-70.26 m: Unaltered volcaniclastic. Looks quite different from other versions of volcaniclastic in other holes. It is blue grey in colour with a somewhat patchy looking dark brown banded pattern at 50 deg to CA. On broken surfaces these brown bands appear to contain biotite. The entire unit contains only weak fine grained disseminated pyrite.
						CN	60															70.26-70.53 m: Strongly sericite altered volcaniclastic (similar to the one at the top of the unit).
																						The lower contact is quite sharp at 60 deg to CA.
70.53	108.16	37.63	DOL	MX	BN										f	t						Creamy white to light grey dolomite with patchy and banded fine grained pyrite and rarer medium grained arsenopyrite. Overall pyrite is weak to fair, arsenopyrite is trace to weak. The light grey dolomite contains a fair amount of quartz and overall the unit seems as through it may be partly silicified.
						BD	60															70.53-74.40 m: White creamy white coarse grained dolomite with zones of light grey fine grained partly silicified dolomite. Pyrite occurs as patchy and banded at 60 deg to CA. Only trace very fine grained arsenopyrite occurs.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other						Other		Other	
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
															f	w						74.40-78.42 m: Overall there is an increase in the amount of mineralization within this interval. It is composed of fine grained light grey to medium grey fine grained dolomite and quartz and medium to coarse grained and even megacrystic creamy yellow white dolomite. The main concentration of the mineralization occurs within the coarser grained dolomite. At 77.72 m there is a strange contact between the grey and the white yellow dolomite. It appears that the yellow dolomite is an alteration (via a fluid corridor) of the grey dolomite. Within some of the up to 2 cm crystals there is a core of grey dolomite. This fluid that altered the dolomite zones runs at ~10 deg to CA and 60 deg to the BD. Banding in the grey dolomite in the grey dolomite occurs at 55 deg to CA. Pyrite occurs as fine grained heavily disseminated bands occurring at 60 deg to CA. These bands are up to 6 cm thick and can be slightly vuggy and weakly altered. These bands are up to 6 cm thick and can be slightly vuggy and weakly altered. The arsenopyrite occurs as
																						medium to coarse grained sub to euhedral crystals scattered throughout. The dolomite which contains the most concentrated mineralization has a slight pinkish tint-possibly Rhodochrosite.
															f	w						78.42- 83.82 m: Decrease in the concentration of mineralization as well as a degrease in the concentration of the coarse grained white/cream yellow dolomite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other

						BD	65								f	w						83.82-91.22 m: Cream yellow to orange-pinkish coarse grained dolomite with a vuggy texture between some of the crystal faces. There are slight gradational changes between the dolomite grain sizes but on average they are ~0.5 cm in diameter. Banding in the unit is defined by thin Py stringer bands as well as changes in the grain sizes but on average they are ~0.5 cm in diameter. Banding in the unit is defined by thin Py stringer bands as well as changes in the grain size of the dolomite layers. This banding occurs at 65 deg to CA. Pyrite occurs as fine grained heavily disseminated bands at 65 deg to CA
																						(fair). Asp occurs as coarse grained crystals scattered throughout (weak).
						BD	55								f	w						91.22-102.11 m: Pinkish white medium to coarse grained dolomite and zones of brecciated and crackle brecciated fine grained light to medium grey dolomite. The clasts in the breccia are subrounded to rounded and are generally more matrix supported. Pyrite occurs as heavily disseminated bands in the non-brecciated limestone, and as scattered disseminations and heavily disseminated patches and zones in the brecciated area. Overall pyrite is fair, arsenopyrite is medium to very coarse grained up to 1.5 cm in diameter overall weak. The breccia accounts for 50% and non-brecciated is 50%.
						VN	50															94.30 m: Three phases of dolomite veins cut the fine grained pyrite mineralization. One occurs at 50 deg, the second occurs at 60 deg, the third occurs at 25 deg to CA. (1st is oldest, 3rd is youngest).
						VN	60	180														
						VN	25	150														
																						98.13-98.56 m: Very heavily disseminated zone of banded Py at 55 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.51	3.51	OVB																			
3.51	176.20	172.69	LST		FO																	Medium grey highly fossiliferous limestone with a prominent, but variable foliation.
																						3.51-24.51 m: Strongly fossiliferous limestone. Fossils include large up to 1.7 cm crinoid stem fragments and what could be calcite concretions (rounded calcite balls). The foliation varies as follows:
						FO	20															3.66-9.14 m: FO is 20 deg to CA
						FO	30															9.14-9.75 m: FO is 30 deg to CA
						FO	40															9.75-18.29 m: FO is 40 deg to CA
						FO	25															18.29-23.00 m: FO is 25 deg to CA
						FO	30															23.00-24.51 m: FO is 30 deg to CA
																						The foliation in general does not significantly disturb the crinoids, only slightly in some locations. In general the crinoid stem fragments are well intact (not broken up). The distinguishing feature of this unit is the size of the crinoids, they are much larger than any others drilled to date. Calcite veins follow the foliation and are 1-3 cm thick.
						VN	50															24.51-29.05 m: Medium grey spotted limestone. Almost looks like the leopard unit, but not exactly. Within you can make out rare crinoid stem fragments. Overall it appears to be slightly recrystallized. It contains trace yellow-green irregular sericite stringer veinlets at 50 deg to CA. The upper and lower contacts are gradational. Thin Ca veinlets occur at 60 deg to CA (trace).
						VN	60															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	45															29.05-41.28 m: Irregular medium to dark grey limestone unit with swaley limestone beds of medium dark grey. The unit contains an abundance of crinoid stem fragments as well as irregular corals or shells (seen in other holes). Due to the irregularity of the bedding only a rough measurement of 40-50 deg. The units looks soft sediment deformed (?) Almost has a mottled camo-texture. Thin Ca vein(lets) 0.2-3 cm cut at 15,20,50,60 deg to CA.
						VN	15															The crinoid stems in this unit are much smaller 0.2-0.5 cm in diameter on average. Rare star crinoids occur.
						VN	20															
						VN	50															
						VN	60															
						FO	40															41.28-42.00 m: Thinly foliated medium to dark grey slightly fossiliferous limestone. FO runs at 40 deg to CA. Very clean and regular looking most fossils are broken up. Rare intact star crinoids.
						BD	30															42.00- 55.90 m: Strongly structurally deformed fossiliferous limestone. Bedding is distinguishable from foliation in a few cases. BD runs at 30 deg. FO runs at 5 deg to ca, and at 190 deg to BD. In most cases the FO is so intense it completely disturbs the bedding. This fossils are much more rare (1%) but in general in good condition.
						FO	5	190														
																						55.90-147.50 m: Strongly structurally deformed banded, light and medium grey limestone with rare crinoid stem fragments. The light grey limestone bands are gritty in texture. The foliation is quite variable as described below. Zones within the limestone are more disturbed and do not have a banded character (this accounts for 20% of the interval). Trace pyrite occurs. The foliation is as follows:
						FO	10															55.90 - 56.90 m: FO 10 deg to CA

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	60															147.50 - 161.76 m: Very dark grey, black limestone with foliation running at 60 deg to CA. Weak pyrite occurs scattered throughout. Crinoid fragments are fairly concentrated but quite broken up in general.
						FO	40															161.76-166.90 m: Very mixed looking medium grey slightly gritty and dark grey limestone. Has a swaley texture. The general structural direction is at 40 deg to CA.
						FO	65															166.90-170.43 m: Medium grey gritty limestone quite massive with a slight foliation at 65 deg to CA.
															f		f					170.43-175.41 m: Coarse grained white to light grey dolomite with calcite infill and possible light grey limestone. Pyrite and pyrrhotite occur as fine grained fairly disseminated patches.
			MBL			CN	80															175.41 - 176.20 m: White marble. Upper contact is at 80 deg to CA. The lower contact is at 70 deg to CA.
						CN	70															
176.20	190.11	13.91	VOL	ALT	AM																	Volcaniclastic. A mixture of amygdaloidal with calcite infill and altered volcaniclastic.
															w							176.20 - 177.60 m: Purple beige sericite altered volcaniclastic with weak disseminated pyrite.
					AM	FO	60															177.60 - 183.91 m: Black amygdaloidal volcaniclastic with calcite filling. The irregularly shaped vesicles are up to 1.5 cm in diameter averages 0.4 cm in diameter. Calcite veins cut at ~ 80 deg to CA with irregular undulating contacts. There is a faint structural orientation (stretching of the amygdales) which occurs at 60 deg to CA.
						VN	80															

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						183.91 - 187.15 m: Dark green - black fine grained volcaniclastic with 0.4 cm Ca veins cutting at 10, 40 and 80 deg to CA. Overall the interval is moderately calcareous. Some of the flood style Ca veinlets have a green tint to them (chlorite? - moderately soft as it easily scratches with a knife).
				ALT	CR	CN	50			ms												187.15-190.11 m: Dark slightly purplish brown volcaniclastic with calcite filled amygdales. From 188.09 m onwards the unit becomes progressively more sericite altered with an overprinting crackle texture. The lower contact occurs at 50 deg to CA.
190.11	200.26	10.15	MBL												w		w					190.11-200.26 m: Very light grey recrystallized looking marble. Does not fizz as much as expected (weak-fair). Very thin veinlets <1 mm cut at 40 deg to CA and contain fine grained Py +/- Po. Small (0.3 cm patches of Po also occurs in a few areas.
						VN	55															197.39 - 197.42 m: Po and Py vein occur at 55 deg to CA. (This part of the hole, and the volcaniclastic reminds me of Rau-09-54 except for the lack of mineralization).
200.26	306.40	106.14	LST		BX																	Light and medium grey fluid collapse brecciated limestone with a slightly recrystallized looking overprinting texture in parts. There appears to be a flaky white talc-like over print to the unit in zone (although it is not talc because it is not extremely soft). The unit fizzes only weakly with zones of stronger reaction to HCL.
						BD	65															207.60 - 212.72 m: Banded limestone with thin (1 mm) stylolites occurring between the bands at 65 deg to CA. Later Ca flood/veins cut this unit at 60 deg to CA.
						VN	60															
						VN	80															214.45-214.47 and 214.93 - 215.00 m: Two Py talc veins at 80 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						224.16-224.35 m: Rubbly altered zone. Fractured surfaces are rarely graphitic.
																				sp	t	224.35-245.30 m: Fractured surfaces sometimes are graphitic. Quartz now occurs with the Ca infill in some of the breccia. Associated with the Qz+/- Ca are fine fibrous black crystals seen in some of the other holes. Trace red sphalerite occurs in some of the fracture fills.
					BX	VN	40															245.30-276.52 m: Dark grey, generally freshly brecciated (mosaic) by white calcite. Clasts are angular. Throughout beneath this breccia and on the top 2.5 m of the interval there is a zone of gritty fine breccia with small angular black limestone clasts with a medium grey gritty looking matrix. Rare Qz+/- Ca veins cut at 40 deg to CA.
																						271.00 m: Begin to see coral mound fragments in the limestone. Trace overall.
						BD	60								t							276.52-289.53 m: Medium grey almost massive limestone with thin 2-5 mm calcite rich white to light grey Ca bands at 60 deg to CA. Rare very dark grey-black shaley horizons occur. Trace pyrite is generally associated with Ca bands.
																						285.15 m: Begin to get coral mound fragments.
																						288.34-289.53 m: Extremely rubbly zone with a 10 cm interval of sandy calcite rubble. This zone seems particularly graphitic.
															t							289.53-294.38 m: Very dark grey to black shaley limestone with graphitic fractures. Quite massive with weak banding at 50 deg to CA. Trace patches (2-5 mm in diameter) of disseminated pyrite.
						BD	70								w							294.38-304.40 m: Medium grey limestone with bands defined by thin <1-2 mm dark grey horizons running at 70 deg to CA. Irregular Ca veins cut at 5, 30, 60 deg to CA. Pyrite is weakly disseminated in small patches which seem particularly associated with the calcite.
						VN	5															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

						VN	30															
						VN	60															
306.40	312.07	5.67	VOL	ALT	FO	FO	50			ms										Fu	w	Light green/grey strongly foliated (almost mylonitic) moderate-strongly sericite altered volcaniclastic with specks of emerald green fuchsite weakly scattered throughout. FO runs at 50 deg to CA. Ca veins cut at 50 deg to CA and at 20 deg to the FO. Py and Po occurs as fine grained disseminations concentrated within Ca rich bands. Upper and lower contacts are gradual.
						VN	50	20														
312.07	317.40	5.33	SHL												f	w						Black non-calcareous shale. The foliation runs at 45 deg to CA. The shale is compositionally quite massive with no sign of bedding. Pyrite patches form wispy bands parallel to the foliation seem to be associated with thin calcite stringers in the unit. Pyrrhotite occurs in the same form as pyrite but the two do not seem to occur together.
317.40	341.40	24.00	DOL		MX	BD	60								30					Sp	t	White to light grey medium to coarse grained dolomite with 1-3% medium to coarse grained quartz. Rare bands of black shale occur within (1-3 %). Semi-massive to massive disseminated pyrite is the most distinctive part of this unit. The pyrite has a pyritohedral (?) crystal shape - like a rounded pentagon giving it a rounded cross section. This is particularly well observed is a small depression at 340 m with a few very well developed crystals growing within it. Rare dolomite/quartz bands occur at 60 deg to CA. Trace fine grained red sphalerite occurs in thin Ca veinlets.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	35															341.40-360.95 m: Medium to dark grey limestone with a weak fluid collapse brecciated texture. Fine to medium grained pyrite occurs disseminated throughout. Weak amounts of quartz occurs within the limestone.
341.40	368.07	26.67	LST												m							344.63 m: There is a 1.5 cm pale orange mass. Does not fizz with acid either fresh or when scratched. As well, it does not lamp under the UV light. It appears to contain reddish subhedral crystals 1-2 mm in diameter - sphalerite???
																						360.95-368.07 m: Begin to get a fine breccia. The clasts are very dark grey to black in colour, angular, to subangular, generally less than 1.0 cm in size and supported by a medium grey gritty looking limestone matrix. Pyrite occurs as fine to medium grained disseminated and small patches throughout.
																						363.70-364.24 m: Dark grey-black shale with fine grained disseminated pyrite throughout. Pre-mineralization Ca veins occur at 30 deg to CA.
368.07	423.85	55.78	LST		CR	BD	30															Medium grey moderately dolomitized limestone with a moderate crackle overprint. Faint banding occurs at 30 deg to CA.
						VN	30	0														
.																						371.65-372.83 m: Within the limestone there are vuggy veins at 30 deg to CA with coarse grained dolomite crystals that have a pink/purple alteration colouration - hematite or rhodochrosite??? Patchy pyrite occurs disseminated throughout but only trace overall.
																						375.51-379.80 m: The core becomes quite fractured up. The fractured surfaces often have a dark red-brown coating on them.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

																						348.35-406.89 m: The limestone becomes brecciated by light grey dolomite flood. Clasts are sub-angular to sub-rounded. Still get some of the medium grey breccia with black shale clasts. Rare quartz veins occur, 1-3 cm thick and cut at 25 and 60 deg to CA. Trace pyrite occurs associated with the dolomite.
																						401.15 m: Quartz +/- minor Ca veins occur cutting the limestone at 20 and 50 deg to CA. The Ca in these veins is occasionally stained a light yellow-orange colour.
																						At 405.05 m, there is a strongly oxidized vein 2 cm thick with a 2 mm calcite min running at 30 deg to CA.
																						Other Qz+/-Ca veins in the interval contain red-orange hematite within.
						FR	15								w		t	Sp	t			406.89-413.10 m: Slight increase in the concentration of pyrite to weak. Late tension cracks running at 15 deg to CA occur in parallel and roughly evenly spaced locations. These contain weak medium grained sphalerite crystals (a photo have been taken). Trace pyrrhotite also occurs throughout this interval. Small intervals (5-15 cm) of non-brecciated dolomitized limestone have a bedding angle of 60 deg to CA.
						BD	60															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	30								t		t					413.10-423.85 m: This interval contains zones of more well worked breccias. The clasts are light grey, and the matrix is medium to dark grey. The clasts are subrounded to rounded and appear to be later structurally deformed slightly to the angle of 30 deg to CA. Overprinting the other limestone is a strong crackle texture. Post crackle de-calcified calcite veins (don't fizz with HCl but are soft and milky in colour) occur at 40 deg to CA and are 0.25-0.75 cm thick. Overall trace pyrite and pyrrhotite occur disseminated as small patches. The pyrite seems most commonly concentrated from 423.45-423.85 m (moderately concentrated in this zone.)
						VN	40															
423.85	464.78	40.93	LEP	ALT		FO	30			w					t		t					Spotted slightly brownish grey and white strongly calcareous leopard spotted volcaniclastic. The unit has a weak foliation at 30 deg to CA, and contains wispy patches of sericite that are concordant to the FO - weak overall. Cannot identify biotite on the broken surfaces of the core, but the slight brownish colour indicates that it might occur within. Trace fine grained pyrite and pyrrhotite occur scattered throughout. Ca bands also occur concordant to the FO and are on average 1 cm thick. The upper contact occurs at 20 deg to CA but is not clearly defined. The lower contact is bound by a 12 cm Qz-Ca vein that occurs at 30 deg to CA.
						CN	20															
						CN	30															
						FO	50															441 m: The foliation changes to 50 deg to CA.
													Chl	w								447 m: The unit begins to be more irregular. The spotted texture more commonly becomes disrupted and weakly deformed. Chlorite begins to occur weakly throughout. 1-5 cm Qz +/- Ca veins occur concordant to the foliation at 50 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						456.40 m: banding becomes more pronounced at 50 deg to CA. With a weak fine tension crackle texture filled by Ca.
																						This area may represent more 'pure' leopard unit before it became reworked to give it the characteristic spotty texture.
																						459 m. The unit gradually becomes slightly bleached and becomes a lighteish medium grey colour.
																						Pyrite also increases in concentration in the last 25 cm (to fair).
464.78	470.61	5.83	SHL			FO	35								f							Black graphitic shale with pyrite disseminated and in small patches throughout. Overall the unit is quite massive with slight foliation recognisable by the alignment of faint pyrite bands at 35 deg to CA. The pyrite is very fine grained overall.
																						Grey dolomite +/- pale bubble gum pink dolomite (fizzes weakly when scratched) +/- Qz patches and vein cut the unit (10% overall).
																						465.07-470.61 m: patchy honey sphalerite and red sphalerite occur with bismuthanite. 15% honey, 5% red, 5% bismuthanite over the interval.
																						470.61 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-09-62

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	6.10	6.10	OVB																			Overburden-mostly small fragments of grey limestone. Around 4.50 m, several 3 cm pieces of light greyish green volcaniclastic.
6.10	24.40	18.30	OX	CLY																		Brown oxide, generally very soft, crumbly to soupy. One small region of dolomite at 21 m. Oxide is quite uniform with no Qz fragments. (COLOUR: 7.5YR 4/4 - brown)
																						6.10-13.72 m: Crumbly brown oxide, slightly reddish-brown on weathered surfaces, usually slightly gritty with some clay. Occasional up to 2 cm more competent, slightly limonitic fragments.
																						13.72-14.80 m Extremely soft, yellowy-brown soupy clay with some fine grit.
																						16.50-16.76 m: A few dolomite fragments, coarse grained, white, and unmineralized.
																						16.76-20.72 m: Soupy brown clay, very soft, sometimes slightly gritty.
																						20.72-21.40 m: Coarse, brecciated dirty limestone, slightly vuggy and pitted with oxide. Light grey/tan.
																						21.40-24.38m Standard crumbly brown oxide.
24.40	32.00	7.60	LST	ALT		FO	50		w						t							Weakly foliated, carbonate altered, dirty limestone with trace crinoid stem fragments and occasional thin black (graphite?) stringers. Trace rusty weathered Py grains. Weak dolomitization.
						FR	15															27.30-32.00 m: Orangey-tan moderately dolomitized, limestone with no original bedding but prominent at 15 deg to CA. The fractures occur every 1-5 cm (healed, surrounded by rusty alteration).

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Other		Pyrite	Arsenopyrite	Pyrrhotite	Other		Other		
													Type	Intensity				Type	Intensity	Type	Intensity	
32.00	40.15	8.15	OX	RBL																		Oxide, slightly more competent, but still very rubbly and clay rich. Bottom contact is a roughly 40.15 m but with poor recovery after 39.62 m it is difficult to tell. The oxide is medium brown (COLOUR: 10YR 4/6 - dark yellowish brown) on outside smeared surface and a slightly darker brown (COLOUR: 10YR 3/4 - dark yellowish brown) on fresh surfaces.
																						38.10-38.75 m: Fine, lighter brown, plasticy oxide clay.
																						38.75-40.15 m: Darker red-brown to almost black crumbly oxide with some, up to 5 cm, competent limonitic fragments.
40.15	54.86	14.71	MBL			FO	40			w					t							Slightly altered dirty marble, orangey brown on fracture surfaces, with a weak foliation defined by yellow to grey sericite or carbonate stringers.
										t					w							44.50-46.70 m: Strange, vuggy stringer patterns in the marble. Increased Py blebs, and possible sericite stringers. Vugs are present where some of the stringers have weathered away. White marble continues, occasionally with weak foliation at 50 deg to Ca until the end of hole.
						FO	50															46.70-54.86 m: White marble continues, occasionally with weak foliation at 50 deg to Ca until the end of hole.
																						54.86 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.86	3.86	OVB																			
3.86	5.00	1.14	DOL	ALT								f										Fairly altered poorly recovered brecciated rubbly medium grained light to medium grey dolomite.
5.00	7.01	2.01	OX	CLY																		Medium orange brown sandy gritty oxide clay. Recovery is not great. (COLOUR - 7.5YR 4/4 - brown).
7.01	11.58	4.57	OX	RBL																		A mixture of weakly to strongly altered dolomite fragments and rubbly gritty oxide clay. The oxide is medium to dark orange brown with strong concentration of limonitic and sideritic fragments. 30% dolomite, 70% oxide. (COLOUR 7.5 YR 3/3 - dark brown).
11.58	14.63	3.05	OX	RBL																		Variably coloured oxide zone with colours ranging from dark brown to milk chocolate brown to reddish brown sideritic fragments. The milk chocolate brown material is soupy clay. The siderite is angular rubble and sandy gritty grey-brown rubble. At the top of the interval there is a fragment with bright yellow-orange-brown oxide coating. (COLOURS: 7.5 YR 4/3 - brown; 7.5YR 2.5/2 - very dark brown; 7.5YR 4/4 - brown).
14.63	21.79	7.16	LST	ALT	BX	VN	10								w	n						Medium grey moderate-strongly dolomitized limestone with a moderate to weak crackle brecciation texture. A 1.5 cm thick pinkish dolomite vein runs at 10 deg to CA. Weak, strongly oxidized fine to medium grained pyrite occurs scattered throughout. No visible arsenopyrite occurs.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
21.79	26.82	5.03	DOL		CR	FR	40								f	t						Medium grained fairly altered dolomite with fair fine grained disseminated pyrite and trace fine grained arsenopyrite. A weak to fair crackle texture overprints the dolomite and might act as a conduit for pyrite bearing fluids as they appear to be most concentrated around them. Common healed fracture orientation is 40 deg to CA.
																						25.53-25.86 m: vuggy dark brown siderite fragment.
26.82	35.97	9.15	LST	ALT	BX				m						t							Medium grey moderately dolomitized fluid collapse brecciated limestone with an overprinting crackle breccia texture in parts. Overall the unit is moderately fractured up. Trace fine grained disseminated pyrite.
					CR																	32.92-35.97 m: The limestone becomes moderately oxidized and strongly fractured and rubbly. Small zones up to 7 cm thick of oxidized rubble occur.
35.97	45.94	9.97	OX	RBL											f							Medium to dark orange brown and dark red brown black sideritic and oxide rubble with fragments of moderately to strongly oxidized cream dolomite with fairly disseminated fine grained pyrite. These zones are becoming pitted with the degradation of the sulphides. Overall the dolomite is 15% and the oxide is 85%. (COLOURS: 7.5YR 4/4 - brown; 7.5YE 3/3 - dark brown; 7.5YR 2.5/1 - black).
45.94	49.68	3.74	LST	ALT	BX	CR			w						t							Weakly dolomitized medium grey fluid brecciated limestone with an overprinted crackle texture. Fractured surfaces have a dark orange-brown alteration stain on them. Trace fine grained widely disseminated pyrite.
															f	t						48.16-49.68 m: Intensely oxidized dolomite. Medium to dark orange-brown in colour. Contains a large clot of arsenopyrite as well as oxidized spots of pyrite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

																						Moderately to strongly altered orange-yellow to creamy-yellow to tan-brown extremely rubbly volcaniclastic.
49.68	54.25	4.57	OX	ALT									SID	ms								Dark red-brown sideritic oxide. Relatively competent with rubbly zones. (COLOUR: 5YR 2.5/2 - dark reddish brown).
54.25	55.78	1.53	DOL	OX																		More competent, dirty white fine grained dolomite (fine-grained). Variably oxidized with some brownish oxidized rubbly regions.
55.78	66.45	10.67	OX																			Crumbly oxide, ranging from lighter brown on smeared surfaces to quite dark reddish-brown/black limonite. Usually slightly competent, broken into 0.5-3 cm fragments (COLOUR: 5YR 3/2 - dark reddish brown).
																						55.78-56.50 m: More competent, harder, with dark purplish black limonite throughout, core also looks semi-metallic in places.
																						63.45-63.55 m: Light brown, gritty, sandy region with some quartz sand grains.
66.45	72.54	6.09	MBL			FO	55															Dirty white marble, contact very abrupt. A few < 20 cm intervals of oxide crumble/gouge, generally located at interval blocks so they may have fallen in from above? Marble has brownish, with a slight oxidized coating on some fractures.
																						72.54 m: E.O.H.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-09-64

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	5.60	5.60	OVB																			Limestone fragments (overburden)
5.60	66.69	61.09	LST		BX																	Slightly crackled to heavily brecciated dark to medium grey fairly dolomitized limestone. 5-20% Ca flood. Interbedded regions of slightly yellowish-tan alteration occur along with some rusty alteration on fractures. The increased alteration is generally associated with increased Ca flood.
						FO	50															10 m: Banded brecciated limestone. Ca/limestone bands with some 'mystery mineral' dark black shiny stubby lath like.
						FO	40															
																						20.00-23.00 m: Bleached slightly orangey tan colour, increased Qz/Carbonate flood (up to 20%) containing small muscovite flakes.
															t							39-50.50 m: Another orangey-tan bleached zone with some Py and rusty mineralization, with prominent, crosscutting, 0.3-2 cm ca/doll veinlets.
						FO	60															41 m: Foliation occurs 60 deg to CA. Thin veinlets cut at 40 deg to CA and at 180 deg to the foliation.
						VN	40	180														43.85 m: Massive vein of pyrite, 3cm thick is quite broken up and tarnished black in zones.
															w							47.75-50.50 m: Especially bleached zone with increased concentration of Py, generally confined to veinlets but also occurs as isolated blebs. An orangey oxidation stain coats the limestone in the vicinity of the pyrite rich zones. Ca veinlets crosscut at several angles, and flood into the limestone as well as flooding it causing brecciation.
						BD	60															50.50 m: The limestone is now a lighter grey colour with thin dark grey stylolites defining banding at 60 deg to CA.
																						52.75 m: One patch of soft, dark green, flaky chlorite/talc? alteration.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	60								t							54-66.36 m: the brecciation and calcite flood becomes less dominant, and is replaced by foliated grey limestone. Minor Ca veinlets still occur along with the addition of crackle brecciation and camo-mottled regions. Trace Py blebs and minor muscovite flakes occurs in some regions. The mystery black elongate needle/lath mineral occurs in weak concentration. Calcite veinlets cut at 25 and 50 deg to Ca. Some chlorite alteration occurs around these areas.
						VN	25															
						VN	50															
																						64.30-66.36 m: Increased brecciation and calcite flood.
66.69	68.60	1.91	DOL	ALT	VN	FO	40						SID	m								Siderite altered dolomite vein. It is quite vuggy with open space filling textures. The dolomite is a mixture of 50% white to yellow dolomite crystals and 50% medium to dark brown siderite. The one s very vuggy, with one cavity that is 3 cm deep. Some banding occurs at 40-45 deg to CA. The bottom contact is at 65 deg, which seems to match the foliation of the underlying limestone. Within the vein, some veinlets cut at opposing angles, particularly later white ca veinlets. Coliform patterns also occur within.
						CN	65															
68.60	107.50	38.90	LST		BX	FO	60								t							Grey, variable brecciated limestone which is at times moderately foliated at 60 deg to CA, ranging between 40-60 deg. 10-15% Qz/Ca flood occurs, and it is often associated w/ the mystery black lath mineral. Trace coarse grained Py occurs in veins. Weak yellow staining occurs on fractures.
						FO	60															
																						77 m: Black stylolites occur at 60 deg to CA.
																						84 m: 3 cm Diameter coral mound fragments occur within.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						97.54-99.14 m: Strong brecciation and Ca flood. After this point, brecciation and flood start to disappear towards lower contact.
																						91-92 m: a few small <1cm crinoid fragments occur within.
107.50	113.40	5.90	LST		FO	FO	60								w		t					Transition zone of banded and or marbleised limestone, alternating with layers of coarse grained calcite crystals and finer grey (silty?) laminations. Minor slightly pinkish layers occur. Py and Po occur as foliaform stringers and blebs, and some disseminated clumps. This interval is quite well-foliated throughout.
																						110.20-111.55 m: More coarse-grained, calcite rich regions
113.40	115.93	2.53	MBL		FO	FO	50			f					t							Light grey marble, mainly massive in texture with wispy, foliaform and slightly stylolitic stringers of beige/light brown sericite +/- Py.
115.93	129.51	13.58	VOL	ALT		FO	50						Cl	w	t		t					Uniform, medium to dark greyish-green foliated volcaniclastic with 5-10% Ca flood veinlets often at random orientations but mainly following the foliation. Minor associated chlorite alteration. Very small, elongate Ca blebs scattered throughout. Trace Py, Po and Mag. Moderately magnetic throughout. Foliation varies between 40 and 60 deg to CA. Several prominent Ca veinlets3-5 cm thick occur and have a weak pinkish tinge.
																						128-129 m: Start seeing a tan-yellowish tinge, and more deformation. The calcite veinlets occur more commonly in a crackled style.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
129.51	137.31	7.80	VOL		CON	FO	50								t			Mag	m			Magnetite volcaniclastic conglomerate (with some interbedded VOL). Vol clasts up to 10 cm in diameter, rounded, and somewhat deformed, with a magnetite-rich matrix and some magnetite clasts. Entire package has been subject to deformation, with elongation of clasts, and foliation at roughly 50 deg to CA. The clasts are generally light tan-beige with darker greyish-green matrix. Some clasts have slight pinkish tinge. The interval is strongly magnetic throughout. Towards bottom of interval, some more vague grain boundaries and patchwork texture occur. After 136 m, the distinct clasts no longer occur and there is a slow transition into foliated, deformed, patchy, less magnetic volcaniclastic unit.
						VN	25	55														136.50 m: A calcite with minor chlorite and trace hematite vein that is 1 cm thin and irregular in form cross cuts the foliation at 25 deg to CA.
137.31	156.95	19.64	VOL																			Back to greyish-green, foliated volcaniclastic with stretched calcite amygdules.
						FO	60															140.15-140.70 m: Interval of white calcite matrix with 50% clasts of feathery, lath like clusters of a dark green mineral (actinolite?). This continues until 143 m when it gradually fades out. It is sometimes associated with a fairly bright red mineral/alteration on calcite veinlets and associated chlorite (?) alteration. Within this interval the volcaniclastic has returned to its dark greyish green form with 5% calcite veinlets and a fair concentration of small amygdules. Towards last metre, colour starts to change to light greyish green

GEOLOGY LOG

													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
156.95	161.95	5.00	VOL	ALT		FO	60								w							Light greyish-green and greyish-pink altered volcaniclastic, well foliated and almost sheared looking with increased heavily disseminated Py patches. Sericite stringers occur throughout along foliations at 60 deg to CA. Trace bright green fuchsite spots occur. Towards 161.95 m, the foliation lowers to 40 deg to CA.
161.95	172.72	10.77	VOL			FO	60								f							Mixture of volcanic layers and Qz/DOL flood +/- Py, sericite, muscovite, chlorite, and limestone. These minerals occur sporadically with unclear relationships. Qz veins containing pyrite occur and seem to parallel the foliation at 50-65 deg to CA. Pyrite occurs as heavy disseminations and stringers on margins of Qz Dol veins/flood (+/- muscovite) as well as more coarse disseminations throughout volcaniclastic layers.
																						161.95-168.95m Interbedded VOL with Qz/Carb veins that parallel the foliation.
															m							168.95-171.79 m: Light grey, fairly massive, slightly fizzy, bleached limestone. Some crosscutting calcite veinlets occur with associated talc. Fine grained disseminated pyrite occurs throughout the interval in moderate concentration.
															ms							171.79-172.72 m: Dark grey to black, calcite rich calcareous silty limestone (?) with blebs and elongate patches of Py. The lower contact is sharp at 60 deg to CA.
172.72	179.54	6.82	QV			FO	60								ms							Vein(?) zone of dolomite and quartz, with significant brecciation and pyrite mineralization. Pyrite occurs as coarse blebs and finer patches, as well as semi-massive regions.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

																						172.72-175.43 m: Primarily dolomite, some rhodochrosite? (pink/red tinged) and minor orange alteration on fractures. The unit is still slightly foliated at ~ 60 deg to CA. Minor crackle brecciation occur with pyrite in the matrix. Several small (<5cm) semi-massive patches of Py occur.
															ms							175.43-176.60 m: Quartz, with large sporadic patches of Py, Ca and muscovite. Weak chlorite alteration occurs on the contacts between the pyrite and the quartz.
															s							176.60-177.92 m: Medium grained dolomite zone with minor red alteration and strong patchy pyrite replacement. The pyrite becomes nearly massive in a few places.
															s							177.92-179.54 m: Quartz vein breccia zone. Pure white quartz appears to be variably crackle brecciated with soft brown, non-calcareous matrix. Strong pyrite mineralization, seemingly unrelated to brecciation. Patches of pyrite up to 5 cm in diameter occur scattered throughout core, in both matrix and clasts.
																						178.30-178.50 m: Fractured zone of quartz fragments (<2cm) with minor yellow staining. The bottom contact is irregular but runs semi-parallel to the limestone.
179.54	185.44	5.90	LST			FO	60								f							Relatively unaltered, foliated grey limestone, with 15-20% irregular quartz carbonate flood in thick vein sections up to 10 cm wide, with irregular lightly to heavily disseminated pyrite throughout.
																						182.88-184.40 m: Especially Qz/DOL flooded zone, with yellow/white flaky muscovite crystals concentrated along contact.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
185.44	194.25	8.81	LST												25							Mixture of brecciated, altered LST (60%), Qz (15%), and Py (25%). Variable Py mineralization, from weak disseminations/stringers in LST, to pure Qz, to semi-massive and massive sections of medium-grained pyrite. Interval ends w/15cm of 60deg brownish grey, banded LST(?)
194.25	211.80	17.55	PY			VN	25								95					Sp	t	Massive pyrite, at least 95%. Up to 199 m, there is 5% white quartz, but this disappears after this, leaving only 1% Ca and a few small patches of what looks like black, foliated siltstone(?) to break up the massive pyrite. Also trace red sphalerite, concentrated along rare thin crosscutting calcite veinlets.
						FO	55								98			Sp	w			199 m: 98% Py, with medium to coarse grains, a few small patches of quartz, and black sphalerite as blebs between pyrite grains and associated with small calcite veinlets. Up to 1 cm in size. The bottom contact transitions into foliated/banded Py at 55 deg to the CA.
211.80	216.41	4.61	VOL												s							Foliated, pyrite rich, very fine-grained, slightly greasy, light to medium grey volcaniclastic? Only slightly calcareous. Pyrite is present throughout as coarse bands at the top, and large patches and foliaform disseminations throughout.
																						215.15-216.41 m: Soft, clay gouge zone of what appears to be the above rock type. Brecciation has cut through at 20 deg, with unaltered rock on one side and brecciated clay gouge on other (+Py grains).
216.41	219.25	2.84	LST	ALT											f							Unusual unit of pinkish grey, gritty LST? Quite calcareous, with strong chlorite alteration on all fractures. Crumbly bluish green on fractures. Unit is quite fractured, foliated, and crackled, with pyrite disseminated throughout.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
219.25	227.36	8.11	DOL												ms							A mixture of crystalline dolomite and strongly dolomitized limestone. It is strongly crackled, with 10% Py as foliaform concentrations and coarse disseminations throughout. Overall texture defined by coarse dolomite grains (usually 0.5 cm in diameter), with distinct grain boundaries. A few small regions/beds of black silt/shale occur, especially from 219.80-220.20 m where the foliation is 30 deg. There is no distinct foliation within the dolomite.
227.36	258.48	31.12	LST	ALT	BX	FO	50		m						w			Sp	t			After 227.36 m, the unit becomes more of a variably dolomitized limestone, with foliation present at 50 deg to the CA. 10-20% Ca/DOL vein flood occurs giving strong patterns of brecciation banding. Trace Sp (red) in late calcite veinlets.
															f							234-235 m: Stronger disseminations of Py.
															w			Sp	t			242.10-243.10 m: Strongly brecciated zone cuts across core at 20 deg. The clasts are generally less than 0.5 cm.
															w			Sp	t			243.10-247.40m Very broken up (1-4cm chunks). Fault or breccia zone?)
																		Sp	t			247.40-249.70 m: Competent gritty limestone? With trace Sp and some yellowish-green alteration on fractures.
															w	t		Sp	t			249.70-252.40 m: Start seeing As as small clumps and dissemination zones. Some lighter grey, irregular sericite? Stringers as well. Up to 3 mm coarse deep red sphalerite along fractures at 20-35 deg to CA.
						FO	50								w			Sp	t			From 252.40 m, the limestone is less dolomitized/brecciated, and more foliated at 50 deg to CA. Mineralization drops off to trace Py/Sp, with no Asp. Sp occurs as blebs in thin, foliaform Ca veinlets.
															t							254.35-255.55 m: Crumbly zone with no real fragments >0.5cm.
															w							255.55-258.48 m: Slightly more vuggy, with increased disseminated Py.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
258.48	297.38	38.90	VOL												w					Sp	t	Fine-grained, pale grey to pinkish grey, greenish-grey, and dark grey well foliated, pyritic volcaniclastic (or siltstone?). The unit is weakly to non-calcareous, with a low angle foliations ranging between 15-40 deg to CA.. Trace fine grained red sphalerite occurs on fractures.
						FO	40															259 m: FO is at 40 deg to CA.
						FO	20															261-281 m: FO is at 20 deg to CA.
						FO	15															282 m: FO is at 15 deg to CA.
						FO	30															283 m: FO is at 30 deg to CA.
																						269-270 m: Darker grey interval that looks more likes slightly more like dolomitized limestone but has the same general characteristics as above.
																						280.37-281.31 m: Chlorite altered, darker green interval.
																						289.56-292.61 m: Increased patchy maroon alteration section with minor weak chlorite alteration. Ca sweats and thin veinlets are common.
															w					Sp	w	292.71-297.38 m: Increased Sp content, generally associated with blebs and stringer veinlets of Ca. Pyrite occurs in thin disseminations.
						FO	45															296.55 m: Foliation occurs at 45 deg to CA. Prominent oblique 2-4 cm thick veinlet, at 20 deg to CA and 90 deg to the foliation.
																				Sp	w	Dominantly calcite, white and grey, with a central region of light blue, translucent, slightly tabular mineral. Appears to fizz, and may be blue calcite?. Contact between this and outer grey Ca has sphalerite beads along it. Sphalerite present throughout.
						FO	20															290 m: FO is at 20 deg to CA.
						FO	30															291 m: FO is at 30 deg to CA.
						FO	40															296 m: FO is at 40 deg to CA.
297.38	298.15	0.77	LST	MX	FO										30							Intensely mineralized disseminated pyrite zone within dark grey limestone. The contact with the upper unit is at 40 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
298.15	322.10	23.95	LST		BX										t					Sp	t	Strongly crackle brecciated light to medium grey limestone with lighter grey clasts and thin black/grey crackle lines. There is no obvious foliation. The interval is quite fractured to rubbly. Trace Sp occurs on a couple fractures, with only trace disseminated pyrite.
					CR																	308.50 m: Some weak green Cl alteration associated near the pyrite.
																						305.65-306.10 m, and 307.85-308.75 m: Fragment/rubble zones. Some darker grey regions nearby.
						VN)	50								t					Sp	t	316.49-319.49 m: More competent bleached brown interval with foliaform stringers and veinlets of pyrite. Trace red sphalerite occurs.
322.10	323.09	0.99	VOL			FO	70															Foliated, light to medium grey volcaniclastic horizon. With trace Sp/Py.
																						319-321 m: Minor graphitic fractures, some that show movement.
																						309-310 m: Darker grey area that was weakly silicified.
323.09	441.96	118.87	LST		CR										t					Sp	t	Same light grey crackle brecciated limestone with dark grey crackles. Overall the interval is not very calcareous, and is variably fractured and brecciated with trace Py/Sp (on fractured and associated with veinlets). The unit is quite uniform over tens of metres.
															50							350.55-351.20 m: Suddenly get semi-massive pyrite mineralized section with 50% Py (and trace Sp) occurring as fine to medium-grained disseminations and semi-massive patches. Mineralization starts and drops off abruptly.
						VN	15															352 m: Calcite veinlets at 15 deg to CA with some cross cutting at 30 deg to CA.
						VN	30															After 354 m, the unit becomes more competent and less fractured.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	45								15							357.56-357.90 m: Dolomite vein crosscuts core at 45 deg to CA. The vein itself has only minor Py, but a 10 cm zone of around 50 % disseminated Py exists on upper contact, with minor Py stringers on the lower contact.
															w		t					357.90-363 m: Start seeing very trace Po as small blebs and a few other patchy local Py zones throughout.
																						363-364 m: More brecciated (smaller clasts) with prominent dark grey colour, with a few spots of local chlorite alteration.
						FO	30															365 m: Weak foliation at 30 deg to CA.
															s							369.80-370.45 m: Slightly increased dolomite flood, with associated increase in pyritization in heavily disseminated bands.
																						372-376 m: Some clast and small bands of dark grey/black siltstone with graphitic fractures in these areas. Whole region very brecciated and deformed.
						VN	90								s							386.60-387.50m Slight increase in Py mineralization, but the rock otherwise same, except for one 1-2 cm wide, soft, greenish-white talc veinlet at 90 deg to CA.
															t					Sp	t	391-392 m: Weakly foliated with thin black stylolites. By this point, only trace Py and very rare, almost non existent sphalerite.
						VN	45															392-413 m: Common crosscutting Ca veins <1cm thick, every 0.3-1 m. Graphitic fractures are somewhat common, especially in more crackled areas.
															f							413.00-413.50 m: Slightly increased Py in conjunction with increased black siltstone clasts/stringers.
						FO	50													Sp	t	413.50 m: occasional trace Sp in low angle, often irregular fractures Weak foliation occurs at 50 deg to CA.
						VN	45															417-419 m: Very low (<5%) fracture irregularly cuts core axis. Blebs of Sp along it. Ca veinlets every 2-3 cm cut at 45 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.09	3.09	OVB																			
3.09	16.15	13.06	LST		BX																	Medium grey limestone with fluid collapse brecciated texture created by medium grained dolomite. The interval is moderately rubbly with some orange brown coatings on the fractures.
16.15	22.63	6.48	LST	ALT									SID	ms								Mixture of orange-red-brown oxide with rubble and silvery-yellow mica flakes and strongly altered limestone.
																						16.15-17.68 m: Poorly recovered medium brown calcareous soupy clay.
																						17.68-19.41 m: Medium to dark orange-red-brown sideritic rubble.
																						19.41-22.63 m: Very strongly altered limestone (fizzes slightly with HCL). Dark grey-green-brown in colour with very faint patchy texture for the top 30 cm. Fractured surfaces have a bright orange-brown oxide stain on them.
22.63	53.71	31.08	LST	ALT	BX				f													Medium grey weakly to strongly brecciated fairly dolomitized limestone with rubbly zones and zones with hematite alteration on fractures.
									m													22.63-24.60 m: Medium grey dolomitized limestone brecciated by medium grey dolomite veins. Fractures have an orange-red-brown alteration on them.
																						23.10-23.40 m: Strongly oxidized red-orange-brown altered rubbly zone with yellow mica flakes within.
																						24.60-25.48 m: The first half is a medium taupe-brown gritty calcareous clay zone. The second half is a rubbly strongly hematite altered limestone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									w													25.48-36.18 m: Medium grey moderately blocky and rubbly moderately brecciated weakly dolomitized limestone with patches of fair hematite alteration and a siderite fragment 4 cm long at 32.32 m. Trace pyrite occurs as fine grained disseminations. Much of the breccia (30% of the interval overall) has angular to subangular clasts.
																						36.18-53.71 m: Increase in the concentration of fine grained disseminated pyrite as well as an increase in the intensity of the brecciation.
53.71	74.07	20.36	LST	ALT																		Weakly to strongly altered limestone with zones of coarse grained dolomite. The dolomite zones seem more consistently altered to a light orange tint.
																						53.71-54.58 m: Moderately altered limestone with bright orange coating on fractured surfaces.
																						54.58-56.85 m: Extremely altered limestone fizzes strongly with HCL. The unit is dark brown-grey in colour and slightly softer than a finger nail. There is a weakly hematite colouration to some of the pieces.
															t							56.85-61.51 m: Moderately altered creamy dolomite with patches of grey dolomite. Trace small patches of pyrite.
						FR	30								w	t						61.51-74.07 m: Mainly grey dolomitized limestone with zones that have weak peachy-orange alteration tint. Pyrite occurs weakly throughout the unit as weak very fine grained disseminations throughout and as patches up to 1 cm in diameter. Trace arsenopyrite occurs as fine to medium grained subhedral crystals. A fracture set runs through the interval at 30 deg to CA, associated with which the alteration seems most pronounced. At 66.45 m the concentration of quartz patches up to 4 cm in diameter increases. At 68.30 m the core starts to become quite fractured up and rubbly.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
74.07	75.59	1.52	VOL	ALT																		Light yellowish-greenish-grey strongly altered fissile volcaniclastic, almost turned completely to clay.
75.59	98.13	22.54	OX	RBL																		75.59-83.21 m: Reddish orange-brown crumbly gritty oxide clay. In zones it has a two tone colouration with dark brown crumbly spots within the orange-red-brown clay. Scattered throughout there are weakly concentrated small yellow-silver mica flakes.
																						83.21-89.31 m: Bright orange very uniform packed clay with pockets concentrated in yellowy silver mica flakes. This material is interzoned with medium to dark brown gritty rubbly oxide fragments. (COLOUR 10YR 6/8 - brownish-yellow and COLOUR 7.5 YR 3/3 - dark brown).
			VOL			FO	30															At 87.78 m the altered volcaniclastic is quite intact with a FO at 60 deg to CA. OVERALL: 65% ALT VOL, 35% OX
																						89.31-95.40 m: Medium to dark orange-red-brown oxide and very dark brown oxide mixed with a zone of moderately altered mineralization medium grained dolomite. This dolomite zone exists from 92.35-93.23 m. It contains 1-3% medium to coarse grained euhedral (cubic) pyrite crystals. The remainder of the interval is quite rubbly.
																						95.40-98.13 m: Very dark red-brown sideritic oxide. The zone is very incompetent crumbling very easily when a small amount of pressure is exerted. (COLOUR 5YR 2.5/1 - black)
			VOL			FO	60															96.82-97.07 m: A small green grey brown zone (volcaniclastic??) with a FO at 60 deg to CA. (COLOUR: 5Y 4/3 - yellow)
						CN	30															The lower contact of the entire unit is extremely sharp at 30 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
98.13	100.60	2.47	MBL		BN	BD	40															Pure white sugary marble with faint impure bands (1-4 mm) occurring at 40 deg to CA. The upper contact with the oxide rubble is very sharp at 30 deg to CA. Fractured surfaces have faint orange-brown colouration on them.
100.60	152.11	51.51	OX	RBL																		Very dark red-brown siderite rubble with minor coatings of medium orange-brown clay. Rubble fragments are quite vuggy and are on average 2 cm in diameter. (COLOUR 5YR 2.5/2 - dark reddish brown).
			VOL			FO	40															104.92-105.35 m: Zone of fissile strongly altered volcaniclastic (??) Medium orange-brown in colour. The FO runs at 40 deg to CA. (COLOUR 10YR 5/6 - yellowish brown)
			VOL			FO	50															111.05-112.95 m: Medium to dark yellow-orange brown more competent slightly fissile possibly altered volcaniclastic. It does not have the typical bright yellow extremely fissile texture that the altered volcaniclastic typically has. The weak foliation occurs at 50 deg to CA.
																						112.95-114.85 m: Dark red-brown crumbly sideritic oxide. (COLOUR 5YR 2.5/2 - dark reddish brown).
			VOL			FR	60															114.85-116.74 m: Slightly fissile highly fractured altered volcaniclastic(?) with a light yellow colour on the cores surface, and a medium to very dark alteration coating on some fractures. Fractures occur at 60 deg to CA.
																						116.74-118.28 m: Medium to dark reddish-brown rubbly sideritic oxide. (COLOUR 5YR 3/3 - dark reddish brown).
																						118.28 m: NOTE! There is a ~ 70 cm section of medium brown soupy clay. This material fell into the hole from above and was not sampled.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						18.28-135.49 m: Mixture of medium to very dark reddish-brown sideritic oxide rubble. On the cored surface there is a bright to medium orange-brown clay coating. When the core is more competent it has a vuggy surface. 50% of the interval is extremely rubbly, while 50% is moderately competent and vuggy. On some of the vuggy surfaces there is bright orange-brown oxide coating.
																						At 129.05 m: there is a 4 cm fragment of limestone.
																						135.49-144.17 m: Mixed dolomitized limestone and dolomite, and dark reddish brown rubbly vuggy sideritic oxide. The dolomite contains fine grained disseminated pyrite. 30% dolomite, 70% oxide rubbly.
						BD	60															144.17-152.11 m: Moderately altered slightly yellowish/orange tinted medium grained dolomite. Fair concentration of disseminated Py bands occurring at 60 deg to CA. The bands are typically 1-3 mm thick.
															60							150.20-150.67 m: there is a zone of semi-massive banded pyrite.
152.11	156.36	4.25	MBL																			152.11-154.33 m: Banded weakly marbleized limestone with bedding running at 50 deg to CA.
																						153.64-153.75 m: There is a band of red-brown slightly vuggy oxide. There is a contact on one of the fragments from oxide to limestone at 75 deg to CA. This fragment is believed to be in place.
																						154.33-156.36 m: White marble with light grey bands at 55 deg to CA
																						156.36 m: E.O.H. - the hole was ended because it was into the marble, and out of the zone of interest.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

This hole containted some of the nicest mineralization to date.

GEOLOGY LOG

HOLE: Rau-09-66

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	7.01	7.01	OVB	LST																		
7.01	8.53	1.52	VOL	ALT		FO	80					m										10 cm altered tan volcaniclastic, then 20 cm grey brecciated limestone, then into light medium brown, soft, weakly foliated, altered to rusty oxidized volcaniclastic(?) Flaky and not competent.
8.53	13.65	5.12	OX	RBL																		Light to medium brown oxide (+/-) minor altered volcanic crumble rubble. Coarse fragments to gritty sand. (COLOUR: 7.5YR 5/4 - brown)
																						11.58-11.70m Light tan brown, presumably crumbled alt volcaniclastic observed above.
																						11.70-13.65m Soft brown oxide with minor limonite (?) crumbly grit from brown to reddish-brown.
13.65	16.15	2.50	MX												35	20						Semi-massive arsenopyrite and pyrite with minor (<10%) Qz and strong scorodite alteration. Most regions without Asp/Py crystals are so scorodite-altered (yellow-green) that original rock type/texture is obliterated. Sulphides are semi-massive, intimate/patchy, with Asp slightly coarser.
						Py	60															Strongly scorodite-altered regions are crumbly and weathered, and remainder is slightly vuggy. Py forms bands (foliaform?), with As seeming to randomly infill.
16.15	19.02	2.87	LST		BX										f							Strongly crackle brecciated, slightly altered grey limestone. Ca veinlets forms brecciation. Py is disseminated throughout, but markedly increases in the last 30 cm. No foliation observed.
															s							17.68-18.00 m: Strong pyrite mineralization, with rusty coating on fractures. Strongly disseminated to semi-massive. Core is broken up into <5cm chunks.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
19.02	77.81	58.79	DOL	MX											25	15	t					Fairly coarse-grained white dolomite mineralized throughout with ~ 40% SX, Py > Asp. A foliation is defined by rough bands of medium-grained pyrite. Asp is slightly variable, and generally is crystallized between Py bands as coarse aggregates and disseminations. A few small regions of brecciated limestone, and grey silty limestone. Asp crystals form up to 1 cm in size. Some ~10% Qz flood in first 30cm
																						22.90-23.00 m: Fine-grained, non-calcareous massive grey siltstone? layer. Non mineralized with pinkish grey alteration for 5 cm around it. Start seeing scattered small white flakes (muscovite?)
						FO	60															19-35 m: Foliation occurs at 60 deg to CA, and gradually steepens to 70 deg for 10 m and back to 60 deg by 41 m.
						FO	70															
						FO	60															
															f		f					34.80-35.40m Py/Asp decrease in concentration, the dolomite is harder, finer-grained and with blebs of Po/Py and no Asp. A few low angle, seemingly splaying fractures (non-pervasive) occur at 15-20 deg.
															f							36.45-37.05 m: Region of darker grey, brecciated limestone, more broken and only minor Py mineralization.
															25	15						40.30 +/- 0.05 m: Crumbly, light greenish alteration zone with Py/Asp.
																						Between ~40.90 and 41.20 m:, increased dark grey brecciated limestone.
						FO	60								10	35						41.35-41.60 m: Especially strong Asp mineralization (Asp>Py). Coarser disseminated crystals up to 0.5 cm (but composed of smaller faces).
																						43.59-43.64 m: Rounded, slightly vuggy pieces of fine-grained massive Py.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FO	60															46.29-46.42 m: Layer (with irregular boundaries) of dark grey, fine-grained siltstone. Sharp contacts, and only a few blebs Asp within.
															10	10	t					42.20-51.21 m: Around 20% sulphides, variably distributed but often forming crude foliation at 60 deg to CA. Pyrite is fine-medium grained stringers and coarse disseminations. Asp is much coarser, with clots and large crystals, intimate with pyrite.
						FO	60								6	4	t					52.21-63.40 m: Slightly less mineralization, though still ~10%. Py slightly > Asp, occurring as thinner stringers defining foliation, and sometimes other patterns. Asp occurs as 2-5 mm crystals throughout, sometimes strung together, sometimes disseminated. White muscovite flakes pop up from time to time.
															f	10						63.40-64.92 m: More grey limestone looking interval, with pyrite largely absent. Asp mineralization continues, however, as coarse clots and crystals. The last 30 cm of interval has increased Py stringers.
															50	35						64.92-67.97 m: Strongly mineralized section of semi-massive to massive Asp and Py. 35% very coarse Asp crystals, with fine Py as infill and stringers. Minor orange staining on the few unmineralized dolomite crystals. The Py content in interval fluctuates but Asp consistently ~35%.
																						64.92-65.78m Nearly massive Asp/Py.
						FO	60								25	15						67.97-74.68 m: Coarse dolomite with defined crystal boundaries, and ~ 40% sulphides, irregularly dispersed from regions of 10% to regions of 90%. Py occurs as finer bands, stringers and patches, and As coarse crystals strongly disseminated. Mineralized banding still remains constant ~ 60 deg to CA.
															10	15						74.68-77.81 m: Variably mineralized dolomite with some rhodochrosite (pink) and a few minor silty patches. Last 10 cm is massive Asp.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
77.81	79.33	1.52	VOL	ALT		FO	65								t	w						77.81-79.33 m: Light brown, foliated, weakly mineralized altered volcaniclastic. 1-3 mm Asp grains disseminated at the start of interval with blebs Py. Both become scarce as interval continues. Below 78.64 m, volcaniclastic becomes broken pebbles.
79.33	79.65	0.32	MBL			FO	70															Solid, competent white marble. Weak foliation defined by siltier stringers at 70 deg to CA.
79.65	80.93	1.28	DOL												w	f						79.65-80.93 m: Weakly mineralized, dirty dolomite with coarse masses of Asp and finer Py stringers. Some weak crackling.
80.93	81.69	0.76	LST	ALT					m						t	w						Light grey, dolomitized limestone, somewhat crackled, with clasts fizzing moderately. Mineralization decreases but is still present.
81.69	94.82	13.13	DOL	MX											m	w						Variably mineralized dolomite with Asp/Py. Py occurs as stringers while Py occurs more as patches. Some slightly rusty fractures. Asp content has dropped to average 3%. A few more Asp rich regions have more pure dolomite and coarse Asp crystals.
															t	m						84.73-87.78 m: Asp described above, less Py, more pure dolomite with up to 2 cm Asp crystals and coarse clusters of Asp. A few thin beige silty stringers occur.
																						87.78-94.82 m: Back to more banded, mineralized dolomite with 10% sulphides. Now almost all Py with only trace Asp. At 87.78 m, a 2 cm dolomite veinlet crosscuts everything, including Py/Asp mineralization. Late stage.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
94.82	99.97	5.15	LST	ALT					m						f	m						Variable dolomite and dolomitized limestone. Generally darker grey than the above interval, crackled and variably dolomitized with a few regions of rhodochrosite. No real foliated fabric in this interval. Total sulphide content is ~10%, but Asp has picked up again to 5-6%. Also some black silty stringers with minor graphitic surfaces.
															f	ms						94.82-95.40 m: Best mineralized Asp region (of this interval), with some up to 1 cm bands and coarse crystals of Asp.
99.97	118.26	18.29	DOL																			Pink, variably iron-carbonate altered coarse Dolomite/rhodochrosite. Slightly vuggy, with distinct grain boundaries, and numerous 10-30 cm FeCa altered dark brown, slightly rusty, broken, rounded, crumbly weathered zones. Some small silty layers in first 2 m. No Asp noted, and <2% Py, occurring as stringers/patches/some disseminations.
																						111-115.21 m: More altered, brownish, and less mineralized. Crackled by long/thin Ca veinlets with rusty alteration.
																						115.21-116.74 m: Washed away
																						116.74-118.26 m: Very poor (<30%) recovery, half altered crackled dolomite, and half crumbly yellowish-brown oxide.
118.26	119.79	1.53	VOID																			118.26-119.79m Void
119.79	125.46	5.67	OX	RBL																		Soft light brown (orangey to reddish) oxide, soft and crumbly to slightly limonite altered and rubbly.
																						119.79-121.31 (last 75cm is "void") Quite bright orange-brown soft, clayey oxide.
																						121.31-122.30 m: light brown clayey to gritty oxide.
																						122.30-123 m: More solid, rubbly (vs. crumbly) darker brown limonitic oxide. (COLOUR: 5YR 3/4 - dark reddish brown)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						124.36-125.46 m: Slightly reddish-brown, otherwise same oxide. (COLOUR: 2.5YR 4/4 - reddish brown)
125.46	150.50	25.04	MBL																			Immediate, sharp contact into marble. White with orangey-brown on fracture surfaces. 5-10% wispy, folded, almost convolute, <2cm bands/stringers of dark grey silt and magnetite. Whole bands are weakly magnetic, especially the margins which appear to contain fine magnetite. Marble colour varies from white to usually slightly pale rosy (peachy?)
150.50	153.31	2.81	LST			FO	40										t					Medium grey limestone with black stringers and weak to trace Po. Fossiliferous, with common <5 mm crinoid stems and other unknown fragments. Minor Ca veinlet flood.
																						153.31 m: E.O.H.

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.52	1.52	OVB																			
1.52	9.14	7.62	OX	RBL											w	w						Medium brown-red rubbly oxide with some rubbly limestone fragments as well as massive sulphide (Asp and Py) rubble.
																						4.57-6.10 m: The oxide contains moderate quartz sand/grit.
															w	w						6.10-9.14 m: Mainly blocky fragments of limonite and mineralized dolomitized limestone. Within there is disseminated-patchy arsenopyrite (weak) and pyrite (weak).
9.14	30.56	21.42	DOL	MX											m	f						Light to medium grey and white to cream-light orange, medium to coarse grained dolomite with heavily disseminated bands of fine grained pyrite and arsenopyrite. Minor zones of medium grey dolomitized limestone. Overall Py>Asp. Pyrite is moderate, arsenopyrite is fair.
						BD	50								40	20						9.14-10.36 m: Semi-massive to massive arsenopyrite and pyrite within a quartz dolomite host. The mineralization consists of coarse grained compact arsenopyrite with fine grained pyrite. Late, post-mineralization through going and non-through going fractures occur at 25 deg to CA. Faint banding of the sulphides occurs in zones that are less massive and run at 50 deg to CA. This interval is well preserved, non oxidized.
						FR	25															
						BD	40								m	f						10.36-14.00 m: Mixture of medium grained grey and orange dolomite with patchy and slightly banded pyrite and arsenopyrite mineralization, and zones of medium to dark grey medium grained dolomitized limestone. 20% Dolomitized limestone, 80% mineralized dolomite. The dolomitized limestone is only very weakly mineralized with fine grained disseminated pyrite. Banding of the sulphides in the dolomite occurs at 40 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						BD	40								m	w						14.00-22.86 m: Cream medium to coarse grained dolomite with 0.2-15 cm heavily disseminated bands of pyrite and arsenopyrite running at 40 deg to CA.
				ALT		BD	40								f	f						22.86-30.56 m: Increase in the concentration of Asp with a slight decrease in the concentration of Py. The Asp generally occurs as medium to coarse grained subhedral crystals and patches with disseminated Py in bands at 40 deg to CA. At 23.80 m there is an increase in the fractures (both through going and non-through going) which form at 35 deg to CA. Associated with these fractures is a faint orange-yellow alteration stain. The sulphides within these altered areas are commonly eroded away leaving pits with only a small smearing of remnant sulphide.
						FR	35															26.72-27.00 m: There is a zone of dark grey dolomitized limestone with patches of white dolomite.
															f	w						30.56-39.79 m: Quite heavily fractured medium to coarse grained dolomite/rhodochrosite altered interval with disseminated to patchy banded Py and Asp. The Asp is generally coarse grained, and in many cases has been partially weathered out leaving pits in the dolomite with a bit of Asp still occurring within. Thin Py bands occur at 60 deg to CA. The most common fracture orientation is 10 deg to CA. The dolomite is mostly orange-red-pink tinted probably Rhodochrosite altered.
30.56	40.44	9.88	LST	ALT					m													30.56-40.44 m: A strange zone of very dark grey dolomitized limestone, strongly brecciated white to light grey, fine grained dolomite. The upper and lower contacts are gradational but occur over 10-15 cm. No mineralization occurs within the unit.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
															f	w						39.79-48.77 m: Decrease in the amount of Rhodochrosite alteration, still weak overall. Zones in the dolomite have vuggy, pockets between crystal faces. Pyrite occurs as disseminated and patchy bands at 40 deg to CA. Asp occurs as medium to coarse grained crystals forming masses up to 4 cm.
40.44	54.86	14.42	DOL	MX		BN	40								f	f						48.77-54.86 m: Slight increase in the concentration of Asp to fair. Also the dolomite now is entirely creamy white and light grey. Banding occurs at 40 deg to CA, steepening to 65 deg at 53.50 m.
						BD	65															
54.86	63.10	8.24	LST	ALT		VN	30		f						w	t						Medium grey brecciated limestone with patchy and disseminated pyrite and trace arsenopyrite. Faint white dolomite veins occurring at 30 deg. Very thin cracks/fractures occur at 70 and 5 deg to CA.
						FR	70															From 60.96-63.10 m: There is a zone of yellowish altered dolomitized limestone.
						FR	5															
63.10	65.84	2.74	MBL		BN	BD	40								t		t					White marble with faint grey bands at 40 deg to CA. Trace patches of pyrrhotite and pyrite occur throughout. There is a faint yellowish tint surrounding very thin fractures at 10 deg to CA.
						FR	10															
65.84	88.39	22.55	LEP		FO	FO	30															Medium grey leopard spotted volcaniclastic with medium 'grained' spotted texture and occasional wispy sericite patches. A slight foliation in the rock occurs at 30 deg to CA. The first 4 m of the unit does not have as strong of a spotted texture and it quite fractured up. There is no sign of any biotite or any mineralization with only a small area of limestone.
						BD	20															
						CN	80															The upper contact with the marble is sharp at 80 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

HOLE: Rau-09-68

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	7.42	7.42	OVB																			
7.42	52.14	44.72	OX	RBL																		7.41-13.72 m: Dark red-brown sideritic oxide with a slightly vuggy texture. In some areas there are pockets of bright orange oxde powder.
				RBL																		7.42-9.14 m: This oxide material is clay in composition and more of a red-brown colour (COLOUR 2.5 YR 3/3 - dark reddish brown).
				RBL																		9.14-12.50 m: The oxide becomes more of a dark red-black colour with more of a medium orange red brown smear on the cored surface. The material is semi-compatent and quite vuggy.
				RBL																		12.50-13.72 m: Coarse grained cream to light grey dolomite with light grey dolomite and faint banding a 80 deg to CA. Fine grained pyrite occurs disseminated throughout.
																						13.72-14.22 m: Semi-massive pyrite and arsenopyrite with a slight pitted texture filled with orange-brown powdery oxide. Oxidized bands run at 70 deg to CA. The last 5 cm of the interval are very crumbly.
																						14.22-15.75 m: Medium to dark red-brown sideritic oxide rubble. The surfaces of the fragments are weakly pitted, but the fragments themselves are quite heavy.
																						15.75-36.17 m: Medium to dark red-brown slightly gritty clay oxide. The clay is quite compact and therefor the recovery is quite good. The entire interval is very consistant with only slight variations in shade of the oxide. Little to no textures or structures are visible. Small pockets of brighter orange oxide. Only very trace yellow micaceous flakes occur in the oxide.
																						36.17-37.94 m: Dark brown-black vuggy limonitic oxide, very rubbly.
																						37.94-43.05 m: Medium to dark brown with a slight red tint oxide rubble with some fair clay intervals.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						43.05-44.11 m: Moderately altered medium grey limestone. Fizzes weakly with acid. Quite rubbly with pockets that are turning to clay. A crackled texture is visible on a few of the surfaces.
															w							44.11-52.14 m: Mixture of the brecciated limestone and red-brown gritty clay oxide. The main limestone occurs from 46.24-50.29 m. This limestone is medium grey with a faint brecciated texutre. 0.3-0.6 cm sulphide bearing veins occur at 20 deg to CA. The limestone also contains a weak concentration f sub-hedral strongly oxidized pyrite (?) crystals.
																						NOTE: At 47.62 m: there is a 74 cm zone of clay oxide, but the drillers pulled back 100 ft to grease the rods so this material most likely fell into the hole.
52.14	56.39	4.25	MBL		BN	BD	60															White marble. Upper contact very sharp at 60 deg to CA.
						CN	60															54.10-56.39 m: White to light orange tinting of the marble with faint silty grey horizons at 50 deg to CA.
																						56.39 m: E.O.H. - The hole was ended because it was past the horizon of interest and into the marble.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.80	2.80	OVB																			
2.80	4.57	1.77	LST																			Mixture of dark green volcaniclastic with specs of white calcite throughout and rubbly limestone. Recovery is poor.
4.57	58.85	54.28	DOL	MX	BN	BD	60								f	w	w					Light to medium grey fine to medium grained dolomite. Talc and quartz occur weak overall. Mineralization consists of fine to medium grained pyrite and pyrrhotite with generally coarse grained, subhedral arsenopyrite.
															m		w					4.57-9.86 m: Fine to medium grained dolomite with indistinct grain boundaries. The upper 1 m is highly fractured with orange-brown alteration on fractured surfaces. Pyrite is mostly patchy as opposed to banded and is fine to medium grained and subhedral. Pyrrhotite forms fine grained irregular patches.
						BD	60								f	w	t					9.86-27.43 m: The mineralization becomes more thinly banded in texture. The concentration of arsenopyrite increases. These grained are typically sub to euhedral. Also white and grey talc seem to increase in concentration to fair. The talc typically consists of short thin compact fibrous zones, sometimes occurring in a rounded texture. Trace quartz occurs within the dolomite. 22.07-22.86 m is a zone of blurry light grey fine grained dolomite with only weak total mineralization. Rare non-through going fractures occur at 30 deg to CA. very minor silty beds occur within the unit following the banding orientation.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						FR	30	180														27.43-42.67 m: Decrease in the concentration of arsenopyrite to trace-weak with a slight increase in the concentration of pyrrhotite. Talc most commonly coats fractures that occur at 10 deg to CA. The pyrite occurs both in thin bands, but now also as concentrated patches. At 34.20 m within a large talc patch, fibrous arsenopyrite occurs scattered along the talcy fractured surface.
																						41.60-42.67 m: Zone of semi-massive light grey quartz with patches of green grey talc and trace Pyrite.
						BD	65								f	w	t					42.67-58.85 m: The dolomite becomes much more typical of the main mineralized horizon. Thin pyrite bands occur at 65 deg to CA. The dolomite is medium to coarse grained, white to light grey with generally well defined grain boundaries. In some areas there are vugs that form between the crystal boundaries. The concentration of coarse grained sub to euhedral arsenopyrite. The concentration of pyrrhotite has decreased to trace. At 58.11-58.85 m there are thin bands of pinkish brown volcaniclastic layers, some with minor chlorite layers. Overall the concentration of talc has decreased to trace overall.
58.85	62.39	3.54	VOL	ALT		BD	50		f				MAG	s								Very dark grey to black volcaniclastic with thin tan/green stringers of sericite alteration that occur at 50 deg to CA. The volcaniclastic contains a strong concentration of magnetite along with small patches of calcite. The lower contact is gradational with leopard print volcaniclastic.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
62.39	71.63	9.24	LEP	ALT	FO	FO	60			w			MAG	w								Gradual transition into leopard printed volcaniclastic. Overall the pattern is medium grained. The upper 2 m contains weakly disseminated magnetite generally concentrated in non-spotted bands. There is a weak foliation to the unit that occurs at 60 deg to CA. Weakly concentrated sericite and patchy alteration occurs throughout, but is slightly more concentrated within the upper 2.5 m.
																						68.85-71.63 m: The concentration of dark grey-black non-spotted volcaniclastic with only trace magnetite increases. There bands follow the foliation at 60 deg to CA and are 5-25 cm thick with a slightly mottled texture.
																						71.63 m: E.O.H. - The hole was ended because it was past the main zone of interest and into the lower leopard spotted volcaniclastic.

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	4.42	4.42	OVB																			
4.42	7.85	3.43	VOL	ALT								I										Very strongly altered medium to dark green-grey-brown clay. Probably altered volcaniclastic. Does not fizz with acid. Rare fragments of green volcaniclastic and medium grey limestone occur. N structures or textures occur within the very consistently massive clay.
7.85	10.30	2.45	DOL	ALT											t	t						Light to medium yellow-orange-brown clay with weak concentration of silvery micaceous flakes. The zone fizzes weakly with acid. Strongly altered creamy and grey medium grained dolomite occur with trace strongly oxidized sulphides probably pyrit and arsenopyrite.
																						From 30.00 m there is a strong concentration of subangular quartz fragments with weak to moderately strong orange-red alteration stain on them.
10.30	13.72	3.42	DOL	MX	BN	BD	70								15	30						Semi-massive to massive pyrite and arsenopyrite within a coarse grained light grey to white dolomite. Most of the dolomite has been replaced with arsenopyrite and pyrite. Arsenopyrite is 15%, pyrite is 30%. The pyrite is subhedral medium grained and weakly banded at 70 deg to CA. The pyrite als clearly overprints the arsenopyrite in a few places. Coarse grained quartz occurs fairly concentrated. I a few spots it appears that the pyrite and arsenopyrite overprint/occur within the quartz. Within the interval there are very rubbly sections of massive pyrite and arsenopyrite. Within the rubbly zones there is weak to moderate orange alteration the dolomite surrounding the pyrite and arsenopyrite. Minor white talc occurs in one of the rubbly zones.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
13.72	38.82	25.10	DOL	MX	BN	BD	60						Tc	m	m	w	w					Medium to coarse grained white to light grey dolomite with bands of fine to medium grained pyrite and patches and disseminated medium to coarse grained arsenopyrite and fine grained patches of pyrrhotite. Banding varies over the interval from 50-70 deg to CA. Light to medium grey talc occurs as both patches within the dolomite and as veins that cut the dolomite at 25-35 deg and less commonly 70 deg to CA.
						VN	30															
						VN	70															
																						The talc veins have a zonational pattern to them. Generally have a core of quartz surrounding by a band of white talc and then surrounded by a band of light-medium grey talc. The white and grey talc bands are most commonly proportional in thickness to each other. Occasionally the patches of talc within the dolomite are a light greenish-grey in colou but more commonly it is white and light to medium grey. Overall talc ~ 5%. The talc veins cut the Py bands and are occasionally cut by them. Po occurs commonly within the talc veins.
								CR														31.30-35.20 m: Decrease in the concentration sulphides to weak pyrite, trace arsenopyrite, and weak pyrrhotite. The host appears finer grained. A weak crackle texture overprints the interval.
																						36.76-37.44 m: Begin to see 0.5-1 cm bands of slightly purple brown volcaniclastic (5% over the interval). The lower contact is extremely sharp at 20 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
38.82	55.21	16.39	VOL	ALT	FO	FO	50			f			Cl	t	w							Purple brown biotite rich volcaniclastic with a weak leopard spotted texture of Ca. Fizzes weakly with acid. A faint foliation occurs defined by taupe-grey sericite stringers in the unit. Very finely disseminated and rare medium grained pyrite occur scattered throughout weakly. Coarse grained quart veins cut at 15 deg to CA and 120 deg to FO. The sericite alteration occurred after the quartz as it weakly cuts it. Minor chlorite alteration occurs at 42.82-42.90 m
						VN	15	120														
			DOL		BN	BD	50								w							42.90-44.46 m: Interval of fine to medium grained light grey dolomite with thin bands, stringers ad disseminations of fine to medium grained dolomite. From 44.20 m begin to get inter-layers of purple-brown volcaniclastic (50/50 with the dolomite). Tota pyrite is weak.
			VOL	ALT	FO	FO	30			ms					w							44.46-55.12 m: Increasingly sericite altered volcaniclastic with Of at 30 deg to CA defined by the stringy sericite alteration. Qz / Ca veins and dolomite veins cut the unit. The quartz calcite are often patchy and irregularly stringy. At 52.00-52.45 m a 1-2 cm medium grained white-light grey dolomite vein cuts at 10 deg to Ca and 100 deg to FO. Fine grained disseminated pyrite occurs throughout.
						VN	10	100														
						CN	30															The lower contact is sharp at 30 deg to CA. Also has more concentrated patches of pyrite associated with this contact.
55.21	80.83	25.62	DOL	MX	BN	BD									f	w						Coarse grained dolomite with bands of pyrite and scattered coarse grained crystals of arsenopyrite scattered throughout. pyrite 5%, arsenopyrite 3%. The dolomite is white to light grey and in zones vuggy between large crystal faces. Small patches of purple grey volcaniclastic occur generally associated with sporadic patches of pyrite. Pyrite bands vary as follows:
																						55.30-59.72 m: BD - 70 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																						59.72-62.00 m: BD - 85 deg to CA
																						62.00-62.50 m: Rare folding of the mineralized dolomite (photo taken).
																						62.50-67.86 m: BD - 75 deg to CA.
						VN	20															At 67.15 m: medium to coarse grained dolomite vein cuts a zone of semi-massive pyrite at 20 deg to CA.
																						NOTE: Within this unit - talc is rare to non existent.
															I	t	t					65.53-67.50 m: There is an increase in the concentration of pyrite to 20%.
															t		w					67.50-69.16 m: The dolomite becomes finer grained and a slightly greyish white colour. Contains white talc and light green fibrous crystals - soft, but not as soft as talc. Weak pyrrhotite and trace pyrite occur.
																						69.16-80.83 m: Medium to very coarse grained white and light grey dolomite with zones of very clearly defined grain boundaries. Wispy patches of purple brown biotite rich zones occur scattered within the first 6 m of the interval (from 67.16-73.80 m). A faint banded texture occurs at 80 deg to CA. Pyrite occurs as fine grained disseminations (weak) along with pyrrhotite (weak).
																						Overprinting white dolomite veins 0.5-1 cm in diameter cut at 20 deg to CA.
																						76.20-79.50 m: The cracks in the dolomite are filled with red-purple stain. Radiating away from the cracks is a faint yellow-orange stain halo.
80.83	88.42	7.59	LST	ALT		VN	10															Dolomitized medium to dark grey limestone with coarse grained white dolomite veins that cut at 10, 20 and 40 deg to CA. Also black stringy veins 0.5-1 cm thick cut the limestone but at cut by the dolomite. These occur at 25 deg to the CA. (They resemble the silty horizons that cut the marble). This zone seems like it could be the transition between the limestone and the hydrothermal dolomite.
						VN	20															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
						VN	40															
						VN	25															
88.42	90.76	2.34	VOL	ALT																		Mostly orange-green brown strongly altered volcaniclastic (?). Does not look very typical. The less altered parts have a fine spotted texture. Weak patchy pyrite occurs throughout. Possible FO occurs at 40 deg to CA. The lower contact has a 12 cm band of semi-massive pyrite. This could be a possible fault zone???
90.76	106.22	15.46	LST	ALT	FO	FO	75		ms													Medium to dark grey moderately to strongly dolomitized fossiliferous limestone with cross cutting dolomite and or quartz veins at 40 deg to CA. A strong foliation at 75 deg to CA occurs in a few places.
						VN	40															
				FO											w		w					96.35-100.10 m: Purplish brown biotite rich bands defined by the foliation are most concentrated in this zone. Weak pyrite, pyrrhotite occur as fine grained disseminations throughout. Rare crinoids - including perfect star crinoids, occur scattered throughout but most commonly in packed zones of crinoids.
106.22	111.87	5.65	VOL																	Mag	I	Fine grained very dark green to black calcareous volcaniclastic with zones of semi-massive very fine grained magnetite. A weak almost leopard style texture occurs with calcite patches.
111.87	112.78	0.91	LEP																			Leopard spotted volcaniclastic with a medium to large spotted texture.
																						112.78 m: E.O.H. - the hole was ended because it was through the main horizon of interest and into the leopard spotted volcaniclastic.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	4.39	4.39	OVB																			
4.39	7.95	3.56	LST	ALT																		Medium grey moderately to strongly clay altered limestone. The less altered fragments are sub-rounded and angular. The more altered zones are altered to medium grey clay with a strong concentration of subangular limestone fragments. The entire unit fizzes strongly with acid. (COLOUR 5Y 4/1 - dark grey)
7.95	25.91	17.96	OX	CLY																		Gritty oxide clay zone grading in colour between bright orange-brown to medium red brown sideritic oxide fragments.
																						7.95-10.67 m: Medium orange brown oxide clay with moderate concentration of clay. There is a moderate concentration yellow mica fragments scattered throughout the interval. (COLOUR - 5YR 4/6 - yellowish red).
																						10.67-16.76 m: Slightly reddish brown gritty slightly rubbly oxide with fair to strong concentration of clay coating the fragments. Weak yellow micaceous flakes occur scattered throughout. (COLOUR 2.5 YR 3/6 - dark red).
																						16.67-25.91 m: Medium orange-brown to orange-red-brown oxide clay with only fair gritty fragments and a fair concentration of yellow micaceous flakes. (COLOUR 5YR 4/6 - yellowish red)
25.91	41.61	15.70	DOL	MX	BN	BD	70								f					Bi	t	Medium grained cream to orangish pink tinted dolomite with patches and very thin bands of pyrite (fair) at 70 deg to CA. Arsenopyrite also occurs as fine to medium grained patches throughout.
																						25.91-27.00 m: Poorly recovered transition zone between the oxide and the mineralized dolomite. It consists of rubble dolomite coated in gritty oxide clay.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
																				Bi	40	39.15-39.16 m: Very coarse grained bismuthinite occurs within a vuggy bands in the dolomite. The bladed crystals are up to 1.5 cm in length.
			VOL		FO	FO	50															39.51-40.17 m: Interval of green-grey slightly altered calcareous volcaniclastic with foliation running at 50 deg to CA.
			DOL		BN	BD	50															40.17-41.61 m: White to light grey, medium grained dolomite with thin bands of pyrite running at 50 deg to CA.
41.61	51.46	9.85	LEP		FO	FO	60															Medium grey, medium to large printed leopard printed volcaniclastic with then sericitic stringers altering the zone in a patchy texture. A faint foliation occurs at 60 deg to CA.
						VN	5															Calcite veins cut the unit at 5,10 and 40 deg to CA.
						VN	10															
						VN	40															
																						47.24-48.77 m: There is a zone of magnetite within the leopard print volcaniclastic. At 48.43-48.49 m, there is a white calcite vein with coarse grained cubic magnetite crystals.
																						48.65-49.40 m: This is a zone where the foliation have been irregularly disturbed.
																						50.09-51.46 m: The sericite alteration becomes much more intense. Within this zone there is a set of low angle 1 cm calcite veins running at 5 deg to CA.
51.46	59.44	7.98	DOL	MX	BN	BD	55								f							White to light grey medium grained dolomite with thin bands 1-3 mm thick of pyrite that occur at 55 deg to CA. These bands are not perfect, rather they are irregular and more patchy than through going. Within the dolomite there are bands of medium to dark grey argillaceous material containing patches of calcite that are being replaces by pyrite. These bands occur at the following locations:
																						56.95-57.02 m, 57.52-57.61 m, 57.65-58.37 m.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
59.44	66.63	7.19	LST	ALT	BX	VN	50								w							Medium grey dolomitized limestone with a fair overprinting fluid brecciated texture and cross cutting dolomite +/- quartz veins 0.5 cm thick cutting at 50 deg to CA. Patchy and disseminated pyrite occurs scattered throughout weakly, not in any particular banded pattern. The pyrite seems more concentrated surrounding the Dol +/- Qz. Fractured surfaces have a fair orange brown alteration stain o them.
																						NOTE: at 59.44 m there appears to be 25 cm of medium to dark brown oxide clay - but this material fell into the hole from above.
																						62.43-63.77 m: Zone of moderate orange-pink alteration of the dolomitized limestone (Rhodochrosite??)
66.63	115.35	48.72	DOL	MX		VN	5								ms	t	t					White to light grey medium to coarse grained dolomite with thin bands to semi-massive zones of fine to medium grained pyrite and very trace fine grained pyrrhotite and arsenopyrite.
						VN	20															Coarse grained Qz-Dol veins cut the pyrite mineralization at 5 and 20 deg to CA.
																						In some locations the coarse grained dolomite has a vuggy texture between grain boundaries.
															35							69.91-75.29 m: Intense to semi-massive heavily disseminated fine to medium grained pyrite interval.
																						79.25 m: there appears to be 35 cm of dark grey gritty clay material; however, these are just cuttings that fell into the hole.
						BD	80															85.22-89.20 m: Tiger-banded pyrite in coarse grained white to light grey dolomite with banding at 80 deg to CA.
																						89.20-94.81 m: Weak to moderately strong orange-pink (Rhodochrosite?) alteration of the dolomite. Many of the areas are very rubbly with strong alteration on the surfaces.
																						99.06-100.00 m:Low angle dolomite vein 1.5 cm thick running at 50 deg to CA.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			LITHOLOGY			STRUC.			ALTERATION						MINERALS							DETAILED DESCRIPTION
													Other					Other		Other		
From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Type	Attitude (tca)	Attitude (tfa)	Dolomite	Sericite	Calcification	Oxidation	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
															w							102.65-115.35 m: Moderate to strong rhodochrosite alteration of medium to coarse grained dolomite. The entire interval has a yellowish orange tint with weak patchy pyrite.
																						108.20-109.30 m: A strong crackle network occurs with a zone of strong brecciation occurring from 109.00-109.30 m.
115.35	124.97	9.62	LST	FOS	BN	BD	60								t							Medium to dark grey fine to very fine grained limestone with bedding defined by colour variations in the limestone occurring in bands at 60 deg to CA. Fair 0.2-0.4 cm crinoid stem fragments occur scattered throughout and in compact zones. Trace fine grained disseminated pyrite.
																						120.80 m: a fine crackle texture in the dark grey/black limestone is filled with white material.
124.97	141.73	16.76	LEP		FO	FO	60			15												Medium to coarse printed brownish grey and white leopard printed volcaniclastic.
																						126.64-141.73 m: Begin to get a more typical leopard printed volcaniclastic. Bands of fine grained sericite altered volcaniclastic (15% overall) Calcite veins cut at 60 deg to the CA. A weak foliation of the patches occurs at 60 deg to CA.
																						E.O.H. - 141.73 - the hole was ended because it was past the horizon of interest and well into the leopard printed volcaniclastic.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

APPENDIX IX

PETROGRAPHIC REPORT

Petrographic Summary: Rau Sample Suite – Dec. 2009.

Lithologic Environment:

The majority of the samples have been collected from a suite of rocks which would be typical for a shallow, distal, marine environment. In general four major litho types and three facies environments are implied:

a. Shallow Water Dirty Dolomitic Limestones ; (09-41 @ 180.5; 09 – 36 @ 155.45; 09-26 @ 150.5; 09 – 22 @ 175.5; 09-60 @ 78; 09-26 @ 126.49; 09- 37 @ 94.5; 09-52 @ 291.4)

   These rocks are characterized by medium to fine grained dolomitic grains locally with minor, quartz rich inclusions. Opaque carbonaceous layers are sometimes noted in these rocks. Many of them have been extensively recystallized and replaced by secondary iron carbonates.

b. Stratified Calcareous to Non-calcareous Siltites and Lithic Wackes. (09-4 @ 266.8; 09-69 @ 59.8; 09-48 @ 158.2; 09-26 @ 115.5; 09-30 @ 199.5; 09 – 49 @ 262.5; 09-32 @ 96.35; 09 – 44 @ 173.25; 09-04 @ 257.9; 09 – 40 @ 142.65; 09 – 49 @ 266.1; 09 – 40 @ 143.5; 09 – 44 @ 190.5.

   Many of the samples have been taken from a series of thinly bedded, fine to medium grained carbonaceous siltites to lithic wackes. Approximately half the suite is calcareous and the remainder are non-calcareous. Lithic clasts and casts are commonly noted and thin compositional layers are common. Grain size variations suggest most of the rocks likely form part of a deep water turbidite succession.

   Most of these samples contain very high carbonaceous, possibly organic carbon, material largely as foliation parallel mm scale lamella and aggregates. These kinds of carbon contents are common in starved euxinic basins.

   Coarser lithic wacke members could be interpreted as volcaniclastic rocks. However, most of the fragments appear to be lithic, not volcanic in origin, and many of them have experienced significant transport. The volcaniclastic classification would be better suited to less mature tuffaceous sediments.

c. Pebble Conglomerates. (09-4 @ 130.5)

   A single sample might be interpreted as a pebble conglomerate. The sample is polylithic and contains three fragment supported clasts, two of which have similar compositions and the third is of a significantly different composition. There is a distinct possibility that the sample has not been taken from a pebble conglomerate but represents a polylithic intrusion breccia or pebble dyke. The correct interpretation would be better arrived at from larger scale rock relations.

d. Intrusive (dykes-sills) or Flows (09-54 @ 180.9; 09 – 54 @ 193.06).

The sequence contains two fine grained strongly altered volcanic or intrusive rocks. These rocks have distinctive feldspar casts and commonly contain microlithic feldspars within the matrix. They may have elongate quartz filled vesicles. The rocks have generally very weak penetrative fabrics which would tend to suggest that they have been emplaced post D1, i.e. they are dyke or sill like bodies. There a slight probability the these vesicular units are flows. Both of these samples contain sufficient free quartz to suggest that they will lie in a felsic field.

Metamorphic Overprints.

The majority of the data suggests that the stable regional metamorphic assemblage is:

biotite-muscovite-clinozoisite-magnetite+/-garnet+/- phengite+/-chlorite

the rocks can be described as lying within the" chlorite out, biotite in" isograd. The petrogenetic grid for these minerals is quite insensitive to pressure but the "biotite in" isograd may occur between 350 - 400º C. In rocks with high CaO contents garnet may appear at temperatures below 450º and at pressures of 4 – 5 kbar. The general absence of amphiboles in these rocks suggests that the field will also lie on the lower side of the mid-greenschist field.

Many of these rocks contain significant amounts of magnetite. In these samples "magnetite in" is part of a stable metamorphic reaction which occurs within the biotite isograd. It is unlikely to be related to a hydrothermal alteration process.

Deformational Style.

Virtually all of the samples have been affected by a strong regional S1 (D1) fabric. Several samples show weak but reasonable evidence for a second penetrative fabric which deforms and rotates S1 fabrics by D2 processes. Both D1 and D2 processes reflect regional scale shortening or compression and are generally non-rotational.

A single sample displays moderately well developed rotational, or shear fabrics, sample number 09 – 40 @ 142. 65. The sample also displays near orthogonal relationships between early planar fabrics, So (?) and later planar fabrics. This relationship infers that the sample has been collected from a hinge line position of a fold structure whose scale cannot be determined from this sample.

The last deformational process documented in these sections is a post D2 extension. Late extensional, commonly calcite, veins cut all previous fabrics and lithologies.

Hydrothermal Overprints – Rock Alteration

Two differing hydothermal processes are outlined:

1. Large scale replacement textures and sulphidation within dolomites.

Although several samples display well developed replacement reactions between primary and secondary carbonates, one sample (09 – 44 @ 190.5) exhibits superb relationships between matrix silicification, secondary iron carbonates, and the formation of talc sericite. In carbonate rocks the principle alteration assemblage is:

silica-iron carbonate – talc/sericite – sulphide

This is a relatively early alteration form as replacement minerals all have well developed S1 fabrics and therefore the replacement pre-dates D1 deformation. This mineral assemblage is equivalent to the alteration mineralogy documented in many Carlin style gold systems.

2. Discordant Veins and Veinlets.

All rock units may be cut by narrow biotite-quartz-k-feldspar +/- sulphide veins. These extensional veins are also overprinted by S1 fabrics and therefore pre-date D1 deformation. This alteration style is not necessarily linked in space or time to the development of replacement textures and sulphidation of carbonates.

The alteration assemblage in these vein sets is:

biotite-potassium feldspar – quartz – iron carbonate – sulphide

The rock suite contains an abundance of carbonate rich rocks. However, within this petrographic suite, there is no evidence for the development of calc-silicate (skarn) mineral assemblages.

Jim Oliver, Ph.D., P.Geo.,
Kamloops, British Columbia.
Dec. 18, 2009.

Sample 09-44 @ 190.5 Standard Thin Section No Opaque Determinations.

Protolith: Silica – Iron Carbonate Silica Replacement. Probable Dolomite Protolith.

Primary textures are poorly preserved within this rock unit. The presence of coarse white talc-sericite, which commonly flanks fine grained grey quartz suggests that sericite is forming as an alteration halo to silica and the quartz within the sample is of secondary origin. Elevated sulphide contents are also associated with sericite rich domains external to quartz. If the dominant mineralogy is interpreted as primary, than the rock could be interpreted as a siliceous dolomite. It is more likely that most of mineralogy in this rock is secondary.

Mineralogy:

Mineral	*Abundance*	*Grain Size*
Quartz	55 - 60%	0.25 – 0.75 mm
Iron Carbonate	25 – 30%	0.25 – 0.5 mm
Talc-sericite	10-12%	0.5 mm
Apatite:	trace	< 0.1 mm
Clinozoisite-epidote:	1.5-2%	0.2 mm
Sulphide-Oxide Opaques	3-4%	0.25 – 1.0 mm

Clinozoisite-epidote generally forms amorphous poorly formed crystals.

Abundant deformational lamella are noted within all quartz grains. Good trigonal grain boundary development and partial re-sorption is also recognized. Quartz is forming coarse mm scale grains commonly flanked by talc-sericite iron carbonate aggregates. Replacement quartz grains have formed prior to S1 deformation and if quartz is secondary, replacement has occurred prior to D1 deformation.

Talc-sericite grains are noted as both aligned and non-aligned crystals forming post peak strain. These minerals are best developed in association with small irregular quartz grains and irregular buff to brown iron carbonate grains. All three mineral forms are likely secondary. Individual talc-sericite phenocryts are commonly non-aligned but the overall talc-sericite, iron carbonate zones are forming roughly parallel to S1 fabrics.

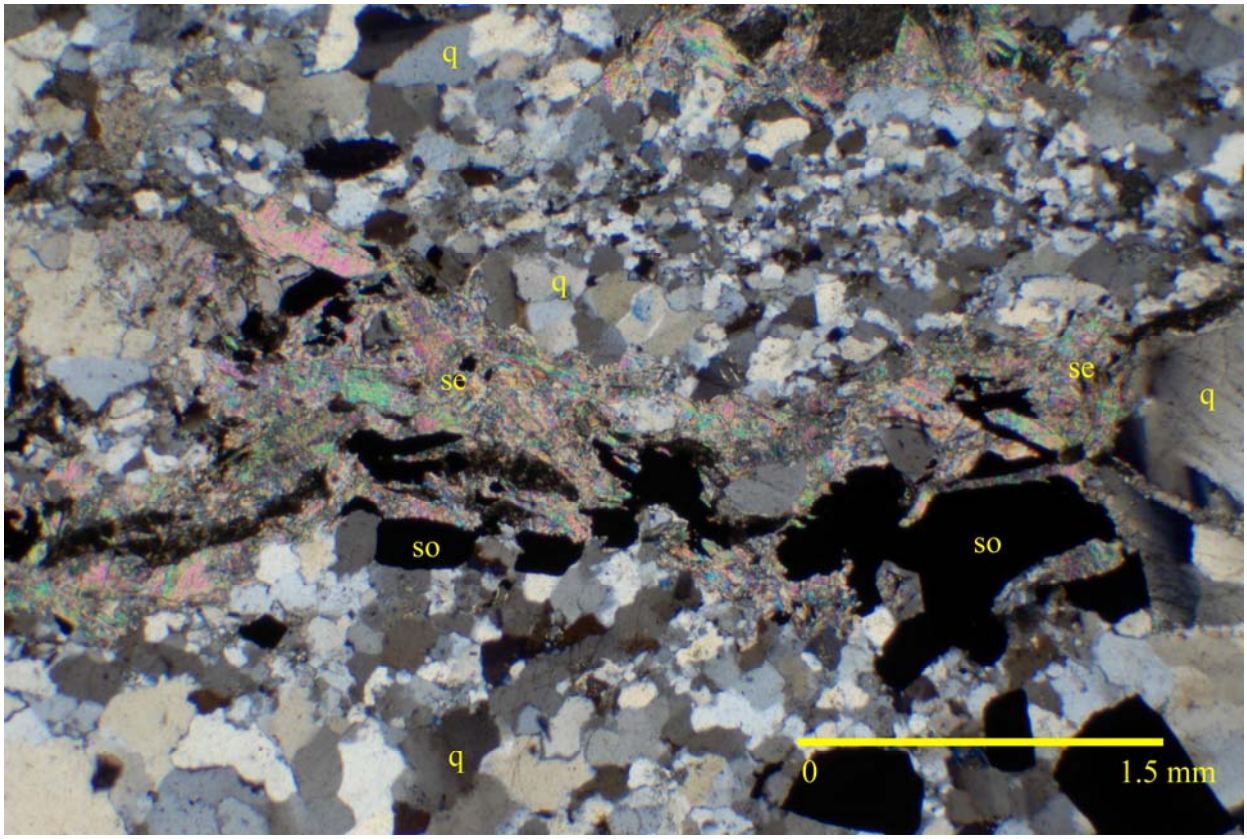
Brown iron carbonates are intimately associated with coarse bladed talc-sericites, and form irregular mm scale compositional bands. Euhedral opaque grains are also spatially related to iron carbonate –talc-sericite zones and are seldom found internally to silica rich zones.

Inclusion morphology: Well rounded, 10-30 micron, dominantly liquid phase inclusions, are documented. Very minor, three phase, liquid-vapor-solid, inclusions are noted. In general, most coherent inclusions are liquid dominant low salinity inclusions.

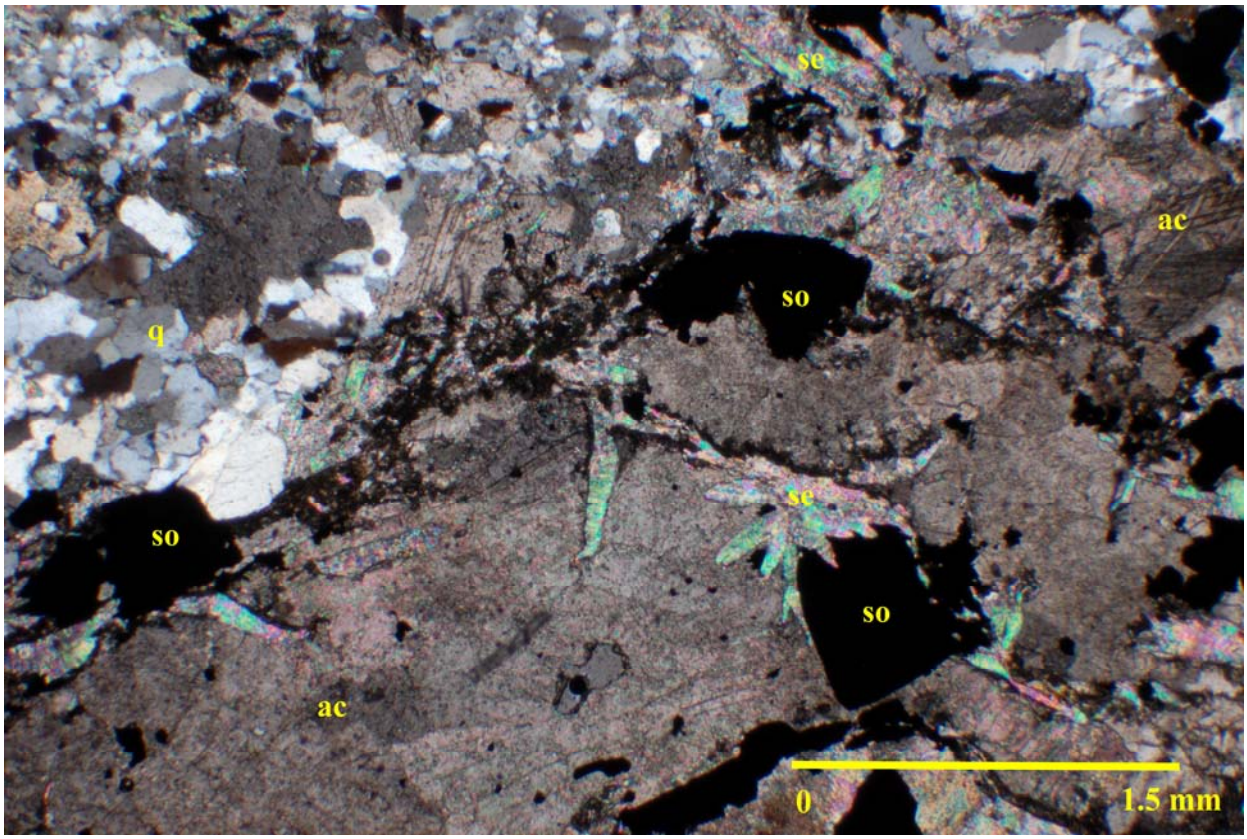
Magnetic Susceptibility: 0.05 SI units.

Deformational Style:

Well formed Type II twin lamella occur within iron carbonates. Sericite forms the dominant foliation surfaces, but flattening fabrics are only modestly developed. Most mineral grains within this sample may have formed post peak strain. No significant development of pressure shadows is recorded and most of the quartz grains are forming coarse mm scale, lozenge shaped scale aggregates.



Sample 09-44 @ 190.5: The photomicrograph illustrates the relationship between moderately to coarse grained quartz and planar zones of sericite-sulphide. Weak petrographic evidence suggests that quartz grains proximal to sericite lamella are coarser grained than quartz phenocrysts distal to sericite lamella. The angular nature of sulphide oxide grains suggests that these minerals have been emplaced in this rock environment relatively late in the strain history of the rock. Abbreviations so: sulphide/oxide, se: sericite, q: quartz. Transmitted light crossed polars, 25x.



Sample 09-44 @ 190.5. The photomicrograph displays the representative alteration assemblage within this rock. The dull brown carbonate in the centre of the field of view is an iron or magnesium rich carbonate. Fine grained, annealed quartz is noted in the upper left field of view and bladed pink-green talc sericites are well illustrated in the central field of view. Most of the euhedral black sulphides/oxides in this rock are associated with iron carbonates and talc sericites. Abbreviations ac: iron carbonates, so: sulphide/oxide, se: talc-sericite, q: quartz. Transmitted light, crossed polars, 25x.

Secondary Alteration Assemblage:

The section suggests that a probable hydrothermal alteration assemblage is:

Quartz-talc/sericite-iron carbonate-sulphide/oxide.

Sample 09-40 @ 143.5 Standard Thin Section, No Opaque Mineral Determinations.

Protolith: Thinly Laminated Moderately Calcareous Carbonaceous Siltite

The protolith is a thinly laminated calcareous siltite. The dark grey black matrix of the rock is caused by an abundance of carbon rich, organic opaques. Net volume of calcite would lie well below that required to interpret this rock as a dirty limestone. The average grain size is less than 0.25 mm and the thin laminations in the unit are suggestive of a distal turbidite.

Mineralogy:

Minerals	*Abundance*	*Grain Size*
Matrix		
Carbonaceous (Non-sulphide) Opaques:	30-35%	0.2 – 0.5 mm
Opaques (Sulphide):	2.0 – 3.0%	0.25 – 1.0 mm
Matrix Calcite/Iron Carbonate	20-25%	< .1 - .25 mm
Matrix Quartz:	28-32%	< .1 - .25 mm
Muscovite-sericite:	3-4%	.1 - .25 mm
Clinozosite-epidote:	1.5-2.0%	.25 - .5 mm
Apatite:	trace	< .1 mm
Vein Quartz:	3-4%	.25 – 1.0 mm
Vein Calcite:	2%	.25 - . 5 mm

Carbonaceous opaques form well defined lamella several mm in width. Within these lamella the volume of carbonaceous opaques may exceed 55%.

Matrix carbonates is most commonly noted within the interstices within the dark carbonaceous lamella. Matrix calcite/iron carbonate has a much weaker distribution in quartz rich lamella.

Quartz rich lamella provide the primary compositional variation within this unit. Quartz has often been deformed into ribbon banded elongate grains.

Muscovite, apatite and clinozoisite have no preferred distribution within this rock mass and are noted as very small disseminated grains throughout the matrix.

Mag Suscept: .02 SI units.

Structural Characteristics - Deformational Style:

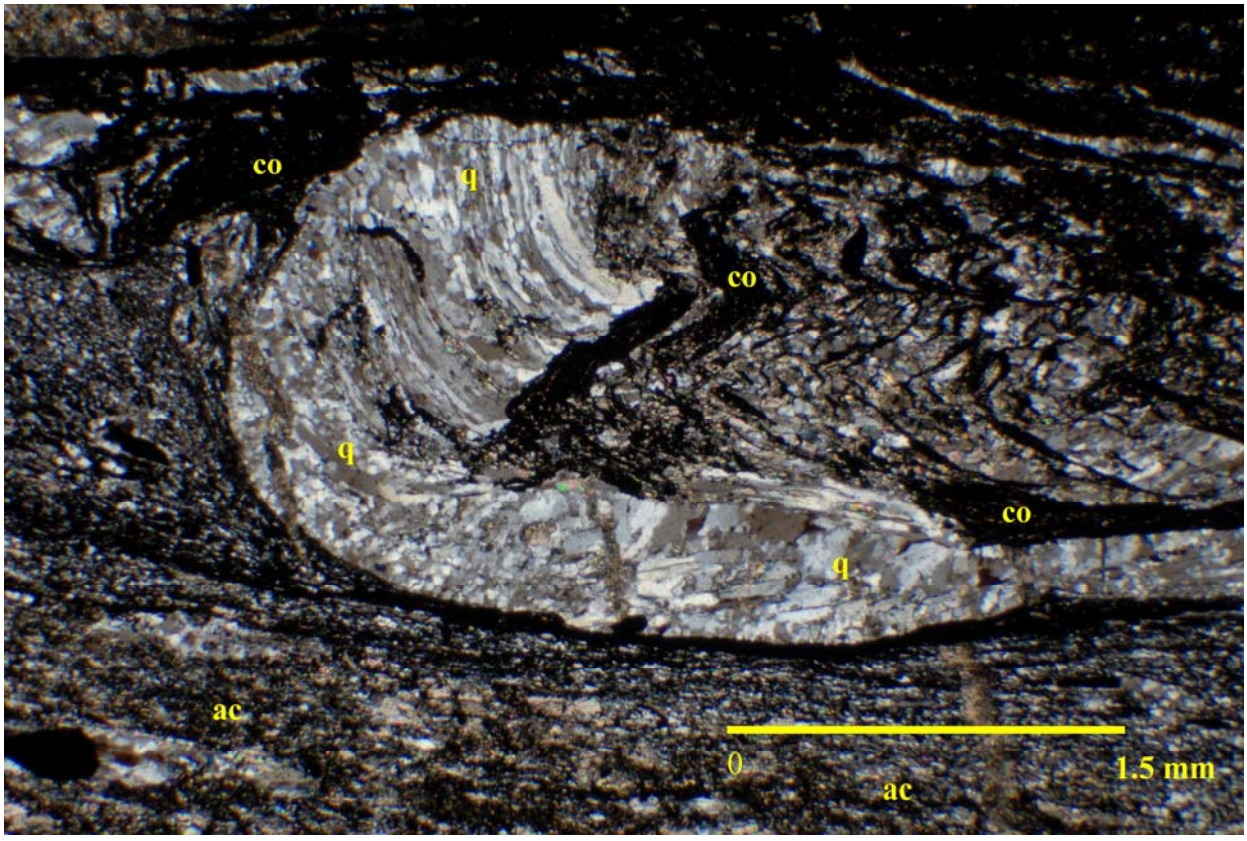
Planar aggregates of carbonaceous opaque material and elongation of matrix quartz grains form an early S1 fabric (D1 deformation). This may be an early compaction fabric which may not be an axial planar fabric. This fabric is deformed into moderately tight

folds with a much weaker penetrative fabric (S2 – D2 deformation) sometimes noted forming at about 15 degrees to the early fabric. Primary compositional layers may be noted at near orthogonal angles to S1 fabrics. This relationship suggest that the sample has been collected from near a fold closure.

Vein Paragenesis:

Two vein sets, of distinct generations, are clearly identified:

1. An early quartz sulphide vein set which pre-dates the small scale isoclines which characterize D2 deformation. Most of these sulphide veins appear to be quartz – sulphide extensional veins.
2. A late calcite only, low sulphide vein set. These veins cut all early fabrics and are likely to have formed late in the regional deformation history. They do not appear to have a sulphide association.
3. In both sulphide-quartz and late calcite veinlets, no significant alteration halos are identified external to vein margins.



Sample 09-40 @ 143.5: The dark black opaque minerals are carbonaceous opaques which form the dominant penetrative, S1 fabric. This fabric has itself been deformed into tight folds locally with transposed limbs. The matrix is composed dominantly of fine grained iron carbonates interposed with lesser quartz grains. The central quartz veinlets have deformed in manner similar to the small fine grained sulphide veinlets noted within this sample. Abbreviations: q – quartz, ac – iron carbonates, co – carbonaceous opaques. Transmitted light, crossed polars, 25 x.

Sample 09 – 37 @ 63.5 Polished Thin Section.

Protolith: Ankeritic Sulphide Vein – Dolomitic Replacement.

No primary textures are preserved in this sample. The sample has likely been taken from an iron carbonate vein or a completely iron carbonate replaced limestone.

Mineralogy:

Mineral	*Abundance*	*Grain Size*
Ankerite/dolomite:	95-97%	0.5 – 3.0 mm
Pyrite:	3.0 – 3.5%	.5 – 2.5 mm
Hematite:	0.5%	< 0.25 mm
Brown Opaques:	2%	< 0.15 mm
Quartz:	0.5-0.75%	0.1-0.25 mm

Coarse iron-magnesium carbonate grains fill the field of view. The grains have stable triple junction boundaries, show no significant evidence of stylolitic cleavages and contain no, or very limited carbonaceous opaque material.

Pyrite grains contain abundant carbonate inclusions but no other contaminants. The optical properties of these pyrite grains suggest they are not significantly zoned. The absence o any gangue material, other than iron carbonates, proximal to the sulphides may suggest that all of the iron carbonates are secondary.

Hematitic is constrained only to small micro-fractures.

Quartz is noted as very small angular inclusions between iron carbonate grain boundaries and to lesser extent as cleavage parallel quartz rich inclusions.

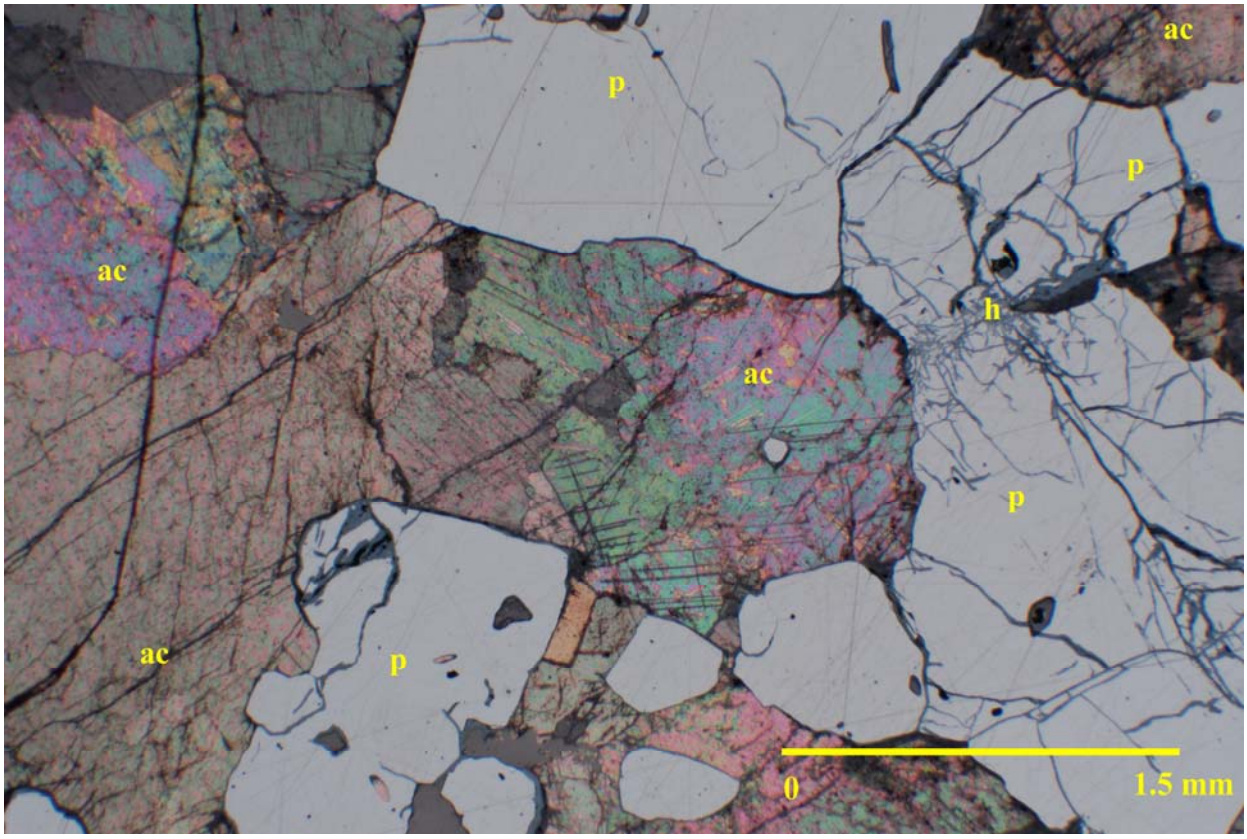
Mag Susceptibility: 0.06 SI units. The sample is essentially non-magnetic.

Deformational Style:

The width of the twin planes and the form of the twin planes within the iron carbonates of this sample can be used as a strain and temperature gauge. The twin planes within these grains are often referred to as Type 1 twin planes. Type 1 twin planes within calcite are thought to form at temperatures of less than 200 C^{o}. *These are very approximate estimates.* These are low temperature twins and this formation of this mineral likely post-dates regional metamorphism. The flanks of the pyrite grains display no evidence of pressure solution shadows which also supports the relatively late and low temperature formation of this mineral.

Inclusion Morphology:

Calcite grains are crowded with small < 10 micron two phase liquid dominant inclusions. These are low salinity inclusions whose morphology suggests they have formed at less than 130 – 300 Cº. These may be both primary and secondary in origin.



Sample 09 – 37 @ 63.5. The sole sulphide phase in this rock is coarse grained euhedral pyrite. The sample has been weakly oxidized and is now cut by small grey iron oxide microveinlets. Coarse grained pink to buff iron carbonates form the remainder of the field. Penetrative fabrics in this sample are weak. Most of the twin planes preserved in the calcite in this sample are narrow single lamella planes or are low temperature Type I deformation twins. Abbreviations: ac – iron carbonates, p: pyrite, h: hematite or iron oxide. Weak transmitted light, strong reflected light, 25x.

Sample SC09-04 @266.8 Standard Thins Section: No Opaque Mineral Determinations.

Protolith: Calcareous, Moderately Sericitized Interbedded Siltites and Lithic Wackes

The rock unit is well defined by mm scale compositional layers which contain a dominance of silt sized, well sorted fragments. Very sporadic well round 0.5 – 20 mm lithic fragments are also noted. No younging directions are observed within this sample although subtle changes in quartz grain content and sulphide laminations could be used, in orientated samples, to confirm younging directions.

The small oval "fragments" noted within this unit are generally porphyroblasts, quartz-biotite overgrowths nucleating around sub mm scale grains.

Mineralogy:

Mineral	*Abundance*	*Grain Size*
Sericite:	45-50%	0.1 – 0.25 mm
Biotite:	8-10%	0.1 – 0.25 mm
Quartz lithics	4-5%	0.2 – 0.4 mm
Plagioclase (corroded)	1.0%	0.5 mm
Matrix quartz	20%	0.1 – 0.25 mm
Iron Carbonate:	3-3.5%	< 0.25 mm
Opaques (sulphide-oxide)	4-4.5%	0.25 mm
Opaques (carbonaceous)	3-5%	< 0.5 mm
Apatite:	trace	< 0.2 mm
Clinozoisite-epidote	< 0.25%	< 0/2 mm

Sericite and biotite form well defined compositional layers. Sericite is noted as very fine grained microliths and biotite forms stubby, medium brown weakly aligned mineral grains. The volume of sericite in this sample suggests that the protolith would likely have been clay, not quartz, rich.

Opaque mineral grains may form diffuse, poorly defined compositional lamella but are more commonly noted within lozenge shaped, up to cm scale, sericitized clasts. Trigonal grain forms on sulphide – oxide opaques, along with magnetic susceptibility data strongly suggests that approximately half of these opaques are likely magnetite group.

The sample reacts weakly to cold HCl and strongly to warm HCl which implies that the very fine grained carbonate phases, commonly flanking oxide or sulphides, are iron-magnesium, not calcium, carbonates.

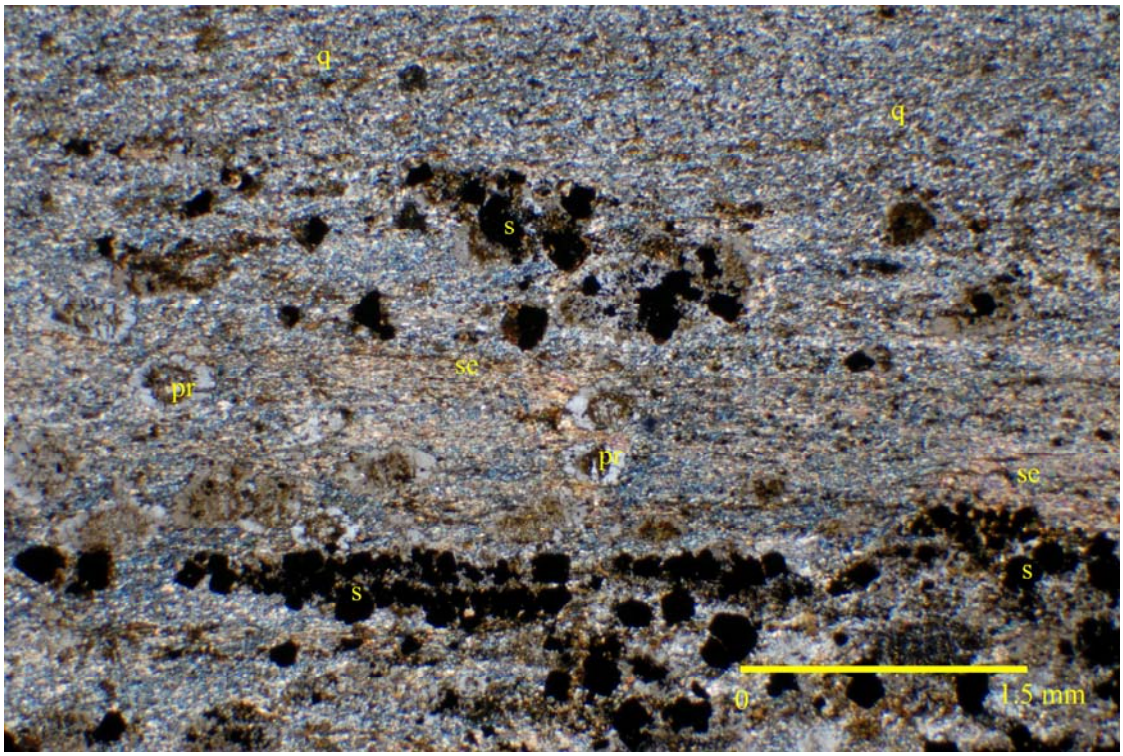
Matrix quartz is most common as discrete quartz grains or as a reaction rim to coarser clasts. Quartz rich lamella are generally absent.

Clinozoisite is distributed as small disseminated grains within oval shaped porphyroblasts. Apatite is noted at trace levels throughout the matrix.

Mag Suscept: 13.3 SI units.

Deformational Style

The rock has a well defined penetrative early S1 foliation formed by the alignment of sericite and biotite. These minerals, as well as the sulphide oxide phases, may define a regional metamorphic assemblage: sericite – biotite – magnetite. In this sample no post S1 deformational processes are identified. S1 fabrics are forming at very low angles, less than 5º to primary compositional layers. The sample has been taken distal to any major fold closures. Quartz is forming well defined early corona structures which is likely synchronous with the formation of S1 fabrics.



Sample SC09-04 @266.8. The upper half of the field of the field is dominated by very fine grained quartz, often less than 0.2 mm in size. Compositional layers in the lower half of the field of view contains bands and laminations of fine grained sericite and quartz. Black opaques, both sulphide and oxide phases, are preferentially concentrated in the lower half of the field of view. Several small porphyroblasts “pr” are identified throughout the matrix and are well defined by the corona structures of quartz which nucleates around central amorphous aggregates of calcite and sericite. All sulphide-oxide phases pre-date, or are synchronous with, the formation of S1 fabrics and are very likely early. Abbreviations pr: porphyroblasts, q: quartz, se: sericite, s: sulphide. Transmitted light, 25x.

Sample 09 – 49 @ 266.1: Standard Thin Section – No Opaque Mineral Determinations

Protolith: Ankeritic Pyritic Mudstone

The protolith of this rock is strongly pyritic, ankeritic or dolomitic mudstone. The protolith is composed dominantly only of very fine grained iron carbonates, diagenetic pyrite (?) and likely a carbonaceous opaque. The rock composition is beginning to move into the field of a micritic sulphidic limestone. The rock is poorly compositionally laminated and appears massive.

Evidence for decalcification textures are inconclusive.

Mineralogy:

Minerals	*Abundance*	*Grain Size*
Micritic iron carbonates	30-35%	< .2 mm
Matrix opaques	40-45%	< .2 mm
Amygdaloidal quartz	5-6%	1.5 – 5 mm.
Amygdaloidal iron carbonates	2-3%	.25 - .5 mm
Sulphide – oxide replacements	10-12%	.5 – 1.5 mm
Sericite – muscovite:	1-1.5%	< 0.25 mm
Sphalerite	trace	< 0.2 mm

Two mineral domains are identified:

1. Micritic dolomitic carbonates are noted as very fine grains and disseminations within the dense black carbonaceous matrix. Very fine grained carbonaceous opaques are found within this domain. No, or very weak, stratification of carbonaceous muds are noted in this domain.
2. Oval vugs or replacements. Much of the quartz, euhedral sulphides/oxides, and coarser grained iron carbonates are contained within these oval shaped replacement zones.

Note: Although sphalerite is identified this has been done only under transmitted light. Small sphalerite grains appear to locally core quartz-carbonate amygdales.

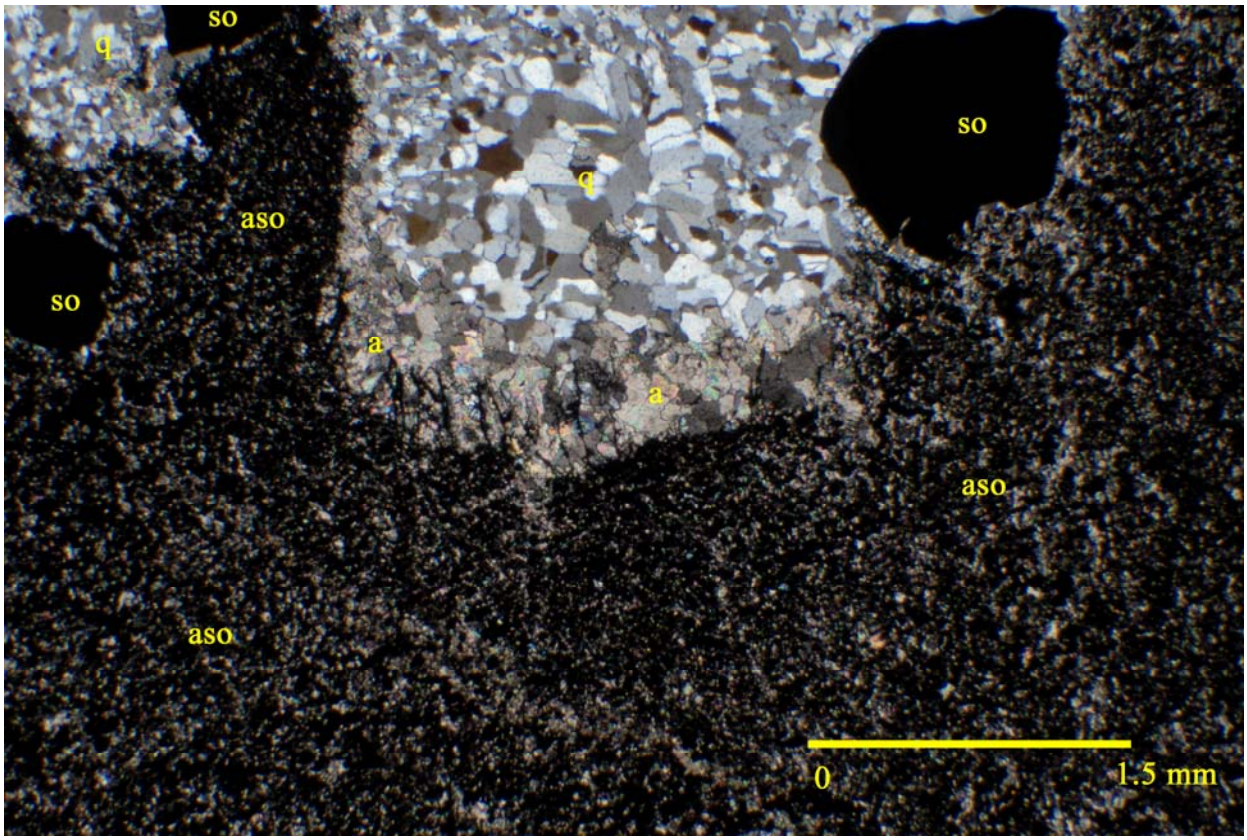
Mag Susceptibility: 0.04 SI units.

Deformational Style:

Pressure shadows are poorly developed within the quartzitic amygdales and overall this essentially bi-mineralic rock displays only a poorly developed penetrative fabric. Deformation twins within calcite are generally low temperature type 1 twins with only rare and poorly developed Type II twins developed. Rock deformation temperatures

between 150 to 300º are inferred. Calcite fiber growth within the amygdales is occurring perpendicular to vesicle walls and exhibits no evidence of rotation or shear strain. All quartz grains within the vesicles have been extensively re-crystallized, stable polysuturing trigonal grain boundaries are common.

Overall penetrative fabrics and or primary compositional layers are poorly developed and are best noted in the macroscale (off-cut) samples. The presence of preserved primary fabrics within this sample suggests that the minute fine grained sulphide phases, which form the bulk of the matrix of these samples may be primary in origin, and have not been introduced post diagenesis.



Sample 09 – 49 @ 266.1. The dominant very fine grained dark brown-black matrix forming the bulk of this field is composed of a bi-mineral assemblage of nearly equal parts of black opaques (sulphide-oxides) with interstitial iron carbonates. Within the matrix the average grain size of opaque mineral phases is less than 0.1 mm, similarly the average size of matrix carbonates is also under 0.2 mm. The iron carbonate rind which forms externally to the quartz filled amygdales may represent a narrow alteration front to these vesicles. All quartz vesicles are strongly polysutured. Sulphide aggregates in this sample have non-planar boundaries and are not related to shear or oblique extensional vein formation. Abbreviations, also: ankerite-sulphide-oxide, q: quartz, a: ankerite or iron carbonate, so: sulphide-oxide. Transmitted light, crossed polars,25x.

Sample 09 – 40 @142.65 Standard Thin Section No Opaque Determinations

Protolith: Calcareous Lithic Wackes – High Strain Zone

Within the same sample strong, structurally related variations in rock composition are noted. The lower third of the sample is a fine grained tan to buff sericite quartz rock with well developed strain fabrics and potentially grain size reduction. Primary fabrics are poorly preserved within this portion of the sample. The upper two thirds of the slide is medium grained carbonate sericite rock with very weak grain size reduction and generally poorly alignment of sericite mineral grains.

Mineralogy:

Mineral	**Abundance**	**Grain Size:**
Matrix		
Sericite – muscovite	55-60	0.2 – 1.0 mm
Calcite-ankerite:	25-30%	0.2 – 0.5 mm
Quartz	3-4%	0.1 – 0.25 mm
Biotite	2-2.5%	< 0.2 mm
Carbonaceous Opaques	2-3%	< 0.2 mm
Sulphide-Oxide Opaques	3.5 – 4.0%	0.75 – 1.5 mm
Vein Mineralogy:		
k-feldspar:	0.5%	< 0.1 mm
quartz:	0.5-0.75%	< 0.1 – 0.3 mm
ankerite-iron carbonates	0.75% - 1.0%	0.1 – 0.4 mm
euhedral sulphides/oxides	< 0.25%	0.1-0.25 mm

The muscovite-sericite in this sample is often pale pink to green in plane polarized light and moderately pleochroic. This suggests that these micas which are distributed throughout the rock unit may be phengites. Coarse grained sericite is best noted as non-aligned disseminations in the low strain portion of the sample with much finer grained sericite forming part of the main rock fabric in the high strain portion of the sample.

Biotite is noted as diffuse aggregates and disseminations in both the low and high strain parts of the sample.

Quartz is noted dominantly within well formed pressure shadows to euhedral sulphide/oxide grains. This mineral is also identified as very small aggregates or disseminations throughout the rock matrix.

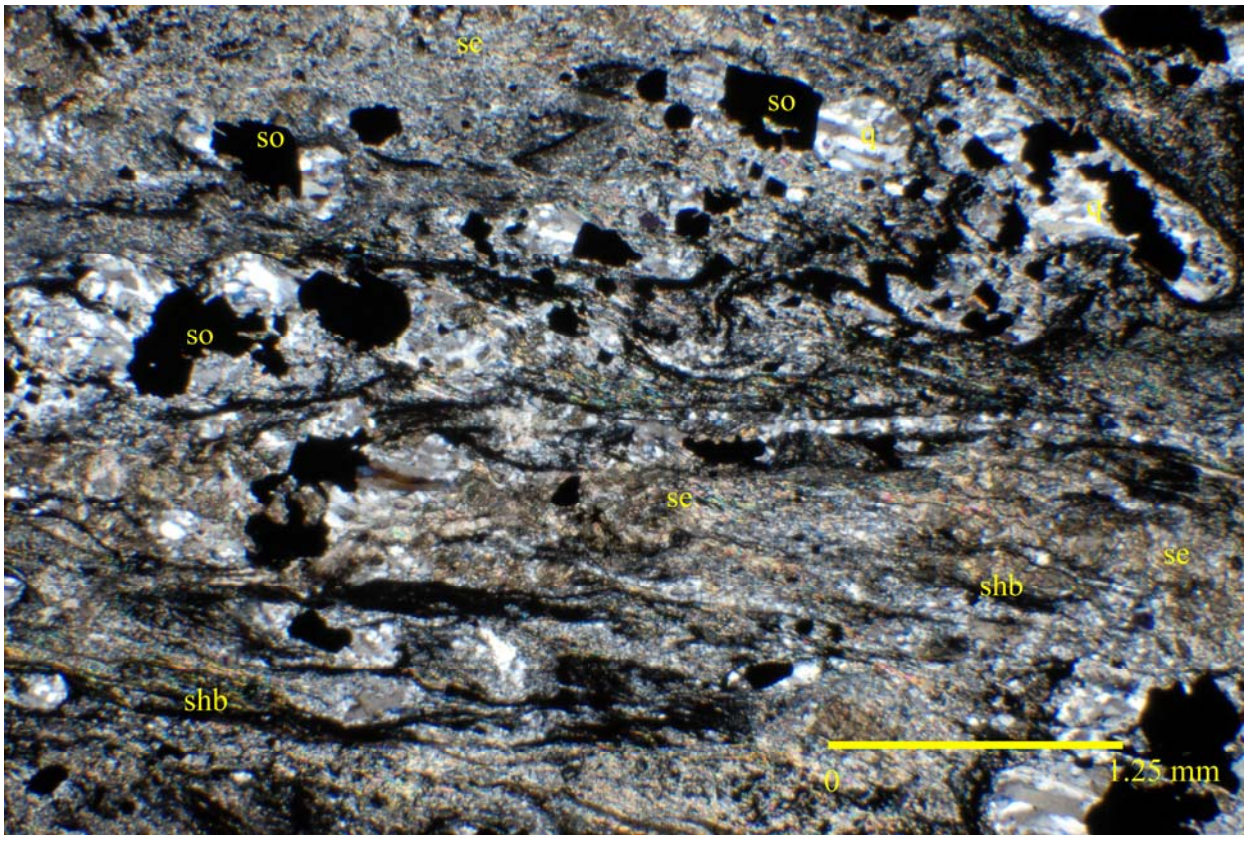
Iron-carbonates and calcite are closely inter grown and are distributed throughout the rock matrix in both the high strain and low strain domain.

Very small, <0.1 mm grains of possible potassium feldspar are noted in the immediate envelopes to small quartz-carbonate grains.

Carbonaceous opaques from sub-mm compositional lamella and define the orientation of the main strain fabric in this rock. Euhedral sulphide-oxide aggregates are recognized in both the low and high stain portions of the sample and are forming without a significant vein association.

Note: a 2-3 mm wide foliation or shear parallel smokey grey quartz veinlet is forms the boundary between high stain zone rocks and low strain rocks; with both strain types noted within this sample. An elevated percentage of sulphide-oxide opaques and formed in the low strain envelop to this portion of the sample.

Magnetic Susceptibility: 0.08 SI units.

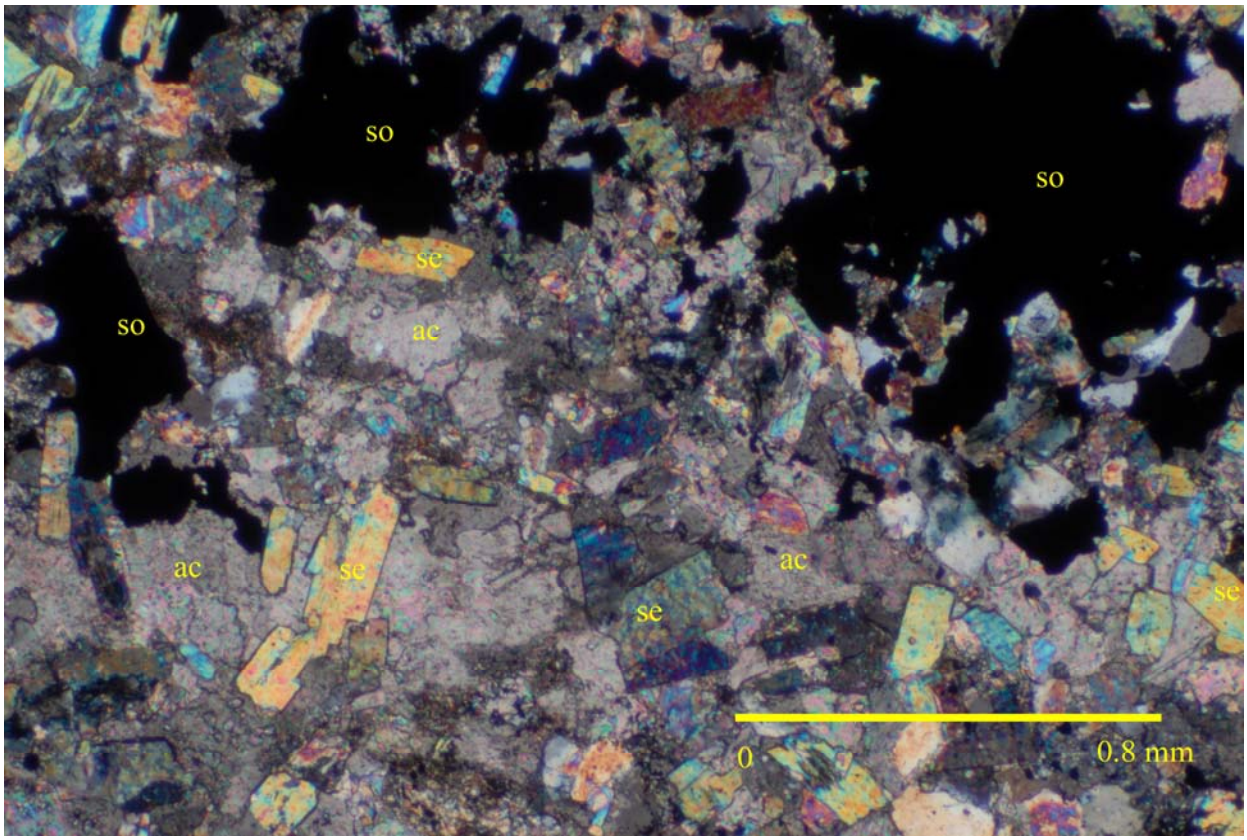


Sample 09 – 40 @142.65. Several lines of evidence clearly support the existence of a high strain zone within portions of this sample. The sample contains abundant well developed shear fabrics (shb) and modest to poorly present rotated quartz pressure solution tails flanking black opaque mineral grains. In comparison to the following plate, the average grain size in this plate averages less than 0.1 mm, grain size reduction within this rock environment is likely. Abbreviations shb: shear band, se: sericite, so: sulphide-oxide, q: quartz. Transmitted light, crossed polars, 25x.

Deformational Style

The strong variation in strain fabric is clearly noted in the two plates which accompany this petrographic summary. Some of the variation within this sample is likely to reflect primary differences in bulk rock composition. High strain fabrics and grain size reduction are best displayed in a sericite – quartz rich protolith. Weak rotational fabrics are noted within this portion of the sample. Non-aligned coarse grained sericites with significantly elevated matrix calcite flank high strain fabrics and may be an alteration halo to this deformation zone. It's also of note that significantly elevated sulphide contents may form in an iron carbonate-calcite rich halo to this high stain zone.

In the high strain portion of the rock, early planar fabrics are roughly orthogonal to later penetrative planar fabrics. Those kinds of orthogonal relationships between cleavage and primary compositional layers will occur in the hinge lines of fold structures. The scale of this fold cannot be determined from the petrographic data.



Sample 09 – 40 @142.65: This photomicraph is separated by less than 10 mm from the photomicrograph illustrated in the previous photomicrograph. The absence of planar penetrative fabrics in this plate conclusively demonstrates the very constrained nature of high strain fabrics in this rock environment. Noteworthy is the absence of strain shadows flanking sulphide/oxide grains and the non-aligned nature of euhedral sericite-muscovite lathes. Much of the rock matrix is composed of anhedral aggregates and massive of iron carbonates. Abbreviations: ac – ankerite calcite; se – sericite, so – sulphide-oxide. Transmitted light, crossed polars, 50x.

Sample 09-04 @ 257.9 Standard Thin Section No Opaque Mineral Identification

Protolith: Carbonaceous Lithic Wackes

The rock unit represents a slightly coarser grained variation of the finer grained siltites commonly noted within this petrographic series. The unit is well characterized by abundant elongate 0.5 x 4.5 mm dark grey clasts and wispy pale cream silica-sericite aggregates. The sample locally contains distinctive definitive lithic fragments. The rock may be classified as a fine grained lithic wacke.

Lithic fragments in this sample are highly elongate to cuspate averaging 0.5 x 3.0 mm. The fragments form three principle groups including dark black lithic fragments, highly elongate pale cream strongly sericitized fragments and lesser clean quartz grains.

The sample contains no significant compositional variations or primary compositional lamella.

Mineralogy:

Mineral	*Abundance*	*Grain Size*
Biotite	20-25%	0.25 mm
Sericite	35-40%	<.1 – 0.25 mm
Quartz	8-10%	0.2 mm
Sulphide-Oxide Opaques	10-12%	0.2 – 0.4 mm
Clinozoisite-epidote	1-1.5%	< 0.15 mm
Zircon	trace	< 0.1 mm
Detrital plagioclase	< 0.25%	0.2 mm

Note: Iron or calcium carbonates are not identified within this sample. Variations in the size and percentage of biotite within compositional layers may reflect primary differences in rock bulk composition. Biotite grains are all forming parallel to S1 fabrics and are commonly enhanced in the pressure shadows to small clasts.

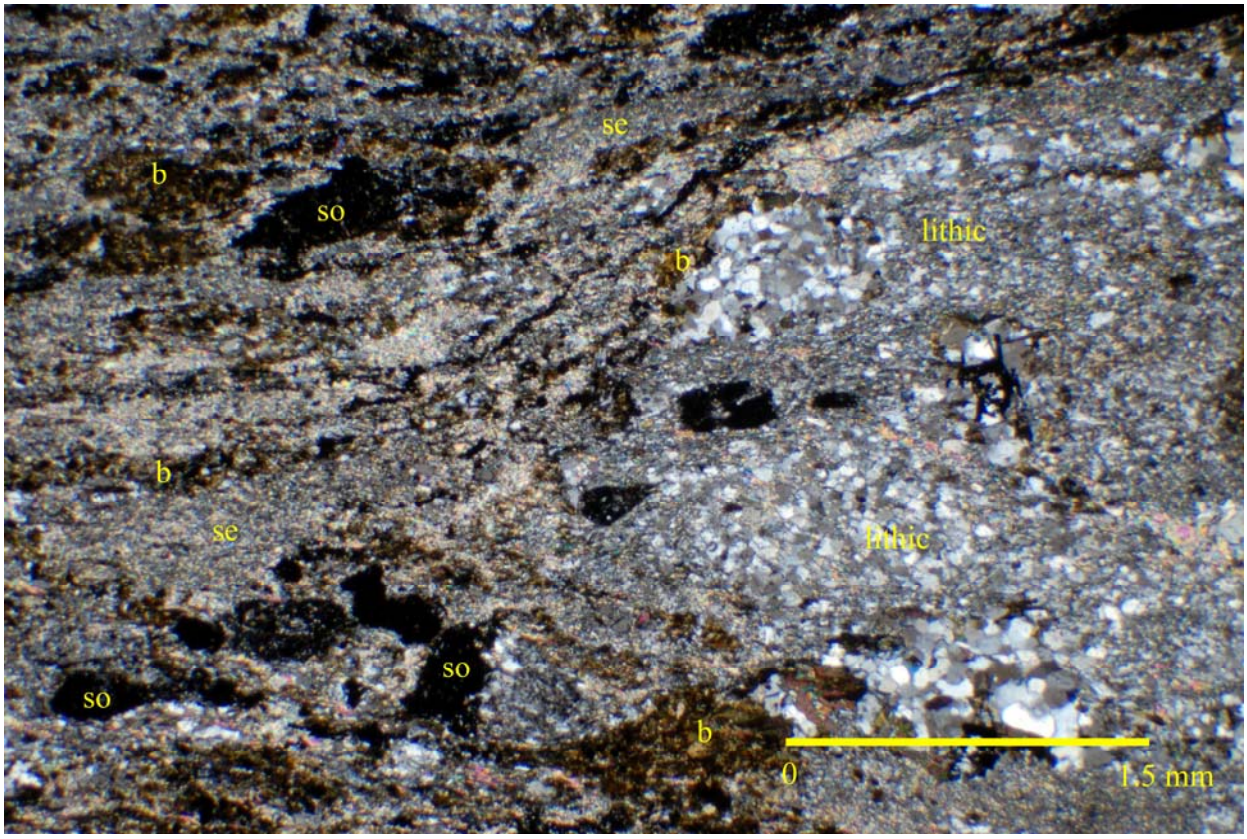
Sericite is one of the principle components of the mm to cm scale clasts noted throughout this section. Very fine grained sericites define the form of lozenge shaped mm to cm scale fragments. Prior to metamorphism, these fragments may have originally been clay rich lithic fragments.

Black opaques are distributed uniformly throughout the interval and are forming without a distinctive vein association. The strength of the magnetic susceptibility measurements for this sample would strongly suggest that at least of these opaques are either magnetite or pyrrhotite.

Magnetic Susceptibility: 5.77 SI units.

Deformational Style:

The rock contains a single pronounced penetrative S1 fabric. Rotational fabrics are not identified. Both biotite and sericite are forming within this penetrative surface. Non aligned sericites – biotites are rare. Rotational fabrics and or quartz rich pressure shadows are poorly developed.



Sample 09-04 @ 257. A mm scale lithic fragment is identified in the right half of this photomicrograph. This lithic fragment pre-dates the formation of S1 fabrics with S1 fabrics being both deflected and traversing this fragment. S1 fabrics are well defined by the orientation of aligned biotite grains. Sulphide-oxide grains are uniformly distributed throughout the matrix with no vein association. Abbreviations so: sulphide/oxide, lithic: lithic fragment, se: sericite, b: biotite. Transmitted light, crossed polars, 25x.

Sample 09-44 @ 173.25 Standard Thin Section No Opaque Mineral Determinations.

Protolith: Strongly Foliated Sericitized Quartzitic Siltite

The sample has been cut from a strongly foliated, well compositionally laminated, fine grained quartzitic siltite. Compositional laminations are defined by sericite rich mm to sub mm scale lamella intercalated with mm scale quartz rich and lithic rich lamella.

Mineralogy:

Minerals	*Abundance*	*Grain Size*
Matrix		
Sericite:	40-43%	<.1 – 0.5 mm
Biotite-Phengite	5-7%	.1 - .25 mm
Quartz	40-42%	.25 – 1.0 mm
Iron Carbonates	0.25%	.2 mm
Grossular	0.5%	.1 - .3 mm
Sulphide-oxide opaques	4-5%	.25 – 1.25 mm
Amorphous iron oxides	1-2%	.1 - .5 mm
Fe-Chlorite	0.25%	<.1 - .25 mm
Clinozoisite-epidote	0.2%	.2 - .5 mm
Vein		
Quartz	2-3%	.25 – 0.75 mm
Grossular	.5%	0.1 – 0.3 mm
Orthoclase	0.25%	0.1 – 0.25 mm
Clinozoisite-epidote	.25-.5%	.2 - .5 mm

Two micas are likely present in this sample. Very fine grained sericites, form mm scale compositional lamella. These lamella are locally flanked by a coarser grained mica and one with a moderate brown green color and significantly pleochroic under plane polarized light. The mineral is most likely to either be a low Fe biotite or a phengitic mica. The small size of these grains does not permit more accurate petrographic identification.

The small veinlet in this sample is a foliation discordant, mm scale veinlet, which is locally flanked by a weak orthoclase-sericite halo. Highest sulphide concentrations are associated with fine grained gritty quartzitic lamella. Sericitic lamella have lower net sulphide concentrations.

Anomalous blue interference colors on rare chlorite grains suggest that this is an Fe not Mg chlorite. Chlorite is only noted as a rare infill mineral noted adjacent to sulphide/oxide aggregates.

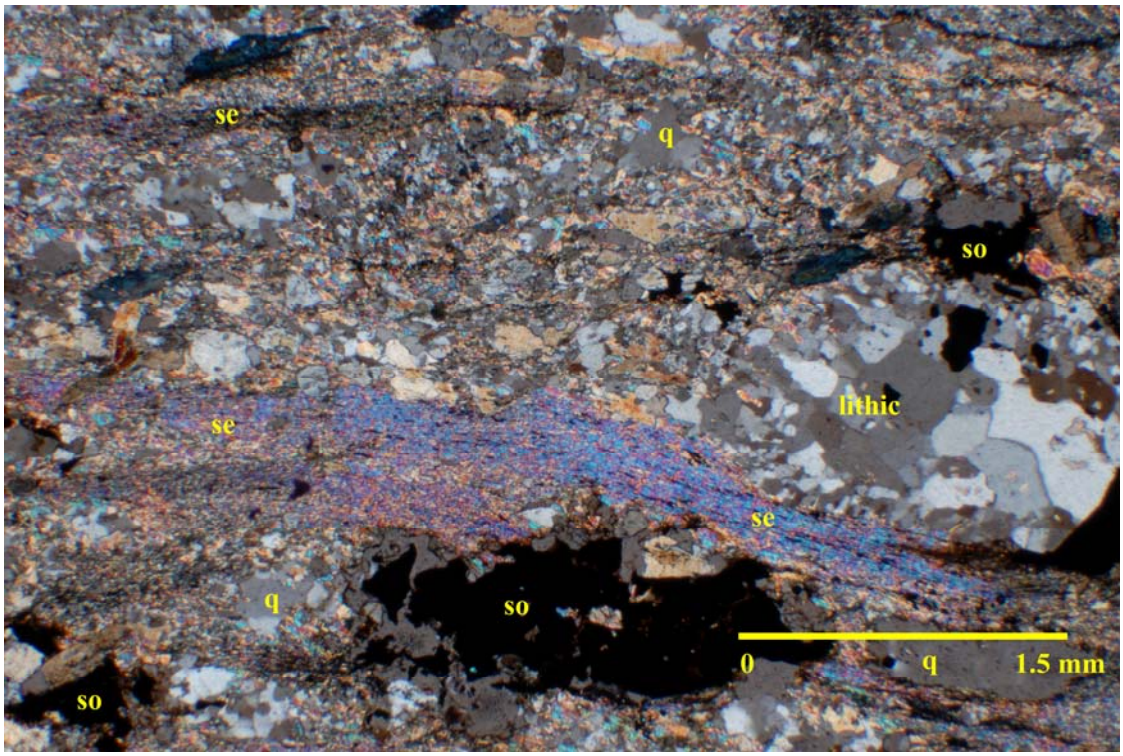
Small poorly formed grossular garnet grains occur throughout the matrix of the sample and form part of the regionally stable metamorphic assemblage. Clinozoisite-epidote grains are noted within the rock matrix but are most common flanking the small extensional veinlet noted within this sample.

Sulphide-oxide phases are preferentially localized to slightly coarser grained, gritty, quartz rich lamella. Strongly sericitic lamella have lower sulphide oxide contents.

Magnetic Susceptibility: 1.31 SI units.

Fluid Inclusion Morphology: 10-20 micron liquid dominate, low salinity inclusions. Solid phases within primary inclusions not identified.

Deformational Style: The sample displays a strong penetrative S1 fabric but weak evidence for rotational fabrics. Shear bands are not recognized. Primary textural preservation is poor with only rare lithic fabrics and quartz grains recognizable as primary fabrics. All quartz grains have polysutured internally recystallized surfaces.



Sample 09-44 @ 173.25: The plate illustrates several key parameters of this rock unit including: 1. The presence of early poly-sutured quartz rich lithic clasts. Clasts have poorly developed pressure solution shadows. 2. An abundance of well formed fine grained sericitic lamella. 3. Foliation parallel weakly elongate sulphide-oxide grains forming without an obvious vein association and without associated alteration halos. Small grossular garnets are occasionally noted but are not identified within this plate. Abbreviations, so: sulphide-oxide, lithic: lithic fragments, se: sericite, q: quartz. Transmitted light crossed polars, 25x.

Sample 09-54 @ 193.06 Standard Petrographic Section No Opaque Mineral Determination.

Protolith: Carbonatized - Sericitized Quartz-Feldspar Porphyritic Intrusion (Vesicular Flow?)

Primary textural preservation is limited within this sample. The best evidence for the rock protolith is noted under plane polarized light. Under plane polarized light numerous angular sub-mm quartz-feldspar pseudomorphic aggregates are visible within the rock matrix. The same unit also contains quartz filled vesicles which would be permissive in a fine dyke rock but uncommon in larger intrusions. The same textural relationships could be permissive in flow sequences.

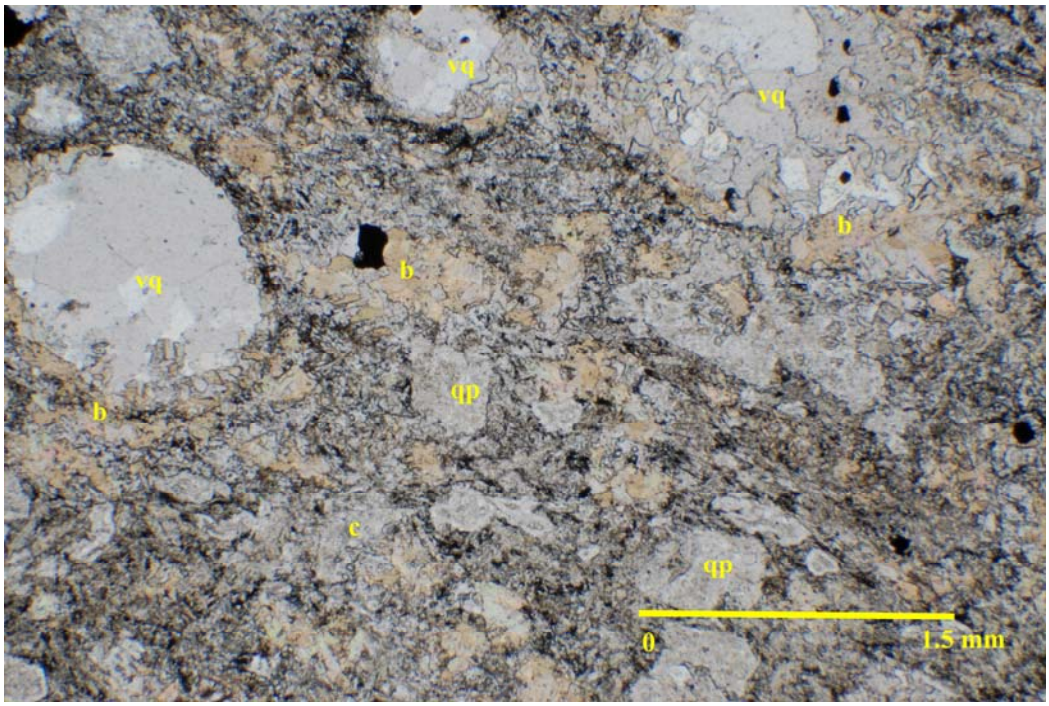
Mineralogy:

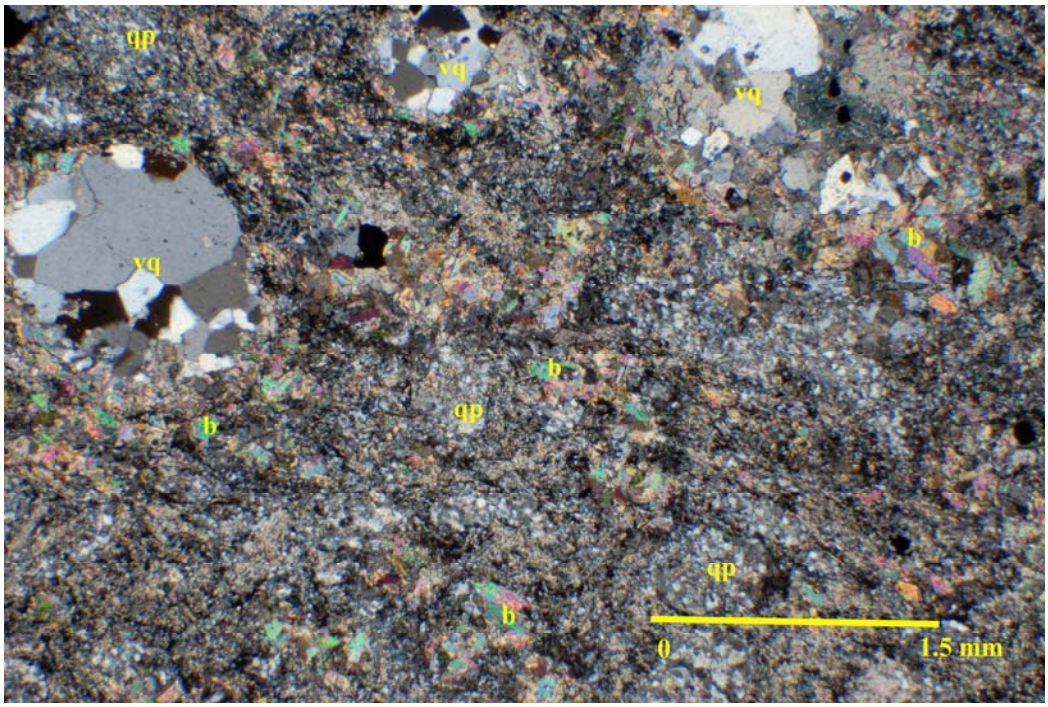
Mineral	*Abundance*	*Grain Size*
Matrix:		
Biotite (phlogopite)	30-35%	0.1 – 0.5 mm.
Calcite:	10-11%	0.25 mm
Potassium Feldspar	12-14%	0.1 - 0.3 mm
Quartz	20-22%	0.1 – 0.75 mm
Chlorite	0.5-0.75%	0.2 mm
Rutile	trace	< 0.1 mm
Black opaques	10-12%	< .1 – 0.7 mm
Vein		
Calcite	10%	.25 - .5 mm
Quartz	3-4%	.1-.25 mm
Chlorite	2%	.1 - .25mm
Biotite	.5%	.1 - .25

Black opaques within this sample are likely to be of two principle types including red-brown iron oxides within the rock matrix and disseminated sulphide grains within the matrix and within, and flanking, small calcite-quartz veins.

The main sheet silicate phase in this sample is likely phlogopite, an end member biotite. This distinction is based on the pale pinkish green to light brown pleochroism of this mineral which is generally much lighter than that noted in biotite. Fine grained potassium feldspars are noted throughout the matrix, most of the petrographic data would suggest that these are secondary in origin. Biotite are noted within the sample where they appear to be forming a halo to mm scale calcite-quartz veins. Biotite within these halos has been significantly corroded and retrograded to chlorite.

No primary or secondary feldspars are identified within this rock unit. Primary feldspar phenocrysts have all been replaced by a sericite – quartz assemblage.





Sample 09-54 @ 193.06. Textural features most indicative of a preserved felsic intrusion are best noted on the upper plate (plane polarized light) and less obvious on the lower plate (cross polarized light). Within these plates, square to rectangular mineral outlines are likely psuedomorphs or replacements of an earlier phenocryst phase. The pale brownish mineral under plane polarized light are likely phlogopitic micas. The mm scale oval quartz filled vesicles are lined by micas and may occasionally be cored by calcite as well as quartz. Abbreviations qp:

quartz plagioclase, vq: vesicular quartz, c: calcite, b: biotite. Plane and crossed polarized light, 25x.
Mag Susceptibility: 0.55 SI Units.

Vein Paragenesis:

Two distinctive vein sets are noted in this sample. Early quartz veinlets with biotite selvedges are cut by later calcite-quartz veins with weak chlorite-biotite haloes. Opaque, sulphide-oxide mineral phases may be associated with either vein form.

Fluid Inclusions: 20 – 30 micron coherent inclusions are noted within amygdaloidal quartz infill. The vast majority of this inclusions are liquid dominant with less than 5% by volume vapour phases. Crystalline (salts) phases are not identified.

Deformational Style: The sample has a weak to absent penetrative fabric and no pressure solution features or strain shadows are identified within it. All of the twin lamella in calcite grains are low temperature Type I twin planes.

Sample 09-54 @ 180.9. Standard Thin Section No Opaque Mineral Determinations.

Protolith: Microlithic Amygdaloidal Felsic Intrusion (Flow?)

This rock appears to be similar to sample 09-54 @ 193.06. The principle difference in the current sample is the much lower percentage of coarse grained phlogopite, higher percentage of fine grained sericite and an increased abundance of well formed elongate vesicles. The absence of mafic mineral phases suggests that the protolith of the unit is likely a fine grained felsic intrusion or potentially a vesicular flow. The absence of a well developed penetrative fabric in this rock would suggest that its emplacement significantly post-dates metamorphism and deformation of the enclosing fine grained sediments. This would support the interpretation of the unit as a vesicular dyke or sill like body and not an older flow sequence.

Mineralogy:

Minerals	*Abundance*	*Grain Size*
Sericite	55-60%	< 0.1 mm
Quartz	20-25%	.2 – 2.0 mm
Biotite (phlogopite)	4-5%	0.25 mm
Opaques	7-8%	0.1 – 1.0 mm
Ankerite	6-8%	.2 - .5 mm
Potassium Feldspar	0.5 – 1.0%	.1 - .4 mm

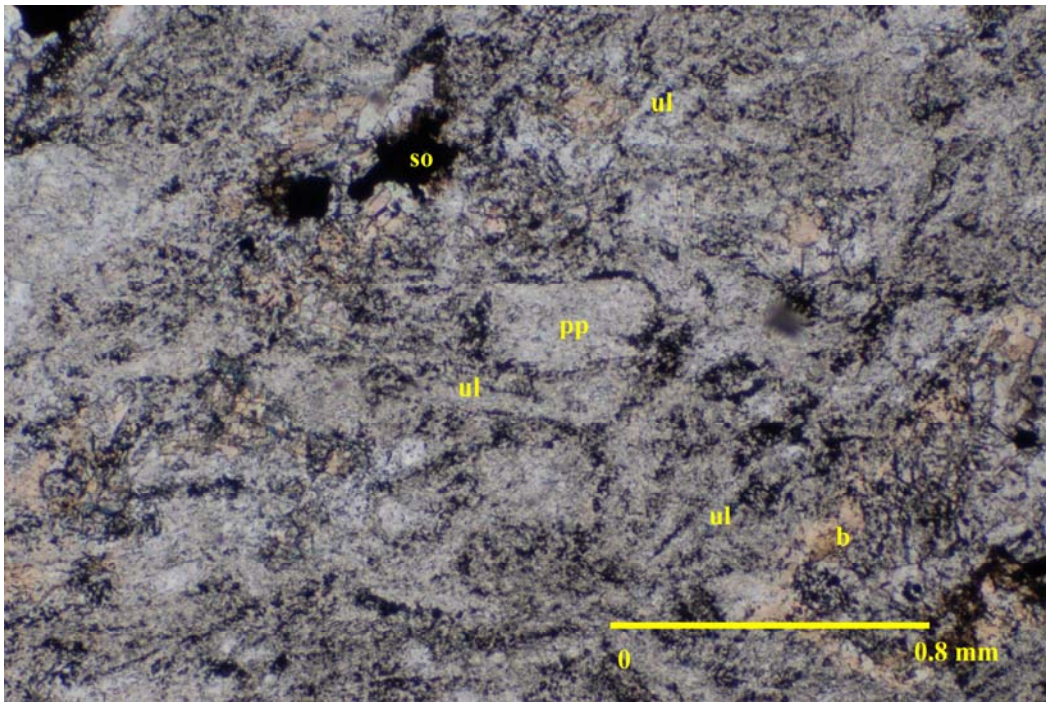
Much of the rock matrix is composed of very fine grained microlithic sericite. Phlogopite is generally noted rimming quartz filled vesicles and in one rare instance flanking a poorly formed quartz-calcite-biotite vein. Iron carbonates are most typically noted as small discrete aggregates also bordered by phlogopite. Primary feldspars are not preserved but their outlines may be interpreted from rare psuedomorphic casts.

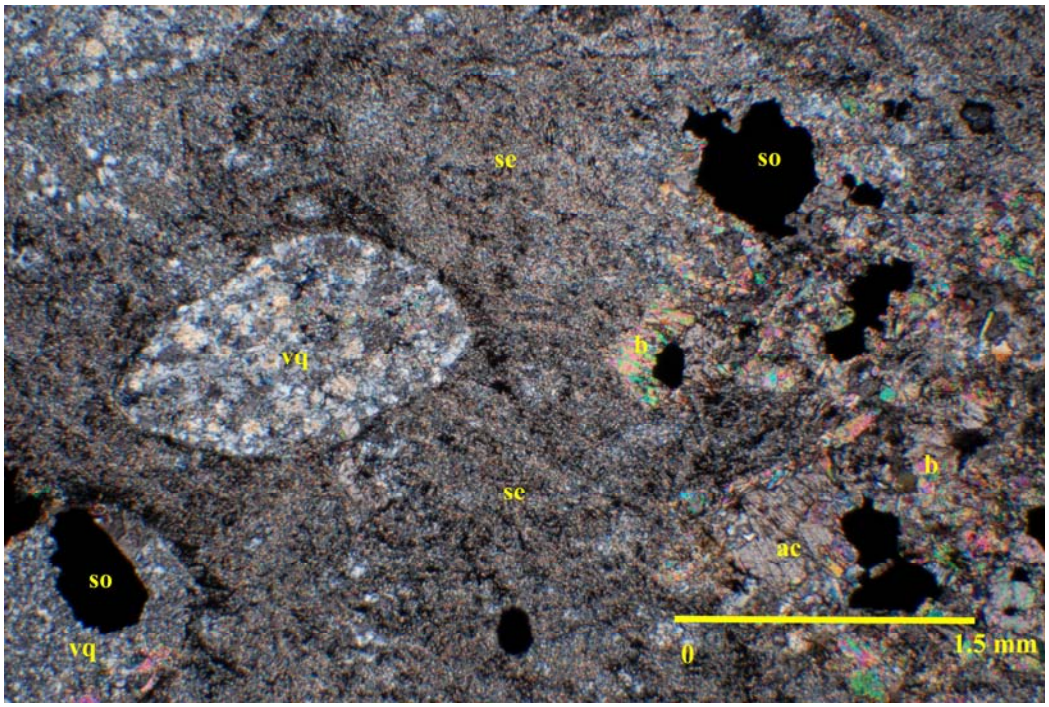
Opaque minerals have two predominate distributions and are noted as either coarser grained, up to 1.0 mm aggregates, often flanking vesicles or as much finer grained, 0.1 mm, matrix aggregates. Fine grained matrix opaques often form the boundaries of silicate mineral pseudomorphs.

Magnetic Susceptibility: 0.99 SI units.

Deformational Style: Although the rock lacks a strong penetrative fabric, the orientation and elongation of vesicles is highly anisotropic. These vesicles have an aspect ratio of approximately 1x4 width to length, with the long axis best displayed within the plane of the thin section.

No strain shadows are noted flanking euhedral black opaques. Both biotite and sericite are present as non-aligned aggregates.





Sample 09-54 @ 180.9. In the upper plate (plane polarized light, 50x) black opaque mineral phases outline early matrix microliths and coarser probable plagioclase pseudomorphs. In the lower plate (crossed polarized light, 25x) the well formed coarse quartz filled vesicles are noted embayed within a matrix of very fine grained sericite. Coarse opaque aggregates are associated with a coarser grained biotite or phlogopite mineral aggregates. Abbreviations vq: vesicular quartz, se: sericite, b: biotite, so: sulphide or oxide, ul: microliths, pp: plagioclase psuedomorph.

Sample 09 – 32 @ 96.35: Standard Petrographic Section, No Opaque Mineral Determinations.

Protolith: Chloritized Calcitic Wackes

This dull green grey, poorly laminated rock unit is, in this sample poorly bedded, and contains wispy, highly elongate aggregates of calcite, chlorite and lesser quartz. Carbonates appear to have formed very early suggesting that the protolith is a limy sediment; either a calcareous siltite or calcareous wacke. The rock column has received a significant amount of mafic input as evidence by the abundance of matrix chlorite. Input from a distal mafic tuffaceous source is probable.

Mineralogy:

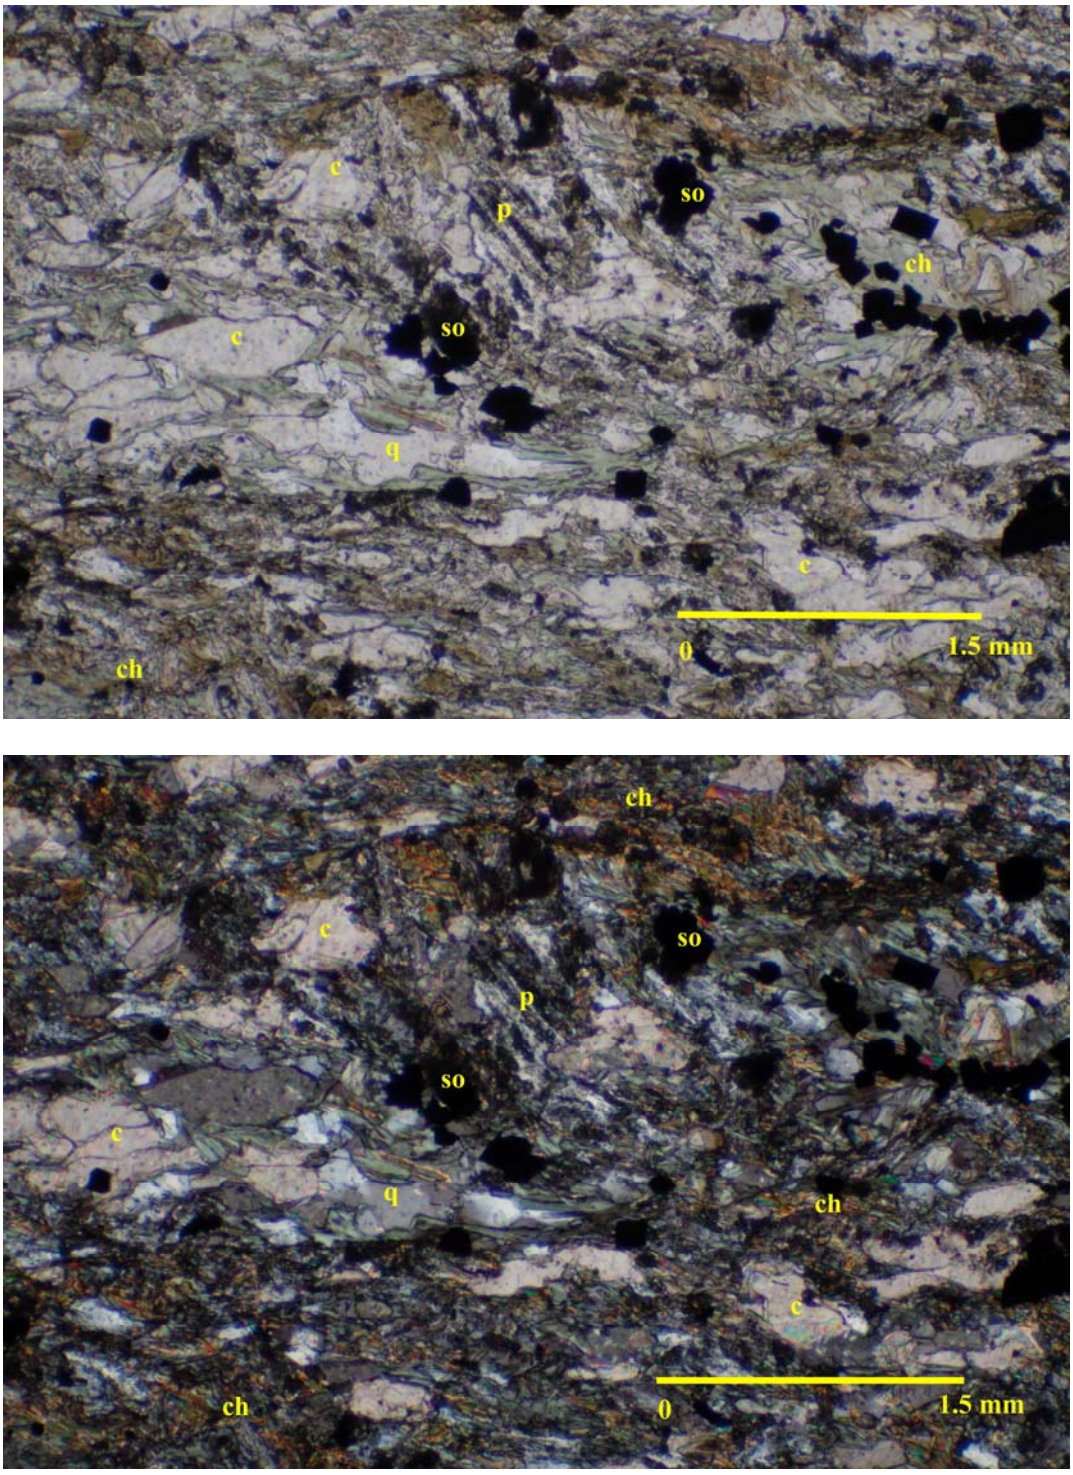
Mineral	*Abundance*	*Grain Size*
Matrix		
Calcite:	40-45%	0.2 – 0. 5 mm
Chlorite:	25-30%	0.15 – 0.5 mm
Biotite:	2-2.5%	0.1 – 0.3 mm
Quartz:	5-8%	0.1 – 0.25 mm
Plagioclase	trace	0.25 mm.
Opaques	6-8%	0.1 - .2 mm
Vein		
Calcite	3-4%	.3 – 75 mm
Chlorite	1%	.15 - .5 mm
Quartz	0.25%	<.1 - .2 mm

Opaque minerals in this sample pre-date the formation of minor calcite-chlorite veins. These veins contain virtually no opaque mineral phases and have only a relatively weak chlorite halo.

Chlorite and calcite are uniformly distributed throughout the matrix and are most often noted as cuspate elongate mm to sub mm aggregates.

Magnetic Susceptibility: 12.8 SI units. The strength of the magnetic susceptibility reading suggests that all opaques are likely to magnetite.

Deformational Characteristics: The rock unit has a profound penetrative fabric formed by the alignment of calcite and chlorite. A weak crenulation cleavage is noted forming at approximately 45º to the S1 fabrics. Calcite veins appear to be oblique extension veins and are forming at a high to S1 fabrics. Twin planes within matrix and vein calcite are dominantly Type II twins.



Sample 09 – 32 @ 96.35. Identical fields of view are shown in both the upper plate (plane polarized light) and the lower plate in (crossed polarized light). The cuspate form of matrix calcite is noted across the section. The photomicraphs display a single partially replaced plagioclase grain located in the centre of the field of view. All opaque mineral phases are uniformly disseminated throughout the rock matrix. Abbreviations are: ch: chlorite, q: quartz, c: calcite, p: plagioclase, so: sulphide-oxide. Transmitted light, plane and crossed polars, 25x.

Sample 09-52 @ 291.4 Standard Petrographic Section, No Opaque Mineral Determinations.

Protolith: Dolomitic Limestone

The rock sample has been selected from a massive dolomitic limestone. Although the sample may be collected from an iron carbonate replacement body, very limited data would support this interpretation. Within the sample very minor primary calcite grains persist. Diffuse grain size variation may suggest weak development of primary compositional layers.

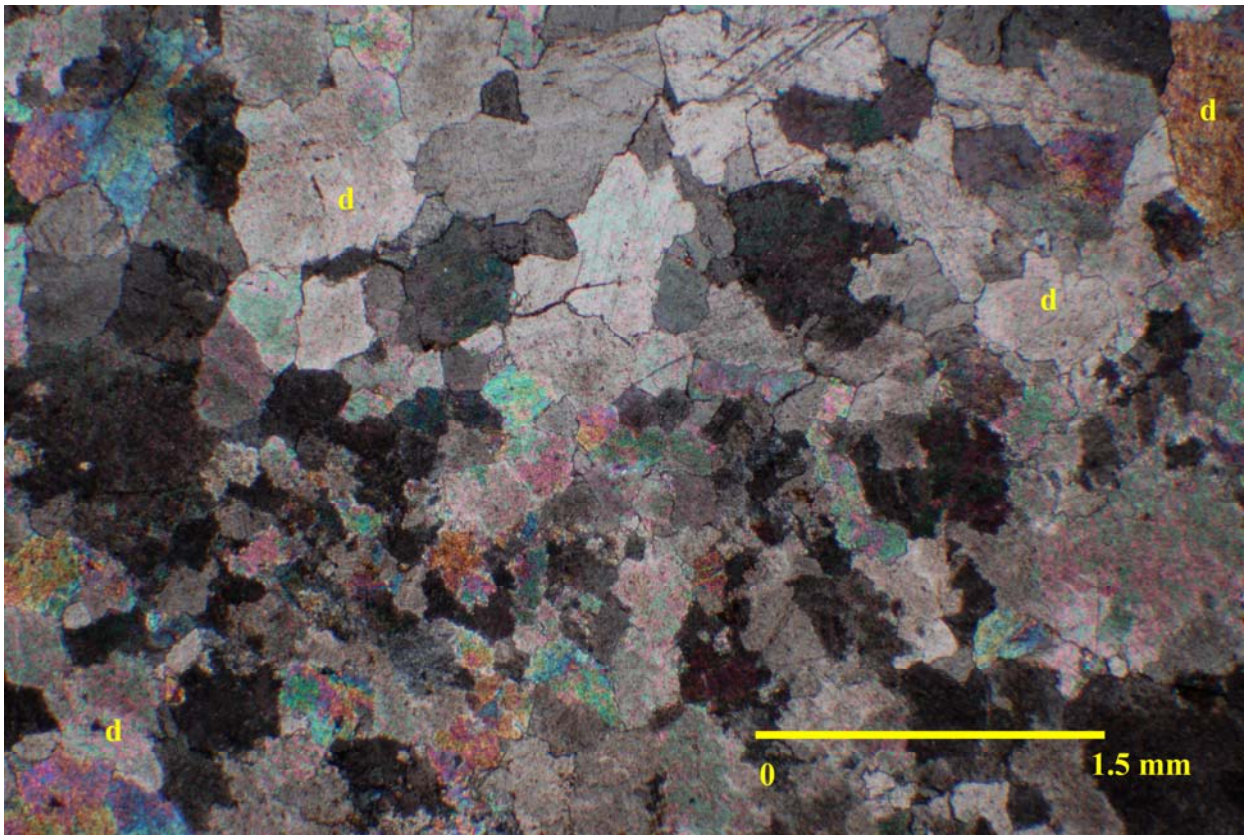
Mineralogy:

Minerals	*Abundance*	*Grain Size*
Dolomite	97-98%	.25 – 1.0 mm
Calcite	1.5%	.25 – 1.25 mm
Limonite	0.25%	0.1 – 0.25 mm

Limonitic fractures or hydrous iron oxides locally outline and bound dolomite grains suggesting that the dominant dolomite phase is a ferro-dolomite.

Magnetic Susceptibilty: 0.00 SI units.

Deformational Style: Dolomite grains are generally non-aligned and may be cut by early stylolitic cleavages. Limonitic fractures are forming sheeted sub-mm joint sets and truncate early stylolitic cleavages. Twin planes are dominantly Type I although a few Type II planes are noted.



Sample 09-52 @ 291.4. The complete field in this photomicrograph is composed of clouded slightly annealed ferro-dolomite grains. Abbreviations, d: dolomite; crossed polarized light, 25x.

Sample 09-37 @ 94.5. Standard Petrographic Section, No Opaque Mineral Determination.

Protolith: Coarse Grained Dolomitic Limestone.

The sample has been taken from a coarse grained, weakly siliceous, dolomitic limestone. The sample contains coarse mm to cm scale dolomite grains locally separated and outlined by yellow buff limonitic oxides, commuted dolomite grains and by minor sericite.

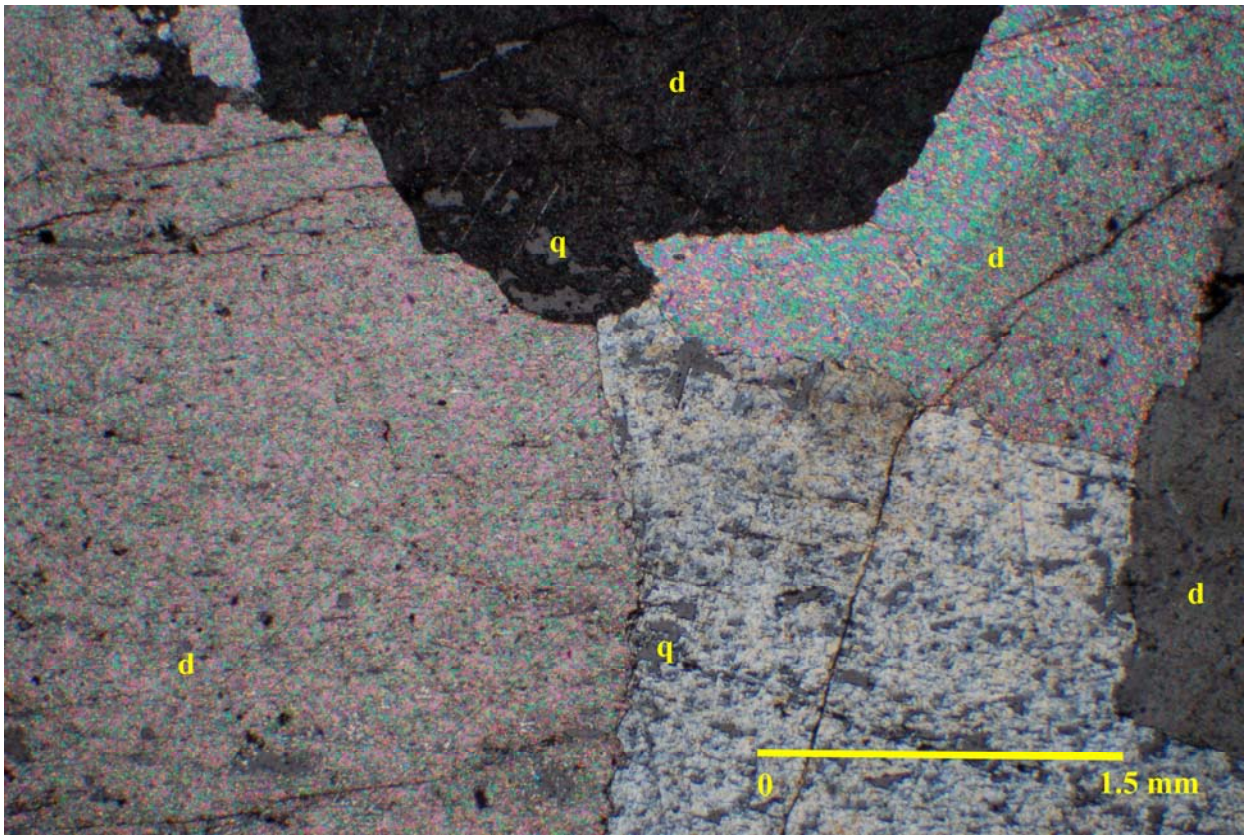
Mineralogy

Mineral	*Abundance*	*Grain Size*
Dolomite	95 - 96%	.2 – 10.0 mm
Quartz	2-3%	0.1 – 0.25 mm
Limonitic oxides	1.0 – 1.5%	.1 – 0.5 mm
Euhedral opaques	0.5%	2.0 – 4.0 mm
Sericite	.25%	< 0.1 mm

Very coarse grained interlocked dolomite crystals dominant within the matrix. Quartz is distributed internal to dolomite grains as small cleavage parallel aggregates. The percentage volume of silica lies far below that required to classify the unit as a siliceous dolomite. Euhedral opaque grains are distributed in the interstices to coarse dolomite grains.

Magnetic Susceptibility: 0.10 SI units.

Deformational Style: The sample contains a weakly developed stylolitic cleavage which is defined by the seriate textured boundaries of dolomite grains, enhanced limonitic oxides and minor sericite grains. The very coarse interlocking nature of the dolomite grains may suggest the development of partial collapse breccias.



Sample 09-37 @ 94.5. Interlocking cm scale dolomite grains dominant the field of view. The grains contain small locally elongate quartz inclusions. Quartz inclusions form at variable concentrations within grains. Abbreviations, q: quartz, d: dolomite. Crossed polars, 25x.

Sample 09-26 @ 126.49. Standard Petrographic Section, No Opaque Mineral Determinations.

Protolith: Recrystallized Dolomitic Limestone.

The sample has been collected from a light to medium grey dolomitic limestone. The rock contains two macroscale crystal phases including a coarse grained euhedral to locally dog-tooth dolomitic grains and a much more anhedral sucrosic mineral phase. No vein margins are identified between the two crystal forms. The two mineral forms may be formed by early replacements of small voids and dissolution features within the limestone.

Mineralogy:

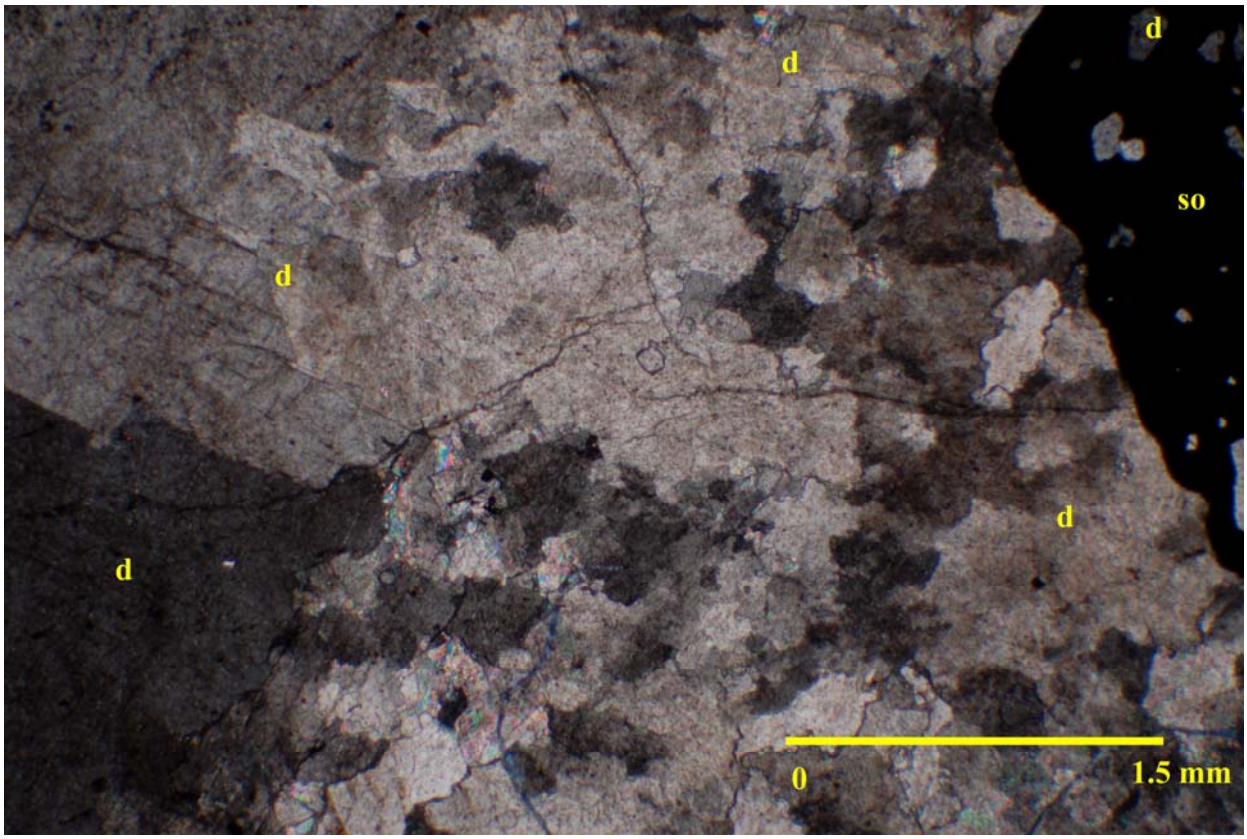
Mineral	*Abundance*	*Grain Size*
Dolomite	96-97%	0.25 – 7.0 mm
Black Opaques	2-3%	0.2 – 4.0 mm
Brown Carbonaceous Semi-opaques	0.5 – 1.0%	<0.1 mm

Black opaque (sulphide phases) may be predominantly associated with anhedral sucrosic dolomite domains but these minerals are also noted in bladed euhedral dolomite domains. Black opaques contain numerous small 0.1 – 0.25 mm dolomitic inclusions.

Open space cavities are noted between coarse phenocyrst phases. Opaque aggregates are forming without a distinctive microveinlet association.

Magnetic Susceptibility: 0.0 SI units.

Deformational Style: Stylolitic sutures are common within this sample and may be more pronounced in the finer grained anhedral phases. Remnant dolomite twin ghosts are locally identified within the finer grained anhedral mineral phases proximal to the crystallization front between the two mineral phases. This may suggest that anhedral finer grained dolomite phases are replacing coarser grained dolomite mineral phases. Although twin planes are best recognized in coarse grained dolomitic crystal phases Type I and II twin planes are identified in both anhedral and euhedral crystal grains. No pressure shadows are identified external to angular opaque grain boundaries.



Sample 09-26 @ 126.49. The division between coarse euhedral dolomitic grains, central and upper left field of view, is clearly noted in this sample. Anhedral, dolomitic grains are located in the central and lower right field of view. The black opaque sulphide grain in the upper right field of view contain numerous dolomitic inclusions. Abbreviations d: dolomite, so: sulphide-oxide. Transmitted crossed polarized light, 25 x.

Sample 09-60 @ 78.0. Standard Petrographic Thin section. No opaque mineral determinations.

Protolith: Sulphidized Dolomitic Limestone

The sample has been taken from a coarse grained dolomitic limestone. The lower third of the sample has been replaced by finer grained anhedral dolomite grains and moderately sulphidized with both pyrite and arsenopyrite.

Mineralogy:

Mineral	*Abundance*	*Grain Size*
Dolomite	95.5-96.5%	0.25 – 10 mm
Black opaques	2.0-2.5%	0.2 – 10 mm
Brown semi-opaques	0.5-0.75%	0.1 – 0.25 mm
Quartz	1.0 – 1.25%	<0.1 – 0.5 mm

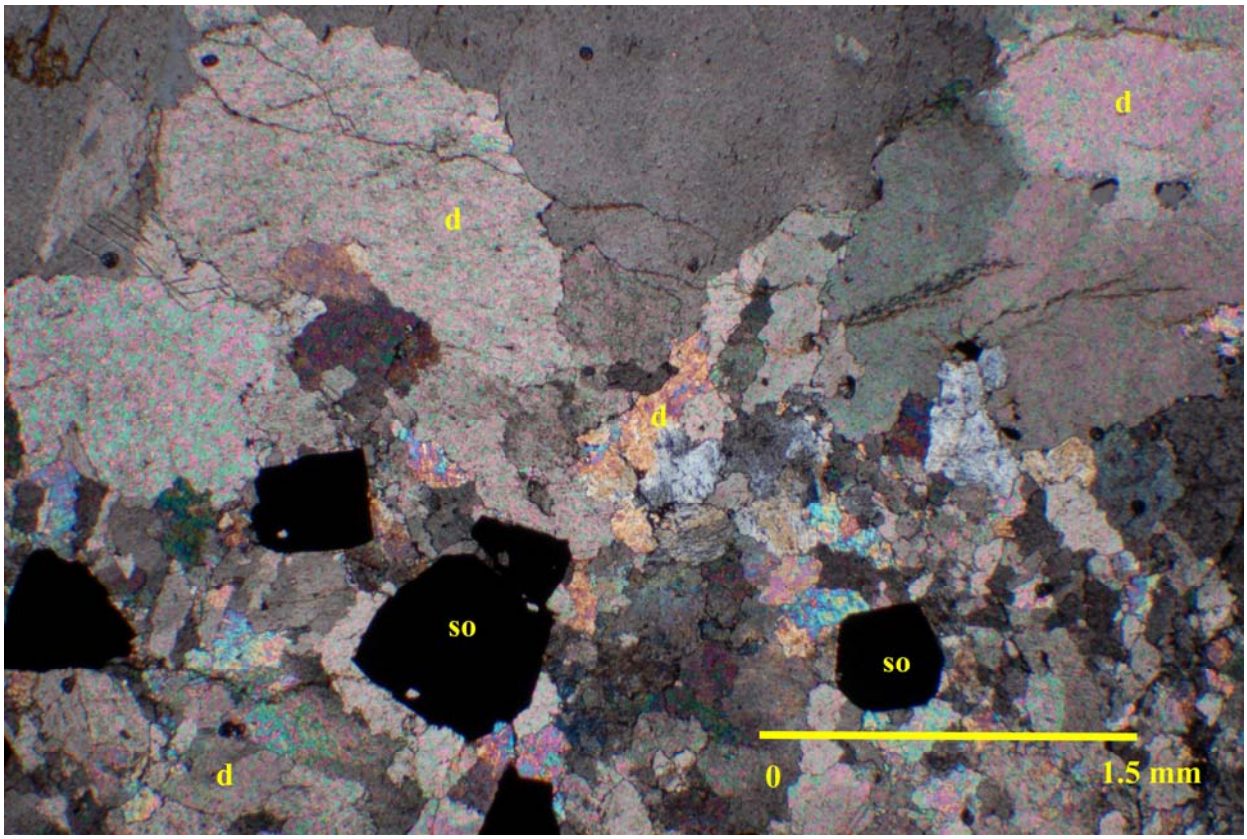
The majority of this rock unit is formed by euhedral, coarse grained dolomite aggregates (75%-80%). Finer grained re-crystallized dolomite aggregates form approximately 15% of the unit. Finer grained dolomite phases appear darker grey in hand-specimen due to the increase in fine grained carbonaceous stylolitic cleavages and pressure solution selvedges. Brown semi-opaques are limonitic oxides forming as very minor microveinlets and locally rimming and outlining dolomite grain boundaries.

Quartz is noted as small cleavage parallel inclusions and as small interstitial aggregates. Vein quartz is not identified.

Black sulphides and opaques are preferentially associated with finer grained anhedral phases and lack any vein association. Abundant very small < 0.2 mm dolomite inclusions are commonly noted within the black opaque grains.

Magnetic Susceptibility: 0.15 SI units.

Deformational Style: The both anhedral and euhedral mineral grains display an excellent pressure solution cleavage. Within the coarse dolomite phase, this stylolitic fabric may be forming roughly sub-parallel to early S1 fabrics. The development of finer grained replacement dolomite grains is forming orthogonal to this stylolitic fabric and potentially post-dates formation of this fabric.



Sample 09-60 @ 78.0. The reaction front between anhedral, small dolomite grains and much coarser euhedral dolomite crystals in clearly demonstrated on this plate. Black opaque (sulphide-oxide) phases are preferentially developed within the finer grained re-crystallized dolomite grains. Abbreviations, so- sulphide-oxide, d: dolomite. Transmitted light, crossed polars, 25 x.

Sample 09-45 @ 262.5. Standard Petrographic Section. No Opaque Mineral Determinations.

Protolith: Sericitized Ankeritized, Fine Grained Lean Lithic Wackes

The sample is well characterized by:

a. Well defined weakly anastomosing mm to sub-mm scale, tan sericitized lamella.
b. Moderate development of iron carbonate matrix replacements or primary iron carbonate compositional layers.
c. Rare, mm to cm scale lithic fragments.
d. An abundance of dark brown to black foliation parallel carbonaceous opaques.

The rock unit will likely lie between a compositional boundary defined by fine grained siltites and lean lithic wackes.

Mineralogy:

Mineral	*Abundance*	*Grain Size*
Sericite	45-50%	0.1 – 0.3 mm
Iron carbonates	30-35%	0.1 – 0.4 mm
Quartz	3-5%	0.1 – 0.25m
Carbonaceous opaques	15-20%	0.2 – 0.25 mm
Sulphide/oxide opaques	3-5%	0.1 – 0.8 mm
Apatite	trace	< 0.1 mm

The predominant fabric within the rock is formed by the alignment of dark brown carbonaceous opaque sub – mm lamella. These lamella are locally deflected around mm to occasionally cm scale lithic fragments. The matrices of most of the lithic fragments have been strongly replaced by intergrowths of sericite, iron carbonate and quartz.

Sericite is forming moderately poorly aligned ton non-aligned aggregates and are likely to have formed post peak strain. Matrix quartz is noted only as very small isolated grains. Locally sericite may also form narrow mm scale reactions rims to oval calcite aggregates.

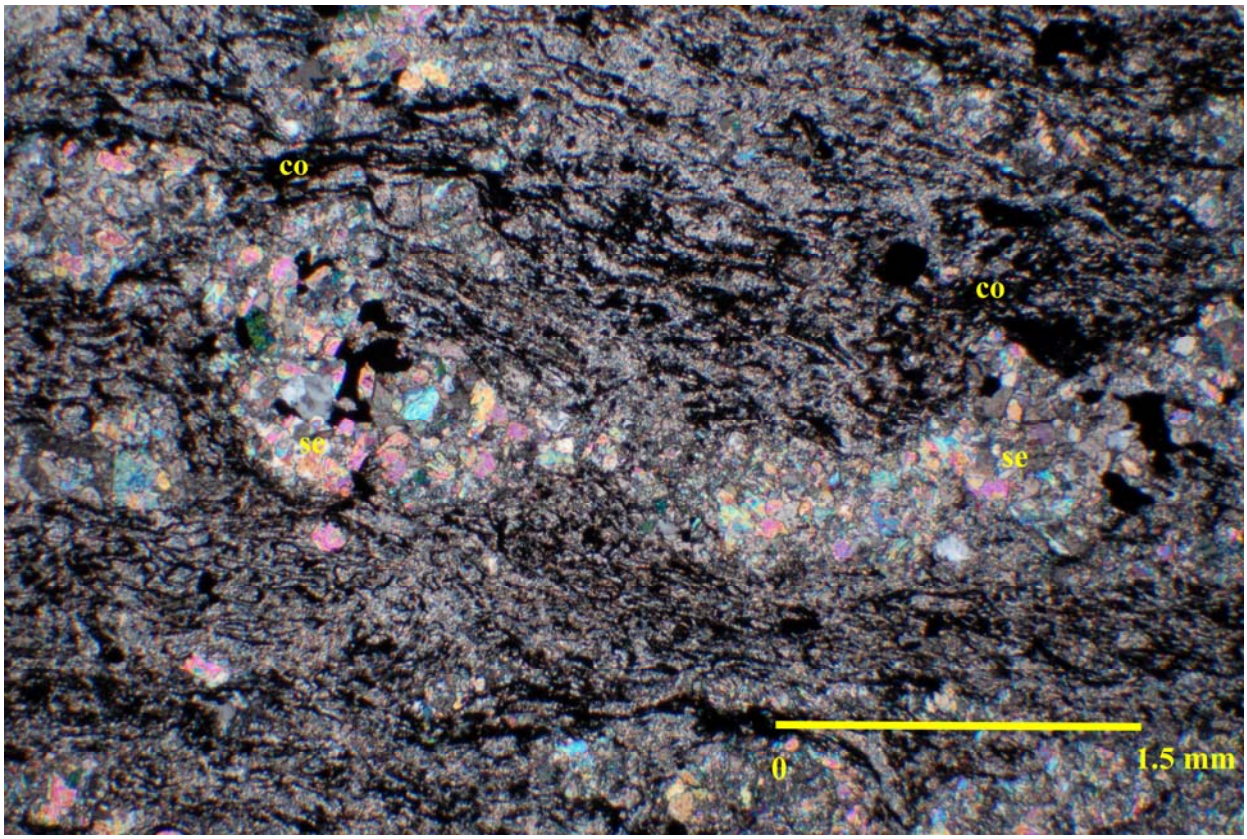
The volume of sericite strongly suggests that this unit had a very clay rich primary protolith and may form poorly defined compositional lamella.

The unit contains no significant discordant vein features. Black euhedral sulphide-oxide phases are uniformly distributed throughout the matrix.

Magnetic Susceptibility: 0.04 SI units.

Deformational Style: The sample contains a strong S1 flattening fabric but no, or limited, evidence of later penetrative fabrics. No rotational strains are identified with this fabric. Fabric deflections around lithic fragments suggest that small lithic fragments pre-date S1 fabric development.

No pressure shadows are identified flanking euhedral sulphide-oxide phases. Twin planes are infrequently recognized in the fine grained carbonates which are scattered throughout the matrix.



Sample 09-45 @ 262.5. Diffuse fine grained compositional layers of sericite are noted throughout the matrix. The colored pink to blue grains are non-aligned sericites which post-date formation of the primary penetrative fabric which is principally defined by the orientation dark black carbonaceous opaques. Abbreviations co: carbonaceous opaques, se: sericite, transmitted light, crossed polars, 25 x.

Sample 09-22 @ 175.5. Standard Petrographic Section. No Opaque Mineral Determinations.

Protolith. Carbonaceous Dolomitized Limestone

The rock protolith is dominated by orange buff dolomitic carbonates which have been strongly overprinted by earlier dolomitization and be later stage fine grained iron carbonate veins.

Mineralogy:

Mineralogy	*Abundance*	*Grain Size*
Dolomite (early)	15-20%	0.2 – 0.8 mm
Dolomite (late replacement)	50-55%	0.1 – 0.25 mm
Iron carbonate (vein)	5-8%	0.2 – 0.4 mm
Quartz	3-4%	0.1 – 0.3 mm
Biotite	1.5-2.0%	0.1 – 0.25 mm
Brown carbonaceous opaques	7.0 – 8.0%	0.1 – 0.4 mm
Black sulphide-oxide opaques	2.0 – 2.5%	0.2 – 0.5 mm

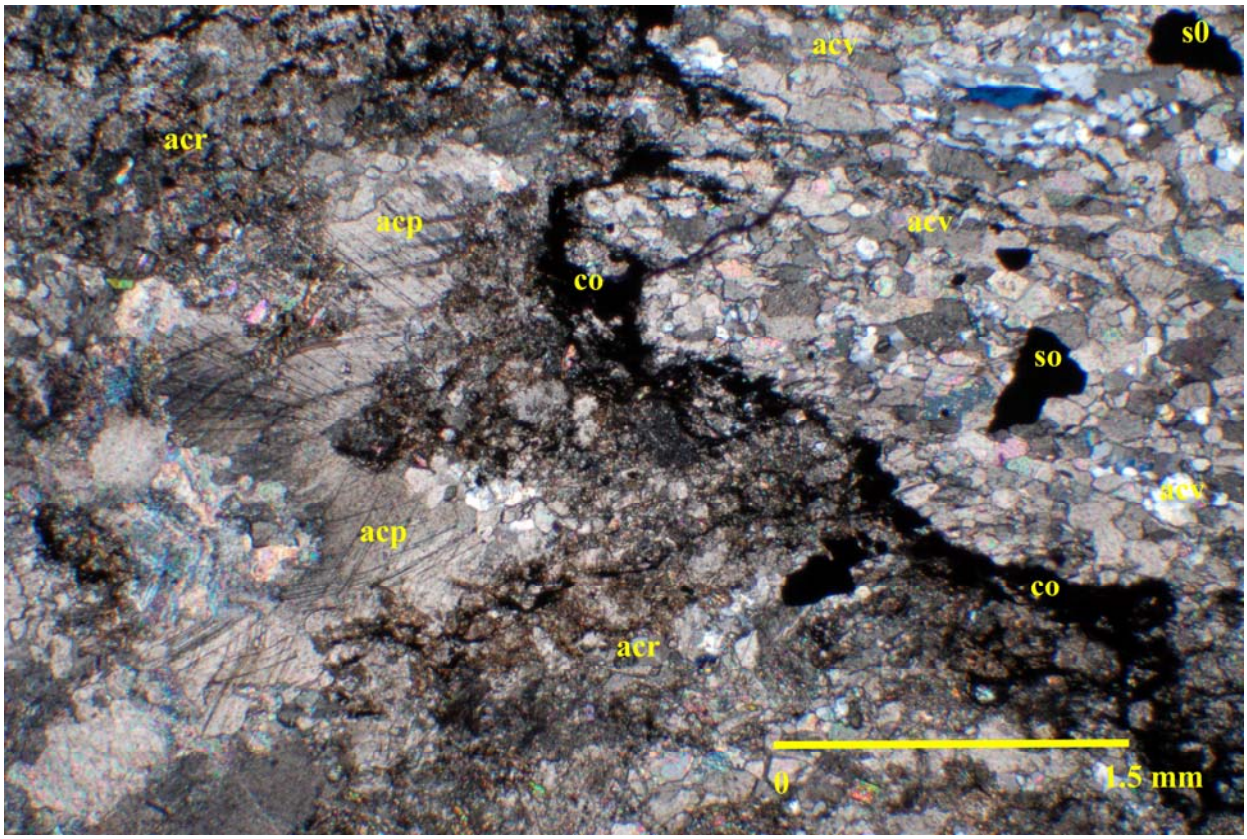
Early dolomite – iron carbonate crystals tend to be significantly larger and contain a lower percentage of opaque mineral contaminants. Their boundaries with small anhedral replacement grains are most often developed across irregular stylolitic like cleavages. Iron carbonates internal to early veins are fine grained and strongly aligned to the early S1 fabric. All carbonate minerals within this sample pre-date S1 cleavage formation.

Although quartz is disseminated throughout the sample, it is preferentially associated with early iron carbonate veins. These veins are also associated with higher percentages of black sulphide – oxide opaques.

Brown carbonaceous semi-opaques occur throughout the section and form the principle S1 surface. Brown carbonaceous opaques are also preferentially developed along the margins to early veins. In both environments these opaque minerals likely represent the non-soluble detritus which is a residuum from pressure solution processes.

Magnetic Susceptibility: 0.09 SI units.

Deformational Style: All components of this thin section have a moderately well preserved flattening fabric. This fabric is present preserved in the finer grained grains internal to iron-carbonate +/- quartz veins. Twin planes within early dolomite grains are Type I – Type II cleavages. Pressure solution shadows flanking angular black opaque sulphide/oxide grains are not developed.



Sample 09-22 @ 175.5. Replacement mineral textures are well illustrated in this strongly altered ankeritic limestone. Coarse grained early dolomitic grains display well developed cleavage sets (acp). Finer grained anhedral muddy secondary dolomite grains typically do not display this cleavage (acr). Dark brown to black carbonaceous oqaques form a distinctive halo to an early iron carbonate veinlet. Abbreviations: acp, primary iron carbonates, acr, iron carbonates replaced, acv, iron carbonates vein, co: carbonaceous opaques, so: sulphide-oxide opaques. Transmitted light crossed polars, 25x.

Sample 09-30 @ 199.5. Standard Petrographic Section. No Opaque Mineral Determinations.

Protolith. Biotite Porphyroblastic Ankeritic Siltite.

This rock unit is characterized by the presence of mm scale compositional layers of creamy buff sericite separated by mm scale brown biotite porphyroblastic compositional lamella. Three lamella types are identified including:

a. Well formed biotite porphyroblastic lamella.
b. Well formed carbonaceous opaques and very fine grained sericite-quartz lamella.
c. Well formed moderately coarse grained iron carbonate-biotite lamella.

Primary textural preservation within this unit is very poor. It is likely that the protolith of this unit was very delicately laminated and dominated by siltite size fractions.

Mineralogy:

Minerals	*Abundance*	*Grain Size*
Matrix		
Biotite	20-25%	0.2 – 0.8 mm
Dolomite	28-32%	0.1 – 1.0 mm
Sericite	14 – 17%	0.1 – 0.4 mm
Quartz	4-6%	<0.1 – 0.3 mm
Carbonaceous Opaques	8-10%	<0.1 – 0.5 mm
Black Opaques	0.5 – 1.0%	<0.1 – 0.3 mm
Vein		
Dolomite	1-2%	0.25 – 0.4 mm
Quartz	0.25-0.5%	0.1 – 0.3 mm
Black Opaques	< 0.25%	0.2 – 0.4 mm
Rutile	trace	< 0.1 mm

Biotite is present as a foliation forming, lamella parallel, porphyroblastic mineral aggregates and locally forming envelops or cored by euhedral calcite aggregates. Very fine grained sericite forms tan to cream colored mm scale lamella locally with minor carbonate and biotite aggregates. Dolomite grains are commonly noted as mm scale lozenge shaped aggregates flanked by dull brown carbonaceous opaques. Carbonaceous opaques form narrow laterally persistent foliation forming bands.

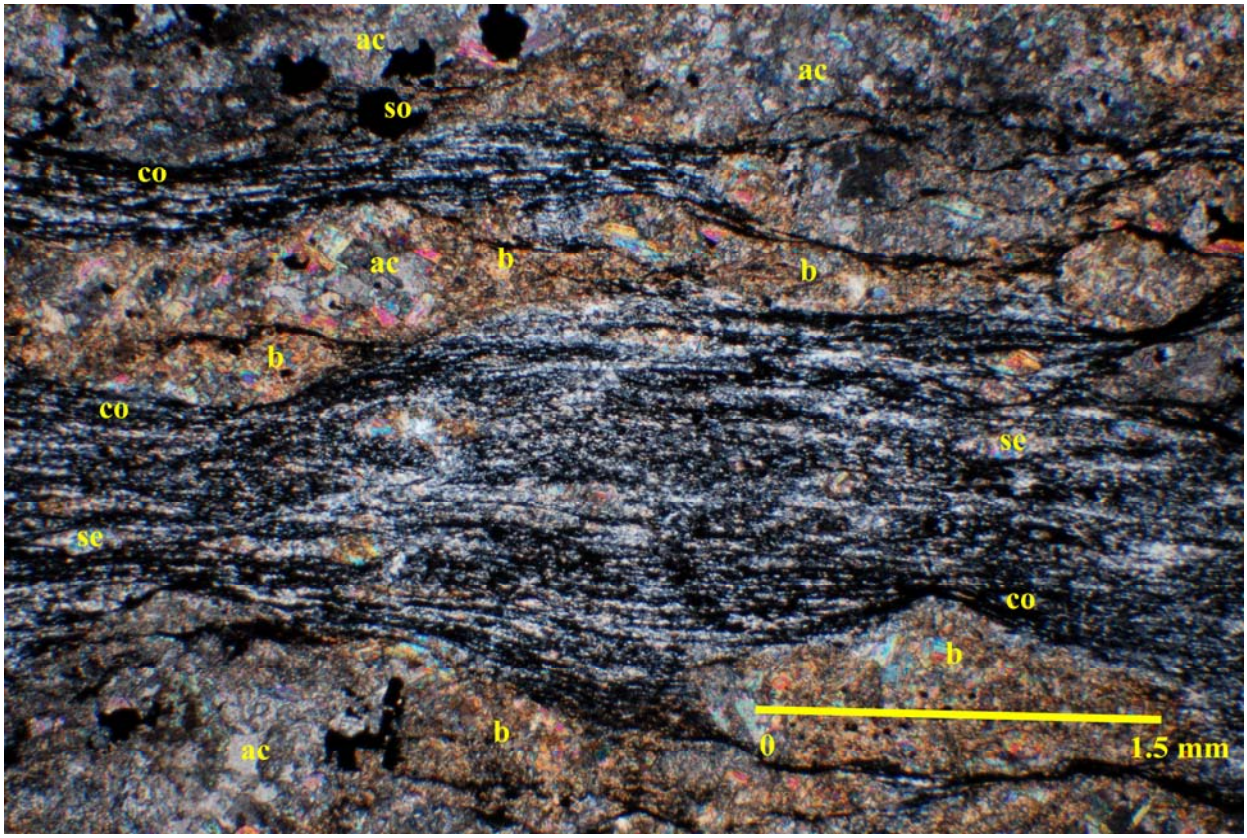
Most of the quartz in the section is associated with sub-mm foliation parallel shear parallel veinlets. Quartz dolomite veinlets are associated with elevated black opaque sulphide-oxide grains. These may also be found as random disseminations throughout the matrix.

Magnetic Susceptibility: 0.10 SI units.

Fluid Inclusion Characteristics:

Well formed small, generally less than 10 micron inclusions are noted within foliation parallel quartz – carbonate veins identified in this section. The inclusions are liquid dominant and only in one inclusion with a solid saline phase identified.

Deformational Style: The rock has a pronounced non-rotational flattening fabric, S1. No other penetrative fabrics are defined. Quartz pressure shadows are absent. Deflections in carbonaceous opaque foliations are related to grain boundary deflections and un-related to a later deformational process.



Sample 09-30 @ 199.5. The intense flattening fabric is noted throughout this section. Both biotite, sericite and carbonaceous opaques are aligned to this surface. Most mineral grains are either metamorphic or replacement in origin. Primary textural preservation is limited. Abbreviations: ac: iron carbonate, so: sulphide-oxide, b: biotite, co: carbonaceous opaques, se: sericite. Transmitted light, crossed polars, 25x.

Sample 09-26 @ 115.5: Standard Petrographic Thin Section, No Opaque Mineral Grain Determinations

Protolith: Biotite Porphyroblastic Carbonaceous Calcareous Siltite.

The rock unit is a well compositionally laminated strongly porphyroblastic clastic sediment. The unit contains abundant biotite porphyroblasts which are uniformly disseminated throughout the matrix. Thin, mm scale, yellow cream compositional bands, are likely primary in origin. Coarser lithic fragments are not identified.

Mineralogy

Minerals	*Abundance*	*Grain Size*
Matrix		
Biotite	30-35%	0.1 – 0.4 mm
Sericite	9-10%	<0.1 – 0.2 mm
Dolomite/calcite	25-30%	0.1 – 1.0 mm
Potassium Feldspar	10-12%	< 0.1 – 0.2 mm
Quartz	1-2%	0.1 – 0.3 mm
Carbonaceous Opaques	8-10%	<0.1 – 0.4 mm
Black Sulphide-Oxides	0.25-0.5%	.25 - .75 mm
Vein:		
Calcite	2.0-3.0%	0.2 – 1.0 mm

Within this sample the identification of potassium feldspar is based largely on the volume of cobalt nitrate stain on the off cut. A very fine grained low birefringence mineral grain is noted within the rock matrix. These grains are typically less than 0.1 mm in width and the reliability of this identification is decreased due to the very small grain size.

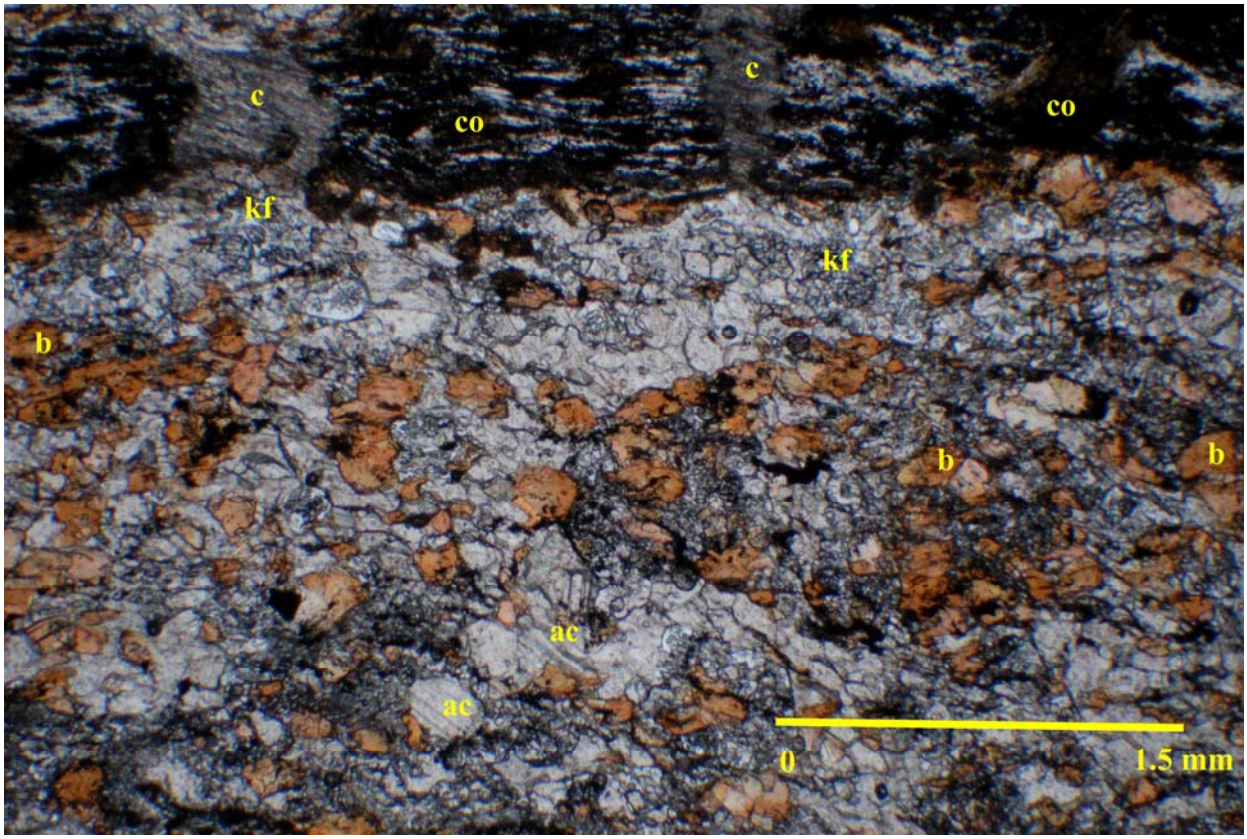
Porphyroblastic biotite forms moderately coarse medium brown mineral grains scattered throughout the rock matrix. In contrast, sericite is present only as very fine grained matrix mineral infill. Iron carbonates are noted throughout the rock matrix and locally are identified as discontinuous compositional lamella. Late calcite microveinlets have no recognizable selvedges and are forming at high angles to the dominant penetrative fabric. Very minor quartz grains are noted, these are typically very fine grained and locally contain carbonate inclusions.

Carbonaceous opaques are noted both as discrete very fine grained foliation parallel laminations and as coarser mm scale compositional forming lamella often associated with very fine grained sericite.

Dark black sulphide-oxide grains are disseminated within the matrix and lack any vein association. Sulphide-oxide grains contain abundant carbonate and lesser sericite inclusions.

Magnetic Susceptibility: 0.97 SI units.

Deformational Style: The rock has an strongly developed S1 fabric which is forming parallel to compositional layers. This strong flattening fabric is cut by narrow mm to sub mm calcite microveinlets which have the diagnostic orientation of late extensional veinlets. No rotational fabrics are identified.



Sample 09-26 @ 115.5. Brown biotite porphyroblasts are noted across the field in this plate. The highest concentration of potassium feldspar grains are likely located immediately adjacent to the dark grey black compositional layer in the upper field of view. Small extensional calcite veinlets have propagated through the more competent dark grey black opaque layer but fail to penetrate the more ductile carbonate rich matrix in the bulk of this section. Abbreviations c: calcite, co: carbonaceous opaques, kf: potassium feldspar, b: biotite, ac: iron carbonates. Transmitted plane polarized light, 25 x.

Sample 9-26 @ 150.5. Standard Petrographic Section, No Opaque Mineral Determination.

Protolith. Grey Biotite Porphyroblastic Dolomitic Limestone

The rock protolith is a dirty dolomitic limestone. This carbonate unit had received significant fine grained clastic input as evidenced by its dark grey matrix color, carbonaceous material, and abundant biotite porphyroblasts.

Mineralogy:

Mineralogy	*Abundance*	*Grain Size*
Matrix:		
Dolomite iron-carbonate	55-60%	0.2 – 0.8 mm
Biotite	15 – 20%	0.2 – 0.4 mm
Quartz	6-7%	< 0.1 – 0.2 mm
Sericite	4-5%	< 0.1 – 0.2 mm
Carbonaceous Opaques	8-9%	< 0.1 – 0.3 mm
Black sulphide/oxide opaques	1-2%	<0.1 – 0.3 mm
Apatite	trace	< 0.1 mm
Vein		
Calcite	3%	0.25 – 2.0 mm

Dolomitic carbonates appear throughout the field of view. Modest evidence for carbonate replacement textures occurs throughout the section. Approximately half of the dolomitic grains identified in this section are primary and approximately half are likely early replacements.

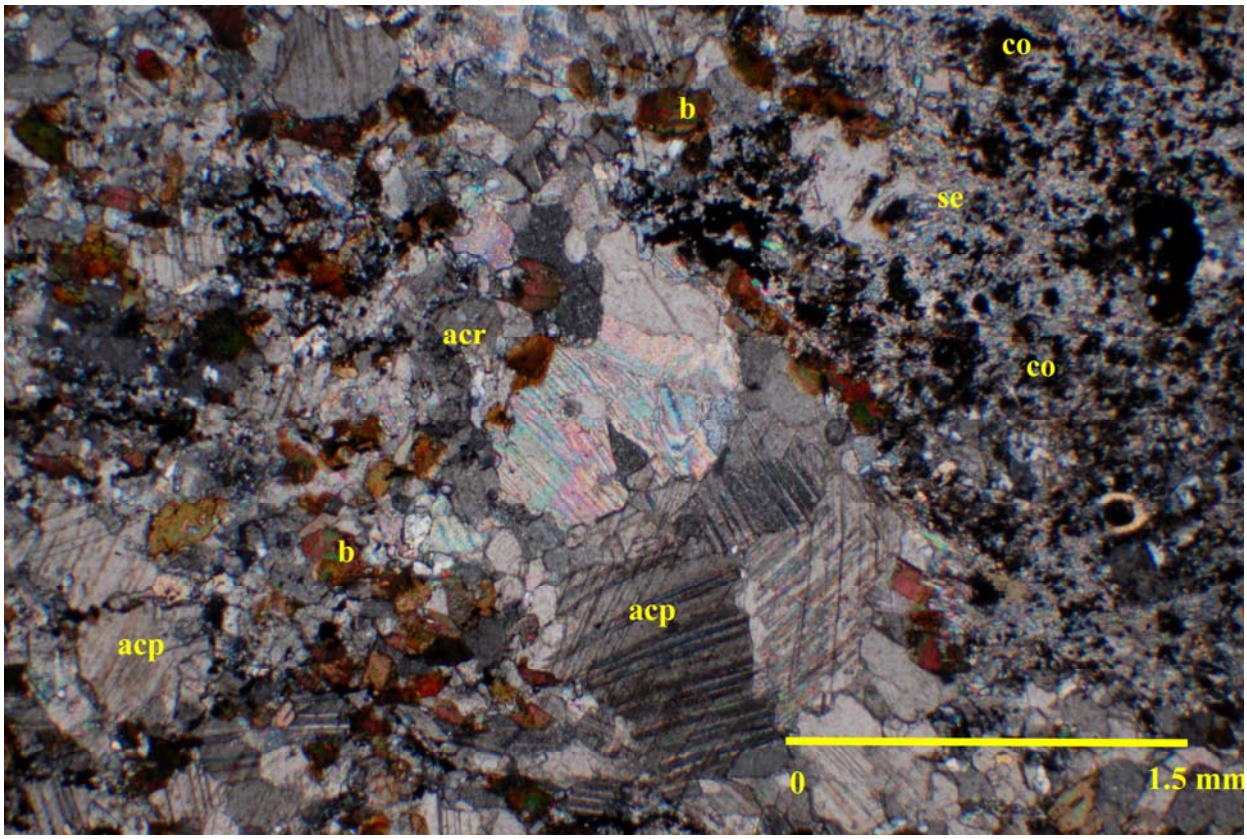
Stubby biotite grains occur throughout the rock mass and are loosely organized into diffuse lamella. Sericite occurs as very fine grained aggregates and generally associated with elevated brown carbonaceous aggregates. Carbonaceous aggregates form, and outline, discrete mm scale zones and form foliation parallel masses. Black sulphide-oxide phases are randomly distributed throughout the section.

Quartz grains are noted as small euhedral grains often located at the boundaries of dolomitic grains.

Calcite veins are foliation parallel, approximately 5 mm in width and lack alteration halos. These veinlets have likely formed pre-S1.

Magnetic Susceptibility: 0.18 SI units.

Deformational Style: The sample displays a modest penetrative S1 fabric which has formed biotite grains into loose compositional lamella. Carbonaceous opaques also are deformed into the S1 cleavage plane as are very fine grained sericites. No pressure solution shadows and no rotational fabrics are identified within this section. Twin planes within calcite show abundant Type II plus or minus Type I deformation planes.



Sample 9-26 @ 150.5. Significant textural variation is noted within this section. An aggregate of very fine grained sericite and carbonaceous opaques is noted in the upper right hand field of view. Primary iron carbonate grains are noted in the central field of view. These coarser grains are flanked by smaller anhedral dolomite grains. Abbreviations: b: biotite, acp: ankeritic-iron carbonates primary, acr: ankeritic iron carbonates replacements, b: biotite, co: carbonaceous opaques, se: sericite.

Sample 09-36 @ 155.45. Standard Petrographic Section, No Opaque Mineral Determination.

Protolith: Biotite Porphyroblastic Grey Limestone

The sample has been cut from a moderately biotite porphyroblastic, well foliated, dark grey dolomitic limestone which is flecked with pale cream calcite aggregates. Relative to other dolomitic rocks examined in this suite, this sample likely has a higher percentage of calcite as opposed to dolomite.

Mineralogy:

Minerals	*Abundance*	*Grain Size*
Matrix		
Ankerite-calcite	55-60%	0.2 – 0.8 mm
Biotite	15 – 17%	0.1 – 0.4 mm
Sericite	7-8%	<0.1 – 0.2 mm
Quartz	2-2.5%	< 0.1 mm
Chlorite	0.25%	<0.1 – 0.25 mm
Black opaque sulphide/oxides	3-4%	.1 - .3 mm
Apatite	trace	< 0.1 mm

Ankerite plus or minus calcite are distributed as annealed grains throughout the matrix, commonly with well formed stable triple junction boundaries. These minerals form the dominant rock forming carbonate. Evidence for secondary dissolution features within this unit is modest.

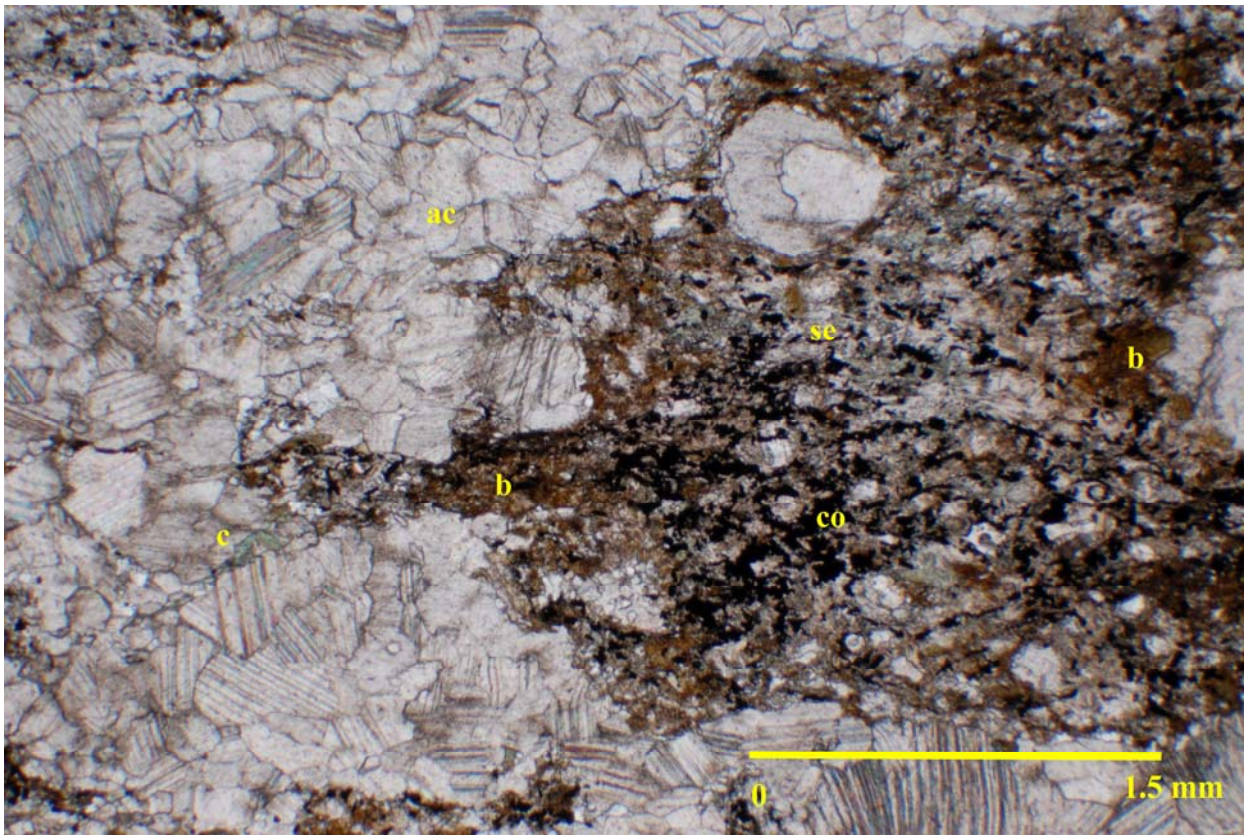
Biotite forms distinctive, discontinuous sub-mm lamella, along with sericite and black opaques, form a well defined strong S1 cleavage.

Very small quartz grains are present as small anhedral aggregates which are distributed throughout the rock mass.

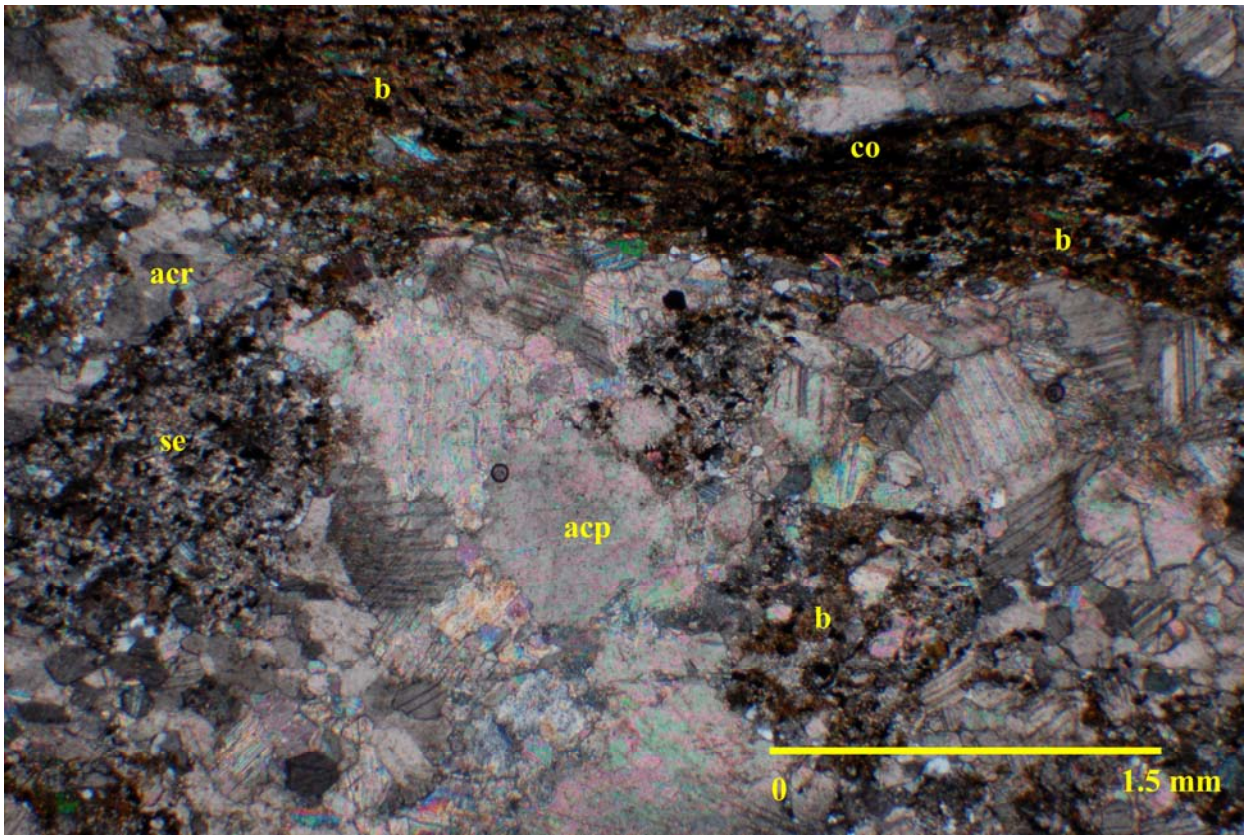
Chlorite grains are rare and most typically associated, or forming internal to, biotite aggregates. Some of these grains may be retrograde.

Magnetic Susceptibility: 0.26 SI units.

Deformational Style: All mineral phases have been affected by a moderate to strong flattening fabric. Biotite porphyroblasts form elongated planar groups in this fabric and ankerite-calcite grains are also elongate into the fabric plane. No rotational fabrics and no strain shadows are identified adjacent to angular opaque sulphide grains.



Sample 09-36 @ 155.45. Under plane polarized light the irregular nature of biotite-carbonaceous opaque clots is clearly identified. Although these have been deformed into the early S1 fabric plane, their initial orientation and shape is likely to have been very irregular reflecting the nature of dissolution processes. Abbreviations ac: iron carbonates, b: biotite, c: chlorite, co: carbonaceous opaques, se: sericite. Transmitted light, plane polarized, 25x.



Sample 09-36 @ 155.45 Under crossed polarized light the patchy distribution of primary carbonate phases versus secondary carbonates is noted. Planar S1 parallel aggregates of biotite and carbonaceous opaques are present in the upper field of view. Finer grained zones of sericite, re-crystallized carbonates and biotite are forming at oblique to irregular angles to planar S1 surfaces. Dark black opaque mineral phases have a strong spatial relation to zones of elevated fine grained sericites and micas. Abbreviations, acr: re-crystallized iron carbonates, se: sericite, acp: primary iron (or magnesium) carbonates, b: biotite, co: carbonaceous opaques. Transmitted light, crossed polars, 25x.

Sample 09 – 41 @ 180.5: Polished Thin Section

Altered Protolith: Iron Oxide Replaced, Sericitic Dolomitic Limestone.

The sample has undergone texturally destructive oxidation. The presence of locally rhomb shaped cavities and proportions of residual phases of quartz and sericite suggest that the protolith of this rock was likely to have been a medium grained dolomitic limestone. The sample contains numerous vugs and cavities and appears to have been completely oxidized.

Two oxide phases are noted in hand specimen including a red brown iron oxide and a yellow orange oxide.

Mineralogy:

Mineral	*Abundance*	*Grain size*
Iron oxide (hematite)	68 – 72%	amorphous
Iron oxide (goethite)	3-4%	amorphous
Sericite-phengite	20-22%	<0.1 – 0.25 mm
Carbonaceous opaques	7-8%	<0.1 mm – 0.25 mm
Quartz	1- 1.5%	< 0.1 mm

The bulk of the matrix of the rock is composed of reddish brown iron oxide, an amorphous hematite. In thin section this mineral is composed of very small radiating and linking sub-rounded ovals and nodules. The volume of limonitic material in this sample reflects both:

1. The volume of degraded primary sulphides.
2. Breakdown and release of iron from iron and magnesium carbonates.

The formation of limonitic oxides can be done by the liberation iron from mineral phases other than sulphides. In the present case, most of these oxides may have been liberated from the breakdown and replacement of iron carbonates.

A yellow orange iron oxide forms a mm scale band at the base of the thin section. Under strong transmitted light, it is semi-transparent and deep red in color. This oxide is likely a hydrous iron oxide, goethite.

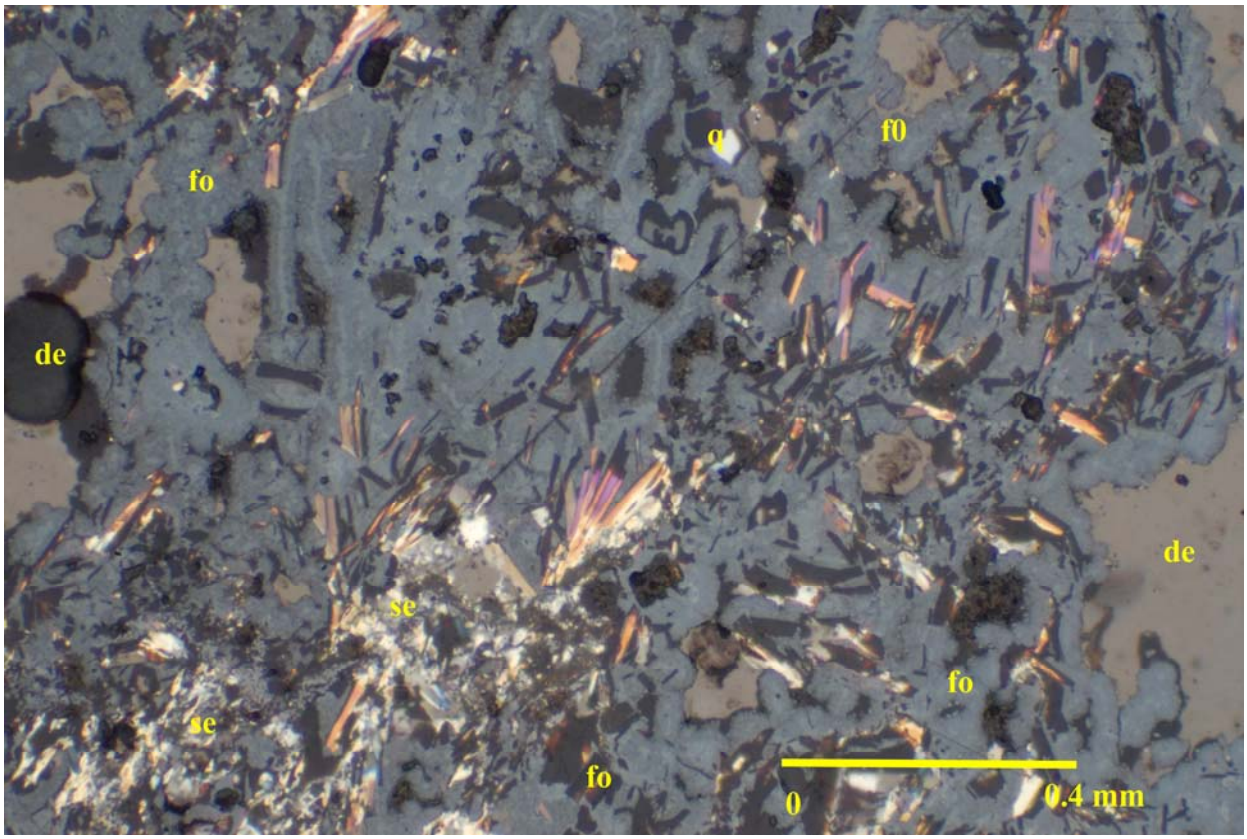
Sericite is distributed throughout the matrix of the rock and contains very small non-aligned sericite lathes and aggregates. A slightly coarser form of this mineral locally lines empty vesicles and its weak pleochroism may suggest that it is a phengitic mica. Sericite may form corroded aggregates up to 8 – 9 mm in length.

Very small residual quartz grains occur scattered throughout the matrix. These grains are similar in size and volume to that noted in unaltered dolomitic limestones.

The section contains a very high percentage of voids or empty space. Several of these have preserved rhombohedra shapes and are likely after iron carbonates.

Magnetic Susceptibility: 2.51 SI units.

Deformational Style: No penetrative fabrics are preserved in this deeply weathered and corroded rock unit. In addition, no late extensional fabrics are preserved.



Sample 09 – 41 @ 180.5. The photomicrograph is taken on moderate transmitted and moderate reflected light. The curvilinear shape of the boundaries of the dark grey iron oxides which form much of the background of this rock are common in haematitic replacements. No preserved sulphide phases are noted within this matrix. Radiating sericite – phengite lathes are present throughout the matrix. The angular open space on the lower right hand field of the plate is interpreted as a corroded outline of a dolomitic carbonate. Abbreviations fo: iron oxides, se: sericite, de: dolomitic empty space, q: quartz. Transmitted and reflected light with crossed polars, 100x.

Sample 09-48 @ 158.2. Standard Petrographic Section, No Opaque Mineral Determinations.

Protolith: Magnetiferous Calcareous Peloidal Siltite.

This dull grey strongly porphyroblastic rock unit is characterized by:

1. A strong flattening fabric and alignment of mm to sum-mm scale clasts into this fabric.
2. General compositional homogeneity with, on the scale of the sample, an absence of well defined compositional layers.
3. Matrix grain sizes which range from silt to sand size.
4. Distinctive sub-mm scale oval or peloidal forms are identified on the macroscale.

Mineralogy:

Mineral	Abundance	Grain Size
Dolomite-iron carbonate	40-45%	0.2 – 0.5 mm
Sericite	35-38%	<.1 mm – 0.2 mm
Carbonaceous opaques	7-8%	< .1 mm – 0.2 mm
Orange brown semi-opaques	2 -3%	0.1 – 0.3 mm
Black sulphides/oxides	6-7%	.2 – 0.6 mm
Quartz	2-3%	0.1 – 0.25 mm
Chlorite	trace	< .1 – 0. 25 mm
Apatite	trace	< 0.1 mm

Dolomitic carbonates from oval to lozenge shaped aggregates throughout the field of view. In rare cases, oval to rounded, possible bioclastic outlines may be preserved. Discordant dolomitic veins are absent.

Quartz is noted as small, generally less than 0.25 mm polysutured grains. The polysutured nature of some of these grains suggest that they are likely detrital in origin.

Sericite forms very fine grained matrix infill with rare coarser grained blades and aggregates. It is abundant within the matrix and is commonly flanked by carbonaceous opaques.

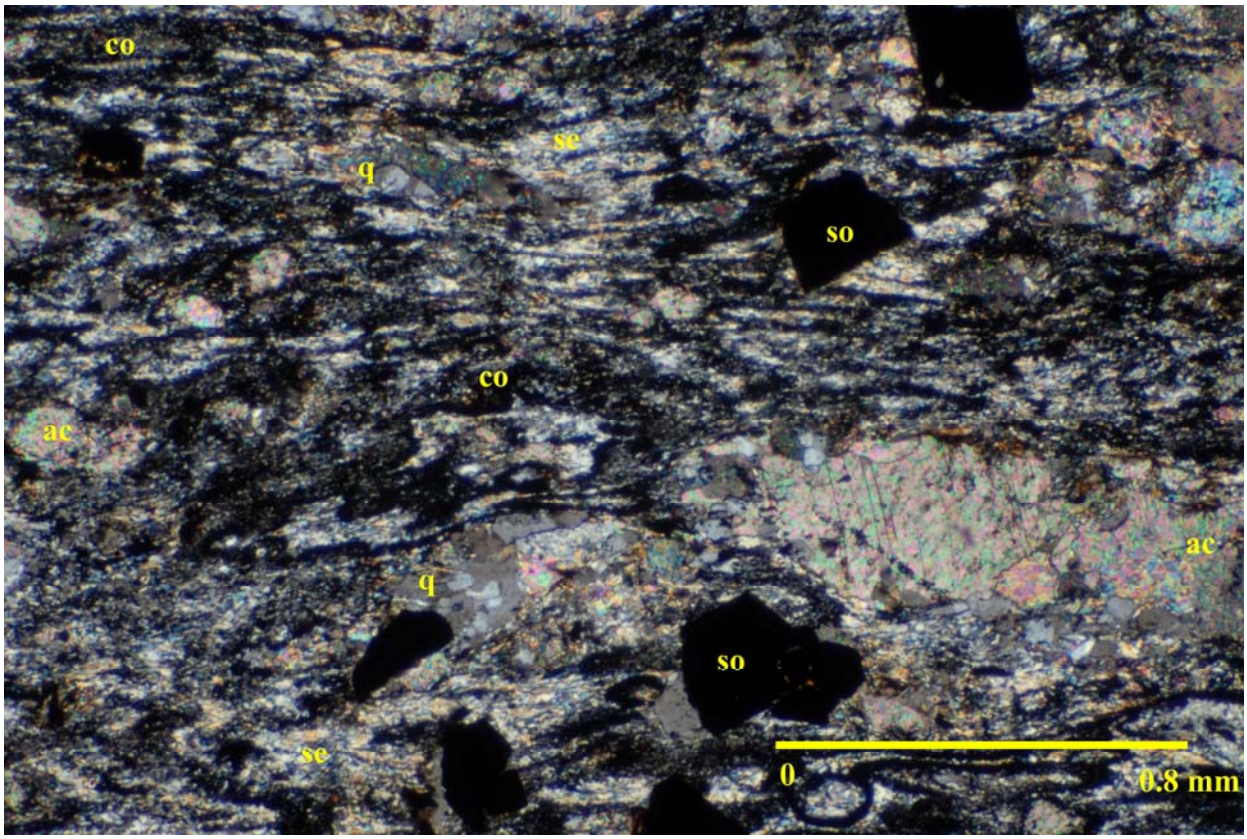
Both dark brown to black carbonaceous opaques and orange-brown (hydrous iron?) semi-opaques have been deformed into complex shape fabrics as well as outlining the principle orientation of S1 fabric. Chlorite is always noted proximal to biotite grains and aggregates. In this sample chlorite may represent a retrograde mineral.

Dark black opaques are very likely to be dominantly magnetite as is evidenced by the very high susceptibility of this rock unit. These grains do not deflect the main

metamorphic fabric and are likely syn-metamorphic. Magnetite porphyroblasts cross all grain boundaries and are identified with all mineral composition types. Peloidal forms are well outlined by dark grey-black semi-opaque rinds which are cored by very fine grained matrix sericite. Peloidal forms are up to 0.1 x 0.4 mm in dimension.

Magnetic Susceptibility: 22.2 SI units.

Deformational Style: Although weak rotational fabrics are suggested in hand specimen, in thin section, no rotational fabrics are identified. The rock carries a single strong S1 fabric and lacks any post-date fabric types. Late extensional features are not identified within this unit. If the peloidal forms are assumed to have originally been perfect ovals than a 4 to 1 flattening ratio in this rock package is likely.



Sample 09-48 @ 158.2. In crossed polarized light, the distinctive iron carbonate aggregates which form a significant portion of this rock are well illustrated. Polysutured quartz grains are noted within this field of view, particularly in the left central field of view. All mineral components within this rock unit are deformed into a strong S1 fabric. The absence of pressure shadows associated with the dark black sulphide-oxide grains suggest that these minerals are also porphyroblasts and have formed synchronous with the dominant metamorphic event. Abbreviations: co: carbonaceous opaques, se: sericite, so: sulphide-oxide, ac: iron carbonates, q: quartz. Transmitted light crossed polars, 50x.

09-69 @ 59.8. Standard Petrographic Section, No Opaque Mineral Description.

Protolith: Strongly Biotite Porphyroblastic Laminated Magnetiferous Siltite.

The rock unit is well defined by the abundance of fine grained biotite, very strong magnetic susceptibility and well developed mm scale compositional lamella. Preserved clasts are absent. In its un-metamorphosed state the rock would likely have been a fine grained pelitic sediment.

Mineralogy:

Minerals	*Abundance*	*Grain Size*
Matrix		
Biotite	35-40%	.1-0.25 mm
Sericite	30-35%	< 0.1 mm
Euhedral black opaque sulphides/oxides	4-5%	.3 - .8 mm
Anhedral black opaques	15-18%	< .1 - .25m
Quartz	3-4%	<0.1 – 0.3 mm
Apatite	trace	< 0.1 mm
Chlorite	trace	< 0.1 mm
Early Vein		
Biotite	1-1.5%	< .1 – 0.25 mm
Dolomite iron carbonate	2.5-3%	0.2 – 0.8 mm
Euhedral black opaques	0.25-0.5%	.3 - .8 mm
Anhedral black opaques	0.1 – 0.2%	< 0.1 mm
Quartz	0.5 – 0.75%	<.1 mm – 0. 2mm

All biotite in this rock is metamorphic in origin. Biotite porphyroblasts from mm scale compositional bands and layers which may reflect primary compositional layers and are sub-parallel to S1 fabrics. Biotite also flanks and forms the perimeter to small circular complex porphyroblastic aggregates, often 2 – 3 mm across, and cored by sericite and quartz.

Sericite forms similar compositional layers, however this mineral phase is exceptionally fine grained. Although the off-cut does contain weak cobalt nitrate stain, this intensity of the stain, and the absence of definitive potassium feldspar aggregates, suggest that small sericite aggregates have accepted a weak stain.

The rock contains an exceptionally high percentage of opaque black mineral phases. Some of these are clearly magnetite others are likely carbonaceous – organic carbon opaques. Quartz grains are most often noted as well developed pressure shadows to euhedral black sulphide-oxide grains.

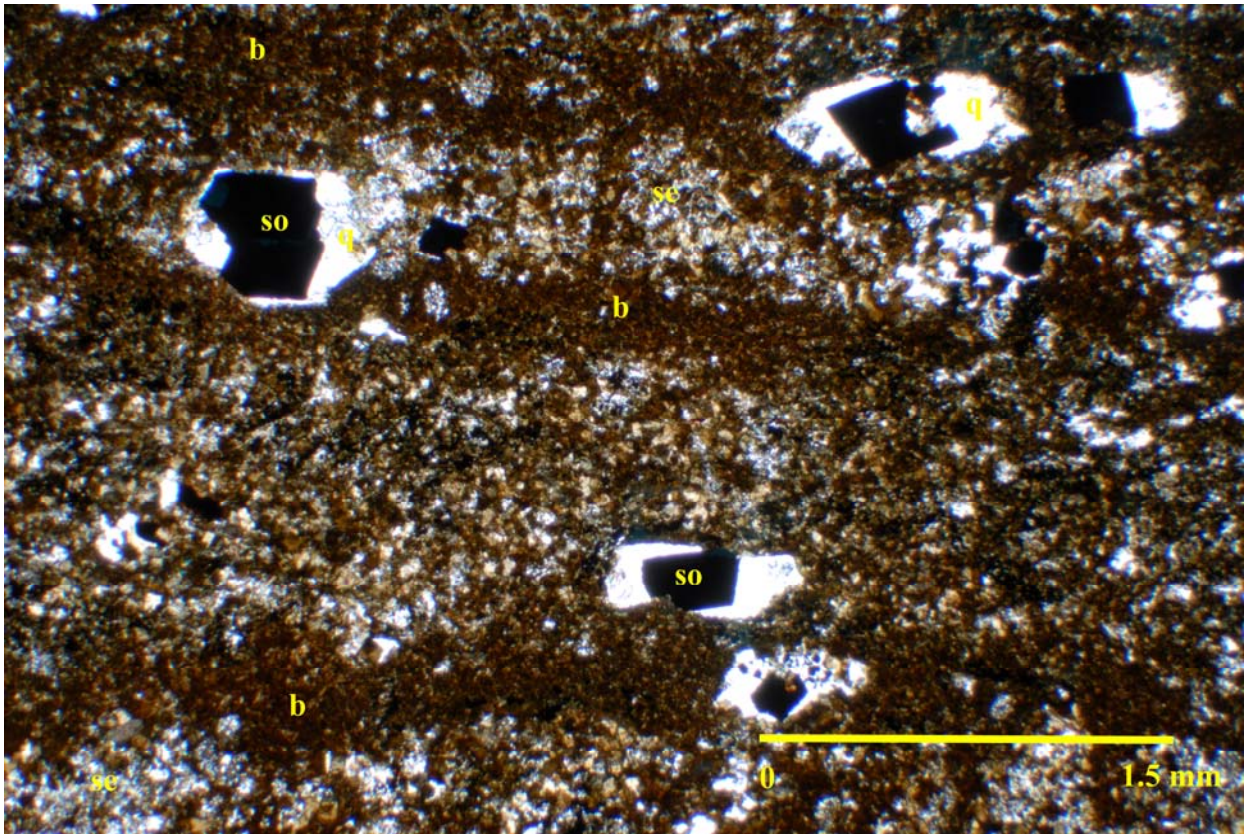
A single early quartz-carbonate vein is noted in this section. The vein is partially oblique to early compositional layers but contains identical mineral assemblages to the rock matrix. These early veins pre-date S1 metamorphism.

Deformational Style

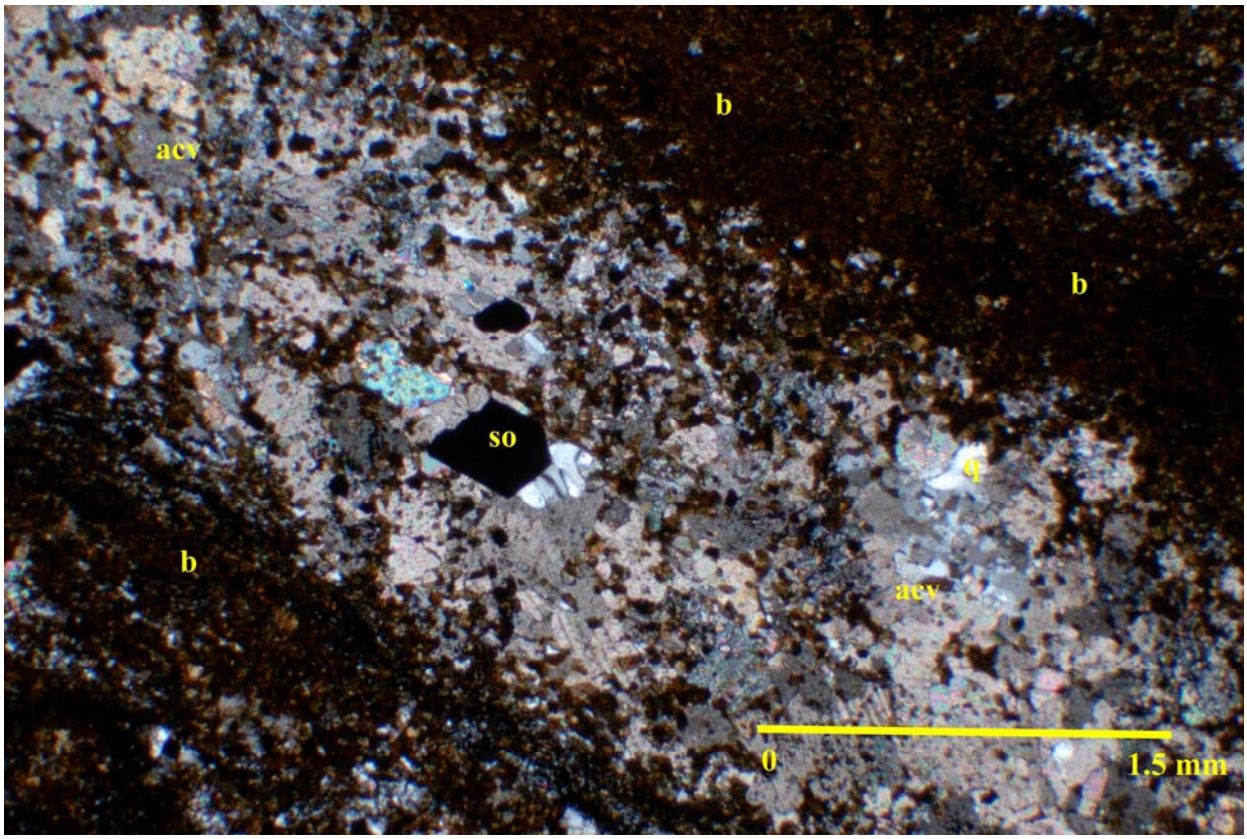
The unit has an single pronounced S1 fabric. Within the rock unit superb quartz rich pressure shadows are developed with euhedral black opaque mineral grains. Significantly, all of these pressures shadows are symmetric, and are non-rotational.

No late extensional fabrics or post S1 fabrics are noted within this sample.

Magnetic Susceptibility: 11.2 SI units.



09-69 @ 59.8. In plane polarized light, the density of porphyroblastic biotite compositional layers are clearly noted. Quartz pressure shadows flank euhedral sulphide-oxide grains are entirely symmetrical and no rotational fabrics are defined. Abbreviations b: biotite, se: sericite, q: quartz, so: sulphide-oxide aggregates. Plane polarized light, 25 x.



09-69 @ 59.8. A very early mm scale quartz-carbonate veinlet traverses the central position of the field of view. Very margins are blurred by a slow decrease in the volume of metamorphic biotite. All mineral phases in the interior of the vein may also be found within the rock matrix. The vein forms at a very shallow angles to early matrix compositional layers. Abbreviations: b: biotite, so: sulphide-oxide, q: quartz, acv: ankerite-calcite vein. Transmitted light, crossed polars, 25x.

Sample 09 – 44 @ 154.45. Standard Petrographic Section. No Opaque Mineral Determinations.

Protolith: Very Fine Grained Compositionally Laminated Quartz and Clay Rich Siltites

The rock is a fine grained well compositionally laminated siltite. The unit contains interdigitated fine grained quartz rich lamella and grey to cream siltite lamella containing cuspate, clay sericite rich lithic fragments.

Mineralogy:

Matrix

Mineral	*Abundance*	*Grain Size*
Sericite	45-50%	<0.1 – 0.2 mm
Biotite	20-25%	<0.1 – 0.3 mm
Quartz	10-11%	<0.1 - .4 mm
Black anhedral opaques	12- 13%	<0.1 – 0.25mm
Dolomite	0.25 – 0.5%	<0.1 – 0.2 mm
Euhedral opaques	1.0 – 1.5%	0.2 – 0.4 mm
Clinozoisite-epidote	.1-.2%	0.1 – 0.5 mm
Zircon	trace	<.1 – 0.15 mm
Chlorite	trace	<0.1 mm

Vein

Biotite	1.0 – 1.5%	.1 – 0.4 mm
K-feldspar	0.5 – 0.75	.1 – 0.3 mm
Quartz	0.25%	.1 – 0.3 mm
Dolomite-iron carbonate	0.5%	.2 - .4 mm

The rock contains several compositional domains. A narrow mm scale quartz lithic rich bed is located near the base of thin section, and is illustrated on the accompanying plate. This interval contains the bulk of the quartz grains noted within this rock and significantly elevated biotite. The portion sample also contains well form frosted and abraded zircon and is the only rock type to contain this minor element.

Very fine grained sericite is best associated with quartz and biotite deficient zones. Elevated very fine grained sericites may have been associated with rocks with high primary clay contents.

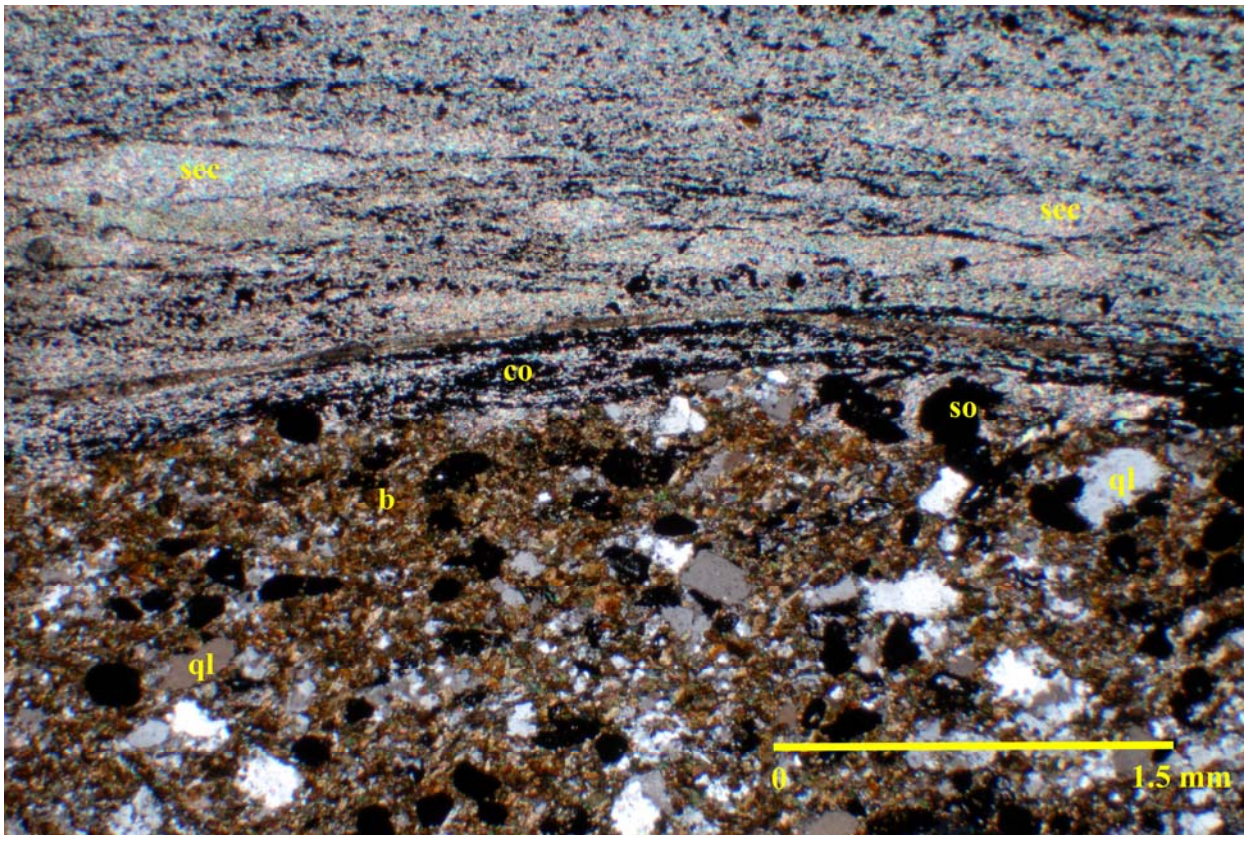
Sericite is also strongly elevated in lithic cast rich zones of this rock unit. Lithic casts are rimmed by dark black opaques and are cuspate ellipsoids in form. Black opaques are noted in all rock types.

Clinozoisite-epidote are most commonly noted as lining the cores of small biotite-quartz sites. Chlorite is noted very rarely and may be present as a minor retrograde mineral.

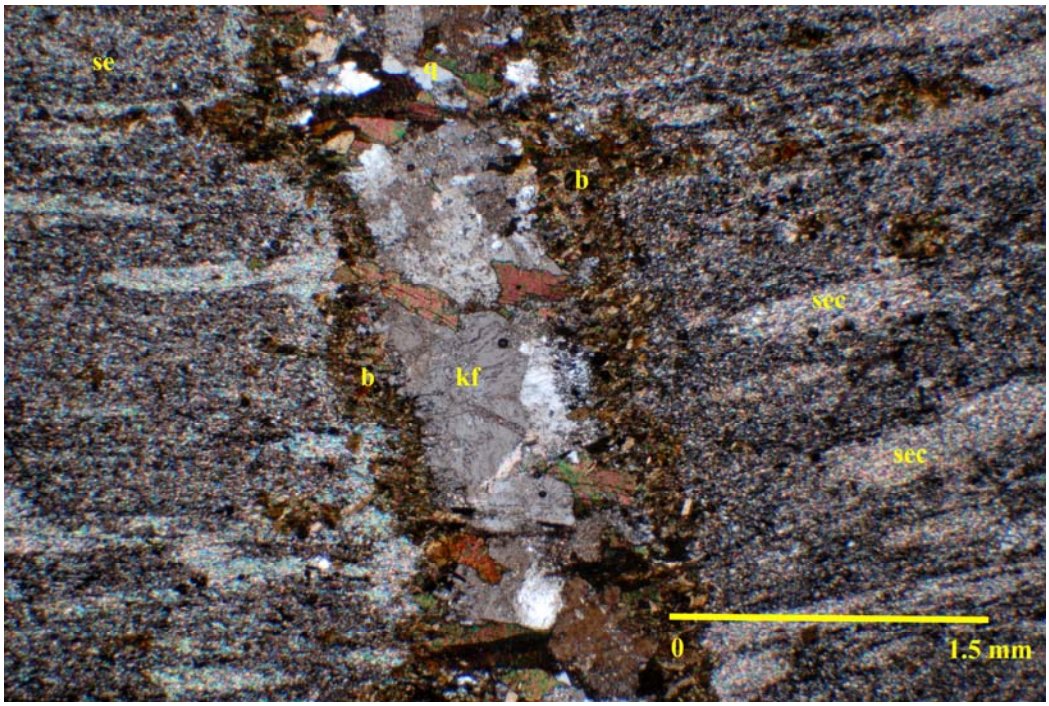
The rock contains a single mm wide extensional veinlet. This veinlet has a well developed biotite halo and is the first definitive example of secondary potassium feldspar residing in these veins. The veinlet generally has a weak sulphide-oxide association.

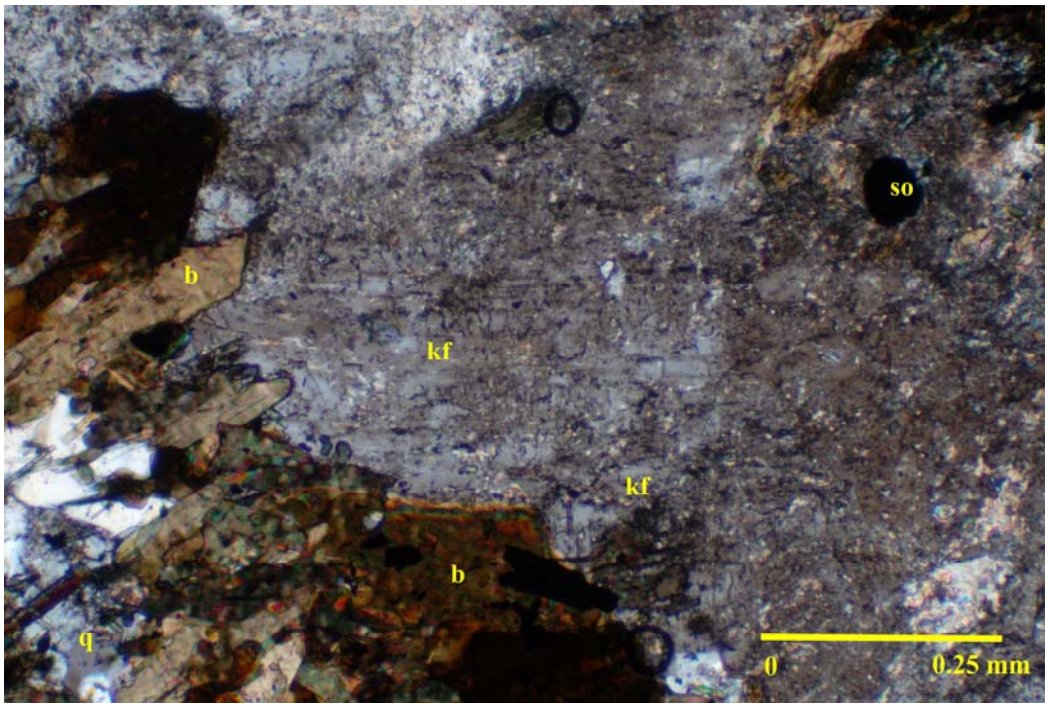
Magnetic Susceptibility: 0.06 SI units.

Deformational Style: The unit contains no rotational or shear fabrics. The S1 is parallel to So which infers that the sample has been taken from the limb, not hinge position of any related folds. Pressure shadows are absent. The single vein noted in the sample is a classic extensional vein, the extensional nature of the vein is clear from the orientation of biotite fiber growth relative to the vein margin.



Sample 09 – 44 @ 154.45. Primary compositional layers defined by the onset of angular quartz rich lithics and elevated biotite are in sharp contrast to the very fine grained sericite (clay) and clast rich lamella in the upper field of view. S1 fabrics approximately parallel So contacts. Abbreviations: sec: sericite cast, co: carbonaceous opaques, so: sulphide-oxide, ql: quartz lithic, b: biotite. Transmitted light, crossed polars, 25x.





Sample 09 – 44 @ 154.45. Textural and compositional characteristics of biotite-potassium feldspar extensional veins are highlighted on these plates. The veins have strong biotite halos and contain a significant percentage of internal potassium feldspar. The perpendicular orientation of mariginal biotite grains to the vein margins clearly indicates that these are extensional veins. The orthogonal cleavages sets common to potassium feldspars are clearly noted in the lower plate. Abbreviations: b: biotite, kf: potassium feldspar, q: quartz, se: sericite, sec: sericite cast. Transmitted light crossed polars, upper plate 25x, lower plate 100x.

Sample 09 – 64 @ 130.5 Standard Petrographic Section, No Opaque Mineral Determinations.

Protolith: **Option A:** Magnetiferous Volcanic/Intrusive Breccias Lesser Lithic Wackes
Option B: Magnetiferous Polylithic Pebble Conglomerates

Macroscale or hand specimen indicators suggest this is a complex rock unit both in terms of its alteration parameters and it's litho type. The sample contains three sub-rounded cm scale fragments. One of these has been selectively sericitized, is pale yellow cream in color, and contains a well developed, narrow mm scale, very fine grained silica (?) rich rind. The fragment contains sporadic but reasonably definitive feldspar microliths. The remaining two cm scale fragments are dark grey black, also contain probable feldspar casts and contain a matrix dominated by dark black brown oxides. Both fragment types are sub-rounded. Between the fragments the protolith appears to be a brown black fine grained lithic wacke.

None of the textures are pepritic. Macroscale data suggests two potential protoliths for this rock type including:

1. The sample has been taken from either contact between a flow/dyke complex and the enclosing sedimentary sequence, or it's an intrusion or contact breccia.

2. The sample is of a polylithic pebble conglomerate.

Mineralogy:

Mineral	*Abundance*	*Grain Size*
Sericite	60-63%	< 0.1 mm
Black Opaques	20-25%	< 0.1 – 0.25 mm
Brown Carbonaceous Semi-Opaques	8-9%	< 0.1
Biotite	3-4%	< 0.1 - .2 mm
Euhedral Black Sulphide/Oxide	2%	0.1 – 0.3 mm
Quartz	0.25%	< 0.1 mm
Apatite	trace	< 0.1 mm

Note: This section is devoid of iron, magnesium or calcium carbonates.

Fine grained sericite occurs throughout this matrix and is the dominant silicate phase in all clast types and is the dominant mineral grain within interstices between the fragments. All sericites are exceptionally fine grained averaging well under 0.1 mm.

Fine grained black opaques have, under greater than 100x magnification well developed square euhedral forms. Brown carbonaceous semi-opaques are generally amorphous and

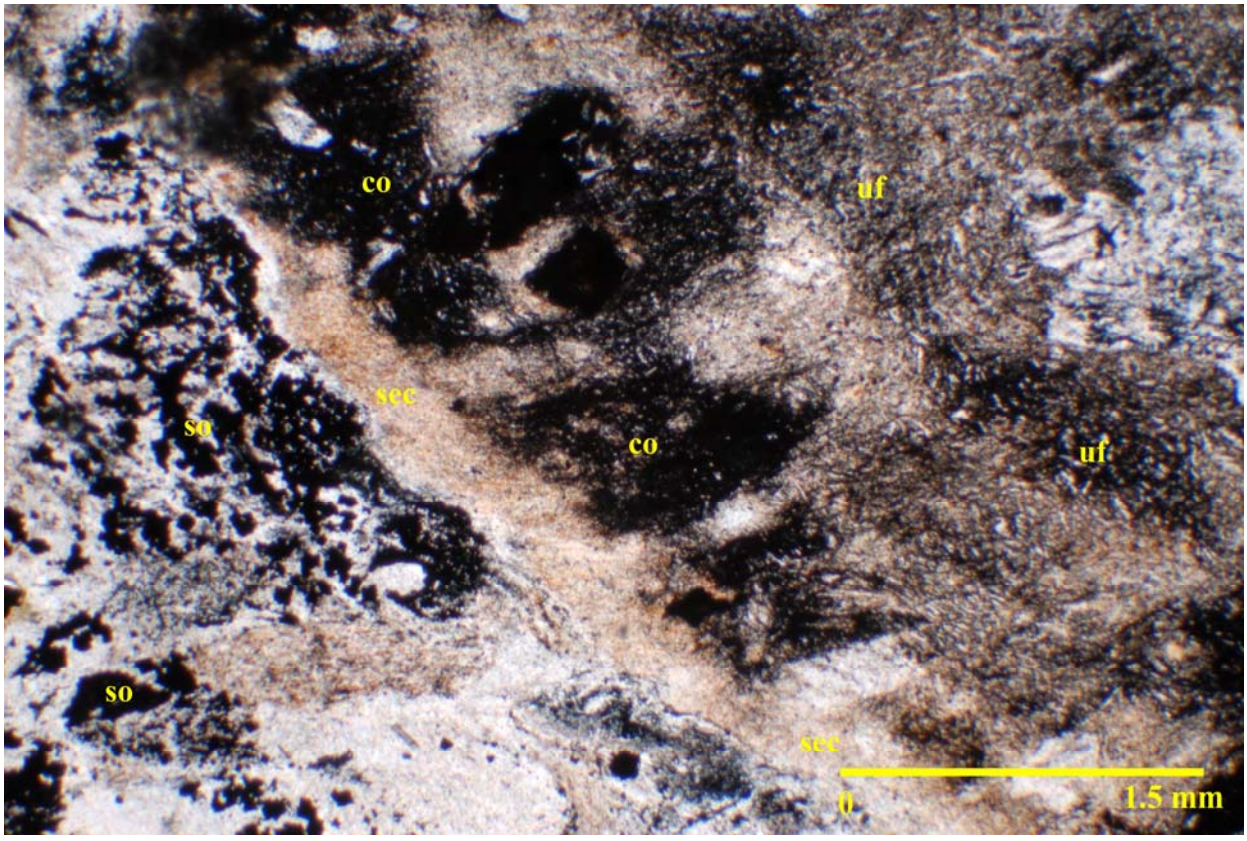
lack well defined crystal forms. Both opaque mineral varieties form curvilinear arcuate forms or complex interlinked mesh textures.

Biotites are present only as minor isolated aggregates, as is quartz, and is noted only as rare and very small grains. All fragment types likely may have mafic protoliths. Apatite grains are preferentially identified in the interstices material between larger fragments.

It is significant the large yellow fragment in this sample appears to have a reaction rind at the lithic wacke contact. This may suggest that the fragment is not in equilibrium, ie. Its "hot", with the enclosing sediments. However, reaction rinds are not identified with the dark brown lithic fragments.

Magnetic Susceptibility: 29.2

Deformational Style: A single well identified penetrative fabric penetrates all clast and matrix forms. No rotational fabrics are identified and no post S1 fabrics are recognized.



Sample 09 – 64 @ 130.5. Contact relations between a pale cream sericitized volcanic clasts and the enclosing sediments are illustrated on this plate. The clast has a definitive chilled or contact margin, indicated by "sec". The fragment matrix in the upper right field of view is distinctly microlithic and has either been derived from a mafic flow or fine grained mafic dyke/sill. Abbreviations, sec: sericite contact, uf: microlithic feldspar, co: carbonaceous opaque, so: sulphide/oxide. Transmitted plane polarized light, 25x.

Certificate of Analysis

RAU Standard 1

Element	Certified Mean	Two Standard Deviations (between lab)
FA Au	0.514 g/t	0.058 g/t

Means and standard deviations were calculated from data supplied by six laboratories using a fire assay, ICP-ES or gravimetric finish.

The participating laboratories were:

ALS Chemex, Vancouver
Acme, Vancouver
Actlabs, Ancaster
IPL, Vancouver
TSL, Saskatoon
Ecotech, Kamloops

The final limits were calculated after first determining if all data was compatible within a spread normally expected for similar analytical methods done by reputable laboratories. This was done by using a Student's t test of means where a laboratory was removed from the data base if failing the t test. The means and standard deviations from the remaining data were calculated. Any analysis that fell outside of the mean ± 2SD was removed from the ensuing data base. The mean and standard deviations were again calculated using the remaining data (shown as the 1st Iteration in the attached Excel spreadsheets). The final standard deviation is known as the "Between Lab" deviation, and can be used to monitor accuracy of a single analysis.

Elements are certified if the Relative Standard Deviation (RSD) is near 5 % or less. Elements that have a RSD of between 5 % and 15 % are given a Provisional mean and elements that have a RSD of more than 15 %, or have insufficient data are not certified but given an Indicated Mean.

web site: www.geochemist.com

The bulk standards were prepared and packaged by CDN Labs of Langley B.C. Each bulk sample was pulverized in a large rod mill, screened through 270 mesh using an electric sieve, and homogenized in a large rotating mixer.

Certificate of Analysis

RAU Standard 3

Element	Certified Mean	Two Standard Deviations (between lab)
FA Au	5.705 g/t	0.498 g/t

Means and standard deviations were calculated from data supplied by six laboratories using a fire assay, ICP-ES or gravimetric finish.

The participating laboratories were:

ALS Chemex, Vancouver
Acme, Vancouver
Actlabs, Ancaster
IPL, Vancouver
TSL, Saskatoon
Ecotech, Kamloops

The final limits were calculated after first determining if all data was compatible within a spread normally expected for similar analytical methods done by reputable laboratories. This was done by using a Student's t test of means where a laboratory was removed from the data base if failing the t test. The means and standard deviations from the remaining data were calculated. Any analysis that fell outside of the mean ± 2SD was removed from the ensuing data base. The mean and standard deviations were again calculated using the remaining data (shown as the 1st Iteration in the attached Excel spreadsheets). The final standard deviation is known as the "Between Lab" deviation, and can be used to monitor accuracy of a single analysis.

Elements are certified if the Relative Standard Deviation (RSD) is near 5 % or less. Elements that have a RSD of between 5 % and 15 % are given a Provisional mean and elements that have a RSD of more than 15 %, or have insufficient data are not certified but given an Indicated Mean.

GOLD ORE REFERENCE STANDARD: CDN-GS-1D

Recommended value and the "Between Lab" Two Standard Deviations
Gold concentration: 1.05 ± 0.10 g/t

PREPARED BY: CDN Resource Laboratories Ltd.
CERTIFIED BY: Duncan Sanderson, B.Sc., Licensed Assayer of British Columbia
INDEPENDENT GEOCHEMIST: Dr. Barry Smee., Ph. D., P. Geo.
DATE OF CERTIFICATION: October 25, 2008

ORIGIN OF REFERENCE MATERIAL:

Standard CDN-GS-1D was prepared using ore supplied by Goldcorp (Les Mines Opinaca – Eleonore property). The host rock of the mineralized zones is usually a thinly bedded greywacke. The mineralized zones consist of stockworks of quartz-tourmaline-actinolite-arsenopyrite-pyrrhotite veins and veinlets. The standard was made using a 5/95 blend of ore and blank, granitic material.

METHOD OF PREPARATION:

Reject ore material was dried, crushed, pulverized and then passed through a 200 mesh screen. The +200 material was discarded. The -200 material was mixed for 5 days in a rotary mixer. Splits were taken and sent to 12 commercial laboratories for round robin assaying. Round robin results are displayed below:

Assay Procedure: assays were fire assay, AA or ICP finish on 30g samples.

GOLD ORE REFERENCE STANDARD: CDN-GS-1D

APPROXIMATE CHEMICAL COMPOSITION:

	Percent			Percent
SiO2	67.4		Na2O	3.1
Al2O3	13.0		MgO	2.5
Fe2O3	6.4		K2O	1.3
CaO	3.8		TiO2	0.6
MnO	0.1		LOI	1.5
C	0.1		S	0.3

Statistical Procedures:

The final limits were calculated after first determining if all data was compatible within a spread normally expected for similar analytical methods done by reputable laboratories. Data from any one laboratory was removed from further calculations when the mean of all analyses from that laboratory failed a t test of the global means of the other laboratories. The means and standard deviations were calculated using all remaining data. Any analysis that fell outside of the mean ±2 standard deviations was removed from the ensuing data base. The mean and standard deviation were again calculated using the remaining data. This method is different from that used by Government agencies in that the actual "between-laboratory" standard deviation is used in the calculations. This produces upper and lower limits that reflect actual individual analyses rather than a grouped set of analyses. The limits can therefore be used to monitor accuracy from individual analyses, unlike the Confidence Limits published on other standards.

Recommended value and the "Between Laboratory" two standard deviations

Gold concentration: 3.10 ± 0.24 g/t

PREPARED BY: CDN Resource Laboratories Ltd.
CERTIFIED BY: Duncan Sanderson, B.Sc., Licensed Assayer of British Columbia
INDEPENDENT GEOCHEMIST: Dr. Barry Smee., Ph.D., P. Geo.
DATE OF CERTIFICATION: October 20, 2009

ORIGIN OF REFERENCE MATERIAL:

Standard CDN-GS-3F was prepared primarily using ore supplied by Agnico Eagle Mines from their Goldex mine in Quebec. The mineralized zones consist of stockworks of pyrite bearing quartz-tourmaline veins. 490 kg of Goldex ore was blended with 116 kg of ore from the Eskay Creek property in B.C. and 200 kg of a blank, granitic material.

METHOD OF PREPARATION:

Reject ore material was dried, crushed, pulverized and then passed through a 270 mesh screen. The +270 material was discarded. The -270 material was mixed for 5 days in a double-cone blender. Splits were taken and sent to 14 commercial laboratories for round robin assaying. Round robin results are displayed below:

REFERENCE TUNGSTEN ORE BH-1

CERTIFICATE OF ANALYSIS

Consensus Value		95% Confidence Interval
W	0.422%	±0.008%

DESCRIPTION

BH-1 is a sample of wolframite ore, hand-picked in 1973 from a stockpile at the Burnt Hill deposit near Fredericton, New Brunswick, the deposit being owned by International Paper Company Limited. The major mineralogical components are 73% quartz, 11% biotite, 5% chlorite, 4% muscovite, 2% of each of feldspar and pyrrhotite, 1% beryl and topaz and 0.4% cassiterite, rutile and apatite. The approximate chemical composition is:

	wt %		wt %
Si	38.0	Mg	0.4
Al	3.5	Ti	0.4
Fe(total)	3.2	Mn	0.2
K	1.7	Na	0.1
S	0.8	C(total)	0.1
Ca	0.5	Mo	0.02
W	0.422		

The ore was dry-gound to minus 74 µm, blended, sampled systematically for analysis by X-ray fluorescence and chemical methods to demonstrate homogeneity sufficient for use as a compositional reference material for tungsten, and bottled in 200-g units.

CERTIFICATION

The consensus value for tungsten is the unweighted mean of 224 accepted analytical determinations by 15 laboratories. The summary of results according to analytical method gives:

1. INTRODUCTION

This report describes the processing and analysis of a VTEM airborne electromagnetic and magnetic survey carried out for Archer, Cathro and Associates Ltd. by Geotech Ltd. in June 2008 over the Rau gold project, Yukon Territory, Canada (Figure 1). A simplified geology map is shown in Figure 2.

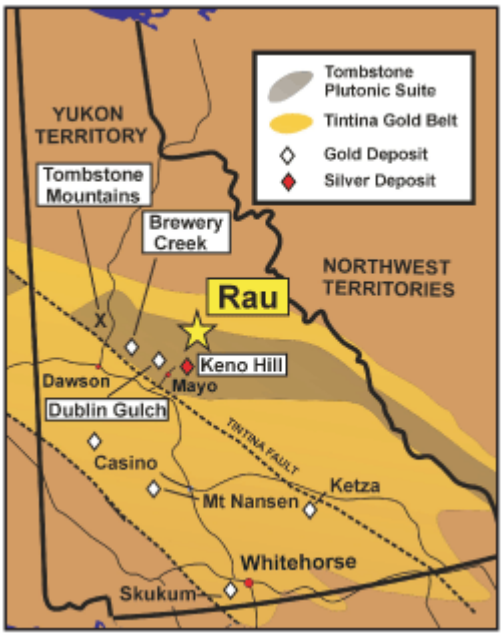

Figure 1: Location of Rau project.

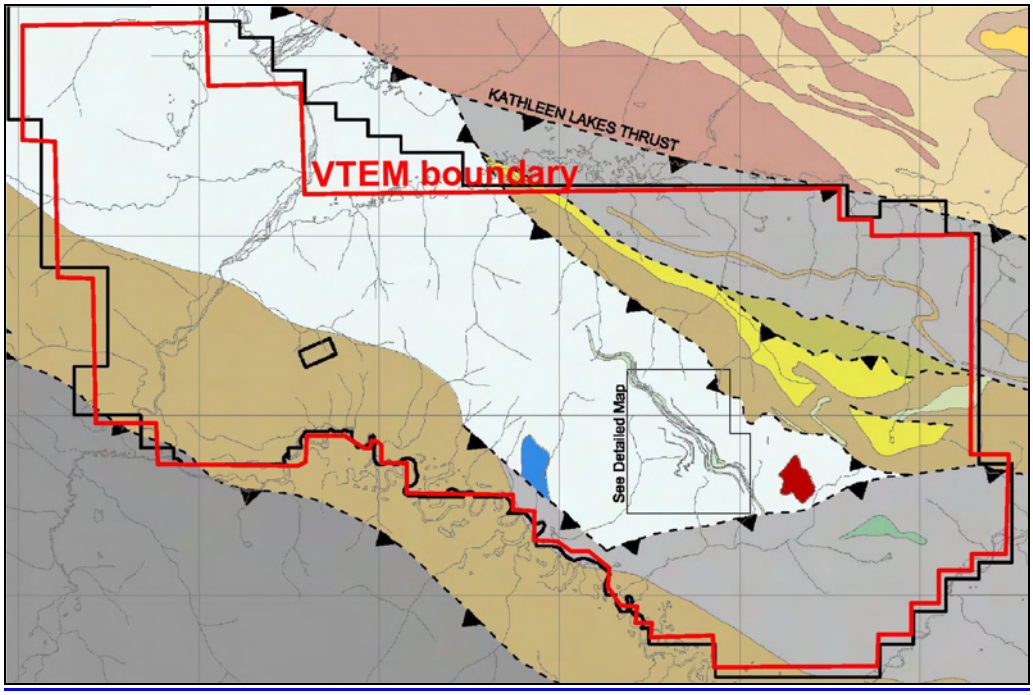

Figure 2: Rau geology.

The following description of the geology and mineralization is extracted from the ATAC Resources website:- http://www.atacresources.com/s/Rau.asp

Geology: The property lies within a band of regional-scale thrust faults, including the Tombstone, Dawson and Robert Service Thrusts, that imbricate rocks of Selwyn Basin and Mackenzie Platform. The thrust panel that contains the Rau property approximately straddles the boundary between Selwyn Basin and Mackenzie Platform and contains units belonging to both tectonic elements. The Rau gold discovery lies within a 22 km long anomalous trend, which has been traced by soil and silt geochemistry and helicopter-borne VTEM and magnetic surveys west-northwesterly from a high-level Late Cretaceous granitic stock. Gold occurs with sulphide minerals that wholly or partially replace dolomitized horizons along the crest of an anticline. The sulphide minerals are locally concentrated beneath a stacked series of sericitized volcaniclastic beds, which may have acted as impermeable caps. To date, three mineralized horizons have been identified. Some mineralization is intensely oxidized.

Mineralization: The uppermost horizon comprises medium to coarse grain, disseminated pyrite often with quartz, pyrrhotite and lesser arsenopyrite. Gold values are generally low in this horizon, but some gold-rich intervals were obtained, including 8.13 g/t gold over 3.05 m. The middle horizon, or discovery horizon, contains most of the significant gold intervals and has the highest concentrations of arsenopyrite, bismuthinite and scheelite. The thickest intersection on this horizon graded 1.71 g/t gold over 78.54 m. The lowermost horizon comprises very coarse grain, massive pyrite with minor sphalerite. Only the final hole of the program extended deep enough to reach this horizon. It ended with 20.77 m of massive pyrite, which averaged 0.13 g/t gold, 24.36 g/t silver and 1.12% zinc. The system remains open along strike and to depth.

The aim of the VTEM survey was to characterize the EM and magnetic signatures of the known gold mineralization and to explore for similar conductors and/or resistors and magnetic features which may host more significant deposits.

The VTEM survey comprised 2 993 line km, with flight lines oriented N-S and nominal spacing of 100 m.

Condor Consulting Inc. (Condor) was commissioned to carry out processing, analysis and interpretation of the EM and magnetic data from the VTEM survey.

This assessment has identified twenty five Target Zones that are deemed worthy of follow-up work.

2. PROCESSING and ANALYSIS TECHNIQUES

PROCESSING

Time Constant: AdTau

The AdTau program calculates the time constant (tau) from time domain decay data. The program is termed ***AdTau*** since rather than using a fixed suite of channels as commonly done, the user sets a noise level and depending on the local characteristics of the data, the program will then select the set of five channels above this noise level. In resistive areas, the earlier channels will tend to be used, whereas in conductive terrains the latest channels available can generally be used. A typical decay fit; in this case, the last five channels are shown to the right in Figure 3.

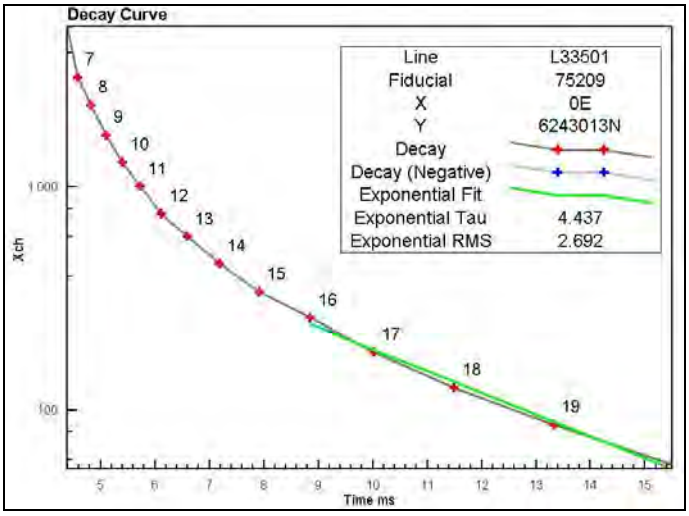

Figure 3: Typical Decay Curve

Layered-Earth Inversion

The layered-earth inversion (LEI) algorithm models the EM data with a 28-layered earth model (Farquharson and Oldenburg, 1993, Ellis 1998), increasing in thickness from the surface to depth in an approximately logarithmic fashion. The first layer was 5 m thick while the deepest was 232 m thick. A starting model of 1 000 ohm-m (0.001 S/m) was used, with a reference model of 5 000 ohm-m (0.0002 S/m). The reference model is what the program defaults to (at depth) when there is no longer enough information to further refine the inversion outcome.

The results of the inversion are presented in the form of a conductivity depth section (CDS), an example of which is shown in Figure 4.

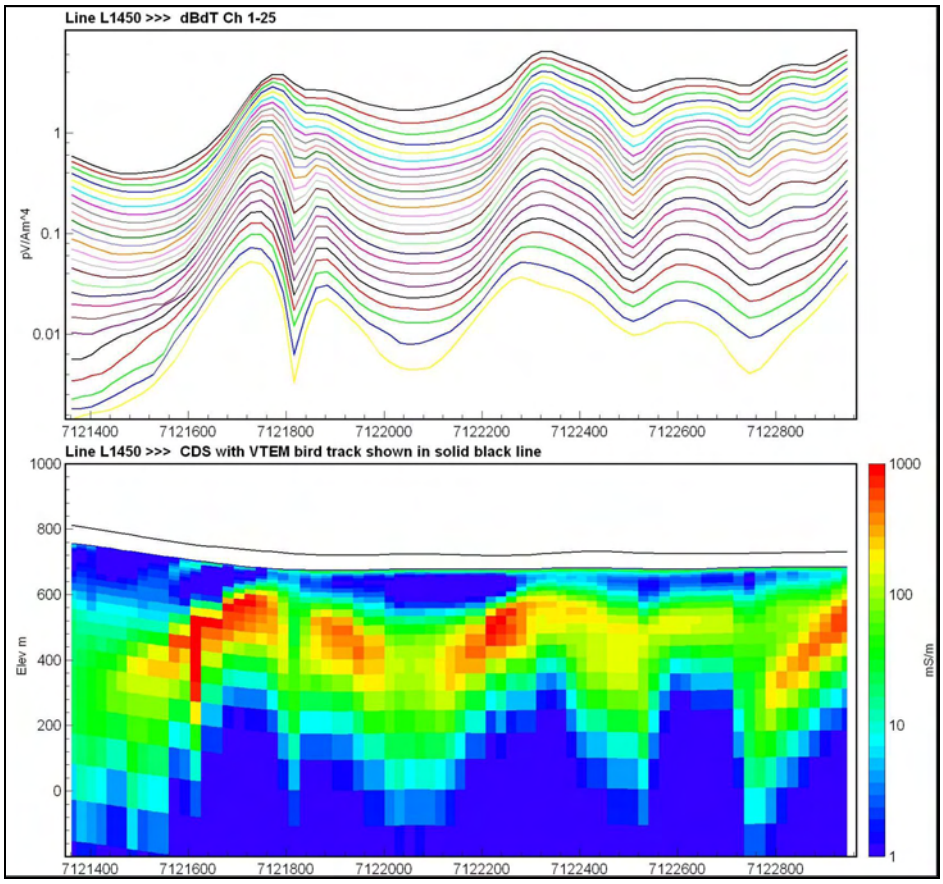

Figure 4: Example profiles and CDS.

Conductors are shown in “warm” colors (red-green) and resistors in “cold” color (blue).

Magnetics

In addition to the normal filters available in the Geosoft application, additional processing was done using the Encom PA[1] software and algorithms described by Shi and Butt (2004) – this paper is included in Appendix D (Archive DVD). A variety of enhancements were produced, but one is deemed to be particularly useful in the present study; termed Tilt Angle. This grid is provided as one of the TargetMaps (see Table 3-1 Products).

[1] Encom PA is a product of Pitney Bowes Business Insight (PBBI).

ANALYSIS TECHNIQUES AND ISSUES

Anomaly Shapes

For discrete plate-like targets, the VTEM system produces two main types of responses; those termed inductively thin or double-peaked responses (DPR) and those termed inductively thick or single-peak responses (SPR). These basic shapes are shown in profile form in Figure 5. Note that, at this time, the VTEM system records only the Z component. No specific economic significance is attached to whether a specific anomaly responds as either one style or another. However, with DPRs, it is possible to better estimate the dip of the conductor.

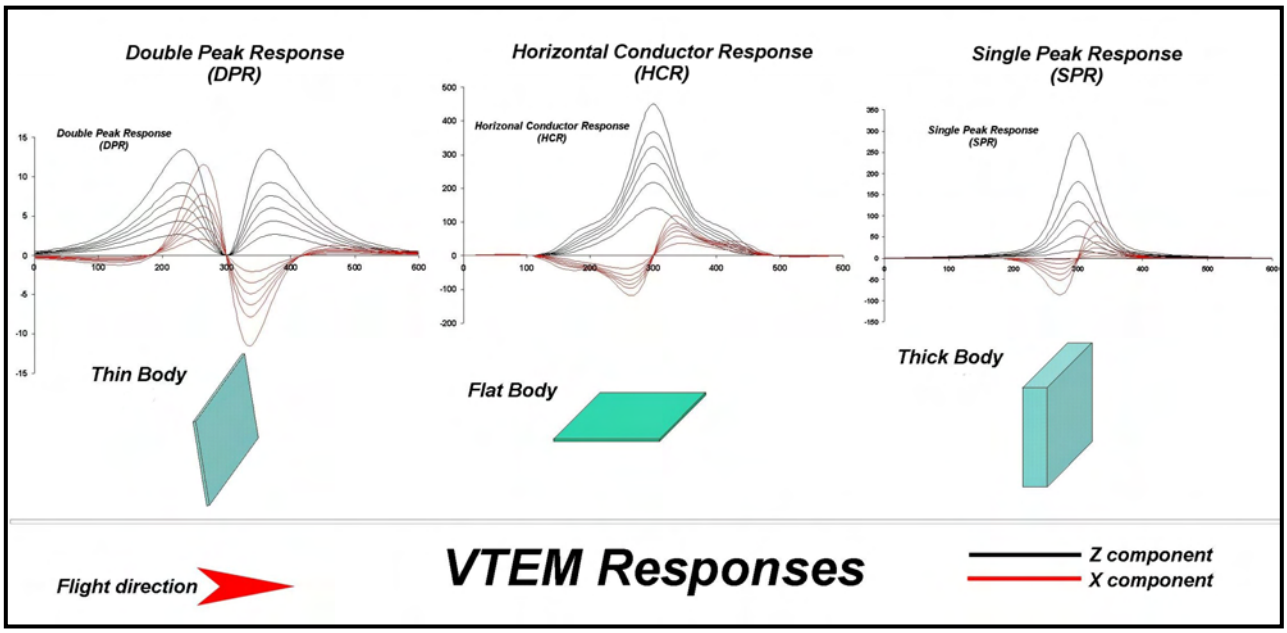

Figure 5: Modeled VTEM Responses.

Only Z component data was acquired in this survey.

Both DPR and SPR responses are common in the Rau VTEM data. In addition large parts of the survey area have broad, shallow, flat-lying conductive zones which appear to be lithologic in origin.

Picking

The MultiPlot™ media was the primary means to examine, identify and then rank the anomalies. This overall process is termed anomaly picking and was on a line-by-line basis, with several passes being required to finalize the process.

Target Zones

Groupings of conductors are termed Target Zones or TZ. A TZ is deemed to be a logical grouping of conductors within a data set and is based on an assessment of the distribution of individual conductor picks, plus the magnetic association and any other available geoscience data. The TZs are then prioritized for follow up work based on their overall geophysical character.

Maxwell Modeling

Maxwell is an EM modeling program developed by EMIT (Electro Magnetic Imaging Technology) of Perth, Australia. Maxwell is designed for the analysis of ground, borehole and airborne survey. A brief description of Maxwell is provided in Appendix A.

Modeling in Maxwell uses either “thin” or “thick” plates. Thin plates are defined as inductively thin and are modelled using a “sheet” consisting of many current filaments aligned within the plane of the sheet. Thick plates are modelled as six thin plates, corresponding to the two sides, the two ends and the top and bottom of the thick plate. Normally the top and bottom sheets are kept horizontal, even when the dip is changed. This simple representation of thick plates speeds up calculations significantly and makes inversions feasible.

The thin and thick plate models are used for DPR and SPR-type responses respectively (see above section). The thick plate model is also useful in situations where the low between the two peaks of a DPR response is not fully developed, implying that the conductor is not inductively thin and some response is arising from the top edge. In this situation the thick plate model is used, but with a comparatively small thickness.

In this Maxwell modelling project, both thin and thick plate models were required to fit the observed data.

Note that Maxwell displays the X, Y and Z coordinates of the center-top of the plate. The latter *may* coincide with the flight lines, but in many cases the plate is not symmetric with respect to the flight lines and so the X and Y coordinates lie off the flight line. This needs to be kept in mind when designing drill holes to intersect the plate.

3. PRODUCTS

Table 3-1 lists the maps and products that are provided. Other products can be prepared from the existing dataset, if required.

Base Maps

All maps are created using the following parameters:

Projection Description:

Datum:	NAD83
Ellipsoid:	GRS 1980
Projection:	UTM (Zone: 8N)
Central Meridian:	135º W
False Northing:	0
False Easting:	500 000
Scale Factor:	0.9996

Table 3-1 Interpretation Products

TargetMaps @ 1:25 000

Each map includes picked anomalies and TZs

- TMI (Total magnetic intensity)
- Tilt Angle of TMI
- AdTau (dBdT, threshold 0.002 pV/Am^4)
- Geology

MultiPlots™ @ 1:20 000 (as PDFs)

A sample MultiPlot™ is shown in Figure 6, annotated to show the various tracks.

Mini-Plates™ (located at the top of each MultiPlots™) – TMI-RTP, Tilt Angle, EM dBdT Z Channel 1 (120 us), AdTau (dBdT, threshold 0.002 pV/Am^4), DTM

On each MultiPlot™ the picked anomalies are indicated along with the following:

- VTEM channels dBdT 120-7 828 us
- VTEM channels BField 120-7 828 us
- Profiles of TMI, 1st Vertical derivative of TMI and Analytic Signal
- Profiles of AdTau dBdT (threshold 0.002 pV/Am^4 - smoothed), AdTau BField (threshold 0.01 pVms/Am^4 - smoothed)
- LEI CDS from dBdT Z + bird height + Maxwell plates (on applicable lines)

- LEI CDS from BField + bird height
- TrackMap: Geology + flight path + conductor picks + TZ + Maxwell plates

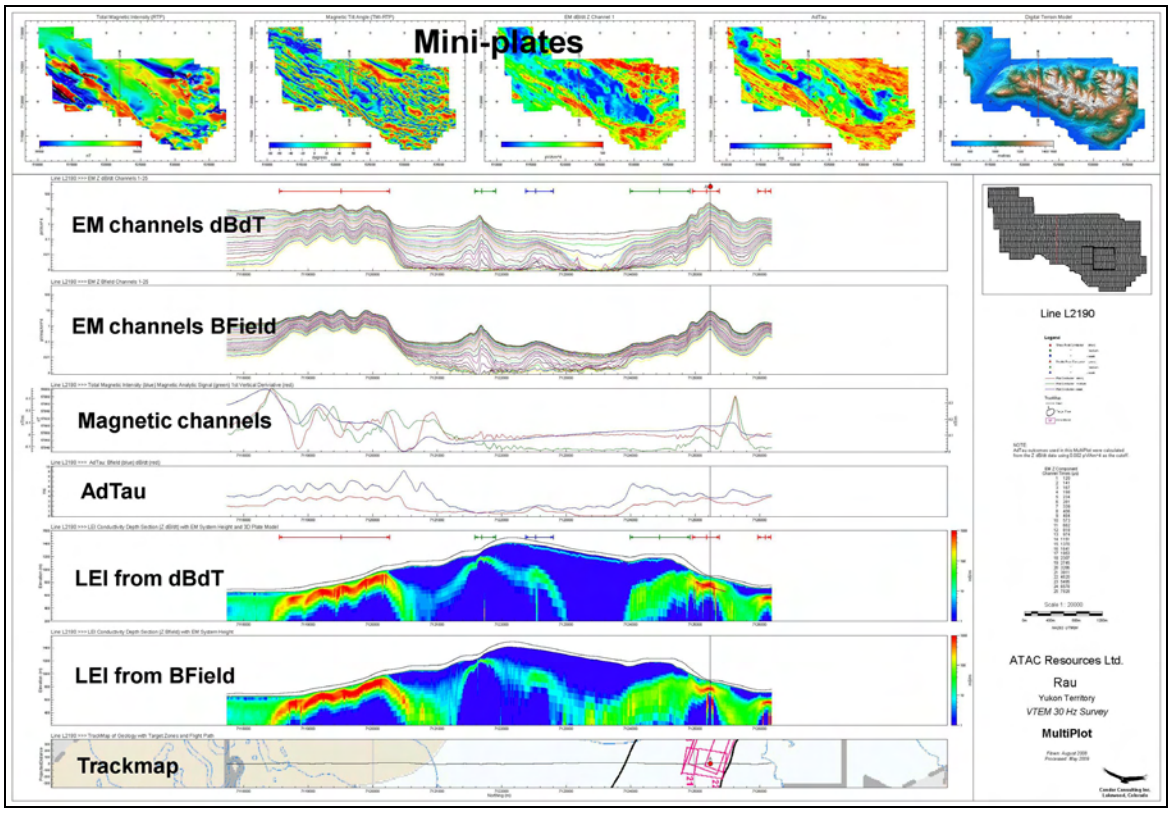

Figure 6: Sample annotated MultiPlot™.

Processing and Analysis Report (PDF)

Archive CD-ROM/DVD contains the following files:

-Databases of primary and derived geophysical data

-Digital grid archives in Geosoft format

-MultiPlots™ - Profile Analyst session files and PDFs

-TargetMaps – Geosoft maps files and PDFs

-ArcView shape files of picked anomalies

-Maxwell plate 3D DXF, shapefiles and spreadsheet listing plate parameters

-UBC MAG3D voxel model in UBC and Geosoft formats

-Processing and analysis report (PDF)

-Geotech Field report

4. EM OUTCOMES

Many conductors were identified within the VTEM survey, consisting of strong-weak DPR and SPR anomalies (interpreted as dipping, relatively thin sulphide or graphitic conductors) and strong-weak flat-lying conductors (interpreted as due to lithologic responses). The locations are shown in Figure 7, superimposed on a geology image. A number of offsets in the conductors on the RDS have been interpreted as faults.

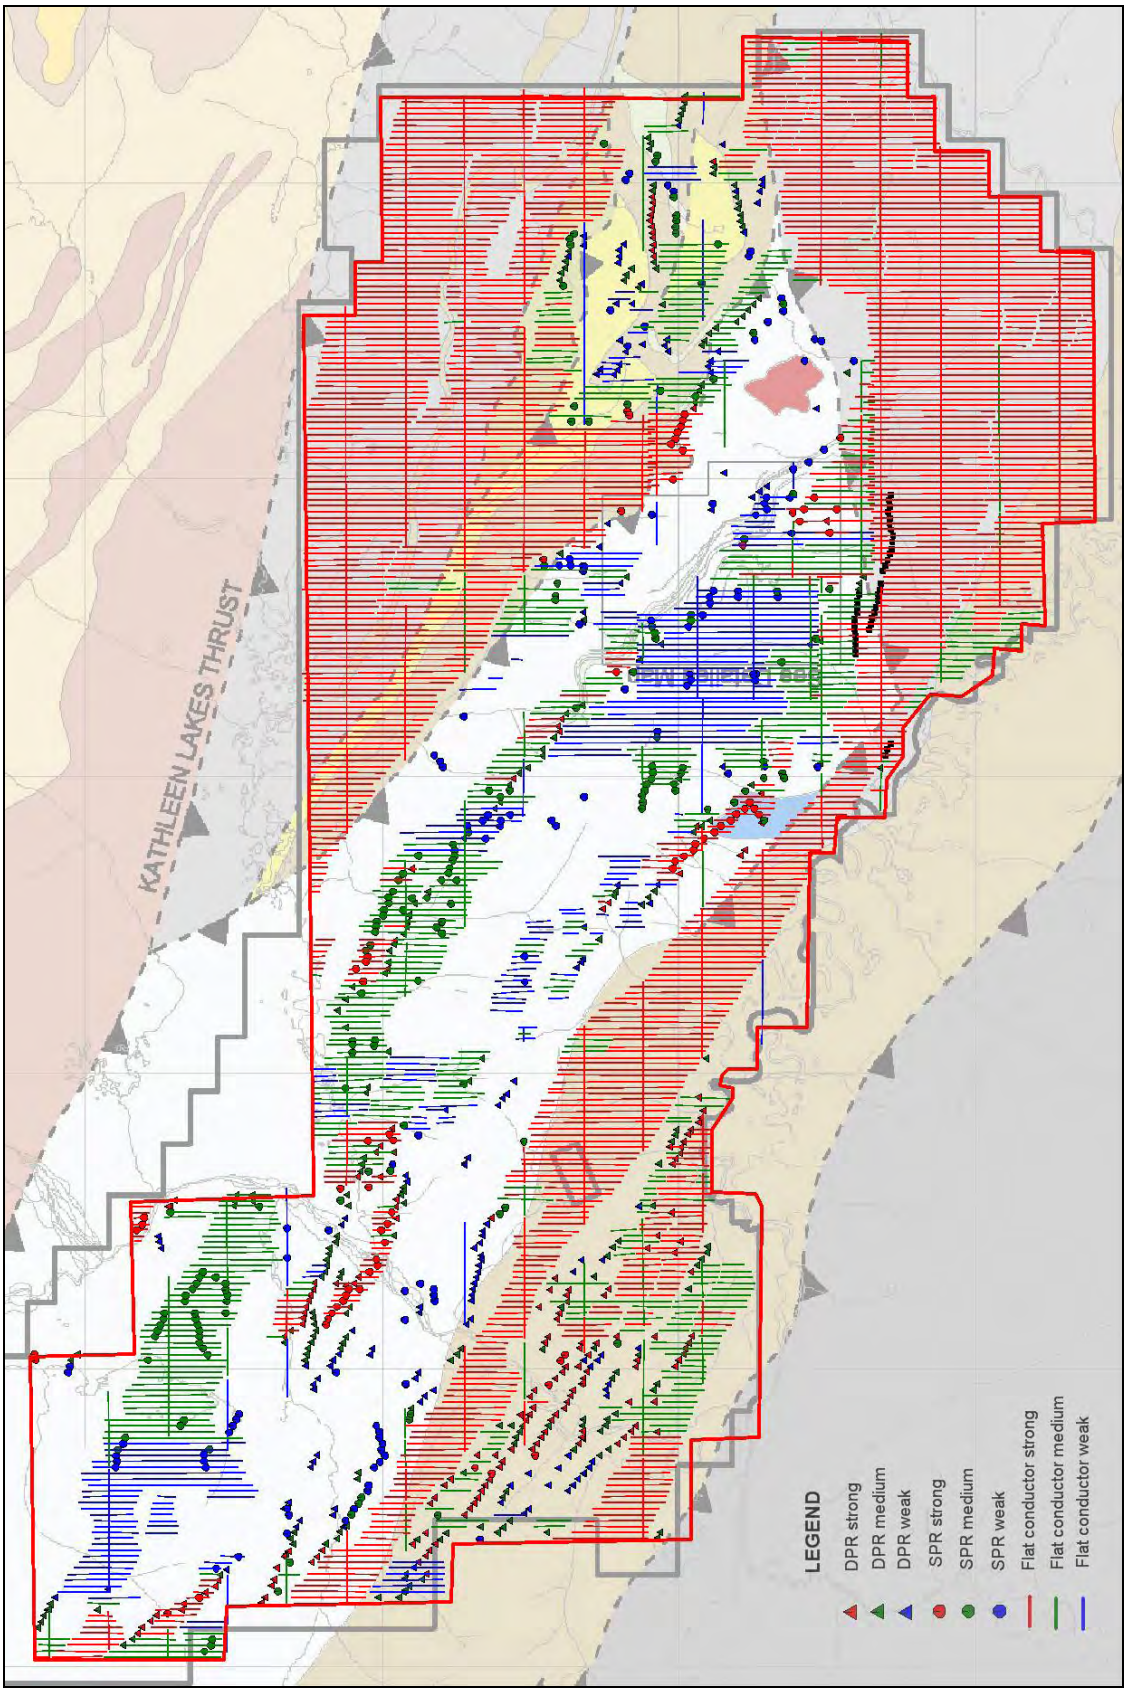

Figure 7: Picked conductors superimposed on geology.

5. TARGET ZONES

The discrete conductors have been grouped into twenty five Target Zones (TZ) labeled A-Y, which are shown in Figure 8. TZs A-X lie within, or at the contact of, mapped Bouvette Fm. TZ Y lies within mapped Keno Hills Quartzite. The TZ have been prioritized 1-3 (1 the highest) based on a subjective judgment as to their prospectivity.

Summary figures and notes on each TZ are included in Appendix B.

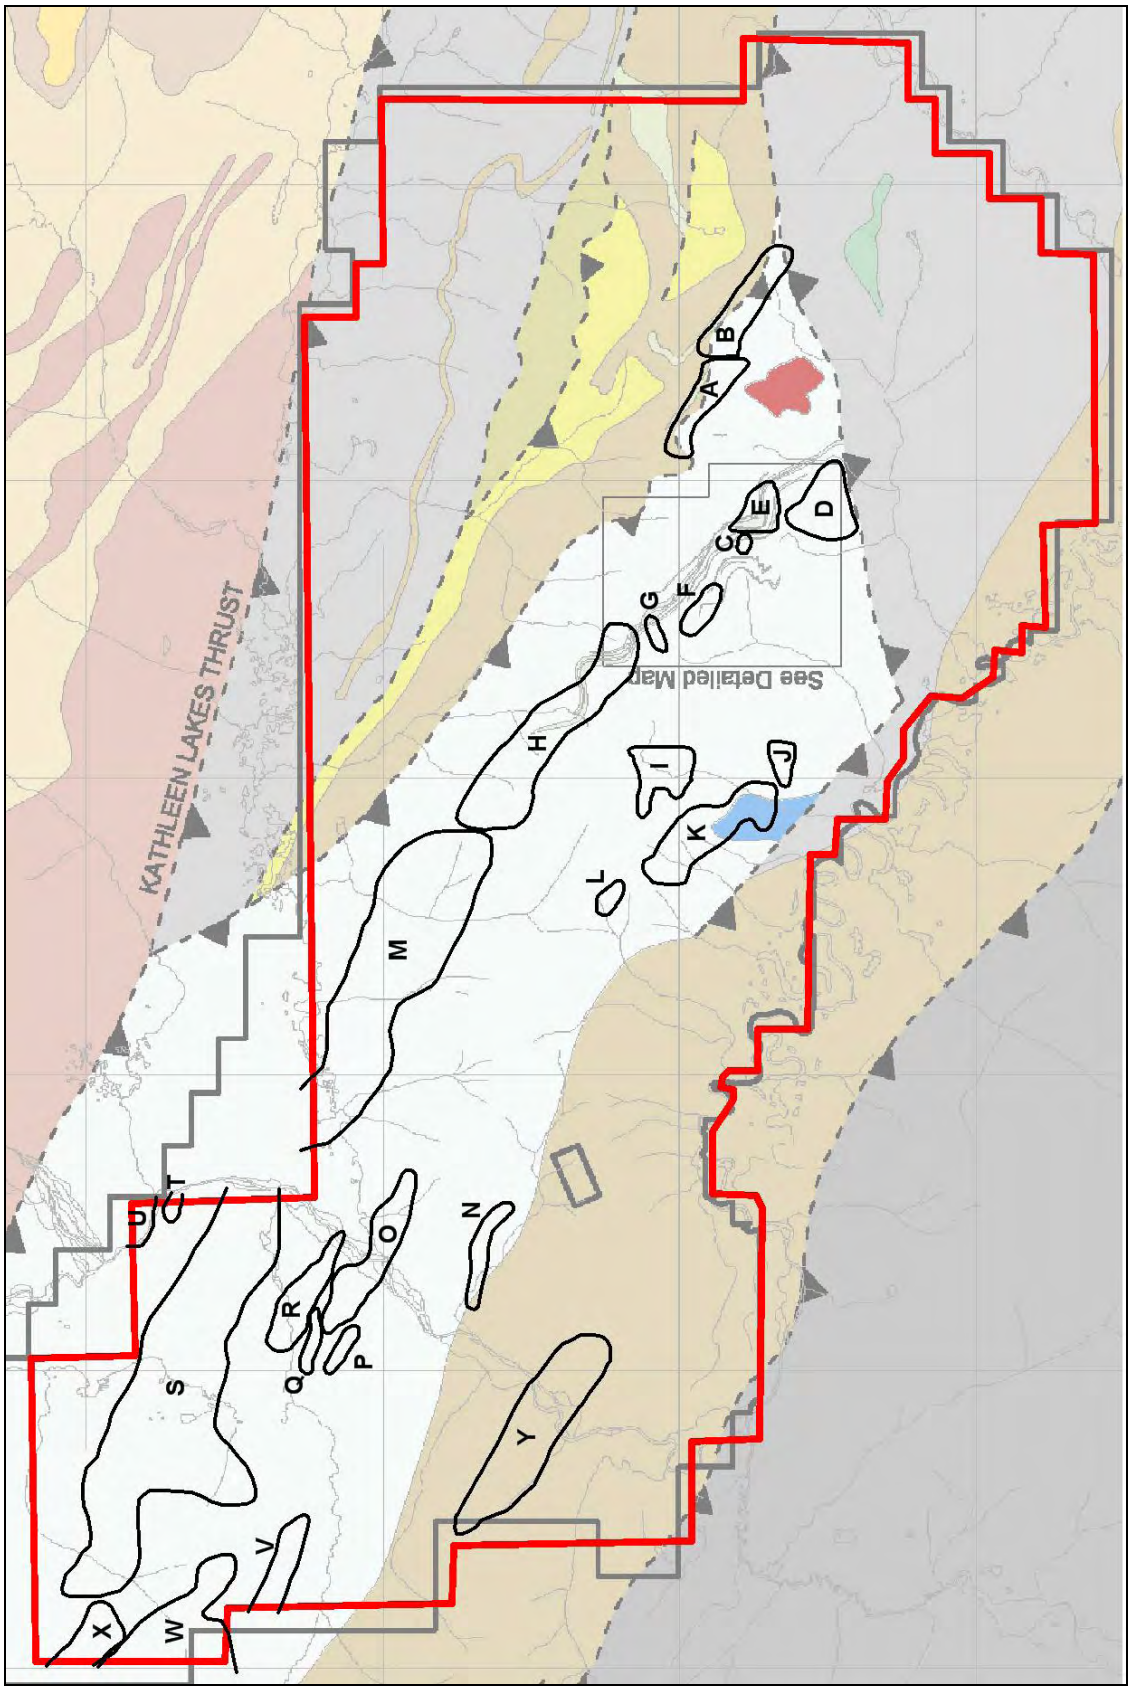

Figure 8: Locations of TZ, superimposed on geology.

6. MAXWELL MODELING

Maxwell plate modeling was run for many of the TZ (as selected by the client). The locations of the resulting plates are shown in Figure 9 and the plate parameters are listed in Table 6-1. Figures summarizing the Maxwell models are included in Appendix C.

Table 6-1– Maxwell modeling summary

TZ	Line	Number of Plates	Plate numbers

7. CONCLUSIONS AND RECOMMENDATIONS

This report provides a description of the processing and analysis of a VTEM EM and magnetic survey performed over the Rau property, in the southwest of Yukon Territory, Canada.

Twenty five Target Zones were delineated during the interpretation, consisting of trends of strong-weak discrete conductors. All but one of these is located within mapped Bouvette Fm. One Target Zone is located within mapped Keno Hills Quartzite.

Maxwell modeling has been carried out on the majority of Target Zones and the resulting plates may be used to site drill holes to test these conductors.

Respectfully submitted,

CONDOR CONSULTING, Inc.

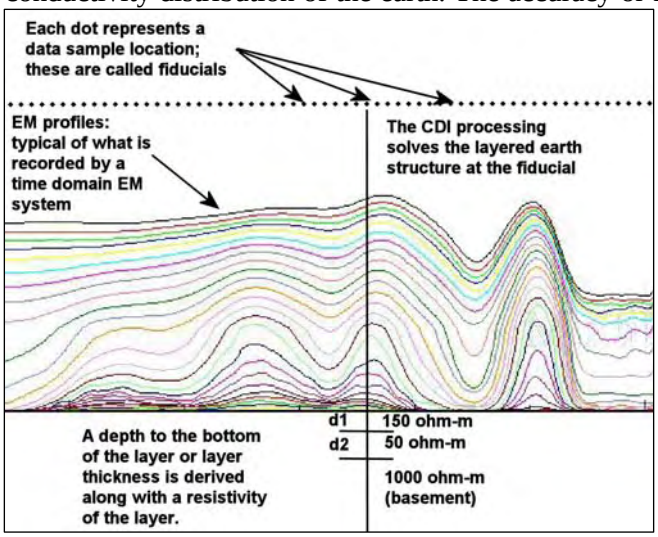
APPENDIX A: DETAILS OF EM PROCESSING

Conductivity Depth Imaging
Introduction

Condor Consulting, Inc.

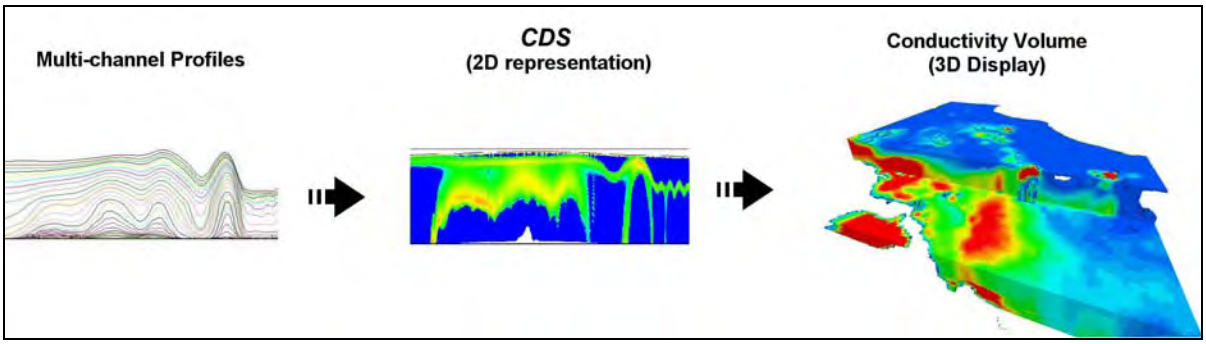
Conductivity Depth Imaging or CDI of airborne EM (AEM) data is the term applied to the mathematical transformation of the EM response recorded in the measuring instrument of the survey aircraft that is the transformed into a conductivity distribution of the earth. The accuracy or resolution of the outcomes of CDI is dependent on a number of factors including the type of EM system employed, the quality of the data the system produces, the terrain covered by the system and methodology of the CDI approach. Basically all CDI approaches in commercial use involve what is termed a 1D approximation of the earth. This means that the mathematical model being fit to the data can only capture changes in conductivity vertically in the earth. Displays of CDI outcomes in 2D (sections along lines) and 3D (gridding between lines) all rely on outcomes that are derived from initial 1D processing.



Imaging vs. Inversion: CDI processing can in turn be broken down into two major approaches in the mathematical process involved in solving the sub-surface conductivity structure; this being what is termed either imaging or inversion methodology. Both approaches are in use by survey contractor and consultants and each technique has advantages and draw backs depending on two primary factors; the EM system which acquired the data and the geological problem. Condor uses both approaches but prefers the inversion approach in most applications.

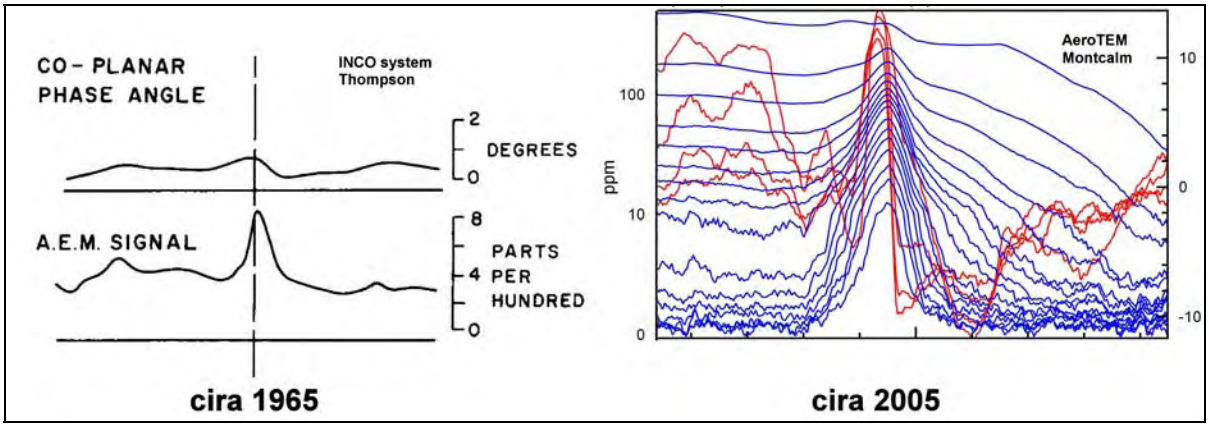
Off-time vs. Bfield: A derived Bfield outcome is now commonly delivered by the major contractors along with the traditional pure off-time data. Condor will routinely process both data streams and then assess which provides the superior outcome for subsequent use specific project assessment. Condor has found this dual processing approach is required as it is very difficult before hand to assess what data stream will provide the best outcome.

In the next several pages, examples of CDI processing will be presented which illustrate the role it can play in modern AEM interpretation. The color section showing a CDI is termed a Conductivity Depth Section or CDS.

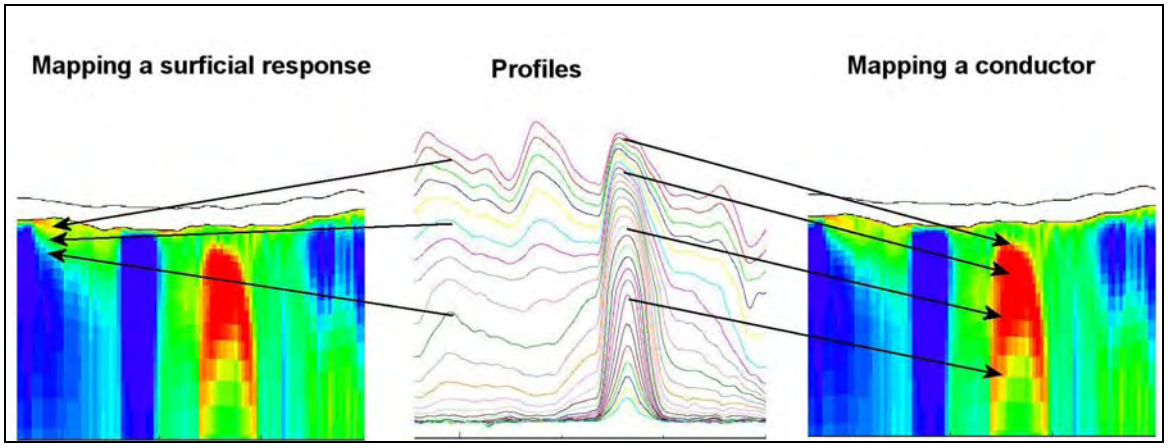


Historically, AEM was used primarily for fairly simple detect of discrete high conductance features which could represent deposits of massive sulfides such as VMS or Ni-Cu. There was little interest in extracting more information other than the X, Y location of the feature and some basic idea of the quality of the conductor. Ground follow-up for location validation and drill hole spotting was always done.

In modern exploration however, there is a far greater range of targets being sought after and in a much wider variety of settings. Even in traditional areas where AEM has been used are now deemed 'mature' explorers are expecting that more sophisticated acquisition and processing techniques will be required to make new discoveries.

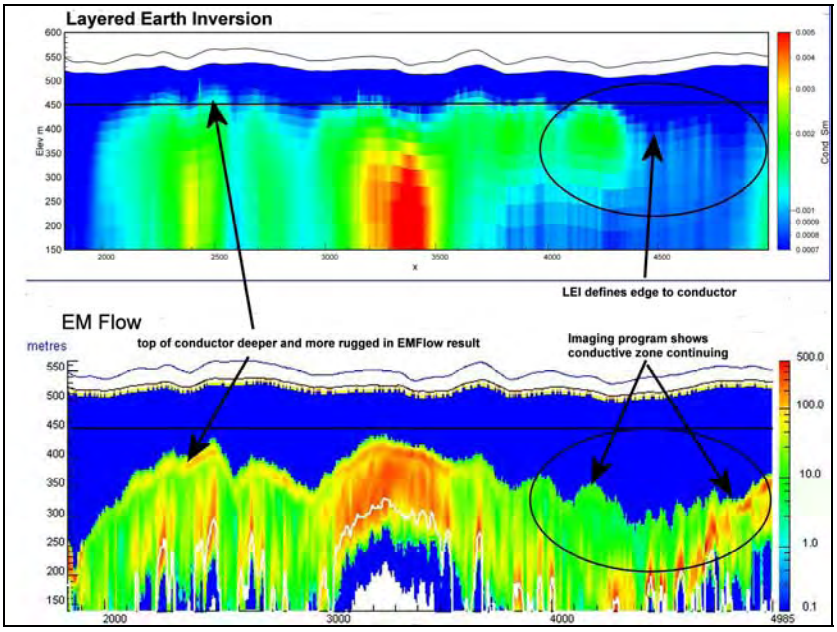


In the CDI process (this applies to either imaging or inversion approaches), those elements of the geology that are dominantly horizontal in nature can be modeled quite well whereas narrow steeply dipping features most often appear with a 'comet-like' shape the depth of which does not necessarily correspond all that well to the actual depth within earth. While this may seem like a major draw back to using these outcomes, a combination of experience, local calibration and access to alternate means to model the data allow the seasoned interpreter to define the subsurface geology quite well. The CDI processing at its best is a very useful means to provide a 3D conductivity "context" of the subsurface which can be extremely valuable in helping to recognize and define zones of interest.



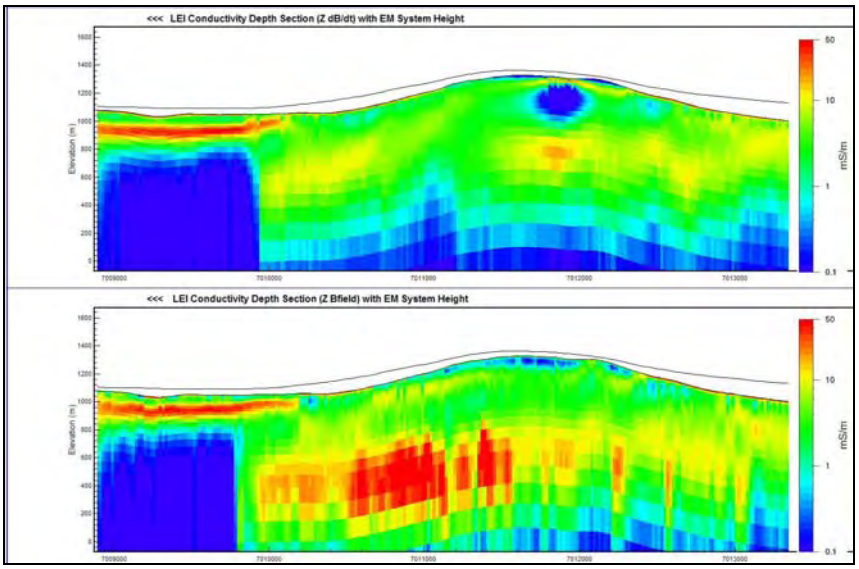
Differences between Imaging and Inversion

The image below shows the outcomes of an inversion program (termed Layered Earth Inversion or LEI) and a imaging program, in this case EMFlow. Three major differences are noted in this example (VTEM survey in the Athabasca Basin); first the depth to the major conductive zone appears deeper in the EMFlow outcome, second the topology of the basement conductor appears to be more rugged in the EMFlow outcome and third, the conductive horizon appears to end in the LEI outcome on the right hand side whereas the EMFlow result shows the zone continuing off the right and side of the image.



Differences between dB/dT and Bfield

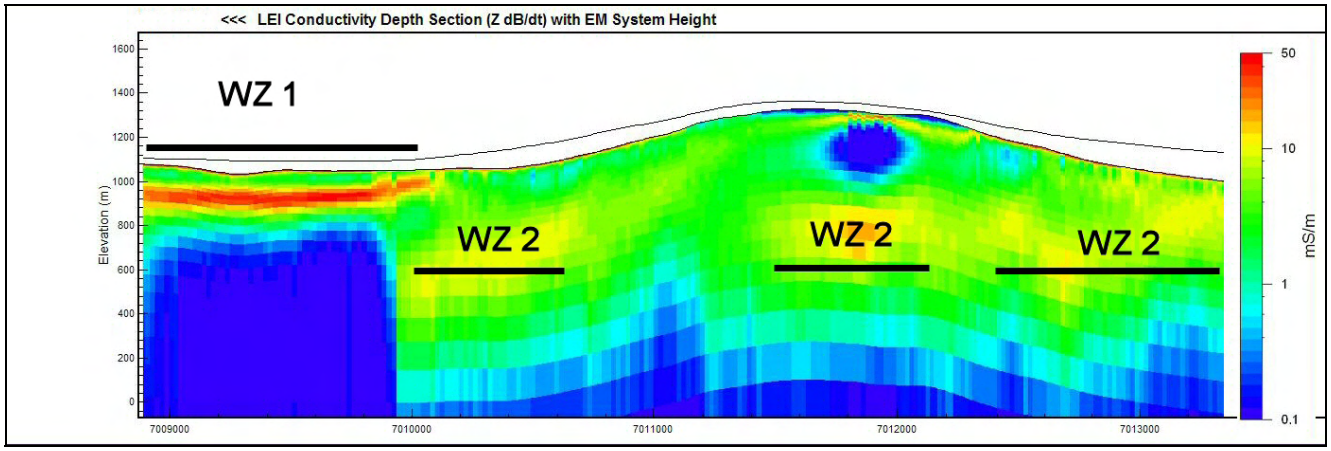
The figure below shows the outcomes of LEI processing to the dB/dT and Bfield outcomes from a VTEM survey undertaken as part of a Ni-Cu search. These results are considered typical in that while the Bfield result shows a nominal greater sensitivity to higher conductance, the results are also somewhat nosier and appear to have slightly less high frequency content than the dB/dT results.

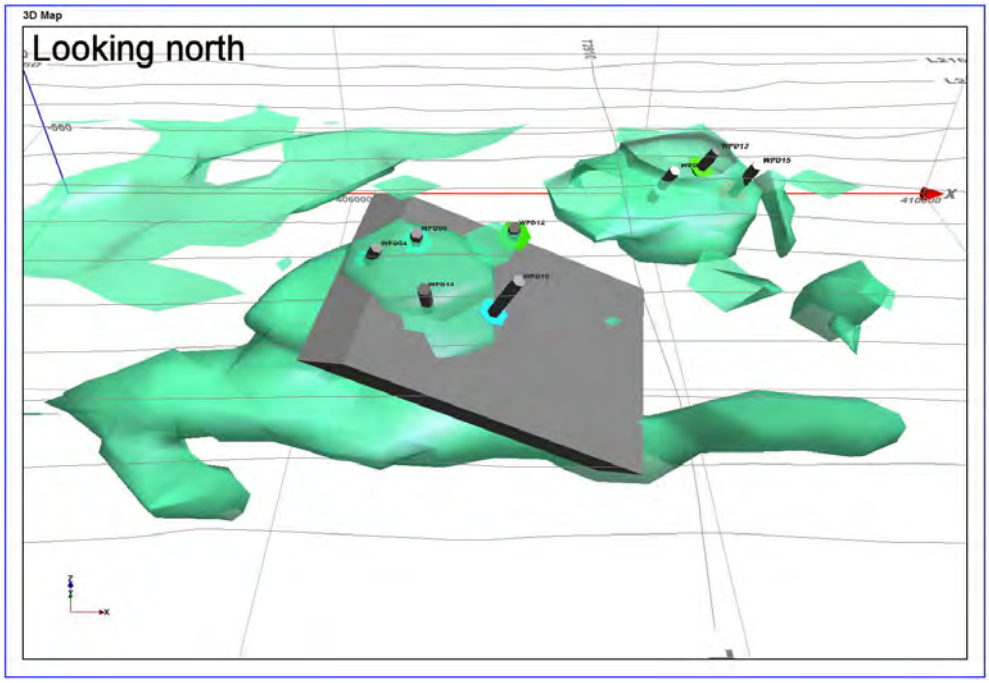


How CDI Helps Interpretation?

A major benefit of having a CDI outcome to interpret is that it coveys a far more geological "feel" to the EM data than profiles along. This is sometimes termed "mapping" with target detection and discrimination a sub-set of this larger interpretive activity.

Using the previous image as an example, the dB/dT CDS has been annotated with what Condor terms Wide Zones. These are zones of broad conductivity in the CDS which are felt to characterize different parts of the geological section. In this case WZ-1 is a thin shallow near surface that could represent lake sediments or a in a weathered terrain, part of a distinctive weather profile over a mafic rock. The WZ-2 features are "in the earth" sources that represent zones of increased conductivity which could represent different rock units or alteration of a specific unit.





Another benefit of the CDI processing is that it in turn allows for the creation of 3D voxel models of the EM outcomes. This is often an excellent means to capture in a holistic sense the sub-surface conductivity distribution either as a stand-alone model or as part of the integrated geoscience model (referred to as a Common Earth Model). An example of such a conductivity model combined with parametric models of specific anomalies (produced using Maxwell) and drill holes is shown in the figure to the left.

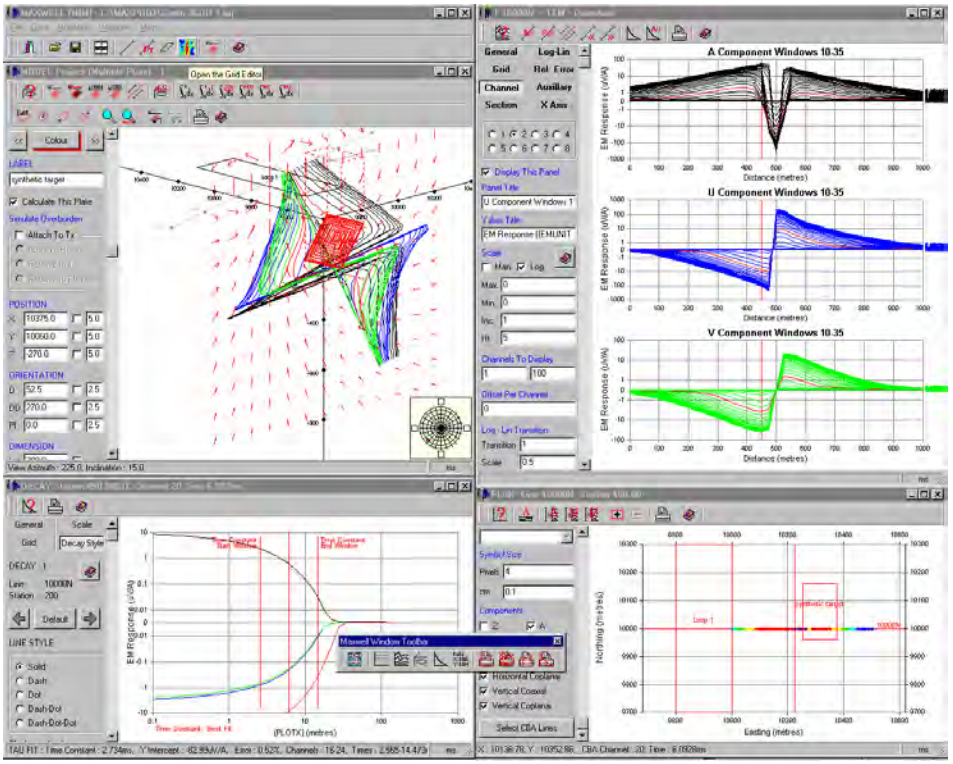
EMIT
ElectroMagnetic Imaging Technology

Maxwell 4.0

Modeling, Presentation and Visualization of EM and Electrical Geophysical Data

- Work with time or frequency domain data – any EM survey with any instrument type
- Ground or airborne, borehole, moving-loop, fixed-loop
- 3-D visualization of plate and other models with OpenGL
- Read and write industry standard file formats, including AMIRA, Geosoft, PEM, Arcview shape
- Modeling of B or dB/dt responses in any units for loop or dipole tx and rx including all normalization required
- Linked plan, profile, section, decay and model displays
- Utilities to load EM data into Geosoft database
- Totally unique forward and inverse plate modeling
- Import and create grid files for display in plan or section
- Execute third-party modeling routines from within Maxwell
- Jointly model data from different EM systems
- Automated overburden response calculation features
- Powerful tool to set or check attributes of each field/model line.
- High quality hardcopy
- Plot primary field lines
- Decay and spectrum analysis, decay constant calculation
- Carry out synthetic modeling
- Build templates to speed graphical presentation
- Save templates, models, system descriptions and sessions
- Custom tools and file-handling routines developed
- Regularly updated on-line help, tutorial, documentation



Maxwell has been written by people who understand what's required of EM geophysical processing and modeling software. It is a unique environment that makes EFFICIENT use of your time and effort. Maxwell has grown into the 21st Century with new features and user support that make it a tool that you can't afford not to have if you interact with EM data.

Geophysical Technology Development for Mineral Exploration, Groundwater and the Environment.

GEOSOFT

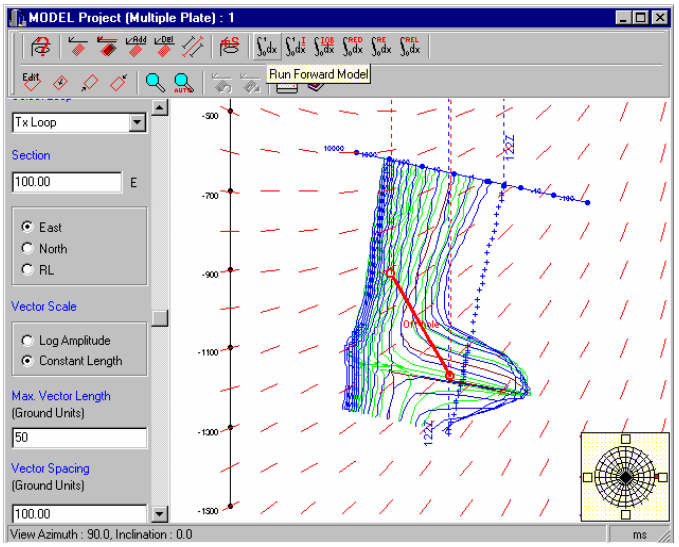
EMIT is a Geosoft Plus Partner and Maxwell provides a powerful interface to Geosoft's Oasis Montaj v5+.

PLAN

View the location of all data, airborne or ground. Define sub-areas for modeling or display. Create effective colored plans of a particular channel, frequency or component to illustrate anomalies and facilitate modeling & quality control. Grid, contour and image data within Maxwell or import a grid file to use as a base for the plan.

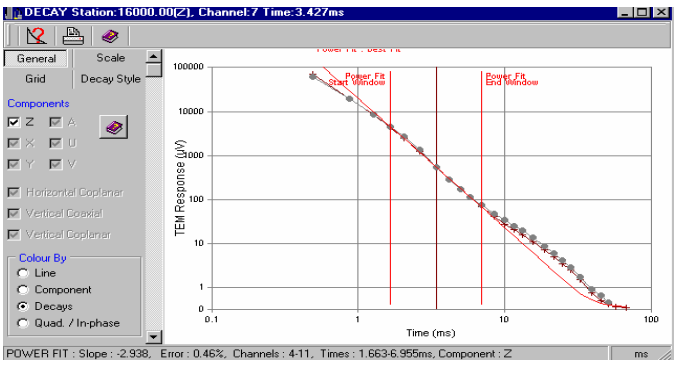
MODEL

Plate and "plate in host" multi-ribbon thin sheet models included, layered earth to be included shortly. Run external modeling algorithms (including plate, prism, 2.5-D and 3-D) with this powerful 3-D graphic interface. Drag-and-drop plate models. Automatically setup variable overburden models, even for moving-loop surveys. Create a synthetic survey simply with any geometry, transmitter waveform, units, window times and frequencies. Select tx-rx horizontal and vertical separation to model airborne responses. Plot primary field lines in any plane. Plot field and model data in the same presentation with user-selection of colors and symbols. Import files of loop coordinates and borehole geometry information.



DECAY/SPECTRUM

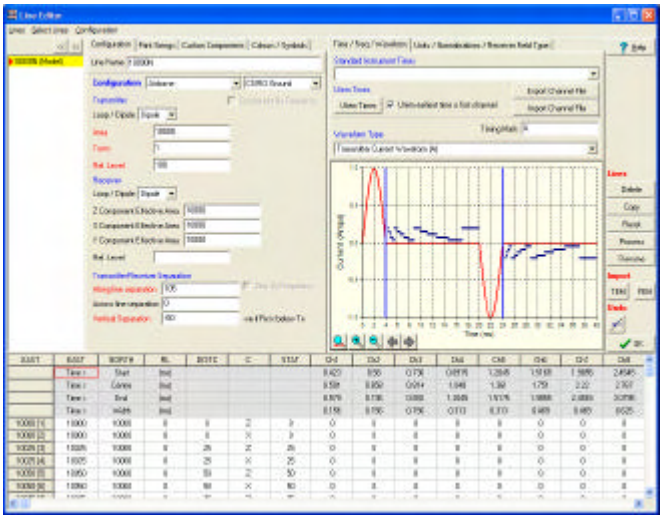
Automatically bring up decays by double-clicking in a profile window. Compare field and model responses. Calculate exponential decay constants and power law decay rates over ranges of times. View EM response versus frequency for frequency domain data.



SERVICE & SUPPORT EMIT is keen to incorporate users' suggestions into its Maxwell software and to respond quickly to questions. Updated software and help files are regularly emailed to Maxwell users.

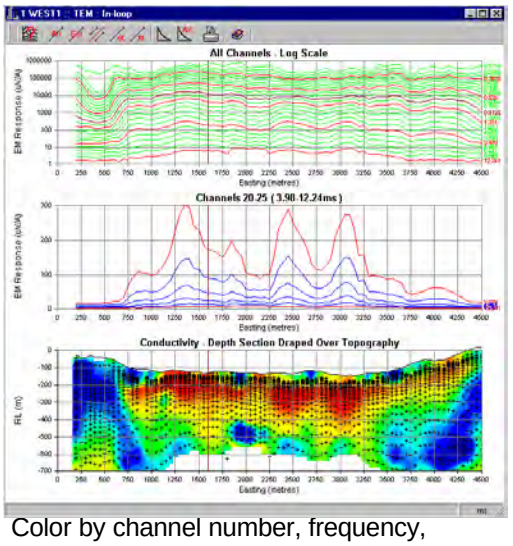
MAXWELL LINE EDITOR

A powerful tool to set parameters of model and field data lines in Maxwell. Set the properties of the EM system so that modeling is straightforward. Check the actual values of the field data and model responses —they can be changed, deleted or sorted. Tool to speed the import of EM system waveforms and window times. Set or check all the relevant properties of the data including units, normalizations, transmitter and receiver details.



PROFILE/SECTION

Create the style of profile you want to look at on screen and in hardcopy. Logarithmic or linear scales, multiple panels, ranges of channels and



frequencies. Color by channel number, frequency, component, line. Plot auxiliary parameters such as power line noise monitor, transmitter current or other geophysical data. Add sections as located grids with selectable color palette, draped on topography if required. Choose scales, symbols, grids, line styles, labels, title blocks and logos. Save the plot style in a template for use with other data. Batch plot all lines from your project without having to setup each one. Automatically extracts annotation values from your data.

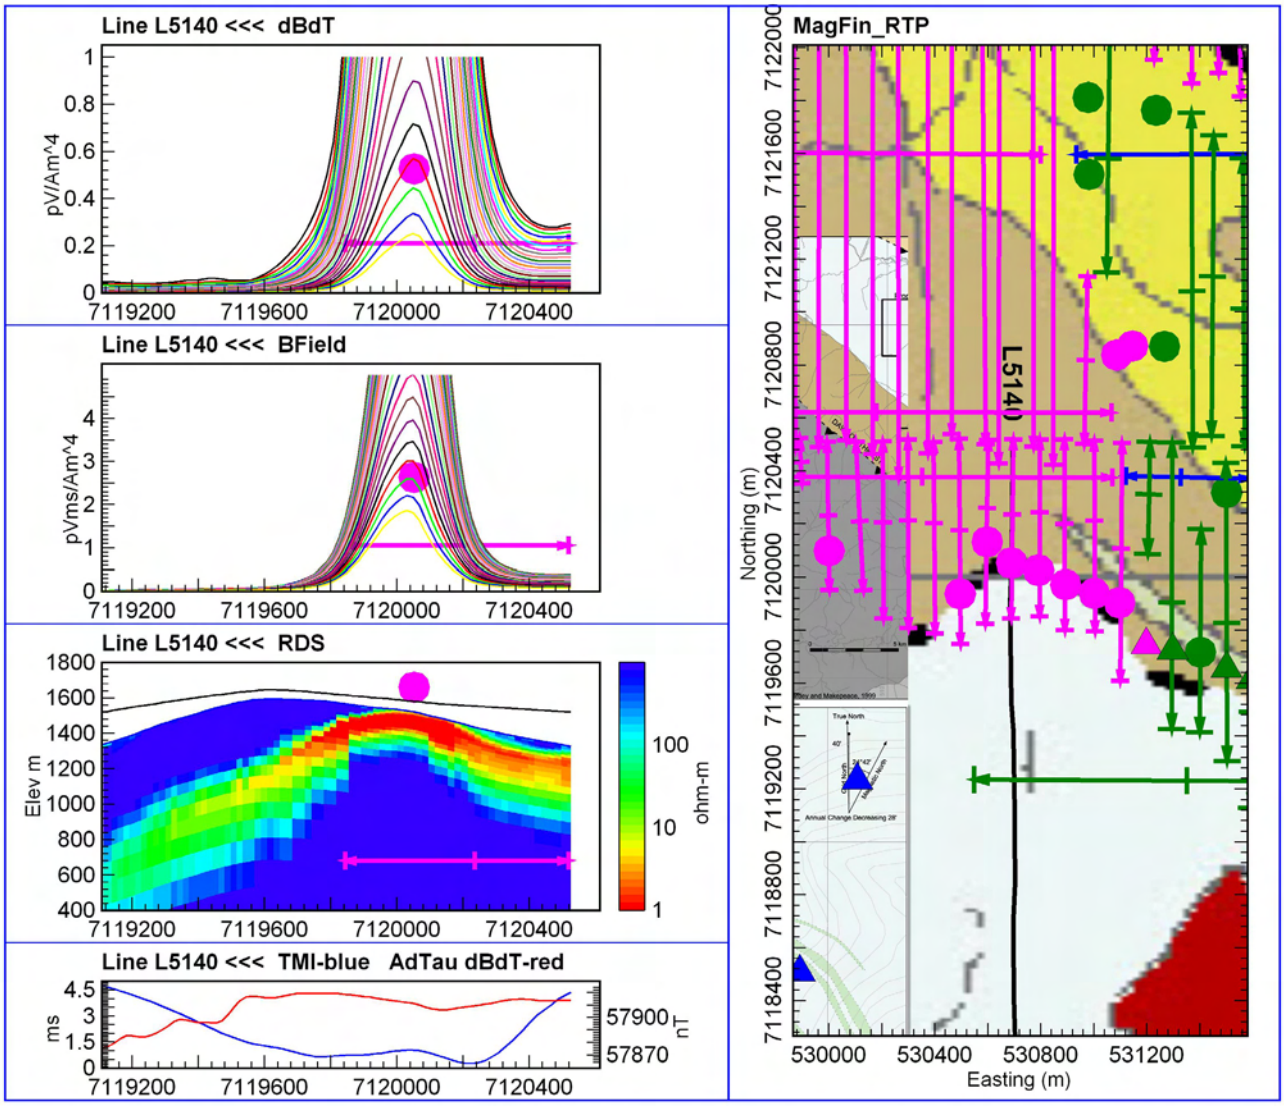
THIRD-PARTY MODELING

Maxwell provides graphical interfaces which can be employed with third-party or in-house modeling codes. The Maxwell GUI allows the design and visualization of models that include conductive plates, prisms, layered hosts and 2.5-D and 3-D meshes. Maxwell can launch the modeling algorithms and retrieve the results seamlessly.

APPENDIX B: NOTES ON TARGET ZONES

TZ A

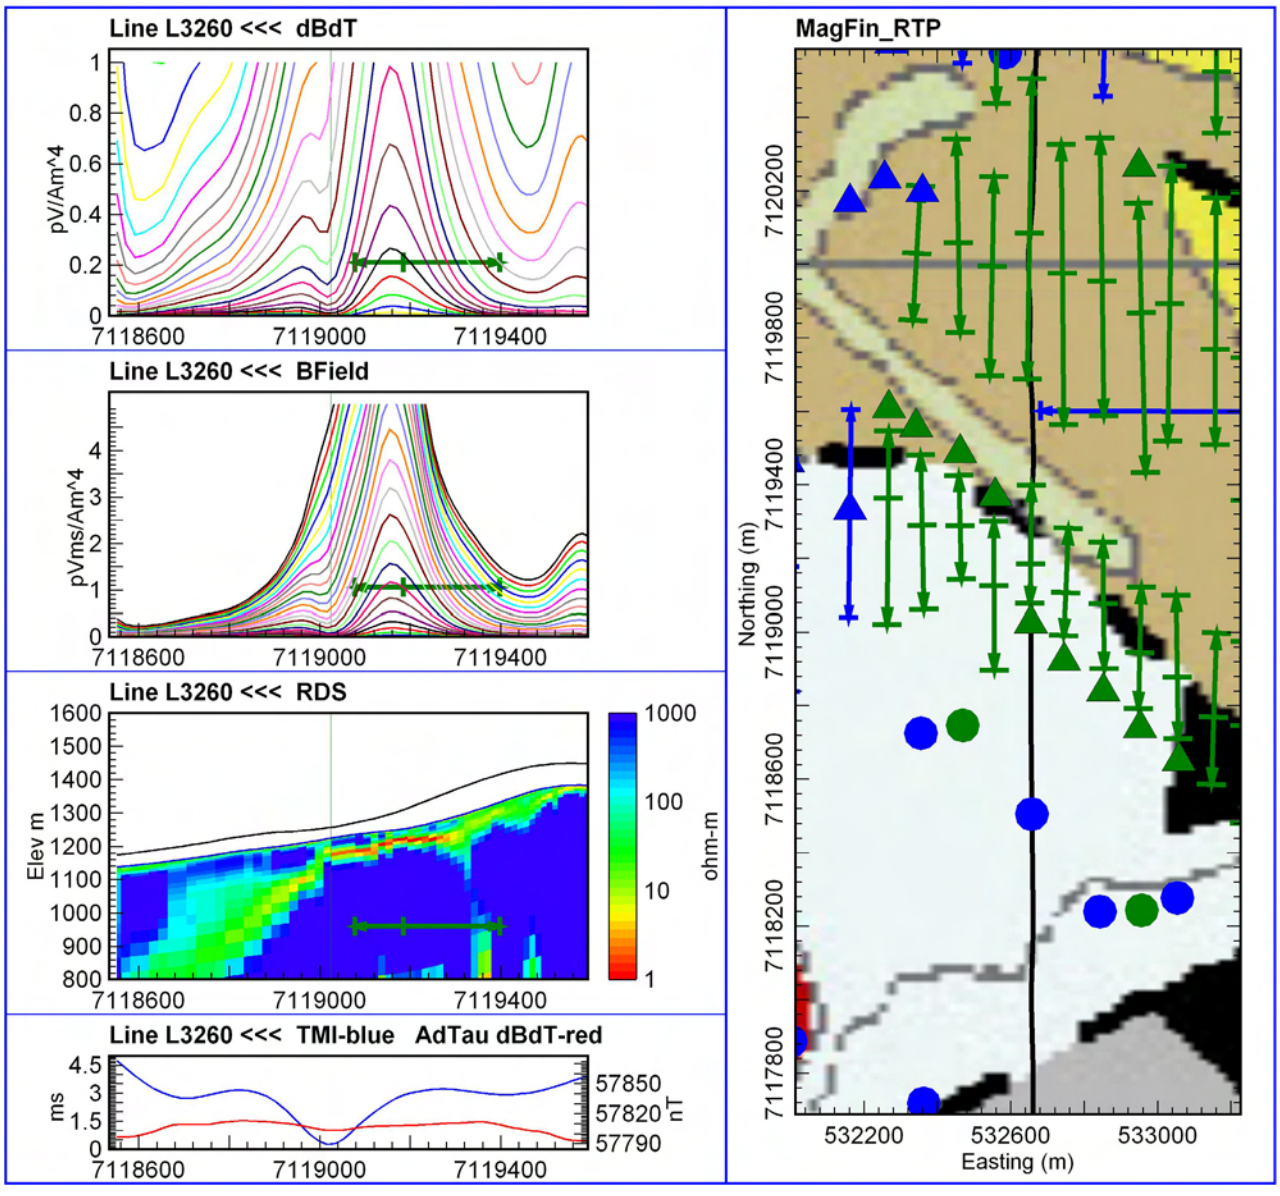
- Priority 1
- This TZ extends from line 5160 to 5010, a strike length of approximately 1.8 km.
- The tops of the conductors are relatively shallow and there is a strong likelihood that they may crop out.
- The conductors are stronger in the west and weaken to the east.
- In the west the conductors appear to be broad and relatively flat-dipping and may be part of the broad, flat-dipping conductor to the north.
- However, on some lines the conductors form a relatively discrete, strong conductor which may have a different source than the broader conductor to the north.
- An example of the latter on Line 5140 is shown in the Figure below.
- These discrete conductors correlate with a weak linear magnetic trend highlighted on the Tilt Angle image, which supports the contention that these arise from a source different than the broad flat-lying conductors to the north.
- This TZ straddles a mapped thrust fault, with Bouvette Fm to the south and Keno Hill Quartzite to the north.



TZ A: Representative flight line 5140 – profiles and RDS.

TZ B

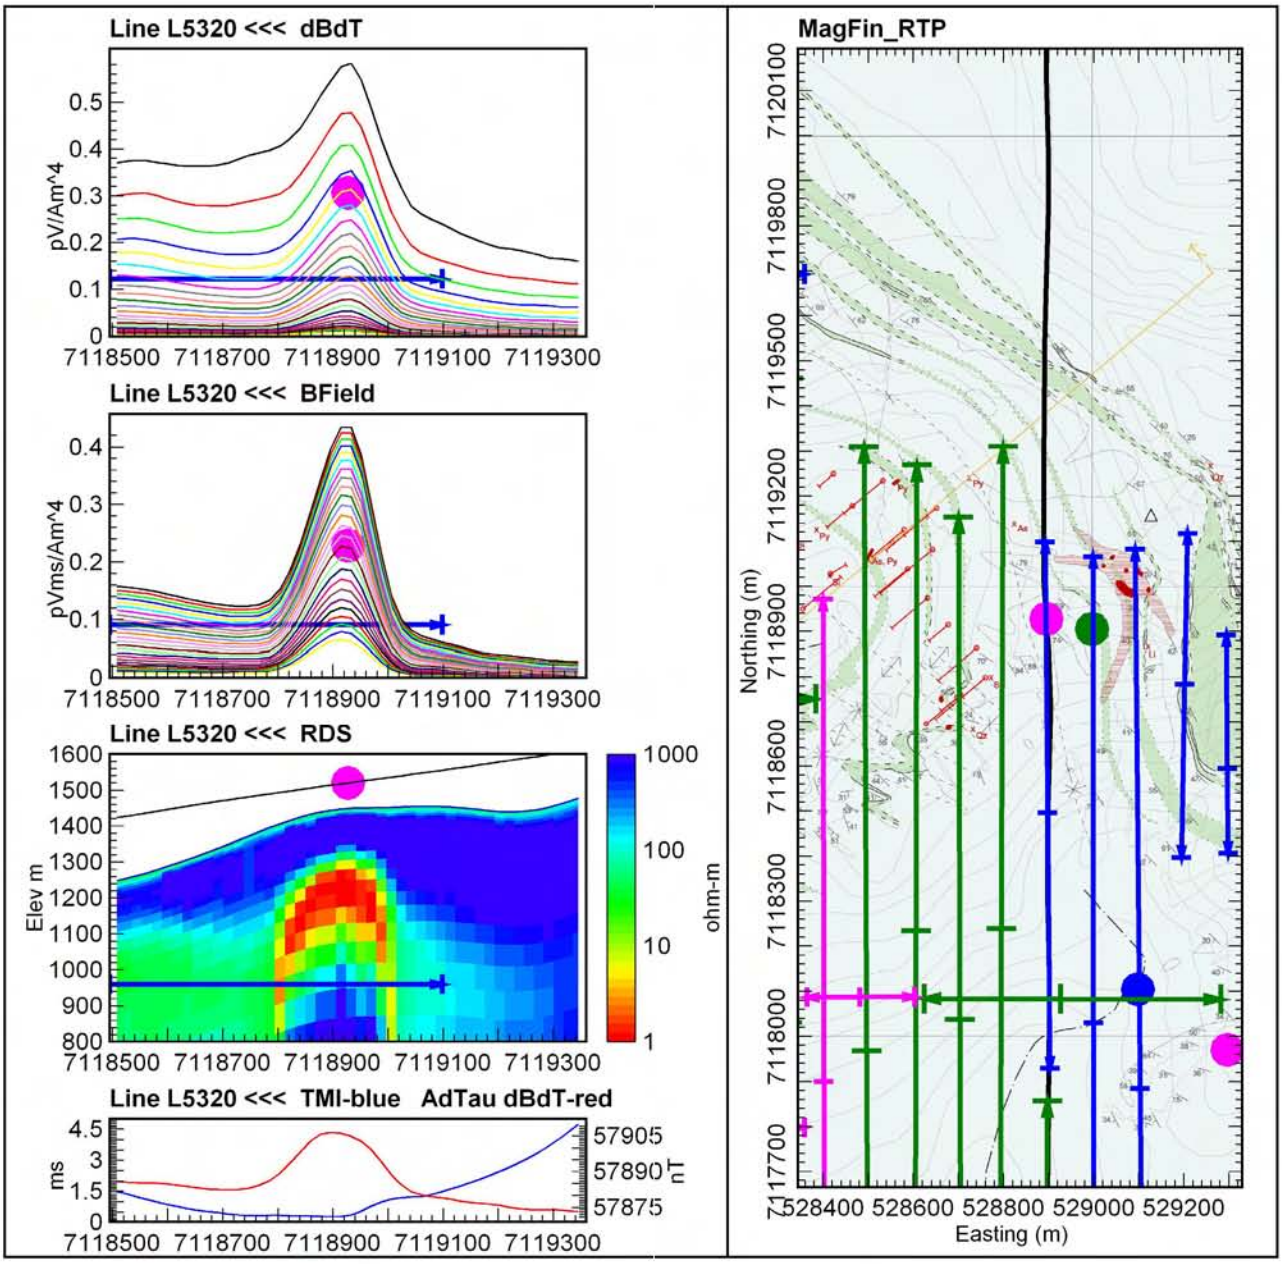
- Priority 3
- This zone of relatively weak, flat-lying conductors lies southeast of TZ A, straddling the same thrust fault.
- However, the conductors are much weaker and appear due to a thin, flat-lying conductor rather than the more discrete, strong conductors comprising TZ A.
- The tops of the conductors are mostly shallow.
- On many lines the southern edge of the flat-lying conductor is defined by a DPR response.
- These DPR responses closely follow a linear magnetic low trending in a WNW-ESE direction
- An example for Line 3260 is shown in the Figure below.



TZ B: Representative flight line 3260 – profiles and RDS.

TZ C

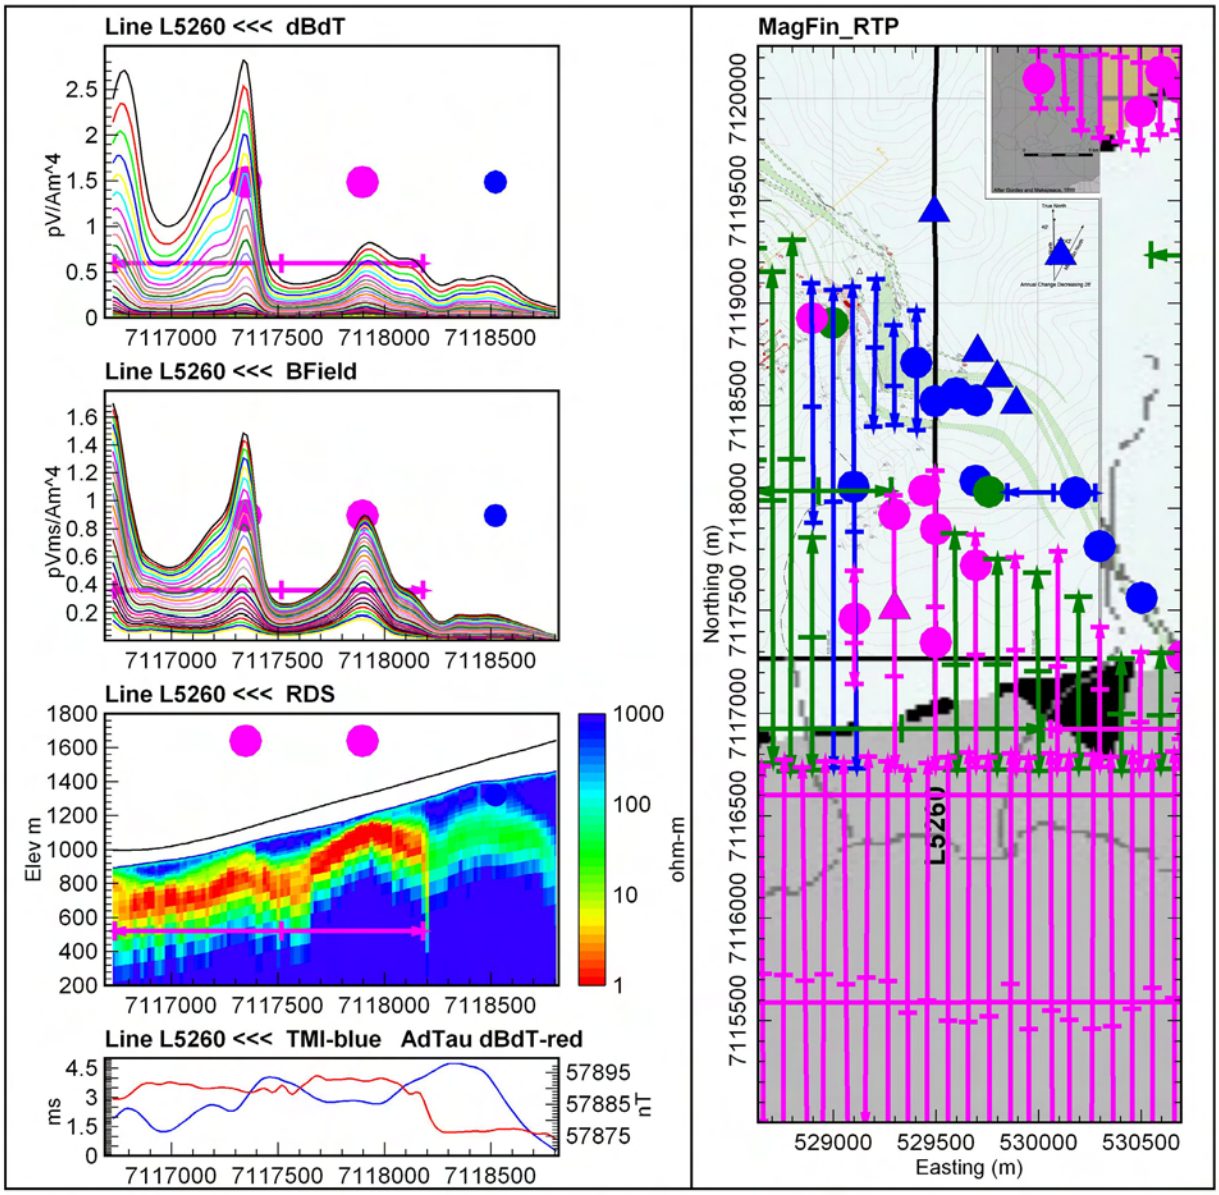
- Priority 1
- This TZ consists of discrete conductive responses on two lines and thus has a very short strike length.
- A very strong SPR response occurs on Line 5320 and a moderate SPR response on Line 5310 (which could be looking sideways as the top of the conductor is deeper).
- The top of the conductor on Line 5320 is approximately 100 m on the RDS, but the true depth may be shallower. However, the conductor may not crop out.
- The conductor is very localized and the possibility that it may be due to a cultural source (e.g. drill rig) needs to be checked.
- This conductor lies only a few hundred meters east of the drill holes which intersected significant gold mineralization.
- However, the nature of the response is quite different from the weak responses correlating with the drilled mineralization.
- Thus, the source of this strong conductor needs to be verified.
- The response on Line 5320 is shown in the Figure below.



TZ C: Representative flight line 5320 – profiles and RDS.

TZ D

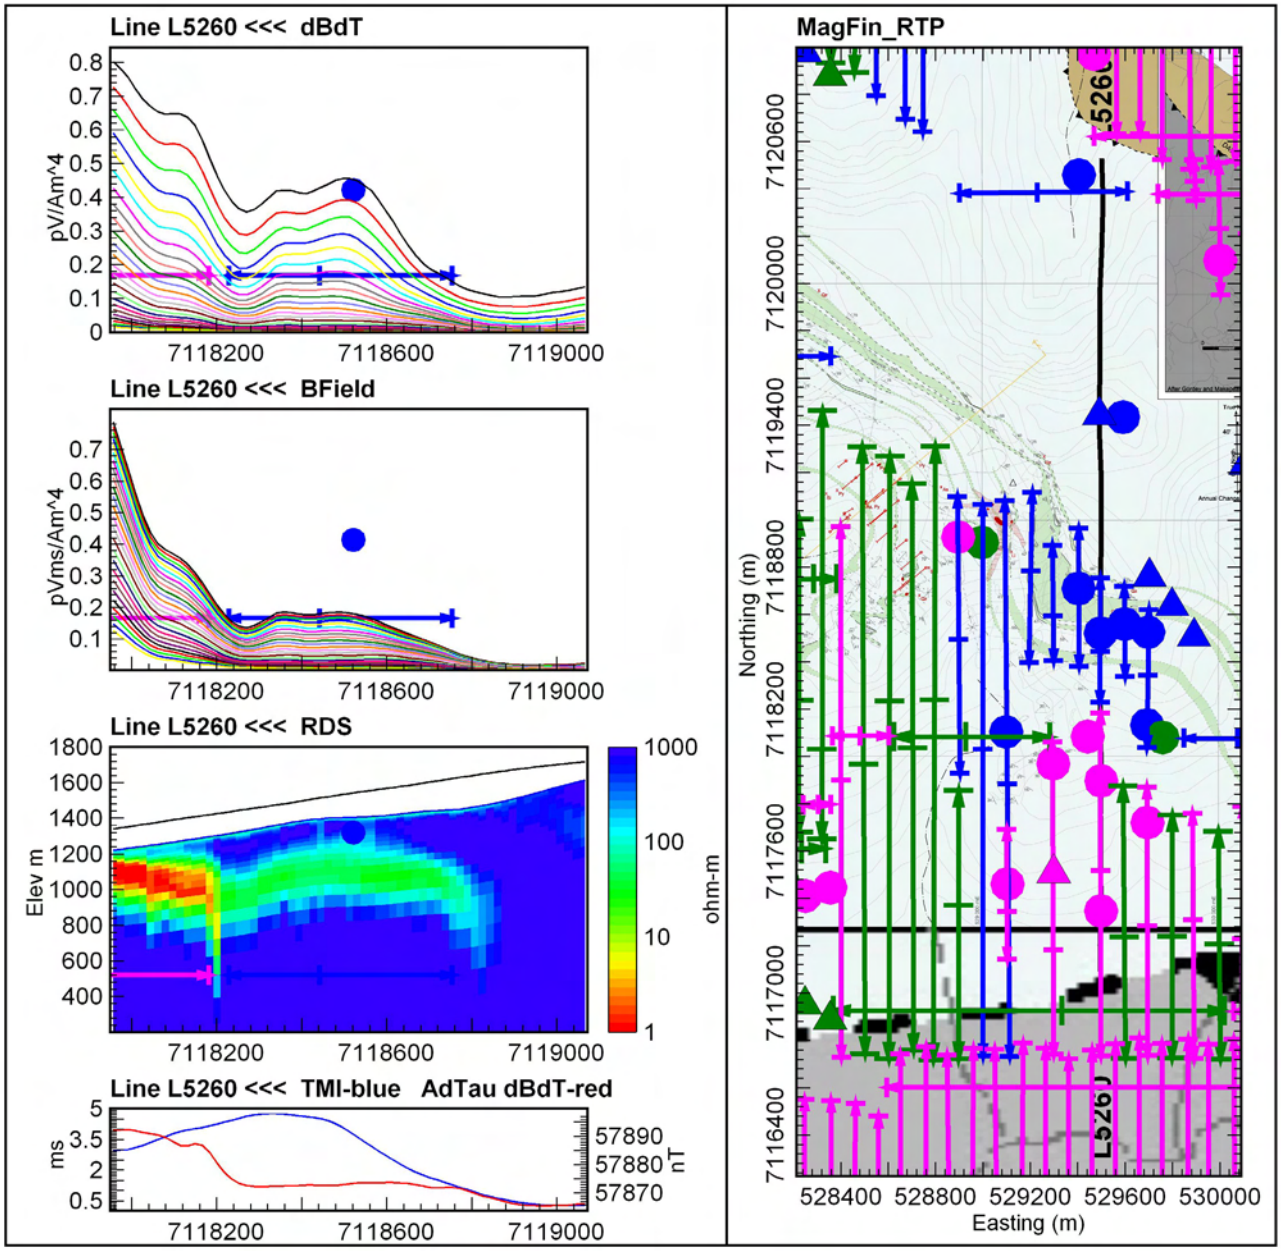
- Priority 3
- This conductive zone lies within mapped Bouvette Fm, but the characteristics of the conductor are similar to those covering the Earn Group to the south, so it appears that the mapping may be in error.
- The conductors are mostly strong and flat-lying, with their tops close to surface.
- However, in some places the top of the conductor is closer to surface (due to folding?) and in these locations an SPR response has been interpreted.
- An example for Line 5260 is shown in the Figure below.
- The interpretation is complicated because every second line (flying North) in this area was flown very high - 400 m or more above ground, which drastically reduces the response amplitude.
- There is no obvious magnetic correlation with this conductor.



TZ D: Representative flight line 5260 – profiles and RDS.

TZ E

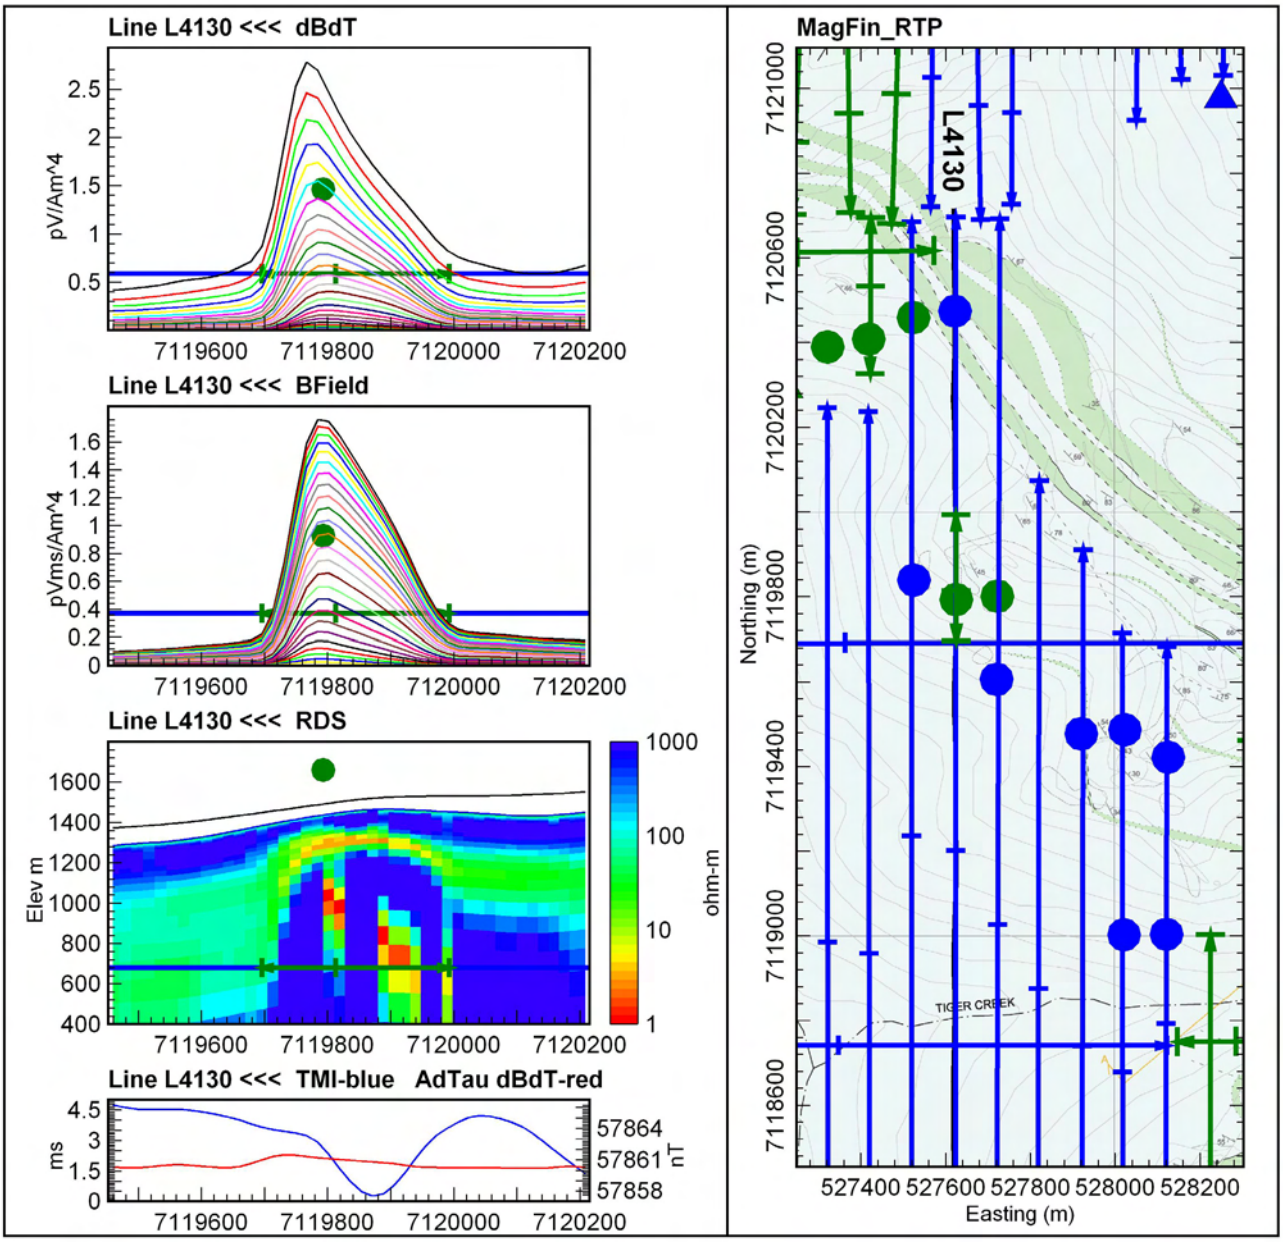
- Priority 2
- This zone of weak, mostly flat-lying conductors lies Southeast of TZ C and could be related to similar responses in the vicinity of the drilled Au mineralization.
- On some lines the conductors on the RDS exhibit an upward "antiform" shape and in these cases the center of the wide conductor has also been picked as a SPR.
- This TZ loosely correlates with the mapped volcanics.
- The response on Line 5260 is shown in the Figure below.



TZ E: Representative flight line 5260 – profiles and RDS.

TZ F

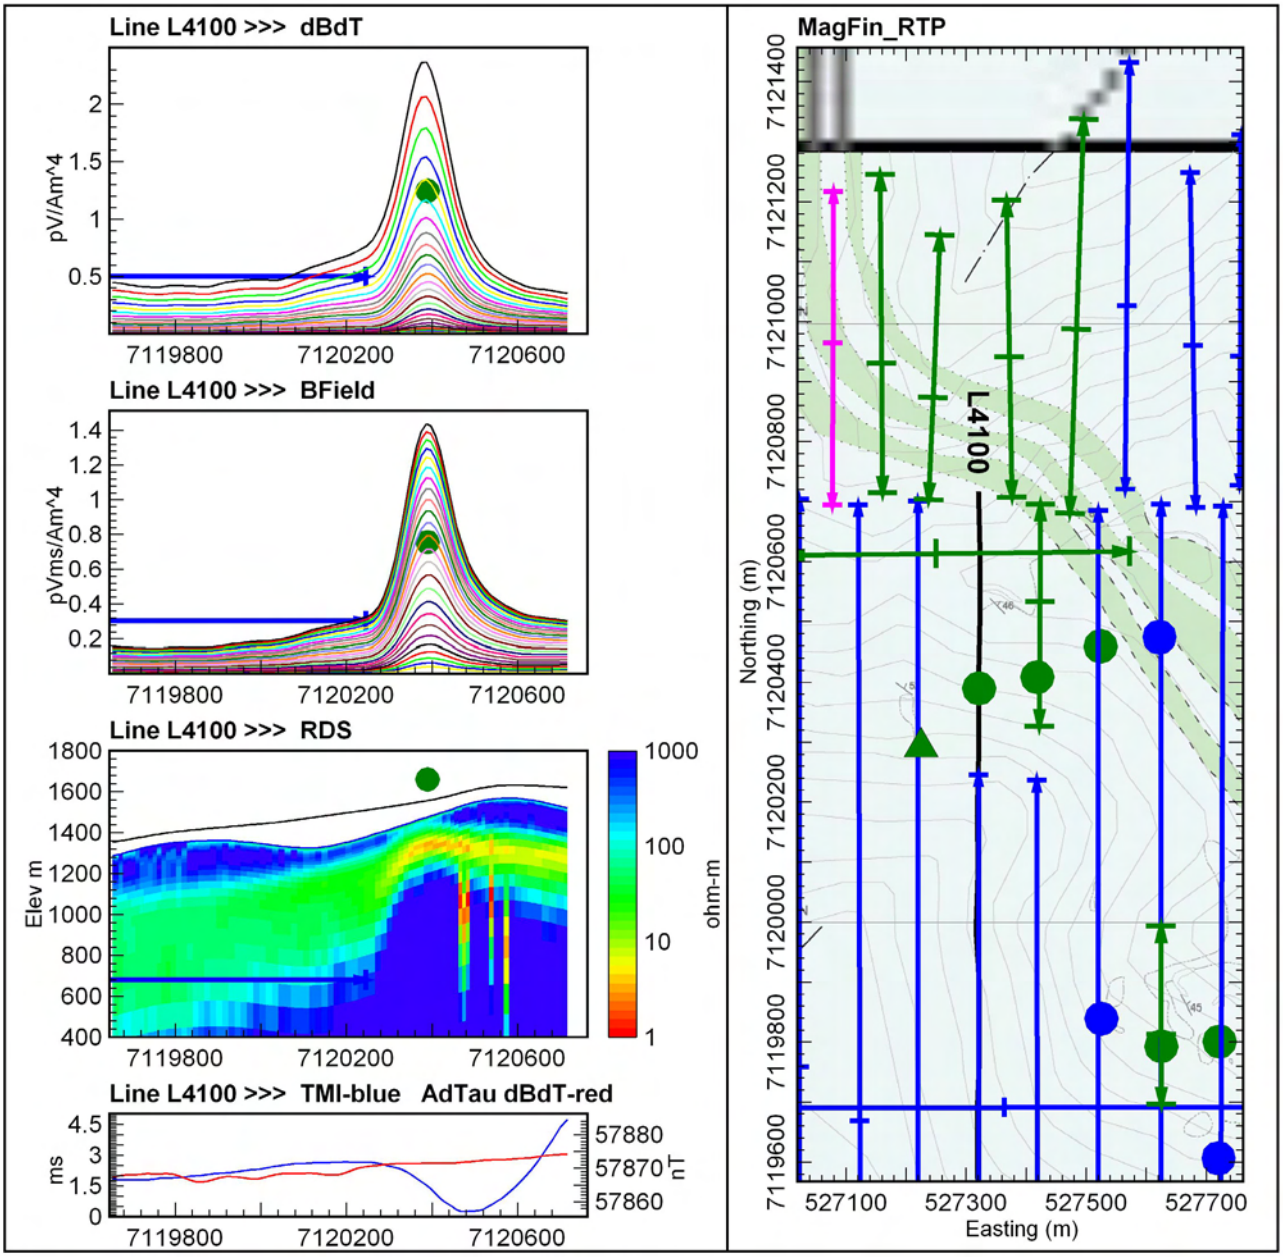
- Priority 2
- This zone of weak-moderate SPR responses lies northwest of the drilled Au area, approximately along strike (based on the trends of the volcanic units).
- The semi-discrete SPR responses are superimposed on weak flat-lying responses, which extend well to the south.
- On two lines (4130 and 4140) the SPR responses are stronger and stand out from the flat-lying conductor and appear to be discrete conductors closer to surface.
- The response on Line 4130 is shown in the Figure below.
- There is no obvious magnetic signature for these conductors.



TZ F: Representative flight line 4130 – profiles and RDS.

TZ G

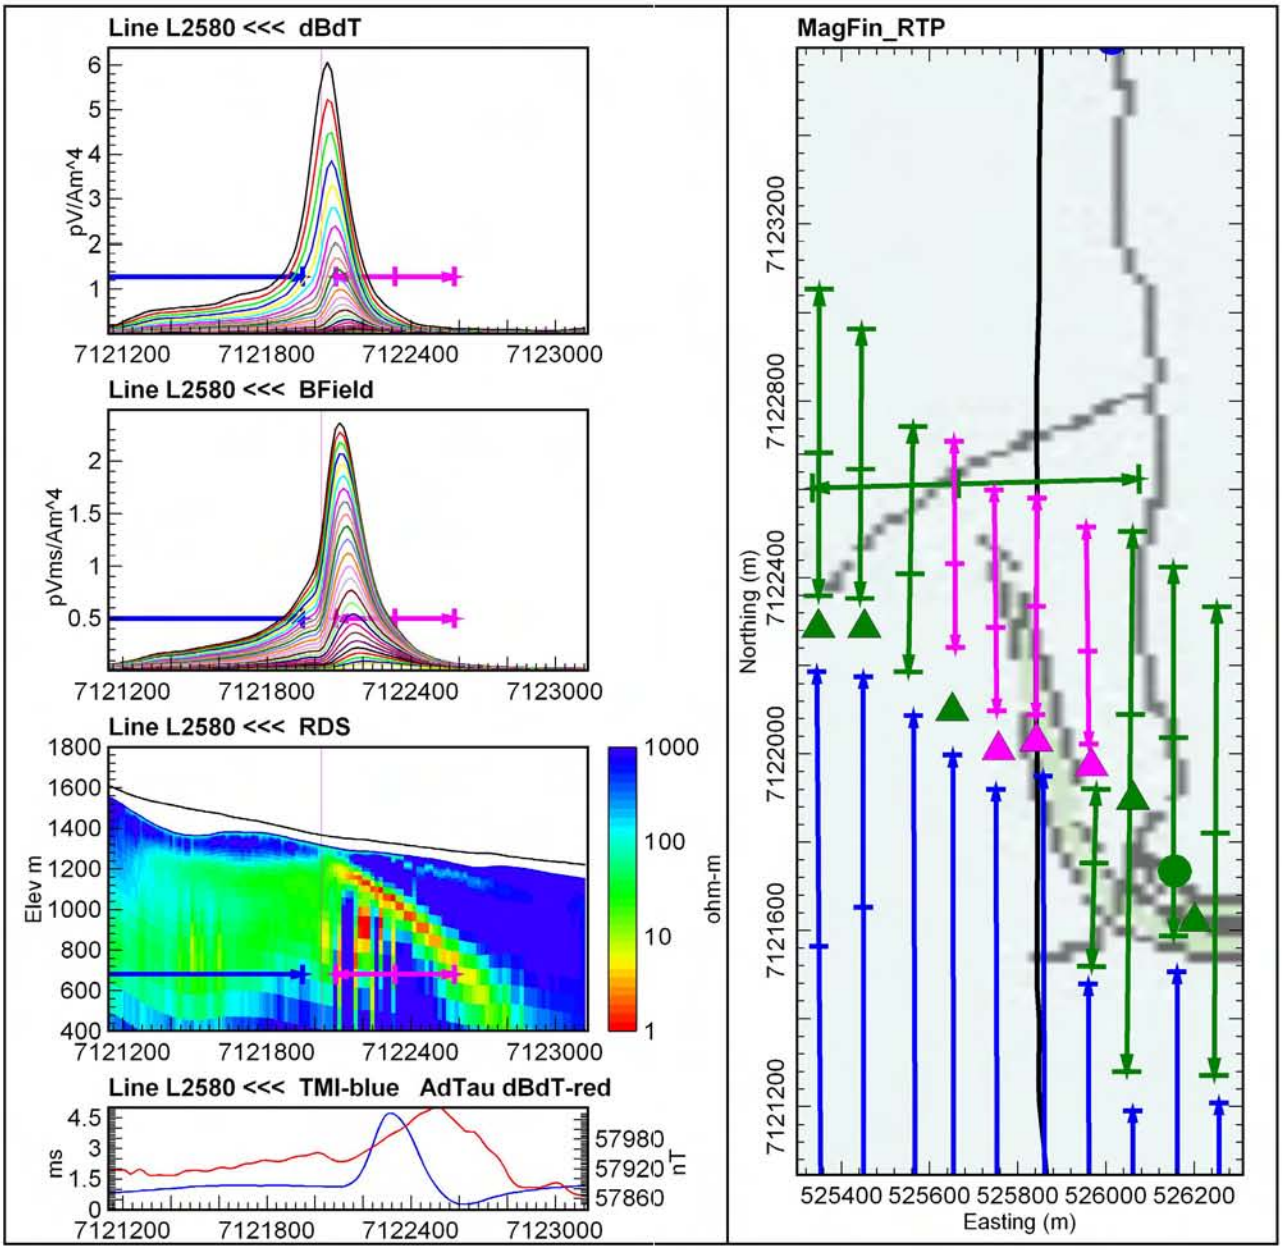
- Priority 3
- This zone extends over 5 lines, with a length of approximately 600 m.
- It appears to comprise the southern edge of a shallow dipping (to the north) conductive unit, where this edge comes close to the surface (perhaps crops out).
- This edge exhibits as SPR responses on four lines and as a DPR response on one line.
- The response on Line 4100 is shown in the Figure below.
- The trend of this zone is almost perpendicular to the mapped volcanic units in the area, which suggests either that the mapping may be incorrect, or that the conductors are related to a cross fault.



TZ G: Representative flight line 4100 – profiles and RDS.

TZ H

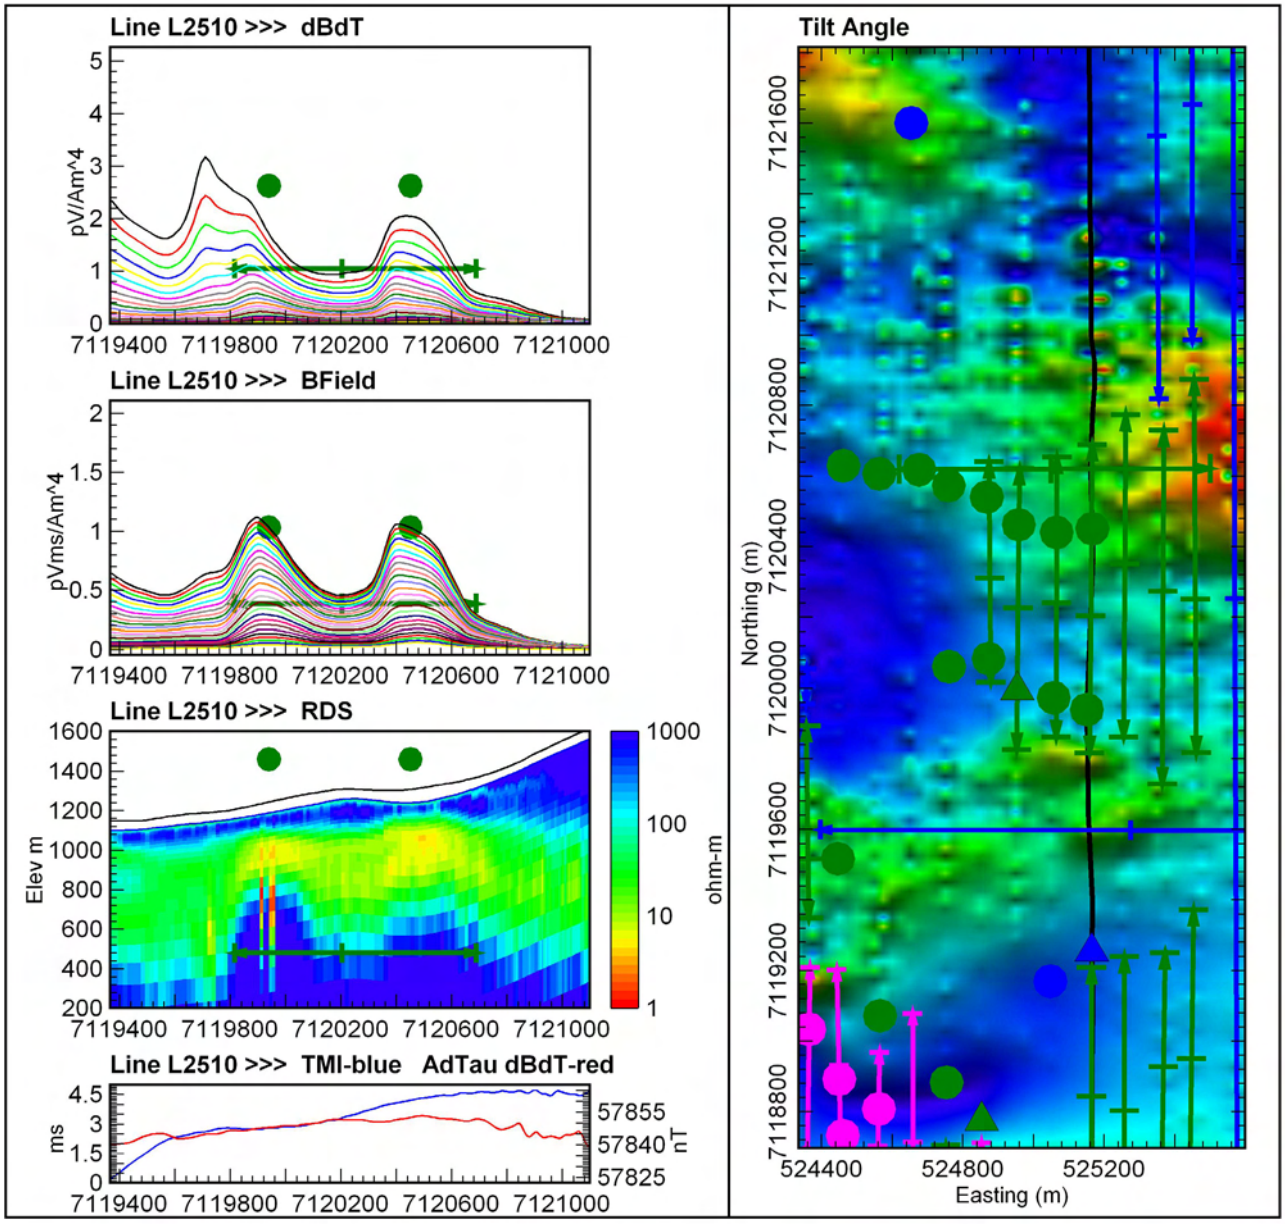
- Priority 3
- This extensive zone has a strike length of 4 500 m and consists of shallow-dipping (to the north) conductors, with SPR or DPR responses where these come close to surface or crop out.
- As such, this zone appears to be a conductive, stratigraphic unit.
- An example for Line 2580 is shown in the Figure below.
- This TZ loosely correlates with a linear magnetic trend, which may be associated with volcanics.



TZ H: Representative flight line 2580 – profiles and RDS.

TZ I

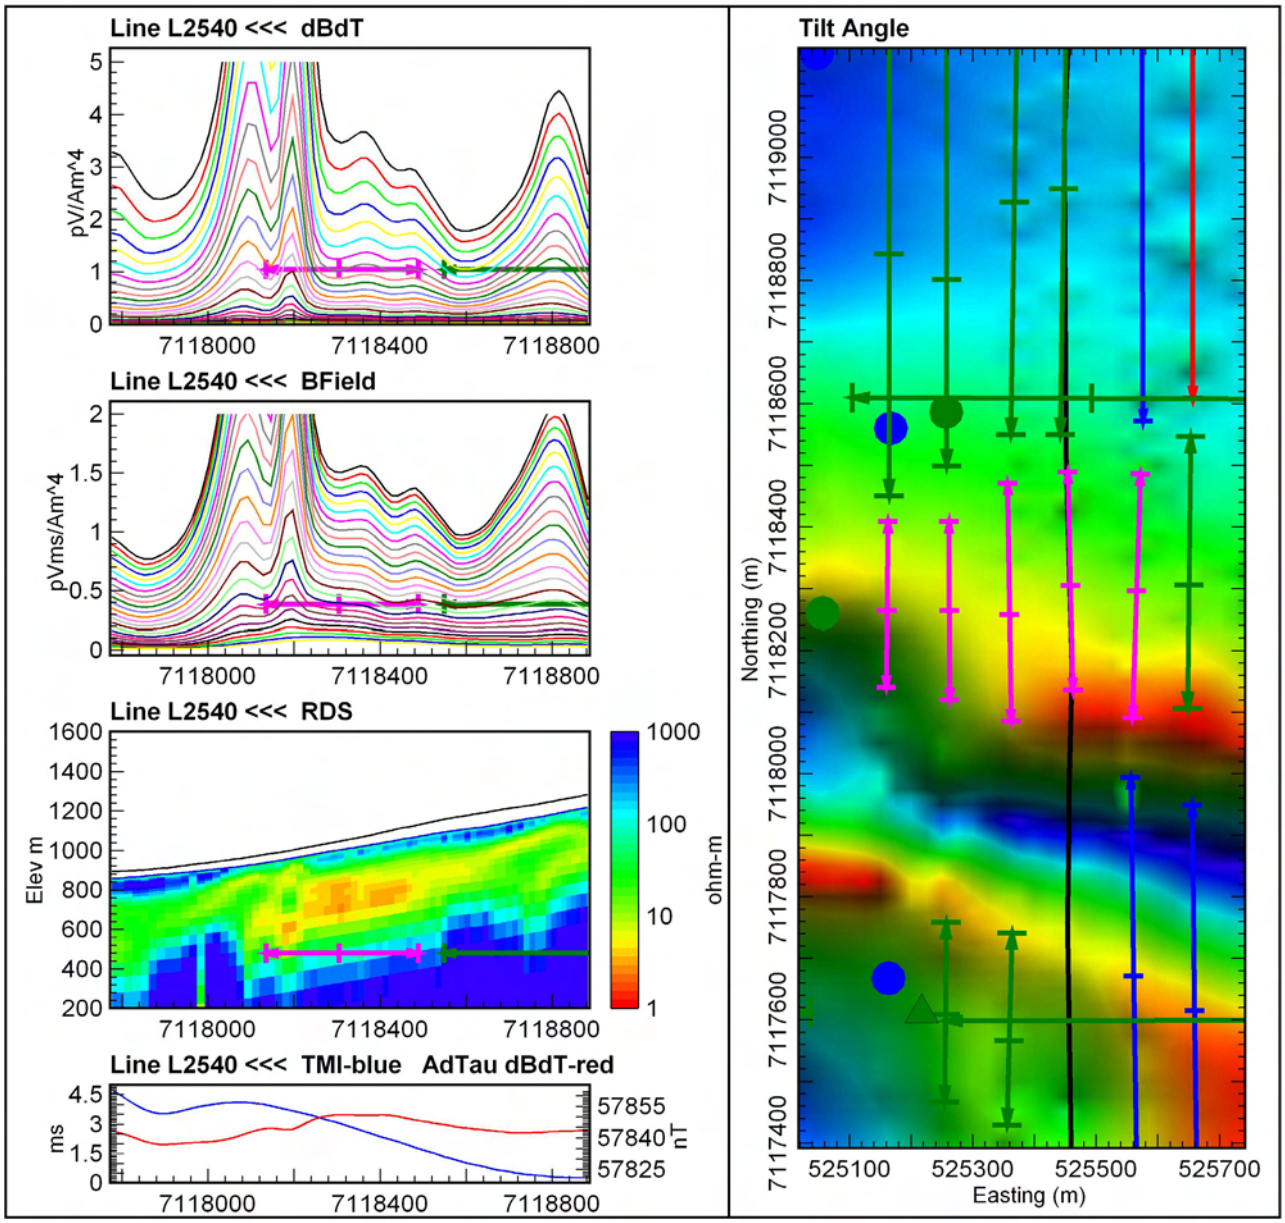
- Priority 3
- This zone has dimensions of approximately 1 000 x 800 m and consists of enhanced conductivity within an extensive weaker conductive zone.
- An example for Line 2510 is shown in the Figure below.
- The conductive zone is relatively flat-lying and while the top is close to surface, it may not crop out.
- In the western part of the TZ the conductor splits into two, with northern and southern parts and a less conductive section between.
- The TZ lies within a broad zone of subdued magnetics.



TZ I: Representative flight line 2510 – profiles and RDS.

TZ J

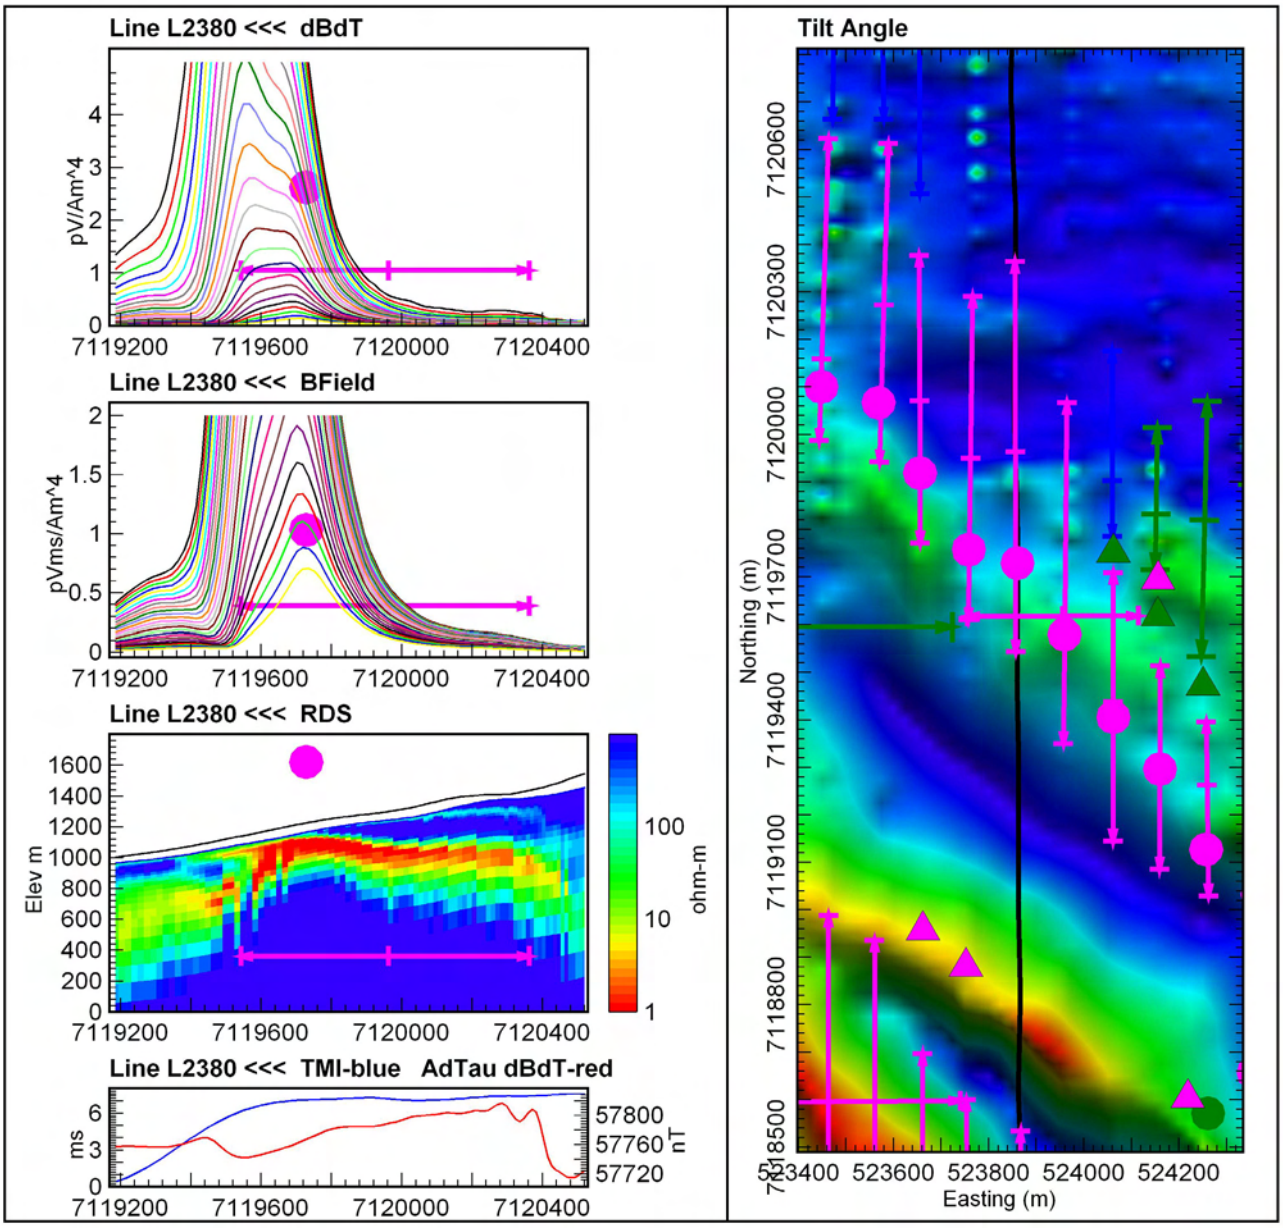
- Priority 2
- This TZ has a strike length of approximately 500 m and consists of a locally stronger conductive zone within a more extensive, flat-lying conductor.
- Strong wide conductors are picked on five lines.
- A typical example (for Line 2540) is shown in the Figure below.
- The conductor trend lies slightly oblique to a magnetic trend.



TZ J: Representative flight line 2540 – profiles and RDS.

TZ K

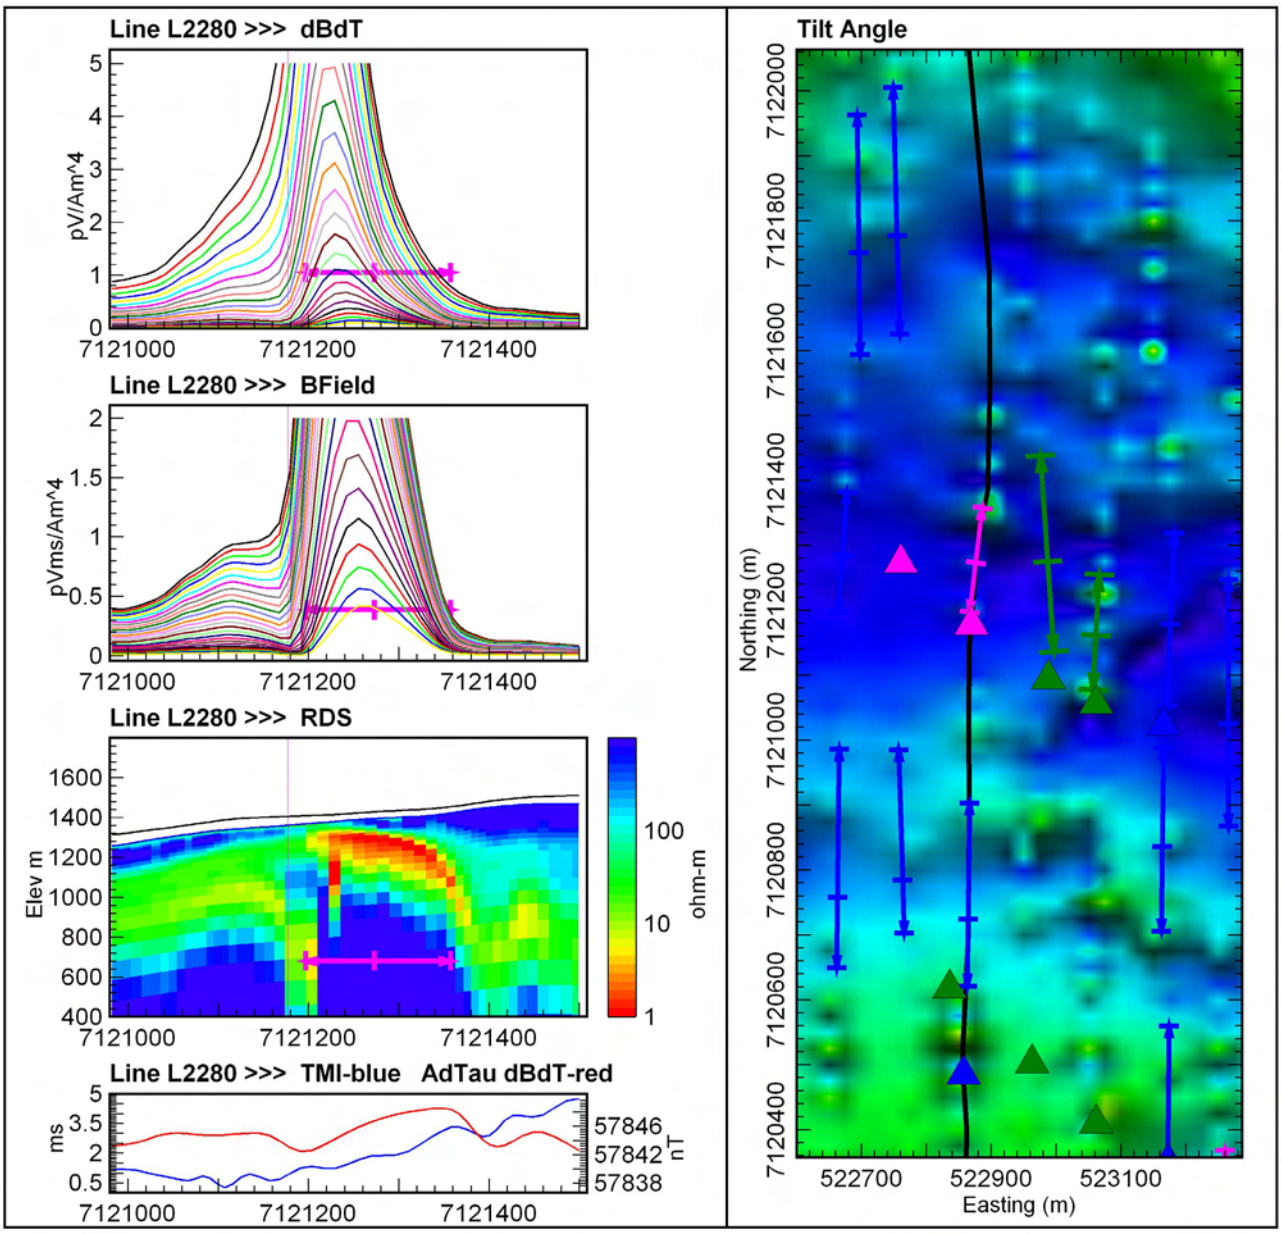
- Priority 2
- This TZ has strike length of approximately 2.5 km and consists primarily of shallow, strong, wide conductors which dip gently to the north.
- Along the southern edge of this zone the conductors are closest to surface and may crop out.
- A typical conductor (for Line 2380) is shown in the Figure below.
- These conductors appear to be stratigraphic in nature.
- The conductors comprising this TZ cross the magnetic stratigraphy at an oblique angle.



TZ K: Representative flight line 2380 – profiles and RDS.

TZ L

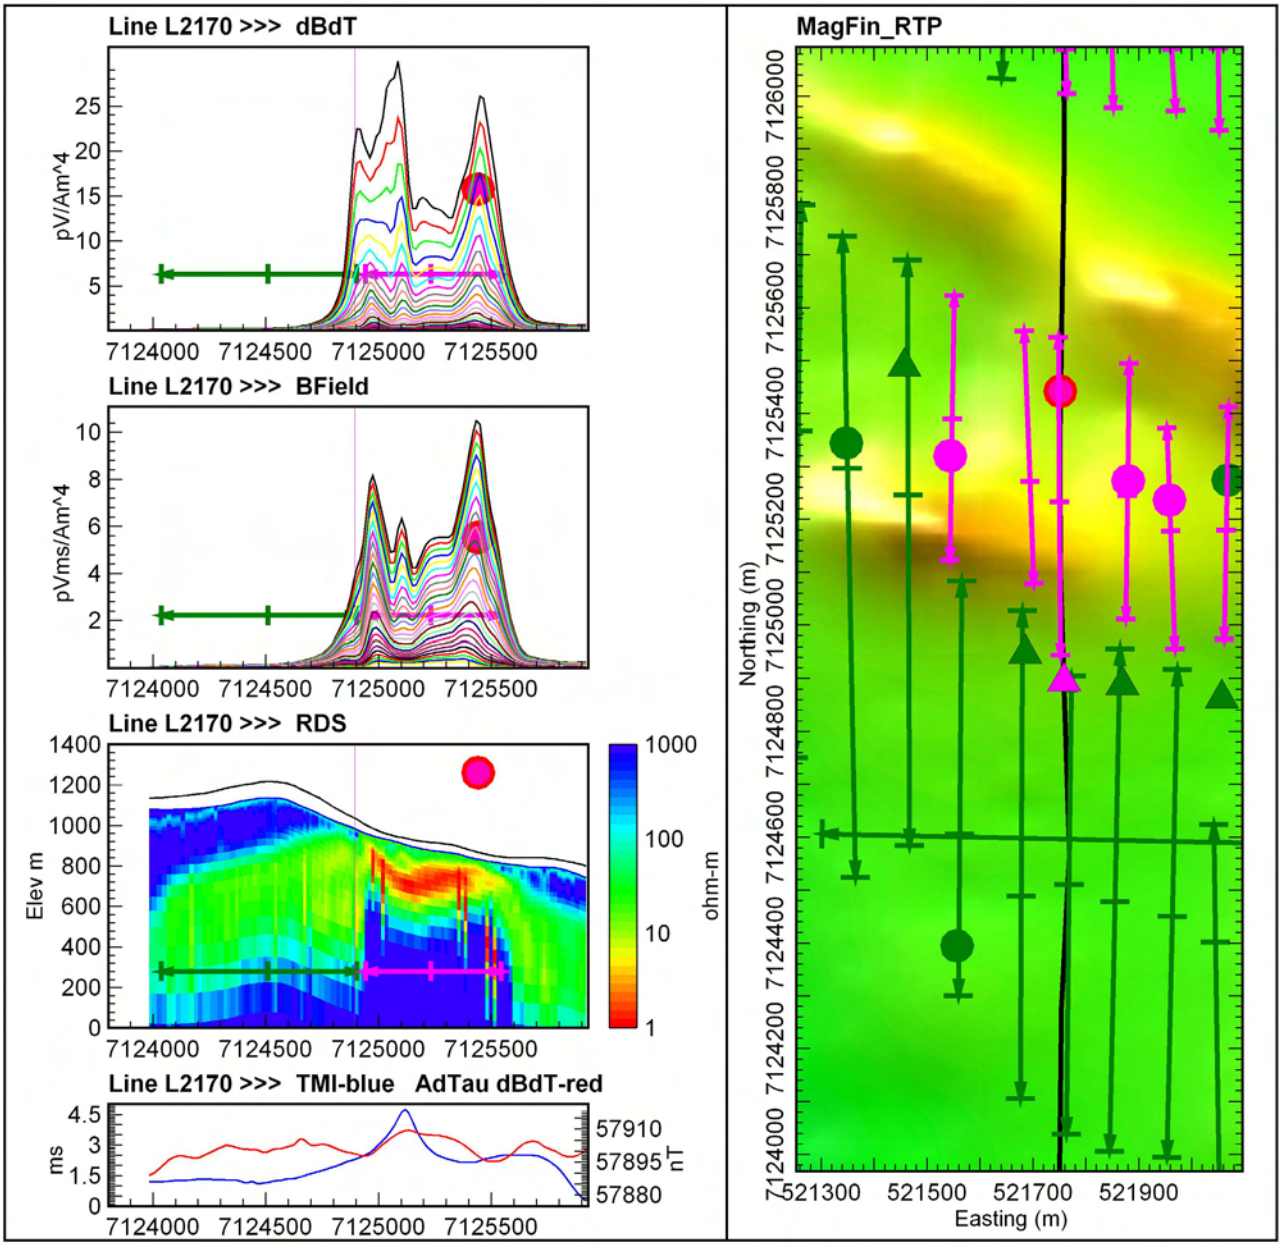
- Priority 1
- This TZ has short strike length of approximately 500 m and consists of DPR responses on four lines.
- The conductor appears to have shallow north dip and may crop out in the locations of the picked DPR.
- The strongest and best defined responses are on Lines 2280 and 2300. The former is shown in the Figure below.
- The TZ lies in an area of quiet magnetics.
- The short strike length suggests that these conductors may not be due to a conductive stratigraphic unit, but some localized feature.



TZ L: Representative flight line 2280 – profiles and RDS.

TZ M

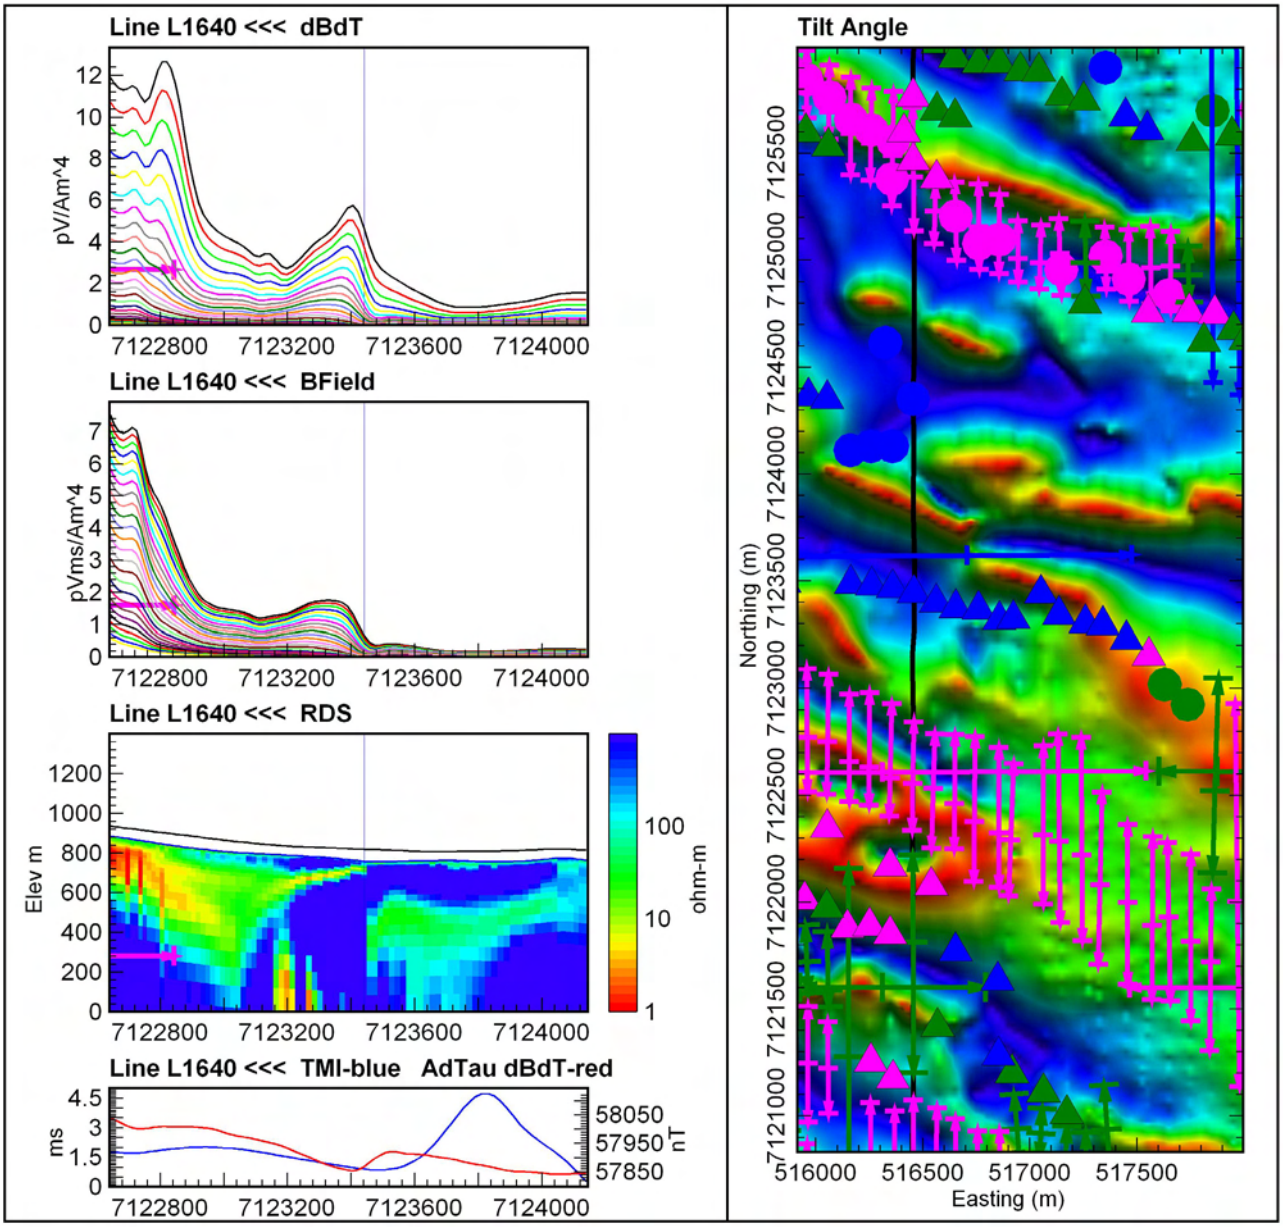
- Priority 3
- This zone has similarities to TZ H. It has a strike length of approximately 5 km and extends northwest beyond the survey area.
- It consists of shallow-dipping (to the north) conductors, with SPR or DPR responses where these come close to surface or crop out.
- As such, this zone appears to be a conductive, stratigraphic unit.
- An example for Line 2170 is shown in the Figure below.
- This TZ loosely correlates with linear magnetic trends, which may be associated with volcanics.



TZ M: Representative flight line 2170 – profiles and RDS.

TZ N

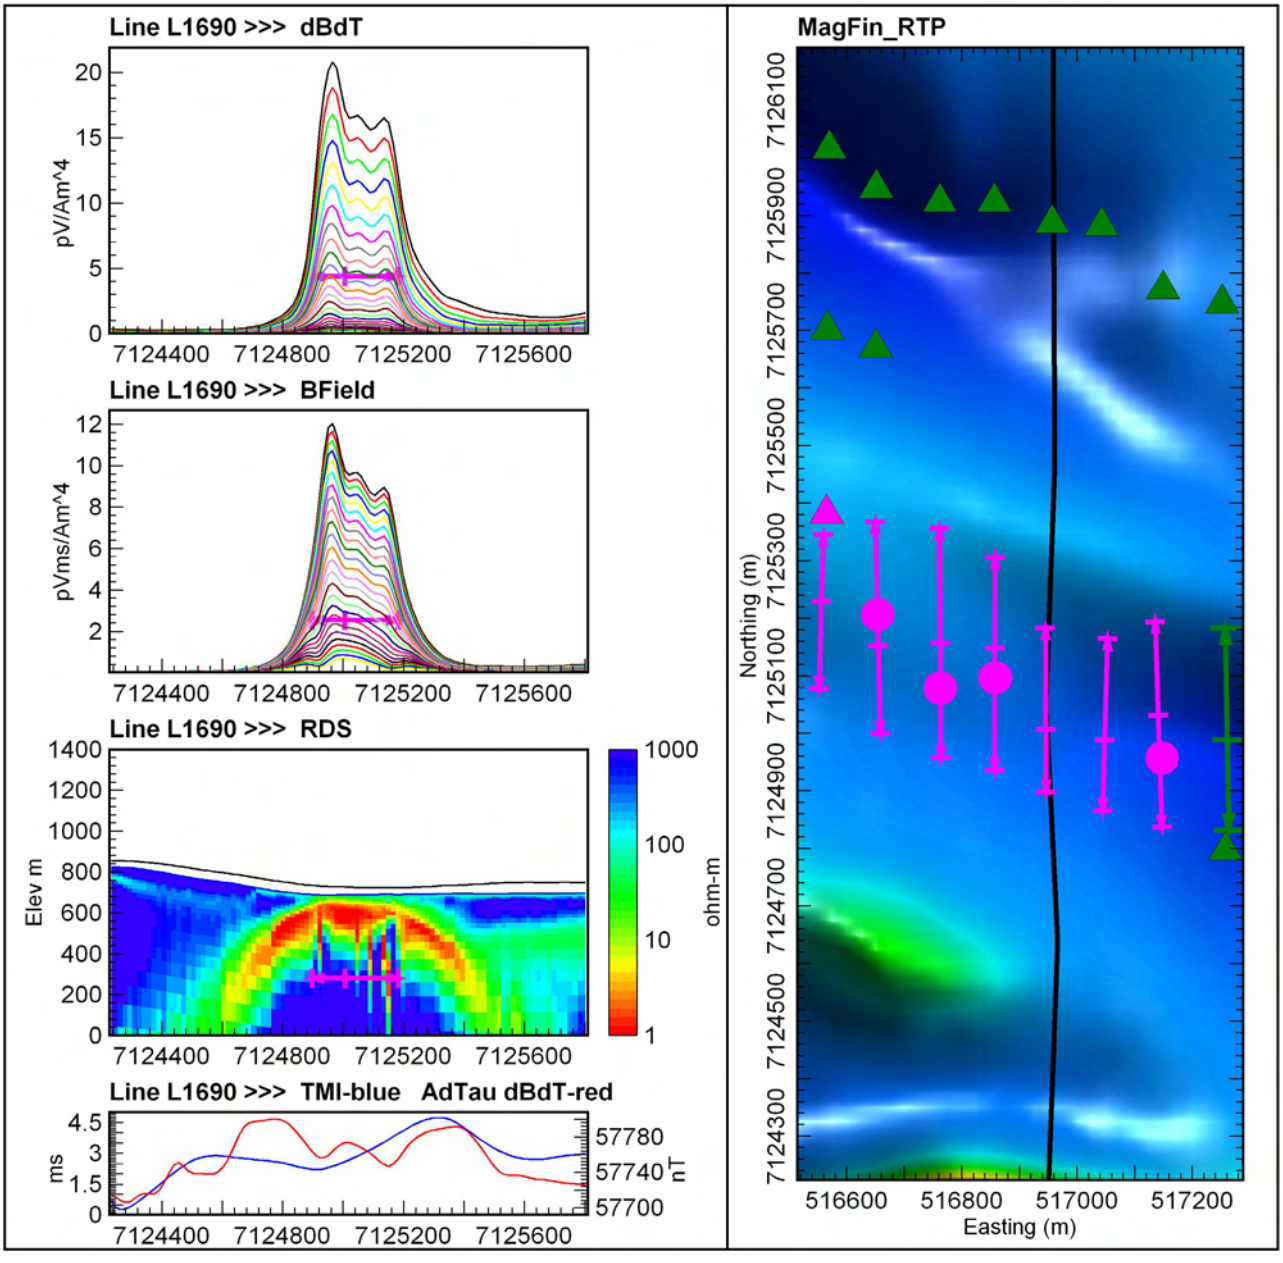
- Priority 3
- This TZ trends east-west, with a strike length of approximately 1 800 m and consists mostly of weak DPR responses with interpreted dips shallow to the south.
- The locations of the DPR picks represent the top of the conductors, where they may crop out.
- A representative example (Line 1640) is shown in the Figure below.
- The conductor trend lies slightly oblique to the magnetic trends in this area.



TZ N: Representative flight line 1640 – profiles and RDS.

TZ O

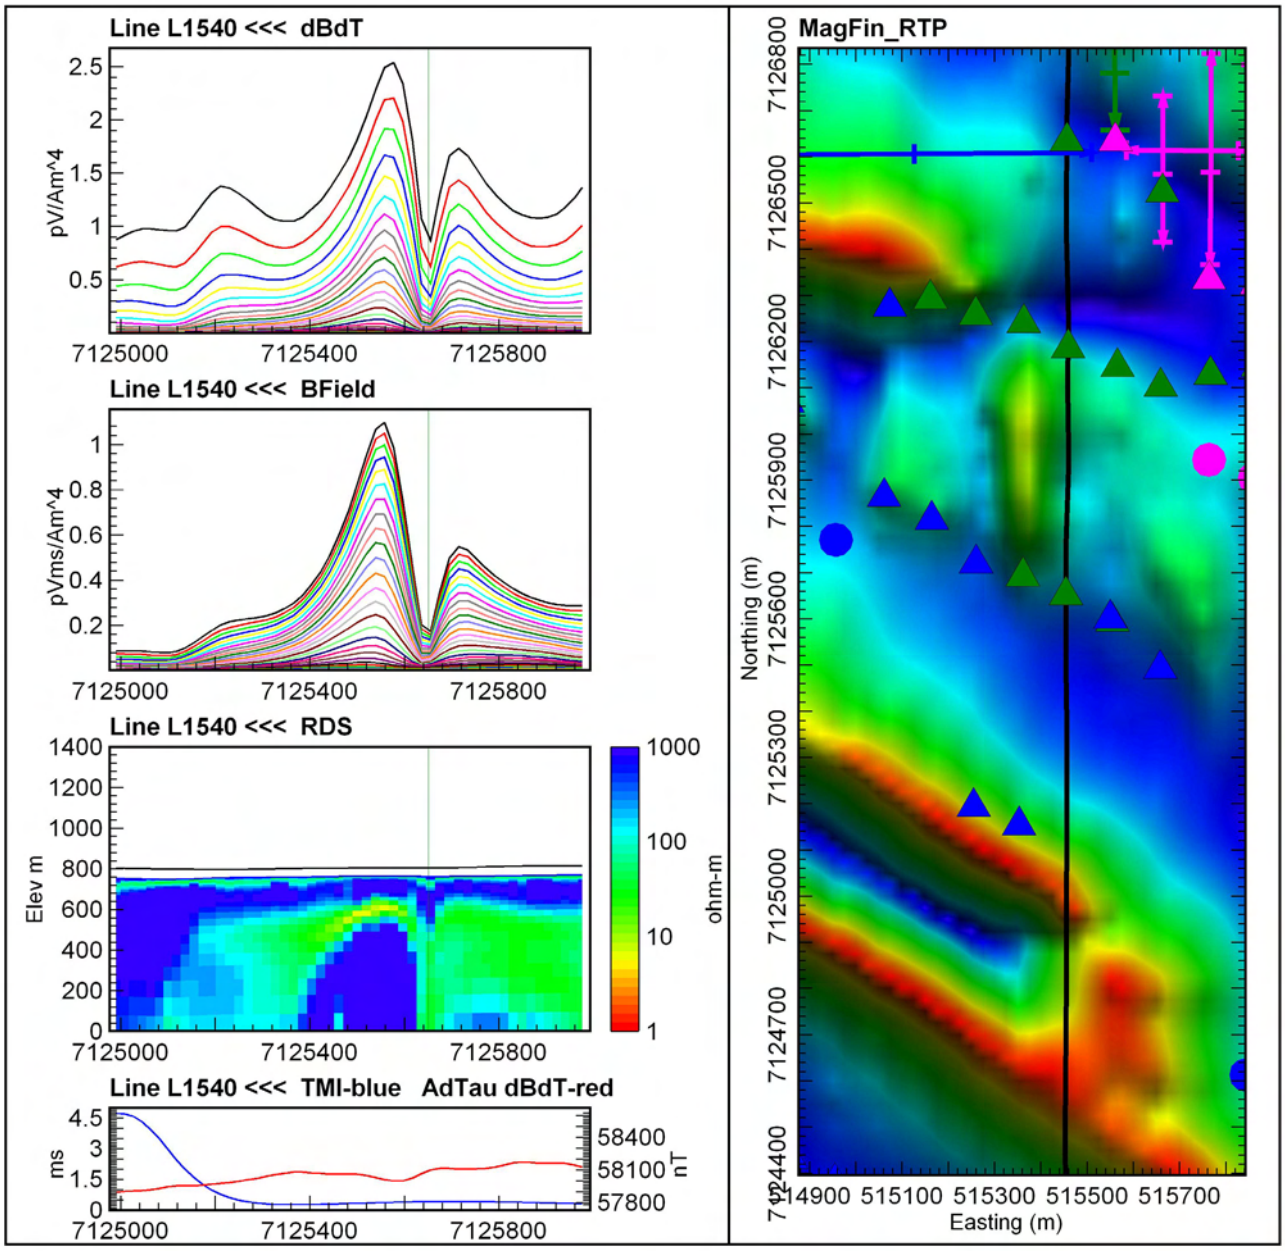
- Priority 2
- This zone extends for approximately 3 km and consists of wide conductors, combined with SPR and DPR conductors.
- An example for Line 1690 is shown in the Figure below.
- It appears to be due to a shallow, north-dipping stratigraphic unit.
- The southern extent of the wide conductors and/or DPR responses indicates where the conductor comes closest to surface and may crop out.
- This zone loosely correlates with magnetic trends.



TZ O: Representative flight line 1690 – profiles and RDS.

TZ P

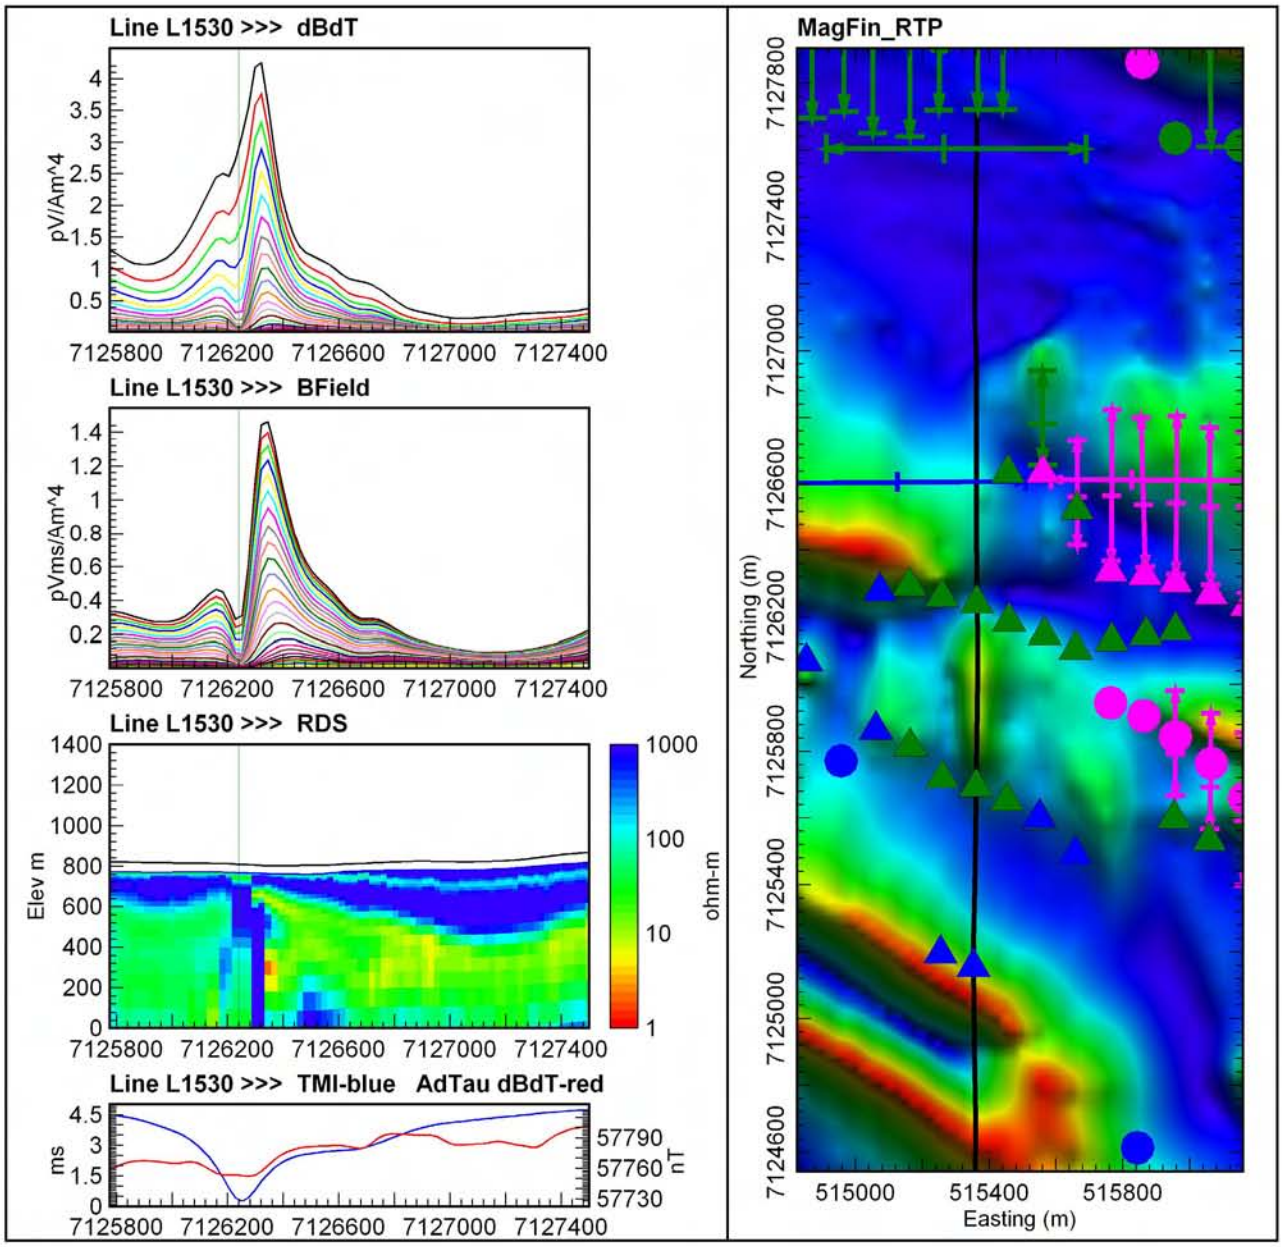
- Priority 2
- This zone is approximately 800 m long and consists of weak-medium DPR responses, the asymmetry of which imply a southerly dip.
- An example of one of the moderate conductors (Line 1540) is shown in the Figure below.
- The conductors loosely correlate with magnetic trends.



TZ P: Representative flight line 1540 – profiles and RDS.

TZ Q

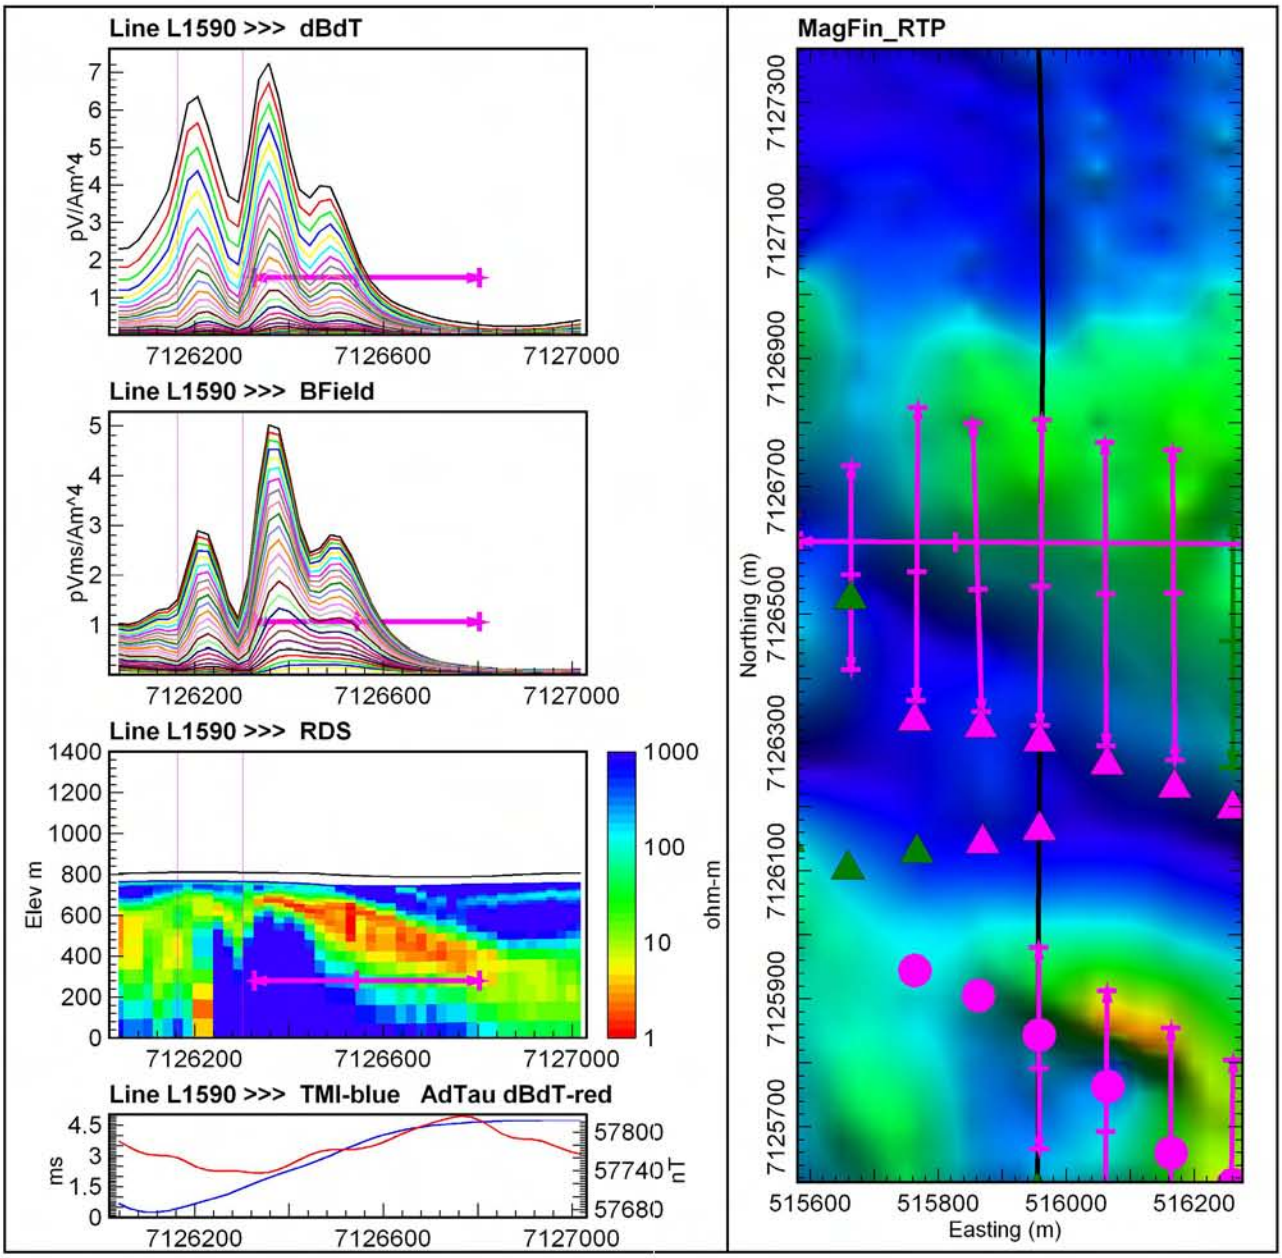
- Priority 2
- This zone is approximately 1 km long and consists of shallow north-dipping conductors, the southern edge of which are delineated by DPR responses.
- These conductors are moderately conductive and appear to be stratigraphic in nature.
- An example for Line 1530 is shown in the Figure below.
- The conductors loosely correlate with magnetic trends.



TZ Q: Representative flight line 1530 – profiles and RDS.

TZ R

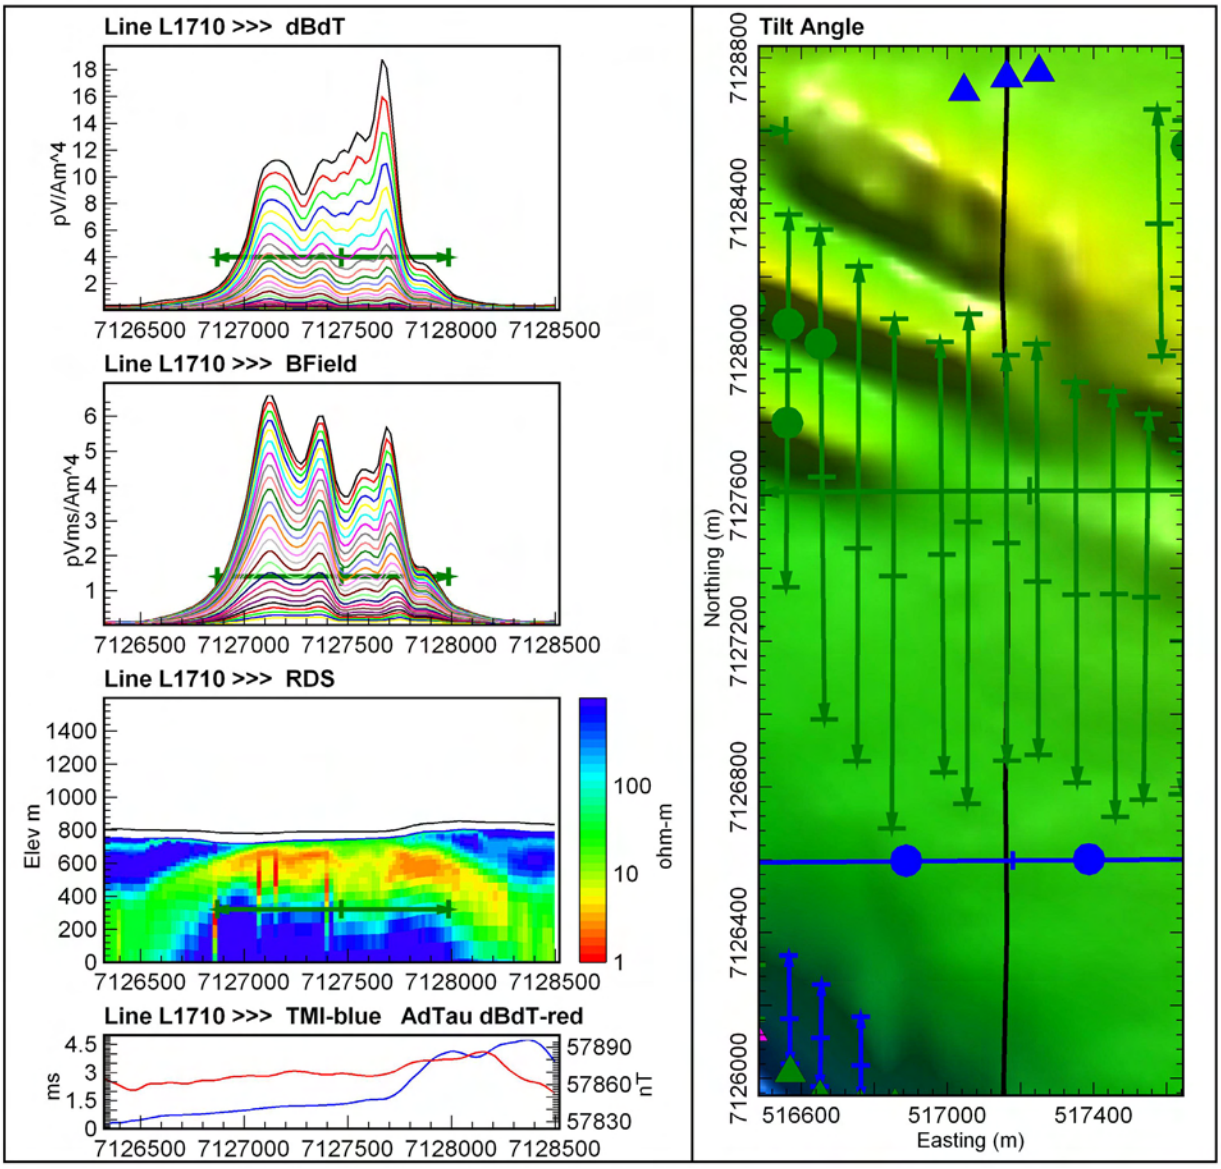
- Priority 2
- This zone is approximately 2 km long and consists of shallow north-dipping conductors, the southern edges of which are delineated by DPR responses.
- These appear to be stratigraphic in nature.
- An example for Line 1590 is shown in the Figure below.
- The conductors correlate with magnetic trends.



TZ R: Representative flight line 1590 – profiles and RDS.

TZ S

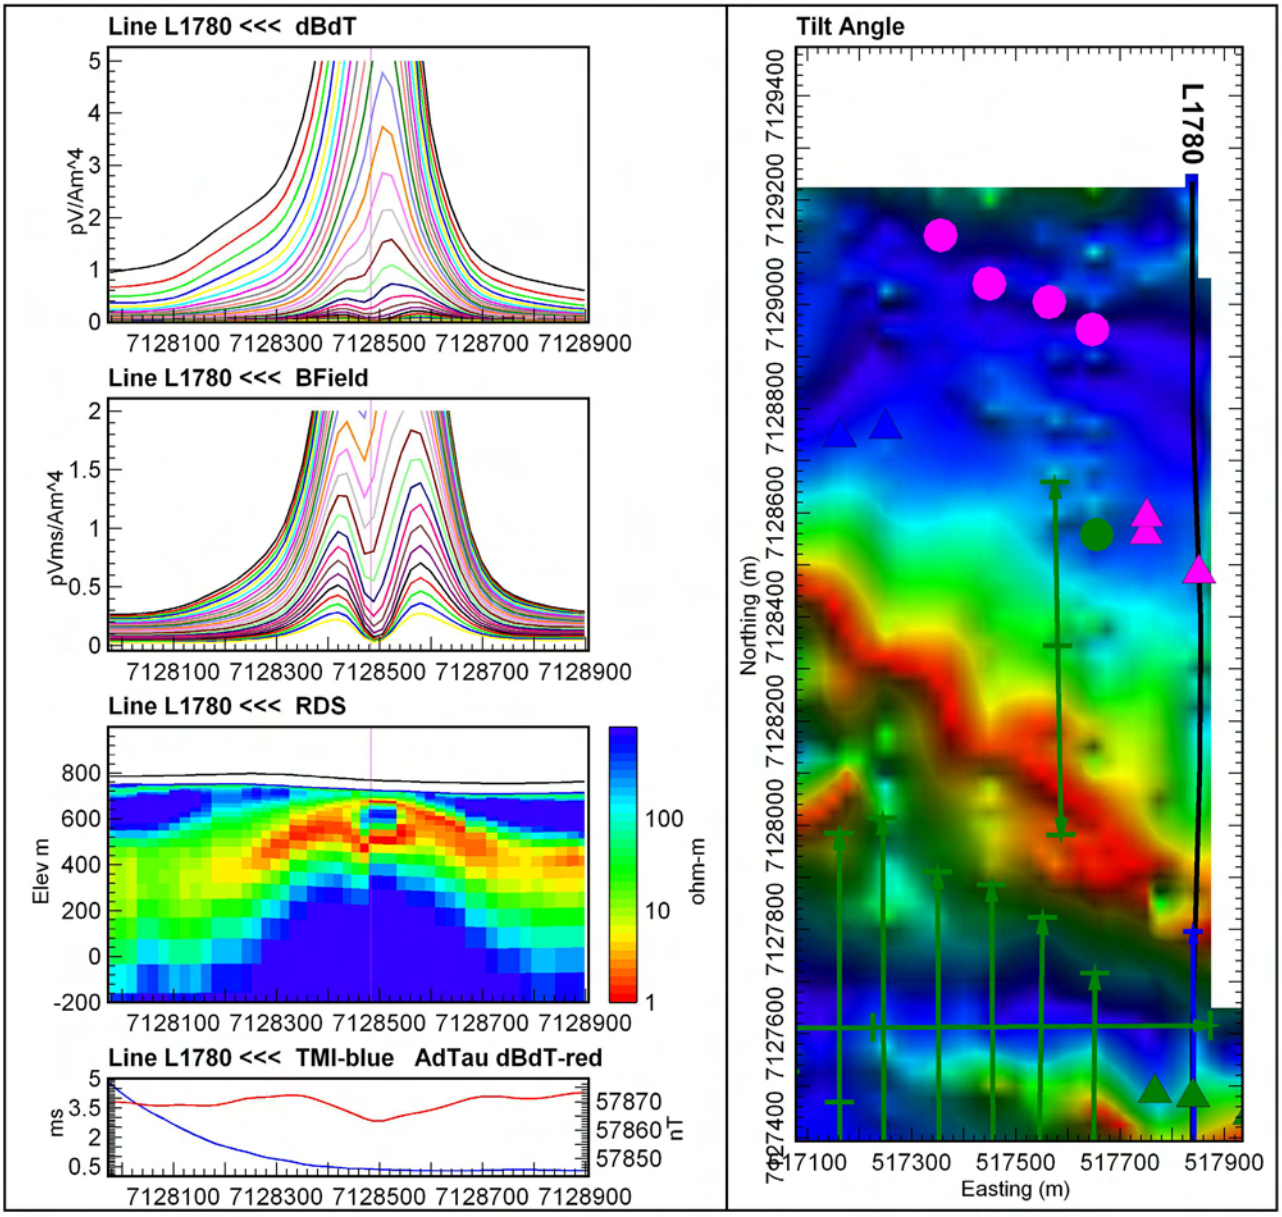
- Priority 3
- This very large zone is likely the northwest extension of TZ M.
- It is approximately 7.5 km long and up to 2.5 km wide and is open to the east.
- The wide overall zone appears to be composed of multiple, close-spaced conductors. In most cases the interpreted dips are shallow to the north.
- In the east and central section the conductors are shallow, but in the west they appear to plunge to the northwest and weaken.
- Also in the west, the overall conductive zone splits into a northern and southern section. The southern section weakens and deepens and may be truncated. The northern section continues northwest for approximately 2 km.
- An example from the eastern part of the zone (Line 1710) is shown in the Figure below.
- The overall zone generally follows the magnetic stratigraphy, but without direct correlation of individual conductors with magnetic units.



TZ S: Representative flight line 1710 – profiles and RDS.

TZ T

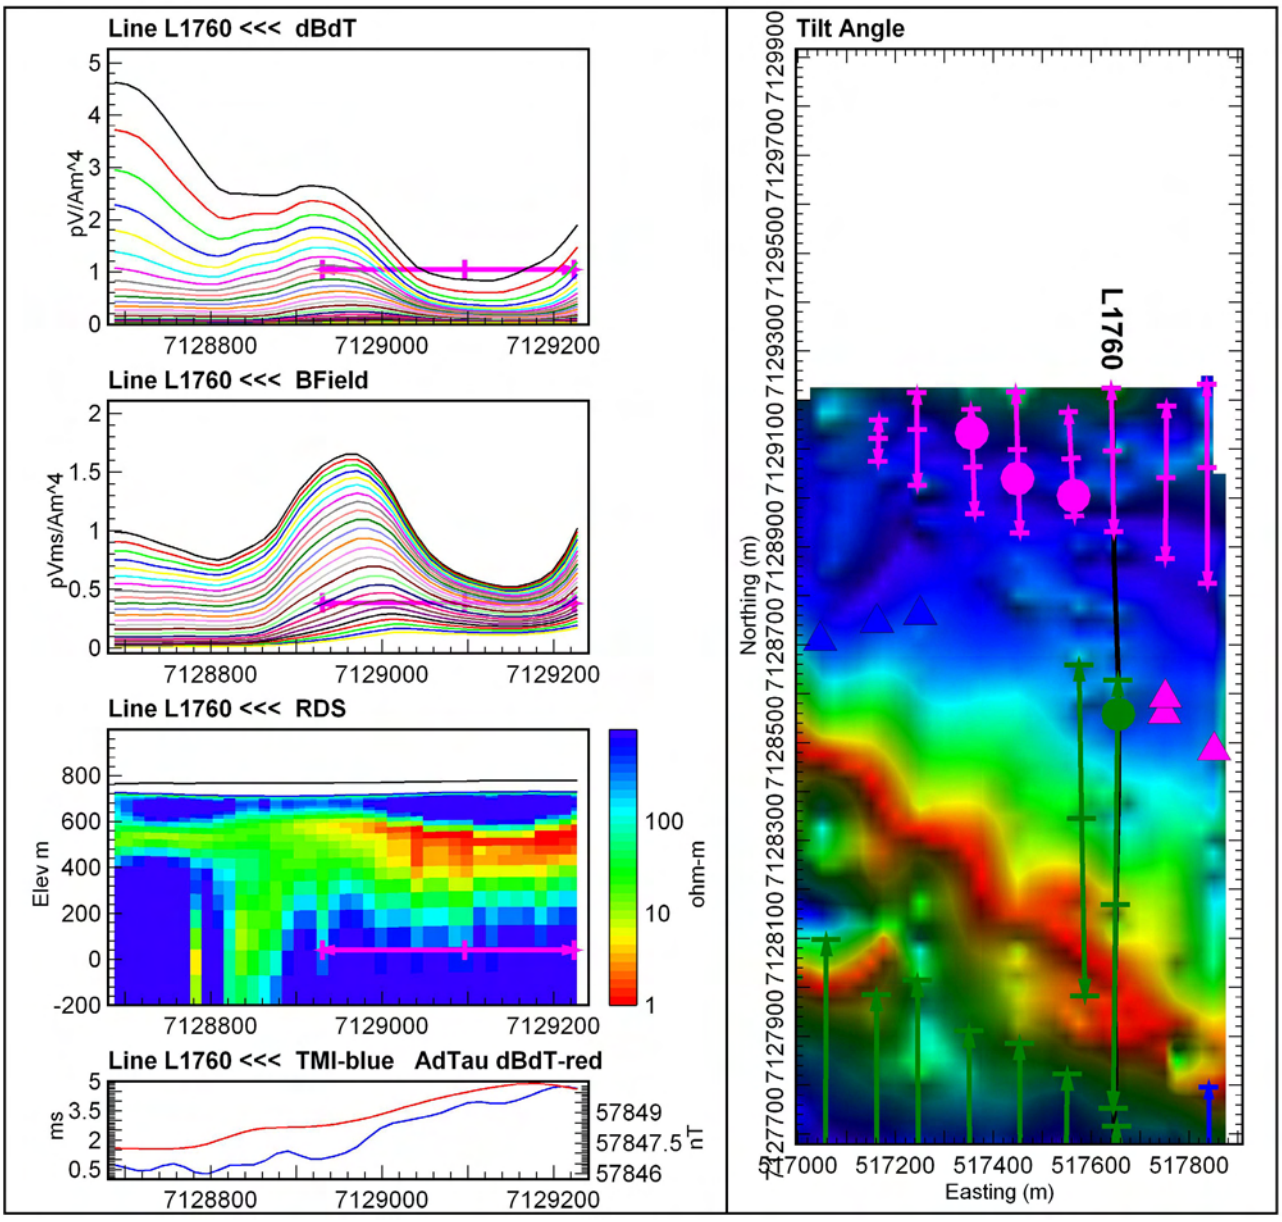
- Priority 1
- This TZ lies close to the survey boundary and is defined on only two lines (Line 1770 and 1780).
- The response on Line 1780 is shown in the Figure below.
- On both lines the picks are strong DPR and appear to be due to a strong, relatively steep conductor which likely extends eastward inside ATAC ground.
- There is no significant magnetic response associated with this conductor.



TZ T: Representative flight line 1780 – profiles and RDS.

TZ U

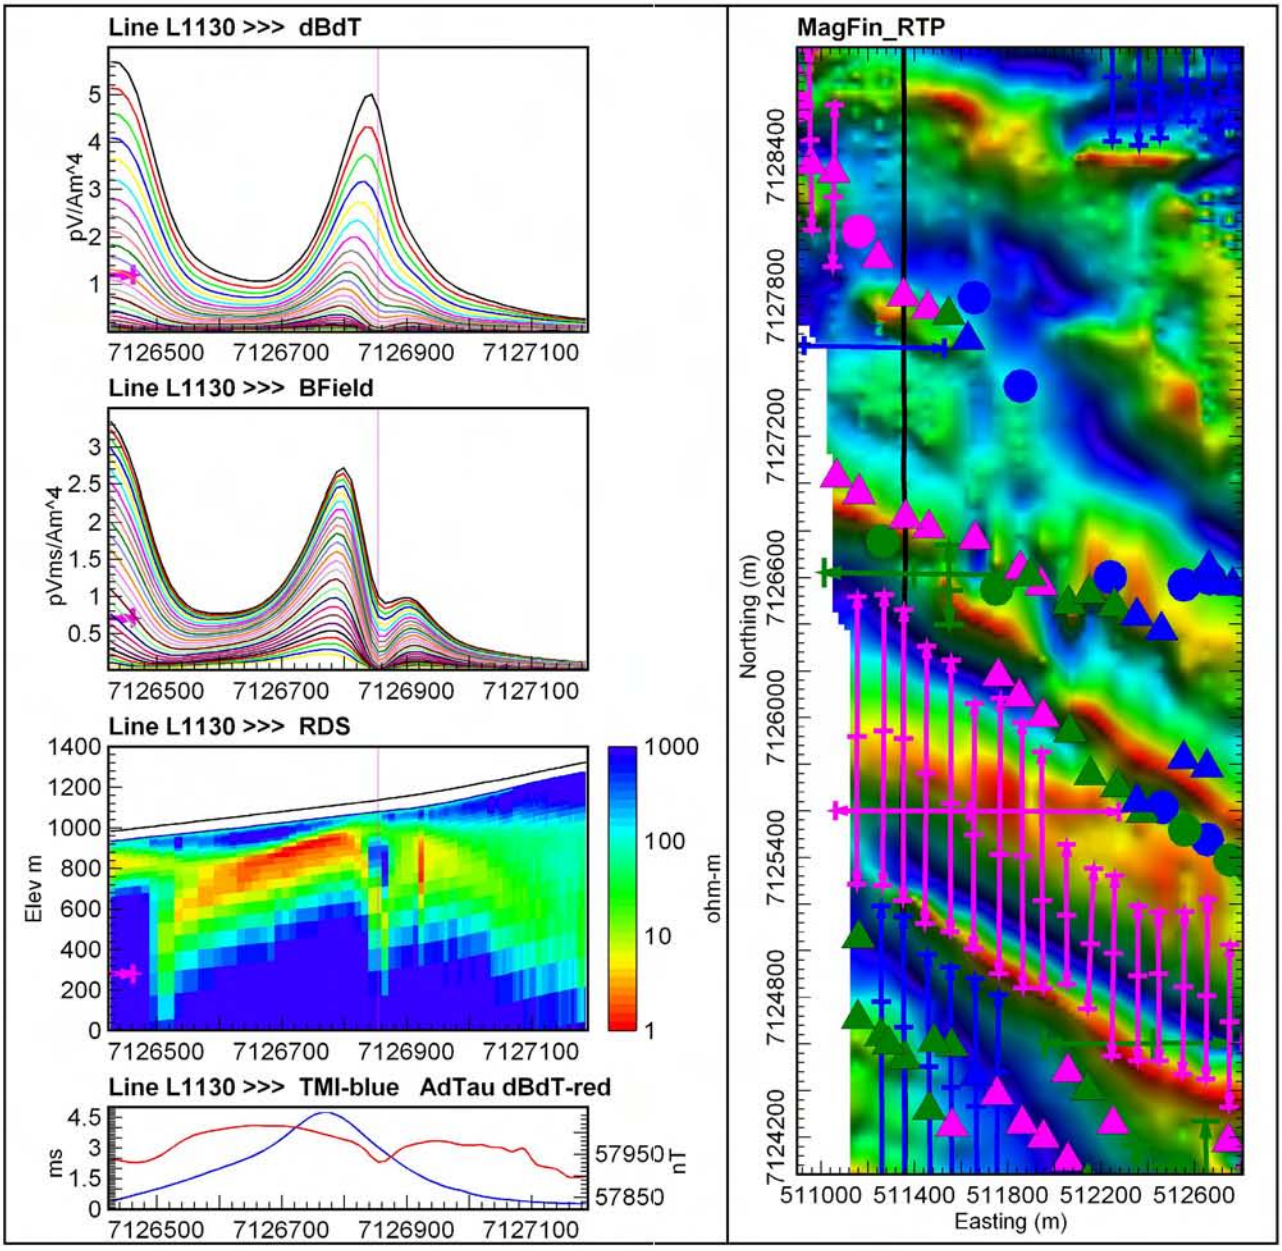
- Priority 2
- This TZ is located close to the corner of the VTEM survey boundary and consequently is not spatially resolved, as the conductors extend beyond the survey boundary in several directions.
- The TZ lies within mapped Earn Group. The conductors are strong wide zones and have characteristics similar to those of the Keno Hill quartzite further east, so possibly may be mis-mapped.
- An example for Line 1760 is shown in the Figure below.
- There is no significant magnetic response associated with these conductors.



TZ U: Representative flight line 1760 – profiles and RDS.

TZ V

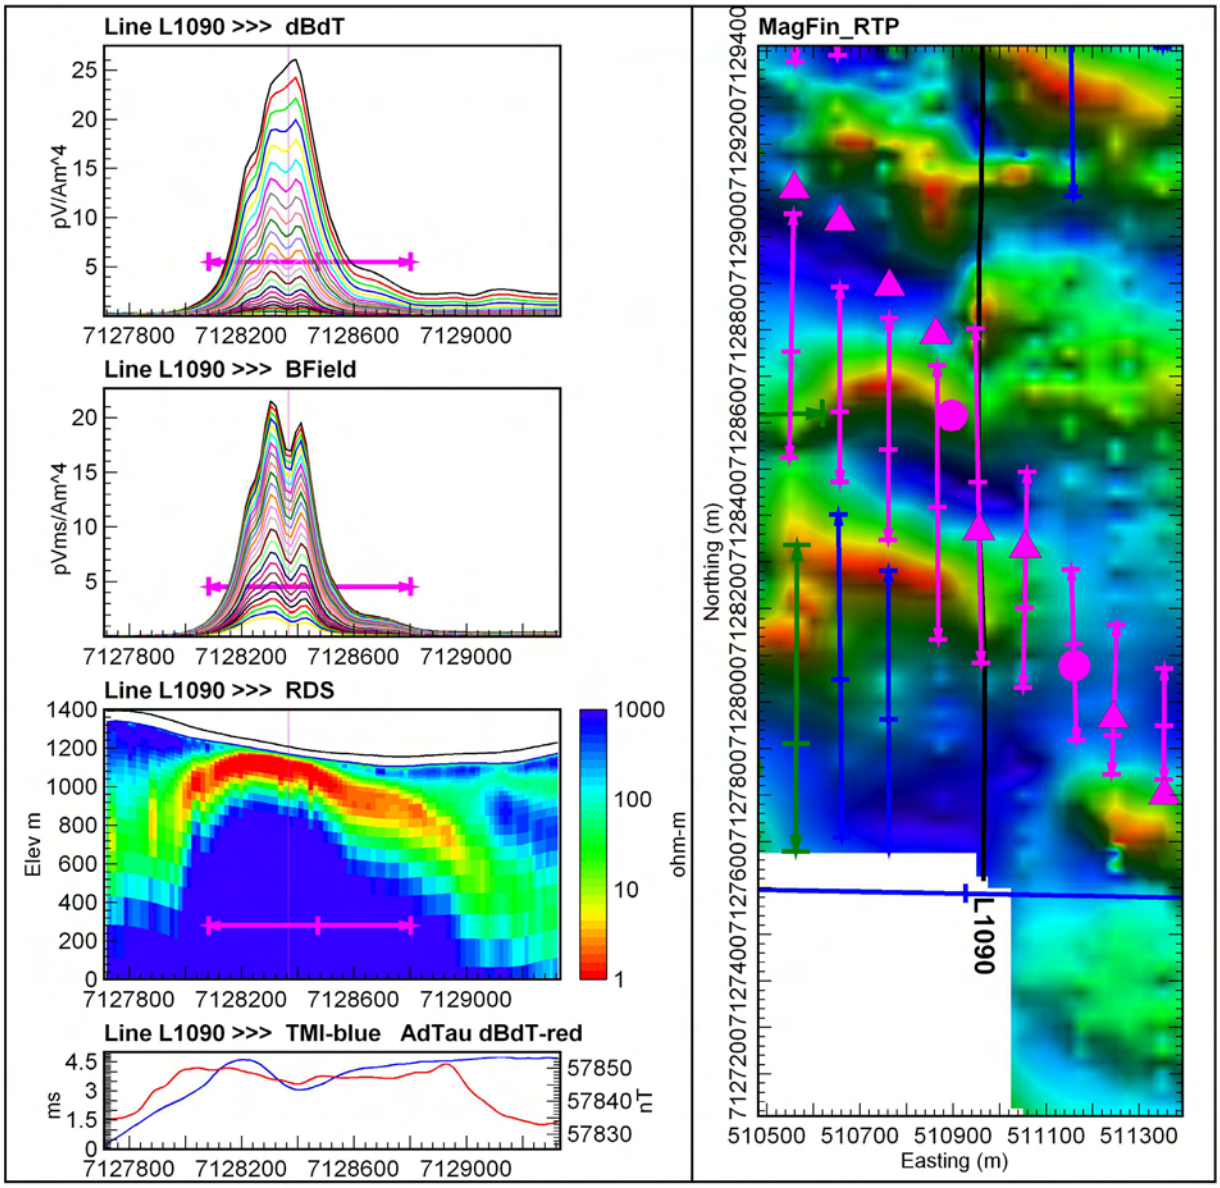
- This zone is 1.5 km long and open to the west. It is comprised mostly of strong to weak DPR responses which indicate a thin conductor dipping to the south.
- The DPR locations define the top of the conductor, where it may crop out.
- An example of one of the stronger conductors on Line 1130, near the western boundary, is shown in the Figure below.
- The conductors loosely correlate with magnetic trends.



TZ V: Representative flight line 1130 – profiles and RDS.

TZ W

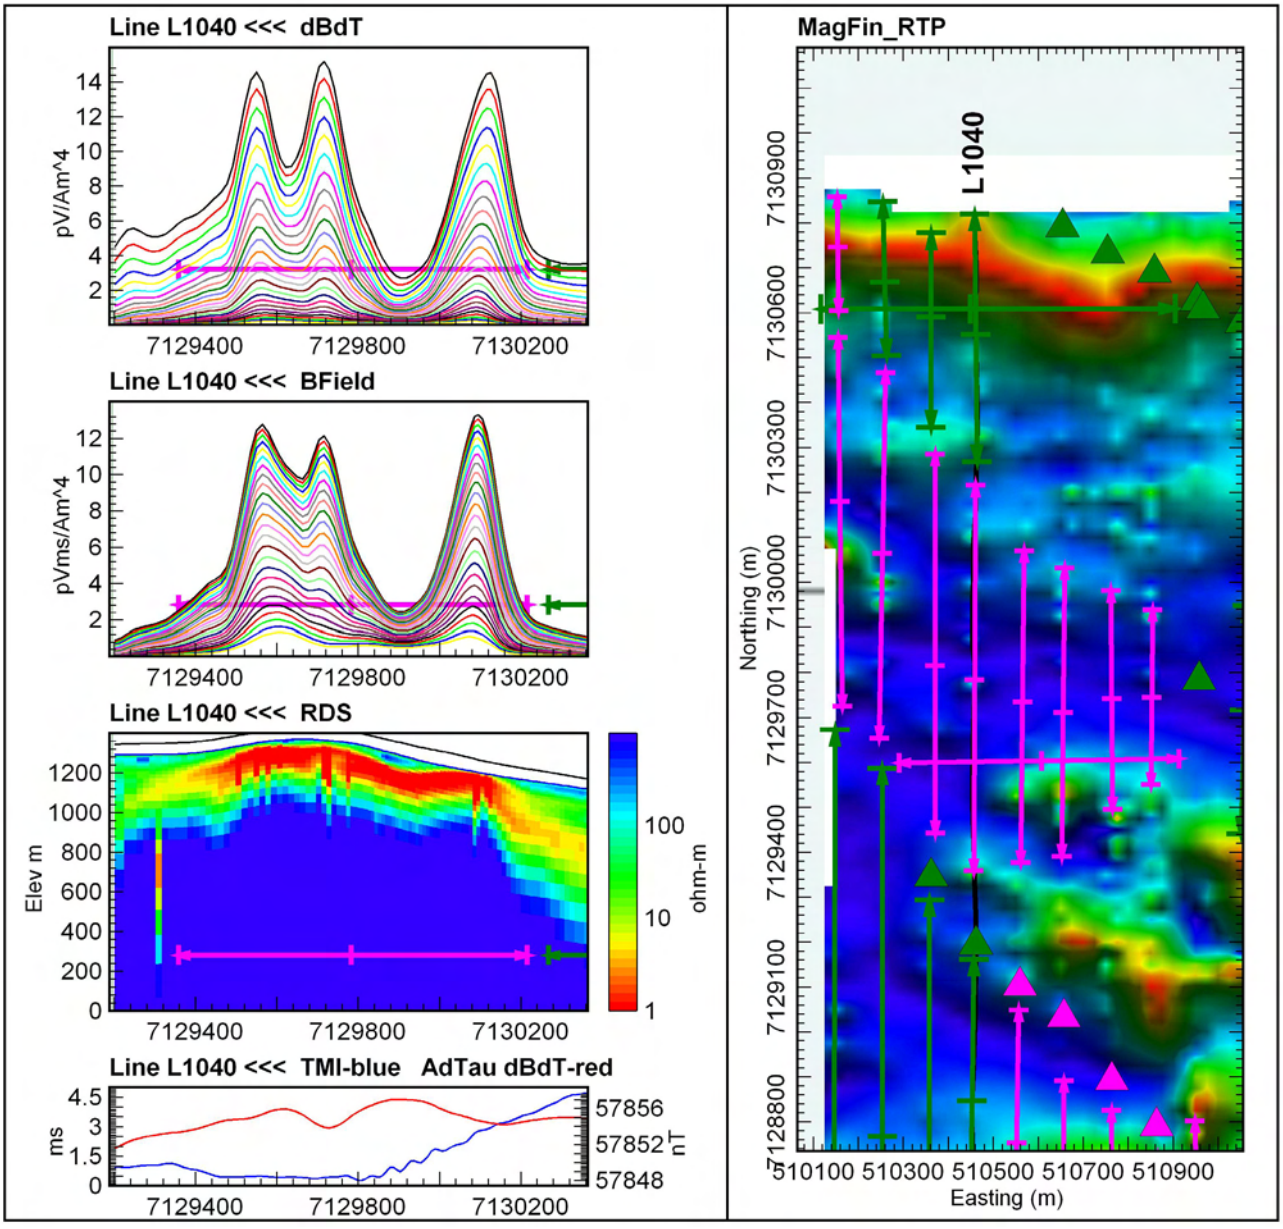
- Priority 2
- This zone is over 2 km long and open to the west of the survey area. It is comprised of strong-medium, wide, relatively flat-lying conductors.
- The edges of these conductors where they come close to surface or crop out are marked by DPR picks.
- At the east end of the TZ the interpreted dip is to the north. In the center of the TZ it appears to be flat-lying. In the west the dip is to the south.
- An example of the flat dip near the center of the TZ on Line 1090 is shown in the Figure below.
- In the west the conductor dips gently south for approximately 800 m and then appears to be folded into an antiform, as exhibited on Lines 1020-1040.
- The TZ has no clear correlation with magnetic trends.



TZ W: Representative flight line 1090 – profiles and RDS.

TZ X

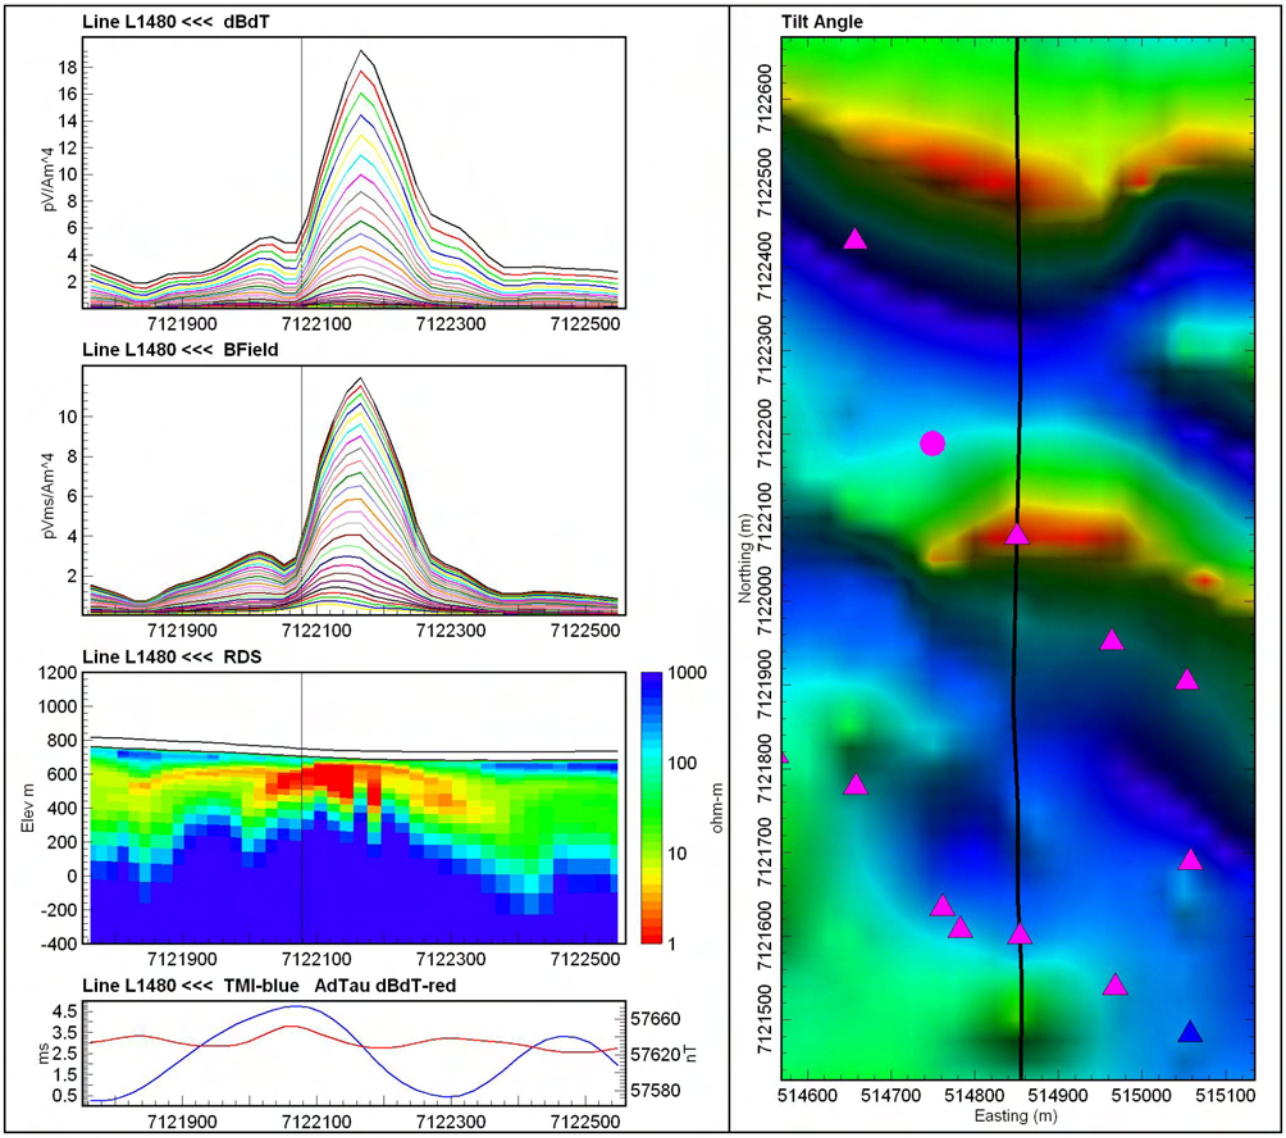
- Priority 3
- This zone of wide, flat-lying, near-surface conductors trends in a NW-SE direction and has dimensions of approximately 1 000 x 700 m. It is open to the west outside the survey area.
- An example for Line 1040 is shown in the Figure below.
- The wide, flat-lying conductors are relatively strong and it is unlikely that the VTEM is seeing through them.
- The area is mapped as Bouvette Fm, but these flat-lying conductors have characteristics similar to those observed in areas of Earn Group, so possibly this area has been mismapped.
- The conductors lie in an area of subdued magnetic intensity.



TZ X: Representative flight line 1040 – profiles and RDS.

TZ Y

- Priority 2
- This zone of multiple strong-weak DPR and SPR, near-surface conductors trends in a NW-SE direction and has dimensions of approximately 4 000 x 800 m.
- Two sub-parallel, general conductor trends are evident within this TZ. The northern trend appears to dip steep north. An example for Line 1480 is shown in the Figure below. The southern trend appears to generally dip steep south.
- The area is mapped as Keno Hills Quartzite.
- Some conductors correlate with discrete magnetic highs, but others show no particular magnetic correlation.



TZ Y: Representative flight line 1480 – profiles and RDS.

AURORA GEOSCIENCES

MEMORANDUM

To: Rob Cairns, Graham Downs **Date:** September 03, 2009

From: Dave Hildes

Re: Rau 2009 Induced Polarization Survey Field Report

FIELD

This memorandum is a field report describing geophysical surveys conducted on the Rau property. The induced polarization (IP) surveys included modified pole-dipole IP on 3 lines over and around the mineralization found to date on the property. The survey was conducted from August 4 to August 13, 2009, based out of the Silver Trails Lodge at Halfway Lakes. A full survey log describing day by day operations is attached to this report.

The modified pole-dipole surveyed a total of 4.2 line-km (3 lines) completed over 6 working days on lines put in prior to the arrival of the Aurora IP crew. There were two weather days due to un-flyable conditions. Production was hampered by both poor weather and logistical difficulties (wildlife on the grid, widely spaced lines in steep terrain) but also by very poor ground conditions. Some areas had very thin to no soil making contact resistance high and the central part of the grid was very conductive causing a poor signal to noise ratio. Consequently many repeats were needed and reliable data was not routinely collected to the farthest offsets.

a. Crew and equipment.

The survey was conducted by the following personnel:

Steven Kramar	Crew chief	Aug 4th – 13th, 2009
Andre Lebel	Helper	Aug 4th – 13th, 2009

Ellen Nielsen	Helper	Aug 4th – 13th, 2009
Ben Power	Helper	Aug 4th – 13th, 2009

The crew was equipped with the following instruments and equipment:

IP receiver	1	Iris Elrec Pro
IP transmitter	1	GDD TxII 3.6 kW
Generator	1	Honda 5kW generator
IP equipment	1	Repair tools & spare IP parts
	8 km	18 gauge wire
	4	VHF handheld radios
		Georeels & spools ,and stainless steel electrodes
Other	1	Laptop with Geosoft IP package
	1	Truck

b. Survey specifications.

The modified pole-dipole IP surveys were conducted according to the following specifications:

Array	Modified Pole-Dipole Array
Dipole spacing	50 m on all lines
Dipoles Read	N=1 through 10 when possible
Tx	Time domain, 50% duty cycle, reversing polarity, 0.125 Hz.
Stacks	Minimum 15
Rx error	5 mV/V or less, otherwise repeated several times until repeatability assured
Grid registration	Handheld GPS points at line ends and every 400m minimum averaged 60 s or until estimated accuracy < 10 m, whichever was longer. All coordinates in

NAD83 UTM Zone 8N.

c. Data Processing.

Data was downloaded nightly from the receiver and imported into Geosoft Oasis Montaj IP package. Every reading was inspected and readings which did not repeat were rejected from the database. Apparent resistivity was recalculated using a four electrode equation assuming a homogeneous earth. Average apparent resistivity and chargeability were calculated using a weighted mean based on the number of stacks and the standard deviation of the chargeability.

GPS points were dumped from the handheld units and the coordinates for the stations determined by linear interpolation between GPS units. Elevations were determined from a digital elevation model equivalent to NTS 1:50:000 map sheet 115 I/14.

Prior to 2D resistivity modelling, errors in the apparent conductance were assigned to the data. There is no means of directly quantifying these errors because neither the transmitter nor receiver records the error in the current or voltage. Errors were assumed to be 0.001 + 5% S/m. Following error assignment, the data were inverted with a deep mesh due to high topographic relief. Default initial and reference models based on an average of the apparent resistivity were used. After the default run, the data were inverted a second time using initial and reference models of 10000 Ohm-m, a much higher value than the average in the survey area. The purpose of this second run is to generate a model with a background resistivity greatly different than the average values used in the default run. After the second run, the two models were compared and the area where the models differed by a factor more than 30% on lines 9650 and 10400 and 40% on line 10120 was removed from the default run model. These points are not sensitive to the field data and there is no reliable subsurface information. Chi factors were adjusted to 2.0, 12.0 and 9.0 on lines 9650, 10120 and 10400 to ensure convergence and an appropriate level of structure to the model.

Prior to 2D chargeability modelling, the observed standard deviation of chargeability was used as a measure of error for apparent chargeability. To avoid zero errors, a minimum of 0.2 mV/V was added to each error measurement. The IP data were first inverted using default values (initial and reference model of a 0 mV/V half-space), with the same mesh as the resistivity modelling, using the default recovered resistivity model. After the first run, the data were inverted a second time using initial and reference models of 100 mV/V (a much higher value than the average in the survey area). The two models were then compared and regions in the default model which varied more than 20% were removed in the final models. In these regions, the final model is not sensitive to the field data and there is no reliable subsurface information. Chi factors were adjusted to 4.0, 5.0 and 1.0 on lines 9650, 10120 and 10400

respectively ensure convergence and an appropriate level of structure to the model.

Pseudosections of apparent resistivity, apparent chargeability, and apparent chargeability error, draped over topography, were produced with Oasis Montaj along with the recovered models plotted at the same scale.

d. **Products**.

The following files are appended to the digital version of this report:

Data\Rau_IP_final.gdb Data\Rau_IP_final.xyz Data\channels.txt Data\Rau_GPS.xyz	Final data in Geosoft ASCII xyz and gdb format. The GPS files have all GPS coordinates taken in NAD83, UTM zone 8N coordinates. The file channels.txt describes the columns of Rau_IP_final.xyz file.
Images\2D inversion Images\L9650_Composite_section.pdf Images\L10120_Composite_section.pdf Images\L10400_Composite_section.pdf	2D inverision images of the models with convergence curves and predicted versus observed data. The composite section show pseudosections of apparent resistivity, apparent chargeability and apparent chargeability error and recovered models of resistivity and chargeability all at a scale of 1:5000.
Raw	A folder with all the raw instrument dump files.
Rau 2009 IP Field Report.pdf	A PDF of this report.
ATC-9544-YT Rau IP Daily Report.pdf	Survey log

e. **Results**.

L10400 – There is a well defined chargeability high situated at station 9900, elevation 1300 m that is in between two conductive zones. This is suggestive of a further sulphide zone south of baseline 10000.

L10120 – A chargeability high is centered at station 10075 at an elevation of 1250 m. This matches fairly well with the known sulphide mineralization as described on the ATAC website. The very conductive zone immediately to the NE of the chargeability high could represent the volcanics package.

L9650 – A conductive zone is centered at station 10000 approximately 100 metres below surface. A broad zone of elevated chargeability extends from station 9900 to 10600 with several small near surface local highs within the broader zone.

If infill lines were to be surveyed, a 3D inversion could be performed to recover a 3D resistivity and chargeability model.

Respectfully submitted,
AURORA GEOSCIENCES LTD.
