APPENDIX

INTRODUCTION

The Jen claim block was staked on June 4, 2008 by Richard A. Ewing on behalf of the Hinton Syndicate, a group of 4 partners. The claims were staked to cover an area identified by an airborne geophysical survey flown in 2007 by Yukon Gold Corporation, at that time partners in the adjoining claims with Hinton Syndicate.

Hinton Syndicate engaged an experienced Geophysicist to examine the data from the airborne survey VTEM survey for that part of it which overlay the Jen claim block. Jan Klein's review was conducted in late 2008 which identified several conductor zones which coincided with EM highs.

Hinton Syndicate engaged Keno Hill Exploration Corp. to follow up the indicated targets with a soil sampling and prospecting program in June of 2009. The field program was under the direction of Lauren Blackburn, Geologist.

HISTORY OF THE CLAIM AREA

The area covered by the northern portion of the Jen claims, and the area just north of the Jen claims, had been explored and staked in the 1965-1966 period by United Keno Hill Mines Ltd. Some high grade silver float was found to the north and a geochemical survey conducted along with some trenching on a vein. In the period 1986-1986 a company, 660250 Ontario Limited carried out some mapping, geochemical sampling and geophysical surveys in the same general area. The following year, 1987, Orex Resources Ltd. drilled 2 diamond drill holes just north of the now Jen Claim boundary. Part of this work overlapped the Jen claim block.

In 2007, Yukon Gold Corp. engaged Geotech Ltd. to conduct an airborne geophysical survey of their claims which partially covered the Jen claim block.

In 2008 the Jen Claims were staked by Richard A. Ewing and Hinton Syndicate, and the Syndicate hired Jan Klein, Consulting Geophysicist to review the data. Hinton Syndicate paid for the work done by Mr. Klein.

PROPERTY LOCATION, CLAIM STATUS AND ACCESS

The Jen property consists of 85 contiguous mineral claims located in the central Yukon. The claim block is approximately centred at Latitude 63º 52' N and Longitude 135º 01' W on NTS map-sheet 105M/14 (Figures 1 and 2)

The claims are registered with the Mayo Mining Recorder in the name of Richard A. Ewing. The locations of the individual claims are shown in Figure 2 while claim registration data are summarized as follows.

Claim Name	Grant Number	Expiry Date
Jen 1 – 85	YC68019 – YC68103	June 4, 2010

The property is located approximately 15 km east and south of the village of Keno City and the nearest highway access. The nearest supply centre is Mayo, approximately 55 km south and west. A four-wheel drive road touches the SW corner of the claim group, extending out from Keno City.

The property basically covers the south slope of a mountain from elevations 6500 ft. to 3700 feet at Granite Creek to the south. The block then extends up the north slope of Mt. Albert to almost 6000 feet at the southwest corner.

REGIONAL GEOLOGY *(Assessment Report, 2003, Call No. 094439 Mt. Hinton Property)*

The Jen property lies along the southwest margin of Selwyn Basin, a region of deep-water off-shelf sedimentation that persisted from late Precambrian to Middle Devonian time. The property is largely underlain by interbedded Mississippian phyllitic quartzite, chloritic and carbonaceous phyllite and massive to well foliated quartzite with lesser limestone of the informally named Keno Hill Quartzite or "Central Quartzite" (Roots, 1997). An underlying carbonaceous phyllite sequence, informally called the "Lower Schist", is assigned to the Middle to Late Devonian Earn Group. Triassic amphibole-chlorite metadiorite and metagabbro sills locally termed "greenstone" intrude the layered strata. The Robert Service Thrust fault that emplaces metamorphosed clastic sedimentary rocks of the Upper Proterozoic Hyland Group (locally called "Upper Schist") over the Keno Hill Quartzite, is located about 3 km to the west of the Jen claim boundary.

Both the Robert Service Thrust Fault and enclosing rocks are intruded by the Roop Lakes Pluton, a 100 km sqare elliptical stock that lies about 5 km east of the Jen claim boundary. Igneous petrology is dominated by medium grained granodiorite with lesser quartz monzonite. A marginal phase composed of quartz diorite to quartz gabbro is present.

The Jen claim area lies in the southeast part of the Keno Hill mining camp, part of the 550 km long Tombstone Gold Belt. Between 1913 and 1989, over 6600 tonnes of silver, 35,000 tonnes of lead and 21,000 tonnes of zinc were extracted from the extensive and numerous vein-faults in the Keno Hill area (Murphy, 1997).

The Tombstone Gold Belt is coincident with mid-Cretaceous plutonism of the 92 Ma Tombstone Plutonic Suite (Hart and Burke 2002). A 92.8+0.5 Ma age for the Roop Lakes pluton has been determined by isotopic dating. This age as well as its petrology places the intrusion within the Tombstone Plutonic Suite. Tombstone Plutonic Suite proximal mineralization occurs within or adjacent to the

mineralizing pluton as replacements, disseminations, stockworks, skarns and discrete veins with a gold-bismuth or tungsten-copper association (Hart and Burke 2002). Distal mineralization occurs at some distance from the associated pluton either as disseminations or veins that are dominated by a gold-arsenic-antimony-mercury association or a lead-zinc-silver association. Precious metal bearing veins on the Mount Hinton property which tie on north and west of the Jen claims, probably belong to the distal suite. (For general view of significant features see DWG. Jen 2)

JEN CLAIM GROUP GEOLOGY

The property was mapped in a preliminary fashion by geologist Lauren Blackburn of Keno Hill Exploration in 2009 and a summary follows.

The property shows a massive package of gently (~020°) southerly-dipping Keno Hill Quartzite with small layers of graphitic schist all cut by massive, Triassic (?) diorite sills (aka: *greenstone*); the package of rocks can be viewed outcropping at the summit looking to the south. Late aplite sills were found as float on the property and as outcrop at the summit.

PROGRAM AND RESULTS

Ten lines of samples were taken totaling 10 km and covering areas of potential conductor zones. Samples were taken at 50 metre intervals on lines spaced 100 metres apart. A total of 313 soil samples were taken in two separate areas. (See DWG. Jen 3) In addition 26 rock samples were taken during the prospecting part of the program by Lauren Blackburn. (See Appendix 2 for full report)

Samples were taken using Swede-pic, bagged in brown soil sampling bags and dried in place. They were then bagged in rice bags and transported to Eco Tech Labs in Whitehorse.

Soils were dried and sieved to 80-mesh (package BSS-11) and analyzed using a multi-element package by aqua-regia digest with an ICPOES finish (package BICP-11). A Gold (30 g) fire assay with a detection limit of 5 ppb was then completed with an AA finish (package BAUFG-12).

Basically the program tested 2 areas of conductor zones identified in an Aerial VTEM survey and demonstrated that sections of those conductors are mineralized with some potential for economic values. (See DWG.'s Jen 4, Jen 5, Jen 6)

INTERPRETATION AND CONCLUSIONS

Further work recommended by Geologist Blackburn are mapping, prospecting and additional soil sampling. (See Appendix 2 for complete Blackburn report)

STATEMENT OF EXPENDITURES

Separate Invoices have been filed in the amount totaling - $20, 309.02

Summary of Expenditures

Keno Hill Exploration – Field work,		- $10,125.17
Fireweed Helicopter	- Crew and sample transports	- $ 4,268.15
Eco Tech Labs	- Assaying	- $ 5,915.70

All invoices were paid for by Richard Ewing on behalf of the Hinton Syndicate.

Jen Claims- YMIP Final Submission

To: Steve Traynor **Date:** 5 Aug 2009
YMIP Geologist, Yukon Geological Survey

Cc: Dick Ewing, Jim Smith & Bob Wagner (Hinton Syndicate)

From: Lauren Blackburn

Re: Jen Claims YMIP Program, Yukon Territory

Please regard the following as Hinton Syndicate's YMIP final submission for work on the Jen Claims. This summary describes the results from the YMIP-funded program that was completed from June 4th to June 11th, 2009 on the Jen Claim block for Hinton Syndicate. The purpose of this program was to verify aerial VTEM anomalies highlighted during the 2007 Yukon Gold Corp. exploration program. Services provided by KHEC included soil sampling, prospecting and mapping of the Jen Claims (no map has been created to date, a tentative map could be created at the clients request). A total of 313 soil and 26 rock samples were collected during the program; these samples were sent to Eco Tech Laboratory (Stewart Group) for analysis. During the program claim posts that were located were marked with a GPS waypoint for spatial verification.

a. Personnel & equipment.
The following personnel conducted the program:

Lauren Blackburn (Geologist)
Matthias Bindig (Prospector, sampler)
Bob Wagner (Prospector, sampler)

b. Project operations. The crew mobed out to the property via helicopter on June 4th and commenced work on the following day. Work continued on the property until June 10th and the group de-mobed via helicopter on June 11th 2009.

c. Deliverable products.
The following files are attached to this report:

Jen Claims Master Spreadsheet_2009.xls
- Jen Claims- Soil Sample Data
- Jen Claims- Geology
- Jen Claims- Post locations

Jen Claims photos (folder)
Geochemical Results (folder)

d. Statement of Costs.*
Staff
- Lauren Blackburn.....7 days @ 425 = $2975
- Matthias Bindig.....7 days @ 350 = $2450
- Bob Wagner.....7 days @ 350 = $2450

Helicopter (Transport, 1 sling both ways)…… ## hours @ = $4300
Geochemical Analysis
- Soils.....313 samples @ 18 = $5634
- Rock.....26 samples @ 30 = $780

Food & Supplies..... = $736.04
Field Supplies..... = $429.60
Field Report..... = $565
TOTAL COST = $21,131.62

* All of the stated costs have 5% GST excluding the helicopter and field report

e. Soil Sampling Program.
A total of 313 soil samples were collected on the property, these sample locations were changed from the 10 lines (sampled at 100 m-intervals) proposed in the YMIP Application for funding. Upon arriving at the property the soil lines were moved from the proposed location in the valley to extend up-hill due to the marshy nature of the area proposed. Lines A, B and C were completed as proposed in the YMIP proposal and lines Z, Y, X, W, V, U, T & S were added on further up the mountain.

Samples were collected using a swede-pic, were bagged using brown soil sample bags and strung along bailing wire to dry. These samples were then packed in rice bags and personally transported by KHEC to Eco Tech Labs in Whitehorse on June 12th 2009. All of the soil sample results have been returned to Hinton Syndicate from Eco Tech Labs and are appended in this field report.

f. Soil Sample Analytical Procedures and Compilation.
Soils were dried and sieved to 80-mesh (package BSS-11) and analyzed using a multi-element package by aqua-regia digest with an ICPOES finish (package BICP-11). A Gold (30 g) fire assay with a detection limit of 5 ppb was then completed with an AA finish (package BAUFG-12).

The soil sample data was compiled with the geochemical data into a master spreadsheet (please refer to appended Jen Claims Master Spreadsheet_2009.xls attached).

g. Prospecting & Mapping.

KHEC geologist Lauren Blackburn prospected and mapped the three hillsides comprising the Jen claims for 6 of the 7 days of the work program. The property was mapped over the 6 days and is summarized as follows: massive package of gently (~020°) southerly-dipping Keno Hill Quartzite with small layers of graphitic schist all cut by massive, Triassic (?) diorite sills (aka: *greenstone*); the package of rocks can be viewed outcropping at the summit looking to the south. Late aplite sills were found as float on the property and as outcrop at the summit (station 09JEN029-R). The Cretaceous Tombstone (Roop Lakes) Intrusive surfaces 5 km to the ESE of Mayo Lake.

Above: view of the steep northern side from the summit. Note the thickly bedded Keno Hill Quartzite, the package of rocks is dipping gently (~020°) to the south.

Table 1. List of Rock Formations

Rock Type	*Age*	*Description*
Aplite	Early Late Cretaceous	Dykes and Sills of fine-grained, locally porphyritic, locally clay- and carbonate-altered aplite and granite
'Greenstone'	Triassic	Foliation-concordant podiform to lenticular bodies of fine- to medium-grained green amphibolite-chlorite-plagioclase meta-diorite and meta-gabbro
Keno Hill Quartzite	Mississippian	Finely to coarsely foliated and lineated, light to dark grey, locally mottled vitreous quartzite, subordinate dark grey carbonaceous phyllite and calcareous quartzite

Three showings were located on the property during the program (Station #'s: 017, 026 & 030; see Master Spreadsheet attached for detailed information and Table below). Mineralization was found in the 'greenstone' as interstitial clots of pyrrhotite, disseminated pyrite and arsenopyrite and possible wire gold (?) within a quartz stringer. In the massive Keno Hill quartzite, mineralization was found as classic Ag-Pb-Zn polymetallic Keno Hill veins. The showings were anticipated to contain highly anomalous Au, Ag, Pb +/- Zn, Cu, Sb.

Table 2. List of showings located on the Jen Claims.

Station	Easting_NAD83	Northing_NAD83	Description
09JEN017-R	499269	7081326	Quartzite that is locally gaussenous with foliation-parallel quartz veins. Massive-appearing, locally foliated diorite sills and late, thinner (<5cm), sills intrude parallel to the penetrative fabric. Manganese staining, minor disseminated pyrite +/- arsenopyrite, 2-3% interstitial pyrrhotite within 'g*reenstone*' unit. Small wire gold (?) in a quartz-vein within the 'g*reenstone*'.
09JEN026-R	498754	7081448	Massive-appearing quartzite that is blocky with a weakly evident penetrative planar fabric highlighted by muscovite. Nice galena (ε5%), possible jamesonite (<1%) and grey-copper (1%), local malachite staining evident. Clear to white 1m-thick quartz vein intrudes

			parallel to penetrative fabric (~068°/070°). Quartz varies from anhedral crystals to euhedral massive (<8cm) prisms.
09JEN030-R	498421	7082198	Nice showing on summit/ridge of classic Keno Hill polymetallic vein. Located next to aplite sill (to the west). 8-10% galena, <15% sphalerite, 1% bournonite (?), <1% chalcopyrite and 2% botryoidal hematite. Locally the quartzite is brecciated and healed with late mineralization.

h. Rock Sample Analytical Procedures and Compilation.

A total of 26 rock samples were collected and sent in for geochemical analysis (see Geochemical Results attached). KHEC met with the General Sales Manager from Eco Tech Ltd. to create a combined analytical package suitable for the analysis of the samples. Rock samples were crushed to -10 mesh and pulverized to -150 mesh (package BRC-11c), a nitric and hydrochloric ore grade aqua-regia digest was completed for Ag, Cu, Pb and Zn (package BMEH-11/BMEH-12) and the samples were finished with an AA 30g gold fire assay (package BAUFA-32).

Above: Showing at station 09JEN030-R looking NE. Vein outcrops at ridge top next to aplite dyke (on west side). The showing is a typical Keno Hill polymetallic vein with 8-10% galena, <15% sphalerite, 1% bournonite (?), <1% chalcopyrite and 2% botryoidal hematite.

i. Interpretation of Data.

The Jen claim geochemical data did not produce the highly anomalous results anticipated by the field crew. Although three nice showings were located the soil data did not duplicate the geochemical results found during the 1965 to 1969 work completed by United Keno Hill Mines, this discrepancy could be explained by the fact UKHM contour soil-sampled and KHES completed a grid survey. Also, UKHM analyzed only for Pb, so only Pb values could be compared with the recently collected data. Anomalous Pb, Ag, Cu, Zn and Au were located sporadically within the soil sample survey.

Geochemical results for the rock samples ran up to 9.8 g/t, however, the bulk of samples did not return anomalous results. One sample contained 0.05 g/t Au.

j. Conclusions.

Three new* showings were located on the Jen claims during the 2009 YMIP-funded program. Two of the showings were classic Keno Hill polymetallic veins and contained appreciable amounts of galena, sphalerite and lesser copper and antimony-bearing minerals (bournonite, chalcopyrite, jamesonite). A sample did contain appreciable amounts of Ag (up to 9.8 g/t), however, it was anticipated that numerous samples would have appreciable Ag-concentrations. The quartz-vein containing wire-gold hosted in 'greenstone' did not detect Au, however, two samples did contain up to 0.05 g/t Au, these samples were both in quartzite boulders towards the ridge.

The aerial VTEM anomaly was inspected and found to be variably deformed, massive diorite sills that are boudin-like in nature (i.e., sausage-like in shape). These sills are penetratively deformed (i.e., they exhibit a penetrative planar, schistose, fabric) at their margins where they come into contact with the strained Keno Hill Quartzite country rock. Although little mineralization was found in these rocks, it is strongly suggested that they are more extensively mapped and inspected for gold potential due to the presence of a small wire of native gold (picture not available, rock is currently in Vancouver in possession of Jim Smith).

Showings 09JEN026 and 09JEN030 appear to line up on a bearing of ~330° for a distance of ~ 910 m. It is possible that these samples were not as anomalous as anticipated due to the distance from the main Keno Hill camp (*e.g.*, Beauvette Hill showings have a similar appearance and do not assay typical Keno camp Ag-values). Furthermore, the ridge crest is presumed to be a fault and could potentially off-set potential veins coming from the north towards the Keno Hill District.

k. Recommendations for future work.

The Jen Claims property shows merit for future work despite the surprisingly low geochemical results obtained from some of the rock and soil samples. The three

showings found on the property exhibit potential for Ag-Pb-Zn and Au mineralization.

KHES recommends the following for future work on the property:

- 1:5000 scale mapping of the property with particular focus on the 'greenstone' bodies (their massive linear sill-like nature allows for interpretation of structural features such as property-scale folding and potential offset from faults);
- investigate the possible extension of the vein from station 09JEN030 to 09JEN026;
- follow-up on the anomalous Au-float sample found near the ridge;
- prospect area around 09JEN025-R (white boulder train);
- prospect area around and above 09JEN027-R (rusty aplite float);
- create a contoured soil sample map for visual interpretation of data and to establish or refute possible linear anomalies; and to
- prospect around Line S stations 002 and 003 [anomalous Pb (up to 174 ppm), Ag (up to 2.4 ppm), Zn (up to 132 ppm), Cu (up to 132 ppm) and Au (up to 30 ppb).

*unreported

Lauren Blackburn

Geologist, Keno Hill Exploration Corp.

APPENDIX 2.

Jen Claims- Geology

Waypoint	Easting_NAD83	Northing_NAD83	Rock Type	Description	Sample Collected?
09JEN001R	499392	7081934	Diorite	Fellsenmeer on south-end of anomaly. Medium-grained, locally porphyritic. Local well-developed penetrative fabric (foliation).	No
09JEN002R	499395	7081957	Diorite with qtz- vein float	Felsenmeer. Some white quartz veins in boulders, some quartzite boulders.	09JEN002R- qtz vein material that is locally rusty and manganese stained. Possible fine-graine galena (may be magnanese).
09JEN003R	499376	7081989	Diorite with quartzite float	Felsenmeer of 'greenstone'-- on anomaly	09JEN003R- rusty quartzite boulder with minor (<1%) euhedral tiny galena and manganese staining.
09JEN004R	499348	7082036	Diorite	Felsenmeer of 'greenstone'-- on anomaly	No
09JEN005R	499347	7081948	Diorite	Felsenmeer of 'greenstone'-- on anomaly. Some quartzite (<2m) boulders	No
09JEN006R	499387	7081808	Quartzite	Felsenmeer	No
09JEN007R	499321	7081581	Quartzite	Felsenmeer, some manganese staining	No
09JEN008R	499178	7081393	Quartzite and aplite float	Felsenmeer. Abundant aplite float.	No
09JEN009R	498810	7081396	Quartzite	Felsenmeer of quartzite with large (<2m) felsic schist.	No
09JEN010R	498770	7081394	Quartzite that is locally schistose	Limonite and manganese-stained quartzite. Cubic vugs.	No
09JEN011R	498603	7081453	Quartzite	Felsenmeer	No
09JEN012R	498513	7081386	Quartzite	Felsenmeer of quartzite, locally graphitic.	No
09JEN013R	498428	7081344	Quartzite	Felsenmeer	No

Waypoint	Easting_NAD83	Northing_NAD83	Rock Type	Description	Sample Collected?
09JEN014R	498059	7081355	Quartzite	Felsenmeer	09JEN004R- quartzite with <1-2% pyrite and galena (2%).
09JEN015R	499500	7081383	Quartzite	Felsenmeer	No
09JEN016R	499462	7081369	Quartzite	Outcrop.	No
09JEN017R	499269	7081326	Massive quartzite overlain by diorite sill	Massive quartzite that is gaussenous upwards towards qtz vein, all intruded upwards by a series of diorite sills.	09JEN017-R1 (qtz vein), 09JEN017-R2 (quartzite(, 09JEN017-R3 (diorite sill + pyrr + v-g?), 09JEN017-R4 (late undeformed diorite sill). 09JEN017-R1B (same qtz-vein, sampled by MB).
09JEN017R5	499261	7081317	Schistose Diorite	Weathers massive-appearing, very tiny silver sulfides disseminated throughout.	09JEN017-R5
09JEN018R	498946	7081100	Diorite	Outcrop of diorite sill trending 190. Dipping ~ 020 S.	No
09JEN020R	498922	7081074	Schistose Diorite	Schistose greenstone and massive quartzite felsenmeer.	No
09JEN021R	498865	7081034	Diorite	Dipping // with gully profile	No
09JEN022R	499247	7081359	Diorite	Schistose greenstone, steel-blue graphtitic phyllite in gully next to outcrop.	No
09JEN023R	498750	7081203	Schistose Diorite	Weathers massive-appearing, outcrop trends 350, very minor arsenopyrite found locally. 060/120 joints -- at fold hinge (?) part of a smaller scale anticline?	No
09JEN023R2	498731	7081224	Schistose Diorite	Same outcrop but uphill.	No

Waypoint	Easting_NAD83	Northing_NAD83	Rock Type	Description	Sample Collected?
09JEN024R	498007	7081433	Quartzite that is locally graphitic	Next to the Rusty cliff on the rusty cliff claims. Locally more schistose, intruded by "rotten" aplite sills.	See below.
09JEN024R1	497994	7081470	See above	See above	09JEN024-R1 (quartz-vein that is clear to rusty-white, has some phyllite caught up in it). Some overturning quartzite (fold--anticlinal).
09JEN025R	498150	7081384	Quartzite	Blocky quartzite, muscovite-lined penetrative fabric. Source of rusty white linear boulder train that runs down hill. (Radiod and had to leave, someone should come back here).	No
09JEN026R	498754	7081448	Quartzite	Nice showing-- >5% galena, 1% jamesonite, <1% grey copper, locally malachite stained around a quartz-vein that cuts quartzite. Quartz vein is white to clear, locally has very large euhedral prisms. Quartz vein oriented ~ 068/072 (could be slumped).	09JEN026-R1 (fxr'd quartzite), 09JEN026-R2 (brecciated quartzite), 09JEN026-R3 (yellow to iridescent quartz) and 09JEN026-R4 (quartzite breccia healed with galena).
09JEN027RF	498185	7081394	Quartzite	Blocky quartzite. Aplite float found locally.	09JEN027-RF (aplite float, rusty. Aplite has ingested phyllite)
09JEN028R	498257	7082190	Brecciated quartzite	Massive, locally "dirty" quartzite, brecciated, abundant quartz-veining.	See below.

Waypoint	Easting_NAD83	Northing_NAD83	Rock Type	Description	Sample Collected?
09JEN028R1	498260	7082175	See above	See above	09JEN028-R1 (intensely quartz veined quartzite with minor (2%) galena).
09JEN028R2	498256	7082179	See above	See above	09JEN028-R2 (just uphill from R1, foliated quartzite just uphill from R1, minor clots of galena).
09JEN029R	498375	7082188	Aplite	Light brown, gritty aplite with rusty clots of mica that highlight the rocks penetrative fabric. Sill trends ~340.	No
09JEN029R2	498407	7082192	Aplite	Sill ends at 0498407 7082192.	No

Waypoint	Easting_NAD83	Northing_NAD83	Rock Type	Description	Sample Collected?
09JEN030R	498421	7082198	Polymetallic vein apl in quartzite	Nice showing-- typical Keno mineralized veins. Brecciated quartzite that shows slickenslide planes on some surfaces. Next to lite sill. Vein appears to be trending ~350.	09JEN030-R1 (qz-vein wih galena + sphalerite in brecciated quartzite). ~19% galena, <15% sphalerite; 09JEN030-R2 (brecciated quartzite with ~10% galena), 09JEN030-R3 (more quartzite breccia), 09JEN030-R4 (BW and LB "hand-trenched" below and uncovered nice brecciated quartzite that is heavily qtz-veind and contains galena (10%), botryoidal hematite (2%), pyrite (1%), bornite (1%) and chalcopyrite (<1%)-- some grey copper?
09JEN031R	498532	7082189	Edge of mineralized quartzite	On edge of brecciated and mineralized quartzite. Depression trending 352.	No
09JEN032R	498539	7082236	Phyllite	Steel blue phyllite that is locally rusty and recessed. Textbook crenulations. Just below lower quartzite.	No

Waypoint	Easting_NAD83	Northing_NAD83	Rock Type	Description	Sample Collected?
09JEN032R1	498527	7082240	Brecciated quartzite	Stratigraphically above phyllite	09JEN032-R1 (vuggy quartzite with slickenslide surfaces and minor internal brecciation, nice cubic vugs and minor pyr and galena mineralization).
09JEN033R	498687	7081806	Brecciated quartzite	Brecciated quartzite next to recessed gully (phyllite?) that trends 020.	No
09JEN034RF	498664	7081855	Brecciated quartzite	Locally rusty, little mineralization, just below ridge towards outcrop 026.	09JEN034-R4 (brecciated quartzite float)
09JEN035R	497914	7082207	Foliated quartzite	Just below rusty cliff claims, quartzite with 1-2% pyrite, some cubic vugs.	09JEN035-R1 (1-2% pyr in quartzite).
09JEN036R	498816	7082283	Quartz vein	Originally marked as wpt Q vein by MB.	No
