CERTIFICATE VA10144151

Project: RAU

P.O. No.: BATCH 99

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 5- OCT- 2010.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% < 2mm
LOG- 23	Pulp Login - Rcvd with Barcode
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
WSH- 21	"Wash" crushers
WSH- 22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME- MS61	48 element four acid ICP- MS	
ME- OG62	Ore Grade Elements - Four Acid	ICP- AES
As- OG62	Ore Grade As - Four Acid	VARIABLE
Au- AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE VA10144151

Project: RAU

P.O. No.: BATCH 99

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 5- OCT- 2010.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% < 2mm
LOG- 23	Pulp Login - Rcvd with Barcode
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
WSH- 21	"Wash" crushers
WSH- 22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME- MS61	48 element four acid ICP- MS	
ME- OG62	Ore Grade Elements - Four Acid	ICP- AES
As- OG62	Ore Grade As - Four Acid	VARIABLE
Au- AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE VA10148570

Project: RAU

P.O. No.: BATCH 100

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 12- OCT- 2010.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% < 2mm
LOG- 23	Pulp Login - Rcvd with Barcode
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
WSH- 21	"Wash" crushers
WSH- 22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME- MS61	48 element four acid ICP- MS	
ME- OG62	Ore Grade Elements - Four Acid	ICP- AES
As- OG62	Ore Grade As - Four Acid	VARIABLE
Au- AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE VA10148571

Project: RAU

P.O. No.: BATCH 101

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 12- OCT- 2010.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
LOG- 23	Pulp Login - Rcvd with Barcode
CRU- 31	Fine crushing - 70% < 2mm
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
WSH- 21	"Wash" crushers
WSH- 22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME- MS61	48 element four acid ICP- MS	
ME- OG62	Ore Grade Elements - Four Acid	ICP- AES
As- OG62	Ore Grade As - Four Acid	VARIABLE
Au- AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE VA10148572

Project: RAU

P.O. No.: BATCH 102

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 12- OCT- 2010.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
LOG- 23	Pulp Login - Rcvd with Barcode
CRU- 31	Fine crushing - 70% < 2mm
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
WSH- 21	"Wash" crushers
WSH- 22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME- MS61	48 element four acid ICP- MS	
ME- OG62	Ore Grade Elements - Four Acid	ICP- AES
As- OG62	Ore Grade As - Four Acid	VARIABLE
Au- AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE VA10148573

Project: RAU

P.O. No.: BATCH 103

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 12- OCT- 2010.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
LOG- 23	Pulp Login - Rcvd with Barcode
CRU- 31	Fine crushing - 70% < 2mm
PUL- QC	Pulverizing QC Test
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
WSH- 21	"Wash" crushers
WSH- 22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME- MS61	48 element four acid ICP- MS	
ME- OG62	Ore Grade Elements - Four Acid	ICP- AES
As- OG62	Ore Grade As - Four Acid	VARIABLE
Au- AA26	Ore Grade Au 50g FA AA finish	AAS

CERTIFICATE VA10148574

Project: RAU

P.O. No.: BATCH 104

This report is for 36 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 12- OCT- 2010.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% < 2mm
LOG- 23	Pulp Login - Rcvd with Barcode
PUL- QC	Pulverizing QC Test
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
WSH- 21	"Wash" crushers
WSH- 22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME- MS61	48 element four acid ICP- MS	
Ag- OG62	Ore Grade Ag - Four Acid	VARIABLE
ME- OG62	Ore Grade Elements - Four Acid	ICP- AES
As- OG62	Ore Grade As - Four Acid	VARIABLE
ME- XRF05	Trace Level XRF Analysis	XRF
Au- AA26	Ore Grade Au 50g FA AA finish	AAS
Au- GRA22	Au 50 g FA- GRAV finish	WST- SIM

CERTIFICATE VA10148575

Project: RAU

P.O. No.: BATCH 105

This report is for 18 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 12- OCT- 2010.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% < 2mm
LOG- 23	Pulp Login - Rcvd with Barcode
CRU- QC	Crushing QC Test
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um
WSH- 21	"Wash" crushers
WSH- 22	"Wash" pulverizers

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME- MS61	48 element four acid ICP- MS	
ME- XRF05	Trace Level XRF Analysis	XRF
Au- AA26	Ore Grade Au 50g FA AA finish	AAS

To: **ATAC RESOURCES LTD.**
ATTN: JOAN MARIACHER
C/ O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016- 510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.98	3.98				OVB			Overburden - No Recovery																		
3.98	112.28	108.30				LST	DOL	sBX	Light buff to medium grey, intensely sBX LST with calcite infill and fair to strong DOL altered. Locally intense cBX and locally lacking sBX texture. Ca VT are common, often altered medium brown. Locally core is very broken, with zones of medium brown to black altered core to clay. Intensely sBX zones commonly have < 1 cm wide black bitumenous infills within the sBX clasts. Bitumen within sBX matrix is less common and tends to form larger blebs and stringers. Dark grey silicified layers with sharp contacts to DOL LST occur periodically.					ms				SIL	w									
			3.98	22.32	18.34	LST	DOL	sBX	Buff to light grey variably DOL LST, sBX by white to light grey DOL. Buff LST is infilled by < 0.5 cm wide black bitumenous material giving spotted appearance. sBX locally has overprinted appearance, with clasts blending into matrix. Zones < 30 cm long of dark grey FG strong SIL LST. The last 2 m have decreased sBX and moderate strong cBX of intense DOL LST.					i												x
			22.32	30.17	7.85	LST	DOL	sBX	Light buff to dark grey. Light buff FG strong DOL LST sBX by dark grey bitumenous and moderate strong DOL altered material which fizzes strongly in less DOL zones. 1 m long zones of non-sBX strong DOL LST with weak cBX occur.					s				SIL	w									
			30.17	33.06	2.89	LST		GRT	Medium grey to orange brown intensely altered to silt and grit with rubble and core pieces of buff to grey sBX DOL LST. Last 50 cm is core pieces altered to sand sized grains with bitumenous spots within. Silt and grit locally fizz in 10% HCl.							t										
			33.06	43.20	10.14	LST	DOL	sBX	Light grey strong DOL MG Ca as matrix in sBX of buff LST clasts, and as long sections of core. sBX clasts strongly overprinted locally. Bitumenous infillings < 1 cm are intense in buff LST, weak in light grey MG Ca and DOL. Last 3 m are very broken to rubble < 4 cm long.							s		CAL	i							
			43.00	43.20	0.20	LST	SHL	GRT	Black bitumenous SHL grit with LST RBL < 2 cm diameter.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	3.05	3.05				OVB			Overburden - No Recovery																		
3.05	207.26	204.21				LST	DOL	sBX	Medium buff to grey and white intensely sBX ,weak to intensely DOL LST, commonly with black bituminous infills < 2 cm wide. Irregularly shaped, sBX is infilled by MG DOL and minor Ca. sBX clasts appear variably overprinted, with long sections of core entirely composed of MG Ca/DOL. Small intervals of intense OX, SID, and smithsonite. The interval is locally fair to intensely SIL.					m														
			3.05	21.49	18.44	LST	DOL	sBX	Medium buff and grey, weak DOL LST with black bituminous infills < 2 cm, irregularly shaped. sBX by MG DOL and Ca, white. Buff LST locally altered to beige and light red brown Ca. Portions of interval have very broken core with sugary texture and silt and sand on broken surfaces; typically found in bituminous LST rich zones. Interval is weakly vuggy.					m														
			8.06	8.34	0.28				DOL VN with 10 cm calcareous orange brown OX zone.	VN	20					s											
			19.40	20.30	0.90	LST		RBL	Grey buff rubble to silt, calcareous with black bituminous clasts and DOL rubble < 4 cm in size.					f													
			21.49	26.90	5.41	DOL		sBX	Light buff to white FG to MG DOL and Ca (recrystallized LST?) with light grey cryptic patches of relict sBX. DOL is sBX by calcareous bitumen rich layers, locally altered orange brown. Trace disseminated MG oxidized unidentifiable mineralization. ICN gradational, with elongate clasts mBX by DOL.	ICN																	
			26.90	29.38	2.48	LST	DOL	mBX	Buff, moderate DOL LST locally foliated with 1cm clasts variably infilled with bituminous material. MG DOL forms patches, VTs and VNs which locally mBX LST. Patches commonly surround vugs and are calcareous. The interval includes a very broken zone ~ 40 cm long.	FO	30			ms													
			29.38	34.36	4.98	LST	DOL	cBX	Buff to medium grey, FG to MG, weak to strongly DOL recrystallized LST with orange brown Ca VT weakly cBX locally. Bituminous clasts occur in calcareous patches and layers. 30 cm medium grey FG moderate-strongly DOL layers with white grey MG DOL VT.	VT	40			s

			34.01	34.13	0.12	VN			Orange brown calcareous smithsonite VN. Has high Eu on XRF readings. uCN 40 and lCN 50 degrees.	VN	45												Sm	s			
			34.36	37.15	2.79	LST	DOL		Buff weakly DOL LST with black bituminous infill < 2 cm wide, and forming seams at contacts with DOL. The interval is very broken up to rubbly with a sugary texture and sand to silt zones < 10 cm long. A DOL VT with light grey to white MG DOL occurs within.					w													
			37.15	44.00	6.85	LST	DOL	sBX	Light buff-grey FG to MG intensely DOL LST with patches and zones of grey LST variably overprinted by a cryptic sBX. Fair SIL alteration of interval. Large portion of interval consists is broken up core.					i				SIL	f								
			44.00	49.71	5.71	LST	DOL	sBX	Medium grey dolomitized LST with buff irregularly shaped patches, and indistinctly bounded forming cryptic sBX. Moderate strong to intense SIL of the interval occurs. Gradational increase in SID alteration associated with Qz/Ca VT toward lCN.	VT	50			m				SIL	s								
			49.71	51.86	2.15	LST	DOL		Buff, MG, strongly DOL LST with SID Ca/Qz VT, disseminated OX MX FG to MG and small vugs scattered throughout.	VT	50			s													
			51.86	55.84	3.98	LST	DOL	cBX	Medium grey to buff FG LST, weak to moderate DOL overprinted by a cryptic sBX texture. A Qz VN in first 1.10 m mBX the LST which has an orange brown colour. This is later overprinted by a SID VT. Local cBX occurs by SID and Smithsonite altered calcareous VTs. Increasingly grey SIL alteration occurs down interval, becoming strongly SIL at ~ 54 m. The last meter is very broken.					f		w		SIL	f								
			52.30	52.46	0.16				Orange brown to black, soft, calcareous alterec zone, with sharp uCN. Smithsonite and SID occur within.	uCN	25						s						Sm	i			
			55.84	69.00	13.16	LST	DOL	sBX	Buff MG weak to moderate DOL recrystallized LST with light to medium grey cryptic sBX patches in a buff fairly DOL LST. Thin Ca VT set through interval, is locally less distinctly oriented forming cBX. VT set 50 degrees at top of interval, decreases to 30 degrees down interval. Vugs, patches and layers of orange brown to dark brown calcareous alteration commonly occur in vuggy or broken zones. SID and smithsonite and trace FG to MG disseminated OX MX occur within.	VT	50			f			w						Sm	w			

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			55.84	56.10	0.26				Dark brown calcareous SID and smithsonite rich LST. The XRF showed high Pb and Mn; possibly cerussite/rhodocrosite?					i			i						Sm	i			
			61.35	61.43	0.08	LST	OX		CG weak DOL LST with orange brown FG OX clay alteration in MG disseminations associated with mBX. The clay is calcareous, high Mn and Zn from XRF could be smithsonite and rhodocrosite.					w		w								Sm	s			
																		RHO	m								
			69.00	70.92	1.92	LST	DOL	sBX	Dark buff FG moderately strong DOL LST that has been sBX and mBX by MG DOL/Ca VT and layers. MG OX MX is disseminated in trace amounts. Locally weakly bitumeninous.																			
			70.92	76.11	5.19	LST	DOL	sBX	Buff and medium grey intensely DOL and moderate-strongly SIL altered LST with cryptic sBX patches with zones of interchangeable predominantly grey and predominantly buff colouration. Local moderate cBX texture. At least two separate VT sets of Qz/Ca altered to orange brown SID occur. There is also ar overprinted MG DOL VT without common orientation.	VT	20			i				SIL	ms								
										VT	40																
			76.11	88.28	12.17	LST	SIL	sBX	Medium to dark grey intensely SIL LST, with moderate dolomitization as irregular weak sBX patches. Intense DOL VT and some Qz/DOL veinlets with associated MG OX MX. Small vuggs are associated with the DOL VT. Local mBX textures also occur.	VT			7	m				SIL	i								
			88.28	89.79	1.51	LST	DOL	RBL	Light buff to light purple, strong to trace DOL altered LST with light purple-brown calcareous SID alteration in patches throughout the core. Medium brown calcareous SID VT generally cut at 40 degrees TCA. A large portion of the interval is rubble to silt, but it is predominantly a light buff calcareous grit. Weak light orange brown OX through interval, most commonly on broken surfaces.	VT	40			m		w	f									
			89.79	91.14	1.35	VOL	OX	RBL	Dark grey VOL intensely OX to orange brown colour in zones and layers following FX. FX surfaces are altered to a green grey colour with a slight sheen, and strong SER alteration. Overall the interval is very broken with clay coatings on the FXs.	FX	40					s		SER	s								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.05	3.05				OVB			Overburden - No Recovery																		
3.05	57.41	54.36				LST	DOL	sBX	Dark grey and buff, weak to intensely DOL LST with sBX texture as buff patches and alteration rims around thin VT and seams, and grey patches in buff DOL LST. The interval is weakly to strongly SIL with zones of <0.5 cm SIL spots closely spaced together and pervasive SIL zones. Local purple grey colour is commonly associated with trace FG disseminated OX MX possibly siderite or hematite. DOL and Ca VT with FG OX MX on rims. Decrease in VT concentration down interval.					ms			w	SIL	ms									
			38.66	39.62	0.96	LST	DOL		Medium buff intensely DOL strong SIL LST with thin SID/Ca VT set in high density, 20 to 30 degrees.	VT	25		20	i				SIL	s								
			40.45	53.41	12.96	LST	DOL	sBX	Medium grey to buff, sBX DOL LST, locally with strong SIL alteration (generally moderate strong). Seams and patches of Ca/DOL with bituminous spots occur throughout. One layer < 5 cm has DOL crystals forming rims and intraclasts in bituminous layer, indicating that DOL/Ca are growth crystals in bitumen layers. OX occurs on rims of some of the layers and patches.					s		w		SIL	ms								
57.41	96.12	38.71				LST	OX		Light to medium buff, moderate to strong DOL LST with overprinted weak sBX. Fair to strong SIL. SID/Ca VT through interval at 40-60 deg to CA, locally forming a cBX texture. LST locally fair to intensely OX and SID altered to a medium brown or purplish grey. Zones of intense OX through interval as orange brown clay to rubble, become more common down interval. Qz VN to VT occur within the moderate to intense OX and SID LST and rubble. Trace FG disseminated OX MX.	VT	50			s		m	m	SIL	ms								
			66.14	66.19	0.05	LST	OX		Medium buff and grey, strong SIL as a spotted texture. A bleb of calcareous bright orange OX with Smithsonite.							s		SMI	f								
			67.16	67.31	0.15	OX			Light orange brown clay to rubble, predominantly silt. Rubble and portions of silt strongly calcareous.							i							Sm	w			
			69.79	70.01	0.22	OX			Medium brown clay to LST rubble, predominantly grit, weakly calcareous.							i											

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			70.27	70.47	0.20	OX			Medium brown clay to LST rubble, predominantly grit, weakly calcareous.							i											
			70.85	71.18	0.33	OX			Medium brown clay to LST rubble, predominantly grit, weakly calcareous.							i											
			74.75	74.80	0.05				Dark grey non-calcareous, soft bituminous mudstone layer with OX on lCN for ~ 3 cm							ms											
			74.98	75.21	0.23	OX			Light orange brown, weakly calcareous, clay to rubble. Some rubble has planar habit.							i											
			82.32	83.11	0.79	OX	LST		Medium orange brown clay to silt, very weakly calcareous, with LST clasts and core pieces < 10 cm long.							i											
			85.00	86.33	1.33	SID			Dark purple brown, intensely SID altered zone with weak MG-CG subhedral disseminated OX MX. BX of SID by Ca occurs over 10 cm. The interval is generally very altered core to grit, with moderate orange brown OX in core and in a zone < 15 cm long.							m	i										
			86.33	91.14	4.81	OX	Qz		Orange brown to dark red black intensely OX, weakly SID interval, rich in < 3 cm Qz rubble, and increasingly Qz rich down interval. OX is clay to rubble, predominantly silt.																			
			86.43	86.73	0.30	LST	Qz		Medium purple grey LST, mBX by Qz VT. Only solid core in interval.																	
			91.14	92.41	1.27	LST			Medium to light brown competent LST core, with thin SID VT and Qz VT. Moderate strong OX in patches and layers. Irregular Qz VT irregular 60 degrees.	VT	60		15			ms	i										
			92.41	94.19	1.78	OX			Medium to light brown clay to rubble. The first 20 cm contains Qz and LST rubble, while the remainder of interval is non-calcareous. A patchy colour from medium to light yellow brown occurs over the last 40 cm.																			
			95.24	95.66	0.42	OX			Bright orange to medium brown oxide, with a dark red brown sideritic component.							i	f										
96.12	107.68	11.56				OX			Bright orange to dark red/black and yellow to medium brown, clay to very altered core, predominantly silt holding core shape. Non-calcareous.							i	i										
			96.12	96.74	0.62	OX			Medium brown, non-calcareous, silt to clay, predominantly clay.							i											
			96.74	99.52	2.78	OX			Light brown and dark brown to black intensely sideritic clay to rubble, predominantly rubble. Zones of orange brown grit < 15 cm wide also occur.							m	i										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			99.52	100.58	1.06	OX			Light yellow brown to medium brown clay to silt, non-calcareous, predominantly clay. Trace Qz rubble.																		
			100.58	107.68	7.10	OX			Bright orange to black intensely OX, strongly sideritic. Does not fizz in 10% HCl. Predominantly still holding core shape. Sharp lCN with DOL LST.							i	s	SMI	w								
107.68	163.07	55.39				LST	DOL	sBX	Dark to medium grey, and yellow buff to purple grey moderate to intensely DOL sBX LST with moderately strong to strong SIL alteration. sBX texture occurs as irregularly shaped patches that are variably coloured and locally form layers defining a weak FO.					s	ms			SIL	s								
			117.15	125.65	8.50	LST	DOL	sBX	Light to medium yellow buff and light pink buff, with dark to medium grey patches and spots, intensely DOL, moderate ANK, and strong SIL sBX LST. Local dark grey sBX clasts, with sBX mostly expressed as non-dolomitized patches and spots.					i	m			SIL	s								x
			125.65	144.32	18.67	LST	SIL	sBX	Medium to dark grey SIL LST with sBX purple grey and yellow buff DOL/AK in patches around DOL VT and blebs, and pervasive through zones. Yellow colour appears to be in more intense DOL/AK patches, with purple grey as moderate strong DOL. DOL VT through interval, locally mBX LST, have trace FG OX MX and SID on rims. Possible very altered graptolite fossil at 139.00 m.					ms	w			SIL	s								x
			140.47	141.45	0.98				Irregular vCG DOL/Qz VN's < 10 cm thick, with MG DOL alteration rim. Locally VN mBX to sBX SIL LST, and have vugs.																		
			141.45	151.79	10.34	LST	DOL	sBX	Light yellow buff DOL/ANK, sBX dark to medium grey LST, with moderate strong SIL of interval. sBX as layers defining weak FO, locally intensely DOL enough to leave only grey spots and irregular patches as remnants. Light purple grey appears to be weak DOL of grey LST, occurs locally as blebs and in zones < 50 cm. MG euhedral DOL crystals occur with SID and Ca infilling vugs.					s				SIL	ms								
			151.79	160.66	8.87	LST	DOL	sBX	Yellow buff and medium grey sBX, intense DOL, fair SIL LST. Trace to weak OX with light orange brown sBX layers, SID VT, and brown fracture surfaces and rubble zones with sugary texture. Small dark grey spots and seams have overprinted dendritic appearance.							w		SIL	f								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

Total: 42

Batch: 5, 6

Date Sent: August 21, 30 2010

Certificate: VA10120434, VA10121213, VA10125455

COMMENTS

The hole was ended because it was past the targeted oxide horizon. All rods and casing froze into the ground.

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	6.71	6.71				OVB			Overburden - no recovery																		
6.71	104.09	97.38				LST	DOL	sBX	Medium grey to light purple and light yellow-buff, variably moderate strong to intense DOL, moderately strong SIL, variably sBX LST. sBX texture of irregular patches of more and less DOL altered LST. Yellow buff zones appear to be more intensely DOL, possibly ANK altered. Down interval, the sBX texture occurs as grey spots < 0.5 cm and subrounded variably overprinted grey and buff clasts. Thin SID VT occur throughout the interval, increasing down interval. OX zones begin down interval and become gradationally more intense towards lCN with OX.					s		w		SIL	ms								
			6.71	36.53	29.82	LST	DOL	sBX	Dark to light grey and buff with a yellow or purple tint. Strongly DOL, strong to moderately strong SIL altered, sBX LST. The sBX texture occurs as alteration patches of yellow and purple tinted buff DOL and as grey non-DOL patches. DOL/Ca VT and VN with irregular orientations have SID and smithsonite on rims and trace FG OX MX. lCN has thin irregular seams with FG DOL crystals, bituminous infill and OX on rims.					s				SIL	ms								
									SID/Ca VT with orientation at 45 deg to CA.	VT	45						s										
			17.88	18.71	0.83	SID	LST	VN	Calcareous VN and VT < 3 cm wide with OX and smithsonite and black dendritic rims transitioning into the LST.	VN	45																
			36.53	44.35	7.82	LST	DOL	sBX	Yellow buff intense DOL LST, with grey patches and zones of moderately strong SIL alteration and grey and buff patchy sBX. Irregular layers of dark grey bituminous material < 15 cm with FG to MG DOL/Ca crystals composing 50% to 90% of the layers. sBX DOL/LST with orange brown OX rims around clasts and sides and local pink colour through layer. Irregular floating habit of some DOL/Ca crystals suggests bitumen as primary infill with DOL as growth crystals. Some bituminous layers have fracture surface showing planar habit, dark grey to light green, with sheen; perhaps VOL? Zones of < 0.5 cm grey overprinted spots occur within the DOL and have weak OX rim separating them from bituminous layers. The grey spots are possibly a more overprinted version of bituminous layers?					i				SIL	ms								x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			44.35	56.27	11.92	LST	DOL	sBX	Medium grey and buff, intense DOL LST, with strong SIL alteration and sBX textures as grey and dark buff spots in light buff DOL. Spotted texture overprints locally cryptic medium grey or buff subrounded sBX clasts. Zones where clasts are less overprinted have bituminous infills. Layers of black bituminous material and FG DOL/Ca crystals occur within the first few meters as a gradational uCN. Broken and mud coated intervals <50 cm occur throughout.	uCN				i				SIL	s								
									Dolomite VT are scattered throughout the interval.	VT	45																
			56.27	60.51	4.24	LST	DOL	sBX	Buff strong DOL, intense sBX LST, fair SIL with some Qz/chert clasts. sBX variably overprinted, with buff clasts, some of which are altered orange brown in their centres. Medium grey to buff matrix, with variable bitumen infill. LST locally recrystalized to FG Ca/DOL, variably calcareous.					s				SIL	f								x
			60.51	104.09	43.58	LST	DOL	sBX	Very broken up medium buff, intensely DOL LST that has sBX textures in the form of medium grey unaltered patches, with Ca and FG DOL crystals. Locally strong SIL alteration, but generally moderate. Thin SID VT locally cBX rock and Qz/Ca/SID VT and VN at 40 deg to CA. Both VT sets can be locally erratic. Zones of intense OX/SID and trace to moderate OX on FX, VT rims, and in patches. Trace FG disseminated OX MX.	VT	40			i		f	w	SIL	m								
			61.79	62.12	0.33	LST	SIL		Medium grey intensely SIL LST, with buff FG crystalline DOL forming cBX texture.									SIL	i								
			64.60	65.04	0.44	OX	LST		Medium brown strongly calcareous clay to silt, predominantly silt, with LST rubble and core.																		
			67.03	68.02	0.99	OX			Medium orange brown to black, intensely SID altered strongly calcareous OX. CG SID crystals occur over < 50 cm until 67.27 m. The final 20 cm of rubble to silt, contain Qz.							m	i									
			75.96	76.07	0.11	OX			Subrounded buff DOL LST clasts < 1 cm wide within calcareous orange brown OX matrix.							s										
			76.37	77.28	0.91	DOL	OX		Medium brown and grey, very broken DOL LST with zones < 20 cm thick of medium brown variably calcareous clay to predominantly silt.							w										
			79.65	80.11	0.46	LST	OX		Medium brown calcareous clay to predominantly silt in zones < 20 cm thick within medium grey and buff DOL LST.							i										
			86.40	86.78	0.38	OX	LST		Medium brown calcareous clay to predominantly silt with LST pieces < 4 cm wide.							i										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			119.49	121.80	2.31	OX			Orange brown non-calcareous clay to silt with Qz rubble < 2 cm wide as ~10% of interval. The lCN has < 5 cm of calcareous OX, then a sharp CN with DOL LST.							i												
121.80	131.06	9.26				LST	DOL	sBX	Light purple and light yellow tinted buff, and light to dark grey, intensely DOL LST. sBX textures occur as alteration patches, with infilling FG to MG DOL. The unit is also strong SIL.					i				SIL	s									
			121.80	127.64	5.84	LST	DOL	sBX	Light purple and light yellow-buff, FG to MG DOL filled sBX LST. Strong SIL occurs throughout. Thin SID/Ca VT are common at two distinct orientations; 50 degrees is most prominent, cross cut by VT at 25 degrees. Grey seams and patches with dendritic appearance occur throughout the interval. The lCN is more intensely BX over 12 cm.	VT	25							SIL	s									
										VT	50																	
			127.64	131.06	3.42	LST	DOL	sBX	Medium to light grey and purple to yellow-buff, strongly DOL and SIL altered LST, with sBX as grey non-DOL patches. ~5 cm thick non-calcareous clay and silt OX zone. Weak SID/Ca VT at 30 degrees.	VT	30					i		SIL	s									
									131.06 m: E.O.H. - The hole was ended because the oxide zone was passed.																			

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.05	3.05				OVB																					
3.05	27.43	24.38				LST	DOL		Light grey to buff, FG to MG, intensely dolomitized LST. Disseminated ~2.0 mm irregular medium grey to light brown to beige clasts pervasive through out. Dark grey VT's ~0.5 mm wide near top of interval gradually change into dark red/deep purple VT's down hole (Si/Sm?). Stylolites pervasive throughout the interval and may be dark grey or dark red/deep purple in color. Few vuggy textures present with MG calcite crystals within.					i			w	Sm	w								x
			13.22	13.44	0.22				Dark grey and light orange strongly calcareous VT's ~0.5 mm, ranging from 40 to 60 degrees TCA.	VT	50																
			19.88						~7 mm, Deep red/deep purple and intensely calcareous VT (Si?).	VT	45																
			20.93						~3 mm deep red/deep purple in color and intensely calcareous VT (Si)?	VT	75																
			20.96						~5mm to 1.5cm dark red/deep purple in color and intensely calcareous VT/VN (Si)?	VT	55																
			24.06	24.10	0.04				~2-6 mm calcite filled VT's with disseminated dark orange to dark red crystals throughout and along the margins (Si?). VT's range from 55 to 85 degrees TCA.	VT	68																
			24.46						~16 cm, deep purple (Si?) intensely calcareous VN.	VN	60																
			26.06						~5 mm calcite VT exhibiting disseminated orange to purple crystals within (Si/He?).	VT	70																
			27.43						Too rubbly to determine contact angle	ICN																	
27.43	29.16	1.73				OX		GRT	Light brown, moderately calcareous oxide. Clay to FG sand at top of interval grades into rubble, then into more competent rock. Competent core is light grey to bleached, intensely dolomitized with disseminated ~1 cm deep purple intensely calcareous FG (Si?). Random VT's ~0.5 mm pervasive through competent rock.					s		s												
			28.83						Light brown to beige ~0.5 mm VT. Other VT's present, but too rubbly to determine angle TCA.	VT	50																
			29.16						Too rubbly to determine contact angle	ICN																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

29.16	42.67	13.51				LST	DOL	sBX	Dark grey to light grey, FG to MG, sBX, strongly dolomitized LST. Pervasive dolomitized sBX throughout interval. Vugs disseminated throughout, which appear to be infilled with FG dolomite. Dog tooth sparry texture has FG dolomite margins being infilled with a light orange to deep purple calcareous matrix (Si/Sm?). Few disseminated stylolites. Episodic BN pervasive throughout unit, and bands appear dark grey and vFG (mud?).					s			w	Sm	w									
																		Sp	t								
			31.51						Dark grey, vFG bands which appear to be overprinted by an undulating calcite VT (~1.0 cm wide).	BN	50																
			31.69						Ca VN 1.6 cm with light orange to red resinous FG (SP?) along the margins.	VN	55																
			40.01						Light grey to light brown, vFG to FG bands being overprinted by undulating Ca VN.	BN																	
42.67	58.47	15.80				LST	DOL		Light grey to bleached, FG, Mottled, sBX, strongly dolomitized LST. Dark grey and light brown banding dominant near top of interval and fades out. Relict dark grey disseminated clasts pervasive through out with some following a preferred orientation. Dog tooth spars disseminated through out, margins composed of FG dolomite and infilled with vFG light brown to light to dark grey clasts (~2 mm - 5 cm). Ca VN's and VT's associated with dark red/purple to light orange FG (Si/Sm?) Episodic intervals of OX, light brown clay to FG sand. Pervasive VT's light brown in color found in close proximity to dog tooth spar regions within the interval.					s			w	Sm	w									
			43.46						Dark grey ~1.5 cm bands composed of vFG to FG matrix	BN	50																
			43.73						Ca VT ~8 mm with disseminated light orange to dark red FG (Si/SM?) found within.	VT	35																
			44.39	44.65	0.26				Alternating bands ranging from 40 to 50 degrees TCA where the dark grey bands composed of FG matrix are 40 degrees TCA (~1.5 cm) and light brown bands composed of FG matrix are 50 degrees TCA (~2-5 mm).	BN	45																	x
			51.22						~2mm calcareous deep red/deep purple VT (Si/Sm?)	VT	65																
			52.19						Calcareous VT deep red/deep purple (Si/Sm) ~2 mm.	VT	50

0.00	3.05	3.05				OVB			Overburden - no recover																		
3.05	60.50	57.45				LST	DOL	sBX	Bleached to dark grey to buff, FG to MG, sBX, cBX, strongly dolomitized LST with trace Py associated with Ca VT's/VN's and with weak Si found within Ca VN's/VT's. Episodic bleached sections with relict, irregular shaped dark grey to light brown clasts. Stylolites pervasive throughout and tend to be deep red/deep purple in color (Si). sBX textures in dark grey, FG dolomitized LST with white DOL matrix. cBX is within buff sections with seams deep red/deep purple in color (Si?). Sections of rubble common. Vuggy textures found randomly throughout interval, filled with either FG DOL, or Ca and Si.					s			w			t							
			3.05	19.32	16.27	LST	DOL		Bleached to buff, FG to MG, strongly dolomitized LST with trace Si in calcareous VT's/VN's. Dark grey to light brown irregular shaped sBX clasts disseminated throughout. Si VT's and VN's concentrations increase downhole. Stylolites deep red/deep purple in color pervasive throughout interval (Si?).					s			t								x
			9.98						Stylolite dark grey to deep red/purple (Si) ~ 0.5 mm.	VT	40																
			12.60						~6 mm Ca VT.	VT	45																
			15.44						~2 mm Ca VT with deep red/purple FG Si.	VT	40																
			19.32	33.14	13.82	LST	DOL	sBX	Dark grey to medium grey FG, sBX, strongly dolomitized LST. Vuggy textures pervasive throughout and infilled with FG DOL and some disseminated Si. Ca VT's are pervasive and locally have Si in margins or through VT. Patchy vFG to FG dark grey bands or patches pervasive throughout.					s			t								
			19.35	19.43	0.08	HEM			(He/Si?) FG irregularly shaped patch ~0.5 - 2 cm with undulating branches.								s									x
			21.67						Blood red intensely calcareous VT (He?	VT	35																
			21.91						~ 3 cm Ca/(Si or He?) VN with cBX texture where seams are light brown in color. Dark red to light orange stylolite within, having same orientation as the VN.	VN	55																
			29.69						~3 - 4 cm vFG to FG dark grey band.	BN	25																

GEOLOGY LOG

60.50	79.05	18.55				VOL	OX		Dark grey, to olive green, to light orange, FG, FO, weakly oxidized VOL. Episodic sections of oxidized VOL, where most is competent rock with some sections of rubble, and few clay sections light orange in color. Olive green, and dark grey VOL locally pitted, possibly from FG euhedral Py. Oxidized Py is present in olive green zones. Sections of banding where FG Si is disseminated throughout, with wisps (~1 - 2 mm) of VOL found within and at the same orientation TCA							w	w

COMMENTS

The hole was ended because it was past the targeted oxide horizon.

GEOLOGY LOG

HOLE: CO-10-01

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	5.29	5.29				OVB			Overburden - no recovery.																		
5.29	28.20	22.91				LST	SID	MO	Dark rusty brown to dark grey, FG to CG sBX FOS LST with moderate siderite alteration. A trace amount of small crinoids are present in dark grey intervals. Where the LST is rusty orange, sinuous rusty-yellow compositional banding is evident although there is a lack of pervasive fabric orientation throughout. Overall the core is blocky and rubbly.	FO	N/A						m										
28.20	35.05	6.85				VOL			Dark grey, MG to FG, variably SID altered, weakly pitted, non-magnetic VOL. XRF yields high Fe, Ti and K values. The core is blocky, rubbly and highly weathered in appearance. There is a lack of uniform foliation as it is mostly obscured by weathering.	FO	N/A															
35.05	46.59	11.54				LST	DOL		Light to dark grey, FG to CG, rubbly intensly DOL altered LST. Dark red/brown variably calcareous siderite occurs on fracture faces. The core is very blocky to rubbly throughout interval appearing highly weathered. sBX textures are exhibited by some blocks of core. A weak foliation is obscured by the highly weathered rubbly nature of the core.	FO	N/A			i		m										
			37.55						Rusty, dark brown calcareous siderite vein, 1.9 cm wide, 45 degrees TCA occurs at 37.55 m. Oxidized stockwork crackle veinlets appear intermittantly throughout the interval.	VN	45															
			35.05	42.51	7.46	LST	DOL	SBx	Interval exhibits strongly dolomitized LST with varying degrees of oxidation and brecciation. Classi sBX texture is present locally along with a more widespreak faint cBX texture. At certain points in the interval cBX appears to be overprinting the sBX texture.					i		f										
									Multiple calcite veinlets ranging in orientation and size from 1 mm to 0.5 cm and 35-65 deg to CA are present within the interval.	VT	35		7													
										VT	65		7														
			42.51	42.73	0.22	SAN			Interval consists of a white to light yellow coloured medium grained, non calcaresous sand.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			42.73	46.59	3.86	LST	RBL		Interval consists of rust coloured, extremely rubbly intesely dolomitized LST exhibiting cBX and dissolution textures in the pieces that are not too broken up. Calcite occurs in veins, filled voids and fracture surfaces. The unit is too broken up to obtain any accurate structural measurments.					i		s											x
46.59	51.52	4.93				LST		sBX	The majority of this interval consists of dark brown siderite with intermittant sections exhibiting relict sBX and cBX strongly DOL LST textures. Near the end of the interval the lCN shows gradation in SID alteration and is a lighter cream brown colour. Stockwork veining is present throughout the interval and appears to be responsible for the addition of siderite to the system. Stockwork veining is present as crackle veinlets of random orientation as well as siderite filled veins. The majority of veins and veinlets throughout the interval are filled with siderite. Some veins are filled with calcite in the center and siderite filling the edges. This may suggest at least some of the crackle texture and veins were present before the addition of SID alteration and acted as fluid pathways.					s			i											x
									Siderite is more common along with calcite in the larger veins. These veins also tend to show a more consistant orientation.	VN	40		5				m											
										VN	45		5															
									Veinlets are generally of random orientation completely siderite filled and contribute to cBX textures.	VT	30		15															
										VT	26		15															
									Trace clear-green glassy sphalerite(?) with calcite occurs on multiple fracture faces.																	Sp	t	
									Smithsonite is present as an earthy, rusty brown, granular variety found disseminated throughout the interval. Values as high as 4.5% zinc were yielded by XRF analysis of the interval.																	Sm	f	
			46.59	48.77	2.18	DOL	SID	SBx	The upper contact between DOL LST and heavily SID altered DOL is a gradational contact illustrating sections of SID alteration as well as weakly DOL altered sections of LST exhibiting classic sBX texturea.	uCN							s											

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									Both siderite and calcite veins are present along contact. Calcite veins show infilling with siderite around edges. Veins are approximatley 1 cm in width.	VN	45		5														
										VN	30		5														
									Both early smithsonite and crystalline sphalerite are present within the contact interval.																Sp	t	
																									Sm	w	
			48.77	50.48	1.71	DOL	SID		This interval consists of dark brown, intensley SID altered DOL overprinting of relict LST BX textures. Siderite alteration is nearly massive throughout and blood red staining can be seen on various fracture surfaces and pits throughout interval (hematite?). Relict sBX LST clasts have been altered to cream brown in colour. Calcite occurs as the residual matrix of relict sBX and is associated with SID alteration zones. Earthy brown smithsonite is found disseminated throughout the interval.								i								Sm	s	
			50.48	53.57	3.09	DOL	SID	sBX	The lower contact of intensley SID altered DOL consists of a weakly SID altered DOL phasing in and out with apparantly unaltered dolomite. Contact is a lighter creamy brown colour illustrating pervasive sBX texture. Small crackle veinlets are oxidized. Trace subhedral pyrite is present, commonly on fracture surfaces.	ICN						t	w			t							
									A banding texture representing foliation consists of a brownish-white dolomite alternating with grey dolomite. Banding is more evident in less SID altered areas of the contact.	FO	60																
51.52	87.17	35.65				LST	DOL	sBX	This interval consists of two main units of DOL. The first unit contains a greater amount of sBX textures, dissolution seams and foliation defined by banding. It is relativley unweathered and contains little oxidation. The second type of dolomite unit present within this interval contains a high density of stockwork style crackle veinlets. This unit is more oxidized and contains trace slightly oxidized pyrite. Veinlets in this style of DOL are generally infilled with oxidized material.					i		f				t							
			53.57	60.59	7.02	LST	DOL	BN	This interval is defined by intensely dolomitized LST with varying degrees of sBX and cBX textures, weak oxidation and calcite filled vugs. Trace oxidized pyrite is present, commonly on fracture surfaces.					i		w			t							x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									A foliation is weakly defined by non pervasive banding at between 20-30 deg TCA.	FO	25																
			60.59	61.70	1.11	LST	DOL		This interval consists of a bleached, moderatly oxidized intensely dolomitized LST. Randomly oriented, oxidized stockwork veinlets are common throughout along with oxide filled pits. Trace subhedral pyrite is present within calcite veins and along fracture surfaces.					i		m				t							
									Oxidized calcite veins are common in the interval.	VN	40		3			m											
			61.70	63.20	1.50	LST	DOL		Bleached, intensely dolomitized LST exhibiting relict cBX textures. Unenvenly spaced pits are pervasive throughout the interval and filled with calcite and oxidized material. Trace anhedral spotted pyrite occurs on fracture surfaces.											t							
									Minor calcite veinlets occur throughout the interval.	VT	50		1														
			63.30	64.40	1.10	DOL	VT		Interval consists of bleached, moderately oxidized dolomite with pervasive stockwork veinlets and stylolitic textures. A 5 cm wide dark grey silty interbed is present at the end of the interval. Trace subhedral pyrite is also present throughout.							m				gt							
									Although stockworck veinlets are pervasive, a large percentage of veinlets appear to share a common orientation at 45 deg TCA.	VT	45		10														
			63.86	63.88	0.02				A large, 2.5 cm calcite vein is present at 63.86 m.	VN	45		1														
			64.40	74.22	9.82	LST	DOL		Intensely dolomitized, variably bleached, weakly oxidized LST with sBX and cBX textures throughout. Stylolitic dissolution seams are pervasive throughout. Dolomitized LST layers ~ 2 cm wide are present within the interval. A weakly pitted texture is present and pervasive throughout the interval. Pits are calcite filled. Minor oxidize stockwork veining is also present. Trace subhedral pyrite is present on fracture surfaces.					i		f				t							
			74.22	74.90	0.68	DOL	VN		Unit consists of bleached intensely dolomitized LST with minor dissolution seams.																		
									Large ~0.5-1cm wide stockwork Ca-Py veining is present. They contain calcite, fizzing readily, and also contain heavily oxidized subhedral-anhedral Py.	VN	20		2							w							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			74.90	80.31	5.41	LST	DOL		Strongly dolomitized LST exhibiting sBX and cBX textures. Towards the end of the unit the dolomite appears more bleached and contains a higher density of stylolitic dissolution seams. Parts of the unit exhibit a pitted texture with minor calcite filling the pits. Parts of this interval are rubbly. Overall this interval exhibits a weak oxide alteration.					i		w												
									Oxidized veinlets are present in this interval anc contain calcite and trace pyrite. They appear to share a common orientation 30 degrees TCA.	VT	30		3			m				t							
			80.31	85.45	5.14	LST	DOL		Unit consists of a bleached moderatley oxidizec dolomitized LST with a high density of stockwork veinlets. The dolomitized limestone appears more granular at the start of the unit and more crystalline at the end. The interval ranges from competant to sand like inttermittently throughout. The more weathered sand and rubble sections show a much higher degree of oxidation than the competant sections. Subhedral to euhedral moderately oxidized disseminated pyrite occurs in veinlets and along fracture faces.					i		m				t								
									Stockwork veinlets are pervasive throughout the unit but at least one set of veinlets shares a common orientation of 50 degrees TCA. Veinlets contain calcite and pyrite and appear highly oxidized.	VT	50		12														
			87.17						Interval becomes more calcarious (fizzes more intensly with 10% HCl) as it approximates lCN. A sharp contact exists from this interval to the next. Unable to obtain a contact angle as it's too rubbly to determine	lCN																		
87.17	92.81	5.64				OX			Medium to light brown, gritty to clay rich, moderately calcarious oxide. Interval consists of variable competant, rubbly and oxidized units. The more competant rock is highly weathered and moderately calcarious with relict stockwork veins and resembles the unit above the uCN. Between 91.35 to 91.44m, a highly bleached intensly calcarious rubbly interval exists.							i												
									Medium grey tp medium reddish where oxidized stockwork veins.	VT																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
92.81	97.69	4.88				LST	OX		Bleached, FG to MG moderately oxidized LST with trace Py mineralization. This unit is moderately calcarious and has a pervasive stockwork veining system which appears to be overprinted by larger veins. Intermittant, more highly weathered sections occur throughout the interval where they are light grey to light brown in colour with a gritty/clayey texture. Disseminated FG to MG Py is found throughout and appears to be overprinting the stockwork veins. FG to MG calcite crystals visible on slightly weathered fracture faces.					w		w												
									Stockwork veins are dark to medium grey and some appear dark red in color (oxidized?). ~0.5-1cm	VT																
			95.23						Oxidized VT appears to overprint the stockwork veining system and is ~1.0cm in size	VT	65																
			96.08						Ca vein with trace FG Py.	VT	55								t							
97.69	98.34	0.65				OX			Light to medium brown, clay to gritty moderately calcarious oxide. The unit is extremely weak and has collapsed onto itself resulting in a non-core form, and more of a soup structure.							i									
			98.34						Sharp contact from OX to LST. Too rubbly to determine a contact angle	ICN																
98.34	102.11	3.77				LST	DOL		Light grey to buff, FG to MG, moderately dolomitized LST. The unit is weakly oxidized giving the buff color. Pervasive stockwork veining occurs throughout and appears to be overprinted by oxidized calcite veins and reddish (SID?) veins. Some sections show a preferred oriented Fo, and other sections show granular FG to MG brown disseminated grains.					w			t											
									Dark to medium grey 0.5 cm Ca VT appears to overprint the stockwork veins.	VT	70																
			101.00	101.31	0.31	LST	DOL	Fo	Bleached to buff intensely dolomitized, slightly vuggy, LST with a strong FO and stockwork veining thin. FG to MG DOL crystals partially infill many of the vugs.					i														
									Foliation is defined by medium to dark grey evenly spaced bands that are pervasive throughout the unit.	FO	60																
			101.31	101.70	0.39				~ 1.0 cm reddish to purplish (SID/HEM?) VT's undulate with no preferred orientation.	VT																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									A series of QZ veins occur over a 20 cm section and vary in diameter from 0.5 cm-1.0 cm.	VN	85		20														
									Gradational contact between silicified dolomitized LST, and the Oxide unti occurs over 10cm.	LCN																	
118.63	120.62	1.99				OX			Rusty orange-brown oxide unit. A gritty texture on the upper contact grades into a clay-earthy texture t the lower contact. The oxide holds cylindrical-core shape. Dark-brown colour on lower fracture surface may represent siderite. Noteworthy Zn-As values provided by XRF readings are 0.4-0.9% Zn, and 0.1- 0.4% As. Oxide does not fizz with 10% HCl.								f												
									Lower contact sharp (over 2 cm) but broken up	LCN																	
120.62	135.64	15.02				LST	DOL		Bleached-buff FG crackle-brecciated, silicified, dolomitized limestone. Unbleached, dark-grey zones occur throughout unit, but are more pervasive up-section. Crackle-brecciations occur without common orientation, but have a 0.1-0.2 cm bleached zone around them. The entire unit (bleached and unbleached) does not fizz with 10% HCl, unless scratched or applied to the smaller calcite veinlets. Several angular-rubbly sections make up to 10% of the unit. No fossils visible.					i				SIL	m									x
			131.30	131.49	0.19	QV			A large, 19 cm thick, Qz vein contains several buff brown angular clasts that fizz strongly with 10% HCl.	VN	25																	
			133.38						0.5 cm thick calcite vein with slight discolouration due to the oxidation of several small but still visible pyrite crystals inside the vein.	VN	25									w							
			126.19	126.69	0.50				0.05 cm thick buff calcite veinlets at 20 degrees TCA occur, over a 50 cm section.	VN	20		15														
			128.31	128.65	0.34	LST	DOL		Dark (unbleached) FG intensly dolomitized, moderately silicified limestone. The unit does not fizz unless scratched. Undulating/irregular upper and lower contacts bleach the LST.					i				SIL	m									

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			132.90	133.50	0.60	LST	DOL		Dark grey (unbleached) FG partially brecciated, silicified (hard) and intensley dolomitized limestone. Brecciation textures are made of light coloured silicified carbonate. The upper contact with the bleached dolomitized limestone is sharp while the lower one is gradational over 7.0 cm. Brecciation textures are 0.2-0.8 cm wide and do not show a common orientation.					i				SIL	m								x
			135.22	135.34	0.12	LST	DOL		Buff-redish, MG, dolomitized limestone. The redish (siderite/hematite?) alteration occurs on the edges o veinslets throughout the unit and fizzes readily with acid on the edges. Partial brecciation at the lower contact by a lighter coloured silicified mfine to medium grained dolomite. Small, angular, dark (unbleached) clasts (1-2 cm in diamter) are also present in the silicified/dolomitized carbonate.					i				SIL	m								
135.34	173.74	38.40				LST	DOL		Dark blue alternating with light grey highly dolomitized, silicified LST. The interval is made up of approximatley 50% dark and 50% light grey units. The dark blue units illustrate sBX textures and calcite veining. The lighter grey units appear to be stained with a weak oxide alteration. Oxidized calcite veinlets occuring in a stockwork fashion are much more prominant in the light grey units. These oxidized calcite veinlets are associated with oxidized subhedral-euhedral pyrite. An underlying cBX texture consisting of what appears to be randomly oriented dissolution seams is present within the lighter grey unit and are visably overprinted by oxidized stockwork veinlets.					s				SIL	m								
									Both quartz and calcite veins/veinlets are present to varying degrees throughout the interval.	VT	10		2														
										VN	20		2

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									There appears to be at least two different sets o calcite veins/veinlets appearing within the unit. Thicker, non-oxidized veinlets ~40 degrees TCA appearing in the dark blue units along with SBX textures and thinner, highly oxidized veinlets containing pyrite mineralization ~10 degrees TCA occuring more prominantley in the lighter grey zones.																			
									Highly oxidized pyrite mineralization is present as a subhedral medium grained variety present on fracture surfaces and in veins/veinlets.										t							
			164.00	164.59	0.59	DOL	VN		This unit consists of relativley large hydrothermal dolomite veining creating a weak sBX textured LST with minor smokey quartz infill. The dolomite veining is sinous, inconsistant and 2 cm at its widest point. The upper part of the veining is at a low angle TCA ~10 degrees; in general, the veining is too inconsistant to obtain an accurate structural measurment. The dolomite crystals within the veins are coarse grained, well defined and are cream brown in colour (ferroandolomite?). LST sBX clasts surrounding the veining have been altered to a pale green colour.									SIL	s									
			169.50	171.50	2.00	LST	DOL		This interval consists of a cream brown, moderatley oxidized, dolomitized sBX LST. The brecciation textures are present but clasts and matrix have been altered to various rusty brown colours. Oxidized veinlets occur in a stockwork fashion and contain oxidized subhedral pyrite.					s		m			t							
									Early calcite veins, cutting at ~40 degrees TCA are 2 cm wide and appear unaltered. These veins are crosscut but later pyrite bearing carbonate veins.	VN	45		3						s							
			171.20	171.21	0.01				A dark brown, slightly calcareous siderite vein 1.5 cm wide cuts at 45 deg TCA and contains pyrite.	VN	45															
			170.35						A quartz vein containing oxidized pyrite occurs at low angles TCA.	VN	10															
									Two distinct sets of veins/veinlets are also present in this unit. An earlier unaltered set of calcite veins ~45 degrees TCA and a later crosscutting set of carbonate and quartz veins/veinlets containing pyrite at ~10 degrees TCA.																	
									Subhedral MG to FG pyrite is highly oxidized and associated with veins at low angles TCA.										w							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			259.21	260.65	1.44	LST	DOL		Medium grey to dark grey MG-CG sucrosic moderately dolomitized limestone. Redish-brown (hematite?) staining visible along fractures and veins. Darker grey clasts (0.5-1.0 cm) to a large extent overprinted by the MG-CG DOL crystals. Upper and lower contacts are gradational, over 10-15 cm. Light dolomitized wavy patches visible, but without common orientation.					m													
			263.52	264.00	0.48				Light (bleached) and dark grey FG moderately dolomitized limestone. sBX possibly indicated by dark grey clasts included in the lighter grey rock. Upper and lower contacts are gradational over 5 cm and not measureable. Light coloured dolomitized carbonate VT's cross cut the sBX texture. Some of the VT's have rusty-coloured stain. VT's fizz with 10% HCl only when scratched.	VT	45		15													
267.85	273.73	5.88				LST	DOL	cBX	Light (bleached) and dark grey FG-MG pervasively banded moderately DOL LST with stylolites and cBX textures. Rock is moderately hard and fizzes lightly with 10% HCl. Extremely pervasive non-dolomitized calcite veinlets and veins (0.05 cm-2.50 cm thick) are variably white and brown (siderite stained?) and cross cut the banding at a remarkabley consistent orientation (25 deg TCA). The larger veins include clasts of the surrounding dolomitized limestone.	VN	25	140	40	m												x
273.73	286.05	12.32				LST	DOL	cBX	Med-dark grey, FG-MG, variably cBX moderatly dolomitized limestone. Angular, rubbly sections make up ~20% of interval. The interval is med-hard and fizzes lightly-moderately with acid. Some bleached-dark banding visible, but mostly at the upper part of the interval. cBX present throughout but more pervasive at the lower part of the interval. Large (7.0 cm) dolomite vein present at 284.15 m, fizzes with 10% HCl only when first scratched. It is yellow-white in colour and occurs at 85 deg TCA. Qz vein at 279.00 m without orientation, contains black (bitumen?) carbon rich soft substance. Feathery cBX texture seen at 283.80 m.	VN	85			m												x
									286.05 m: E.O.H. - The hole was ended because it was past the targeted depth.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	4.49	4.49				OVB			Overburden - No recovery																		
4.49	86.22	81.73				LST	FOS		Medium to dark grey, FG to MG, bedded, FOS LST with interfingering segments of non-fossiliferous primarily vFG silty LST. Numerous Ca VT and VN run throughout interval. Trace FG to MG bright Py is disseminated throughout and is more common in the silty LST intervals, overprinting Ca. Overall the interval fizzes strongly with 10% HCl. Foliation angle is 70-90 deg TCA. Fossils include brizoans and crinoids.	FO	80									t							x
			5.05	8.22	3.17	LST	CLY		Medium grey, FG CLY coating on FX of the LST. Weak to strong coating intermittently throughout section.																		
			9.38	16.10	6.72	LST			Series of intermixed Ca and Qz VT with approximately 1cm Qz blebs surrounded by a FG Ca "matrix". VT are 0.5 to 10 cm thick. A dark vFG thin layer coating contacts (silt?). 70-90 deg. TCA, 0 5 deg. TFA.	VT	80	5	3														
			26.72	30.46	3.74	LST			Dark grey to black, vFG silty LST with sections of faint bedding. Ca stringers, with no preferred orientation, are present with FG, bright Py overprinting them. FG, medium grey clay coating seen at last 30 cm of interval. Interval fizzes strongly with 10% HCl	FO	70									w							
			36.14			LST			Ca VT. 1cm thick.	VT	55																
			38.86	42.72	3.86	LST			Dark grey to black, vFG, FOS, silty LST with sections of faint bedding. Fossils present include crinoids and brizoans. A bryzoan "deathbed" at 40.65 - 40.80 m. Small sections (1-5 cm) of darker silty LST are present with 5% extremely broken up fossil fragments. FG, bright, trace disseminated Py seen primarily in the darker regions overprinting Ca. Gradational uCN and lCN.	FO	80									t							x
			44.20	45.55	1.35	LST	FOS		FG, light to dark grey, non laminated FOS LST. Strongly disrupted/jumbled up sections (mild BX?) that have been weakly silicified. Qz VT present with Ca rimming and Ca nodules in the VT.	VT	50		4					SIL	w

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			51.11	54.70	3.59	LST			Medium to dark grey, vFG silty LST with segments of faint bedding. Small Ca stringers, with no preferred orientation sparse through interval. First half of interval has "camo" texture (bioturbation?). Trace, vFG to FG, bright Py overprinting Ca in darker grey-black regions.											t							
			60.40	61.19	0.79	QZ	VN		Large Qz VN without preferred orientation with non-laminated, broken up LST segments. Ca rimming and small nodules in Qz VN. vFG, dark grey to black stringers throughout (silt?). Silvery-black coating on FX surfaces (BIT?). Trace Py in the dark grey-black stringers. Gradational contacts.	VN	n/a									t							
			61.40	63.18	1.78	QZ	VN		Large Qz/Ca VN without preferred orientation intermixed with non-laminated, broken up LST segments. Segment from 61.40-62.22 m has a brown-red-orange alteration (OX? SID? HEM?) that is FG to MG and non-uniform colour. Vugs are present that have crystalline Ca rimming them. Vugs approximately 2 mm to 2 cm in length and 2 mm to 1 cm deep. Uneven/gradational contacts.	VN	n/a																	x
			64.10	64.27	0.17	LST	FOS		A segment of MG to CG packstone. Medium grey in colour with small Ca stringers (with no preferred orientation) throughout. Fossil fragments range from 1-3 mm. uCN 40 deg TCA, lCN gradational.	uCN	40																	x
			68.82	69.63	0.81	LST			A series of Ca VT and stringers from 1 mm to 7 mm thick. Bedding is 70-85 deg TCA.	FO	75																	x
										VT	50	100	7														
										VT	75	0	7														
			72.90	86.22	13.32	LST			Dark grey to black, vFG silty LST with sections of laminated FOS LST. Ca VT, stringers and blebs pervasive through interval. Trace, vFG, dull to bright Py overprinting Ca. Some of the VT have an orange alteration (OX?) Vugs present sparsely and are rimmed with a non-calcareous brown material. Gradational contacts.	FO	75					w				t							
										VT	45	40	6														
										VT	55	180	10														
										VT	30	160	2														
										VT	75	0	2														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
86.22	92.20	5.98				VOL	SER		Light grey to light green, intensely bleached SER altered VOL. First 2 m of interval has interfingering of LST with Ca stringers with no preferred orientation. Interval is weakly to strongly OX, more OX closer to end of interval. Fo is 65 deg. TCA.	FO	65					w		SER	i								x
			87.84	88.17	0.33	VOL	mBX		A segment of mBX VOL and LST fragments. Clasts range in size from 2 mm to 7 cm and are supported by a weakly calcareous OX matrix.																		x
92.20	94.13	1.93				LST	DOL		vFG, dark grey to black fine grained moderately dolomitized limestone. Fizzes very weakly with 10% HCl when scratched. Faint laminations with an orientation of 50 deg TCA. Slightly OX at end of interval. Vugs present with light yellow/orange rimming. Gradational oxidized lCN.	FO	50			m														
94.13	96.01	1.88				VOL	SER		Medium green-grey, FG to MG SER altered VOL. Weakly to strongly OX. OX stringers with no preferred orientation throughout competent rock. FO is 45 deg TCA. Gradational lower contact into OX	lCN						m											
96.01	96.32	0.31				OX	GRT		Dark brown grey to orange, MG OX GRT. Segmented colouring (grey section and an orange-ish section)							i										x
96.32	148.63	52.31				LST	DOL	cBX	Light to dark grey to buff, FG to MG, cBX, moderately to intensely dolomitized LST. Episodic dark to light grey to buff dolomitized LST consisting of dark grey cBX seams being overprinted by dark red to purple calcareous stringers/VTs (SID?) pervasively throughout the interval. These red/purple VTs may or may not be foliated. Intervals of moderately to intensely SIL altered LST, where QZ VTs are present. Clasts of lime-mud (~2mm to 7cm) which have been silicified and others which have not. Interval of tBX present. Episodic rubbly sections which appear to be more highly weathered than the more competent rock. Disseminated vuggy textures pervasive throughout. Some fracture faces, see weathering into clay.					m				SIL	m								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			96.32	98.08	1.76	LST	OX		Medium grey to orange-brown weakly OX, moderately dolomitized LST. Weakly to moderately OX with segments of rubble. ~1-2cm clasts.					m		f												
			98.08	103.14	5.06	LST	DOL		Dark grey to buff, FG to MG, cBX, moderately dolomitized and weakly silicified LST. Qz VTs and blebs disseminated throughout. cBX is being overprinted by ~0.5 mm oxidized stringers/VTs. Both calcareous oxidized stringers and VTs are being overprinted by later Qz VTs and blebs.					m				SIL	w									
									~0.2-0.7 mm Qz VTs varying from 25 to 40 degrees TCA, cross cutting both cBX and oxidized calcareous VTs.	VT	30																
			103.14	104.46	1.32	LST	DOL		Dark grey to buff, intensely silicified and moderately dolomitized LST, with FG Qz crystals disseminated throughout. ~ 0.5-1 mm Qz crystals supported within a white FG matrix that does not fizz with 10% HCl. Dark grey bands (some may be oxidized) (~0.5 mm-1 mm) found pervasively throughout interval.					m				SIL	i									x
									~2 mm Qz VT enclosed by oxidized seams	VT	55																
			104.84	105.61	0.77				Dark grey to white FG to MG, banded, moderately dolomitized, intensely silicified LST. Disseminated remnant interclasts of DOL are supported in dark grey, FG silicified matrix. DOL and Qz banding intermittent throughout interval.					m				SIL	i									x
									Qz VTs ~5-7 mm cross cutting FG DOL interclast, dark grey silicified matrix.	VT	90																
									~2 mm DOL VTs banded intermittently with Qz VTs	VT	90																
									Dark grey VTs ~5 mm which may exhibit oxide staining, crosscut both Qz and DOL VTs and show no preferred orientation.	VT																
			109.17	109.94	0.77	LST	DOL	tBX	Dark rusty-red, intensely calcareous seams ~5 mm to 1 cm wide, occur where calcite crystals may still be present within the seams. Irregular buff DOL clasts ~5 mm to 2 cm. Relict dark to medium grey cBX is overprinted by tBX. Vuggy textures found pervasively throughout unit and are calcite filled. Wider seams tend to have calcite centres, with its margins rimmed with a dark red to deep purple colour (SID? HEM?).					m			s										x
									~5 mm vuggy calcareous dark rusty red VT. Cross cutting relict cBX.	VT	25																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									~2 mm calcareous dark rusty red VT cross cutting relict cBX.	VT	35																
			115.82	117.35	1.53				No recovery between this interval, drillers said "sof interval, got no recovery".																		
			125.05	125.14	0.09	OX	LST		Dark to medium brown gritty to rubbly OX that fizz weakly with 10% HCl.																		
									~0.5 mm oxide stained, intensely calcareous, FO with variable spacing. FO is most obvious in buff, moderately dolomitized unit, where FO cross cuts relict cBX.	FO	50		110			m												
			133.45	133.55	0.10	LST	DOL		Highly weathered extremely soft unit showing flaky white to beige mineralization (mica?).																		
			134.46	137.60	3.14	LST	DOL	RBL	Buff to orange-brown and dark brown very broken moderately to intensely DOL LST with Ca VT and rubble surfaces altered to a dark brown colour from moderate SID alteration and orange from weak smithsonite mineralization. Alteration increases after 135.70 m, proximal to large DOL veins <1 m wide which BX wall rock. lCN is gradational, VT have moderate SID for ~1 m past contact.						s	t		m							Sm	w		
									1 cm thick SID VT set, calcareous.	VT	10																
			137.60	144.96	7.36	LST	DOL		Buff FG to MG intense DOL LST with irregular SID altered Ca VT. Broken zones < 20 cm with sugary texture on surfaces.					i													
			144.96	147.83	2.87	LST	DOL		Light grey strongly DOL altered LST, FG, as very broken core. Zone < 20 cm of medium grey clay to grit, predominantly silt with orange-brown thin non-calcareous patches.					s														
			147.83	148.63	0.80	DOL	VN		White CG DOL VT with FG orange and dark brown smithsonite and siderite.								s	SMI	s							
									Sharp lCN with intense DOL LST.	lCN	40			i													
148.63	307.84	159.21			0.00	LST	DOL	sBX	Buff to light grey, sBX LST as overprinted light grey to buff clasts and buff to white matrix, interlayered grey and buff layers, or cryptic grey, white, or buff patches. The clasts are strongly DOL LST, while the matrix is MG DOL with some Ca. Strong to intense SIL alteration locally. Non- brecciated zones are increasingly frequent down interval.					s				SIL	m										
			153.07	155.08	2.01	LST	DOL	sBX	Buff to light grey overprinted sBX strongly DOL LST. Pink alteration is found on some broken surfaces (HEM?).									HEM	f								
			160.13	160.34	0.21	LST	DOL	RBL	Very broken with yellow silt coating FX, and yellow alteration of DOL on FX surfaces.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			161.07	165.70	4.63	LST	DOL	sBX	Buff clasts with white DOL matrix. Clasts are overprinted and strongly DOL altered. Bitumen occurs as FG black infills in buff DOL LST and as stringers. The last 50 cm is very broken.																			
			165.70	167.00	1.30	LST	DOL	sBX	White DOL clasts in buff strongly DOL LST matrix with bituminous infill. Interval is very broken. Zones of unbrecciated DOL LST and zones <10 cm of strong SIL medium grey FG LST occur.																		
			166.32	166.45	0.13	LST	DOL	RBL	Orange brown clay to silt with sBX LST clasts <2 cm wide. FLT?					t												
			168.55	168.80	0.25	VOL			Orange brown FG soft non-calcareous interval with sharp uCN with sBX DOL LST. Light yellow with orange-brown layers weakly defining FO.	FO	65																
			168.80	169.00					Light grey moderately DOL LST strongly altered to dark purple silt and white sugary textured grit.																		
			169.80	171.56	1.76	LST	DOL		Medium grey to buff moderately DOL LST with black bituminous infills and seams and medium grey to medium buff calcareous subrounded clasts. Trace disseminated red-brown OX altered mineralized spots. Soft, becoming harder toward gradational contacts with medium grey intensely SIL sBX LST with Ca/DOL matrix. Buff zones have DOL Ca and Qz blebs and VT locally overprinting. Sharp uCN and lCN							t											x
									Sharp uCN and lCN.	uCN	35																
			171.65	181.09	9.44	LST	DOL	sBX	Light grey FG to MG intensely DOL recrystallized sBX LST. sBX texture locally includes overprinted styolites rimming DOL altered zones. Interval remains weakly calcareous, not entirely altered to DOL . Zones of strong and intense SIL through interval overprint various sBX textures.					i														
			181.09	209.30	28.21	LST	DOL		Light buff intensely DOL LST with local weak sBX and moderate to strongly cBX by thin Ca VT. Dark grey intervals of intensely SIL LST < 1 m long, often mBX by DOL VT.					i														
			181.09	184.49	3.40	LST	RBL		Very broken rubbly zone.																		
			184.49	185.37	0.88	LST	SIL		Buff and light grey moderate-strongly DOL LST with intense SIL alteration with SIL nodules < 0.2 cm which merge into pervasive masses. Strong cBX texture of the entire interval.					m				SIL	s									
			191.53	191.91	0.38	LST			Buff CG DOL that has been cBX to mBX by Ca VT, with local strong SIL alteration with Qz blebs throughout. The interval is more calcareous then the surrounding rock. Both upper and lower contacts are sharp.	uCN	30																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

										ICN	40																
			200.21	200.66	0.45	LST	SIL		Medium and dark grey intensely SIL altered LST that has been sBX by white FG-MG DOL. The first 20 cm have layering of grey and white that weakly define the FO.	FO	70																
			209.30	210.37	1.07	LST	DOL		Buff and dark grey interlayered intensely DOL LST in discontinuous layers (sBX?). Starts predominantly as buff coloured, then becomes predominantly grey after 209.80 m. Layering defines weak FO, with CN following FO.	FO	70																
			210.37	225.06	14.69	LST	SIL		Medium grey moderate-strongly SIL, locally intensely SIL altered LST. The interval is locally mBX by DOL VTs with an overprinted appearance from moderate DOL alteration. Zones of buff coloured strongly DOL, moderately SIL altered LST have DOL infilling sBX textures.																		
			217.02	217.34	0.32	LST	RBL		Buff weakly DOL altered LST, with bituminous infill and large silicified clasts, some of which are mBX by DOL VT. The interval is very broken.																		
			225.06	231.96	6.90	LST	DOL	sBX	Medium grey to buff moderate-strongly DOL alterec LST with weak sBX textures and bleaching to buff colour around Ca VT. sBX textures are very overprinted and cryptic looking. An interval of largely broken core with rubbly zones ~ 50 cm long occurs within. Silicified zones < 35 cm also occur throughout.					ms														
			227.14	227.49	0.35				Orange white and medium to dark grey tBX with Qz and DOL clasts, orange and white calcareous matrix, SIL altered portion through center, and black bituminous layers focused in the last 10 cm.									SIL	w								x
			231.96	243.30	11.34	LST	DOL		Buff strongly DOL altered LST with small grey patchy zones with cryptic contacts with DOL altered LST (moderate SIL altered patches as very cryptic sBX texture?). The interval has very broken zones. The lCN has 30 cm of MG DOL, followed by mBX of DOL LST by DOL VT.					s													
			243.20	250.66	7.46	LST	DOL	sBX	Medium grey and buff strongly DOL altered moderately SIL altered LST, sBX appears as overprinted irregularly shaped patches of buff and medium grey. The first 20 cm of intensely SIL altered, medium grey with buff alteration near VT.					s				SIL	m								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			250.66	256.65	5.99	LST			Medium grey intensely DOL altered LST locally forming grey FG moderately SIL altered spots in a DOL matrix. Overprinted by layers and patches of buff intense DOL which defines a weak FO.	FO	65			i												
			256.65	257.28	0.63	LST	DOL	sBX	Medium grey and orange buff, intensely DOL altered LST. sBX by DOL VT, with orange brown alteration of grey sBX clast centers and DOL matrix. sBX transforms to overprinted cBX and mBX locally.					i													
			257.28	259.35	2.07	LST			Medium grey FG LST with orange buff alteration along FX, VT, and surrounding MG OX MX disseminated in trace amounts. Cryptic patches of lighter and darker grey calcareous, moderate-strongly DOL altered areas. Silt rich layers also occur.					s													
			259.35	263.36	4.01	LST	DOL	sBX	Buff to medium grey intensely DOL altered, strongly SIL altered LST. sBX and cBX on their own or overlapping. sBX of buff LST by white DOL and of grey LST by buff LST. cBX by DOL and Ca VT.					i				SIL	s								
			263.36	270.54	7.18	LST	DOL	sBX	Buff to dark grey, intensely DOL altered, sBX LST with weak to intense SIL alteration. Dark grey layers sBX by buff LST locally forming elongate clasts. Locally cBX texture overprints the interval and increases in intensity downhole.					i				SIL	s								
									FO is locally weakly defined by grey and buff interlayers.	FO	70																
			270.54	276.17	5.63	LST	DOL		Light grey-buff intensely DOL altered LST intensely cBX by medium grey weakly calcareous seams which locally emanate from Ca/DOL VTs. Seams are cut by Qz/Ca VT and VN with low angle TCA.					i													
			276.17	291.34	15.17	LST	DOL	sBX	Light to medium grey and buff, intensely DOL and strongly SIL altered LST with moderate sBX and weak cBX textures. The sBX occurs as buff clasts in a DOL matrix. The DOL forms irregular layers, and weak overprinted patches. sBX zones locally include Qz VT and patches.					i				SIL	s								
			291.34	307.84	16.50	LST	DOL	sBX	Medium grey and buff, strongly DOL and moderate-strongly SIL altered LST with intense sBX textures as buff clasts in DOL matrix, as strongly FO grey and buff interlayers, and as buff clasts in grey matrix, variably overprinted. White DOL VTs occur throughout, locally offsetting layers. Trace vugs, some infilled by dark Qz occur.					i				SIL	m								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.15	2.15				OVB			Overburden - no recovery																		
2.15	31.67	29.52				LST	FOS		Medium to light grey, fossiliferous. irregularly FO LST, with weak to intense MBL The intensity of the marbleization increases down the interval. Fossils include crinoids, bivalves and rugose corals. Ca occurs as erratic patches, circular blebs, and elongate broken clasts which may also be of organic origin. Ca VT with no common orientation occur through interval. Zones with decreased FOS and less erratic FO which is more common down interval. Trace Py is associated with fossils/Ca blebs.	FO	80							MBL	m	t						
			21.34	31.67	10.33	LST	MBL		Medium grey to light grey, intensely MBL LST, with fossils (crinoids) still locally unidentifiable and Ca VTs in common orientation.	VT	20	70						MBL	i							
									FO is defined by thin black seams in intensely MBL zones as well as interlayered medium to light grey layers in less altered zones.	FO	75															
31.67	39.02	7.35				MBL			Light grey MBL with < 5 cm thick medium grey overprinted looking layers which define the FO. Trace SER and Py occur throughout, becoming weak in the last 50 cm before the lCN.	FO	65							SER	t	t						
39.02	69.77	30.75				VOL		AM	Blue-green-grey CHL altered VOL with buff yellow SER increasing down interval. Amygdaloidal sections are common thorough interval, often associated with Bi.									CHL	ms							
																				SER	f						
																				BIO	f						
			39.02	39.60	0.58	VOL		AM	Light blue-grey, FG VOL with moderate FG BIO defining FO and rimming Ca amygdules. SER alteration and increased calcareousness occurs in the first 15 cm as a gradational uCN. The lCN has a gradational decrease in Bi and Ca.	CN								BIO	m							
																				SER	w						
			39.60	46.44	6.84	VOL	Ep	AM	Green-blue-grey FG strongly CHL altered VOL with pistachio green FG spots (Epidote) associated with FG Ca spots and amygdaloidal zones. Bi in amygdaloidal zones weak to moderate strong. Epidote weak through first 3 m, trace after.									BIO	w							
																				Ep	t						

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			46.44	58.87	12.43	VOL			Blue-grey VOL with dark elongate spots and FX coatings of very soft CHL with trace disseminated Py. Ca occurs as FG patches to amygdaloidal spots, not continuous through interval. The light blue grey layers are harder, generally associated with Qz/Ca VT and blebs and is moderate SIL.								CHL	s	t							
																		SIL	m								
			58.87	62.04	3.17	VOL		AM	Medium grey and light blue-grey, intensely Ca spotted VOL with dark grey intensely CHL altered layers. The light blue and green-grey patches are SER altered. Locally appear to as be elongate clasts.								CHL	m								
																		SIL	f								
			62.04	64.00	1.96	VOL	SIL	AM	Buff grey VOL that is moderately hard with FG Ca spots and very thin VTs, as well as thicker Qz/Ca VT and zones of amygdaloidal spots. Moderate SIL occurs with trace to moderate SER increasing toward gradational lCN.	lCN								SIL	m								
																		SER	w								
			64.00	69.77	5.77	VOL	SIL		Buff-yellow to medium brown-grey with intense orange-brown OX locally. uCN gradational, with brown-grey VOL increasingly SER altered down interval. VOL entirely buff yellow SER altered after 65.85 m. The interval is strongly SIL altered, with Ca/Qz blebs and VT/VN throughout the interval. Fractures and <20 cm wide show an orange-brown OX stain. The OX areas are more calcareous and softer than the surrounding SIL and SER alteration. The lCN is gradational. FO is defined by SER altered layers.	FO	60					m		SER	i								
																		SIL	s								
69.77	91.17	21.40				LST			Medium grey, erratic FO LST with FG soft black weakly calcareous layers and zones at contacts; mudstone or VOL?. Qz/Ca VNs recrystalize zones up to 30 cm long. Local moderate MBL alteration. Crinoid fossils, and trace disseminated Py occur throughout the interval.								MBL	w	t							
			69.77	71.41	1.64	LST	VOL		Black VOL or mudstone rich LST, with moderately-strong OX, sericite alteration and vuggy areas. uCN is transitional into the LST.	uCN					ms		SER	f								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			88.27	91.17	2.90	LST	VOL		Gradational uCN with Ca blebs elongate to the FO and intense OX alteration in thin layers with vugs. Moderate-strongly SID alteration locally along with bands of SER altered VOL. This VOL rich mudstone, grades into VOL on lCN.	FO	70					m	f	SER	w								
91.17	98.52	7.35				VOL	SER		Yellow grey to brown, locally intense SER and moderate strong BIO altered VOL, with Ca blebs elongated with the FO; and VT parallel to the FO. Fair Py occurs as dark brassy disseminated blebs, preferentially within SER altered VOL. Qz/Ca VN < 3 cm follows the FO. Both the uCN and lCN are gradational.	FO	70							SER	s								
																		BIO	m								
98.52	179.31	80.79				LST			Medium grey, FG, FO, LST with crinoid stem fossils. FG dark grey layers are common near the uCN and decrease down interval. Trace Py is disseminated in Ca blebs and lime mud, the mineralization transitions into trace Po for 20 m down interval. Ca blebs and VT's are common, while Qz/Ca VT which follow general FO are less common. The lower portion of the interval is intensely SIL altered, making the fossils unrecognisable, also reaction to 10% HCl has decreased.	FO	70									t		t					
			101.57	103.20	1.63	LST			Dark grey-brown, strongly calcareous VOL rich LST with trace Bi and Py. Calcareous clasts < 1 cm in diameter occur in darker calcareous matrix Ca VTs occur throughout and are often offset by darker layers.	VT	35	185	10					BIO	t	t							
			111.00	131.50	20.50	LST	FO		Medium grey FG LST with trace Po grading into an area with trace Py. The Po mineralized LST seems to be less fossiliferous than the Py mineralized zones and is found in elongate disseminations, not associated with Ca unlike the Py.	FO	80										t						
			146.30	150.69	4.39	LST	SIL		Gradational uCN, with increased Ca/Qz VTs and general silicification. Trace crinoids are still visible.	uCN								SIL	m								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			150.69	179.31	28.62	LST	SIL	FO	Dark grey with intense Ca/Qz veining and intense SIL of interval decreasing LST reaction to 10% HCl. Veining forms local mBX and silicification causes layered white and black texture not recognizably emanating from a vein. FG black thin layers and seams common, define irregular FO. No visible fossils. Trace to weak brassy Py in FG patches and bright FG disseminations. First meter rubble, up to 161.20 m very broken; more shale rich than bellow. Very gradational uCN. lCN has wisps of SER and rubble zone ~ 20 cm long.	FO	60							SIL	i	t							
179.31	187.75	8.44				VOL	SIL		Light yellow to buff SER altered VOL with layers and patches of light grey MBL which has been intensely silicified, fizzing only very weakly in 10% HCl. The interval is predominantly SER and SIL altered VOL. Brassy FG Py occurs in patches and layers associated with and replacing Qz/Ca patches and VT.									SIL	i	t							
																		SER	i								
																		MBL	i								
187.75	190.69	2.94				LST	SIL		Dark grey FG very hard SIL altered LST with intense thin Ca/Qz VTs locally cBX to tBX the LST. Thin black shale seams define the FO at 60 deg to CA. A gradational lCN occurs with decreased VT concentration and a light grey colour.	FO	60							SIL	i								
190.69	204.22	13.53				VOL			Variably coloured, from black to green-grey to purple grey, non-calcareous to weakly calcareous VOL. Contacts between the different colours are sharp.																		
			190.69	197.22	6.53	VOL	MBL		A mixture of light yellow-grey SER altered VOL and light to medium grey MBL altered LST with gradational, wispy CN between the two. Both parts of the interval are strongly SIL. MBL very weakly fizzes in 10% HCl because of SIL. Fair Py as FG brassy disseminations in Qz/Ca blebs, and replacing SER rich zones. OX on FX, VT, and thin layers. Gradational lCN with increased OX of Py and FX, corroded appearance, and SID VT.	CN							SER	f	f							
																		MBL	ms								
																		SIL	ms								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			197.22	198.88	1.66	VOL			Black to very dark green to dark red, soft VOL, with locally very broken corroded appearance and SID alteration. The rock is very porous as it quickly absorbs moisture.																			
			198.88	201.96	3.08	VOL	OX		Green-grey SIL and SER altered VOL with silicified LST patches and intense OX on fractures and in intervals up to 15 cm long. Disseminated OX FG MX, and local SID also occur.							i	t	SIL	f									
																		SER	f								
			201.96	203.28	1.32	VOL			Black to very dark green to dark red, soft and porous VOL, with a locally corroded appearance with a high iron content (SID).								w										
			203.28	204.22	0.94	VOL			Medium grey VOL with purple a tint. It is non-calcareous and has a FO defined by darker thin wispy layers. Py occurs and is represented by medium grained corroded cavities. Intense SID alteration occurs over 4 cm on FX surfaces.	FO	65						t											
204.22	302.36	98.14				LST	DOL	sBX	Medium grey to white and buff, FG to MG intensely DOL LST with sBX textures as grey, buff or white patches, variably overprinted. Intense to trace cBX overprint gradationally increases down interval. Moderate SIL alteration occurs through most of interval, with zones of intense SIL. Trace disseminated OX MX is generally near the rims of Qz/Ca/DOL VTs. Bituminous infill and seams occur locally along with SID and smithsonite VTs increasing in density. VOL interlayers are a very minor part of the interval.						i				SIL	s									
			204.22	204.40	0.18	LST	SIL		Broken, strongly SID altered zone at uCN of DOL LST. Weak OX and intense SIL	uCN				i		w	s	SIL	i								
			204.40	219.49	15.09	LST	DOL	cBX	Light grey FG-MG intensely DOL LST intensely cBX by grey seams and strongly SIL with Qz blebs throughout. Grey patches most likely represent remnant sBX textures. Orange-brown seams with OX FG MX occur locally along with short broken intervals.					i				SIL	s									
			219.49	222.91	3.42	LST	DOL	sBX	Medium grey to orange-brown strongly DOL, moderate SIL and fairly OX LST, sBX by white MG DOL and entirely overprinted by a thin crackle texture. Black bituminous infills and stringers are common within the medium grey matrix. The LST clasts are < 5 cm wide.					i		t		SIL	m									

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			222.91	243.38	20.47	LST	DOL	cBX	White to buff and grey, intensely cBX and moderate strong sBX dolomitized LST. Intense DOL alteration and strong SIL occur. Local bituminous infills and seams occur along sBX margins.					i				SIL	s									
			240.53	240.85	0.32	LST	DOL		Light yellow cBX DOL/ANK altered LST with grey seams forming cBX texture. The yellow colour occurs as a rim ~ 20 cm wide on orange pink VT and OX zone. OX zone is rubbly, with a white non-calcareous mineral. XRF showed high Zn and Ba. (possibly barite and smithsonite).	VT	35			i	f	ms		SMI	m									
																		Ba	m								
			241.72	242.01	0.29	VN	Ba		Vein composed of elongate non-calcareous white crystals (Barite?) which brecciates the DOL LST with orange and dark brown rims. Weak Smithsonite and SID.								w								Sm	w	Ba	f	
			253.41	260.00	6.59	LST	DOL		Very broken interval, with rubble sections < 1 m long. Light yellow-white DOL/ANK altered LST with SID alteration on FX and through zones < 4 cm wide. Light yellow OX alteration also occurs on FX. Overprinting light yellow and grey sBX textures with fair cBX occur throughout. Thin SID VT set occurs at 35 deg to CA.	VT	35			i	w	t	w												
			262.90	263.30	0.40	LST	DOL		Dark buff intense SID VT within an intensely DOL altered LST. The SID VTs form a weak cBX texture, have 25 to 50 degree orientation, mainly 35 degrees.	VT	35			i			s												
			271.70	272.16	0.46	LST	VOL		Orange-brown to black, intensely OX, strongly SID altered, and strongly DOL altered LST at the upper contact with thin (< 15 cm) black to dark green non-calcareous, soft, weakly amygdaloidal VOL. The ICN with sBX and cBX DOL LST are sharp but too broken to measure.	ICN						i	s												
			274.16	276.76	2.60	LST	DOL	sBX	Light yellow-white and grey cryptic sBX patches, in a intensely DOL LST that is locally cBX by SID VTs and bituminous infill in FG grey zones. The interval is very broken up to rubble and small core pieces. OX alteration occurs on FX.					i		t	w												
			276.76	277.48	0.72	LST	SIL		Light grey intensely SIL and moderate DOL altered LST with SIL forming FG circular spots to pervasive zones.					m				SIL	i									

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			277.48	279.49	2.01	LST	VOL		Light orange-beige to black interval of interlayered intensely DOL altered LST and VOL. The VOL layer close to uCN is light green-blue-grey with strong SER alteration, and intense OX in layers and zones. VOL layers after that are black to dark green-grey, non-calcareous, weakly vesicular with OX in irregular layers and on FXs. DOL LST is light buff and grey, sBX and strongly SIL altered. The entire interval is very broken to rubble, with OX and SID alteration on FXs. The CN between the VOL and SIL altered DOL LST is very broken.						w	w										
			282.39	295.83	13.44	LST	SIL		Buff to medium grey, intensely DOL LST, sBX, with intense SIL in light to medium grey zones with DOL light buff spots giving fuzzy looking texture. Remainder of interval is strongly SIL. Very broken zones < 2.5 m long with weak OX and SID on FX. Trace disseminated Py MX. Black to green grey non-calcareous layers < 70 cm long of VOL interlayered with strong orange brown OX on FX and in layers.					i		w	w	SIL	i								
			287.80	288.42	0.62	VOL			Dark grey to green-grey, FG non-calcareous VOL with strong OX alteration on FX and through layers defining possible FO. The uCN and lCN have sugary textured DOL and uCN has moderate strong OX.	FO	50					m										
			292.57	292.85	0.28	VOL			Dark green-grey to black, FG non-calcareous VOL with OX on FX, in blebs, and forming weak cBX. In rubble zone with broken contacts.							ms										
			295.83	302.36	6.53	LST	DOL	sBX	Medium grey to buff, strong DOL moderate strong SIL, sBX LST. sBX as grey patches in buff matrix, or buff patches in grey matrix. Local bituminous infill and seams. Last 2 m are broken core and rubble					s				SIL	ms								
									Thin seams of SID VT and Qz DOL VN < 3 cm all at 30 deg to CA.	VT	30															
									302.36 m: E.O.H. - The hole was ended because it was past the targeted oxide horizon.

COMMENTS

The hole was ended because it had reached its target depth.

GEOLOGY LOG

HOLE: CO-10-05

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	5.60	5.60				OVB			Overburden- no recovery.																		
5.60	20.34	14.74				LST			Medium to dark grey, FG, silt-rich LST with Ca stringers and VT throughout. cBX present locally where Ca VT/stringers are very abundant. Interval gets gradually lighter in colour down interval. At the end of interval cBX also present with dark grey seams (silt) creating texture. Interval fizzes moderately to strongly. OX present on rims of Ca stringers and on some FX surfaces. FO defined by stringers.	FO	60					t											
			15.67	15.92	0.25				White to light grey-buff, MG to CG Ca VN. Trace OX along interior seams, and a few dark grey stringers throughout (silt?). Slight buff-alteration to the Ca. Very sharp CN.	VN						t											
										uCN	25	210															
										lCN	35	0															
										FO	55																
			19.44	20.34	0.90	LST	RBL		Medium grey LST rubble with weak to strong OX as coating on broken surfaces, and as grit through intervals < 10 cm long. Clasts angular, from 0.5 - 3 cm in diameter. Clasts have a medium green grey clay coating. OX grit fizzes strongly with 10% HCl.	lCN	60					m											
20.34	24.99	4.65				OX	VOL		Light buff-grey to medium orange brown FO OX VOL. Local pearly lustre on surfaces indicating intense SER. Segment ranges from moderately OX to intensely OX with some 10 cm segments of competent VOL OX. Some rubbly sections with 0.5-2 cm angular clasts. Slight FO ranges from 45-50 deg. TCA. OX mainly holds core shape. Interval does not fizz with 10% HCl	FO	50					i

24.99	48.70	23.71				LST	OX		Medium grey to dark grey banded, mildly FOS, LST with medium orange brown moderate strong OX bands with trace SID. OX bands make up 30-50% of interval, possibly have VOL component. Local cBX formed by Ca stringers. Ca stringers, VT and elongated blebs along FO present throughout interval. Local Qz VN and DOL VN present. Interval fizzes with 10% HCl including the OX bands. Zones of highly FX core with angular 0.5-1 cm clasts and a light grey coating on surface. Local weak light grey clay alteration on FX surfaces. Sharp uCN, gradational lCN. Pervasive FO ranging from 65 to 85 deg TCA.	FO	75					m								Si	t			x
			38.19	39.70	1.51	VN	RBL		White to light orange buff, extremely rubbly, MG to CG Qz/Ca VN. Medium brown-grey sandy-grit intervals intermixed with VN RBL. RBL clasts range from 0.5 cm to 3 cm, and are sub-angular. Contacts rubbly and non-measurable.																			
			40.17	41.18	1.01	VN			Light grey to medium buff, CG to vCG DOL VN/series of VT -- 2 20 cm VN in interval. Several small (0.5-1 cm) angular LST clasts in VN. Dark reddish-brown seams and blebs in VN. 1-2 cm rhombic brown Si crystals with a glassy lustre throughout VN -- Found mostly around dark brown seams. Contacts sharp for first VN in interval. Contacts undefined for second VN.	uCN	50		2										Si	t			
										lCN	65	0															
										FO	65																
			42.64	42.97	0.33	VT			White to light grey, MG to CG Ca/Qz VT/VN set following FO. Trace Si in VT. VT ranging from 0.5 to 6 cm wide.	FO	55		6										Si	t			x
			44.81	46.61	1.80	OX	RBL		Medium brown grey strong OX RBL. Interval fizzes moderately with 10% HCl. Clasts range from 0.5-2 cm and are sub rounded. Gradational contacts.							s											
			46.61	48.70	2.09	LST	OX		Medium grey-green and orange brown moderate OX LST with Si/Ca VN and VT throughout. VT/VN range from 0.2 - 2 cm thick with MG to CG crystals. Have sharp CN and appear somewhat pitted, with slightly lighter orange rims around the contact. Many unoriented VT/VN, however a prominent orientation is 20deg TCA, 175 deg TFA. FO is less defined than above intervals.	VN	20	175	4			m										x
										FO	45																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

48.70	53.90	5.20				OX	SID		Medium orange-brown to dark brown, FG to CG OX with segments of intense SID. Texture of OX ranges from silt to grit. Core holds shape in intense SID zones, otherwise very crumbly. Sharp undulating upper contact (non-measurable). Gradational lCN. A few QZ blebs/crystals present in interval approximately 1.5cm wide. Interval does not fizz with 10% HCl.								s										
53.90	150.91	97.01				LST			Medium to dark grey finely laminated DOL LST with intensely SIL zones and Ca/Qz stringers and VT throughout. Bands of dark grey-black silty LST pervasive through interval with weak Py MX in bands and elongated Qz blebs; often rimmed with Ca. Interval fizzes weakly to moderately (in the lighter sections). cBX locally formed by Ca/Qz seams. Relict SIL FOS beds present, very broken up FOS fragments of crinoids, brachiopods and finger coral/bioturbation? Weak to moderate Fe staining present on rims of Ca/Qz stringers and on some FX surfaces. Qz VT appear rimmed by very silicified Ca. Segments of abundant SID-Ca VT/VN. Gradational contacts.	FO	45			m				SIL	m	t							x
									Ca VT at 59.54 m. 0.71-1.0 cm thick.	VT	20	180														
									Ca/Qz VT at 68.87 m. 0.5 cm thick	VT	40															
									Ca/Qz/silt VN with FG \Py MX at 70.24 m. 1 cm thick. Fine laminations of silt, Ca and Qz.	VT	60	130														x
			79.68	80.77	1.09	LST	SIL		Medium to dark grey, FG to MG SIL LST with a light grey speckled pattern (spots 1 mm). Speckles have uneven edges and look similar to sBX texture. Speckles are mildly elongated along FO. Gradational contacts	FO	55							SIL	i								x
			84.42	87.11	2.69	LST	SIL	BX	Light to dark grey, FG to MG SIL LST with a mild BX/mottled texture defined by faint dark grey stringers. Top 30 cm of interval strongly FO (45 deg. TCA.) and rest of interval has no FO. Trace Py MX in dark seams.	FO	45							SIL	s	t							
			90.88	99.88	9.00	LST	DOL		Medium to dark grey, FG to MG DOL LST with pervasive Qz, Qz-Ca and SID-Ca VT throughout and Fe staining on FX surfaces and VT rims. Majority of Qz-Ca and SID-Ca VT have 2 mm - 1 cm vugs throughout. First half of interval more Fe-rich. Second half has more pervasive Qz stringers and VT and localized tBX formed by stringers. Fo 40 45 deg. TCA primarily defined by Ca/Qz stringers.	FO	40			m			t	Fe	w							x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			144.83	145.52	0.69	LST	VOL	AM	Medium to dark grey, FG to MG DOL LST with dark grey-black, vFG AM VOL interfingering. AM VOL has 1-5 mm rounded, white Ca amygdules throughout. Trace vFG Py in wispy stringers (with no preferred orientation) throughout. Weak FO present at 50 deg TCA. Sharp contacts. uCN 45 deg TCA, 55 deg TFA; lCN 70 deg TCA, 265 deg TFA.	FO	50								t							x
										uCN	45	55															
										lCN	70	265															
			147.06	150.91	3.85	LST	SLT		Dark grey to black, vFG finely laminated DOL SLT LST with trace Py and tremolite and a graphitic coating on FX surfaces. Py is FG to MG dull greenish-yellow in stringers 1-5 mm thick. Tr is FG and prismatic/fibrous, light green--and slightly Fe altered in sections -- and found in stringers 1-4 mm thick. FO primarily defined by Py and Tr stringers, but zones of Fe altered DOL LST - brownish grey bands present. FO ranges from 55 to 75 deg TCA. Sharp contacts. uCN 75 deg TCA, 0 deg TFA; lCN 75 deg TCA, 0 deg TFA.	FO	65			s				FEC	t	t			Tr	t	Gr	t	x
										uCN	75	0															
										lCN	75	0															
150.91	223.12	72.21				LST	DOL	cBX	Light to medium grey intense DOL LST, variably sBX andcBX, with increasing cBX down interval. OX on FX and through rubbly intervals < 50 cm long. Local strong SIL. Gradational uCN.					i														
			150.91	157.98	7.07	LST	DOL	cBX	Light to medium grey, FG to MG cBX DOL LST with trace CG disseminated Py throughout. Several very FX segments and a weak Fe staining on FX surfaces throughout interval that ranges from medium yellow-brown to medium pinkish-brown. SIL zones sporadically throughout. Interval fizzes moderately to strongly in 10% HCl.					i		w		SIL	w	t							
			157.98	158.32	0.34	LST	RBL		Medium reddish brown, highly FX LST with a moderate iron-staining/grit on surfaces. Clasts range from 2mm-2cm and are angular							m											
			160.81	161.21	0.40	LST	GRT		Light pink-brown (He?) LST GRT with moderate Py throughout. GRT ranges from <1mm size clasts to 1cm. Sharp contacts into surrounding competent rock							w				m							
			170.77	171.06	0.29	LST	RBL		Highly FX LST with a moderate, medium brown Fe-staining on surfaces. Clasts range from 0.5-2cm and are angular							m											

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

The hole was ended because it was passed the target depth.

GEOLOGY LOG

HOLE: CO-10-06

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.20	2.20				OVB			Overburden - no recovery																		
2.20	135.99	133.79				LST			medium grey fairly to moderately FOS LST with variable MBL alteration and FO. In general the unit is FG, but vFG and MG zones also occur. Fossils include crinoid stem fragments and burrows. FO is defined by FX orientation, banding and strain indicators, and is moderately strong. Varies from 45-60 degrees to CA.	FO								MBL	f							
			2.20	20.42	18.22	LST		FG	Medium to light grey FG to vFG FOS LST with a distinct banded texture. Fossils include broken up crinoid stem fragments and rounded burrows infilled with slightly coarser grained white calcite grit (?). The FO is moderately strong, defined by strain. 1-4 mm calcite VT cut the unit at 25 degrees to CA and over all the interval is 70% FG to MG and 30% vFG lime mudstone.	FO	60															
										VT	25	270															
			20.42	42.80	22.38	LST	MBL		Light to medium grey moderately to strongly marbleized LST with medium to dark grey irregular pressure solution seams throughout. Where less marbleized the limestone reveals moderate to strongly concentrated crinoid stem fragments 1-4 mm in diameter. Trace vFG pyrite is associated with the darker grey pressure solution stringers. And overall moderate to strong pervasive marbleization overprints75% of the unit.									MBL	ms	t						
									The FO is defined mainly by the swaley pressure solution stringers 45-60 degree TCA.	FO	50																
			42.80	57.82	15.02	LST	SID	cBX	Medium grey FG LST with zones of moderately strong SID alteration and fair cBX infilled with FG white Ca. The upper 5 cm of the unit is moderately rubbly and has a more silty texture.								m										
			42.80	44.81	2.01	LST	OX		Gradual transition from MBL LST into a rubbly orangeish/ creamy grey silty unit. The silty unit is strongly calcareous and appears as though it may be a SER altered VOL with weak to fair concentration of strongly oxidized sulphide mineralization.							f				w							
									A strong foliation is defined by the variation banding.	FO	50																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			44.81	57.82	13.01	LST	SID	cBX	Medium grey strongly cBX LST with fair to strong dark brown overprinting siderite alteration. The SID is more concentrated in zones that are more highly cBX. There appears to be at least 2 stages of cBX; an early very fine cBX that was infilled by CA, and later stained orangeish brown associated with SID alteration. A later, slightly thicker cBX texture occurs which is infilled by white Ca.								m											
			57.82	63.59	5.77	LST		cBX	medium grey strongly cBX LST with moderate Ca/DOL veinlets throughout. The interval has a strong multi-stage cBX texture that has most recently been overprinted by a white to slightly orange cream DOL/Ca veinlet set, almost stockwork in appearance. The veinlets are <1mm to 4 mm wide and are most commonly at 50 degrees TCA. This orientation represents ~ 60% of the VT in the unit. A common cBX orientation can not be determined.																			
			63.59	85.90	22.31	LST	FOS		A very rubbly transition (fault?) into dark grey to black LST. Bellow the rubbly uCN the unit becomes medium to dark grey intensely FO LST with fair crinoid stem fragments. FO is defined by distinct banding, strain indicators, and a common fracture orientation between 80 and 90 degrees TCA	FO	85																
									The upper contact is extremely sharp at 55 degrees TCA, but is very broken up and rubbly over ~1.3m	uCN	55																
									Near the uCN calcite filled VT are common but are rare moving down interval. The <1 mm to 3 mm VT are most commonly oriented 30 degrees TCA and 120 degrees TFA.	VT	30	120															
			85.90	90.05	4.15	LST			Begin to get medium greyish brown silty 3 mm to 2 cm thick bands parallel to other banding in the core.	FO	85																
			90.05	124.84	34.79	LST			medium to dark bluish grey FG to vFG LST with a weak to trace concentration of crinoid stem fragments and a weak to fairly developed FO. Toward lCN begin to get 0.5 to 2 cm DOL/Ca stockwork veins and veinlets at random orientations.	FO	85																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Other Type	Other Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Other Type	Other Intensity	Other Type	Other Intensity	
			124.84	135.99	11.15	LST	FOS		Increase in the concentration of fossils to moderately strong to intense. The mainly crinoid stem fragments occur within medium grey weakly banded moderately foliated LST. Banding occurs at 75 degrees TCA with FO which is defined by very thin dark grey wispy lines. Banding defined by variation in fossil fragment concentration within medium grey lime mud. Outside of packstone bands only trace to weak crinoids occur. Weak Py as very fine grained disseminations and blebs throughout.	BD	75								w							x
135.99	208.28	72.29				LST	DOL		Medium grey moderately DOL LST with weak fine grained disseminated Py throughout and variable structural deformation and FO.					m						w							
			135.99	156.30	20.31	LST	DOL		Medium grey moderately DOL quite massive LST with 1 to 3 mm quartz veins cutting throughout and weak disseminated Py throughout. Vein orientation is quite random, but most commonly occurs at 75 degrees TCA. No foliation can be recognized in the core.	VT	75			m						w							
			156.30	159.05	2.75	LST	DOL	cBX	Medium to dark grey FG to MG LST with moderate dolomitization. The unit has taken on a light grey gritty appearance in a very dark grey matrix. Numerous phases of FG to MG Qz/Ca VT and VN occur throughout. Veinlet orientations are erratic but the most common orientation is 55 degrees TCA. A very weak background cBX texture occurs.	VT	55			m													
			159.05	174.91	15.86	LST	DOL		Medium to light and dark grey DOL LST. The interval consists of mainly very disrupted gritty looking light to medium grey DOL LST with bands and patches of very dark grey to black mudstone. In general the unit is too irregularly disrupted to get many orientations. Banding between the dark and lighter LST occurs at 70 degrees TCA. Trace Py occurs disseminated throughout and associated with calcareous spots. The disseminated Py could be diagenetic.	BD	70			m						t							x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			174.91	208.28	33.37	LST	DOL		Dark grey and white strongly dolomitized LST with intense crenulation cleavage textures. Throughout, the most recent structural FO occurs at 80 degrees TCA, and an earlier Fo defined by black and white banding that is rotating into a crenulation cleavage occurs more commonly at 30 degrees to Ca. Trace Py is associated with the darker grey bands - it is most likely diagenetic Py.	FO	80			s					t							x
										FO	30																
									MG to FG DOL/Qz/Ca VT 3 to 5 mm wide cut the unit at 20 degrees TCA.	VT	20																
									An earlier phase of DO/Qz/Ca VN occurs at 10 degrees TCA and is offset ~ 3 mm by later crenulation cleavage FO.	VN	10																
208.28	213.76	5.48				VOL	MST		Slightly brownish grey vFG to FG volcaniclastic with light to medium grey non-calcareous (mudstone?) interbands. The VOL appears weakly SER altered. 0.5 to 1 cm slightly elongate Ca amygdules (?) in weak concentration. FO is fair in strength and occurs at 80 degrees TCA.	FO	80							SER	w							x
									Both uCN and lCN are very gradational over ~ 30 cm.	CN																	
213.76	226.93	13.17				SHL			Black vFG very weakly foliated shale with patches up to 30 cm in diameter of vFG Py (diagenetic), fair overall. Faint debris flow texture with 0.2 to 1 cm multi-lithologic subrounded clasts supported in a very fine grained medium and dark grey matrix. Overall ~ 20% of interval consists of a debris flow texture.											f							x
226.93	276.46	49.53				LST	DOL	cBX	Light to medium grey strongly crackle brecciated strongly DOL LST. The LST is creamy white grey, and crackle seams re medium to dark grey. Rare speleothems occur with overprinting crackle textures. The unit was likely earlier sBX and later cBX. Common crackle orientation of 45 degrees TCA. Qz rubble begins 10 cm from EOH.					s													x
			253.82	276.41	22.59	LST	OX		Interval with weak to fair concentration of oxidized sulphides and zones of extremely rubbly weakly oxidized material. ~30% rubbly.							t										
									276.46 m: E.O.H. - Hole ended because it was passed target depth.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

Hole ended because it was passed the target depth.

GEOLOGY LOG

HOLE: KT-10-01

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	4.51	4.51				OVB			Overburden - no recovery																		
4.51	206.28	201.77				LST			Medium grey FG fossiliferous FO LST, with variable fossil concentration from mudstone to wackestone. Crinoids main identifiable fossil. Trace Py through interval. Calcareous VT both following and cutting FO. Qz VT less common, cut FO. Irregular black and white intergrown calcareous VT to VN, commonly with Qz blebs within, occur locally in high concentration. Weakly OX and trace SIL overall.	FO	60					w		SIL	t	t							
									Low angle TCA Ca VT set, appears to offset FO following VT locally. 10-30 degrees.	VT	20	90															
			6.30	16.37	10.07	LST			Medium grey wackestone, gradational into mudstone on uCN and lCN.																		
			78.26	116.70	38.44	LST	OX		Gradational increase over ~ 20 m in OX. Occurs in thin layers following FO before uCN. Contact at first OX layer thicker than 2 cm. OX layers are orange brown, soft, with unoxidized grey LST between layers with trace crinoid fossils. Trace Py in interval, predominantly altered dark red brown or entirely corroded leaving a void space. Interval very gradational, with increased concentration of OX layers toward center, decreasing toward both CN. Increased Qz VN through interval.	FO	65					ms			t	t						
			85.79	89.36	3.57	LST			Intensely veined interval. Qz/Ca, irregular, with black and orange brown calcareous OX patches. Light orange colour to Ca common. Trace dark red brown OX Py.								ms			t							
			135.87	137.16	1.29				Interval has trace Po instead of trace Py.												t						
			140.46	169.31	28.85	LST	SIL		Light grey patchy moderate strong SIL of mudstone LST over < 3 m zones, separated by weak SIL to unsilicified LST.									SIL	m									
			159.37	201.37	42.00	LST	FOS		Light grey FG to MG wackestone to packstone layers within LST which are significantly more FOS rich than surrounding LST occur over 5 to 20 cm. Crinoids only identifiable fossil. Often bounded by thin black seams on contacts, and show slight coarsening of clasts down hole. Occur ~ 1 per m, particularly dominant in last 4 m.																			

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			187.03	202.25	15.22	LST			black FG layers and zones significantly less calcareous or non-calcareous, interlayered with mudstone and packstone LST layers. Weakly SIL VOL/ARG? Locally altered orange brown in thin layers.									SIL	w								
			202.25	202.80	0.55	LST	tBX		Light green grey calcareous matrix with up to 1 cm long subangular dark grey calcareous clasts which coarsen down interval. No distinguishable fossils.																		
			202.80	206.28	3.48	LST	VOL		Medium grey strong MBL LST, interlayered with FG black to medium green grey weakly calcareous VOL and hematitic red layers. Interval ~ 60% MBL LST. Layers define FO.	FO	65							MBL	s								
206.28	211.66	5.38				VOL	AMG		Light green or blue grey, locally altered light orange, very amygdaloidal VOL, with milky white and clear calcareous amygdules. VOL moderate to strong SER altered and moderate CHL altered, with local SIL. Trace Po through interval . uCN very irregular with SIL, SER, and Ca/DOL VT.									SER	ms			t					
																		CHL	m								
211.66	213.11	1.45				LST	MBL		Medium grey strong MBL LST, with thin black, buff, and orange brown VOL rich layers defining FO which are weakly to non-calcareous. uCN follows FO, lCN gradational.	FO	55							MBL	s								
213.11	222.50	9.39				LEP	SER		Light grey and green grey with local dark grey and light orange, intensely calcareous VOL (LEP) with intense SER. Trace Py throughout, locally OX. Zones of moderate strong OX < 3 m. Dark blue non-calcareous clasts < 3 cm through first 2 m. Thin dendritic mineral in SER altered zone possibly CHL.						m			SER	i	t							
			217.24	222.50	5.26	LEP	OX		Light orange OX LEP, extremely calcareous with FG disseminated OX spots, likely Py, and 2 cm thick zone of FG Py as rim on FX. Orange brown gritty intense OX zones < 10 cm long remain calcareous. Decreasing OX toward lCN.						s					t							
222.50	225.00	2.50				FLT	GRT		Green brown , orange brown, and black, clay to rubble, predominantly grit. Weakly calcareous locally.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								PHOTO
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
225.00	249.02	24.02				LST	DOL		Light buff to dark grey variably intensely DOL and SIL LST, commonly DOL cBX which is locally overprinted by SIL. Weak OX on FX locally.					s				SIL	ms									
			225.00	234.70	9.70	LST	DOL	cBX	Light to dark grey, locally with yellow tint, intense cBX intense DOL LST. Local intense SIL, strong overall. Very broken with orange brown grainy alteration on FX and through zones < 50 cm. cBX texture overprinted by SIL, medium to very dark grey. cBX often incorporates thicker ~ 0.5 cm seams of black Qz with thin cBX seams. Sharp uCN and lCN.					i		f		SIL	s									
			234.70	238.20	3.50	LST	SIL		Dark grey VOL rich strong to intense DOL and SIL LST, with weak orange brown alteration in VOL layers. FO regular for first 15 cm, then becomes irregular, becoming intense SIL. Intensely SIL zone followed by intense DOL cBX LST. Layering then repeats itself starting at 236.91. Possibly two debris flows? Have fuchsite layers in irregularly FO zones.					s		w		SIL	s									
			238.20	249.02	10.82	LST	DOL	cBX	Light buff to medium grey intense DOL LST, locally strong SIL. Medium grey patches with indistinct rims remnant from sBX. Thin Dark grey to black Qz VT appear to link with thin overprinted grey cBX seams. Thin black irregular soft seams with orange brown alteration on rims common. Very broken, with increasing orange brown OX on FX down interval. Trace OX MX beginning ~ 246 m. Last 2 m are rubble to grit.					i				SIL	m									
			239.24	239.43	0.19	LST	SIL		Thin < 20 cm interval of increased SIL, decreased DOL. Medium grey, with variably grey clasts and irregular uCN with black and orange brown soft seams on contact. Grades back into intense DOL.									SIL	s									
									239.43 m: E.O.H. - The hole ended because the target depth was reached.

GEOLOGY LOG

HOLE: NW-10-01

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	12.19	12.19				OVB			Overburden - no recovery																		
12.19	16.28	4.09				SHL			Black to dark grey, vFG to FG, fissile, weakly Fo, moderately calcareous SHL. Intermittent rubbly Qz VN/section (~8cm). Disseminated Qz fragments ~1mm-1.5cm within SHL unit. SHL unit is competent to gritty. FX locally oxidized. Too rubbly to determine Fo angle. Moderately calcareous stringers near top of interval variably oxidized (orange rusty color).							t										
16.28	39.62	23.34				OX	LST		Medium orange to buff, FG to MG intensely dolomitized LST, strongly OX, with weak Py, fair Si, and trace Qz. ~30% intensely dolomitized LST and 70% OX. Buff to light grey FG to MG zones of intensely dolomitized LST with weak subhedral to anhedral FG-MG (~0.5mm-5mm) Py disseminated through out. FG to MG Si euhedral to subhedral crystals found along FX. OX zones are strongly pitted with some pits forming FG cubes (Py?) ~1 mm and other well rounded pits. Some vug like pits. FG to CG euhedral to subhedral Si disseminated through out and found along FX. Lack of Py within OX zones. Intermittent zones of competent, to rubbly, to gritty OX, with intermittent intensely dolomitized LST throughout.					i		s	f			w			Qz	t				
			20.86						~1.5 mm DOL VT	VT	45

GEOLOGY LOG

HOLE: NW-10-02

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	21.00	21.00				OVB			Overburden - No recovery. Had to advance to 21.0C m in front of casing.																		
21.00	50.15	29.15				LST	OX		Rusty brown to light yellow, and light grey, intensley dolomitized LST with intense oxidation on FX and through sections of clay to core. Quartz veinining and rubble within oxide common. FG anhedral Py found throughout LST, most prevalent in strongly oxidized zones with sub-cubic pitting, likely from oxidation of Py.					i		i				w							
									A 8cm wide quartz vein housing trace Py is present at 22.85 m.	VN	10																
50.15	67.06	16.91				SHL	OX		Black to dark brown variably weathered SHL. The upper portion of the unit appears black, compatent, fissile, and pitted. The unit then grades into a more weathered dark brown variably oxidized section exhibiting a platy cleavage. Some of the pits in the upper section of the interval are filled with orange brown oxide material. trace tarnished FG Py crystals occure on rare fractures.							ms				t							
									67.06 m: E.O.H. - The hole was lost.

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Galena	Sphalerite	Pyrite	Type	Intensity	Type	Intensity	
0.00	2.47	2.47				OVB			Overburden - No recovery																		
2.47	5.59	3.12				VOL			Dark green, MG, chloritized VOL with interstitial Ca. Disseminated, euhedral Py crystals are 1-2 mm. Ca occurs as irregular shaped patches (1-4 mm), and as subrounded crystals (1-2nmm). CHL alteration decreases with depth. A few irregular shaped cherty clasts (10-30 cm) occur between 8.41-8.88 m with a light banded SER matrix. The lower contact is diffuse.						w		CHL	ms			w					
5.59	6.20	0.61				VOL			Buff, FG, porous VOL with interstitial Ca. The lower contact is moderately sharp at 40 deg TCA. Euhedral 1-5 mm Py crystals are abundant adjacent to the lCN.	ICN	40					w											
6.20	12.06	5.86				SLT			Grey, porous SLT with compositional banding and shear related fractures. Pores are <1 mm , 20% are filled with a black BIT. Vuggy areas are paler and bleached. Oxide-filled compositional banding at 40 deg. Some shear FX have undergone oxidation and are oblique to the compositional banding. Numerous Py-rich veinlets (1-3 mm), and blebs occur adjacent to and within oxidized FX; sparse hematitic staining also coats fractured surfaces.	BN	40					m							w			He	w	
			8.45	9.10	0.65	CHT			Black CHT with sheared oxidized fractures and disseminated <1 mm Py blebs.													t					
			9.10	12.06	2.96	SLT			SLT without porosity and Py. Oblique oxidized shear fractures have a preferential orientation of 20 deg TCA.	FX	22					f										
12.06	14.38	2.32				VOL			Light brown, FG, strongly OX VOL. Matrix is porous, oxidized, and altered with iron-rich compositional banding at 45 deg.							s										
14.38	16.46	2.08				SLT			Light grey interbedded layers of SLT and black CHT 1-2 mm Qz VT's contain oxidized borders.																		
16.46	20.73	4.27				VOL		AM	FG, buff green VOL with iron-rich and dolomitic <1 - 1 mm subrounded to irregular shaped amygdules with an iron stained Ca infilling between 17.90-18.10 m. Few cross-cutting oxidized 1-3 mm DOL veinlets at 30 deg TCA.	VN	30					f										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Galena	Sphalerite	Pyrite	Type	Intensity	Type	Intensity	
20.73	21.06	0.33				VOL			Black to rusty, speckled to slightly gritting looking VOL with white lathe to subrounded 1-2 mm clasts. Sharp, highly oxidized lCN at 40 deg TCA.	lCN	40																
21.06	24.11	3.05				CHT			Black, aphanitic CHT with irregular shaped dolomitic patches Py VT's. The CHT is porous with numerous vugs. uCN is gradational between 21.08 to 21.38m and contains orange/rusty, highly oxidized and porous with a 4 mm DOL VT.																		
			22.05	22.86	0.81	VOL			Buff green, oxidized and porous VOL. Numbers VN and vugs are highly oxidized.							s										
24.11	29.40	5.29				LST	cBX		Grey to dark grey, DOL, cBX, LST with numerous cross-cutting FX (1-2 mm) with associated organics/bitumen. Abundant empty vugs (3-13 mm), although some cavities are filled with crystalline DOL, and occasionally FG Ga (?) (28.72-30.41m). Siderite is common along fractured surfaces (Dark brown to yellow). Along fracture at 24.65 m, minor Ga spotting. Dark grey LST clasts are between 1-3 mm. 1 mm to 1 cm scale stylolitic folds are scattered and common. Slickensides occur on graphitic coated FX at 28.97m .					s		m									Gn	t	
			27.06	27.43	0.37	LST	GRA		Black, massive graphitic LST with dolomitized clasts. Crumbly and earthy with sharp upper and lower CN. White angular dolomitic clasts are common and interstitial.																		
			28.18	28.27	0.09	LST	GRA		Black, massive graphiticnLST with dolomitized clasts. Crumbly and earthy with sharp upper and lower CN. White angular dolomitic clasts are common and interstitial.																		
29.40	41.26	11.86				LST	sBX		White, FG, sBX LST with intermittent layers of cBX. Siderite staining is common on FX surfaces. Few pyritic blebs occur alongside stylolitic folds. Abundant pitting, vugs are mainly filled with crystalline DOL (or FG Gn(?) at 30.48m). Vugs range in size from 4 to 25 mm.					s			t	SIL	s			t						
			30.04	30.15	0.11	LST	GRA		Black, massive graphitic LST with dolomitized clasts. Crumbly and earthy with sharp upper and lCN. White angular dolomitic clasts are common and interstitial.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Galena	Sphalerite	Pyrite	Type	Intensity	Type	Intensity	
41.26	48.50	7.24				LST	cBX	St	White to light grey, FG, bleached cBX LST with numerous stylolites. Vugs are 2-10 mm and filled with crystalline DOL. Sparry texture is common throughout. Few CG slightly dolomitized Ca crystals.					i				SIL	s									
			41.65	41.78	0.13	LST			Few well preserved bedded clasts roughly perpendicular TCA.																	
48.50	49.12	0.62				LST	sBX		Light grey to dark grey/black, FG sBX LST with minor cBX texture. Dark grey clasts are 1-4 cm and become indistinguishable towards the lower mineralized CN.					i													
			48.60	48.64	0.04	LST	GRA		Graphitic layer.																	
			48.77	48.97	0.20	LST			Silicified dark grey section with bituminous clasts (2-10 mm) surrounded by sparry minerals.	uCN	40							SIL	s							
										lCN	40															
49.12	49.18	0.06				MX			Porosity bleaching CN at ~85-90 deg., bleaching envelope is rusty orange with minor interstitial Gn. Evidence of remnant bedding (or fabric) at uCN at 52 deg.											40							
49.18	50.21	1.03				MX			Massive Sm and Gn with crystalline Sp. Minor blotchy (2-5 mm) tarnished Py crystals. Remnant bedding (or fabric) at 50 deg at 49.27 m, 30 deg at 49.33 m, 25 deg at 49.5 m, and 50 deg at 49.57 m. From 'bedding' measurements, replacement is roughly parallel to bedding. Few crystalline Qz and Carbonate vugs are present. Appears to be primary mineralization phase.										40	25		Sm	35	Py	m		
			49.18	49.28	0.10	MX			Massive Sm.														Sm	95			
			49.85	50.21	0.36	MX			Irregular shaped, semi-massive Py pods with sub massive Gn.											25					45		
50.21	51.18	0.97				MX			Buff brown, massive, FG amorphous Sm with cross-cutting tarnished Py veins. FG black and red crystalline Sp. (Crystalline Sp MX is likely due to the Zn and Fe poor environment which stripped Zn from Sm and remobilized to form Sp (black and red)). At 51.06 m, small shear zone adjacent to Sm and Py CN with slickensides at 30 deg. Highly fractured zone, but still well mineralized. Most likely a secondary mineralized (structurally controlled?) phase. Note: highly likely section was affected by incoming Qz VN with sulphides which overprinted onto primary mineralization.										w	i	25	Sm	60				

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other				Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Galena	Sphalerite	Pyrite	Type	Intensity	Type	Intensity	
51.18	52.40	1.22				MX			Qz VN with massive Py and Sm. Qz VN is likely the cause for intense dolomitic silicification above and below mineralized unit.	VN												65					
			52.18	52.28	0.10				Light brown, massive Sm and massive Py.												40	Sm	50			
52.40	53.35	0.95				MX			Gn and Py band with BX Sm. Zone is Qz flooded and Sp appears as darker brown blotches surrounded by pale brown Sm. Sharp lCN with numerous empty vugs (1-3 mm).	lCN	25									45		20	Sm	20			
53.35	63.82	10.47				LST	cBX		Light grey to white, FG, cBX LST with weak Py mineralization along stylolitic folds. Stylolites are abundant. Py mainly follows stylolitic paths, occasionally expands to blebs (2-8 mm) or concentrates in stylolitic nose of folds. Spar texture is very common, and mainly filled with black bitumen. Few sparry black crystals surround CG DOL crystals.					i				SIL	s			w					
63.82	73.71	9.89				LST	sBX	ST	Grey to deep grey, FG to MG, sBX LST with minor intermittent zones of cBX. Clasts are angular to sub angular. Minor stylolites occur throughout. Few MG packages. CG DOL crystals are more common in the dark grey LST sections.					s													
			72.71	73.71	1.00	LST	sBX		Dark grey and black anhedral to irregularly shaped bituminous clasts increase in concentration.																	
73.71	82.90	9.19				LST	cBX	ST	Grey to dark grey, FG to MG, cBX LST with abundant stylolite texture. Scattered patchy black bituminous sections (rubs off on fingers black), is often associated with minor speckled crystalline Py overprinting. A few bleached intervals with empty vugs occur. Euhedral, cubic 1 mm Py crystals are disseminated throughout. Py mineralization occasionally follows stylolitic paths. Pyro-bitumen is common on fractured surfaces.					s								w					
			77.05	77.21	0.16	TLC			Talc infilled gouge. Soft with minor disseminated cubic Py crystals (1 mm).																	
			78.50	78.51	0.01			FX	Light green Sm on FX surface. Botryoidal in texture.													Sm	s			
			80.60	83.50	2.90	LST	cBX		Intensely crackled and fractured interval with abundant graphite of the fractured surfaces.																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Galena	Sphalerite	Pyrite	Type	Intensity	Type	Intensity	
82.90	91.64	8.74				LST	sBX		White, FG to MG, sBX LST. Prominent sparry texture has been overprinted with minor cBX. Scattered vugs have been filled with crystalline DOL with associated bleaching of the host rock. A few dark grey angular clasts have a pyritic sheen.					m								t						
			86.50	88.75	2.25			SP	Pervasive sparry texture with white calcareous layers (7-20 mm).																		
91.64	99.06	7.42				LST	sBX		Dark grey to grey, MG to FG, cBX LST with carbon-rich irregular shaped lenses along FX surfaces. Intermittent zones of cBX occur throughout. Dissolution is strong in a few areas producing an 'empty' vuggy mosaic texture. Numerous botryoidal pale to dark green Sm crystals and glassy crystalline Sm occur. Sparry veins are common throughout.					m				SIL	m									
			95.55	96.62	1.07	LST			Black highly FX limy mudstone with carbon-rich fracture surfaces. Overall the interval contains very angular rubble fragments from 2-5 cm in size.					m				SIL	s								
			98.70	99.06	0.36	LST	GRA		Black graphitic layer. BIT is interstitial.																		
99.06	136.30	37.24				LST	SBX		Dark grey to grey, MG to FG, sBX LST with minor cBX. Sparry zones are abundant and resemble cross-cutting veins (2-6 mm). Few areas have undergone minor bleaching resulting in talk alteration. White DOL clasts are 2-10 mm concentrate in carbon-rich layers. Blotchy and blebby Py occurs adjacent to few bituminous-rich borders.					s				SIL	s			t						
			105.50	106.20	0.70		RBL		Moderately fractured and crackle brecciated sectior with a dark grey matrix.	FX																	
			113.50	115.10	1.60		RBL		Highly FX and rubbly section with a few competent 2-5 cm zones.	FX																	
			116.65	117.70	1.05		RBL		Intensely FX and rubbly interval. Fragments are 1-3 cm, and appear to have undergone intense compression.	FX																	
			120.64	121.01	0.37	LST	GRA		Black graphitic LST. Mainly rubbly with a few 2-5 cm competent sections. Fragments are 1-2 cm.																		
			124.45	126.80	2.35	LST	GRA																				
			128.02	130.67	2.65	LST	GRA			FX																	
			131.60	133.00	1.40				Light grey bleached zone																		
			134.81	136.30	1.49				Intermittent 10-20 cm intervals of cBX. Sparry veins are sparse. Clasts are sub-rounded to irregularly shaped.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Galena	Sphalerite	Pyrite	Type	Intensity	Type	Intensity	
136.30	152.40	16.10				LST	sBX		Dark grey, FG to MG, sBX LST with buff brown patches throughout. This interval does not resemble the typical sBX. The matrix is dark grey with white sparry veins throughout. Buff brown patches resemble infilled vugs. A few 1 cm hematitic stringers cut the unit. A cBX texture overprints the interval and increases in intensity with depth. Bitumen commonly occurs interstitially. Siderite commonly occurs on fractured surfaces. A large 42 cm clast occurs from 149.55 m with an uCN at 90 deg and lCN at 77 deg.					s		t		SIL	s							
			140.80	149.35	8.55	LST			Highly fractured and oxidized zone	FX				m		m											
			150.27	152.40	2.13		RBL		Highly fractured and rubbly section. Fragments are 1-4 cm.	FX																	
									152.40 m - E.O.H. The hole was ended because it was past the targeted depth.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

The hole was ended because it was past its tageted depth.

GEOLOGY LOG

HOLE: OC-10-02

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.05	3.05				OVB			Overburden - No recovery																		
3.05	6.35	3.30				VOL			Chloritized VOL with interstitial 1-3 mm Ca crystals. Light brown cemented matrix, SER? Fractured surfaces commonly have an orange/rusty Li coating.	ICN	40					w		CHL	s				Li	m			
6.35	22.19	15.84				SLT		AN	Grey, aphanitic, calcareous SLT with subrounded, iron-rich vugs that are abundant in the first 15 cm of the interval. These vugs are commonly empty, subrounded (1mm wide) and lath shaped (2.4 cm wide).	BN	30												He	m	Li	w	
									The lower contact is distinct at 40 deg TCA.	lCN	40																
			11.14	11.44	0.30	CHT		AN	Black chert with crosscutting Qz veinlets up to 2 mm in diameter.	ICN	40																
			11.44	15.50	4.06	SLT			Shear fractures with oxidation coating occur oblique to compositional banding (30 deg).							w											
			16.00	19.00	3.00	SLT			Abundant Ca veining, few are stylolitic and cross-cut 'earlier' Ca veins. Earlier Ca veins are cut at 30 degrees TCA.	VN	30																
22.19	25.40	3.21				VOL		AM	Green, FG to MG VOL with occasional iron-rich and dolomitic amygdules that are subrounded to irregular shaped, 1-3 mm in diameter. Strong to moderate effervescence throughout the interval. Few dolomitic veins (2-10 mm).	uCN	40					m											
25.40	26.00	0.60				AND			Gritty volcaniclastic with strong limonitic staining on fractured surfaces. Clasts are 1-3 mm in diameter are scattered within the dark green-grey VOL.							m							Li	s			
26.00	28.50	2.50				VOL			Light grey to buff and rusty, FG to MG VOL with strong pervasive oxidation. The clasts that make up the VOL are subrounded to angular and 1-8 mm in diameter. Pyrite occurs weakly disseminated throughout with occasional semi-massive bands.							s						w					
			28.36	28.43	0.07				Abundant subrounded disseminated Py crystals (3 10 mm) show oxidized borders.												s					
28.50	29.75	1.25				CHT	AN		Black silicified chert with minor VOL and LST interbeds (2-6 cm). Py staining and veining occurs throughout the section along with a few irregular shaped Py patches.							m		SIL	s		m					

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
29.75	64.35	34.60				LST	sBX		White to grey, FG, DOL, sBX LST with cBX overprint and concentrated interbeds. Strongly cBX sections have a slightly bleached appearance. Dark grey LST clasts are silicified and angular (1-3 cm). Sparry texture becomes more evident with depth.					s		w												
			33.83	34.08	0.25				Strongly sBX DOL LST with white angular DOL clasts in a black rusty matrix with numerous infilled semi-crystalline vugs. Crystals filling vugs are blebby and appear stylolitic with a brown coating, Sm?														Sm	m			
			34.52	34.86	0.34	LST	RBL		Fault. Rubbly with gougy altered clay	FLT								CLY	s							
			37.50	37.59					White, angular BX DOL LST with 2-15 mm clasts in a black rusty matrix. Orangey brown, crystalline and botryoidal, sub-massive Sm occurs intensely throughout.														Sm	i			
			37.93	39.96																			Sm	i			
			37.96	51.00	13.04				Sm is common on fractured surfaces. It can appear oxidized, brown, or as crystalline masses on fractures or in vugs.														Sm	m			
			53.57	60.60	7.03	LST	cBX		cBX intensity increases in the LST. The interval is pale to creamy orange/rust coloured with elevated XRF zinc readings.																	
			54.86	55.47	0.61				Gougy, clay altered and sandy interval									CLY	i							
64.35	141.73	77.38				LST	cBX		Grey, FG, cBX LST with a few graphitic intervals and intermittent narrow zones of sBX. Crystalline Sm (possibly Sp?) occurs randomly throughout infilling vugs. Note: There is no visible lithological change to identify increased zinc concentration.					s				SIL	m									
			69.60	69.80	0.20	LST	GRA		Black, carbon-rich, graphitic layer. Interval is mainly granular.																	
			70.65	70.75	0.10				Interval containing vugs with infilled pale green crystalline Sm (possibly Sp?).														Sm	i			
			72.28	72.32	0.04	LST	GRA		Black, carbon-rich, graphitic layer. Interval is mainly granular.																	
			74.00	75.00		LST	sBX		Grey, FG, sBX LST with cBX overprint. Dark grey LST 'clasts' are 0.5-4 cm and angular. Stylolites commonly overprint onto sBX. Vugs contain infilled pale green crystalline Sm (possibly Sp?).					s													
			75.00	80.00	5.00	LST	sBX		Limy, pale green, botryoidal Sm infilled vugs. Crystalline Sm is also common with crystals 1-8 mm (Sp?).					s									Sm	m			

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	1.81	1.81	OVB	No recovery.
1.81	3.20	1.39	LST	sBX
3.20	7.95	4.75	MST	Fossiliferous mudstone.
7.95	50.80	42.85	LST	sBX
50.80	157.95	107.15	LST	sBX with numerous rubbly and faulted sections. Bituminous coating is common on fractures.
157.95	164.00	6.05	VOL	Volcanic with patchy and disseminated pyrite.
164.00	179.75	15.75	LEP	Chloritized volcaniclastic with altered pumice fragments.
179.75	217.28	37.53	VOL	Chloritized volcaniclastic.
217.28	229.14	11.86	SLT	Aphanitic siltstone with semi-massive pyrite in the last meter of the interval.
229.14	230.25	1.11	LST	Intermittent texture between sBX and tBX which hosts disseminated and blebby pyrite.
230.25	288.04	57.79	LST	sBX with bituminous fracture coated zones, and rubbly, faulted zones.
288.04	E.O.H.			

SAMPLES

Numbers: G285425 to G285434

Batch: 3

Date Sent: August 5, 2010

Certificate: VA10108984

COMMENTS

The hole was ended because it was past the targeted magnetic and IP anomalies.

GEOLOGY LOG

HOLE: OC-10-03

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	1.81	1.81				OVB			Overburden - No recovery																		
1.81	3.20	1.39				LST	sBX		Spotty grey, FG to MG, sBX limestone (LST) with oxidized veinlets. Vugs are scattered and some have remnant fossils enclosed. Foliation is at 50 deg TCA.	FO	50			s				SIL	s							
3.20	7.95	4.75				MST	FOS	AN	Dark grey, aphanitic mudstone (MST) with scattered fossils. White calcite bands are sparse and betweer 1-2 mm. Remnant crinoid fossils are commonly found throughout the interval and range in size from 1 to 3 mm.																		
7.95	50.80	42.85				LST	sBX		Grey to dark grey, FG to MG, sBX LST with weak to moderate cBX overprint and intermittent mudstone layers (10-40 cm). Sparry texture occurs throughout. Remnant fossil outlines are seen throughout and range in size from 1 to 4 mm. Rubbly sections signifies a possible fault.																	
			16.58	17.00	0.42		RBL		Fault? Rock fragments are buff to dark brown, granular and rubbly.																	
			32.90	34.39	1.49	LST	cBX		Moderate cBX overprint with few stylolitic bands. Bands show a preferred orientation to 40 deg TCA.																	
			35.10	45.52	10.42	LST	sBX		Pervasive sparry texture ('zebra dolomite') has a minor cBX overprint of sBX. Sparry DOL veins are between 3 to 15 mm wide and infill between dark grey LST clasts that are subrounded to angular and 4 to 8 cm thick. A dark brown/purple coating is observed on fractures. This coating produces a darl brown streak and resembles iron or hematite staining?					m											
			49.61	50.30	0.69	MST	GRA		Black to dark grey, aphanitic MST with graphitic fractured surfaces. White CG dolomite crystals are scattered throughout and range in size from 1 to 3 cm.																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
50.80	157.95	107.15				LST	sBX	St	Uniform grey, CG, vuggy LST with intermittent layers of cBX and sBX. The changes between cBX and sBX layers are very subtle. Distinct contacts between both textures are difficult to see. Numerous vugs occur throughout the intervals. Vugs are filled with crystalline calcite, disseminated pyrite, or black botryoidal pyro-bitumen, and range in size between 0.5 to 4 cm. Stylolites are small (<1 cm) and are sparse. Few rubbly sections faulted sections.					m														
			56.10	58.00	1.90				Bright green, crystalline fuchsite (1-2 mm) occurs interstitially and on fractures.													Fu	t			
			57.10	63.70	6.60	LST	GRA		Possible fault(?). The interval is rubbly and bleached white. Vugs are abundant and between 1-7 mm. Limonite and graphite are common on fractured surfaces.	FLT													Li	f			
			73.40	73.65	0.25		RBL		Fault. Section is rubble and contains subrounded dark grey pebbles.	FLT																
			82.35	82.82	0.47	LST	GRA		Semi-rubbly section with graphite coating on fractured surfaces.																	
			90.90	91.00	0.10	LST	GRA		Semi-rubbly section with graphite coating on fractured surfaces.																	
			93.05	97.00	3.95		BIT		Abundant crystalline cavities with white euhedral calcite crystals (1-3mm) and black botryoidal pyro-BIT crystals (5-10mm). Calcite and BIT crystals occur adjacent to each other, some BIT crystals appear to surround calcite crystals. The interval between 94.00 to 95.00 m is fractured and shows evidence of bleaching.	FR																
			97.00	124.00	27.00	LST	sBX		Well developed sBX texture with weak to moderate cBX overprint and common stylolites. Dark grey LST clasts become more prominent towards the end of interval. The interval between 121.92 to 123.00 m contains well preserved fossils.					m													
			124.50	135.50	11.00	LST	cBX		Light to medium grey, MG, moderately fractured LST with a well developed cBX texture. Crystalline DOL and pyro-BIT are common interstitially and on fractured surfaces..					s													
			143.60	143.65	0.05		RBL		Fault. Rubbly with grey pebbles.	FLT																
			148.00	157.95	9.95	LST	sBX		sBX LST with a lower contac at 40 deg TCA.	lCN	40			s				SIL	s							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
157.95	164.00	6.05				VOL			Light grey to light green, MG, volcaniclastic with disseminated to patchy Py throughout. A weak leopard spotted texture is gradational into the strong LEP unit below. Siderite is interstitial and common on fractured surfaces. A few hematitic stringers occur throughout.														m	Si	m	He	w	
164.00	179.75	15.75				LEP			Dark grey to green, MG, moderately magnetic LEP VOL with trace disseminated Py thoughout. Altered pumice fragments are angular to subrounded and range in size between 5 to 15 mm. There are numerous calcite veins, of which few are stylolitic. Light brown interstitial clay alteration occurs throughout. The interval is moderate-strongly calcareous.										CLY	m			t	Mg	m			
			165.40	167.50	2.10				A moderate foliation occurs at 45 deg TCA. There are few areas that show graded bedding at 45 deg TCA.	FO	45																	
			171.50	171.62	0.12				A 3 cm magnetite band at uCN. This band is followed by a dark green volcanic clast with white angular pumice(?) fragments that range in size between 1 to 3 mm.														Mg	s			
			171.62	174.35	2.73				The interval shows a strong foliation at 50 deg TCA (few areas show FO at 55 deg.).	FO	50																	
			175.00	179.75	4.75				Less prominent LEP texture with numerous calcite infilled vugs. Vugs are between 3-10 mm in size. CHL alteration becomes more prominent and increases in intensity with depth.																			
179.75	217.28	37.53				VOL			Soft, dark green, FG, intensely chloritized VOL with calcite infilled vugs. Calcite vugs are 1 to 2 mm in size. The unit is non-magnetic, slightly fractured and contains slickensides which are scattered throughout. There are few gougy and clay altered areas. Light brown sericite 'banding' occurs at 70 deg.	BN	70								CHL	60									
217.28	229.14					SLT			Pale grey, aphanitic, siltstone (SLT) with numerous calcite veins. Ca veins are between 1 to 3 mm, and dip 40 deg TCA. Py is interstitial and becomes semi-massive towards the end of the unit. Hematite staining is common on fractured surfaces.	uCN	45											t

			224.35	227.00	2.65	SLT			There are numerous oxidized shear fractures in this interval. This feature is relatively identical to the texture seen in the SLT unit in holes OC-10-01 & OC-10-02. Py is disseminated throughout. There is a light brown to buff coloured alteration that increases in intensity with depth, possibly sericite mixed with clay alteration.	FR						m		CLY	m			w					
			227.00	229.14	2.14	SLT			Pale grey to dark grey, vuggy SLT with abundant pyrite veins. Py is disseminated and in 1 to 2 mm veins in size that show no preferred orientation. From 228.60 m to 228.90 m, Py is semi-massive and mineralization continues into the dolomitic unit below. Vugs are empty, and range in shape from subrounded (1-2 mm) to linear (1-5 mm).											s					
229.14	230.25	1.11				LST	DOL		Grey, FG, LST. The unit has a unique texture not seen before in the Ocelot holes. Dark grey clasts are 1-5 mm and angular to subrounded. The texture appears intermittent between sBX and tBX. Py is disseminated and blebby, with blebs ranging in size from 5-10 mm. There are few calcite infilled crystalline vugs.											s					
230.24	288.04	57.80				LST	sBX		Grey, FG, sBX LST with moderate to strong cBX overprint. Dark grey clasts are hard, subangular to subrounde and range in size from 1-5 cm. Pyro-bitumen is common on fractured surfaces and has a slight metallic sheen. Few slickensides occur throughout interval. Sparry veins are common, with thicknesses ranging between 5 to 20 mm. Vugs are empty or crystalline and filled with dolomite and pyro BIT. Vugs range in size between 2-10 mm and increase in concentration with depth.					s				SIL	s							
			236.50	236.60	0.10	LST	BIT		Throughout these intervals, black bitumen occurs on all fractured surfaces and crystalline botryoidal pyro-bitumen occurs in 1-2 cm vugs.																	
			239.55	239.90	0.35	LST	BIT		Black bitumen occurs on all fractured surfaces and crystalline botryoidal pyro-bitumen occurs in 1-2 cm vugs.																	
			242.10	242.20	0.10	LST	BIT		Black bitumen occurs on all fractured surfaces and crystalline botryoidal pyro-bitumen occurs in 1-2 cm vugs.																	
			247.65	247.70	0.05	LST	BIT		Black bitumen occurs on all fractured surfaces and crystalline botryoidal pyro-bitumen occurs in 1-2 cm vugs.																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	3.05	3.05	OVB	Overburden.
3.05	9.80	6.75	MST	Mudstone.
9.80	81.00	71.20	LST	sBX with well preserved fossils, and bitumen-rich coating on fractures.
81.00	105.75	24.75	LST	cBX with numerous faults.
105.75	239.15	133.40	LST	sBX with moderate to strong cBX overprinting. Few tBX zones.
239.15	240.95	1.80	VOL	Sericite altered volcanic
240.95	247.80	6.85	LEP	Volcaniclastic
247.80	275.62	27.82	VOL	Chloritized volcaniclastic.
275.62	292.61	16.99	SLT	Siltstone with calcite amygdales and veins.
292.61	293.15	0.54	DOL	Dolomudstone with disseminated and blotchy pyrite.
293.15	301.75	8.60	LST	sBX. Vuggy with minor pyrite.
301.75	E.O.H.			

SAMPLES

Numbers: G285435 to G285448

Total: 14

Batch: 3

Date Sent: August 5, 2010

Certificate: VA10108984

COMMENTS

The hole was ended because it reached its targeted depth, and passed magnetic and IP anomalies.

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Galena	Sphalerite	Pyrite	Type	Intensity	Type	Intensity	
0.00	3.05	3.05				OVB			Overburden - no recovery																		
3.05	9.80	6.75				MST		FG	Dark grey to black, aphanitic mudstone with white Ca veinlets scattered throughout. Fractured surfaces show a dark reddish/purple hematite staining. The veinlets range in size from 1 to 2 mm. A gradational lower contact shows the change to the sBX LST unit below.	ICN								HEM	w							
9.80	81.00	71.20				LST	FOS	sBX	Medium to dark grey, FG to MG, sBX dolomitized LST with scattered areas of well preserved fossils. Fossils (mainly rugose corals) range in size between 5 to 30 mm. Areas with a high density of sparry veinlets 3-15 mm wide appear 'zebra-like'. Dark reddish/purple hematite staining is common on fractured surfaces. Vugs are scattered and mainly filled with crystalline DOL, or FG pyro-BIT. A subtle overprinting cBX texture mainly occurs in areas adjacent to crystalline vugs.	FO	50			m													
			10.64	10.82	0.18	LST	RBL		Minor fault? Rubbly grey LST fragments	FLT																
			17.52	17.82	0.30	MST		FG	Dark grey to black, aphanitic mudstone with dark reddish/purple hematite staining.									HEM	t							
			21.20	23.16	1.96		RBL		Fault. Grey rubbly section with rock fragments between 1-2 cm. There are few competent sections between 3-7 cm.	FLT																
			27.00	28.30	1.30	LST	BIT	cBX	BIT-rich coating on fractured surfaces. Section also shows moderate cBX overprinting.									BIT	f							
			33.85	34.55	0.70		RBL		Fault? Grey rubbly rock fragments between 1 to 4 cm.	FLT																
			38.00	38.40	0.40	LST	BIT		Moderately cBX LST with BIT-rich coating on fractured surfaces.																	
			40.60	40.85	0.25	LST	BIT		BIT-rich coating on fractured surfaces of a cBX LST.																	
			45.40	46.65	1.25	LST		sBX	Prominent sparry DOL veins in a sBX LST. Appears 'zebra-like'.	VN																
			50.00	50.05	0.05	LST		sBX	Preferred foliation at 45 deg TCA	FO	45															
			59.15	59.16	0.01	LST	FOS	sBX	Well preserved rugose fossil. Approximately 1.5 cm.																	
			60.00	61.00	1.00		RBL		Fault. Dark green to grey rubble. Rock fragments are between 1 to 3.5 cm.	FLT																
			61.00	68.00	7.00	LST	BIT		BIT-rich coating on fractured surfaces with well preserved fossils. Abundant crystalline vugs infilled with DOL and/or pyro-BIT.

			165.35	183.96	18.61		RBL		Fault. Fractured, rubbly, medium to dark grey LST fragments between 0.5 to 3 cm. There are few competent sections between 5 to 20 cm. These sections contain euhedral DOL crystals, and needle-like BIT crystals. The interval has been strongly silicified, as the rock is very hard.	FLT				s				SIL	s								
			169.00	169.50	0.50	LST	BIT		Pyro-BIT-rich coating on fractured surfaces																		
			175.00	178.00	3.00	LST		cBX	Light grey, highly fractured and rubbly section. Characteristic cBX texture is observed in LST fragments.					s				SIL	s								
			183.40	184.40	1.00	LST		tBX	Dark grey, FG, matrix supported tBX with white angular to subrounded clasts. Unique texture. Clasts range in size between 0.3 to 2.0 cm. Fractures lines on clasts are in line with or oblique to cBX fractures bounding the unit. Section leading up to and after tBX texture shows strong cBX overprinting. Clasts occupy 20-25% section. Sharp lCN and uCN.					s				SIL	s								
			192.35	192.55	0.20	LST		tBX	Dark grey, FG, matrix supported tBX with white angular to subrounded clasts. Unique texture. Clasts range in size between 0.4 to 1.1 cm. Section leading up to and after tBX texture shows strong cBX overprinting. Clasts occupy 50% of section. Clasts weakly fizz with 10% HCl. Sharp lCN and uCN.					m				SIL	s								
			195.42	195.65	0.23		RBL		Possible fault? Rubbly. LST fragments are 3 to 5 cm.	FLT																	
			196.38	196.44	0.06	LST		tBX	Dark grey, FG, matrix supported tBX with white angular to subrounded clasts. Unique texture. Clasts range in size between 0.2 cm to 1.3 cm. Fracture lines on clasts are in line with or oblique to cBX fractures bounding the unit. Section leading up to and after tBX texture shows strong cBX overprinting. Clasts occupy 50% of section and appears graded. Sharp lCN and uCN.					s				SIL	s								
			197.00	223.00	26.00	LST		sBX	Scattered vugs are filled with crystalline DOL or BIT. These vugs are dispersed throughout the section, and range in size between 0.5 to 2.5 cm.					m

			213.22	214.18	0.96	LST		tBX	Dark grey, FG, matrix supported tBX with white angular to subrounded clasts. Unique texture. Clasts range in size between 0.5 to 6.0 cm. Fractures lines on clasts are in line with or oblique to cBX fractures bounding the unit. Section leading up to and after tBX texture shows strong cBX overprinting. Clasts occupy 50% of section and appears graded. Sharp lCN and uCN.																			
			231.16	232.10	0.94	LST		tBX	Dark grey, FG, matrix supported tBX with white angular to subrounded clasts. Unique texture. Clasts range in size between 0.5 to 6.0 cm. Fractures lines on clasts are in line with or oblique to cBX fractures bounding the unit. Section leading up to and after tBX texture shows strong cBX overprinting. Clasts occupy 50% of section and appears graded. Sharp lCN and uCN.																			
239.15	240.95	1.80				VOL	SER		Grey to buff, FG to MG, altered VOL with moderate disseminated, interstitial Py. SER alteration results in a buff to yellow sheen on the core, pervasive in some areas. A few Ca veins cross the unit at 30 deg TCA. Entire section moderately fizzes with 10% HCl. The unit has been strongly silicified as it is quite hard.	VN	30							SIL	s			m	SER	m			
240.95	247.80	6.85				LEP			Spotted black and white, MG, LEP with weak disseminated Py. Py occurs in upper 2.0 m of interval. The abundant Ca spots range in size from 1 to 3 mm, and fizz strongly with 10% HCl. Numerous Ca veins crosscut the unit. A sharp lower contact occurs at 45 deg to CA.	uCN	45							CHL	m			w					
									A strong foliation occurs at 50 deg to CA	FO	50																	
247.80	275.62	27.82				VOL			Dark green, FG to MG, soft, intensely chloritized VOL. Ca rich patches occur throughout.									CHL	m								
			252.98	275.62	22.64	VOL			Vugs significantly decrease in concentration									CHL	ms								
			274.28	274.45	0.17	VOL			Qz vein with patches of dark grey to buff SER(?) alteration.	VN								SER	m				Se	m			
275.62	292.61	16.99				SLT		FG	Light to dark grey/black, aphanitic siltstone with crosscutting Ca veins and amygdules. Weak Py is disseminated throughout. Black shear fractures increase in concentration between 289.40 to 290.30 m. Numerous linear vugs are empty or lined with trace crystalline Py.													w						

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

0.00	3.05	3.05				OVB			Overburden - 50 cm recovery, DOL LST boulder																		
3.05	9.90	6.85				LST	FOS	FG	Black, aphanitic, intensely dolomitized limestone with cryptic fossils scattered throughout. The interval is moderately fractured up with dark reddish/purple hematite staining coating the fractures.	FX				i									He	s			
			5.23	5.30	0.07		RBL		Fault or cave. Rounded pebbles are between 0.5 tc 1.5 cm.	FLT																	
			6.10	6.20	0.10		RBL			FLT																	
9.90	20.44	10.54				LST		sBX	Dark to light grey, FG to MG, sBX intensely dolomitized LST with cryptic fossils throughout. White sparry veins, stylolites and a minor crackle overprinting textures are common throughout. Dark grey clasts are angular to subrounded.					i														
20.44	46.86	26.42				LST	FOS	FG	Dark grey to black, aphanitic, dolomitized limestone with well preserved fossils throughout. Sparry veins and pervasive crackling is mainly observed in white dolomitized zones. Fossils consist of Halysites (chain coral) as well as a cephalopod at 23.53 m and numerous elongate, spherical fossils.					i														
			27.30	30.99	3.69	DOL			Sparse vugs are infilled with crystalline BIT and DOL.									BIT	w							
			30.99	46.84	15.85	LST	FOS	FG	Moderately to highly fractured interval that consists of 1-4 cm angular fragments and rubbly patches.	FR				i													
			45.16	46.84	1.68		RBL		Black rubbly interval with fragments between 0.5 to 3 cm.	FLT																	
46.86	115.20	68.34				LST		cBX	Grey to dark grey, FG to MG, cBX LST with BIT-rich zones. Section contains numerous rubbly and fractured areas. BIT-stylolitic seams are common throughout.					i														
			48.20	48.77	0.57		RBL		Fault. Mainly rubbly fragments between 0.2 to 1.5 cm with a few semi-competent sections approximately 12 cm long at the centre of the interval.	FLT																	
			48.20	51.82	3.62	LST		sBX	Highly to moderately fractured section with a few competent zones with core lengths between 3 to 15 cm.	FR				i													
			51.20	51.82	0.62		BIT		BIT-rich coating on fractured surfaces									BIT	f							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			70.90	72.45	1.55		BIT		Fault. Rubbly section with a BIT-rich coating on fractures. Rock fragments are grey to dark grey, and between 0.5 to 3 cm.	FLT								BIT	f								
			79.79	82.30	2.51	LST		cBX	Highly to moderately fractured section with few competent zones.	FR																	
			89.00	91.90	2.90	LST		sBX	Very subtle sBX textures are seen in few zones. Mainly sparry veins or dark grey remnant clasts.																		
			91.90	92.00	0.10		RBL		Fault. Rubbly section with rock fragments between 0.2 to 0.7 cm.	FLT																	
			91.44	95.50	4.06	LST		sBX	Highly fractured zone. Rock fragments are angular and between 3 to 10 cm.	FR																	
			106.65	106.68	0.03		BIT		BIT-rich coating on fractured surfaces									BIT	w								
115.20	134.22	19.02				LST	tBX		Black, matrix supported, aphanitic, tBX LST with a BIT-rich coating on fractured surfaces. White to light grey breccia clasts are between 0.5 to 2.0 cm, and angular to subrounded.									BIT	w								x
			116.90	118.87	1.97	LST	BIT	RBL	Rubbly. BIT-rich coating on fractured surfaces. Matrix has been altered to black, granular, BIT-rich rubble.									BIT	m								
134.22	171.45	37.23				LST	DOL	cBX	Dark to light grey, FG, cBX, DOL LST with BIT-rich areas. Sections have been silicified, styolites and pyro-BIT seams are common throughout. Ca rimmed 1-4 mm vugs are seen sporadically throughout the interval. Unit fizzes fairly with 10% HCl when scratched.					i				SIL	f								x
									Lower contact into VOL extremely gradational with interfingering for 55 cm.	ICN																	
			147.70	148.00	0.30	LST	BIT	RBL	Dark grey to black, vFG, rubbly, BIT-rich LST interval that is extremely soft and fizzes intensely with 10% HCl. Gradational contacts into surrounding DOL LST									BIT	m								
			150.94	151.18	0.24	LST	BIT		Pyro-BIT present on FX surfaces, as a bright grey/silvery colour with a bulbous structure that occurs with crystalline DOL. The material is soft and weakly reacts with 10% HCl.									BIT	m								
			152.40	155.50	3.10	LST	DOL	RBL	Light grey to buff, FG, bleached DOL LST. Very rubbly with a light orange alteration on the FX surfaces (slight OX? slight Sm?) FX surfaces have a buff, powdery coating. Overall, silicified and weakly reacts to 10% HCl. Small vugs are present throughout interval ~1 mm-1 cm in size. Gradational contacts.							w		BLE	m								
																		SIL	m								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other	
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Galena	Sphalerite	Pyrite	Type	Intensity	Type	Intensity	
			160.51	160.67	0.16	DOL			Medium-grey, CG, DOL crystals with a black bituminous matrix. Crystals ~ 1-2mm. DOL crystals make up 80% of section, 20% BIT-matrix.									BIT	m								x
			169.38	171.45	2.07	LST	DOL		White, CG DOL VN ~10-20 cm thick with no preferred orientation. BIT coating present on FX and in wisps throughout VN	VN			5													x
171.45	173.61	2.16				VOL	SER		Medium grey-green FG, FO, SER VOL. Small (1-3 cm) DOL VNs occur throughout the interval. Trace vFG Py seen along FO, and disseminated FG Py occurs sparsely throughout. Orange-buff wisps seen throughout (SER?). Fuchsite also present in trace amounts	FO	40							SER	s			t	Fu	t			
									Ca VN (1-3cm thick)	VN		240	3														
									Sharp contact back into cBX DOL LST	lCN	20																
173.61	174.74	1.13				LST	DOL	cBX	Dark to medium grey, FG, cBX DOL LST with BIT coating on FX surfaces, along with BIT seams throughout interval. First half of interval more BIT-rich and more rubbly					s				BIT	f									
174.74	225.55	50.81				LEP			Light to dark grey, FG, volcaniclastic LEP unit. Clay-alteration is pervasive throughout. Fizzes intensely with 10% HCl due to Ca patches within. FO is present throughout the unit, being far more evident in some more banded regions. The foliation ranges from 25-60 deg TCA. FG, dull-brownish Py occurs at the top of the interval primarily following the FO, but also disseminated throughout. Trace fine patches/smears of fuchsite are present at the top of the interval. A few sections down interval having little to no Ca patches are present.	Fo	40										w	Fu	t			
									uCN is sharp - defined at 20 deg TCA	uCN	20																
			175.27	176.72	1.45	LEP	CLY		Light grey, bleached, strongly clay altered LEP. Extremely soft. Sharp uCN, gradational lCN.	uCN		80						BLE	s								
			177.35	178.65	1.30	LEP	CLY		Light grey, bleached, strongly clay altered LEP. Extremely soft. Gradational uCN, sharp lCN. Towards lCN, rock becomes more competent with lots of vugs.	lCN		50						BLE	s								
			178.65	180.15	1.50	LEP			Strongly bleached LEP - Light grey to buff in colour									BLE	s								x
			187.48	188.00	0.52	LEP	RBL	CLY	A significantly more broken up and rubbly section made up to angular fragments 0.5-3 cm in diameter. Clay alteration is present on FX surfaces.																			

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

The hole was ended because it was passed the target depth.

GEOLOGY LOG

HOLE: Rau-10-100

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.93	3.93				OVB			Overburden - no recovery																		
3.93	83.74	79.81				LST	DOL	BX	Light to dark grey, variably sBX to mottled "camo" BX, FG to CG, intensely DOL altered LST. Weak OX and SID alteration with trace LIM alteration present, locally increasing in intensity. Trace calcareous fizzing is present along fractures and vugs throughout. Trace fossils are present with depth.					i		w	w	LIM	t								
			3.93	46.97	43.04	LST	DOL	BX	Light to dark grey, CG to FG, intensely DOL altered LST. A white, toothy spar "matrix" supports medium to dark grey "clasts". Fair SID alteration present, VT's of rusty brown siderite crosscut BX textures with Fe staining of LST. Trace stylolites are present throughout cross cutting sBX textures. Fe staining of white matrix minerals increases with depth.					i			f										x
									FO is defined by moderate orientation of BX clasts, oriented 70 to 85 degrees TCA.	FO	75																
									SID VT, dark brown-red with an earthy lustre, 3 mm wide. VT's appear in clusters oriented 25 degrees TCA, 180 degrees to FO and are found at 28.00 and 30.20 m.	VT	25	180														
									Brown-red SID VT, 4 mm wide, 50 degrees TCA, 0 degrees to FO at 30.11 m.	VT	50	0														
									Sinuous, narrow CG Ca VT oriented 20 to 30 degrees TCA, 180 degrees to FO exhibiting a vuggy texture and crosscuts above VT at 30.11 m.	VT	25	180														x
									Sinuous, MG, vuggy Ca VT with a SID altered selvage. MG, sparry Ca partially infill's veinlet void, 3 mm to 1.5 cm wide, oriented 20 degrees TCA and 120 degrees to FO and is found at 31.22 m.	VT	20	120														

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			46.97	52.68	5.71	LST	OX	RB	Rusty red-brown to medium grey, FG to CG, strongly OX, strongly SID altered intensely DOL altered LST. Core is competent to rubbly, poor recovery of core is evident where OX/SID alteration is strongest. sBX textures are exhibited where not overprinted/obliterated by strong OX/SID alteration. Where OX/SID altered, core appears from competent blocks to coarse, subangular rubble >3 mm in size. Trace white and colourless prisms of Qz are found in OX altered rock. ICN and uCN are gradational, defined by the extent of pervasive alteration of host LST.					i		s	s										
									A lack of common fabric or orientation precludes an FO measurement.	FO	n/a																
			52.68	65.11	12.43	LST	DOL	BX	Dark grey to white, FG to CG, intensely DOL altered, variably sBX LST with weak Fe staining near uCN. Fe staining decreases with depth. Dark to medium grey clasts are supported by a CG, white sparry matrix.					i			w											
									FO is generally absent, but where present is defined by BX fabric orientation, 65-70 degrees TCA.	FO	70																
			65.11	73.86	8.75	LST	DOL	MO	Medium to dark grey, FG to MG, fairly fossiliferous "camo" BX, intensely DOL altered LST. Fossils are generally present up hole, becoming trace with depth, a gastropod fossil is found at 70.98 m. Uphole fossils include rugose and halycites fragments with crinoid stems. Rock is most fossiliferous at 62.01 m, becoming halycites-rugosa-crinoid wakestone in composition. 10% of unit is composed of fossils.					i														x
									FO is defined by MO texture, oriented 65 to 80 degrees TCA.	FO	70																
									Numerous narrow, CG Ca stringers loosely follow FO, <2mm wide.	VT	70	0															
			73.86	74.53	0.67	LST	DOL	CG	Medium to light grey, intensely DOL altered LST (skeletal tempestite?). Grains are light coloured, up to 1 mm in size (fossil fragments?) with trace Py present as bright yellow blebs <2 mm in size. Trace vugs exhibit toothy DOL crystals <2 mm in size on cavity walls.					i														
									FO is defined by grain orientation, 70 degrees TCA.	FO	70																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			74.53	82.77	8.24	LST	DOL	BX	Dark to light grey, FG to CG, variably BX, weakly FOS, intensely DOL altered LST. Rock is variably mBX to MO in texture, becoming increasingly MO with depth. Where mBX, darker clasts are supported by a white, sparry matrix. Generally, texture is convolute BX "clasts" (bioturbitation?) where MO. Brown and dark grey, FG mud interbeds become present with depth approaching lCN. Fossils present are brachiopod, gastropod and crinoid fragments, usually where rock exhibits MO textures.					i													
									FO is defined by BX orientation and fabric, 65-90 degrees TCA.	FO	75																
			82.77	83.04	0.27	LST	DOL	CG	light to dark grey, CG to FG, intensely DOL altered LST with narrow, <1 mm ruddy-red VOL interbeds. One-hole crinoid fragments are present (crinoid packstone?). lCN is convolute, defined by a white, toothy Ca VT between this and lower unit.					i														
									FO is defined by the orientation of VOL interbeds, 80 degrees TCA.	FO	80																
									White, sparry CG DOL-Ca VT, lacking uniform orientation, 4 mm wide and defines lCN of CG DOL altered LST above.	VN	n/a															
			83.04	83.74	0.70	LST	DOL	FG	Dark grey, FG, weakly MO LST with dark, undulose, sub-stylolitic dissolution bands throughout. Weak interbeds of dark to medium grey, MG LST are present.					i														
									FO is defined by dissolution bands, 60 to 80 degrees TCA, generally steep throughout.	FO	75																
83.74	96.10	12.36				DOL		CG	White to medium grey, CG to FG, variably deformed, crystalline, intensely DOL altered LST with FG, bleached cBX LST interbeds throughout. FG interbeds have convolute boundaries with CG, crystalline DOL (relict sBX?) Weak Py MX is present as dull, grey-yellow blebs and as a second phase of bright, MG disseminations. Po blebs <6 mm with narrow CHL selvages are associated Qz nodules present in crystalline DOL. Trace favocitid coral fragments are present. A sBX texture becomes dominant with depth.										w		t						
									A lack of common fabric or orientation precludes an FO measurement.	FO	n/a															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
96.10	116.81	20.71				VOL		BN	Medium to dark green, FG to CG, variably magnetic, variably SER and CHL altered, banded VOL. lCN is sharp, defined by Py band oriented 70 degrees TCA. Py MX is variable, generally fair throughout, present as FG disseminations to banded masses. Trace fuchsite is associated with SER alteration.									SER	s	f			Fu	t			
																		CHL	s								
			96.10	100.81	4.71	VOL	SER	BN	Creamy olive green to brown, FG to CG, strongly SER altered, weakly BIO altered VOL with fair Py MX. SER alteration preferential to bands with BIO alteration often rimming the periphery of SER alteration to forming narrow dark brown bands. Py MX is present as dull, grey-yellow, FG to CG, subhedral crystals forming narrow wisps to 5.9 cm wide bands/masses. Trace FG Po is seen replacing Py. Rock is variably magnetic, less so in SER bands.									SER	s	f		t	Fu	t			
																		BIO	w								
									A strong FO is defined by banding, oriented 70 degrees TCA.	FO	70																	
			100.81	106.95	6.14	VOL	CHL	BN	Black to green, FG to CG, magnetic, strongly CHL altered with trace SER, banded VOL with trace Py MX. Py is present as MG cubic disseminations variably exhibiting exsolution textures, relict Py textures are replaced with white calcite. Lenses and bands of dark VOL (magnetite pebble conglomerate?) throughout. lCN is sharp, defined by a SER altered band below a dark (BIO?) band, oriented 75 degrees TCA.									CHL	s	t			Mg	f			
																		SER	t								
									A strong FO is defined by banding, oriented to 70 degrees TCA.	FO	70																	
			106.95	108.31	1.36	VOL	SER	BN	Olive-yellow to green-brown, FG to CG, intensely SER altered VOL with moderate-strong SIL alteration. Trace Py is present as narrow, ~1 mm bands to rare disseminations of bright yellow subhedral crystals. VOL is magnetic throughout.									SER	i								
									FO is defined by banding, 80 degrees TCA	FO	80							SIL	ms								
									White, CG Qz-Py-Ak VN, with CHL rims around blebs of bright yellow Py. VN is oriented 70 degrees TCA, 0 degrees to FO.	VN	70	0

			108.31	116.81	8.50	VOL	SER	BN	Olive green to brown, FG to CG, strongly SER altered, moderately BIO altered, variably magnetic, banded VOL. Moderate magnetite MX is present as MG disseminations to narrow bands. Weak Py MX is present as dull, FG to MG blebs to small bands up to 3.1 cm wide. Trace Po appears as disseminations uphole where BIO alteration is most strong. Trace bright green small ~1 mm smears of Fu are present with SER alteration. SER alteration is more pervasive while BIO alteration is less so with increasing depth. lCN is sharp, defined by a Py band oriented 70 degrees TCA.									SER	s	w		t	Mg	m	Fu	t	
																		BIO	m								
									FO is defined by banding, oriented 70 degrees TCA.	FO	70																	
									Py-Ca-Qz VT, 1.9 cm wide, oriented 30 degrees TCA, 180 degrees to FO, composed of bright, coarse Py with orange-pink Ca and translucent grey Qz at 109.74 m.	VT	30	180																
									CG Py-Ca-Qz VT at 110.53 m, bright euhedral Py is present with orange-pink Ca and grey Qz. Coarse, cubic Py is present in VT selvages, up to 12 cm away from VT margins.	VN	50	180																
116.81	134.06	17.25				DOL	MX		White to dark grey, variably recrystallized, CG DOL with As and banded Py MX. Dark, FG, DOL alt LST interbeds are present uphole and become absent with depth. Py is FG, dull grey-yellow forming bands to masses. As is present as CG, euhedral crystals, metallic silver grey in lustre. Py is present in both the hydrothermal CG DOL and in the FG, DOL altered LST interbeds. Where not CG crystalline DOL, LST exhibits variable sBX textures (karst prep for MX?).					i									m	t					
			116.81	117.87	1.06	DOL	MX	BN	White to medium grey, CG crystalline DOL with banded Py MX and CG As. Narrow clay altered, FG, light brown VOL interbeds are present throughout. Intense Py MX is present as dull yellow, FG to CG subhedral crystals forming bands commonly oriented together. As is present as CG to MG, bright euhedral crystals diminishing in grain size and occurrence with depth. CNs are sharp, defined by Py bands oriented 70 degrees TCA.					i									i	m					

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									FO is strong, defined by Py banding, 70 degrees TCA.	FO	70																
			117.87	120.37	2.50	LST	DOL	FG	Light to dark grey, FG, variably bleached, weakly BX, intensely DOL altered LST with weak Py MX. Subunit is generally FG, dark LST unless where BX; a white sparry CG matrix defines BX textures. Py is present as dull yellow "shotgun" masses approaching lCN in dark, FG DOL altered limey muds, sometimes with trace stylolites.					i							w							
									FO is weak, defined by dissolution textures, 75 to 80 degrees TCA.	FO	75																	
			120.37	122.78	2.41	DOL	MX	CG	Light to medium grey, CG, crystalline DOL with moderate Py MX. DOL crystallization is variable, some dark, FG DOL altered FG "clasts" are present and do not exhibit coarse recrystalization textures. Orientation and boundaries of dark LST clasts are irregular, sometimes exhibiting sBX textures (karst prep for MX?). Py is present as dull, greenish-grey-yellow blobs in DOL to shotgun masses in dark LST. Trace TLC alteration is associated with Qz. Qz nodules (veining?) are intermittent throughout.					i				TLC	t	m							
									A lack of common fabric or orientation precludes a FO measurement.	FO	n/a																
			122.78	129.03	6.25	LST	DOL	BX	Dark to light grey, intensely DOL altered, FG to CG LST with fair CG DOL recrystalization. Generally, sub unit is dark grey LST moderately sBX in texture. Weak Py MX is present as FG, nebulous clouds to blobby masses. Trace Po is associated with Qz, rimming to replacing Py. Trace TLC alteration is present along Qz veinlet selvages.					i				TLC	w								
									A weak FO is defined by weak bedding in LST clasts, oriented 85 degrees TCA.	FO	85																
									Qz veining is shallow and undulose, and only skirts, never cross cuts the core axis. A general orientation of 10 degrees TCA is measured, no thickness measurements can be taken.	VN	10

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			129.03	134.06	5.03	LST	DOL	CG	White to medium grey, discontinuous bodies of crystalline DOL with lenses of bleached sBX LST hosting weak sulphide MX. The subunit is split 50/50 between crystalline DOL and LST. Bleaching of LST increases with depth. Weak Py and As MX is present, As is found as a large CG mass at 130.51 m. Py is present as FG clouds bounding the As mass, to MG disseminations throughout. Trace Po is present as blebs where Qz is seen.					i						w	w	t					
									A lack of common fabric or orientation precludes a FO measurement.	FO	n/a																
134.06	169.81	35.75				DOL	MX	BN	White to medium grey, CG to MG, crystalline DOL with banded Py MX, weakly vuggy in appearance throughout. Intense Py appears as dull, FG grey-yellow Py bands 1 mm to 8.0 cm wide to CG subhedral masses which exhibit overprinting by trace Po. Trace CG, As is intermittent throughout, forming trace masses of euhedral crystals. Trace Bi is present as large, bright silver, soft crystals proximal to Qz nodules (Qz veining?). Trace soft, pearly plates of talc from TLC alteration of DOL is associated with Qz MX (appearing as convolute veins? geometry is difficult to recognise). lCN is abrupt, trace narrow clay altered "VOL" bands are present over lower 7 cm of unit before reaching lCN defining Py band oriented at 70 degrees TCA.					i				TLC	t	i	t	t	Bi	t			x
									A strong FO is defined by Py banding, oriented 60 to 80 degrees TCA, generally around 70 degrees,	FO	70

169.61	250.42	80.81				LEP		MO	Brown to grey, FG to CG, mottled LEP, variably supported by a white, FG calcite matrix with intermittent, variable lenses of soft, dark FG noncalcareous rock. A weak BN texture is exhibited by dark, FG, narrow, 1 mm wide sericite altered layers 3 mm to 4.5 cm apart. With depth, the white calcite matrix diminishes and rock becomes darker. Weak SIL alteration is associated with Qz veining. SER alteration is intense below uCN over 1.65 m, below that SER is associated with Ca-Qz veining and fractures. Trace Py and Po are present as vFG disseminations, rare throughout. At times, rock exhibits strain/deformation, some sinuous and offset textures indicate weak shearing.									SER	w	t		t						x
									FO is defined by a weak banded texture and mottled orientation, 70 degrees TCA up hole, increasing to 80 degrees but decreasing in strength with depth.	FO	75															
									Translucent grey and white, CG, Qz-Ca vein oriented 70 degrees TCA, 180 degrees to FO. The VN is 5.2 cm wide with sharp margins.	VT	75	180															
									White, CG Ca vein, 9.7 cm wide with a sparry texture. Wide, "baked" selvages up to 76 cm occur on either side of the vein with intense, soft, olive green clay SER alteration of LEP up to 17 cm from the vein margin. The vein is located at 206.70 m.	VT	40	180															
			206.70						White, CG Qz-Ca VN with dark clasts of LEP (?) incorporated into vein material. Weak wisps of CHL are present within vein, interstitially between Qz and Ca. Narrow, soft, dark brown Bi selvages extend 6 mm from vein margins. Vein is located at 212.00 m and is 31 cm wide.	VN	80	n/a															
			211.30						Narrow, MG Ca-Qz VT, 3 mm wide at 211.30 m, oriented 15 degrees TCA, 180 degrees to FO, with trace Po, moderate Py and moderate-strong Cp MX, all present as subhedral, irregular blebs contained within vein margins.	VT	15	180															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			220.60						White, translucent, CG Qz-Ca VT's, 3 at 220.60 m, 4.7 to 6.9 cm wide. Veinlets are oriented 75 to 85 degrees TCA and 180 degrees to FO. Trace euhedral Po crystals are present in uppermost VT. Where VT's are more Ca rich, VT selvages exhibit strong SER alteration. Lower-most VT is 75% Ca; its selvage is strongly SER altered and 6.2 cm wide. Upper VT's are more Qz rich and do not exhibit SER altered selvages.	VT	75	180										t					
									Creamy white-yellow Ca VT's with grey greenish yellow SER/clay altered selvages, oriented 70 to 75 degrees TCA and are 2 to 3 mm in width. SER alteration is present up to 2.5 cm from VT margins. A lack of foliation in host rock precludes measurement to FO.	VT	75	n/a															
			248.53	250.42	1.89	LEP	BIO		Brown to medium grey, FG to MG, strongly BIO altered LEP. Fair Py MX is present as dull grey-yellow, FG to MG crystals forming cloudy masses up to 9.9 cm wide and as blebs to FG disseminations throughout. SER alteration of Ca VT's appear soft, grey-green in colour. The rock becomes grey gradationally over 30 cm and Py occurs preferentially in these grey zones. The There is a gradational lower contact with dark grey tabular crystals (40% concentration). Rock is blocky at 250.42 m, but a sharp transition from LEP to SHL is seen on a core fragment.	CN							BIO	s	f						
250.42	251.21	0.79				SHL	SIL	FG	Black, FG to MG, weakly bedded with light grey silts, Py MX, moderate-strongly SIL altered SHL. SIL alteration is present below 250.71 m. Strain is exhibited by convolute, sinuous to curvilinear fabric in bedding planes. Py MX is present as dull, grey-yellow amoeboid masses up to 4.4 cm in size to vFG wispy bands. lCN is sharp, defined by a shale bed above BX textures, oriented 65 degrees TCA.	CN							SIL	ms	ms						
									A weak FO is present, defined by bedding fabric in the shale.	FO	65															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
251.21	393.65	142.44				LST	DOL	BX	Light to medium grey, intensely DOL altered, variably SIL altered, cBX LST with trace Py and graphite mineralization. The LST has a "shattered", cBX texture throughout. DOL alteration is pervasive, rock does not fizz unless scratched. SIL alteration is variable throughout (selvages of Qz veining?), often exhibiting a hardness greater than expected for DOL altered LST.					i				SIL	ms	t			Gr	t			x
			260.60	262.52	1.92	LST	RBL	BX	Medium to light grey, intensely DOL altered, weakly rusted, BX LST. Rock is rubbly to blocky throughout, clasts are >5 mm in size. Fe staining of rock increases with depth, trace HEM alteration is present on rare fracture surfaces.					i				SIL	m									
																		LIM	w								
																		HEM	t								
									A shiny, dark grey slickensides surface on a block of core oriented 0 degrees TCA with narrow, 1-2 mm lineations.	SS	0																
			289.60	316.09	26.49	LST	DOL	BX	White to medium grey, intensely DOL altered, strongly SIL altered, variably BX LST. cBX overprints sBX textures throughout. Rock is harder than usual, some silica rich nodules are intermittent throughout. Trace yellow-rust LIM staining is exhibited on fracture faces. At times, rock appears mottled with white crystals against a medium-grey "matrix" (relict solution textures? recrystalization?) overprinted by dark, FG cBX. White crystals variably exhibit cryptic sparry, CG textures throughout. cBX textures increase in intensity with depth becoming mix in texture in a few local instances only a few cm in width. Trace red Sp MX is hosted within Ca VT's throughout interval.					i				SIL	s				Sp	t			
																		LIM	t								
									Foliation is weakly defined by intermittent cBX orientation, 40-55 degrees TCA.	FO	50																
									Translucent, light grey Ca VT's with red Sp mineralization, 1 to 3 mm in width, oriented 45 to 60 degrees TCA and 0 degrees to FO. VT's crosscut to follow cBX fractures, approximately 1 per m.	VT	50	0	1													
									A translucent, CG, Qz-Ca-Sp VT at 300.48 m is oriented 50 degrees TCA, 0 degrees to FO.	VT	50	0														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			319.62	326.81	7.19	LST	DOL	BX	Light to dark grey, FG to CG, variably brecciated, intensely DOL altered, strongly SIL altered LST. Relict sBX textures exhibit overprinting by cBX textures. Dark to medium grey sBX clasts are supported by CG, white to light grey matrix. In general, rock is harder than typical DOL LST throughout, with amorphous nodules up to 4 cm in size. SIL/chert nodules appear more often in dark sBX clasts than in lighter matrix. cBX appears variably throughout as dark, fine crackles which at times can appear mBX over a few cm locally.					i				SIL	s									
									A Weak FO is defined by sBX clast orientations, 45 to 60 degrees TCA. Generally FO is 50 degrees throughout where an FO is present.	FO	50																
									Translucent grey, CG, undulose Qz vein, 1.0 cm wide with narrow, < 1 mm calcareous selvages found at 220.34 m. The VT does not crosscut the core axis and is oriented generally 20 degrees TCA and 220 degrees to FO.	VN	20	220															
			335.72	339.85	4.13	LST	DOL	BX	Medium to light grey, FG to CG, intensely DOL altered, moderately SIL altered, tBX with intervals of sBX LST. cBX textures are present, preferentially overprinting sBX, and less so for tBX. Trace Py is present as dull, FG blebs up to 8 mm in size, Py MX is solely contained to tBX textures. tBX exhibits a medium to light grey, FG to MG matrix supporting dark, angular to sub rounded clasts 1 mm to 2.0 cm in size. Where sBX, a light grey to white CG matrix most readily overprinted by cBX supports medium to dark grey clasts typical of sBX textures on the property. Contacts between sBX and tBX textures are sharp and very irregular lacking a common orientation throughout. Trace graphite nodules can appear along tBX-sBX contacts.	CN				i				SIL	m	t			Gr	t			x
									A weak FO is defined by tBX clast orientations, 30 degrees TCA.	FO	30																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			339.85	340.41	0.56	VOL	SER		Grey yellow to grey-blue, FG to MG, weakly banded strongly SER altered VOL with moderate Py MX throughout. A weak banded appearance comes from narrow, ~1 mm Py and clay alteration wisps commonly oriented with the FO. Py is occurs as dull, FG to MG bands 1 mm wide to disseminations throughout, sometimes a dark grey halo is exhibited surrounding Py grains. lCN and uCN are sharp, uCN is oriented 80 degrees TCA, the lCN is irregular with a general orientation of 40 degrees TCA.	CN								SER	s	m						x
									Defined by weak banding in the rock, the FO is oriented 35 to 50 degrees TCA, generally on the steeper side of that range.	FO	45															
			340.41			LST	BLE	BX	Light grey, MG intensely DOL altered, intensely bleached, moderately SIL altered cBX LST with irregular dark VOL masses throughout. A dark cBX texture is pronounced against light, MG core. Bleaching is pervasive throughout (relict MBL alteration?). SIL alteration is present in fracture selvages and as dark, cherty nodules throughout. Where cherty, white, MG euhedral dolomite crystals are often disseminated throughout chert. Narrow, irregular, FG, soft, black VOL (XRF yields high K and Ti measurements)layers are intermittent throughout and host vFG Py disseminations to leticular blebs. A light grey, soft, clay altered VOL layer (similar to subunit above) from 341.66 to 341.88 m hosts FG Py along its margins. cBX textures decrease with depth, sBX textures become more pronounced with depth.					i				SIL	ms	t						x
									FO is defined by cBX orientation, 40 to 50 degrees TCA.	FO	45															
									Translucent to white, CG, Qz-Ca-Sp VT, 7 mm wide, oriented 25 degrees TCA and 270 degrees to FO is found at 344.53 m.	VT	25	270

COMMENTS

The hole was ended because it was past the favourable oxide horizon. The hole was lined with PVC to be used in a later density survey.

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.55	2.55				OVB			Overburden - no recovery																		
2.55	28.59	26.04				LST	FOS	FO	Light to dark grey, FG fossiliferous LST with brachiopods, favosites and crinoid wackestone with packstone intervals. The unit is very broken, generally along FO, becoming more competent down-hole. Bands of FG black mud rich LST, are locally altered orange-brown colour. Ca VT follow FO. lCN MBL altered.	FO	30							MBL	t								
			2.55	11.90	9.35	LST	FOS	FO	Light grey packstone to wackestone, with crinoids and unidentifiable fossils up to 1 cm, averaging 0.2 cm. Intervals of FG medium grey LST with dark red grey angular patches and no visible fossils are up to 80 cm long and have sharp contacts at various angles, accompanied by orange altered layer.																		
			11.90	15.20	3.30	LST	MBL	FO	Light grey, FG, white and black spotted weakly MBL LST with no recognisable fossils. FO is defined by medium grey vFG layers. The first 80 cm has mud rich layers ~ 0.5 cm wide, altered orange-brown. The lCN is very gradational.									MBL	w								
			15.20	23.74	8.54	LST	FOS		Medium to dark grey, wackestone with brachiopods, crinoids, locally in packstone concentrations. Intervals of FG fissile, foliated, non fossiliferous black mud occur up to 1 m long. The interval is locally weakly oxidized a medium orange brown colour.						w												
			20.27	23.74	3.47	LST	FOS		Favosites rich horizon; ~50% of interval identifiable as favosites. Irregular FO defined by FG black mud rich interlayers.																		
			23.74	27.15	3.41	LST		FO	Medium grey FG LST, with a decreased and unidentifiable FOS content. FO is defined by medium grey and dark grey interlayers. The rock is more competent than the above intervals.																		
			27.15	28.59	1.44	LST	MBL		Gradational lCN between LST and VOL is identified by moderate to intensely MBL alteration of the LST. The marbleized LST is light grey to white in colour with interlayered light orange brown altered VOL layers up to 10 cm thick. The interval becomes more MBL altered and VOL rich down interval. lCN is irregular, with VOL layers cutting through MBL.	ICN								MBL	i								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
28.59	59.34	30.75				VOL		FO	Blue grey FG VOL, becoming green grey SER altered at depth. The unit has Ca VT, generally following FO and a variable concentration of Ca spots < 0.5 cm making VOL fizz variably with acid. Zones of brown Bi rich VOL occur up to ~50 cm long. Ca VT are associated with trace Py. The unit is locally magnetic. Fractures contain oxidation stain towards the lower contact.	FO	30					t		SER	w				Mg	w			
			28.59	30.20	1.61	VOL	OX		Transitional unit from intense OX to trace OX in grey blue FG VOL. OX is light orange to brown, fissile, and intense for first 30 cm, grading into layers ~0.5 cm thick following FO.							f											
			40.83	42.70	1.87	VOL	Mg	FO	Banded blue-grey, buff to orange and black fairly SER altered and trace OX. Black magnetic disseminated spots and layers occur throughout.	FO	30					t		SER	f				Mg	f			x
			42.65	42.70	0.05				Oxidized orange-brown Ca VT's which alter wall rock to a buff colour for ~ 2 cm on either side. Trace Py is disseminated throughout.	VT	45	80				t				t							
			44.85	45.59	0.74	VOL		CGL	Green- blue grey FG weak SER VOL with black and blue-green coloured clasts, elongate along FO. Qz/Ca patches occur throughout, particularly in first 5 cm, and are associated with trace Py.	FO	30							SER	w	t							
			46.33	47.18	0.85	VOL	BIO		Dark brown to orange brown VOL with intense BIO and intense to weak OX alteration with fair SER locally. The first 25 cm are rubble (intense OX) with decreasing OX down interval. OX associated with Qz/Ca VT.	FO	30					m		BIO	i								
									Qz/Ca VT, both with FO and at 170 TFA.	VT	35	170						SER	f								
			48.77	52.62	3.85	VOL	SER	CGL	Green grey, FG, weakly fizzing SER altered VOL CGL with elongate clasts of white and black carbonaceous material and Qz < 1 cm long. CN gradational.									SER	s								
																				BIO	w							
			52.62	54.30	1.68	VOL	BIO		Dark brown BIO altered VOL, with a slight sparkle and brown streak and weak CGL texture. Most clasts occur near contacts with SER VOL. Ca clasts and orange brown non calcareous clasts are elongate and approximately 2 cm long. Ca spotting occurs throughout and is slightly orange-brown in colour. 4 cm thick Qz/Ca VT cut the unit and have a SER alteration rim. uCN is marked by a sharp decrease in SER across thin Ca VT's.									BIO	i								
									Ca VT set, overprints and offsets the foliation locally	VT	40	280	9														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			54.30	57.56	3.26	VOL	SER	CGL	Green grey to green brown SER altered VOL with gradational BIO alteration (strongest at CN). Elongate clasts of Ca, light green SER altered VOL, weakly calcareous dark grey and purple grey rock. Clasts up to 7 cm long, averaging 1 cm.									SER	s									
																		BIO	f								
			57.56	59.34	1.78	VOL	BIO		Dark brown BIO altered VOL, with light yellow to white disseminated Ca spots. Sometimes associated with the SER alteration are Ca VT. OX is moderate near lCN, trace overall, following FO.	FO	30					t		BIO	i									
									Ca VT's associated with SER alteration.	VT	50	280	2					SER	w									
59.34	60.70	1.36				MBL		FO	Light grey, FG, MBL with dark grey FG layers ~ 0.5 cm thick partially altered light orange alteration layers. Qz/Ca patches occur throughout along with.	FO	30																
60.70	68.81	8.11				LST	MBL		Weak to intense MBL LST, mostly moderately strong with light grey with medium grey overprinted looking seams defining FO.	FO	25							MBL	ms								
68.81	143.22	74.41				LST	FOS	FO	Medium grey FG, FO, fossiliferous LST. Mudstone to whakestone in composition with some intact fossils. Trace Po MX throughout, and thin Ca VT and vFG black layers define FO. Irregular black and white spotted Ca layers with vertical white Ca/Qz filled lines are locally common (irregular veining?). Local OX alteration increases in intensity down	FO	30					t							t						
			68.81	76.61	7.80	LST	FOS	FO	Medium grey LST that is rich in white and black spotted layers and patches, some with white Ca vertical lines. FO defined by Ca VT and black layers Crinoids, chain coral, and unidentifiable FOS occur throughout.	FO	30										t						
			76.61	82.04	5.43	LST	FOS	FO	Significantly fewer white and black spotted layers and an increase in chain coral with an introduction of rugosa. Trace crinoids visible on some fracture planes.	FO	30										t						
			82.04	92.19	10.15	LST	FOS	FO	Very broken interval with OX alteration on some fractured surfaces. There is an increase in black/white spotted layers (VT?). Rugosa, bivalves, crinoids occur throughout while Halycites does not occur. Gradational lCN to less broken core with fewer black/white spotted layers.	FO	30					t					t						

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			92.19	101.19	9.00	LST	FOS	FO	Particularly fossiliferous interval with increased concentration of rugosa, crinoids and bivalves. Large black/white spotted layer with white Ca/Qz vertical layers occurs within. Trace OX alteration occurs on fractured surfaces.	FO	30					t						t						
			101.19	112.12	10.93	LST	OX		Medium grey LST with decreased fossil content, and orange brown alteration in layers < 0.5 cm wide following FO. Gradational increase in OX down interval.	FO	35					w					t						x
			112.12	122.01	9.89	LST	OX		Increase in OX of LST, with pervasive alteration of core through < 5 cm, and following FO. Core more broken than above. Trace Po, and oxidized spots 9which may be Po).	FO	50					ms					t						
			122.01	138.66	16.65	LST	OX		Gradational contact to FG black LST with trace crinoids and finely spaced OX layers following FO. Intense OX zones ~ 50 cm long, and through last 3 m of interval, are orange brown to medium brown clay to grit. MG OX spots may be Po. FX on Fracturing occurs along the FO.	FO	65					s											
			138.66	143.22	4.56	LST	OX		Medium grey FG LST, less OX than above interval. uCN is intensely OX for 3 m with uncommon medium brown colour. OX alteration occurs as FO following layer < 5 cm thick, orange brown to orange red. Zones < 10 cm thick of intense MBL, weak MBL overall. Fossils unidentifiable, and compose ~ 2% of interval.							m		MBL	w								
									FO is irregular; 70 to 90 degrees.	FO	75																
143.22	146.12	2.90				LST	MBL		Light to medium grey, FG intense MBL LST with orange brown OX alteration pervasive through core becoming gradationally stronger toward lCN. Dark brown thin seams in intense OX and black seams in weak OX define FO.							ms		MBL	i								
									FO is irregular; 35 degrees in OX, and 70 degrees in unoxidized.	FO																	
146.12	204.83	58.71				VOL	Cl		Blue green grey to brown FG VOL. Variably fizzes in 10% HCl, locally magnetic, largely in trace amounts. Ca VT abundant. Soft, chlorite altered, with sections of intense Bi alteration and OX alteration toward alternating lCN.							f		BIO	w								
									VOL intensely OX, with interval of LST within VOL.	lCN																	
			146.12	148.15	2.03	VOL	BIO		Dark brown, intensely BIO altered soft and FG VOL. Gradational lCN with Cl altered VOL below. Ca VT's increase in abundance ad become more irregular.	FO	45							BIO	i								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			204.83	207.00	2.17	OX	LST		Orange brown, calcareous, moderately strongly OX LST. Weak light orange OX zones in moderately MBL LST. Where solid the LST is overprinted by a fair dark brown cBX network. Overall the unit consists of clay to cohesive weak OX core.							i		MBL	m								
			207.00	209.40	2.40	LST	Ca		vCG light grey Ca with zones of FG strong MBL LST < 5 cm long. First 1 m medium to light grey, very altered, easily broken core to clay with orange brown alteration in patches, and retaining the FO of the LST.	FO	55							MBL	s								
			209.40	211.23	1.83	OX	LST		Orange brown OX clay to grit with < 10 cm pieces of strongly MBL LST core to rubble. OX variably fizzes in 10% HCl; may be LST or VOL OX.							i		MBL	s								
			218.54	219.76	1.22	OX	LST		Interval with very poor recovery. Recovered 3 cm s MBL LST and 2 cm orange brown clay OX.							i											
			219.76	220.37	0.61	OX			Dark brown non-calcareous OX with a light orange brown oxide coating on the surface. Clay to silt texture, (predominantly silt).																		
223.38	259.61	36.23				OX			Orange brown intense OX and dark brown to black intense SID with red brown surface. Clay to rubble, with SID zones more rubble to solid core. First meter of interval is moderately calcareous							i	m									
			223.38	224.18	0.80	OX			Light orange brown, clay to silt oxide that grades into red brown material. Weakly calcareous throughout.							i										
			231.59	235.36	3.77	OX			Dark brown to black OX with bright red brown and red orange surface coating in the clay zones. The interval is predominantly rubble.							i	i									
			250.90	252.92	2.02	OX			Light orange OX with brown zones, clay to easily broken core. Less altered sections appear intensely SER altered (VOL). Non-calcareous throughout.							i		SER	i								
			255.22	258.19	2.97	Qz			Qz rubble and light grey non-calcareous clay. Qz < 5 cm diameter.																		
			258.19	258.78	0.59	OX			Light orange yellow, blue grey, and medium orange brown non-calcareous OX clay over intervals <15 cm long. The blue grey zone similar to Qz rich intervals in other holes, but has no visible Qz.							i											
			258.78	259.61	0.83	OX			Orange-brown to green-brown clay to easily broker core, predominantly rubble. Non-calcareous until ~ 3 cm from lCN.							i											

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
259.61	270.36	10.75				LST	DOL		Light grey with yellow white intense to moderately DOL and moderate to weak ANK LST, cBX by medium grey seams which fizz in 10% HCl. Subrounded medium grey LST clasts with DOL infill from sBX texture locally, overprinted by cBX. Local foliated relatively unaltered LST. First 10 m has zones of intense OX and SID.					ms	f	f												
			259.61	268.78	9.17	LST	DOL		Yellow white, intense DOL and moderate ANK, sBX overprinted by cBX, with zones of mg DOL which appears hydrothermal, generally obscured by strong to intense OX. Zones of grey clay alteration up to 10 cm long occur through interval. Patches of HEM alteration.					i	m	s												
			268.78	269.48	0.70	LST	DOL		Medium grey strongly DOL LST, FG, with FO defined by white and grey banding. Sharp uCN and lCN with cBX LST follow general FO trend.	FO	55			s													
									270.36 m - E.O.H. The hole was ended because it was past the favourable oxide horizon. The hole was lined with PVC pipe for use in a later density survey.

Total: 72

Batch: 56, 57, 58, 59, 60

Date Sent: July 27,28,29,30 2010

Certificate: VA10104814, VA10104816, VA10104815 VA10104915, VA10104914

COMMENTS

The hole was ended because it was past the targeted horizon. The hole was lined with PVC pipe for use in a later gravity survey.

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	5.18	5.18				OVB			Overburden - no recovery																		
5.18	38.85	33.67				LST		RBL	Grey sBX to muddy limestone with minor fossils. Very rubbly to gritty.																		
			5.18	14.45	9.27	LST		RBL	Grey weakly dolomitized sBX LST, with varying degrees of open space formation and filling. Very rubbly with trace OX, and trace favocities fossils.					w		t											
			14.45	38.85	24.40	LST		RBL	Grey weakly banded and bioturbated crinoid wackstone LST with cryptic fossil fragments after wispy rust-red OX fragments. Weak OX rubble to gouge between broken core.							w											
38.85	41.13	2.28				OX	VOL		Pale yellow to rusty orange OX VOL. lCN rubbly into intensely MBL LST. Clay to easily broken rubble to core.							i		SER	i								
41.13	46.17	5.04				LST	MBL		FG to MG medium grey intensely MBL LST. FO defined by light grey and dark to medium grey banding. Very broken core, rubbly with medium orange brown to medium brown clay coating FX and in rubble zones. lCN has 5 cm thick dark brown silty zone 15 cm before contact.							w		MBL	i								
46.17	62.41	16.24				OX			Medium orange brown OX clay to rubble and dark brown to black SID silt to rubble. Variably fizzes in 10% HCl. Qz rubble rich zones. Trace Qz throughout.							i	s										
			54.05	56.65	2.60	OX			SID rich interval, largely rubble, dark brown to black with orange brown surface locally. Trace Qz though interval, Qz rich for last 20 cm, with < 2 cm angular Qz rubble composing 15% of zone.							i	i										
			56.65	57.30	0.65	OX			Orange brown with white and dark green grey layers, doesn't fizz in 10% HCl. Appears to be relic texture, possibly of FO in DOL?	FO	50					i	m										
			58.83	60.30	1.47	OX			Dark brown to black with orange brown surface, intense SID zone of mostly solid core, with some clay to rubble.							i	i									
			60.30	62.41	2.11	OX			Light to medium orange brown clay to core, easily broken to rubble. Trace Qz throughout the interval, ~40% from 60.30-60.60 m and 30% from 61.10-61.27 m. Interval begins to fizz in 10% HCl after 60.90 m, with intense SID alteration toward the lCN.							i	ms										

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
62.41	64.00	1.59				LST	OX		Sharp uCN with orange brown OX which fizzes in 10% HCl. Interval is less OX medium grey to light medium orange clay to core. Medium grey zones are cohesive core with dark grey stringers forming cBX which are more calcareous than light grey to light yellow DOL. Interval is intensely OX in zones to orange brown and dark brown bottle clay to core.					s		s												
64.00	68.25	4.25				SHL	OX		FG dark grey FO SHL. Fractures occur along the FO with a slight sheen on their surface. Non-calcareous in 10% HCl. Completely OX in zones, generally interfingering with dark grey shale. FO is obscured by alteration but is weakly present at 70-75 degrees. Textures in the OX are grit to clay, but predominantly silt. 5 cm Qz/Ca zone 5 cm before lCN.	FO	70					i											
68.25	87.97	19.72				OX	LST		Orange brown clay to rubble with zones of variably OX, variably DOL altered LST.																		
			68.25	69.00	0.75	LST	OX		uCN in oxide zone; determined by transition from non-calcareous to calcareous OX. Grades into weakly OX medium grey cBX LST with oxidized Py and crinoid fossils throughout.							s											
			69.00	70.40	1.40	OX			Dark orange brown calcareous OX, clay to core which is easily broken to rubble. Qz VN < 3 cm wide. Grades into brown clay to rubble.																		
			70.40	71.82	1.42	LST	DOL		Medium grey, FG, weak to intensely DOL altered locally cBX LST. Alteration averages moderately DOL altered. Very broken with weak to intense, overall moderate OX. Dark brown FG to MG OX Py is disseminated throughout.					m		m											
									Low angle Qz VT ~ 1.5 cm wide.	VT	10																
			71.82	73.20	1.38	OX	LST		Orange brown clay to core, calcareous oxide that is less altered portions appear to be DOL or intensely DOL LST. Qz rubble occurs throughout the interval.					i		i											
			73.20	74.04	0.84	LST	OX		Medium grey to brown, predominantly solid core with increased alteration to silt and clay in the last 30 cm. Weak cBX by black seams occur throughout along with trace disseminated OX Py.					m		s											
			74.04	74.49	0.45	OX	Qz		Qz rich (70%) rubble <4 cm diameter with orange brown clay to grit coating rubble.							i

			74.49	75.54	1.05	OX	DOL		Orange brown clay to relatively unaltered MG, cBX, DOL with trace disseminated FG to MG OX Py. The last 25 cm are intensely SID altered and broken up to grit. OX and cBX seams fizz in 10% HCl.							i	s										
			75.54	81.00	5.46	LST	OX		Medium grey, locally weakly MBL LST. Very broken with weak to intense OX along fractures and in pervasive zones up to 30 cm long of orange brown and grey brown clay to rubble.							m		MBL	t								
			78.89	81.00	2.11				3 Qz VN, 3 to 35 cm long the largest of which is very broken.	VT	20		1													
			81.00	82.70	1.70	OX	LST		Medium grey clay to solid core with a gradational increase in clay content and orange brown colour, along with increased Qz content, down interval.																	
			82.70	84.00	1.30	OX	Qz		Bright orange-brown clay to rubble, locally SID rich. Very Qz rich (60%) rubble < 3 cm in diameter.																	
			84.00	87.97	3.97	OX	Qz		Green grey to orange brown clay to rubble, with solid relatively unaltered LST core in zones. Grey clay fizzes strongly in 10% HCl. Qz rubble common in orange brown altered zones.																	
87.97	143.25	55.28				OX			Orange brown clay to rubble with SID rich zones of silt to solid core, predominantly grit. Also has grey brown sections < 30 cm long of clay to rubble. Variably calcareous, with trace Qz locally increasing to fair Qz rubble < 4 cm in diameter. LST clasts trace through first 11 m.							i										
			98.60	101.50	2.90	OX			Orange brown to grey brown clay to rubble. First 10 cm is LST rubble followed by 1 m of orange clay to grit with LST and Qz rubble > 3 cm, averaging 0.5 cm. Interval fizzes in 10% HCl. Ream in rods directly above interval may account for loose LST RBL in top 10 cm.							i										
			108.70	109.12	0.42	OX	Qz		Orange brown clay to grit with 30% Qz rubble to core < 6 cm long.							i										
			109.12	112.49	3.37	OX			Dark grey brown to light yellow brown clay to rubble with sand sized rubble in first 2 m. Fizzes in 10% HCl, gradational lCN.							i										
			112.49	114.60	2.11	LST	OX		Medium grey, FG, strong DOL LST, weak cBX by overprinted grey seams. Locally intense orange brown OX and light brown clay to rubble. LST is rubble to solid core.					s		s										
			114.60	115.21	0.61	OX			Light brown OX clay to rubble, fizzes in 10% HCl.							i										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.92	3.92				OVB			Overburden - no recovery																		
3.92	93.48	89.56				LST	DOL	BX	Light to dark grey, FG to CG, variably BX, weakly SID altered, intensely DOL altered LST. Generally units sBX with some intervals of tBX or mottled "camo" BX. Medium to dark grey sBX "clasts" are supported by a white to light grey, sparry CG matrix with trace, soft, bituminous, MG material infilling sparry matrix voids. Core is broken and rubbly to 8.90 cm. Trace crinoid fossils are present.					i			w											x
			10.36	20.92	10.56	LST	DOL	BX	Light to dark grey, FG to CG, intensely DOL altered sBX LST with fair SID alteration throughout. SID alteration can appear medium-strong, locally altering coarse, sparry sBX matrix to rusty red to orange colour. SID appears to propagate through sBX matrix (as veinlets?). SID alteration is the only material in sub-interval that reacts to acid.					i			f											x
									A weak FO is defined by orientation of BX clasts, 60 degrees TCA.	FO	60																
			26.51	30.97	4.46	LST	DOL	BX	Medium to dark grey, MG to CG, intensely DOL altered, tBX LST. Coarse, dark, angular to subrounded clasts are supported by a medium to light grey, MG to FG matrix. Sub-unit is weakly calcareous with trace, narrow <1 mm stringers and calcite rims around clasts that fizz with HCl. Trace Py is present as FG disseminations to blebs in the matrix.					i							t							x
									A lack of pervasive fabric or common orientation precludes a foliation.	FO	n/a																
									Translucent grey to white, CG Qz-DOL VT, oriented 50 degrees TCA, 1.8 cm wide.	VT	50																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			38.06	45.49	7.43	LST	DOL	BX	Medium to dark grey, clastic, variably BX, intensely DOL altered LST. Sub-interval is generally tBX in texture with mBX and sBX textures intermittently throughout. Dark, CG clasts are supported by a MG matrix with narrow intervals of coarse, white sparry sBX and angular, fragmented mBX throughout. Trace crinoid (and a cryptic stromatoporoid?) fossils are present. Crinoid fragments are present in CG-MG LST at 44.55 m. sBX clasts of uniform, DOL altered, CG LST are present (tempestite?) Soft, dark bituminous material is found with sparry sBX matrix. Sub-interval is texturally interesting, enigmatic textures and relationships are present.					i						t							
									A lack of pervasive fabric or common orientation	FO	n/a																
									White to rusty orange, CG Ca VT overprinted by a rusty, MG to CG DOL-Py VT. Cubic, <5 mm Py crystals appear rusted on crystal faces, exhibiting yellow metallic lustre only on fresh cut surfaces. VT is oriented 50 degrees TCA at 44.69 m. Ca VT is 3.6 cm wide, DOL-Py VT passing through Ca VT is 2.0 cm wide.	VT	50															
			45.49	46.39	0.90	LST	DOL		Medium grey, MG, weakly sBX, bedded, intensely DOL altered LST. Bedding textures of rythmic medium and light grey beds <1 mm thick (tidal flats?) are exhibited in large clasts divided by a white, sparry matrix. Clasts are up to 21 cm of core length with up to 2 cm of sparry matrix dividing them, some clasts exhibit rotation; original clast orientation can be reconstructed and pieced together. A narrow SID stringer veinlets crosscuts some of the core 0 degrees TCA.																	x
									FO is defined by bedding and varies with clast "rotation" from 45 to 70 degrees TCA, generally steeper.	FO	60															
			46.39	53.09	6.70	LST	DOL	MO	Dark to medium grey with variable rusty orange stains, intensely DOL altered, stongly SID altered, mottled, "camo" BX LST with intermittent sBX textures throughout. SID alteration and staining is pervasive along the selvages of SID veinlets throughout sub-interval. Where sBX, clasts exhibit a mottled texture. Trace, delicate crinoid and favocitid fossil textures are present.					i			s	LIM	t									

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									FO is weak, at times absent. Where present, FO is defined by BX textures and orientation, 45 to 70 degrees TCA, but generally 50 degrees throughout. FO increases with depth.	FO	50																
									Rusty brown, MG, SID veinlets oriented 40 to 50 degrees TCA. Veinlet selvages stain host rock a rusty shade of grey. Weak MG to CG white, Ca crystals are present with SID veinlets. Vuggy textures are exhibited with translucent, soft, <2 mm crystals present on cavity walls. Veinlets at times appear to locally fracture/shatter host LST.	VT	40															
									Rusty brown, CG, vuggy SID VN from 52.43 to 53.28 m. Poor recovery of this zone should be noted. uCN is oriented 60 degrees TCA, lCN 45 degrees TCA. Vugs exhibit brown 1 to 2 mm SID crystals on cavity walls. Trace LIM staining is present on fracture faces.	VT	50															
			53.09	78.86	25.77	LST	DOL	BX	Dark to light grey, FG to CG, intensely DOL altered variably BX, intensely DOL altered LST. A mottled, "camo" BX texture is overprinted by sBX textures. sBX exhibits typical white, sparry CG matrix throughout. Textures become convolute with depth, almost clastic in appearance (brittle-plastic deformation?)					i													
									A weak FO is defined by BX orientation, 60 to 70 degrees TCA.	FO	65																
									Narrow, Ca filled fractures oriented 0 to 20 degrees TCA, 1 to 2 mm wide run through core.	VT	10																
			78.86	85.46	6.60	LST	DOL	BN	Medium to dark grey, CG to FG, interbedded, intensely DOL altered LST. Coarse grained bands of crinoid fragment packstone (?) are interlayered with dark, FG silts and muds. Trace brachiopod fossils are present in fossiliferous bands. Weak Py is present as FG disseminations in dark, FG beds and as a yellow, metallic "shotgun" mass at 80.60 m. Dark FG bands decrease in width and occurance, appearing more undulose and irregular as depth increases, and becomes crinoid packstone with wide beds of MG, weakly mottled LST. Aproximately 50% of sub-interval is made of fossils.					i							w							x
									FO is defined by interbedded bands, oriented 50 to 70 degrees TCA. FO angle decreases with depth.	FO	55															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
									White, narrow, vuggy Ca, 2 mm wide veinlets with occasional CG Py MX oriented parallel to FO become more common with depth.	VT	55	0															
			85.46	93.48		DOL	VOL	BN	Light to medium grey, CG to FG, white-light grey crystalline DOL and moderately DOL altered LST with interbeds of FG, clay altered to dark VOL. Lenticular, SER altered VOL blebs are present up hole, becoming dark, FG bands interlayered with crystaline DOL (sills?). Banded texture becomes more convolute with depth. Trace Po is present as blebs in dark, FG VOL bands. lCN is gradational, becoming more calcareous over 15 cm. Trace Py is present as FG whisps.	CN				i							t		t					x
									FO is defined by banding textures oriented generally 70 degrees TCA, but can be as high as 80 degrees.	FO	70																
93.48	94.45	0.97				LST	MBL	BN	Dark to light grey, MG to sucrosic, calcareous, strongly MBL altered LST with grey-brown bands of VOL. Interval is moderately FOS, aproximately 7% of interval is crinoid fossils. Fossil content decreases with depth. MBL alteration increases with depth, becoming light grey, sucrosic MBL. lCN is sharp, defined by an irregular Py band. Trace Po is present as amorphous blebs <1 mm in size disseminated throughout.	lCN								MBL	s	t		t						
									Uphole, FO is 50 degrees, but at 94.03 m, FO changes 180 degrees in orientation and becomes 60 degrees TCA where most strongly MBL altered.	FO	50																
94.45	132.06	37.61				VOL	SER	BN	Grey-green to olive-yellow, FG to CG, variably magnetic, intensely SER and clay altered, laminated/banded VOL with variable sulphide mineralization. Generally, rock is FG with whispy clay altered "matrix" supporting grains of coarse minerals or clasts (pumice?). Sulphides present are Py, Po, As, Bi and Cp. Py is present as FG disseminations to vCG to large cubes in veinlets. Po is present as MG to CG, subhedral crystals in narrow VT's to disseminations in VOL. Other sulphides are trace and are noted where located. Fu is present as bright green smears <2 mm in size in SER altered VOL.								SER	i	ms	t	w	Fu	t	Bi	t		
																		BIO	ms				Cp	t			

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			101.58	105.34	3.76	VOL	DOL	BX	Brown-grey to olive yellow, strongly BIO and moderately SER altered VOL with irregular, DOL, BX-like "veining" throughout. Brown-grey to red-grey (potassic alteration?) VOL exhibits irregular banding and convolute margins with grey DOL. Moderate Py MX is present as blebs dispersed intermittently to forming small masses.					s				BIO	s	m								x
																		SER	ms								
									FO is defined by banded VOL layers where present oriented 70 degrees TCA.	FO	70																	
			104.28	104.33	0.05				Metallic yellow, CG Py VT, oriented 30 degrees TCA, 5 mm to 3.0 cm wide, becoming vCG, euhedral cubes of Py when passing from VOL to white-grey DOL at 104.28 m. VT exhibits calcareous halos around large, cubic crystals.	VT	30																	x
			107.00	107.02	0.02				CG, translucent Qz and white Ca with MG subhedral Py and Po VT oriented 40 degrees TCA and 0 degrees to FO, 2.2 cm wide at 107.00 m.	VT	40	0								t		t						
									White, CG Qz veinlets wih subhedral, dull yellow Py oriented 0 degrees to FO and 30 to 60 degrees TCA from 108.20 to 108.45 m. VT selvages are calcareous, soft and exhibit TLC alteration.	VT	45	0						TLC	w	t								
			109.26	111.69	2.43	VOL	SER		Green-yellow, FG to MG, intensely DOL and moderately BIO altered VOL with disseminated sulphide MX. Cubes of MG, dull Py sometimes exhibiting exsolution textures and silver coloured, MG As crystals occur throughout along with subhedral, <1 mm blebs of Po. Concentration of sulphide minerals is variable, where stronger, sulphide mineralization is more FG.									SER	i	w	w	w						
																		BIO	m								
									Foliaiton is defined by weak banding and grain orientation, 45 to 55 degrees TCA.	FO	50																	
			109.96						Metallic yellow and white, CG Py and Qz VN with coarse, crystalline bismuthanite grains 6 mm in size which can be scratched with a thumbnail. VN is oriented 60 degrees TCA and 0 degrees to FO and is found at 109.96 m.	VN	60	0																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			114.39	116.22	1.83	VOL	BIO		Brown to green, FG to CG, strongly BIO altered, weakly banded VOL with calcite filled amygdules.The amygdules are up to 2.1 cm in length, all commonly oriented in line with the foliation. Trace disseminated Po is associated with amygdules. Small, dull cubes of Py <1 mm in size are disseminated throughtout.								BIO	s	t		t					
									FO is defined by AM orientation and weak banding textures, oriented 55 degrees TCA.	FO	55																	
			123.68	126.21	2.53	VOL	SER		Green-grey, strongly SER altered, moderately-strong SIL altered VOL with coarse, angular to subrounded Qz "eye" clasts. Py is present as <3 mm cubes to FG disseminations which sometimes form whispy bands. Pinch-swell textures are exhibited around Qz clasts. SIL alteration is pervasive, much of rock is harder than typical, clay altered VOL.								SER	s	m			Fu	t			
																		SIL	ms								
									FO is defined by grain orientation and banding, 50 to 60 degrees TCA.	FO	55																	
									Slickenslide lineaments are present on a fracture surface at 122.86 m. The surface that slickenslides are present on is oriented 30 degrees TCA and 270 degrees to FO (FO is 60 degrees TCA locally). On the fracture surface, SS lineaments are oriented 55 degrees TCA. SS are 1 to 2 mm wide and exhibit soft, TLC and CHL alteration on surfaces.	SS	30	270																	
			126.21	132.06	5.85	VOL	SER		Green-grey to grey-brown, FG to CG, strongly SER and BIO altered, moderately SIL altered VOL, weakly BN in appearance, with moderate Py MX. Banding textures are convolute to undulose, exhibiting pinch-swell textures around coarse Py cubes. A short 12 cm interval of SIL alteration is present at 128.00 m. Crystalline DOL layers are intermittent throughout, becoming more frequent with depth. Py blebs <1.1 cm in size exhibit calcareous rims. Fabric gradationally becomes more irregular and dolomitic approaching lCN as VOL becomes more intermittent, appearing as whispy, brown, clay altered bands.	CN								SER	s	m								x
																		BIO	s								
																		SIL	m								
									FO is defined by banding and orientation of grains, 55 degrees throughout.	FO	55																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
132.06	191.30	59.24				DOL	MX	BN	White to medium grey, CG crystaline DOL with Py and As "Tiger Zone" MX. Weak TLC alteration of DOL is intermittent throughout. Uphole is typically less banded, and also hosts dark, DOL altered LST "sBX clasts". MX uphole is more coarse than rest of unit and does not exhibit banding. Weak vuggy textures are intermittent throughout. uCN is gradational, narrow VOL bands decrease with depth in width and occurance. Arsenopyrite MX is present as CG to MG euhedral crystals up hole often forming small masses, but the general lack of As throughout is conspicuous. Py is present throughtout, typically as commonly oriented bands of various widths.	CN				i				TLC	w	ms	t	t					
			134.53	141.87	7.34	DOL	MX	BX	White to dark grey, FG to CG crystaline DOL with CG Py and As MX with irregular intervals/clasts of FG to CG, DOL altered LST which at times exhibit sBX textures. Overall, sub-interval exhibits partial recystalization of hydrothermal DOL over sBX (karst topography?) textures. Py is present as dull, FG to MG whisps to masses in LST to vCG cubes in crystaline DOL. Coarse, euhedral grains of As <2.1 cm in size form small masses.											s	w						x
									A lack of pervasive fabric or common orientation precludes a foliation.	FO	n/a																	
			141.87	181.27	39.40	DOL	MX	BN	White to medium grey, variably sparry, crystalline DOL with banded Py MX. Trace As is present up hole as corase, euhedral crystals forming small masses, as seen at 143.72 m. As content decreases with depth. Po is present as trace blebs <2.0 cm in size. Weak TLC alteration is seen throughout, and is locally concentrated proximal to Qz MX. Trace Bi is also associated with Qz as coarse crystals with Py near Qz-TLC mineralization/alteration (Qz veining?).										TLC	w	s	t	t	Bi	t			x
									FO is defined by Py banding, oriented 55 to 65 degrees TCA.	FO	60

			181.27	182.57	1.30	DOL	TLC	CG	White to medium grey, CG crystaline DOL with intense, soft, creamy green TLC alteration throughout. Moderate Py MX is present as dull, yellow FG to MG whisps to mases with trace Bi crystals when near Qz. Local translucent Qz patches occur intermittantly throughout. Pearly, talc plates are present on fracture surfaces. CN's are gradational over 3 to 5 cm.	CN				s				TLC	i	m			Bi	t			
																		SIL	m								
									A weak FO is defined by mottled DOL and TLC orientations and weak bands of Py, oriented at 60 degrees TCA.	FO	60																
			182.57	191.30	8.73	DOL	CG	BX	White to medium grey, CG to MG crystalline DOL, lacking typical "Tiger Zone" MX textures. An irregular fabric of coarse, crystaline DOL becomes sub-cBX in texture where rock is more FG. Where FG, Py is present as dull grey-yellow bands to small masses. Py is also present in MG to CG DOL. lCN is sharp, defined by a clay altered band oriented 50 degrees TCA.	CN				i				SIL	m	f							
									FO is defined by a weak orientation shared by some Py bands, oriented 50 to 60 degrees TCA.	FO	55																
191.30	211.10	19.80				LEP		MO	Brown to grey, FG to CG, mottled, weakly banded LEP. Dark clasts/bands are variably supported by a white, calcareous "matrix" with intermittent, olive-yellow bands of soft SER/clay alteration. At times, SER alteration appears as ameboid blebs. Py is present as coarse, amorphous blebs forming small masses with calcareous rims to FG disseminations throughout. SER alteration bands are 1 mm to 3.1 cm wide. SER band frequency decreases with depth appearing again only close to lCN. Interval exhibits a more mottled appearance when lacking SER bands. lCN textures are convolute with undulose to sinuous SER bands appearing 51 cm above lCN. Unit becomes non-calcareous 25 cm above lCN which is defined by a band of Py oriented 50 degrees TCA.	CN								SER	m	f							x
									Fo is defined by banding and mottled clast orientation, 50 degrees TCA.	FO	50																
			197.40	197.42	0.02				White, 2.2 cm wide, CG, Ca-Qz-Py vein oriented 30 degrees TCA, 270 degrees to FO with MG, subhedral Py. Veinlet exhibits wide selvages strongly SER altered up to 44 cm from veinlet margins uphole.	VN	30																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

The hole was ended because it had passed the target depth. Similar to 'massive Py' in hole Rau-09-18. The hole was lined with PVC.

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	2.00	2.00				OVB			Overburden - no recovery																		
2.00	39.52	37.52				LST	DOL		Grey fine-grained bioturbated to solution collapsed LST to dolomitized LST. The unit is intermittent between solution brecciated dolo-mudstone and dol mudstone with minor portions of siderite rich oxidized LST as well as some DOL-Qz veining. The unit has a fair amount of broken core along the bioturbated foliations with variable amounts of gritty material and gouge in fractures. Fracture surfaces are often stained a rusty orange and have undulatin surfaces. Portions with solution breccia textures are filled with dogtooth spar-bitumen and quartz vug fills. Upper contact of the unit is especially rubbly and gritty.					f		t												x
									Bioturbated bedding planes.	BD	55																	
									Fibrous buff dolomite vein with trace pyrite.	VN	30		1							t								
			3.96	4.20	0.24	OX			Grey gritty to silty(fault gouge?) wish a core of rusty oxide colour.	FT																	
			24.17	25.30	1.13	OX			Brown fine-grained siderite rich competent yet spongy looking oxide with extensive calcite matrix.							i											
			26.27	26.80	0.53	OX			Deep red to brown silty gouge-siderite oxide. Sof exterior with a hard siderite interior.							i											
			31.60			OX			Oxidized fault gouge with broken core.	FT						ms											
39.53	49.89	10.36				VOL	OX		Pale yellow to rusty orange foliated and sericitized, oxidized volcanic. Core is fairly competent but will cleave under pressure along foliation. The lower contact interfingers with dolomitized limestone. Minor rubbly quartz occurs within VOL-OX.							i		SER	m									x
49.89	82.62	32.73				LST	DOL		Grey moderately bioturbated dolo-mudstone with abundant quartz and dolomite veining. This unit has a prominent foliation consisting of stylo-bedding and black lime-mud wisps and fine-grained disseminated digenetic pyrite. Lower contact begins to show solution brecciation and pyrite mineralization as medium-grained disseminations.					i					t	t							
									Stylo-bedding	FO	55																
									Qz-Ca-DOL all refolded and cryptic	VN																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			77.00	82.62	5.62	LST	DOL		Dolomitized limestone with increasing solution brecciation texture as well as coarse dolomite replacement and splashy medium-grained pyrite, very trace amounts of arsenopyrite.					i						w	t						
82.62	87.87	5.25				DOL	MX		Intensely dolomitized hydrothermal overprints of limestone protolith. This unit has abundant foliated pyrite and minor arsenopyrite. Dolomite is white-buff coarse-grained and destroys primary textures. Pyrite is medium-grained and occurs along a foliation and is associated with quartz. Minor disseminations of medium-grained arsenopyrite occurs.					i						s	t						
									Thinly banded Py defines the foliation in the DOL.	FO	60															
87.87	91.85	3.98				MX	Py		Massive medium-grained euhedral pyrite with interstitial quartz and lesser calcite, likely vein related pyrite.											i							
91.85	108.43	16.58				LST	MX		Intensely dolomitized sBX limestone unit with 'fuzzy' clasts and vug fills. The unit has a pervasive disseminated medium-grained pyrite overprint and trace coarse-grained arsenopyrite. Mineralization is more concentrated in heavily dolomitized portions. Grey-white talc associated calcite occurs as small intruding phases with trace pyrrhotite. Small intervals of massive pyrite and quartz also occur.					i						m	t	t					
									Foliation is defined by weak stylo-bedding	FO	60															
108.43	115.40	6.97				LST			Grey banded non-dolomitized lime-mudstone. Bedding is wispy and bioturbated? And possibly sheared.																		
									Foliation is defined by stylo bedding	FO	60																
									Calcite vein with trace pyrrhotite and pyrite.	VN	30	90	1							t		t					
115.40	119.42	4.02				MX	Py		Massive medium-grained euhedral pyrite with interstitial quartz and minor interstitial calcite, likely a large vein. Pyrite is quite brittle in places.											i							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

119.42	128.93	9.51				LEP	VOL		Brown to light-grey spotty to weakly foliated leopard unit. This unit consist of brown to grey fine-grained biotite and argillaceous material occurring in anhedral masses as well as along a foliation. This unit has a strongly calcareous matrix and multiple quartz-calcite-pyrrhotite-pyrite veins which range from 1-10 cm. Coarse to fine-grained and often irregular with no measurable foliation. The pyrite and pyrrhotite occur as fine-grained anhedral masses within the vein and slightly disseminated in the leopard. The veins cut parallel to and oblique to the foliation.											w		t					
									Moderate foliated and aligned biotite.	FO	60																
									128.93 m - E.O.H. The hole was ended because it was past the favourable mineralized horizon and into the lower LEP unit.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.65	2.65				OVB			Overburden - no recovery																		
2.65	38.00	35.35				LST	FOS		Medium to dark grey FOS LST, locally moderately MBL altered. FO is defined along fractures and are often coated in dark grey mud. Fossils include crinoids, favosites, and unidentified Ca clasts.									MBL	w							
			2.65	10.25	7.60	LST	FOS		Medium grey LST, with crinoids and unidentified MG white Ca spots forming a wackstone. Ca VT are common at various angles. Weak orange brown alteration on broken surfaces and in thin seams locally defining FO. The entire interval has a moderate marble overprint.									MBL	m							
									FO variably defined, with large zones of very weakly FO LST.	FO	25																
			4.89	5.97	1.08	LST	FOS	RBL	Very broken zone of LST. The RBL averages < 3 cm.																		
			10.25	13.35	3.10	LST			Medium grey LST, with FG Ca spots and no recognizable fossils, forming mudstone. Increased SHL content in very broken intervals of rubble and core. Stylolitic layers of thin shale vaguely define FO. Weak MBL alteration of LST.	FO	30							MBL	w							
			13.35	20.00	6.65	LST	FOS	FO	Medium to light grey, FG LST with FG to MG Ca spots and crinoid fragments. FO is defined by darker grey layers in medium to light grey LST. Orange brown alteration occurs on fractured surfaces. Mudstone with wackstone zones < 50 cm long.	FO	30							MBL	ms							
			20.00	27.51	7.51	LST			Medium to dark grey, FG with FG to MG Ca spots and crinoids. One favosites fossil is present at 24.73 m. Increased FG dark grey shaley material along FO and in zones <70 cm long. Orange brown alteration on some shale seams. Mudstone to wackstone.	FO	30															
			27.51	31.09	3.58	LST	FOS		Light grey with dark grey vFG seams and shale rich zones < 15 cm long. Interval is favosites rich packstone, with most of the light grey calcareous zones being fairly marbleized. Trace rugose fossils.									MBL	f							
			31.09	34.34	3.25	LST			Medium grey FG LST, with a decreased fossil content forming a mudstone. FO is defined by Ca VT and MG fossiliferous Ca layers < 3 cm long.	FO	30															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			34.34	38.00	3.66	LST	MBL		Light to medium grey, FO, moderately-strongly MBL altered LST. FO is defined by light grey Ca layers with yellow orange alteration. Irregular Ca/Qz VT follow FO. Orange brown (oxide) alteration increases down interval in layers and on broken core. The last meter of interval is very rubbly.							w		MBL	ms								
38.00	91.58	53.58				VOL			Variably altered FO VOL, Ca VT and spots throughout, locally CGL. CHL and BIO alteration grades into SER alteration with weak OX and magnetic zones. Qz VT and chert nodules occur locally.							w												
			38.00	55.80	17.80	VOL			Medium blue grey to dark brown, strong CHL, moderate BIO altered FG VOL, FO. Zones of intense grading to weak BIO. Ca VT at various angles, largely along the FO.	FO	25							CHL	s								x
																				BIO	m						
									Qz/ Ca VT ~ 4 cm thick, cut off by FO.	VT	40	55															
			48.00	50.90	2.90	VOL			Dark brown Bi rich VOL, intense Bi, strong Cl, with MG Ca spots making interval fizz strongly in 10% HCl. Fo undefined. Trace Py associated with Qz/Ca VT, some with orange brown colouration of Ca.									BIO	i	t							x
																		CHL	s								
			55.80	59.60	3.80	VOL			Dark blue-grey, weak SER and OX altered VOL that is strongly magnetic and moderately FO. Weak oxidation occurs along fractures along the FO.	FO	20					w		SER	w			Mg	s			
			58.00	59.38	1.38	VOL	SER		Non-magnetic strong SER zone with Qz/Ca VT at centre. Periphery has moderate OX with orange Ca spots.	FO	20					m		SER	s							
									QZ/Ca VT~ 5 cm wide.	VT	40	80															
			59.60	62.52	2.92	VOL	BIO		Dark brown to blue-grey intense Bi VOL, intensely Ca VT with FG to MG Ca spots. VT generally follow FO.									BIO	i								
																		CHL	s								
			62.52	63.82	1.30	VOL			Medium green grey, strong SER, trace OX, moderate-strong Bi altered VOL. Very broken, with gradational lCN.	FO	25					t		SER	s							
																		BIO	ms								
			63.82	68.10	4.28	VOL	CGL		Blue grey, strong Cl, fair SER and BIO altered FO VOL CGL. Clasts are rounded Ca and chert < 2 cm in diameter, elongate on FO. Ca in VT and altering VOL in patches and spots.	FO	25							CHL	s								x
																		BIO	f								
																		SER	f								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			68.10	70.71	2.61	VOL	CGL		Dark brown to light green blue, intense Bi, moderate-strong SER, FO VOL CGL. Chert and Ca clasts up to 7 cm in diameter, elongate on FO. Ca clasts commonly intensely Bi altered. Thin, blebby Ca VT which curves so as to start and end on same core side, ends in large Ca bleb with orange brown alteration rimmed by white Ca, with small Qz grains.	FO	20							BIO	i								
																			SER	ms							
			70.71	71.93	1.22	VOL	CGL		Dark orange brown strong BIO moderate SER FO VOL CGL. Clasts < 1 cm in diameter, entirely Ca, elongate on FO. Ca spots are light orange, MG and replacing VOL in patches following FO.	FO	15					t		BIO	s								
																			SER	m							
			71.93	91.58	19.65	VOL	CGL		Medium green blue FG FO VOL CGL with zones of increased to intense BIO. Generally weak BIO. Zones of fair SER generally moderate-strong to intense. Clasts largely Ca, also include dark grey, light blue, and light yellow non-calcareous clasts up to 4 cm wide, and 20 cm long. Generally 1 cm diameter. Last 50 cm of interval has fair OX on FO and Ca spots and is rich in chert clasts < 1 cm.	FO	25							SER	s								
																			BIO	m							
91.58	101.37	9.79					MBL	FO	Light grey to yellow white FG MBL with medium grey vFG seams defining FO and locally undulatory. Interzones of dark grey non-calcareous rock with sharp CN following FO.																			
									Variable from 20 to 30 degrees, locally undefined.	FO	25																	
			97.61	98.00	0.39	VOL			Dark grey FG non-calcareous zone with Ca clasts up to 1 cm wide elongate on FO. Possibly VOL? Sharp CN with MBL.	uCN	20																	
			98.35	98.72	0.37	VOL			Dark grey FG non-calcareous zone, with small Ca spots through interval as opposed to large Ca clasts CN are irregular with rounded clasts.																			
101.37	109.54	8.17				LST	MBL	FO	Medium to light grey FG strong MBL LST. FO defined by light grey and medium grey layering. MG white and dark grey spotted layers which both follow and cut FO (VT?), and locally have FO deformed around them. Gradational uCN with ~ 7 cm cBX at lCN.	FO	30							MBL	s								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
109.54	163.54	54.00				LST			Medium grey to light grey, FG fossiliferous LST. Crinoid, halycites, rugose and unidentified Ca fragments in mudstone. Trace Po disseminated throughout, locally oxidized until 129.25 m, after which all Po is OX. Weak OX on FX and as thin seams following FO increases gradationally down interval to strong OX as seams and patches following FO and on FX. Down interval have larger contrast in colouration as layers 5-10 cm long, with bleached looking light grey layers and softer dark grey layers in which Po is always OX.	FO	30									t							
									Thin Ca VT set.	VT	30	255														
			144.55	163.54	18.99	LST	OX		Medium orange brown to brown, and dark grey, OX LST. OX on FX and FO, closely spaced. Increases down interval to occurs in layers generally < 4 cm long, sometimes forming longer zones. Unaltered LST is FG dark grey FO. Very broken zones commonly intense OX. OX likely of VOL rich layers.	FO	45														x
			159.17	159.49	0.32	VOL	OX		Orange brown intense OX VOL with platy rubble, strong FX angle, and green white sheen on FX.	FO	50							SER	i							
163.54	198.10	34.56				VOL		FO	Blue grey to dark green grey FO VOL, with CGL layers. Locally magnetic, with Ca spots and VT through most of interval. Fo variable through interval.																	
			163.54	164.20	0.66	VOL	OX	FO	Orange brown intense OX VOL grades into dark brown Bi altered VOL intensely Ca VT following FO.	FO	55					i		BIO	s							
			164.20	173.81	9.61	VOL	CHL	FO	Blue grey FG VOL, with Ca VTs throughout. Fractures occur along the FO and weak oxidation occurs on some of the fractures down interval. Strong Cl and medium SER alteration occurs throughout. The uCN is gradational.	FO	65					w		CHL	s							
																				SER	m						
			168.47	173.81	5.34	VOL	Mg		Chloritized VOL becomes weakly magnetic.									CHL	s						Mg	w	
			173.81	180.98	7.17	VOL	CGL		Dark grey to medium green-grey, magnetic VOL CGL with clasts elongate along the FO. Clasts are light green where intensely SER altered and dark to medium grey. Some clasts are large enough to form apparent layers. Ca VTs are absent in layer, begin, but Ca clasts occur toward the lCN. At the lCN there is a gradational decrease in magnetism. The interval rubbly in zones.															Mg	s	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			180.98	188.32	7.34	VOL		BN	Dark green FO intensely chlorite altered non-magnetic with abundant Ca in the matrix and Ca VT defining the foliation. The core is very broken along FO and had multiple sections of 10 cm FLT gouge.	FO	75							CHL	i								
			188.32	198.10	9.78	LEP	VOL	LP	Grey to pale green argillaceous to lithic lapilli tuff LEP spotted VOL. Majority of unit is grey interbedded very fine grained to silt sized argillite beds and elongate foliated lapilli tuff. Unit has strongly calcareous matrix and variable degrees of sericitization. Lower contact begins to interfinger with white MBL. Unit is much more competent than the green VOL above. Lapilli fragments are cryptic and irregular, some are silica and argillite rich.	FO	45																
198.10	201.65	3.55				MBL			White to very light grey MBL with abundant black sinuous bands and intervals of broken core throughout. Fracture surfaces are orange and rusty coloured, while rubbly intervals often have associated OX gouge. The lCN is gradational into OX VOL chips.																		
201.65	217.74	16.09				OX			Light yellow-brown and dark red-brown to black, intensely OX and locally intensely SID altered. Variably calcareous, clay to solid SID core.																	
			201.65	206.65	5.00	OX	SID		Light yellow brown clay to solid core, easily broken to grit. Non-calcareous, breaks on common orientation. Less altered zones have intense SER. Gradational uCN and lCN.							i		SER	m							
			206.65	209.94	3.29	OX	cBX		Light brown to grey oxide with local pink colouration on surface. Patches of white in calcareous zones show remnant cBX texture. Gradational lCN.							i										
			209.94	217.74	7.80	OX	SID		Dark red to orange-brown oxide surface, with dark brown to black centres. Intense SID rich zones occur throughout. Clay to solid core, (mostly core) easily broken to rubbly and gritty. Trace Qz with increased Qz toward the lCN. The last 10 cm fizzes, grading into LST.							i	i									
217.74	225.27	7.53				DOL	OX		Orange-brown clay to core, intensely oxidized hydrothermal DOL with local cBX Ca seams. Overall, the OX is variably calcareous, with some OX displaying SER alteration (VOL interlayers).							i		SER	w

COMMENTS

The hole was drilled on the west side of the fault that marks the marble contact to test the mineralized dolomite intersected in Rau-10-99. It did not intersect the mineralization.

GEOLOGY LOG

HOLE: Rau-10-106

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	2.78	2.78				OVB			Overburden - no recovery																		
2.78	26.30	23.52				VOL			Green to dark green weakly banded and locally graded lithic tuff to lapilli tuff, with secondary compaction and a weak calcite fluid influx. Compositional and weakly graded beds occur in layers from 1 cm to meters in depth. Lithic fragments tend to be cryptic and often clear and argillaceous with colours ranging from white to pale green to clear and are subrounded to irregular-angular in a matrix of wispy mildly sericitized ash fragments. The unit contains abundant biotite and chlorite resulting in the deep green colouration. Primary or secondary nature of the micas are unknown. Secondary calcite occurs in rare veinlets as well as disseminated and replacing white cm-scale clasts, which may be altered phenocrysts. Some secondary calcite occur with fine biotite rims as well as euhedral pyrite. This core is very competent and rarely breaks along vein surfaces.							SER	w	t			Ch	i			x
									Graded compositional bedding.	FO	65																
									Calcite veins up to 1 cm.	VN	30	0	0.5														
			21.22	26.30	5.08	VOL		LP	This subunit is basal to the overall VOL, and is a deep-green coloured lithic lapilli tuff. Compositional bedding is common indicated by local sericitization. Lithic fragments occur up to a few cm and are rounded to irregular-angular and often argillaceous with ash and argillite in matrix. Black lithic fragments are quite magnetic with presumed high levels of magnetite. One 20 cm section exhibits inverse grading with respect to the DDH up direction.							SER	f	t			Ch	i	Mg	t	x
									Interfingering of VOL-LP-tuff with white marble that has sharp but irregular contacts	LCN																	
									Bedding	BD	60																
26.30	34.17	7.87				MBL			White to light brown fine grained marble with black dissolution-like seams and sericitized portions. Secondary calcite and pyrrhotite are disseminated throughout.											SER	m		w

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			26.30	30.65	4.35	MBL			White to light grey fine-marble with abundant black sinuous anastamosing silty-organic dissolution residuum. An irregular intruding grey calcite occurs in small veinlets.																		
			30.65	34.17	3.52	MBL			White to light brown irregular interfingerings of marble and sericitized aphanitic material. Pyrrhotite commonly occurs with grey calcite in disseminations throughout the subunit. This portion due to its character and basal location to the VOL could be the onset of carbonate mud and early ash fall inter mixing before the later larger events occur and marbleize the carbonate.									SER	ms			w					
									Weak FO, undulating contacts interfingering of white marble and sericitized rock all define the foliation.	FO	50																
34.17	111.86	77.69				LST			Grey mottled to banded weakly to strongly bioturbated lime-mudstone with minor interbeds of crinoidal wackestones. Minor secondary pyrrhotite and pyrite and grey calcite occur in episodic disseminations and bands, and small portions of marbleization occur as well. Allochems within the lime-mudstone are mostly crinoid ossicles and minor brachiopod shells and rugosan fragments. Weakly bioturbated portions have irregular interbeds of grey to light grey lime-mud. Intensely bioturbated portions are homogeneous lime-mud with no primary structures. Crinoidal wackestones occur up to 5 cm thick and non-graded, likely small tempestite deposits.														t		t					x
									Weak undulating bedding.	FO	40																
			78.36	111.86	33.50	LST	MBL		Grey bioturbated lime-mudstone with common sections of lighter coloured marblized LST as well as cBx and minor sBx textures. cBx has anastamosing black organic material in thin irregular patterns occurring more proximal to the lower contact. Fossils are cryptic to non-existent. Calcite veining increases within this subunit and is associated with quartz and minor rusty-staining.									MBL	f								
									Cryptic banding.	FO	40																
									Qz-Ca 0.3 cm - 5 cm wide.	VN	30	180	1														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			242.00	245.32	3.32	LST	sBX		Fresh to slightly overprinted sBX of light grey moderately MBL and strongly SIL LST by dark grey LST. Locally clasts are dark grey and matrix is light grey. Increased Py content, FG, brassy in stringers preferentially located within dark grey layers.									SIL	s	w							
																		MBL	m								
			265.88	267.36	1.48	LST	FLT	RBL	Medium grey LST, very rubbly with bright orange to pink OX on FX. Possible FLT.							w										
			269.11	270.21	1.10	LST			Dark grey, irregular FO, FG LST, with FG Py as brassy layers following FO.										f							
			274.22	279.42	5.20	LST	FLT	RBL	Light grey, intensely cBX, strongly MBL and SIL LST. Orange brown alteration on FX and pervasive through zones <20 cm. Very broken. Low angle TCA Ca VN's ~ 2 cm wide locally display slickenslides. Last 40 cm of interval is gouge.							t		MBL	s								
																		SIL	s								
			298.34	299.00	0.66	LST	RBL		< 3 cm subrounded LST rubble with yellow and pink OX on surfaces. Ca VT on either side of rubble are vuggy and have sugary texture.							w										
			316.15	321.32	5.17	LST	sBX		Light to dark grey sBX LST with Ca spotting in zones (weak MBL) and weak to intense cBX. Increased Py as FG to MG bright brassy "splashy" Py and disseminated, generally near DOL/Ca VT and VN.										w								
			367.30	369.25	1.95	LST	FLT		Red purple HEM alteration on FX surfaces and in patches. Ca VN 15 cm wide, very broken core, rubble to grit. LST is medium grey, moderate strong DOL altered.					ms				HEM	w								
			386.44	390.69	4.25	LEP	VOL		Red brown and white Ca rich VOL tuff "LEP" with SER alteration in layers, interzoned with purple grey to dark grey FG VOL and weakly calcareous in zones. Moderately disseminated Py layers occur preferentially in FG VOL zones, following FO which is irregular (generally ~ 65 degrees). Py is FG, brassy, trace in LEP as disseminations and blebs. Upper and lower contacts are sharp and irregular.	FO	65							SER	f	w							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

The hole was ended because it had passed the target depth. From 262.65 to 310.50 m, stong to intense OX alteration is present, at times appearing to exhibit textures that may be associated with a hydrothermal alteration front.

GEOLOGY LOG

HOLE: Rau-10-107

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								PHOTO
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.88	2.88				OVB			Overburden, no recovery																		
2.88	70.28	67.40				LST	MBL		Dark blue to blue gray moderatley marbelized fossiliferous LST with a high density of dark dissolution seams that range from stylolitic to cBx in texture. The cBx texture occurs in areas exhibiting higher density of dissolution seams, and are lighter grey in colour. Pressure solution is likely the cause of the dissolution seams. Fossils are present to varying degrees throughout the interval and include crinoid stems/fragments, flavocities corals and rugose corals. Parts of this unit may have experienced a low degree of ductile deformation as illustrated by fossil elongation and curved LST banding.									MBL	m							x
									A foliation defined by parallel alignment of dark tc light blue banding and dissolution seams is present intermittantly within the interval.	FO	45															
									Calcite veining occurs although the veins are infrequent and not a prominent.	VN	45		0.3														
			58.75	61.90	3.15	LST	FOS		Interval consists of a dark grey fossiliferous marbelized LST. The unit ranges from floatstone to wackestone in composition. Fossils in this interval include crinoid stems, rugose coral, brachiopods, flavocities and the silurian index fossil halocyties. Large, curved unknown fossils that have a bleached halo surrounding a darker spotted granular core (photo taken).									MBL	m							x
									A foliation defined by banding and alignment of crinoid fragments is present.	FO	45															
									Lower contact to more marbelized, contains a greater abundance of dissolution bands and is sharp.	lCN	20	0														
70.28	85.63	15.35				LST	FOS		Pale grey, non foliated, fosilliferous limestone with common calcite veining. The interval becomes increasingly more fossiliferous (wackestone) with depth. The matrix consists of dark grey LST exhibiting a mottled "camo" texture (bioturbation?). Fossil clasts of the LST wackestone include crinoids, rugose corals, gastropods, halocyties and possible amphipora. Foliation is not evident in this interval.	uCN	55	170															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									Calcite veins and veinlets are present in the upper portion this unit.	VN	45		0.5													
										VT	30		5														
			85.63	86.10	0.47	LST	SIL		Dark to light grey, FG to CG, irregularily banded cherty LST. Light grey, silicious chert bands up to 2.2 cm thick are found throughout sub-interval with irregular, undulose forms. Dark, FG, calcareous bands <1 mm to 2 mm throughout bound cherty bands and pass through medium grey, coarse grained LST. Lack of fossil textures is conspicuous.									SIL	s							
									FO is defined by cherty and dark. FG beds. 35 to 50 degrees TCA, but generally 45.	FO	45															
			86.10	94.92	8.82	LST	FOS	MO	Dark to light grey, FG to MG, mottled, FOS LST. Large rugose corals up to 3.0 cm in diameter on core surface occur along with halycites, bulbous stromatoporoids, crinoid fragments and brachiopods The core appears mottled with irregular to undulose, medium and dark grey LST textures throughout (bioturbidation?). Large, white to light grey, rounded (cryptic fossils? bioturbidation cavities?) present below 92.69 m in mottled, medium to dark grey LST with halycites corals present locally. vlCN is gradational, with the frequency of dark, narrow, carbonic bands increasing with depth.	CN																
									Moderate FO is defined by an irregular fabric of mottled "clast" orientations, 45 to 50 degrees TCA.	FO	45															
									White, MG, irregular Ca VT at 91.87 m, oriented 30 to 40 degrees TCA, 90 degrees to FO with a sinuous appearance, cross-cutting mottled texture o LST. Solitary VT in interval.	VT	35	90														
			94.92	111.04	16.12	LST		BN	Medium to dark grey, CG to FG LST grainstone with dark, irregular carbonaceous bands throughout. LST is coarse to FG, being more fine grained up hole. Weak concentrations of crinoid and rugose fossils occur where the LST is fine grained. Dark, carbonic layers from 1 mm to 1.1 cm in width variably host dull, FG, yellow Py MX. These bands are soft, non-calcareous, and appear irregular to undulose to near stylolitic in texture. With depth, this banding and LST fabric become convolute, lacking a distinct, common orientation as above. lCN is gradational over 1.15 m, becoming increasingly more FG, laminated and less convolute in texture.	lCN									t							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									A moderate FO is defined by carbonic banding, oriented 40 to 50 degrees TCA, increasing with depth.	FO	50																
									Narrow, MG carbonaceous veinlets present thoughout interval, 1 to 3 mm wide, 40 to 50 degrees TCA and are generally oriented 0 degrees to FO with +/- 10 degree variation.	VT	45	0	2.5														
			111.04	114.76	3.72	LST		BN	Dark to medium grey, FG to CG, laminated LST. Rock consists of alternating dark and medium grey layers with weak amounts of rugose, crinoid and brachiopod fossils throughout. CG, calcareous, white nodules may be cryptic fossils. White, CG Ca VTs are present variably throughout, 3 to 5 mm in width forming undulose bands parallel with layering/bedding. Trace Py is present as yellow, metallic, < 1 mm blebs in dark bands/beds. An irregular fabric of bedding/banding is present throughout (bioturbidation?).																	
									A strong FO is defined by laminations, 45 degrees TCA.	FO	45																
			114.76	117.46	2.70	LST	FOS		Light to dark grey, CG to FG, FOS LST. Large favocitid coral fossils up to 27 cm of core length are bounded by dark, FG lime muds (favocitid boundstone?). Trace Py is present as <1 mm, yellow, metallic blebs in dark lime mudstone bands. Fossils make up ~80% of sub-interval.										t							
									A weak FO is defined by orientation of lime mud beds, 50 to 55 degrees TCA.	FO	55																
			117.46	131.44	13.98	LST	FOS		Dark to medium grey, FG to CG, variably FOS and bedded LST. Rock exhibits alternating beds of FG, dark lime muds and CG, crinoid wakestone-packstone beds. Layers vary in thickness from 2.1 to over 30 cm in width. Other fossils present are halycites and favocitid coral fragments, gastropods and other cryptic fossil textures. A total of 20% of sub-interval is made up of fossils. Where dark and fine grained, calcareous nodules <1.3 cm and white, calcareous, undulose bands are present.																	
									FO is defined by bedding fabric, 40 to 50 degrees TCA.	FO	45																
									White, variably oriented Ca veinlets crosscutting bedding fabrics are present throughout, generally <1 mm in width, oriented 25 degrees TCA and 190 degrees to FO.	VT	25	190	1														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
140.93	187.57	46.64				VOL	CGL		Green, FG to MG, weakly amygdaloidal, non-magnetic, intensely CHL altered, conglomerate VOL. Fair BIO and weak SER alteration are also present. Generally, unit is FG with MG, dark crystal matrix supporting round to sub rounded conglomerate clasts. FG bands and layers of rock oriented preferentially are also seen throughout VOL interval. Where amygdaloidal, Ca infilling of cavities occurs. "Stockwork"-like, 1-3 mm wide Ca veinlets are variably present, giving the rock a shattered appearance with VOL clasts 1 to 4 cm in size. A preferential orientation of stockwork veinlets is exhibited. Trace bright, metallic, greenish-yellow chalcopyrite is present as <2 mm blebs with Ca blebs and VTs. Po is present as <7 mm blebs in VOL. At times, a "clastic" texture is exhibited with large, oval, dark green "clasts" supported by a lighte green (SER?) "matrix". Fine, whisps of SER-CHL mineralization are present throughout. uCN exhibits brown, BIO alteration, becoming increasingly CHL with depth and is weakly AM in texture with calcareous "stockwork" fracturing.	CN								CHL	i			t	Cp	t			x
																		BIO	f								
			140.93	151.55	10.62	VOL	CHL		Green to brown, FG to CG, intensely CHL altered VOL with narrow, white, CG Ca stockwork veinlets throughout. Stockwork veinlets are 1 to 3 mm wide, and give rock a coarse, shattered appearance with large, 1 to 4 cm, angular VOL clasts throughout. Stockwork texture persists through brown, BIO altered VOL below uCN into green, chloritic VOL below.									CHL	i								
																		BIO	s								
									FO is defined by preferential fracturing, grain and "clast" orientaion, all common to each other at 50 degrees TCA.	FO	50																
									Though stockwork fracturing is at times oblique to FO, a strong orientation of large, "main" stockwork fractures/veinlets is oriented parallel with FO. Narrow, <8 mm wide "stockwork" VTs are variable in frequency throughout.	VT	50	0

			151.55	156.97	5.42	VOL	CGL		Light to dark green, FG to MG, intensely CHL altered, CGL VOL. Dark green, oval clasts up to 3.8 cm in size are supported by a light green, at times weakly SER altered VOL matrix. Fine, whisps of SER alteration present in both clasts and matrix. Trace, FG pyrite is disseminated throughout. ICN is gradational, becoming darker, uniform in colour and lacking conglomerate clasts, and exhibits a laminated texture.	CN								CHL	i	t						
									FO is defined by clast and grain orientation and preferential fracturing, 35 to 40 degrees TCA.	FO	40																
			156.97	170.77	13.80	VOL		FG	Black to dark green, FG to MG, very soft VOL. A fine, black powder persists (graphitic? suplhides?) on saw and core cutting surfaces, giving rock a near graphitic characteristic, as it rubs off easily on fingers and can even draw lines on paper with sharp core fracture faces. XRF readings yield elevated Ti, K and Fe, consistent with a VOL geochem signature. Disseminated, FG Py is present throughout. Trace blebs of Cp are found as blebs with narrow Ca VTs and as rare, <1 mm disseminated blebs in VOL. Cut core surface reveals curious textures in Py mineralization, FG Py crystals are oriented in curvilinear, undulose structures to linear orientations parallel with FO. Some Py blebs exhibit brown (BIP? SID?) haloes. Rounded, Py-Cp nodules are present in interval and are up to 4.8 cm in size, cross-cutting VT's which can exhibit offset. ICN is gradational, becoming more coarse and exhibiting laminated, white, non calcareous bands <1 mm in width.	CN								w			Cp	t			x
									FO is defined by laminated texture and grain orientation, 40 degrees TCA throughout.	FO	40																
									Narrow, rusty (SID?) VT's oriented parallel to FO are found trhoughout, 1 to 4 mm wide, decreasing in frequency with depth.	VT	40	0	1.5													
									Qz-Si-Py VTs, 2 mm wide with coarse, grey Qz and brown Si with yellow Py. Vuggy textures are exhibited in veinlets. Veinlets are oriented 15 degrees TCA and 270 degrees to FO.	VT	15	270	0.5							w						
									Narrow, white 1 mm to <1 mm wide VT's with MG Py and Cp blebs variably throughout. Veinelt frequency increases with depth, becoming common above lCN.	VT	40	0								w			Cp	t		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			170.77	187.57	16.80	VOL	CGL		Green to brown, FG to CG, intensely CHL altered CGL VOL. Generally a green, FG to MG matrix supports rounded to subrounded "pebble" clasts throughout. Clasts are heterogenous in size, shape and composition throughout. Sizes and shapes range from tabular, 7 cm long clasts to 3.5 cm wide, round clasts. CGL pebbles appear strongly CHL altered, BIO altered, calcareous, to dark, MG (pumice?) clasts. BIO alteration is strong with intermittent patches of brown, BIO altered matrix. Trace Py occurs throughout as FG disseminations in CGL matrix. Core exhibits bedding/banding with depth, alternating bands of green to brown, FG to MG VOL with coarse conglomerate beds exhibit sharp contacts. lCN is sharp, VOL overlays white, MBL and is oriented 40 degrees TCA.	ICN								CHL	i	t							x
																		BIO	s							
									FO is defined by clast orientation and bedding/banding fabrics, 40 degrees TCA throughout.	FO	40																
187.57	188.53	0.96				MBL			White to medium grey, sucrosic, bedded MBL with narrow interbeds of FG, SER and clay altered VOL. VOL interbeds decrease in width and frequency with depth. ICN is gradational, becoming grey and more fine grained over 1.25 cm.	CN																	
188.53	245.59	57.06				LST		BN	Medium to dark grey, FG to MG, laminated to BX LST. Trace halycites, crinoid and rugose fossils are present. Weak, rusty orange iron-alteration is exhibited on fracture faces throughout. Interval generally exhibits a laminated fabric throughout with intermittent zones of mottled to BX textures. Trace Py and Po is present as FG disseminations in laminated LST.							w			t		t					

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			188.53	197.01	8.48	LST		BN	Medium grey, MG to FG, weakly FOS, weakly laminated LST. Narrow, soft, rusty brown to green grey, calcareous, 1-3 mm wide bands are present throughout, 8 mm to 5.1 cm apart. Trace halycites, crinoid, and other delicate, cryptic fossil textures are present throughout. Weak rusty orange to yellow LIM staining is present on fracture surfaces. Trace vuggy textures are present along margins of some o the rusty brown bands.									LIM	w									
									A strong FO is defined by the banded fabric of commonly oriented narrow, brown-grey beds throughout, oriented 40 degrees TCA.	FO	40															
									White, CG Ca VNs oriented 65 degrees TCA and 0 degrees to FO found at 193.72 m and 195.27 m and are 2.4 cm and 1.3 cm wide respectively.	VN	65	0														
			197.01	199.23	2.22	LST		MO	Dark grey, FG to MG, fairly mottled LST. Trace crinoid and possible amphipora fossils are present. Round, ovular, grey mottled "clasts" are supported by a dark grey matrix. MO texture is variable throughout, generally decreasing with depth. Coarse Ca VN's present throughout. lCN is gradational, becoming irregular, and weakly laminated over 35 cm.	CN																	
									FO is defined by mottle clast orientation and a weak lamination fabric, ranging from 30 to 50 degrees TCA, but most commonly oriented 40 degrees TCA.	FO	40															
									White, CG Ca VNs present, oriented 60 to 65 degrees TCA and 0 degrees to FO, 1.4 to 2.9 cm wide.	VN	60	0	2													
			199.23	202.11	2.88	LST		BX	Light to medium grey, FG to MG LST with fine dark, cBX textures with a common orientation throughout sub-interval. Trace crinoid fragments are present. At times, core appears weakly mottled, darker grey FG LST appears to be "supporting" lighter grey, ovular clasts.																	
									FO is defined by a common orientation of cBX fabric and mottled 'clast' orientation, 40 degrees TCA.	FO	40															
									White, CG Ca VT's 1.1 to 0.8 cm wide, oriented 70 degrees TCA and roughly 0 degrees to FO are intermittent throughout.	VN	70	0	0.5

			202.11	236.66	34.55	LST		BN	Medium to light grey, FG to CG, banded LST with intermittent, rusty orange beds throughout. Rusty bands are variable in width and frequency throughout, ranging from 1 mm to 1.3 cm in width. Bands at times appear greenish grey (SER alt?) and do not fizz with HCl (VOL?). At times, rock appears fissile where rusty banding is most strong. Fracturing is preferential along bedding planes. On fracture surfaces, yellow-orange LIM-Fe alteration is present. Some vuggy textures are local to or form rusty bands (hydrothermal?). In zones with weaker rusty banding, core appears dark grey, FG with light grey-white, 1-2 mm wide laminations with trace, FG, white-yellow, metallic Py and white-grey, FG Po (may all be Po, difficult to differentiate with hand lens), <1 mm in width, and elongate with bedding planes, up to 2.5 mm in length. Trace crinoid, halycites and rugose fossils are present.								LIM	t	t		t				
																		SER	w								
									A strong FO is defined by banding/bedding fabric and orientation, 50 degrees TCA.	FO	50																	
									Narrow, white to light grey Ca stringers parallel with FO are present throughout, from linear to bulbous, swelling veinets up to 8 mm wide. Frequency of veinlets is variable, but generally 1-2 per meter are found throughout sub-interval.	VT	50	0	1.5															
									White to creamy orange, CG, Ca-Qz VN, 4.0 cm wide, oriented 65 degrees TCA and 90 degrees to FO. Trace platey (TLC alteration? muscovite?), soft whiteish minerals present along vein margins. VN is located at 206.78 m.	VN	65	90																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			236.66	238.64	1.98	LST	LIM		Rusty orange to brown-grey, FG to MG, soft, fissile, strongly Fe altered LST. Rock fizzes readily to moderately throughout with acid. A laminated/bedding fabric is pervasive throughout, exhbiting preferental fracturing, and splitting with light pressure along bedding planes. Narrow bands of LST protolith are intermittent throughout, up to 2.7 cm wide, medium grey, FG, and lacks textures beyond that. Where LIM/Fe altered, contacts with LST protolith follow bedding planes with sharp contacts. Creamy white, calcareous nodules are found throughout, elongate with bedding, and up to 6 mm in width. Trace dark, cherty bands up to 1.5 cm in width are rare, and lack LIM/Fe alteration. XRF readings yield elevated Ti (10,000 ppm) and K (26,000 ppm), indicating a VOL geochem signature.								LIM	s							
									A strong FO is defined by bedding/fractre planes, oriented 55 to 65 degrees TCA.	FO	60																
			238.64	245.59	6.95	LST		MO	Dark to light grey, FG to MG, weakly laminated to mottled LST. Core exhibits a laminated fabric up hole, becoming less so and more mottled with depth. uCN is sharp, oriented 60 degrees TCA. Mottled core textures are elongate, oriented with bedding/lamination fabric. Approaching lCN, core becomes lighter in colour, with clay altered VOL interbed at 245.12 m. lCN is gradational with VOL interbeds appearing with depth, but contacts between LST-VOL layers are sharp, oriented 50 to 60 degrees TCA.	lCN																
									FO is defined by the orientation of a laminated fabric and elongate mottled textures, 60 degrees TCA.	FO	60																
									White, CG, Ca veinlets with shared orientations are present throughout, oriented 60 to 70 degrees TCA, 0 degrees to FO, and range in thickness from 0.6 to 0.9 cm.	VT	65	0	5												

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

245.59	262.65	17.06				VOL	CHL	AM	Dark to medium green, FG to CG, variably magnetic, amygdaloidal, intensely CHL altered VOL. Amygdules are generally ovular in shape, from 1 mm in size up to 4.6 cm in length, commonly elongate and infilled with white to reddish-brown, CG Ca. VOL is variably calcareous, at times fizzing readily with HCl (calctic cement?). FG, CHL bands exhibit pinch-swell textures around amygdules. AM texture decreases with depth, becoming MG to FG, darker, and weakly magnetic. Trace Cp is associated with Ca VN.								CHL	i				Cp	t			
			256.31	262.65	6.34	VOL	CHL		Dark green, FG to CG, weakly magnetic, intensely CHL altered VOL. Lacking coarse amygdules, core is generally FG to MG, dark green volcanics with a laminated fabric throughout. Rock becomes coarser grained and darker with depth with MG, soft, black (biotite?) crystals disseminated throughout. Elongate nodules of Qz-Ak are present variably throughout, up 2 mm to a 0.9 cm wide band, MG, with creamy orange-yellow Ak and grey, translucent Qz. Ak fizzes when scratched. Core is near fissile, breaking easily along lamination (bedding?) planes. Trace Cp bleb is found in a Ca VT at 256.55 m. lCN is sharp, bt is obscured by broken core, and is oriented 70 degrees TCA. Core is often blocky with some rubble, trace brick red Fe staining is present on some fracture faces, more so with increasing depth.								CHL	i				Cp	t			
									Defined by a laminated fabric, preferential fractrinç and orientation of elongate Qz-Ak nodules, FO is commonly oriented 70 degrees TCA but can be as low as 60 degrees.	FO	70															
									White, CG Ca VT oriented parallel with foliation, 7 mm wide with 1.5 mm, bright, metallic, greenish-yellow Cp bleb present. Veinlet is found at 256.55 m.	VT	70	0										Cp	t

262.65	264.49	1.84				MBL		BN	White to brown grey, sucrosic, banded MBL. White MBL with bands of non-calcareous, brown-green VOL and brown-grey LST exhibiting irregular alteration margins around fresh LST. Where LST exhibits alteration, small ~1-1.5 mm rusty cubes of Py are present. Trace bright metallic Py is found in white MBL as small, 1 mm-scale blebs. At times banding appears convolute, irregular with alteration margins, but generally alteration appears commonly oriented throughout.										t							
									FO is defined by the banded "bedding" fabric and preferential fracturing, oriented 70 degrees TCA.	FO	70																
264.49	296.12	31.63				LST	OX	BN	Medium grey to brown-orange, FG to CG, weakly FOS, laminated to banded, variably OX altered LST. LST is generally laminated in texture, FG beds alternating with MG-FG, white to light grey beds and Ca nodules. At times, LST bedding appears irregular and undulose. Where coarse, white, calcareous (cryptic fossils?) with pinch-swell of darker lime muds form around white clasts. A singular closed fold is present at 272.49 m. Trace rusty Py cubes <1 mm are associated with Ca nodules and bands and in rusty OX altered bands. OX bands are variable in frequency and width, both generally increasing with depth. Banding is parallel with bedding, deeper OX alteration though can exhibit irregular alteration margins (hydrothermal front?) exhibits a preferential orientation parallel with bedding of LST. Trace SID veinlets are present throughout, oriented sub-parallel TCA.						s		w			t							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			264.49	280.87	16.38	LST		BN	Medium grey to brown orange, FG to CG, laminated to mottled, variably OX altered LST. Rock fizzes with acid throughout. Intermittent VOL interbeds present up hole, but decrease with depth in width and frequency. Where FG, laminated fabric present. Rock becomes more coarse with depth, becoming crinoid wakestone in composition. Intermittent, rusty orange OX ALT and greyish-green-brown layers throughout. OX ALT bands are generally preferential to FG LST, and usually planar, parallel with bedding but at times exhibits irregular, convolute margins. Trace rusty Py crystals <1 mm are present with Ca nodules and altered LST bands. A closed fold of bedded, FG dark lime muds and light MG grains present at 272.49 m. Delicate, cryptic calcareous textures are present throughout (fossils?). Crinoid stem fragments are intermittent throughout, but become common with depth where core becomes more CG and lighter in colour (crinoid wakestone).																			x
									FO is defined by laminated/bedding and banding textures, oriented 60 to 70 degrees TCA.	FO	65															x
									Narrow, 1 to 5 mm wide rusty orange SID veinlets oriented sub-parallel TCA (0 to 10 degrees) throughout with, brown-orange siderite crystals <1 mm in size to earthy, FG, powdery coatings on veinlet margins (fracture filling?).	VT	10	90														x
			280.87	284.86	3.99	LST	OX		Dark grey to rusty orange, FG to CG, strongly OX altered LST with intermittent MBL alteration and trace fossils. uCN is gradational, with MBL alteration to 280.87 m becoming variable and appearing white to light grey below. Patchy, strong OX (Fe alteration?) throughout, at times in bands but can exhibit irregular margins . Even where irregular, OX altered rock exhibits a common, preferential orientation (stratiform controls?). Trace relict crinoid textures are present in zones of OX alteration. OX altered rock can appear gritty where OX alteration is strongest, to competent but blocky core where OX strength is less so.	CN						s	f	MBL	ms	t							x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			284.86	292.12	7.26	LST	OX	BN	Medium to light grey to grey-orange, CG to FG, mottled to banded, Strongly OX altered LST with moderate MBL alteration. LST is generally CG, granular (wakestone?), light grey with darker, FG, muddy, irregular bands, to patchy, sucrosic MBL altered LST throughout. Narrow interval of sBX textures over 12 cm are present at 290.80 m along the bottom margin of a CG Qz-Ca VN. MBL alteration is associated spatially with Qz-Ca veining. OX alteration overprints vein textures, as vein crystals exhibit a rusty-orange staining texture. Trace grey Qz, <1 mm, prismatic crystals are disseminated in LST. Trace dark grey chert nodules <2 cm in size are present near OX bands above lCN at 295.02 m. Weak rusty PY MX is present as <2 mm cubes preferentially hosted in rusty orange OX altered bands. Bands of OX alteration follow bedding/lamination fabric of LST throughout, though at times margins of OX alteration can appear convolute. OX alteration increases with depth. OX altered bands are 1.1 cm to 23 cm wide and fizz with acid. Narrow, grey-green, soft clay layers (VOL interbeds) < 1 cm in width are intermittent throughout in both OX altered and fresh LST and do not fizz with acid. lCN is sharp, but is obscured by the core fracturing along the contact, oriented ~70 degrees TCA.	ICN	70					s					w							
									Defined by a laminated fabric and marble banding where present, oriented 55 to 70 degrees TCA, becoming shallower with depth and with MBL banding.	FO	60															
									CG, white to translucent, Qz-Ca VN oriented 90 to 60 degrees TCA. VN margins are planar to irregular. CG white Ca and translucent Qz appear central with strong, CG tremolite alteration of LST along VN margins. Beyond tremolite alteration, strong MBL alteration of LST is exhibited. Grain boundaries of Ca and tremolite exhibit Fe staining, indicating OX alteration was post veining event. VN's are 8 and 21 cm wide, at 287.00 and 290.41 m respectively.	VN	75					w		MBL	s

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
296.12	297.94	1.82				OX			Rusty red-orange, FG to CG, gritty, OX. Patchy yellow LIM alteration is evident on fractured core faces. Rock is generally gritty with some weakly competent rock. Relict protolith textures are present below uCN, grey-orange-green, laminated bands are present in dark, rusty-red SER altered LST (VOL interbed in SER alt LST?) with patchy, orange and yellow LIM alteration exhibiting an earthy, dull, powdery appearance. Where not competent, core is a rusty orange-red, gritty to rubbly and very friable. Both uCN and lCN appear gradational, with relict protolith textures becoming obliterated moving towards the centre of the OX unit. Above the lCN, rock exhibits OX overprinting of LEP textures.	CN						I													
			296.12	296.99	0.87	OX			Brick red to rusty orange, MG to FG, OX with strong SID alteration. Core is blocky, generally competent, with preferential fracturing along relict protolith fabrics. Grey-green (VOL?) bands are intermittent throughout, with parallel orientation and are 2 to 8 mm wide. Core becomes yellow, remaining competent with LIM alteration on core surfaces. lCN is defined by core becoming blocky to rubbly over 8 cm with narrow Qz structures at 296.95 m. Relict sBX textures strongly overprinted by OX alteration is present 296.95 to 296.83 m, fizzing readily with acid. Trace Py is present where LST exhibits sBX textures.	lCN						i	s	LIM	s	t							
									Where present, FO is defined by bedding/banding textures remaining in altered protolith, 50 degrees TCA from 296.12 to 196.83 m where core exhibits narrow VOL interbedding.	FO	50														
			296.83	296.99	0.16				Defined by a relict sBX fabric, 70 degrees TCA	FO	70

			296.99	297.79	0.80	OX			Rusty orange, gritty to rubbly, weakly SID ad LIM altered OX with trace HEM alteration. Core is generally grit to rubble, but clast size ranges from 1-2 mm up to 3.5 cm earthy chunks of core. The average size of OX fragments is <1 cm, and is rusty orange in colour with occasional LIM coatings on weathered clasts. Weak SID alteration is present as intermittent, dark, rusty brown patches throughout. Rare bright red (hematite?) alteration is present on trace OX clasts. lCN is defined by a change to compotent core which is uniform, rusty orange in colour, but is harder and much less friable over last 3 cm of sub-interval. Weak amounts of a creamy white-green, talc is present throughout appearing platey where core is more compotent. Trace Qz is present throughout as CG, rust-stained coarse sand.	ICN						i	w	LIM	w				Tc	t	Qz	t	x
																		HEM	t								
									A lack of a uniform fabric or orientation precludes a FO measurement.	FO	n/a																
			297.79	297.94	0.15	OX	LEP		Dark red-brown to orange-red, FG to MG, blocky to rubbly, vuggy, strongly SID altered, weakly LIM altered OX. Core is friable to compotent, with a relict, strongly OX overprinted LEP texture. Whispy bands of orange stained, clay alteration are present throughout. Small vugs also occur throughout (disolved Ca nodules?) Where friable, core is orange rusty-red in colour and appears clay-like. Patchy SID alteration is intermittent throughout, weak LIM alteration is present on some fracture faces. Fracturing is irregular throughout. lCN is sharp, defined by a LEP-OX contact, oriented 55 degrees TCA, following LEP FO.	ICN	55					i	ms	LIM	w								
									FO is defined by a relict fabric of LEP protolith. Where present, FO is oriented 55 degrees TCA.	FO	55

297.94	310.50	12.56				LEP	OX		Rusty brown to grey-brown, FG to CG, laminated to weakly mottled, blocky to rubbly, strongly OX altered LEP. Trace vuggy textures are exhibited where core is most strongly OX altered. OX alteration is variable throughout in bands up to 3.4 cm wide. LEP textures are obliterated where OX alteration is strongest. Fresh LEP is grey-brown, mottled, occuring in bands up to 2.9 m thick, and is variably calcareous throughout with a white matrix variably supporting grey to brown-grey clasts. Whispy SER alteration is present throughout, and at times greenish SER alteration is found in patches overprinting fresh LEP.							s		SER	w	t							
									FO is defined by a laminated fabric (bedding?) 50 degrees TCA.	FO	50																	
									White to creamy orange, CG Ca vein, 4 cm wide, oriented 35 degrees TCA and 0 degrees to FO is found at 299.22 m.	VN	35																	
			299.80	301.10	1.30	LEP	OX		Rusty red to rusty brown, gritty to compotent, intensely OX altered LEP. Relict LEP textures are obscured by OX alteration. Core is compotent, blocky and rubbly with coarse grit and narrow, irregular clay intermittent throughout on margins of gritty zones. LIM alteration present where core exhibits vuggy textures. An undulose, pervasive fabric is present in compotent core (hydrothermal textures?) oriented 40 degrees TCA and is defined by sinuous, narrow bands of dull orange, soft alterations 1-3 mm wide, present in core where OX alteration is less intense.							i	ms	LIM	f								x
									Defined by a fabric of soft, orange bands where present, fracturing is sometimes preferential to this plane, oriented 40 to 45 degrees TCA.	FO	40																	
			308.86	309.60	0.74	LEP	OX		Rusty orange-grey, FG to MG, soft, friable, clay to comptent, intensely OX altered LEP. LEP textures are obliterated by OX alteration leaving orange grey soft, FG to MG, blocky to clay-like OX. CN's sharp along alteration margins, which are parallel to FO. A preferential fracturing is exhibited, oriented 65 to 80 degrees TCA.							i											
									FO is defined by preferential fracturing, 70 degrees TCA. Alteration margins follow FO.	FO	70

			309.60	310.50	0.90	LEP	OX		Dark reddish-brown to dark grey-green, FG to CG, stongly SER and OX altered LEP. Trace grains of rusty Py <1 mm are disseminated throughout. LEP textures are moderately obscured by alteration. The unit becomes darker and more MG with depth with LEP clasts appearing dark grey-green and are supported by a dark, red-brown matrix. lCN is obscured by strong alteration and broken core.	CN						s		SER	s	t							
									FO is defined by relict LEP fabric, oriented 60-50 degrees TCA, shallowing with depth and with increasing alteration.	FO	55															
310.50	343.51	33.01				LST	DOL	BX	Medium to light grey, FG to MG, cBX, intensely DOL altered LST. Intermittent, narrow, rusty orange OX alteration is present up hole, but not below 328.00 m. Trace pink-white (rhodochrosite?) is present with a narrow sBX interval. Rock exhibits typical cBX DOL altered LST found elsewhere below the LEP unit. uCN is gradational, very dark grey to black, at times exhibiting a conchoidal fracture (mudstone? shale?) but exhibits a relict cBX texture which persists below. Rock is very dark over 1.15 m, becoming increasingly lighter with depth, more readily exhibiting cBX textures. Trace Fe staining is present on fracture faces throughout.	uCN				l		w										x
			315.70	327.90	12.20	LST	DOL	BX	Medium grey, FG to CG, cBX, intensely DOL altered LST. With moderate, intermittent SIL alt, fair OX alteration and weak SID alteration variably throughout. Light to medium grey clasts up to 3.8 cm but generally 1.0-1.5 cm in size are narrowly separated by a dark grey FG cBX matrix. Rusty orange to brown-red SID alteration is present along fracture faces throughout. Core is at times rubbly to blocky, with orange-yellow LIM alteration on fractures, especially where core is blocky to rubbly. Generally core is compotent, only exhibiting OX/Fe alteration where fractured.					i		f	w	SIL	m							
									A lack of a uniform fabric or orientation precludes a FO.	FO	n/a															
									White, CG, Ca-Qz vein oriented 20 degrees TCA.	VN	20															
			324.94	325.66	0.72	LST	DOL	BX	Medium grey to pinkish white, FG to CG, sBX, intensely DOL altered LST with strong SIL alteration.					i				SIL	s

SECTION: 10+250NW

HOLE: **Rau-10-108**

CLAIM:

Contractor: Superior

Drill: 2

Core size: HQ

Casing depth: 1.52 m out in / out

Drilling dates: August 8-11, 2010

Geology logged by: K. Unger

TARGET: Down dip extension of Oxide Zone.

COMMENTS

The hole was ended because it was past the target depth.

GEOLOGY LOG

HOLE: Rau-10-108

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.44	2.44				OVB			Overbburden, no recovery																		
2.44	86.26	83.82				LST	DOL	BX	Light to dark grey, variably BX, FG to CG LST with trace fossils. Rock is cBX to sBX, and mottled "camo" BX in texture. Weak MBL alteration and trace SIL alteration are seen intermittently through interval. Brown and tan coloured sediments appear with depth exhibiting rythmic and graded bedding (speliothems?) supporting LST clasts. Dissolution textures are variably present, stylolitic bands appear to be more common in cBX textures.					i				MBL	w								
																		SIL	t								
			3.96	6.90	2.94	LST	SIL	MO	Dark grey, FG to MG, mottled, moderately-strong SIL altered LST. Core is harder than typical DOL altered or unaltered LST. Some moderate fizzing with HCl is noted. A dark, FG "matrix" supports medium-dark grey, MG, rounded "clasts" (bioturbation?). Trace fossils are present, favocites fragments and posible amphipora fossils are seen. At times, the dark, FG matrix appears near stylolitic in texture.									SIL	ms								
									A very weak FO is defined by mottled "clast" orientation and dissolution texture orientation, 80 degrees TCA.	FO	80																
			6.90	10.83	3.93	LST	DOL	BX	Medium to dark grey, FG to CG, variably BX to clastic, strongly DOL altered LST. Rock variably exhibits sBX and tBX textures. Sparry white infilling of sBX voids are present throughout, variably supporting FG LST (lime mud) clasts. lCN is gradational, becoming lighter and more coarse with cBX and dissolution textures becoming more evident with depth.	lCN				s													
									A weak FO is defined by BX fabric and clast orientation, generally 50 to 60 degrees TCA.	FO	55																

GEOLOGY LOG

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
			10.83	15.91	5.08	LST	MBL	BX	Light to medium grey, CG to FG, fairly cBX, strongly MBL altered LST. Dissolution textures and stylolites are variably exhibited throughout. Interval fizzes readily with HCl. Generally rock appears CG, sucrosic recrystalized LST with dark grey, FG, narrow <1 mm cBX to stylolite bands at various orientations throughout. Where cBX textures are strongest, core appears near mBX in texture with small, <5 mm clasts supported by a dark, FG matrix. MBL alteration increases with depth, with a moderate banded texture where MBL alteration is strongest. Weak yellow limonitic staining is present on fracture surfaces.									MBL	s											
																		LIM	w									
									FO is defined by orientation of banding in MBL and a shared orientaion in a small majority of stylolites and cBX textures, 65-80 degrees TCA, but generally 70 degrees throughout.	FO	70																	
			15.91	42.99	27.08	LST	DOL	BX	Medium to dark grey, FG to CG, variably brecciated, intensely DOL altered LST. Vaiable mottled camo texture occur with sBX textures overprinting and crosscutting the mottled texture. sBX textures are variable in frequency and strength throughout. They contain intermittant sparry fractures ~2 mm wide to 2 cm voids with sparry white calcite crystals. Trace fossils in the form of crinoid stem fragments, and halycities are present. Mottled and brecciated textures become convolute with depth (strain?). Foliation angle decreases with depth.					i													x
			15.91	20.45					Up hole where FO is defined by MO orientation, FO is 80 degrees TCA.	FO	80																	
			20.45	42.99					FO becomes shallower below 20.45 m, 55 to 60 degrees TCA. Where textures become convolute, FO is oriented 50 degrees TCA.	FO	55																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			42.99	60.35	17.36	LST	DOL	BX	Medium grey to brown, MG to CG variably brecciated intensely DOL altered LST. The interval is mainly sBX but also shows brown to tan MG sands to silty bedding with occasional sparry infilling of the voids. Clasts are uniform, medium to dark grey, FG to MG LST supported by a matrix that exhibits alternating layers of medium grained brown to tan coloured sands to darker silts. In spots possible crossbedding is exhibited. Bituamous, soft black crystals fills crystal gaps in the sparry sBX matrix. Increase in sparry matrix with depth. Ca filled fractures occur throughout at times offseting banding. Core is compotent but can be blocky to rubbly down to <3 mm fragments.					i													x
									Where defined by bedding, FO is 70 to 90 degrees TCA.	FO	80															
									A weak FO is defined by BX orientation, becoming shallower with depth, 50 to 60 degrees TCA.	FO	55															
									White, CG, Ca-Qz VT, 75 degrees TCA, 10 to 11 cm wide at 46.21 m, and again at 47.00 m. Core is rubbly at second VN, attitude and orientation are unavailable.	VN	75	n/a														
									Ca filled fractures oriented sup-parallel to CA are intermittent throughout. Where passing through bedded speliothem, 2 mm offset is exhibited at 56.90 m.	VT	0															
			60.35	86.26	25.91	LST		BN	Dark to medium grey to rusty-brown, FG to MG, banded/bedded LST with soft, brown beds. LST exhibits fine, mm-scale laminations of medium and dark grey, FG beds with rusty brown beds intermittently throughout. Frequency of brown bands increases with depth. Core is blocky to sub-fissile, fracturing along bedding planes, to rubbly. Frequency of rubbly core increases with depth. lCN is sharp, but obscured by broken, blocky core, becoming yellow OX below.	lCN				i												
									Foliation is defined by laminated texture	FO	80															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
86.26	115.68	29.42				OX			Red-brown to yellow-brown, compotent to very soft clay-silty like OX. Moderate-strong SID alteration is present with gritty to fine rubble, dark rusty-brown core. Hardness and grain size of OX is variable throughout. Trace Qz grit present, locally in bands up to several mm wide. Intermittent zones of weak to moderate OX altered zones up to 20 cm in width are present variably throughout, but are not common.							i	ms										
			86.26	93.50	7.24	OX			Yellow-brown to orange-brown, soft, gritty to clay OX. Some fissile rubbly core is present up hole. A few, blue-grey-orange bands up to 8 cm in width are intermittent throughout (relict LST?). At 42.00 m, an unoxidized, medium grey, zone ~18 cm of core length with irregular margins is present. LST protolith exhibits laminate, fine beds of alternating light and medium grey bands/beds up to a few mm thick. Protolith fizzes readily with HCl. lCN is gradational, becoming darker over 12-15 cm.	lCN						i												
									In the limestone protolith, the FO is defined by its laminated fabric, oriented 45 degrees TCA. There is no visible FO in intensely OX rock.	FO	45															
			93.50	98.45	4.95	OX			Dark brown-red, blocky to gritty to clay-like, soft, strongly SID altered OX. Core appears as earthy blocks to dark red-brown rubble with a glassy lustre to soft, rusty orange-brown silty clays. On fractures of compotent core, rusty orange bands 2.1 cm wide oriented shallow to CA cross-cutting dark, SID altered core. T race yellow limoninte is present as <1 mm crystals on fracture faces with coarse, glassy siderite crystals, with soft, rusty-orange blebs <2 mm in size.							i	s	LIM	t								
									A lack of a uniform fabric or common orientation precludes a FO.	FO	n/a															
			98.45	107.59	9.14	OX			Rusty orange to rusty red, soft, clay-like to gritty OC. Trace Qz gravel to grit is present in bands up to a couple of cm variably throughout. Fair SID alteration is present variably throughout, bands up to 7.8 cm wide exhibit dark red-brown SID alteration. Blocky, re-drilled LST core at 104.55 m appears to be sluffing from above.							i	f										
									A lack of a uniform fabric or common orientation precludes a FO.	FO	n/a															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			107.59	109.80	2.21	OX			Rusty red, gritty to blocky, very soft OX. Fair SID alteration is variable throughout. Trace creamy white-yellow, soft bands 4 mm in width locally associated with a sinuous, 2 mm wide SID VT at 108.80 m. On fractures, core appears dark and earthy where SID altered and rusty red to orange elsewhere.							i	f									
									A lack of a uniform fabric or common orientation precludes a FO.	FO	n/a																
			109.80	115.68	5.88	OX	LST		Rusty red to red-grey, soft gritty-clay to component OX with intervals of strongly to moderate-strongly altered protolith. Generally, interval is gritty, rusty red-orange OX. Intermittent bands of protolith from 3 cm to 41 cm in width throughout. Narrow protolith bands exhibit stronger OX alteration than wider bands. Widest LST protolith band is found at 110.40 m, exhibiting a relict cBX texture and is grey-green to creamy white. Protolith fizzes readily with HCl. Narrower bands of protolith lack relict textures, but appear similar in colour and in hardness as widest LST band. lCN is sharp, with a fracture oriented 90 degrees TCA. Rock becomes grey LST 6 cm below fracture.							i										
									A lack of a uniform fabric or common orientation precludes a FO.	FO	n/a																
115.68	154.54	38.86				LST	OX	BN	Medium grey to rusty red, strongly DOL altered, strongly OX altered, FG to CG LST. Intermittent bands of intensely OX rock 2 to 35 cm wide lay between intervals of DOL altered LST up to 1.95 cm wide. DOL altered LST exhibits variable OX alteration from moderate to intense. Where not obliterated by OX, DOL altered LST exhibits sBX textures and sparry infilling of voids with trace amounts of bituminous material. Qz veining is intermittent throughout. Bright red staining of sparry matrix minerals (HEM?) variable throughout. Trace crinoid fossils are present. OX alteration decreases with depth.					s		s	f									
									A moderate FO is defined by BX orientation where present, 50 degrees TCA.	FO	50

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			135.03	139.08	4.05	OX	LST		Brick red to rusty grey, very soft to hard, gritty to compotent OX with intervals of variably OX altered DOL-LST. Dark red-brown zones of SID alteration up to 4 cm in width are intermittent throughout. Where intensely OX, material meets more compotent, less OX altered protolith OX-DOL-LST along irregular contacts oriented 50 degrees TCA. These contacts are found at 136.84 m, 137.01 m and 138.15 m. Contacts with protolith are sandy brown to yellow, limonitic grit, with coarse, <2 mm rust-orange siderite(?) crystals throughout the gritty contacts. Generally OX is gritty to rubbly, brick red to rusty orange with limonitic patches proximal to protolith contacts. Partially oxidized protolith can be found 136.41 to 137.01 m, and again from 138.15 m and below, exhibiting strong OX alteration to lCN. Relict textures in protolith are obscured by OX alteration. Protolith exhibiting less than intense OX alteration is hard and compotent, apearing yellow-brown to rusty grey. A preferential fracturing is seen in core, particularily in protolith below 138.70 m, oriented 60 to 70 degrees TCA. At 139.50 m, a fracture face oriented 0 degrees TCA exhibits a relic cBX texture oriented 60 degrees TCA, parallel with fracturing. lCN is gradational, becoming more grey and less yellow-brown OX over 15 cm.	CN				s		i	ms	LIM	m								
									A weak FO is defined by preferential fracturing in strongly OX rock and in relict cBX textures, 60 to 70 degrees TCA. This FO is intermittent throughout sub-interval.	FO	65															
									A FO is defined by a common orientation between OX and protolith contacts where present, oriented 50 degrees TCA.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	0.91	0.91				OVB			Overburden, no recovery																		
0.91	105.90	104.99				LST		BX	Dark to light grey, FG to CG, variably BX LST. Vuggy textures are exhibited up hole. Textures are generally sBX with white, vCG Ca matrix filling sBX voids. cBX and tBX textures are intermittent throughout. Fossil content varies throughout interval as does DOL alteration.					f													
			0.91	9.89	8.98	LST		sBX	Dark to medium grey to grey brown, vuggy, sBX LST with occasional MO textures where not sBX. CG, white calcite and grungy, dirty calcite partially fill sBX voids, most exhibit coarse vugs (weathering of Ca). Core is broken to blocky throughout, exhibiting irregular fracturing.																		
									A common foliation was not identified	FO	n/a																
			9.89	40.31	30.42	LST		sBX	Dark to light grey, FG to CG, mottled to sBX LST. Core is generally sBX in texture with coarse, white calcite filling sBX voids. At times, white, sparry dolomite crystals rim dark LST sBX clasts and are up to 3 mm in size with coarse, white Ca filling remaining void space. Trace bituminous material is present with sBX matrix minerals as small, tabular crystals infilling central void space within sBX cavities. Rare Qz crystals exhibit interstitial textures in sBX voids. Where not brecciated, the LST exhibits a mottled texture.					m			t										x
									A common foliation was not identified	FO	n/a																
									Rusty white to dark brown, CG to FG, Qz-Ca-Si vein with patchy LIM alteration on siderite and vuggy, cavity walls is found at 32.93 m, and is oriented 40 degrees TCA.	VN	40															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			40.31	50.83	10.52	LST	DOL	sBX	Medium to dark grey, FG to CG, clastic, tBX LST exhibiting a weak vuggy texture throughout. Dark, angular clasts <1.1 cm in size are supported by a medium grey, FG to MG matrix exhibiting cataclastic textures with trace brick-red, <2 mm, euhedral to irregular, hematitic grains. Vugs are variably infilled with earthy to rusty brown minerals which fizz intermittently. Some zones of sBX textures are seen overprinting tBX, sBX clasts exhibit tBX textures and are supported by a vCG calcite sBX matrix. Occasional sparry dolomite rim clasts of tBX LST where core exhibits sBX. Intermittent, moderate-strong DOL alteration of tBX is variable throughout, core fizzes weakly to readily when scratched. Trace yellow, powdery LIM alteration is exhibited on fracture faces and on vug walls.					ms				HEM	t									x
																		LIM	t								
									A common foliation was not identified	FO	n/a																
			50.83	90.02	39.19	LST	DOL	sBX	Dark to light grey, FG to CG, variably mottled, moderately DOL altered sBX LST with trace fossils. sBX LST clasts exhibit massive, dark grey to mottled, light to dark grey textures and are often rimmed with drusy dolomite. White to dark grey calcite infills sBX voids with coarse crystals, at times exhibiting planar dissolution along cleavage planes. Core is fractured to blocky throughout, fractures are weakly uniform in orientation throughout. Trace LIM alteration is exhibited on fracture faces.					m				LIM	t									
									An intermittent FO is defined by mottled clast orientation and breccia fabric, 50 degrees TCA when present.	FO	50																
			90.02	91.20	1.18	FLT	GRT		Red brown to grey, FG to coarse rubble with gritty clay fault gouge and coarse, broken Ca crystals. Iron alteration is pervasive, except on calcite (late Ca flooding?) Rubbly clasts exhibit relict sBX textures. ICN is obscured by rubbly/blocky core. Sub-interval fizzes readily throughout. Poor recovery through FLT is noted.	FT								FEC	s								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			91.20	93.64	2.44	LST	FOS	BX	Rusty brick red to grey brown, FG to CG, fossiliferous, Fe-OX altered tBX LST. Red colour of core is conspicuous. tBX clasts are very angular to rounded. Angular, dark grey lime mud clasts are up to 2.6 cm in size, brick-red, rounded clasts and fossil fragments are all cemented by a white calcareous matrix. Fossils present are crinoid fragments, tabulate corals (favocites?) rod-like coral and possible stachioides.																			x
									A weak FO is defined by clast orientation, most commonly 60 degrees TCA.	FO	60																
			93.64	95.35	1.71	LST		BX	Dark grey to brown red, MG to CG, sBX LST. Red-brown "clasts" at times appear bedded (speliothems?) with hematitic alteration on fracture faces. Red clasts fizz readily with acid. Moderate LIM alteration stains white sBX matrix minerals along fracture faces and margins, penetrating up to 4 mm into core. Generally red-grey textures appear mottled, lacking strong orientation or a common fabric throughout.									HEM	ms									
																		LIM	m									
									FO is weak, defined by BX textures where present, oriented 50 to 60 degrees TCA.	FO	55																		
			95.35	105.90	10.55	LST		BN	Dark grey to rusty orange, FG to MG, banded SLT with trace fossils. Rusty orange, silty, planar to irregular beds/bands lay between dark, FG lime muds with occasional coarser, medium to light grey LST beds. Bands range from 2 to 3 mm in width up to 4.2 cm. Orange bands when irregular, exhibit a sinuous nature propagation tangential to bedding planes. Occasional Ca nodules with pinch-swell tails oriented with bedding are present and up to 1.3 cm in size. Trace fossils are cryptic, (possible brachiopod) delicate calcareous textures appear deformed (strain zone?)																			
									FO is defined by a laminated, "bedding" fabric, oriented 70 to 90 degrees TCA, steepening with depth.	FO	80																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
105.90	123.24	17.34				VOL	CHL		Dark to creamy green, FG to MG, soft, intensely CHL altered, VOL with MBL interbeds and strong OX alteration with depth. Core is magnetic up to 111.61 m. The unit exhibits a laminar texture with strong, parallel orientation of MG grains and bands of FG CHL alteration. White, MG, calcareous bands are parallel with VOL textures throughout. OX alteration appears with depth below a white, sucrosic MBL interbed. Yellow alteration is present on VOL fracture faces. Core is weakly calcareous except where OX altered (calcareous cement?)									CHL	i							
									A strong FO is defined by a laminated fabric throughout, oriented 75 to 85 degrees TCA.	FO	80																
			111.65	113.69	2.04	VOL	OX		Rusty brown to dark green, FG to MG, very soft, friable OX altered VOL. OX alteration overprints VOL textures. A light grey MBL interbed 35 cm long is present at 112.98 m. Core is blocky to rubbly, rusty brown above the MBL interbed and Dark greer brown below to lCN. lCN is defined by a core break along a weak contact at 113.69 m.	lCN						s		CHL	s							
									FO is defined by relict, foliated VOL textures, 80 degrees TCA.	FO	80																
			113.69	116.69	3.00	LST	MBL		Medium to light grey, intensely MBL altered LST with rusty orange OX staining intermittently throughout. Rusty orange OX alteration (Fe alteration?) is present along fracture faces, appearing to patches up to 2.0 cm in size and up to bands 5.5 cm wide. OX alteration increases with depth. OX alteration is fairly common in orientation, subparallel to FO. Core appears competent to rubbly, breaking where OX alteration is strongest.							f		MBL	i							
									MBL textures define a FO, oriented 70 degrees TCA.	FO	70																
			116.69	122.55	5.86	VOL	CHL		Dark green to rusty brown, FG to MG, laminated to fissile, intensely CHL altered VOL with mod-strong OX alteration. Core is magnetic from 118.20 to 121.24 m, losing magnetism where OX is strongest. Core is blocky to rubbly, fracturing easily along a pervasive, laminated fabric throughout. Core is weakly calcareous below uCN. Trace, narrow, brick-red to rusty brown structures are present intermittently throughout.	uCN						ms	w	CHL	i							
									Defined by laminar fabric and preferred fracturing 80 degrees TCA.	FO	80																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									Rusty dark red-brown, 5 mm wide siderite veinlets oriented 70 degrees TCA and 180 degrees to FO are present at 118.07 and 118.41 m. Further veinlets may be obscured by OX alteration.	VT	70	180					ms										
			122.55	123.24	0.69	VOL	OX		Yellow orange, soft, FG to MG, intensely OX altered VOL appearing clayey to platey, fissile rubble. Where gritty, clasts are plate-like, micaceous and exhibit a pearly lustre. lCN is sharp, contact with LST below is oriented at 70 degrees TCA.	lCN	70					i											
									FO is defined by fissile fracturing and platey mineral orientations, oriented 70 to 75 degrees TCA.	FO	70																
123.24	135.60	12.36				LST	MBL		Light to medium grey, banded, strongly MBL altered LST. Core is competent to rubbly with muddy brown, very soft interbeds hosting grey LST rubble and grit intermittently throughout. Soft brown lenses become weakly more red in colour with depth, becoming a brown-rusty orange. Brown clay bands up to 25 cm wide with irregular contacts are tangential TCA oriented 30 to 70 degrees, and 180 degrees to FO. lCN is fast, defined by a narrow 1.5 cm wide band of LST grit with a brown-red OX clay. LST is broken at lCN 60 degrees TCA, 180 degrees to FO.	BD	50	180				f	t	MBL	s							
									FO is defined by a laminated/banded texture in LST, oriented 45 to 60 degrees TCA.	FO	50															
									A group of siderite veinlets is present at 312.66 m, oriented 25 degrees TCA, 10 degrees to FO and are 1 to 3 mm thick.	VT	25	10														
135.60	144.17	8.57				OX	GRT		Rusty orange brown to rusty red-brown, gritty, very soft OX. Weak amounts of Qz grit to gravel throughout, generally present in narrow bands. Subtle colour changes from rusty hues of brown, orange and red are exhibited. lCN is defined by a gritty Qz band. OX does not fizz with acid. OX alteration pervasively obliterates structures and minerals of host rock, and does not exhibit a foliation throughout.							i	m	LIM	w							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			135.60	135.74	0.14	OX	GRT		Reddish-brown, gritty OX with LST grit and rubble below uCN. Core becomes more rusty orange-brown with depth, gradationally over 7 cm. LST clasts decrease in size and occurrence with depth over the top 4 cm of OX interval. LST grit has been smeared down the outside of core by drilling.							i										
			135.74	136.70	0.96	OX	GRT		Rusty orange-brown, weakly limonitic, gritty OX with weak concentration of coarse siderite crystals. Where core is broken, earthy, irregular fractures reveal patchy, yellow LIM alteration on some earthy clasts of OX and regular to subhedral, 3 to 8 mm siderite crystals/aggregates. Possible cubes of rusted Py <2 mm in size occur on core fractures, but may be siderite. Soft, white, earthy alteration is present on some oxidized gritty clasts as <3 mm, irregular overprints. Small, <1 mm, reflective, pearly grains are disseminated throughout (micas?).							i	w	LIM	w								
			136.70	137.55	0.85	OX	GRT		Rusty brown-orange, gritty OX with weak siderite alteration present on broken core faces. Core is very soft, breaking into earthy clumps with ease. Dark red brown, subhedral siderite grains occur on broken core faces. This sub-interval lacks the micaceous flakes as above and appears to have more dull faces of gritty clasts.							i	w										
			137.55	138.30	0.75	OX	GRT		Dark rusty red-brown, gritty, sideritic OX. Core fractures in an earthy, irregular habit. Dark, glassy to dull siderite crystals up to 9 mm in size are revealed on broken core faces. When glassy, siderite crystals exhibit a conchoidal fracture. Trace LIM alteration is present on coarser siderite grains and aggregates of grit.							i	s	LIM	t								
			138.30	138.39	0.09	LST	OX		Brown-red to grey green, competent, intensely OX altered, dolomitized LST. Greyish protolith lacks original textures, but is conspicuous by its colour and hardness. Sub-interval does not fizz with HCl. Core is harder than core in this OX interval, but is slightly softer than the typical DOL-LST. If core is DOL altered LST protolith, it marks a change from LST above to DOL alteration between here and top of OX alteration at 138.30 m.					s		i											

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			138.39	141.85	3.46	OX	GRT		Rusty orange-brown, very soft, fairly limonitic OX. Earthy fractures of core expose patchy, yellow LIM altered OX surfaces. Coarse grit to gravel sized white Qz occurs over 16 cm at 139.22 m. On core surface, weakly visible red-brown and brown 4 mm to 8 mm "clasts" appear with yellow, 1 mm to <1 mm wide, limonite "matrix" encompassing the clasts.							i	w	LIM	m								
			141.85	143.05	1.20	OX	GRT		Rusty orange, very soft, gritty OX with patchy SID alteration present as intermittent patches to bands and veinlets throughout. Fractures expose fresh core, revealing SID alteration and weak LIM present as <1 mm overprints on gritty aggregates. Qz grit 3 to 4 mm in size is present intermittently throughout.							i	m	LIM	w								
									A planar, 2 mm wide dark rusty red siderite veinlet oriented 50 degrees TCA at 142.30 m exhibits a dull, earthy lustre.	VT	50	n/a															
			143.05	144.17	1.12	OX	GRT		Brown-orange, gritty OX with moderate SID alteration. Fractures expose dark red SID altered patches of gritty aggregates. Core becomes more brown with depth approaching lCN where brown, pearly plates of micaceous grains are visible as <1 mm grains on fractured core surfaces. uCN and lCN are bounded by gritty to gravelly white Qz bands.	CN						i	m										
144.17	189.89	45.72				LST	OX		Medium grey to rusty red-brown, FG to CG, intensely DOL altered LST with zones of intense OX alteration variably throughout. DOL altered LST exhibits variable BX textures where not overprinted by OX alteration. Core is generally competent, only becoming soft and gritty where OX alteration is strongest. OX alteration decreases in strength and frequency as depth increases. Trace hydrothermal, crystalline DOL is seen on weakly OX core surface with depth. At times, OX alteration is calcareous.					i		s											
			144.17	148.28	4.11	LST	DOL		Grey-green to olive brown, FG to MG, intensely DOL altered LST with strong OX alteration. LST show sBX textures overprinted by a strong OX alteration and obscured at margins of sub-interval where OX alteration is strongest.					i		s	w										
									A common foliation was not identified	FO	n/a																

GEOLOGY LOG

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									White to brick red, Qz-siderite vein, 1.1 cm wide, 20 degrees TCA with minor small vugs. Narrow, parasitic Si-Qz veinlets occur proximal to the VN and are oriented parallel to it, at 20 degrees TCA.	VN	20	n/a															
			147.15						CG, brown calcite vein oriented 40 degrees TCA with MG, euhedral Ca crystals. VT fizzes readily with HCl, and is found at 147.15 m.	VT	40	n/a															
			148.28	149.35	1.07	OX			Rusty, dark red-brown, gritty OX with mod-strong SID and weak LIM alteration. Patchy, dark red-brown SID alteration of gritty aggregates are exhibited on fractured core surfaces with small yellow LIM altered blebs intermittently throughout. 7 cm band of coarse Qz grit is present at 149.15 m and oriented 40 degrees TCA. Trace amounts of micaceous <1 mm flecks are present most commonly at margins of OX alteration. OX is non-calcareous.						i	ms	LIM	w								
			149.35	150.47	1.12	DOL	OX		Greyish-orange, FG to CG, strongly OX altered crystalline DOL with disseminated rusty Py cubes. Oxidation is intense up hole, gradationally decreasing in strength with depth, revealing relict crystalline DOL textures and Py MX where OX alteration is weaker. A 5 cm red coloured band is present at 149.85 m (red clay smeared by drilling?). Where OX alteration is strongest, dark red-brown SID alteration is exhibited on fracture faces of core with small, patchy lenticular LIM blebs. ICN is sharp, defined by an irregular, shallow contact between CG crystalline DOL and massive, dark grey DOL-altered LST below.	ICN				i		s	ms			t						
			150.47	156.68	6.21	LST	OX		Brown to rusty brown-red, FG to MG, competent to gritty, intensely DOL altered, variably BX LST with strong OX alteration. OX alteration is intermittent, appearing as rusty bands within grey, sBX to cBX DOL-LST. Generally core is competent, becoming gritty where OX alteration is strongest. Weak SID alteration is associated with zones of OX alteration. Pearly, <1 mm, micaceous flecks are exhibited in fractured OX bands. Contacts between OX and LST are gradational, becoming more red, softer, and more calcareous with increasing OX alteration.					i		s	w								
									A common foliation was not identified	FO	n/a																
									3 mm wide, red-brown, CG calcite veinlet is oriented 25 degrees TCA at 156.65 m.	VT	25	n/a

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			156.68	160.63	3.95	OX	LST		Grey to brown-red, gritty to rubbly, intensely OX altered LST exhibiting narrow patches of DOL altered protolith LST. Generally core is gritty to rubbly, soft, brownish grey OX exhibiting more red colours up hole, becoming progressively more grey below 157.93 m. uCN and lCN are gradational, becoming more competent approaching margins of sub-interval. Patches of weakly red (HEM), dark red-brown (SID) and yellow (LIM) alteration are exhibited on rubbly fracture faces of core up hole. These alterations become absent with depth as core appears more grey in colour. Where protolith is seen, relict sBX textures are exhibited. OX alteration fizzes with HCl.					i		i	w	LIM	t								
																		HEM	t								
									Narrow brown or white calcareous veinlets, commonly oriented at 25 degrees TCA occur where OX alteration is weakest. These VT's may be present elsewhere, but may be obliterated or obscured by OX alteration.	VT	25																
			160.63	185.01	24.38	LST	DOL	cBX	Medium grey to rusty red-brown, intensely DOL altered cBX LST with strong OX alteration. OX alteration zones decrease in width, frequency and strength with depth. Intensely OX altered bands are up to 40 cm wide up hole and as little as 60 cm apart, decreasing to 15 cm in width and increasing to a separation of 4.15 m with depth. Oxidized areas are non-calcareous. OX-LST contacts are gradational in both colour and hardness over 6 to 35 cm. On irregular OX fractures, yellow limonitic alteration is exhibited, stronger than other OX zones seen in this hole. SID alteration in OX bands increases with depth, deeper OX alteration lacks LIM. Rare, pearly, micaceous grains are seen throughout OX altered rock. cBX textures are exhibited on core where textures are not obliterated by OX alteration. At times, drusy white dolomite teeth rim clasts of grey breccia clasts. Grey, dolomite infilling of voids give core a cBX texture, lacking coarse, white, matrix mineralization typical of sBX textures. lCN is defined by the lower limit of an OX altered band, becoming tBX in texture below.					i		s	m	LIM	m								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									FO is defined by common orientation of cBX fabrics, oriented 45 to 60 degrees TCA, most commonly 50 degrees throughout.	FO	50															
									Rusty brown-red, CG, sinuous siderite veinlets oriented 25 to 50 degrees TCA are 3 to 7 mm wide are proximal to OX alteration, at times defining the margins of alteration. VTs are oriented both 0 and 180 degrees to FO. VTs are commonly oriented 25 degrees TCA where oriented 180 degrees to FO, and 50 degrees TCA where parallel with foliation (75 80 degrees, structural fracturing?) Shallow VTs are most common, at times exhibiting Ca where VTs are widest.	VT	25	180																
									Siderite VTs 2-3 mm wide, oriented 50 degrees TCA, 0 degrees to FO.	VT	50	0														
			185.01	189.89	4.88	LST	DOL	BX	Medium to dark grey, FG to CG, intensely DOL altered LST with variable OX alteration. OX is strongest as a narrow 15 cm wide band of rusty red-brown grit at 185.37 m with patches of dark SID alteration and yellow LIM overprints on clumps of OX grit. OX becomes much weaker below, present as competent, rusty-orange brown bands, nodules and wispy stains intermittently hosted in tBX LST. LIM staining is exhibited on fracture faces. Red to red-brown alteration of silty interbeds is exhibited with depth. LST has a clastic texture with dark grey and brown angular clasts up to 2.1 cm in size, usually 6-7 mm, supported by a light to medium grey, FG to MG tBX matrix. Weak cBX textures are variable throughout, with white, toothy, dolomite crystals 1-2 mm filling cBX fractures. LST becomes less tBX with depth appearing as irregular, interbedded CG to MG beds of silty grey-brown and light-medium grey, CG nodules with weak cBX textures and the toothy dolomite as described above					i		ms	w	LIM	w	t						
									FO is variable, oriented 50 to 55 degrees where tBX textures are exhibited, steepening to 65-70 degrees TCA below.	FO	55															
									Rusty white, 1-2 mm wide, calcite-dolomite veins exhibiting orange Fe staining throughout. VTs are oriented parallel with foliation, and exhibit a more undulose texture when hosted in tBX textures.	VT	55	0	2

SAMPLES

Numbers: I077018-I077021, I077035, I077046-I077066

Total: 27

Batch: 71, 72

Date Sent: August 20 and 22, 2010

Certificate: VA10120384, VA10120384

COMMENTS

Reduced to NQ2 at 115.21 m. The hole was ended because it was past the targeted horizon, past the LEP and into the dolomitized crackle brecciated LST.

GEOLOGY LOG

HOLE: Rau-10-110

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other				Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.05	3.05				OVB			Overburden - No recovery																		
3.05	47.24	44.19				LST	MBL	BX	Light to medium grey, FG to CG, variably cBX, strongly MBL altered LST at times exhibiting mottled and weakly banded textures. Rare stylolitic dissolution textures are present intermittently throughout. The major axis of mottled, cBX and dissolution textures are all similarly oriented throughout. Pervasive, strong MBL alteration occurs throughout.									MBL	s								
									A strong FO is defined by mottled LST and cBX fabrics, 30 degrees up hole, steepening to a consistent 40 degrees TCA with depth.	FO	40																
									White to rusty orange, CG, heavy barite veined with rusty coloured carbonates. White CG barite does no fizz, exhibits high specific gravity and orthorhombic crystals. Brown-grey to rusty carbonate patches fizz readily with acid (Fe-Ca?). Vein exhibits coarse vugs throughout, lacking crystal-growth infilling. VN is oriented ~60 degrees TCA, 200 degrees to FO and is 17-18 cm wide. VN is located at 24.15 m. XRF yields high Ba on white crystals (200,000 ppm Ba) and elevated Zn in earthy brown Ca crystals (7,000 ppm Zn. Smithsonite?).	VN	60	200												Ba	m	Sm	w	
			27.74	35.78	8.04	LST	FOS	MO	Medium to dark grey, mottled to cBX, FG to CG, FOS LST with coarse Barite-base metal sulphide veins and mottled, orange-grey alteration throughout. LST is typically mottled to cBX, FG, dark grey and hosts (crinoid fragment, gastropod, favocitid and halycites?) fossils. Fossils make up ~10% of unit, with their presence increasing with depth. MBL alteration also becomes slightly more concentrated with depth. Narrow, white, calcite with rusty orange (Smithsonite?) VTs with a common orientation are seen variably throughout. Patchy grey orange-brown alteration is intermittent throughout, with patches up to 2.7 cm in size at times forming masses up to 7.5 cm wide. CG Ba-Ca-cerussite-smithsonite-galena veining is strongest between 31.00 and 32.00 m, making up ~30% of core. VN's are irregularly oriented with sharp margins, but at times exhibit dark, FG to MG "baked" LST selvages.									MBL	f				Gn	t			

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									FO is defined by the mottled fabric of LST (bioturbation?) and is oriented 40 to 50 degrees TCA.	FO	45																
			31.05						CG, white to rusty brown, Ca-Gn-smithsonite VN, oriented 40 degrees TCA and 0 degrees to FO. VN is 6.5 cm wide. CG white Ca is euhedral to occasionally spherical with cubic Gn up to 7 mm in width. uCN is irregular, lacking a vein selvage while the lCN exhibits a darker, "baked" LST CG vein margin 2.3 cm wide. Gn makes about ~7% of vein material, Ca 60%, orange Fe-Zn carbonate ~30%. VN is found at 31.05 m.	VN	40	0												Gn	m			
									White to rusty orange to metallic grey, CG, vuggy barite-Ca-cerussite-Gn-smithsonite VNs at 31.39 m and 31.70 m. VNs are oriented ~ 40 degrees TCA and ~10 degrees to FO. XRF readings yield elevated As and Au values in vein galena, along with zinc and tungsten. Other readings in carbonate minerals yield elevated As, Au, Zn, W and Pb levels. Gn makes up about 10% of vein minerals. Barite and Gn exhibit step-wise, regular crystal face contacts, indicating contemporaneous growth. Grey-brown Pb-carbonate (cerussite?) crystals exhibit coarse, euhedral crystals with regular crystal faces. Zn-carbonate (smithsonite?) appears interstitially as irregular, rusty-orange, earthy, MG crystals forming aggregate masses filling spaces between Ba-Pb mineralization. Carbonate MX exhibits coarse vugs, along with barite; the latter appearing as primary cavities during crystal growth. Barite is present as CG, tabular sheets up to 4 mm thick, at times exhibiting an orthorhombic habit. White barite does not fizz with acid. Gn makes up ~10% of vein minerals, barite ~50%, cerussite ~30% and smithsonite ~10%. Veins at 31.39 and 31.70 m are 6 and 20+ cm in width respectively.	VN	40	10												Gn	s			
									Brown, FG, clay-like vein at 28.00 m, oriented 40 degrees TCA, 0 degrees to FO and passes through a narrow interval of sBX LST. XRF analysis yields high Zn and elevated As in brown clay-like material (smithsonite?).	VN	40	0																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									White to creamy-orange, earthy, dull grey, Ca vein exhibiting vuggy texture throughout with drousy Ca growing on earthy crystal faces. Appearance is similar to the Ba-Ca-Pb-Zn veins above (Ca-cerussite-smithsonite vein?) and is found at 32.68 m, oriented at 60 degrees TCA and 180 degrees to FO. A wide, calcareous selvage is found below the lower vein margin appearing dull orange-grey to dar grey. FG bands with vugs throughout the vein selvage.	VN	60	180															
									White to dull orange-grey, CG, calcareous, toothy VN oriented 50 degrees TCA and 0 degrees to FO is found at 33.26 m. Rusty dark brown, MG, vuggy siderite occupies the centre of the 11 cm wide vein. Vein margins and selvages appear as dark, "cooked LST and are up to 1.5 cm from vein margins.	VN	50	0															
			34.82	47.24	12.42	LST	MBL	MO	Light to dark grey, MG to CG, sucrosic, weakly fossiliferous, mottled, strongly MBL altered LST. Weak cBX textures are present, but core generally exhibits a mottled "camo" texture overprinted by strong MBL alteration. Cryptic fossil textures are present. Where mottled, favocites coral and other fossil textures are obscured to obliterated by MBL alteration. lCN is gradational, becoming less MBL altered over 25 cm.									MBL	s							
									FO is defined by MBL "banded", mottled "camo" and cBX fabrics, oriented 50 degrees TCA uphole, steadily decreasing to 30 degrees TCA with depth.	FO	40																
47.24	152.14	104.90				LST	FOS	MO	Dark to light grey, FG to CG, variably FOS LST with weak MBL alteration intermittently throughout. Interval is generally muddy to silty, mottled (bioturbated?) LST with crinoid, favocites, ostrocod, rugosa and other fossils supported by fine grained matrix. Where most fossiliferous, rock can be up to grainstone in texture. Though irregularly mottled, a strong, pervasive common orientation is exhibited throughout (bedding fabric?).									MBL	t

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			47.24	60.91	13.67	LST	FOS	MO	Medium to dark grey, FG to CG, fairly MBL altered fossiliferous LST. Rock is generally FG, sucrosic at times, and mottled in texture. Large favocites coral fragments and possible stromatoporid fragments are supported by dark, FG, irregularly "bedded" (bioturbation?) lime muds. Trace crinoid fossils are present throughout.									MBL	f								
									FO is defined by mottled clast orientation and FG mud "bed" orientations, 40 degrees TCA throughout	FO	40																
			66.29	66.92	0.63	LST		MO	Dark to light grey to light brown-grey, FG to MG, mottled LST. Irregularly shaped, but commonly oriented, silty brown lenses to nodules (speliothems?) lay between mottled, dark to light grey, irregularly laminated LST. Trace SER alteration is exhibited on brown silty lenses and bands (VOL interbeds?) Rock preferentially fractures along margins of silty brown layers. At times brown rock exhibit cavities/vugs (partial speliothems infilling?). Brown lenses do not fizz with HCl.									SER	t								
									FO is defined by brown silty lenses and bands, along with laminated fabric of LST, oriented 30 to 40 degrees TCA.	FO	40																
			82.34	114.30	31.96	LST	FOS	MO	Dark to light grey, FG to CG, mottled, FOS LST. Light to medium grey mottled "clasts" are supported by a FG, dark lime mud matrix (bioturbations?). The mottled fabric is commonly oriented throughout. Fossils present are bulbous stromatoporids, gastropods,favocitid and halycites corals, brachiopods and crinoids. Fossils make up 10-15% of sub-interval. Trace cherty nodules are present at 98.12 m. lCN is gradational, becoming more sucrosic and CG with depth below a narrow, crinoid grainstone "tempestite" bed at 113.40 m.									SIL	t								
									FO is defined by mottled fabric and orientation of fossil textures (bedding), 35 to 40 degrees TCA.	FO	40																
			114.30	117.98	3.68	LST	MBL	MO	Medium to dark grey, MG to FG, mottled, moderately MBL altered LST. Irregular, FG, lime mud beds 1 to 8 mm thick exhibit a weakly laminated fabric with mottled, MG, medium grey patches between FG beds. Fossil content increases with depth, exhibiting a weak amount of crinoid fossils. MBL alteration is present at uCN, decreasing with depth over 1.55 m.									MBL	m								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									FO is defined by FG mud beds and mottled fabric, 50 degrees TCA.	FO	50																
									Narrow, very fossiliferous (tempestite?) bed at 117.53 m, 7 cm wide, bedding parallel to FO and can be classified as a crinoid-rugosa grainstone.	BN	50																
			117.98	118.92	0.94	LST	FOS	CG	Dark to light grey, CG to FG, fossiliferous, crinoid grainstone LST. Fossils make up ~50% of subunit, mostly crinoid fragments and trace gastropod and bryozoan fossils. uCN and lCN are sharp, defined by narrow, brown, silty layers ~1 mm thick.																		
									FO is defined by grain orientations, 30 to 50 degrees TCA.	FO	40																
			118.92	128.09	9.17	LST		MO	Dark grey to light grey, FG to MG, mottled and interbedded, moderately FOS LST with trace Py mineralization. Sub-interval exhibits planar to irregular (bioturbation?), interbeds of medium-light grey, MG LST and dark to medium grey lime muds. Bedding fabrics and interbeds exhibit mottled, irregular fabrics variably throughout, giving core a mottled appearance. Fossil content increases with depth with star and one hole crinoids, small favocitid fragments and ostracod fossils. The lCN is defined by the lower margin of a narrow, 6 cm wide CG crinoid grainstone bed. Trace Py is present as FG disseminations in narrow mud beds (diagentic Py?).											t						
									FO is defined by a bedding/lamination fabric, 40 degrees TCA.	FO	40																
			128.09	131.28	3.19	LST	FOS		Light to dark grey, CG to FG, FOS LST. Large favocitid coral fragments up to 19.5 cm of core length are surrounded by dark, FG lime mud (favocitid boundstone). Where muddy, weak amounts of ostracod fossils are present. Trace metallic, <1 mm yellow Py disseminations are present occasionally with lime mud bands. Mud bands can appear planar, commonly oriented, but also exhibit convolute textures when surrounding coral fragments.											t						
									Defined by a weak orientation of lime mud bands and clast orientations, 40 to 70 degrees TCA, but generally around 55 degrees.	FO	55

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			135.99	137.93	1.94	LST			Dark to light grey, FG to CG, variably FOS LST with moderate-strong Py MX. Py is present as FG to MG disseminations to nebulous aggregates of yellow, metallic, subhedral grains hosted in dark lime mud bands. At times, Py appears to almost replace entire lime mud bands. Lime mud bands are sinuous to convolute in texture throughout and range from 1 mm to 2.1 cm in width. Core is generally light to medium grey, MG to CG, mottled limestone supported by bands of lime mud and Py.										ms							
									FO is defined by grain orientation and lime mud/CG fabrics, oriented 50 to 35 degrees TCA, becoming shallower with depth where textures and fabric appears more convolute (strain?).	FO	40														
									White, CG, Ca-Qz VN oriented ~90 degrees TCA, variable in width from 2.5 to 3.6 cm. VN is found at 137.12 m.	VN	90														
			146.89	149.80	2.91	LST	FOS		Light to medium grey, CG to FG, FOS LST. Large facocitid clasts up to 18 cm of core length, and making up greater than 50% of the core are encased in dark, FG lime mud (favocites boundstone?). Trace ostracod and star crinoid fossils are present in lime mud throughout. Trace Py MX is present in lime mud as FG, subhedral disseminations.										t							
									FO is weak, a convolute fabric displays a weakly common orientation of clasts and mud beds, 45 degrees TCA.	FO	45														
152.14	157.50	5.36				MBL		BN	Light to dark grey, MG to FG, sucrosic, banded MBL. uCN is gradational, MBL alteration increases with depth, though dark, FG lime mud bands from 152.65 to 153.10 m exhibit weak MBL alteration. Bedding in mud bands is parallel with MBL banding and dissolution textures, which are exhibited throughout. Banding is most obvious in FG, dull, metallic, planar to sinuous, Py bands 1 mm to 1.2 cm wide, which are more prevalent uphole. VOL bands are present, exhibiting red to yellow-grey-green alteration with trace fuchsite. ICN transitions fairly quickly into MBL, lacking strong, wide VOL-MBL interbeds seen elsewhere at Rau. The change from MBL to VOL occurs over 12 cm, with angular VOL clasts in MBL and a convolute mass of intertwined green VOL shoots into MBL.										f			Fu	t			

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

157.50	222.67	65.17				VOL	CHL		Dark to light green, CG to FG, AM to CGL, variably magnetic, intensely CHL altered VOL. Generally, VOL exhibits variable clastic textures from pebble conglomerate to pumice-like and dark grey (tuff?) with FG, SER alteration in place of CHL alteration. Where not clastic, VOL appears massive, FG to MG, lacking amygdules. Magnetism is exhibited only up hole. Trace sulphide mineralization is present, usually as MG blebs or FG disseminations. This VOL unit exhibits a thickness and variety of textures not typically seen in a VOL unit at Rau. Preferential fracturing is common throughout and uniform in orientation. Core is magnetic from 157.87 to 170.98 m.								CHL	i	t		t	Cp	t			
																		SER	ms								
			157.50	164.71	7.21	VOL	CHL	MA	Green to dark green, MG to FG, variably calcareous massive VOL with a BX to banded texture from Ca veining/fracturing throughout. Core is magnetic from 157.87 m on. Trace Py is present as cubes <5 mm in size disseminated throughout. Calcite is present as a white cBX "matrix" up hole to commonly oriented banded "veining". Ca structures are commonly oriented, and range from a few mm to 6 cm in width. Trace Py and rare Cp mineralization is present with Ca structures as <3 mm blebs. Magnetism when exhibited, is variable in strength. Dark, MG, tabular to prismatic, <1 mm mineralization is disseminated throughout, making up 7-10% of sub-unit. Small, <1 mm Ca round "amygdules" are present variably throughout.								CHL	i	t			Cp	t	Mg		
									FO is defined by grain orientation and calcitic "veining", 40 to 45 degrees TCA. Fracturing is sometimes exhibited on this plane.	FO	40															
									White, Ca-CHL-TLC veinlet, oriented 15 degrees TCA and 180 degrees to FO is 4 mm thick and found at 161.50 m.	VT	15															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			175.41	196.89	21.48	VOL	CHL	AM	Green to brown, FG to CG, variably clastic, amygdaloidal, intensely CHL altered VOL with strong BIO alteration. CHL alteration is pervasive with some zones of brown BIO alteration overprinting CHL. BIO alteration is present in bands 12 cm to 80 cm of core length. CNs between CHL and BIO alteration are gradational over 3 to 6 cm. Amygdules are irregular, rounded to subrounded, calcareous filled structures throughout and range in size from <1 mm spheroids to amoeboid blobs up to 4.4 cm in length. When elongate, amygdules are uniformly oriented. Textures become increasingly varied with depth, clastic, pink brown (pumice?) are present with calcareous amygdules below 188.70 m. Below this, amygdules exhibit a pinched "tails" pointing down hole on one side of the amygdule, supported by a variably CHL and SER altered matrix, exhibiting a patchy, interfingering fabric. "Pumice" clasts are up to 1.8 cm in size, rounded to sub rounded, vesicular (?) and exhibit wispy SER alteration within clast margins. Amygdule content decreases with depth. lCN is sharp, defined by a contact with a very dark, massive, VOL unit below. Above the lCN, Py and Po MX appear with calcareous infilling of amygdules.	CN								CHL	i	t		t					x
																		BIO	s							
																		SER	ms							
									Foliation is defined by the orientation of elongate clasts and amygdules, and bedding/banding textures of CHL layers, 30 to 35 degrees TCA becoming shallower with depth.	FO	30															
									White, MG, calcareous, <9 mm VTs and fracture filling are present throughout, generally oriented parallel with FO, but at times appear irregular and undulose, and oriented 30 to 50 degrees TCA, 90 to 180 degrees to FO. Veins with different orientations lack cross-cutting relationships.	VT	35	0															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			196.89	199.46	2.57	VOL		MA	Black-green, FG to MG, soft, near fissile, laminated VOL. Core fractures easily along lamination planes when struck with a hammer falling without assistance. Core is non magnetic and doesn't fizz, except on sinuous, calcareous bands/VT's throughout, oriented parallel to laminations. Weak sulphide mineralization is associated with calcite; Py blebs and rare <1 mm chalcopyrite crystals are present. Py is also present disseminated in very dark core, appearing as elongate, <1 mm in width, elongate with lamination fabric, lenses to bands intermittently throughout.										w			Cp	t			
									FO is defined by the laminated fabric and preferential fracturing of core, 35 to 40 degrees TCA.	FO	40															
			199.46	222.67	23.21	VOL	CGL		Green to brown, FG to CG, polymictic, strongly CHL altered, CGL VOL with strong BIO and SER alteration. Core is variably calcareous throughout (calcite matrix? calcite flooding?) with some white, rounded calcareous (amygdules?) clasts <2.1 cm in diameter. Clasts are variable in size, shape and colour, with variable reaction to HCl. Clast size ranges from angular, 2-3 mm clasts of various colours to elongate, green-grey and brown-grey clasts larger than the core diameter. Clasts are generally <5 mm in size and are uniformly oriented, supported by a FG, variably CHL, BIO and SER altered matrix, appearing dark green, brown and olive green respectively. ICN is quite sharp defined by a soft, clay altered band 9 mm wide oriented 30 degrees TCA.	CN								CHL	s							
																		BIO	s							
																		SER	s							
									FO is defined by clast orientation, 35 to 45 degrees TCA.	FO	40																
222.67	223.57	0.90				MBL		BN	Light grey, banded MBL with narrow, grey-brown to creamy rusty orange, clay altered VOL (interbeds?) throughout. Bands are 1 to 8 mm in width. Commonly oriented and are soft. ICN is defined by a grey-brown band oriented 40 degrees TCA, becoming bleached LST below.	CN																
									FO is defined by the orientation of bands within the marble interval, 35 degrees TCA.	FO	35															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
223.57	261.45	37.88				LST			Medium to dark grey, MG to FG, laminated LST with trace fossilization. Top of unit hosts narrow VOL interbeds and exhibits bleached alteration with moderate MBL alteration below. LST exhibits a strong laminated fabric of alternating MG, medium grey beds between dark, FG muddy beds to dark brown silts. Beds are no more than 9 mm thick, darker, FG bands are generally 2 to 3 mm thick (rhythmic bedding?). Trace Po is present with depth as elongate, FG, <1 mm wide, 3-4 mm long, bronzy, magnetic features parallel with bedding. Trace gastropod and crinoid fossils are present, but rare. Calcareous nodules up to 1.4 cm in size exhibi pinch-swell textures parallel to the FO.								BLE	s			t					
																		MBL	m								
									A very strong FO is defined by laminated bedding, 45 degrees TCA.	FO	45																
			223.57	232.53	8.96	LST	BLE		Light grey, cloudy, intensely bleached LST with mod strong MBL alteration with depth. Where alteration is strongest, VOL and LST interbeds exhibit a convolute, very irregular fabric and Fe staining. Bleaching and convolute textures are spatially associated with a CG, Qz-Ca VN at 224.67 m. Bleached alteration decreases with depth, becoming sucrosic, MBL alteration. MBL decreases with further depth, becoming absent over a gradational contact with laminated LST below over 90 cm. Where MBL, a banded/laminated fabric appears more regular than in uphole textures. Trace Po is present as FG to MG blebs disseminated with narrow, clay altered VOL interbeds.								BLE	i			t					
																		MBL	ms								
									Where defined by irregular, convolute textures, FO is shallow, 15 degrees TCA up hole, steepening with depth where core fabric appears more uniform, oriented at 40 degrees TCA.	FO	30

									White to a rusty white, CG, Qz-Ca VN with irregular margins (which make vein orientation difficult to ascertain - 90 deg TCA??). Fe staining occurs along crystal faces of vein minerals exhibited. Vein selvages are strongly altered, SER alteration is adjacent along upper margin of vein and is up to 6 cm wide with subhedral, 1-2 mm, soft, black, metallic minerals. Vein is found at 224.67 m, 7.5 to 12 cm wide, and exhibits intense, wide bleached selvages up to 4 m down hole.	VN	90	n/a																		
									Rusty orange-white, CG, carbonate veins with rusty-white orange and dull, earthy-grey-brown crystals. Vein appears similar to Ca-Pb-Zn veins found higher up hole. Margins are sharp, but oriented differently, 50 degrees TCA and 0 degrees to FO for the upper margin and 35 degrees TCA and 90 degrees to FO below. Veins are found at 233.61 m and 234.57 m, 16 cm and 9 cm wide respectively.	VN	40	45																		
									White, MG Ca VT, 3 mm wide, 25 degrees TCA and 270 degrees to FO. 1.8 cm offset of bedding textures is exhibited along VT.	VT	25	270																		
261.45	264.90	3.45				VOL	BIO	BN	Dark brown to olive grey, FG to MG, laminated, strongly SER and intensely BIO altered VOL. Fine bands of BIO altered VOL 1 mm to 3.7 cm thick are laminated with white, calcareous layers ~4 mm thick and olive coloured, SER altered bands. SER alteration increases with depth. lCN is defined by a green-grey SER/clay altered band oriented 45 degrees TCA, creating a sharp divide between this VOL and the rock below. Trace Py is disseminated as fine, metallic yellow blebs <1 mm throughout.	CN								BIO	i	t							
																		SER	s								
									A strong FO is defined by a banded texture, oriented 40 to 45 degrees TCA.	FO	40																
			262.44	262.45	0.01				White to metallic yellow. CG, Py-Ca-tremolite (?) vein (skarn vein?) is 1.4 cm wide, and oriented 40 degrees TCA and 200 degrees to FO. Py is present as subhedral masses with vuggy textures along crystal margins. White calcite, and small, dark green, translucent, tabular crystals are present, <1 mm in size (tremolite?). Py crystals are disseminated throughout.	VN	40	200																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

264.90	265.57	0.67				LST	SIL	BN	Dark to light grey, FG to MG, banded, SIL altered LST. Core fizzes readily throughout and exhibits a hardness greater than typical LST. A banded texture with alternating layers of dark and light LST in 2 mm to 1.1 cm wide beds(?) is seen throughout. Weak cBX textures are seen just below uCN. lCN is gradational, becoming more dolomitic, with a weak sBX texture overprinted by a dull, cloudy, MG, equigranular dolomite alteration/recrystalization.									SIL	s									
									FO is defined by a banded fabric, oriented 40 to 45 degrees TCA.	FO	40																
265.57	268.89	3.32				DOL	OX	MO	Light grey to rusty orange, MG, OX altered DOL with minor sulphide mineralization. sBX textures are exhibited up hole, becoming obliterated with depth over 9 cm by dolomite recrystalization. Weak "Tiger Zone" textures are exhibited intermittently, but generally dolomite texture is more massive and FG than coarse and banded as seen in Tiger Zone stratigraphy. A rusty orange OX alteration is presen throughout distal to the upper and lower contacts, representing the bulk of the interval centred at the middle of the unit. Sulphides appear fresh to variably oxidized where OX alteration is present. Trace As is present as coarse, euhedral crystals up hole, decreasing in size with depth from 9 mm to 2 mm in size, exhibiting weak OX alteration on crystal margins. Weak Py as euhedral 2 mm cubes (rusty when hosed in OX altered rock) to irregular blebs with As mineralization. Py bands are present 5-6 mm wide near lCN. Trace Po is present as blebs weakly forming a band where Tiger Zone-like textures are exhibited. lCN is defined by a band of Py mineralization oriented 50 degrees TCA. Core becomes MBL LST below Py band.	CN				i		m					w	t	t					x
									The foliation is defined by weak "Tiger" banding textures where present and Py bands proximal to lCN, 50 to 70 degrees TCA.	FO	60															
268.89	269.57	0.68				LST	MBL		Dark to light grey, banded, MG, moderately MBL altered LST. A banded fabric is exhibited below the uCN where MBL alteration occurs becoming more irregular with depth. lCN is sharp, defined by a VN margin (skarn vein?) below.	lCN								MBL	m								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									A variable FO is defined by banding textures, 40 to 70 degrees TCA.	FO	55																
269.57	272.78	3.21				VOL	VN		Brown, FG to CG, laminated, intensely BIO altered VOL hosting intense, CG Qz-Po-Py veining. 1-2 mm wide FG brown bands are layered with <1 mm, FG SER and green CHL bands throughout. CHL alteration is also present on fracture faces. Sulphide mineralization is present in veins as CG, euhedral crystals to large masses of Py and Po . Amoeboid masses of Py and Po hosted within VOL exhibits strongly pitted (exsolution?) textures. Trace chalcopyrite is present as ~1 mm blebs in the Qz-Po Py veins. Vein mineralization makes up approximately 40% of interval. uCN and lCN are both defined by veins. VOL rock are present in intervals from 12 to 45 cm long between veins. Veins exhibit different orientations and irregular margins, meaning that attitudes could not be measured.	CN								BIO	i	m		s	Cp	t			
									FO is defined by laminated textures exhibited by VOL rock and is variable, especially proximal to veining. Distal to veins, FO is oriented 45 to 60 degrees TCA.	FO	50							SER	ms							
																			CHL	ms							
272.78	285.55	12.77				LST		BN	Medium grey, FG to MG, laminated LST. Orientation of laminated textures (bedding?) are variable throughout. Beds exhibit a shallow, irregular fabric up hole, uniformly steepening to 80 degrees TCA mid-unit, shallowing again with depth. Beds uphole are FG to MG, white and calcareous with grey-brown silts. Irregular fabric appears to exhibit boudinage deformation (?). With depth, <1 mm wide dark grey mud beds begin appearing within. Weak cBX textures are exhibited with depth. lCN is defined by a shift from cBX to sBX. Trace Py is present as <1mm blebs with lenticular calcite and as rare euhedral, FG disseminations.	BN	80										t						
			277.89	278.86	0.97	VOL	CLY		Dark green-brown, laminated, FG, soft, competent to clay altered VOL interbed. Dark green, chloritic alteration is present below uCN becoming brown-red clay alt (OX?) with depth. Core is very soft, only competent approaching uCN and lCN.							ms		CHL	s								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
285.55	308.59	23.04				LST	DOL	BX	Dark to light grey, FG to CG, variably BX, intensely DOL altered LST with intervals of CG, crystalline, hydrothermal DOL. Dark grey LST clasts are supported by a CG, sparry, white sBX matrix. mBX textures become frequent with depth. Trace, bituminous material is variably seen filling centres of sBX matrices. DOL alteration is extensive, with core only fizzing readily where Ca infills fractures. Py mineralization is associated with crystalline dolomite, along with trace base metal sulphides.					i						t							
			294.41	295.86	1.45	DOL		CG	White to light grey, CG, hydrothermal DOL exhibiting vuggy textures throughout. Crystals are up to 2.1 cm in size. Margins of crystalline dolomite bodies are irregular, lacking a common orientation on core surfaces. Py MX is present as rare yellow cubes <5 mm, but more commonly as aggregates of FG, euhedral grains forming small amoeboid masses. Red, rarely black, sphalerite and galena partially occupy vug cavities, forming small bunches of FG, euhedral crystals. A soft blue, powdery, earthy mineral coating is local to Sp-Gn mineralization (cerussite?).											w			Sp	t	Gn	t	
									A uniform foliation could not be determined	FO	n/a																
308.59	339.02	30.43				LEP			Brown, FG to MG, spotted LEP, variably SER altered throughout, exhibiting intermittent laminated textures with depth. Core is weakly calcareous, with "fuzzy" brown to brown-grey mottled "spots". Sharing a uniform orientation. A white, variably calcareous "matrix" supports mottled LEP clasts, becoming narrow, laminar bands to diminishing further with depth. SER alteration is present as FG wisps to bands up to 30 cm in width, most commonly as lenticular to amorphous patches elongate with rock fabric. Trace Py is present as FG disseminations to aggregates of yellow grains forming masses up to 9.6 cm in size. Larger masses of Py are present only while approaching the lCN within bands of grey-green SER/clay alteration. At the lower contact, trace clasts of orange-grey and yellow, vesicular(?), rounded to subangular material (pumice?) appear to be differen from the typical LEP material.									SER	s	t							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									A strong FO is defined by a laminated fabric and common orientation of clasts, varying from 35 degrees to 55 degrees TCA throughout.	FO	45															
									Pink-white, weakly calcareous, MG VT oriented 15 degrees TCA, 270 degrees to FO. VT is 3 mm wide and crosscuts a narrow, grey-green SER altered band parallel with FO at 318.55 m. Other white VT's follow similar orientation throughout, generally 1 every 2 m throughout.	VT	15	270	0.5													
339.02	361.80	22.78				LST	DOL	cBX	Light to dark grey, FG to MG, intensely DOL altered cBX LST. Light grey cBX clasts are supported by a dark, FG, cBX matrix throughout. Trace LIM alteration is present on some fracture faces. Trace graphitic alteration is exhibited at 339.70 m as FG, soft, dark grey mineralization that rubs off on fingers Trace Py is present as bright yellow, "splashy", MG blebs forming masses up to 1.2 cm in size.					i				LIM	t	t							
									The foliation is highly variable and defined by cBX fabrics, FO orientation varies from 40 degrees to 90 degrees throughout. A common FO could not be determined.	FO	n/a															
									White, CG, dolomitized Ca veinlets, 2 to 4 mm wide, oriented 25 degrees TCA. At times veins are vuggy and weakly calcareous.	VT	25	n/a															
									White, largely void, CG, DOL-Qz-Sp VN oriented 40 degrees TCA. VT is 4 mm wide with orthorhombic, white DOL, clear prismatic Qz and FG, red sphalerite crystals. Coarse grained Qz can be seen growing on VT margins. VT is oriented parallel to a local FO defined by cBX textures.	VT	30	0															
									361.80 m: E.O.H. - The hole was ended because it was well past the targeted OX horizon.

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							PHOTO
																		Other					Other		Other	
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.00	2.00				OVB			Overburden- No Recover																		
2.00	49.82	47.82				ARG			Black to green grey, intensely altered FG ARG with zones of black clay to rubble with minor orange brown patches. Consolidated core locally has dark orange brown subrounded clasts which appear weakly elongate along a FO, and orange brown layers and FX surfaces. Thin white VT, locally orange, of Ca and soft white non-calcareous mineral, locally with vitreous crystals; possibly Barite. Local Qz VN. Trace FG Py.										t							
			2.00	23.27	21.27	ARG			Black to dark green and blue grey, with orange brown patches, and intervals up to 6 m long of clay to rubble, predominantly silt. Weakly calcareous, decreasing down interval. Less altered core has thin Ca VT.																		
			23.27	40.82	17.55	ARG			Dark blue grey to black FG non-calcareous argillite, with weak OX on FX, in VT, and in layers and clasts. Clasts subrounded, orange brown, weakly elongate on irregular FO. Trace FG to MG Py disseminated. Thin white, soft, non-calcareous VT locally orange altered; possibly Barite with Smithsonite/OX. Some Ca VT. Very broken zones, corroded look with vugs common.	FO	30					w				t							
											55																
			26.84	26.91	0.07				7 cm Qz VN with Ca rims and orange OX associated. Qz VT and patches for ~ 50 cm afterwards.	VN	60																
			30.24	30.80	0.56	ARG			Medium blue grey non-calcareous layer, with orange buff patches, FO, with irregular CN with black argillite. Weak to fair FG disseminated Py. Small white and light yellow soft non-calc patch on FX surface; Talc?	FO	35									w							
			40.82	48.08	7.26	ARG			Dark green grey FG non-calcareous argillite with black and blue grey clasts locally, subrounded and elongate on FO. Fair OX on FX and pervasive through < 25 cm zones as red orange OX clay to rubble. No VT, trace disseminated Py. Interval very broken with clay to rubble intervals < 3 m. Lighter green zones appear SER altered; some volcaniclastic component?	FO	30					f			t							

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			48.08	49.82	1.74	ARG			Medium blue grey and black interlayered ARG and volcaniclastic, as irregular FO and layers. Weak FG Py in patches. Bright orange, soft, non-calcareous layer.											w							
49.82	63.21	13.39				VOL			Interlayered black, blue grey and green grey, FG VOL and ARG. Altered orange brown in patches, layers, and zones. FG to MG disseminated OX MX. Layers thin to < 30 cm thick, form variable FO. Non-calcareous.							s											x
63.21	65.13	1.92				ARG			Sharp irregular uCN with VOL/ARG. Medium to dark grey ARG, locally intense SIL with cBX like texture. Interval very broken, with zones < 20 cm of dark red brown OX/SID clay to rubble, with red brown alteration on FX of broken core. Interval non-calcareous.																		
65.13	96.32	31.19				LST	DOL	cBX	medium grey LST, strongly cBX to sBX by DOL/Ca with weak overprinting, with DOL/Ca VT to VN, commonly at 25 to 40 degrees TCA, and Qz/Ca VN. Thin black styolites commonly truncate structures (VT and blebs of Qz/Ca/DOL). Weak OX on FX and VT/VN. Qz/Ca VN up to 20 cm wide ~ 50 degrees. Thin black seams defining local FO of ~ 30 degrees, commonly erratic and are mBX by VT and VN. Very broken rubble zones < 20 cm, some altered to dark brown clay to grit. DOL VN < 15 cm.	VT	40			m		t											
96.32	114.00	17.68				LST	MBL	FO	Dark to light grey, FO LST with favocites, and possible colonial rugose fossils. Circular Ca blebs elongate on FO may also be organic in origin. Locally moderate to intense MBL, increasing down interval to pervasive strong MBL. Intervals < 1 m of very broken altered core, easily broken to grit.									MBL	ms							
			96.93	97.83	0.90	LST	OX	GRT	Orange brown clay to grit, and orange to dark brown alteration of LST over zones < 20 cm and layers following FO.							s										
			108.19	109.08	0.89	LST		SLT	Dark grey LST with brown clay to silt alteration. Very broken.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

114.00	116.15	2.15				MBL			Light grey FG MBL with dark grey layers and trace light orange brown OX in thin layer and on FX. Dark grey layers increase toward lCN; uCN and lCN gradational.							t											
116.15	149.58	33.43				VOL	CHL		Green blue grey, intense CHL VOL with Ca VT and blebs, erratically elongate on FO. Bi rich layers brown, with platy MX on FX. OX on FX surfaces which generally follow FO. Small Ca spots within VOL, elongate on FO, make VOL weak to strongly calcareous, and some of the spots have stylolitic texture. Very broken zones < 30 cm long, with blue grey clay on surfaces. Segments of dark grey magnetite pebble conglomerate with clasts ranging from 1cm to 10cm and elongate along FO. Variable magnetite patches throughout unit. FO ranges from 50-75 deg TCA	FO	60							CHL	i								x
																			BIO	m							
			120.73	121.00	0.27	VOL	RBL		Very broken up, rubbly section. Clasts range from 3mm - 2cm with a medium grey clay coating on the surface.																		
			121.74	123.46	1.72	VOL	CHL		Dark green-grey, MG, intense CHL VOL with 15% Ca blebs that are irregular in shape and only mildly follow FO; look almost stylolitic. Some of the Ca blebs have a slight pink alt.									CHL	i								
			123.46	130.75	7.29	VOL	CGL		Medium to dark grey, FG to MG VOL magnetite pebble conglomerate. Dark greenish-medium grey clasts that are elongate along Fo; SER altered clasts. Clasts range from 0.5cm - 10cm wide and 3cm upwards in elongated length. Clasts have visible Mg specks throughout and many appear zoned. Mg matrix supported CGL.	FO	50							SER	m				Mg	ms			x
			124.44	124.56	0.12	VOL	RBL		Very broken up, rubbly section. Clasts range from 2mm - 1cm with a medium grey clay coating on the surface.																		
			132.60						Ca VT that has stylolitic texture. 0.5mm thick with wisps of Ca up to 2cm thick.	VT	40	130	2														
										FO	75																
			134.33	134.43	0.10	VOL			Ca VN/large bleb. Sharp contacts with VOL at widest part and very gradational as bleb thins. Ca has a slight buff alteration in places. No measurable orientation.	VN																x

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
			135.08	139.56	4.48	VOL			Medium green-grey, MG, CHL VOL with 20% Ca spots that are 1mm-4mm wide and elongate along FO. Ca spots are quite rounded and very white in colour. They appear in "bands" of more intense Ca regions. Wispy blue-blueish grey Ca stylolite-VT throughout interval with no measurable orientation.																		
			139.98	147.50	7.52	VOL			Dark grey to black, MG VOL with Ca VT/elongate blebs that follow/define FO. Ca VT/blebs are more common towards end of interval. uCN is very sharp and has a slightly OX-clay ~2mm coating. FX surfaces also have a mild OX-clay coating. lCN is gradational over 30cm.	FO	70					t												
										uCN	90																
			147.50	149.08	1.58	VOL	OX		Moderately to intensely OX VOL with a light to medium buff colour (VOL slightly bleached). Fizzes strongly in the less OX regions with 10% HCl, and weakly in the more OX zones. FO present in some of the weaker OX zones. Small MBL LST sections seen throughout with brown, platy Bi present.	FO	65					s		BIO	t							x
			149.08	149.58	0.50	OX			Medium brown to orange, clay rich, vFG to FG OX. Extremely sharp contact into LST below.	lCN	30															x
149.58	210.33	60.75				LST	OX		Light to medium grey, MG to CG DOL LST with a lack of FO, and some places slightly BX with zones of weakl to intense OX. From 152-167m interval is 40-50% OX, 50-60% LST. OX becomes less pervasive down interval and is only fair to moderate OX overall. DOL intensity varies throughout interval from weak to intense. Dogtooth sparry texture visible in the competent LST segments, with trace Bi and trace OX Py.					s		m				t							x
			149.58	151.34	1.76	LST	MBL		Light to medium grey, MG, slightly FO/BN, intense MBL LST. Banding very planer at start of interval and becoming more undulating down hole. Gradational lCN into LST.									MBL	i								
			152.00	152.70	0.70	OX	LST		Medium brown, FG to MG OX LST. Ca rimming lCN. uCN gradational.	lCN	25															
			154.33	154.76	0.43	OX	GRT		Medium grey-brown, MG, GRT OX. Grit at start of interval and more rubble at end of interval. Fizzes strongly with 10% HCL. Holds shape of core.							i									

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			155.59	156.75	1.16	OX	GRT		Dark red-brown-grey, MG to CG GRT OX. Colour variant throughout interval with a few light patches in the middle. Sharp contacts into LST. Does not fizz with 10% HCL. Holds core shape, and is darker brown on the inside.	uCN	25					i											
			157.53	158.39	0.86	OX	GRT		Dark red-brown, MG to CG OX GRT. Fizzes strongly with 10% HCl. Darker brown colour on the inside, and holds core shape.	uCN	65					i											
			160.03	161.96	1.93	OX			Dark red-brown, MG OX. Fizzes strongly with 10% HCl. Colour the same on the outside and inside of the core. Holds core shape. Sharp uCN - non-measureable with a more gradational lCN							i											
			163.93	163.37	-0.56	OX	GRT		Dark red-brown, CG OX. Sharp UCN	uCN	45					i											
			174.30	174.61	0.31	SID			Dark brown, porous, MG to CG SID VN. Sharp but undulating contacts with Ca rimming present at both.	VN																x
										uCN	65																
										lCN	30																
			176.00	176.74	0.74	DOL			CG to vCG slightly OX DOL. Slight yellow/pinkish alt - Ankerite. LST "clasts" seen at end of interval between the CG DOL crystals.						w											
			183.72	185.32	1.60	OX	LST		Medium brown-red, MG very intensely OX DOL LST. DOL LST texture present in the less intensely OX segments. Rock is competent but extremely weak. Fizzes moderately with 10% HCl. Surface of core has pits -- eroded from drilling. OX has a very gritty texture.					m		i											
			185.32	186.93	1.61	OX			Medium red-brown-orange, FG to MG OX. Fizzes moderately at top of interval, but does not down interval with 10% HCl. Core holds its shape, and external colour is the same as the internal colour. uCN very gradational, lCN sharp.	lCN	50	320														
										FO	45																
			186.93	207.36	20.43	LST	OX		DOL OX LST has a slight FO at top of interval. FO very weak, but becoming more defined down interval. FO varies from 45 deg. To 65 deg. TCA.	FO	55																
			191.00	191.41	0.41	OX	LST		Orange-red-brown, FG to MG OX LST. Large partially OX Py crystals visible. OX competent and holds core shape. Sharp uCN and lCN.	uCN	90								t							x
										lCN	90																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			192.98	200.61	7.63	LST	OX		Medium grey, FG to MG LST. DOL altered in small sections of interval in small seams and stringers along FO. DOL alteration not as pervasive as surrounding intervals. Dark grey/brown, slightly OX stringers defining FO -- 55-65 deg. TCA. FX surfaces strongly OX. Fizzes intensely with 1-% HCl. Some seams/FX have a pinkish colouration - HEM?	FO	60			w		w		HEM	w							
			200.02	200.23	0.21	LST	Ca		CG, white Ca VN. Could be a series of closely spaced VT. LST appearing through "bands" of Ca. Dark rimming around crystals (silt?) Gradational uCN, sharp lCN.	VN																		x
										lCN	55																
			202.45	203.64	1.19	LST	OX		A series of DOL VT following FO in dark grey, FO LST that has OX on FX surfaces. VT have dogtooth texture and a few VT have some darker infilling in the middle. The DOL appears slightly orange/pinkish - Ankerite?	VT	60				w												x
										FO	60																
210.33	219.57	9.24				OX			Light orange-red to dark brown, MG to vCG primarily grit OX. Many segments are SID altered and much more competent, with a few OX Qz VN. uCN sharp. First 45cm fizzes strongly with 10% HCl, but rest of interval does not fizz. There are a few segments of competent, intensely OX mBX VOL.	uCN	50						m								
			210.33	214.45	4.12	OX	GRT		Medium reddish-brown to dark brown, CG to vCG OX GRT. First 45cm calcareous. SID alteration increasing down interval - moderate SID at end. OX mainly doesn't hold core shape and is mainly consistent in colour from interior to exterior.								m									
			214.45	216.85	2.40	OX	SID		Dark reddish-brown, MG to vCG SID OX. Core is competent and holds shape -- moderately strong to weak in strength. Core is darker in the inside - a very dark reddish brown. Interior colour appears somewhat variant and mottled. Gradational contacts.								s									
			216.85	219.57	2.72	OX	VOL	mBX	Medium orange-brown to light grey-brown, FG to MG, tBX OX SER VOL. SID alt. Is most pervasive at top of interval and weakens towards the end. Visible mBX in the VOL with trace Py around clasts. A slight FO visible - 55 deg. TCA. Several vCG QZ VN/VT seen throughout interval.	FO	55						m	SER	s	t					x

			217.75	218.27	0.52				A series of 1-4cm vCG OX Qz VN. No preferred orientation visible and not measurable. The material around the Qz crystals have been heavily OX and eroded, so VN appear vuggy.	VN																	
219.57	235.29	15.72				LEP	MX		Medium grey-brown, FG to MG heavily Py MX, FO, HEM altered LEP with slight OX locally. LEP texture very FG - smaller Ca blebs ~ 1-2mm with very few larger blebs. Py MX is semi-massive (seem more at top of interval) FG Py and wispy vFG Py to CG/vCG splashy, disseminated Py (seen more at bottom of interval). HEM alteration locally from weak to intense in thin 1-2mm bands along FO. HEM alteration pervasive at top of interval and not present down interval. CG DOL VN/blebs at top of interval ~2-3 cm wide with orange alteration on rims. Qz VT/blebs seen sporadically throughout interval -- associated with Py MX. FO 55 - 65 deg. TCA. uCN gradational. lCN gradational and following FO. Weak OX at lCN in bands. Interval weakly fizzes in the highly MX areas and fizzes intensely in the very un-MX areas. Weak OX on FX surfaces	FO	60						w				ms							
											lCN	55															
			219.57	220.12	0.55	OX	Py	GRT	FG to CG, light to dark grey, intensely OX massive Py grit. Holds core shape and Py "sand" can be seen inside core. Gradational contacts.	VN																		
			220.12	222.08	1.96	LEP	HEM		Medium grey-brown to red-brown, FG to MG FO HEM altered LEP. Buff stringers throughout interval following FO. Weak OX of interval causing slight erosion of core due to drilling in the more intensely HEM altered patches. Gradational contacts	FO	65						w		HEM	s	t						x
			222.29	223.43	1.14	MX	Py		MG to CG, greenish-yellow, bright massive to semi massive Py VN. Contacts gradational - interfingering into LEP. Qz VN and blebs seen throughout interval - CG to vCG	VN											i						x
			224.21	224.72	0.51	MX	Py		Greenish-yellow, bright, MG massive Py VN. Small Qz blebs seen throughout. Gradational contacts with some interfingering.	VN											i						
			235.18	235.25	0.07	MX	Py		Greenish-yellow, bright, MG to CG massive Py VN. Sharp uCN and lCN following FO.	VN											i

COMMENTS

The hole was ended because it was past targeted oxide horizon.

GEOLOGY LOG

HOLE: Rau-10-112

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.74	2.74				OVB			Overburden - No Recovery																		
2.74	77.80	75.06				ARG		FO	Dark to medium grey, fine grained, foliated argillite with variable but present pyrite throughout as blebs and patches and calcite+/- dolomite veinlets and veins. Clasts within the unit vary from 0.5 cm to 5 cm in diameter. Clasts occur along foliation and include pyrite and light-grey (carbon-rich?) clasts. In general, the unit does not fizz with 10% HCl and has soft-medium hardness.										t							
			2.74	25.30	22.56	ARG		FO	Heavily fractured and weathered dark-grey Argillite presumably originally the same as the surrounding interval, as clast-rich texture visible in more consolidated core in the sub-interval. Limonite/oxidation staining on fractures. Small amounts of disseminated pyrite visible. Heavily weathered portions have a greasy, clay-earthy feel and leave dark, and hard to rub off marks on fingers. Fractures occur along foliation and foliation angle consistent throughout. Unit does not fizz with 10% HCl.										t							
									Foliation at 22.25 m (representative of sub-interval).	FO	35																
									Oxidized fracture at 26.18 m (representative of sub interval).	FX	35																
			25.30	77.80	52.50	ARG	MX	FO	Dark-grey, fine grained, foliated non-weathered competent argillite with less fracturing and much less oxidation than previous sub-interval. Pyrite and other (grey, carbon rich?) clasts dominate (15% of core). Calcareous veinlets and veins occur with and oblique to the foliation. Oxidation of clasts is more prevalent at the beginning of sub-interval. Pyrite blebs of up to 4-6 cm are common. Clasts are elongated and matrix supported. Small section from 42.30 m-43.15 m fizzes readily with 10% HCl (lime mud?) while the rest of the sub interval is non-calcareous.										m							
			39.80						Calcareous VN/VT set.	VN	35	280	15														
									Common Foliation take at 37.70 m.	FO	35																
									White-buff-tan vein present at 37.18 m is 2.5 cm thick. The edges of the vein are dolomite, and the centre is calcite (based on acid test).	VN	20	270															
									Sub-unit becomes less carbon rich farther down, and clasts become pyrite dominated.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			50.28	60.00	9.72				FO at 50.28 m (slightly undulating).	FO	20																
			60.00	64.00	4.00				FO at 60.00 m.	FO	25																
			64.00	68.50	4.50				FO at 64.00 m.	FO	20																
			68.50	72.50	4.00				FO at 68.50 m.	FO	30																
			72.50	77.00	4.50				FO at 72.50 m.	FO	25																
			77.00	77.80	0.80				FO at 77.00 m.	FO	25																
									Oxidation on fracture increases slightly down sub interval, but still not prevalent at 64.92 m. Small white flecks and thin bands are hard and don't fizz strongly with 10% HCl present throughout (Silicified dolomite?)																	
			45.20	48.70	3.50	ARG	DOL	FO	Grey-light carbon rich heavily dolomite veined Argillite. Dolomite VT follow foliation in the top of the sub-interval, and become weak stockwork veining lower down in the sub-interval. Only one pyrite bleb is visible, clast-dominated texture present. sBX visible at 46.35m (by dolomite).					f					t								
									Veinlets at 46.00m measured	VN	15																
			74.07	76.00	1.93	ARG	MX		Dark-grey, fine grained Argillite with intense fine grained pyrite mineralization. Pyrite occurs in patches and in blebs, but also disseminated throughout sub-interval. Aside from the intense mineralization, Argillite appears identical to the main unit.											i								
									Pyrite patch at 74.50m photographed																		X
									Foliation at 74.15m measured	FO	10																
77.80	100.10	22.30				LST		BN	Medium-light grey fine-grained calcareous-banded limestone, with trace-weak pyrite and pyrrhotite mineralization. Medium hardness, and fizzes readily with 10% HCl. Pyrite blebs common from 77.80m-83.21m and Pyrrhotite common from 83.21m until 92.30m. Py and Po have the same blebby texture throughout the LST. Both Py and Po occur commonly in the white-calcareous bands as well. At the start of the interval until 83.00m the calcareous bands appear less intense and with random orientation. After 83.00m however, the calcareous bands have more consistent orientations and follow the core foliation.										t					Po	t		
									FO at 84.73m	FO	20																
									FO at 86.30m	FO	20																X
									FO at 87.90m	FO	30																
									FO at 90.00m	FO	25																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

105.12	107.79	2.67				LST	VOL	FO	Dark-light, intermittent dark/light banded LST with Volcanic fingers and trace visible fine-grained pyrite along the Volcanic fingers. Foliation at 106.00m measured (consistent throughout). Unit has medium strength and fizzes with 10% HCl.	FO	70									t							
									Calcareous vein 0.80cm thick runs through interval, does not appear to be associated with the pyrite.	VN	0																
									Oxidation present on some fractures																		
107.79	109.04	1.25				VOL	LST		Brown-grey, fine grained weathered volcanic with LST clasts and t-w fine grained pyrite mineralization. Hematite visible at 108.75m. Oxidation along fractures predominant at the start of the interval. Unit fizzes variably with 10% HCl. Upper contact along FO, lower contact gradational.	uCN	50					f			t							
109.04	153.61	44.57				VOL		FO	Forrest-green, fine-grained, calcite rich foliated, mec strong magnetic chlorite altered Volcanic. Competent, with only trace oxidation. Trace amounts of pyrite visible. Unit has "medium" hardness. Calcite VN/VT and fingers occur overwhelmingly only with the foliation. Unit is approx. 15% calcareous, and fizzes readily with 10% HCl. Veins up to 12.0 cm thick. Ca VN at 113.55 m, irregular and disjointed (shear indicator?) The final part of this interval (after the subinterval ends at 136.45 m) is less magnetic than before the VOL CGL.							t		CHL	ms	t			Mg	m		
									FO at 110.60 m.	FO	60															
									FO at 117.20 m.	FO	50															
									FO at 130.00 m.	FO	65															
									FO at 144.00 m.	FO	75															
									FO at 150.30 m.	FO	60															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			130.25	136.45	6.20	VOL	CGL	FO	Very dark-green, fine-grained, foliated, chlorite altered VOL less calcareous (7-10%) than main unit with intermittent layers of Magnetic Pebble conglomerate. Sub-interval is darker than main unit, and only calcite veins fizz with 10% HCl. Sericite alteration of the clasts prevalent. Clasts within the VOL CGL are elongated, and follow the foliation. The magnetic pebble conglomerate is weakly to moderately magnetic, and makes up 60-70% of the interval. Unit has medium hardness, and no mineralization is visible. Upper and lower contacts are gradational and not measurable.								SER	f				Mg	m			
			151.86	153.61	1.75	VOL		FO	Dark-grey to light tan/buff, fine grained, foliated Volcanic with large amounts of calcite within it, that grades down to partially oxidized Volcanic. Unit has moderately strong sericite alteration lower down. Foliation remains consistent throughout.							f		SER	f							
									FO at 152.00 m measured.	FO	80															
									Pyrite veins occur along foliation											t						
									Contacts occur along foliation	uCN	75															
										lCN	80															
153.61	171.60	17.99				LST	DOL	BX	Light-Dark grey, fine grained, brecciated dolomitized Limestone, with sections of OX and PY. Upper portion fizzes more readily with 10% HCl than the lower portion. cBX and sBX present throughout interval, but cBX more prevalent at the upper portion, while sBX is more common lower down. Visible pyrite is present in fair amounts above 160.49m, weak overall. Pyrite blebs and veins appear random and stockwork. Unit is hard. Sections of significant pyrite concentration include 157.35m-158.00m and 160.00m-160.30m. Pyrobitumen is visible at 157.50m. Sections of dark-red orange oxide increase in length and frequency farther down interval. The longer sections include from 163.00m-166.00m. Oxide makes up 15% of the interval. Oxide starts at a deeper brown-red and turns lighter orange farther down. Upper contact is not measureable, and lower contact is broken up and gradational.					s		ms				w							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
171.60	192.70	21.10				OX			Red, Orange and pale Olive Oxide. Does not fizz with 10% HCl. Competency of core decreases (from solid rock to claylike) down the interval, with the exception of a hard section of 183.50 m-184.00 m. Unit grades from Orange-brown at the start to medium-brown at 175.26 m, which grades into yellow-green at 181.00 m. This fades into a short grey part, from 183.00m- 183.2 5m, which turns into an Olive green/brown unit for the rest of the interval. Quartz rubble visible at 175.90 m, 178.00 m, 182.80 m, 184.00 m, and at 185.0 0m.						i				t							
									Remnant (Fresh) pyrite visible at 175.40m and appears to be disseminated.																		
192.70	196.50	3.80				CLY	GRT		Dark-Grey, highly weathered, non calcareous, soft and gritty, quartz rich clay unit. Quartz pieces are angular and rounded and some are 0.5cm-1.5cm in diameter, but most are sand-size. Quartz grit makes up 30-40% of the interval at the start, but increases to 70-80% at the end of the interval. Competency consistently weak throughout the interval.																		
196.50	202.47	5.97				OX			Light-medium "orange-brown" oxide unit, that increases in competency (from clay-rubble to solid core) farther down. Remnant FG pyrite veins visible throughout in more competent sections. Some hematite staining is visible at the bottom of the interval. Unit is in general very "clayish" and Quartz fragments are visible only a 200.56m. Quarts fragments are both rounded and angular.						i		HEM	t	ms							
202.47	203.41	0.94				DOL	SIL		Med-grey, moderately oxidized, moderately strongly silicified hydrothermal Dolomite, with Pyrite blebs and veins present throughout. Silicification increases down interval. Unit fizzes with variably with 10% HCl. Oxide is 0.20m long and starts at 202.70m. Oxide is brown and gritty. Unit is medium hard. Upper and lower contacts are gradational.						m		SIL	ms	ms							
203.41	208.79	5.38				LEP	SER		Pale green grading to medium grey, foliated LEP. Moderate Py in Qz VN's, disseminated and in layers. Local OX near Py bands and on FX. Local sericite alteraton following FO.											m							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									Foliation is visible at 204.50m.	FO	70																
			203.41	206.07	2.66	LEP	SER		Pale green-grey sericitized Leopard, with moderate-strong pyrite mineralization. QZ veins occur at the start and end of the interval 10.0 and 30.0cm long respectively. Both QZ VN's (not measurable) have heavy pyrite mineralization. Pyrite is subhedral over the interval, and FG-MG. Oxide occurs along some fracture surfaces, and along some Py veins. Sericite in bands parallel to Py mineralization. Unit Fizzes weakly, at the most and variably less, with 10% HCl. Upper and lower contacts are gradational.							f	ms	SER	f	ms							
			206.07	208.79	2.72	LEP			Pale- medium grey foliated Leopard, with moderate Py mineralization. Some QZ veining visible at 208.00m, 4.0cm across (orientation not measurable). Pyrite is M-F grained. Unit fizzes moderately with 10% HCl, and has a "med" hardness. Pyrite appears to coarsen downwards.											m						
									208.79 m: E.O.H - The hole was ended because the targeted depth was passed.

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.45	1.45							Overburden - no recovery																		
1.45	83.16	81.71				LST	DOL	FOS	Light-Medium gray, fine grained, variably but mostly weakly Dolomitized, Partially sBX'd, variably fossiliferous LST. Fizzes variably with 10% HCl. No sulphide mineralization visible. cBX (weak) visible at the start of the interval from 2.00m- 4.00m. Section of MG Dolomite with black (carbon rich?) infill from 9.50 m - 10.00 m.					w													x
									mBX visible at 8.25m, limestone fragments (2cm in diameter and angular) held within a calcareous vein without measurable orientation.																		
									Small but MG dolomite VT's present throughout interval.																		
									Favocites visible at 18.75 m, 36.20 m.																		
									Halycites visible at 19.20 m, 37.20 m.																		
									Rugose Coral visible at 19.00 m, 36.20 m.																		
									Large calcareous VN/VT set from 31.50 m to 34.0 m, ranges from 0.2-5.0cm thick with oxidized edges.	VT	30		22														
									Large, very coarse grained and botryoidal DOL/CA vein at 29.80m. Some oxidation along the edges.	VN	40																
			4.05	8.00	3.95	LST	DOL	SID	Medium grey and tan to orange/brown trace DOL, SID veined LST with calcareous veinlets. Unit fizzes mod-strongly with 10% HCl. Some cBX visible.					t			s											x
									SID vein at 7.05m measured, orientation is consistent for SID veins in this sub-interval.	VN	20																
									Both Upper and Lower contacts are gradationa																		
			16.30	16.78	0.48	LST	DOL	cBX	Light-grey, FG, heavily cBX, trace DOL LST with oxidized calcareous veinlets. Stylolites visible throughout.					t		w											
									Calcareous oxidized VT set at 16.40m measured (0.2cm thick)	VT	30																
									cBX occurs without common orientation																		
									uCN not measurable, while the lCN is a sharp colou change (from light-dark) between the LST.	lCN	65																
			21.00	24.00	3.00	LST	DOL	sBX	Dark-light grey, sBX'd, heavily Ca/DOL veined LST. Camo texture visible throughout. The Upper part of the sub-interval is more heavily dolomitized, while the lower part is predominantly calcareous which fizzes with 10% HCl. 5cm thick calcite vein visible at 23.77m.					s														
									sBX more prevalent at the bottom of the interval																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									4.0cm thick Calcareous vein at 22.30m measured.	VN	55																
									lCN slightly undulating, but measurable	lCN	55																
			34.80	35.27	0.47	Ca	Vn		White, calcite veins, with dolomite at the edges. Appears to be 2 large veins (Infill sBX?) whose edges are touching, but some limestone between them. They do no not have a common orientation.																		
									Upper contact sharp.	uCN	40																
									Lower contact sharp.	lCN	30																
			35.27	83.16	47.89	LST	DOL	BX	Medium to dark grey, moderately DOL, weakly fossiliferous LST with variable sBX, cBX and MO textures. The more intense dolomitization is associated with the most intense sBX textures.					m														
									Multi stage Qz/Ca +/- DOL +/- BIT veins cut the DOL LST at 50 deg TCA. The vein material also acts as infill of sBX cavities from 44.05 m-50.20 m and 56.93 m-62.12 m.	VN	50																
			45.21	49.84	4.63	LST		sBX	Medium grey slightly gritty speliothem sBX infilling occurs within this interval. As well variably coloured light and medium-dark grey graded bedding with a fining uphole nature occurs at 55 deg to CA.	BD	55																x
			55.05	69.05	14.00				Thin DOL/QZ veinlets cut graded bedding. The veinlets are zones with 1 mm of DOL on the outside edges and 2 mm of QZ in the middle. These veinlets transition into 1-3 cm FG to CG veins filled with Qz-Ca.	VT	55	270														x
										VN	40																
										VN	15																
			63.70	65.25	1.55	LST	FOS		There is an increase in crinoid FOS up to crinoid wackestone composition. The crinoids, which include star crinoids, are up to 0.5 cm in diameter. In this interval the host limestone is only weakly dolomitized.					w														
			69.05	83.16	14.11	LST	FOS		Light to dark grey vFG-FG fairly fossiliferous LST with a strong FO defined by thin strained bands. The upper and lower parts of the interval contain black moderately carbonaceous, calcareous materia infilling between white strongly calcareous patches and bands (coral?). Trace fine grained Py is associated with these darker areas. Trace OX stain occurs on fractures near the lCN.	FO	70					t			t							x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									The ICN is gradational into moderately to strongly marbleized LST.	ICN								MBL	f								
83.16	89.63	6.47				LST	MBL	FO	The general textures of the LST above continue with a gradational increase in the marbleization. A fair FO occurs at 40 deg to CA.	FO	40							MBL	ms								x
89.63	113.86	24.23				VOL	CHL		Dark green to black weakly to strongly magnetic, variably chlorite altered VOL with a zone of sericite altered pebble conglomerate as well as a zone of variable Ca veining.									CHL	m				Mg	m			
			89.63	93.04	3.41	VOL	CHL		Dark green, strongly chlorite rich VOL with weak calcite patches up to 2 cm in diameter disseminated throughout. The interval is strongly magnetic with vFG disseminated magnetite. Were concentration of SER alteration occurs in bands defining the FO at 60 deg to CA. Weak oxidation occurs on fractures.	FO	60				w		CHL	s				Mg	s			
																		SER	w								
			93.04	99.84	6.80	VOL	CGL		Yellowish greenish grey, moderately sericite altered VOL with a strong concentration of elongate pebbles that have a zones appearance. The interval is weakly clast supported ~65% clasts, 35% dark blue grey black magnetite rich matrix.									SER	m				Mg	ms			x
									A strong FO is defined by common pebble elongation and orientation as well as a common fracture orientation at 75 deg TCA.	FO	75																
			98.80	99.84	1.04	VOL	CGL		Moderate to strong oxidation of magnetite pebble conglomerate associated with a central 1 cm wide vuggy cross cutting structure that cuts at 15 deg TCA and 180 deg to FO.	VN	15	180				ms								Mg	w			x
			99.84	104.44	4.60	VOL		FO	Dark green to black weakly to strongly magnetic VOL with a moderate FO at 60 deg TCA defined by a common fracture orientation. A zone from 102.35-103.55 m contains moderate Ca veinlet flooding at 65-80 deg TCA. The calcite flooded veinlets contain weak to fair medium creamy orange OX alteration - possibly OX mineralization.	FO	60				f							Mg				
										FO	70																
			100.51	101.29	0.78	VOL	OX		Another moderately to strongly oxidized zone occurs from 100.51-101.29 m. It appears to be associated with structures running at 60 deg to CA. Strongly OX sub-hedral cubes of Py also occur along this trend.	FO	70					ms					w					
										VN	60	n/a															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			104.44	105.77	1.33	LST	MBL		Light grey to white intensely marbleized LST with a very faint FO at 60 degrees TCA The upper contact, sharp over 2 cm is marked by moderate oxidation and occurs at ~65 degrees TCA The lower contact is sharp but slightly swaley at 65 deg TCA.	FO	60							MBL	i								
										uCN	65																
										lCB	65																
			105.77	113.86	8.09	VOL	CHL		Dark green to black moderately rich VOL with moderately strong Ca flooding in 0.5-2 cm bands throughout the core. ~60% VOL, 40% Ca. It appears that the Ca bands were pre-foliation development as they show stepwise shear indicators. Trace OX occurs along fracture faces as bright orange stain.							t		CHL	m				Mg	f			x
									A strong FO is defined by general Ca banding and a common fracture orientation at 50 deg to CA.																		
			111.98	113.86	1.88	VOL			Dark green to black VOL with thin elongate patches of medium bright orange oxide and bright pink-red hematite.							f		HEM	w								
									A moderate FO occurs at 45 deg TCA and is defined by oxidized and hematite altered bands and patches.	FO	45																x
									The lower contact is gradational over 30 cm and is defined by an increase in OX alteration.	lCN																	
113.86	118.26	4.40				OX	VOL		Bright yellow orange intensely oxidized VOL with relict FO at 60 deg TCA. The texture of the oxide is mainly rubbly platy clay that barely holds core shape and crumbles easily. The lower contact is sharp at 50 deg TCA.	lCN	50					i											
118.26	139.30	21.04				LST	CLY		Medium grey limestone with intervals of moderate to intense clay alteration. 60% solid LST, 40% variably clay altered LST. The contacts between the clay alteration and the fresh alteration occur at 50 deg TCA. The base of the LST is non to weakly dolomitized and contains cross cutting Qz/Ca veins at 40-50 deg TCA. Also a weak overprinting cBX texture occurs throughout. The clay altered LST fizzes strongly and varies from gritty clay to rubbly core. The solid LST contains trace fine grained OX mineralization.					t				CLY	m								x
			133.89	134.21	0.32	OX	RBL		A small interval of reddish orange-brown rubbly oxide that is moderately sideritic in composition.								m										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
139.30	146.20	6.90				OX	SID		Dark reddish brown strongly sideritic, crumbly oxide that interfingers with small zones of clay altered LST and solid sBX LST. Overall 50% sideritic oxide, 35% clay altered LST, 15% solid LST. The contacts between the siderite rich OX and the LST occur at 60 deg to CA.	CN	60						s									
146.20	161.18	14.98				LST	OX		Mixture of fairly to intensely hematite/oxidized dolomitized LST. The unit is brownish-red and reddish-grey in colour and is 60% fairly altered LST and 40% competent hematitic oxide. The LST contains coarse grained DOL veins at 40 deg to CA.	VN	40					w		HEM	ms								x
			153.20	153.35	0.15	LST		tBX	A faint tBX texture is seen within this interval.																	
			156.40	157.01	0.61	QV			A very coarse grained Qz vein with moderately strong OX/HEM overprint. The contacts o the vein are difficult to distinguish due to the intense alteration of the host.	VN	40															
161.18	170.08	8.90				LST	DOL		Medium grey, strongly DOL altered LST with a moderate concentration of MG DOL veins/veinlets cutting at irregular orientations. Weak HEM alteration and trace iron carbonate/oxidation coats fractures in a slightly more rubbly zone within the unit. Large patches (up to 5 cm in diameter) are associated with the Qz rich areas.					s		t		HEM	w								
									170.08 m: E.O.H. The hole was ended because it was past the targeted oxide horizon. The unit did not extend far enough to reach the LEP unit.																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

SAMPLES

Numbers: I077317-I077323, I077354-I077365, I077384-I077404

Total: 40

Batch: 79, 80, 81

Date Sent: September 12, 15, 16 2010

Certificate: VA10132859, VA10136192, VA10135269

COMMENTS

The hole was ended because it was past the target oxide zone.

GEOLOGY LOG

HOLE: Rau-10-114

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.44	2.44				OVB			Overburden - no recovery																		
2.44	66.45	64.01				LST	MBL	cBX	Medium to light grey, FG, moderately marbleized LST with a moderate mottled texture. The main textures recognisable within the unit are thin stylolitic, pressure solution and cBX medium to dark grey lines oriented at 70-80 deg to CA. The unit is weakly rubbly in zones up to 30 cm zones with ground gravel sized fragments up to 3 cm in diameter.	FO	75							MBL	m								
			43.20	45.98	2.78	LST			Begin to see slightly reddish greyish brown calcareous swaley interbeds oriented at 85 deg to CA.	FO	85																
			45.98	54.85	8.87	LST	FOS	cBX	Medium to light grey, fairly marbleized, moderately fossiliferous LST with a very faint crackle orientation at 60 deg to CA. In general the fossils appear as fuzzy white specks throughout but towards the lower contact they clearly become crinoid stem fragments.	FO	60							MBL	f								
			54.85	64.05	9.20	LST	FOS		Medium to dark grey, weakly to moderately fossiliferous LST with up to 25% slightly reddish greyish brown gritty calcareous interlayers. The interlayer banding defines the main structural features in the core at 65 deg to CA. Zones that contain more intense gritty banding tent to be more fissile and rubbly. Fossils in this part of the unit occur in more intensely packed zones and include crinoid stem fragments and brachiopod shell fragments.	FO	65															
			64.05	66.45	2.40	LST	MBL		The intensity of the soft gritty calcareous interlayers has increased to 60 % of the interval. It has become a darker brown colour (possible SID component). LST is now intensely marbleized and has relatively poor recovery.									MBL	i								
66.45	73.85	7.40				VOL	OX		Orangey brownish yellow, moderately to intensely oxidized extremely fragile and fissile volcaniclastic with an interval of non-sericite altered soft VOL occurs within.						s											
			66.45	67.49	1.04	VOL	OX		Orangey yellow intensely oxidized, intensely sericite altered, clay rich fissile VOL, with a faint FO at 50 deg TCA.	FO	50				i		SER	i								
									The upper contact is sharp but occurs at a marker block. The lower contact is gradational over 15 cm, becoming less siderite rich.	CN																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			67.49	69.53	2.04	VOL			Dark slightly greenish grey, FG, non-sericite altered VOL with a strongly developed FO. Zones of strong clay alteration occur, although in general the unit is solid to slightly fractured.	FO	60															
			69.53	73.85	4.32	VOL	SER		Medium yellowish-orange-brown, intensely sericite altered, intensely oxidized VOL with a strong preserved FOO. The core holds the cylindrical shape, but is very fragile as it crumbles quite easily.																	
									Both the upper and lower contacts are gradationa over ~10 cm.	CN																
73.85	114.05	40.20				LST	MBL	FO	Medium to light grey, FG-MG weakly to moderately MBL altered LST with a strong FO. The unit is weakly to moderately fractured and rubbly with weak bright orange-brown clay oxide coating many of the fracture faces. Rubbly zones occur up to 30 cm in length where the LST has been ground into 1-3 cm sized subrounded fragments.							w		MBL	m									
									The FO is strong, defined by a common fracture orientation and a strong strain fabric within.	FO	85															
114.05	122.13	8.08				MBL		FO	White to very light grey MBL with rare very faint grey layers defining a weak foliation. The unit is fairly fractured with many of those fractures having a yellow-orange-brown oxide stain on them.	FO	85					w										
			119.79	122.13	2.34	MBL			White marble with extremely sharp contacts with medium brown slightly gritty clay. The brown clay is non-calcareous except where small fragments of MBL occur within. Contacts between the MBL and brown clay are variable but the most common orientation is 35 deg TCA, while less commonly they occur at 80 deg TCA. All contacts within this unit are knife-edge sharp.	CN	35															x
										CN	80																
									The lower contact with the main oxide unit is extremely sharp at 70 deg TCA..	ICN	70															
122.13	134.35	12.22				OX	CLY		Dark reddish brown clay-rich, non calcareous oxide with trace fine grained gritty quartz fragments within. The oxide holds its core shape well, but starts to split open and crumble as it dries. Overall recovery is very good. Many density samples have been taken within this unit.																	
									The upper contact is sharp at 70 deg TCA	uCN	70															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Other Type	Other Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Other Type	Other Intensity	Other Type	Other Intensity	
									The lower contact is extremely sharp at 45 deg TCA.	ICN	40																
134.35	138.07	3.72				LST			Light grey altered to a medium taupe-grey-brown LST with a very faint cBX textures and oxidized (siderite?) cutting at 35 deg TCA.	VN	35					w	w										
138.07	140.87	2.80				OX			Dark reddish brown slightly gritty clay rich oxide. The core holds its shape until is dries and starts to break apart. The oxide is slightly more rubbly than the interval above. Recovery is quite good.																		
140.87	146.65	5.78				LST	OX		Pinkish-reddish grey, moderately to strongly oxidized limestone with 25% reddish-orange-brown oxide rubble. Very few textures remain visible in the LST, but a fair concentration of red-brown oxidized sulphides are present. Both upper and lower contacts are gradational.							ms											
146.65	151.79	5.14				OX	GRT		Dark orange-red-brown soft, crumbly gritty rubbly oxide that holds core shape originally, but crumbles easily during the drying process. The oxide is non-calcareous except where associated with a few rubbly blocks of limestone within. Total limestone is less than 5%.																		
151.79	173.13	21.34				LST	OX		Medium brownish grey, FG-MG moderately oxidized LST with intervals of calcareous oxide and a weak crackle veinlet texture. Overall ~ 25% oxide, 75% LST. The dominant crackle orientation is at 50 deg TCA.	FO	50					m											
									Coarse grained moderately oxidized dolomite sulphide veins 1-2 cm thick cut at 30 deg to CA. The veins are strongly oxidized and have a pitted texture.	VN	30		0.5													
173.13	177.20	4.07				OX	RBL		Dark reddish brown rubbly gritty clay oxide that holds its core shape originally, but crumbles easily when it dries. The upper contact is marked by a marker block while the lower contact is much more gradational.																		
			179.85	180.60	0.75	DOL			Poorly recovered zones of coarse grained, euhedral DOL crystals up to 1.5 cm in diameter. No visible sulphides, weak orange brown oxide clay and rubble within. Weak to fair red-brown oxidized sulphides.							w											

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

199.89	206.63	6.74				DOL			White to light grey FG to MG DOL with Ca/Qz/talc zones. Very broken, locally to rubble zones < 2 m long. Trace to semi-massive Py, generally FG but locally vCG, disseminated or following FO. Talc on FX and as FG disseminated plates associated with Ca and Qz.	FO	75									f							
206.63	212.27	5.64				LST	DOL	sBX	Dark grey to white intense DOL LST with sBX and cBX layers where dark LST and DOL form variably the matrix or clasts. Very broken interval, largely rubble. FG trace to massive Py , fair overall. Qz and Ca layers and patches common. Ca on broken surfaces.					i						f							
			206.81	208.06	1.25	MX	Py		Massive to semi-massive FG to MG brassy Py with Qz/Ca blebs. Has irregular CN with intense DOL LST.											i							
212.27	230.97	18.70				DOL			Light grey to white DOL with a large amount of Qz in layers and patches, associated with talc and calcite found disseminated, in layers, and on FX. Local light pink patches with vFG light orange and dark red sphalerite, variably calcareous. Strong FG to CG dull brassy Py disseminated and in semi-massive bands and zones < 70 cm.											s			Sp	t			
230.97	235.90	4.93				LST	DOL		Dark to medium grey intense DOL LST with FG to MG DOL forming sBX textures. DOL is cBX by dark grey seams. Ca and talc on FX and in thin layers. Dark red and light orange sphalerite in thin variable calcareous VT and in matrix of mBX. Weak FG Py in patches and layers through interval .					i						w			Sp	t			
235.90	239.41	3.51				MBL			Medium grey MBL with thin light brown SER and vFG Py layers defining FO and some patches of FG to MG bright brassy Py.	FO	65									t							
239.41	255.12	15.71				LST			Medium to Dark grey variably DOL LST with zones of MBL. Trace Py disseminated, and local trace Sp in VT.					ms					m	t			Sp	t			
			239.41	240.34	0.93	LST	DOL		Medium grey strong DOL LST with DOL VT and layers defining FO. Trace disseminated Py.	FO	55			s						t							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

SAMPLES

Numbers: I077450-I077480

Total: 31

Batch: 83, 84

Date Sent: September 15, 16 2010

Certificate: VA10136190, VA10135268

COMMENTS

The hole was ended because it has passed the target oxide horizon.

GEOLOGY LOG

HOLE: Rau-10-116

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								PHOTO
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.83	1.83				OVB			Overburden - no recovery																		
1.83	28.50	26.67				LST	OX		Medium to light grey, fairly fossiliferous, moderately foliated, highly fractured LST that is medium to light grey with a orange-brown stain on many fractured surfaces. Fossils include crinoids and crinoid stem fragments (including star crinoids). Gritty beige-brown layers 0.5-1.5 cm thick occur throughout the unit and are strongly deformed by the strain.							f											
									FO is moderate to strong and defined by strain textures throughout.	FO	60																
			25.30	26.82	1.52	LST	OX		Slightly yellowish taupe-brown calcareous gritty clay with subrounded rubbly LST fragments throughout.							s										
			26.82	28.22	1.40	LST			Medium to light grey moderately fractured and fragile LST with a fair foliation at 45 deg TCA.	FO	45															
			28.22	28.50	0.28	LST	OX		Medium taupe-grey gritty and rubbly calcareous clay.																	
28.50	57.50	29.00				LST	MBL		Medium to light grey, moderately to strongly marbleized, strongly foliated, intensely fractured LST with orange-brown oxide stain on many fractures. The FO is slightly variable between 70-80 deg TCA. 20% of the interval is intensely rubbly.	FO	75					t		MBL	ms								
57.50	108.40	50.90				OX			Gritty to rubbly to solid blond-yellow to yellow-brown to orange-brown, to purplish-red-brown oxide. The majority of the oxide is gritty rubble but extensive solid sideritic zones occur.																		
			57.50	73.88	16.38	OX	GRT		Medium orange gritty-rubbly oxide with the rubbly being quite sideritic in composition. 60% of the interval holds the core shape well but crumbles irregularly when it begins to dry out. The more sideritic gritty/rubbly areas are slightly more reddish-purple in colour.								m										
			73.88	88.26	14.38	OX			Medium orange-brown to slightly yellowish orange brown more fine grained gritty silty oxide.																	
			73.88	74.15	0.27	OX	CLY		Thin interval is both fine grained gritty grey clay and fine grained yellow-grey clay.																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			88.26	98.60	10.34	OX	SID		Red strongly sideritic gritty rubbly to solid core. In general the interval holds core shape well but crumbles easily when dried. Subrounded breccia textures are present from ~92-03.75 m. The clasts appear to be sideritic and are matrix supported and are 0.5-2 cm while the matrix is a lighter orange-brown oxide.																		x
			98.10						A vuggy area with coarse grained siderite crystals 0.7 cm in diameter.																		
			98.60	108.40	9.80	OX			Medium yellowish-brown silty gritty oxide that holds core shape well but crumbles when pressure is applied. A weak concentration of quartz fragments occurs within.														Qz	w			
108.40	113.69	5.29				OX	VOL		Light creamy yellow (blonde) silty gritty clay oxidized VOL with a faint LEP texture in part with. A weak foliation texture is present.	FO	60															
									An intensely oxidized sulphide vein cuts the oxide at 20 deg TCA.	VN	20																
			111.50	112.75	1.25	OX	VOL		Cubic 2 mm wide pits occur scattered throughout the unit. They may be the remnants of disseminated sulphides.																		
113.69	119.62	5.93				OX	LEP		Medium to light orangeish brown oxide with a fairly obvious spotted leopard texture and a FO at 50 deg TCA.	FO	50															
									The lower contact transitions into sideritic rubbly then transitions very sharply into marbleized LST at 30 deg to CA.	ICN	60																
119.62	124.36	4.74				LST	MBL		Strongly marbleized LST with a distinct foliation. The unit gradually becomes intensely marbleized to MBL at123.00 m	FO	40							MBL	s							
									The upper contact (as mentioned above) is sharp as a knife.	uCN	30	90															
									124.36 m: E.O.H - The hole was ended because it was past the oxide horizon and into the MBL.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.87	1.87				OVB			Overburden - no recovery																		
1.87	70.93	69.06				LST			Dark grey to medium grey variably brecciated and DOL LST, with zones of sBX by DOL, mBX by Ca/DOL and mBX of dark grey LST with medium grey LST matrix. Local fossils and foliation which develops down interval. Increasing MBL toward lCN. Dark red brown hematite locally on FX.					m												
			1.87	7.52	5.65	LST			Dark grey ARG rich LST fairly DOL, with cBX by dark grey seams locally becoming mBX with Ca matrix. FG to MG DOL VT to VN < 10 cm locally mBX LST. Moderately broken interval, with corroded appearance and dark red brown coating on FX and in vugs.					f		t										
			7.52	9.14	1.62	LST			Dark to medium grey and milky white LST with Ca VN which mBX LST and cut DOL VT and sBX. First ~ 30 cm massive vCG Ca																	
			9.14	17.38	8.24	LST	DOL	sBX	Intensely sBX LST with white to light grey FG to MG DOL. sBX commonly as irregular thin elongate LST clast with DOL matrix.					ms													
			23.47	42.64	19.17	LST	DOL		Dark to medium grey DOL LST. Dark grey ARG rich LST strongly mBX with medium grey more calcareous LST as matrix. Down interval, becomes more sBX in nature with local mBX. Both medium and dark grey LST locally sBX by Ca/DOL, commonly forming "shadow" with medium grey LST on uphole side of Dark grey LST clasts in sBX. DOL often found in thin rim on downhole side of dark grey layers/patches.					m												
			23.47	24.41	0.94	LST	DOL		Dark grey LST variably BX by DOL with zones < 20 cm of intense DOL as FG crystals with black bituminous FG clasts; very sugary and broken texture. Also have local light orange to dark red brown alteration in very broken DOL veined and mBX LST and on FX. Variably calcareous, with HEM and OX alteration.					ms		w		HEM	w							
			39.04						First fossil occurs in LST. Rugose, favocites, unknown coral, and crinoids present.																	
			42.64	51.46	8.82	LST	DOL		Dark grey FOS LST with overprinted honeycomb coral and crinoids. Moderate strong DOL with weak FO locally. Locally sBX by FG to MG DOL, with decreasing Doll down interval, grading into un-DOL, un-sBX LST. Trace FG Py disseminated through interval.					ms					t							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			51.46	55.68	4.22	LST			Dark to medium grey irregular FO LST with crinoid FOS. Dark buff layers on FO, VOL rich. Associated with vFG Py and trace disseminated Py also.											t							
			55.68	70.93	15.25	LST	MBL		Very dark grey to light grey variably MBL LST with FOS preferentially MBL altered. Honeycomb corals ~ 20 cm long variably identifiable due to MBL, with very dark grey calcareous layers, irregular and as matrix between mounds. Remainder of interval FO, variably MBL, layers with thin black layers following FO. More intensely MBL zones have buff SER layers < 5 cm with FG disseminated Py. Py in small patches through rest of interval.	FO	50							MBL	m	t						
70.93	71.85	0.92				MBL			Milky white to light purple brown and buff MBL with BIO and SER layers which define FO, and CG Ca layers and patches. Gradational lCN. Trace FG Py in patches.	FO	55									t							
71.85	86.36	14.51				VOL			Light green buff to blue grey or brown, variably CHL BIO, and SER altered VOL. Largely calcareous, with local Ca VT. Locally conglomeritic, grading into variably altered layers. Variably magnetic due to trace Po and possibly due to vFG Mg.																		
			71.85	73.67	1.82	VOL			Dark brown to blue green, strong SER with patchy moderate strong BIO VOL, magnetic due to trace Po for last 1/2 of interval. Trace FG disseminated Py. Strongly calcareous in vFG disseminated spots associated wit BIO and irregular VT.									SER	s	t		t					
																		BIO	ms								
			73.67	76.32	2.65	VOL	CHL		Dark blue grey intensely calcareous moderate strong CHL VOL. Ca in vFG spots with CHL rim and in irregular VT. uCN fairly sharp, lCN very gradational into SER VOL. No mineralization.	uCN	35							CHL	ms								
			76.32	85.74	9.42	VOL	SER		Green buff to blue green grey intense SER moderate CHL VOL with bands and patches of BIO, associated with Ca spots and VT. Interval variably strongly to weakly calcareous. FO defined by platy minerals and thin Py layers. Trace fuchsite. Magnetic locally due to trace to weak Po, vFG in layers and disseminated. Toward lCN, SER has light purple buff and bright yellow colourations.	FO	45							SER	i	w		t	Fu	t			
																		CHL	m								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		BIO	f								
			81.65	84.10	2.45	VOL			Grey and light brown trace BIO patches with green buff to bright yellow strong SER and trace fuchsite surrounding, locally patches have rounded edges giving clastic appearance; possibly conglomerate. Weak Py, FG to MG, bright brassy, and trace FG Po.									SER	s	w		t	Fu	t			
																		BIO	t								
			85.74	86.36	0.62	VOL			Gradational CN, Dark grey FO VOL with decreasing SER. Thin calcareous layers with FG to MG bright Py associated.	FO	55							SER	w	w							
86.36	160.69	74.33				DOL	MX		Light grey to white, FG to vCG DOL with irregular Qz VN and patches, associated with talc and calcite patches which also occur without Qz. Zones < 50 cm of intense DOL sBX LST with decreased MX, and thin< 5 cm dark grey vFG weakly calcareous layers (VOL/ARG?). Weak to strong FG to MG bright brassy Py disseminated and in layers defining weak FO. weak MG to CG dull grey silver As disseminated in patches and layers after 91.83 m. As appears to be overprinted by Py. Trace Po throughout, associated with talc tremolite patches. Talc patches typically calcareous, locally light green tremolite coloured. Trace OX increasing down interval on FX, as Py tarnish, and in VT.	FO	55					t				m	w	t	Tc	w			
			94.50	95.05	0.55	LST	DOL		Intensely DOL sBX LST, with trace Py. Gradational uCN, lCN 5 cm dark grey weakly calcareous VOL/ARG.																		
			108.65	109.66	1.01				Predominantly Qz VN and blebs in interval, at irregular orientations with talc/Ca rims and increased Talc/Ca content uphole for ~ 3 m. Qz VN in CG DOL with weak FG to CG Po disseminated and trace FG Py.											t		w	Tc	f			
			109.66	109.97	0.31	DOL			Light grey FG DOL with CHL layers. Talc alteration and FG As which has tabular form; possibly from replacing talc. Trace Po, FG disseminated.									CHL	f		t	t	Tc	w			
			109.97	110.47	0.50	LST	DOL		Intense DOL sBX and cBX LST, medium grey, with weak FG disseminated Po grading into trace Py at gradational lCN. uCN sharp, marked by CHL/DOL layers.	uCN	60									t		w					
			134.27	134.55	0.28	DOL			Broken, weakly OX on FX. Py bellow this interval weakly tarnished locally, and core OX on some FX.							w										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			151.35	158.17	6.82	DOL	OX		Light orange to dark red brown alteration on FX, VT, and through zones of CG DOL. Weak ANK and moderate HEM and OX. Weak talc in moderate OX zones. Interval vugged and non-calcareous.						w	m		HEM	m				Tc	w			
160.69	161.30	0.61				MBL			Milky white to dark grey MBL with thin dark grey layers with strong to weak FG Py within them, weak overall. 13 cm interval of DOL within MBL, with VOL layers on CN. Dark layers altered to olive green, soft non-calcareous. uCN very irregular, with dark green alteration layers ~ 50 cm into DOL and on FX.											w							
161.30	166.73	5.43				VOL			Dark grey to black and dark brown and buff greer variable SER, BIO, and CHL VOL, locally very corroded, commonly strongly calcareous in irregular spots and layers.																		
			161.30	163.59	2.29	VOL	BIO		Dark grey to black, strong BIO VOL with uCN intense SER, gradationally decreasing until no SER after 162.20 m. Ca in vFG spots, VT, and irregular patches, rimmed by BIO. Some vFG spots DOL altered. Strong Py over 5 cm at uCN, becomes trace through rest of interval. Ca decreased down interval to almost nothing.									BIO	s	t							
																				SER	ms							
			163.59	164.97	1.38	LEP			Dark grey to black moderate strong CHL, strongly calcareous, LEP. uCN defined by sharp increase in Ca as irregular spots. From 164.70 have vFG Ca in layered VOL.									CHL	ms								
			164.97	166.73	1.76	VOL			Green buff and brown strong SER and BIO VOL, and intense Ca in irregular patch with BIO rims. First meter extremely corroded, no Ca, almost entirely BIO with fair SER and trace Qz. Trace Py increases to strong at lCN.									SER	s	t							
																				BIO	s							
166.73	168.19	1.46				DOL			Milky white to light grey CG DOL with growth spaces. Weak Py as FG disseminated and irregular layers. Light green brown alteration on FX, non-calcareous.											w							
168.19	174.12	5.93				MBL			White to light grey MBL with overprinted light to medium grey layers locally verging into zones < 50 cm long. Dark grey weak SER layers begin ~ 1 m before lCN.									SER	t							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

The hole was ended because it was passed the target oxide horizon.

GEOLOGY LOG

HOLE: Rau-10-118

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	2.73	2.73				OVB			Overburden - no recovery																		
2.73	32.35	29.62				LST	DOL	sBX	Medium grey to purplish grey, weakly to moderately dolomitized, fairly fossiliferous, strongly sBX LST. Fossils include mainly broken up favocites, well preserved halycites and crinoid stem fragments. A strong sBX texture is infilled with DOL dog tooth spar, a thin rim with trace bitumen then infilled with a varying mixture of quartz and calcite. This texture is occasionally overprinted by 0.5-1 cm Qz +/- Ca veinlets. Fossils are mainly preserved in the less intensely sBX LST.	VT	40			f													x
			19.80	32.35	12.55	LST	DOL	sBX	The dolomite clasts in the sBX now have a medium purplish-brown grey colouration (HEM-alteration?). The brecciation of this interval is in general less intense, but where present the brecciation is much 'clearer' with sharper, more defined contacts between clasts and DOL+/-Ca+/-Qz FG-CG matrix. Also the concentration of Qz in the matrix has decreased (to weak) with darker grey Ca infill.					f				HEM	f							x
									The lower contact is rubbly but has an increased intensity of sBX. The clasts are only 0.5-1 cm as opposed to up to 10 cm above. Below the lower contact the LST is no longer dolomitized.																		x
32.35	56.82	24.47				LST	VOL		Medium to dark grey, fossiliferous LST with 15% greenish-brown strongly calcareous VOL (?) interlayers that are quite irregular to patchy and define a weak-fair foliation at 80 deg TCA. A moderate concentration of 0.1-0.3 cm wide crinoid stem fragments are scattered throughout (including star crinoids). The entire interval is weakly to moderately rubbly.	FO	80																x
56.82	58.83	2.01				VOL	OX		Dark greenish-grey-black volcaniclastic with fair to intense oxidation to a yellow-orange-brown colour. 60% of the interval is intensely oxidized into gritty clay, while the other 40% is competent to rubbly, fairly to moderately oxidized VOL. A moderate FO occurs at 85 deg TCA.	FO	85				ms										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
58.83	75.59	16.76				LST	MBL		Fine to medium grained medium to light grey, moderately to strongly marbleized LST with a strong strain defined FO. Trace yellow-orange oxidation stain occurs on some fractured surfaces. The unit is moderately to strongly fractured and rubbly. Towards the lower contact, the FO becomes less strong.	FO	60					t		MBL	ms								
75.59	177.70	102.11				OX			Dark red to black, yellow, or grey brown OX with intervals of intense OX LST and VOL recognizeable Variably calcareous.																	
			75.59	87.78	12.19	OX	SID		Dark red brown-black strongly siderite rich oxide grit and rubbly. The core in general holds its shape, but crumbles easily when pressed or dried. The entire interval is non-calcareous.								s										
			80.50	80.60	0.10				A coarse grained quartz vein is preserved within the oxide but quartz also occurs through the interval mainly in rubbly form.																	
			87.78	103.55	15.77	OX	LST		Medium greyish brown, strongly calcareous oxide with minor intervals of relict LST (15% overall). The oxide is most likely LST in origin and is gritty clay in composition. It holds core shape well but cracks and begins to crumble with time. The unit contains a fair concentration of quartz rubble. This rubble occurs in 10 cm concentrated zones throughout (as opposed to more evenly dispersed throughout). A weak foliation preserved in the non-clay altered LST occurs at 70 deg TCA.																	
			98.45	99.47	1.02	OX	SID		An interval within the unit is composed of more sideritic rubbly oxide. The zone is non-calcareous.								s									
			103.55	126.35	22.80	OX	SID		Dark red-brown-black strongly sideritic gritty rubbly oxide. The core holds its shape well but crumbles easily when dried. Some fractured surfaces show a bright orange clay rich component to some of the interval. Only trace Qz occurs within the interval. The upper and lower contacts are gradational over 10-50 cm.																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			126.35	142.65	16.30	OX	LST		Medium reddish-greyish brown, moderately to strongly calcareous, variably clay altered LST with rubbly moderately clay altered zones ~ 25% solid, 60% weak core to rubble, 15% fragile gritty rubbly clay. The more competent pieces show a weak concentration of fine grained oxidized sulphides (Py?). A very weak FO is present in a competent fragment.Both upper and lower contacts are gradational over 20-50 cm and are defined by mild colour variation and change in calcite content.	FO	55					ms												
			134.10	137.70	3.60	OX			Brick red-brown fragile core shaped oxide that crumbles easily. A moderate concentration of fine grained disseminated Py occurs on some fractured surfaces. Weak to fair cBX texture can be seen on some washed core surfaces.																		
			138.64	142.65	4.01	LST	OX		Light to medium pinkish-creamish clay coating on light grey moderately DOL LST (?). In general the unit is very fragile, crumbling easily in some zones, while it is solid in others. A fair FO occurs at 55 deg TCA.					m													
			142.65	148.68	6.03	OX	VOL		Medium brownish orange, strongly oxidized VOL The unit holds core shape but breaks apart into rubble very easily. The material consists of gritty rubbly/clay/silt. Moderate textures occur on some of the fragments. They reveal a banded texture at 50 deg to CA. Both upper and lower contacts are gradational over 20-30 cm.	FO	55					s											x
			148.68	158.80	10.12	OX	LEP		Medium orange-brown with dark brown-black and light crackly-yellow spots, that resemble the texture of the LEP volcaniclastic. Unit is core shaped but has a high silty/clay content and crumbles easily. A strong FO is recognised on clean core pieces at 65 deg TCA. The entire unit is non-calcareous. The interval within is a medium greenish brown colour with a faint spotted pattern (may be a VOL that is less LEP spotted).																	x
			158.80	177.70	18.90	OX	SID		Dark reddish brown black strongly sideritic, strongly rubbly to gritty oxide with minor 5-10 cm intervals of solid vuggy dense siderite. The core only barely holds core shape cracking and crumbling easily when touched or dried. No structural orientations can be obtained in this unit. The lower contact is sharp, but occurs at a block so does not contain any structural information.	ICN							s											x

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.36	1.36				OVB			Overburden - no recovery																		
1.36	73.60	72.24				LST			Medium to dark grey LST, variably DOL and brecciated by FG to MG DOL and FG Ca. Locally intensely OX. sBX to mBX locally of dark grey LST with medium grey LST matrix. Toward lCN have increasing MBL, and SER VOL rich layers. FOS begins down interval.					m		w											
			1.36	10.73	9.37	LST	DOL	cBX	Medium to dark grey LST, sBX by FG to MG DOL and FG Ca, generally expressed as medium grey clasts with MG DOL rim. Overprinted by cBX by dark grey calcareous seams which form DOL clasts. Interval fair DOL, with local light grey and dark grey sBX texture.					f													
			10.73	23.67	12.94	LST	DOL	sBX	Medium grey moderate DOL, intensely sBX LST with local minor cBX. sBX FG to MG DOL, forming matrix with medium grey irregularly shaped, often elongate clasts or as thin irregular layers in LST. Interval locally OX to a dark orange brown on FX, through thin seams, and through intervals. Trace Py in patches near DOL.					m		f					t							
			13.14	14.33	1.19	LST	OX		Dark orange brown OX pervasive through interva and coating core. Strongly calcareous, locally DOL. Locally dark brown SID, mostly OX. OX in VT and FX surrounding interval.					f		s	t										
			23.67	27.87	4.20	LST			Medium grey moderate DOL LST with local thin sBX of FG DOL crystals and irregular dark grey clasts. Remainder of interval unbrecciated, with DOL and SID VT to VN at various angles, and zones < 25 cm of SID/OX, variably calcareous. Local bright orange VT may be SMI based on colour.					m		f	m										
			27.87	33.50	5.63	LST			Medium to dark grey LST, fair DOL, with moderate sBX to mBX by DOL/Ca. Dark grey LST is mBX to sBX by medium grey LST; locally the dark grey clasts are strong SIL.					f													
			33.50	40.39	6.89	LST	DOL	sBX	Medium grey LST intensely sBX by FG to MG DOL forming grey clasts in DOL matrix, or irregular DOL growths in LST. Qz often in central cavity of DOL growths. Light and dark grey sBX texture common in LST.					i													
			40.39	46.43	6.04	LST			Medium to dark grey LST with irregular layers of medium and dark LST. FOS begins with rugose and unknown corals visible. Local SIL. 25 cm Qz VN with measurable lCN. Not sBX.	VN	55															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			46.43	48.65	2.22	LST	DOL		Medium grey LST, moderate DOL, with strong sBX by FG to CG DOL. Light orange to pink OX and HEM through DOL (ANK?) locally. LST has FG white FOS remnants within, crinoids identifiable.					m	f	w		HEM	w									
			48.65	50.00	1.35	LST	MX		Medium grey LST, fair DOL and moderate SIL, with Qz VN < 10 cm thick, irregular, with semi-massive Py. Cross-cuts foliation. Py vFG, green brassy, strong overall.	FO	55			f				SIL	m	s							
			50.00	52.43	2.43	LST	DOL		Medium to dark grey moderate DOL LST with dark grey and medium grey interlayers. Medium grey layers fossiliferous, with crinoids visible. Trace vFG Py in dark grey layers.					m						t								
			52.43	58.32	5.89	LST			Dark to medium grey LST, intensely sBX by DOL forming irregular layers and matrix. sBX of dark grey and light grey LST					s													
			58.32	62.80	4.48				Light to medium grey LST with MG Ca/DOL crystals in layers separated by vFG dark grey to light buff green VOL layers, increasingly SER altered down interval. Weak Py as vFG layers on rims of VOL rich layers. Light grey layers variably DOL. Increasing Pc down interval, vFG, with Py. Trace MG As crystals disseminated. Rugose and crinoid FOS visible.					s						w	t	t						
			62.80	73.60	10.80	LST			Medium to dark grey LST, locally intense MBL. FOS over first 2 m, with dark grey to black weakly calcareous irregular layers between MBL FOS patches. Remainder of interval has FO defined by medium grey MBL and less calcareous dark grey interlayers. Trace FG bright brassy Py disseminated. In intense MBL, weak SER of dark grey layers.	FO	45							MBL	ms	t							
73.60	75.54	1.94				MBL			Light grey to white MBL with SER and BIO in thin layers, light brown to buff green. lCN and uCN gradational on FO. Trace FG to MG bright disseminated Py.	FO	40							SER	t	t							
																		BIO	t								
75.54	108.17	32.63				VOL			Medium grey, light green and buff, and dark brown, BIO and SER VOL, variably calcareous. Locally magnetic, and with conglomeritic subintervals.									SER	s									
																		BIO	f								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			75.54	80.32	4.78	VOL	SER		Dark brown to buff green, strong BIO and intense SER VOL, with strong Ca VT and vFG Ca spots associated with BIO patches. After 78.20 m, interval increasingly magnetic due to FG Mg gradationally increasing toward lCN. Ca VT and BIO layers follow general FO. Trace Py, vFG in small patches and disseminated.	FO	55							SER	i	t			Mg	t			
																		BIO	s								
			80.32	83.72	3.40	VOL	Mg	CGL	Medium grey and green buff magnetic pebble conglomerate locally with calcareous matrix. Clasts light to dark grey, locally light pink, non-calcareous, very magnetic. Matrix variably SER altered VOL with < 10 cm intervals of calcareous matrix with Mg rims on clasts. Trace FG Py disseminated and in Ca VT rims.	FO	50							SER	m	t			Mg	f			
			83.72	88.85	5.13	VOL	SER		Grey to green grey intense SER magnetic VOL with Ca blebs and VT rimmed by CHL/BIO elongate on FO. < 0.5 cm subrounded medium grey and dark grey areas, likely FG CGL, decreases down interval.									SER	i				Mg	f			
																		BIO	w								
			88.85	91.94	3.09	VOL	BIO		Dark brown intensely Ca fair CHL to strong BIO VOL, with Ca was vFG spots to < 1 cm patches and VT. Trace Py in Ca VT and disseminated. Brassy and weakly OX locally. Grades from moderate to intense BIO down interval. Non-magnetic.									BIO	s	t							
																		CHL	f								
			91.94	97.13	5.19	VOL			Buff green and brown intense SER and strong BIO Vol, BIO associated with vFG Ca spots. Non-magnetic. Fair Py as FG to MG disseminations and bands < 5 cm. Brassy.	FO	50							SER	i	f							
																		BIO	s								
			97.13	100.60	3.47	VOL	SER		Buff green SER VOL with BIO layers and rounded clasts of Ca/BIO; Appears to be CGL. Clasts locally appear more like alteration layers, particularly after 99.67 m. Fair FG to MG Py disseminated and in layers, focused in BIO/Ca layers.									SER	s	f							
																		BIO	m								
			100.60	106.51	5.91	VOL	SER		Light blue green grey with light yellow and bright blue, intense SER and trace Fu. SER variably coloured, weak to strong SIL. Weak FG to CG Py in layer and patches associated with Ca.									SER	i	w			Fu	t			
																		SIL	f								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			106.51	108.17	1.66	VOL	CGL		Medium grey FO VOL (ARG?) with weakly SER elongate clasts and Ca/DOL FG spots. Clasts irregularly shaped, matrix generally non-calcareous. Trace FG to MG bright brassy Py in patches with Ca and disseminated. Sharp uCN with intense SER VOL, gradational lCN with intense DOL LST. Possible debris flow?	FO	50							SER	t	t						
108.17	118.86	10.69				LST	DOL	sBX	Medium to light grey, strong DOL LST, with FG to MG DOL/Ca, and pervasive sBX. Locally cBX by dark grey overprinted seams. Very gradational lCN into DOL. Local fair MBL, and thin dark grey layers and clasts of weak SER VOL. Intensely calcareous zones associated with talc and Qz. FG to MG Py and Po disseminated, replace dark VOL layers, and on VT rims.					s						w		w					
118.86	196.10	77.24				DOL	MX		Light grey to white FG to vCG DOL with Qz/Ca/Tc locally intense, ad with dark grey to brown weak SER layers, locally up to 10 cm thick. Moderate strong FG to MG Py in layers defining FO and disseminated. Weak Dark silver grey As after ~ 121 m associated with and overprinted by Py. FG to CG disseminated and layered Po weak in first ~ 6 m, decreasing to trace, overprinted by Py. Trace bismuthinite at 160.59, overprinted by Py. FO changes from ~ 50 to 40 degrees down interval, with decreased Qz/Ca.	FO	45									ms	w	t	Bs	t			
			172.90	177.75	4.85	VN	Tc		~ 6 cm talc VN which cut MX with Ca rims. Variably oriented, light milky green.																	
196.10	198.03	1.93				VOL			Dark brown and dark blue grey strong BIO and CHL VOL, with FG Py defining FO with patchy layers. Intense BIO and weak SER at top of interval grades into intense CHL and fair BIO at lCN. Qz/Ca VT irregular. Sharp uCN at 30 degrees. lCN has gradational CHL increase, and sharp Ca increase on FO.	uCN	30							BIO	s	t						
										FO	50									CHL	s						
198.03	212.45	14.42				LEP			Dark blue grey strong CHL intense Ca VOL; LEP. Ca as irregular patches FG to ~ 1 cm wide, forming ~ 60% of rock locally. Layers < 25 cm of non-calcareous VOL.											CHL	s						

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.90	1.90				OBV			Overburden - no recovery.																		
1.9	49.53	47.63				LST			Dark to light grey variably DOL and MBL LST, with DOL sBX decreasing and MBL increasing down interval. Very broken, with rubbly to clays layers. Increasingly intense OX down interval. Locally fossiliferous, FO, and SIL.					w		t			w									
			1.90	21.34	19.44	LST	DOL	RBL	Medium grey weak to moderate DOL LST, sBX by DOL/Ca, FG, forming medium grey irregular clasts, commonly elongate. Local sBX of medium and lighter grey LST, with lighter coloured LST more calcareous. Very broken green grey and light brown zones with calcareous clay to grit < 20 cm wide.					f														
			21.34	49.53	28.19	LST	MBL	RBL	Dark to light grey FOS LST with MBL increasing down interval. FO becomes more distinct and lower angle down interval. Chain coral and crinoids in trace amounts. Strong MBL layers have FG Ca spots which may be fossil fragments, but can't be identified due to MBL overprinting. Very broken interval with calcareous light brown to bright orange brown clay to grit OX zones < 30 cm long with LST fragments within.							w		MBL	m								
49.53	131.23	81.70				OX			Bright orange brown, yellow orange, and dark brown OX weakly calcareous in first 50 cm bellow uCN. Clay to solid core, predominantly clay in light VOL portions and grit in SID zones.								i									
			49.53	50.90	1.37	OX			Orange brown clay to grit, weakly calcareous in first 50 cm with dark brown SID rubble in last 50 cm.								m									
			50.90	58.05	7.15	OX	VOL		Light orange brown to yellow with light green grey sheen from remnant SER, intense OX VOL. Trace Qz in layers. Non-calcareous. Preserves FX on remnant FO. Clay to rubble, predominantly silt.	FX	55															
			58.05	60.80	2.75	OX			Orange brown clay to rubble, predominantly grit, with green grey colour over 15 cm. Qz rubble within OX and as 10 cm piece of core with SER wisps. Non-calcareous.								f									
			60.80	67.95	7.15	OX	SID		Dark brown with red orange coating, intense SID interval with sharp uCN. Non-calcareous silt to rubble, predominantly grit.								i									
			67.95	70.01	2.06	OX			Light orange brown clay to grit with weak Qz rubble in zones < 25 cm.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			70.01	75.82	5.81	OX	SID		Orange brown to dark brown clay to rubble, predominantly grit. Trace Qz in < 5 cm intervals, and mixed in grit of last 20 cm before CN.								s											
			75.82	76.81	0.99	CLY	Qz		Medium brown to blue grey, with subangular Qz rubble forming breccia clasts. Matrix blue grey clay or brown OX. ~ 40% Qz clasts < 2 cm in diameter.																			
			76.81	79.02	2.21	OX			Orange brown clay to grit, predominantly grit, with SID rubble in first 20 cm of interval. Trace Qz rubble.								w										
			79.02	79.86	0.84	Qz			Qz rubble and blue grey clay to silt with OX grit to rubble mixed into last 10 cm. Non-calcareous.																		
			79.86	81.87	2.01	OX			Orange brown with pink tint, silt to rubble, predominantly grit, with Qz rubble < 3 cm, and weakly calcareous OX.																		
			81.87	83.83	1.96	OX	LST		Green grey and orange brown intensely OX LST, strongly calcareous. Intact LST core up to 30 cm long, intensely cBX, strong DOL locally.					f		i												x
			83.83	87.16	3.33	OX			Red brown to orange brown calcareous OX with LST rubble < 3 cm, subrounded, and Qz rubble in trace amounts. Dark grey layer with OX layers within possibly ARG rich band. Trace Qz in layer < 10 cm wide.																		
			87.16	92.05	4.89	OX			Dark brown and orange brown rubble and grit with moderate Qz rubble. Non-calcareous.																		
			92.05	101.80	9.75	LST	OX		Very broken, strongly OX LST with last 3 m very poor recovery. LST medium grey, intense DOL, and sBX by DOL. Trace to weak OX MX disseminated. Qz VT at low angles < 2 cm at various orientations generally ~ 20 degrees.	VT	20			i		s												
			101.80	104.24	2.44	OX			Medium grey brown to blue grey and light yellow mottled. Dark grey clasts with platy appearance; ARG/VOL?																		
			104.24	114.65	10.41	OX			Dark pink to red and grey weakly calcareous clay tc grit, locally with relict sBX texture visible. Predominantly silt. Qz rubble in zones < 15 cm long.																		
			114.65	117.74	3.09	OX	LST		Medium brown clay to LST clasts and core < 20 cm long, which have weak OX, strong DOL sBX. OX zones weakly calcareous.					f														
			117.74	127.23	9.49	OX			Bright orange brown with dark brown SID variably intense. Clay to SID core, predominantly grit, non-calcareous.								ms										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			127.23	131.23	4.00	OX	LST		Green grey and orange brown to light grey, intense OX clay to rubble with zones of weak OX LST which have intense sBX by DOL and cBX by thin black seams to styolites. Gradational lCN between OX and LST.					ms														
131.23	135.34	4.11				LST			Light grey LST, sBX by DOL in upper portion, gradationally becoming more MBL down interval. Very broken, locally intense OX near irregular Qz VN with FG Py disseminated on rims. Strong Py in last 50 cm associated with Qz blebs and VN on lCN. Black mineral with conchoidal FX locally appears to have cubic form, softer then iron nail.					m		f		MBL	m	f							
135.34	138.08	2.74				VOL			Light grey, buff and green buff SER VOL with interlayered MBL/DOL. uCN ~ 15 cm Qz/Ca VN with strong Py for ~ 25 cm after, decreasing down hole to weak overall. Interval ~40% MBL and FG DOL. Very broken with local moderate strong OX on FX and through core.					m		m		SER	s	w							
																		DOL	m								
									EOH at 138.08 because ground condition was unfavourable.

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	0.91	0.91				OVB			Overburden - no recovery																		
0.91	26.82	25.91				LST	FOS	sBX	Medium grey weakly to fairly fossiliferous LST with zones that are weakly FO and zones that have a moderate sBX with associated reddish purple HEM alteration.									HEM	w								
			0.91	7.01	6.10	LST	RBL		Strongly rubbly medium grey LST. The fragments are too broken up to determine a structural orientation.																		
			7.01	10.98	3.97	LST	HEM	sBX	Fairly rubbly medium grey and medium purplish red grey HEM FOS LST with moderate sBX textures. Fossils are disrupted and overprinted by sBX and HEM, but appear to be mainly favocites. The sBX is narrow and infilled by dogtooth DOL spar. A moderate patchy hematite alteration occurs throughout.	FO	80							HEM	m								
			10.98	20.00	9.02	LST	FOS		Medium grey LST with 1-3 mm crinoid stem fragments scattered throughout. A weak FO is present at 80 degrees TCA. The interval is weakly to fairly fractured with minor rubbly sections. Many fractures are coated in a taupe brown iron carbonate stain.							t										
			20.00	26.82	6.82	LST	OX		Begin to get 1 -15 cm intervals of medium yellow orange brown weakly to moderately calcareous silty clay rich OX, with LST fragments within. Overall 15% OX, 85% LST. The LST is moderate MBL and has a weak FO at 60 degrees TCA.							m		MBL	m								
26.82	119.90	93.08				OX			Orange brown to dark brown OX, clay to core. Non-calcareous, with rare fragments of non-oxidized LST to MBL fragments within. Variably Qz and SID rich.																		
			26.82	31.39	4.57				Medium to dark brown grit to silt, non-calcareous, with non-oxidized LST fragments which are weakly MBL. A sharp CN with one of these fragments occurs at 40 degrees TCA. The LST has a FO angle of ~ 70 degrees TCA, very faint and disrupted.	CN	40																
			31.39	33.36	1.97	OX			Chocolate brown gritty to silty non-calcareous OX.																		x
			33.36	35.57	2.21	OX			Medium slightly greenish brown OX with 50% very fragile dark grey non-calcareous fragments within; VOL?																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			37.49	39.01	1.52	OX			Medium to dark brown gritty oxide with 50% subangular quartz fragments up to 1 cm in diameter.																		
			40.54	42.06	1.52	OX			Bright orange brown slightly gritty silty OX with 5% < 1 cm subangular Qz fragments throughout.																		
			42.06	48.16	6.10	OX			Medium orange red brown gritty silty oxide with rubbly zones containing 2-3 cm round (ground) Qz and SID fragments. The rubble occurs in zones with fines likely washed away. ~ 10% rubble.																		
			48.16	49.68	1.52	OX			Bright light yellow and medium grey sandy OX. The yellow colour occurs in patches within the grey gritty silt. Interval has poor recovery, looks similar to grey high grade zones in other holes.																		
			49.68	55.78	6.10	OX			Medium slightly orangeish brown slightly gritty silty OX with Qz rubble zones containing < 1 cm fragments of subangular white Qz. Rarer dark grey FG DOL LST subangular fragments also occur within the unit.																		
			55.78	58.83	3.05	OX	LST		Medium brown OX and medium grey fragments of LST, the zones of LST are very fragile and held together by the weakly calcareous clay.																		
			58.83	61.87	3.04	OX			Very poorly recovered interval that is half medium brown silty clay OX with Qz rubble throughout, and half dark red brownish black SID rubble with a few Qz fragments intact within.								s									
			61.87	68.88	7.01	OX			Medium brown OX with fragments of non-calcareous to weakly calcareous DOL LST within. The interval is poorly recovered, but of what was recovered ~ 35% is rubbly LST. 50 cm interval within zone from 65.0 to 65.5 m is bright creamy yellow gritty silty OX; possibly VOL.																		
			68.80	71.74	2.94				No recovery due to reduction to HQ from PQ.																		
			71.74	72.00	0.26	MBL			Light grey MBL rubble with very poor recovery (~ 20 cm). Rubbly lCN with OX																		
			72.00	93.80	21.80	OX	LST		Dark purple brown to bright orange brown clay to rubble, predominantly grit, with light grey brown intense OX LST intervals, very broken, locally with intense DOL and weak OX MX still visible, and cBX by dark brown seams. Increasingly DOL down interval. OX zones variably SID, with intense SID over short < 25 cm intervals, moderate strong overall. Small zones of intense OX are non-calcareous, but generally OX is calcareous. Trace Qz through unit in zones < 25 cm.							i	ms

SAMPLES

Numbers: I077767-I077778, I077794-I077819

Total: 38

Batch: 91, 92, 93

Date Sent: September 24, 27, 28

Certificate: VA10139134, VA10143564, VA10143565

COMMENTS

The hole was ended because it was passed the target oxide horizon.

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other	
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	6.70	6.70				OVB			Overburden - no recovery																		
6.70	12.00	5.30				LST	MBL		Medium to light grey FO LST, very broken, with OX in thin layers following FO, on FX, and through zones < 5 cm wide. OX medium brown. LST variably intense to weakly MBL, moderate overall.	FO	60					f		MBL	m							
12.00	14.45	2.45				OX	VOL		Light green grey and light yellow to dark green brown or orange brown, intense OX interval with relic FO, which is followed by FX. Light green grey SER locally; OX VOL. Very broken, non-calcareous.	FX	60							SER	w							
14.45	53.00	38.55				LST	MBL		Medium to light grey FG LST, very broken, with rubble zones ~1 m long variably MBL. Moderate strong MBL overall. OX on FX, in thin layers following FO, and through zones < 20 cm. OX orange brown to very light brown, increasing toward lCN.	FO	60					f		MBL	ms							
53.00	94.24	41.24				OX			Orange brown to dark brown clay to grit with local LST core which is moderate OX.								s										
			53.00	64.13	11.13	OX			Orange brown clay to grit, non-calcareous . uCN light brown calcareous for first 30 cm with LST rubble.																		
			64.13	67.40	3.27	OX			Light orange brown to brown calcareous clay to LST rubble, locally with dark grey seams forming cBX visible. Irregular CN between LST and OX. LST moderately OX. ~ 35% LST.																		
			67.40	69.49	2.09	OX			Orange brown clay to SID grit, non-calcareous, predominantly silt.								f									
			69.49	74.51	5.02	OX	SID		Red orange brown with dark brown and orange brown mottle in centre. Clay to grit, predominantly silt. Non-calcareous.								s									
			74.51	78.64	4.13	OX			Orange brown clay to grit, predominantly silt, non calcareous.								w									
			78.64	82.35	3.71	OX			Orange brown to very dark green brown SID rubble to silt, with SID crystals locally FG to MG.								i									
			82.35	83.15	0.80	OX			Light orange brown with light grey patches, clay to grit, predominantly grit. Non-calcareous.																		
			83.15	94.24	11.09	OX			Red brown OX and SID clay to rubble, with SID rubble zones and FG to MG SID crystals. Non-calcareous until last 10 cm gradational lCN.								i									

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.69	1.69				OVB																					
1.69	12.26	10.57				LST	DOL		Medium to dark grey DOL LST, with zones of intense MG to CG DOL/ANK crystals forming irregular VN. DOL crystals separated by thin grey seam ("cataclastic"). lCN gradational. Trace disseminated Py in CG DOL, and trace OX MX, likely Py. Thin black stylolitic seams within DOL, on CN of DOL and LST, and through LST. Weak OX on FX and through zones < 10 cm. Gradational lCN.					i		w			t							
12.26	26.59	14.33				VOL			Green buff to dark blue grey VOL, variably SER, CHL, BIO, with local Ca and locally magnetic.	FO	60															
			12.26	16.10	3.84	VOL	SER		Light green buff SER VOL, with Ca/DOL VT on FO and vFG to FG bright brassy weak Py disseminated in layers on FO. Increasing DOL/Qz within VOL toward lCN, as irregular interlayers disruption FO. lCN gradational, with increasing BIO and vFG Ca.									SER	i	w						
			16.10	19.60	3.50	VOL			Dark blue grey to black, strong BIO, moderate strong CHL, with vFG Ca spots disseminated throughout and Ca VT on FO. Unmineralized.									BIO	s							
																		CHL	ms								
			19.60	22.25	2.65	VOL	Mg		Medium blue grey moderate strong CHL with moderate BIO, grades into green buff intense SER VOL, then back to CHL over intervals ~ 1 m long. Magnetic due to trace Po locally and FG Mg. Last meter has strong BIO and SER, with local trace Py and Ca patches.									CHL	ms	t		t	Mg	t			
																		SER	ms								
																		BIO	m								
			22.25	24.92	2.67	VOL	CGL		Green buff SER VOL with elongate rounded clasts of BIO/Ca up to 1 cm wide. Clasts grade to blue grey non-calcareous clasts down interval, with intermediate clasts visible. Trace Py throughout, locally up to intense.									SER	i	w						
			23.85	24.04	0.19				Zone of intense FG to MG brassy Py											i							
			24.92	26.59	1.67	VOL	SER		Bright green buff to green grey intense SER interval with FG Py on FO and MG brassy Py in Ca/DOL blebs elongate on FO. Very gradational lCN into LST, increasingly calcareous after 26 m.									SER	i	w						

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
26.59	42.02	15.43				LST	DOL		Dark to light grey intense DOL LST, locally strong SIL. sBX by GF to CG DOL. OX on FX and local OX of Py. Py FG to MG disseminated in weak amounts.					i				SIL	w	w								
			26.59	28.93	2.34	LST			Dark to medium grey LST with moderate DOL. Medium grey LST more calcareous than dark grey, have weak sBX. DOL increases down interval. Trace FG Py disseminated. Thin black to green grey seams ~ 0.5 cm apart though first meter. Gradational uCN with VOL? Trace talc in DOL VT with Ca associated.					m						t				Tc	t				
			28.93	34.28	5.35	LST	DOL		Light grey intense DOL, sBX LST, locally strong SIL, with trace talc as FG unoriented flakes disseminated, on FX, and associated with Ca. Black elongate FG mineral disseminated in trace amounts. FG Py disseminated in thin layers and zones, locally intense Po. OX on FX, and of Py locally. Light grey colour due to SIL?					i				SIL	f	w		t		Tc	t				
			34.28	42.02	7.74	LST	DOL		Dark to medium grey LST, intense DOL and sBX by FG to MG DOL, locally mBX. Weak FG to MG Py increasing toward lCN. Trace vCG As in DOL, Trace Po associated with talc patches and layers, and with trace Qz blebs and VN. Gradational lCN into DOL.					i						w	t	t		Tc	f				
42.02	89.16	47.14				DOL			Light grey FG to vCG DOL, Qz and talc rich, with trace scheelite in patches within DOL. Local intense DOL LST zones and < 5 cm dark grey soft layer undolomitized. Fair bright brassy Py, locally intense, FG to MG, disseminated in zones and thin layers defining FO. Trace MG to CG dull grey As, and trace FG to MG Po associated with Py. As commonly in Tc zones. Scheelite is peachy coloured, blebs < 3 cm in DOL. Trace Bs at 64 m.	FO	60									f	t	t	Sh	t	Tc	f				
									Qz/Talc VT to VN cross-cut Py layers defining FO at various orientations, usually ~ 20 to 35 degrees TCA, and 190 to 280 degrees TFA.	VN	30	280																		
			44.45	45.44	0.99	LST	DOL		intense DOL sBX LST, dark grey with white DOL . Talc alteration and trace MG Py and Po. Thin black seams in last 15 cm. Gradational CN.					i						t		t		Tc	w				
			52.46	52.50	0.04				Dark grey brown non-calcareous soft layer in DOL, with Py on rims. "Speliothems" or VOL interlayer?

COMMENTS

The hole was ended because target horizon was passed.
Core barrel lost.

GEOLOGY LOG

HOLE: Rau-10-124

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	7.01	7.01				LST	DOL	sBX	Dark grey moderate DOL sBX LST, very broken with dark grey grit on FX. First 50 cm and small intervals within LST are orange brown clay to rubble OX, variably calcareous. Trace talc.					m		w							Tc	t			
7.01	17.80	10.79				OX			Orange brown to dark brown OX and SID clay to rubble, predominantly grit, non-calcareous. Trace LST rubble at uCN.								s										
			13.00	13.14	0.14				Light green white clay to grit, non-calcareous, with FG Qz rubble; talc interval?																		
			16.15	17.00	0.85	OX			Light blue grey platy intense SER core for 12 cm, followed by Qz rubble.																		
17.80	32.41	14.61				DOL			Gradational uCN and lCN from OX DOL/ANK to unoxidized DOL, and back. FG to CG DOL with Qz VN , thin dark grey to brown layers, and light grey < 20 cm zones with sharp CN with DOL; Speliothems? Fair FG to MG dull brassy Py, locally OX, form layers defining FO and disseminated on rims of dark grey speliothems. Trace MG to CG As in layers on FO. Talc layers associated with Qz. As increases down interval.	FO	60				f					f	t		Tc	w			
			29.90	32.41	2.51	DOL	ANK		Light to medium orange and pink DOL and ANK with HEM alteration. Increasingly OX down interval, and grading into OX DOL. FG dull brassy Py in layers defining FO and semi-massive over < 25 cm. Dull As MG to CG, disseminated and in layers.	FO	60				m	w		HEM	f	ms	w						
32.41	55.78	23.37				OX			Orange brown, red brown, and brown OX, strong SID, non-calcareous clay to SID core.								s										
			32.41	34.98	2.57	OX			Light orange brown to red brown silt to predominantly OX core, non-calcareous. Local Py within intense OX rock and Qz blebs, and local MG SID crystals.								s			t							
			34.98	35.15	0.17	OX			Bright orange-brown with blue grey platy rock, non calcareous. ARG or VOL?																		
			35.15	54.75	19.60	OX			Orange brown to red brown with dark brown to black centre, clay to SID core, predominantly grit, with local light yellow patches associated with trace Qz. Piece of Qz rich DOL at 42.06, < 10 cm long.								s										
			54.75	55.78	1.03	OX			Grey brown non-calcareous silt to rubble, predominantly grit, gradation lCN to DOL.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	1.52	1.52				OVB			Overburden - no recovery																		
1.52	58.20	56.68				LST	MBL		Light to medium grey LST, intense MBL at top of interval decreasing locally to weak MBL down hole. Very broken with OX on FX, and through intervals < 20 cm long of solid OX LST to rubble and grit. OX light brown to medium orange brown, locally more intense. FO defined by MBL and OX layers. Locally have overprinted Ca clasts, possibly fossiliferous.	FO	60					f		MBL	m								
			27.58	43.90	16.32	LST	OX		Light grey, light orange-brown, and dark brown strong OX LST, very broken, with OX in zones < 20 cm long, on FX, and following FO. LST variably intense to weak MBL, with local Qz rubble zones < 20 cm long. Weak SID on FX of core. OX strongly calcareous.							s		MBL	m								
			55.40	56.39	0.99	LST			Light beige clay to grit with LST/MBL rubble within, intensely calcareous.									MBL	s								
58.20	62.48	4.28				MBL			Light buff to white MBL rubble to core < 15 cm long, with OX LST rubble and core intermixed. Orange brown OX coating on FX and rubble.							m											
62.48	101.10	38.62				OX			Variably light to dark orange brown to red brown, with local light yellow and grey colour. Clay to SID core, predominantly grit. Non-calcareous.								ms										
			62.48	64.01	1.53	OX			Bright red brown clay to grit, predominantly silt, non-calcareous. Sharp uCN and lCN.																		
			64.01	64.50	0.49	OX	Qz		Light orange brown to blue grey, gradational, with light orange brown surficial coating and as patches in core grading to pure blue grey clay to grit, predominantly Qz grit. Non-calcareous, similar to high grade zones in previous holes.																		
			64.50	65.48	0.98	OX			Light yellow beige core to grit with < 1 cm white soft clasts in beige matrix; talc? Has tBX appearance. Sharp contacts.																		
			65.48	68.58	3.10	OX			Medium orange brown clay to solid SID core, predominantly grit; non-calcareous. uCN pinkish red for ~ 25 cm as gradational uCN, with light yellow patches. lCN very gradational into intense SID core.								s										
			68.58	81.00	12.42	OX	SID		Medium red brown to black intense SID clay to core, predominantly grit. Non-calcareous. Trace light orange brown patches within core.								i										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

SAMPLES

Numbers: I077903-I077944

Total: 42

Batch: 95, 96

Date Sent: September 29, 30 2010

Certificate: VA10143567, VA10143568

COMMENTS

The hole was ended because it was passed the target Oxide zone.

SAMPLES

Numbers: I077945-I078009

Total: 65

Batch: 96, 97, 98

Date Sent: September 30, October 3 2010

Certificate: VA10143568, VA10143569, VA10144150

COMMENTS

The hole was ended because the drill rods became stuck.

HOLE: Rau-10-127

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	5.15	5.15				LST	MBL		Medium grey FO LST with MBL layers defining FO, moderate MBL overall. Very broken with brown OX on broken surfaces, increasing down interval. Gradational lCN to OX.	FO	60					w		MBL	m								
5.15	60.90	55.75				OX			Variably orange brown , brown, light yellow, or blue grey OX with local unaltered core. OX variably calcareous, generally non-calcareous clay to rubble, predominantly Grit.																		
			5.15	9.14	3.99	OX	LST		Brown to red brown clay to grit, with LST rubble to core within, moderately MBL. OX variably calcareous with local Qz rubble.																		
			9.14	13.72	4.58	OX	VOL		Light yellow with blue grey less altered section, grades into brown OX with dark grey play unoxidized pieces, with sBX appearance. OX VOL with SER in upper portion, grading to un-sericitized (or possibly ARG?). Non-calcareous. Qz rubble in first 10 cm after uCN.									SER	t								
			13.72	30.48	16.76				Orange brown clay to grit, rich in Qz rubble, locally > 90% Qz, ~ 10% overall. Weak to fair SID. Trace FG talc on surfaces.								f									
			30.48	43.70	13.22	OX			Orange brown to yellow brown clay to rubble with medium to light grey rubble and zones of core, non-calcareous, soft, < 20 cm long. Yellow brown layers have less altered platy blue grey rubble with SER sheen; VOL? Qz rubble through interval locally intense, weak overall.									SER	t								
			43.70	45.95	2.25	OX	Qz		Orange brown coating over blue grey centre with very gradational uCN, becoming increasingly Qz rich over ~ 1 m. Interval blue grey, Qz rich, non-calcareous. ~ 25% Qz rubble, with blue grey silt. lCN becoming more red brown SID grit with less blue grey silt.																		
			45.95	56.42	10.47	OX	SID		Orange brown coating on dark brown to black SID with sheen, minor silt, predominantly rubble and core. First 10 cm following uCN are bright orange silt to slightly platy rubble.								i									
			56.42	59.44	3.02	OX			Orange brown, green brown, and dark red brown OX, calcareous locally with non-calcareous platy green grey and dark grey core, very broken, with HEM/SID on FX. VOL/ARG?								t									
			57.10	57.47	0.37	OX			Green brown calcareous clay to silt with trace Qz.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval	Unit	Comments
0.00	39.86	39.86	LST	Very Broken, fair OX on fractures
39.86	95.60	55.74	OX	LST rubble locally within
95.60	101.50	5.90	LST	Strong DOL sBX and moderate OX

SAMPLES

Numbers: I078025-I078055

Total: 31

Batch: 99

Date Sent: October 3 2010

Certificate: VA10144151

COMMENTS

The hole was ended because it has passed the targeted horizon. Hole lined with PVC.

GEOLOGY LOG

HOLE: Rau-10-128

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	39.86	39.86				LST	OX		Medium to light grey LST, altered light brown to black locally, with zones < 10 cm of orange brown calcareous clay to grit OX. LST very broken, locally sBX by DOL VT or MBL and locally FO. OX on FX.					f		f		MBL	m								
			0.00	8.20	8.20	LST	MBL		Light to medium grey strong MBL LST, with MBL forming variable FO. Very broken, with OX on FX.							w		MBL	s								
			8.20	15.59	7.39	LST	MBL	FO	Medium grey moderate strong MBL LST, FO, very broken, with FX on FO. OX on FX and in layers < 5 cm following FO.	FO	65					f		MBL	ms								
			15.59	39.86	24.27	LST	OX		Medium grey and light brown to black variably DOL LST, moderate OX with local intense OX and SID. FX are dark brown, strongly calcareous. Locally DOL sBX, and cBX by SID seams. Gradational lCN to OX. Qz VN < 10 cm occasional.					m		m	w										
39.86	95.60	55.74				OX			Orange brown to red brown and black clay to SID rubble. Non-calcareous after uCN with LST as gradational CN, and trace local LST pieces. Qz in trace amounts.								m										
			39.86	42.06	2.20	OX	LST		Orange brown to brown calcareous clay to rubble with LST rubble and core which has been moderately OX.																		
			44.97	45.05	0.08	OX			Light yellow layer within orange brown OX. Clay to silt, non-calcareous.																		
			51.60	52.00	0.40	OX	LST		Light grey LST rubble to core, with Qz rubble and orange brown clay to grit. Calcareous.																		
			60.75	62.15	1.40	OX	SID		Orange brown coating on black SID centred silt to rubble, predominantly grit. Intensely SID zone.							s	i									
			70.85	72.20	1.35	OX	SID		Orange brown and black silt to rubble, predominantly grit. Intense SID.							s	i									
			75.65	75.90	0.25	OX	Qz		Orange brown silt to rubble with Qz rubble <2 cm ~ 10% of interval.																	
			90.54	91.00	0.46	OX			Light orange brown to yellow brown calcareous silt to OX core, predominantly core.																		
95.60	101.50	5.90				LST	DOL		Medium to light grey DOL LST with DOL sBX. DOL locally CG, sharp uCN with OX, followed by decreasing OX of LST down interval on FX and through core, variably calcareous. Trace FG OX MX through interval.					s		m											
									101.50 m E.O.H - Hole ended because OX interval passed.

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	17.50	17.50				LST	OX		Light grey intense MBL LST, locally MBL over < 1 m, FO defined by MBL and LST layers, moderate strong brown to orange brown clay to grit OX on broken surfaces, and through zones < 15 cm with LST rubble locally within. OX calcareous.	FO	60					ms		MBL	i								
17.50	21.34	3.84				OX			Orange brown to brown OX, locally calcareous with LST pieces. Generally clay to grit.																	
			17.50	18.60	1.10	OX			Medium brown and red brown clay to grit, calcareous, with LST rubble and core < 10 cm as gradational uCN with LST.																	
			18.60	21.34	2.74	OX			orange brown clay to grit with Qz rubble locally. Increasingly light brown down interval. Sharp lCN with LST with OX in irregular zones.																	
21.34	25.07	3.73				LST	OX		medium grey moderate strong MBL LST, with dark grey to orange brown OX zones < 25 cm with LST rubble within, with irregular CN with LST. Moderate Strong OX. LST locally cBX, with irregular sBX clasts of MBL.							ms		MBL	ms								
25.07	76.90	51.83				OX			orange brown to brown, locally red brown clay to rubble, variably calcareous with LST rubble and zones of intense OX LST. Locally blue grey and Qz rich.																	
			25.07	29.60	4.53	OX	LST		Orange brown clay to rubble with LST rubble to core, variably calcareous. LST medium grey. LST is trace beyond this interval.																	
			32.00	32.27	0.27	OX	Qz		Orange brown clay to grit, non-calcareous, with Qz rubble throughout ~ 15 % of interval.																	
			33.04	33.43	0.39	OX	LST		Medium brown to orange brown clay to rubble with LST rubble to intense OX core, calcareous.																	
			36.20	36.58	0.38	OX	Qz		Medium red brown to orange brown clay to rubble with Qz rubble ~ 25 % of interval.																	
			36.58	40.10	3.52	OX	SID		Red brown silt to SID rubble locally black. Non calcareous, with local MG SID crystals visible. Increasingly clay/silt toward lCN.								i										
			40.10	42.67	2.57	OX	Qz		Green grey to light orange brown and red brown clay to rubble with Qz rubble variably intense to absent over ~ 25 cm. Strong overall.																	
			42.67	44.00	1.33	OX			Blue grey and dull orange brown clay to silt, non calcareous, grading into light bright orange brown clay to rubble down interval.																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

COMMENTS

Hole ended because target oxide horizon was passed.
Hole lined with PVC.

GEOLOGY LOG

HOLE: Rau-10-130

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.78	3.78				LST			Light grey FO LST with moderated MBL defining FO. Very broken to rubble and grit locally. Weakly OX. Particularly toward lCN.							w		MBL	m								
3.78	37.24	33.46				OX	LST		Red brown to orange brown clay to rubble, with intervals of fair to intense OX LST, variably DOL sBX, with SID/OX VN. Qz rubble common in patches and zones.																		
			8.35	10.06	1.71	OX	Qz		orange brown clay to grit with Qz rubble < 4 cm as ~ 30% of interval (very poor recovery, OX likely washed away).																		
			10.06	13.11	3.05	OX	LST		Intense OX and SID LST core. Very poor recovery.								i									
			13.11	17.15	4.04	OX			Orange brown clay to grit with local Qz rubble, locally calcareous.																		
			17.15	20.69	3.54	LST	OX		medium grey to light buff LST, sBX by FG to MG DOL with SID cBX seams locally and SID VT at ~ 35-40 degrees. Intense OX on rubble surfaces, FX, and through zones < 20 cm of clay to LST rubble.	VT	35						m										
			20.69	27.00	6.31	OX	LST		Orange brown clay to rubble, predominantly silt with local Qz rubble and LST clasts toward lCN, where OX also becomes calcareous.																		
			27.00	30.50	3.50	OX	LST		Medium grey to orange brown intense OX LST rubble and core with OX zones of clay to grit, OX generally calcareous. Qz rubble locally through interval, and 7 cm Qz VN in OX toward lCN. Gradational contacts.																		
			30.50	34.44	3.94	Qz	OX		White Qz as rubble to core < 15 cm long with light orange staining on FX and red brown Ox as ~ 15 % of interval. Non-calcareous.																		
			34.44	37.24	2.80	OX			Orange brown to red brown clay to grit, non calcareous except near intense OX LST rubble at uCN. Local Qz rubble.																		
37.24	52.73	15.49				LST	OX		Light grey and light to medium brown intense OX, variably DOL LST. Strongly calcareous core to silt. LST locally cBX by thin dark grey seams. Generally too OX to see LST structures. Local Qz in patches and zones. Local intense OX/SID clay to rubble.					ms		i	ms										
			41.89	42.90	1.01	Qz	OX		White Qz with medium brown calcareous silt to rubble.																		
			46.43	48.16	1.73	OX			Orange brown to black intense SID and OX zone. Non-calcareous after uCN, silt to rubble.								i										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	12.19	12.19				LST	MBL		Medium grey, weak to intense MBL LST, foliated, with crinoid fossils. Very broken with light brown to light orange brown OX on FX, coating rubble, as patches of clay, and through core. Gradational lCN.							f		MBL	ms								
12.19	13.69	1.50				MBL			White to orange brown MBL with orange brown stained colour following FO and in irregular patches.																		
13.69	21.39	7.70				LST	MBL	cBX	Medium to light grey and light beige strong MBL LST with corroded appearance and intense cBX by dark grey seams. Locally oxidized light to dark brown. Locally less calcareous due to DOL.					f		w		MBL	s								
21.39	40.60	19.21				OX			Orange brown and red brown to black, OX and SID clay to core, predominantly grit. Local LST < 10 cm long, with rest of OX interval non-calcareous.								s									
			21.39	22.66	1.27	OX			Bright orange brown clay to silt, non-calcareous, with LST fragment with irregular contacts.																	
			22.66	40.60	17.94	OX	SID		Orange brown to red brown and black intense to strong SID and intense OX. Clay to core, predominantly grit.								i									
			27.38	27.49	0.11	OX			Blue grey clay to grit with Qz rubble ~ 5% of interval.																	
			39.34	40.60	1.26	OX			Light red brown clay to rubble with dark red brown to black SID rubble locally, grit overall. Non-calcareous.								s									
40.60	59.44	18.84				DOL	OX		FG to MG light buff to light grey DOL/ANK with intense OX on FX and through intervals of core. Trace to weak OX cubic MX (Py), MG to FG, disseminated and in layers. uCN very gradational with OX sections throughout. OX variably calcareous.							s				t							
			54.25	55.80	1.55	OX			Orange brown clay to core, predominantly core, variably calcareous, gradational on CN into OX DOL.																	
59.44	66.04	6.60				LST	DOL		Medium to light grey intense DOL sBX LST with grey thin seams cBX DOL. Local intense OX on FX and though core for < 25 cm, and local alteration to dark blue grey in broken interval.					i		ms											

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			60.35	62.64	2.29	LST	OX		Broken interval of LST, starts as red brown and brown intense OX, becoming more dark blue grey down interval. Weakly calcareous.							m										
66.04	101.02	34.98				DOL			FG to CG light grey to orange buff DOL/ANK, with ANK and OX decreasing down interval. Weak OX and fresh Py, FG to CG, locally semi-massive.						w	w				w							
			66.04	78.55	12.51	DOL	OX		Light grey to orange buff DOL/ANK, FG to CG, with local intense OX on FX and through core over < 30 cm. Trace FG to MG Py, locally OX, in irregular layers, disseminated, and commonly associated with intense OX in DOL. uCN with DOL LST very gradational.						w	m				t							
			78.55	97.54	18.99	DOL			Light grey FG to CG DOL, with bright orange alteration on FX and in seams. FG to CG Py in trace to intense amounts, disseminated and in layers, dull brassy. Trace Dull silver grey As.							t				w	t						
			90.80	93.04	2.24	DOL	MX		Two distinct zones < 1 m wide of semi-massive FG to CG brassy Py in light grey DOL.											i							
			97.54	101.02	3.48	DOL	OX		Light grey to orange buff DOL/ANK, FG to CG, with local intense OX on FX and through core <5 cm long. Local intense Py, semi-massive, dies out to weak; moderate over all.						w	f				m							
			97.65	98.40	0.75	MX			semi-massive Py zone with small DOL patches. Weak OX. FG to MG.											i							
101.02	103.63	2.61				LST	DOL		Intense DOL LST, medium grey with DOL sBX and zone of DOL < 1 m with strong FG to MG Py.					i						f							
									103.63 m: E.O.H.- Hole ended because target zone was passed.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	11.58	11.58	LST	Foliated with intense MBL, weak OX.
11.58	14.95	3.37	MBL	Local intense OX zones.
14.95	25.85	10.90	LST	Moderate strong OX and DOL sBX.
25.85	62.51	36.66	OX	
62.51	72.04	9.53	LST	Intense OX and DOL.
72.04	114.15	42.11	DOL	with ANK and moderate OX, weak Py, trace Bs
114.15	118.26	4.11	LST	Strong SIL
118.26	E.O.H.			

SAMPLES

Numbers: I078206-I078253

Total: 48

Batch: 104, 105

Date Sent: October 8 2010

Certificate: VA10148574, VA10148575

COMMENTS

The hole was ended because the target horizon had been passed. Hole was lined with PVC

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	11.58	11.58				LST	MBL		Light grey to light orange intense MBL LST, becoming increasingly OX toward lCN. Very broken, with FO defined by MBL layers. Local trace MG OX MX, cubic and disseminated. OX as clay to rubble on FX and orange staining through core.	FO	70					w		MBL	i								
11.58	14.95	3.37				MBL	OX		White to light orange MBL with medium to dark grey layers. Locally intense OX grit, light orange, toward lCN.							f											
14.95	25.85	10.90				LST	OX		Medium grey to light brown OX LST, locally intense OX, moderate strong overall. OX light to medium brown, clay to OX core, predominantly rubble. Un-oxidized sections intense cBX by grey seams and moderate strong sBX by DOL. OX is calcareous.					m		ms												
			24.00	25.85	1.85	LST	OX		Intense OX lCN to LST. Predominantly solid intense OX LST core, calcareous.							i											
25.85	62.51	36.66				OX			Orange brown to red brown clay to OX core, predominantly rubble generally non-calcareous.																		
			25.85	30.60	4.75	OX			Orange brown to red brown clay to rubble, predominantly silt. Non-calcareous.																		
			30.60	32.65	2.05	OX	SID		Red brown SID silt to core, predominantly rubble. Non-calcareous.								i										
			32.65	34.44	1.79	OX			Light orange to yellow core to rubble as upper anc lower contacts to blue grey Qz rich zone. Irregular contacts.																		
			32.97	34.07	1.10	CLY	Qz		Blue grey clay to core, predominantly clay, with FG Qz rubble within as ~ 30% of interval. Solid blue grey core piece within is less Qz rich.																		
			34.44	43.59	9.15	OX	SID		Orange brown and red brown clay to core, predominantly rubble. Non-calcareous and variably SID.								s										
			43.59	46.86	3.27	OX			Orange brown clay to rubble, predominantly silt. Non-calcareous. Local SID rubble.								t										
			46.86	59.15	12.29	OX	SID		Orange brown coating on dark red brown to black SID core, silt to core, predominantly rubble. Non-calcareous.								i										
			59.15	62.51	3.36	OX	LST		Brown to orange and red brown clay to OX core, predominantly core, calcareous, with no visible LST textures due to OX.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
62.51	72.04	9.53				LST	OX		Light grey to dark orange brown intense OX and intense DOL LST. DOL locally FG to MG through intervals < 1 m. OX on FX and pervasive through core, orange/red brown to dark brown, clay to core, predominantly core. Trace brassy to OX Py, disseminated.					i		i				t							
72.04	114.15	42.11				DOL			Orange to light grey DOL, decreasing in OX/ANK down interval with local DOL LST and thin VOL seams. Py bright brassy FG to CG in layers and disseminated. Trace to intense Py, weak overall. Trace Bismuthinite locally.						f	m				w			Bs	t			
			72.04	84.22	12.18	DOL	OX		Light orange and pink DOL/ANK with HEM, and OX on FX and through zones < 1 m long of clay to rubble. lCN very gradational, and marks last OX clay to rubble interval. Trace FG Py, locally OX, bright brassy otherwise, disseminated. DOL locally cBX by SID VT.						m	s	t			t							
			73.00	73.98	0.98	OX	DOL		Orange brown OX zone, weakly calcareous silt to core, generally OX core. Gradational CN.																		
			82.00	82.50	0.50	OX	DOL		Orange brown clay to grit, weakly calcareous.																		
			84.22	111.83	27.61	DOL			Light orange/pink to light grey DOL with local ANK interzones, FG to CG. OX on FX and intense HEM through <5 cm. Locally intense Py, fair overall, FG to CG, in irregular layers and zones, and disseminated. Trace Bs locally. Zones of DOL LST < 25 cm long.						f	f		HEM	w	f			Bs	t			
			110.04	110.76	0.72	DOL	MX		Bright greenish brass FG to MG Py in semi-massive irregular zones within DOL. ~ 35% of interval is Py. Trace Bs within interval.											i			Bs	t			
			110.93						Start of thin dark grey and beige VOL layers, variably SER. Soft, < 5 cm wide.																		
			111.83	114.15	2.32	DOL	SIL		Light grey moderate SIL DOL, FG to CG, with DOL crystals locally visibly zoned with white and light grey layers. Local intense Py over < 25 cm, FG to CG, Py moderate strong overall.									SIL	m	ms								
114.15	118.26	4.11				LST	SIL		Medium grey LST, sBX by strong DOL and intense to moderate strong SIL. Dark grey, soft, irregular layers through first 1.5 m (VOL/ARG?). DOL LST cBX by dark grey seams. SIL decreases down interval.					s				SIL	s								
									118.26 m: E.O.H. - Hole ended because target zone was passed.

COMMENTS

The rods were reduced from HQ to NQ at 144.72 m. The hole was ended because the drill rods seperated past 600 feet and cound not be reattached.

0.00	1.35	1.35				OVB			Overburden - no recovery.																		
1.35	107.29	105.94				LST	FOS		Medium to dark grey LST exhibiting a weak foliation, variably brecciated. Foliation is undulose, dissolution like dark bands exhibiting a stress fabric. Variably "camo" limestone in appearance. Coral fossils at 16.20 m.																		
									Wavy dark "dissolution" bands dictate FO ~50 degrees TCA.	FO	50																
									Calcite veins of variable orientations and widths from 2 mm to 12 cm.	VN	45	70	6														
			13.00	31.98	18.98	LST	FOS		"Camo" mottled LST, sometimes weakly brecciated with calcite veins sub-parallel to oblique TCA.	FO	30																
									Veins hosting calcite crystals as large as 6 cm in size crosscut but appear to locally deform the weak foliation in LST.	VN	20	n/a														
			31.98	38.40	6.42	LST		cBX	Medium grey LST with dark grey crackle breccia matrix.																		x
									Weak foliation present in breccia 30 degrees TCA.	FO	30																
									Fine grained calcite veinlets ~30 degrees TCA, sub-parallel to parallel with breccia fabric, sometimes propagating through brecciation fractures.	VN	30																
									Wider veinlets crosscut breccia, 1 cm wide, 45 degrees TCA.	VN	45																
			38.40	44.35	5.95	LST		fBX	Light to very dark grey LST clasts of various roundness's and sizes <1 cm between larger dark grey clasts. Light grey, fine grained calcite veins cross-cut brecciation with no preferential orientation, linear and angular in appearance.																		
			47.75	51.96	4.21	LST		MO	"Camo" LST with large, 2-9 cm mottled light grey and dark grey patches oriented at 50 degrees TCA defining weak FO.	FO	50																
									Calcite veinlets cross-cutting mottles at 45 degrees TCA, <1 cm in appearance hosting dark grey inclusions, likely LST.	VN	45		5														
			60.65	63.49	2.84	LST		MO	Light grey LST with elongate, dark grey "camo" patches oriented elongate to 80 degrees TCA defining weak FO.	FO	80																
			67.65	107.35	39.70	LST	FLT		LST, variably faulted with blocky LST fragments, exhibiting shear strain fabric throughout, increasingly sinestral with depth oriented 45-60 degrees TCA.	SH	50				w												X

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
107.29	129.03	21.74				VOL			Green FG VOL, strongly foliated at 50-69 degrees TCA. Variably hosting narrow faults <1 m in width. Fractures prevalent along foliation planes. Fracture surfaces appear slightly oxidized, some feel greasy with talc. Sericite alteration variable throughout, increasing with depth. Unit appears moderately sheared at bottom contact, with lower mottled unit extremely oxidized.	FO	55					w	f											
									Narrow <1 cm calcite veinlets propagating along foliation planes.	VN	55	0	8														
129.03	178.92	49.89				LST	FOS		Variably marbleized, strongly foliated LST. Weak oxi alteration on fracture surfaces which follow foliation, oxidation alteration increasing with depth in interval. Rock variably exhibits weak to moderate strain textures. Carbonaceous augens present ~1 cm in size with pinch/swell fabric. , small, carbonaceous blebs appear strained along foliation, are very soft (SER-ALT?). FO angle decreases with depth. Weak Hem(?) alt/staining on fracture surfaces in LST at 141.45 m.							w												X
								SH	Rock appearing moderately strained from 129.03 m to 142.50 m with a weak sinestral shear indication a 131.03 m.																	
									Strong FO in dark, wavy bands in LST, 55 degrees TCA, <2.5 cm in width.	FO	55																
									Qz-Ca veinlet, 8 mm wide at 131.33 m parallel with FO, but deformed locally appearing sheared.	VN	55	0														
									NOTE: REDUCED FROM HQ to NQ at 134.72.																		
			142.33	145.80	3.47	LST	MBL		Moderately marbleized LST, light grey with medium grey bands, moderately bleached in appearance. Crinoid fossils at 143.92m.																		
							FOS		FO 70 degrees TCA from grey bands in marble	FO	70																
			145.80	148.78	2.98	LST	FLT		Dark grey with white calcareous 1 mm blebs. Blebs are very soft and fizz with 10% HCl. Weak to moderate oxi-alteration on fracture surfaces. Vesicles of dissolved minerals (Ca?) present in moderately oxidized patches in interval. Core is blocky, fracturing irregularly and along FO at 30 deg to CA.	FO	30														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			156.20	159.54	3.34	LST	FLT		Blocky, marbleized faulted LST, light grey with dark grey nebulous blebs <1.2 cm and narrow bands <2 mm wide, bleached in appearance. Oxide alteration on fracture surfaces, weak to moderate. Recovery very poor between 157.29 and 159.41 m.							m										
							MBL																				
			159.54	171.06	11.52	LST			Dirty brown LST with Ca veins and trace Py oriented 60 degrees TCA. Trace rusty Py sometimes locally weathered out or plucked, soft where remaining, scratches rusty red (Hem alt?). Voids and rusty mineralization appear pyritic in crystal habit, <3 mm. Variably debris flow-like, clasts up to 1.5 cm, sub angular in a matrix of <2 mm grains.											t							
			167.78	167.99	0.21	LST			FO in brown LST 50 degrees TCA present from 167.78 to 167.99 m.	FO	50															
									3 mm, sinuous Ca-Qz veinlet oriented at 30 degrees TCA and 185 degrees to earlier vein.	VN	25															
									Outside of FO zone, a 5-6 mm wide Ca veinlet at 25 degrees TCA is cross cut and offset by a 3 mm, sinuous Ca-Qz veinlet.	VN	30	185														
									A wide Ca vein 168.00 to 168.63 m, 70 degrees TCA, moderate MBL alteration within, coarse grained white CA with dark, narrow bands within.	VN	60						MBL	m								
			171.06	178.92	7.86	LST	OX		LST with strong FO, appearing rusty red to dark grey, variably oxidized throughout. Poor recovery (driller's "void") from 173 to 175 m. Foliation angle lowers with depth with small <1 mm, soft white blebs fizzing, oriented with FO. Qz lens (?) at 175.90 m.							s											
									Strong FO at 25 degrees TCA, lowering with depth, exhibiting a wavy strain fabric.	FO	25															
			173.00	174.00	1.00	LST	OX		Intensely oxidized LST from 173.04 to 174.00 m							i										
									1.4 cm wide vein, 30 degrees TCA, 20 degrees to FO.	VN	30	20														
			175.90	175.92	0.02				Quartz lens(?) in rock, orientation unavailable	VN																
									FO 40 degrees TCA below Qz.	FO	40															
									Narrow 1 mm wide Ca veinlet 20 degrees TCA, 175 degrees to FO.	VN	20	175														
178.92	187.81	8.89				OX			Oxide, rusty red where clay-like in texture to rusty brown-rusty orange where rubbly. Extremely oxidized throughout with relic fabrics of previous LEP rock texture seen variably through OX unit, hosting variable SER alteration.							i											
									White Qz veinlet (lens?) at 180.02 m, 2 cm wide.	VN																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

			178.92	181.55	2.63	OX	CLY		Very soft, rusty red clay oxide. 2 cm Qz lens at 180.02 m.							i											
			181.55	183.00	1.45	OX	RBL		Rusty brown OX rubble from 181.55 to 181.87 m, becoming rubbly rusty orange to 183.00 m.							i											
			183.00	184.55	1.55	LEP	OX		Oxidized LEP, Rock fizzes with 10% HCl from 184.70 to 184.55 m.							i											
									FO at 35-40 degrees TCA and wavy	FO	40																
			184.55	186.70	2.15	OX	RBL		Rubbly red OX.							i											
			186.70	187.15	0.45	OX	GRT		Rusty red, gritty OX, very soft.																		
									Cryptic FO remaining at 40 degrees TCA	FO	40																
			187.15	187.71	0.56	OX			Extremely oxidized moderate-strong LEP																		
187.81	197.52	9.71				LEP			Weakly to extremely oxidized LEP, strong FO 40-50 degrees TCA, variably SER altered throughout from moderate to very strong. Rock oxidized strongly to intense near upper contact and proximal to broken, blocky areas (faulting?)																			
			187.71	189.45		LEP	FLT		Very strongly sericitized LEP, intensely oxidized.							i		SER	ms								
									FO 40 degrees TCA.	FO	40																
			190.55	191.70	1.15	LEP	OX		Strongly oxidized LEP, fault rubble from 190.80 to 191.00 m, which is the centre of the oxidized zone (maybe iron staining?). Rusty yellow overprinting LEP.																			
							FLT																				
			193.05	197.52	4.47	LEP			LEP, blocky, moderately to moderately-strong oxidized, fractures along FO planes and along core axis most prevalent. Small, 1 mm wide lenses (Ca? Ser?) elongate with FO throughout.							ms		SER	m								X
									55 degrees TCA. Small blebs and fractures dictating FO.	FO	55																
197.52	216.05	18.53				OX			OX, yellow green in colour to red to dark brown in colour, variable LEP in texture throughout, variably very soft to rubbly to moderately strong rock throughout. Rock is variably altered by oxidation and sideritization throughout. FO at 60 degrees TCA, fractures follow foliation planes. Relict FO visible in intensely oxidized LEP. Siderite OX appearing from rubbly to component core. Component siderite vuggy, weathered out coarse grained crystals (Ca? Py?) giving it a rotted log appearance. Oxide core appearing rubbly to very soft clay in texture. Poor to very poor recovery throughout.							75	i											
			197.52	201.22		LEP	OX		Intensely oxidized LEP, soft, fissile along FO							i										x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									Strong FO, 60 degrees TCA, rock fissile along FO.	FO	60																
			201.22	205.00		OX	RBL		Rubbly orange-brown Ox, <3.5 cm, earthy clasts, some blocky LEP present, extremely oxidized.							i										
			205.00	208.18	3.18	OX	RBL		Yellow, rubbly to competent, intensely oxidized LEP and OX rubble.							i										X
						LEP	OX																				
									Relic FO at 65 degrees TCA, overprinted by intense oxidation.	FO	65																
			208.18	209.01	0.83	OX	RBL		Rubbly brown siderite. <4 cm clasts, weathered crystals present.							i										
			209.01	210.79	1.78	OX	CLY		Red clay OX. Very soft, not soupy, core maintains cylindrical shape.							i										X
			210.79	216.05	5.26	OX	RBL		Rubbly siderite to large <20 cm competent core, brown in colour, weathered out crystals give a rotted log appearance, regular size and shape of crystals suggest Ca or Py weathering out.																		X
216.05	221.28	5.23				VOL			Green, variably magnetic FG VOL with <2 mm magnetite crystals disseminated variably throughout Rock is variably oxidized and sericitized throughout.							w									Mg	m	X
									FO in banded VOL 50-60 degrees TCA	FO	55																
									Narrow, white, soft 1 mm veinlets 25 degrees TCA and 180 degrees to FO between 218.00 and 219.00 m.	VN	25	180	2														
			216.05	216.71	0.66	VOL	OX		Magnetic, extremely oxi VOL, some red (Hem?) staining on irregular fracture surfaces.							i										
			216.71	217.78	1.07				Yellowy green Ser/oxi alteration on fracture surfaces/planes, less magnetic than rest of unit.							m		SER	f						Mg	t	
									MS foliation 60 degrees TCA, banding seen in VOL unit.	FO	60																
			217.78	221.00	3.22	VOL			Green VOL, magnetite present, 5-7%, disseminated throughout, Mg crystals occasionally plucked from core, <2 mm in crystal size. Weak oxi on some fracture surfaces.							w										m	
									Weak FO 50 degrees TCA.	FO	50																
			221.00	221.28	0.28	VOL			Magnetic VOL, brown in colour above contact with LEP below. Blocky, fracturing along FO planes.							m									Mg	m	
									Strong FO at 55 degrees TCA, controlling fracturing of interval.	FO	55																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
221.28	234.72	13.44				LEP			LEP, weakly foliated, variably volcaniclastic in appearance with small intervals of clastic, matrix supported rock. Trace pyrrhotite present, brassy, magnetic, <1mm in size. SER bands intermittent, <2.2 cm in width, sub-parallel to core axis. Rock becomes oxidized with depth until bottom contact. Fe/Oxi staining LEP along fracture selvages, <8 cm in width.						w					t						X
									FO is weak, 60 degrees TCA.	FO	60															
									NOTE: Sluffing of above OX in core from 222.98 to 223.15 m.																	
									Ca veinlets 60 degrees TCA	VN	60		1													
									Qz-Ca veinlet 70 degrees TCA, 1.4 cm wide, SER and dark, FG banded selvage on either side of Qz-Ca veinlet	VN	70	n/a	1													
			232.78	234.72	1.94	LEP	OX		Oxidized LEP, soft core, light grey clasts in orange matrix. Dark, soft, 2.5 cm blebs elongate in a preferred orientation. Dark blebs scratch red (Hem alt?)															He	t	x
									LEP weakly foliated at 55 degrees TCA	FO	55															
									Dark blebs, soft, up to 2.5 cm in size elongate with a very weak foliation at 40 degrees TCA, 340 degrees to earlier FO.	FO	40	340														
234.72	235.05	0.33				SHL			Black shale, FO 70 degrees TCA, soft, does not fizz Ca-Qz lens, coarse grained at 234.84 m. Rusty orange <1 mm bands (iron-Ser?) dictate Fo.																	
									FO 70 degrees TCA seen in narrow sub-millimetre bands (iron sericite?)	FO	70															
235.05	260.60	25.55				LST	DOL		Grey to light grey extremely dolomitized LST, variably cBX throughout, fizzes only slightly after being scratched. Appears strained (shear?) below contact with above narrow SHL unit. LST alternates from grey clasts with white matrix to lighter coloured clasts with dark matrix.					i													
							cBX																					
			235.05	241.31	6.26	LST	DOL	cBx	Grey DOL alt. LST, grey clasts with white matrix.					i													X
			241.31	242.68	1.37	LST	DOL	cBx	Light grey DOL-LST with dark matrix, cob.					i													
			242.68	243.81	1.13	LST	DOL	cBx	Grey DOL-LST with white matrix.					i													
			243.81	245.97	2.16	LST	DOL	cBx	White with dark grey matrix, DOL-LST.					i													
			245.97	249.35	3.38	LST	DOL	cBx	Grey with white matrix.					i													
			249.35	260.60	11.25	LST	DOL	cBx	Light grey to white with dark grey matrix.					i													
									Dirty brown, sugary dolomitized LST with drusy Ca on fracture 15 degrees TCA at 250.62 m.

COMMENTS

The hole was ended because it was gettint too deep to continue with the small drill. The LEP unit showed no signs of weakening and Po minralization remaied relative consistant.

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	4.00	4.00				OVB			Overburden - no recovery																		
4.00	12.19	8.19				VOL		AM	Amygdaloidal volcanic, pale green to grey in colour and fine-grained 60% of sample. Bordering the VOL and the AM are fine-grained biotite crystals which also occur disseminated throughout the sample. Amygdales are filled with secondary calcite and are oblate-elongate and sub-rounded and 10-20% of sample. Fine to coarse-grained disseminated Py occurs throughout this unit. Heavily oxidized and sericitized portions occur for small intervals up to 40 cm, they are fine-grained rusty brown and very soft (breaks readily), usually associated with disseminated fine-grained Py.											f							x
									AM and VOL are elongated and form a foliation throughout the unit.	FO	60																	
12.19	121.00	108.81				LST			Light to grey fine-grained very dolomitized limestone. A high degree of fluid events are marked by prevalent calcite veining, sBx, cBx and stylolitic dissolution seams which form the foliation. At 16.76 m a 10 cm interval of massive-euhedral medium-grained Py occurs, it is slightly altered and the grains fall apart fairly easily.					80								t							
									Numerous single seamed stylolites, not pervasive throughout unit likely due to overprinting of other textures but when observed they occur in high densities, around 100 per m.	FO	60		100															
									Vein is Qz-Ca up to 1.5 cm in width. A few small sub-cm coarse grained anhedral As grains are present proximal to these veins. They are surrounded by fine-grained Py.	VN	40	85	1						t	t						
			12.19	48.00	35.81	LST			Dolomitized LST with up to 1 m sections of highly oxidized zones, red-rusty in colour and very soft and brittle. Fine-grained disseminated Py is pervasive in the oxidized portions. The LST bounding the oxidized area have a higher vein density and sBx association than the rest of the unit.					80		35				w							x

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			62.00	81.00	19.00			sBX	sBx rich subunit within the LST unit, some clasts are angular and 10 cm large appearing more as mBx but most are sub-rounded with large amounts of calcite filling interstitial space, matrix. This zone has a high degree of stylolites yet is often overprinted by the sBx texture.											t							
									Stylolitic	FO	55		100														
									Low angle Vn composed of Ca up to 1 cm wide.	VN	20	270	3														
									Vn parallel to Fo with Ca infilling, trace Py in veins.	VN	55		5							t							
			81.00	99.00	18.00			cBX	cBx rich unit in dolomitized LST. Most LST is fine-grained and structure less. Area from 92.35-94.79 m is rich in a coral-bafflelstone like texture filled with Ca, yet fossil ID is too cryptic. Trace Py in cBx matrix.											t							x
			99.00	121.00	22.00	LST			Fine-grained LST grey-black colour with weak dolomitization to none. Weak veining and minor brecciation is present but not very apparent. Fo is from variations in black and grey fine-grained portions. The black portion appears to be a fine-grained silty/clay (shale) with a weak calcite matrix.					w					t							x
									Usually very wispy and un-defined, made from Ca and fine-grained disseminated Py, Py usually more abundant in darker silty units. From 120.00 - 120.53 a highly fossiliferous, mostly altered echinoderm stem, unit occurs.	VN	25	285	0.1															
									Fo and Vn do not occur together as Fo and Vn's are not homogeneously pervasive.	FO	45																
121.00	162.80	41.80				VOL	BN		Well banded VOL consisting of grey and darker colour minerals that create the Fo. The grey VOL is often sericitized and displays a creamy green to yellowish colour and higher degree of Fo parallel broken core. Darker units are very fine grained and potentially shale interfingered with the VOL, they have a moderately strong Mg content and trace disseminated Fu as a bright green colour, and very fine-grained. The grey VOL has a small amount of Ca in the matrix. Biotite is present as fine-grained minerals usually defining a Fo and bounding shales and VOL. Py is fine-grained and disseminated in the upper portion of the unit as well as trace Po. Close to lower contact also has higher degrees of Py and Po disseminations.											t					Mg	ms	x
									Fo is defined by the VOL, fairly thin laminations	FO	45															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									Qz-Ca up to 1 cm wide and sharp contact. One Vn occurs 0.5 cm wide of massive Py at 85 TCA.	VN	50	270	0.5														
			121.00	121.72	0.72				Highly silicified with interfingered banded LST and grades into the VOL.	uCn																	
			121.00	124.50	3.50				MG DOL with VOL zones																		
			125.60	128.90	3.30				Very calcareous VOL, with calcite forming layers and blebs. Possibly interbedding.																		
			152.50	156.75	4.25	VOL	CGL		VOL cobble conglomerate with VOL and shale clasts elongated into the Fo with a weak Mg and Ca matrix.										t					Mg	w	x
									Elongated cobbles, often Mg associations.	FO	35																
			158.50	162.80	4.30	VOL	BN		Banded VOL, grey to light-green as it becomes sericitized, laminations are fine-grained and rusty. Disseminated Py and Po and laminated Py and Po occur, semi-massive in some sections. Mineralization increases closer to lower contact.										m		f						
162.80	172.95	10.15				LST	DOL		Medium grey fine-grained dolomitized LST with extensive Ca Vn's and Qz Vn's as well as cBx and Py-Po mineralization. LST is 60% of unit and hosts all the primary textures. Qz Vn's are 30% of unit associated with large amounts of Py-Po, Po is globular and fine-grained, Py is brassy to bright gold fine-grained as well as coarse grained sub-euhedral (P3 ?). Thin Fo parallel veinlets occur with minor Ch-Po-Py. From 168.50-170.39 m and from 173.00-174.00 m large quartz Vn dominates lithology with associated fine-grained Po and fine-coarse-grained Py. Vn also is associated with fibrous white-green talc in Tr amounts. Fo is weak wispy and associated with black sinuous shaley zones. Rare crinoid fragments are visible in the LST.					90					m		w						
									Weak, wispy and delineated by the dark silty shaley portions that resemble dissolution residuum.	Fo	45																
									Ca vein 1 cm, with perpendicular fibrous Ca infilling, crack-seal crystallization, fracture formed before fluid flux. A large Qz vein at the basal part of the unit occurs with weak mineralization.	VN	60		3

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			206.20	209.55	3.35	DOL	OX		uCn grades into quartz rich zone, lCn grades into ankerite. The hydrothermal dolomite is medium-coarse-grained and very rusty coloured, likely mixed with ankerite. Moderate Fo defined by medium grained subhedral Py. Unit is very oxidized displaying a rusty brown colour and is broken often along core, often a muddy to partially cohesive limonitic portion occurs on core ends. This unit may represent a small scale local fracture or fault intersecting the DOL allowing oxidation. HEM stains most of the minerals red and occurs in small Fo parallel fractures. Veinlets are SID altered.							i						w					HEM	m	x
									Defined by 1 cm pyrite bands or fine HEM in fractures.	FO	60																
			209.55	214.88	5.33	DOL	MX		Hydrothermal dolomite coarse to medium-grained and sparry 90%. Upper contact is moderately veined Ca and silty grading into dolomite from oxide layers. Lower contact grades into LST DOL cBx rather sharply. Py (P3) is medium-grained and subhedral and disseminated, and may occur patchy to weakly foliated. As is also disseminated but mainly in masses and in Tr amounts and fine-grained. A cryptic cBx occurs in the dolomite with Py infilling.						t						m	t						
									Weak, mineralized.	FO	90																
									Medium-grained dolomite, 1 cm Vn.	VN	40																
			214.88	217.84	2.96	LST	DOL		Fine-grained grey to dark grey LST intensely altered to dolomite. Medium-grained subhedral Py is disseminated to vein associated. As occurs in small patches 1 cm large and very fine disseminations. LST has visible and cryptic fossil fragments, only small crinoid stems are identifiable. Textural changes between weak cBx and dissolution seams in random orientation have fine-grained black refractory minerals remaining.					l						t	t						x
									Two sets of veins, both 40 TCA with no Fo present. Both are Ca 0.5 cm, some veins filled with coarse dolomite.	VN	40																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			217.84	227.78	9.94	DOL	MX		Hydrothermal coarse-grained buff-dolomite dominates, all original texture is overprinted. DOL has low amounts of weakly cBx and subsequent infilling of Py and trace As. Minor talc is also sporadically spread throughout the zone. Py is fine to medium-grained and occurs as disseminations but more so infilling weak cBx interstices. Small black silty units are finely laminated and interfingered with the unit in small amounts. cBx at times resembles a mottled texture since the DOL is so coarse grained.										m	t						x
									Dolomitized LST with up to 1 m sections of highly oxidized zones, red-rusty in colour and very soft and brittle. Fine-grained disseminated Py is pervasive in the oxidized portions. The LST bounding the oxidized are have a higher vein density and sBx as	FO	85														
227.78	254.42	26.64				LST	DOL	BN	Light grey to grey thin to medium laminated dolomitized limestone. The protolith LST is very cryptic and original structures are highly overprinted by the present Fo, the original lithology appears to be a fine-grained grey limestone with variable degrees of Ca veining that were pre-Fo. Thin laminations of silty-black material also exist as small sinuous whisps in the pre-Fo material, often broken up from subsequent deformation. The Fo is made of LST, hydrothermal DOL, and Ca veining.					50							t							x
									LST/DOL banded with Ca veins. Foliations wispy and mildly undulatory, many pinches and swells with no distinguishable shear sense. Elongation is present in the foliation parallel plane from pinching and swelling and minor boudinage of veins and silty laminations. Augens also are present displaying pure shear. The top of the unit has a Fo of 0 TCA from 229.30-230.30 m then changes to 40 TCA for the rest of the unit. The Fo interchanges sporadically from minor cBx texture to sBx texture to dissolution seams, all at points dominate the Fo in different zones. The dissolution seam dominant Fo sections are easier to recognize since the dissolution residuum remains as black demarkations in the seams.	FO	40														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
										VN	60	90	0														
									Gradational from DOL MX into LST DOL BN, contact is sharp but textural changes are discrete.	uCN																	
									Lower 2 m grade from strong dissolution Fo to weak cBx Fo and MX increases for disseminated Py, and the Fo overall becomes weaker. lCN has more visible weathering and oxidation associated with a higher degree of Ca veining and rusty appearance. Ox occurs with sulphide rich veins.	lCN						t											
254.42	255.49	1.07				QV			Large quartz vein with minor Ca, the uCN and lCN have marginal subhedral Py and minor foliations grading out towards the contacts. Vn is mainly Qz and broken core. Trace radiating white crystals of talc/tremolite.											t							
255.49	314.80	59.31				LST	DOL		Fine to medium-grained grey to light-grey to darker LST protolith very overprinted by the present Fo and Bx and Vn textures. Protolith LST appears to be mix of grey-white-black fragments, black being a silty unit, yet no original texture exists. The silty unit occurs in small thin laminations up to 1 cm thick, and is often sharply broken by strain and may be boudinage. Vn's range from fine-grained and <cm DOL to 1-2 cm large coarse-grained DOL+Qz Vn's. DOL often replaces even present Fo textures as white buff coarse-grained subhedral hydrothermal DOL grains. Common textures throughout zone are dissolution seams with dark refractory material delineating the seam, minor cBx and more sBx with coarse-grained DOL infill. All assumed protolith material (which lies in the Fo) is assumed to be pre Fo, pre-Fo Ca veins have been incorporated into Fo and together with LST protolith display moderate-strong pure shear textures, wispy laminations that pinch and swell around more competent grains, as well as competent silty foliations displaying boudinage. Py is brassy, disseminated (P3).					95	t	t	t			t					Sp	t	x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									Ca vein 0.3 cm	VN	65	90	1														
									Broken core and rock flour and minor Ox, at 330 331.01 m and 334.00-336.00 m	FT																	
			355.09	439.20	84.11	LEP	VOL		Same LEP as above yet much better defined and displays FO and shear and potential fBx. The LEP becomes more defined down hole as well as an increase in MX. LEP in places shows a distinct relationship with the VOL as the LEP overprints and forms as a result of VOL ALT from Ca rich fluid phases, that also appears to be coincident with shear. Py is trace and very fine-grained and disseminated throughout the unit. Po occurs as a few percent of rock as hosted in mainly Qz-Ca VN's which tend to be syn and post-shear. Po occurs as fine-grained anhedral masses and clumps in the veins and also as disseminations deeper in this unit. The Qz Ca Po veins also have associated trace chlorite.										t		w	Ch	t			x
									At 347.00 m LEP defined the FO due to the elongation of the biotite spots and calcite infilling.	FO	20																
									Ca fine to medium grained, is concordant with FO at 40 TCA up to 2 cm wide. The most visible Ca veins are sheared and pre-FO or syn-FO therefore measurements are difficult. At 387.00 a single 1 cm vein of Ca, shows signs of sinestral shear which is cut by a veinlet showing dextral shear. (?)	VN	40		2														
										FO	40											t					
			439.20	450.75	11.55	VOL	LEP		Fine-grained grey to mildly green volcaniclastic weakly banded to non-banded and interfingers with LEP unit. Unit is veined more so than any other portion of the major LEP unit. Both LEP and VOL units are weakly magnetic.											t		w	Ch	t			

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

COMMENTS

Reduced from HQ to NQ at 177.70 m. The hole was ended because it was past the fault and therefore past th targeted depth.

GEOLOGY LOG

HOLE: Rau-09-74

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other	
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	0.98	0.98				OVB			Overburden - No recovery.																		
0.98	104.51	103.53				LST			Undolomitized LST, fizzes throughout with 10% HCl. Variably brecciated and foliated throughout. Calcite veins hosting very coarse Ca crystals up to several cm's in size. Fault breccia with large to <mm angular clasts hosting trace oxidation throughout interval. Textures present: cBX, fBX, FO, Ca-VN, mBX, dissolution, strain/shear.																	
			0.98	9.97	8.99	LST		cBX	Medium grey LST, cBX clasts appearing weakly extensionally strained/sheared along a weak FO of 30-40 degrees TCA.	FO	35															
			9.97	16.87	6.90	LST		cBX	Medium to light grey LST, relic cBX texture becoming more sheared/strained/deformed in appearance. FO 70 degrees TCA becoming 40 degrees TCA with increasing depth after 15.20 m.	FO	70															
			16.87	27.04	10.17	LST		cBX	LST with a strongly deformed relict cBX texture, FO dictated by the dark bands that make up relict breccia matrix becoming near styolitic in texture, FO 35-40 degrees TCA, locally 0 degrees TCA @ 17.95 m.	FO	35															
									Wide Ca veins present intermittently in interval, 30-35 degrees TCA, parallel with FO. Ca crystals very coarse in size, up to several cm, possibly larger than HQ core barrel. Vein is white in colour, trace oxidation on a few fracture planes, fracturing blocky along crystal/cleavage planes	VN	35	0	1			t										
			27.04	28.74	1.70	LST		cBX	Light grey LST, weak cBX texture with a weak to moderate FO at 35 degrees TCA, dictated by narrow <1 mm medium-dark grey cBX matrix.	FO	35															
									Ca (Ca-Qz?) veinlets, <1 cm wide, 40 degrees TCA, 180 degrees to and crosscutting FO. Veinlets almost appear CBX in texture, very linear and angular in structure, sometimes propagating along earlier cBX fractures.	VN	40	180	3													
			28.74	31.98	3.24	LST		cBX	LST, variably deformed cBX texture, FO cryptic or absent.																	
									Narrow Ca veinlets <1 cm wide variably oriented from 0 to 70 degrees TCA , angle increasing with depth.	VN	35															

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other	
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			31.98	60.35	28.37	LST		fBX	Fault breccia LST, medium grey to dark grey angular clasts in light grey matrix, periodically consisting of fault rubble. Small, angular oxidized clasts, trace throughout but up to 3-5% from 40.00 to 43.59 m near Fe-Ca rich fBX. cBX from 45.65 to 46.80 m, "camo" LST 48.65 to 49.69 m. Rock becomes fBX in texture below, but lacking the small oxidized clasts as above.																	
								cBX																			
									Narrow, <2 mm Ca veinlets, 35 degrees TCA through upper, oxidized clast bearing fBX.	VN	35		3													
									Coarse Ca vein, 70 degrees TCA with some dark LST(?) bands appearing proximal to crystal faces (dissolution?)	VN	70		1													
			60.35	63.40	3.05	LST	FOS	MO	Medium to dark grey camo-mottled limestone with overprinting structurally deformed Ca veins. Coral stem fragments up to 2 cm in diameter and are moderately broken up.																	
			63.40	67.20	3.80	LST		MO	A strong FO defines the mottled texture.	FO	50															
			74.07	79.55	5.48	LST	RBL		The interval contains very rubbly and broken up camo mottled limestone. Begin to see Ca veins 0.5-1 cm thick cutting camo mottled limestone at 40 deg TCA.	VN	40		2													
			79.55	86.20	6.65	LST		FO	The limestone becomes strongly foliated with some reddish brown (hematite altered?) silty bands up to 1 cm thick within.	FO	70															
									Thin 0.5 cm Ca veins.	VN	40	0	1													
			86.20	104.51	18.31	LST	FOS	FO	The limestone becomes increasingly fossiliferous with 1-3 mm fossil fragments scattered throughout up to 20%. Swaley deformed interbands of darker grey limestone generally follow the FO.																	
									Foliation is well defined.	FO	60															
			93.88	99.97	6.09	LST	RBL		The limestone is strongly broken up in this interval. The breaks occur both along FO but also randomly forming limestone rubble. Silty horizons (30% of the interval overall) are interbedded within and are concordant to the dominant FO. The bands are light greyish brown and are very weakly oxidized or Fe-stained. The silty bands seem to be more easily deformed than the limestone which gives this zone of core a patchy appearance.	FO	70					t										
			99.97	103.75	3.78	LST			Slight increase in the amount of deformation effecting the LST. Also, there has been a gradational decrease in the concentration of silty horizons to 15%. 1-3 cm calcite patches that overprint the LST are deformed along FO plains.	FO	70															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			103.75	104.51	0.76	LST	MBL	FO	Gradational upper contact into fairly to moderately marbleized limestone. The alteration appears to overprint the foliation and silty horizons seen in the limestone units above.									MBL	m								
									The FO is fairly strong at 5 deg to CA.	FO	65																
									1 cm Ca veins cut at 110 deg to the FO and occur roughly twice per metre.	VN	40	110	2														
									The lower contact is extremely rubbly (possible fault?) Exhibiting strong sericite alteration on the upper contact of the VOL.	lCN																	
104.51	131.77	27.26				VOL		FO	Dark greenish grey to black fine grained volcaniclastic with strong calcite veining and areas of magnetite pebble conglomerate. Magnetite is finely disseminated throughout, but is concentrated in some zones. Strong fracturing occurs along the FO with many of the fractures revealing moderately strong orangeish brown Fe- oxidation.	FO	45					w		SER	w	w							
									The FO is quite strong and defined by a high density of fractures in the core.	FO																	
			112.00	113.40	1.40	VOL	RBL		The VOL becomes moderately to intensely fractured along both the FO and within an area that has been intensely sericite altered to a light greyish green colour.	FO	55							SER	i								
			113.40	126.20	12.80	VOL	CGL	FO	Magnetite pebble conglomerate elongated along the FO. The VOL pebbles are strongly SER altered while the matrix is greenish grey with moderate to strong concentration of magnetite. The pebbles are 3-4 cm long, and only 1 cm wide. The are always elongated along the FO plain. The density of the pebbles is only 3-4 every metre. There is w-f sericite alteration of the interval.	FO	55							SER	w				Mg	m			
			126.20	128.66	2.46	VOL		AN	Dark green to black highly strained volcaniclastic with 0.5-1.5 cm oblong to circular augens with calcite pressure shadows indicating the direction of strain (sinestral). The augens are brownish orange in colour (Fe-alteration) and other patches similar in composition to the augens occur in up to 2 cm layers concordant to the FO at 45 deg TCA. The augens occur in densities of approximately 15 per metre.	FO	45												Mg	w			x
			128.66	131.77	3.11	VOL	SER	AN	Intensely sericite altered volcaniclastic with oxidized patches. The unit still contains augens, but they too have been strongly altered. 1 mm by 1 mm pits also occur that probably represent the location of pre-existing magnetite grains. The FO is strong at 55 deg to CA.	FO	55					f		SER	i								x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
131.77	138.85	7.08				LST		cBX	Dark grey to grey-brown cBX with rusty white breccia clasts intermittent among oxidized fractures and BX matrix minerals. Qz-Ca (Dol?) vein, 2.5 cm wide, oriented 40 deg. TCA, mineralized with bands of Qz & rusty coloured CA growing perpendicular to vein walls.	VN	40					m											
138.85	167.03	28.18				LST	MBL		White to medium grey moderate to strongly marbleized LST with narrow dark bands throughout, weak to mod exsolution along fracture faces. Marbleization increases with depth. Strong FO, defined by banding in marble 40 deg TCA.	FO	40					m		MBL	m							
			148.65	154.10	5.45				Grey to orange blocky <1 cm FLT rubble.	FLT																	
			164.28	167.03	2.75	LST	MBL		Increase in oxidation on fractures. NOTE: there may be slight contamination of this sample from the row of extremely soupy oxide the is next to the one.							m		MBL	m							
167.03	171.60	4.57				OX	CLY		Very runny, soupy oxide, medium orange-brown in colour. Mainly clay type material with ~30% sandy grit. Does not fizz with 10% HCl. Recovery in the first run is quite bad, but improves past there.																		
171.60	179.22	7.62				LST	MBL		Strongly marbleized medium grey limestone 1-3 mm Ca veins cut at 20 deg. TCA. FO unrecognizable.									MBL	s							
			172.00	176.32	4.32	LST	BX		Oxidized LST, appears to be brecciated. Light brown grey clasts with irregular shapes in medium brown matrix. Elongate black mineral in matrix. Crinoids visible. BX broken by calcite VT with variable orientations.																		
			177.20	179.22	2.02	LST	MBL		Weakly to moderately Fe stained marbleized LST, also there are slightly pitted areas where acidic fluids have begun eroding the LST									MBL	s							
			177.90	179.22	1.32	LST	cBX		cBX of orange brown clasts by medium grey to brown crackle seams in moderate density.																	
179.22	192.18	12.96				OX	GRT		Medium to dark orange-brown oxide, mainly clay rich in composition with varying amounts of quartz and Ca sand sized grit. The majority of the oxide fizzes fairly to strongly with 10% HCl. Colour banding from medium grey brown to orange brown to red brown over ~ 1 cm thick intervals.																	
			181.90						Irregular Qz VT in intensely OX rock.	VT																
			185.00	187.00	2.00	OX	GRT		Zone of oxide with a particularly high concentration of Qz/Ca grit from sand sized up to 5 cm sized fragments. Oxide fizzes moderately in HCl.																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

			468.00	468.45	0.45				Mud fell into the hole. Interval not sampled.																	
			470.50	471.45	0.95				Low angle TCA, undulating, ~6 cm thick Qz/Dol veinlet. Py FG to MG euhedral, bright gold. Trace honey coloured Sp.	VT													Sp	t			
			473.07	484.33	11.26	LST	SIL		Dark grey, FG, very hard, fizzes slightly without being scratched. High density of light grey-white veinlets which fizz when scratched (Dol). Form breccia's locally. Py is disseminated, following fracture orientation in some areas, FG to CG, brassy gold, sub to euhedral, with dodecahedral crystal shape in some areas.						w				SIL	ms	m							
			476.10	476.64	0.54				Dolomite vein with yellow-white mica altering to clay. Trace red Sp. Py mainly in surrounding wall rock, trace in vein.	VN	25									t							x
			481.00	484.33	3.33			mBX	Veinlets of DOL brecciate dark grey sub-angular 0.1-4 cm diameter clasts. Mosaic to crackle breccia. Overall half of the interval is brecciated.																		
									E.O.H. 484.33 - The hole was ended because it had passed the fault and was therefore past its targeted depth.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

The hole was ended because it had passed the targeted depth and was well into the LEP unit.

			32.00	69.89	37.89	LST	DOL	sBX	Variably DOL solution breccia LST, dark grey clasts supported by a white matrix, variably DOL throughout, with matrix usually less so than clasts, fizzing more readily with 10% HCl. FO variable in angle and strength from n/a to very strong. Some BX clasts elongate with FO, but usually sub-angular to sub-rounded without orientation. Talc is present in LST as small, pearly plates < 1mm, fresh fractures feel soapy. Some weak red alteration (HEM?) on grey LST clasts along some fracture surfaces. Clasts range in size from 3 mm to 10 cm.					m		w				t	t						
									FO ~15 degrees TCA up hole in interval	FO	15																
			65.72	66.45	0.73				FO 75 degrees TCA from 65.72 to 66.45 m.	FO	75																
			39.25	39.31	0.06				DOL Ca VN, 45 degrees TCA, coarse grained CA, 6 cm wide. Py hosted in selvage in grey BX clasts, FG, up to 4 cm away from veinlet wall.	VN	45		1														
									35 degrees TCA, DOL-Ca vein hosting <1 mm grained Py in vein, crosscutting brecciation.	VN	35		1														
			69.89	78.32	8.43	LST	DOL	cBX	Strongly DOL LST, weakly cBX, exhibiting some sBX or fBX texture nearing FLT below.					e					t			Bs	t			
									Weak to moderate FO in breccia clast orientation, 50-70 degrees TCA.	FO	60																
			71.92						Py-Ca-Bs vein, coarse grained Py and Bs with Ca matrix. Cubic Py <1.3 cm, large Bs, fibrous crystal mound present. Oriented 40 degrees TCA, roughly parallel to local FO, single vein of it's kind in interval. Py oxidized on cubic crystal surfaces.	VN	40	0														
			78.32	91.94	13.62	FLT			Blocky, dark LST, small <2 cm rubble to competent core fracturing preferentially at 30-70 degrees TCA, bisecting breccia clasts. Oxidation alteration on fracture surfaces.							f										
			91.94	98.12	6.18	LST	DOL	BX	Strongly DOL LST, variably brecciated in texture from cBX to sBX.					s													
									Weak FO 30-60 degrees TCA.	FO	45																
98.12	112.17	14.05				DOL			Light grey hydrothermal DOL exhibiting medium grained dolomite (recrystalization?), sucrosic to sparry in texture, with medium grey, FG LST in intervals up to 12 cm in width, the frequency of LST intervals decreases with depth. Banded Py is parallel to FO. Py present both fine and medium grained cubic crystals <0.7 cm, rock is calcareous around Py, fizzing with 10 % HCl more readily than elsewhere.					s					w								x
									FO 40 degrees TCA.	FO	40																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									FO 25 degrees TCA, seen in wavy foliation bands.	FO	25																
									1 mm veinlet, 45 degrees TCA, 120 degrees to FO.	VN	45	120	1														
									1 mm Qz veinlet crosscutting above veinlet, oriented 15 degrees TCA, 270 to FO.	VN	15	270	1														
									Py veinlet, 3 cm wide with some MG Po and Ca. 65 degrees TCA, 180 degrees to FO. Py is fine grained ~95% of veinlet's composition.	VN	65	180	1														
			127.03	130.68	3.65	VOL			Dark grey-dark green VOL appearing more chloritic and less sericitic than above, minor Fu where sericite-rich.					s				CHL	s	t			Fu	t			
																			SER	ms								
									Strong FO at 25 degrees TCA, defined by VOL "bedding".	FO	25																
									1 mm wide Py veinlets at 127.65 m, oriented 50 degrees TCA, 180 degrees to FO.	VN	50	180	2														
			130.68			VOL			Green, less sericitic than rock above volcaniclastic hosting pyrite and arsenopyrite, both medium grained, Py as MG cubes, As rhombs. Mineralization forming bands parallel to FO, preferentially hosted in darker greenish-brown bands vs. lighter SER bands.									SER	ms	m	m						
									FO defined by VOL bedding/layers, 25 degrees TCA.	FO	25																
			139.68			VOL			Green, sericitized VOL hosting Py finer grained than above, magnetic Po starting at 138.98, abundance increasing with depth to contact with "East Zone" below. Contact sharp, chlorite sharp. Rock is strongly chloritic from "East Zone" contact up to 138.98 m.									SER	s	m		m					
									Strong FO dictated by layers in VOL (relic bedding?) 25 degrees CA.	FO	25																
139.68	220.45	80.77				DOL	MX		DOL, hydrothermal in texture, coarse grained hosting massive to banded Po and Py along with trace As. DOL is talcy sometimes exhibiting a pearly lusture on fine grained platy mineral faces, fresh fractures feel soapy from talc. Talc and tremolite present variably in interval. Py banding defines a weak to moderately strong FO (bedding or strain fabric?) Pyrrhotite hosted in top 22 m of interval, mineralization becoming Py dominated below. "East Zone".					s						i	t	s					
									FO between 50 and 85 degrees TCA, increasing with depth defined by Py bands where present, variably cryptic/obliterated in interval.	FO	70																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			139.68	171.00	31.32	DOL	MX		Hydrothermal DOL, crystals upwards of 1.5 cm in size, DOL appearing as recrystalized sBX clasts, rimmed with FG Po in dirty DOL matrix with Py overprinting Po and vice versa. Po occurrence lessening with depth. A weak FO defined Py bands, in some areas Po also follows FO. FO is stronger in Py than Po, Po overprinting foliated Py. Rock hosting massive Py and Po is variably talc-tremolite altered. Py appearing later than Po, Po replaced by cubic Py that is locally associated with Qz. However, Po is sometimes overprinting FG massive Py (?). Chl ALT around Po is intermittent. Weak oxi-alteration on some fractures. Talc and tremolite present on fresh surfaces.					s		w				i		i					x
									Weak to moderately defined FO by pyrite bands, ~75-80 degrees TCA up hole.	FO	80																
									Foliation angle decreases with depth, eventually becoming cryptic/ obliterated.																		
									2.5 cm chlorite-Po veinlet, 55 degrees TCA, Po overprinting minerals on veinlet boundary and Py within vein.	VN	55									w		i					
			171.00	204.03	33.03	DOL	MX		Coarse grained DOL hosting FG Py in parallel to sub-parallel bands, roughly 30 per meter (following bedding? Strain fabric?), with angle increasing with depth. Bands ~2 mm to 5 cm in width, with 0.5 to 8 cm between bands. Py is dull greyish yellow.											s		t					x
									FO defined by sub-parallel Py bands, ~ 50 degrees TCA, FO angle increases with depth.	FO	50																
			198.55	198.60	0.05				Sericitic veinlet, 5 cm vein at 198.55 m, Py bands appearing sheared/strained within veinlet, deformed from linear to wavy.	VN	50	0	2														
			200.35	200.55	0.20	DOL	MX		FG massive Py.											80							
			204.05	205.85	1.80	VOL			Grey-green volcaniclastic, weak FO present in grain/clast orientation, Py bands following FO but less frequent, 3 per meter. Trace fuchsite present in zones of SER alteration.									SER	w	w			Fu	t			
									Weak FO defined by orientation of grains and clasts 50 degrees TCA (relict bedding?)	FO	50																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			205.85	220.45	14.60	DOL	MX		Medium to coarse grained DOL with banded Py, typically more uniform in width than above but lacks strong foliation as mineralized DOL above. Py is FG dull, and ranges from bands to nebulous clouds growing outward from FO to lenses in shape. (Vol? BX clasts?) Py diminishing with depth. MG euhedral As is associated with Py mineralization. DOL appears more cBX in texture nearing bottom of interval.					s						ms	t						x
									FO defined by Py bands, 50 degrees TCA	FO	50																	
			206.85	206.95	0.10				Narrow OX/Hem (Siderite?) at fracture	VN																		
			207.50	209.02	1.52				Tremolite-talc alteration of coarse grained DOL, sof green in appearance.									TLC	ms									
			212.00	213.00	1.00				Trace As with narrow Py bands exhibiting weak FO in this interval, Py band frequency in less than above.																			
220.45	240.57	20.12				DOL	MX	cBX	Variably oxidized, Py mineralized, talc-trem altered and cBX DOL. Dolomitization sometimes weak with minor intervals of calcareous rock which fizz with 10% HCl. Py is present as narrow, wispy FG bands with sub-parallel orientation (P1?) to medium grained crystals overprinting dolomite, to "shotgun" texture in talc rich rock. FG Py appears late, overprinting oxidized DOL, both as masses of FG Py nebulous blebs to wispy bands. FO varies from absent to weak throughout.					s				TLC	w	f								
			220.45	224.30	3.85	DOL	OX	cBX	Rusty red to light grey oxidized DOL, relict cBX texture overprinted by oxidation. Rock fractures are preferential in orientation crosscutting cBX texture (strain fabric?). Late Py "veinlet" in OX showing different orientation and crosscutting fractures.					l		l		TLC	w	m								x
									Preferred fracture orientation, 90 degrees TCA	FO	90																	
									FG, wavy 0.6 cm wide Py vein overprinting OX, crosscutting fracture "foliation ".	VN	20	90																
			224.30	226.81	2.51				Grey, weakly cBX DOL LST, light grey breccia clasts in dark matrix. Py is intermittent, sometimes as narrow 1 mm bands (veinlets?) and as FG cubes, and is preferentially hosted/associated with dark matrix minerals.											f									
									Foliation defined by cBX clast orientation and narrow black bands (dissolutions?)	FO	45																	
									Py veinlet, 45 degrees TCA, parallel with FO, 1 mm cubes in black, carbonaceous matrix.																			

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			241.46	247.03	5.57	LEP	MX		Brown, Py mineralized LEP, fine grained to more coarse banded "clasts" in grey carb matrix. Py present as fine grained, wispy bands and MG coarse crystals following Fo, overprinting carbonate matrix and brown biotite(?)-rich brown clasts and bands. Coarse Py appearing in bands up to 4 cm wide, and as single crystals in Ca-matrix.										s							
									Strong FO in wispy Py bands and LEP layers (LEP-VOL interbedding?) 50 degrees TCA.	FO	50																
			244.75						Steep, 10 degrees TCA oriented Qz-Ca vein with weak talc-trem alteration hosting dull, FG Py in upper vein selvages to brassy, sub crystalline coarse grained Py blebs within the vein.	VN	10	90	1					TLC	w	s								
									Chlorite veinlet, 1.5 cm wide, crosscutting but offset by a silty-clay interbed in LEP. Dextral movement, Py overprinting chlorite.	VN	50	160															
									Grey, silty bands in Ca (pinkish) matrix appearing strained (interbed silts?)	VN	50	0															
			247.03	262.13	15.10	LEP			Brown to dark brown/black LEP, dark, oval shaped clasts oriented preferentially in grey carb matrix with some grey-green silty interbeds <3 cm thick throughout, exhibiting shear textures.									SER	t								
									Strong foliation, oriented 50 degrees TCA, defined by clast orientation and relict bedding.	FO	50																
									Strain/shear, steepening to CA~40 degrees TCA, brown bedding deformed with cracking, deforming bedding plane up towards core axis from original FO, grey, silty layers more commonly exhibiting strain textures.	SH																
									262.13 m: E.O.H. The hole was ended because it had passed the targeted depth and was well into the LEP unit.																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	4.35	4.35				OVB																					
4.35	131.16	126.81				LST			Dark to light grey, variably fossiliferous LST, variably brecciated and marbleized throughout. Rock exhibits variable strain texture throughout. Oxidation is weak some fractures appearing rusty on fracture surfaces.							w										
			4.35	18.50	14.15	LST	FOS		Dark to medium grey FOS LST, exhibiting fine to medium grained seds, sometimes with coarse, sub-rounded clasts up to 1 cm in size (debris flow? Bioturbitation?). Narrow, <1 cm Ca bands/veinlets aligned weakly with FO. Crinoids and other fossils present, star crinoids up to 1 cm in diameter. Fossil occurrence decreasing with depth, becoming cryptic to obscured by strain fabric.							w										x
									Silty brown-grey interbeds defining FO, 55 degrees TCA.	FO	55																
									White, calcareous <1 cm wide veinlets, 3 per meter, parallel with FO.	VN	55	0	3														
									Sinuous, white Ca vein cross cutting carbonate vein above, deforming rock locally to previous vein boundary, 25 degrees TCA, 170 degrees to FO.	VN	25	70															
			18.50	36.65	18.15	LST		cBX	Dark to medium grey LST, variably cBX, with relict breccia clasts exhibiting strain. Eventually BX clasts becoming elongate with core axis, to obscured with depth. Strain fabric increasing down hole.																		
									FO is weak, 10 degrees TCA, defined by elongate, strained breccia clasts,	FO	10																
			36.65	67.27	30.62	LST	MBL		Light to dark grey, variably marbleized (from weak to medium strong) LST. Relict BX texture becoming obliterated by marbleization, dark matrix becoming near-stylolitic in appearance with increasing marbleization, and exhibiting strain fabric. LST is fine grained, increasing to medium grained where marbleization has occurred.							f										
									Foliation is variable between 0 and 20 degrees TCA defined by dissolution/stylolitic bands in marbleized LST.	FO	10																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			67.17	79.95	12.78	LST	FOS		Dark grey to medium grey fossiliferous LST, interbedded with silty, light grey layered, variably deformed layers. Strained throughout, with augens in narrow interbeds exhibiting pressure shadows (perhaps dextral shear?). White Augens are set against the dark matrix, up to 1.1 cm in diameter, coarser grained than rest of interval. Rounded, blebs of lighter grey, coarser grained LST (bioturbitation?) infrequent, small, <0.5 cm crinoids present with other comb-shaped (teeth like) fossils up to 1.2 cm in width.																	
									FO is 25 degrees TCA, defined by interbeds of grey silty layers in LST. As well, the augens are elongated by the FO.	FO	25																
			79.95	116.82	36.87	LST		cBX	Dark to light grey LST exhibiting a relict cBX texture that is variably obscured by strain throughout. Lighter grey BX clasts occur in a darker matrix. The clasts and matrix are deformed by strain. \the matrix becomes stringer/stylolite-like with increasing strain. The interval becomes weakly marbleized with depth.								MBL	t									
									Strain/shear variable throughout, oriented variably throughout interval from 45 degrees TCA to parallel, back to 45 degrees, defining a weak and variable FO.	FO	25																
									Narrow, Ca veinlets intermittent throughout, both sheared and unsheared, but lacking crosscutting relationship between the two different veinlet types. Unsheared veinlets 40 degrees TCA, 210 degrees to FO. Sheared veins lack a common orientation.	VN	40	210	3															
			116.82	131.16	14.34	LST	MBL		Light to medium grey, variably marbleized LST, strongly uniform in FO, banded in appearance with FG LST crystals exhibiting medium grained, sugary recrystallization texture. Dark bands in rock appearing from bands up to 2 cm in width to narrow, near stylolitic (dissolution?). Marbleization increases with depth.																		
									Strong FO, 40 degrees TCA, defined by banding in LST.	FO	40																
									Crack sealed, < 1 mm Ca veinlet, with mm scale offset in crosscutting dark bands within the marbleized LST, 40 degrees TCA, 10 degrees to foliation.	VN	40	10

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
131.16	133.75	2.59				MBL			White marble with narrow black intermittent bands throughout that share a common orientation. Interbeds of VOL are present down hole, and exhibit sericite to biotite (potassic?) alteration. Trace Py present in VOL beds. Bedding planes are sheared. The contact between marble and beds exhibiting shear, is very wavy and deformed.									SER	w	t							
133.75	158.44	24.69				VOL			Green to dark green, intensely chloritic, soft, variably amygdaloidal, variably magnetic, FG VOL. Ca-amygdales and Ch-VOL variably strained/sheared throughout. Green VOL becoming brown with depth (ser + bi?), white Ca amygdales becoming grey (doll?) with browning of VOL. FG Py mineralization overprinting brown VOL.									CHL	i	t							
									FO defined by amygdale shape and orientation, both giving a weak FO of 45 degrees TCA.	FO	45																
			133.75	137.83	4.08	VOL			Dark green, intensely chloritic, amygdaloidal VOL, amygdales compose ~10% of rock. The unit is magnetic throughout. Amygdales are calcareous in composition, fizzing readily with 10% HCl.									CHL	i								
									Foliation defined by amygdaloidal shape and orientation, weakly 45 degrees TCA.	FO	45																
			137.83	143.29	5.46	VOL			Green, FG intensely chloritic VOL, lacks amygdales as above. Ca veinlets throughout.									CHL	i								
									Narrow 0.5 cm wide Ca veinlets, 40 degrees TCA with a density of 3 per metre.	VN	40		3														
									Qz-Ca veinlet, 0.7 cm wide, 45 degrees TCA, minor CHL present in vein, crosscutting calcareous, 1 mm wide stringers. <1 cm pods with a light green selvage, pinkish and soft (Hem staining on Ca?).	VN	45																
									Qz-Ca-Chl vein 22 cm wide, banded Cl-Ca in appearance, parallel to FO, deforming relict bedding (?) locally at vein boundary.	VN	40	0															
			143.29	154.51	11.22	VOL			Green to green-brown FG CHL altered VOL, variably amygdaloidal throughout and non-magnetic. Amygdales, become slightly larger, are filled with Ca. Both the amygdales and Ca veinlets/stringers exhibit shear.									CHL	i	t							x
			144.26						Coarse, Ca-Qz vein, 20 cm wide "brecciation" CHL VOL. Py is present on selvages and occurs as coarse, sub-hedral grains.	VN	50		2							t							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			145.55						Qz-Ca vein with a sheared texture in chlorite alteration extending 60 cm into the VOL on either side of vein.	VN	45																
			154.51	156.90	2.39	VOL			Reddish brown, amygdaloidal FG VOL, with biotite and sericite(?) overprinting chlorite. There is a gradational change from green to brown over 35 cm (potassic alteration?) Py present in brown VOL matrix and in white amygdales as fine grained overgrowths.									SER	f	t			Bi	25			
									Brown, sericitized, dolomitized Py mineralized fine grained VOL, biotite(?) overprinting ser and chlorite, Py present as fine grained wispy bands and rims around amygdales to FG masses overprinting dark minerals (biotite? Chlorite?)									SER	m	m			Bi	35			
158.44	319.88	161.44				LST	DOL		White and light grey to dark grey intensely dolomitized LST, variably brecciated and deformed throughout. Weak Po present as FG masses in Po-Ca-Qz veins, Py mineralization present as MG overgrowths in Po veins (P3?) to fine grained wispy bands and disseminations (P2?) throughout. Py mineralization increasing with depth. Trace talc associated with Po-Qz-Ca veins.					i				TLC	t	w		w						
			158.84	164.55	5.71	LST	DOL	cBX	Dark to medium grey, intensely dolomitized crackle brecciated LST. The breccia fabric appears deformed/strained, becoming wavy as opposed to angular. The upper contact is sharp, VOL terminated with FG Py vein, 1.2 cm wide with a gradational lightening of limestone in colour nearing VOL over 10 cm. Trace fine grained Py disseminated variably.					i						t								
									FO variable, from none to moderately strong, at 30 degrees TCA where strained, becoming 5 degrees TCA with depth.	FO	30															
									Ca veinlet, cross cutting cBX, 0 degrees to FO and 5 degrees TCA.	VN	5	0															
			164.55	188.45	23.90	LST	DOL	MBL	Light to medium grey, intensely dolomitized limestone, generally monochromatic (MBL?), variably exhibiting recrystallization and dissolution. Rock also hosting medium grey, FG DOL with intervals of "paisley" textured LST with nebulous, MG white crystals bordered by small, black tooth-like minerals (dissolution?) in banded, light grey LST matrix. Weakly cBX at 171.05 m.					i						w		w						x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			167.18						Po-Py-Marcacite(?) vein, 30 degrees TCA, strongly magnetic, MG, "massive" Po with MG Py replacement <1cm throughout with dark, similar hardness 2-3 mm (reaction?) rims surrounding Py. A brassy-orange (marcacite? tarnish?) overprinting Po. Coarse grained, bright, Py (P3?) over printing Po and Py. Talc alteration occurs along vein selvages.	VN	30									30		50	Ma	3				
			188.45	212.40	23.95	LST	DOL	cBX	Light to medium grey, variably cBX LST, intensely dolomitized. cBX variable throughout, sometimes appearing strained to soft-sed deformation(?) in appearance. Some recrystallization and dissolution textures occur with white DOL BX clasts being rimed with dark "tooth like" dissolution seams. Trace Py and Po in veins.					i						t		t						
									Talc-tremolite (altered MBL?) with Po overprinting fibrous, coarse grained tremolite (hardness ~5-6, crystals breaking in narrow fibres). Bright, medium to coarse grained Py (P3?) overprinting Po. Vein at @ 194.20 m.	VN	70																	
			196.00	197.00	1.00				CG Py and talc, with weak tremolite, Po is absent. (complete Py replacement?) @ 196.00 and 197.00 m.	VN	45																	
			212.40	285.09	72.69	LST	DOL	BX	White to dark grey, variably brecciated, intensely dolomitized LST exhibiting rebrecciated sBX to cBX by crackle breccia textures. Minor mBX is also present. Earlier brecciation appearing variably strained, and "out of focus", fuzzy recrystallization and is cross cut by sharper cBX. Occasionally bleached in appearance (dolomitized MBL?) Some Py mineralization is associated with replacing Po in Po-Py-Talc-Ca veins to MG masses with bleached, 12 cm selvages. Local trace Py and Po replacing fiberous dark mineral (actinolite).					i						t		w						
									Po vein with talc-tremolite-chlorite selvage, talc appears as pearly plates. The vein selvage bleaches the LST for approx 3 cm on either side.	VN	90											90						
			249.00	251.50	2.50				Po-Py-Tc vein. Po varies from blebby disseminations to 6 cm wide masses. Py is coarse grained and overprinting Po. Talc is associated as a matrix/host(?) mineral (Marble to talc to Po to Py?) Photo taken.	VN																		x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			285.09	319.88	34.79	LST	DOL	BX	White to medium grey, intensely DOL, variably brecciated LST exhibiting variable strain throughout, hosting wide Qz veins. LST appears bleached (MBL?) above Qz veins. The entire interval is weakly ankerite altered. Qz-Py-Tc-Dol (Ca to DOL?) up to 4.15 m wide, hosting coarse grained Py (P3?). Py is also present as MG, bright crystals in LST.					s	s													x
									Strongly ankerite, yellow stained LST (VOL?) exhibiting strong shear fabric. ANK as FG overprint of LST to coarse recrystallizations rimming Ca (Dol?) veins (exsolution of Fe-rich phase?)	SH																		x
			300.85	304.00	3.15				4.15 m wide Qz-Py-Tc-Dol (weak Ca) vein, 50 degrees TCA. Py occurs as masses of MG crystals nebulous in shape, trace dark alteration on Py (chlorite?). No Po (later vein? Complete replacement?)	VN	50									s								
			308.95	311.00	2.05				Vein from 308.95 to 311.00, Qz-Py-Ca-Tc vein, pyritic as MG to CG masses replacing Po, of which only trace amounts remain.	VN	40									s		t						
319.88	350.83	30.95				VOL			Green-grey to brown, banded fine grained volcaniclastic, variably SER altered and variably magnetic. Sulphides variably hosted throughout with Py and Po as FG wispy bands following FO to coarse, bright crystals of Py (P3?) overprinting Po present as FG to MG masses. Strong foliation throughout (relic bedding?)									SER	s	w		t							
			319.98	320.59	0.61	VOL			Green, banded FG VOL, strongly SER altered with chloritic bands, soft, hosting MG Py preferentially in non-sericitic bands.									SER	s	f							
									Very strong foliation, 35-40 degrees TCA defined by banding.	FO	40																	
			320.59	323.19	2.60	VOL			Green, banded strongly SER altered VOL with chloritic bands hosting FG bands of PY to MG masses following FO, preferential to dark, non-sericite altered bands. The interval is non magnetic.									SER	s	ms								
									Strong FO defined by bands, 40 degrees TCA	FO	40																	
			323.19	325.70	2.51	VOL			Green and brown FG VOL, strongly SER with grey, silty "interbeds" increasing with depth. Weakly mineralized compared to above, trace Po and Py in narrow Qz veinlets and FG magnetite blebs disseminated in green bands.									SER	ms	t		t	Fu	t	Mg	t		
									Strongly FO, 40 degrees TCA defined by bands	FO	40																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			334.62	346.42	11.80	VOL			Variably green and brown, BIO and SER altered, moderately blocky VOL. Py present as FG to MG whips to near massive bands up to 15 cm wide, parallel with FO. Nonmagnetic throughout.									SER	s	m							
																		BIO	ms								
									Strong FO, 35 degrees TCA, defined by banding	FO	35																
			346.62	349.47	2.85	VOL			Green FG-MG, intensely SER VOL, lacking strain fabric as above. Weak BIO alteration, frequency of brown bands decreasing with depth, following weak FO. Weak Po mineralization as blebs intermittent throughout. Py present as FG masses near bottom of interval.									SER	i			w					
									Weak FO defined by soft bands and grain orientation.	FO	40																
			349.47	350.83	1.36	VOL		tBX	Contact between VOL and LST appears to be a healed fault, tBX in appearance with grey, <4 cm clasts in soft, grey-brown "fault gouge" like matrix. Contact with lower unit sharp, 8 cm white Ca selvage between grey LST and tBX. Py present as coarse grains, exhibiting Ca "pressure shadow" heads and tails (?) and near complete replacement of Po.	lCN																	x
350.83	393.80	42.97				LST		BX	White to medium grey LST, variably BX throughout, exhibiting crackle to tectonic breccia textures. Weakly mineralized with sulphides, mineralization stronger at top of LST interval. Fizzes readily throughout with 10% HCl. Trace to no dolomitization. Textures at times exhibiting rebrecciation.											t		t					
			350.83	353.20	2.37	LST		BX	Black, non-calcareous brecciated LS hosting wispy Po masses replaced by Py. Rock appearing sheared, FG Py overprinting Ca veinlet at 351.40 m.																		
			353.20	385.80	32.60	LST		BX	White to light grey, variably rebrecciated cBX to tBX and rebrecciated LST. cBX overprinting sBX textures. Tectonic Brecciation appearing later, overprinting earlier brecciation at ~386 m depth.																		
									Coarse grained Py replacing Po in wide vein at 359.87 to 360.50 m. Py is bright, coarse, brassy (P3?)	VN										s		m					
			385.80	393.80	8.00	LST	DOL	tBX	Variably tBX LST, dark clasts <1.7 cm in size in FG grey to white matrix. Interval hosts deformed narrow calcite veinlets. Rock is weakly DOL.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
393.80	458.72	64.92				LST	DOL	BX	White to dark grey, variably brecciate, intensely dolomitized LST, variable Py mineralization throughout (appearing digenetic?). Rock exhibits none to weak fizzing with 20% HCl. Py present as FG, nebulous masses to MG "shotgun" blasts in rock, sub cubic <5 mm crystals. Trace talc-tremolite alteration associated with few Qz veins in rock. Trace Po appearing FG, replaced by Py. Rock variably exhibits recrystallized, "granitic" texture. Trace fossils present at top of interval.					i				TLC	t	t		t						
			393.80	404.45	10.65	LST	DOL	BX	Dark grey to light grey, variably brecciated, intensely dolomitized LST, weakly fossiliferous. Py present as FG disseminations in dark LST to bands following dark breccia matrix minerals, to MG "shotgun" masses. Variably strained throughout.					i						t								
									Weakly foliated, 40-50 degrees TCA, defined by strain fabric.	FO	45																
			400.75	401.40	0.65	LST	FOS		Fossiliferous 400.75 to 401.40 m, small <1 cm crinoid rings present, other trace fossils present are fragmented, becoming deformed with depth.																		
									Qz-Ca-Tr-Tc veinlet, coarse grained, 2.0 cm wide, crosscutting foliation but oriented in same direction.	VN	30	0															
			404.45	406.31	1.86	DOL			Vuggy, CG recrystallized DOL, white crystals with dark matrix, Py present as fine grained nebulous cloud-like masses to MG "shotgun" masses.					i					w								
			406.31	413.50	7.19				Dark to light grey, variably brecciated, intensely dolomitized LST hosting Qz-Tc-Tr-Py veins. Py mineralization present as CG subcrystalline growths in veins and as FG-MG disseminations in dark LST.	VN	35		1														
									4 cm wide, Qz-Tr-Tc-Ca vein, coarse grained	VN	25								w								
									95 cm wide, coarse grained Qz-Tc-Tr-Ca-Py vein, MG Py present in "shotgun" texture along vein boundaries.																		
			413.50	416.71	3.21	DOL			Light to dark grey, recrystallized, moderately talc tremolite altered "granitic" in texture DOL, coarse grained lighter dolomite crystals set against a darker matrix. Py present as FG to MG disseminations in matrix. Talc-tremolite present as radiating, fibrous overgrowths (of Ca?)					i				TLC	m	t							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			416.71	451.09	34.38	LST	DOL	BX	Light to dark grey, variably brecciated to rebrecciated dolomitized LST, recrystallization is not as strong as above. Trace Py associated with Qz veins as bright, MG crystals (P3?) to wispy, bright and brassy FG crystals along dark, younger breccia matrix paths. Py mineralization increases with depth. Rock is variably strained throughout from strong (silty interbeds?) to n/a, overall strain is weak throughout, but increases with depth. Few Ca veinlets in rock.					i						t							
									Foliation, when present, is strong at 30 degrees TCA, defined by bands in low numbers throughout rock (strained silty interbeds?) to more predominantly defined by strained breccia fabric after brecciation, increasing with depth.	FO	30															
									CG Qz-Tc-Tr-Ca veinlet, 6 cm wide, FG-MG "shotgun" Py found in vein selvage, up to 2 cm from vein boundary (P3?)	VN	35								w							
									CG Qz-Tc-Tr-Ca vein, 20 cm wide, locally deforming LST to narrow, sheeted bands up to 15 cm from vein (propagating through silty interlayer?) FG Py disseminated in strained selvage.	VN	30								w							
									CG, 1.5 cm wide Qz-Ca vein crosscutting brecciation, no sulphide mineralization present.	VN	30															
			451.09	458.72	7.63	LST	DOL	BX	Light to dark grey, intensely dolomitized, brecciated and rebrecciated LST, becoming weakly to moderately oxidized. Weak oxidation in rebrecciation matrix, oxidation more prevalent on fracture faces.					i		w	t									
			454.95	455.45	0.50	LST	DOL	tBX	Strongly DOL tBX, strongly oxidized breccia matrix. Rock is orange-grey in colour with fault rubble/gouge >0.5 cm in size. Competent core exhibits higher specific gravity (siderite altered?).							s	m									
									458.72 m: E.O.H. The hole was ended because it was past the targeted depth.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	3.76	3.76				OVB			Overbrden - no recovery																		
3.76	38.40	34.64				LST			Interbedded dark-grey lime-mudstone and lighter-grey wackestones to packstones, fossiliferous fragments are dominantly crinoids and rare rugosa corals. These interbedded units resemble that of a debris flow deposition. Overall this unit is moderately strained in some locations with a moderately developed foliation. The most pervasive foliation is due to abundant stylolitic dissolution seams that occur throughout the unit and especially at lithologic breaks as in debris flow boundaries. Low amounts of pre-strain calcite veins occur, all are deformed and their character and orientation is cryptic.											n							
			3.96	12.19	8.23				Foliation is cryptic, consists of often thin black 'organic?' wisps interbedded in the LST unit, they are often undulation around 0 TCA.	FO	0																
									Predominantly stylolites, most prevalent from 3.96 12.19 m.	FO	80																
									Calcite veining, coarse grey crystals to fine white crystals anhedral to euhedral. May have a rust-brown Fe-stain on the surface, veins are 3-5 mm wide and cuts the unit sharply.	VN	40		0.2													
									Qz vein, clear and anhedral, replacing a calcite vein as calcite lines the vein. May be a later Qz replacement or later cooling of the same fluid system.	VN	40		0.1													
									Minor cBx occurs in small 10-20 cm intervals in this unit, often has dark 'organic?'-rich matrix, clasts are the LST post-shear protolith.	cBx																
			31.00	38.40	7.40	MBL			The lower contacts gradationally becomes marbleized LST. Marble is fine to medium grained crystalline carbonate, white to dirty light-grey. Some deformed veins cut the marble and indicates the marble was in place pre-strain.	ICN																
38.40	58.30	19.90				MBL			Medium to fine-grained light to dark grey crystalline marble, punctuated by many sinuous and deformed black stylolitic seams with no preferred foliation. Upper and lower contacts are more 'mud'-rich and have an associated strong foliation.											n							x
									Upper and lower contact of the marble unit is interbedded with muddy laminations.	FO	40															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									Some minor cBx is associated with the lCN and the dark 'organic?' matrix.	cBx																	
58.30	118.79	60.49				LST			Interbedded dark lime-mudstones with debrite light grey crinoidal wackestone to packstones. Crinoidal wakestones often occur in small discrete packages interbedded lime-mud and the occasional baffle coral. Small 30 cm intervals of marbleized LST occur but are rare.											t							x
									Strong foliation defined by a dark lime-mud wisps within the less dark lime-mud. The darkest lime-mud bears small euhedral-anhedral disseminated pyrite (most likely diagenetic).	FO	40									t							
									Rare calcite veins 3-4 mm wide occur, medium-grained and anhedral and parallel the foliation yet also postdating it..	VN	40	0	0.1														
			117.25	117.70	0.45	DOL	MX		Small sub-interval of typical foliated tiger zone mineralization. Coarse grey dolomite and light orange ankerite hosts euhedral coarse arsenopyrite, is overprinted by a foliated fine-grained pyrite, and overprinted by another phase of anhedral, dull, fine-grained pyrite.											i	w	t					x
118.79	122.17	3.38				DOL	MX		Tiger zone with dolomite and ankerite. Coarse grained grey-white-buff dolomite and ankerite, hosting euhedral coarse arsenopyrite, both unstrained. As disseminated and in weak layers which are overprinted by Py. A fine-grained Py1 overprints the arsenopyrite and may occur with or post-dolomite, the Py1 forms the dominant foliation. A second Py2 is very-fine-grained and overprints the previous phases along foliation as well as without any lithologic control. Po is associated with coarse-grained subhedral grey-white calcite and overprints the arsenopyrite. The arsenopyrite is then overprinted by Py2? and then overprinted by anothe shiny euhedral pyrite.											i	i	w					x
									Upper and lower contacts are sharp transitions intc white-light grey marbleized LST. This marble appears to overprint the 'Tiger zone' as it occurs late.	CN																
									Fine-grained pyrite Py1 in bands mark the FO.	FO	50																
122.17	125.40	3.23				MBL			Fine to medium-grained white to dirty grey crystalline marble, with a weak foliation as dark grey sinuous bands and SER wisps.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									The upper contact is very sharp and overprints the 'Tiger' whereas the lower contact is more gradationa and interfingers with a sericitized volcanic unit over ~1 m. The lower contact has marble infilling AM looking vugs within the VOL, this AM is usually observed in other units with calcite filling.	CN								SER	w							
									Grey discolourations in the MBL, likely organic stylolitic remnants from the protolith.	FO	75																
125.40	141.81	16.41				VOL	AM		AM volcanic, unaltered areas occur as black to dark-grey fine-grained volcanics with large 0.5-2 cm amygdales throughout. The middle of the unit is slightly sericitized and heavily altered by chlorite with a deep-green hue. The upper and especially lower contacts are heavily sericitized and discolour the VOL to a light-green to pale-yellow colour. The sericite at the lower contact extends to a few meters from lCN, the upper contact only have 1 m maximum of interbedded marble and sericitized units. The amygdales are filled with Ca except for the uCN which has MBL in the infilling them. The calcite infill at the lCN have abundant very-fine grained biotite+pyrrhotite+pyrite rimming the amygdales that overprint the sericite phases, this extends for a few meters into the unit from the lCN. Some portions of the VOL are brown in colour likely from a strong biotite alteration (potassic alteration?)								SER	i	w		w					x
																		CHL	i								
																		BIO	i								
									Cryptic and weak, becomes more noticeable at lCN, defined by strained AM's.	FO	45																
									Rhodonite? Mn-rich pale pink veins occur twice in the unit at 128.90 m and 129.10 m, the crystals are medium-grained and sub-anhedral.	VN																	x
									Quartz vein is 2 cm wide, anhedral and medium-grained, cuts rhodonite and is associated with spotty anhedral Py.	VN	65								m							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									Calcite veins 5 mm wide, white medium-grained with calcite. They contain deep-forest green chlorite usually rimming veins. Fine-grained disseminated pyrite is also associated with these veins. Many of the fractured core occurs along these veins and most have clear slickensides. One vein at 138.60 m has Qz-Ca matrix with large euhedral pyrites filling the vein, indicating possibly that the Qz and Ca veins may be related to a similar or the same event, they have very similar angles TCA as well.	VN	70												t							x
									Slickensides are associated with calcite veins at 70 TCA	SS																				
			132.00			SKN			2 skarn veins, dominantly coarse Qz-Ca with coarse-euhedral Actinolite as a deep shiny green colour. Minor Py and Cp also occur within the veins. Veins occur at 132.00 m and 135.70 m.	VN	45																		
			135.70			SKN				VN	15																	
141.81	276.20	134.39				LST	DOL		Fine-grained grey to dark-grey LST alt-DOL, the protolith LST when present is filled with many stylolites around 100/m. Most of this unit has undergone extensive veining, sBx and minor cBx textures followed by subsequent carbonate and Qz infilling. The earliest recognizable phase is a sBx texture associated with white dolomite veining as well as vug and clast rimming of white dogtooth dolomite. These crystals are lined with a fine-grained black mineral in sub-mm proportions. The open spaces and vugs are filled with a grey calcite or a Ca-Qz infill +- Py, Talc. Some original LST has been quite bleached into a light-grey colour. Py occurs as small fine-grained masses associated with darker-LST portions and another Py is present in Qz-Ca veins as anhedral and coarse-grained.	BX											t		t						
									Usually weak in brecciated areas but stronger with LST-stylolites and veining.	FO	40																		
									White Ca, appears to cut most vug and BX textures, 0.2-2 cm width.	VN	35	90	2																
									Qz-Ca veining +/-Py+/- talc, fills 5 mm Vn's and often has a pink hue.	VN	70		1						t		t						
									Qz-Ca-talc, may be associated with other Qz-Ca but occurs at very different orientation, associated with bleached LST.	VN	25																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other	
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									Brittle low angle fracture vein filling with euhedral med-grained Ca, stained with an orange-rusty Fe stain, and may have Sp, Py, Cp and a silvery mineral (very fine-anhedral)	VN	0									t			Cp	t	Sp	t	
			240.59	243.70	3.11	LST	DOL		Protolith LST-DOL with dogtooth breccia and vug fills is present and visible. The overprint here is a Dolomitic medium-grained 'raw' sugar texture that preserves the original texture, non-destructive. The re-crystallization has a peach-cream colour and is associated with Sp, and trace sulphides. Small parts of this unit is overprinted by a late quartz infill.					i											Sp	t	
			243.42	262.13	18.71	LST	DOL		Protolith LST-DOL with dogtooth breccia and vug fills, stylo-mottled, and dissolutions seams are present and visible. The overprint here is a Dolomitic medium-grained 'Raw' s sugar texture that preserves the original texture, non-destructive. The re-crystallization has a peach-cream colour and is associated with Sp, and trace sulfides. The sphalerite is occurring often with quartz as well as disseminated throughout the unit has black sphalerite often in grain interstities adjacent to dolomite crystals, appears later stage. Some large 7 mm euhedral zoned sphalerite crystals occur cherry red. Small parts of this unit are overprinted by a late quartz infill. This overprint appears transitional towards dolomitization of an LST unit through slow recrystallization.					i					t					Sp	m	x
276.20	297.67	21.47				VOL	SER		Grey-brown to pale-green volcaniclastic with a strong foliation. Unit grades in and out of what appears to be a Mg pebble conglomerate with magnetic elongated clasts in a partially sericitized fine-grained foliated matrix. Sericite alteration is most pervasive at the upper and lower contacts of the unit from light-grey to a pale yellow-green. Most of the unit is slightly sericite altered with mostly a dark-grey colour intermixed with a deep-brown. The middle of the unit is very brown from extensive biotite alteration which occurs with a euhedral pyrite and overprints the volcanic and the sericite alteration. This unit also has episodic chloritic alteration and deep green bands throughout.										t					Mg	t	
									Defined by strained 'bedding' in the volcanic unit as well as the elongated conglomerate clasts.	FO	30																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									Fine-grained anhedral Py+Ch+Qz+-Tc in 5mm wide veins.	VN	60	90	0.5														
									Qz-Ca and bitumen in fibrous opening veins 1.5 cm wide.	VN	60	180	0.1														
									Qz-An-Po-Py in steep 1.5 cm veins	VN	75	170	0.2														
									Ca-Py follow FO +/-Cl in sub-cm veins.	VN	40	0	0.5														
297.67	384.66	86.99				LST			Light to dark grey, calcilic, variably strained, alternating beds of "debris flow", weakly BX LST and calcilic, variably magnetic dark grey FG VOL (possibly lime mudstone/wakestone/shale?). Debris flow beds increase in frequency and thickness with depth. Contacts between beds are generally sharp, may grade over a few cm. Py mineralization present as FG whispy bands to small, <2 cm cloud-like masses in VOL, and as FG trace disseminations to <8 mm cubes in debris flow rockin narrow, Py-Ca-Cl veinlets. Py is typically bright yellow and near crystaline in form (P3?) and associated with dark mineral bands or in matrix minerals. Dolomitization weak through out, though DOL alteration of LST increases with depth. CG hydrothermal dolomite veins prensent in interval and host talc-tremolite alteration. Ca veinlets present, most exhibiting strain with host rock. Strain fabric increases with depth.					w				TLC	t	t								x
									Foliation constant throughout where seen in VOL(mudstone?) and debris flow rock, 30 to 40 degrees TCA.	FO	35																
			340.04	340.61	0.57	SHL			Dark, calcilic, FG "shale" (lime mudstone?) with very fine grained Py present in bands/beds with few <7 mm cubic crystals throughout. Py coarsens with depth. Some weak crossbedding(?) seen in rock.	FO	40									m							x
									Qz-Ca veinlet, CG with MG dolomite bordering Qz Ca veinlet. FG whispy bands of Py present in veinlet selvage up to 5 cm from veinlet boundary.	VN	45	0								w							
									CG Ca veinlet, 1.2 cm wide, 80 degrees TCA. Crosscutting foliation in VOL, 180 degrees to foliation.	VN	80	180	2														
									Py-Cl veinlet, 1.1 cm wide, MG bright yellow Py with chlorite selvages.	VN	30	90	2						75								
									CG hydrothermal dolomite vein, parallel to FO, hosting coarse dolomite crystals. Fair talc-tremlite alteration of dolomite crystals exhibited.	VN	30	0						TLC	f								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									Qz-Ca-DOL veinlet, 5.5 cm wide, (partially dolomitized calcite/hydrothermal dolomite?) Py present as disseminations in dark, veinlet matrix minerals.	VN	30	0		m						w							
									CG Qz-hydrothermal dolomite-Ca with dark, soft clasts (soft, black, FG, mudstone?), appearing weakly vuggy. Vein hosts weak talc-tremolite alteration of Ca-Dol. Vein has minor calcilic component to composition. Brown, translucent, soft (Bi?) rims dark clasts. Py present as sub-crystaline blebs, sometimes partially infilling vugs, and overprinting Ca, between crystal faces and associated and overprinting dark clasts. Vein boundaries sinuous, steep to CA, unable to get accurate attitude measurment, (15-40 degrees).	VN	25			ms				TLC	w	w							x
384.66	413.00	28.34				LST	DOL	BX	Light to dark grey, intensely dolomitized, variably strained, rebrecciated LST with MG to CG "primary" hydrothermal dolomite present . CG recrystalized DOL evident in sunlight. Foliation is weak, defined by variably strained breccia textures. Breccia ranges from cBX to sBX textures, with a late cBX appearing most readily to rebrecciated earlier brecciation (syn-strain as some breccia elongate with FO?), and is sometimes overprinted by hydrothermal DOL. Py mineralization is variable throughout from none to weak. Where present, Py is typically bright yellow, MG sub crystalline to <2 mm cubes of "shotgun" masses to FG cloud-like masses proximal to/overprinting dark, FG minerals.					i						w			Sp	t			x
									Weak FO, defined by strained breccia clast orientation, 55 degrees TCA.	FO	50															
									White, talc-tremolite vein at 397.22 m with coarse, radiating fibrous crystal growth up to 1 cm in radius, becoming less so nearing core circumfrence where vein material becomes softer, more powdery. (tremolite to talc alteration?) White fibres in centre harder than pencil graphite.	VN	65													Tr	80	Tc	20	
									CG Qz-Ca vein, Ca exhibiting partial replacement by talc-tremolite alteration, trace silvery Py cubes present.	VN	65							TLC	w	t							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									Yellow to light grey, CG Ca vein 400.00 to 401.05 m exhibiting partial replacement of ANK/DOL, sugary to sparry in crystal habit, vein is vuggy throughout, with DOL/ANK altered Ca(?) exhibiting drusy teeth-like pyramidal teeth partially infilling vugs. Sp present as dark black to red and in some cases yellow, resinous, coarse to fine grained sub-euhedra crystals. Crystal zonation distinguished under microscope with yellowish cores becoming red on crystal faces and some red crystals becoming darke with growth, though some exhibit black and red sphalerite intergrowths. Sp present as FG red masses to <5 mm red ehedral crystals. Trace black Sp present, less so for the yellow variety. Py is present as yellow, bright sub-crystaline replacements(?) of sphalerite, limited to dark (Fe-rich) Sp. Vein wall is serpentine, attitude of vein is 15-40 degrees CA.	VN										t			Sp	f			x
									Narrow, 1-2 mm veinlets with <1 mm dolomite drusy crystals and coarse, flat to veinlet plane red Sp crystals up to 1 cm in size.	VN	25		5														
									Ca veinlet, 3 cm wide, CG, crosscutting brecciation. Fizzes readily with 10 % HCl.	VN	35		1														
									413.00 m E.O.H. The hole was ended because it was not showing any new signs of interesting mineralization and was through the fault.

COMMENTS

The hole was lost well before its targeted depth as the rods became stuck in the hole. An attempt to reduce the rods to NQ was unsuccessful and 350 feet of rods were left in the hole. (Only 6 were retrieved from the top)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								PHOTO
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	2.39	2.39				OVB																					
2.39	32.82	30.43				LST			Dark to medium grey, variably strained, FG to MG LST exhibiting variable BX and MO textures throughout, strong FO throughout, weak OX on fracture faces and narrow Ca veinlets. Variably fossiliferous throughout.							w										
			4.88	12.19	7.31	LST	FOS	MOT	Medium to dark grey, MG mottled LST, moderately strained bearing crinoid stem fragment fossils, becoming wackstone in composition. Oxidation on fracture surfaces. Core appearing blocky to competent.							w										
									Moderate foliation defined by strain fabric (bedding? 60 degrees TCA where present.	FO	60																
			12.19	14.77	12.19	LST			Light to dark grey, foliated FG lime-mudstone exhibiting sinuous, deformed banding (and dissolution?) throughout. Ca bands or veinlets are deformed parallel to the host , are vuggy and Fe-stained Ca where remaining.																	
									Foliation is variable, typically ~70 degrees, angle decreasing to 30 degrees TCA where most strongly strained/sheared.	FO	50																
			14.77	22.44	7.67	LST		BN	Medium to dark grey weakly fossiliferous lime mudstone, exhibiting strain fabric defining FO. Core is competent becoming fissile where strain is strongest. Trace crinoid stem fragments area at times obscured by the foliation. Small, <1 mm white blebs are elongated by the strain. Pinch-swell textures present around MG calcite nodules (relict FOS?).							t										
									Strong FO 35 degrees TCA.	FO	35																
			22.44	32.82	10.38	LST			FG, strained, light to dark grey LST, with large coral fossils present. Foliation increases downwards, obscuring breccia texture. Core is mottled 55 cm from the lower CN.																	
									Variable from 35-50 degrees TCA	FO	40																
32.82	58.05	25.23				VOL			Dark green to brown, FG, variably amygdaloidal VOL hosting hydrothermal Ca veinlets dispersed irregularly throughout. Core is magnetic, and non-calcareous and foliated. Weak OX occurs on fractures.							w										
									Strong FO, 35 degrees TCA, defined by banding in VOL.	FO	35																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			32.82	38.52	5.70	VOL			Dark green, banded, FG VOL, intensely chloritic hosting deformed Ca stringers to planar veinlets crosscutting FO. Trace, very fine grained Py disseminated throughout. Contacts between subunits gradational throughout.									CHL	i	t							
									Strong FO defined by banding, 35 degrees TCA	FO	35																
			37.00	38.00	1.00				Narrow Ca veinlets, <1 mm to 5 mm wide, 40-50 degrees TCA, 270 degrees to FO.	VN	45	270	4														
									Ca-Qz veinlet, 6 cm wide, coarse grained Qz and Ca with trace blebby yellow Py present in veinlet. Oriented 60 degrees TCA, 90 degrees to foliation.	VN	60	90															
			38.52	39.24	0.72	VOL		AM	Green-brown amygdaloidal, FG VOL, intensely biotite an chlorite altered (chlorite overprinting biotite?), with calcite filling the amygdules. Rock hosts trace Py in very FG disseminations.									BIO	s	t							
																		CHL	s								
									Weak FO, defined by amygdule orientation and weak bands, 40 degrees TCA.	FO	40																
									Narrow Ca veinlets, 50 degrees TCA, sub parallel to FO, around 10 degrees.	VN	50	10															
			39.24	43.75	4.51	VOL			Medium green, fine grained intensely chloritic, banded VOL, hosting hydrothermal CA veinlets exhibiting sub angular fracturing of VOL host.									CHL	i								
									Gradation increase in sericite alteration noted by a lighter green colour and softening of the core.									SER	f								
									Variably sinuous to linear, 3 mm to 8 cm wide, hydrothermal Ca veinlets, fracture the VOL and occur preferentially in the un-sericitized VOL. Veinlets oriented 25-40 degrees TCA.	VN	35																		
			43.75	45.75	2.00	VOL			Dark brown to blue-green, soft, calcite veined VOL. FO defined by veining and small elongate Ca spotting. Variably brown coloured areas are likely due to vFG biotite.	FO	40							CHL	s								
																		BIO	f								
									Thin Ca veinlets occur at several orientations, some x-cutting other Ca veinlets.	VN			15															
			45.75	50.44	4.69	VOL			Strongly foliated dark blue VOL with orange-brown Fe-alteration and fair SER alteration, following the FO. Trace Ca-veinlets, far less prevalent than in above interval.	FO	35							SER	f								
			50.44	52.73	2.29	VOL			Rounded slightly elongate clasts of dark grey rock up to 5 cm in diameter in dark grey matrix. Calcite overprinting both clasts and matrix, making them fizz moderately.																			
			51.95	53.00	1.05	VOL			Very rubbly zone with 6 cm thick Qz/Ca vein with weak oxidization. Possible FLT.							t										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			52.73	58.05	5.32	VOL	SER	CGL	Calcite rich clasts (which fizz strongly) and sericite altered clasts in a matrix of SER altered VOL. There is a greater concentration of Ca clasts. The clasts are more elongate than above CGL. Black stringers follow FO, wrapping around clasts.									SER	m								
									2 Qz/Ca veins ~ 1 cm thick, with vugs occurring in one vein.	VN	40	270															
			56.50	56.88	0.38	VOL	SER		Ca rich patches up to 12 cm thick with some DOL alteration of Ca. Irregular contact of Ca with VOL.																		
			57.63	57.85	0.22	VOL			Interval of black vFG zones ~2 cm thick interlayered with ~2 cm thick MG, sparry Ca which follows FO (or possibly original bedding?).	FO	25																
58.05	124.68	66.63				LST	MBL		Medium grey, strongly calcareous limestone with intervals of MBL alteration which decrease down-hole. Weak cBX occur throughout. Unmarbleized sections have trace Po occurring along the FO. Some fossils are visible. White FG Ca occurs in patches throughout.									MBL	w			t						
			58.05	59.00	0.95	LST	MBL	cBX	Crackle breccia with light grey MBL clasts and dark grey crackle seams, which largely follow a similar orientation. Heavily seamed areas also have FG white and black spotted patches which fizz strongly. Small light beige SER patches and stringers occur throughout.									MBL	m									
			59.57	61.65	2.08	LST			Non-marbleized, medium grey LST with orange-brown alteration on fractures and following the FO. Calcite spots and veinlets occur throughout along with patches of FG black and white Ca (fossil recrystalization?).	FO	40																
			76.00	80.25	4.25	LST			Medium grey LST with orange-brown alteration on fractures and following the FO. Calcite spots and veinlets occur throughout along with patches of FG black and white Ca. Crinoid and chain coral fossils visible throughout.	FO	40																
			77.52	77.62	0.10	LST			Chain coral, very well preserved, with relatively little deformation.																		x
			108.60	124.68	16.08	LST			Orange brown alteration following FO of medium dark grey LST is more prevalent in this interval. Darker orange-brown spots are possibly altered Py, or altered Po which is seen nearby in less altered LST.	FO	40																
			124.36	124.68	0.32	LST			LST fragments in light brown mud, possibly not from the hole.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

SAMPLES

Numbers: I075134-I075154, I075174-I075196

Total: 44

Batch: 18,19, 20

Date Sent: June 21, 22, 2010

Certificate: VA10083886, VA10083930, VA10085428

COMMENTS

364 feet 10.5 inches of plastic casing were positioned in the hole for a later gravity survey. The hole was ended because it was through the targeted oxide zone.

GEOLOGY LOG

HOLE: Rau-10-79

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	6.76	6.76				OVB			Overburden - no recovery																		
6.76	7.01	0.25				LST	OVB	cBX	White calcite with black crackle seams forming cBX.																		
7.01	25.60	18.59				LST			Medium grey, foliation defined by light grey calcite bands and spotting in darker grey mud rich layers which fizz strongly. Some layers with crinoid fossils and calcite spots (wackestone). Some alteration to medium orange-brown, very FG, soft, strongly associated with dark grey layers. Small amount of deep red very FG alteration (HEM?) in veins and on fractures. Core is very broken.	FO	55							SIL	t							
									Calcite veinlets following foliation. Some with slight vuggy texture. Up to 1 cm thick.	VT	55		1													
			17.92	25.60	7.68	LST			Silty rich LST with strong foliation. Increased alteration (15% of interval) to medium orange-brown, very FG, fizzy and soft patches, often following foliation.	FO	60															
25.60	31.55	5.95				VOL	SER		Light yellow to medium orange-brown intensely SER altered friable VOL, semi-cohesive to clay sized particles. After 31 m have black, dull to shiny alteration (SID?).	FO	55					m	t	SER	i							
									uCN sharp, without alteration of LST.	uCN																	
31.55	83.67	1.00				LST	MBL	cBX	Medium grey, with interlayered light grey-white and darker grey layers. Both fizz strongly. Dark layers thin and blurry from weak marbleization, form cBX locally. uCN rubbly, slightly oxidized.	FO	65							MBL	t							
			32.07	32.13	0.06				Very broken core, with light brown alteration/mud on surfaces. Possible fault (?)																		
			33.65	37.00	3.35	LST		cBX	Brecciated zone of LST. FG to CG calcite, possibly a vein, brecciated by a high density of dark to medium grey crackle seams. Dark grey LST is also brecciated by light grey calcite. Indistinct intervals with possible BX being overprinted. Core highly broken, with light orange alteration on fracture surfaces. Brecciated zones are slightly vuggy, and appear corroded - possibly by fluids associated with SER ALT VOL.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			37.00	49.91	12.91	LST	MBL		Medium grey fizzy LST. Interlayered light grey-white and dark grey layers following FO and undulation creating pinches and swells in white calcite layers. Dark grey seams go around MG Ca bands and nodules which have been elongated. Ca nodules are likely recrystalized fossils. Core very broken. MBL alteration weak and localized.	FO	60							MBL	w							
			49.91	63.00	13.09	LST	MBL		Intensified MBL over interval, with blurring of medium grey seams, which still pinch and swell around calcite nodules. Intervals of light pink to yellow-white, MG marble up to 20 cm thick. Interval very broken with rubble zones up to 50 cm. Medium orange-brown clay sized coating on fractures and broken surfaces, locally forming clay masses.	FO	65							MBL	ms							
			59.05	61.02	1.97	LST		cBX	Zone with dark grey crackle seams brecciating LST which has been locally dolomitized and silicified. Zones of dark grey with small light grey clasts and blebs with blurred contacts, appears to be same material forming breccia matrix. Interval is cut by vuggy Ca and a general orientation of 50-60 degrees.	VN	55			f				SIL	w							
			63.00	79.10	16.10	LST			Very broken dark grey, silt rich LST with layers of increased fossil content (wackestone). FO defined by light grey- white and dark grey layering White calcite pinches and swells, and can be blebby. Light orange brown very FG, soft, calcareous alteration occurs on fractures, coating rubble and as patches. Also forms a muddy zone 15 cm thick @ 47.50 m. Thin dark red alteration on fractures and following FO (SID?). Some zones of altered and broken core fractured along FO plane in a platy manor; may be shale rich zones or VOL interlayers (some possible SER alteration).	FO	65							SID	w							
			79.10	83.67	4.57	LST	MBL		Variably marbleized LST, medium grey with blurred grey stringers. Contains zones up to 15 cm thick of orange-brown semi-coherent clay to rubble alteration.	FO	65							MBL	f							x
			81.15	83.67	2.52	MBL			Light grey, FG to MG gradation into intensely MBL LST. The lCN with OX is sharp.	lCN																	
83.67	101.45	17.78				OX			Medium orange-brown to dark red-brown semi cohesive clay to loose rubble, with Qz as rubble in oxidized material, and comprising full sections of core up to 10 cm long.							i										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			83.67	90.70	7.03	OX	CLY		Orange red-brown clay to grit with dark purple SID sheen common. Trace Qz locally. Holds core shape but crumbles or squishes when poked. uCN has 13 cm of medium brown clay to grit with black streaks, which fizz. The rest of interval does not fizz.							i	ms										
			90.70	101.45	10.75	OX	QZ		Start of Qz rubble and cohesive core. Most Qz rich over first 3 m. Oxide in interval is medium orange-brown, clay to grit, doesn't fizz. Light orange and dark purple brown interlayers locally.							i											
			91.20	91.45	0.25				Clay is light grey, doesn't fizz, associated with quartz rubble with sugary texture.																		
101.45	110.64	9.19				LST	OX		Medium brown-grey LST with dull, uneven surfaces which appear corroded. Fizzes with 10% HCl, soft, locally oxidized to medium orangey-brown clay to grit over up to 15 cm. Red-brown oxidized Py spotting on solid core, but no fresh Py. Oxidized Py sometimes follows FO. Some Qz blebs and dark grey-black silty clasts.	FO	45					m											
									Calcite veinlets with common orientation locally altered to siderite.	VN	35						m										
									110.64 m: E.O.H. - The hole was ended because it was past the targeted oxide zone and had transitioned into LST.

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	6.50	6.50				OVB			Overburden - no recovery																		
6.50	12.00	5.50				OVB			Brown to black, earthy overburden. Some blocky core fragments present, dark grey LST and green VOL core above 11.43 m. Weak to moderate oxidation.							f										
12.00	117.93	105.93				LST			Dark grey to light grey, variably brecciated, variably strained, variably marbleized LST. Dark, FG (lime mudstone?) interbeds present, frequency of lime mudstone increasing with depth. Mudstone beds exhibiting strain/shear more readily than other subunits. Rock fizzes readily throughout with 10% HCl. Trace fossils present. Foliation variable throughout, generally defined by strain fabric.							t				t							
			12.50	15.24	2.74	LST	FOS		Light to medium grey interbedded wackestone (?) and mudstone exhibiting debris flow (rip up?) texture at top of interval. Crinoid fossils present, frequency of crinoids increases with depth. Weakly oxidized, on rock fracture faces.							w				t							x
									30 degrees TCA, defined by bedding (strain?) Soft, white clasts elongate with FO.	FO	30															
			15.24	25.45	10.21	LST	FOS		Medium to dark grey, FG fossiliferous LST hosting crinoid and coral fossils. Crinoids decrease, corals increase and rock becomes darker exhibiting more dissolution and strain moving down hole.							w										
									35 degrees TCA, defined by strain fabric (possible bedding?)	FO	35															
			24.45	31.15	6.70	LST	MBL	BX	Light to medium grey, strained, weakly marbleized LST. Strain obscures relict brecciation. Wavy dissolution textures are present exhibiting a near stylolitic appearance between lighter coloured relict breccia clasts. Strain fabric and marble alteration increases with depth, though marbleization varies slightly throughout.							t										
									Foliation is variable throughout from 10 to 40 degrees, foliation angle is lower where more marbleized occurs and grades to 40 degrees TCA where marbleization is weaker.	FO	30														
									Narrow, 1 mm Ca veinlets crosscutting but oriented parallel to the FO.	VN	70	0	3													

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			31.15	46.89	15.74	LST		BX	Dark to light grey, variably brecciated, variably strained LST, exhibiting variable dissolution textures becoming near stylolitic. Brecciation is obscured by strain, breccia clasts elongate with strain fabric. Weak OX alteration on fracture faces. LST is weakly marbleized, exhibiting a fuzzy, sucrosic recrystalization texture.							w		MBL	w								
									30 degrees TCA, defined by strained clast orientation and dissolution bands.	FO	30																
			46.89	66.27	19.38	LST	MBL		Light grey, moderately to strongly marbleized LST with dark dissolution bands. Marbleization overprints brecciation in the rock. MBL is gradational with top subunit over 90 cm, and over 50 cm to contact with lower subunit. Dissolution bands 1-2 mm wide, appear as stylolites to deformed breccia matrix, dark sinuous bands against light grey, sugary, recrystalized MBL LST.									MBL	ms								x
			46.89	57.40	10.51				Foliation is variable in subunit, varying from 5 to 30 degrees TCA, becoming closer to core axis with increasing depth.	FO	30																
			57.40	66.27	8.87				Steep, 5 to 15 degree foliation, defined by dissolution bands.	FO	10																
			66.27	76.12	9.85	LST		cBX	Dark grey, variably strained and variably brecciated LST, clasts elongate becoming obscured up hole where strain is strongest. Dissolution textures are present where strain is strong becoming near stylolitic, decreasing down hole with decreasing strain. Crackle brecciation texture increases with depth.																			
			66.27	66.70	0.43				Foliation is 10 degrees TCA nearing marbleized subunit above.	FO	10																
			66.70	75.10	8.40				FO is 40-70 degrees TCA to unfoliated with cBX	FO	50																
									Brecciated Qz-Ca veinlet @ 75.22 m, CG Qz-Ca with dark, cBX matrix. 6 cm selvage exhibiting mBX texture. Veinlet is 5 cm wide.	VN																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			76.12	90.66	14.54	LST		FG	Dark, FG calcareous lime mudstone , variably fossiliferous with frequency of fossils increasing with depth. Rock is variably sheared/strained to folded, shear increasing with depth, with bands/beds exhibiting sinuous to m-folds appearing where deformation is strongest. Sheared rock exhibiting round, Ca "eyes" with pinch/swell following foliation. Trace Py is present, dull grey in colour, in an FG nebulous mass near bottom contact @ 90.64 m replacing darker area. Trace (actinolite?) in sheared mudstone also present, small, 1 mm long narrow needle-like crystals in dark bands with no preferred orientation. Contact with lower subunit is sharp, but exhibits shearing above contact.											t							x
									Variable, 50-80 degrees TCA, angle lessening where strain/shear increases in rock from parallel bands to sinuous, folded beds.	FO	70															
									M-folds in layered lime mudstone @ 89.83 m	SH																x
			90.66	91.73	1.07	LST		CG	White to medium grey, appearing recrystalized variably to concentric semi-circles 3-5 cm wide to linear "picket fence", fibrous coarse crystals to 9 cm long canoe paddle-like in shape (fossils?) Calcareous throughout. Weak OX occurs on fracture faces. MG recrystalized matrix.						w											
									Weak FO defined by irregular bands in matrix	FO	40															
			91.73	108.22	16.49	LST	FOS	FG	Dark, fine grained, variably strained/sheared, variably fossiliferous, lime mudstone. Where most fossiliferous, rock can become crinoid stem wackestone in composition. Fossils present are crinoid stems and coral mounds. Calcareous bands exhibiting strain fabric throughout, from planar to deformed sinuous 2-4 mm wide bands without foliation to weakly brecciated mudstone (soft sediment deformation?) Trace Py mineralization, fine grained bright <mm cubes of pyrite associated with FG dark beds/bands in deformed areas.											t							
									30-80 degrees TCA, lower angle approaching core axis where strained.	FO	60															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			108.22	117.93	9.71	LST		BX	Light to dark grey, variably brecciated, variably marbleized, weakly fossiliferous cBX LST, becoming dolomite altered 20 cm above lower contact. cBX throughout, varying in intensity, cBX clasts becoming finer with depth, exhibiting a "wrinkled" appearance nearing lower CN, and appearing moderately bleached. Breccia texture becomes obscured where marble alteration is strongest. Strain exhibited by dissolution bands in moderately marbleized rock. Fossils trace throughout, most fossils present at top of subunit. Crinoids, corals and a solitary bivalve (?) present. Py present as FG, dull brassy masses (P1 or P2?) associated with deformed Ca veinlets with bright, FG <1 mm yellow Py subcrystalline cubes overprinting duller Py. Trace OX occurs on fracture surfaces.					f		t		MBL	m	t							x
									40-60 degrees TCA when present, defined by strain fabric.	FO	50																
			115.00	116.00	1.00				Narrow 2-9 mm Ca veinlet in marbleized rock	VN	30		8														
			117.00	118.00	1.00				Deformed Ca+Py veinlets, Py as FG masses in selvage to veinlet minerals, dull Py with bright overprints in vein selvage.	VN	20	190	2														
									114.55 to 116.92 m, moderately marbleized, medium grey LST, exhibiting strained BX texture and recrystalization.									MBL	m								
117.93	125.14	7.21				DOL	MX		Tiger Zone. White to medium grey, intensely DOL, MG dolomite with bands of Py giving a slightly mottled appearance. Dolomite generally coarsens with depth. Py present as FG dull bands with a common orientation 3 mm to 3 cm in width (P1?) generally lacks overprinting by bright, yellow Py. As is present variably throughout, from weak to trace mineralization, exhibiting both stability with and being replaced by Py. Trace Po present, seen replacing Py. Trace red Sp hosted in narrow Ca veinlets, most readily visible as disk-shaped crystals on fracture faces following Ca veinlets. Trace OX, some rusty Py with oxidation on some fracture surfaces.					l		t				l	t	t	Sp	t			

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

The hole was ended because the rods became stuck. The targeted depth was not reached. The hole was re-drilled as Rau-10-83

GEOLOGY LOG

HOLE: RAU-10-81

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	5.00	5.00				OVB			Overburden - no recovery																		
5.00	106.00	101.00				LST	FOS		A combination of dark to medium grey variably fossiliferous crinoid wackestones, variably strained FG lime mudstone and occasional debris-flow textures. Crinoid stem fragments and well preserved coral fossils are present. Coral walls fizz while the inner chambers are siliceous (hard and don't fizz with 20% HCl). The limestone exhibits weak "camo" mottled texture with depth, at times deformed to obscured by strain. Rock is variably strained throughout, overprinting relict breccia texture. Strain at times deforms the crinoid stem fragments, coral fossils appear more competent and less strained (due to silicification?). Oxidation is weak throughout, mainly represented on fracture faces giving them a rusty colouration.																x
									Foliation is typically 10 degrees TCA, defined by strain fabric. FO occasionally present at ~30 degrees TCA and is defined by deformed beds/bands.	FO	15															
									Qz-Ca veinlets, cross cutting strain fabric and relict sBX textures, 0.5 to 1.5 cm wide.	VN	65	180	2														
									Qz-Ca veinlets, 1 cm wide cross cutting FO and relict breccia texture.	VN	35	45	1														
			69.86	81.38	11.52	LST	FOS	BX	Light to dark grey, variably brecciated LST, weakly fossiliferous with trace coral fragments present. Rock exhibits strain, represented by elongated breccia clasts. Dissolution bands are present, becoming near-stylolitic where strain is highest.																			
									FO 50 degrees TCA, defined by elongate breccia clasts and strain fabric.	FO	50																
			81.38	92.44	11.06	LST	MBL	BX	Light to dark grey, strongly marbleized, brecciated LST exhibiting, fuzzy, sucrosic, recrystalized texture. Marbleization overprints brecciation. Dark BX matrix minerals are harder than lighter breccia clasts (possibly silicified?) with matrix becoming near dissolution like in appearance where marbleization is strongest. Breccia clasts exhibit strain, defining a weak FO.										MBL	s							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

									Weak to moderately-strong FO, defined by elongate clasts and dissolution bands at 40-50 degrees TCA.	FO	45																
			92.44	97.87	5.43	LST		BN	Medium to dark grey, banded, fine grained, weakly fossiliferous, crinoid stem rich lime-mudstone. exhibiting variable foliation throughout. uCN with FOS LST is very sharp, becoming gradationally marbleized with unit below. Crinoid stem fragments are present. Where rock exhibits strong strain, core hosts elongate, calcareous blebs (strained crinoids?).	uCN																	
									Foliation defined by strain fabric, 50 degrees TCA. Foliation is generally parallel but exhibits with a wavy appearance.	FO	50																
			97.87	106.00	8.13	LST	MBL	BX	Light to dark grey, variably brecciated, variably strained, marbleized LST. Marble alteration overprints breccia, rock exhibits sucrosic marble recrystalization. MBL increases in strength and dissolution textures increase in concentration with depth. The dissolution textures define the foliation are enhanced in zones of the strongest marbleization. Trace OX alteration occurs on fracture surfaces.							t		MBL	m								
									The foliation runs at 50 deg TCA and is defined by strained breccia clasts and dissolution bands within the marble.	FO	50																
106.00	106.31	0.31				MBL			White, "Italian" marble, sucrosic in texture, faint, dark specks in dissolution patches present, gradational contact with subunit above over 25 cm, grading from grey to light grey to white marble.	uCN						t										
									Defined by dissolution shadow bands, 50 degrees TCA.	FO	50																
106.31	117.22	10.91				DOL	MX	CG	"Tiger Zone", white to yellow to grey, CG dolomite with ankerite, hosting FG Py bands to masses, CG As crystals, and other trace sulphides. As presence and crystal size decreases with depth (replacement by Py?). Rock is blocky, with poor recovery below 112.78 m (fault?). Tiger zone below 112.78 doesn't exhibit typical "tiger" appearance, as there is a decreased As content and crystal size, Py becomes more massive and patchy and less banded. Also red Sp occurs associated with Ca veinlets.						f			TLC	t	l	m	t	Sp	t	Cp	t		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			106.31	112.68	6.37	DOL	MX	SP	"Tiger Zone", white to yellow to grey, CG sparry dolomite with ankerite, with banded Py and coarse euhedral As generally occurring stable with each other. Sparse, silty interbeds are irregularly dispersed throughout. Weak concentration of Po overprints some of the Py, which at times occasionally appears overprinting As. (Py and As, then Py overprint, then Po over Py). Weak talc-tremolite alteration of dolomite present, green, soft, radiating fibres appear replacing dolomite.						f			TLC	w	l	s	w					
									Foliation is defined by Py bands, oriented 40-50 degrees TCA.	FO	45															
									Po, Py and Ca veinlet, crosscutting Py banding, CG Po and MG Py replacing fine banded Py along vein selvages, 9 cm wide @ 111.80 m.	VN	50	180							s		ms					
			112.68	114.31	1.63	FLT			Bleached, calcareous, blocky to competent core with small amounts of fault gouge below 112.68 m, poor recovery to 114.00 m. Coarse, siderite (?) stained Ca present near fault gouge (Ca vein?) uCN sharp, 50 degrees TCA, 0 degrees to foliation. Bottom contact also sharp, with moderate BX of DOL below.	uCN	50	0					w									
			114.31	117.22	2.91	DOL	MX		White to yellow to grey, MG to CG, sparry dolomite and ankerite, intermittently appearing vuggy. Py mineralization lacking "Tiger stripe" texture, appearing as irregular masses to wavy bands to MG cubes disseminated in CG dolomite. Dolomite at times appearing mottled, hosting FG As and dull, grey-green FG Py which is overprinted by a brighter yellow Py (P2 and P3?) @ 116.89 m. Sp present in narrow Ca veinlets, Trace Bs with Py in sparry dolomite. ICN is irregular, recrystalized and deformed. FO becoming stronger approaching CN.						w					s	t		Sp	t	Bi	t	
									Weak FO defined by Py bands and masses, 50 degrees TCA lowering to 30 degrees approaching ICN.	FO	50															
									Ca-Sp veinlets, <1 mm to 6 mm wide, orangish-red fine grained sphalerite, veinlets oriented 35 degrees TCA.	VN	35		3									Sp	I

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			194.89	206.49	11.60	LST		BX	Dark grey to medium grey, mBX overprinting relict "camo" mottled area. Debris flow textures have white CG calcite matrix with trace Qz. Dolomite alteration is variable from none to moderate. FG, camo mottled clasts fizz readily with 10% HCl. Sub unit is more calcareous than the overall interval. Py present as FG rims and overprints in dark breccia clasts to small, ~4 mm bright yellow blebs.					w					t							
			199.40	207.66	8.26	LST		BX	Brecciated "camo" mottled limestone with, FG to debris-flow (small 1-2 mm angular black clasts), with white CG calcite matrix.																	
									Moderate FO, defined by breccia clasts and banding/strain in large, FG calcareous BX clasts, 50 degrees TCA.	FO	50																
			206.49	215.99	9.50	LST	DOL	BX	Dark grey, strongly DOL, variably mBX to cBX limestone, dark grey clasts with white, MG-CG breccia matrix. Weak OX alteration on fracture faces. Core competent to blocky. Blocky core exhibits oxidation on fracture faces. Brecciation becomes weaker with depth. Strain variable from none to moderate throughout.					s		w												
									Weak FO, defined by strain fabric when present, 40 degrees TCA.	FO	40																
			215.99	222.50	6.51	LST		BX	Dark to medium grey, weakly cBX, clastic "debris flow" and lime mudstone with weak DOL alteration. Strain varies throughout, generally increasing with depth. Rock is weakly fossiliferous with crinoid stem fragments in lime mudstone breccia clasts. Strain deforming "debris-flow" fabric and brecciation. BX matrix appears hydrothermal-like, CG euhedral calcite crystals growing into breccia space.					w												
									222.50 m - E.O.H. The hole was lost because the rods became stuck in the hole. The targeted depth was not reached.

SAMPLES

Numbers: I075222-I075275

Total: 54

Batch: 21, 22

Date Sent: June 23, 2010

Certificate: VA10085427, VA10087262

COMMENTS

The hole was ended because it was past the targeted depth. It has been lined with PVC pipe for later use during a downhole gravity survey.

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							PHOTO
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
0.00	4.75	4.75				OVB			Overburden - no recovery																		
4.75	6.09	1.34				TIL			Medium brown clay to grit with short sections and pebbles of unaltered LST.																		
6.09	9.95	3.86				LST	OX		Medium grey strongly fizzing, LST, highly oxidized to rubble with siderite and oxidized Py.	FO	55					m	m										
			6.09	6.83	0.74	OX	LST		Dark red to black, rubbly and corroded core, fizzes strongly. Corroded areas appear to follow FO. Very poor recovery.	FO	55					ms	ms										
			6.83	9.14	2.31	LST	OX		Relatively unoxidized, MG, medium grey LST. Dark red-brown alteration occurs on fractures, along stringers and through corroded areas of core.							m	m										
			9.14	9.95	0.81	OX	RBL		Dark red-brown to purple-black rubbly oxide with cored fragments up to 8 cm long. Fizzes strongly with acid and contains purple-black sub-euhedral spots (oxidized pyrite?).							m	ms										
9.95	56.43	46.48				DOL	MX		MG sub to euhedral dolomite and ankerite with FG MG Py in thin bands defining FO and disseminated throughout. Intervals of intense oxidation occur interfingered throughout.							ms											
			9.95	12.25	2.30	DOL	OX		Medium grey and light orange with medium brown to dark red-black clay and rubble oxide. Fizzes weakly to moderately with acid. Rubble zones occur up to 10 cm thick. Oxidized Py visible in some rubbly areas.						f	m	f										
			12.25	15.62	3.37	OX	DOL	GRT	Very rubbly, oxidized, medium orange-brown DOL/ANK, with up to 20 cm of orange-grey solid core with weak disseminated Py. Patches and stringers fizz weakly with acid. 3/4 of interval is rubble to clay while the other quarter is strongly oxidized DOL.							i	f			w							
			15.62	17.80	2.18	DOL	OX		Broken, relatively unoxidized, light yellow to grey DOL or dolomitized LST with medium red-brown grit to clay along fractures and as <10 cm intervals. Core fizzes in patches. Oxidized and unoxidized Py.						m	m	w			t							
			17.80	20.61	2.81	OX	DOL	CLY	Mainly medium red-brown to dark purple-black clay to grit that doesn't fizz. 1/4 of interval is light yellow to orange DOL/ANK with weak Py mineralization along stringers, trace overall. Calcite occurs in thin veinlets and small patches.						m	i	ms			t							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			20.61	23.20	2.59	OX	DOL		2/3 orange-brown and red-brown rubble to silt. 1/3 light yellow to light orange, non-calcareous DOL/ANK. Pyrite is fine grained and mainly oxidized.						m	i	w			t							
			23.20	25.34	2.14	DOL	OX		Solid, weakly oxidized, non-calcareous, light yellow to orange, DOL/ANK with FG brassy Py defining the FO and overprinted by CG Py.	FO	60				ms	w	t			m							
			25.34	26.20	0.86	OX	GRT		<4 cm lengths of orange-brown to dark red-brown angular rubble and grit with some semi-cohesive material that crumbles easily.							i	m										
			26.20	27.15	0.95	DOL	OX		Yellow grey to orange, non-calcareous, weakly oxidized core with unoxidized Py occurring in stringers that occur at various orientations throughout. In zones where the core is more strongly oxidized, CG brassy Py remains.						m	f	f			m							
			27.15	30.30	3.15	OX	DOL	RBL	Rubbly light orange to medium grey DOL (DOL LST??) fragments up to 12 cm long that are weakly to moderately oxidized and contain weakly to strongly oxidized FG to MG Py. This material is interfingered with highly oxidized medium orange-brown to red-brown grit to rubble, containing a high percentage of quartz rubble within. Weak cBX overprints the unit as grey irregularly cutting stringers.	cBX					s	ms												
			30.30	30.95	0.65	OX		GRT	Medium orange-brown oxidized clay to grit which holds core shape, but breaks easily.							i											
			30.95	31.80	0.85	DOL	OX	cBX	Light yellow to medium orange cBX DOL with FG-MG Py both disseminated and following seams.						w	f											
			31.80	34.50	2.70	DOL	OX		Weakly oxidized white to light yellow DOL with trace MG Py, Po, and As disseminated throughout. Fine grained red spots may be FG Sp. Up to 40 cm intervals of orange brown clay to grit, and large zones of orange brown to dark purple oxidized rubble occur within.						w	ms	w			t	t	t	Sp	t			
									Oxide clay zone with quartz rich rubble and a ~2 cm thick quartz vein at approximately 25 degrees.	VN	25																
			39.62	45.72	6.10	OX	DOL	GRT	Medium orange-brown to dark brown, clay and grit, with dark brown spots (oxidized Py) . Sections of light yellow to grey, weakly oxidized cBX DOL/ANK with trace disseminated Py.						w	s	t			t							
			45.72	48.77	3.05	OX	CLY		Dark brown with medium orange-brown clay to rubble oxide zones with most of the interval holding core shape.							i											

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			48.77	56.43	7.66	OX	CLY		Oxidized clay to rubble. First 90 cm are medium brown, grading into medium orange-brown with dark brown-yellow colouration of the surface of the core. A small amount of Qz rubble fragments occur throughout. Weak to moderately altered orange-grey DOL/ANK, dark brown spotty pits resulting from the oxidation of Py. Trace unoxidized Py also occurs throughout.						ms	s	ms			t							
56.43	76.95	20.52				LST	OX	cBX	Light orange and dark grey cBX, with dark grey stringers in high density. Clasts are light orange, some with grey centres which fizz; contact between the two is blurred (Ca altering to DOL/AK). Grades into unbrecciated light orange interval bellow. Oxidized section is dark brown, rubbly, fizzes.					m	m	m				w							x
			59.49	64.25	4.76	DOL	OX		Light orange-grey, ANK/DOL that is calcareous in patches and has a FO defined by light brown seams. Oxidized zones are medium to dark browns clay to rubble, with some Qz rubble.	FO	55				ms	s											
			64.25	65.56	1.31	OX	SLT		Chocolate brown, strongly calcareous clay to grit.							i											
			65.56	66.90	1.34	OX	LST		Dark brown, silt to sand sized calcareous interval with fragments up to 20 cm long and irregular thin Ca veinlets. The last 10 cm contains a breccia of light grey-brown subrounded clasts up to 3 cm in diameter in Ca vein matrix with trace Py.							s			t							x
			66.90	73.90	7.00	LST	cBX		Medium grey LST with medium brown crackle seams, altered to medium to dark brown rubble. FO is defined by dark grey stringers and lighter grey layers. Calcareous throughout.	FO	55					ms											
									Ca veinlets up to 2 cm thick with common orientation.	VT	70	270															
			73.90	76.95	3.05	OX	LST		Medium orange-brown to dark brown, calcareous clay to rubble with up to 15 cm long limestone fragments.							s											
76.95	85.34	8.39				MBL	OX		White to light pink FG-MG marble with dark grey stringers defining the FO and forming an irregular zone ~7 cm thick with calcite blebs inside (strained original bedding?). Patches of yellow-white talc occur within. Interval grades from white to pink, to orange-brown fairly OX, and back to white.							w											
									Ca veinlets with OX rims and trace Py.	VN	40								t								
									85.34 m E.O.H. - The hole was ended because it was into the marble and therefore past the targeted depth.																		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	1.52	1.52				OVB			Brown, earthy soil overburden with organics and OX LST rubble.																		
1.52	107.44	105.92				LST	FOS		Dark to light grey, MG-FG LST with interbeds of variably strained fossiliferous LST becoming a crinoid fragment wackstone where most strongly fossiliferous. Fossils present are crinoids (most prevalent), tabulate (honeycomb) corals and rugose coral fragments (least prevalent). Rock is variably strained throughout, becoming more intense with depth, deforming to obscuring fossils. Rock takes a banded appearance where strain is strongest. Fizze strongly with 10% HCl throughout except where tabulate coral fragment fossil chambers appear silicified.						t	t				t							x
									Strong foliation represented by banding at 10-30 degrees TCA.	FO	20																	
			12.19	16.23	4.04	LST		BX	Medium to light grey, variably strained cBX to mBX in texture, fossiliferous LST. Black cBX matrix is overprinted by white mBX (veinlets?) matrix. White mBX matrix is composed of coarse grained Ca-Ak-Qz and is preferentially oriented at 10-30 degrees TCA.							t												
									Foliation is variable from none to moderately strong. Where present, FO angle varies from 10 to 30 degrees TCA where strain fabric defines FO.	FO	20																	
									4 CG, Ca-Ak-Qz veinlets, angularly fracture host rock at 10-20 degrees TCA and oriented ~180 degrees to FO. TFO attitude difficult to obtain with no clear FO present near veinlets. Vein appears white to creamy orange in colour.	VN	15	180	1																
			16.23	49.74	33.51	LST	FOS	BN	Medium to dark grey, MG, banded, fossiliferous LST exhibiting variable strain throughout and dark interbeds of FG LST or siltstone (relict bedding?). Weak to strong strain deforms crinoid and coral fragments obliterating tabular coral textures where strongest. Weak shearing of mud-siltstone interbeds occurs where strain is strongest. Py is present near centre of a deformed tabular coral fragment as a brassy yellow, FG bleb.											t							x
									Foliation is variable, with angle TCA swallowing with increasing strain. Orientation of FO is 0 to 45 degrees TCA and is defined by banding and the orientation of elongation in deformed fossils.	FO	25																	

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			49.74	71.61	21.87	LST	MBL		Medium to dark grey, variably strained, moderate-strong marbleized LST, with relict fossils deformed to obliterated by strain and marbleization. Rock fabric alternates from near planar bands to sheared and clastic-flow-like, and exhibits a sucrosic, fuzzy recrystalization texture throughout. Where MBL alt is strongest, dark dissolution style bands occur as narrow, sinuous near stylolitic in texture. Py is present as FG disseminations of bright yellow FG crystals in clastic fabrics overprinting dark clasts. Weak OX alteration occurs throughout, but is strongest near a blocky rubbly area (fault?).							w		MBL	ms	t								
			51.80	52.60	0.80				Light to dark grey, blocky to rubbly, fractured/faulted angular blocks to subrounded limestone rubble with brown to brown-red toothy MG carbonate crystals growing the on fracture faces. The crystals fizz in acid (Fe-calcite?) Siderite alteration?	FT					m										
									Foliation is variable throughout, where strong FO is generally oriented 25 degrees TCA. Where MBL is strongest it is 40 degrees TCA and it is 5-10 degrees TCA and wavy where the strain is most intense. FO is defined by banding or strain fabric.	FO	25														
			71.61	101.59	29.98	LST	FOS	BX	Dark to medium grey, variably BX, strained FG LST interbedded with MG-CG fossiliferous LST exhibiting moderate MBL alt with depth. The LST contains 0-3% fossils up to ~30-50% (crinoid packstone) where most fossiliferous. Breccia clasts are rounded (soft sediment deformation?) and strained. Dissolution bands increase in concentration with depth and deform around tabular coral fragments. Py is trace, present as FG, wispy bright yellow bands in deformed/sheared dark LST and also overprints Ca "augens".									MBL	f	t								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			101.59	107.44	5.85	LST	MBL	BX	Light to medium grey, MG, variably BX, weak to moderately marbleized, variably brecciated, fossiliferous LST exhibiting strain and dissolution textures throughout, especially around tabular coral fragments. Tabular coral is present as large, (up to 12 cm) mounds with a "honeycomb" texture. Total concentration is approx 3-5%. Breccia matrix and clasts exhibit strain throughout. Dissolution/marble banding defines the weak FO. A fuzzy, sucrosic recrystalization texture occurs throughout. uCn gradational over 15 cm, lCN gradational over 10 cm.	CN								MBL	m									
107.44	109.66	2.22				LST	MBL	BN	Light grey, MG, sucrosic, intensely MBL LST with dark bands defining the FO. The LST transitions to a more white to white-brown colour with depth. Occasional brown bands pass through the white MBL (dirty silty interlayer?). lCN is quite sharp.									MBL	I									
									Strong foliation is defined by banding at 45 degrees TCA	FO	45																	
									1.1 cm wide CG Ca veinlet cuts the white-brown marble, at 20 degrees TCA, 0 degrees to FO.	VN	20	0	0.5															
109.66	116.89	7.23				DOL	MX		White to medium grey, MG to CG dolomite with FG bands and masses of grey-yellow Py and coarse grained As throughout. Occasional darker, FG calcareous bands occur (silt-mud interbeds?). Py also forms coarse crystals up to 1.2 cm in diameter. As occurs as up to 1.6 cm euhedral crystals, silvery grey in colour with a metallic lustre. Trace TLC alteration of dolomite to creamy green soft, fibrous patches up to 4 cm in size. Unit has typical "Tiger Zone" appearance.								TLC	t	i	s	t					x
									Defined by Py banding, 50-60 degrees TCA	FO	55																	
									2.0 cm Py-Po-Tr-Ca veinlet, cuts the dolomite at 50 degrees TCA. The MG anhedral Py with Po is replacing Py(?) that occurs alongside a green, hard (H~5-6) fibrous mineral (actinolite? tremolite?). Single veinlet of this composition occurs.	VN	50	180															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
116.89	118.42	1.53				MBL		BN	Light grey to white with increasing dark banding with depth, trace sericite alteration in interlayer within marble unit. Generally sucrosic in texture, contact with unit below gradational, over 16 cm.									SER	t								
									Strong FO defined by banding, 55 degrees TCA	FO	55																
118.42	118.42	0.00				LST	MBL	CG	Medium to dark grey, CG, strongly marbleized LST. Py is present as FG blebs to wispy bands. Ca stringers roughly follow FO.									MBL	s	t							
									ICN with volcaniclastic unit is yellow-green in colour, 6 cm thick, soft, and sericite altered.	ICN								SER	m								
									Weak FO, 50 degrees TCA, defined by weak banding (bedding?).	FO	50																
118.42	134.26	15.84				VOL		AM	Green to olive-brown, variably amygdaloidal, variabl magnetic, variably calcareous FG VOL. Rock becomes intensely SER altered with depth approaching lower unit, with biotite rimming sericite masses with large Qz-Dol blebs above lower contact.									SER	m	t							
																		BIO	w								
			119.00	121.68	2.68	VOL	AM	FG	Dark green, intensely chloritic, amygdaloidal VOL hosting Ca veinlets. Amygdules are filled with calcareous material and are on average 6 mm in diameter, but rarely range up to up to 4 cm amorphous blebs in size.									CHL	i								
									FO defined by bands and amygdule orientations, 50 degrees TCA.	FO	50																
									Narrow Ca veinlets, 2-9 mm in width, 50 degrees TCA, 0 degrees to foliation. Ca becoming coarser grained with increasing veinlet width.	VN	50	0	5														
			121.68	123.42	1.74	VOL		FG	Dark green, intensely chloritic FG VOL, lacking large amygdules as above. Rock is magnetic throughout.									CHL	i								
									Weakly defined by <mm strained "small amygdules", oriented 50 degrees TCA	FO	50																
									Narrow Ca veinlets, 2-4 mm wide, 50 degrees TCA, 0 degrees to foliation.	VN	50	0															
									1 mm wide ca veinlets, lacking a cross-cutting relationship with veinlets above. Orientation is 30 degrees TCA, 180 degrees to FO.	VN	30	180															
			123.42	127.27	3.85	VOL	AM		Dark green, intensely chloritic, variably SER altered, amygdaloidal volcaniclastic with a few intensely sericitized bands up to 21 cm wide, associated with creamy, deformed Qz-Dol/Ak veinlets. Amygdules are infilled with calcite and weakly share a common orientation.						t			Cl	i								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		SER	m								
									Weak FO defined by amygdule orientations, 45 degrees TCA.	FO	45																
									Creamy, sinuous to strings of blebs, Qz-Ak veinlets with intense SER alteration. Veinlet selvages up to 21 cm wide, parallel to FO.	VN	40	0	2														
									Irregular, Ca veinlets, ~6 mm wide, 30 degrees TCA, 290 degrees FO.	VN	30	290	1														
									Narrow 1 mm Ca veinlets, parallel to FO	VN	40	0	4														
			127.27	131.61	4.34	VOL		FG	Dark green, intensely chloritic, variably magnetic VOL lacking amygdules as above. Magnetism generally decreases with depth. Moderate SER alteration near creamy yellow Qz-Ak(Dol?) veinlet. Contact with above and below units gradational.					w				SER	m									
									Weak FO at 45 degrees TCA.	FO	45																
									Ca veinlets, parallel to FO, <1 mm to 3 mm wide, 35-50 degrees TCA, 0 degrees to FO.	VN	45	0	8														
			131.61	134.68	3.07	VOL		MO	Brown, amygdaloidal to mottled, intensely SER and BIO altered, variably magnetic VOL. Amygdules becoming large blobs of Qz-Dol, VOL exhibiting intense SER alteration with biotite rimming to replacing sericite-chlorite volcanics. Py present as FG, overprinting biotite rims and bands with a later magnetic Po overprinting the FG Py. lCN is sharp.	lCN				m				SER	i	t		t						
																		Bi	s								
134.26	270.36	136.10				LST	DOL	BX	White to medium grey, variably BX, intensely dolomitized LST that is variably strained throughout. Brecciation varies from cBX to sBX in texture. Crackle breccia varies from random cracks to a more stylolitic texture where the strain is more intense.					i														

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			138.79	147.76	8.97				From 138.79 to 147.76 m, massive pyrrhotite veins and veinlets, hosted in bleached and strongly talc altered dolomite. Po is present as wide masses up to 50 cm wide, >90% locally, to wispy bands and blebs. Py is present following Po, with bright, brassy yellow CG euhedral crystals up to 3 cm in size replacing Po. Talc alteration is associated with intense Py and spreads up to 20 cm away from it. Relict breccia texture exhibits stronger talc-alteration in breccia matrix than in clasts. Trace chlorite present. Trace bismuthanite present as coarse grained, tabular crystals, associated with Po and talc.	VN												w		i	Bs	t			
			148.04	151.75	3.71	LST	DOL	BX	White to dark grey, intensely DOL, variably strained and brecciated LST. Relict sBX is overprinted by cBX texture. The brecciation becomes finer, more random with depth.					i		w											
									Weak foliation, defined by strain in breccia, oriented 50 degrees TCA.	FO	50																
			151.75	153.29	1.54	LST	DOL		Medium grey, intensely DOL ALT LST with dark grey rectangular cBX matrix texture with narrow dark bands becoming near stylolitic in appearance. Trace OX alteration occurs on fracture faces.					i		t											
			155.23	197.79	42.56	LST	DOL	BX	White to dark grey intensely DOL LST with strong sBX texture. The unit is variably strained throughout, hosting trace FG Py disseminations within dark matrix and clast material. Generally the matrix is composed of white, FG to CG dolomite (dolomitized calcite?). Clasts are typically dark grey, sometimes weakly calcareous and exhibit a weak strain fabric as they preferentially elongate and fracture along common orientation.					i				SIL	t	t								
									Weak foliation defined by strain fabric and breccia clast orientation, 50 degrees TCA where present. FO absent in some areas of rock.	FO	50																
									Qz-Py veinlet, 50 degrees TCA, bright CG Py with CG Qz, talc and chlorite present on vein boundaries. Dolomitized LST appears bleached and fairly silicified up to 12 cm from veinlet margin.	VN	80							SIL	f	s								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			197.79	204.95	7.16	LST	DOL	FG	Dark grey, fine grained, strongly dolomitized LST, generally lacking brecciation and only weakly calcareous. A relict BX/clastic flow texture can be seen throughout and is often deformed by the strain fabric. Trace Py is present as fine grained disseminations/overprints.					s						t							
									FO is oriented 50 degrees TCA and defined by strain fabric and breccia clast orientation.	FO	50																
									Narrow DOL-Ca veinlets, 1-4 mm wide, parallel the foliation.	VN	50	0	3														
									1.9 cm wide, white, translucent Qz, oriented 55 degrees TCA, 210 degrees to FO, crosscut the DOL Ca veinlets mentioned above.	VN	55	210															
			208.45	210.22	1.77	LST	DOL	MO	Dark to medium grey, strongly dolomitized, fine grained, camo mottled limestone that reacts weakly to acid. Small Dol-Ca (dolomitized Ca?) stringers occur throughout, generally lacking a preferential orientation. Some of the stringers parallel the elongate "camo" mottled dissolution patches.					s														
									Weak FO, defined by an orientation of mottled patches at 30 degrees TCA.	FO	30																
									Sinuous, <1 mm to 2 mm wide Dol-Ca veinlets.	VN	30																
			220.83	221.34	0.51	LST	DOL	BX	White to dark grey, variably brecciated intensely dolomitized LST. Py is present as FG ~1 mm "shotgun" masses, small crystals to blebs overprinting dark BX clasts and along BX clast margins. The LST is moderately altered with a red staining (possibly Hem?) both on fractures and local pervasive patches.					i		f				ms								
									Moderate foliation, defined by breccia clast elongation and orientation at 25 degrees TCA.	FO	25																
			221.05	221.15	0.10				Moderate-strong locally pervasive OX alteration o rock.							ms											

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
			228.84	235.33	6.49	LST	DOL	FG	Dark grey, FG, strongly dolomitized LST exhibiting relict(?) clastic/breccia textures. Rock is weakly calcareous. A variably strong strain fabric is exhibited throughout. Weak OX alteration present, red-maroon staining on fracture surfaces (hematite?). Ca-Dol stringers without orientation throughout, ~1 mm wide. Calcareous "augens" present in sheared, dark grey, FG "lime mudstone" interbed exhibiting slightly curved pressure shadows at 233.75 m. Rock exhibits an intermittent mottled texture throughout. Trace halycites chain coral fossil fragments are present at 232.79 m.					s		w												x
									Foliation is defined by relict bedding(?) and strain orientation at 45 degrees TCA.	FO	45																
			237.81	259.60	21.79	LST	DOL	FG	Medium to dark grey, variably brecciated and strained, strongly dolomitized limestone exhibiting dark fine grained interbeds of "lime mudstone" and clastic "debris-flow" like rock, variably strained throughout. FG interbeds occasionally appearing mottled "camo" in texture. Brecciation is generally weak, being obscured to deformed by strain. Severa Qz blebs to sinuous stringers hosted in clastic looking interbeds. Rock becoming increasingly calcareous with depth.					s														x
									FO defined by relict bedding and strain orientation, most strong in FG rock, oriented 45 degrees TCA.	FO	45																
			259.60	270.36	10.76	LST	MBL	BN	Dark grey-green to green-brown to white, banded, intensely marbleized LST with SER and CHL altered interbeds throughout. ICN is gradational, wide marbleized bands of LST becoming narrower and less frequent with depth (MBL alt of LST increases with depth). As MBL increases and LST/MBL band width and frequency decrease, VOL interbeds become thicker and more strongly chloritic approaching VOL. SER and BIO alteration preferential to narrow VOL bands up hole. SER altered blebs with BIO rims/overprints @ 260.20 m. Volcaniclastic interbeds are weakly magnetic.								MBL	i	t							x
																		SER	s								
																		CHL	s								
									Foliation is strong, defined by banded layers and occurs at 30 degrees TCA.	FO	30																

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
270.36	282.46	12.10				VOL		BN	Dark to olive green, fine grained, variably magnetic, banded VOL with alternating dark green chloritic layers with olive green intensely sericitic layers and is weakly calcareous. The chloritic layers are variably magnetic, and preferentially host pyrite as FG disseminations to wispy bands following narrow Ca veinlets/fracture filling. The Py mineralization increases with depth to <2 mm blebs to small FG crystals and 1.2 cm masses hosted in darker non-SER altered bands. Trace fuchsite is present, <1 mm, bright green blebs within sericite bands.								CHL	i	w			Fu	t			
																		SER	s								
									Strong FO, defined by banding at 40 to 50 degrees TCA.	FO	45																	
									Narrow Ca veinlets, 30-50 degrees TCA, 0 degrees to FO, hosting FG bright yellow Py blebs, crosscutting FO.	VN	50	0	2															
									Shallow, irregular barren Ca veinlets occur at 25 deg TCA and crosscut the foliation at 270 degrees .	VN	25	270	1															
282.46	343.20	60.74				LST	DOL	BX	Dark to light grey, variably BX, moderate-strong dolomitized limestone hosting weak Py mineralization as FG, bright <2 mm crystals to coarse, ~1.2 cm cubes. Trace talc-tremolite alteration of dolomitized LST occurs intermittently throughout. the LST has brecciated, interbedded clastic "debris flow"-like material that is matrix supported and contains dark, angular <1 cm clasts to FG dark LST. cBX to mBX increases in concentration with depth, with the cBX matrix exhibiting strain variable dissolution textures throughout.					ms				TLC	t	w							
																		SER	w								
			291.48	296.04	4.56	VOL	SER	BN	Olive green, intensely SER ALT FG VOL with yellow, FG Py occurring preferentially in darker bands. Limestone interbeds finger throughout the top of interval, but decrease with depth.									SER	i			f					
									FO defined by banding, 50 degrees TCA	FO	50																
									Dol-Ca-Tc-Tr-Qz vein, CG, grey translucent dolomite with milky-grey Ca and creamy green talc-tremolite, lacking sulphide mineralization at 289.20 m.	VN	40	180															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			290.00	291.00	1.00				Dol veinlets (dolomitized Ca?), oriented 30 to 35 degrees TCA, 0.8 to 1.3 cm in width, white grey in colour. 3 per meter from 290.00 to 291.00 m.	VN	20	270	3														x
									White, translucent MG Ca occurring at 40 deg TCA, cutting the FO at 50 degrees, and crosscutting the above Dol veinlets at ~ 90 deg.	VN	40	50							t							x
									CG Qz-Ca vein, 18 cm wide, ~85 % quartz. With talc alteration (of Ca), creamy green in colour, soft, fibrous mineral. Py is hosted in vein selvage as small, FG "shotgun" masses at 305.35 m.	VN	50			t													
			306.00	307.00	1.00				Qz-Ca-Cl veinlets, CG quartz with fine to medium grained Ca. Chlorite on veinlet margins, trace FG "shotgun" Py associated with chlorite. 3 per meter from 306.00 to 307.00 m.	VN	80	270	3							t							
			319.84	340.19	20.35	LST	DOL		Light to dark grey, variably brecciated and deformed clastic, strongly DOL LST, hosting weak Py mineralization as small, FG, "shotgun" masses. The clastic LST is matrix supported, with a light grey, FG weakly calcareous matrix containing 10-25% clasts which are dark grey with an angular to tabular shape approximately 1.2 cm in size. Clastic "debris flow"-like rock is interbedded with dark grey, FG LST. Brecciation is weak throughout, variably sBX with the breccia matrix becoming sinuous in appearance. The strain fabric is variable throughout, commonly shallow TCA, wavy, with Ca/BX veinlets often oriented near 0 degrees TCA, following strain fabric.					s					w							x
									Foliation is variable in angle and strength, generally strong, 30 degrees TCA but variable. Foliation is defined by the strain fabric/relict bedding.	FO	25															
									Qz-Dol-Cl-Py vein, CG, milky to translucent white-grey Qz ~90% with MG-CG Dol (dolomitized Ca?) with FG, yellow "shotgun" Py with chlorite on vein margins. Trace Py mineralization within vein. Py defining extent of vein selvage, up to 12 cm from vein.	VN									f							
			340.19	343.20	3.01	LST	DOL	BX	Light to dark grey, strongly dolomitized, variably strained, cBX LST, with rounded and angular strained clasts. Trace "shotgun" Py occurs as FG yellow crystals overprinting and rimming dark BX clasts and matrix materials.					s					t							
									Generally 50 degrees, defined by strained BX fragments, locally 30 degrees TCA in FG, silty strained interbeds.	FO	45															

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

HOLE: Rau-10-84

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS								
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	Photo
0.00	3.05	3.05				OVB			Overburden - no recovery																		
3.05	30.34	27.29				LST			Medium grey foliated, FG, LST with fossiliferous zones and silt rich intervals. White and grey spotted MG Ca as patches and zones occur throughout and often have irregular styolitic contacts with FG LST.	FO	45															
									Ca veinlets < 2 cm thick, at various orientations to CA.	VN			3														
			5.40	6.28	0.88	LST			Light grey LST with dark grey seams with blurred contacts at irregular orientations (dissolution texture). Increased seam density at low angle TCA and following general FO orientation. The last 4 cm are cBX FG LST with medium grey crackle seams.	FO	35																
			9.11	13.35	4.24	LST			White and grey spotted MG Ca throughout interval with trace crinoid fossils and trace FG Py following FO. Contacts have FG black seams that are altered medium-orange. Outside of interval, MG patchy Ca occures but in a lower density.	FO	45										t						
			17.12	21.90	4.78	LST	SLT		Dark grey, FG, calcareous, strongly FO, and fractures LST with a dull sheen on the fractures (silt and organic rich LST). Trace crinoids occur throughout the interval.	FO	45																
			19.79	20.06	0.27	LST		CN	Light to medium grey, MG LST with white spots ~ 0.2 cm in diameter and patches/layers ~ 3 cm thick. Contacts with FG LST are sharp, follow FO, and lack dissolution seams. Clasts of silt rich LST are found near lCN	FO	45																
			21.80	22.75	0.95	LST			Light to medium grey, MG, with white spots and patches which are elongate by the FO.	FO	45																
			22.75	24.80	2.05	LST		cBX	Very fossiliferous zone, mostly composed of coral that has been locally BX by black seams which form zones up to 10 cm wide (silt and organic rich).																		
									Thin black seams define FO.	FO	40																
			24.80	26.51	1.71	LST		lCN	Dark grey, vFG LST with variably elongate ~ 5 cm zones of MG white Ca. Fractures occur along the FO. Thin Ca veinlets follow FO. lCn is gradational.	VN	40		1														
			26.51	30.32	3.81	LST			Medium to light grey, MG, moderately calcarous, fossiliferous LST with FG interbeds. The lCN brecciates FG black clasts. Thin black stringers following FO and cross-cut Ca veinlets.	FO	40																x

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			28.10	29.57	1.47	LST			Very fractured interval with preferential fracture angle following FO. Orange brown alteration occurs on FX surfaces.	FX	45																
30.34	50.31	19.97				VOL			Dark grey, FG,non-calcareous, variably SER altered VOL with intervals containing Ca filled amygdals.																		
			30.34	34.15	3.81	VOL			Dark grey, vFG VOL, with FG to 0.5 cm Ca spots along FO and associated with trace Py. The interva bevomes more Ca rich down interval.										t								x
									Ca veinlet set <0.5 cm thick.	VN	35	90															
			34.15	39.21	5.06	VOL		AM	Amygdaloidal and Ca VT rich interval. Ca veinlets follow the FO and form blebs and patches up to 7 cm thick. The lCN is gradational.	VN	40		10														
			39.21	40.61	1.40	VOL	SER	CGL	Medium to dark green-grey SER altered VOL with orange-brown iron alteration along fractures and FO planes. vFG biotite occurs in intervals <10 cm thick. Slightly elongate medium grey clasts occur throughout unit, are non calcareous, non-magnetic and are surrounded by biotite rims.								SER	ms								
			40.61	42.06	1.45	VOL			Medium grey VOL with intense clacite veining FG to MG light grey spots. Ca veinlets have varied orientations, with the majority following FO. Trace SER and weak BIO alteration overall.	VN			15					SER	t								x
																		BIO	w								
			41.57	42.06	0.49				~ 5 cm thick vein occurring at a low angle TCA, with a irregular form. The veinlet appears to have brecciated the dark grey VOL into long straight pieces.	VN																	x
			42.06	45.17	3.11	VOL	SER		Dark green-grey SER altered VOL with orange brown alteration on fractures and following FO. Core very broken with FX following FO. Trace BIO aleration. A few dark grey elongate clats occur as it transitions into the lower unit.	FO	40							SER	s								
																		BIO	t								
			45.17	47.10	1.93	VOL	CGL		Transition from dark brown-grey to medium green-grey. The interval is biotite rich at the top of interval, grading into more SER altered, less BIO near the bottom. The interval has elongate clasts of medium grey to light blue-green-grey VOL up to 5 cm wide. BIO alteration is more predominant in matrix of conglomerate, while SER predominates in clasts. Trace chlorite is associated with the Ca veinlets.	FO	45							BIO	m				Ch	t			

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
									Ca veins up to 3 cm thick, cuts FO at 100 degrees.	VN	30	100						SER	m								
			47.10	49.28	2.18	VOL			Medium blue-grey to dark grey, FG VOL with moderate SER altereation at the top, decreasing down interval.									SER	w								
									Foliation is defined by medium blue-grey and dark grey banding.	FO	45																	
			48.08	48.24	0.16				Qz vein with small vuggs, dark grey clasts and blue green (SER?) alteration on rims. Smaller veinlets and blebs with similar composition are found until 49.28 m.	VN			3														
			49.28	50.31	1.03	VOL			Medium green to brown, weakly to strongly calcareous VOL with strong SER alteration and weak BIO alteration at the top of the interval. Elongate Ca clasts occur scattered thoughout. There is a gradual transition into strong BIO alteration with calcite filled amygdules and Ca stringers in last 40 cm. The lCN with LSt is sharp.	lCN								SER	ms								
																		BIO	m								
50.31	68.94	18.63				LST	MBL		Medium to light grey weakly to intensely MBL ALT LST. The alteration occurs in zones. A cBX-like texture formed by dissolution is common in the strong to intensely MBL zones. White and dark grey spotted MG Ca occurs as small patches and layers.									MBL	m								
			50.31	52.17	1.86	LST	MBL		Intensely MBL LST interval is moderate concentraton of dissolution crackle seams.									MBL	i								
			52.17	55.48	3.31	LST			Gradational contacts into only weakly marbleized zone. The interval is very broken up. Orange browr alteration occur on fractures.									MBL	w								
			55.48	57.00	1.52	LST	MBL		Intensely to mod-strongly MBL, FG, light to medium grey LST. Black stringers follow FO, and patchy white-dark grey MG Ca patches are common.									MBL	s								
			57.00	68.94	11.94	LST	MBL		Medium grey to light grey, FG to MG LST without stringers as above. White-dark grey, MG Ca patches are smaller than in above interval. Intense to moderate-strong MBL contains dissolution seams throughout.	FO	45							MBL	s

INTERVAL			SUB-INTERVAL			LITHOLOGY			DETAILED DESCRIPTION	STRUCTURE				ALTERATION						MINERALS							Photo
																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
68.94	107.88	38.94				LST			Medium grey, FG, foliated LST with fossils (chain coral and diatoms). Dark grey stringers follow FO, and are locally altered medium orange brown. Trace disseminated Py and Po. White-dark grey mg spotted patches and layers common (may be fossils?)	FO	40									t		t					
			68.94	72.76	3.82	LST			Medium grey, FG, fossiliferous LST with strong FO at 40 deg TCA. Medium orange brown alteration coating occurs on fractures and FO planes. Trace Py and Po is disseminated throughout.										t		t					
			72.76	83.21	10.45				Increased density of white-dark grey Ca layers locally brecciating the medium grey LST. Some of the layers are offset by veinlet sets. Fossil rich areas including halysities, crinoids and other unidentified corals are cut off by darker grey layers. Trace disseminated Py and Po mineralization occurs throughout.										t		t					
									Very thin Ca veinlet set that is offset in parts showing a dexral shear direction (when core is pointed up hole).	VN	25	120														
			83.21	90.90	7.69	LST			Medium grey LST with light grey patches throughout. White- dark grey spotted Ca layers with white vertical lineations and white Ca veinlets occur throughout. Crinoids and other unidentified fossils occur weakly througout. Trace disseminated Py and Po occur throughout with Po also occuring in thin FO parallel stringers.	FO	40									t		t					x
			88.31	89.96	1.65	LST			Very broken interval with orange-brown alteration or fractured surfaces and along seams following the FO. Both the uCN and lCN's are gradational with decreasing orange alteration for approximately 1 m in either direction.																	
			90.90	98.69	7.79	LST			Medium grey, MG LST with irregularly cross cutting Ca veinlets and white to dark grey spotted layers that are slightly vein-like in appearance. Altered light green-grey to light orange-brown alteration patches, increasing down interval. The altered areas are calcareous and soft. Disseminated Py occurs at the top of the interval and likely accounts for oxidized spotting towards the end of the interval.										t							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

																		Other					Other		Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
			96.73	97.02	0.29	LST			Highly altered beige to light orange-brown zone trending ~ 30 deg TCA. It appears to be an alteration product of white-dark grey spotted Ca layer. This is followed by a blue-grey shiny layer which is most likely a VOL interbed.																		
			98.69	106.69	8.00	LST			MG, light to medium grey, fossiliferous LST with white-medium grey patches and layers throughout. Medium orange-brown alteration occurs as layers following FO and comprises approximately 10% of the interval. Small orange-brown disseminated spots may be OX Py or Po.																		
			98.69	98.76	0.07				uCN is broken and altered with Qz fragments, and SID and soft bright orange-yellow alteration thoughout.	uCN																	x
			106.00	107.88	1.88	LST	VOL		Dark grey-brown LST that is easily broken along FC plane. Small holes occurring on the surface give it a corroded appearance. Fractures are coated in a black sheen (high VOL/SLT content).																		
107.88	111.84	3.96				OX	VOL		Light orange-brown oxidized volcanic that is easily broken along the FO plane. Less altered surfaces are light green-grey with a fair sheen.	FO	45															
			108.97	111.84	2.87	VOL			Medium grey-brown, non-calcareous, increasingly competent and less altered VOL. Towards end of interval can see green-grey to orange-brown patche of alteration on FG black rock. Corroded spots and orange-brown altered calcareous rectangular spots may be broken up fossils.																	
			108.97	110.64	1.67	VOL			Very altered, friable interval of VOL, that grades into more cohesive core.																	
111.84	126.12	14.28				LST			Dark to medium grey, FG to CG, LST.																	
			111.84	113.03	1.19	LST	SIL	cBX	Dark grey, calcareous, silicified limestone, cBX by 1 mm Qz/Ca veinlets, mainly of which follow the FO. Orange brown altered layers also follow FO. Silicification occurs more intensely near the veinlets but is still fair in intensity in the unbrecciated areas.	FO	45							SIL	m								
			113.04	114.66	1.62	LST	SIL		Medium grey, MG, unfoliated, LST. SIL is moderately strong near veining. Decrease in the concentration of thin Qz/Ca veinlets but increase in the concentration of larger (~4 cm) veins that locally brecciate the unit.	VN			2					SIL	w								

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture		Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Dolomite	Ankerite	Oxidation	Siderite	Type	Intensity	Pyrite	Arsenopyrite	Pyrrhotite	Type	Intensity	Type	Intensity	
126.12	156.57	30.45				LST		RBL	Mediumg to dark grey, FG-MG, highly foliated and strained, interbedded lime-mud and clastic event beds. The fine-grained 'muddy' limestone is most pervasive and contacts with event beds are cryptic due to highly folded and sheared foliations as well a highly broken rubbly broken core. Core rubble averages 10 cm in length with flakey to clay-gouge material in cm-intervals at fracture surfaces. The foliation contains wispy and folded 1-2 cm bands of rusty-orange to red fine-grained anhedral iron-oxide staining. Fossils occur mainly in event beds but are also pervasive, including abundant star crinoids, minor Favosites (honeycomb coral) and minor Rugosan horn corals. Wisps of oxide often form within fossil fragments and are weakly correlated to event beds, possibly linked to higher porosity in protolith? Trace fine-grained pyrite red in colour from oxidation occur within the oxidized portions.												t							
									152.00-156.70 m core is much more competent is lighter grey in colour, weakly marbleized with a sinuous foliation.	lCN								MBL	w							
									Elongation and strain of foliation is parallel to folc bends and elongated clasts.	FO	65																
156.57	159.00	2.43				LST	MBL	RBL	Light grey to slightly mottled highly marbleized limestone with minor original foliation and crinoid fragments present. The uCN contains 15 cm of orange rusty mud to coherent oxide with sharp contacts. Overall unit is fairly rubbly and breaks along foliation.	uCN						i		MBL	s							x
									Foliation defined by elongatred sheared fabric.	FO	70															
									Strongly oxidized orange-rusty coloured marleized limestone with 1-5 mm cross cutting Ca veinlets.	VN	70					s

159.00	169.00	10.00				VOL			Forest green to slightly pale grey, FG-MG foliated volcaniclastic. The unit alternates between 5-20 cm intervals of lighter and darker areas due to abundance of white small elongated calcite clasts, some resemble crinoid stems and are strained. Pre-strained calcite veins are now folded and oriented along foliation, occasionally has fine-grained anhedral red specs (Sp?) and golden to dull fine mica bounding the veins. Small brown to pale red wisps occur within the volcanic. The unit is pervasively magnetic, containing fine to medium-grained anhedral magnetite crystals disseminated throughout. The deep green colour may be from chlorite alteration. The core is frequently broken along foliation with 1 mm-scale fault gouge smears on fractures.									CHL	m				Sp	t	Mg	m	x
									FG-MG elongated clasts of volcaniclastic and calcite veins as well as broken core.	FO	55																	
									Fine to medium-grained anhedral to euhedral calcite, 1 mm to 10 mm with golden dull brown mica at contacts.	VN	55	0	3												Sp	t	
169.00	173.13	4.13				VOL	CGL		Dark to pale grey magnetic conglomerate 1-4 cm long clasts that are elongated parallel to the foliation They are light to pale grey in colour with disseminated anhedral magnetite crystals throughout. The matrix is a cryptic with clastic fine to medium-grained grey magnetite rich material. The core is very broken along the foliation with 1 mm intervals of clay rich gouge common.																Mg	i	x
									The lCN gradually grades into a dark-grey fine grained clastic unit without large conglomerate clasts and significant decrease in magnetite.	LCN															Mg	w	
									Foliation is defined by elongated clasts of all sizec as well as fracturing of the core.	FO	55																
									Weak < 1mm calcire veinlets occur throughout.	VN	55	0	1
