Summary

The 3Ace Property is located in southeast Yukon Territory. The company optioned the property from Mr. Alex McMillan in 2010 and has since been the operator. The property was first staked by Hudson Bay Mining and Development in 1997. Little work has been completed on the property since Hudson Bay returned the property and it has only been since 2010 that bonanza grade gold mineralization has recognized on the property.

The 3Ace Property is located in the Selwyn Basin; a lenticular belt of sedimentary rocks that extends across the Yukon. The property is underlain by interbedded clastic and carbonate sedimentary rocks of the Hyland Group, the basal unit of the Selwyn Basin. The stratigraphic sequence is assigned to the Yusezyu and Narchilla formations; although recent regional mapping suggests a distinct package of calcareous sedimentary rocks occurrs between the two classic formations of the Hyland Group. Polyphase fold and fault systems overprint the stratigraphy, structurally preparing the rocks for later hydrothermal fluids and acting as pathways for the mineralizing fluids. Sulphide (i.e., pyrite and arsenopyrite) and associated gold mineralization occurs along late, brittle faults formed within an extensional step-over zone between two regional dextral trans-extensional faults. Mineralised hydrothermal fluids migrated through these faults during late phases of brittle fault displacement. Gold mineralization on the property is associated with extensive argillic, iron carbonate, and limonitic alteration zones that broadly overprint the stratigraphy and early structural fabrics.

Northern Tiger Resources completed a large exploration program during 2011. The program was comprised of silt sampling, soil sampling, prospecting, airborne geophysics and diamond drilling. A total of 423 silt samples were collected from all the drainages on the property. Eleven new Au anomalies were identified by this survey. The 2010 soil grids were expanded to cover the central portion of the property between the Main, Green, and Sleeping Giant zones. A total of 4295 soil samples were collected on the expanded grid. Several new Au-in-soil anomalies were identified: the Green Zone East, the newly discovered Kaiser Trend, and a prominent anomaly east of the Main Zone, at the edge of the grid. The prospecting program collected 598 rock samples across the property. A total of 26 samples returned assays greater than 1.0 g/t Au and several samples were above 10 g/t Au, including the highest grade sample of 34.2 g/t from the Sugar Bowl Prospect on the Sprogge claims. Multi-gram samples were also collected in the vicinity of several silt anomalies. The airborne geophysics survey was hampered by poor weather and strong solar magnetic activity. The most extensive dataset was collected from the northernmost portion of the property, but is poor quality. A total of 8,458 m of diamond drilling was completed on the Main, Green, and North Zones. Two holes were also drilled at the Road Showing. Anomalous gold was intersected at all the zones, but the only significant intersections were at the Main Zone. The Main Zone was extended along strike to the north by 200 m and 225 m down dip. Broad, 10 m plus, Au+arsenopyrite+pyrite mineralized zones were intersected on each drill fence and visible gold was observed in several of the holes. The highest grade sample was 106.2 g/t Au over 1.0. The full results are presented in section 13.1. The drill program verified the presence of high-grade gold at the Main Zone and demonstrated the size of the zone. The Main Zone is a high priority exploration target for the 2012 exploration season.

The 3Ace quartz claim package was grouped in September, 2011 and two claim groups were created: the North Claim Group and South Claim Group; assessment requirements on the claim groups totaled $143, 200 and $298,400, respectively. Northern Tiger Resources expended $155,152 on the North Claim Group and $1,667,043 on the South Claim Group. The total exploration expenditure prior to September 29, 2011 was $1,822,195. These expenditures are sufficient to meet the minimum required assessment and the excess expenditure allows the claims to be carried in good standing for an additional four years.

1.0 Introduction

The 3Ace Property is located in southeastern Yukon at the confluence of the Hyland and Little Hyland Rivers (Figure 1). The property was optioned from Mr. Alex McMillan in the spring of 2010. Northern Tiger Resources Inc. has operated the property since June, 2010.

In 2011 Northern Tiger Resources Inc. complete an extensive mineral exploration program designed to evaluate the extensive claim package for economic gold mineralisation. The program was comprised of regional silt sampling, soil sampling in prospective areas, prospecting, and diamond drilling. A total of 423 silt samples, 4295 soil samples, 598 rock samples were collected from the property. An additional 8,458 m of diamond drilling was completed at four previously identified zones on the property. The intention of the program was to identify new exploration targets in the region and evaluate high priority targets identified in the 2010 program, particularly the Main and Green zones.

A total exploration expenditure of $1,822,195 was incurred on the 3Ace Property in 2011. The claims were grouped into a large South Claim Group and a smaller North Claim Group to facilitate the distribution of exploration expenditures across the claim package. The exploration expenditure on the North Claim Group was $155,152 and the expenditure on the South Claim Group was $1,667,043. The exploration expenditure on both claim groups exceeds the required assessment expenditure for 2011.

The results of the 2011 exploration program and associated expenditures are presented in this report.

2.0 Disclaimer

This report is based upon information available at the time of preparation. It is believed that the information, interpretations, and estimates contained herein are reliable under the conditions and subject to the qualifications set forth. All information contained within the report has been garnered from studies prepared and written by qualified persons, as cited in the references (see Section 15).

3.0 Data Conventions and Protocols

The data presented in this report adheres to several standard geological conventions and protocols for data collection and presentation.

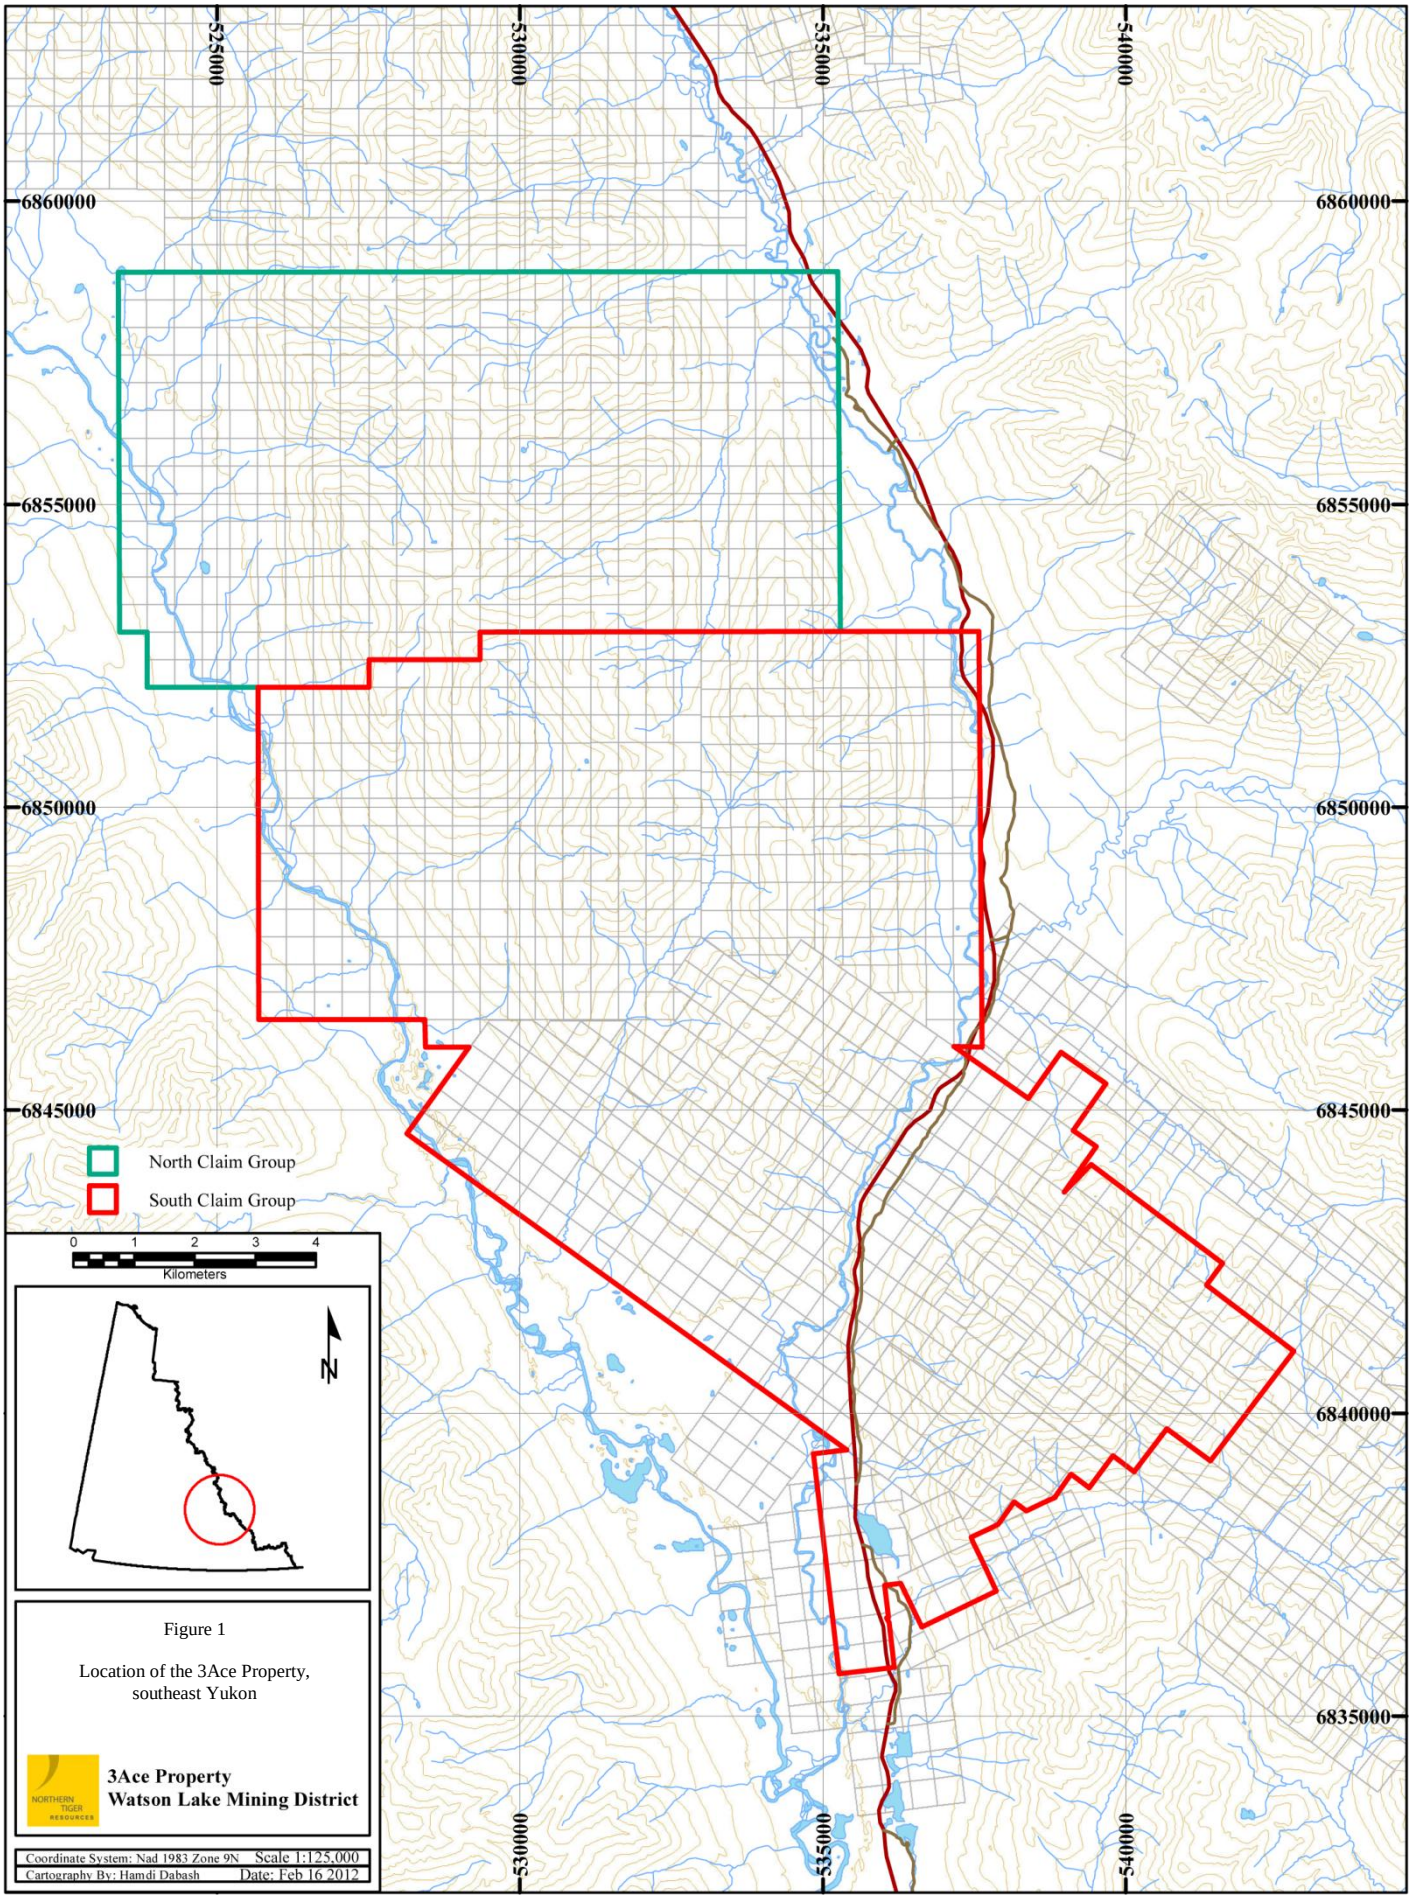

Figure 1

Location of the 3Ace Property, southeast Yukon

All of the sample co-ordinates and the most of the accompanying maps are projected using the UTM NAD83, Zone 9 projection. Any co-ordinates presented in the main body or appendices of the report will adhere to this protocol. The inset map in Figure 1 and Figure 3 are the only exceptions, because these maps show the entire Yukon Territory they are projected using the Lat\Long, WGS84 datum.

Structural data is presented in this report using the following conventions: planes are presented as strike\dip in right-hand rule notation (i.e., xxx/xx) and lines are presented as plunge-trend (i.e., xx-xxx). However, data was collected in dip-direction \dip notation. Structural measurements are recorded in the field notes and stored in the accompanying database using this alternative notation.

The magnetic declination used during this project was 23^{o} east. This declination value was obtained from the NRCAN website (i.e., http://geomag.nrcan.gc.ca/apps/mdcal-eng.php) on July 10, 2011.

It should also be noted that references to the geological time scale in this report are made in accordance to the most recent time scale published by The Geological Society of America (Walker and Geissman, 2009).

4.0 Location and Access

The 3Ace Property is located in the Selwyn Range, southwestern Yukon (Figure 1 inset). The property is located on NTS map sheet 105H/09 and 105H/16, between the Hyland and Little Hyland rivers. The central portion of the property is located approximately 187 kilometres north-northeast of Watson Lake, YT and 380 kilometres northeast of Whitehorse, YT (i.e., 533700E, 6843800N).

Access to the property is provided by the Nahanni Range Road (Rd# 10) via the Robert Campbell Highway (Rd# 4) from either Watson Lake, YT or Ross River, YT. A small roadside clearing, approximately 140 kilometres north of the Tuchitua, YT junction, is located at the eastern edge of the property, providing a convenient staging area to mobilise into the 3Ace Property. Although the property has been accessed from the road by hiking, the Little Hyland River poses a significant obstacle and hazard and helicopter support is necessary for significant exploration programs. Northern Tiger Resources mobilised field and drill crews using a helicopter based at the 3Ace Camp located at km 135 on the Nahanni Range Road. Trans-North Helicopters maintains year-

round bases in Watson Lake, YT and Ross River, YT which can be used for off-season access to the property.

Anomalous gold has been identified at four primary locations on the property: the Main Zone, Green Zone West, Sleeping Giant, and Road Showing are the four primary prospects on the 3Ace Property (Figure 2). Figure 2 also shows the locations of the Green Zone East, Main Zone West, and Kaiser Anomaly showings. These areas have been identified through prospecting and/or Au-in-soil anomalies and represent large areas prospective geology coincident with the soil anomalies. Each of the indicated showings is a high-priority exploration target for the 2012 exploration program.

5.0 Physiography

The 3Ace Property occurs in an area of moderate to rugged terrain directly north of the confluence of the Hyland and Little Hyland Rivers, with elevations ranging from 940 to 2,100 metres. The property is covered by coniferous forest to about 1,500m, and by tundra vegetation to 1,800m, with scattered taiga to 1,650m. White and black spruce forest covers lower elevations, and subalpine fir covers higher forested elevations. There are no permanent snowfields within the claim groups.

Outcrop is fairly abundant above tree line, particularly along ridge lines and areas above 1,800m in elevation. Outcrop is sparse towards the floor of the Little Hyland River valley, although scattered exposures exist along valley walls. Much of the mid to higher elevations are covered by rubblecrop and talus.

The 3Ace Property has a northern alpine climate, with cool summers and very cold winters. Daily high temperatures in July average 15^{o}C, with variation depending on elevation; daily highs in January average -20^{o}C, although temperatures as low as -50^{o}C have been recorded. Precipitation is moderate, although higher than most other areas of Yukon. Snowfall levels average about 1.5 metres by mid-March. The field season extends from late June to mid-September, although diamond drilling may continue into early winter.

6.0 Regional Geology

Located in the southeast Yukon Territory, the 3Ace Property is situated along the edge of the ancient North American continental shelf in the clastic sedimentary rocks of the Selwyn Basin (Gordey and Anderson, 1993). The Selwyn Basin is a long, narrow

belt that extends across much of the south-eastern and central portions of the Yukon. The succession of sedimentary rocks record the progressive infilling of primarily Neoproterozoic to Devonian-aged rift basins formed along the margin of Ancient North America

The oldest component of the Selwyn Basin stratigraphy is the late Neoproterozoic to Early Cambrian Hyland Group. The Hyland Group is sub-divided into the Yusezyu and Narchilla formations (Roots et al., 1966; Gordey and Anderson, 1993). The Yusezyu Formation consists of coarse-grained conglomerate and arkosic sandstone packages interbedded with thick black phyllite. Locally, green shale and ribbon-bedded limestones occur as lesser components of the formation and thick limestone units have been documented near the top of the Yusezyu Formation (Gordey and Anderson, 1993; Hart and Lewis, 2006) . The Narchilla Formation overlies the Yusezyu Formation and consists of thick sequences of maroon, green, and black shale interbedded with variable proportions of limestone and calcareous sandstone units. The contact between the formations is tectonized in the area, but regionally the stratigraphic contact is gradational (Gordey and Anderson, 1993). Sedimentary rocks similar to the Hyland Group occur along the strike-length of Ancient North America in the Yukon and British Columbia, comprising the Windermere Supergroup (Goodfellow, 2007).

Recent mapping in support of mineral exploration programs in the region has recognized that the calcareous sedimentary rocks underlying a large portion of the area, including the northern and southern claim blocks, are a regionally mappable unit that is distinct from the Yusezyu Formation (Buchanan, 2010). The unit is comprised of a succession of calcareous phyllite, calcareous arkosic sandstone, thin-bedded calcareous siltstone, ribbon-bedded limestone, thick-bedded non-calcareous quartz pebble conglomerate, and locally limestone cobble to boulder breccias. Figure 3 is a district scale geological map that depicts the currently mapped extent of this proposed unit. Colpron (2012) has mapped and described the Algae Lake formation, a lithologically similar unit in the northwestern extent of the Hyland Group that is stratigraphically between the Yusezyu and Narchilla formations. This correlation is tentative, but due to the lithological similarity and spatial relationship to Yusezyu Formation rocks it is

hypothesised that the calcareous stratigraphic succession is possibly a lateral equivalent to the Algae Lake formation (M. Colpron, P.Comm.).

This portion of the Selwyn Basin has a prolonged and complex tectonic history. The entire Selwyn Basin experienced multiple extensional events throughout the Paleozoic Era that affected Devonian and Mississippian stratigraphy in the upper portions of the basin. These early tectonic events play a significant role in the formation of several base-metal rich SEDEX deposits in the basin. During the Cretaceous the basin experienced compressional deformation that initially thrust portions of the Selwyn Basin onto the Ancient North American margin. These events are recorded as a first generation, easterly- to northeasterly-verging recumbent fold system. As the orogen progressed, through-going, crustal scale transpressional fault systems developed that define the tectonic architecture of the northern Cordillera. Two such faults are present in the vicinity of the 3Ace and Sprogge properties, the March and Hyland Valley faults (Figure 3). Displacement on both faults is interpreted to be dextral (S. Craggs, P.Comm.), which is consistent with the apparent strike separation of stratigraphy along the fault system. The March Fault (MF) is difficult to trace southeast of the Sprogge Property and it is hypothesized that displacement along this fault is transferred to the Hyland Valley Fault (HVF) through an extensional step-over zone. The Little Hyland Fault (LHF) is interpreted to be a first-order normal fault that developed to accommodate extension within the step-over zone (Figure 3). The significance of these regional scale structures is the deeply rooted nature of the Highland Valley and March faults combined with the extensional step-over zone. The crustal scale nature of these faults provides a source for mineralised hydrothermal fluids and magma. Additionally, the large extensional zone within the fault system provides abundant pathways and a mechanism for the hydrothermal fluids to ascend to upper crustal levels.

7.0 Previous Work History

Table 1 Summary of previous exploration on the 3Ace Property

Year	Company	Reference	Description
1964-1990	Norquest Joint Venture, Conquest Exploration Ltd., Vista Resource Company	Yukon MINFILE, 2010	The earliest exploration in the present 3ACE area occurred in 1964 when the Norquest Joint Venture staked the RAIN 1-6 claims about 14 kilometres southwest of the Kilometre 138 campsite. The Norquest JV conducted geological mapping in 1965. The RAIN block was restaked as the SUN 1-8 claims in 1980, and sold to Conquest Exploration Ltd. In 1987 the Vista Resource Company optioned the property, conducted surface magnetometer surveying and geological mapping, and followed with a 4-hole, 389-metre diamond drilling program targeting copper-gold skarn mineralization. These claims eventually lapsed and were subsequently staked by Hemlo Gold Mines Inc. as the Justin claims. The Justin claims are currently held by Eagle Plains Resources Corp.
1996	Hemlo Gold Mines Inc. Battle Mountain Canada Ltd.	(Bidwell and Schulze, 1996)	Geological mapping and prospecting on the Sprogge Property identified quartz-scorodite-arsenopyrite vein systems, referred to as the Meadow Zone. A 900m X 600 m Au-As-Bi soil anomaly was also delineated over the area, particularly along the southern ridge line and is identified as the Ridge Zone. A number of secondary showings were identified within the main zones, including: the Meadow, Matilda, Shela, and Swagman Zones. The mineralisation, quartz veins are hosted by arkosic and quartzose sandstones and quartz pebble conglomerate of the Neoproterozoic Hyland Group. The Hyland Gp. rocks exhibit varying intensities of iron carbonate, limonitic, and argillic hydrothermal alteration. A total of 186 rock, 716 soil, and 11 stream sediment samples were collected during the initial recconaissance program. Gold values from grab and chip samples range from below detection to 21.87 g/t. Notable gold assays from the 1996 program include 6.9 g/t over 12.0 m in outcrop, 1.89 g/t over 10 m, 6.8 g/t over 1.5 and a grab sample that assayed 21.87 g/t. Previous, unreported sampling yielded a grab sample assay of 34 g/t from the Meadow Zone (Schulze, 1998). The rock samples and Au-As-Bi soil anomaly delineate a prospective area 1.5 km long and .6 km wide.
1997	Viceroy Resources Inc.	(Schulze, 1998)	Viceroy Resources Corp. optioned the Sprogge Property from Battle Mountain Canada Limited in April, 1997. The central cirque on the Sprogge 1-74 claims is referred to as the 'Sugar Bowl' by Schulze (1998), encompassing the Meadow and Ridge zones and the subsiduary showings. The 1997 exploration program focused on the Justin (i.e., Sun Showing), Snow, and Sprogge 75 -158 quartz claims, new claims staked to form a contiguous package between the Sugar Bowl and historical Sun Showing. Significant results fom the Sprogge 1-74 claims include a grab sample from the Warren Showing which assayed 1.8 g/t Au,149 g/t Ag, and 7.7% Pb. Limited trenching at the Meadows Zone yielded chip samples with Au values ranging from below detection to 1.38 g/t. However, numerous isolated outcrop hosted veins were identified up

Table 1 Summary of previous exploration on the 3Ace Property			
Year	**Company**	**Reference**	**Description**
			to 250 m along and across strike. These occurrences yielded assays ranging from below detection to 26.47 g/t. Further prospecting was recommended for the Sprogge 1-74 claims and the Meadows Zone was considered the highest priority target for diamond drilling.
1998	Viceroy Resources Inc.	(Scott, 1999)	The 1998 exploration program covered the entire claim Sprogge and Justin claim blocks. In the area covered by the Sprogge 1-74 claims the work consisted o geological mapping, soil sampling, and prospecting. A total of 2189 soil samples and 349 chip samples were collected in the area. Gold assays for the soils ranged from below dection to 1.4 g/t and the chip samples ranged from below detection to 32.9 g/t. The most signifcant chip sample was collected at the Sheila/KD showing and had an assay of 1.83 g/t over 2.0 m. The rock samples confirmed the presence of mineralisation at most of the main showings on the property. The extensive soil survey identified a 4 km long, northwest-trending Au-in-soil anomaly along the north side of the Dayo Creek valley. Au-in-soil concentrations within the anomaly range from 30 ppb to 875 ppb. Scott (1999) recommended trenching at the Sheila/KD showing and prospecting along the length of the Dayo Creek soil anomaly. Scott (1999) noted that previous exploration results could not be repeated at the Meadows and Maltida showings, two of the most significant showings at the Sugar Bowl Prospect. However, these showings are incorrectly located on the maps provided for assessment. It appears that the exploration program may not have effectively tested the targets at the Sugar Bowl Prospect.
1998	Hudson Bay Exploration & Development Co. Ltd.	(Buchanan, 1999)	Hudson Bay staked the HIT 1-129 claims in 1997 in response anomalous Au and As in the regional stream sediment survey released by the Department of Indian Affairs. In 1998 Hudson Bay conducted a soil survey across a large portion of the HIT claims to evaluate the area and generate exploration targets. A total of 1154 geochemical samples were collected over 47.5 km of grid and traverse lines, in which preliminary results outlined 8 areas with Au values ≥100 ppb. Gold mineralization was inferred to be loosely correlated with quartzites and grits, not shales and carbonates. Recommendations were made to complete a detailed geological and structural map across known mineralized areas, additional geochemistry to enlarge or close off existing anomalies, conduct geophysical surveys (IP or Mag) over areas of known mineralization, and to trench and sample existing targets and determined source of gold mineralization. AlexMacMillan staked the 3ACE 1-83 claims directly to the south in August to September 1998, and optioned them to Hudson Bay. Hudson Bay also staked the HAB 1-113 and HAT 1-20 claims to the northwest. The HIT, HAT, HAB, and 3ACE claims eventually formed a contiguous claim group between the Nahanni Range Road and the northern most HAT claims.

Table 1 Summary of previous exploration on the 3Ace Property			
Year	**Company**	**Reference**	**Description**
1999	Nova Gold Resources Ltd.	(Schulze and Johnson, 2000)	A small exploration program was completed on the Sprogge and Justin claims in 1999. A total of 13 rock samples were collected from the Sugar Bowl Prospect on the Sprogge 1-74 claims. The sampling focused on the Ridge showing, along the top of the Sugar Bowl cirques headwall. This zone of strongly oxidized quartz pebble conglomerate yielded gold concentrations ranging from below detection to 6.79 g/t. Although the Dayo soil anomaly is discussed by Schulze and Johnson (1999) it does not appear to have been evaluated by rock samples. Further exploration was recommended for 2000, including surface geochemical surveys and diamond drilling. Five to eight drillholes were recommended, but no specific targets were presented by the authors. It is unclear if the drilling was recommended for the Justin or Sprogge claims, or both prospects.
1999	Hudson Bay Exploration & Development Co. Ltd.	(Buchanan, 2000b; Buchanan, 2000a; Buchanan, 2000c)	A soil geochemistry and aeromagnetic survey (in conjunction with their HIT claims) was conducted over much of the 3Ace claims during the 1999 exploration program. A total of 653 soil samples were taken, which followed up anomalous gold and arsenic values in soils. Results from the geochemical survey indicated several strong gold-in soil anomalies throughout the property. Four of these anomalies were selected for a 4-hole, 600.1 metres diamond drill program. One, targeting the northernmost anomaly, returned a value of 4.506 g/t gold over 1.5m from a siltstone-shale layer overlying a large unit of greywacke to conglomerate, the latter returning anomalous gold and arsenic values. No significant values were returned from the other three holes. Two strong gold + arsenic ± lead values were also found in soil occurring in the northern portions of the claims but appear to close off in the south, and were heavily correlated with the aeromagnetic survey results. Both anomalies have gold and arsenic values up to 200 ppb Au and 500 ppm As. It was recommended that a detailed geological and structural map be completed around the areas of the soil anomalies, additional sampling (rock and more soil) be completed in areas of thinner overburden, and to trench/ sample existing targets to determine the source of gold and arsenic. In 2000, Hudson Bay returned the 3Ace property to Alex McMillan.
2000	Nova Gold Resources Ltd. Kennecott Exploration	(Brownlee and Johnson, 2001)	A four hole diamond drill program, totalling 776m was completed at the Sugar Bowl Zone. The drill holes intersected zones of strong argillic alteration, silicification, and disseminated sulphide mineralisation (py+aspy+po), but no significant Au-mineralisation. Au concentrations in the four drill holes ranged from below detection to 140 ppb. Persistent early season snowfall hampered efforts to drill the prinicple, higher elevation targets at the Sugar Bowl Zone. Brownlee and Johnson (1999) report that these targets were not adequately tested by the drill program and unequivocally recomment further exploration on the Sprogge Property.

Table 1 Summary of previous exploration on the 3Ace Property			
Year	**Company**	**Reference**	**Description**
2001	Alex McMillan Exploration	(McMillan, 2001)	The 2001 summer field program carried out a geochemical soil survey and prospecting program that followed up the 1999 work in order to provide some fill to the soil-sampling grid yielding anomalous gold and arsenic values. A total of 153 soil samples and 5 rock samples were collected from various outcrops within the claims, including one from a trench adjacent to Nahanni Range road. Results from the soil geochemical survey provided further support that gold anomalies occur in the north western portion of the 3Ace claims, and they close off towards the south as indicated by Hudson Bay in 1999. Rock samples yielded assay values ranging from 6-4610 ppb Au at various locations on the 3Ace claim blocks. The highest value of gold at 4.6 g/ t was obtained from a quartz pebble chert conglomerate underlain by limestone and shale outcrop in approximately 2 km NW of the Road Showing, across the Little Hyland River. This sample was located 690 m southeast of the eventual Main Zone discovery outcrop. The trench sample consisted of a quartz pebble chert conglomerate underlain by limestone and shale, with assay values of 39.7 g/ t Ag and 7.81 g/t Au. Although this one trench-rock sample yielded silver values, no soil samples were assayed for silver, and therefore no Ag, Pb, or Zn anomalies were detected. Further recommendations were made to expand soil and rock sampling to the east, because none had been completed by either Hudson Bay or Alex McMillan.
2003-2004	Alex McMillan Exploration and ATAC Resources Ltd.	(McMillan, 2005)	The property was optioned to ATAC Resources in 2003 and a program of geological mapping, prospecting and rock sampling was completed on the Road Showing. Alex McMillan discovered significant gold-arsenic mineralization along the Nahanni Range Road while prospecting and soil sampling between 2003 and 2004. Grab samples from a small trench returned values of 33.90 g/t gold and 30.5 g/mt Ag at the Road Showing. A chip sample assayed 4.00 g/t Au, >100, 000 ppm As, and 1820 ppm Pb. Overall the trench yielded several pieces of rusty weathering massive and semi massive arsenopyrite as well as quartz fragments and lenses, for a combined total width of ~15 cm. Other significant results in the vicinity of the Road Showing trench include grab samples of 2.59 g/t Au and 6.81 g/t Au. A northwest striking quartz vein, 4 m long by 1.25 m wide was discovered 2 km northwest of the Road Showing, across the Little Hyland River. Maximum assay value received from a grab sample in 2003 had values of 5401 g/t Au and 355 g/t Ag. This is the Main Zone discovery outcrop.
2005	North American Tungsten	(Casselman, 2005)	In Feb of 2005, the 3ACE claims were optioned to North American Tungsten Ltd. under a 4 year option to purchase agreement. Aurora Geosciences Ltd completed HLEM and gorund magentic geophysical surveys and collected 711 soil samples on the Main Grid. Three rock samples were also collected from the Road Showing

Table 1 Summary of previous exploration on the 3Ace Property			
Year	**Company**	**Reference**	**Description**
			Trench. The gold assays were 6.81 g/t Au, 3.37 g/t Au, and 3.64 g/t Au and >10% As. Soil samples collected on the main grid at the Road Showing produced scattered Au and As anomalies. However a small grid (i.e., Grid C) on the southeast flank of the ridge NE of the river returned a northwest trending Au-in-soil anomaly. The geophysical surveys did identify distinct geophysical anomalies at th Road Showing or Grid C. Aurora Geosciences recommended trenching at Grid C, an IP survey at the Road Showing, and two, 150 m long drillholes to test the Road Showing at depth.
2010	Northern Tiger Resources Ltd.	(Schulze and Buchanan, 2010)	In April 2010, NTR acquired an option to attain 100% interest from Alex McMillan on the 3Ace property, at which time the property was expanded to a total of 293 claims covering 6153 hectares. Due diligence sampling returned Au values ranging from 83.58 g/t to 4259.31 g/t. A surface exploration program focused primarily, but was not limited to, the southern portion of the claim block. The surface exploration program consisted of geological, structural mapping, silt sampling, and systematic soil sampling at the Main, North, and Green zones. Prospecting in the vicinity of historical soil anomalies identified two new zones: The Sleeping Giant Zone, ~1.2 km east of the Main Zone, and the Green Zone/ Green Zone East, ~2.0 km north of the Main Zone. Chip sampling of the discovery outcrop at the Main Zone returned gold values ranging from 64.6 g/t over 1.0 m to 795.9 g/t over 1.1 m. The zone was sampled for 50 m along strike to the north. Notable results from these chip samples include several samples greater than 2.0 g/t Au, including bonanza grade samples of 30.2 g/t Au, 38.1 g/t Au, and 181.1 g/t Au over 1.0 m. Ag and As were common accessory elements across the zone. Surface mapping at the Main Zone demonstrated the presence of a large quartz vein system (i.e., a 50 m strike length and 25 m width) with abundant visible gold, arsenopyrite, silver, and pyrite. Surface exploration carried out at the Green Zone East revealed a 450 m E-W trending horizon of auriferous altered coarse clastic sediments directly south of the interpreted trace of the thrust fault. A rock sample collected from this zone returned a gold assay of 66.5 g/t in the talus slope below a large quartz vein The Sleeping Giant Zone is comprised of N-S trending Au and As bearing quartz veins hosted by coarse clastic rocks of the Yusezyu Fm. Notable au assays from the extensive quartz vein exposure include: 43.67 g/t Au and 82.4 g/t Au. Across the zone 21 of 49 samples returned Au values exceeding 1.0 g/t Au and 9 samples exceeded 10 g/t Au. Based on the results of the 2011 surface exploration program, a property wide soil survey, chip sampling at the newly discovered zones, and induced polarization (ie. Resistivity) to identify structures were recommended for the property. Reconnaissance-style geological

			mapping and stream silt sampling was recommended to cover the expanded claim block to the north of the Green Zone.
2010	Northern Tiger Resources Ltd.	NTR Press Releases 2010/11/04 and 2010/11/25	In the fall of 2010, diamond drilling commenced at the Main and Sleeping Giant zones. Three holes were drilled at the Main Zone and six holes were drilled at the Sleeping Giant Zone, for a total of 1241 m. The Sleeping Giant drillholes intersected quartz veins, but did not identify the subsurface extension of the Au mineralisation observed in outcrop. The best intersections at the Sleeping Giant Zone was 1.35 g/t Au over 6.5, including 5.05 g/t Au over 1.0 m and 1.51 g/t Au over 11.9 m in 3A-10-04. The Main Zone holes intersected broad, strongly altered and brecciated quartz pebble conglomerate and phyllite. Quartz veins with arsenopyrite, pyrite and visible gold were abundant. The highlights from these holes were 4.3 g/t Au over 30.3 m in 3A-10-01, 14.8 g/t Au over 11 m, including 145.2 g/t over 1.05 m. The success of the 2010 drill program initiated an large, multi-million dollar exploration program for 2011.

8.0 2011 Claim Status and Property Expenditures

The 3Ace Property is comprised of 1105 contiguous quartz claims in the southeast Yukon (see Pocket Maps). Grey shading on the claim map indicates which individual claims were worked in 2011. The extent of the property is covered by NTS mapsheets 105H09 and 105H16, a total area of 225 km^2. Assessment requirements for the claim package in 2011 were $110,500. An additional expenditure of $331,500, for a total of $442,000, will cover assessment each claim for an additional four years.

On September 29, 2011 the certificate of work was filed and an application was submitted to group the claims into two large groups (Figure 4 and see Pocket Maps). The assigned grouping numbers are currently unavailable, for the purposes of this report and are referred to as the north and south claim groups. Grouping claims on the expansive 3Ace Property will allow for more effective distribution of exploration expenditures and work programs.

The north claim group is comprised of 359 contiguous claims, which cover an area of 75 km^2. Table 2 lists the sequences of individual quartz claims, claim owner, and the current operator. A series of newly identified silt and prospecting targets are located within the north claim group and it is considered highly prospective for mineral exploration.

The south claim group is comprised of 746 contiguous claims and covers 151 km^2. Table 3 lists the sequences of individual quartz claims, claim owner, and the current operator. As the larger of the two claim groups, the southern claim group encompasses the known Au prospects on the property, including the Main Zone, Green Zone, and Sprogge Property.

Expenditures incurred on the 3Ace Property up to September 29, 2011 totals $1,822,195. The mineral exploration expenditures being applied to the 3Ace Property for assessment requirements are presented in Table 4. The expenditures are divided between the north and south claim groups. The north claim group required expenditures totalling $143,200 to meet the assessment requirements. Geochemical and airborne geophysical surveys across the claim group required an expenditure of $155,152, exceeding the assessment requirements. On the south claim group $1,667,043 was expended on geochemical surveys, prospecting, and diamond drilling, exceeding the $298,400 assessment requirement. The mineral exploration expenditures within both claim groups exceed the minimum assessment requirements and each quartz claim is in good standing for an additional four years.

9.0 2011 Program Summary

Northern Tiger Resources completed an extensive and multi-fauceted exploration program on the 3Ace Property in 2001. The work included property wide geochemical surveys (i.e., silt and soil sampling), prospecting, and diamond drilling. In addition to specific exploration work Northern Tiger Resources also completed a series infrastructure

Note: Drillholes 3A-11-033, 034, 035, 3ANZ-11-001, 002, and 3ARS-11-001, 002 are not included in the 2011 assessment expenditures, as the cost was incurred after September 29, 2011. However, the data is included in this report in order to provide a complete dataset.

projects that include: construction of a 45-person camp at km134 of the Nahanni Range Road and an access trail to the main exploration areas. The 3Ace exploration program was completed between June 15, 2011 to October 25, 2011 and employed up to 64 full-time and contract employees (Appendix A).

The program successfully identified new exploration targets across the entire property and expanded the strike- and dip-extent of known Au-mineralisation at the Main Zone. Limited drill testing of targets at Green Zone, North Zone, and Road Showing did not identify significant widths of Au-mineralisation, but the presence of alteration and indicator minerals (e.g., arsenopryite, pyrite, iron carbonate alteration, and anomalous gold concentrations) at each of the zones suggests that these targets are prospective for Au-mineralisation. Regional soil sampling delineated two new Au-in-soil anomalies: the Kaiser Anomaly, a northwesterly trending extension of the Main Zone West, and an extensive anomaly southeast of the Main Zone (see Section 10.2). Northern Tiger Resources remains optimistic that, based on surface rock and soil samples, the potential for significant gold mineralization remains at these early stage exploration targets.

All of the geochemistry samples were analysed by Inspectorate Exploration & Mining Services Ltd. of Vancouver, BC (Inspectorate). Samples were shipped from the 3Ace camp to Inspectorate's prep lab in Whitehorse, YT; where the samples were processed for analysis in Vancouver, BC. Detailed descriptions of the sample preparation

and analytical techniques used for the silt, soil, rock, and core samples are presented in Appendix C (see Volume 2). The signed geochemistry certificates are presented in Appendix F (see volumes 5, 6, 7, 8, 9, and 10).

The results of the 2011 3Ace Property exploration program are discussed in detail in Sections 10.0 to 15.0.

10.0 Geochemical Surveys

Silt and soil geochemical surveys were conducted on the 3Ace property from July 26 through September 23, 2011. Silt sampling was completed along drainages across the entire property to identify new targets following an extensive claim-staking program conducted for Northern Tiger in the fall of 2010. The soil geochemical survey expanded two existing soil grids established during the 2010 surface exploration program. Details on the 2010 program are provided in Northern Tiger's 2010 assessment report on the 3Ace property (Schulze and Buchanan, 2010).

10.1 2011 Silt Survey

In September through November of 2010, an additional 674 claims were staked to expand the 3Ace property following encouraging results from rock and soil samples taken during the summer exploration program (Schulze and Buchanan, 2010). Four hundred and twenty-three (423) silt samples were collected from July 11th through July 25th, 2011 as part of a reconnaissance program to identify new areas of interest across the extensive land package. Creeks bearing multiple tributaries were sampled only at drainage junctions while those drainages lacking tributaries had stream sediments taken at 200-metre spacing.

The 2011 silt survey yielded encouraging results with Au values up to 0.113 ppm. As expected, all of the streams draining known zones with high Au-in-soil values returned anomalous Au in silt samples as well with values ranging from <0.005 to 0.112 ppm (see Pocket Maps). Several creeks in newly acquired areas to the north also had consistently anomalous Au in stream sediments, particularly those draining the western part of the property. Almost every drainage sampled returned at least one Au value greater than the 80th percentile range (>0.025ppm).

In addition to anomalous Au results, several drainages returned assay values elevated with a different suite of elements including copper (Cu), cobalt (Co), manganese

(Mn), zinc (Zn) and, to a lesser extent, tin (Sn) and tungsten (W). This base metal signature is most notable in 2 creeks sampled on the western side of the Hyland River and a creek draining the northwestern part of the property (see Pocket Maps). Silt samples in these three drainages returned assay values ranging from 21.1 to 263.5 ppm Cu, 8 to 146.4 ppm Co, 257 to >10,000 ppm Mn and 58 to 6,269 ppm Zn. It should be noted that although Sn (0.6-1.2 ppm) and W (0.19-3.5 ppm) values are elevated in the 2 creeks west of the Hyland River relative to elsewhere on the property, the values would not be considered extremely anomalous. Drainages in the Sprogge area also tend to have a base metal component, but include slightly elevated levels of lead (Pb, up to 106.5 ppm), antimony (Sb, up to 2.3 ppm) and locally silver (Ag, up to 0.65 ppm). Creeks yielding consistently anomalous base metal values generally have fewer samples containing significant amounts of Au coupled with lower Au values overall. However, one creek draining the mid-western part of 3Ace returned high Au in addition to Cu, moderate Mn, and weakly-elevated Ag and Pb values.

Given the successful correlation between known Au zones on the property with anomalous Au values in streams draining those areas, silt sampling is considered a valuable exploration tool on the 3Ace property. Prospectors were sent to several creeks following the return of anomalous silt assays, consistently returning with sulphide mineralized rocks, which returned high arsenic (As), Cu and Au assay values (see Section 11). The stream sediment program identified several new gold and base metal targets on the property that still require follow-up. Prospected targets that generated positive results in 2011 should be prioritized for detailed mapping and soil sampling in 2012 to identify additional mineralized zones on the property.

10.2 2011 Soil Survey

Northern Tiger completed a regional B-horizon soil survey, encompassing the two 2010 soil grids. The 2011 grid was sampled at 25 meter spacing on lines spaced 100 m apart in order to infill un-sampled areas between the 2010 soil grids. The line spacing was reduced to 50 m in areas that were considered highly prospective targets (i.e., Green Zone and Green Zone East). The first survey was conducted from July 26th to September 7th with 3562 samples collected. A second survey, conducted September 13-23 by a 4-

person crew from All-In Exploration Services, collected an additional 732 samples (see Pocket Maps) for a total of 4294 soils taken in 2011.

Geochemical analysis of the 2011 soil samples outlined four new areas of interest: the Kaiser Trend, the Green Zone East, extension of the Main Zone West Au zones, and a partially delineated soil anomaly along the edge of the grid, east of the Main Zone. The Kaiser Trend combined parts of two 2010 anomalous Au-in-rock/soil zones, the Hoito showing and the northwestern part of the Main Zone West, with new anomalous areas to the southeast outlined by the 2011 soil survey. This northwest-southeast oriented trend yields Au values up to 2.0 ppm. The modified Green Zone East area shows the apparent association between high Au-in-soil values (up to 1.5 ppm) and a bedded sandstone unit existing to the north and south of the major East-West Green Zone thrust fault. This possible correlation between lithology and Au provides a valuable targeting tool that can be used elsewhere on the property. Discoveries in Green Zone East will also assist in constraining mineralization in the Green Zone West, which is largely talus-covered with much less in situ exposure. The Green Zone East soil anomaly remains open to the east. Additional areas of anomalous Au extending to the southeast and northeast of the Main Zone, towards the Sleeping Giant Zone, were identified and remain open as well. The coincidence of anomalous gold in 2010 rock samples with 2011 soil anomalies demonstrates that B-horizon soil samples are an effect technique for generating new targets on the 3Ace project.

The soil survey identified other anomalous elements including arsenic (As), lead (Pb) and silver (Ag) that correlate to anomalous Au samples. The Kaiser Trend yielded anomalous soil results for Ag (up to 2.3 ppm), As (up to 8,396 ppm) and Pb (up to 7,388 ppm), as did Green Zone East with up to 12.1 ppm, 10,000 ppm, and 2,833 ppm respectively. Soil samples which exceed the 90th percentile in Au, As, and Ag delineate an anomaly that appears to from a ‘ring’There is no direct correlation of individual samples for Au:As, Au:Ag, or Ag:As, but there is a definite trend with high Ag and As values occurring where soils also have anomalous Au within this ring-shaped area.

Soil samples with anomalous Au values also tend to have the highest relative antimony (Sb), Pb, and tungsten (W) values, although there is again no direct single-element correlation with Au. Some negative correlations emerged when Au was

compared with cobalt (Co), copper (Cu) and manganese (Mn). Soils yielding anomalous Co and Cu values tend to rim the regional ring-shaped area of anomalous Au, particularly in Green Zone East with Co-Cu anomalies bounding the northern edge of the Au zone. Co and Cu values tend to be particularly low in proximity to the east-west-trending Green Zone Fault. The negative correlation of Mn and Au is more distinct, showing low Mn in samples with high Au results while noticeably higher Mn values occur where soils yielded low Au values across the entire grid.

Further geochemical analysis of the soil assays should be conducted to determine possible multi-element associations with Au. Defining a distinct element suite that could be correlated to known Au zones would provide a more effective targeting method and allow for the use of analytical tools, such as an XRF machine, to identify potential targets while still in the field. Additional soil sampling should be conducted in 2012 to complete the grid across the Sleeping Giant Zone as well as define the eastern extent of anomalous samples at Green Zone East. Targeted recon soil grids across areas proximal to anomalous silt samples as well as infill of historical soil grids on the Sprogge property should also be incorporated into the 2012 soil survey. 2011 soil anomalies, including the Kaiser Trend and prospective areas identified between the North Zone and Green Zone East, require follow-up prospecting and mapping to determine their potential as future drill targets.

11.0 Regional Prospecting

A team of three prospectors was used to evaluate large, under-explored portions of the property and initial follow-up work on the anomalous silt samples. The team was very prolific, collecting a total of 598 rock samples from across the property (see Pocket Maps). Aside from collecting mineralised rocks, the prospecting crew was adept at following alteration zone and finding prospective outcrops within the zones, particularly on the Sprogge Claims (see Pocket Maps).

Gold assay values range from <0.5 g/t Au to 34.2 g/t Au. A small subset of five samples had copper concentrations that range from 0.21% Cu to 2.9% Cu. A total of 96 samples exceeded 0.2 g/t gold. This subset of samples was concentrated in three main areas: Sprogge, Kaiser Trend, and Hat. Table 5 summarises a subset of 25 samples (i.e., 4% of the samples collected) with Au concentrations greater than 1.0 g/t, the best rock

samples of the program. The highest grade sample collected during the program was 34.2 g/t Au from the Sugar Bowl Prospect on the Sprogge claims. The highest grade sample from the 3Ace Property was 11.2 g/t Au, located in the central portion of the Kaiser Trend. West of the Little Hyland River Au mineralisation is associated with a small suite of elements that includes: As+Ag+Fe. On the east side of the river, at Sprogge, the samples are characterised by an suite of elements that includes: Au+As+Ag+Bi+Cu+Pb. The elemental relationships are distinct enough that the source of float samples in the valleys should be identifiable from its geochemical fingerprint.

Prospecting on the Sprogge claims was intended to verify historical work. The initial phase of work focused on the known showings to confirm that gold mineralisation and alteration was widespread in this area. Samples collected at Sprogge included 34.2 g/t Au, 17.9 g/t Au, and three samples around 11 g/t Au (see Table 5). However, the highlight of prospecting at Sprogge was the verification of a broad, approximately 600 m wide by 4 km long zone of limonite and iron carbonate alteration that corresponds to the Dayo Anomaly (Scott, 1999; Schulze and Johnson, 2000). A newly discovered outcrop at the south end of the Dayo Anomaly returned gold values of 1.0 g/t Au and 0.6 g/t, samples 20738 and 21129 respectively. This is an important exploration result and highlights the potential for zones of gold mineralisation within the large, relatively untested, Dayo Anomaly.

The Hat Zone, nine kilometres northwest of the Green Zone, is an area highlighted as a prominent silt anomaly. Five rock samples collect from the Hat Zone area returned Au concentrations greater than 1.0 g/t Au. The assays range from 1.05 g/t Au to 3.26 g/t Au. Hudson Bay had a small soil grid with a Au-in-soil anomaly and this subset of samples verifies the presence of outcrop hosted gold mineralisation in the vicinity of the soil anomaly. Malachite staining was also found in a boulder talus slope in the Hat area, but an outcrop source was never discovered. Sample 20416 from this area returned a Cu assay of 0.21%

A total of seven samples collected from the Main Zone West and Kaiser trends returned assays greater than 1.0 g/t Au. This result is significant due to the extensive alpine meadow and boreal forest that obscures the bedrock in this area. The samples range from 1.08 g/t to 11.2 g/t Au (Table 5) and were predominantly collected from

bedrock hosted quartz veins. All of the samples were taken from within the 2.5 km long soil anomaly that delineates these two trends. Although these prospecting results are very good and indicate bedrock hosted mineralisation is present within the soil anomalies, there is not much more outcrop to aid in pin-pointing a new gold zone. It is hoped that utilising a reverse circulation drill rig will economically help identify the elusive mineralised zones within the Kaiser Trend.

Table 5 Geochemical summary of rock samples with Au values >1.0 g/t

A subset of copper values is distributed across the property. The southernmost sample, 20105, was a cobble size rock collected on a talus slope. This sample had a Cu concentration of 0.53%. Two samples were collected west of the Green Zone, 20706 and 20841, and returned a Cu concentration of 0.31% and 0.29%, respectively. Sample 20416, in the Hat area, had a Cu concentration of 0.21%. However, the highest Cu assay is sample 21060, which returned a Cu value of 2.89%. This sample is located near the northeastern corner of the North Claim Group. The presence of significant Cu

mineralisation was unexpected on the 3Ace Property. Since most the samples were taken during reconnaissance prospecting trips, there is very little geological context for this mineralisation. However, further evaluation of these geochemical exploration targets is planned for the 2012 field season.

12.0 Geophysical Surveys

12.1 Airborne Magnetic and Radiometric Survey

An airborne geophysics survey was commissioned to collect magnetic and radiometric data from across the entire 3Ace Property. The contractor, Precision Geosurveys Inc. (Precision), flew the survey between August 25, 2011 and September 15, 2011. The purpose of the geophysical survey was to identify regional- and property-scale structures and to assist in remote mapping of alteration and lithology. However, poor weather, unsettled magnetic field conditions, and technical issues with the magnetometer dramatically reduced the proportion of the property that was covered by the survey. A total of 1097 line kilometres was completed on the north claim group of the property. A report by Precision detailing the parameters and results of the 2011 airborne geophysical survey is included in Appendix G (see volume 12).

The survey was designed to acquire high resolution magnetic and radiometric data. The radiometric and magnetic data were acquired simultaneously as the survey was flown. The survey was flown at 100 m spacing on a heading of $090^{o}/270^{o}$ and a nominal altitude of 35 m above the ground. North-South tie lines were intended to be flown at a spacing of 1 km, but were not completed due to the poor survey conditions and time constraints of the geophysical crew.

The analytical equipment used for the survey was comprised of an Integrated Radiometric Information System (IRIS) and a Scintrex cesium vapour CS-3 magnetometer. The IRIS measures gamma radiation emitted from the surface of the Earth. It is shielded to minimise cosmic and solar gamma noise. The Scintrex magnetometer is a high sensitivity instrument that can measure the Earth's geomagnetic field to within ±-0.01 nT. The magnetic data are recorded at 10 Hz. Additionally a magnetic compensator filters out noise created by movement of the helicopter within the Earth's geomagnetic field. A GEM GSM-19T magnetometer was installed as a base station in the southeast corner of the claim block. This unit measure data at 0.5 Hz and has an accuracy of ± -0.02 nT at 1 Hz. The base station measures diurnal fluctuations in

the Earth's geomagnetic field and is used to correct data acquired by the Scintrex magnetometer.

The analytical equipment is mounted within a 'stinger' attached to a Bell 206 Long Ranger. The helicopter is equipped with a laser altimeter to accurately maintain the altitude of the geophysical equipment. The helicopter is also utilises a special guidance system to assist in navigation and maintain the correct ground clearance.

The airborne TMI magnetic data is presented on a pocket map. Due to the lack of tie lines and unresolved issues with the Scintrex magnetometer the level of confidence in the quality of the raw data is reduced. Significant regional features like the Hyland Valley and March faults are highlighted by airborne magnetic data. However, a strong east-west striping is present in the dataset, reflecting the flight lines, and interpreting lower order structures is tenuous at best (see Pocket Maps).

The radiometric data collected during the airborne survey was strongly affected by groundwater saturation in the area. Above normal volumes of rainfall throughout the summer ensured that creeks, tarns, and bogs did not dry out in 2011. Water strongly attenuates gamma particle radiation, reducing the effectiveness of airborne radiometric surveys. The radiometric data received from Precision is very subdued and the narrow range of the absolute measurement values limits the usability of the data. The quality of the radiometric data needs to be reviewed by a professional geophysicist to determine if it reasonable to use the data for geological interpretations.

TerraNotes Ltd., a geophysics consulting firm in Toronto, ON, has been contracted to review the 2011 airborne geophysics data. This review is currently ongoing and the final results have not yet been released to the company. Precision will continue the airborne geophysical survey in 2012 with the intent to obtain tie line data for the North Claim Group and cover high priority sections of the South Claim Group.

13.0 Diamond Drilling

A diamond drill program was completed on the 3Ace Property between July 1, 2011 and October 25, 2011. At total of 8,458 m was drilled in 34 holes at four different zones on the 3Ace Property (Table 6 and see Pocket Maps). The drill contractor, Driftwood Drilling of Smithers, BC, initially supplied a single drill rig, but in order to meet the planned meterage a second drill rig was added in mid-August.

Note: Drillholes 3A-11-033, 034, 035, 3ANZ-11-001, 002, and 3ARS-11-001, 002 are not included in the 2011 assessment expenditures, as the cost was incurred after September 29, 2011. However, the data is included in this report in order to provide a complete dataset.

The core was transported from the drill by helicopter and logged at the 3Ace exploration camp. The 2011 core is cross-stacked in the camp (i.e., 535580E, 6839746N), a permanent core storage for the 3Ace Property. Eventually, a characteristic cross-section of the Main Zone will be shipped to Whitehorse for storage in the Yukon Geological Survey's core library.

The results of the drill program were variable at each of the drilled zones, but multi-metre intersections of anomalous to moderate-grade gold concentrations were intersected at each zone and several 'bonanza' grades were intersected at the Main Zone. Cross-sections for each of the drill holes are presented in Appendix D (see Volume 2) and drill logs are presented in Appendix E (see volumes 3 and 4). The drilling results at each zone are described in the following sections.

13.1 Main Zone

The Main Zone is the most significant Au mineralised zone on the 3Ace Property. Surface sampling in 2010 extended the discovery outcrop for 50 m along strike and identified multiple, en echelon Au-bearing quartz veins that returned multiple high-grade assays (Schulze and Buchanan, 2010). A short, late season drill program tested the surface mineralisation with three drillholes for a total of 299 m. The results of this initial drill program included 4.31 g/t Au over 30.3 m and 14.84 g/t Au over 10.9 m, confirming the presence of a significant, high-grade gold system at the Main Zone. In 2011 a follow-up program was planned to test the mineralisation along strike and down dip. A total of 5604 m was drilled in 23 holes (Figure 5 and see Pocket Maps). The drill program extended the known strike length of Main Zone 250 m to the north and down dip approximately 225 m, a significant expansion of the zone.

The drillholes intersected a succession of interbedded arkosic sandstone, quartz pebble conglomerate, ribbon-bedded siltstone, and phyllite. The stratigraphy broadly strikes west-northwest and dips moderately to the north. Towards the north end of the zone the drillholes collared in phyllite and intersected up to 90 m of phyllite (Unit A) in the upper portions of the zone. To the south, holes were collared in quartz pebble conglomerate. Across most of the zone a thick (i.e., up to 90 m) package of arkosic sandstone and quartz pebble conglomerate delineates the middle portion of the stratigraphic sequence (Unit B). Unit C is comprised of a phyllite/siltstone package

approximately 100 m thick that contains a 25 m thick sequence of arkosic sandstone and quartz pebble conglomerate (see Section N6843903, Appendix D, Volume 2).

Polyphase faulting at the Main Zone has created complex overprinting relationships and extensive brecciation within the stratigraphic succession. The Main Zone Fault (MZF) is the primary structure that controls mineralisation. The MZF has an orientation of approximately 350/75. Polyphase movement along the fault is suggested by the presence of folded and boudinaged crack seal quartz vein fragments with arsenopyrite mineralisation. The early vein system was subsequently overprinted by multiple phases of younger, less deformed quartz tension vein arrays, stockwork quartz veins, and sheeted quartz veins. The final movement phase is evidenced by brittle faulting that brecciate the older structural features and country rock; forming extensive clay gouge faults. Drillholes collared along the eastern side of the ridge (Figure 5) intersected a previously unrecognized fault. This fault is similar in style and geometry to the MZF and it is hypothesized that displacement on the MZF steps onto a fault segment east of the discovery outcrop. This interpretation is supported by the lack of significant structure in drillhole 3A-11-024, south of the discovery outcrop. 3A-11-021 targeted a prominent east-west satellite lineament and intersected extensive clay fault gouge, suggesting the presence of late west-striking, steeply north-dipping brittle faults that cross-cut the Main Zone. The significance of these faults is poorly understood at this time, but the presence of brecciated and crushed sulphide minerals in the cataclastic gouge zones indicate the faults post-date mineralisation at the Main Zone.

The Main Zone alteration package is characterised by argillic clay alteration, iron carbonate alteration, quartz-carbonate veining, sericite, desilicification, and discontinuous patches of silicification. A strong limonite overprint is present throughout the zone and is interpreted to be formed from oxidation of pyrite by meteoric water. Alteration is strongest within the fault zone and becomes less intense in the footwall of the MZF. In the deeper portions of the stratigraphic package alteration is predominantly vein hosted and is comprised of quartz-carbonate veins and vein hosted chlorite. The trace element geochemistry displays distinct patterns through the zone, which are strongly dependent upon lithology, but also appear to be spatially related to mineralisation. A geochemist

has been contracted to investigate the geochemistry identify the geochemical signature of the alteration system.

Mineralisation at the Main Zone is characterised by arsenopyrite+pyrite+trace galena+trace molybdenite+trace chalcopyrite±gold. Table 7 presents the significant 2011 intersections. There were twelve intersections with a width great than 7.0 m and a composited grade greater than 0.6 g/t Au. Ten of the intersections had a width greater than 10 m and nine of the intersections were over 23 m wide. 3A-11-016 had the best intersection of the season, 4.61 g/t Au over 35 m, and included 106.21 g/t over 1.0 m. The longest intersection, 2.58 g/t Au over 53.0 m, in 3A-11-033, is an exaggerated apparent width due to the small angle of intersection between the hole and MZF. However, this is the deepest mineralised intersection in the zone, demonstrating that it is open to depth. Visible gold occurs throughout the zone and has been observed in each generation of quartz veins, although it seems to be more common in the first generation, grey, deformed quartz veins. Arsenopyrite is a common accessory mineral and always occurs in conjunction with gold mineralisation within the Main Zone. However, broad intervals of 4%-8% arsenopyrite have returned assay samples with only slightly anomalous gold concentrations. Total sulphides associated with gold mineralisation at the Main Zone rarely exceed 8% of the modal mineralogy.

Coarse, nugget gold concentrations represents a challenge for accurately assessing the Au grade at the Main Zone. In several cases Au assays changed dramatically when samples were re-assayed for metallic screens. Furthermore the values could be increased or decreased; there was no distinct pattern to the changes. Nuggety gold is a challenge in many orogenic gold vein systems and there is no easy solution to the problem of accurately estimating the grade of a sample. Northern Tiger Resources is planning to re-analyse a set of samples with a cyanide leach bench test. The goal of the experiment is to determine if the fire assay and metallic screens are appropriate techniques for analysing gold on the 3Ace Property. The test will also determine if the current assay results reflect an accurate estimate of the gold grade in the 2011 drill core.

The geometry of the mineralisation is strongly controlled by the strike and thickness of the MZF, creating a generally planar zone of mineralisation. However, the concentration of high-grade gold occurrences in the central portion of the zone (see

Section N6843903, Appendix D, Volume 2) indicates the development of a steeply, northeast plunging ore shoot. A secondary structural control on the geometry of mineralisation is the intersection between the MZF and bedding. This structural feature generates a moderately, northeast plunging zone of mineralisation in the vicinity the contact between units A and B. Interpretation of these three structural controls on the geometry of mineralisation is ongoing, but even this preliminary recognition of the plunging ore shoots provides a powerful targeting tool for the 2012 drilling program.

The 2011 drill program at the Main Zone successfully extended the extent of known gold mineralisation 200 m to the north and 225 m down dip. The program

demonstrated that the current geological and structural model for the Main Zone is robust and can be used to identify high priority drill targets for the 2012 exploration program. The Main Zone is open in all directions and remains the highest priority exploration target on the 3Ace Property.

13.2 Green Zone

The Green Zone is comprised of a large, ~650 m long Au-in-soil anomaly located 2.0 km north of the Main Zone. In 2010 rock samples collected within the soil anomaly returned Au assays up to 8.0 g/t. The rock and rubble crop samples identified zones of strong scorodite alteration of disseminated arsenopyrite in the quartz pebble conglomerate underlying the zone. Strong clay alteration and brecciation of the host rocks coincident with the soil anomaly was interpreted as a significant zone of hydrothermal alteration associated with controlling structures (Schulze and Buchanan, 2010). In 2012 seven drillholes (i.e., 1,976 m) were collared on the zone to test for disseminated and structurally controlled gold mineralisation (Figure 6). The drill targets were selected based on the juxtaposition of high gold concentrations in the 2010 soil survey and rock samples. The holes were oriented perpendicular to the interpreted orientation of bedding to test the stratigraphy.

Hudson Bay Mining Company drilled a single hole, HB-99-01, at the Green Zone in 1999. The hole was targeted approximately 180 metres northwest of the 2011 drill holes. The best intersection of the 1999 drill program was 4.5 g/t Au over 1.5m and Hudson Bay concluded the area did not contain the potential to host a large, high-grade gold deposit.

The Green Zone drillholes intersected a sequence of interbedded quartz pebble conglomerate, arkosic sandstone, black phyllite, and thin-bedded siltstone. The succession is predominantly comprised of the coarse clastic rocks interleaved with comparatively thin intervals (i.e., 10 m to 20 m) of the pelitic rocks. Discrete intervals of quartz tension vein arrays occurred through-out the drillholes. Structural analysis of oriented core data suggested the vein arrays are hosted in steeply-dipping brittle-ductile shear zones with a strike of 020^{o}. This analysis resulted in changing the orientation of the last four holes (i.e., 3A-11-026, 027, 029, and 030) to 160^{o} to provide a more appropriate test of the shear zone hosted quartz veins. The reoriented drillholes did intersect high-

grade Au mineralisation, however, the understanding of the structural controls on mineralisation at the Green Zone is improving and the results should be reviewed based on the newly developing ideas.

Alteration at the Green Zone is comprised of limonite, desilicification, argillic clay, iron carbonate, chlorite, and scorodite. Limonite is pervasive at the top of the holes, but deeper in the system is predominately fracture controlled. Argillic clay alteration is typically expressed as replacement of feldspar clasts in the quartz pebble conglomerate. Chlorite is typically only observed near the bottom of the drill holes and is generally hosted by quartz veins. It is not yet clear if the chlorite demarcates the outer limits of a more oxidised alteration halo, or if an unidentified fault juxtaposes the two alteration systems. Scorodite is a unique component of the system at the Green Zone. On surface scorodite was commonly associated with weathered arsenopyrite. However, a brittle fault zone intersected in 3A-11-023 from 155.2 m - 157.9 m contained strong, fracture controlled scorodite, which overprinted and older, brittle-ductile shear zone. The older shear zone was delineated by a foliated quartz vein breccia with 6.0% arsenopyrite, 4% pyrite, and 3.36 g/t Au.

Table 8 presents the significant assay results at the Green Zone. The best interval was 3.0 g/t Au over 2.7 m within the scorodite fault zone in 3A-11-023. However, a total of 39 samples returned assays greater than 0.2 g/t Au and each of the holes drilled at the Green Zone returned intervals of greater than 0.5 g/t Au. Mineralisation is characterised by pyrite+arsenopyrite±Au. Arsenopyrite is common throughout the zone and locally fine-grained, disseminated arsenopyrite, associated with anomalous Au, forms halos in the wallrock around fault zones (i.e., 3A-11-027). Trace amounts of disseminated arsenopyrite are commonly observed in a medium-grained arkosic sandstone unit intersected at the bottom of the drillholes, but was not accompanied by significant gold mineralisation.

The broad distribution of anomalous gold throughout the Green Zone drillholes is interpreted to be indicative of a broader, structurally controlled hydrothermal fluid system. The topography and extensive talus cover of the Green Zone inhibits geological mapping, essentially creating a blind target. Although the 2011 assay results were not as

Table 8 Table of Significant Results at the Green Zone							
Hole	**Zone**	**Azimuth**	**Dip**	**EOH (m)**	**Interval (m)**	**Width (m)**	**Gold (g/t)**

3A-11-30	Green	160°	75	372	97.0 – 98.3	1.3	0.64

extensive as suggested by previous surface sampling, there still remains a viable exploration target at the Green Zone.

13.3 North Zone

The North Zone is where visible gold was first identified by Hudson Bay Mining in 1998 (Buchanan, 1999) . The surface showing is comprised of thin, complex quartz tension vein arrays (TVA). The steeply dipping fault zone that controls the TVA trends east-southeast and is predominately hosted by thicked-bedded quartz pebble conglomerate packages interbedded with arkosic sandstone. The veins system hosts abundandant coarse-grained arsenopyrite, pyrite, and visible gold. Alteration associated with the veins is predominantly comprised of iron carbonate alteration and pyrite that has oxidised to limonite across much of the surface showing. Locally, where quartz veins are abundant, the alteration forms zones of intense, pervasive iron carbonate and limonite altered wall rock. The vein and alteration system can be traced for 250 m along strike and over 75 m across strike at the North Zone, forming a large, attractive exploration target.

Hudson Bay Mining Company drilled a single hole, HB-99-03, at the North Zone in 1999. However the hole was targeted approximately 150 metres northeast of the primary showing and it does not appear the drillhole was appropriately targeted to test the vein system at the North Zone. There were no siginificant gold intersections in this hole and Hudson Bay Mining concluded the North Zone did not contain the potential to host a large, high-grade gold deposit.

Two holes (i.e., 416 m) were drilled during the 2011 field season, targeting the main outcrop with visible gold, arsenopyrite, and pyrite mineralisation (Figure 7). The holes intersected 68 m of interbedded quartz pebble conglomerate and arkosic sandstone.

Underlying the clastic rocks was a broad, 125 m interval of black phyllite. The upper clastic portions of the drillholes were strongly faulted and characterised by extensive brecciation and quartz veining. In contrast to the other zones, brittle-ductile shear zones were well developed in throughout the lower phyllite unit. The shear zones are characterised by narrow intervals of graphitic gouge and broader damage zones of folded and boudinaged quartz tension vein arrays. In the clastic intervals strong, pervasive alteration is comprised of limonite, argillic clays, desilicification, quartz-carbonate veins and patchy silicification. In the phyllite the alteration is constrained to the quartz veins and gouge zones in the phyllite, where it is comprised of chlorite, carbonate, graphite and grey clay.

The results of the North Zone drilling were disappointing. Visible gold was observed at 38.9 m in 3ANZ-11-001. This corresponded to an assay of 0.4 g/t Au over 0.5 m, an underwhelming gold assay for an interval in which a large (1 mm) flake of gold was observed. There were no significant results from 3ANZ-11-002, a scissor hole on the same pad as 3ANZ-11-001.

Buchanan (2010) suggested the stratigraphy at the North Zone was comprised of a thick, >100 m, succession of quartz pebble conglomerate and arkosic sandstone striking east-west and dipping moderately to the north. The comparatively thin intersection of clastic rocks in the 2011 drillholes indicates that this geological interpretation is incorrect. The implication of the 2011 drillhole data is that a significant fault, or unrecognized fold closure, is obscured by the extensive alpine meadow at the North Zone. No further drilling is recommended at the North Zone until trenching and associated mapping refine the structural and geological model for this area.

13.4 Road Showing

The Road Showing is one of the original discoveries in the Little Hyland valley. The prospect is comprised of roadside outcrops that extend for 300 m along the edge of the Nahanni Range road and a small trench. Previous work in the vicinity of the prospect indicated that Au and Ag mineralisation is associated with As and disseminated alteration. McMillan (2001) reported a grab sample assay of 7.8 g/t Au and 40 g/t Ag from a rock sample of quartz pebble conglomerate, quartz veins, and massive arsenopyrite. A second sample collected from the trench at the Road Showing returned

an assay of 28.0 g/t Au (McMillan, 2005). Subsequent work in the vicinity of the trench, by North American Tungsten, identified coincident Au and As anomalies centred over the original trench (Casselman, 2005). Although this showing has not been heavily worked by Northern Tiger Resources a few visits to the prospect and a review of the historical data indicated the presence of a subcropping zone of mineralisation. A drill collar was positioned 25 m north of the trench in order to target the trench and central portion of the soil anomaly and two drill holes (i.e., 462 m) were drilled on the set-up (Figure 8).

Table 9 presents the significant assay results from the two drill holes at the Road Showing Prospect. The holes intersected an interbedded succession of quartz pebble conglomerate, arkosic sandstone, and phyllite. The initial 56 m of the drill holes was predominantly coarse-grained clastic rocks with associated quartz veins, fault gouge, and alteration. The deeper portions of both holes are predominantly black phyllite with short interbeds of arkosic sandstone and thin-bedded black and grey argillite. The best structure, alteration, and sulphide mineralisation (i.e., arsenopyrite and pyrite) was located within the first 60 m of both holes at the Road Showing. The mineralisation was hosted in brecciated quartz veins and generally had a modal abundance of approximately 0.5% to 1%. Although the visible indicatations were good for Au mineralisation only anomalous gold concentrations in the order of 0.2 g/t to 0.76 g/t was intersected at the Road Showing. A segment of core with strong quartz veining and massive arsenopyrite veins was recovered from casing that ran 2.99 g/t, however, it is not known if it the sample was in-place or a boulder in the overburden.

Table 9 Table of significant results at the Road Showing

Hole	Zone	Azimuth	Dip	EOH (m)	Interval (m)	Width (m)	Gold (g/t)
3ARS-11-01	Road	170^{o}	60	225	48.0 – 49.0	1.0	0.76
3ARS-11-02	Road	170^{o}	75	340	**66.5 – 67.5**	**1.0**	**0.61**
				Including	71.5 – 72.5	1.0	0.45

prospecting should be completed prior to a second phase of drilling. The Road Showing will not be a high-priority exploration target for Northern Tiger Resources in 2012.

14.0 Conclusions and Recommendations for Future Work

14.1 General Conclusions

The 2011 exploration program on the 3Ace Property successfully identified new regional and property scale exploration targets and expanded the strike and dip extent of gold mineralisation at the Main Zone. Drilling results at the other three zones were less encouraging, but anomalous to sub-gram per ton gold was intersected at each of the zones.

The current exploration strategy on the 3Ace Property is based on the metallogenic models presented for orogenic gold deposits. These types of deposits have been described extensively throughout the northern Cordillera of Alaska and BC (e.g., Groves et al., 1998; Kerrich, 2000; Goldfarb et al., 2001; Goldfarb et al., 2004), but have not been extensively explored for in Yukon Territory. The primary characteristics of the 3Ace Property that make the orogenic gold model an appropriate analogy for the property are: mid- to upper-crustal level crack-seal style quartz veins, high competency contrast between lithologies, transextensional crustal-scale regional faults that provide fluid pathways for deeply sourced metamorphic fluids, and a prolonged polyphase deformation history that allowed multiple generations of fluid to pass through the region.

At the Main Zone the best intersections of gold mineralisation and associated alteration form where the brittle-ductile to brittle faults transect the clastic components of the stratigraphy. Relative to the phyllite these competent rocks have been strongly fractured and brecciated within the faults and their enveloping damage zones. The structural preparation of the wallrock enhances fluid flow along the fault system and within the stratigraphy. Exposed fault-fill quartz veins at the Main Zone have distinct extensional step over zones between the vein segments. This characteristic of the lower order faults is expected to be repeated by the higher order faults (i.e., Main Zone Fault). This hypothesis implies the presence of extensional faults within the bigger scale step over zones, a structural feature that provides pathways for deeply sourced hydrothermal fluids to migrate through the zone.

The primary structural and stratigraphic controls on the gold mineralisation at the Main Zone are repeated at each of the zones on the 3Ace Property. The areal extent of

the Au-in-soil anomalies is interpreted to indicate the presence mineralised fault systems intersecting the clastic stratigraphy. However, narrowing down the location of the faults is difficult due to poor exposure along the flanks of the ridge and talus slopes (i.e., Sleeping Giant and Green Zone West zones and the Kaiser Trend).

The 2011 exploration program on the 3Ace Property demonstrated the potential for significant gold mineralisation at the Main Zone. The Main Zone target also remains open along strike and to depth. Additionally, the silt and soil sampling programs identified multiple new exploration targets, both proximal to the Main Zone and across the extent of the property.

14.2 Recommendations for Future Work

The results of the 2011 exploration program warrant further exploration work. Six general recommendations and considerations for future work are discussed below:

1. **Soil Sampling:** The 2011 soil program was extensive and covered all the ground between the Green and Main zones. However, three of the gold-in-soil anomalies occur along the edge of the completed grid: the eastern extent of Green Zone East, east of the Main Zone, and the northwestern end of the Kaiser Trend. The soil grid should be expanded in each of these areas to evaluate the potential for mineralisation outside the current grid. It is estimated that 1500 soil samples would adequately cover these areas.

2. **Follow-up on 2011 Silt Anomalies:** The 2011 silt survey identified 11 new Au and Cu occurrences across the 3Ace Property. Limited follow-up, by prospectors, on these new occurrences was completed during the 2011 field season, but no systematic evaluation of these targets was completed. It is highly recommended that reconnaissance soil sampling, prospecting, and geological mapping be completed to fully evaluate each target. It is estimated that 2000 soil samples and 88 man-days will be required to evaluate the occurrences.

3. **Geophysics:** The 2011 airborne geophysical survey was left incomplete. It is recommended that the remainder of the property be flown to acquire the data. The magnetic and radiometric data will be useful for mapping structures and lithology across the property, two important components of the exploration model.

4. **Geological Mapping:** The geological mapping program was limited in 2011 due to weather and scheduling conflicts. North the Green Zone the area is underlain by a package of calcareous sedimentary rocks similar to the Algae Lake fm., a unit that is geochemically favourable to precipitate gold. However, very little is known about the previously unrecognized stratigraphic unit. Regional, 1:50,000 mapping should be completed over the northern half of the property to evaluate its potential for mineralisation.

5. **Regional Data Compilation:** Northern Tiger Resources has started to understand the first order structural controls on the area and the role of the regional fault systems in mineralisation. The fault geometry presented in Figure 3 represents a regional scale pattern that can be utilised to evaluate prospective targets in the Hyland Valley area. A desktop study and review of the regional geology, geochemistry, lineament analysis, and known occurrences should be completed to generate new target areas.

6. **Drilling:** The 2011 drilling program successfully extended the Main Zone and demonstrated the presence of significant Au mineralisation at this prospect. Although, drill results were discouraging at the other zones, anomalous gold was intersected at each one, further drilling is recommended for the 3Ace Property

Reverse Circulation

A reverse circulation (RC) drill is recommended for efficiently testing shallow blind and indistinct targets. Samples from an RC drill may not accurately represent the gold concentration, but the rate of drilling and ease of moving the rig out weights some of these disadvantages. An RC rig is able to rapidly drill fences of shallow holes across an area with minimal helicopter support. This allows targets like the Kaiser Trend to be efficiently tested by drilling and identify more discreet anomalies to test with the diamond drill. A total of 5,000 m of RC drilling is recommended to test the strike extent of the Main Zone, the Kaiser Trend, the Sleeping Giant Zone, and accessible portion of the Green Zone West.

Diamond Drilling

Diamond drilling is the best method of testing and evaluating structure, lithology, and grade. Furthermore, several of the targets will require pads to be built on rugged, inaccessible terrane, and several of the follow-up targets at the Main Zone Require 275 m holes to test the down plunge projection of the high-grade ore shoot. A total of 3000 m of diamond drilling is recommended for the 3Ace Property in 2012. Table 10 lists the breakdown of the recommended meterage at each zone.

Table 10 List of diamond core meterage at each zone

Zone	No. of Holes	Meterage
Main Zone	7	1400
Sprogge	4	800
Green Zone East	4	800
Total	**15**	**3000**

The recommended work program is estimated to cost approximately $2,038,585. Table 11 presents a simplified breakdown of the program and the estimated cost for each recommendation. This budget does not include camp operations, which are normally outside the exploration expenditures.

Table 14.2 Estimated budget for recommended work program

	Total Expenditures ($)	
	South Claim Group	**Notes**
Wages: 466 person days	$198,050	
Analytical Charges - Rock Samples	$25,000	rock samples @ $50

17.0 Certificates of Authors

I, Chris R. Buchanan, M.Sc., PGeol hereby certify that:

1. I am currently employed as Senior Geologist by Northern Tiger Resources Inc., located at the following address: Suite 220, 17010-103 Ave. NW, Edmonton, AB T5S 1K8.

2. I graduated with an Honours Bachelor of Science, co-op degree in Geology from the University of Waterloo, Waterloo, Ontario, in 1997. I obtained a Masters of Science degree in Geology from Memorial University of Newfoundland, St. John's, Newfoundland and Labrador, in 2004.

3. I am registered as a Professional Geologist with the Professional Engineers, Geologists and Geoscientists of Alberta (APEGA) since 2012, member number 142930.

4. I have worked as a Professional Geoscientist since graduation with an Honours Bachelor of Science, co-op degree from the University of Waterloo, including defending research for a Masters of Science degree from Memorial University of Newfoundland in 2004.

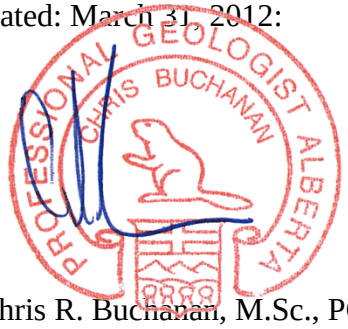
5. I have read the definition of "qualified person" set out in National Instrument 43-101 (NI 43-101) and certify by reason of my education, work experience and registration with APEGGA that I fulfill the requirements to be a "qualified person" for the purposes of NI 43-101.

6. I am responsible for the preparation, in its entirety, of the technical report titled "Assessment Report on 2011 Exploration Activity on the 3Ace Property: Drilling, Geochemical, and Geophysical Surveys, Little Hyland River Area, YT.." The report, dated March 31, 2012, was prepared for Northern Tiger Resources Inc., relating to the 3Ace Property.

7. I currently hold options to purchase stock in Northern Tiger Resources Inc.

8. I consent to the filing of the Technical Report with any stock exchange and other regulatory authority and any publication by them, including electronic publication in the public company files on their websites accessible by the public.

Dated: March 31, 2012:



Chris R. Buchanan, M.Sc., PGeol

I, Bonnie Pollries, B.Sc., G.I.T., hereby certify that:

1. I am currently employed by Northern Tiger Resources Inc. as an Exploration Geologist, located at the following address: Suite 220, 17010-103 Ave. NW, Edmonton, AB T5S 1K8.

2. I graduated with a Bachelor of Science degree with Specialization in Geology from the University of Alberta, Edmonton, Alberta, in 2009.

3. I am registered as a Geologist in Training with The Association of Professional Engineers, Geologists and Geoscientists of Alberta (APEGA) since 2009, member number 88909.

4. I have worked as a Geologist since graduation with a Bachelor of Science degree from the University of Alberta in 2009.

5. I have read the definition of a "qualified person" set out in National Instrument 43-101 (NI 43-101) and certify by reason of my education, work experience and registration with APEGGA that I do **not** fulfill the requirements to be a "qualified person" for the purposes of NI 43-101.

6. I am responsible for the preparation, in part, of the technical report titled "Assessment Report on 2011 Exploration Activity on the 3Ace Property: Drilling, Geochemical, and Geophysical Surveys, Little Hyland River Area, YT.." The report, dated March 31, 2012, was prepared for Northern Tiger Resources Inc., relating to the 3Ace Property.

7. I currently hold options to purchase stock in Northern Tiger Resources Inc.

8. I consent to the filing of the Technical Report with any stock exchange and other regulatory authority and any publication by them, including electronic publication in the public company files on their websites accessible by the public.

Dated: March 31, 2012

Bonnie E. Pollries, B.Sc., G.I.T.

Appendix B

Analytical Procedures and Quality Control and Assurance Protocol

Analytical Procedures at Inspectorate Exploration & Mining Services Ltd.

Samples collected on the 3Ace Property were analysed by Inspectorate Exploration & Mining Services Ltd. of Vancouver, BC (Inspectorate). All samples collected during the 2011 program were analysed for gold by fire assay and a 49 element suite by ICP-AES or ICP-MS. The sample processing and digestion technique utilised was determined by the type of sample; as such appropriate techniques were used for silt, soil, and rock/core samples.

The following sections describe the sample processing and digestion protocol used for the geochemical analysis of the 2011 geochemical samples collected on the 3Ace Property.

Sample Preparation

The samples are submitted to the Inspectorate preparation facility in Whitehorse, YT. Soil and Silt samples are dried at 60^{o}C, sieved to 180 µm and riffle split (i.e., package SP-SS-1K). Rock and core samples are crushed and pulverised to 75 µm and riffle split (i.e., package SP-RX-2K). Aliquots, riffle split from the pulp, are shipped to Vancouver, BC for geochemical analysis at the Inspectorate Laboratory.

Silt and Soil Samples

Silt and soil samples collected on the 3Ace Property are processed using the same analytical techiniques, package 50-AR-UT. The samples are crushed, ground and a 5 g sample is split for analysis. An aqua regia digestion is used to dissolve the sample, which is subsequently diluted with deionised water for analysis. The aqua regia digestion adequately dissolves base metals, but not silicate and oxide minerals. As a result lower levels will be reported for a suite of elements commonly incorporated into these minerals. The elements are Al, K, Mg, Ti, Ba, La, W, and Sr. If more detailed and accurate analyses of these particular elements are required then more complete digestion techniques (e.g., lithium metaborate fusion) should be considered.

Rock and Core Samples

All rock and core samples collected on the project were processed using a four acid digestion, package 50-4A-UT. The 4-acid digestion is adequate for most metallic elements. However, it may not completely digest more refractory elements (i.e., Zr and rare earth elements). As discussed above a more complete digestion is required for these elements. Additionally, the sample heating process may adversely affect the accuracy of

measurements for volatile elements like Hg and As. If these elements are required for analysis a more appropriate analytical technique should be selected.

Fire Assay Protocol

Gold is analysed by fire assay at Inspectorate using standard procedures. A 30 g sample is mixed with PbO flux in an earthenware crucible. Silver nitrate is added to the sample as a collector and the mixture is heated to 1060^{o}C for an hour. After removal from the fire assay oven the slag is poured of the sample, leaving a Pb button in the mold. The Pb button is cupelled at a temperature of 950^{o}C, separating Pb from the remaining Ag 'doré' bead, which contains the gold. The doré bead is heated in nitric acid, leaving behind a gold flake. After being washed in deionised water the Au concentration is measured by atomic absorption. If the Au concentration exceeds the upper limit of atomic absorption the sample will be weighed gravimetrically.

Quality Control and Assurance (QA\QC) Protocol

A system of blank, duplicate, and standard reference material (SRM) samples were utilised for QA\QC on the 3Ace Property. The insertion frequency for the drill core alternated between blank/SRM and blank/duplicate samples, every 38 samples. This ensured that at least one complete set of QA/QC samples was included in every sample batch. Additional blanks were inserted into the sample after mineralised or strongly altered intervals of core. For the soil program a field duplicate was collected at every 38th sample station.

The blank for the 2011 program was pre-packaged crushed limestone purchased at Home Hardware in Whitehorse, YT. Au assays for the suite of blank samples were all less than three times the detection limit. This indicates the crushed limestone is an appropriate blank for gold mineralisation on the property.

Field duplicate samples were generated on site by quartering the drill core. The initial sample of half core was cut and packaged and a second sample was cut from the remaining core to represent the duplicate sample. The results of the duplicate samples suffered from nugget gold assay, similar to the main assay dataset. The only clear result from the duplicate dataset is that gold is not distributed homogenously throughout the core, an attribute of mineralisation that was already clear from the assay data.

A single SRM was used on the 3Ace drill program in 2011. It was purchased from CDN Resource Laboratories Ltd. in Langley, BC. The SRM certificate number

CDN-GS-8B. The recommended values of this standard in 7.76 ±0.42 g/t Au for fire assay with AA/ICP finish and 7.72 ± 0.32 g/t Au for fire assay with gravimetric finish. The SRM was prepared from Devonian carbonates in northern Nevada, which means it may not be the most appropriate material for testing the clastic sedimentary hosted gold system at the 3Ace Property. A total of 65 SRM samples were inserted into the sample stream during the drill program. Only two of the samples exceeded the lower 2-sigma boundary, and none of the samples exceeded the lower 3-sigma boundary; although sample 29668 returned an Au concentration of 6.51 g/t, which lies on the lower 3-sigma boundary. The results of the SRM assays indicate that no significant QA/QC issues are present in the 2011 geochemical data from Inspectorate.

Chain of custody of the samples was maintained throughout the project. Samples were collected by project personnel and placed into tagged sample bags sealed by plastic zip ties. The samples were stored in rice bags on the property until the samples were picked up for delivery to the Inspectorate prep lab in Whitehorse, YT. The samples were initially expedited by Hyland Gold Inc., Watson Lake, YT, but issues arose with the timing of sample delivery to the lab. To resolve this chain of custody concern Inspectorate picked up the samples with their own truck, unfortunately the truck broke down and a third shipping solution was required. Twilite Services of Watson Lake, YT expedited the samples for the remainder of the summer. The samples were picked up in camp and delivered the following day to Inspectorate in Whitehorse, YT. A chain of custody form, containing a list of shipped samples, was transported by the driver and signed by both project personnel and Inspectorate personnel. Security tags were utilised to ensure the integrity of the rice bags during transportation by a third-party. The security tag numbers were recorded by project personnel and Inspectorate confirmed the tags were intact upon receipt of the sample shipment.

Assessment Report on 2011 Exploration Activity on the 3Ace Property: Drilling, Geochemical, and Geophysical Surveys, Little Hyland River Area, YT.

Green Zone

Diamond Drill Log and Sample Summary

Project: NTR3A **Prospect:** Green Zone **Hole ID:** 3A-11-022 **Grant No.:** YC72448

Location

Easting:	Northing:	Latitude:	Longitude:
533366.9	6845918.9		

Elevation: 1808 m **Grid Name:** GZS

Datum:	UTM Zone:	Grid N:	Grid E:
NAD83	9		

Orientation

Plunge: 60
Azimuth: 245
EOH: 300.0 m
Core Size: HQ

Start Date: 25/08/2011
Finish Date: 31/08/2011
Status: Completed
Contractor: Driftwood

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality
21	59.9	246.64	5847	Reflex	1
45	60	246.24	5816	Reflex	1
96	60	247.14	5816	Reflex	1
147	60.5	247.34	5814	Reflex	1
198	61.1	246.14	5816	Reflex	1
249	62	244.14	5819	Reflex	1
300	62.1	241.84	5819	Reflex	1

Objective:

The initial test of the Green Zone is targeting the upper band of scoridite alteration and arsenopyrite in rubble crop. The hole will test stratigraphy an for the 'Green Zone' fault.

306	75.8	244.64	5821	Reflex	1

Objective:

The initial test of the Green Zone is targeting the upper band of scoridite alteration and arsenopyrite in rubble crop. The hole will test stratigraphy an for the 'Green Zone' fault.

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	12	no core recovered	CASING		100.0%				co	1
12	14	intensely rust-oxidized, friable quartz-pebble-conglomerate: - some original texture dissernible - bright orange colour - appears arenitc (discerned from fragments) Grainsize: ~0.4cm Grainshape: subangular Composition: 85% quartz clasts discernible in oxidized fragment	MT-CO	pbl	100.0%	o	qtz	85	co	1
14	31.3	virtually no quartz veining except for several oxidized quartz vein framtement between ~22.5 to ~23.5 meters. [no discernible mineralization]	QZVN		1.0%	w			br	1
14	31.3	black, rust oxidized phyllite - combination thereof given dark brown appearance Texture is too fine-grained to determine exact composition. Rare dark grey-tan, interbedded phyllite lamellae. Frequent rust-seams along bedding foliation. Entire unit is very blocky and also intensely weathered + possibly structurally gouged in large parts of unit interval [see structure interval]. However location near surface could also indicate meteoric weathering. Faulting at lower contact with limonized QPC unit. [no discernible mineralization]	MT-Phy		99.0%	m			br	2

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Project:	NTR3A	Prospect:	Green Zone	Hole ID:	3A-11-023	Grant No.:	YC72448
Plunge:	Azimuth:	EOH:					
75	245	306					

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
31.3	72.3	Densely distributed quartz veining varying from 1cm - 40cm in width. No obvious mineralization. Frequently brown precipitate in quarz vein vugs. (manganese oxide? siderite?) Quartz veins have sharp boundaries and variable orientations and are frequently criss-crossed by rust tension seams. [see point structures for orientation details] Vein density and vein width increases significantly from ~60 meter downwars	QZVN		20.0%	w			co	1
31.3	72.3	0.4-2cm diameter Quartz-Pebble-Conglomerate: rust-staining along fractures and on white clay-altered feldspars throughout Composition: 88% white quartz clasts; 10% clay-altered and frequently rust-stained feldspar clasts; 2% black phyllite fragments Grainshape: subangular too subrounded clasts are surrounded by ~2% chlorite matrix (dark grey rimming - scratches white) both upper and lower contacts of unit with phyllite are marked by narrow phyllite interbed wedges with conglomerate.	MT-CO	pbl	80.0%	gy	qtz	88	co	1
72.3	83	Quartz veining in phyllite-silt sequence are generally <2cmthick and contain multiple iron-stained tension cracks parallel to vein boundaries. Several veins are axial planar to cink folding in So. Vein core angles are generally ~75TCA.	QZVN		2.0%	w			co	1
72.3	83	silt potion in phyllite (up to 15cm wide interbeds)	MT-SLT		18.0%	gy			co	1
72.3	83	originally black Phyllite with grey silt interbedding and red iron (hematite?) staining along bedding cleavages. Texture too fine-grained to determine exact composition. Silt interbeds are frequently up to 15cm in width. Gouge faulting and tension veining in lower half of unit [see structure table]. Foliated with flex/cink folding visible.	MT-Phy		80.0%	r			co	1
83	115.4	Quartz veining is predominantly narrow (<2cm thick) and sheeted as well as frequently concordant to alignment of chlorite matrix seams.	QZVN	frg	20.0%	w	qtz	80	br	2
83	115.4	Granule to pebble size Quartz Conglomerate with intense rust-staining, and a high degree of fracturing. Most competent with only rare fractures between 95.70-104 meters, which also coincides with sulfide mineralisation. Remainder of unit appears predominantly unmineralized. Possible scorodite mineralization from 92.8-95 meters. Has a developed of foliation in form of aligned wispy grey chlorite matrix seams that surround quartz and feldspar clasts. Foliation not persistent throughout entire unit and most strongly expressed in lower half of unit. Grainsize: 2-5mm Grainshape: subangular to subrounded Composition: 80% grey diffuse quartz; 20% pitted, altered feldspars Alteration of feldspars: white clay with subsequent iron-staining Related to conglomerate unit that follows below but separate due to marked difference in degree of fracturing.	MT-CO	frg	80.0%	gy			br	2

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
115.4	152.48	Quartz veining throughout rust-stained conglomerate is gennerally in form of narrow (<4cm thick) veinlets. [see structure table for detailed orientations] several broader, massive veins from ~139 meters downwards	QZVN		5.0%	w			co	1
115.4	152.48	granule to pebble size Quartz Conglomerate with a much higher degree of competence than previous conglomerate unit above Grainsize: 2-6mm; Grainshape: subangular locally grades into coarse grained sandstone over brief intervals clast size especially coares in lower part of unit from ~142 meters downwards whith aligned streching of quartz clasts and locally up to 2cm clast diameters. Composition: 85% quartz clasts; 14% altered feldspar clasts; 1% dark black, phyllite clasts feldspar is white clay altered and frequently iron-rust stained ~1% matrix in form of dark grey chlorite seams that surround clasts are that frequently run aligned at variable spacing (0.3-1cm); chlorite seams are frequently rust-stained and not always fully penetrative and not consistently prominent throughout entire unit. Lower contact with intensely scorodite mineralized zone.	MT-CO		95.0%	gy	qtz	85	co	1
152.48	168.7	Generally quartz veins in this unit are densely spaced, stockworked ad frequently have a boudinaged appearance with intersecting vein boundaries that do not allow generational distinction (diffuse). Intense scorodite mineralisation along vuggy vein fractures in form of mouldy, salad-green, friable coating. unit contains a brecciated quartz-scorodite-arsenopyrite-pyrite interval from 155.2-157.9m with quartz clasts up to 4cm in diamter surrounded by a dark grey metallic matrix [see structure interval]	QZVN	bx	30.0%	w			co	1
152.48	168.7	Intensely scorodite mineralized zon in coarse grained, light grey sandstone with only minor felspar portion. Both upper and lower contacts of unit are with conglomerate sequences. Narrow low core angle (~30TCA) gouge wedge mark both upper and lower contacts. Compostion: 90% grey, diffuse quartz clasts; 10% white, clay altered feldspare clasts Grainsize: 1-2mm Grainshape: subangular unit contains a brecciated quartz-scorodite-arsenopyrite-pyrite interval from 155.2-157.9m with quartz clasts up to 4cm in diamter surrounded by a dark grey metallic matrix [see structure interval] Generally quartz veins in this unit are densely spaced, stockworked ad frequently have a boudinaged appearance with intersecting vein boundaries that do not allow generational distinction (diffuse).	MT-SS	cgr	70.0%	gy			co	1
168.7	219	Quartz veining in turbidite sequence is predominantly narrow (<2cm thick) and of variable orientation. [see point structure table for localized vein trend in this ~50m long unit] frequent pyrite and galena vein mineralziation	QZVN		5.0%	w			br	1
168.7	219	Turbidite Sequence: black Phyllite conglomerate with interbedded phyllite and fine to coarse grained sandstone beds brown-orange rust-staining throughout foliation in phyllite is well expresses and poorly rexpressed in sandstone sequences conglomerate sequence shor frequent alignment of 0.2-1cm spaced rusty chlorite seams Lower contact bounds phyllite gouge fault. Texture of phyllite too fine-grained to determine exact composition. Pyllite occassionally as angular aligned, large wedges in sandstone beds.	MT-Phy		20.0%	n			br	1

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
12	18.25	FZ	200.0%	BFZ	Friable, soft, rust-oxidized phyllite fragements. Softness may be in part due to meteoric weathering
21	23.5	FZ	300.0%	BFZ	oxidized clay gouge and friable fragments in phyllite unit
21	23.5	QZVN	200.0%	BFZ	several 4cm diameter, rust-staine quartz vein fragmets in brittle fault zone -- acoount for about 5% of fault material
28	31.3	FZ	300.0%	BFZ	softened, fragmented and partially gouged core in phyllite at lithological contact
53.7	54	FZ	200.0%	BFZ	softened, intensely rust-stained conglomerate fragementes -- surrounded by competent rock above and below
77.55	80.7	FZ	300.0%	BFZ	gouged, crushed and partially blocky phyllite interval
80.7	83	QZVN	400.0%	TVA	densely spaced, high core angle, vuggy, parallel quartz veinlets below fault gouge in phyllite unit
155.2	157.9	SZ	400.0%	bx	brecciated qurtz clasts in ~10% dark grey, metallic matrix that consists of very fine grain pyrite and (predominantly) arsenopyrite; also green vuggy scorodiate intermittantly along healed fractures
195.15	201.55	FZ	200.0%	BFZ	hight degree of fragmentation with several softend, friable, gouged zones and repated rust-stained 10-40TCA fracture surfaces
207	209.4	FZ	100.0%	BFZ	possible fault zone with very low recovery: intensely fractured (poorly) interval with rust-coating along rough, low core angle fracture surfaces
219	219.5	FZ	400.0%	BFZ	dark grey, soft, plastic, partially rust-stained gouge with good recovery
219.5	226.7	FZ	200.0%	BFZ	partially broken and blocky with rannow phyllite gouge wedges and partially softed sandy clay coated fragmets; rust-staining along 30-45TCA rough fracture srufaces -- both phyllite and sand lithology
232.3	233.6	FZ	200.0%	BFZ	crushed fragments and rust-stained fractures -- marks change to predominantly granule-pebble clast size
248.3	253.3	FZ	300.0%	BFZ	intense fragmentation and softened crush in interval with foliated conglomerate and phyllite wedge interbes
257.4	258.9	FZ	300.0%	DBSZ	crushed softnened fragments in brittle fault zone in conglomerate. Weakly sheared - fragments show alignment of chlorite seams and stretched quartz clasts --- several galena blebs in quartz ribbons [brittle-ductile shearing of quartz veining]
275.84	279.2	FZ	400.0%	BFZ	brittle fault zone across lithological contact between very coarse grained conglomerate and foled phyllite unit - gouged and fragmented - with high intensity of quartz-iron-carbonate veining in phyllite portion of fault zone.
279.2	282.5	QZVN	300.0%	BFZ	high density of boudinaged quartz-iron-carbonate veining in phyllite below gouge zone
292	293.2	FZ	100.0%	BFZ	partially softend rock, fragmentation and gouge seams along contacts of interval
296.8	300	FZ	300.0%	bx	Sheared gouged phyllite-sitl breccia. Angular softened fragments surronded by aligned black phyllite chlorite seams at beginning of interval. Remaineder of interval loosely fragmented.
303.75	305.8	FZ	200.0%	DBSZ	softend with partial gouging high degree of aligned, green chlorite wedges and boudinated quartz veining with phyllite inclusions [soft deformation]

124.66	Axial Plane		Fx	fecb		30			flex-folded, intensely vuggy, 3cm thick quartz veinlet with axial plane of flexfolding concordant to foliation in conglomerate foliation; acute intersection angle between vein trend and foliation: ~70 degrees
124.66	Veins			fecb		30			flex-folded, intensely vuggy, 3cm thick quartz veinlet with axial plane of flexfolding concordant to foliation in conglomerate foliation; acute intersection angle between vein trend and foliation: ~70 degrees
124.8	Cleavage		Sx	lim		55			alignment of wispy, partially penetrative, rusty chlorite seams at 0.5cm spacing in conglomerate
126.5	Cleavage		Sx	lim		65			alignment of wispy, partially penetrative, rusty chlorite seams at 1cm spacing in conglomerate
126.5	Veins			lim	FOL	65			closely spaced, rust-stained, tension-cracked, ~2cm thick quartz veinlets
129.7	Cleavage		Sx			65	170		alignment of wispy, partially penetrative, rusty chlorite seams at 0.3cm spacing in conglomerate
130	Cleavage		Sx			65	160		alignment of wispy, partially penetrative, rusty chlorite seams at 0.3cm spacing in conglomerate
130	Veins				SHTV	45	145		repeated vein orienatation in rust-stained conglomerate
130.6	Veins				SHTV	65	190		repeated vein orienatation in rust-stained conglomerate
134	Cleavage		Sx			65	170		alignment of rusty hlorite seams at ~0.5-1cm spacing in rust-stained, granule size conglomerate sequence
135.4	Veins					20	160		rust-stained and tension cracked vein orientation
136.09	Veins			chl	Gouge	50	160		1cm thic gouge seam with green chlorite (?) wedges
136.6	Bedding		So			55			bedding chleavage in narrow interbedded phyllite wedge
138.35	Contact					70			conglomerate above, coarse grained sandstone below - sandstone bed ~1m long with intense stockworking of quartz veinlets
138.35	Veins				STWK				~ 1m long zone of intensely stockworked quartz veinlets in coarse grained sandstone interbed in rusty conglomerate
139.76	Veins				bx matrix	70			~5cm thick quartz vein with brecciated texture
140	Cleavage		Sx			65			alignment of wispy grey chlorite seams in conglomerate
143	Cleavage		Sx			70			streched alignment of up to 3cm diameter quartz clasts in rust-stained conglomerate
144	Veins				SHTV	55			foliation conocordant, repeated vein orienation in rust-stained conglomerate
147	Contact				FOL	50			repeated 2-6cm thick, interbedded phyllite wedges with contacts with conglomerate concordant to phyllite foliation
147.85	Veins				Gouge	65	240		upper, gouge coated contact of 10cm thick, rust-stained quartz vein with phyllite wedge inclusions
148.5	Veins					30	10		upper contact of 40cm thick quartz vein with alignment of chlorite and phyllite seams along upper contact within quartz vein
148.8	Contact				FOL	50	130		lower contact of 40cm thick quartz vein and upper contact of black phyllite wedge concordant to phyllite bedding cleavage
149	Cleavage		Sx			55	190		alignment of chlorite seams at ~0.5cm spacing in rust-stained conglomerate
149.7	Cleavage		Sx			50	192		alignment of wispy chlorite seams

Objective:
target the scorodite arsenopyrite fractured zone observed in Hole 3A-11-023 -- planned to 150 meters

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	18	no core recovered	CASING		100.0%				co	1
18	30	black phyllite with red-brown pervasive iron oxidiation and orange stain colour along foliation. Rather friable and soft in upper1-2 meters of interval. Compositional bedding cleavage appears consistent high core angle (80-90TCA).	MT-Phy		100.0%				fr	1
30	81.9	Quartz Veing in conglomerate is generally vuggy and rust-stained Vien thickness varies from 2-30cm and veins frequently contain seams with matrix material which are occassionally aligned with foliation. [see point structure table for vein orientation trends]	QZVN		8.0%	w			co	1
30	81.9	occassionally interbedded coarse grained sandstone sequence in conglomerate	MT-SS	cgr	12.0%	gy	qtz	90	co	1
30	81.9	Quartz Pebble conglomerate with localized foliation fabric in form of intervals with aligned wispy, grey chlorite seams that surround clasts at 0.2-1cm spacing. Grainsize: 0.4-1cm Grainshape: subangular Composition: 90% white-grey quartz; 8% altered feldspar (mostly iron-carbonate); 2% lithics in form of black, angular phyllite clasts	MT-CO		80.0%	gy	qtz	90	co	1
81.9	83.2	small wedges of conglomerate within quartz veining as seen in previous unit above	MT-CO		1.0%	gy	qtz	90	co	1
81.9	83.2	massive quartz vein with upper contact @50TCA and fragmented lower contact rust-stained throughout with frequent tension cracks along 25TCA and occassional aligned, partially penetrative chlorite seams along 85TCA several inclusions of conglomerate materail with in quartz vein	QZVN		99.0%	w			co	1
83.2	99.8	Frequent quartz veining in form of 1-4cm thick, dusty white veinlets with densely spaced, rust-stained tension cracks parallel to vein boundaries. Occassional slitted vugs perpendicular to vein boundaries in foliated and folded rust-stained phyllite unit. some veins contain angular phyllite clasts. som veins are axial planar to small cink/flex folds in foliation	QZVN		5.0%	w			co	1

Project:	NTR3A	Prospect:	Green Zone	Hole ID:	3A-11-025	Grant No.:	YC72448
Plunge:	85	Azimuth:	245	EOH:	283		

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
83.2	99.8	black phyllite with brownish hue on lamellar grey silt interbed due to pervasive iron-staining. Foliation bedding cleavage varies between 90-55TCA. Several small scale, cink fold profiles visible. Texture too fine-grained to determine exact composition. Frequent quartz veining in form of 1-4cm thick, dusty white veinlets with densely spaced, rust-stained tension cracks parallel to vein boundaries. Occassional slitted vugs perpendicular to vein boundaries.	MT-Phy		95.0%	m			co	1
99.8	139.85	quartz veining in granule (2-4mm) size conglomerate: - intermittent thin vuggy vienlets throughout unit [see point structures for vein trends] - several narrow (up to 1m long) zones with densely spaced rust-stained veins that are criss-crossed by healed, rust-stained fracture seams	QZVN		8.0%	w			co	1
99.8	139.85	Granule Size Quartz Conglomerate (2-4mm) Composition: 82% grey quartz; 17% feldspar; 1% black lithics (phyllite clasts) Grainshape: angular alteration of feldspar: white clay + frequent rust-stain overprint intermittent foliation fabric throughout in form of rusty, wispy, semi-penetrative seams at ~4-5mm spacing rust-oxidation throughout entire unit and especially prominent along veins and fractures upper contact is lithological with phyllite brittle deformation and transition to pebble size clast size at lower contact	MT-CO	grn	92.0%	gy			co	1
139.85	147.2	Quartz veining in QPC with various orientations and frequently weakly brecciated texture. Intensely rust-stained throughout. [see point structures for orientations] Veins are frequeently densely spaced and criss-crossed by a a multitude of rust-stained tension cracks that also penetrate in to surrounding QPC rock matrix. Occassionall strechted concordant quartz vein ribbons that align with foliation of conglomerate.	QZVN	bx	40.0%	w			co	2
139.85	147.2	Quartz Pebble Conglomerate (QPC): foliated and intensely rust-stained throughout -- Grainsize: 3-6mm Quartz clasts appear streched and matrix is partially penetrated by aligned rusty seams at ~3-6mm spacing. Also several prominant, ~1cm thick, black, foliation concordant phyllite wedges and strechted clasts in conglomerate matrix. Composition: 85% stretched quartz clasts; 14% white clay altered feldspar clasts; 1% black, lithic phyllite clasts Grainshape: streched and subangular clay alteration of feldspars is freqeuntly overprinted by rust-staining	MT-CO	pbl	60.0%	gy	qtz	85	co	1
147.2	153.03	ingested conglomerate within quartz vening and towards lower contact of interval with same composition as conglomerate unit that lies below	MT-CO	pbl	2.0%	gy	qtz	85	br	1
147.2	153.03	scorodite mineralized instersection - with brecciated quartz veining and aligned, ingrested conglomerate seams within massive veining. green scorodite as matrix surrounding softened, brecciated clasts and as coating in healed and open fractures also visible, fine-grained arsenopyrite in breccia matrix !Only 10% reccovery between 147-150 meter blocks due to mislatch!	QZVN	bx	98.0%	g			br	1
153.03	165.84	only minor diffuse, variable core angle, thing quartz veinlets	QZVN		1.0%	w			br	1

270.2	282.6	foliated grey sanstone interbed with lithic phyllite clasts from 276.4-277.83 meters. Foliation: 50/060 and expressed as sheeted veinlets and stretched quartz clasts Composition: 90% grey-transluscent quartz; 6% iron-carbonate altered feldspar; 4% black, lithic, phyllite clasts matrix has grey-greenish hue poorly sorted Grainsize: 0.5-3mm Grainshape: subrounded, subangular and angular both upper & lower contact of sandstone bed are concordant to phyllite foliation (So), not sandstone foliation sandstone contact are at right angles to sandstone foliation!	MT-SS	mgr	2.0%	gy		90	co	1
270.2	282.6	intense, soft deformation quartz veining in phyllite -- generally concordant to phyllite bedding cleavage, but frequently flex-folded and boudinaged with phyllite inclusions in veining and varying in thickness from 1cm - 30cm.	QZVN		20.0%	w			co	2
270.2	282.6	Black phyllite with grey lamellar silt interbedding and frequent visible, variable scale fold profiles. Texture fo phyllite too fine-grained to determine exact composition. Intensely quartz veins with phyllite inclusions in folded veining. Narrow gouge fault at lower contact	MT-Phy		78.0%	n			co	2
282.6	283	Sheared Quartz Veining: stretched aligned quartz ribbons rimmed by dark grey, wispy matrix seams at 0.5-1cm spacing in sandstone matrix.	QZVN	fol	100.0%	gy			co	2

Alteration

From:	To:	Comments:	Mineral	Intensity	Distribution	Colour:
18	30	orange-brown rust-staining throughout giving black phyllite unit a brown colour	lim	3	perv	m
30	83.2	yellow-white iron coarbonate alteration of feldspars - frequently overprinted by rust-staining	fecb	1	smgr	bf
30	65.3	weakly limonite stained throughout generally along quartz vein boundaries and fractures as well as overprinting clay alteration of feldspar clasts	lim	1	perv	o
30	83.2	weak pervasive greenish overprint that is especially apparent in sandstone interbeds	chl	1	perv	g
65.3	83.2	limonite-rust staining intensified in comparison to previous unit above - staining more penetrative through out rock matrix and intense in several fractured intervals	lim	2	perv	o
83.2	101.35	pervasive rust-staining on phyllite - leaving lamellar grey silt interbeds with a grey hue	LIM	2	perv	m
99.8	139.85	orange rust-staining throughout -- in veins, overprinting alteration of feldspars and especially prominent along open and healed fracture surfaces	LIM	2	perv	o
99.8	103.2	intense rust staining in vuggy quartz veining and along fractures and in narrow gouge zone	LIM	4	vn	o
99.8	147.2	white clay alteration of feldspar clasts	cy	2	smgr	w
139.85	147.2	orange-brown rust-staining throughout, overprinting clay alteration of feldpars, coating fragments and penetrating into rock matrix along foliation and healed fracture seams	LIM	3	perv	o
147.2	153.03	mouldy yellow-green scorodite (after arsenopyrite) coating in healed and on open fractures as well as in softened matrix of brecciated quartz veining	sco	4	frac	g
147.2	153.03	orange rust staining on open and healed fractures	LIM	2	frac	o
153.03	165.84	pervasive rust-staining; most prominent along fractures and when overprinting alteration of feldspars	LIM	2	perv	o
156.8	165.84	gritty sandy clay, rust-stained coating along undulated, rough low core angle fractures	LIM	4	frac	o
165.84	176.95	white clay alteration of feldspar clasts in conglomerate - frequently overprinted by rust-staining	cy	2	smgr	w

185.2	229.2	orange brown rust-staining along open and healed fractures and intermittently staining white clay alteration of feldspars	LIM	2	frac	o
190.4	194.5	scorodite-after-arsenopyrite along fracture surfaces in conglomerate surfaces and in healed matrix seams in brecciated, sheared quartz veining	sco	4	frac	g
229.2	270.2	white clay alteration of feldspare clasts in sandstone and conglomerate sequences	cy	2	smgr	w
229.2	270.2	rusty coating on low core angle fractures in friable, weathered nterval	LIM	2	frac	o
271	273.5	orange-buff iron-carbonate overprint in variable thickness quartz veins in phyllite [in zone below gouge fault]	fecb	3	vn	bf
273.41	273.5	green chlorite wedges in deformed quartz veining in phyllite	chl	3	vn	g

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
64.5	65.5	QZVN	400.0%	bx	conglomerate with brecciated appearance and intense rust-staining with only few yellow feldspar clasts and rust-stained seams surrounding angular clasts --- [brecciated quartz veining?]
72.4	73.8	QZVN	200.0%	BFZ	possible fault zone: semi-massive, rust-stained quartz veining in conglomerate with high degree of coarse fragmentation with rusty, grillity clay coating. Surrounded by competent (but equally rust-stained) rock.
79.6	80	FZ	200.0%	BFZ	2-4 cm diameter, subangular, crushed fragments with gritty, sandy, rust-stained coating
96.1	96.8	FZ	400.0%	BFZ	very poorly recovered gouge fault with rust-stained quartz-veinlets in fragments
96.8	97	QZVN	400.0%	bx	rust-stained quartz veining with ingested angular phyllite wedges at lower gouge fault contact
100.2	101.35	QZVN	300.0%	BFZ	intensely rust-stained, semi-massive quartz veining with "ingested" conglomerate wallrock wedges
101.35	107.4	FZ	300.0%	BFZ	gritty, rust-stained sandy clay coated conglomerate fragments --- fairly well recovered
114	115.35	QZVN	200.0%	DBSZ	Densely spaced foliated quartz ribbons rimmed by aligned dark grey chlorite seams and rust-stained throughout --- also stretching of quartz clasts in ingested conglomerate matrix wedges
120.35	124.7	QZVN	200.0%	bx	Intensely veined zone with vein orienations @ 30TCA; 40TCA & 55TCA. Veins are criss-crossed by multiple rusty fracture seams which also peneetrate into rock matrix. 30-40TCA veins appear openly folded. Rubbled fragments at lower bound of interval.
139.85	141	FZ	200.0%	BFZ	rusthy partially softened fragments; fault marks transition from granule to pebble size quartz conglomerate
141	144.8	QZVN	100.0%	DBSZ	high density of rust-stained quartz veining in conglomerate; veins are criss-crossed by multiple, rusty tension cracks that penetrate into surrounding rock matrix; rusty seams in conglomerate show clear alignment and veins are frequently concordant to this (shear?) foliation
144.8	147.2	QZVN	300.0%	BFZ	poorly recovered fault with rubbled quartz vein fragments and gritty sandy clay gouge
147.2	153.03	QZVN	400.0%	bx	brecciated quartz veining with scorodite coating along open and healed fractures as well as fine-grained disseminate pyrite within matrix; partially fragmented, but also intervals with softened scorodite immersed matrix with <1cm diameter angular quartz fragments; only 10% recovery between 147-150 meters blocks due to mislatch
181.1	185.2	SZ	200.0%	DBSZ	localized crenulations at lower bound of quartz breccia interval; crenulated quartz ribbons rimmed by dark grey chlorite seams

Project:	NTR3A	Prospect:	Green Zone	Hole ID:	3A-11-025	Grant No.:	YC72448
	Plunge:	Azimuth:	EOH:				
	85	245	283				

From	To	Mineral	Intensity	Distribution	Comments
190.4	191.5	QZVN	300.0%	bx	sheared brecciated quartz veining with black arsenopyrite-pyrite matrix seams and scorodiation coating in matrix healed fractures with slickensiding along polished 30TCA fractures at 199.3 meters.
199.4	200	QZVN	200.0%	DBSZ	weakly sheared grey,diffuse quartz veining 60-70TCA orienation and multiple massive pyrite stringers as well as fine grained disseminated arsenopyrite.
214.3	215.2	QZVN	200.0%	DBSZ	low grade shearing in form of aligned strechted quartz ribbons rimmed by dark grey chlorite seams and with densely disseminated fine-grained pyrite
229.2	241.4	FZ	300.0%	BFZ	Zone of Brittle Deformation: crushed, softened fragments intermingled with gouge and blocky fragments contains interchanging lithology of Quartz-Pebble-Conglomerate with prominent phyllite clasts as well as phyllite interbedding ~20cm poor gouge intersection at lower contact of fault zone Zone contains one very competent, 1m long QPC interval between 237.7-238.8 meters.
249.2	250.75	FZ	100.0%	BFZ	rust-coated low core angle fractures in friable, clay altered itnerval due low degree of brittle deformation
270.2	271	FZ	300.0%	BFZ	gouged and fragmentend sandstone and phyllite
271	273.5	QZVN	300.0%	SHTV	iron-carbonate-quartz veining in phyllite below gouge fault with densely spaced veining of varialbe thickness

Mineralisation

From:	To:	Comments	Mineral	Percent	Distribution
96.1	99.8	trace disseminated pyrite in rust-stained quartz veining in phyllite	py	0.01	vn

152	Joints			sco	bx matrix	35			repeated scorodite coated, healed fracture orientation in quartz breccia matrix
152.6	Bedding		So		Veinlets	65			reapeated aligned, non-penetrative, thin conglomerate wedges in ~40cm thick massive quartz vein
156.8	Joints			LIM		15			repeated, intensely rust-coated undulated, rough, low core angle fractures (likely healed fractures that opened due to mechanical drill pressure)
162.4	Joints			LIM		10			repeated, intensely rust-coated undulated, sandy clay coated, low core angle fractures (likely healed fractures that opened due to mechanical drill pressure)
164	Joints			LIM		50			repeated, intensely rust-coated undulated, sandy clay coated, low core angle fractures (likely healed fractures that opened due to mechanical drill pressure)
164.5	Cleavage		Sx	LIM		55	30		localized alignment of rusty seams in conglomerate at ~5mm spacing
165.84	Contact				Gouge	55			weakly gouged lithological contact between angular conglomerate and phyllite interbedded subrounded conglomerate of coarser clast size - concordant to phyllite bedding cleavage
166.98	Cleavage		Sx			80			alignment of chlorite seams and strechting of quartz clasts in QPC
167	Bedding		So			60			compositional bedding cleavage in phyllite interbed
168.4	Bedding		So	hem		60			hematite stained foliation fabric in both phyllite interbeds and conglomerate
171.33	Faults				FOL	80	265		alignment of chlorite seams and strechting of quartz clasts in QPC that cuts of 40TCA So bedding in phyllite wedge above [healed fault]

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

	60	160	306				

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
13.5	37	Densely spaced, deformed, rusty quartz veining at variable scales from 1cm - 80cm thickness within sandstone conglomerate sequence. Rusty infill in tension cracks in veining and within vugs. Frequent "ingested" wallrock wedges within semi-massive, broad vein zones. Also locally stretching of veinlets into aligned ribbons into low grade shearing. Unit is intensely fragmented and oxidized. Frequently blocky and rubbled. Several intervals with softened fragments with gritty sandy clay coating. Frequently boundaries between veining and wallrock and veining are blurred with minor altered feldspar clasts showing in brecciated veining.	QZVN	bx	60.0%	w			br	2
37	51.9	Quartz veining in Phyllite is concentrate most intensely between 47.6-50 meters as broad up to 50cm thick veins with angular phyllite wedge inclusions that appear to be concordant to phyllite bedding cleavage. In general: 37.0-37.9m: High density of 3-5cm thick quartz veining at upper contact of unit. 37.9-44.75m: Competent and only rare veining 44.75-51.9m: locally rather friable with high density quartz veining with broad 20-50cm veins with ingested, angular phyllite wedges [no discernible mineralization]	QZVN		20.0%	w			co	2
37	51.9	Black foliated and folded phyllite unit with thin, grey, lamellar silt interbedding. frequent cink folding in foliation Tecture of phyllite too fine grained to determine exact composition. 37.0-37.9m: High density of 3-5cm thick quartz veining at upper contact of unit. 37.9-44.75m: Competent and only rare veining 44.75-51.9m: locally rather friable with high density quartz veining with broad 20-50cm veins with ingested, angular phyllite wedges	MT-Phy		80.0%	n			co	1
51.9	92.1	Black Phyllite occurs as lithic clasts within conglomerate and as interbedded narrow (<15cm wide) wedges, which are not always fully penetrative. Gouged phyllite wedge fault from 75.62-75.90 meters.	MT-Phy		2.0%	n			co	1
51.9	92.1	Quartz Veining in sedimentary quatz-breccia is frequently concordant to localized foliation in rock matrix and oftne has ribbon appearance with diffuse vein boundaries. Breccia matrix seams appear to penetrate into quartz veining giving veins a breciated texture. No discernible mineralization. Vugs in veins are rust-stained from pervasive limonite oxidation in unit.	QZVN		15.0%	w			co	2

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
146.55	171.06	Quartz veining in conglomerate white interbedded phyllite wedges occurrs as generally 3-10cm thick, vuggy veinlets. Veins in phyllite interbeds tend to be <2cm thick, unless located at contacts between phyllite and conglomerate. Variable vein orienations. [see point structures] 149.3-150.0m massive quartz vein (~55TCA) Intensely pyrite mineralized, grey quartz vein breccia from 167.0-169.15m near lower contact of unit.	QZVN		10.0%	w			co	1
146.55	171.06	Quartz Pebble Conglomerate with interbedded phyllite wedges. Phyllite wedges are not always fully penetrative. Contacts between conglomerate and phyllite interbeds are concordant to phyllite compositional bedding cleavage (So). Compositon of phyllite too fine-grained to determine exact composition.	MT-Phy		15.0%	n			co	1
146.55	171.06	Quartz Pebble Conglomerate with interbedded phyllite wedges. Phyllite wedges are not always fully penetrative. Contacts between conglomerate and phyllite interbeds are concordant to phyllite compositional bedding cleavage (So). Conglomerate -- Composition: 88% grey quartz; 10% altered feldspar; 2% black lithic phyllite clasts Grainsize: 4-8mm Grainshape: subangular Feldspar has buff-creme iron-carbonate alteration from 146.55-~157.62m. Feldspar appears rust-stained and white (where unstained) from ~157.62-169.15m.	MT-CO	pbl	75.0%	gy	qtz	88	co	1
171.06	179.5	Quartz Veining in phyllite unit is generally <3mm thick occassionally intensely folded. 171.4-171.6m semi-massive quartz veining with prominent iron-carbonate patches and weakly brecciated texture	QZVN		20.0%	w			co	1
171.06	179.5	Black, foliated phyllite with lamellar grey silt interbedding. Upper contact with conglomerate is hard and competent at 60TCA concordant to phyllite bedding cleavage (So). Lower contact is defined by gouge fault. Texture of phyllite is too fine-grained to determine exact composition.	MT-Phy		80.0%	n			co	1
179.5	203.2	Quartz Veining in quartz conglomerate occurrs predominantly as 1-4cm thick high core angle 65-75TCA barren quartz veinlets with well-defined vein boundaries. Veins are densely spaced with up to 4 veinlets per 50cm. Veins are generally barren. However unit features an intensely mineralized zoned of brecciated quartz veining from 179.5-180.4m at upper contact. Matrix of breccia is intensely pyrite mineralized. Quartz Veining becomes broader and semi-massive towards lower contact of unit between 194.70-202.13 meters.	QZVN		15.0%	w			co	1

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
31.1	31.5	FZ	300.0%	DBSZ	crushed and softened, rust-stained interval with a softened intensely foliated conglomerate block with light grey chloritized seams along foliation at ~4mm spacing [low grade brittle-ducitile shearing]; high quartz content, but iron-stained feldspar clasts discernible
64.1	67.8	SZ	100.0%	DSZ	possibly low grade shearing in Quartz Conglomerate: Stretched and frequently ribboned quartz clasts surrounded by rusty matrix seams at regular (~4mm) spacing and frequent ribboned, foliation concordant quartz veining which appears with rather indistinct boundaries.
75.62	75.9	FZ	300.0%	BFZ	gouged phyllite interbed with vuggy, rust-stained quartz vein fragments contacts are concordant to So in phyllite and to alignment in conglomerate matrix
90.4	92.1	QZVN	300.0%	SHTV	densely spaced, ribboned, folation concordant, flex-folded quartz veins over 2 meter interval above contact with zone of brittle deformation; some veins are up to 20cm thic but contain aligned, chloritic, partially penetrative seams that are concordant to vein contacts [65TCA]
92.1	100.8	FZ	100.0%	BFZ	high degree of fragmentation, rust-staining, occasional partial softening and some interspersed narrow gouge wedges
99.35	99.63	FZ	300.0%	BFZ	80TCA bedded phyllite that terminates veining in sandstone bed above and contains ~15cm thick gouge section
108.25	108.65	QZVN	300.0%	bx	diffuse semi-massive quartz vein with brecciated appearance in form of angular sandstone wallrock inclusions and massive, fine grained pyrite clusters
112.6	113.1	FZ	200.0%	BFZ	softened, friable core along ~75TCA bedding cleavage
130.1	134.55	QZVN	400.0%	DBSZ	Scorodite mineralized quartz breccia with angular 0.5-4cm diameter quatz clasts surrounged by ~10 arsenopyrite-pyrite matrix. Green scorodite-after-pyrite alteration in healed fracture and as coating along open fractures. About 50% of interval is coarsely fragmented with gritty sandy clay coating. Polished 10TCA surface @~133.5 meter with slickensiding lineations along aresnopyrite coated surface [gamma angle = 40 degrees]
149.3	150	QZVN	300.0%		massive quartz vein
152.7	153.1	FZ	300.0%	BFZ	intensely rust-stained, weathered, friable and fragmented interval with both conglomerate and phyllite source material
155.5	157.62	QZVN	100.0%	bx	densely spaced, variable orienation 4-10cm thick quartz veinis in phyllite-conglomerate interbedding with prominent buff-crème iron carbonate patches; several veins contain angular phyllite wedges; also angluar vein wedges within phyllite; veining occassionally cut-off by phyllite interbed contacts
160.1	161	FZ	300.0%	BFZ	dark yellow-brown iron-stained, softened fragments and gouge
163.1	166.6	QZVN	100.0%	bx	Several broad massive (~40cm thick) quartz veins [45TCA] some with repeated healed fractures along 30TCA within conglomerate wallrock. Veins are vuggy and frequently contain angular phyllite wedges. Conglomerate clasts appear angluar and several small veins appear to blurr into matrix with aligned matrix seams occassionally crossing vein boundares.
167	169.15	QZVN	300.0%	bx	Grey, diffuse, brecciated quartz veining with a multitude of pyrite stringers and massive fine-grained pyrite clusters. Boundaries between quartz veining and conglomerate are indistinct. Zone also contains several cloudy white, ~4cm thick, 45TCA quartz veins.
173.3	173.6	FZ	300.0%	BFZ	gouged, dark orange-brown rust-stained fault in phyllite concordant to phyllite beddin cleavage [see point structures]
179.36	179.5	FZ	400.0%	BFZ	brown-black gouge fault with predominantly phyllite source materail emplaced alongside foliation concordant quartz veining along So (50TCA).
179.5	180.4	QZVN	300.0%	bx	Intensely mineralized zoned of brecciated quartz veining from at upper contact of conglomerate unit. Matrix of breccia is intensely pyrite-arsenopyrite mineralized. Arsenopyrite is very fine-grained.
186.84	187.9	FZ	200.0%	BFZ	coarsely fragmented, partially friable conglomerate fragments with grittly sandy silt coating

Project:	NTR3A	Prospect:	Green Zone	Hole ID:	3A-11-026	Grant No.:	YC72447
	Plunge:	Azimuth:	EOH:				
	60	160	306				

From	To	Mineral	Intensity	Distribution	Comments
201.95	204.1	QZVN	200.0%	BFZ	massive quartz veining, phyllite interbedding with deformed quartz-iron-carbonate-chlorite veining, fragmentation and friable core at lithological contact between conglomerate and phyllite pyrite mineralization in quartz veining [no gouge component]
209.9	210.1	FZ	300.0%	BFZ	friable fragments and gouge coating along compositional bedding cleavage in phyllite fault marks change in beta angle of So in phyllite from ~345 to ~200 (alpha remains consistent at 25-30TCA)
227.3	227.4	FZ	300.0%	BFZ	gouged, friable fragments in phyllite bounded by competent rock
238.3	241.83	QZVN	300.0%	BFZ	Broad deformed quartz veining just above lower contact of phyllite unit (with conglomerate below) with prominent iron carbonate vein patches. Friable and intensely fragmented in lowermost 60cm of interval. Disseminated pyrite and chalcopyrite in veining. Angular phyllite wedge inclusions between densely spaced veining.
249	254.85	QZVN	200.0%	bx	Deformed ,folded, densely spaced quartz-iron-carbonate veining -- frequent folded and boudinaged at upper contact of phyllite unit (with conglomerate above). Multiple gouge seams concordant to compositional bedding cleavage of phyllite just below upper contact of interval.
277.2	281.5	FZ	100.0%	BFZ	high degree of fragmentation below lithological contact between phyllite (above) and sandstone (below); partially softened and friable with narrow gouge seams
288	288.5	FZ	100.0%	BFZ	angluar, partially friable sandstone fragments with gritty sandy clay coating
298.9	301.7	FZ	100.0%	BFZ	Blocky with high degree of fragmentation in form of angluar, partially friable sandstone fragments with gritty sandy clay coating

118.1	Veins			LIM	FOL	60			frequent rust-stained, variable thickness quartz veining concordant to alignment/foliation in matrix
120.8	Cleavage		Sx			80			wispy grey, partially penetrative seams at irregular spacing within sandstone bed
121.1	Contact			LIM	FOL	80			upper contact of phyllite interbed with sandstone concordant to phyllite bedding cleavage
122.57	Faults			LIM	Gouge	90			softening and slight gouging concordant to 1cm thick phyllite band in conglomerate
123	Cleavage		Sx			55	290		alignment of dark grey chloritic matrix seams surrounding clasts in QPC interbed
125.9	Veins			chl	FOL	65	280		aligned, solid green chlorite wedges in quartz veining and in interspersed aligned, bedded phyllite wedges in conglomerate
125.9	Cleavage		Sx	chl		65	280		aligned, solid green chlorite wedges in quartz veining and in interspersed aligned, bedded phyllite wedges in conglomerate
127.93	Axial Plane		Fx			65			15cm phyllite wedge within conlgomerate with 3cm amplitude, close fold profile
129	Bedding		So			65	300		compositional bedding cleavage in phyllite interbed
129.5	Veins				bx matrix	50	135		semi-massive (~50cm thick) quartz veining with angular phyllite wedge inclusions in veining and in conglomerate wallrock
130	Faults				bx matrix	75			softened, gouged, foliated, ~5cm wedge of stretched quartz clasts in ribboned phyllite at lithological contact to higley mineralized quart breccia
130.8	Joints			sco	bx matrix	30			healed scorodite coated fractures in quartz vein breccia with asp-py matrix
132	Cleavage		Sx	asp	bx matrix	65	90		repeated mechanically induced cleavage in quart vein breccia with py-asp matrix in section of only minor brecciation
132.5	Veins		V2	asp	bx matrix	28	95		V2 is intensely brecciated and cross-cuts V1
132.5	Veins		V1	asp	bx matrix	45	200		repeated alignment of broad (up to 5cm diameter), angular quartz clasts rimmed by asp-py in quartz vein breccia also several original vein boundaries discernible.
134	Faults			sco	bx matrix	10		40	polished slickensided surface with chlorite and scorodite coating in quartz vein breccia with asp-py matrix [after V1 & V2]
134	Lineation			sco	bx matrix	10		40	polished slickensided surface with chlorite and scorodite coating in quartz vein breccia with asp-py matrix [after V1 & V2]
135	Cleavage		Sx	LIM	bx matrix	60			alignment of rusty seams in sedimentary breccia matrix
137.2	Cleavage		Sx	LIM	bx matrix	45	300		polished slickensided surface with chlorite and scorodite coating in quartz vein breccia with asp-py matrix

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	10.5		CASING		100.0%				co	1
10.5	36.6	0.5-3cm sheeted qzvns throughout the QPC running parallel with the foliation observed through the granule SS. Intensely brecciated zones of qzvning next to fault zones. Veins contain clasts of the wall rock.	QZVN		10.0%	w			co	2
10.5	36.6	Highly brecciated, deformed and broken QPC with several fault zones. Clasts vary in size from a granular sandstone up to 1cm diameter. Unit is also highly quartz veined. There is a pervasive foliation through the granular QPC which the Sheeted qzvning tend to follow. QPC: 90% Quartz, 10% Feldspar - Clast supported, subangular-angular, 2mm-1cm clasts	MT-CO	pbl	90.0%	bf	qtz	90	br	3
36.6	50.75	Fine grained grey SS, bedding ranges from lamella to the odd 3cm bed.	MT-SS	fgr	5.0%	gy			co	3
36.6	50.75	Black Phyllite, with penetrative foliation x-cutting bedding. Fracture filled qzvns with intense red hematite alteration. Thin grey SS lamella throughout with few thicker SS beds.<5% quartz veining. Localized zones of intense chlorite alteration typically next to qzvns.	MT-Phy	n	95.0%	n			co	3
50.75	69	Grey-Buff pbl conglomerate with 2 5-10cm zones of granule SS. QPC grades into SS with phyllite layers at 98.70m toward the contact. Pervasive foliation through granule QPC. At beginning of unit the altered fspars have been weathered away and only vugs remain. Further through unit white clay alteration dominates with rust stains. <2% 0.5-2cm Sheeted quartz veins follow foliation. QPC: Clasts: 90% qrtz, 10% fspar, subrounded 2mm-1cm	MT-CO	pbl	100.0%	bf			co	1
69	72	Black phyllite, with 1mm thick wavy quartz veins	MT-Phy	n	100.0%	n			co	2
72	86.55	qrtz veins and fractures in the phyllite have been altered by hematite. Phyllite bedding highly folded	MT-Phy	n	20.0%	n			co	2
72	86.55	Dominantly pbl size QPC with zones of granule size clasts. Beds of black phyllite 5cm-20cm at beginning of unit. QPC-phyl contacts are concordant with phyllite bedding. Some contacts are folded. Zones of intense shearing in QPC where quartz clasts are intensely stretched and elongated. QPC: composition of QPC clasts varies depending on grain size. Pebble QPC: 90% Qrtz, 10% Fspar. Granule QPC: 80% qrtz, 20% fpsar. Alteration is dominantly white clay and limonite smgr and in fractures.	MT-CO	pbl	80.0%	bf	qtz	85	co	2

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
253.25	258.25	Fine-grained grey sandstone with both thin laminations and thicker beds of black to dark grey phyllite interbedded. Some zones where green colouration from chlorite and sericite alteration subsumes the grey colouration. Some zones may be more properly identified as siltstone. Abundant quartz veining (7%) along with lesser carbonate (2%) and quartz carbonate (3%) veining some of which is carrying minor pink rhodochrosite. There are also lesser dark almost massive sulfide veining cutting in some places.	MT-SS	fgr	70.0%	gy			co	3
258.25	259.25	white to slightly cream discolored veining ranging in size from 0.2 - 4 cm in width. Generally at moderate angles to the core.	QZVN		15.0%	w			co	1
258.25	259.25	pale green to beige coloured fine-grained sandstone with a bleached appearance. Reasonably abundant quartz veining and moderately abundant chlorite veinlets parallel to foliation.	MT-SS	fgr	85.0%	t			co	2
259.25	259.95	Abundant quartz veining with irregular, pinch and swell shapes tending to run parallel to foliation and ranging from 0.05 - 6 cm in width (often within the same vein)	QZVN		25.0%	w			co	1
259.25	259.95	Black phyllite showing a wavy to disrupted foliation and extremely abundant quarz veining with strong clay sericite alteration halos. Minor zones almost brecciated by the veining.	MT-Phy	bx	75.0%	n			co	3
259.95	262.1	white to slightly cream discolored veining ranging in size from 0.2 - 4 cm in width. Generally at moderate angles to the core.	QZVN		20.0%	w			co	1
259.95	262.1	pale green to beige coloured fine-grained sandstone with a bleached appearance. Reasonably abundant quartz veining and moderately abundant chlorite veinlets parallel to foliation.	MT-SS	fgr	80.0%	t			co	2
262.1	276.5	Minor greyish green fine-grained sandstone rarely interbedded with the darker phyllite.	MT-SS	fgr	5.0%	g			co	3
262.1	276.5	Quartz veining ranges in thickness from 1mm - 5cm. The thinner veining shows distinclty tigmatic veining structures almost without exception. The quartz veins contain and are borderd by dusty pale green alteration of phyllite that is likely made up of sericite, clay and minor chlorite.	QZVN		15.0%	w			co	1
262.1	276.5	Black to deep grey to slightly green altered phyllite. Pervasive foliation is at a high CA and appears to be axial planar to the tigmaticly folded quartz veining.	MT-Phy		80.0%	n			co	3
276.5	276.8	Contact zone between the phyllite and a fg sandstone. The texture is not so much interbedded as brecciated. It is possible that the sandstone has ripped up large (ranging from 10-1cm) clasts of the phyllite.	MT-SS	fgr	40.0%	gy			co	2
276.5	276.8	Contact zone between the phyllite and a fg sandstone. The texture is not so much interbedded as brecciated. It is possible that the sandstone has ripped up large (ranging from 10-1cm) clasts of the phyllite.	MT-Phy		60.0%	n			co	3
276.8	277.9	Minor black rip-up clasts of phyllite within the sandstone.	MT-Phy		5.0%	n			co	3
276.8	277.9	Still a contact zone between the sandstone and phyllite. Now very predominantly a fine-grained pale grey to greenish sandstone with ~2-5% phyllite rip-up clasts. Sandstone shows a penetrative fabric and possibly some folded/boudinaged mgr beds that are now tretched and pinched to almost stretched pebble appearance except that they blend so well with the host.	MT-SS	fgr	95.0%	gy			co	2
277.9	281.9	Interbedded grey to to minor buff sections of medium and fine-graiend sandstone. Abundant white quartz and white to buff quartz-carbonate veining ranging from 0.05-5 cm in width. Some veining shows folding whilel others appear to be planar. Many different orientations.	MT-SS	fgr	15.0%	gy			co	2
277.9	281.9	Interbedded grey to to minor buff sections of medium and fine-graiend sandstone. Abundant white quartz and white to buff quartz-carbonate veining ranging from 0.05-5 cm in width. Some veining shows folding whilel others appear to be planar. Many different orientations.	QZVN		15.0%	w			co	1
277.9	281.9	Interbedded grey to to minor buff sections of medium and fine-graiend sandstone. Abundant white quartz and white to buff quartz-carbonate veining ranging from 0.05-5 cm in width. Some veining shows folding whilel others appear to be planar. Many different orientations.	MT-SS	mgr	70.0%	gy			co	2

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
21	22.15	QZVN	300.0%	stwk	Highly folded and brecciated STWK qzvns above BFZ
22.15	26.28	FZ	300.0%	BFZ	BFZ-fragmented QPC blocks <5cm. Lots of wcy alteration and lim altn
27.6	28.7	QZVN	300.0%	bx	Massive and highly bx quartz vein with lim altn along fracs
32.5	36	FZ	300.0%	BFZ	BFZ-fragmented QPC blocks <5cm. Wcy alteration intense lim altn along broken faces and fractures
43.2	43.5	QZVN	300.0%	mass	Massive competent quartz vein with minor lim alteration
75.6	76.8	FZ	200.0%	BFZ	BFZ and phyl gouge with hem alteration
111.6	115	SZ	400.0%	DBSZ	Brittle-Ductile sheared phyllite with boudinaged qzvns. Brecciated QPC with brecciated qzvn.TVA altered to chlorite in phyl. Hem and lim altered qpc bx
127.8	128.6	SZ	300.0%	DBSZ	Sheared SS and phyl with sheared offset SHTVs. Chaotic veining in the phyl with hem altn
134.4	136	FZ	300.0%	BFZ	BFZ fragmented into blocks <5cm mineralized on the surface of fractures with scorodite and mod limonitic.
142.5	146.15	QZVN	400.0%	mass	Qzvn with chlorite stringers and limonitic alteration
168.8	172.6	FZ	300.0%	BFZ	brittle ductile characteristics in phyllite boudinaged vns, chaotic deformation. Phyl gouge zone and bx qzvn at end of fault.
189.2	193.8	QZVN	300.0%	bx	highly silicified and brecciated qzvns and qpc, pervasive chlorite altn
192	193.5	FZ	300.0%	BFZ	broken and shattered qzvn and qpc
203.75	210.1	QZVN	200.0%	bx	broken/fragmented quarzt breccia. Angular qrtz clasts, highly silicified with chl altn
206.6	209.2	FZ	300.0%	BFZ	faulted qpc and qzvns with phyl gouge and qbx
217.8	219	QZVN	400.0%	mass	~1m thick qzvn with fecb altered qpc and chl stringers
220.25	221.2	FZ	300.0%	BFZ	crush and fragmented chloritized qpc and qzvn after 1m qzvn. No gouge
241.69	241.95	QZVN	100.0%		large quartz-carbonate vein with abundant vugs and very minor pyrite
248.4	248.8	QZVN	100.0%	TVA	White quartz-carbonate tension vein array
262.1	256.75	QZVN	200.0%	TVA	Abundant white quartz tension vein arrays many of which appear to have undergone intense deformation/folding
269.1	274.1	QZVN	200.0%	TVA	Abundant white quartz tension vein arrays many of which appear to have undergone intense deformation/folding
281.9	283.12	QZVN	100.0%	TVA	Abundnat (10%) white qtz-carboante tension vein arrays
288.92	294	FZ	300.0%	BFZ	Very abundant zones of clay fuault gouge… the more competent sections show signs of minor brecciation.
298	300.1	FZ	300.0%	BFZ	Very abundant zones of clay fuault gouge… the more competent sections show brecciation.
300.1	301.3	QZVN	200.0%	bx	Quartz veins weakly brecciationg thre rock. Brecciation dereasing away from fault zone
306.75	309.5	FZ	300.0%	BFZ	Rubbly, fragmented core from abundant small brittle fault zones cutting the rock.
317.95	318.5	FZ	400.0%	gouge	muddy phyllitic/sandy gouge zone
320.45	321	SZ	200.0%	DBSZ	Sheared qpc, elongated qtz clasts and semi penetrative seams through matrix
324.45	327	QZVN	300.0%	bx	faulted qz bx zone with brecciated qpz, chlorite alteration in fracs
339.2	339.6	SZ	200.0%	DBSZ	sheared phyllite with TVA qzvns altered by chlorite
342.85	347.5	SZ	200.0%	DBSZ	sheared phyllite with TVA qzvns altered by chlorite

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
251.1	Veins			qtz	SHTV	25	300		Quartz vein set with minor carbonate, abundant pyrite and sphalerite. Appears to be cutting earlier less sulfide-rich vein set described at the same location
251.2	Veins			qtz	SHTV	55	231		White quartz vein set that dominates the interval.
252	Bedding	46	So			70	72		Bedding contact between fg sandstone and phyllite. Very sharp.
252.5	Veins			qtz		55	43		White to cream-coloured quartz-carboante vein. Carbonate concentrated in centre of vein.
253.7	Veins	38			SHTV	55			2 0.5cm spaced shtv qzvns
258.8	Veins			qtz	SHTV	75	280		Qtz-carbonate vein set with up to 5% pyrite, 3% asp.
259.45	Cleavage	4	S1			50	230		
259.95	Bedding	46	So			70	165		
261.15	Veins			qtz	SHTV	50	305		Qtz-carboante vein set with up to 5% pyrite and 1% arsenopyrite
261.2	Veins			qtz	SHTV	80	0		Qtz-carbonate vein set with up to 10% pyrite and minor, 1%, asp. Cuts vein at 261.15 and displaces it out of core.
267.15	Veins			qtz	SHTV	55	178		tigmatically folded with approximately 2% pyrite.
267.6	Cleavage	5	S2			85	347		Axial planar cleavage around whcihc S1 and many of the quartz veins are folded
269.5	Cleavage	5	S2			70	182		Axial planar cleavage aroudn which quartz veining and S1 is folded
270.8	Cleavage	4	S1			50	10		Foliation within the phyllite… folded by S2 parallel to some qtz veins while seeming axial planar to some of the folding in the quartz veining.
270.92	Bedding	46	So			35	180		Bedding contact between sandstone and phyllite
273.7	Veins	38		qtz		60	165		qtz veins with a braided, brecciating character off of which abundant perpendicular splays of tension veining branch off.
275	Cleavage	5	S2			35	190		penetrative cleavage.. Looks to be subtly crenulating S1
275.1	Veins	5		qtz	SHTV	55	198		wavy quartz vein with minor pyrite.
275.2	Cleavage	4	S1			25	35		penetrative cleavage
275.35	Veins	38		qtz		15	260		qtz vein with abundant (30%) pyrite. Shows some disruption/displacement and a slight wavyness (gently folded?)
275.8	Veins	38		qtz		30	315		Banded quartz-carbonate vein with abundant pyrite and some possible trace sphalerite. Vein is cut and displaced
275.85	Faults	78		qtz		40	181		parallel microfaulting set with minor qtz stringers… displace qtz carbonate veins in a reverse direction (likely a strike-slip component as well but not visible) displacement ranges from 2mm to 1cm.
281.9	Veins	38		qtz	Veinlets	25	130		parallel to bedding contact with abundant pyrite
281.9	Bedding	1	So			25	130		bedding contact between sandstone and phyllite. Seems to be fining upwards
281.95	Cleavage	17	Sx			70	130		penetrative cleavage in phyllite
283.12	Bedding	46	So			60			bedding contact between phyllite and sandstone
283.15	Veins	38		qtz	Open	20			Very vuggy quartz carbonate veins with abundant cubic pyrite and sphalerite
285.65	Veins	38		py		30			small almost entirely pyrite stringers
293.4	Fold axes	18	F1			50			isoclinal folding of bedding
296.4	Veins	38		qtz	SHTV	50			qtz-crb-pyr-asp vuggy veining cuts the shallower angle qtz-crb veining
296.4	Veins	38		qtz	SHTV	5			qtz-crb-pyr-asp vuggy veining cut by other veining
296.4	Veins	38		py	Veinlets	50			pyrite-aspy veinlets
296.4	Veins	38		asp	Veinlets	85			Stringers composed almost entirely of aspy

Project: NTR3A **Prospect:** Green Zone **Hole ID:** 3A-11-027 **Grant No.:** YC72447

Plunge: 75 **Azimuth:** 160 **EOH:** 354

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
296.4	Veins	38		py	Veinlets	10			pyrite-aspy stringers
297.5	Veins	38		qtz	SHTV	65			Set of large (2-6cm wide) white quartz vein cut by stringers and qtz-crb veining minor sulfides on vein margins.
300.2	Cleavage	4	S1			80			penetrative foliation and fold axis of So
300.25	Cleavage	5	S2			20			spaced cleavage and fold axis of crenulations in S1
301.6	Veins	38		asp	SHTV	30			asp-py veinlet set
301.75	Cleavage	4	S1			80			spaced to penetrative foliation and axial plane to folding in a quartz vein
307.4	Bedding	46	So			45			Bedding contact between phyllite and sandstone
310	Cleavage	4	S1	qtz		70			penetrative foliation in QPC along which qtz pebbles are lining up and merging.
312.6	Veins	38	V1	qtz		50			Large (2 cm) white quartz vein with minor carbonate at fringes… is cut and displaced by qtz vein with 85CA and a banded qtz-crb-chlorite vein with 45CA
312.6	Veins	38	V2	qtz		45			Thin (0.5 cm) banded qtz-crb-chlorite vein that cuts and displaces qtz vein with 50CA.
312.6	Veins	38	V2	qtz		85			Large (3 cm) white quartz vein with minor carbonate at fringes… cuts and displaces qtz vein with 50CA. This steep CA vein set is the dominant vein set within this lithology interval.
320.5	Cleavage	4		fecb	FOL	55			Sheared elongated qtz clasts in qpc with penetrative seams, shtv follow same plane
320.65	Veins	38		fecb	SHTV	55			1cm thick shtv qzvns, 2-10cm spacing
329.45	Veins	38		chl	TVA	35			0.5cm thick, 3 cm long qtz tension veins. This measurement is the shear zone boundary
329.45	Veins	38		chl	TVA	25			0.5cm thick, 3 cm long qtz tension veins. This measurement is the qzvns
332.8	Veins	38		fecb	Drusy	80	212		1cm thick shtv with vugs throughout
333.15	Cleavage	4			FOL	65	180		penetrative seams thru SS
333.2	Contact	46		fecb	bed	75			contact between SS and qpc in interbedded zone
334.15	Faults				Gouge				10cm long phyllitic gouge zone
336.85	Veins	38		chl	SHTV	75	74		0.5-1cm thick sheeted veins throughout phyl/SLT
339	Bedding	46			bed	80	62		phyllite SLT bedding
342.4	Cleavage	4			FOL	55	182		shinny phyllitic cleavage in phyl and slt beds
342.75	Contact	46			bed	50	160		phyllite SLT bedding
345	Bedding	46			bed	70	60		phyl SLT bedding planes
347.7	Cleavage	4			FOL	65	95		penetrative foliation in phyllite

Datum:	**UTM Zone:**	**Grid N:**	**Grid E:**	**Core Size:** HQ	**Contractor:** Driftwood	
NAD83	9					

Objective:
Follow up to 3A-11-026/027. It is stepped back 50m to the NW and 50m to the NE in order to test the broad sandstone hosted arsenopyrite interval intersected in 026 and 027.

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	9	Casing	Overburden		100.0%					
9	13.25	Gry QPC w/ 10% wh cy alt fspar grns and 20% wh to gy qz grns, 0.2-0.4cm (granules size). Wk yel-biege lim alt along fracs and locally concentrated in fspar grns. Fspar grns preferentially weathered (recessive) due to cy comp. Lim alt intensifies as get closer to lower contact w/ interbedded phy-QPC.	MT-CO	grn	100.0%	gy	qtz	20	br	1
13.25	17	2cm wh sheeted QV w/ syntaxial and antiaxial lim fracs x-cutting, wk lim alt. Only occur in QPC.	QZVN	frac	0.0%	w			co	1
13.25	17	Vfgr, blk, well fol (penetrative) w/ 1mm interbeds of gry slt w/ wk fecb alt (red-or) along S0. Occur as interbeds in altered QPC. Sharp irregular contacts. Locally have QPC pbl in phy (soft sed def?).	MT-Phy	fol	45.0%	n			fr	3
13.25	17	Gy QPC w/ 0.2-5cm pbl, dom in 0.4-0.7cm range, pbl are sub angular (phy) to rounded. Clast supported w/ 40% wh-gy qz pbl, 20% (3/4 are or lim alt, 1/4 red hem alt) recessive fspar pbl, 3% blk phy pbl. Wk fecb alt along hairline fracs, mod lim alt along hairline fracs + selectively in fspar pbl.	MT-CO	pbl	55.0%	gy	qtz	40	co	2
17	23.7	Tr 1-2cm wh sheeted QV in pbl QPC w/ lim alt antiaxial fracs.	QZVN	frac	1.0%	w			co	2
17	23.7	Matrix (cgr sndst) supported QPC w/ 0.1 to 0.4cm subrounded to rounded clasts (granule size) interbedded w/ pbl QPC. 1% vfgr blk subangular lithic grns, 15% recessive lim alt fspar grns, 30% wh-gry qz grns. Wk lim alt along fracs and fspar grns.	MT-CO	grn	20.0%	gy	qtz	30	co	2
17	23.7	Clast supported QPC w/ 15% wh (1/2 wh cy alt) to or (1/2 lim alt), 2% lithic (vfgr blk), 70% gry-wh qz pbl measuring 0.5-0.7cm. Wk lim alt along fracs and fspar grns. Locally grns elongated along some kind of fabric, unclear whether it is bedding or foliation.	MT-CO	pbl	79.0%	gy	qtz	70	co	2
23.7	27	0.5-1cm sheeted QV w/ lim antiaxial fracs x-cutting. One 20cm fault fill vn w/ lim antiaxial and syntaxial fracs. Some QPC incorporated into vn plus lim vugs.	QZVN	frac	5.0%	w			co	2
23.7	27	Blk, vfgr, well fol (penetrative) w/ 1mm gy slst interbeds. Mod lim alt along bedding/fol/fracs. Occur as interbeds in QPC w/ sharp irrecgular contacts. Some are v. lrg clasts in QPC, so layers may actually just be lrg phyl boulders in QPC??	MT-Phy	fol	15.0%	n			fr	3
23.7	27	Clast supported pbl QPC w/ 0.2-1cm pbl. 60% wh>gy qz pbl, 15% recessive lim/cy alt or fspar pbl, 2% subangular vfgr blk lithic pbl. Mod lim alt along x-cutting hairline fracs and in fspar grns. X-cut by sheeted QV + one thicker 20cm fault fill QV. 5cm gouge zone at base of interval.	MT-CO	pbl	80.0%	gy	qz	60	co	2
27	30	Interval of gy QPC gouge w/ mod lim alt of gouge. More competent pieces have subrounded to rounded 0.2-0.5cm pbl w/ 10% wh cy alt fspar pbl and 60% gy qz pbls that tend to be 0.4cm (smaller than fspar) and 1% subangular lithic.	MT-CO	gouge	100.0%		qtz	60	lc	4

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
19.55	23	QZVN	300.0%	bx	Qtz Bx zone with intense lim altn throughout matrix
19.55	42.85	FZ	300.0%	BFZ	~20m thick fault zone with qtz bx, phyl gouge and broken/blocky qpc and phyl
61.7	62	QZVN	300.0%	SHTV	2 10cm thick SHTVs 5cm spacing. Qtz has orange hue from lim alteration
74	79.1	FZ	300.0%	BFZ	broken/fragmented qpc with Qtz Bx at end of fault
79.1	79.45	QZVN	300.0%	bx	Qtz Bx zone with silicification throughout matrix and chlo stringers
79.85	83.55	QZVN	300.0%	bx	Qtz Bx zone. Mod shearing, mod silicification and chloritization of matrix. Angular clasts up to 1cm diameter
90.2	93.4	SZ	300.0%	DBSZ	Sheared qpc and qzvns, elongated clasts with penetrative fabric. SHTV and TVA veins
98.25	101	QZVN	300.0%	bx	QzBX zone w/ strong silicification
109.6	112	FZ	200.0%	BFZ	Broken phyllite fault zone. Minor hem altn in fractures, gouge at beginning of fault @ 109.60m
145	147.9	QZVN	300.0%	bx	QzBX zone, strong silicification and minor chl alteration along fracs
187.35	189	SZ	400.0%	DBSZ	Intense shear zone through clast supported pbl QPC. QPC clasts have become wedged shaped, length:width ratio is 3:1.
227.2	231.7	FZ	300.0%	BFZ	Broken/Blocky phyl/SS fault zone, minor gouge, py mineralisation
234	240	FZ	300.0%	BFZ	Brittle fault zone in phyl/SS with phyl gouge zone highly mineralised with py+asp- up to 90% sulphides
264	270	FZ	200.0%	BFZ	Brittle fault zone through QPC with qzvns
266	267.2	QZVN	300.0%	bx	Qzt breccia zone within BFZ
279.2	279.55	SZ	300.0%	DBSZ	Strong shear zone of QPC, TVA qzvns. Stong silicification blurring qzvns and QPC grain boundaries
280.1	283.8	FZ	200.0%	BFZ	Faulted QPC/SS with phyllite gouge and graphite coating
292	299.8	SZ	200.0%	DBSZ	Moderate shear zone of QPC with TVA qzvns throughout. Mod silicification blurring qzvns and QPC grain boundaries
312		FZ	200.0%	BFZ	Broken/Fragmented QPC/SS

Point Structure

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
14.6	Veins			LIM	mass	10			20cm qzvn with lim altn
15.75	Bedding		So	hem	bed	35			congruent phyl/qpc bedding with strong pervasive hem altn
23.6	Faults			LIM	Gouge				highly fragmented, wcy and lim gouge zone
32.9	Faults				Gouge				fault gouge after qtz bx, before phyl unit
33.6	Veins		S1		qzvn	30			0.5cm thick folded qzvn following phyllite So, angle bw So and AXP is 80
43	Bedding			LIM	bed	75			blk phyl bedding plane w/ lim altn
45.5	Veins			LIM	SHTV	35			2 shtvs. 1st vein 1cm thick, 2cm spaced, 2nd vein 5cm thick. Lim altn
53.8	Cleavage	17	Sx	LIM	FOL	65			semi penetrative fabrix through granule qpc
58.3	Veins			SIL	SHTV	50			
61.5	Veins			LIM	SHTV	45			
71.15	Cleavage	17	Sx	LIM	FOL	65			1-2cm spaced semi-penetrative seams altered by lim
81	Veins			SIL	QBX				silicified and chloritized quartz bx zone. Angular clasts up to 1cm diameter
85.35	Veins			LIM	STWK				5mm thick array of stockwork veining in qpc
91.8	Cleavage		Sx	LIM	FOL	70			long axis of elongated qtz clasts, and semi penetrative fabric thru QPC
92.8	Cleavage		Sx	SIL	FOL	30			5mm spaced semi penetrative seams through QPC
92.8	Veins				SHTV	35			1cm thick, 5 cm spaced sheeted qzvns
98.25	Veins			SIL	STWK				2-4mm thick stockwork vn array at beginning of qtz bx zone
103.85	Bedding		So	LIM	bed	35			phyl/SLT lamella
106.3	Cleavage		S1		FOL	65			penetrative foliation through phyllite and silstone lamella causing wispy flames off bedding planes
108	Cleavage		S1		AXP	70			orientation of plane that connects fold axis' of SLT lamella in phyllite
109.6	Faults			LIM	Gouge				10cm phyllite gouge zone
110.8	Veins				SHTV	50			2cm thick vn with lim altn in fracs

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
240	Faults			py	Gouge				Muddy phyllite gouge zone with 40% py and 10% asp mineralisation
245	Bedding		So		bed	50			Compositional phyllite/SS bedding
246.8	Faults			py	Gouge				10cm thick phyllite gouge with 10% py mineralisation
247.4	Veins					25			0.5cm thick vn following S1
247.7	Bedding		So		bed	45			Compositional Phyl/SS bedding
247.9	Cleavage		Sx		FOL	25			Semi penetrative wispy cleavage lines causing flares along phyl/SS bedding planes
252.1	Veins				CTV	15			0.5cm vuggy comb textured qzvn
253.4	Cleavage		S1		FOL	60			Semi penetrative cleavage causing flares along phyl/SS bedding planes
257.4	Bedding		So		bed	55			Compositional phyl/SS bedding
260.6	Veins					20			2mm thick qzvn
263	Bedding		So		bed	40			Compositional phyl/SS bedding
270	Veins					50			1cm thick qzvn
273.9	Veins			cy	SHTV	65			4 1cm thick, 25 cm spaced sheeted qzvns. Angle bw sheeted vein arrays is 40 degrees
273.9	Veins			cy	SHTV	15			1 0.5cm thick, and 1 3cm thick sheeted qzvns. Angle between different SHTV arrays is 40
276.15	Cleavage		S1		FOL	90			Penetrative cleavage in phyl causing flares along phyl/SLT bedding planes
276.2	Bedding		So		bed	50			Compositional phyl/SLT bedding
276.5	Bedding		So	cy	bed	45			Compositional SS bedding
277.8	Cleavage		Sx		FOL	55			Semi penetrative seams and faint alignment of wcy alteration throughout QPC/SS matrix
282.5	Veins				qzvn	55			Single 1cm thick qzvn
287.2	Veins				SHTV	55			3 2mm thick sheeted qzvns
292.7	Lineation			cy	SZB	30			TVA shear zone boundary
296.6	Veins			cy	SHTV	25			Series of low angle 2mm thick Sheeted qzvns
299.65	Lineation			cy	SZB	15			TVA shear zone boundary
304.6	Veins				SHTV	65			3 0.5cm thick, 10cm spaced sheeted qzvns
308.7	Cleavage		Sx	cy	FOL	55			Semi penetrative seams and alignment of faint clasts in QPC/SS
311.5	Cleavage		Sx	SIL	FOL	50			Semi penetrative seams through strongly silicified QPC/SS
316.5	Cleavage		Sx		FOL	50			Alignment of clasts in pbl QPC
320.7	Veins				TVA	30			Orientation of 10 TVA qzvns 0.5cm-1cm spaced
321.6	Veins				TVA	40			Orientation of TVA boundary
325.8	Cleavage		Sx		FOL	55			0.5cm spaced penetrative seams through SS
328.3	Bedding		So		bed	55			QPC pbl/SS compositional bedding
332	Veins				SHTV	40			3 0.5cm sheeted qzvns
333.6	Cleavage		S1		AXP	70			Axial planar cleavage measured from folded 0.5cm thick qzvn following phyl bedding, angle bw So and AXP is 80
333.6	Bedding		So		bed	30			0.5cm thick phyllite bed containing a folded qzvn, angle bw So and AXP is 80
336.7	Veins				SHTV	65			2 1cm thick sheeted qzvns, 3cm spacing
342.85	Veins				SHTV	40			20-25 2mm thick sheared sheeted qzvns
344.6	Cleavage		Sx		FOL	65			Weak semi penetrative seams and aligned QPC clasts
356.4	Bedding		So		bed	60			SS/phyl compositional bedding
357.65	Faults				Gouge				phyllite gouge zone

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

North Zone

Diamond Drill Log and Sample Summary

Project: NTR3A **Prospect:** North Zone **Hole ID:** 3ANZ-11-0 **Grant No.:** YC72728

Location

Easting:	Northing:	Latitude:	Longitude:
533910.4	6844320.4		

Elevation: 1565 m **Grid Name:** NA

Datum:	UTM Zone:	Grid N:	Grid E:
NAD83	9		

Orientation

Plunge: 60
Azimuth: 160
EOH: 194.0 m
Core Size: HQ

Start Date: 01/10/2011
Finish Date: 08/10/2011
Status: Completed
Contractor: Driftwood

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality
21	60.3	159.64	5828	Reflex	1
105	59.8	158.04	5815	Reflex	1
174	60.7	160.44	5820	Reflex	1
194	60.7	160.04	5826	Reflex	1

Objective:

To test the North Zone mineralisation at depth. The surface target is the priniciple VG outcrop. The intent of this drill hole is to determine the thickness of the QPC at this location and establish improved controls on the geometry of the fault hosting the vein system. Target depth is approximately 45 m.

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
4.6	5	White bull qzvn at top of unit after casing. Minor lim staining along core surface and in fracs	QZVN		100.0%	w			co	1
5	26.35	Sheeted and TVA arrays throughout QPC unit, dominantly lim altered.	QZVN		5.0%	w			co	2
5	26.35	Buff pbl QPC. Pervasive lim+rust alteration throughout sections of unit with alteration of fspar clast, clast boundaries and fractures.Minor chl and fecb alteration of fspar in sections. Unit is both competent and broken. QPC filled with Sheeted and TVA qzvns, surrounded by silicified matrix. Clasts: Clast supported, subangular-subrounded, 0.5-2.5cm clasts. Fecb and chl alteration of fspar clasts with lim+rust pervasive overprinting. 95% qtz, 4% fspar, <1% lithics	MT-CO	pbl	95.0%	bf	qtz	95	co	2
26.35	29.65	Grey-green cgr SS. Chl alteration of matrix with unaltered fspar clasts. TVA arrays throughout unit. SS grades into highly angular pbl QPC at end of unit toward a zone of intensely veined QPC with lim alteration	MT-SS	cgr	100.0%	gy-g	qtz	95	co	2
29.65	58.1	Sheeted and TVA arrays throughout QPC unit, dominantly lim altered.	QZVN		5.0%	w			co	2

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

	60	160	194				

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
29.65	58.1	Beginning of unit is a 10-15cm cobble QPC with a SS matrix which grades into a buff pbl QPC. Zone of intense qzvning and pervasive lim alteration of QPC matrix immediately after cobble QPC. Pervasive lim+rust alteration throughout sections of unit with alteration of fspar clast, clast boundaries and fractures. Minor chl and fecb alteration of fspar in sections. Unit is both competent and broken. QPC filled with Sheeted and TVA qzvns. Sections of silicified matrix where qzvns are prevalent. From 42.35-44.10m there is a QPC sedimentary Breccia, angular, mod sorted ~0.5cm clasts with strong lim alteration in matrix seams. Clasts: Clast supported, subangular-subrounded, 0.5-2.5cm clasts. Fecb and chl alteration of fspar clasts with lim+rust pervasive overprinting. Sheard zones where QPC clasts are elongated. 95% qtz, 4% fspar, <1% lithics	MT-CO	pbl	95.0%	bf	qtz	95	co	3
58.1	68.4	Grey cgr SS, silicified with overprinted wcy smgr alteration.	MT-SS	cgr	100.0%	gy	qtz	95	co	2
68.4	175.9	Intensely folded and faulted chaotic qzvns with chl and minor cbt alteration	QZVN		3.0%	w			lc	3
68.4	194	Intensely broken, fragmented, gouged and deformed Black phyllite with SLT lamella. Gouges vary in alteration: graphite, limonite and chlorite described in interval and point structure. QZVNS throughout are chaotically deformed	MT-Phy	gf	97.0%	n			lc	3

4.6	5.5	Diss boxwork, weathered out euh py. Replaced by rusty limonite	py	0.2	diss
4.6	5.5	Diss sub-euh asp xls diss throughout QPC matrix	asp	0.5	diss
5.5	5.8	Sparse fgr subhedral py xls in qzvns and wallrock	py	0.2	vn
5.5	5.8	Intense asp mineralisation throughout altered qzvns and wallrock contact zone. Blebs of fgr asp have altered lim halos. This is a very broken, vuggy altered zone. Asp mineralisation is also boxwork replaced by lim+rust.	asp	7	vn
5.8	10.6	Up to 1cm diameter blebs of fgr asp in qzvns and wallrock contact zones	asp	0.5	vn
5.8	10.6	Sparse fgr subhedral py xls in qzvns and wallrock	py	0.2	vn
10.6	17.8	Sparse fgr subhedral py xls in qzvns and wallrock	py	0.3	vn
10.6	17.8	Sparse blebs of fgr asp in qzvns and wallrock contact zones	asp	0.1	vn
17.8	21.1	Sparse blebs of fgr asp in qzvns and wallrock contact zones	asp	0.2	vn
17.8	21.1	Diss cgr subhedral py throughout matrix	py	2	diss
21.1	26.35	Cgr sub-euh asp xls in qzvns and wallrock, xls up to 1cm diameter	asp	1	vn
21.1	26.35	subhedral and boxwork py throughout qzvn and wallrock, replaced by lim+rust	py	0.2	vn
26.35	37	Trace py xls in vn and wallrock	py	0.01	vn
26.35	30.23	Trace asp xls in vn and wallrock	asp	0.01	vn
37	41	fgr subhedral pyrite in sheeted qzvns, veinlets and silicified wallrock	py	0.3	vn
37	41	Blebs of fgr subhedral asp in sheeted qzvns, veinlets and silicified wallrock	asp	0.2	vn
38.92	38.93	1mm speck of VG in 1cm thick low core angle, vuggy qzvn. Strong lim+rust alteration fillling in vugs and pyrite boxwork	au	1	vn
41	46.1	Blebs of fgr asp mineralisation in qzvns and in dark stingers in fault filled fractures	asp	0.1	vn
41	46.1	fgr subhedral pyrite in sheeted qzvns, veinlets and silicified wallrock	py	0.1	vn
46.1	68.4	Trace fgr py in qzvns and silified wallrock	py	0.01	vn
46.1	68.4	Trace fgr asp in qzvns and silified wallrock	asp	0.01	vn
68.4	103	Trace fgr py min in altered phyllite gouge zones	py	0.01	gouge
103	156	Trace fgr py min in chl altered intensely deformred qzvns within phyllite	py	0.01	vn
156	157.9	Fgr py blebs, completely replaced qzvns with py and py diss in the QBX	py	0.3	vn
157.9	177.5	Fgr py replacing deformed qzvns that follows compositional phyl/SLT bedding/cleavage	py	0.1	vn

Point Structure

Project: NTR3A **Prospect:** North Zone **Hole ID:** 3ANZ-11-001 **Grant No.:** YC72728

Plunge: 60 **Azimuth:** 160 **EOH:** 194

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
5	Veins			LIM	SHTV	40			2cm thick SHTV qzvn, 20 cm spacing
5.25	Veins			LIM	SHTV	40			2cm thick SHTV qzvn, 20 cm spacing
5.85	Veins		cbt	LIM	qzvn	25			Single 1cm thick low core angle cbt altered qzvn
9	Veins			LIM	SHTV	30			3 1-3cm thick sheeted veins with lim alteration along fracs and selvedge
9.5	Veins			LIM	SHTV	25			Low core angle set of 1cm thick qzvns
9.8	Veins			asp	qzvn	40			Orientation of 6cm thick qzvn
10.8	Veins			asp	qzvn	20			single 1cm thick qzvn
13.3	Veins			asp	qzvn	80			single 1cm thick qzvn
13.4	Cleavage		Sx	SIL	FOL	60			Alignment of mineral grains in QPC
13.55	Veins			SIL	TVA	5			Orientation of 2cm long, 2mm thick pinched TVA qzvns
13.6	Veins			SIL	SHTV	50			Widely spaced 1cm thick qzvns in silicified QPC
13.8	Cleavage		Ssh	SIL	FOL	65			Orientation of sheared/elongated mineral mineral grains in QPC
14.4	Veins			SIL	SHTV	55			Widely spaced 1cm thick qzvns in silicified QPC
15.7	Cleavage		Ssh	LIM	FOL	65			Sheared/elongated mineral grains in QPC
19.6	Veins		V1	LIM	qzvn	10			Single low core angle qzvn cut by V2 SHTV qzvn. Intervein angle is 35
19.6	Veins		V2	LIM	SHTV	40			Series of 0.5cm, 3-4cm spaced sheeted qzvns, intervein angle is 35
20.65	Veins			asp	SHTV	35			Series of 0.5cm, 3-4cm spaced sheeted qzvns, intervein angle is 35
22.8	Veins			LIM	SHTV	50			Few 2cm thick lim altered qzvns
25.5	Veins			LIM	mass	75			massive, fragmented lim+rust altered qzvn
26.85	Veins			chl	SZB	15			15 TCA SZB of 1cm thick tension vein
26.85	Veins		V1	chl	TVA	10			1cm thick pinched out TVA qzvn, cut by sheeted V2 veins
26.85	Veins		V2	chl	SHTV	65			High core angle 1cm thick, 20cm spaced sheeted vns
27.35	Veins		V1	chl	TVA	10			Thin pinched out and offset TVA array, cut off by V2 SHTV, intervein angle of 35
27.35	Veins		V2	chl	SHTV	55			0.5cm thick 5-10cm spaced SHTV array which x-cuts TVA array at an intervein angle of 35
29.4	Veins			LIM	SHTV	50			0.5-2cm thick SHTV array
29.55	Veins			LIM	SHTV	80			0.5-1cm thick SHTV array
30.8	Veins			LIM	qzvn	60			1cm thick qzvn
31.55	Veins			SIL	SHTV	45			0.5cm thick sheeted qzvn array
32.2	Veins			SIL	SHTV	25			1-3cm thick sheeted qzvns, 10-15cm spacing, lim altered along fracs
37.25	Veins			LIM	SHTV	35			several 2-3cm thick SHTV
37.25	Veins			LIM	SHTV	25			several 2-3cm thick SHTV
38.8	Veins			LIM	mass	55			10-15cm broken up qzvn with lim alteration along fracs
38.92	Veins			Au	qzvn	20			20 degree TCA 1cm thick qzvn with 3mm speck of VG
40.1	Veins				SHTV	20			Faint silicified sheeted veins cutting QPC
40.3	Veins				SHTV	25			Faint silicified sheeted veins cutting QPC
43.5	Cleavage		Ssh	LIM	FOL	40			Elongated, aligned mineral grains and matrix seams in shear zone
44.4	Veins			LIM	SHTV	45			0.5-2cm thick, 5cm spacing sheeted array, intervein angle 75
44.4	Veins			LIM	SHTV	55			0.5cm thick, 5cm spacing sheeted array, intervein angle 75
44.6	Cleavage		Sx	LIM	FOL	35			Semi penetrative lim altered seams in QPC

Project: NTR3A **Prospect:** North Zone **Hole ID:** 3ANZ-11-001 **Grant No.:** YC72728

Plunge: 60 **Azimuth:** 160 **EOH:** 194

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
47.9	Veins				qzvn	65			3cm thick lim altered qzvn
51.3	Veins			SIL	SHTV	45			0.5cm thick array of sheeted vns
52.8	Veins			LIM	SHTV	45			1-2cm thick sheeted array,
56.65	Contact		So	chl		80			Contact between pbl QPC and a granule QPC
58.9	Veins				SHTV	15			0.5cm widely spaced low core angle sheeted veins
61.7	Veins				qzvn	30			2cm thick qzvn
63.05	Cleavage		Sx		FOL	60			Semi penetrative silicified seams
63.6	Veins				SHTV	55			~10 2mm thick, 3-5cm spaced sheeted qzvns
63.9	Contact		So			60			Contact between grn QPC above a phyl bed
63.95	Cleavage		So			60			phyl/SLT compositional bedding/cleavae
64	Contact		So			55			phyllite seam contact
67.3	Veins				qzvn	20			2cm thick qzvn
67.7	Veins			LIM	SHTV	35			2 3cm thick, 15cm spaced SHTV
68.7	Cleavage		So			25			phyl/SLT compositional bedding/cleavae
69.1	Cleavage		So			50			phyl/SLT compositional bedding/cleavae, Angle bw So and AXP is 55
69.1	Axial Plane				FOL	75			Angle bw So and AXP is 55
74.9	Faults			gf	Gouge				Black graphitic gouge zone
76.5	Faults			gf	Gouge				Black graphitic gouge zone
78.25	Faults			chl	Gouge				Blk/green chloritic gouge zone
79	Faults			chl	Gouge				Blk/green chloritic gouge zone
80.8	Faults				Gouge				Grey gouge zone
83.8	Cleavage		S1		FOL	50			Penetrative axial planar cleavage
83.8	Veins				SHTV	50			3 0.5cm sheeted vns following S1
83.8	Axial Plane					50			folds in sheeted qzvns
87.4	Cleavage		So			85			Phyl/SLT compositional bedding/cleavage
87.4	Cleavage		S1		FOL	60			Penetrative wispy flared bedding seams
95.4	Veins			cbt	SHTV	80			3 2mm thick cbt, chl altered sheeted veinlets
102.6	Veins			cbt	mass				30cm thick qzvn with chl and cbt alteration intensely deformed
102.6	Veins			chl	mass				30cm thick qzvn with chl and cbt alteration intensely deformed
102.7	Cleavage		So			55			Phyl/SLT compositional bedding/cleavage
102.85	Axial Plane				FOL	75			Axial planar cleavage with oppositely oriented bedding on either side
102.95	Cleavage		So			45			Phyl/SLT compositional bedding/cleavage
105	Veins				STWK				Chaotic STWK qzvning in deformed phyllite
106.8	Cleavage		So			15			Phyl/SLT compositional bedding/cleavage, angle between Bedding and AXP is 45
108	Veins			chl	qzvn	45			3cm thick chl altered qzvn
109.55	Axial Plane					30			axial planar clv in phyl/SLT, angle between Bedding and AXP is 45
113.7	Veins				qzvn	75			0.5cm thick chl altered qzvn
117.3	Cleavage		So			90			Phyl/SLT compositional bedding/cleavage
119	Veins			cbt	SHTV	60			1cm thick, 1cm spaced sheeted vn array intensely altered by carbonate, vein has yellowish tinge

Diamond Drill Log and Sample Summary

Project: NTR3A **Prospect:** North Zone **Hole ID:** 3ANZ-11-0 **Grant No.:** YC72728

Location

Easting:	Northing:	Latitude:	Longitude:
533910.4	6844320.4		

Elevation: 1565 m **Grid Name:** NA

Datum:	UTM Zone:	Grid N:	Grid E:
NAD83	9		

Orientation

Plunge: 75
Azimuth: 160
EOH: 222.0 m
Core Size: HQ

Start Date: 08/10/2011
Finish Date: 14/10/2011
Status: Completed
Contractor: Driftwood

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality
45	73.5	155.64	5790	Reflex	1
138	73.8	157.34	5867	Reflex	1
192	74	161.94	5826	Reflex	1
222	74.3	162.8	5821	Reflex	1

Objective:

To test the North Zone mineralisation at depth. The surface target is the priniciple VG outcrop. The intent of this drill hole is to determine the thickness of the QPC at this location and establish improved controls on the geometry of the fault hosting the vein system. Target depth is approximately 45 m.

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
6.1	27	Intensely altered and weathered pbl QPC. Lim alteration along fractures, smgr fspar and replacing boxwork pyrite. Zones of compositional QBX. Intense interval of silicification. Thin sheeted qzvns throughout with silicification of QPC matrix. Clasts: angular-subrounded, 0.5-1cm. 95% qtz, 4% fspar, 1% lithics	MT-CO	pbl	100.0%	bf	qtz	95	co	2
27	39	Broken, Fragmented QZVN fault zone with strong lim alteration along fractured surfaces.	QZVN		100.0%	w			co	3
39	50.15	Intensely altered and weathered pbl QPC. Lim alteration along fractures, smgr fspar and replacing boxwork pyrite. Zones of compositional QBX. Intense interval of silicification. Thin sheeted qzvns throughout with silicification of QPC matrix. Clasts: angular-subrounded, 0.5-1cm. 95% qtz, 4% fspar, 1% lithics	MT-CO	pbl	100.0%	bf	qtz	95	co	2
50.15	60.85	Intensely altered and weathered grn QPC. Lim alteration along fractures and vn boundaries. Minor pervasive sil and chl alteration of QPC matrix and grain boundaries. Clasts: subangular-subrounded, 1-3mm. 98% qtz, 2% fspar	MT-CO	grn	100.0%	bf	qtz	98	co	2
60.85	109.1	Broken blk phyllite/SLT unit with minor gouge, various alteration throughout unit- lim, chl. Less than 1% thin deformed qzvns throughout unit.	MT-Phy		100.0%	n			co	3
109.1	142.6	Chaotic sheeted, TVA and stwk veins throughout deformed graphitic phyllite unit altered by chlorite and carbomate.	QZVN		5.0%	w			fr	4
109.1	142.6	Intense folded/deformed, faulted phyllite with ~3-5% chaotic qzvning. Graphitic coated gouged zones.	MT-Phy		95.0%	n			fr	4
142.6	143.1	Broken, fragmented QBX zone with chl, chl alteration	QZVN	bx	80.0%	w			fr	4
143.1	168.7	Chaotic sheeted, TVA and stwk veins throughout deformed graphitic phyllite unit altered by chlorite and carbomate.	QZVN		5.0%	w			fr	4
143.1	143.1	Broken, gouged phyl in breccia zone	MT-Phy	bx	20.0%	n			fr	4
143.1	168.7	Intense folded/deformed, faulted phyllite with ~3-5% chaotic qzvning. Graphitic coated gouged zones.	MT-Phy	gf	95.0%	n			fr	4
168.7	170.2	Broken, gouged phyl in breccia zone	MT-Phy	bx	20.0%	n			co	4
168.7	170.2	Broken, fragmented QBX zone with chl, chl alteration	QZVN	bx	80.0%	w			co	4

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Project:	NTR3A	Prospect:	North Zone	Hole ID:	3ANZ-11-002	Grant No.:	YC72728
Plunge:	Azimuth:	EOH:					
75	160	222					

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
170.2	174	Chaotic sheeted, TVA and stwk veins throughout deformed graphitic phyllite unit altered by chlorite and carbomate.	QZVN		5.0%	w			co	4
170.2	174	Intense folded/deformed, faulted phyllite with ~3-5% chaotic qzvning. Graphitic coated gouged zones.	MT-Phy	gf	95.0%	n			co	4
174	189.4	High density of deformed quartz veining between 174.00-175.20m. But generally only minor thin vein seams.	QZVN		1.0%	w			fr	2
174	189.4	Logged by Doreen Hacker: Black graphtic phyllite that is softened and friable troughout. Rather blocky and broken between 174.00-178.00m. Texture of phyllite is too fine-grained to determine exact composition. Generally only minor grey, laminar silt interbedding.	MT-Phy	gf	99.0%	n			fr	2
189.4	197	White quartz veins with frequent acid soluble calcite wisps in veining. Veining ranges from 1-4cm tin thickness and is generally deformed and/or sheeted. Often as tension vein arrays. High density of broad veining at lower contact of unit with another phyllite unit below that differs significantly in vein intensity.	QZVN		5.0%	w			co	2
189.4	197	Generally competent black phyllite unit with minor grey laminar interbedding (So). Texutre of phyllite is too fine-grained to determine exact composition. Multiple parasitic profiles discernible.	MT-Phy		95.0%	n			co	1
197	222	Quartz veining in phyllite is generally <2cm thick and has small calcite wisps. Veining runs discordant to So and genrally axial planar or axial planar parallel to flex-folding/low amplitude parasitic fold profiles in So.	QZVN		1.0%	w			co	1
197	222	Black phyllite with ~5% grey laminar silt interbedding (So) and generally competent throughout. Minor localized gouge seams -- see point structure. Bounded by graphitic phyllite above and high density quartz veining bounding upper contact. Texture of phyllite is too fine-grained to determine exact composition. Frequent parasitic fold profiles and flexing in bedding.	MT-Phy		99.0%	n			co	1

Alteration

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
171.5	Faults				QBX				phy/qtz gouge
171.5	Faults				Gouge				phy/qtz gouge
174.2	Veins			chl	SHTV	55			2cm thick strongly chl altered qzvn in a sheeted array
175.05	Veins				SZB	30			Orientation of shear zone boundary of TVA qzvns
175.55	Faults			gf	Gouge				gf phyl/ gouge
176.4	Bedding		So			20			compositional bedding in friable graphitic phyllite
181.65	Veins					30			multiply folded vein seam in friable graphitic phyllite; intersects So at 20 degrees
181.65	Bedding		So			20			compositional bedding in friable graphitic phyllite
183.5	Cleavage		S1			40			S1 intersects So at 70 degrees
183.5	Bedding		So			20			compositional bedding in friable graphitic phyllite
185.5	Veins			fecb	SHTV	30			deformed, densely spaced quartz-iron-carbonate veinlets in friable, graphitic phyllite over 60cm width
189.4	Faults				Gouge	25			lower contact of friable graphitic zone against competent phyllite
189.4	Contact				Gouge	25			lower contact of friable graphitic zone against competent phyllite
189.4	Veins				SHTV	25			densely spaced paralellel veinlets at gouge contact
190	Bedding		So			60			compositional bedding in phyllite
190	Cleavage		S1			40			S1 intersects So at 20 degrees
192	Veins			fecb	TVA	70			mulitple, densely spaced tension vein arrays over 30cm width
192.7	Veins			cbt	SHTV	70			3 deformed vein wedges over 10cm width
192.8	Veins			cbt	SHTV	20			three 1-2cm thic veins over 50cm width
193	Cleavage		S1			70			S1 intersect So at right angles
193	Bedding		So			20			compositional bedding in phyllite
194	Bedding		So			20			compositional bedding in phyllite
194	Cleavage		S1			60			S1 intersects So at 45 degrees
194.7	Bedding		So			0			compositional bedding in phyllite
195.6	Bedding					20			compositional bedding in phyllite
196	Veins					45			compositional bedding in phyllite
196.3	Bedding		So			40			compositional bedding in phyllite
196.6	Veins			chl	bx matrix	50			upper contact of 15cm thick quartz vein with angular phyllite clast inclusions
196.6	Contact			chl	bx matrix	50			upper contact of 15cm thick quartz vein with angular phyllite clast inclusions
196.75	Veins			chl	bx matrix	85			lower contact of 15cm thick quartz vein with angular phyllite clast inclusions
196.75	Contact			chl	bx matrix	85			lower contact of 15cm thick quartz vein with angular phyllite clast inclusions
196.9	Veins			chl	AXP	85			two 2-4cm thick quartz-chlorite veins that run axial planar parallel to closed parasitic fold profile in phyllite
196.9	Veins			chl	SHTV	85			two 2-4cm thick quartz-chlorite veins that run axial planar parallel to closed parasitic fold profile in phyllite
197.1	Bedding		So			40			compositional bedding in phyllite
199	Bedding		So			80			compositional bedding in phyllite
200.9	Bedding		So			90			compositional bedding in phyllite
201.09	Cleavage		S1			90			closed fold profile
201.1	Axial Plane		Fx			90			closed fold profile

Project: NTR3A **Prospect:** North Zone **Hole ID:** 3ANZ-11-002 **Grant No.:** YC72728

Road Showing

Diamond Drill Log and Sample Summary

Project: NTR3A **Prospect:** Road Showing **Hole ID:** 3ARS-11-00 **Grant No.:** YD07111

Location

Easting:	Northing:	Latitude:	Longitude:
535591.0	6841952.0		

Elevation: 1030 m **Grid Name:** NA

Datum:	UTM Zone:	Grid N:	Grid E:
NAD83	9		

Orientation

Plunge: 60
Azimuth: 170
EOH: 225.0 m
Core Size: HQ

Start Date: 14/10/2011
Finish Date: 17/10/2011
Status: Completed
Contractor: Driftwood

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality
21	59.5	169.6	57036	Reflex	1
72	72	169	57017	Reflex	3
123	59.7	173	57139	Reflex	1
174	61.5	176.6	56857	Reflex	1
225	61.8	181.8	57041	Reflex	1

Objective:

The objective of this hole is to test the original 3Ace 'Road Showing'. The hole is a wildcat hole at the excavated showing and along strike of the fabric to the northwest

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	6		CASING		100.0%				co	1
6	12.2	Green-gy phyllite unit. Intense sericite altn from 6-7.5m. Unit is broken and gouged with mud coating.	MT-Phy		100.0%	g-gy			br	3
12.2	20.4	Grey Qtz-phyl breccia zone, silicified with py mineralisation	QZVN	bx	5.0%	gy			co	4
12.2	20.4	Intensely deformed black phyllite with Qtz Bx @ 13.90-14.30m. Phyllite is also brecciated in areas with gouge and mud coating	MT-Phy	gf	95.0%	n			fr	3
20.4	25.2	Grey pbl QPC. Weak-moderate shear causing aligment of clasts. Wcy and fecb alteration of smgr fspar clasts. Chlorite along stringers and semi penetrative seams (sericite seams). Clasts: Subangular, elongated, 95% qtz, 4% fspar, 1% lithics (phyl clasts)	MT-CO	pbl	100.0%	gy	qtz	95	co	2
25.2	26.1	Intensely broken/fragmented phyllite lens with graphitic gouge/coating.	MT-Phy	gf	100.0%	n			fr	4
26.1	41.85	Grey cgr SS with intense silicification. Local areas of green tinge from chl/ser alteration. Beige fecb alteration of fspar clasts and filled qzvns	MT-SS	cgr	40.0%	gy-g			co	1
26.1	41.85	Grey pbl QPC. Weak-no shear. Wcy and fecb alteration of smgr fspar clasts. Minor chlorite sericite along seams. Strong-intense grey silicification of matrix blurring grain and vein boundaries. Clasts: Subangular, elongated, 95% qtz, 4% fspar, 1% lithics (phyl clasts)	MT-CO	pbl	60.0%	gy	qtz	95	co	1
41.85	47.6	Gouged black phyllite lens sericite alteration along bedding/cleavage	MT-Phy		100.0%	n			lc	3
47.6	92.5	Grey pbl QPC. Weak-no shear. Wcy and fecb alteration of smgr fspar clasts. Minor chlorite sericite along seams. Weak grey silicification of matrix. Lim alteration along natural fractures. Clasts: Subangular, elongated, 95% qtz, 4% fspar, 1% lithics (phyl clasts)	MT-CO	pbl	30.0%	gy			co	1
47.6	92.5	Grey cgr SS with weak silicification. Local areas of green tinge from chl/ser alteration. Beige fecb alteration of fspar clasts and filled qzvns Lim alteration along fractures	MT-SS	cgr	70.0%	gy			co	1
92.5	95.7	Deformed sheeted qzvns 0.5-5cm thick with chl alteration and semi massive fgr py mineralisation	QZVN		10.0%	w			fr	3
92.5	95.7	Deformed graphitic black phyllite with chaotic qzvns. Chl alteration of qzvns with semi massive py mineralisation	MT-Phy		90.0%	n			fr	3
95.7	152.9	Competent/broken black phyllite. Low core angle bedding with cross cutting foliation visible as wispy flares off bedding planes. Chl and fecb alteration of deformed thin qzvns	MT-Phy		100.0%	n			co	2

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
152.9	170.25	Grey-green cgr SS with penetrative pressure solution fabric. Pervasive sericite alteration throughout matrix. Weak lim alteration coating penetrative seams. Fecb altered TVA and SHTV qzvns throughout	MT-SS	cgr	100.0%	gy-g			co	3
170.25	171	Broken and gouge black phyllite fault with chaotic qzvning and QBX	MT-Phy	gf	15.0%	n			co	3
170.25	171	Brecciated Qtz and chaotically deformed qzvns with	QZVN		20.0%	w			co	3
170.25	171	Modified by CRB. This short interval is faulted, grey sandstone with granule clasts. Phyllite beds are a minor component that have been the locus of gouge development during deformation. The quartz appears to be a TVA that has been rotated and deformed after it's initial formation. This brief interval likely represents a narrow, moderately dipping brittle fault zone.	MT-SS		65.0%	gy	qtz	5	co	3
171	171.65	Grey-green cgr SS with penetrative pressure solution fabric. Pervasive sericite alteration throughout matrix. Weak lim alteration coating penetrative seams. Fecb altered TVA and SHTV qzvns throughout	MT-SS	cgr	100.0%	gy-g			co	3
171.65	199.7	TVA and SHTV cbt/fecb altered qzvns	QZVN		5.0%	w			co	2
171.65	199.7	Grey-green cgr SS with penetrative pressure solution fabric. Mod-strong pervasive sericite alteration throughout matrix. Fecb/cbt altered TVA and SHTV qzvns throughout	MT-SS	cgr	15.0%	gy-g			co	2
171.65	199.7	Moderately foliated QPC with semi penetrative seams. Local alignment of clasts. Pervasive grey-green alteration of matrix and clasts - chl and ser alteration. Wcy alteration of fspar clasts with chl overprint. Fecb/cbt altered TVA and SHTV qzvns throughout Clasts: Subangular, moderate elongation, 90% qtz, 7% fspar, 3% lithics (phyllite clasts). Higher degree of phyl clasts and seams than other previous QPC units.	MT-CO	pbl	80.0%	gy-g			co	2
199.7	225	Highly folded competent black phyllite	phyl		100.0%	n			co	3

Alteration

170.1	Cleavage		So			80			Contact between phyl lense above SS
171.65	Cleavage		So			40			Lower contact of phyl fault and competent chl/ser altered SS
172.6	Cleavage		Sx	ser		65			Penetrative altered sericite pressure solution seams
173.8	Veins				qzvn	65			1cm thick qzvn
179.5	Veins			SIL	SHTV	40			Silicified SHTV in Strong shear zone
180.2	Cleavage		Ssh	chl		65			Sheared and elongated clasts with aligned matrix seams
181.65	Veins		V1	fecb	TVA	45			Tension array crosscut by V2 TVA array
181.65	Veins		V2	fecb	TVA	30			TVA V2 cross cut TVA V1
181.75	Veins				SZB	25	0		Shear zone boundary
183.3	Veins				SZB	15			Shear zone boundary
184.38	Cleavage		So			45			SS bedding/cleavage
184.8	Veins				TVA				Large tension vein array
189.6	Veins			fecb	qzvn	60			3cm thick qzvn
193.35	Veins			fecb	qzvn	55			5cm thick fecb altered qzvn
193.75	Contact		So		FOL	25			Phyl foliation concordant contact of QPC above phyl lense
194.4	Contact		So			45			Phyl foliation concordant contact of QPC above phyl lense
194.7	Contact		So			40			Contact of QPC above SS lens
196.2	Cleavage		Sx			45			Semi penetrative fecb altered sericite pressure solution seams
197.3	Cleavage		So			60			SS QPC interbedding orientation
197.4	Veins			chl	STWK				Stockwork vein array
197.6	Veins			chl	qzvn	20			single 0.5cm qzvn with intense chl alteration
197.65	Cleavage		So			75			Compositional phyl SS interbedded
197.65	Cleavage		S1			40			Penetrative thin dark fabric x-cutting So
201.1	Faults				Gouge				muddy gouge zone
201.9	Axial Plane					80			axial planar cleavage
202	Axial Plane					75			axial planar cleavage
203.5	Axial Plane					80			axial planar cleavage
203.8	Cleavage		S1		FOL	85			wispy cleavage along bedding planes, angle between So and S1 is 15

Diamond Drill Log and Sample Summary

Project: NTR3A **Prospect:** Road Showing **Hole ID:** 3ARS-11-00 **Grant No.:** YD07111

Location

Easting:	Northing:	Latitude:	Longitude:
535591.0	6841952.0		

Elevation: 1030 m **Grid Name:** NA

Datum:	UTM Zone:	Grid N:	Grid E:
NAD83	9		

Orientation

Plunge: 75
Azimuth: 170
EOH: 237.0 m
Core Size: HQ

Start Date: 17/10/2011
Finish Date: 21/10/2011
Status: Completed
Contractor: Driftwood

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality
27	74.1	166.6	56966	Reflex	1
78	74.1	168.1	57123	Reflex	1
129	74.7	173.4	57130	Reflex	1
180	75.1	172.8	57240	Reflex	1
222	75	175.9	56976	Reflex	1
237	74.2	177.8	56910	Reflex	1

Objective:

The objective of this hole is to test the original 3Ace 'Road Showing'. The hole is a wildcat hole at the excavated showing and along strike of the fabric to the northwest

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	6.1		CASING		100.0%				co	1
6.1	15	Strongly sericitized platy green phyllite. Broken/blocky, Lost core	MT-Phy		100.0%	g			lc	2
15	18	Intensely gouged muddy/sandy black phyllite fault/gouge zone	MT-Phy		100.0%	n			lc	3
18	33.3	Grey mod silicified granule QPC interbedded with pbl QPC. Dominantly white clay alteration of fspar grains with minor beige lim/fecb overprinting. Very weak light green chlorite alteration along matrix seams. Clasts: Subrounded, Qtz 95%, fspar 4%, lithics 1%	MT-CO	grn	9.0%	gy	qtz	95	co	2

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
41.4	41.9	Black graphitic phyllite fault	MT-Phy	gf	100.0%	n			fr	3
41.9	50.3	Grey mod-strong silicified pbl QPC interbedded with granule QPC, blurred grain boundaries. Dominantly white clay alteration of fspar grains with minor beige lim/fecb overprinting. Strong lim alteration along natural fractures. Very weak light green chlorite alteration along matrix seams. Clasts: Subrounded, Qtz 95%, fspar 4%, lithics 1%	MT-CO	pbl	49.0%	gy	qtz	95	co	2
41.9	50.3	Grey mod-strong silicified granule QPC interbedded with pbl QPC. Dominantly white clay alteration of fspar grains with minor beige lim/fecb overprinting. Strong lim alteration along natural fractures. Very weak light green chlorite alteration along matrix seams. Clasts: Subrounded, Qtz 95%, fspar 4%, lithics 1%	MT-CO	grn	51.0%	gy	qtz	95	co	2
50.3	50.8	Strong silicified grey-dark grey Qtz Bx. Angular clasts up to 1.5cm. Massive fgr mineralisation (dominantly pyrite) concentrated in dark chloritic matrix seams following foliation. Chl alteration of matrix, fecb alteration of clasts.	QZVN	bx	100.0%	gy			co	3
50.8	65.8	Grey mod-strong silicified granule QPC. Dominantly white clay alteration of fspar grains with minor. Strong lim alteration along natural fractures. Clasts: Subrounded, Qtz 98%, fspar 2%	MT-CO	grn	100.0%	gy	qtz	98	co	2
65.8	74.2	Strong silicified grey-dark grey Qtz Bx. Angular clasts up to 3cm. Massive fgr sulphide mineralisation along filled fractures and in matrix.	QZVN	bx	100.0%	gy			co	3
74.2	79.95	Coarse grained silicified SS. Deformed matrix seams which are randomly oriented due to deformation no resemble vugs. Py and asp mineralisation along dark grey chloritic matrix seams. Sharp 'Rip-up' type contact at the end of unit into black phyllite.	MT-SS	cgr	100.0%	gy			co	2
79.95	157	Friable and faulted black phyllite with interbedded SLT lamella and sparse deformed chl-fecb altered chaotic qzvns. Minor graphitic coating in fault and gouge zones.	MT-Phy		100.0%	n			fr	2
157	184.83	Phyllite occurse as narrow localized interbeds with high tan-grey silt content from 163.40m-163.70m and from 174.10m -174.44m. Phyllite interbed from 174.10m-174.44m is highly mineralized by low core angle quartz veinlets and underlies a ~60cm thick quartz breccia intercept. Mineralization is markedly reduced below 174.44m	MT-Phy		1.0%	n			co	1
157	184.83	Quartz veining in silicified and sericitized sandstone unit is frequently intensely vuggy. Frequently also diffuse and only partially penetrative. Several internsely sulfide mineralized, densely veined interceptes with sphalerite, galena, pyrite and arsenopyrite mineralization. Vein thickness is generally <2cm. Quartz breccia texture with dense pyrite-arsenopyrite mineralization from 173.50-174.10 meters.	QZVN		4.0%	w			co	1

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
157	184.83	Light grey silicified sandstone with variable degrees of texturally destruction and locally very intense sericitization. White aligned sericitic seams forming cleavage [Sx]. COMPOSITION: 95% grey quartz; 5% white altered feldspar; ~1% black lithic phyllite clasts (frequently <1% - but locally present) MATRIX: <1% GRAINSIZE: 1-2mm GRAINSHAPE: subangular Upper contact is sharp and competent with phyllite unit above and concordant to phyllite compositional bedding (So). Lower contact with Quartz Pebble Conglomerate appears gradational, but is marked by increased fragmentation.	MT-SS	cgr	95.0%	gy	qtz	95	co	1
184.83	208.02	Phyllite in Quartz-Pebble-Conglomerate unit occurs as occassional 2-20cm width interbeds with frequently gradational contacts that are concordant to phyllite compositional bedding (So).	MT-Phy		1.0%	n			co	1
184.83	208.02	Quartz veining in QPC unit is generally <3cm thick, occassionally slightly vuggy and predominantly with rather diffuse, cloudy vein boundaries. Quartz veining is more intense in lower 3rd of QPC unit.	QZVN		4.0%	w			co	1
184.83	208.02	Sandstone in QPC unit occurs and localized gradational interbeds with same composition as surrounding QPC unit. Grainshape is subangular. Grainsize: 1.5-2mm Composition 96% grey (partially transluscent) quartz, 4% white, clay altered feldspar	MT-SS		10.0%	gy	qtz	95	co	1
184.83	208.02	Light grey Quartz-Pebble-Conglomerate with an intermittent, localized alignment and stretching of clasts [Sx]. Lithic phyllite clasts are locally stretched and aligned. Feldspar clasts have white clay alteration that is intermittently combined with buff-creme iron-carbonate overprints. Composition: 93% grey quartz; 6% altered feldspar; 1% angular lithis phyllite clasts Matrix: <1% Grainshape: angular to subangular Upper contact of unit is gradational with sandstone unit above, but marked by broken and blocky intervals. Lower contact with phyllite unit below is hard and competent and concordant to phyllite compositional bedding (So).	MT-CO		85.0%	gy	qtz	93	co	1
208.02	231.52	Veining in phyllite is generally concentrated in narrow loacalized concentration associated with structural interval, i.e. at in upper contact zone of unit. Rare, thin (<0.5cm thick), low core angle veinlets throughout remainder of unit.	QZVN		1.0%	w			co	1
208.02	231.52	Weakly chloritized fine-grained sandstone unit near upper contact of phyllite unite from 208.70m - 209.62m.	MT-SS	fgr	1.0%	gy			co	1
208.02	231.52	Black, bedded and folded phyllite with ~5% grey lamellar silt interbedding. Compositional bedding So an locally well expressed S1 cleavage. Texture of phyllite is too fine-grained to determine exact composition. Generally competent.	MT-Phy		98.0%	n			co	1
231.52	232.2	Quartz veining in granule size conglomerate unit is very vuggy and with very difusse contact boundaries.	QZVN		2.0%	w			co	1

Elevation:	1567 m	**Grid Name:** NA		**EOH:** 40.0	m	**Status:** Incomplete	
Datum:	**UTM Zone:**	**Grid N:**	**Grid E:**	**Core Size:** HQ		**Contractor:** Driftwood	
NAD83	9						

Objective:

The targets for this drill hole are 3-fold; it represents a 25 m infill hole relative to the mineralised section in 3A-10-01, it tests the down dip extension of the 'Discovery' outcrop, and finally it tests the anomalous soil results located up-slope from the Main Zone. Targets expected around 40m and at 73m. The final 100m of this drill hole are specultative testing below the soil anomalies.

31	40	intensely fractured (partially mechanical fractures) interval with rubbled fragments of vuggy, iron-carbonate altered quartz vein fragments; some veining exceeds 5cm in thickness and and frequent emplacement subparallel to foliation can be discerned ; iron oxide staining and manganese oxide coating observed in vugs; some rusty, very fine-grained disseminated pyrite	QZVN		20.0%	w			lc	1
31	40	quartz-pebble-conglomerate (QPC); colour: grey; Composition: 75% quartz clasts; 20% feldspar clasts; 5% fine grained, dark (mafic?) lithic fragments; clasts are subangular to subrounded; Foliation: persistent weakly developed regional foliation (see point measurements); Alteration: Iron-carbonate alteration of feldspars expressed as buff-orange colour and pitted powdered appearance; Structure: QPC hosts abundant (occassionally vuggy quartz veining of variable width (2mm to 4cm), which is frequently subparallel to cleavage; Mineralization: minor very fine-grained sulfides in veins and in rock matrix; occasional elongation and stretching of feldspar clasts along foliation; mild moblization of platy, transluscent mica along foliation	MT-CO	pbl	80.0%	gy	qtz	75	co	1

Alteration

From:	To:	Comments:	Mineral	Intensity	Distribution	Colour:
3	39	persistent iron-carbonate alteration of feldspar clasts thourghout entire rock matrix expressed as buff-orange & powdered appearance of feldspar clasts	fecb	1.5	perv	bf
31	40	emplacement of iron carbonate in vuggy quartz veining	fecb	2.5	vn	bf
35.6	37	dark-brown, penetrative manganese oxide staining of quartz pebble conglomerate	meteoric	3	perv	m
39	40	chlorite-sericite coating observed in vugs of rubbled, fragmented quartz veins accompanied by occasional very fine-grained, disseminated arsenopyrite. Interval has low revovery.	chl	1.5	smgr	g
39	40		chl	1.5	vn	
39	40		ARG			

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-010	Grant No.:	YD07124
Plunge:	Azimuth:	EOH:					
55	270	40					

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
3	16.4	QZVN		SHTV	
21.05	21.57	QZVN		SHTV	vuggy up to 1cm thick veinlets subparallel to foliation with very fine-grained disseminated sulfides
25.2	25.4	FZ		BFZ	angular broken core coated with ~15% silty clay Interval is bounded by competent core above and below along sharp contacts. Possible fault contacts along 80 degree CA coated with up to 2 cm silty clay
25.4	26	FRAC		BFZ	several jagged, occassional stepped low CA (~30 degree) fracture with <1mm silty clay coating and dark manganese oxide staining - possible fault shadow
31	40	QZVN		BFZ	Extremely broken and rubbled zone with up to 20% quartz veining. Frequent intervals of soft incompetent rock with silty clay coated fragments and sharp boundaries against competent core along foliation. Several up to 50cm long intervals with intensely weathered core with deep manganese oxide penetration. Additionally near EOH a zone with extended quartz clasts (?), which appear elongated parallel to core axis (Tension gashes?)
39.09	39.1	Mafic		Wedge	2 cm thick, black-grey, very fine-grained, non-magneted mafic wedge at 45CA. Wedge is accompanied by parallel, flattened folation in surrounding QPC host rock and thins out in uphole direction.

Mineralisation

From:	To:	Comments	Mineral	Percent	Distribution
16.4	30	recurring, very fine-grained disseminated sulfides in QPC matrix where thin quartz veinlets reoccur parallel to subparallel to foliation	py	1	fol
21.05	21.5	group of up to 1cm thick, vuggy, rust-stained quartz veinlets, subparallel to foliation with very fine-grained disseminated sulfides	asp	1	vn

Point Structure

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
10	Bedding		So			50			regional foliation; no orientation mark available
18.2	Bedding		So			50			regional foliation, no orientation mark available
21.05	Veins					55			vuggy up to 1cm thick quartz veinlets over .45m interval subparallel to foliation with very fine grained disseminated sulfides
21.2	Bedding		So			51			regional foliation, no orientation available
23.7	Bedding		So			52			regional foliation, no orientation mark available
25.2	Faults	34				80			possible (upper) fault contact: jagged high CA break coated with 4cm silty clay
25.4	Faults	34				85			possible (lower) fault contact: jagged high CA fracture coated with 3mm silty clay - bounding competent core below
26.1	Bedding		So			54			regional foliation, no orientation available
26.7	Bedding		So			62	18		regional foliation, orientation mark available; measured 8 cm away from bottom mark in QPC (quartz pebble conglomerate)
32.26	Bedding		So			57			regional foliation, no orientation available
32.7	Veins					46			disseminated sulfides in broken, rubbled quartz vein, ~5-10cm thick at 33m drill run block.
34.5	Bedding		So			52			regional foliation, no orientation available
35.3	Bedding		So			58			regional foliation, no orientation available
39.09	Bedding		So			52			foliation observed in 2cm thick mafic dyke, subparallel to dyke boundary and subparallel to QPC

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-010	Grant No.:	YD07124
	Plunge:	Azimuth:	EOH:				
	55	270	40				

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
39.09	Contact	38				45			DYKE: fine-grained, black mafic wedge (non-magnetic) at 45CA - does not fully penetrate core (thins in uphole direction), ~15cm thick; contains contact concordant foliation
39.8	Bedding		So	ser		75			regional foliation, no orientation available, foliation has smooth, slightly pearly coating (sericite?); foliation core angle signifcantly steepened. Transition from previous foliation core angle not observable due to broken rubbled intervals.

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
24.94	27.18	FZ	200.0%	stwk	Intensely fragmented, poorly recovered zone with multiple angular fragments that show evidence of thin high core angle and sometimes cross-cutting veinlets. Oxidized iron coating on fracture surfaces combined with sandy silt.
39.9	40.1	QZVN	100.0%	SHTV	multiple <1cm thick sheeted and folded veins that occur subparallel to foliation
42.9	44.1	FZ	200.0%	BFZ	Very poorly recovered interval with intense crushed rock. Gritty sand mixed with rubbled quartz vein fragments. Pervasive iron oxide staining observed. Interval bounds fairly competent rock above and below.
45.7	50	QZVN	100.0%	stwk	Intensely stockworked interval with some veins appearing folded or running subparallel to core axis. Main foliation in QPC appears warped and slightly folded in various instances.
46.9	48.1	SZ	400.0%	DSZ	Not a classic shear zone (low intensity): Original QPC texture is almost completely replaced by chloritization. The usual selective iron carbonate alteration of feldspars is recognizable only as multiple tiny buff-orange, folation concordant wisps. Frequent warping of foliation cleavages. Quartz clasts as well as quartz vein wedges appear elongated and stretched.
50	50.8	FZ	200.0%	BFZ	80cm long interval with only 10cm of core recovered that bounds competent rock above and below. Core recovered consists of angular fragments below 3cm in diameter with occassional sandy, silty coating. May indicate a structural weakness. Fragmentation could have mechanical causes due to occasional dense vein stock working in the interval.
50	51.98	SZ	400.0%	CSZ	intensely chloritzed, catalastic shearzone with locally weakly developed crenulation cleavage [see point depth measurements]; features folded and stockworked quartz veining.
52.8	53.1	QZVN	300.0%	stwk	Stockworked (possibly folded) quartz veining
54	54.5	FZ	300.0%	BFZ	Poorly recovered soft-plastic, grey, silty clay fault gouge with internal iron stained foliation cleavage of 60TCA
72.6	74.1	FZ	200.0%	BFZ	Intensely crushed interval with about 50% recovery: About 40% of recovered particles are <3cm in diameter. This interval of brittle deformation marks both a change in alteration as well as a significant change in grainsize of the QPC unit. Bounded by hard competent core at upper and lower contact.
83	86.5	FZ	400.0%	BFZ	several balck gouge wedges at lithological contact~50% recovery
103.8	104.6	FZ	400.0%	BFZ	Very low strength (can be broken apart by hand), cohesive breccia (likely crushed by drill pressure in parts). Bleached appearance (light grey to white) and features densely disseminated sulfides (predominantly pyrite).
113.3	113.9	FZ	300.0%	BFZ	Brecciated, gouged black phyllite, very friable and emplaced along foliation.
114.5	115.02	QZVN	300.0%	bx	Quartzveining semi-concordant to phyllite foliation with angular wedges of ingested phyllites in vein matrix. Minor small (<2cm diameter), angular wedges of green chlorite.
119.2	119.9	FZ	200.0%	BFZ	Crushed, and partially gouged interval in phyllite emplaced along foliation. Bounding competent rock above and below. Partially soft with plasticity.
125.1	125.5	FZ	200.0%	BFZ	Very poorly recoverd interval bounding competent rock above below. About 10cm recovered. Finely crushed and fragmented phyllite.
129	130.55	QZVN	200.0%	SHTV	Several parallel (1cm) thick 20TCA quartzt veinlets possibly mineralzed but not observed
132.78	133.09	QZVN	100.0%	SHTV	2 closely spaced iron carbonate altered, massive quartz veins @ 23TCA enclosing wedges of wall rock
134.8	134.9	QZVN	200.0%	bx	Intensely fragmented massive quartz vein with clay-rich, iron-carbonate infill
136.5	134	SZ	300.0%	DBSZ	Low grade shearing with localized C-S fabrics and several localized shear veins. Possibly texturally destructive silification.
137.7	139.3	QZVN	200.0%	bx	Large, up to 10cm diameter wedges at low core angles enclosing slightly friable, iron-carbonate altered rock matrix.

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

NAD83	9						

Objective:
To test for the presence of faulting and associated quartz veining along the strike of the QPC unit intersected in 3A-10-01. The hole will also test the down-dip extension of mineralisation intersected in 3A-10-01. Targets expected at approximately 60m and 115m.

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	3	no core recovered, casing	CASING		100.0%	n			co	1
3	44.7	quartz veining in black phyllite unit: generally very rare foliation concordant and deformed quartz veining Persistent 3mm thick, slightly vuggy quartz veins that occur foliation concordant and sometimes cross-cutting. Veinlets are generally iron-carbonate altered.	QZVN		2.0%	n			br	1
3	44.7	black phyllite: very fine-grained black unit with high chlorite content. Regional foliation well developed and consistently at low core angle no orientation marks available for this entire interval. (Ezy-Mark Tool needed to be replaced after rods got stuck in previous hole.) Composition difficult to determine due to fine-grained nature of rock matrix. Lower contact of unit is marked by brittle deformation and bounds a folded phyllite unit below. Foliationn cleavages sometimes have a well expressed lineation in form of polished groves and bladed habit of chlorite. Only minor quatz veining and generally no mineralization observed in fine-grained phyllite matrix. Repeated thin (silty) lighter brown-black laminae along foliation.	MT-Phy		98.0%	n			br	1
44.7	45	parallel, white, massive quartz veins @ 36TCA	QZVN		10.0%	w			co	1
44.7	45	vergy fine-grained (0.5mm) sandstone/siltstone with sharp lower contact @ 30TCA. Upper contact with phyllite visible in fragment at 42TCA	MT-SS	fgr	90.0%	gy	qtz	75	co	1
45	52.72	generally vry thin (<1cm thick), sheeted, vuggy, dusty white quartz-carbonate veinlets. Veinlets are either concordant to S1 or frequently intersect axial planes in the folded phyllite wallrock.	QZVN		5.0%	w			co	1

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-011	Grant No.:	YD07124
	Plunge:	Azimuth:	EOH:				
	55	270	342				

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
45	52.72	visibly folded phyllite unit very fine-grained with high chlorite contact and generally dark grey to black colour regular silty laminae unit shows abundant mesoscopic fold structures uper contact with sandstone is sharp along 30TCA	MT-Phy		95.0%	n			co	3
52.72	53.4	iron-stained, slightly vuggy quartz veinlets at variable core angles (sometimes visibly off-set) and not always fully penetrative	QZVN		10.0%	o			co	1
52.72	53.4	very fine-grained, grey-green sandstone with sharp upper and lower contact with phyllite @40-45TCA (parallel) iron staining and dark-green non-pentrative lamellae (chlorite?)	MT-SS	fgr	90.0%	g	qtz	75	co	1
53.4	54	brief, poorly recovered and a highly fragmented phyllite interval very friable and partially dark red iron staining. Sharp upper contact with sandstone [see point measurements]	MT-Phy		100.0%	n			fr	2
54	60.1	generally low core angle quartz veining of variable thickness with small slitted vugs some veining (59-60m) has very diffuse boundaries with iron-carbonate haloes and buff ankerite patches in veining	QZVN		5.0%	o			co	1
54	60.1	coarse -grained sandstone with pervasive iron-staining. Composition: 75% quartz, 20% felspare, 5% dark lithic fragments Grainsize: 1-3mm Clasts are angular to subangular Feldspars appear orange-buff and pitted (FeCb) Lithic fragments are frequently soft, black and angular with up to 2mm grainsize and may be phyllite clasts Contacts of unit are poorly defined due to low recovery and fragmentation Cave-in @ 60M no well-developed foliation fabric discernible	MT-SS	cgr	95.0%	gy	qtz	75	co	1
60.1	60.8	folded phyllite: very fine-grained, black- grey phyllite unite with several clearly visible tight fold profiles High chlorite content - composition difficult to discern due to fine-grained nature of matrix Frequent grey-green silt laminae Upper contact poorly recovered due to cave-in Lower contact poorly recovered due to fault gouge	MT-Phy		100.0%	n			fr	2
60.8	67	Quartz veining is pre-dominantly high core angle and densifies towards bottom of unit.	QZVN		2.0%	w			co	1
60.8	67	Unit features prorgressive grainsize increase in downhole direction from fine to coarse to gravel size Composition: 75% quartz, 23% feldspar, 2% very fine-grained lithic fragments Foliation fabric discernible as dark green lamellae pervasive iron staining lower contact is marked by densely packed sheeted, high core angle quartz veins	MT-SS	mgr	98.0%	gy	qtz	75	co	1
67	73.2	Quartz-veining interspersed throughout interval. Generally <2cm thick with small vugs and iron-carbonate alteration. Predominant trend: high core angle intersecting foliation at an acute angle <40 degrees	QZVN		10.0%	w			co	1
67	73.2	Coarse grained sandstone with intense iron-carbonate staining that penetrate into matrix Quartz clasts appear angular and partially at gravel size. Feldspar are intensely altered and appear as diffuse rusty pits. Unit terminates at poorly recovered fault gouge below. Well developed high core angle foliation fabric @ 65TCA.	MT-SS	cgr	90.0%	o	qtz	75	co	1

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
9.02	9.24	QZVN	300.0%	SHTV	multiple intensely iron-carbonate stained (not vuggy) quartzveining crosscutting folded foliation. Vein boundaries are jagged and deformed. [see point structure]; grooved lineatiosn visible in axial fold plane cleavages
16	16.6	QZVN	300.0%	TVA	Multiple thin seams of green-grey chlorite as well as a folded quartz-iron-carbonate-veinlets - aligned along foliation.
37	40	FZ	300.0%	BFZ	Very poorly recovered soft, friable interval with minor iron staining. Crushed phyllite and fragmenation with about 20% gritty silt matrix (where recovered)
41	44.7	FZ	300.0%	BFZ	About 1.6m of core recovered for this 3.5m long structural interval Very friable and shattered with intense iron-staining Larger fragments show fold profiles. Also contains rubbled fragments of a rubbled, vuggy, iron-carbonate altered quartz vein.
65.9	67.4	QZVN	300.0%	SHTV	mulitple densely spaced <2cm thick sheeted high core angle quartz veinlets in zone of fluid flow, intensified foliation and textural destruction veins @ 72 TCA
81.35	83.4	QZVN	300.0%		Several massive buff-white quartz veins whith dark green-gey chlorite wedges, seams and lamellae. Veins are about 20-40cm thick. Veins are situated above major fault structure. Gold mineralization observed
83.4	86.5	QZVN	200.0%	stwk	multiple somewhat diffuse, variable core angle and multiply intersect quartz veins with stockworked/fragmented appearance and ironstaining. Wallrock matrix appears fine-grained and green-grey in appearance (fluid-flow or fine-grained sandstone?)
85.38	91.2	FZ	300.0%	BFZ	Extensive brittle fault zone at that extends over lithological boundaries and is intensely sulfide mineralized with predominantly disseminated pyrite Texture: 0.1-1.5cm angular fragments in gouge clay/silt matrix
91.2	92.3				competent phyllite interval following brittle fault zone with evidence of folding and multiple off-set, folded quartz seams/veins
92.3	92.65	FZ	300.0%	BFZ	gouged, fragmentd friable interval in phyllite unit
93	96.5	FZ	200.0%	BFZ	multiple gouge wedges emplaced along non-planar surface and bounding competent intervals of phyllite
96.5	99.2		200.0%		Persistent iron-stained, grooved low core angle fractures along foliation in interval below faut zone
107.4	107.55	FZ	200.0%	BFZ	Low core angle, iron-stained veining bordering friable fragments, multiple tension veins
117	120	FZ	200.0%	BFZ	blocky and friable along high core angle foliation, poorly recovered
128.4	128.6	QZVN	300.0%	BFZ	gold mineralized intercept with low core angle gouge emplacement and densely distributed quartz veining. Veining: - <2cm thick - foliation concordant - dusty-white colour - some tension crack arrays perpendicular to foliation @128.4m visible gold mineralization in in hematized/iron-carbonated stained gouge wedge emplaced between 2 parallel, low core angle, vuggy, grey quartz veinlets (very fine-grained specs)-- about 15cm thick intercept
130.5	133.7	FZ	100.0%	BFZ	Blocky and iron-stained at lithological contact with small abount of friable core
144	147	QZVN	400.0%	SHTV	iron-stained fractures along vuggy low core angle quartz veining that runs subparallel to core axis and clusters of pyrite (+ some aresenopyrite) in vugs

From	To	Mineral	Intensity	Distribution	Comments
160.85	163	FZ	300.0%	BFZ	Intensely fragmented, poorly recovered interval with orange-brown iron staining and mixed lithologies - also a gouge wedge with angular phyllite fragments.
172.9	173.4	QZVN	200.0%	BFZ	45TCA quartx vein with arsenopyrite bleb brittle-deformation lithological boundary
181.5	185.5	QZVN	400.0%	SHTV	densely spaced (<1cm thick) low core angle quartz veins with high degree of disseminated sulfides and stretching of wallrock matrix between veins
191.33	191.88	FZ	400.0%	BFZ	soft, gouged fragmented zone bounding competent rock
204.5	205.2	QZVN	400.0%	TVA	off-set, dusty white tension veins in phyllite and predominantly parallel to core axis, pyrite mineralization in wallrock & veining
215.9	216.1	FZ	300.0%	BFZ	gouge friable interval along foliation with lithological change at lower contact
219.51	228.51	FZ	300.0%	BFZ	Fault Zone - soft, brittle deformation - no gouge [strain partioning]: Intense quartz veining: - frequently folded and foliation concordant - massive up to 40cm thick, with irregular boundaries - disjointed, quartz-ankerite wedges that cross-cut foliation PREDOMINANT TREND: concordant to highly variable foliation due to folding
259.8	261.8	FZ	400.0%	stwk	generally competent, but highly deformed with multiply offset, jagged veins and pyrite stringer mineralization
261.8	274.9	FZ	200.0%	BFZ	regular intersperse gouge wedges over 20-40cm and emplaced at ~30-40TCA om otherwise relatively competent black phyllite
274.9	278	QZVN	400.0%	bx	highly deformed and mechanincally fragmented [see lithological interval for description]
282.5	282.7	FZ	400.0%	bx	brecciated, cohesive, low strength silicified sandstone bounding a gouged fault structure with phyllite lithology below
282.7	327.2	FZ	400.0%	BFZ	Predominantly phyllite lithology with locally competent blocs with foliation fabric. Large extensive structure with phyllite ranging from gouged to friable. Competence increases gradually towards lower end of interval. Foliation present throughout. Unit is also folded.

Mineralisation

From:	To:	Comments	Mineral	Percent	Distribution
7.3	17	occassional rare, very fine grained, singular grains of silver metallic mineral in phyllite rock matrix	asp	1	diss
73.3	86.5	0.5-1% -- associated with densely distrubted (pre-dominantly foliation concordant) quartz veining - rare blebs and mostly very fine-grained disseminated in vein wallrock and in veining	asp	3	vn
73.3	86.5	1-2% -- associated with densely distrubted (pre-dominantly foliation concordant) quartz veining - rare blebs and mostly very fine-grained disseminated in vein wallrock and in veining	py	4	vn
81.35	83.4	2 very fine-grained specs of visible gold in foliation concordant quartz veining	Au	2	vn
83.4	91.2	FAULT ZONE mineralization: generally <0.5mm diameter dissminated pyrite and frequently euhedral, occasionally in gouge in clusters of up to 3mm per euhedral pyrite crystal	py	4	vn
83.4	91.2	FAULT ZONE mineralization: <0.5mm diameter disseminated arsenopyrite in fault gouge arsenopyrite mineralization especially intensified in brecciated quartz veining between 94.40-96m	asp	3	vn
123.35	123.36	fine-grained disseminated pyrite in dusty white, 65TCA, foliation discordant quartz veinlet	py	1	fol
128.4	128.6	@128.4m visible gold mineralization in in hematized/iron-carbonated stained gouge wedge emplaced between 2 parallel, low core angle, vuggy, grey quartz veinlets (very fine-grained specs)-- about 15cm thick intercept	Au	2	vn
132	132.15	disseminated pyrite in foliation concordant veining cross-cut by tension veins near lithological contact	py	2	vn
132.12	165.71	fine-grained disseminated pyrite in low core angle vuggy <2cm thick quartz veining	py	2	vn

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
194.35	Joints				Open				(possilbly 1m long) intensely fragmented, poorly recovered interval
194.4	Veins			fecb		30			partially fragmented, at least 12cm thick quartz vein
196.5	Bedding		So			53			
197.52	Contact				FOL	60			foliation concordant, sharp contact between lithological units
199.73	Bedding		So		Gouge	45			1cm thick soft-friable wedge along foliation bounding competent rock
202	Bedding		So			50	240		
202.7	Axial Plane		Fx			80			axial plane of localized crenulations
202.75	Bedding		So			45			foliation flexes
205.23	Faults			py	Gouge	53			partially recovered gouge wedge, subconcordant to foliation with stringer sulfide mineralization in grey, gouged quartz veinlet @ upper contact
205.8	Axial Plane		Fx			65			
206.2	Bedding		So			42	210		
207.1	Bedding		So			68			
207.1	Veins				FOL	68			
207.1	Veins				SHTV	68			densely spaced foliation concordant quartz veining over 40cm with dusty white collour and partially boudinaged and folded thin pyrite stringers + disseminated
209.55	Veins			fecb		38			15cm thick quartz vein with undulated upper contact and sharp lower contact at 38TCA with calcite in veining and prominent buff ankerite patches
211.2	Veins				SV	60			foliation concordant (0.5cm thick), syntaxial vein with disseminated sulfides in wallrock
212.83	Faults				Gouge				locally friable and gouge with some plasticity, partial recovery and no planar contact; pyrite mineralization at lower contact where gouge bounds competent rock
214.4	Bedding		So			25			
215.9	Faults	4	S1		Gouge	48			gouged friable interval along foliation. Lower contact bounds lithological change to sandstone
215.9	Contact				FOL	48			gouged friable interval along foliation. Lower contact bounds lithological change to sandstone
216.8	Veins				Veinlets	23			several 3mm thick, low core quartz veinlets in sandstone interval
217	Cleavage		Sx			34			very weak alignment of elongated quartz clasts in black-grey sandstone
217.4	Contact					78			DYKE: lithological contact with strain partioning in veining
218.82	Contact					30			lithological contact with cut-off veining
218.82	Faults					30			lithological contact with cut-off veining
219.51	Faults					40			lithological contact with cut-off veining
219.51	Contact					40			lithological contact with cut-off veining
220.6	Bedding		So			25			polished phyllite foliation cleavage with graphite coating
221.5	Veins				SHTV	0			multiple sheeted quartz veins that undulate parallel to core axis
222.7	Axial Plane		Fx			85			open fold profile
224.1	Axial Plane		Fx			85			open fold profile
227.1	Axial Plane		Fx			70			open fold profile
227.5	Bedding		So			48			
228.15	Contact					45			lithological contact
228.45	Contact					45			lithological contact

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-011 **Grant No.:** YD07124

Plunge: 55 **Azimuth:** 270 **EOH:** 342

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
228.8	Bedding		So			48	220		
229.7	Bedding		So			35			
229.8	Contact					80			lithological contact
229.8	Contact					80			lithological contact
233.5	Veins					45			vein orientaiton in fragmented silicified sandstone
233.8	Veins					60			vein orientation in fragmented silicified sandstone
238	Veins					15			vein orientation in fragmented silicified sandstone
240.8	Veins				SHTV	45			vein orienation of sheeted vein pattern starting @ 240.8m
244	Faults				Gouge	30			possibly a gouged phyllite wedge emplaced at low core angle [very poorly recovered interval]
250	Veins					24			vein orientation in fragmented silicified sandstone
252	Veins				SHTV	30			vein orientation of repeating vein pattern over 1-2 meters I silicified sandstone
253.1	Faults				Gouge	45			gouged phyllite wedge emplaced along 45TCA
254.6	Faults				Gouge	25			lower contact of poorly recovered faulted phyllite wedge
257	Veins					17			vein orientation in silicified mineralized sandstone
259	Faults				Gouge	50			Phyllite wedge (gouged and friable) with internal foliation and in highly fragmented, partially recovered interval
259	Faults				FOL	50			Phyllite wedge (gouged and friable) with internal foliation and in highly fragmented, partially recovered interval
259.8	Faults				Gouge	53			highly mineralized gouged fault contact [well-preserved]
261.8	Faults					40			sharp competent lower fault zone contact, sharp transition from intense vein deformation to predominantly phyllite lithology
262.2	Bedding		So			40			foliation in black phyllite
265.2	Bedding		So			48			
265.35	Veins				TVA	88			localized 10cm wide tension vein array
265.55	Faults				FOL	25			gouge wedge along locally shallow foliation
265.55	Faults				Gouge	25			gouge wedge along locally shallow foliation
267.6	Veins				TVA	80			localized 10cm wide tension vein array
267.75	Veins				TVA	75			10cm wide tension vein array
267.9	Bedding		So			32			foliation fabric offset along 60TCA quartz-carbonate seam
267.9	Faults			fecb	Veinlets	60			quartz-carbonate veinlet off-setting foliation fabric
269.4	Fold Axial Plan		F1			75			visible fold profile
269.4	Bedding		So			44			lower fold limb foliation
272	Veins				FOL	70			foliation concordant quartz seam veinlets in black phyllite
272	Bedding		So			70			foliation fabric in black phyllite
273.4	Bedding		So			40			
274.1	Faults				bx matrix	40			brecciated, gouged phyllite at upper contact of structural and lithological zone emplaced foliation concordant along 40TCA
275.8	Bedding		So			50			phyllite foliation preserved in fragment

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-011 **Grant No.:** YD07124

Plunge: 55 **Azimuth:** 270 **EOH:** 342

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
275.9	Veins				SHTV	40			several sulfide mineralized veinlets preserved in blocky fragments
278.2	Bedding		So			40			foliation in sand-silt-phyllite interbedding as part of lithological boundary
281	Veins				SHTV	60			repeated pattern in silicified sandstone interval
282.7	Faults				Gouge	20			sharp, preserved fault contact between silicified sandstone and gouged phyllite of extensive 30m+ fault zone
284	Bedding		So		Gouge	61			foliation fabric in gouged phyllite fault zone
285.2	Bedding		So		Gouge	85			high core angle foliaton fabric in gouged phyllite fault zone
288.8	Bedding		So		Gouge	85			flexing, high core angle foliatoin in phyllite in fault zone
292	Bedding		So	chl	Gouge	62			foliation in friable phyllite in fault zone
294.02	Bedding		So		Gouge	82			foliation in coarsely brecciated, friable phyllite in fault zone
296.9	Bedding		So		Gouge	47			foliation in coarsely brecciated, friable phyllite in fault zone
299	Axial Plane		Fx		Gouge	10			visible fold axis in friable phyllite in fault zone
299.6	Veins				TVA	45			axis of core axis parallel tension vein array with sulfide mineralization in friable phyllite
302.5	Bedding		So		Gouge	45			foliation in friable phyllite in fault zone
305.6	Bedding		So		Gouge	25			foliation in friable phyllite in fault zone
306	Lineation				Gouge	30	180	10	successful orientation in gouged phyllite with foliation and well developed foliation grooves in foliation plane
306	Faults				Gouge	30	180	10	successful orientation in gouged phyllite with foliation and well developed foliation grooves in foliation plane
306	Cleavage		Sx		Gouge	30	180	10	successful orientation in gouged phyllite with foliation and well developed foliation grooves in foliation plane
307.22	Bedding		So		Gouge	28			foliation in friable phyllite in fault zone
310.5	Veins			cbt		26			Calcite-quartz seam in more competent, uniformly black phyllite interval in fault zone
311.8	Bedding		So		Gouge	28			foliation in softened phyllite in fault zone
312.8	Bedding		So		Gouge	25			foliation in phyllite bounded by more gouged interval in fault zone
312.8	Veins					68			pyrite stringer mineralzation in high core angle, dusty white, quartz-calcite seam discordant to foliation
313.05	Faults				Gouge	45			foliation discordant gouge wedge bounding more competent interval in fault zone
313.05	Cleavage		Sx		chl	10			locally very low core angly foliation in competent interval in fault zone
313.9	Cleavage		Sx		chl	30			
314.1	Cleavage		Sx		chl	65			
316.4	Bedding		So		Gouge	48			foliation fabric in gouged phyllite in fault zone
319.3	Faults				Gouge	85			gouge wedge against stockworked, competent blocks
319.6	Bedding		So			60			foliated, very fine-grained fragment of stockworked sandstone interbed
319.9	Faults				Gouge	79			gouge at lower contact of quartz-stockworked, fine-grained sandstone interbed
322.8	Bedding		So			54			foliation in phyllite
324.9	Bedding		So		Gouge	60			foliatoin in gouged phylite
325.9	Veins				TVA	70			foliation discordant tension vein array
325.9	Bedding		So			55			foliation in phyllite
327.2	Contact				FOL	52			foliation concordant gradational lithological contact

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-011	Grant No.:	YD07124
Plunge:	Azimuth:	EOH:					
55	270	342					

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
329.1	Bedding		So			46			
330.4	Veins				STWK	30			several, milky white, folded, parallel quartz veinlets (~1cm thick)
332	Bedding		So			51	250		
336.5	Veins				SHTV	38	290		densely distributed sheeted, boudinaged (partially non-penetrative) quartz veining
340.5	Bedding		So				55		foliation in phyllite interbed
341.2	Bedding		So			45			foliation in somewhat friable interbed

Diamond Drill Log and Sample Summary

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-012 **Grant No.:** YD07124

Location

Easting:	Northing:	Latitude:	Longitude:
533691.2	6843901.0		

Elevation: 1557 m **Grid Name:** NA

Datum:	UTM Zone:	Grid N:	Grid E:
NAD83	9		

Orientation

Plunge: 55
Azimuth: 270
EOH: 265.0 m
Core Size: HQ

Start Date: 13/07/2011
Finish Date: 18/07/2011
Status: Completed
Contractor: Driftwood

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality
18	54.5	268.84	5822	Reflex	1
69	55.9	268.24	5830	Reflex	1
135	56.9	267.44	5835	Reflex	1
186	58.3	264.94	5837	Reflex	1

Objective:

This drill hole is targeted on the trace interpreted trace of the 3Ace Fault. It tests the possible strike extension to the north of mineralisation intersected in 3A-10-01. Targets expected at 92m.

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	6	no core recovered	CASING		100.0%	w			fr	1
6	73.28	occassional quartz veining in phyllite fairly scarce [1 per 6m on average] and predominantly foliation concordant and predominantly as localized sheeted packages over short 10-30cm intervals. Vuggy and with buff iron-carbonate alteration.	QZVN		5.0%	w			co	1
6	73.28	black phyllite with regular grey (and occassionally iron stained) silt laminations/interbeds; Generally very uniform in appearance with mulitple mechanical breaks as well as naturally occuring fractures along foliation and discordant to foliation. Evidence of folding in form of variable core angle of regional foliation cleavage and localized, small scale (~4cm wavelength) fold profiles. Exact composition difficult to determine because of very fine-grained nature.	MT-Phy		95.0%	n			co	1
73.28	75.5	Quartz veining vuggy and sheeted and concentrated in sandstone interbed at about 74m [60TCA]	QZVN		5.0%	w			br	3
73.28	75.5	very fine-grained silt/sandstone interbed with prominent vuggy quartz veining preserved at about 74m in blocky and gouged fault zone. Grainsize: 0.5mm (or smaller) 75% Quartz 20% feldspar, 5% fine-grained lithic fragments	MT-SS	bx	40.0%	t			br	3
73.28	75.5	Faultzone: blocky with poorly recovered gouge segments [angular fragments in clay matrix] Localized silt to fine-grained sandstone interbedding Size of silt interbeds proportionally increases [gradational contacts]	MT-Phy	bx	55.0%	n			br	3
75.5	77.6	multiple, milky white (<1cm thick), variable core angle quartz veins in tan, fine-grained sandstone bed - leading to stockworked appearance. Singular grain of arsenopyrite observed in vein fragment	QZVN		20.0%	w			br	2
75.5	77.6	fine to medium grained, tan coloured sandstone with pale orange iron-carbonate staining [pervasive] Grainsize: 0.5-1mm Composition: predominantly quartz 70% subrounded quartz clasts, 25% dusty white feldspar, 5% lithic fragments upper and lower contact are sharp with gouge seams	MT-SS	fgr	80.0%	t			br	2

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-012	Grant No.:	YD07124
Plunge:	Azimuth:	EOH:					
55	270	265					

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
77.6	128.8	quartz veining in phyllite unit is sparsely distributed and frequently foliation concordant. See point measurement for detainls on vein orientation trends generally veins in phyllite hae a dusty white colour rather than milky white and vitreous	QZVN		4.0%	w			co	1
77.6	128.8	folded Phyllite unit with lamellar grey silt interbedding predominantly low core angle foliation in upper 2/3 or unit interval and steepening foliation core angles in lower 1/3 of unit interval exact composition difficult to determine due to fine-grained nature	MT-Phy		96.0%	n			co	1
128.8	131.8	Thin, 1 mm - 2 mm thick white quartz veins crosscut bedding. Small breccias filled with fe-cb altered clay are formed between intersectecting veins.	QZVN		1.0%	w			co	2
128.8	131.8	Buff coloured, very fine-grained sandstone interbedded with the phyllite. Locally the beds are folded in small mesoscale folds. Fe-cb alteration is disseminated through the matrix of the unit.	MT-SS	fgr	20.0%	bf			co	1
128.8	131.8	Black phyllite interbedded with .3 -2.5 cm very fine-grained sandstone beds. The sandstone beds are buff coloured and contain disseminated fe-cb porphyroblasts in the matrix.	MT-Phy	n	79.0%	n			co	1
131.8	141.53	Quartz carbonate veins ranging in width from .2 - 4 cm cross cut the interval. The veins contain vugs and abundant fe-cb alteration in fractures and along selvedges. Many of the veins display coxcomb textures and have distinct medial seams, indicating antitaxial vein development.	QZVN		2.0%	w			co	2
131.8	141.53	Grey medium-grained, arkosic sandstone with clasts of clay altered feldspar and quartz (2-5mm). Rounded lithic fragments of phyllite are rare component of the clast composition. The feldspars are mostly altered to white clay, but in the vicinity of quartz veins and open fractures the clay is stained orange by iron. Minor lenses of quartz pebble conglomerate are interbedded throughout the interval. The lenses range in thickness from 5-10cm. The clasts are composed of rounded pebbles (<2cm) of quartz, feldspar, and rare phyllite.	MT-AR		98.0%	gy	ksp	10	co	2
141.53	143.86	White quartz veinlets with fe-cb and sulphides.	QZVN		5.0%	w			co	1
141.53	143.86	Grey quartz pebble conglomerate with angular lithic fragments of black phyllite. The conglomerat is matrix supported, which is a medium-grained arkosic sandstone. Clasts are comprised of quartz and feldspar and are subrounded. Feldspar is altered to white and pale green clay. A well developed disjunctive cleavage overprints the interval and displays an average spacing of .75 cm. The cleavage is locally sub-parallel to quartz veins. Alteration of the unit is controlled by open fractures and quartz vein and is limited to fe-cb along fractures and vein selvedges. A small proportion of clay altered feldspar is pale green, indicating the presence of eipodote or chlorite. The upper contact of the conglomerate with the sandstone is gradational, but the lower contact is a narrow fault zone delineated by broken, brecciated black phyllite.	MT-CO	pbl	95.0%	gy	qtz	30	co	2
143.86	165.6	Several 5-8cm black phyllite bed are present in the interval and is interbedded with siltstone/sandstone beds less than 1cm wide. These narrow units are often brecciated by open fractures and display shear zone fabrics formed by slip within the less competent interval.	MT-Phy	n	3.0%	n			co	1
143.86	165.6	fe-cb bearing white quartz veins. Quartz veins in the interval are more abundant than the previous interval. Fe-cb alteration occurs within the vein filling vugs and fractures. It also forms distinct alteration halos in the country rock in the immediate wall rock.	QZVN		7.0%	w			br	1
143.86	165.6	Grey quartz pebble conglomerate. The conglomerate is locally clast supported, but primarily matrix supported. The matrix is comprised of fine- to medium-grained sandstone. Quartz is the predominant clast type (up to 40%) and are generally sub-rounded to rounded clasts.	MT-CO	pbl	10.0%	gy	qtz	40	br	3

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-012	Grant No.:	YD07124
Plunge:	Azimuth:	EOH:					
55	270	265					

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
143.86	165.6	Grey, arkosic sandstone with abundant, angular feldspar and rounded quartz clasts. Clasts range in size from 3-4mm. The feldspar clasts are altered to white clay. Several brittle faults crosscut the interval generating intervals of broken core associated with increased clay and fe-cb alteration. The alteration is primarily controlled by fracture surfaces, but forms disctinct halos, up to 2 cm around quartz veins.	MT-AR	mgr	80.0%	gy			br	3
165.6	171.93	A black phyllite with thin (2-3cm), buff coloured siltstone beds. Bedding is planar in this unit, but is overprinted by a penetrative, slaty cleavage. 1-2mm quartz veinlets are abundant and controlled by the orientation of the foliation. The foliation is refracted within the siltstone beds. Foliated quartz-carbonate veins and small and small (1mm) porphyroblasts of an unidentified mineral are also present (andalusite?). There is minor fe-cb alteration associated with cross-cutting quartz veins at the start of the interval and a small proportion of the siltstone beds are fe-cb altered. It is a relatively quiert interval structurally. The beds are planar. No mineralisation was observed in this interval.	MT-Phy	n	100.0%	n			co	1
171.93	187.4	The quartz veins are thin white quartz associated with minor fe-cb.	QZVN		3.0%	w			co	1
171.93	187.4	The sandstone is interbeded with medium-bedded (10-15cm) beds of black phyllite, which also contain thin (.5-1cm) sandstone beds.	MT-Phy	n	5.0%	n			co	1
171.93	187.4	Grey, medium-coarse grained arkosic sandstone. The interval contains white quartz veins that cause broken core, but are not major faults.	MT-AR	mgr	92.0%	gy			co	1
187.4	196.8	Black phyllite beds interbedded with thin- to medium-bedded arkosic sandstone.	MT-Phy	n	20.0%	n			co	1
187.4	196.8	Grey, fine-grained arkosic sandstone with local beds of coarse-grained sandstone. The planar bed range from 1 cm to 70 cm in thickness. Thin black phyllite beds are interbedded with the arkose beds. A well developed slaty cleavage is developed in the arkose and phyllite beds. The structure in this interval is limited to open fractures crosscutting the lithology.	MT-AR	fgr	80.0%	gy			co	1
196.8	237.4	A possible mafic feldspar porphyry dyke. The feldspar phenocrysts are angular plagioclase crystals, approximately 1mm diameter. This is a rare occurrence in the drillholes at the Main Zone.	MI	por.fsp	1.0%	n			co	4
196.8	237.4	Thin- to thick-bedded sandstone interbedded within a broad phyllite unit.	MT-AR	fgr	5.0%	gy			lc	4
196.8	237.4	Black phyllite with a small proportion of interbedded sandstone. The sandstone is thin- to thick-bedded (.2 cm - 70 cm). Parasitic folding is abundant in this interval and delineated by variable core axis angles of the bedding. A significant fault was intersected within this interval at 214.55m. The fault zone is comprised of strong clay alteration and cataclastic grain size reduction, generating a clay gouge with abundant, angular wall rock clasts. Short intervals of sandstone are also pervasively clay altered (light grey clay).	MT-Phy	n	94.0%	n			lc	4
237.4	240.86	Grey, coarse- to medium-grained arkosic sandstone. The competent sandstone is preserved within the broader fault zone interval. Two narrow phyllite beds are present within the sandstone interval, which are much higher strain then the clastic rock.	MT-AR	cgr	100.0%	gy			co	2

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-012	Grant No.:	YD07124
Plunge:	Azimuth:	EOH:					
55	270	265					

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
240.86	249	A strongly foliated and sheared graphitic phyllite with (1-2mm) siltstone beds. Cross-cutting quartz veins are rare in this interval, but brecciated and crushed quartz veins are abundant clasts in the gouge zones. This is interpreted that quartz veins were developed in brittle-ductile fault zones prior to the formation of brittle cataclastic faults. Sulphides are disseminated throughout the zone. py(5%)+asp(2%) is common in the gouge zone with quartz vein clasts.	MT-Phy	gf	100.0%	n			co	4
249	265	Grey, medium-grained arkosic sandstone comprised premdominately of quartz and lesser feldspar sand grains. The unit is faulted and cross-cut by quartz veins with abundant white clay distributed along fractures and vugs. The veins also contain a small amount of py (1%). Several intervals of rubble with narrow clay gouge seams indicate the presence of late, brittle fault zone in the interval.	MT-AR	mgr	100.0%	gy			co	3

Alteration

From:	To:	Comments:	Mineral	Intensity	Distribution	Colour:
6	73.28	weak orange-brown iron-carbonate staining throughout entire unit: preferentially in lamellar silt interbeds nd as rimming in predominantly foliation concordant veining	fecb	1	vn	o
52.5	55.9	blocky fragmentation with intense iron staining along fractures	fecb	2	frac	o
73.28	81.2	near pervasive iron-carbonate staining - especially visible in sandstone intervals	fecb	3	perv	o
124	126.37	moderate-strong fe-cb distributed along fractures in the vicinity of quartz veins.	fecb	2	frac	o
124	126.37	weak epidote is present in quartz tension veins formed along fault fill veins.	ep	1	vn	g
124	126.37	clay alteration is fills fractures and vein margins. It is strongly coloured by associated fe-cb alteration.	cy	3	vn	o
124	126.37	strong fe-cb alteration along vein selvedge	fecb	3	vn	o
130	131.8	pervasive clay alteration developed in a brittle fault. It replaces both phyllite and sandstone. The colour depends on protolith. Three clay gouge zones are present in the interval with crushed wall rock fragments.	cy	3	perv	gy
131.8	143.5	fe-cb alteration along open fractures in the core	fecb	1	frac	o
136.06	143.95	moderate fe-cb associated with thin, sheeted quartz veins.	fecb	2	vn	o

155.16	159.75	quartz vein hosted fecb alteration.	fecb	2	vn	o
159.75	164.75	weak fecb alteration along the selvedges of quartz veins.	fecb	1	vn	o
165.2	165.75	A weak epidote halo formed around a stratigraphic contact.	ep	1	perv	g
165.2	165.75		cy	1	diss	g
165.2	165.75	A weak epidote halo formed around a stratigraphic contact.	ep	2	vn	g
165.6	171.93	pale yellow clay, primarily formed on foliation planes.	cy	2	fol	y
165.6	171.93	fecb overprint is subdued in this interval and a pale yellow clay is the dominant alteration.	fecb	2	frac	o
165.6	171.93	fecb porphyroblasts formed along thin siltstone/vfg sandstone beds.	fecb	1	bed	o
172.56	178.5	disseminated porphyroblasts of fecb in the wall rock. This forms a distal halo around the strongly altered quartz veins.	fecb	1	diss	o
172.56	178.5	quartz vein hosted fecb alteration	fecb	3	vn	o
172.56	178.5	fecb alteration formed along open fractures in the interval.	fecb	3	frac	o
172.56	178.5	weak clay alteration forming a narrow halo around fault hosted quartz veins.	wcy	1	perv	w
172.56	178.5	White clay formed within quartz veins, commonly as blebs and small seams within the vein.	wcy	2	vn	w
178.5	183	more intense alteration in the core of a fault zone.	wcy	3	vn	w
178.5	183	more intense fecb alteration in the core of a fault zone.	fecb	4	vn	o
178.5	183	more intense fecb alteration in the core of a fault zone.	fecb	3	diss	o
178.5	183	more intense fecb alteration in the core of a fault zone.	fecb	4	frac	o
178.5	183	more intense alteration in the core of a fault zone.	wcy	3	perv	w
179.1	179.25	Hematite is an uncommon alteration at the Main Zone, but does occurr from time to time. It indicates a more oxidised fluid than what is commonly associated with Au mineralisation. As such, it may represent the passage of a late stage, post-mineralisation fluid.	hem	2	vn	r
183.6	184.26	minor epidote formed on the selvedge of fractures.	ep	1	vn	g
183.6	184.26	weak clay development on vein selvedge.	wcy	1	vn	w
183.6	184.26	epidote, and probably chlorite/muscovite, replacement of fsp grains in the clastic rocks (i.e., sauseritization). Epidote is localised to the hanging wall of a lithological contact.	ep	1	smgr	g
184.4	198.1	fecb alteration drops off in the phyllite interval. Fluids are passing through the rock and fecb is present on fractures, in the S1 foliation and pervasively in some siltstone and fgr sandstone beds; where there is increased permeability. fecvb alteration is also present along the selvedge of some veins.	fecb	1	fol	o
184.4	198.1	fecb alteration also forms along foliation planes, which have enhanced fluid flow.	fecb	1	frac	o
184.4	198.1	fecb alteration is strongest along chemically reactive, permeable fgr sandstone and siltstone beds.	fecb	2	bed	o
198.6	198.7	Intense clay development in a grey clay fault gouge.	gcy	4	gouge	gy
199.8	203	Hairline quartz-carbonate veinlets, which occur every 1 m, or so. This array of veins is also associated with py and asp (1-2%).	cbt	2	vn	w
207.66	214.54	There is little alteration in this interval, just an off-white clay in discreet quartz veins cutting the interval.	wcy	1	vn	w
207.66	214.54	Graphite is a component of the phyllite,but is also remobilised along the S2 foliation plane.	gf	3	perv	n
207.66	214.54	white clay forms halos around quartz veins, where fluids have bled along the pre-existing foliation plane.	wcy	2	fol	w

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-012	Grant No.:	YD07124
Plunge:	Azimuth:	EOH:					
55	270	265					

From:	To:	Comments:	Mineral	Intensity	Distribution	Colour:
214.59	249	Blebs of white carbonate alteration are distributed throughout the interval. The carbonate is typically calcite and is associated with py+asp. The morphology of the calcite blebs and grain boundary relationships with the gouge particles indicates the calcite formed from late, epigenetic fluids migrating through the cataclastic shear zone.	cbt	2.5	bleb	w
214.59	249	Intense clay alteration within an extensive brittle fault with broad gouge zones. Cb is present as blebs through the interval. It is notable that two short subintervals of sandstone are less intensely clay altered and the clay is white. However, the sandstone is abundantly faulted and clay seams form conjugate faults. The specific subintervals are broken out in the structural section.	cy	4	perv	n
220.17	224.14	Intense, pervasive clay alteration of phyllite. The inteval is friable and semi-competent due to alteration.	ncy	4	perv	n
224.14	225	Intense, pervasive grey clay alteration of a thin, medium-grained arkose bed. The interval is semi-competent, friable sandstone.	gcy	4	perv	gy
225	229.5	Strong, clay alteration of mostly competent, faulted black phyllite.	ncy	3	perv	n
229.5	237.4	Strong, pervasive clay alteration of black phyllite. Abundant clay gouge zones are present.	ncy	3	perv	n
237.4	240.86	Moderate to strong clay alteration of a medium-grained arkose bed. The sandstone is competent rock, but somewhat friable.	gcy	2.5	perv	gy
240.86	249	Intense pervasive clay alteration of black phyllite and extensive developement of black, clay gouge.	ncy	4	perv	n
249	265	weak clay alteration is quartz veins.	wcy	1	vn	w
249	265	wcy is pervasive in the interval and is controlled by fractures. It is not as intense as higher in the hole, but pervasive clay alteration of the wall rock is strong enough to weaken the rock so it cannot be lifted intact out of the core box.	wcy	2	perv	w
249	265	moderate intensity of white clay on the face of open fractures.	wcy	2	frac	w

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
14.1	15	FZ	400.0%	BFZ	gouge friable phyllite [poorly recovered]
32	32.2	FZ	200.0%	BFZ	fissile, friable shattered phyllite fragments [poorly recovered] along foliation
41.86	46.4	FZ	300.0%	BFZ	brittle faultzone with about 50% of core preserved as blocky, competent, foliated phyllite fragment. Remainder of core as interspersed, poorly recovered gouge wedges and fissile, shattered, softened, iron-stained fragments - loose and and also in part bound in gouge matrix. Some fragments shoe intersecting tension veining [thin <0.5cm thick seams]
60.4	61	FZ	300.0%	bx	small angular fragments held in 20% gouge-clay matriz with internal 60TCA foliation fabric
73.28	81.2	FZ	300.0%	BFZ	Fault Zone that contains lithological contacts: Broken, blocky and rubbled with partially competent core with interspersed [partially poorly recovered] gouge wedges that hold angular rock fragments. Zone contains two blocky sandstone interbeds and possibly sandstone gouge [tan colour],--- see lithology Phyllite lithology predominates in this zone.
84.5	85.1	QZVN	400.0%	bx	Multiple densely spaced, foliation concordant quartz veins win phyllite that contain angular wedges of phyllite in vein material veins are iron-carbonate stained and have multiple tension cracks perpendicular to vein contacts also grey-green chlorite wedges in vein material that appears elongated along foliation [low grade shearing?] contacts of structure are not well preserved due to poor recovery
124	126.37	FZ	300.0%	BFZ	A faultzone delineated by quartz tension veins which are weakly folded and form various angles to the core axis. Local brecciation occurs in the interval. Strong fe-cb alteration is associated with the veins and orange clay is fills open fractures through the fault. The most significant vein and associated alteration is parallel to the core axis.
130	131.8	FZ	300.0%	BFZ	A brittle fault zone with three distinct clay gouge zones. The fault occurrs at the contact between a phyllite dominated interval and sandstone. The exact location of the contact is ambiguous, but both rocks types are faulted and brecciated.

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-012	Grant No.:	YD07124
	Plunge:	Azimuth:	EOH:				
	55	270	265				

From	To	Mineral	Intensity	Distribution	Comments
131	132.03	FZ	300.0%	bx	A fault zone formed in black phyllite at the contact with an underlying arkosic sandstone. The fault is delineated by intense clay development and broken core. A 15 cm wide cataclastic gouge is comprised of brecciated and ground sandstone and phyllite. This is appears to be the core of the fault zone.
132.37	134	FZ	300.0%	BFZ	A brittle fault zone where most of the core was lost the remaining fragments consist if thin (3-5mm) vuggy quartz veins with fe-cb alteration in the vein and a narrow, .3cm, halo around the vein.
143.5	143.64	FZ	300.0%	BFZ	A narrow brittle fault zone formed within a minor phyllite bed. The fault contains folded quartz veins with 5-8% py + 2-3% asp. Sulphides are distributed in both the vein and in the brecciated phyllite.
143.86	144	FZ	200.0%	bx	A fault zone at the lower contact of a conglomerate unit. The zone is delineated by broken core and fe-cb bearing quartz veins.
148.7	151.72	FZ	200.0%	BFZ	A brittle fault zone with broken core, fecb alteration associated with quartz veins. The central portion of the fault is intact core, but 2 narrow (3cm) gouge zones are present.
153.88	155.16	FZ	200.0%	bx	A brittle fault zone demarcated by rubble with brecciated quartz vein. The veins are thin, vuggy veins with strong fecb alteration. fecb alteration is also pervasive in the wall rock.
178.5	183	FZ	100.0%	BFZ	The abundance of quartz veins picks up in this interval, along with associated alteration. It is a brittle fault zone demarcated by the quartz veins. The veins are 3-5 cm thick and cross cut earlier foliated quartz veins, which indicates reactivation of the fault zone.
197.04	198.3	FZ	300.0%	bx	A grey clay gouge with brecciated phyllite clasts and a small amount of fecb altered quartz vein clasts. This is a cataclastic fault.
207.66	214.54	Folds	300.0%		An interval of F2 an F1 parasitic folds. The F1 folds are manifested as isoclinal folds with axial planar S1 cleavage. F2 is observed as open warps of So, which form steep and gentle limbs. A space (1-2mm) slaty S2 cleavage is axial planar to F2 folds. S2 crenulates So, S1, and D1 veinlets. Pyrite is strongly developed along S2 planes and gf probably defines the cleavage. There is no asp in the foliation. Note F2 verges north. White quartz veins with asp and py cross cut both cleavages and a younger generation of structure.
213.7	214.85	FZ	200.0%	BFZ	A series of quartz tension veins form an array in the immediate hanging wall of the shear zone down hole. These are possibly kinematic indicators of a late stage of movement associated with brittle faulting and clay gouge development within the shear zone. The geometry of the TVA indicates reverse dip-slip on a moderately dipping fault of unknown orientation.
214.54	220.17	FZ	400.0%	bx	Black clay gouge with breccia clasts of phyllite.
214.85	249	SZ	400.0%	CSZ	This is a broad intersection of intense cataclasis with abundant, discreet clay gouge zones. It is formed, predominantly, in phyllite, but a few sandstone beds are present (i.e., grey vs. black clay gouge). Most quartz veins in the fault zone has been milled and the few which are not milled are strongly brecciated. Although the deformation state of quartz veins may indicate polyphase movement in the cataclastic shear zone, the varied degree of brecciation and cataclasis may also suggest the continuous vein development during a prolonged deformation/fluid event. The presence of relatively less deformed, non-cataclastic rocks in the shear zone indicate that the fault may comprise, four discreet fault/slip planes. No oriented core was recovered and the geometry of the fault is completely unknown, although quartz TVA in the hanging wall of the shear zone suggest it is a moderately dipping, reverse fault. The four sub intervals are broken out as discreet brittle fault zones.
225	229.5	FZ	300.0%	BFZ	Strong black clay alteration of phyllite, but still competant. There are abundant, brittle conjugate faults throughout the interval with thin (1 cm) clay seams.
229.5	237.4	FZ	300.0%	BFZ	Strong black clay alteration of phyllite with abundant thin to moderately thick, discontinuous clay gouge zones. These are thought to represent anastomosing fault strands.

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-012	Grant No.:	YD07124
	Plunge:	Azimuth:	EOH:				
	55	270	265				

From	To	Mineral	Intensity	Distribution	Comments
240.86	249	SZ	400.0%	CSZ	80% cataclastic gouge formed from milled and brecciated black graphitic phyllite. Sulphides are abundant in this interval, some of which are from the milled quartz veins, but some the larger and better formed asp grains appear to be from fluids. A series of thin, late quartz veinlets cross cut the gouge. There are short intervals of semi-competent, friable phyllite, but it is strongly, pervasively clay altered.
249.3	249.5	FZ	300.0%	BFZ	A grey clay gouge with milled breccia clasts of sandstone from the wall rock. This particular fault is probably associated with the main shear zone up hole.
256.75	256.9	FZ	300.0%	BFZ	A narrow, grey clay gouge fault zone. No contact angles were preserved.

Objective:

This target is another test of the 3Ace Fault 37m north of 3A-11-P09. Step was moved 12m further north to accommodate topography. Target expected at 59m and possibly around 85m.

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	4	Casing	CASING		100.0%				co	1
4	83.85	A broad interval of black phyllite intersected at the top of the hole. The unit is well bedded with grey siltstone beds ranging in thickness from 1mm to 3cm. The thicker siltstone packages contain complex contact morphologies and often isoclinal folds, which do not contain an axial planar foliation. These folds appear to be transected by the regional S1 cleavage. The contact morphologies and fabric relationships suggest the thicker siltstone layers formed as syndepostional deformations (e.g., slump) structures. Most of the panel is fairly quiet structurally with consisten core axis angles of 35, but towards the bottom of the interval a series of F1 and F2 parasitic folds are intersected.	MT-Phy	n	100.0%	n			co	1
83.85	106.05	A grey, medium-grained arkosic sandstone; locally the unit is coarse-grained sandstone. The composition of the sand grains is predominantly quartz and feldspar. The proportion of quartz grains indicates the unit is probably sub-arkosic. Pervasive chlorite gives the sandstone a greenish tinge in a narrow (1m) halo developed at the contact with a underlying phyllite unit. This overprinting could be epi- or diagenetic. The interval displays abundant brittle fault structures, including quartz veins and minor clay gouge. Quartz dissolution within the brittle fault zones indicates fluid flow was enhanced within the structures. Sulphides are disseminated throughout the matrix of the sandstone (py+tr. asp). asp is abundant (3-4%) in the zones of stronger quartz dissolution, where it forms euhedral grains up to 2mm. Quartz veins consist mostly of 1cm-2cm wide veins with white clay. A small proportion of the quartz veins have fe-cb distributed along the selvedge of the vein and in small vugs. In the dissolution zones, brecciated clasts of quartz vein are common. It's not clear if asp mineralisation is from the milled vein fragments, or later overprinting fluids migrating through the fault zones. However, some of the euhedral asp grains are disseminated in the matrix of competent rock.	MT-AR		100.0%	gy			co	1
106.05	127.22	Grey, very fine-grained siltstone interbeds within the phyllite. The beds are rythmically deposited, but sedimentary structures were not observed to indicate if the depositional environment of the beds (i.e., turbidites or not?).	MT-SLT		30.0%	gy			co	1

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-013	Grant No.:	YD07124
Plunge:	55	Azimuth:	270	EOH:	246		

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
106.05	127.22	Black phyllite with 2-3cm thick interbeds of siltstone. No sedimentary structures were observed to determine the younging direction in the beds. Although polyphase folding would make the determination of structural facing difficult in this stratigraphic sequence.	MT-Phy	n	70.0%	n			co	1
127.22	164.05	Medium-bedded gray quartz pebble conglomerate interbedded with grey arkosic sandstone that dominates the interval.	MT-CO	cgr	20.0%	gy			co	2
127.22	164.05	A grey, arkosic sandstone with 5-6% pebble clasts (quartz and lithic fragments) interbedded with quartz pebble conglomerate. The conglomerate beds typically have a more spaced, disjunctive cleavage. This interval has strong alteration in the form of pervasive desilicification. The foliation planes are particularly altered and ragged, sugguesting this was a primary fluid pathway. Narrow gouge zone throughout the interval are clay breccias and are typically limonite and fe-cb stained.	MT-AR	mgr	80.0%	gy			co	1
164.05	172.84	Thin-bedded grey siltstone from 1-4cm interbeds in the phyllite.	MT-SLT		15.0%	gy			co	1
164.05	172.84	Black phyllite interbedded with thin-bedded, grey siltstone. Bedding and cleavage planes in the phyllite are coated with graphit, but very weakly; remobilised from phyllite matrix? Bedding is relatively quiet and planar in this interval.	MT-Phy	gf	85.0%	n			co	1
172.84	180.93	A strongly veined interval of sandstone and minor amounts of pebble conglomerate with feldspar clasts. Alteration in this interval is comprised primarily of silicification, which crosses the upper lithology contact, and fe-cb veinlets. Arsenopyrite mineralisation is much stronger in this interval and is both disseminated and vein controlled. The lower contact of the interval is a fault gouge which cuts the mineralised zone off.	MT-AR	fgr	100.0%	gy			co	3
180.93	197.62	Thin-bedded (.2 cm-2cm thick) grey siltstone beds within the phyllite interval.	MT-SLT		25.0%	gy			lc	4
180.93	197.62	A strongly disrupted section of black phyllite with grey siltstone beds. The interval is strongly faulted and clay altered. Broad gouge zones with milled and crushed wallrock breccia clasts are found throughout the interval. This is similar to other holes, but the zone is higher up in the hill. The upper contact is a gouge zone with crushed sandstone breccia clasts (20cm wide). There is a sub-interval of relatively competent fine-grained sandstone within this interval. It was broken out for sampling.	MT-Phy	n	70.0%	n			co	1
197.62	212.1	Pervasively clay altered and faulted sandstone. Clay alteration makes the interval white. The alteration has made much of the interval weakly competent and the core breaks with handling. Clay altered feldspar grains are present as a clasts in the sandstone, approximately 15% and phyllite rip-up clasts are abundant. An interval of less altered sandstone is present and seperates two fault strands in the drillhole. The less altered and deformed sandstone is grey (201.89-204 m) Sub-intervals of less altered and deformed sandstone contain Ssh, a disjunctive cleavage associated with the brittle faulting.	MT-SS	mgr	100.0%	w	fsp	15	fr	3
212.1	216.3	Strongly faulted and gouged black phyllite. So is is sub-parallel to the core axis in this interval, indicating an F2 steep limb. The grey siltstone beds are up to 3 cm wide and form 30% of the interval. S1 cleavage is prominent and refracts strongly through the lithological boundaries.	MT-Phy	n	100.0%	n			fr	3

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-013	Grant No.:	YD07124
Plunge:	Azimuth:	EOH:					
55	270	246					

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
216.3	226.8	Strongly deformed, black graphitic phyllite with siltstone beds. The beds are 1-3mm thick and only 5-10% of the interval. It is a distinct lithological break from the previous interval	MT-Phy	gf	100.0%	n			fr	2
226.8	246	Fine- to medium-grained arenitic sandstone. There are minor phyllite beds, one of which is isoclinally folded. Locally 1mm feldspar clasts are present in low abundances. At 231m a sandstone/siltstone bed contains 5-10%, angular rip-up clasts along a bedding plane contact. The fine- and medium-grained sandstone beds are interbedded. Locally, Ssh is developed, but most structure is in the immediate footwall of the uphole brittle fault zone. This unit is typical of the footwall lithologies intersected in other holes in this area.	MT-SS	mgr	100.0%	bf	fsp	2	co	1

Alteration

From:	To:	Comments:	Mineral	Intensity	Distribution	Colour:
4	42.9	Replacement of 2 mm thick siltstone beds	fecb	2	bed	o
4	42.9	Minor migration of fecb alon foliation planes. This is a pretty quiet interval for alteration. Fluids are obviously migrating along early, preexisting features in the phyllite. Perhaps the distal edge of a fault zone halo in the country rock.	fecb	1	fol	o
40.56	40.95	Weak chlorite coating on a hairline quartz vein. This only occurrs in two quartz veins.	chl	1	frac	g
42.9	57.2	Orange stained clay coating on orange fractures. Alteration is overall, fairly low key through the initial interval in this hole. A cataclastic clay gouge with milled fecb fragments cross cuts this interval at 56.55 m (see structure).	ocy	1	frac	o
42.9	57.2	1 vein every .5 m or so.	fecb	2	vn	o
57.2	83.85	Below the fault fecb drops out of the system; fault cut-off/displacement. Sulphides make their first appearence in the hole in the footwall of the fault. Alteration in this interval is vein controlled and does not have a large impact the country rocck. In damage zones around the gouge pervasive and fracture controlled clay (gy) affects wall rock. These halos are approximately 20-30 cm wide. In this interval an off-white, mineral in the quartz veins is thought to be ankerite. It fizzes very weakly when scratched, but there is no stain to test it.	fecb	2	vn	w
57.2	83.85		py	1	vn	y
57.2	83.85	fecb distributed along less then 1% of the fractures.	fecb	1	frac	o
65.47	66.14	Clay gouge. This alteration interval is mostly consistent up to the contact with the clastic rocks. Two sub-intervals of sulphides (py) are present, but the alteration is the same, just zones of increased pre-D3 quartz veins forming distinct zones in structures. Most of the gouge in the structures contains short pieces of intensely clay altered phyllite that is semi-competent and still preserves the pre-D3 fabrics.	gcy	3	gouge	gy
65.47	66.14	Forms halos around the clay gouge.	gcy	2	frac	gy
84	95.47		ycy	2	frac	y
84	95.47	Forms halos around fractures.	fecb	1	frac	o
84	95.47	Quartz dissolution is pervasive throughout the sandstone, causing the rock to be friable in the fault zones.	DSIL	2	perv	bf

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
18.4	18.5	FZ	300.0%	BFZ	A grey clay gouge with cataclastic breccia clasts. The top of the hole is pretty quiet, although there are several narrow gouge zones distributed through it. There are also a few small mesoscale parasitic folds.
26.5	26.6	FZ	300.0%	BFZ	Grey clay gouge with clasts of brecciated country rock. The edges of the core is ground and no core axis angles could be recovered for the gouge.
27.55	27.61	FZ	200.0%	bx	A coherent breccia in the hanging wall of a 3 mm quartz-carbonate vein with weak fecb alteration.
29.55	29.7	FZ	300.0%	BFZ	Grey clay gouge with breccia clasts of phyllite.
30.1	30.15	FZ	200.0%	BFZ	Grey clay gouge.
30.9	31.6	FZ	200.0%	BFZ	Grey clay gouge
32.65	32.75	FZ	200.0%	BFZ	Grey clay gouge. The gouge contains minor (1%) py from brecciated veinlet in the footwall of the gouge.
39.45	40.5	FZ	200.0%	BFZ	Grey clay gouge with milled phyllite clasts. An interval of lost core with a high proportion of clay gouge material remaining.
43.79	43.94	FZ	200.0%	bx	Grey clay gouge seams in hairline fractures which form a brecciated interval associated with broken core. Hairline quartz veins are present in this interval and contain strong fecb along combs and axial septa boundaries.
56.55	57.2	FZ	300.0%	BFZ	Orange-brown clay gouge with abundant milled phyllite and brecciated quartz vein clasts. At the top of the gouge, fragments are orange from fecb fracture coatings, but the lower half of the gouge is predominantly grey clay with wall rock clasts. The change in composition of the gouge and alteration style reflects the style in wall rock across the fault zone, suggesting some degree of offset on the gouge. Unfortunately the kinematic sense of shear and amount of displacement is unknown.
59.1	60	FZ	200.0%	bx	An interval of broken core with a lot of grey clay gouge and milled wall rock. A fracture just below this zone has dip-slip slickenlines, indicating normal displacement.
65.47	66.14	FZ	300.0%	BFZ	Grey gouge with distinct damage zone highlight by fractures in the hanging and foot walls of the gouge.
66.54	70.54	folds	100.0%	folds	An interval of abundant F1/F2 parasitic folds. A possible F2 hinge zone.
70.4	72	FZ	200.0%	BFZ	Grey clay gouge with milled wall rock clasts and 2-3% pyrite.
72.36	72.46	FZ	200.0%	BFZ	Grey clay gouge with coarse, angular breccia clasts of milled wall rock.

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-013	Grant No.:	YD07124
	Plunge:	Azimuth:	EOH:				
	55	270	246				

From	To	Mineral	Intensity	Distribution	Comments
72.46	72.9	FZ	300.0%	bx	A laminated quartz vein cross cuts an interval of folded, dismembered veinlets and a local increase in the abundance of pyrite. This is an earlier, reactivated fault zone.
75.95	76.22	SZ	300.0%	DBSZ	A zone of folded quartz veins within a brittle-ductile shear zone. The top of the shear zone is reactivated as a brittle fault demarcated by a grey clay gouge. The veins appear to contain ankerite.
76.76	77.15	FZ	200.0%	BFZ	A brittle fault zone demarcated by seams of grey clay gouge forming a network of faults that brecciate the country rock. The core through this interval is mostly broken along the gouge seams.
81.14	81.31	FZ	300.0%	BFZ	Clay gouge.
81.85	82	FZ	300.0%	BFZ	Clay gouge and pervasive clay alteration in fault zone.
84	85	QZVN	200.0%	BFZ	Quartz veins in a fault zone with lost core. The amount of sand indicates significant quartz dissolution in this interval. The vein contains asp+py.
85.5	86.2	QZVN	200.0%	BFZ	Similar to the previous zone, quartz dissolution and broken quartz veins define the fault zone. Asp+py are abundant, but probably no more than the surrounding, less deformed wall rock. This is post mineralisation faulting.
88.6	88.7	FZ	200.0%	BFZ	A narrow fault zone with quartz dissolution and grey clay gouge. The gouge is a minor component of this fault.
91.16	91.8	FZ	300.0%	BFZ	An interval of lost core due to quartz dissolution. Abundant quartz vein clasts and 4-5% sulphides (asp+py) in the interval. There is very little rock left in the box, just sand.
93.79	94.29	FZ	200.0%	BFZ	A fault zone with pervasive quartz dissolution, similar to previous fault zone.
94.93	95.47	FZ	200.0%	BFZ	A fault zone with pervasive quartz dissolution. The rock in these fault zones has completely turned to sand and there is little to describe in the way of fault fabrics.
101.1	101.57	FZ	300.0%	BFZ	A fault zone with intense quartz dissolution, leaving just sand behind in the box and some large sandstone clasts.
102.81	103.16	FZ	300.0%	BFZ	Broken core with abundant sand from quartz dissolution, a crumbled breccia zone.
131.1	133.7	FZ	300.0%	BFZ	Extensive clay gouge and crushing of sandstone weakened by quartz dissolution and clay developement in the fault. The fault probably consisted of multiple fault planes. The fault starts in the footwall of a vuggy quartz vein with fecb alteration. The vein has a small alpha angle and is subconcordant with foliation; much of the gouge is subconcordant to foliation. The foliation is a space (3 mm) disjunctive cleavage. This style of cleavage has been observed in outcrop at Sprogge and 3Ace and in many of the drill holes. It seems to be developed in response to the brittle faults. The foliation is ubiquitous throughout the clast lithological unit, forming beyond the boundaries of the fault.
158.3	160.2	FZ	200.0%	BFZ	Broken core with strong quartz dissolution, probably a stockwork/breccia zone.
172.75	180.93	SZ	300.0%	DBSZ	A brittle-ductile shear zone delineated by abundant quartz veins with multiple orientations. There are no distinct TVA veins, but some of the veins are weakly folded due to progressive shearing. The veins are vuggy and a few of the Q1 veins are TVA. There appears to be 3 phases of vein development in the shear zone, based on cross cutting relationships.
180.93	181.13	FZ	200.0%	BFZ	Grey clay gouge with breccia clasts of sandstone/conglomerate forms a fault contact with abundant py and lesser asp.
184.64	193.6	FZ	300.0%	BFZ	A black clay gouge zone with short intervals of semi-competent phyllite that is pervasively clay alterated. The gouge contains 2-8 mm breccia clasts of phyllite wall rock. A short interval of sandstone is also cataclastically deformed. The phyllite above this interval is strongly veined.
195	201.8	FZ	300.0%	CSZ	A cataclastic fault with grey clay gouge breccia and pervasively, clay altered, semi-competent intervals of wall rock. A fair amount of core is lost through this interval and no primary strucutural fabrics are preserved.

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-013 **Grant No.:** YD07124

Plunge: 55 **Azimuth:** 270 **EOH:** 246

From	To	Mineral	Intensity	Distribution	Comments
204	212.1	FZ	300.0%	CSZ	A cataclastic fault in sandstone. There is strong quartz dissolution throughout the interval and some cross cutting quartz veins. The quartz veins are pre- to syn-brittle faulting. There are multiple fault strands present in the fault zone, which are separated by short intervals of competent sandstone. Pervasive clay alteration affects the entire interval, but its intensity is variable. The individual fault zones within the broader cataclastic shear zone are also broken out.
204	205	FZ	300.0%	BFZ	Clay gouge fault.
205.5	207.65	FZ	300.0%	BFZ	Clay gouge fault
208.1	212.1	FZ	300.0%	BFZ	Clay gouge fault.
216.3	221.8	FZ	300.0%	BFZ	Strong, pervasive clay alteration associated with fine-grained clay gouge. The gouge is mostly due to less competent wall rock. Short intervals of competent rock is preserved near the bottom of the fault zone. Rare quartz veins cross cut the interval, but are brecciated. The brecciation suggest the veins formed during a fluid pulse within a progressively developed brittle fault zone.
223.5	224.5	FZ	300.0%	BFZ	Clay gouge.
225	226.8	FZ	300.0%	BFZ	Clay gouge.

Orientation

Plunge: 55
Azimuth: 270
EOH: 198.0 m
Core Size: HQ

Start Date: 22/07/2011
Finish Date: 24/07/2011
Status: Incomplete
Contractor: Driftwood

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality
12	55.6	266.94	5835	Reflex	1
63	56.7	267.14	5832	Reflex	1
114	56.7	267.94	5829	Reflex	1
165	56.4	265.64	5824	Reflex	1

Objective:

The objective of this drill hole is to test the 3Ace Fault 25m north of 3A-11-P10. Target expected at 60m and 210m.

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	3		CASING		100.0%				co	1

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
12.55	12.56	SZ	400.0%	DSZ	No alpha angle possible to measure. Minor parasitic folding of qz-fecb vns and slst/phyl beds.
29.24	29.24	SZ	400.0%	DSZ	another small shear zone in phyl w/ gouge & phyl frags
40.6	42	FZ	300.0%	BFZ	Interval w/ 4 small broken/gouge zones in phyl.
45.55	51	FZ	300.0%	BFZ	Interval w/ 7 small flt gouge/broken zones in phyl, abndt lost core. First 2 gouge zones in FW of vuggy QV (underlying), base of vn w/ angular phyl clasts. Other gouge zones just in phyl w/ little cly, abndt fragmented mm to cm size phyl pieces w/ no assoc QV.
58.8	63	SZ	400.0%	BFZ	Significant zone of lost core & abndt cly gouge.
58.8	59.3	SZ	400.0%	BFZ	Intense gouge zone of cly w/ angular phyl clasts. Remainder of interval w/ intermitten cly gouge/broken phyl.
64.25	72	FZ	400.0%	BFZ	Zone of broken + gouged phyl. Significan gouge/cly zones contain angular 0.3-1cm QV clasts. Several areas of lost core.
76.8	79.18	SZ	400.0%	DSZ	Intense zone of fault gouge w/ intermittent solid pieces of core that is a cataclastic silicified bx. Measured upper contact w/ sndst (see pnt struc). Abndt cly w/ qz+phyl frags.
99	105.45	SZ	400.0%	CSZ	Broken zone/gouge @ top of interval (99.35m) followed by phyl gouge (contact), then cataclastic phyl bx w/ phyl clasts + qz matrix.
109.45	112.15	SZ	400.0%	CSZ	Phyl gouge w/ milled qz clasts w/ matrix-supported bx visible in more consilidated pieces (qz clasts in phyl matrix).
112.15	115.55	FZ	400.0%	CSZ	Sndst bx w/ 1.1m of lcy gouge @ base of interval.
121.05	122.7	SZ	300.0%	BFZ	Phyl interval w/ 5 intermittent gouge zones w/ assoc lost core.
127.7	131.7	FZ	300.0%	DBSZ	Interval of intense fracturing + gouge in sndst. Intense lim/cly alt as well. No measurable fabrics or contacts. More consolidated zones are bx q/ milled qz clasts in cly altd matrix.
132.3	133	FZ	300.0%	BFZ	Interval of intermittent gouge/broken core in gry sndst. Consolidated core is cly alt & desil. Lost core in a few places.
134.46	150.48	FZ	300.0%	BFZ	Intermittent broken zones (little cly gouge) in cg sndst. More qz vning in this interval w/ 2 consistent orientations @ 75TCA & 15TCA x-cutting. 75TCA set has 0.5-2cm QV.
159.7	183	FZ	400.0%	BFZ	Almost entirely continuous zone of gouge + broken/crumbly cs sndst, into phyl @ base of interval. QV clasts are milled/rounded. Sndst is very cly alt (zones of wh and grn-yel cly) + desilicified. Diss cs euhed py throughout sndst gouge, phyl gouge appears graphitic.
185.11	190.1	SZ	300.0%	BFZ	Intermittent thin gouge zones w/in phyl interval. Several zones of lost core. Gouge contains diss euhed py.

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality
21	55.8	263.84	5843	Reflex	1

Objective:
The objective of this drill hole is to test for potential mineralisation along the line of intersection between the fault and bedding. This target is somewhat reliant on the results of 3A-11-P01. Targets expected at 78m and 129m.

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	3	no core recovered	CASING		100.0%	w			lc	1
3	4.5	Very thin phyllite interbands in rubbled, poorly recovered, semi-massived quartz vein	MT-Phy		5.0%	n			lc	1
3	4.5	Poorly recovered, rubbled, semi-massive quartz vein with thin phyllite interbeds and prominent up to 5cm diameter buff-crème iron-carbonate patches and seams. Intensely rubbled. Lower contact with Phyllite is undulated and low core angle. No mineralization observed.	QZVN		95.0%	bf			lc	1
4.5	22.7	Only a small proportion of foliation concordant quartz veining. Generally only up to 1cm thick and sometimes with boudinaging indicating shearing (in combinantion with strongly developed grooving along phyllite foliation cleavages. Dusty white appearance with small vugs.	QZVN		5.0%	w			lc	1
4.5	22.7	Folded black Phyllite unit with grey silty lamellae. Mild iron-staining throughout, which generally shows along foliation and discolours grey silt lamellae to a pale orange hue. Matrix to fine-grained to determine exact composition. Several open fold profiles visible with about 20-30 cm wavelength. Large portion of this unit interval hosts thin (<1cm thick), sheared, foliation concordant quartz veinining. [Multiple folded wipsy gashes distributed over 1cm making up a single vein pattern]. Foliation cleavage are often intensely grooved and iron-stained.	MT-Phy		95.0%	n			lc	1
22.7	24.5	Massive, poorly recovered, crushed and rubbled quartz vein with dark red-brown iron-carbonate filled vugs and minor very fine-grained disseminated arsenopyrite. Upper contact of vein is sharp and undulated at low core angle. Lower contact is fragmented and bounded by fault gouge. Possibly some angular phyllite wedges in quartz vein @ upper contact.	QZVN		100.0%	w			lc	1
24.5	31.1	Generally no thin quartz seams alon foliation discernible, but some vein fragments in shattered intervals of Fault zone	QZVN	bx	1.0%	w			br	3

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-015	Grant No.:	YD07124
Plunge:	Azimuth:	EOH:					
55	270	72					

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
24.5	31.1	Black phyllite with only occassional grey-brown silt lamellae and generally devoid of quartz veining. Texture too fine-grained to determine exact composition. Faultzone throughout this unit interval. Softened, gouged and shattered almost continuously. Upper contact with quartz vein - poorly recovered. Lower contact by gradual transition to more competent phyllite [fault wallrock weathering]. Intense grooves along foliation cleavages in upper 4 meters of this unit.	MT-Phy	bx	99.0%	n			br	3
31.1	72	Quartz veining in Phyllite unit is generally distributed over the upper 16 meters of this unit with scarce veining the remaining lower part. Veining is: - predominantly foliation concordant [S1] - sheeted, foliation concordant and tightly folded on micro scale [<0.5cm wavelength] - occasionally sheeted and concordant with [S2] bisection closed/tight folds and parallel to axial planes where not bisecting. - generall <0.5cm thick - dusty white appearance with small vugs with presence of carbonate [acid soluble]	QZVN		2.0%	w			co	1
31.1	72	Black, foliated phyllite with occasionally visible tigh fold profiles where axial planes run subparallel to foliation. Regular grey-brown silt lamellae throughout. Well developed lineation along foliation cleavages. Texture too fine-grained to determine exact composition. Generally competent rock with good recovery, but several discrete gouged,fragmented subintervals. [see point measurments/structure]. Upper contact with zone of brittle deformation in Phyllite. Units ends at EOH.	MT-Phy		98.0%	n			co	1

Alteration

From:	To:	Comments:	Mineral	Intensity	Distribution	Colour:
3	4.5	patches and intersecting seams of iron-carbonate (ankerite?) on extensive, semi-massive quartz vein	fecb	3	vn	bf
24.5	31.1	orange brown iron-staining in softened, gouged phyllite	fecb	2	frac	o
39.7	43.62	frequent grey-green chlorite seams along foliation and assciated with foliation concordant quartz seams/wedges	chl	1	vn	g

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-015	Grant No.:	YD07124
Plunge:	Azimuth:	EOH:					
55	270	72					

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
16.3	16.7	QZVN	100.0%		Only about 20% of quartz vein actually recovered as rubbled, 3-4cm diameter fragments. Also drill grind marks in interspersed phyllite wedge. Preserved vugs with brown-red iron-carbonate infill.
18	22.7	FZ	200.0%	BFZ	Intensely fragmented interval [possibly predominantly mechanical breaks] with poor recovery with interspersed softened gouge wedges.
24.5	31.1	FZ	300.0%	BFZ	Black phyllite with only occassional grey-brown silt lamellae and generally devoid of quartz veining. Texture too fine-grained to determine exact composition. Faultzone throughout this unit interval. Softened, gouged and shattered almost continuously. Upper contact with quartz vein - poorly recovered. Lower contact by gradual transition to more competent phyllite [fault wallrock weathering]. Intense grooves along foliation cleavages in upper 4 meters of this unit.
37.2	38.42	FZ	200.0%	BFZ	Angular crushed fragments - partially slightly softed. Bounded by fairly competent rock. Only about 50% recovery. Possible brittle fault.
40	40.3	FZ	100.0%	BFZ	Fairly coarse angular fragments with about 20% crushed, softened fragments. About 60% recovery. Possible fault.
52.7	54.46	FZ	200.0%	BFZ	Poorly recovered, softened, weakly iron-stained interval. About 50-60% recovery. Bounded by competent rock.
69.65	72	FZ	200.0%	BFZ	very poorly recovered interval with red-brown iron-stained, coarse angular fragments - possibly along low core angle fractures with minor crush clay (~10%) Some gouge emplaced subparallel to core axis in larger preserved fragment

Mineralisation

From:	To:	Comments	Mineral	Percent	Distribution
10.2	10.24	Fine-grained disseminated arsenopyrite in preserved vug of rubbled quartz vein	asp	2	vn
22.7	24.5	Fine-grained disseminated arsenopyrite in (about 50% recovered) partically crushed, massive quartz vein that lies above phyllite fault zone.	asp	2	vn

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
5.98	Veins					55			foliation concordant quartz-carbonate seams
5.99	Bedding		So			55		10	measured foliation lineation in phyllite
12.2	Veins			chl	TVA	25			grey-green chlorite tension gashes (non-penetrative) that cross-cut foliation repeatedly
12.4	Bedding		So		FOL	35			foliation in phyllite
12.95	Axial Plane		F1			55			open folding
13.5	Bedding		So		FOL	16		20	foliation in phyllite with lineation
15.2	Bedding		So			37		50	foliation boardering boudinaged shear veinlets; strongly developed lineation
15.2	Veins				HSV	37			boudinaged, foliation cocordant shear veinlets
16.7	Veins			chl	SHTV	44			multiple ~1mm grey-green chlorite seams cross-cutting foliation
16.8	Lineation		So			42		40	lineation measured in foliation cleavage
18	Bedding		So			62	40	85	cleavage and lineation measured in cleavage plain in phyllite
24.7	Bedding		So		Gouge	55		85	grooved lineation in gouge wedge foliation in fault zone
27.4	Bedding		So			51		84	lineation measured in cleavage plane in softened phyllite in fault zone
27.4	Veins					51			foliation concordant quartz carbonate seams
29.9	Bedding		So		Gouge	39			softened phyllite with smoot, polished cleavage
30.3	Bedding		So			65		5	lineation measured in cleavage plane in softened phyllite in fault zone
31.23	Veins			ser	SHTV	58			multiple ~1cm thick quartz-ankerite veins - foliation concordant (& some boudinaged) over 30cm interval with sericitization along foliation cleavages
32.2	Bedding		So			58			foliation in phyllite
36	Veins				SHTV	55	275		multiple <1mm thick, parallel quartz-carbonate seams that cross-cute foliation at an acute angle of 20 degree
36	Bedding		So			35	260	50	foliation in phyllite with lineation
39	Bedding		So			30			both S1 & S2 discernible
39	Cleavage		S1			49			both S1 & S2 discernible
39.7	Veins				SHTV	70			several grey-green chlorite seams bisecting tight/closed folds (i.e. along fold axial plane)
39.7	Veins			chl	AXP	70			several grey-green chlorite seams bisecting tight/closed folds (i.e. along fold axial plane)
39.7	Axial Plane		Fx			70			tight/closed folds with ~4cm wavelenght
42.95	Bedding		So			50		40	lineation measured in foliation
43.05	Veins				SHTV	58			multiple, densely spaced folded, boudinaged parallel quartz-carbonated veins in phyllite - subconcordant to foliation
43.62	Faults				Gouge	65			poorly recoverd gouge wedge parallel and at lower contact of sheeted vein array
45	Bedding		So			50			
46	Bedding		So			35		45	strong grooves along foliation cleavage
46.28	Joints				Gouge	50			poorly recovered gouge wedge
48	Bedding		So			50		40	lineation measured in foliation cleavage
48	Lineation					50		45	
49.8	Bedding		So			48			
51.1	Veins				AXP	85			2 quartz veinlets bisecting closed folds [axial plane]
54	Bedding		So			40			
55	Lineation					40		25	rusty open joint along foliation with stepped grooves (lineations)

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Objective:

3A-11-015A is a replacement for 3A-11-015 (location of proposed hole 3A-11-P02) which failed prematurely due to stuck rods. Plunge was steepened to 60 degree from previous plunge of 55 degree.

Lithology

60	270	386					

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
175.04	186.27	Late generation quartz veining in sandstone unit is undulated and low core angle throughout (15-35TCA) and ranges from 2-10cm in thickness. Appearance in milky white with well-defined boundaries. Some veins are openly folded. Multiple generations of thinner more diffuse ~50TCA veinlets present, which are cross-cut by the undulated, low core angle (thicker) veins. Late generation veins is ferquently vuggy with iron-carbonate staining and generates low core angle fractures in lowe part of unit.	QZVN		10.0%	w			co	1
175.04	186.27	medium to coarse grained Sandstone (1mm-2mm) with subangular feldspar clasts and subrounded grey quartz clasts. Entire unit appears grey with a slightly greenish hue and has intermittent intervals where the original texture is partially overprinted by dark grey-green, aligned, wispy chlorite lamelle. Feldspars have white-buff clay and possibly weak iron-carbonate alteration. Composition: ~88% Quartz, 10%Plagioclase, ~2% Lithics (occasional elongated wedges of phyllite in matrix)	MT-SS	cgr	90.0%	gy	qtz	88	co	1
186.27	193.06	Interbedding of fine-grained dark-grey sandstone, black phyllite & grey silt. Silt-phyllite interbedding contacts are generally sedimentary successions. Contacts with fine-grained sandstone appear occasionally as healed competent fault contacts. Phyllite and silt interbedding too fine-grained to determine exact composition. Both upper & lower contacts of unit are sharp and competent.	MT-SLT		20.0%	gy			co	1
186.27	193.06	Quartz veining occurs predominantly as milky white 1-4cm thick, 30-40TCA veins (Generation 2) throughout. However other generations are present. Vein mineralization occurs predominantly in thin <0.5cm thick, slight diffuse, intensely angulated 5-15TCA veinlets (Generation 1) that are cross-cut by steeper core angle Generation 2 veinlets.	QZVN		20.0%	w			co	1
186.27	193.06	Interbedding of fine-grained dark grey sandstone, black phyllite & grey silt. Silt-phyllite interbedding contacts are generally sedimentary successions. Contacts with fine-grained sandstone appear occasionally as healed competent fault contacts. Phyllite and silt interbedding too fine-grained to determine exact composition. Both upper & lower contacts of unit are sharp and competent.	MT-Phy		25.0%	n			co	1
186.27	193.06	fine-grained, dark grey sandstone: 75% grey quartz; 20% white, clay-altered feldspar, 5% dark lithics clasts are subrounded some sandstone interbeds may have been moved along healed slip faults at lithological contacts	MT-SS	fgr	35.0%	gy	qtz	80	co	1
193.06	193.7	massive white quartz vein with 3% buff ankerite patches and green chlorite and black phyllite wedges at both contact. Milky white colour. See point mearsurements for orientaiton of upper contact.	QZVN		100.0%	w			co	1
193.7	204.92	milky white (low core angle) quartz veining in fine-grained sandstone interbed from 198-199.50m also minor, <0.5cm thick quartz veinlets in phyllite (often foliation concordant)	QZVN		2.0%	w			co	1
193.7	204.92	Unit consists of intermingled black phyllite, grey silt and grey to dark grey sandstone interbedding. Interbedding consitst of 10cm interbanding as well as long up to 1m sections with solely silt/sand. The upper and lower 3 meters of this unit are dominated by phyllite. Quart veining is generally restricted to sandstone interbedding. Texture in silt and phyllite to fine-grained to determine exact composition. Unit contains a fault @ upper contact. Lower contact grades into low grade shearing.	MT-SLT		15.0%	gy			co	1

From	To	Mineral	Intensity	Distribution	Comments
295.8	296.67	FZ	400.0%	BFZ	gouged phyllite with densely dissmienate pyrite and fragmented quartz ankerite quartz veining
301.85	302.05	FZ	300.0%	BFZ	gouge wedge emplaced @ 80TCA at both upper and lower contacts
343.2	346.46	FZ	300.0%	DBSZ	low grade quartz-ankerite shearing followed by cohesive QPC breccia
346.46	374.54	FZ	400.0%	BFZ	Extensive fault gouge zone that contains both phyllite and sandstone gouge source materials
383.5	386	FZ	200.0%	BFZ	fragmentation, poor recovery and ~40% light grey QPC crush and gouge

Mineralisation

From:	To:	Comments	Mineral	Percent	Distribution
83.3	90.5	~ 0.5-1% fine-grained disseminated in vein wall rock in QPC	asp	2	vn
83.3	90.5	~0.5% fine-grained disseminated in vein wall rock in QPC	py	1	vn
90.5	100.4	intensity of sulfide mineralization increases towards lower bound of this interval (which is terminated by a fault) - mineralization of pyrite and arsenopyrite is generally fine-grained disseminated and in small blebs in quartz veining and predominant fine-grained disseminated in wallrock of quartz veining. Arsenopyrite mineralization is more frequent than pyrite mineralization	py	3	vn
90.5	100.4	intensity of sulfide mineralization increases towards lower bound of this interval (which is terminated by a fault) - mineralization of pyrite and arsenopyrite is generally fine-grained disseminated and in small blebs in quartz veining and predominant fine-grained disseminated in wallrock of quartz veining. Arsenopyrite mineralization is more frequent than pyrite mineralization	asp	4	vn
100.4	103.04	0.1-1mm diameter disseminated arsenopyrite in brecciated quartz veining above phyllite gouge zone	asp	4	vn
100.4	103.04	0.5-1mm diameter euhedral disseminated pyrite in brecciated quartz veining above phyllite gouge fault	py	3	vn
100.4	103.04	multiple instance of 1mm - 0.1mm specs of gold in angulated, brecciated grey-white quartz clasts in brecciated quartz veining above phyllite gouge zone; gold mineraizsation increases in intensity towards lower contact with fault	Au	2	vn
103.04	110.5	gouged phyllite fault zone containing massive and crushed quartz veining in gouge sulfide mineralization lessens in intensity towards lower fault contact pyrite densely disseminated and also as fold concordant stringers at 104.10m. Mineralization in both vein fragments & phyllite gouge	py	4	perv
103.04	110.5	gouged phyllite fault zone containing massive and crushed quartz veining in gouge sulfide mineralization lessens in intensity towards lower fault contact occasional very fine-grained disseminated pyrite in quartz vein fragments & phyllite gouge	asp	1	perv
110.5	112.6	pyrite stringers, blebs and disseminated pyrite in thin quartz veinlet near upper contact of phyllite of unit that bounds and mineralized brittle fault	py	2	vn
112.6	131.5	~0.05% very fine-grained disseminated pyrite visible throughout in silt interbedding lamellae; occasional pyrite blebs and stringers in quartz veining (see point structures)	py	1	diss
131.5	133	massive pyrite stringers in quartz veining in gouged, faulted phyllite	py	3	vn
138	141	1-2mm grains of disseminated arsenopyrite in quartz veining in brittle fault zone: veins appear to undulate subparallel to core axis	asp	1	vn
141	150	~0.5% fine-grained disseminated arsenopyrite in wallrock of sheeted low core angle veins	asp	3	vn
141	150	~0.3% fine-grained disseminated pyrite in wallrock of sheeted low core angle veins	py	2	vn
150	151.9	~ 0.2% fine-grained disseminated pyrite in QPC matrix with minor low core angle quartz veining	py	1	diss
151.9	153.02	very fine-grained disseminated pyrite in phyllite interbedding	py	1	diss
153.02	159	fine-grained disseminated pyrite in rock matrix - possilble wallrock association with veining	py	1	diss
157.6	159	small bleb in undulated, low core angle, ~1cm thick quartz veining	py	1	vn

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-015A **Grant No.:** YD07124

From:	To:	Comments	Mineral	Percent	Distribution
157.6	159	small bleb in undulated, low core angle, ~1cm thick quartz veining	gn	1	vn
171	175.04	fine-grained (<0.5mm), disseminated pyrite in grey silt interbedding that increases locally at lower lithological contact of phyllite due to healed slip fault seam	py	1	diss
175.04	186.27	minor, very fine-grained, disseminated pyrite in wallrock of quartz veining	py	1	vn
180.8	180.98	sheeted quartz-pyrite stringer veinlets in phyllite wedge within sandstone unit; cut-off by faulted, competent lithological contacts	py	20	vn
186.27	193.06	fine-grained disseminated in veining + as wallrock mineralization also very fine-grained disseminated pyrite visible in silt interbedding independent of veining Quartz veining occurs predominantly as milky white 1-4cm thick, 30-40TCA veins (Generation 2) throughout. However other generations are present. Vein mineralization occurs predominantly in thin <0.5cm thick, slight diffuse, intensely angulated 5-15TCA veinlets (Generation 1) that are cross-cut by steeper core angle Generation 2 veinlets.	py	2	vn
193.7	204.92	fine-grained disseminated in thin silt interbedding as well as foliation concordant, partial stringers in silt-phyllite-fine-grained sandstone interbedding	py	2	fol
198	198.3	pyrite blebs in low core angle quartz veining [see point measurements]	py	4	vn
198	198.3	blue-purple covellite coating pyrite in low core angle quartz veining [see point measurements]	co	4	vn
204.92	207.84	sheared, flattened pyrite along foliation in Graphitic Phyllite as well as partial foliation concordant stringers	py	4	fol
207.84	211.6	some fine-grained disseminated pyrite in foliation concordant quart seams near gradational cotnacts of phylllite unit	py	1	vn
211.6	213.93	1-2% pyrite in stringers and blebs in thin, dusty white quartz veinlets in graphitic phyllite unit	py	3	vn
213.93	214.8	very fine grained disseminated in possible diorite dyke	py	1	diss
214.8	221	disseminated, blebs and partial stringers in brecciated, folded and or/boudinaged dusty white quartz veinlets in phyllite within brittle deformation fault zone	py	4	vn
221	243	1-2% pyrite as partial stringers, blebs and small clusters in occasional vuggy, variable orientation, low core angle, densely spaced quartz veining in weakly silicified sandstone mineralization intensifies after 231.3 due to intense quartz vein stockwork with somewhat diffuse vein boundaries	py	4	vn
227.7	228	small galena cluster in 60 TCA quartz vein (also with pyrite mineralization)	gn	2	vn
227.7	227.72	galena bleb in 1.5cm thick, 62TCA, milky white quartz vein	gn	3	vn
228.4	228.5	sphalterite & pyrite bleb in 40TCA, 10cm thick quartz vein	sl	2	vn
236.5	238.5	occassional very fine grained, disseminated aresenopyrite in quartz veining	asp	1	vn
243	246.97	0.3 % sheared pyrite, flattened along foliation and in predominantly foliation concordant quartz veining	py	1	fol
246.97	258.7	generally trace amounts disseminated along foliation and in dominantly foliation concordant quartz veining	py	1	fol
254	254.8	soft deformation [low grade shearing] with mulitiple angulated quartz wedges and foliation concordant 3mm thick pyrite stringer foliation.	py	4	fol
258.7	269.82	0.5% pyrite disseminated in quartz veining and wallrock	py	2	vn
269.82	270.7	trace, very fine-grained disseminated pyrite	py	1	diss
270.7	274.8	trace, very fine-grained disseminated pyrite	py	1	diss
274.8	279.67	0.8% pyrite as clustered and disseminated in phyllite-quartz-ankerite soft deformation zone	py	3	diss
279.67	291.2	~0.6% pyrite disseminated and clustered in quartz veining in sedimentary succession with mineralized quartz veining in all units. Also as disseminated wallrock mineralization.	py	2	vn
290	290.25	pyrite-galena intergrowth cluster in stockworked veining	gn	3	vn
291.8	295.8	some in (foliation concordant veining)	py	1	vn
295.8	297	densely disseminated in fault gouge and bounding competent wallrock	py	4	diss

From:	To:	Comments	Mineral	Percent	Distribution
297	303.2	~0.3 pyrite in partially penetrative stringers in thin foliation concordant vein seams	py	1	vn
303.2	311.7	~0.1% pyrite trace pyrite mineralization as singular up to 2mm diameter grains in wall rock as well as some denser dissemination along fractured vein boundaries and occassional euhedral blebs in vuggy quartz veins	py	1	vn
311.7	336.5	~0.2% trace fine-grained disseminated pyrite in quartz veining and wallrock + rare blebs	py	1	vn
336.5	343.2	1-2% sheeted clusters in variable core ange densely spaced, diffuse quartz veining, vein intensity and mineralization lessens in downhole direction	py	4	vn
343.2	346.46	~0.2% fine grained disseminated pyrite	py	1	vn
346.46	374.54	very fine-grained disseminated pyrite discernible in fault gouge (from time to time)	py	1	gouge

Point Structure

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
6	Bedding		So			51			compositional bedding in phyllite
10	Bedding		So			48			compositional bedding in phyllite
14	Bedding		So			47			compositional bedding in phyllite
14	Veins			fecb	SHTV	36			1mm thick iron stained tightly spaced veinlets [foliation discordant]
15.5	Veins			fecb	SHTV	55			vuggy (<3mm thick) multiple, parallel, quartz-iron-carbonate veinlets [foliation concordant]
15.5	Bedding		So			55			foliation in phyllite
17	Bedding		So			52			compositional bedding in phyllite
17.5	Veins					68			foliation concordant, buff-orange, 3cm thick quartz vein - generall devoid of vugs
18.9	Veins					45			2-3 vuggy 6cm thick quartz veins - in fragmented interval (18.9-19.4m)
19.7	Bedding		So			35			upper fold limb
19.8	Veins				AXP	46			quartz seams bisecting fold profiles with 3cm wavelength interlimb angle ~120 degree
19.9	Bedding		So			23			lower fold limb
21.2	Bedding		So			20			open fold profile with ~160 degree interlimb angle
21.5	Cleavage		S1			42			cleavage parallel to axial plane of open fold profiles
22.8	Cleavage		S1			69			in phyllite
22.8	Bedding		So			40			compositional bedding in phyllite
23	Faults				Gouge	30			about 6cm gouge wedge emplaced in phyllite @ 30TCA
23.8	Faults				Gouge	45			poorly recovered gouge wedge emplaced in phyllite along 45TCA
25	Veins				SHTV	45			multiple parallel thin, 1mm thick, dusty white quartz seams
25.1	Bedding		So			35			foliation in phyllite
25.1	Veins					39			foliation discordant, 2cm thick, buff-orange, quartz vein with only minor vugs
26	Bedding		So			45			compositional bedding in phyllite
27	Veins				FOL	40			folation concordant, (partiall flexing/folded), 1mm thick quartz seams
27	Bedding		So	ser		40			seriticized, flexing foliation in phyllite
27	Veins				SHTV	40			folation concordant, (partiall flexing/folded), 1mm thick quartz seams
29.5	Bedding		So			45			compostional bedding in phyllite
29.88	Veins								partially recovered quartz vein; upper contact with phyllite sharp but irregular, non-planar and undulated; lower contact fragmented

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
72	Bedding		So			30	205		foliation fabric in phyllite
72	Cleavage		S1			58	220		repeated mechanical, smooth cleaving along this orientation
75	Bedding		So			25			
77.6	Lineation					68		10	bedding cleavage with strong grooving along smooth cleavage
77.6	Veins			fecb		40			vuggy, ~3cm thick quartz vein
77.6	Bedding		So			68		10	foliation cleavage with strong grooving along smooth cleavage
77.85	Faults			fecb	Gouge	27			5cm thick gouged, low core angle quartz vein
78	Bedding		So			74			foliation in phyllite, steepened after narrow, low core angle fault
78	Veins				SHTV	80			1mm -2cm thick multiple parallel, vuggy, quartz-carbonate veins that intersect foliation at an acute angle of about 20 degrees (subparallel to foliation)
81	Bedding		So			46			bedding in phyllite
82.7	Veins				FOL	52			foliation concordant quartz seams
82.7	Bedding		So			29			bedding in phyllite
83.1	Faults			fecb	Gouge	49			gouged, slip-faulted lithological phyllite to QPC contact, ~20cm thick
83.1	Contact			fecb	Gouge	49			gouged, slip-faulted lithological phyllite to QPC contact, ~20cm thick
83.7	Bedding		So	fecb	fecb	50			foliation in QPC with weakly brecciated texture
83.95	Contact					55	75		10cm thick phyllite wedge in weakly brecciated QPC with phyllite vein seams terminated by contact
86.4	Veins				SHTV	85	345		several parallel hight core angle quartz veins
87.23	Bedding		So			70			
87.74	Veins					50			arseonpyrite mineralized, flex folded , foliation concordant, 8cm thick quartz vein
88.6	Veins				SHTV	75			Generation 2 vein at this depth (cross-cuts Generation 1 --- with mineralized boundaries
88.6	Veins				SHTV	50			Generation 1 vein at this depth point - several 0.5cm thick veins - mineralized wall rock
91.5	Bedding		So			65			foliation in QPC with weak chloritization - expressed as thin wispy, aligned lamellae
94.4	Veins				SHTV	39	280		2 parallel 15cm thick, mineralized quartz veins
95.55	Veins		V1			42	300		Generation 1 vein; foliation discordant, mineralized wallrock
95.55	Veins		V2			80	330		Generation 2 vein; foliation discordant; wallrock mineralization; crosscuts Generation 1
95.55	Bedding		So			50	290		
95.74	Bedding		So			50	340		
95.74	Veins				SHTV	50	340		several foliation concordant, sulfide mineralized 3-15cm thick quartz veins
96.5	Veins					40	60		over 1 m several late generation, sulfide mineralized veins that cross-cut earlier blurred and boudinaged veining
97.57	Bedding		So			85	340		aligned chlorite lamellae
98	Veins				SHTV	78	270		mineralized vein trend in QPC - sometimes foldes flexed - blurry boundaries and with chlorite lamellae; 1-8 cm thick
99.52	Veins		V2		SHTV	30	300		Generation 2 mineralized vein trend
99.52	Veins		V1		SHTV	75			Generation 1 vein trend
99.7	Bedding		So			72	10		chlorite lamellae forming foliation in QPC with densely distrubited mineralized, blurred quartz boudins
100.4	Faults				Gouge	53	320		10cm thick gouge fault bounding hard, competent, well recovered rock - gold mineralizing structure
100.7	Bedding		So			71	270		alignement of chlorite lamellae & quartz wedges in gold minealized zone

173.6	Bedding		So			48			in phyllite
173.6	Contact				FOL	48			20cm silt-sand interbed in phyllite (foliation concordant)
173.7	Veins					52			folded, 1cm thick veinlet that penetrates through phyllite-silt/sand interbed contact
174	Bedding		So			65			phyllite-silt interbedding
174	Faults				TVA	25			low core angle tension vein array over 10cm offsetting silt interbed by ~2cm
175.04	Faults					58			contact between phyllite and coarse-grained sandstone that cuts/terminates quartz vein in sandstone; Faulting only indicated by vein cut-off and sharp lithological transition [healed and cohesive]
175.04	Veins		V1			20			Generation 1 vein in sandstone cut-off by lithological contact with above lying phyllite
175.04	Contact					58			contact between phyllite and coarse-grained sandstone that cuts/terminates quartz vein in sandstone; Faulting only indicated by vein cut-off and sharp lithological transition [healed and cohesive]
175.06	Veins		V2			40			Generation 2 vein cross-cutting Generation 1 in sandstone
175.07	Joints				fecb	23			fairly smooth iron-stained low core angle fracture near (faulted) lithological contact
175.5	Veins			fecb	SHTV	50			1cm thick, parallel quartz veinlets with iron-carbonate patches
175.9	Contact					55			5cm phyllite wedge concordant to phyllite foliation in sandstone unit
176.14	Contact			ser		43			2mm thick phyllite seam in veined sandstone with densely dissemianted peraly, vitreous musconvite in phyllite
180.8	Veins				SHTV	15			sheeted quartz-pyrite stringer veinlets in phyllite wedge within sandstone unit; cut-off by faulted, competent lithological contacts

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-015A **Grant No.:** YD07124
Plunge: 60 **Azimuth:** 270 **EOH:** 386

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
180.8	Contact				FOL	56			~20cm thick phyllite wedge inserted by healed slip faulting; contains low core angle pyrite stringer veinlets that are cut off by contacts with sandstone above and below. Both contacts are sharp and competent. 180.8-180.98
180.8	Faults				FOL	56			~20cm thick phyllite wedge inserted by healed slip faulting; contains low core angle pyrite stringer veinlets that are cut off by contacts with sandstone above and below. Both contacts are sharp and competent. 180.8-180.98
180.98	Contact					40			~20cm thick phyllite wedge inserted by healed slip faulting; contains low core angle pyrite stringer veinlets that are cut off by contacts with sandstone above and below. Both contacts are sharp and competent. 180.8-180.98m
180.98	Faults					40			~20cm thick phyllite wedge inserted by healed slip faulting; contains low core angle pyrite stringer veinlets that are cut off by contacts with sandstone above and below. Both contacts are sharp and competent. 180.8-180.98m
181	Veins				SHTV	25			long-running, folded, ~2.5cm thick quartz vein, which is part of a late generation, low core angle, undulated vein set
183.6	Joints			fecb	SHTV	15			natural iron-stained, clay-coated fractures along vuggy low core angle quartz veining
187.97	Veins					15			pyrite mineralized, thin, boudinaged (non-penetrative), folded/undulated, ~0.4cm thick pyrite mineralized quartz veinlets
188	Bedding		So			75			bedding in siltstone
189.2	Faults				Gouge	40			slip faulted contact between grey-green chlorite altered sandstone interbed & phyllite, veining in sandstone is terminated by phyllite Contact is pyrite mineralized on both sides and phyllite is partially gouged with about 5cm of phyllite gouge. [Sandstone above & phyllite below.]
189.25	Contact					76			189.25-189.45m: possible dyke? Either black sandstone with aligned white feldspar, or dyke with feldspar phenocyrsts. Contains round xenolith (?) of light grey, fine-grained sandstone however contains some low core angle quartz veining that crosscuts both the possible dyke and the surrounding sedimentary rock (phyllite). Upon microscope examination: feldspars appear too rounded for phenocrysts
189.6	Veins					17			terminated pyrite mineralized vein in chloritized sandstone interbed
189.6	Bedding		So			52			bedding in phyllite
190.97	Contact			chl		75			chloritized sandstone with sharp contactcs and a multitude of quartz veining that are cut-off at ends of interval. Stockworked by veining -- about 70% quartz also contains angular phyllite wedges
190.97	Faults			chl		75			chloritized sandstone with sharp contactcs and a multitude of quartz veining that are cut-off at ends of interval. Stockworked by veining -- about 70% quartz also contains angular phyllite wedges
191.47	Contact			chl		67			Lower contact: chloritized sandstone with sharp contactcs and a multitude of quartz veining that are cut-off at ends of interval. Stockworked by veining -- about 70% quartz also contains angular phyllite wedges

301.85	Faults				Gouge	80		0	20cm gouge wedges emplaced at 80TCA at both upper and lower contact
302	Bedding		So			33		0	foliation in displaced sandstone interbed
302.28	Contact				FOL	60		0	sharp contact between displaced sandstone interbed with 33TCA foliation and foliated phyllite-silt-sand interbedding concordant to phyllite foliation
302.28	Faults				FOL	60			sharp contact between displaced sandstone interbed with 33TCA foliation and foliated phyllite-silt-sand interbedding concordant to phyllite foliation
302.5	Bedding		So			70		0	foliation in phyllite-silt-sand interbedding
303.9	Contact				FOL	80		0	multiple (foliated), black phyllite interbands over 10cm that off-set veining in sandstone
303.9	Faults				FOL	80			multiple (foliated), black phyllite interbands over 10cm that off-set veining in sandstone
304.5	Veins				SHTV	65		0	several 1-3cm thick, high core angle veinsets (some offset along low core angle veining @ 307.2m
305.05	Faults				FOL	90		0	partially gouged phyllite interbed that terminates veining in sandstone. Contact concordant to phyllite foliation
306.5	Veins				SHTV	25		0	several variable orientation 25TCA vein sets with milky white colour and generally not vuggy
307.53	Faults			fecb	FOL	72		0	high core angle ankerite altered and pyrite mineralized phyllite wedge along phyllite foliation that cuts off veining in sandstone
309.53	Contact				FOL	45		0	1.5cm thick black, foliated, pyrite mineralized phyllite wedge in sandstone -- concordant to phyllite foliation
313.22	Faults				Gouge	60	310	0	5cm thick gouged phyllite interbed with well preserved lower contact [pyrite mineralized]
313.3	Veins				SHTV	30	30	0	
313.5	Faults				Gouge	76		0	1cm thick gouge wedge in QPC
316	Veins				SHTV	20	270	0	
319	Veins				SHTV	20	20	0	
319.8	Veins				SHTV	15	250	0	
320	Veins		V2		SHTV	45	200	0	late generation
320	Veins		V1		SHTV	50	340	0	early generation
320	Veins				SHTV	50	180	0	
326	Veins		V1		SHTV	25	90	0	early generation, vuggy and mineralized
326	Veins		V2		SHTV	20	290	0	late generation
328.5	Veins		V3		SHTV	5	15	0	very late generation; undulated and slightly vuggy
328.5	Veins		V1		SHTV	45	310	0	early generation
329.5	Veins		V1		SHTV	10	15	0	early generation
329.5	Veins				SHTV	25	300	0	
329.5	Veins		V2		SHTV	60	260	0	late generation
333.5	Veins		V2		SHTV	70	80	0	late generation
333.5	Veins		V1		SHTV	20	280	0	early generation
339	Veins				STWK			0	intensely pyrite mineralized ~60% quartz veining veining appears diffuse and intersects multiply with extremely dense distribution (upper part of this subsection)
340	Veins				SHTV	55		0	
344	Cleavage		Ssh			48		0	weak shearing with phyllite and quartz ankerite wedges

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
86.31	104.16	veining in Quartz-Pebble-Conglomerate (QPC): - densely distributed and multiply intercepting as well as frequently boudinaged - vein boundaries frequently diffuse - folded, foliation concordant veining present in low grade, chloritized shearing - several branching, low core angle boudins - vein thickness generally < 3cm Vein & wallrock sulfide mineralization increases in downhole direction throughout unit. Visible gold mineralization (small spec) @ 100m in <0.5cm thick, low core angle vein boudin.	QZVN		30.0%	w			co	1
86.31	104.16	Quartz-Pebble-Conglomerate (QPC): grey to medium grey colour Composition: 83% milky white, subangular quartz grains; 15% altered, pitted, subrounded feldspar; 2% dark lithics (phyllite clasts?) Alteration type of feldspar varies throughout interval. [see alteration table] Grainsize: 3-7mm (predominantly granule size) <5% matrix Intermittent chloritization leading to alignment of wispy, semi-penetrative, grey-green chlorite lamellae at about 0.5-1cm spacing likely indicating low grade shearing. Alteration fluid boundaries appear sharp, chlorite rimmed and frequently planar. [low grade shear zone boundaries?] about 60% of unit has weak shear texture with frequency of shear intervals increasing in downhole direction ~30% quartz veining which tends to be intensely sulfide mineralized from about 93m downwards. Cave-in of black-grey, very uniform sandy clay @ 92.74m. [about 30cm of extra material]	MT-CO		69.0%	gy	qtz	80	co	1
104.16	105.2	VG mineralized, buff-yellow massive quartz vein. Upper contact: 55TCA Lower contact: 60TCA appears concordant to low grade shear foliation formed by alignment of wispy, semi-penetrative chlorite lamellae at ~0.8cm spacing minor QPC inclusions at banded lower contact - alson contains various dark grey, metallic seams (arsenopyrite-antimony combination?) - gold as multiple small specs - 0.5-2mm grains of pyrite and arsenopyrite	QZVN		100.0%	w			co	1
105.2	111.2	Quartz veining in Quartz Pebble Conglomerate unit (QPC): - on average exceeds 4cm thickness - milky white with sharp boundaries - vein core angles are generally less or equal to 45TCA - some thinner vuggy, iron-stained quartz seams - veins are sulfide mineralized	QZVN		30.0%	w			co	1

210	Bedding		So			75	255		in phyllite
212	Cleavage		S1			60	265		in phyllite
213.4	Veins					20	238		folded, dusty white veinlets, off-set along foliation
214	Bedding		So			85	180		in phyllite-silt laminar interbedding
214.65	Contact				FOL	85			upper contact of QPC wedge in phyllite, contact concordant to phyllite foliation and cuts of veining in QPC
214.83	Contact				FOL	85			lower contact of QPC wedge in phyllite, contact concordant to phyllite foliation and cuts of veining in QPC
216.08	Contact					88	180		phyllite-sandstone QPC
216.2	Veins				SHTV	10	355		multiple, densely spaced, diffuse quartz seams in QPC
216.86	Contact				FOL	80			upper contact of phyllite wedge
217.16	Contact				FOL	80			lower contact of phyllite wedge
219.8	Contact				Gouge	80			1cm thick phyllite gouge seam in QPC unit
220.2	Contact				FOL	65			upper contact of folded partially gouged phyllite wedge in QPC unit wedge is ~50cm long and lower contact is fragmented
221.7	Contact					60			upper contact of massive ~0.7m thick, sulfide mineralized quartz vein; lower contact is fragmented

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-016 **Grant No.:** YD07124

Plunge: 75 **Azimuth:** 270 **EOH:** 288

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
223.1	Veins				SHTV	10			multiple low core angle, ~1cm thick quartz veins in QPC
223.5	Contact				FOL	45			upper contact of phyllite wedge with quartz-ankerite-veining, concordant to phyllite foliation
223.7	Contact								lower, fragmented contact of phyllite wedge in QPC unit
225.2	Contact				Gouge	30			folded, curved, smooth contact of QPC above and gouged (barely recovered) phyllite wedge below
230	Veins				SHTV	30			multiple, slightly vuggy, <3cm thick, milky white quartz veinlets in QPC unit
230	Veins				SHTV	10			common vein orientation in QPC unit: multiple, slightly vuggy, <3cm thick, milky white quartz veinlets have iron-carbonate patches
233	Veins				SHTV	45			common vein orientation in QPC unit: multiple, slightly vuggy, <3cm thick, milky white quartz veinlets have iron-carbonate patches
236.3	Contact				FOL	55			sharp, competent lithological contact between QPC and Phyllite unit below -- concordant to phyllite foliation
237	Veins				Gouge	60			narrow zone of low grade shearing with with intensified quartz veining
237	Veins				Gouge	20			gouge-terminated, vuggy, milky white quartz vein with upper contact at 20TCA and lower contact cut-off along foliation
237	Veins				Gouge	60			narrow zone of low grade shearing with with intensified quartz veining
238.4	Veins					15			1.5cm thick, low core angle, vuggy, pyrite mineralized quartz boudin; upper contact cut off along foliation
239.5	Bedding		So			70			smooth cleavage along bedding
240	Bedding		So			72			smooth cleavage along bedding in phyllite
244	Bedding		So			80			smooth cleavage along bedding in phyllite
244.5	Bedding		So		Gouge	80			3mm gouge seam along bedding cleavage
244.6	Bedding		So		Gouge	80			3mm gouge seam along bedding cleavage
245.44	Faults				Gouge	20			friable clay along irregular low core angle fracture
246.7	Bedding		So			85			cleavage along bedding in phyllite
246.7	Veins				TVA	85			repeated 0.5cm thick foliation concordant tension veining
247.6	Cleavage		Sx			75	280		thin wispy foliated phyllite wedges in sandstone
248.63	Bedding		So			40	270		foliation in silt/sand as part of extended low amplitude open fold profile
248.63	Contact				FOL	50	280		phyllite wedge in sandstone that contains fold profile with folded foliation smoothly continuing from sand/silt stone into phyllite
248.66	Bedding		So			15	270		foliation in silt/sand as part of extended low amplitude open fold profile
248.68	Axial Plane		Fx			85	360		cleavage parallel to axial plane in phyllite wedge with 2cm amplitude fold profile
248.82	Contact				FOL	47			lower contact of phyllite wedge located on fold hinge -- concordant to phyllite foliation. Hard competent contact with fine-grained sandstone Fold hinge has quartz-iron-carbonate wedges and is preferentially pyrite mineralized
249	Faults				Gouge				narrow zone of gouged/partially softened sandstone fragments
249.3	Contact								Cave-in with rubbled lithologically diverse material
249.7	Veins					45			early vein orientation in fine grained sandstone bed
249.7	Veins					5			late vein orientation in fine grained sandstone

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-016 **Grant No.:** YD07124

Datum:	**UTM Zone:**	**Grid N:**	**Grid E:**	**Core Size:** HQ		**Contractor:** Driftwood	
NAD83	9						

Objective:
This drill hole test the down plunge potential of the same target as 3A-11-P02. This is a 62m step-out to the north. Targets expected at 92m and 140m.

0	4.5	no core recovered	CASING		100.0%				co	1
4.5	90.95	Quartz veining in black phyllite unit is extremely rare and generally present as sparse, dusty white (lacking vitreous lustre) thin seams that generally occur foliation discordant. Also several fragments of vuggy quartz-chlorite veining in upper 20 meters of unit. Quartz veining intensifies near lower contact of unit from 86.4-90.34m in form of 0.2-2cm thick quartz-iron-carbonate veining with intense pyrite mineralization. (Tension veins precede poorly recovered fault gouge from 90.34-90.95m.	QZVN		1.0%	w			br	1
4.5	90.95	black Phyllite with grey, thin silt laminae silt laminae increase somewhat from 43meters onwards texture too fine-grained to determine exact compostion Rock competence varies throughout unit: 4.5-24m very broken and blocky with lower recoveries 24-44.65m competent core 44.65-51.20m increased fragmentation and iron staining with partial gouging & low core angle fractures [weak brittle deformation] 51.20-60.30m mostly competent core -- slightly blocky 60.30-72.62m brittle & blocky with 40% interspersed gouged softened fragments; competent core interspersed throughout 72.62-79m mostly competent core 79-86.04 gouged fragments along iron stained low core angle fractures 86.04-90.34 mostly competent core 90.34-90.95 poorly recovered (~30%) gouge fault at lithological contact foliation along bedding planes throughout [see point measurements]	MT-Phy		99.0%	n			br	1

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
90.95	96.3	Unit has a sheared breccia texture with grey-green chlorite overprint at upper contact of unit that is expressed as alignment of wispy, semi-penetrative grey-green lamellae with about 0.5cm spacing. Also a multitude of frequently aligned vuggy, iron-stained quartz veins with diffuse and folded contacts. Localized stretching of quartz clasts. Sulfide mineralization in veining and wallrock -- generally very fine-grained & disseminated. Unit appeas to grade from QPC (presence of altered feldspar) with sheared quartz veins into a Quartz vein breccia (increase of clast size and angularity) towards lower contact. Part of a large scale fault zone from 90.34-111.00 meters, that crosses lithological boundaries. Unit grades into loss of competence and crush gouge towards lower contact.	QZVN	bx	40.0%	w			br	3
90.95	96.3	light grey Quartz-Pebble-Conglomerate with orange-rusty iron-carbonate over print in quartz veining, along vein boundaries and partially on feldspar. Composition: 85% white to light grey quartz; 15% feldspar ~5-10% dark grey (chlorite-rich?) matrix grainsize:2-5mm to 2cm towards lower contact of unit grainshape: subangular to subrounded feldspar appears pitted and either dusty white or rust-stained (white clay alteration with iron-stain overprint? - no buff colours) Unit has a sheared breccia texture with grey-green chlorite overprint at upper contact of unit that is expressed as alignment of wispy, semi-penetrative grey-green lamellae with about 0.5cm spacing. Also a multitude of frequently aligned vuggy, iron-stained quartz veins with diffuse and folded contacts. Localized stretching of quartz clasts. Sulfide mineralization in veining and wallrock -- generally very fine-grained & disseminated. Unit appeas to grade from QPC (presence of altered feldspar) with sheared quartz veins into a Quartz vein breccia (increase of clast size and angularity) towards lower contact. Part of a large scale fault zone from 90.34-111.00 meters, that crosses lithological boundaries. Unit grades into loss of competence and crush gouge towards lower contact.	MT-CO	bx	60.0%	gy	qtz	85	br	3
96.3	101.8	Quartz-Vein Breccia: generally low strength, but cohesive. about ~5% matrix in form of grey-green chlorite seams. Clast size about 0.5-3.5cm and very angular with white, to dusty white quartz clasts (lack of vitreous lustre). Occassional black-grey, high core angle (~80TCA) chlorite seams and massive high core angle pyrite stringers. All over colour is light grey (grey matrix with dusty white clasts) Interval is sulfide mineralized. Lower contact with gouged/faulted phyllite.	QZVN	bx	100.0%	gy			br	4
101.8	114.98	Veining as fragments, semi-massive (folded) boudins; veining is concentrated between 101.8-107 meters in zone of intense gouging. Veins near upper contact are brecciated and range from 10-40cm in thicknes with wedglike chlorite and phyllite inclusions as well as buff iron-carbonate overprints.	QZVN		10.0%	bf			fr	3
101.8	114.98	Black foliated and folded phyllite unit that includes zones of intense brittle deformation [see structure table]. Predominantly brecciated and gouged with a competent core interval from 111-114.2 where closed micro fold profiles are continuously bisected by thin, brown quartz-iron-carbonate seams. This unit is part of a large scale fault zone from 90.34-111.00 meters, that crosses lithological boundaries.	MT-Phy		90.0%	n			fr	3

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
44.65	51.2	FZ	100.0%	BFZ	low intensity brittle deformation: increased fragmentation & iron staining with partial gouge and frequent low core angle fractures
60.3	72.62	FZ	200.0%	BFZ	low intensity brittle deformation: brittle and blocky with ~40% interspersed softened fragments and occasional true, soft, plastic gouge wedges, which are frequently emplaced along 15-25TCA fractures; about 60% of interval is competent core
79	86.04	FZ	100.0%	BFZ	gouged fragments along iron-stained low core angle fractures
90.34	90.95	FZ	400.0%	BFZ	poorly recovered (~30%) gouge fault along low core angle fractures
90.95	96.3	QZVN	300.0%	bx	Unit has a sheared breccia texture with grey-green chlorite overprint at upper contact of unit that is expressed as alignment of wispy, semi-penetrative grey-green lamellae with about 0.5cm spacing. Also a multitude of frequently aligned vuggy, iron-stained quartz veins with diffuse and folded contacts. Localized stretching of quartz clasts. Sulfide mineralization in veining and wallrock -- generally very fine-grained & disseminated. Unit appeas to grade from QPC (presence of altered feldspar) with sheared quartz veins into a Quartz vein breccia (increase of clast size and angularity) towards lower contact. Part of a large scale fault zone from 90.34-111.00 meters, that crosses lithological boundaries. Unit grades into loss of competence and crush gouge towards lower contact.
96.3	101.8	QZVN	400.0%	bx	angular 0.5-3.5cm quartz clasts in chlorite matrix, cohesive and low strength (somewhat friable); some alignment of chlorite seams along 80TCA locally

From	To	Mineral	Intensity	Distribution	Comments
101.8	111	FZ	400.0%	BFZ	Brittle defomation in phyllite as part of a large scale fault zone from 90.34-111.00 meters, that crosses lithological boundaries. high degree of crush gouging and fragmentation - gradual transition into blocky more competent core towards lower contact of unit. Contains boudinaged and brecciated quartz veining (especially near upper contact). Sulfide mineralization highest near upper contact of unit.
114.2	114.98	FZ	400.0%	BFZ	intense gouging with small and larger, angular crush fragments in phyllite clay-gouge matrix Interval bounds competent phyllite above and weakly brecciated Quartz-Pebble-Conglomerate with quartz veining below.
125	125.5	FZ	200.0%	BFZ	dark brown poorly recovered fault gouge (silt/phyllite source?)
125.5	133.8	SZ	100.0%	bx	Quartz-Vein-Breccia with rusty semi-pervasive iron-carbonate staining and elements of quartz-pebble-conglormerate (presence of about 5% pitted, buff-orange, iron-carbonate altered feldspar). Foliation fabric present in form of aligned dark grey chlorite wisps at about 3mm spacing. Quartz grades from, large angular fragments into foliation concordant veining iwth more defined sharp boundaries. Frequent rusty, low core angle fractures. Several intervals with crushed partially softened or friabe fragments.
132.1	132.3	FZ	300.0%	BFZ	dark grey (phyllite source) fault gouge
133.8	154.95	SZ	100.0%	SHTV	QPC unit with a multitude of <1cm thick white-grey, 10-25TCA veinlets and weakly developed shear texture at same orientation in form of grey-green aligned cholirite seams surrounding clasts at ~4mm spacing (clast grainsize).
144.56	144.8	FZ	300.0%	BFZ	10cm black phyllite wedge follow by ~40cm of iron stained, bronw fault gouge that also contains intensely weathered quartz veining
151.35	152.1	FZ	300.0%	BFZ	poorly recovered fault with intensely softened, iron-stained fragments; fragments are gritty and sandy
153.85	154.55	FZ	200.0%	BFZ	softened, gritty, iron-stained fragments and large qurtz vein fragments
170	171	FZ	200.0%	BFZ	fragmenation and gougeing that crosses lithological contact in form of low core angle, iron stained QPC fragements that transition into vein gouged phyllite wedges concordant to high core angle phyllite foliation
171	176.04	QZVN	400.0%	SHTV	buff, pyrite mineralized, quartz-iron-carbonate veins (0.5-5cm thick) that run parallel to axial planes of low amplitude cink folds in compositional bedding foliation of phyllite unit. [see point measurements for orientations] also sevral broken, fragmented partially softened subintervals in this unit
194.1	196.1	FZ	200.0%	BFZ	softened and gouged, friable and partially blockky phyllite
204.58	205.15	QZVN	300.0%	SHTV	localized low grade shearing/soft deformation (?) in form of densely spaced, 0.1-3cm thick quartz veining that run concordant to graphitic phyllite foliation
209.28	211.52	FZ	300.0%	DBSZ	Intensely stretched quartz vein clasts surrounded by phyllite wedges/seams that grade into gouged, graphitic, black phyllite
214.61	221	QZVN	400.0%	bx	Brecciated quartz veining in zone of soft deformation in phyllite that grades into gouge at lower contact; Veins have buff iron-carbonate patches, green chlorite wedges and enclose angular phyllite clasts
223	223.8	FZ	300.0%	BFZ	poorly recoved, gouged and shattered phyllite
246.8	248.59	QZVN	300.0%	SHTV	mulitple ~55TCA, massive quartz veins and pararallel narrow veinlets with occassional angular phyllite wedge inclusions and pyrite mineralization; veins occur in QPC sequence and broaden in thickness towards lower contact of interval which occurs at a lithological contact + the upper bound of a zone of vein deformation.
270.48	272.1	FZ	300.0%	BFZ	friable core and gouge sections emplaced along 20-30TCA in phyllite
284.2	285.8	FZ	200.0%	BFZ	broken, soft and frialble with off-set veining
295.6	295.7	FZ	300.0%	BFZ	10cm gouge wedge concordant to phyllite foliation at lithological contact with chloritized sandstone

Plunge: 60 **Azimuth:** 270 **EOH:** 296

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
213.8	Bedding		So			60	200		compositional bedding foliation
213.8	Veins				SHTV	60	200		thin quartz-iron-carbonate veinles concordant to compositional bedding foliation
214.02	Contact					55	190		phyllite-black sandstone contact
214.02	Veins				SHTV	40	350		pyrite mineralized quartz-iron-carbonate veinlets
214.02	Cleavage		S1			55	105		discernible in compositional bedding foliation
214.02	Bedding		So			55	190		compositional bedding foliation
214.61	Contact					50	190		phyllite-black sandstone contact
214.61	Veins				SHTV	50	190		pyrite mineralized quartz-iron-carbonate vein wedges
215.05	Contact					70	310		upper contact of dark grey, fine grained sandstone interbed
215.2	Bedding		So			25	280		compositional bedding cleave in dark grey, fine-grained sandstone interbed with prominent large, angular phyllite inclusions
216.13	Bedding		So			60	190		compositional bedding cleavage in phyllite
216.13	Faults				FOL	60	190		compositional bedding cleavage in phyllite cutting off brecciated low core angle quartz veining above
216.95	Veins				bx matrix	65	250		brecciated quartz-chlorite-ankerite veins in zone of deformation in phyllite
217.5	Bedding		So			65	160		compositional bedding cleavage in phyllite
218.7	Veins				TVA	65	10		boudinaged, pyrite mineralized quartz-iron-carbonate vein seams/wedges
219.05	Bedding		So			60	240		compositional bedding cleavage
219.13	Bedding		So			60	270		compositional bedding cleavage foliatoin
219.13	Faults				Gouge	30	60		black, 6cm thick gouge seam enclosed in phyllite
220.25	Faults				Gouge	88			~10cm gouge wedge with recovered lower contact at high core angle and ~40degree acute intersection angle with bedding cleavage
220.25	Bedding		So			60			compositional bedding cleavage in phyllite
221.3	Bedding		So			45			compositional bedding cleavage in phyllite-silt sequence
221.78	Bedding		So			0			compositional bedding cleavage in phyllite-silt sequence
221.78	Axial Plane		Fx			78			axial plane of 0.3mm amplitue open fold profile with 14cm wavelength
221.8	Cleavage		S1			75			S1 cleavage discernible within compositional bedding cleavage planes
222	Veins				AXP	75			several axial planar parallel quartz-iron-carbonate veins
222	Bedding		So			35			compositional bedding cleavage in phyllite-silt sequence
222.3	Axial Plane		Fx			75			multiple closed fold profiles in phyllite-silt sequence with 1cm amplitude; cink folds/parasitic folds
224	Bedding		So			45			compositional bedding cleavage in phyllite-silt sequence
224.6	Bedding		So			50	170		
224.8	Veins			fecb		40	210		pyrite wallrock mineralization in phyllite-silt sequence
227	Bedding		So			55	165		compositional bedding cleavage in phyllite-silt sequence
227.79	Contact				FOL	60	180		
227.83	Veins			fecb		15	270		in QPC-Sand sequence
227.9	Veins			fecb		20	15		in QPC-Sand sequence
229	Bedding		So			60	190		compositional bedding cleavage in phyllite
229.2	Veins			fecb	Veinlets				tightly folded, long running, 0.4cm thick veinlet in Phyllite-Silt sequence
229.5	Veins			fecb	SHTV	30	90		iron-carbonate-quartz veining in QPC sequence
230.15	Veins			fecb	SHTV	40	15		multiple, densely spaced, quartz-chlorite-iron carbonate, vein boudins

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-017 **Grant No.:** YD07124

Plunge: 60 **Azimuth:** 270 **EOH:** 296

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
230.5	Veins			fecb	SHTV	60	340		0.2-8cm thick quartz-iron-carbonate veins in QPC sequence
232.7	Bedding		So			55	180		compositional bedding cleavage in phyllite
234.6	Bedding		So			55	170		compositional bedding cleavage in phyllite
234.6	Veins			fecb		55	0		intensely pyrite clustered, densely spaced, ~0.5-1cm thick quartz-iron-carbonate veinlets in silt sequence and continuing on into QPC sequence below
235.3	Veins			chl	bx matrix	65	330		quartz-iron-carbonate-chlorite veins in short phyllite sequence that off-set foliation and are clustered with pyrite; contain angular phyllite wedges
235.86	Faults			fecb	Gouge	25	180		gouge wedge with intense pyrite clusters and iron-carbonate wedges
235.9	Bedding		So			60	160		compositional bedding cleavage in phyllite
236.22	Veins				SHTV	60	340		pyrite mineralized vein orientation in QPC sequence
237.2									intense drill grinding with mixed lithologies
240.2	Veins			fecb	Veinlets	20	0		multiple buff, iron-carbonate-quartz seams in QPC sequence
240.41	Veins			fecb	FOL	40	100		wispy phyllite wedges with pyrite clusters and iron-quartz-carbonate patches
241.65	Bedding		So			50	105		phyllite wedge with multiple folded quartz-carbonate seam
242.5	Veins				SHTV	30	70		reapeated vein orienation in QPC sequence: ~1cm thick, milky white and with sharp boundaries
245	Veins				SHTV	60			repeated vein orientation in
246.2	Faults				Gouge	40			poorly recovered gouge wedge in phyllite interbed with quartz-iron-carbonate veining
247	Veins				SHTV	40			occassionally pyrite mineralized vein orientation of varying thickness in QPC sequence
248.59	Veins			fecb	TVA	30			partially penetrative, buff, tension seams
249	Veins			fecb	SHTV	25			boudinaged, 1cm thick, quartz-iron-carbonate veinlets; acute intersection angle with So: ~58 degree
249	Bedding		So			40			compositional bedding cleavage in phyllite-silt sequence
250.5	Axial Plane		Fx			80			axial plane of low amplitude open fold profile
250.6	Veins			fecb	bx matrix	15			quartz-iron-carbonate vein with angular phyllite clast inclusions and pyrite stringers concordant to vein orientation
252	Veins			fecb	FOL	40	40		vein seams parallel to compositional bedding cleavage in phyllite-silt sequence
252	Bedding			fecb		40	40		compositional bedding cleavage in phyllite-silt sequence
252.55	Contact				FOL	30	40		phyllite sandstone contact - concordant to phylite foliation
253.5	Cleavage		Sx			10	105		cleavage in chloritized sandstone; possibly sheared
253.6	Veins			chl	bx matrix	45	250		pyrite mineralized, ~40cm thick, massive quartz vein that contains angular wallrock wedges
254	Veins			fecb	SHTV	5	320		pyrite mineralized quartz-iron-carobonate veins seams in chloritized sandstone
254.7	Veins			fecb	SHTV	25	350		thin seams
254.8	Veins				SHTV	80	310		thin seams
255.2	Veins			chl	FOL	35	210		pyrite clustered qtz-fecb-chl vein in phyllite wedge and concordant to phyllite foliation
256	Bedding		So			35	250		compositional bedding cleavage in phyllite
257.5	Bedding		So			60	240		compositional bedding cleavage in phyllite
258.38	Veins			chl	TVA	35	40		pyrite mineralized
258.38	Veins			chl	SZB	65	60		pyrite mineralized
258.48	Veins			chl	Veinlets	5	20		intensely pyrite mineralized, likely related to tension vein array above
259.5	Veins			py	SHTV	10	185		repeated pyrite quartz seams
260	Bedding		So			70	160		compositional bedding cleavage in phyllite

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-017 **Grant No.:** YD07124

Plunge: 60 **Azimuth:** 270 **EOH:** 296

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
261.3	Veins					25	0		repeated vein orientation for boudinages seams in phyllite
265	Bedding		So			50			compositional bedding cleavage in phyllite
268	Veins			chl	SHTV	55			densely spaced quartz-iron-carbonate-chlorite veins in phyllite
269.35	Bedding		So			28	340		compositional bedding cleavage in phyllite
274.85	Bedding		So			15			compositional bedding cleavage in phyllite-silt sequence
276.1	Bedding		So			55			compositional bedding cleavage in phyllite
276.5	Contact				FOL	55			phyllite-sand contact, concordant to phyllite foliation
277.6	Veins			fecb	SHTV	65			iron-carbonate-quartz seams in fine-grained sandstone sequence
278.6	Axial Plane		Fx			60			multiple, 0.3cm amplitude and 2cm wavelength fold profiles
278.6	Bedding		So			0			compositional bedding cleavage in phyllite, multiply folded
281.2	Bedding		So			60	260		compositional bedding cleavage in phyllite
281.5	Bedding		So			30	300		compositional bedding cleavage in phyllite
283.55	Veins			fecb	AXP	75			closed cink folding with multiple axial planar paraall qtz-fecb veinlets
283.8	Bedding		So			20			compositional bedding cleavage in phyllite
284.4	Veins			fecb		10			pyrite mineralized, fecb-qtz vein offset along 60TCA
286.2	Cleavage		S1			70			compositional bedding cleavage in phyllite-silt sequence
286.2	Bedding		So			35			compositional bedding cleavage in phyllite-silt sequence
288.3	Bedding		So			70	50		compositional bedding cleavage in phyllite
289.5	Bedding		So			60	300		compositional bedding cleavage in phyllite
293	Bedding		So			60	295		compositional bedding cleavage in phyllite
294	Bedding		So			70	300		compositional bedding cleavage in phyllite
295.37	Bedding		So		Gouge	70	310		gouge wedge along compositional bedding cleavage in phyllite
295.6	Faults				FOL	75			10cm gouge wedge along phyllite foliaton
295.7	Contact				FOL	70			lithological contact between phyllite and folded, chloritized sandstone -- concordant to phyllite foliation
295.75	Veins				FOL	20			quartz vein concordant to chloritized sandstone foliation fabric
295.8	Bedding		So			20			foliation, fabric in chloritized sandstone

Diamond Drill Log and Sample Summary

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-018 **Grant No.:** YC72728

Location

Easting:	Northing:	Latitude:	Longitude:
533733.3	6843982.3		

Elevation: 1540 m **Grid Name:** NA

Datum:	UTM Zone:	Grid N:	Grid E:
NAD83	9		

Orientation

Plunge: 60
Azimuth: 270
EOH: 357.0 m
Core Size: HQ

Start Date: 08/08/2011
Finish Date: 12/08/2011
Status: Completed
Contractor: Driftwood

Objective:

The target of this drill is the same as 3A-11-P03, the down plunge extension of the potential ore shoot. Targets expected at 105m and 160m.

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	6	no core recovered	CASING		100.0%				co	1
6	57.18	Quartz veining in phyllite unit is relatively scarce and occurs as: - thin, <0.5cm thick, dusty white, foliation concordant seams - localized as 4-15cm thick massive, quartz-chlorite-iron-carbonate veining - on instance of massive, ~40cm thick quartz veining [point measurements + structure table hold more detailed information]	QZVN		2.0%	w			co	1
6	57.18	in progress: black, folded phyllite, with regularily occuring thin, grey silt lamellae Texture too fine-grained to determine exact composition foliated along original, compositional bedding planes (So) S1 occassionally discernible (drill markings perpendicular to core axis tend to obscur S1); several localized intervals where small cink (parasitic) fold profiles are visible. Unit fairly competent (especially at top of hole) with blocky appearance due to mainly mechanical fractures along foliation. Several narrow, localized, structural deformation zones between 50-70 meters downhole depth.	MT-Phy		98.0%	n			br	1
57.18	60.65	foliation concordant quartz veining in graphitic phyllite with about 2-20cm thickness	QZVN		10.0%	w			fr	2
57.18	60.65	graphitic phyllite: colour (virtual absence of silt lamellae) and texture too fine-grained to determine exact composition unit is blocky and locally friable graphite is remobilized along cleavages with polished appearance Upper Contact: Core is blocky an partially friable above upper contact. Lower Contact: Narrow, partially gouged zone at lower contact of zone that apears to terminate graphitic component. Contacts chosen for discernible graphite component.	MT-Phy	gf	90.0%	n			fr	2

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-019	Grant No.:	YC72728

75	270	333					

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
60.65	101.15	Quartz veining is scarcely distributed and generally present in localized narrow zones: - from 72-79 m as thin, dusty white, predominantly foliation discordant seams - from 60.65-61.75m in form of pyrite minerlized, foliation concordant veining related to vein formation in graphitic unit above	QZVN		2.0%	w			co	1
60.65	101.15	Black phyllite with ~5% thin, grey silt lamellae that appear throughout (striped, lamellar appearance) Texture too fine-grained to determine exact composition Unit is broken and blocky from 60.65-72.20m and interspersed gouge wedges ast center from 66-68.35m Lower contact with unit with densely distributed veining.	MT-Phy		98.0%	n			co	1
101.15	105.8	Quartz veining is densely spaced and generally 0.5-3cm thick. Veining is dominantly foliation concordant. Upper and lower contact of unit are determined by absence of veining.	QZVN		15.0%	w			co	1
101.15	105.8	Black foliated phyllite as seen in previous unit with high density of foliation concordant quartz veining and occassionally flex-folded bedding cleavages. Upper and lower contact of unit are determined by absence of veining.	MT-Phy		85.0%	n			co	1
105.8	120.1	silt as laminae and occassionally as discrete up to 20cm beds	MT-SLT		10.0%	gy			fr	2
105.8	120.1	black phyllite with occasional discrete, up to 20cm width silt interbeds blocky and broken throughout with gouge wedges and freiable coe towards lower contact	MT-Phy		90.0%	n			fr	2
120.1	127.8	Quartz veining is thin and diffuse and grades into angular clasts towards lower contact	QZVN	bx	35.0%	w			co	3
120.1	127.8	light grey, friable, brecciate Quartz-Pebble-Conglemerate with diffuse quartz veining and increasing size of quartz (vein) clasts towards lower contact of unit. Several blocks with weakly developed shear texture in form of alignment of wispy chlorite seams at ca. 4mm spacing. original composition: 10-15% pitted, clay/iron-carbonate altered feldspars discernible. Difficult to discern angular quartz clasts from angular quartz vein clasts. Clasts size: 0.5-3cm	MT-CO	bx	65.0%	gy	qtz	85	co	3
127.8	157.75	quartz veining in folded phyllite in form of broad 4-30cm vens with angular phyllite inclusions and prominent buff iron-carbonate patches. Vein intensity and thickness varies greatly throughout unit. [see structure table, alteration and point measurements for details on vein density distriubtion]	QZVN		10.0%	bf			br	2
127.8	157.75	folded phyllite with open folding of up to 0.5m wavelenght; texture too fine grained to determine exact composition various fault intervals throughout unit [see structure table and point measurements] competence of this unit is very variable [refer to geotechnical log]	MT-Phy		90.0%	n			br	2
157.75	167	Quartz veining is frequently parallel and sheeted along 35-40TCA and about 0.5-1cm in thickness. Veining is milky white in appearance with slight diffuse boundaries and occassionally vuggy.	QZVN		5.0%	w			co	1
157.75	167	light grey, granule size Quartz Conglomerate grainsize: 2-5mm Composition: 85% grey quartz; 14% white, clay altered, pitted feldspar; ~1% fine grained, dark lithics Grainshape subangular several localized intervals of low grade shearing in form of aligned, wispy, semi-penetrative grey chlorite lamellae at ~8mm spacing narrow gouge wedge at lower contact upper contactwith phyllite is poorly recoverd but grading from sandstone into granule size conglomerate is apparent	MT-CO		95.0%	gy	qtz	85	co	1

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-019 **Grant No.:** YC72728

Plunge: 75 **Azimuth:** 270 **EOH:** 333

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
167	204.52	Quartz Veining in Turbidite Sequence: - generally 1-4cm thick and at 30-50TCA in sandstones and conglomerate - often with buff iron carbonate patches - where in sandstone and conglomerate frequently terminated/cut-off at contacts with Phyllite (phyllite contacts are concordant to phyllite bedding foliation) - as thinner seams in phyllite sequences [see point measurements and structure table for details on quartz veining]	QZVN		10.0%	w			br	1
167	204.52	Turbidite Sequence with rapidly changing lithologies (granule size Conglomerate - fine to coarse grained Sandstone - black Phyllite with grey laminar silt interbedding. Interbeds range from 25cm to 3meters in length. Assay samples are separated by Lithology wherever possible. Conglomerate mostly near upper contact of unit. Conglomerate Composition: 85% grey quartz; 14% buff, pitted, iron carbonate altered feldspar; 1% dark lithics Grainsize: 2-4mm Grainshape: Subangular Quartz veining in Conglomerate is frequently terminated at contacts with Phyllite. Contacts with PHyllite are concordant to Phyllite bedding foliation.	MT-CO		15.0%	gy	qtz	85	br	1
167	204.52	Rapidly interchanging phyllite sequence with up to 30% grey silt laminae; fine to medium grained sandstone and phyllite predominate in lower 2/3 of unit. Texture of phyllite-silt too fine-grained to determine exact composition. Contacts between phyllite and coarser grained units tend to be concordant to phyllite foliation. Sandstone ranges from fine to predominantly medium grained: 0.5-1.5mm Grainshape: subangular to subrounded Composition: 80% grey quartz; locally up to 20% orange buff, iron-carbonate altered feldspar Upper contact bounds pure conglomerate sequence. Lower contact bounds phyllite sequence with intense iron-carbonate veining.	MT-SS	mgr	35.0%	gy	qtz	80	br	1
167	204.52	Rapidly interchanging phyllite sequence with up to 30% grey silt laminae; fine to medium grained sandstone and phyllite predominate in lower 2/3 of unit. Texture of phyllite-silt too fine-grained to determine exact composition. Contacts between phyllite and coarser grained units tend to be concordant to phyllite foliation. 185.3-190.0m continuous phyllite-silt sequence with 20-30TCA compositional bedding cleavage core anlge.	MT-Phy		40.0%	n			br	1
204.52	213.3	silt as grey laminae in phyllite and as larger scale interbedding grading into fine-grained sandstone at lower contact of unit	MT-SLT		5.0%	gy			co	1
204.52	213.3	densely distributed - frequently non-planar/jagged iron-carbonate-quartz veining in phyllite [see point structures table for orientations] vein intensity receedes in last 3 meters of interval	QZVN		15.0%	bf			co	1

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
24.5	30.9	QZVN	300.0%	SHTV	green chlorite wisps in multiple, parallel, mircofractured, 5-25cm thick quartz veins: - slight iron staining - occassionally contain smal pyrite blebs - run foliation concordant (50-60TCA)
43.5	50.34	QZVN	300.0%	SHTV	densly spaced quartz-iron-carbonate wedges and veins with undulated contacts concordant or subconcordant to compositional bedding cleavage in phyllite
57.18	60.65	QZVN	200.0%	SHTV	foliation concordant quartz veining in graphitic phyllite interval with friable wedges and massive, foliation concordant pyrite mineralziation at lower bound of interval
66	68.35	FZ	200.0%	BFZ	gouge wedges along foliation in friable phyllite
120.1	140	FZ	300.0%	BFZ	brittle fault zone that crosses lithological contacts: gouged zones and friable brecciated zones high incidence of quartz-iron-carbonate veining towards lowe bound of this intervals with angular phyllite clast inclusions and buff iron-carbonate wedges
131	135.1	QZVN	400.0%	bx	undulated, dusty white quartz veins with prominent, buff iron-carbonate patches and and angular (up to 4cm diameter) inclusions of phyllite; interval is partially softed and contains localized gouged fragments Interval is part of large scale fault zone from 120.1-143.00m.
150.8	153.4	FZ	300.0%	BFZ	softened gouged core along undulated low core anlge fractures in folded phyllite
153.4	157.75	QZVN	200.0%	TVA	high incidence of pyrite cluster mineralized quartz-iron-carbonate tension veins - with jagged branching habit
172.6	172.8	FZ	200.0%	BFZ	narrow 85TCA fault wedge at conglomerate-phyllite interbed contact: - cuts off veining in conglomerate - contains quartz fragments in high core angle gouge wedge - marks a drastic change in foliation (So) core angle in phyllite from 80TCA above to 20TCA below
181.3	185.3	QZVN	400.0%	bx	Variable core angle, intersecting and densely distributed quartz iron-carbonate veinlet in both sane and phyllite sequences with frequent soft gouged fragments. Veining grades into brecciated texture towards lower contact of unit and has frequent angular, elongated phyllite inclusions.
198.9	199.4	FZ	300.0%	BFZ	poorly recovered fault gouge (~25% recovery)
202.2	202.8	QZVN	400.0%	SHTV	semi-massive ~15TCA quartz veining
218.9	239.72	FZ	300.0%	BFZ	Brittle Fault Zone that crosses lithological boundaries: 218.0 - 223.15 graphitic phyllite 223.15 - ~225.00 phyllite with intensely pyrite mineralized vein seams 225.00 - 239.72 frequently interchanging intervals of gouged phyllite and blocky fragments of brecciated quartz veining with possibly minor congllmerate inclusions
248.5	250.6	FZ	200.0%	BFZ	Brittle fault zone with gouge
268	268.4	SZ	300.0%	TVA	Quartz vein within the phyllite with central vein with tension veins on either side
303.3	304.45	QZVN	200.0%	SHTV	
316.5	317.4	QZVN	200.0%	SHTV	1cm galena xl within qzvn

170	Faults					75			healed fault seam in conglomerate offsetting 2 vein generations by ~1cm
171	Veins				AXP	55			pyrite mineralized dusty white quartz seams parallel to cink-folding in phyllite
171.2	Contact		So		FOL	68			conglomerate (above) and phyllite (below)
171.2	Veins				SHTV	18			diffuse veins in conglomerate; cut-off by contacts with phyllite
171.76	Bedding		So			85			in phyllite
172.1	Veins			fecb	SHTV	25			dense parallel veinlets in conglomerate
172.6	Faults				Gouge	75			~5cm phylite-quartz fragment gouge wedge followed by softened fragments at conglomerate-phyllite interbed contact
172.85	Bedding		So			20			in phyllite (drastic foliation core angle change!)
173	Bedding		So			20	300		
173.6	Veins				SHTV	25	70		vein orientation in phyllite
175.24	Faults				Gouge	60			4cm gouge wedge along narrow phyllite bed in sandstone
176.2	Veins			fecb	FOL	60			So concordant fecb-qtz veinlets in phyllite

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-019 **Grant No.:** YC72728

Plunge: 75 **Azimuth:** 270 **EOH:** 333

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
176.2	Bedding		So			60			compositional bedding cleavage in phyllite
176.8	Contact				FOL	60			phyllite (above) - sandstone (below) contact concordant to So in phyllite
176.8	Veins			fecb		30			quartz vein in sandstone cut-off by phyllite contact
177.66	Bedding		So			65			in phyllite, cuts off vein in sandstone
177.66	Veins		V2	fecb		30			quartz vein in sandstone cut-off by phyllite contact
177.68	Veins		V1	fecb		70			vein seams cross-cut by V1
179.7	Axial Plane			py		45	280		isoclinally, tightly folded pyrite wedge
181.3	Veins			fecb	SHTV	40			repeated vein orientation in densely veined interval [see structure]
182.5	Veins			fecb	SHTV	88	270		repeated vein orientation in densely veined interval [see structure]
183.1	Veins			fecb	bx matrix	40	320		quartz and phyllite fragments as brecciated texture with foliation along upper contact with sandstone
183.1	Contact			fecb	FOL	40	320		quartz and phyllite fragments as brecciated texture with foliation along upper contact with sandstone
184.85	Veins			fecb	FOL	60			iron-carbonate seams in intensely veined sandstone concordant to phyllite gouge wedge contact below
185.05	Faults			py	Gouge	60			~6cm thick phyllite wedge in intensely veined sandstone with soft gouge texture and intense pyrite stringer mineralization subconcordant to contact
185.3	Contact					90			contact between extensive phyllite interbed (below) and cohesive high core angle brecciated (~20cm thick) quartz vein (above) Phyllite interbed with low core angle So from 185.3m-190.0m
186.3	Bedding		So			10			compositional bedding cleavage in phyllite
187	Bedding		So			20			compositional bedding cleavage in phyllite
189.1	Veins			fecb		40			quartz carbonate seams that crosscute So
190	Bedding		So			14			compositional bedding cleavage in phyllite
190	Contact				FOL	40			polished black contact between phyllite (above) and sandstone (below)
190.01	Veins			fecb	SHTV	65			iron-carbonate seams in sandstone
190.5	Veins					0			folded ~1cm thick, white quartz vein that undulate parallel to core axis in sandstone (closed folding with ~15cm wavelength and 1.5cm amplitude
192.23	Contact				FOL	23			sandstone (above) - phyllite (below) contact concordant to phyllite foliation
192.3	Veins			fecb	FOL	23			pyrite mineralized qtz-fecb veinlets concordant to So in phyllite
193.8	Bedding		So			23			compositional bedding cleavage in phyllite
194.6	Axial Plane					20			closed cink fold in phyllite
194.7	Bedding		So			85			compositional bedding cleavage in phyllite adjacent to cink fold
196	Veins		V2			5			repeated vein orientation in sandstone
196	Veins		V1		SHTV	60			repeated vein orientation in sandstone
196.2	Contact					65			sharp contact between sandstone (above) and ~20cm partially gouged phyllite wedge (below) that runs concordant to veining in sandstone
197.7	Veins				SHTV	25			densely spaced, parallel quartz veinin in sandstone sequence
198.7	Veins					80			~30cme thick, vuggy, pyrite mineralized quartz vein
198.9	Faults					85			~50cm gouge fault structure [with about ~25% recovery - surrounded by competent core]
199.42	Bedding		So			65			compositional bedding cleavage in phyllite
199.42	Veins			fecb	Veinlets	40			pyrite mineralize, fecb-qtz veinlet discordant to foliation; intersects So at an acute angle of 75 degrees
200	Bedding		So			55	265		compositional bedding cleavage in phyllite

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-019 **Grant No.:** YC72728

Plunge: 75 **Azimuth:** 270 **EOH:** 333

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
200.5	Veins			fecb	Veinlets	35	65		euhedral pyrite in thin pararallel veinlets in sandsteone
204	Veins			fecb	Veinlets	30	325		multiple, pyrite mineralized (euhedral) qtz-fecb veinlets/seams
204.57	Bedding		So		FOL	50	90		sandstone (above) - phyllite (below) - contact concordant to phyllite foliation
204.6	Bedding		So			50	90		compositional bedding cleavage in phyllite
205.5	Bedding		So			55	65		compositional bedding cleavage in phyllite
206.6	Veins			fecb	AXP	78	325		veinlets parallel to multiple small scale, closed fold profiles
206.72	Axial Plane					73	325		in phyllite
207	Bedding		So			15	80		compositional bedding cleavage
207	Cleavage		S1			90			S1 fabric
207.4	Veins			fecb	AXP	30	290		multiple parallel, densely spaced, partially penetrative iron-carbonate seams that run axial planar parallel to closed parasitic microfold profiles
207.8	Veins			fecb	AXP	40	300		axial planar parallel to closed, parasitic fold profiles
207.95	Bedding		So			75	5		compostional bedding cleavage
207.95	Cleavage		S1			15	0		parasitic folds in So
208.3	Faults				Gouge				poorly recovered friable section [possible fault]
209	Bedding		So			55			compositional bedding cleavage in phyllite
211	Veins			fecb	SHTV	30	20		repeated parallel iron-carbonate seams
211	Bedding		So			85	330		compositional bedding cleavage in phyllite
212.8	Contact				FOL	55	320		phyllite-silt (above) - sandstone-silt below contact concordant to phyllite-silt So foliation
213.3	Contact					30	190		sandstone-silt (above) - graphitic silt below
213.5	Veins			fecb	bx matrix	40	90		pyrite mineralized, vuggy ~25cm thick quartz vein with angular phyllite clast inclusions
215.8	Axial Plane				Veinlets	55	70		axial plane of So parallel, folded veinlets
216.6	Veins				Gouge	38	325		graphite gouge seams along fecb-qtz-py veinlet
217.5	Bedding		So			40			compositional bedding cleavage in graphitic phyllite
218.3	Veins			py	Veinlets	15			multiple pyrite mineralized quartz seams
219.1	Contact					65			upper contact of black, fine-grained sandstone bed
224.7	Bedding		So			65			compositional bedding cleavage in phyllite
237.1	Bedding		So			36			compositional bedding cleavage in phyllite gouge
239.72	Contact					38			contact between gouged phyllite (above) and quartz vein breccia (below)
240.2	Veins				bx matrix	30			vein orientation in quartz vein breccia
242	Cleavage		Sx		bx matrix	55			repeated orientation of dark grey chlorite seams in Quartz Vein Breccia
243.1	Cleavage		Sx		bx matrix	55			repeated orientation of dark grey chlorite seams in Quartz Vein Breccia
246.8	Faults				Gouge	15			poory recovered dark grey fault gouge along low core angle plane in Quartz Vein Breccia
248.3	Contact				Gouge	70			lower contact of Quartz Vein Breccia with Phylite gouge
273	Veins				SHTV	18	30		2cm thick qrtz vein following fol
273.18	Veins				SHTV	20			repeated vein orientation in fault zone
278.2	Bedding		So	wcl		70	224		
278.7	Cleavage		Sx		FOL	67	270		
291	Veins				SHTV	45	188		
293.1	Veins				SHTV	45	168		

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Status: Completed
Contractor: Driftwood

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality
12	60.2	189.84	5859	Reflex	1
63	61.2	187.54	5815	Reflex	1
108	61	186.84	5850	Reflex	1
153	60.7	188.64	5812	Reflex	1

Objective:

This hole is designed to test for the presence of 080 trending cross faults at the Main Zone, It should also provide a better picture of stratigraphy.

Lithology

Diamond Drill Log and Sample Summary

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-024A **Grant No.:** YD07124

Location

Easting:	Northing:	Latitude:	Longitude:
533704.7	6843763.5		

Elevation: 1535 m **Grid Name:** NA

Datum:	UTM Zone:	Grid N:	Grid E:
NAD83	9		

Orientation

Plunge: 65
Azimuth: 270
EOH: 205.0 m
Core Size: HQ

Start Date: 06/09/2011
Finish Date: 12/09/2011
Status: Completed
Contractor: Driftwood

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality
51	67.2	269.04	5840	Reflex	1
111	68.5	268.34	5837	Reflex	1
153	69.4	268.04	5835	Reflex	1
201	69.8	267.44	5832	Reflex	1

Objective:
To test the 3Ace fault along strike to the south of the Discovery vein and 3A-10-02 and -03

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	10.5		CASING		100.0%				co	1
10.5	22	Broken/Blocky phyllite. Zones that are highly fragmented <5cm. Lim+rust altn along fractures and phyllite bedding. High core loss	MT-Phy	n	100.0%	n			lc	3
22	26.8	Highly Fragmented <5cm Qtz Bx zone. Clast supported angular qtz clasts 0.5-1cm diameter. Intense lim+rust alteration in fractures.	QZVN		100.0%	w			lc	3
26.8	35.33	Broken-fragmented Blk phyllite with high core loss. Gouge zone at 27m	MT-Phy	n	100.0%	n			lc	3
35.33	58.15	Highly deformed pbl QPC. Pervasive lim+rust altn in fspar smgr and fractures. Fault zones are intensely fragmented. Clasts: 90% qtz, 10% fspar	MT-CO	pbl	100.0%	bf-b	qtz	90	br	3
58.15	87.4	Broken Blk phyllite with gouge zones at 60m and 63m. Py min along thin qzvns and filled fracs	MT-Phy		100.0%	n			co	3
87.4	107.2	Broken/Fragmented wcy+lim/rust altered pbl QPC. Strong fault zone throughout entire unit. Entire unit has been mod silicified causing blurred QPC grain boundaries. Clasts: subrounded, 95% qtz, 5% fspar	MT-CO	pbl	20.0%	bf	qtz	95	br	2
87.4	107.2	Broken/Fragmented wcy+lim/rust altered granule QPC. Strong fault zone throughout entire unit. Entire unit has been mod silicified causing blurred QPC grain boundaries. Clasts: subrounded, 95% qtz, 5% fspar	MT-CO	grn	80.0%	bf	qtz	95	br	2
107.2	114.6	Beginning of unit has abundant gy-bf fecb altered SLT lamella throughout. At 112.40-112.90m is a large SLT bed.	MT-SLT		20.0%	gy			co	2
107.2	114.6	Black phyllite with interbedded SLT	MT-Phy		80.0%	n			co	2
114.6	129.49	Grey pbl QPC with silicified matrix blurring grain boundaries Clasts: subrounded, 95% 4%fspar, 1% lithics	MT-CO	grn	20.0%	gy			co	2
114.6	129.49	Grey cgr SS with silicified matrix blurring grain boundaries Clasts: subrounded, 95% 4%fspar, 1% lithics	MT-SS	cgr	80.0%	gy			co	2

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Objective:
follow up of mineralized intersections observed in 3A-11-011

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	4.5	4.50 meters of casing --- no core recovered	CASING		100.0%				co	1
4.5	70.6	Only very minor thin, foliation concordant quartz seams throughout entire phyllite unit. Singular occurrences of broader up to 10cm thick quartz-chlorite veining @10.60m & 29.50m.	QZVN		1.0%				br	1
4.5	70.6	Black foliated (and folded) phyllite with lamellar, grey silt interbedding. Texture of phyllite too fine-grained to determine exact composition. 4.50-~16.00m: Unit is blocky, partially friable and fragmented. Either structural deformation of meteoric weathering. Also relatively blocky and fragmented in remainder of unit, but reasonably competent. Unit contains several narrow (<0.5m wide) zones of brittle deformation. 48.40-53.10m: Broad zone of brittle deformation with intense rust staining along low core angle fractures. Silt portion in unit changes from thin lamellar to up to 15cm thick, grey interbeds following this fault zone. 61.60-62.00m: poorly recoverd gouge fault silt portion reduced following this fault Only very minor thin, foliation concordant quartz seams throughout entire unit. Singular occurrences of broader up to 10cm thick quartz-chlorite veining @10.60m & 29.50m.	MT-Phy		99.0%				br	1
70.6	80.4	quartz veining in chloritized, rust stained sandstone unit is predominantly high core angle @ ~65TCA and generally 0.5-3cm thick. Occassionally, vuggy, undulated and low core angle.	QZVN		1.0%	w			co	1
70.6	80.4	Fault emplaced phyllite bed from 77.43m-78.50m in rust-stained sandstone unit. Texture of phyllite too fine grained to determine exact composition.	MT-Phy		1.0%	n			co	1

Project:	NTR3A	Prospect:	Main Zone	Hole ID:	3A-11-028	Grant No.:	YD07124
Plunge:	Azimuth:	EOH:					
60	270	286					

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
70.6	80.4	Medium grained, rust-stained sandstone that grades into coarse grained sandstone towards lower contact of interval. Orange-brown rust staining throughout sandstone unit along open and healed fractures, within quartz veining. Rust stain overprint on (clay?) alteration of feldspars. Where rust-staining is less intense - sandstone has greenish hue. Unit contains a fault emplaced phyllite bed from 77.43m-78.50m. Sandstone --- Composition:~80% grey, diffuse quartz; ~20% altered feldspar Sandstone --- Matrix: <1% matrix [chloritic] Sandstone --- Grainsize: 0.5-1mm Sandstone --- Grainshape: subangular to subrounded	MT-SS	mgr	98.0%	gy	qtz	80	co	1
80.4	92.3	Several interbedded, <50cm wide, intensely fragmented phyllite wedges. Blocky, fragmented and rust-stained throughout with frequent gritty, sandy clay coating along variable core angle fractures. Texture of phyllite is too fine-grained to determine exact composition.	MT-Phy		1.0%	n			co	2
80.4	92.3	Intensely fragmented unit with variable core angle quartz veining and intense rust-staining throughout. High density of broad, massive, 10-30cm thick quartz veining at lithological contact. Quartz veining marks the top of a highly fragmented and partially friable interval from 81.10m-92.30m.	QZVN		5.0%	w			co	2
80.4	92.3	Grey granule size Quartz Conglomerate that locally grades into coarse grained sandstone. Composition: 85% grey diffuse quartz; 15% altered feldspar Matrix: <1% matrix Grainsize: 2-4mm Grainshape: subangular Lower contact of unit is marked by interval of rust-stained crush-gouge.	MT-CO	grn	94.0%	gy	qtz	85	co	2
92.3	107.44	Densely spaced quartz veining of variable width and orienation. Sulfide mineralized throughout - as blebs in veining and fine-grained disseminated as wallrock mineralization.	QZVN		15.0%	w			co	1
92.3	107.44	Unit interchanges between sand and granule size and is rust-stained throughout. Densely spaced quartz veining of variable width and orienation. Sulfide mineralized throughout - as blebs in veining and fine-grained disseminated as wallrock mineralization. Composition of Sandstone (0.5-2mm) and granule size Conglomerate (3-4mm) matches and contacts are gradational. Sandstone is poorly sorted. Composition: 85% grey quartz; 15% altered feldspar Matrix: <1% Grainshape: subrounded	MT-CO	grn	20.0%	gy	qtz	85	co	1

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-028 **Grant No.:** YD07124

Plunge: 60 **Azimuth:** 270 **EOH:** 286

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
92.3	107.44	Unit interchanges between sand and granule size and is rust-stained throughout. Densely spaced quartz veining of variable width and orienation. Sulfide mineralized throughout - as blebs in veining and fine-grained disseminated as wallrock mineralization. Composition of Sandstone (0.5-2mm) and granule size Conglomerate (3-4mm) matches and contacts are gradational. Sandstone is poorly sorted. Composition: 85% grey quartz; 15% altered feldspar Matrix: <1% Grainshape: subrounded	MT-SS	cgr	65.0%	gy	qtz	85	co	1
107.44	134.4	Intensity of veinin is high in zone of brittle deformation from 107.44-117.80m and predominantly in form of quartz vein breccias with phyllite-clay-pyrite-arsenopyrite matrices. [[see structure & mineralization] Quartz veining occurs generally as <5mm thick, foliation discordant veinlets from 117.80-134.40m.	QZVN		5.0%	w			co	1
107.44	134.4	Black foliated (and folded) Phyllite unit that contains an interval of intense brittle deformation from 107.44 meters (upper contact) to 117.80 meters with a high degree of sulfide mineralization. [see structure table] Grey, lamellar silt interbedding becomes prominent from about 123 meters downwards. Fault zone also contains intervals of brecciated quartz veining with phyllite clay - pyrite - arsenopyrite matrix. Unit is competent and generall uniform in appearance from 117.80-134.40m (lower contact). Texture of phyllite too fine-grained to determine exact composition.	MT-Phy		95.0%	n			co	1
134.4	142.1	Quartz veining is predominantly ~1cm thick and occurs as sheeted 0-20TCA veins and occassional tension vein arrays at the same orientation. Veining is mineralized and mineralization predominantly occurs along vein boundaries. [see point measurements]	QZVN		5.0%	w			co	1
134.4	142.1	Medium to coarse grained, grey sandstone with white clay alteration on feldspar clasts. Composition: 85% grey, diffuse quartz; 15% altered feldspar Matrix: <1% Grainshape: subangular Grainsize: 1-2.5mm intensely sulfide mineralized by 0-20TCA sheeted quartz veining	MT-SS	cgr	95.0%	gy	qtz	85	co	1
142.1	143.7	Massive, white quartz vein with small (1mm diameter) sulfide grains within vein and sulfide clusters along 40TCA vein boundaries. [both pyrite and arsenopyrite mineralized]	QZVN		100.0%	w			co	1
143.7	157.5	Localized occurrences of phyllite interbedding within conglomerate-sandstone unit from 155.10m-155.50m & 147.30m-147.60m with upper and lower contact concordant to phyllite compositional bedding cleavage. Phyllite interbeds are rust-stained and partially gouged. Also occasional, <4cm thick, frequently only partially penetrative phyllite wedges. Texture of phyllite is to fine-grained to determine exact composition.	MT-Phy		1.0%	n			co	1

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
13	14.2	FZ	200.0%	BFZ	poorly recovered interval with intensely friable, crushed phyllite and quartz vein fragments
48.4	53.1	FZ	200.0%	BFZ	gouged and fragmented zone with orange-brown rust coating and staining; 20-35TCA open and healed fractures predominate [fractures are foliation discordant]
61.6	62	FZ	300.0%	BFZ	poorly recovered gouge fault + friable, crushed fragment; upper fault contact 65TCA; lower fault contact 25TCA
64.07	65	FZ	300.0%	BFZ	poorly recovered gouge fault; lower contact is fragmented; upper contact in form of poorly bound angular fragments within clay matrix emplaced in phyllite along 15TCA [cataclasite]
81.1	82.8	QZVN	200.0%	BFZ	high density of broad, massive, 10-30cm thick quartz veining at lithological contact. Quartz veining marks the top of a highly fragmented and partially friable interval from 81.10m-92.30m.
90.2	91.8	FZ	300.0%	BFZ	intensely rust-stained, fragmented and poorly recovered interval: ~50% crushed, gritty, sandy clay covered fragments
94.2	94.6	FZ	400.0%	BFZ	MINERALIZING FAULT: Intensely gouged and chloritized, partially recovered phyllite interbed wedge inserted concordant to phyllite compositional bedding cleavage. Influx of pyrite and arsenopyrite (and occasssionally galena) begins below this fault.
107.44	116.5	FZ	400.0%	BFZ	Fault Zone that marks lithological contact between sandstone-conglomerate sequence (above) and phyllite unit below. Zone is intensely mineralized and contains a subinterval of quartz vein breccia with phyllite clay - pyrite - arsenopyrite matrix. Crushed and gouged throughout with occassionally competent sequences in phyllite.
108.5	110.85	QZVN	400.0%	bx	brecciated quartz veining with phyllite clay-pyrite-arsenopyrite matrix; sulfied grainsize ~0.5mm; partially crushed
116.5	117.8	QZVN	400.0%	bx	brecciated quartz veining with phyllite clay-pyrite-arsenopyrite matrix; sulfide grainsize ~0.5mm; partially fragmented
134.4	157.5	QZVN	300.0%	SHTV	generally <2cm thick, densely spaced, 0-20TCA, parallel quartz veins with sulfide mineralization withing veining and as veinboundary/wallrock mineralization
137.4	138	FZ	100.0%	BFZ	orange-brown rust-coating along gritty sandy clay coated, rough, undulated low core angle fractures with partially softened, crushed fragments
142.1	143.7	QZVN	400.0%	MASS	Massive, white quartz vein with small (1mm diameter) sulfide grains within vein and sulfide clusters along 40TCA vein boundaries. [both pyrite and arsenopyrite mineralized]
168.54	170.1	FZ	300.0%	BFZ	multiple foliation concordant gouge wedges in phyllite unit
172.1	178.5	FZ	300.0%	BFZ	intensely rust-stained interval dominated by rough, sandy clay coated fractures and ~70% intensely crushed, sandy clay coated fragments in sandstone unit
196.9	198	QZVN	200.0%	SHTV	Multiple, densely spaced, 50TCA quartz veins in fragmented interval with white clay (?) coating on fragments and buff iron-carbonate patches in veining. Interval marks lithological contact into graphitic phyllite unit below.
226	231.25	FZ	300.0%	BFZ	Brittle fault across lithological boundary bewteen phyllite (above) and weakly silicified sandstone (below): phyllite clay gouge and softened, crushed, gritty sandstone fragments
226.5	226.9	QZVN	400.0%	BFZ	Fragmented quartz vein within fault zone that crosses lithological contact: contains both pyrite and arsenopyrite -- sometimes as small intergrowth clusters Veining also contains thin, wispy phyllite inclusions.
234.77	237	FZ	200.0%	BFZ	Brittle fault in weakly silicified sandstone: intensely fractured interval with ~40% gritty sand coated crush fragments
260.35	260.4	FZ	300.0%	BFZ	locally gouged core
264.3	264.3	FZ	300.0%	BFZ	phyllite-chlorite gouge wedge emplaced at 50TCA
276.6	286	FZ	200.0%	BFZ	blocky, intensely fragmented, partially friable and with sandy clay coating on fragments

163.6	Contact					60			graphite coated phyllite seam in sandstone

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-028 **Grant No.:** YD07124

Plunge: 60 **Azimuth:** 270 **EOH:** 286

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
165.4	Bedding		So			50			compositional bedding cleavage in phyllite-silt sequence
165.5	Cleavage		Sx			15			wispy grey-green, partially penetrative, 2cm wide spaced aligned seams in sandstone
167	Veins		V1	py	SHTV	30			pyrite cluster mineralization along vein boundaries & withing veining with clear cross-cutting relationship
167	Veins		V2	py	SHTV	5			pyrite cluster mineralization along vein boundaries & within veining with clear cross-cutting relationship
168	Veins				SHTV	40			densely spaced parallel veinlets
168.54	Contact				Gouge	50			phyllite gouge at lithological contact [sandstone above; phyllite below]
168.54	Faults				Gouge	50			phyllite gouge at lithological contact [sandstone above; phyllite below]
168.7	Veins			py	SHTV	25			multiple pyrite mineralized veinlets that intersect phyllite compositional bedding cleavage at an acute angle of ~20 degrees
168.7	Bedding		So			80			compositional bedding cleavage in phyllite-silt sequence
168.9	Faults			LIM	Gouge	90			foliation concordant, rust-stained and pyrite mineralized gouge in phyllite-silt sequence
168.9	Faults			LIM	FOL	90			foliation concordant, rust-stained and pyrite mineralized gouge in phyllite-silt sequence
170.3	Bedding		So			70			compositional bedding cleavage in phyllite-silt sequence
171.9	Veins			py	SHTV	20			multiple, densely spaced, pyrite mineralized veinlets that intersect Phyllite So at an acute angle of ~70degrees
171.9	Bedding		So			70			compositional bedding cleavage in phyllite-silt sequence
172.1	Contact				FOL	70			lithological contact with sandstone above and phyllite below concordant to phyllite compositional bedding cleavage [hard & competent]
174	Joints			LIM	Gouge	30			sandy clay and rust-staineing laong densely spaced fractures; high degree of fragmentation
177.5	Veins			chl	Gouge				~50cm of partially recoverd crushed, fragmented quart veining with grey chloritic coating along fragments and some fragments with possible chalcocite and/or molybdenite coating
178.8	Veins			gn	Veinlets	30			rust-rimmed vein orienation with small galena bleb
179.6	Veins			py	SHTV	50			repeated vuggy, pyrite mineralized vein orienation
180.2	Veins		V2	py	SHTV	30			repeated vuggy, pyrite mineralized vein orienation
180.2	Veins		V1	py	Veinlets	10			not mineralized and cross-cut by V2
181.8	Veins			py	SHTV	30			repeated, pyrite mineralized, vuggy vein orienation
182.6	Joints			hem	Clay	40			multiple, hematite-clay coated healed fractures near lithological contact
183.53	Contact				FOL	60			contact between coarse-grained sandstone (above) and phyllite (below) concordant to phyllite compositional bedding cleavage
183.6	Bedding		So	LIM		60			compositional bedding cleavage in phyllite
185.8	Bedding		So			60			compositional bedding cleavage in phyllite
187.6	Contact				Gouge	60			multiple thin clay gouge seams along phyllite compositional bedding cleavage
187.7	Veins			chl	FOL	60			chloritic, foliation concordant seams/veinlets
188.13	Cleavage				Gouge	60			friable fragments along phyllite compositional bedding cleavage
188.7	Cleavage		S1			50			S1 & So intersect at an acute angle of ~40degrees
188.7	Bedding		So			70			S1 & So intersect at an acute angle of ~40degrees
189.3	Bedding		So			80			compositional bedding cleavage in phyllite
189.4	Veins			py	AXP	70			multiple, quartz-iron-carbonate-chlorite veinlets that are axial planar parallel to small, tightly folded cink fold profile

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-028 **Grant No.:** YD07124

Plunge: 60 **Azimuth:** 270 **EOH:** 286

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
189.46	Axial Plane		Fx			70			tightly folded, ~5cm amplitude profile in phyllite; interlimb angle ~50 degrees
189.7	Veins			py	SHTV	30			pyrite mineralized, repeated vein orienation
190.2	Bedding		So			50			compositional bedding cleavage in phyllite interbed
192.8	Veins			chl	Veinlets	50			densely spaced, thin, quartz-chlorite-pyrite seams
192.84	Veins			chl	Clay	40			clay coated, ~2m thick quartz-chlorite veinlet
193	Bedding		So			60			compositional bedding cleavage in phyllite interbed
193.4	Bedding		So			55			compositional bedding cleavage in phyllite interbed
195	Veins			chl		25			pyrite, mineralized, ~2cm thick, quartz chlorite veinlet
196.1	Veins			fecb	Veinlets	40			repeated, buff-crème, parallel vein seams in sandstone sequence [seams are not always fully penetrative]
196.9	Veins			fecb	SHTV	50			partially fragmented, pyrite mineralized, parallel 50TCA quartz veins in zone that marks transition into graphitic phyllite unit below
198.9	Bedding		So			58			compositional bedding cleavage in phyllite interbed
200.5	Bedding		So			60			phyllite compositional bedding cleavage
202	Bedding		So			60			phyllite compositional bedding cleavage
204.3	Bedding		So			80			phyllite compositional bedding cleavage
204.4	Veins			py	bx matrix	20			angular phyllite clast within ~3cm thick, pyrite mineralized veins that intersects So at an acute angle of ~20 degrees
204.45	Bedding		So			90			phyllite compositional bedding cleavage
204.7	Bedding		So			60			phyllite compositional bedding cleavage
204.9	Veins			py	FOL	60			multiple deformed, pyrite mineralized veins that trend foliation concordant and contain angular phyllite clasts
207	Bedding		So			70			phyllite compositional bedding cleavage
207.4	Veins				SHTV	40			densely spaced, parallel quartz veinlets in partially gouged zone in graphitic phyllite
208.1	Veins		V1	fecb		45			
208.1	Veins		V2	fecb		20			
210	Bedding		So			50			phyllite compositional bedding cleavage
210.5	Bedding		So			55			phyllite compositional bedding cleavage
210.5	Veins			py	SHTV	70			multiple partially penetrative (boudinaged?) pyrite mineralized, parallel veinlets over ~0.5m interval that intersect So at an acute angle of ~70 degrees
213	Cleavage		So		Gouge	60			gouge seams along compositional bedding cleavage in graphitic phyllite
215	Bedding		So			50			phyllite compositional bedding cleavage
215.7	Bedding		So			35			phyllite compositional bedding cleavage
215.7	Veins			chl	Veinlets	90			partially penetrative, repeated, parallel chlorite seams
216	Axial Plane		Fx			60			~0.5cm amplitude, open cink fold profiles (parasitic)
216	Bedding		So			0			~0.5cm amplitude, open cink fold profiles (parasitic)
216.13	Axial Plane		Fx	py		60			tightly folded partially penetrative pyrite cluster [AXP of pyrite is parallel to AXP at 216m]
216.5	Bedding		So			70			phyllite compositional bedding cleavage
216.5	Veins			fecb	Veinlets	60			intersect So at an acute angle of ~50 degrees
216.7	Veins			py	SHTV	60			densely spaced veinlets that intersect at So at 90 degrees

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-028 **Grant No.:** YD07124

Plunge: 60 **Azimuth:** 270 **EOH:** 286

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
216.7	Bedding		So			60			phyllite compositional bedding cleavage
216.8	Faults				Gouge	55			graphitic gouge along 55TCA (~3cm thick)
217.3	Bedding		So			45			phyllite compositional bedding cleavage
218.5	Bedding		So			55			phyllite compositional bedding cleavage
218.6	Veins		V1	py	SHTV	15			V1 intersects So at an acute angle of 60 degree
218.6	Veins		V2			55			V1 intersect V2 at an acute angle of 40 degrees
221.5	Veins			py	SHTV	20			intersect So at an acute angle of 60 degrees
221.5	Bedding		So			43			phyllite compositional bedding cleavage
223.2	Veins			fecb	FOL	35			foliation concordant, pyrite mineralized quartz iron-carbonate veins
223.3	Axial Plane		Fx			40			multiple. <1cm amplitude, open cink profiles along foliation [AXP intersects So at an acute angle of ~60 degrees]
223.3	Bedding		So			35			phyllite compositional bedding cleavage
224.3	Axial Plane		Fx			38			multiple. <1cm amplitude, open cink profiles along foliation [AXP intersects So at an acute angle of ~60 degrees]
224.3	Bedding		So			25			multiple. <1cm amplitude, open cink profiles along foliation [AXP intersects So at an acute angle of ~60 degrees]
224.6	Bedding		So			35			phyllite compositional bedding cleavage
225.4	Bedding		So			90			phyllite compositional bedding cleavage
225.5	Axial Plane		Fx			90			tightly folded, cink fole with ~4cm amplitude
226	Faults			py	Gouge				disseminated pyrite in ~50cm phyllite gouge wedge with quartz vein fragments
226.6	Cleavage		Sx	asp	QBX	55			aligned dark wispy, sulfided mineralized seams in fragmented massive quartz vein
228.3	Veins			asp		25			arsenopyrite mineralized vein orientation -- measurement taken from fragment
229.1	Veins			asp		55			aresenopyrite mineralized veinlet orientation
230	Veins			py	Veinlets	30			pyrite mineralized vein orientation in weakly silicified sandstone
231.25	Veins			py	Veinlets	35			pyrite mineralized vein orientation in weakly silicified sandstone
231.7	Veins				Veinlets	50			repeatd veinlet orienatnation in silicified sandstone
233	Cleavage		Sx			60			dark diffuse, aligned semas at 1-3cm spacing in silicified sandstone matrix
233.8	Veins			fecb	Veinlets	30			repeatd buff-crème iron-carbonate seams
237.6	Veins				Veinlets	50			repeated veinlet orientation in weakly silicified sandstone
239.9	Veins			py	SHTV	50			repeated, pyrite mineralized vein orienation
240.8	Faults				FOL	80			contact between silicified sandstone (above) and phyllite (below) concordant to phyllite compositional bedding cleavage; contacts cuts off veining in sandstone
240.8	Contact				FOL	80			contact between silicified sandstone (above) and phyllite (below) concordant to phyllite compositional bedding cleavage; contacts cuts off veining in sandstone
240.9	Bedding		So			80			phyllite compositional bedding cleavage
241.95	Faults				Gouge	65			gouge seam concordant to phyllite compositional bedding cleavage at sandstone-phyllite interbed contact [veining in sanstone cut-off by fault]
241.95	Contact				FOL	65			gouge seam concordant to phyllite compositional bedding cleavage at sandstone-phyllite interbed contact [veining in sanstone cut-off by fault]
242.1	Veins			fecb	AXP	25			axial planar, sulfide mineralized veinlet (cink folding)

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-028 **Grant No.:** YD07124

Plunge: 60 **Azimuth:** 270 **EOH:** 286

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
243.5	Veins			py	FOL	50			vuggy, pyrite mineralzed veinlets concordant to compositional bedding cleavage in So; grey chlorite infilling in vugs
243.5	Bedding		So			50			phyllite compositional bedding cleavage
244.5	Bedding		So			60			phyllite compositional bedding cleavage
244.6	Axial Plane		Fx		FOL	60			tightly folded cink fold with axial plane concordant to So on either fold limbf
244.7	Bedding		So			60			phyllite compositional bedding cleavage
247	Bedding		So			80			phyllite compositional bedding cleavage
247.06	Axial Plane		Fx		FOL	80			tightly folded cink fold with ~4cm amplitude; axial plane concordant to So in above and below
247.15	Bedding		So			80			phyllite compositional bedding cleavage
247.63	Axial Plane		Fx			25			cink-folding in So; intersects So at an acute angle of ~70degrees
247.78	Veins			chl	AXP	30			axial palanar to cink folding in So; pyrite mineralized quartz-chlorite-iron-carbonate veining
248	Bedding		So			60			phyllite compositional bedding cleavage
248.1	Veins			chl		40			pyrite mineralized fecb-chl-quartz veining that intersects So at an acute angle of ~50 degrees
248.4	Bedding		So			60			phyllite compositional bedding cleavage
248.43	Axial Plane		Fx			60			closed cink profile with axial plane parallel to So
251	Cleavage		S1			60			in phyllite
251	Bedding		So			70			in phyllite
252.5	Cleavage		S1			70			in phyllite
252.5	Bedding		So			80			in phyllite
252.8	Axial Plane		Fx			80			~20cm wide open fold profile
252.9	Cleavage		S1			80			in phyllite
252.9	Bedding		So			40			phyllite compositional bedding cleavage
254	Cleavage		S1			70			in phyllite
254	Bedding		So			35			phyllite compositional bedding cleavage
255	Bedding		So			10			phyllite compositional bedding cleavage
255.05	Axial Plane		Fx			60			in phyllite
256	Bedding		So			40			phyllite compositional bedding cleavage
256.2	Bedding		So			30			phyllite compositional bedding cleavage
257	Axial Plane		Fx			50			multiple cink folds
257	Bedding		So			10			phyllite compositional bedding cleavage (cink-folded)
259	Veins			fecb		10			buff-crème vein seam that intersects So at an acute angle of ~40 degrees
259	Bedding		So			40			phyllite compositional bedding cleavage
259	Cleavage		S1			60			in phyllite
260.6	Bedding		So			10			phyllite compositional bedding cleavage
262	Bedding		So			60			phyllite compositional bedding cleavage
264	Bedding		So			45			phyllite compositional bedding cleavage
264.3	Faults			chl	Gouge	50		5	lower contact of gouge fault emplaced @ 50TCA with slickensiding on chloritized surface
264.3	Lineation			chl	Gouge	50			lower contact of gouge fault emplaced @ 50TCA with slickensiding on chloritized surface
265.6	Bedding		So			40			phyllite compositional bedding cleavage
265.6	Veins			fecb	SHTV	30			densely spaced, buff-crème, iron-carbonate seams with small vugs

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Interval Structure

From	To	Mineral	Intensity	Distribution	Comments
14.9	15.9	FZ	300.0%	BFZ	soft, plastic, brown, weakly oxidized phyllite gouge
20.9	21.5	FZ	200.0%	BFZ	partially gouged to complete gouged with brownish hue due to rust-staining [within phyllite unit]
46.4	49.6	FZ	100.0%	BFZ	partially blocky, broken and patially gouged; intense rust-staining
49.6	49.83	QZVN	300.0%	BFZ	massive quartz-chlorite vein at lower contact of gouge fragment zone; vein is concordant to phyllite compositional bedding cleavage @ 55TCA
61.2	61.6	FZ	300.0%	BFZ	intensely rust-stained zone with partial gouging and red-brown limonite stained, clay coated, partially softened fragments Brittle fault across lithological contact between phyllite (above) and sand conglomerate sequence below
61.6	63	QZVN	300.0%	BFZ	intensely red-orange-brown rust-stained fragmented zone with arsenopyrite mineralized, brecciated quartz veining
76.4	77.3	FZ	300.0%	BFZ	intensely rust-stained with clay-coated partially softened fragments with possible yellow-green scorodite coating
87.7	90.6	FZ	100.0%	BFZ	Low intensity brittle deformation in form of intermittent, narrow (10-20cm wide), discrete interval with finely crushed, rusty sandy clay coated fragments. Zone consists predominantly of competent core. ~25% crush
90.6	93.14	QZVN	300.0%	SHTV	repeated massive quartz veins (some with aligned, chloritic matrix inclusions) of 20-30cm thickness at lithological unit contact. Veins mark abrupt end of intensely limonite stained unit end. Vein contacts range from 55-70TCA . [puzziling shows that they are subparallel]
116	118.74	QZVN	200.0%	stwk	densely veined interval with variable vein orientations and abundant fine-grained disseminated arsenopyrite; grades into quartz vein breccia towars lower contact
118.74	121.5	QZVN	300.0%	bx	intensely pyrite mineralized quartz vein breccia with ~5% black phyllite clay matrix [overlies lithological contact with phyllite]
121.5	132.1	FZ	400.0%	BFZ	gouged and crushed phyllite with occassionally discernible quartz vein fragments
132.1	136.5	QZVN	200.0%	TVA	repeated, thin, (<0.5cm thick), diffuse tension vein arrays with fine-grained arsenopyrite-pyrite mineralization SZB: 20TCA TVA: 35TCA acute intersection angle of TVA with Sx: ~50 degree
148.2	150.43	FZ	200.0%	BFZ	Partially friable with crushed, gritty fragments. Faut disrupts texturally silicification observed previously above and feldspar clasts are clearly discernible in sandstone-conglomerate structure until a second structure re-introduces silicifcation at 154.30m.
154.3	157.8	FZ	200.0%	BFZ	Coarse grittly and partially gouge coated fragments as part of brittle structure that re-introduces intensely texturally destrucitve silicification (marked by near absence of feldspar clasts). High degree of pyrite-arsenopyrite mineralization following this interval.
178.45	180.26	QZVN	200.0%	stwk	dense network of lense-like chlorite wedges and iron-carbonate veining [30% veining]
187.2	187.9	QZVN	400.0%	BFZ	Densely spaced, multiply folded quartz-iron-carbonate veining concordant to gouged, bedded phyllite with fine-grained pyrite stringer mineralization. Contacts of interval are concordant to phyllite compositional bedding cleavage @50-55TCA. Bounded by competent rock above & below.
192.1	193.7	QZVN	100.0%	BFZ	Slightly friable intercept with occaccsional stretched, lenselike, ~0.5cm thick foliation concordant quartz ribbons and abundant remobilized graphite as polished coating along compositional bedding cleavages (So). Vein ribbons are pyrite mineralized.
197.44	199.6	FZ	300.0%	BFZ	Partially friable & gouged and intensely fragmented in remaining portions of interval. Two 10cm wide fold noses discernible in upper 3rd of interval. Densely quartz veined by foliation concordant and axial planar veining with prominent pyrite cluster and densely disseminated pyrite mineralisation. Gouging at pper contact is gradual. Gouging at lower contact withing more competent phyllite is along ~25TCA (where So is locally ~90degree and intersected at an acute angle of ~60 degrees).
202.3	202.75	FZ	300.0%	BFZ	Intensely black and graphitic, soft friable interval that retains foliation fabric and is emplaced concordant to phyllite compositional bedding cleavage So at both upper and lower contact. Bounded by competent rock above and below. Fine-grained disseminated pyrite in two ~15TCA quartz-iron-carbonate veinlets.

309.8	Axial Plane		Fx			75			small cink-folds
309.8	Bedding		So			5			peak-to-peak of small parasitic cink folds
310	Veins			chl	py	30			pyrite mineralized, quartz chlorite veins with angular phyllite clast inclusions
310.9	Bedding		So			30			compositional bedding cleavage in phyllite
311.35	Axial Plane		Fx			50			closed flex-fold profile
311.9	Bedding		So			70			compositional bedding cleavage in phyllite
311.97	Veins			chl		50			4cm thick quartz vein with green chlorite rim patches
312.05	Bedding		So			80			compositional bedding cleavage in phyllite
313	Bedding		So			50			compositional bedding cleavage in phyllite
313.5	Faults				Gouge	45			phyllite gouge wedge
313.6	Veins			chl	SHTV	55			pyrite mineralized, densely spaced quartz-chlorite veinlets along weakly flex-folded compositional bedding cleavage
314.4	Bedding		So			80			compositional bedding cleavage in phyllite
314.4	Cleavage		S1			45			S1 intersects So at an acute angle of 50 degrees
315.7	Veins				SHTV	40			densely spaced, parallel quartz veining with raterh diffuse boundaries in silicified sandstone
316.4	Veins		V1		Veinlets	15			multiple, densely packed, subparallel quartz seams

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-031 **Grant No.:** YD07124

Plunge: 75 **Azimuth:** 270 **EOH:** 420

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
316.5	Veins		V2			30			V2 cross-cuts V1
316.85	Veins			py		30			partially penetrateive pyrite stringer veinlets that intersect Phyllite So at 70 degrees
316.85	Bedding		So			60			compositional bedding cleavage in phyllite
317.2	Veins				STWK	70			same generation, densely packed multiple intersecting veinlets in silicified sandstone
317.2	Veins				STWK	30			same generation, densely packed multiple intersecting veinlets in silicified sandstone
317.2	Veins				STWK	40			same generation, densely packed multiple intersecting veinlets in silicified sandstone
317.5	Bedding		So			55			compositional bedding cleavage in phyllite
319.2	Bedding		So			55			compositional bedding cleavage in phyllite
319.2	Veins			py		30			pyrite cluster mineralized vein orientation that intersects So at an acute anlge of 80 degrees
319.55	Axial Plane		Fx	py	bx matrix	50			axial plane of isoclinally folded vein; contains angular phyllite clasts
319.55	Veins			py	bx matrix	50			peak to peak of isoclinally folded vein; contains angular phyllite clasts
320.25	Faults				Gouge	90			thin gouge seam and partially friable core
320.5	Bedding		So			70			compositional bedding cleavage in phyllite
320.55	Veins				FOL	70			foliation concordant quartz veinlets
320.75	Veins				Gouge	30			Thin clay gouge seam along parallel veinlets that in intersect Phyllite So at 40 degrees.
320.77	Contact				FOL	80			phyllite above and silicified sandstone below; phyllite So locally steepened
321.6	Veins			asp		5			diffuse veinlets with occassional arsenopyrite grains
321.7	Veins			fecb	Veinlets	4			mulitple, subparallel, buff-crème iron-carbonate seams in intensely silicified sandstone
322.8	Veins				Veinlets	60			repeated vein orientation in silicified sandstone
323.7	Contact				FOL	25			phyllite-silt interbed (upper) contact -- concordant to So
323.8	Bedding		So			25			phyllite interbed compositional bedding cleavage
324.6	Veins			asp		10			sulfide mineralized vein orientation
324.6	Veins			asp		50			pyrite-arsenopyrite stringer veinlets
325.5	Veins			py		55			sulfide mienralized vein orienation
326.5	Veins					40			vein orienation in silicified sandstone
326.7	Veins			py	SHTV	55			densely spaced, parallel, pyrite mineralized quartz veining
327	Veins			asp		10			vuggy, sulfide mineralized vein orienation
327	Veins			fecb	Veinlets	20			densely spaced seams
327.7	Veins					30			vein orienation in silicified sandstone
328.3	Veins			asp		40			sulfide mineratlized vein orientation
328.5	Veins		V2	fecb	SHTV	60			repeated vein orientation in silicified sandstone
328.5	Veins		V1	py	SHTV	30			vuggy pyrite mineralized vein orientation
329.5	Veins				SHTV	50			repeated, thin, parallel quartz veinlets
329.5	Veins			fecb	SHTV	30			densely spaced, parallel, buff-crème iron-carbonate seams
330	Veins			asp		40			pyrite and arsenpyrite mineralized quartz veinlet
331.6	Veins				Veinlets	75			repeated, thin diffuse vein seams
332.1	Veins			fecb	Veinlets	20			vuggy qtz-fecb veinlets in phyllite interbed wedge
333.7	Bedding		So			40			phyllite interbed wedge [possilbe on lower side of fold limb]
333.9	Veins				SHTV	30			repeated vein orienation in silicified sandstone

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-031 **Grant No.:** YD07124

Orientation

Plunge: 60
Azimuth: 270
EOH: 285.0 m
Core Size: HQ

Start Date: 24/09/2011
Finish Date: 28/09/2011
Status: Completed
Contractor: Driftwood

Objective:

25m step-out east of drill fence 3A-11-012/015/015A/016. The intent is to track the down dip extent of mineralisation in 3A-11-015A.

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	6		CASING						co	1
6	11	Top of hole. Extremely weathered and faulted with ferquent intervas of gouge and of intense clay and limonite. Minor brecciated fragments. Gre to orangeish colouration.. Otherwise non-descript.	MT-Phy		100.0%	n			co	3
11	11.8	Vuggy white to patchy orangey o greenish quartz-carbonate fault-fill vein with minor feo and chlorite.	QZVN		40.0%	w			co	3
11	11.8	Extremely faulted clay gouged and altered grey to greenish phyllite. In fault zone.	MT-Phy		60.0%	n			co	3
11.8	20.65	white to buff to green (from minor chlorite content) qtz-carbonate, qtz and crb veining. Many veins are very vuggy and contain minor chlorite and feo.	QZVN		10.0%	w			co	2
11.8	20.65	Frequently faulted and variably veined (dominantly qtz-carbonate vbeins with lesser qtz and crb exclusive veining). Rock ranges from pale grey to a dark grey that is almost black… colouration seems to correlate with grain-size (coarser-grained paler, finer-grained is darker). Very, very minor fg siltstone to vfg sandstone.	MT-SLT		20.0%	gy			co	3
11.8	20.65	Frequently faulted and variably veined (dominantly qtz-carbonate vbeins with lesser qtz and crb exclusive veining). Rock ranges from pale grey to a dark grey that is almost black… colouration seems to correlate with grain-size (coarser-grained paler, finer-grained is darker). Very, very minor fg siltstone to vfg sandstone.	MT-Phy		70.0%	n			co	3
20.65	24	lead-grey to black graphitic phyllite with very abundant quartz-carbonate veining, abundant feo and some lesser realgar and orpiment.	QZVN		35.0%	w			co	2
20.65	24	lead-grey to black graphitic phyllite with very abundant quartz-carbonate veining, abundant feo and some lesser realgar and orpiment.	MT-Phy		65.0%	n			co	3
24	64.3	grey to black phyllite and lesser siltstone (tends to be lighter in color than the finer-grained phyllite) finely laminated/interbedded on the scale of mm to cm and showing folding around foliation and variably aundant axial planar quartz-carbonate veining and some pale green sericite-chlorite-rich veinlets, which, in turn, show signs of having been folded.	QZVN		5.0%	w			co	1
24	64.3	grey to black phyllite and lesser siltstone (tends to be lighter in color than the finer-grained phyllite) finely laminated/interbedded on the scale of mm to cm and showing folding around foliation and variably aundant axial planar quartz-carbonate veining and some pale green sericite-chlorite-rich veinlets, which, in turn, show signs of having been folded.	MT-SLT		25.0%	gy			co	3

63.4	Veins	38		cbt		30			white qtz-carbonate veinet

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-032 **Grant No.:** YD07124

Plunge: 60 **Azimuth:** 270 **EOH:** 285

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
63.45	Bedding	46	So			30			Finely interbedded phyllite and lesser siltstone
63.5	Veins	38		cbt		70			white qtz-carbonate veinet
68.6	Bedding	46	So			40			interbedded phyllite, siltstone, and sandstone.
68.7	Veins	38		fecb	SHTV	65			Very red-brown, feo-rich vuggy carbonate-quartz vein set
71.15	Cleavage	4	S1			75			
72.25	Contact	46	So			60			Bedding contact between phyllite and sandstone
72.45	Veins	38		cbt		20			white to orange tinted quartz-carbonate vein with pyrite blebs and possible trace arsenopyrite.
72.65	Veins	38		cbt		30			white to orange tinted quartz-carbonate vein with pyrite blebs and possible trace arsenopyrite.
73	Veins	38		cbt		45			Large (30cm) white to orange tinted quartz-carbonate vein with pyrite blebs, carbonate fragments and ct by range-brown fe-carbonate stringers.
73.7	Veins	38		fecb		10			5mm wide fe-carbonate vein with abundant hematite and pyrite.
74.25	Veins	38		rea		70			bright red-orange veinlet filled by feo and realgar with lesser orpiment
75.2	Bedding	46	So			40			
77	Veins	38		cbt	SHTV	75			sub-parallel, white carbonate-calcite vein set
79.3	Bedding	46	So			40			interbedded phyllite, siltstone, and sandstone.
79.35	Cleavage	4	S1			50			
80.55	Faults	38		cy	Gouge	50			gouge seam
81.15	Veins	38		cbt		30			qtz-crb vein with abundant associated pyrite in selvage and lesser amounts in vein proper.
81.55	Bedding	46	So			50			
83	Veins	38		cbt		60			pinch and swell vuggy quartz-carbonate vein with minor chlorite and abundant feo.
83.9	Contact	46	So			40			Sharp bedding contact between sandstone and phyllite
85.95	Veins	38		qtz		30			qtz-crb vein with pyrite
86.4	Bedding	46	So			50			
86.5	Veins	38		py		50			pyrite-rich (35-40%) stringer set.
86.8	Bedding	46	So		bed	45			Phyl SLT compostional bedding
86.9	Veins	38		py		15			pyrite-rich stringer
86.95	Veins	38		py		5			pyrite-rich stringer
87	Veins	38		py		50			pyrite-rich stringer
87.05	Contact	46	So		bed	50			sharp, somewhat disrupted bedding contact between pyllite and interbedded sandstone/QPC
87.05	Bedding	46	So		bed	35			Phyllite/SS contact intruded by multiple stages of SHTV qzvns
87.05	Cleavage	4	S1		FOL	80			
90.3	Contact	46	So		bed	45			Phyllite/QPC contact
90.8	Bedding		So	chl		35			compositional bedding cleavage in silt/sand
92.4	Cleavage		Sx			45			penetrative seams altered by chlorite & limonite at about ~1cm spacing
93.5	Cleavage		Sx			20			alignment of elongated QPC clasts
95.3	Veins			fecb		80			2cm thick vein with
95.95	Veins			LIM	SHTV	45			4 densely spaced sheeted veins: 0.5-2cm thick at 1cm spacing
96.16	Veins			LIM		40			10cm thick quartz veing with contact parallel chlorite stringers within vein
97	Veins		V2	LIM		40			0.5cm thick, undulated veinlets
97	Veins		V1	LIM		80			0.5cm thick, undulated veinlets ;V1 crosscuts V2 at 65 degrees

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Depth	Structure	struct_code	Generation	Coating	Habit	CA	Beta_Angle	Gamma	Comments
98.3	Veins			fecb		55			1cm thick, individual undulated quartz vein
98.85	Veins			LIM	SZB	20			SHEAR ZONE BOUNDARY of tension vein array
98.85	Veins			LIM	TVA	50			1cm thick, slightly vuggy, boxwork pyrite mineralized, lenseshape quartz boudins at 2cm spacing
99.85	Cleavage		Sx	LIM		50			semi-penetrative seams in granule size QPC at 5mm spacing
100.75	Veins			Au		30			12cm gold mineralized vein; contacts are fragmented but repeated healed fracture orienation within vein at 30TCA
101.04	Veins			Au	MASS	60			gold mineralized, massive, ~30cm thick, yellow-white stained quartz vein
102.3	Cleavage		Sx			65			semi-penetrative seams in granule size QPC at 5mm spacing
102.3	Veins				SHTV	65			foliation concordant (Sx) series of 3-5mm thick veinlets
102.6	Veins			asp	MASS	15			asp mineralized, 6cm thick massive quartz vein with limonate and chlorite seams in healed fractures
103.65	Veins			fecb		35			20cm thick, massive quartz vein
104.5	Veins			bn	Veinlets	65			bn wallrock mineralized, concordant to QPC-Sandstone contact
104.55	Contact			LIM		65			QPC above and Sandstone below; hard & competent
106.63	Veins			LIM		10			3cm thick, yellow-white quartz vein
107.65	Cleavage		Sx			55			aligned dark grey, wispy chloritic seams and strechted, ribboned quartz clasts
107.95	Faults			chl	Gouge	60			gouged quartz breccia with dark grey chlorite and also white clay component
109	Veins			LIM		10			0.5cm thick, undulated veinlet in quartz breccia (late stage?)
109.9	Cleavage		So			45			compositional bedding cleavage in phyllite/silt sequence
110.03	Contact					35			sandstone above and phyllite below
110.7	Faults					25			black sheared, friable phyllite wedge below and veined silt/sand above
111.4	Veins			py	Veinlets	30			semi-massive, ~1cm thick pyrite stringer-quartz veinlets --- flex-folded
111.85	Veins					70			3mm thick veinlet in phyllite gouge zone
117.05	Cleavage		So			30			flex-folded compositional bedding cleavage in phyllite
118	Cleavage		So			30			flex-folded compositional bedding cleavage in phyllite
120.4	Axial Plane					25			parasitic folding; AXP intersects So at 80 degrees
120.4	Cleavage		So			90			compositional bedding cleavage in phyllite (flex-folded)
120.7	Cleavage		So			25			compostional bedding cleavage in phyllite-silt
120.8	Cleavage		So			25			compostional bedding cleavage in phyllite-silt
122.45	Cleavage		So			65			compostional bedding cleavage in phyllite-silt
122.8	Veins					70			vein orientation in sandstone
122.9	Cleavage		Ssh			65			semi-penetrative chlorite with small cink-folds
123.25	Veins			py	MASS	50			10cm thick, white quartz vein
123.93	Cleavage		Ssh			55			semi-penetrative chlorite with small cink-folds
127	Faults				Gouge				white clay chlorite gouge in quartz breccia
128.8	Faults			py	Gouge	60			muddy black phyllite gouge with quartz vein fragments and pyrite mineralization
129.1	Cleavage		So			45			compostional bedding cleavage in phyllite-silt
130.8	Cleavage		So			25			compostional bedding cleavage in phyllite-silt
131.25	Veins			LIM		60			2cm thick quartz vein
131.4	Contact					80			phyllite above and sandstone below; contact concordant to phyllite So
133.65	Veins			LIM	SHTV	30			densely spaced, 1-3cm thick, parallel veins

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

Diamond Drill Log and Sample Summary

Project: NTR3A **Prospect:** Main Zone **Hole ID:** 3A-11-033 **Grant No.:** YD07124

Location

Easting:	Northing:	Latitude:	Longitude:
533747.9	6843901.5		

Elevation: 1546 m **Grid Name:** NA

Datum:	UTM Zone:	Grid N:	Grid E:
NAD83	9		

Orientation

Plunge: 80
Azimuth: 270
EOH: 291.0 m
Core Size: HQ

Start Date: 27/09/2011
Finish Date: 01/10/2011
Status: Completed
Contractor: Driftwood

Depth (m)	Plunge	Azimuth (true N)	Mag Suss	Tool	Quality
21	80.5	268.64	5827	Reflex	1
81	79.9	266.74	5819	Reflex	1
132	79.1	264.64	5822	Reflex	1
201	79.5	263.24	5820	Reflex	1
291	79.8	259.84	5822	Reflex	1

Objective:

25m step-out east of drill fence 3A-11-012/015/015A/016. The intent is to track the down dip extent of mineralisation in 3A-11-015A.

Lithology

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
0	7.5	7.5 m of casing - no core recovered	CASING		100.0%				co	1
7.5	27	Quartz veining in phyllite is generally scarce with vuggy veinlets of less than 1cm thickness. However in contrast to more competent phyllite unit, which bound this interval below several borader up to 20cm thick quartz-chlorite veins are present.	QZVN		2.0%	w			fr	2
7.5	27	Black foliated phyllite with lamellar grey silit interbedding. [~15% silt] Unit has orange-brown rust-staining along compositional bedding cleavages (So) throughout. Unit is blocky, broken and friable -- some of this is due to genuine brittle deformation [see narrow gouge wedges recorded in point structures] and some is due to meteoric weathering at the top of the hole. Lower contact is not truly lithological. Phyllite below this unit has markedly increased competence. Texture of phyllite is too fine-grained to determine exact composition.	MT-Phy		98.0%	n			fr	2
27	70.6	Quartz veining in phyllite unit is generally rare. - always <1cm thick - sometimes as sheeted veinlets (concordant to So or discordant) - occassionally axialplanar to small scale fold profiles - often vuggy and iron-carbonate altered	QZVN		1.0%	w			co	1
27	70.6	Black foliated phyllite with grey lamellar silt interbedding. Proportion of silt interbeds varies from 5-20% throughout unit and from 1mm to 20cm in width. Texture of phyllite is too fine-grained to determined exact composition. Upper contact of this phyllite unit marks the transition from broken, friable and meteorically weathered phyllite to this more competent unit. Lower contact of this unit is sharp and competent with a conglomerate-sandstone sequence below and concordant to phyllite compositional bedding cleavage So.	MT-Phy		99.0%	n			co	1
70.6	126.25	occassinal 10-50cm long phyllite interbeds between 70.60 to 88.20 meters. Contacts between phyllite and sandstone-conglomerate sequence are generally concordant to phyllite compositional bedding cleavage So	MT-Phy		1.0%	n			co	1
70.6	126.25	Quartz veins in sandstone-conglomerate sequence are generally milky white and occassionally vuggy. Orientations of veins are extremely variable, but localized sheeted patterns exist. Minor vein sulfide mineralization. [see point structures]	QZVN		6.0%	w			co	1

Abbreviations: Rock Code = lithology; Text = textural modifier; Prop = % proportion of interval; Clasts = sedimentary clasts or igneous phenocrysts, or metamorphic porphyroblasts; CI = competency index (co-competent; fr-friable; br-broken; lc-lost core); SI = strain index (0 - 4: undeformed to high strain)

From:	To:	Description:	Rock Code:	Text:	Prop:	Colour:	Clasts:	Clast %	CI	SI
126.25	136.7	Friable and partially gouged phyllite with densely spaced quartz veining from 131.20-136.70m. Vieing is sheeted, frequently foliaton concordante and usually flex folded aore as partially penetrative aligned wedges. Vein thickness varies from 1cm-40cm width. High degree of pyrite mineralization throughout unit. <5% lamellar silt Texture of phyllite is to fine-grained to determine exact composition. Both upper and lower contacts are sharp with sandstone-conglomerate sequence below.	MT-Phy		92.0%	n			fr	3
136.7	162.06	Quartz veining is generally <2cm thick and associated with fine-grained pyrite and arsenopyrite wallrock mineralization (where arsenopyrite is less dominant). Vein density increases in lower half of unit with two quartz stockworked and brecciated subintervals . Lower contact is marked by transition into shear-brecciated veining.	QZVN		7.0%	w			co	1
136.7	162.06	Phyllite occurs as discrete, localized 0.5-1m width friable and gouged interbeds within sandstone-conglomerate sequence. Frequently associated with quartz-iron-carbonate veinlets.	MT-Phy		8.0%	n			fr	3
136.7	162.06	Grey coarse grained (1-2mm)sandstone that intermittently grades into granule size (2-4mm) quartz conglomerate. Composition: 89+% grey quartz; 10% altered feldspar; <1% black phyllite lithics Matrix: <1% matrix Grainshape: subangular Quartz clast frequently appear strectched and are surrounded by aligned grey wispy (chloritic?) matrix seams at ~0.5cm spacing forming a discernible fabric [Sx]. Unit is intensely veined by variable orientation (generally <2cm thick) milky white quartz veinlets, which occassionally have rather diffuse vein boundaries. Fine-grained vein wallrock mineralization throughout. Several structural subintervals with either intensely stockworked or brecciated vein texture. [see structure table]	MT-CO	grn	25.0%	gy	qtz	89	co	1
136.7	162.06	Grey coarse grained (1-2mm)sandstone that intermittently grades into granule size (2-4mm) quartz conglomerate. Composition: 89+% grey quartz; 10% altered feldspar; <1% black phyllite lithics Matrix: <1% matrix Grainshape: subangular Quartz clast frequently appear strectched and are surrounded by aligned grey wispy (chloritic?) matrix seams at ~0.5cm spacing forming a discernible fabric [Sx]. Unit is intensely veined by variable orientation (generally <2cm thick) milky white quartz veinlets, which occassionally have rather diffuse vein boundaries. Fine-grained vein wallrock mineralization throughout. Several structural subintervals with either intensely stockworked or brecciated vein texture. [see structure table]	MT-SS	cgr	70.0%	gy	qtz	89	co	1
162.06	172.2	Densely spaced generally aligned quartz veins, which frequently appear as diffuse stretched ribbons hosted in granule size quartz conglomerate. Veins are multiply deformed and generally <2cm thick. Some may be blurred, deformed tension vein arrays. Upper and lower portions of unit have clearly brecciated texture with with light-grey, up to 2cm diameter quartz clasts surrounded by dark grey chloritic matrix. [see structure table]	QZVN		40.0%	w			co	2
