INTRODUCTION

The Cask property is located in the Anvil Range of the Pelly Mountains. It was staked to cover a Minfile occurrence consisting of minor copper-zinc mineralization. Silver Range Resources Ltd. holds 100% interest of this property.

This report describes a two day geochemical sampling program conducted on July 1 and August 4, 2011 by Archer, Cathro & Associates (1981) Limited on behalf of Silver Range. The author compiled and interpreted the data and her Statement of Qualifications appears in Appendix I.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Cask property consists of 78 contiguous mineral claims, which are located on NTS map sheet 105K/12 at latitude 62°36' north and longitude 133°50' west (Figure 1). The property covers an area of approximately 1580 ha (15.8 km²). The claims are registered with the Whitehorse Mining Recorder in the name of Archer Cathro, which holds them in trust for Silver Range. Specifics concerning claim registration are tabulated below, while the locations of individual claims are shown on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date</u>
Cask 1-78	YD118193-YD118270	March 13, 2016*

* Expiry date includes 2011 work that has been filed for assessment credit.

The 2011 exploration program was conducted from Faro, the local supply center, which is located approximately 50 km southeast of the property. The crew stayed at the Archer Cathro crew house in Faro and was set out and picked up daily by a Bell 206B helicopter, operated by Trans North Helicopters from its seasonal base at the Faro airport. The closest ground access is the Robert Campbell Highway, which at its nearest point lies about 47 km to the south of the claim block. The highway is accessible by two-wheel drive vehicles throughout the year.

HISTORY AND PREVIOUS WORK

The Cask claims cover Yukon Minfile occurrence 105K 095 which consists of minor copper-zinc mineralization that occurs in two locations approximately 2.5 km apart.

Golden Gate Explorations Ltd. staked the Pete claims in 1965 and the North claims in 1966 to cover the two locations of the Minfile occurrence. It flew an airborne magnetic survey later in 1966. No results or other reported work could be found.

Between 1969 and 1972, Anvil Syndicate, which included Canadian Reserve Oil and Gas Ltd., Occidental Minerals Corp. of Canada Ltd., Aquitaine Co. of Canada Ltd., Husky Oil Ltd., Canada Southern Petroleum Ltd. and Overland Exploration Services (1969) Ltd., conducted a three year exploration program in the vicinity of the Cask claims. Work in the first two years comprised regional-scale reconnaissance gravity surveying with limited geological mapping, prospecting, geochemical sampling and diamond drilling. The final year of the program saw follow up work done on several targets that had been identified. The Anvil Syndicate's Twopete

✕ Gold prospect owned by other operators

Area encompassed the current Cask property. Reconnaissance prospecting and mapping were carried out here in conjunction with geochemical sampling. No mineral showings of economic interest were found during this program. Five targets were worked in this area, but only two are within the current Cask claims. Anomalous values were returned from geochemical samples with one stream sediment sample yielding 65 ppm for copper, 29 ppm for lead, 310 ppm for zinc and 24 ppm for molybdenum (Adamson, 1972).

Strategic Metals Ltd. staked the Cask claims in November 2010. In summer 2011, the claims were sold to Silver Range.

GEOMORPHOLOGY

The Cask property is situated in the Anvil Range of the Pelly Mountains and is drained by creeks that flow into the Tay River to the north. The Tay River ultimately connects to the Pacific Ocean via the Pelly and Yukon rivers.

The property covers an area of low mountains and ridges and is bisected by a north-northwesterly flowing creek valley. Local elevations range from about 1130 to 1980 m above sea level (asl), with treeline at approximately 1500 m asl. The property is defined as mostly subalpine to alpine. Slopes above treeline are vegetated primarily with low-lying grasses, staghorn moss and sparse brush. Spruce and poplar forests with an understory of dwarf birch and mountain alder and sphagnum moss are seen at lower elevations. Outcrop is abundant, generally on ridge crests and steep slopes.

Much of the overburden in the region is associated with the most recent Cordilleran ice sheet, the McConnell glaciation, which is believed to have covered south and central Yukon between 26,500 and 10,000 years ago (Yukon Geological Survey, 2010). Tay River map area was covered by the Selwyn Lobe of the Cordilleran ice sheet. A complex system of ice-caps and cirque glaciers was active at high elevations in the Pelly Mountains and contributed to the ice bodies surrounding them.

The climate at the Cask property is typical of northern continental regions with long, cold winters, truncated fall and spring seasons and short, mild summers. Although summers are relatively warm, snowfall can occur at any month at higher elevations. The property is mostly snow free from early June to late September.

GEOLOGY

The Cask property is situated in the west-central part of Selwyn Basin (Figure 4), a tectonic element comprising deep water clastic rocks, chert and minor carbonate accumulated along the North American continental margin during Paleozoic time. The basin is bound to the northeast by a shallow carbonate platform (Mackenzie Platform), which formed the near-shore facies of ancient North America (Abbott et al, 1986).

The claims lie within the Anvil Zinc-Lead-Silver District, which has been the focus of numerous government and industry sponsored studies since the 1953 discovery of the Vangorda Deposit. Regional bedrock geology for the Tay River map area (105K) was completed in 1:253,440 scale

by Roddick and Green (1961) and at 1:250,000 scale by Gordey and Irwin (1987). A more detailed study was completed in 1972 by Tempelman-Kluit at 1:125,000 scale. Gordey and Makepeace later completed a Yukon-wide geological compilation in 2003.

Between 1969 and 1972, the Anvil Syndicate performed limited geological mapping in the vicinity of the Cask claims. No detailed mapping was done in 2011.

The following description is based on published data while Figure 4 illustrates geology as compiled by Gordey and Makepeace. The main lithological units are described in Table I.

Table I – Regional Stratigraphic Units (after Gordey and Makepeace, 2003)

Unit Name	Age	Map Name	Description
Selwyn Suite	Mid-Cretaceous	mKqS	Equigranular to porphyritic (K-feldspar) biotite $\pm$ hornblende, $\pm$ muscovite granite, quartz monzonite and granodiorite. Porphyritic biotite-hornblende granite with large smoky grey quartz phenocrysts and locally K-feldspar phenocrysts.
Rabbitkettle Formation	Upper Cambrian and Ordovician	COR1	Thinly bedded, wavy banded, silty limestone and grey lustrous calcareous phyllite. Limestone intraclast breccia and conglomerate. Massive to laminated, grey quartzose siltstone and chert and rare black slate. Local mafic flows, breccia and tuff.
Gull Lake Formation	Lower Cambrian	ICG1	Shale, siltstone and mudstone, locally bioturbated, with minor quartz sandstone. Rare green-grey chert. Local basal limestone and limestone conglomerate. Phyllite to quartz-muscovite-biotite schist ($\pm$ garnet, $\pm$ sillimanite $\pm$ staurolite $\pm$ andalusite).
Marmot Formation	Cambrian to Silurian	CSM2	Amygdaloidal basaltic flows and breccias, mostly subaqueous. Thick, flow-banded rhyolite and felsite, includes breccia and tuff.

The property is underlain by volcanic rocks of Marmot Formation in the south and Rabbitkettle Formation in the north. Selwyn Suite rocks are present in a limited area along the southeastern boundary of the claim block. No major structures have been mapped in this area.

MINERALIZATION

Mineralization in the area was described by Adamson (1972) as rusty weathering, pyritic hornfelsed sediments adjacent to the granodiorite contact or as malachite-stained shear zones with no visible copper sulphide mineralization.

Two samples were collected in 2011. These samples were taken from the southern part of the property during soil sampling traverses. Sample locations are plotted on Figure 5 while results for gold, silver, copper, lead and zinc are plotted on Figures 6 to 10, respectively. Rock sample descriptions are provided in Appendix II, while Certificates of Analysis are given in Appendix III.

 CASK PROPERTY

Rock geochemical sample sites on the property were marked with orange flagging tape labelled with the sample number. The location of each sample was determined using a handheld GPS unit.

Samples were sent to ALS Chemex in Whitehorse, Yukon and North Vancouver, BC, where they were dried, screened to -180 microns, and then analyzed for 51 elements using an aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy and atomic emission spectroscopy (ME-MS41). An additional 50 g charge was further analysed for gold by aqua regia digestion with inductively coupled plasma mass spectroscopy finish (Au-TL44).

One sample was described as massive magnetite with serpentinite and minor calcite while the other is weakly magnetic hornfelsed rock. Both samples returned subdued values for all elements of interest.

SOIL GEOCHEMISTRY

The Anvil Syndicate collected geochemical samples in the vicinity of the Cask property in 1972, but the sampling focused only on the eastern part of the property. The samples that lie within the current claim boundaries returned weakly to moderately anomalous values, with one stream sediment sample yielding 65 ppm for copper, 29 ppm for lead, 310 ppm for zinc and 24 ppm for molybdenum (Adamson, 1972). The samples were not assayed for gold or silver.

A total of 565 soil samples were collected from the Cask property in 2011. These samples were taken along contour traverses throughout the property area at approximately 50 m spacing. Sample locations and results for gold, silver, copper, lead and zinc are plotted on Figures 5 to 10, respectively, while Certificates of Analysis are given in Appendix III.

Soil samples were collected from 30 to 60 cm deep holes dug by hand-held auger. All samples were placed into individually pre-numbered Kraft paper bags. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. Sample locations were recorded using hand-held GPS units.

Samples were sent to ALS Chemex in Whitehorse, Yukon where they were dried, screened to -180 microns. The fine fraction was then sent to ALS Chemex's lab in North Vancouver, BC, where it was analyzed for 51 elements using an aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy and atomic emission spectroscopy (ME-MS41). An additional 25 g charge was further analysed for gold by aqua regia digestion with inductively coupled plasma mass spectroscopy finish (Au-TL43).

A few samples returned weakly to moderately anomalous values for gold (up to 64 ppb), silver (up to 1.19 ppm) and lead (up to 60 ppm). The majority of the elevated results are located in the southern part of the property. Weakly to strongly elevated copper values were also returned, mostly from areas underlain by Marmot Formation in the southern part of the property. The best sample yielded 664 ppm copper. Some of the samples also returned weakly to moderately anomalous values for zinc (up to 200 ppm).

DISCUSSION AND CONCLUSIONS

Previous geochemical sampling in the areas surrounding the Cask property returned weakly to moderately elevated copper and zinc values, no significant mineralization are reported.

Reconnaissance sampling in 2011 resulted in moderately to strongly anomalous values for copper and weakly to moderately anomalous values for gold, lead and zinc. Generally, samples yielding more elevated values were located in the southern portion of the property, which is underlain by Marmot Formation. No prospecting or mapping was done in 2011 to follow up the anomalous results.

Future work should include detail geological mapping, prospecting and soil sampling. Additional soil sampling should be performed on grids over the southern part of the property to better characterize the copper-in-soil anomaly. If encouraging results are returned, hand trenching should be done in areas of highly evaluated values to identify bedrock sources for the metals.

Respectfully submitted,

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
