INTRODUCTION

The DDL property is a gold-silver prospect that had been previously explored for porphyry and skarn style copper mineralization. It is 100% owed by Strategic Metals Ltd.

This report describes a geochemical survey conducted on August 6, 2011 by Archer, Cathro and Associates (1981) Limited on behalf of Strategic Metals. The author compiled and interpreted the 2011 data and her Statement of Qualifications appears in Appendix I.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The DDL property consists of 14 contiguous mineral claims, which are located on NTS map sheet 115E/03 at latitude 61°04' north and longitude 135°02' west (Figure 1). The property covers an area of approximately 284 ha (2.84 sq km). The claims are registered with the Whitehorse Mining Recorder in the name of Archer Cathro, which holds them in trust for Strategic Metals. Specifics concerning claim registration are tabulated below, while the locations of individual claims are shown on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date</u>
DDL 1-14	YC89987-YC90000	March 31, 2016*

* Expiry date includes 2011 work that has been filed for assessment credit.

The 2011 exploration program was conducted from the Whitehorse International Airport, which is located approximately 45 km south of the property. The crew stayed at the Archer Cathro crew house in Whitehorse and was set out and picked up by a Bell 206B helicopter, operated by Capital Helicopters (1995) Inc. from its permanent base at the airport. The closest ground access is the Livingstone Creek winter road, which lies about one kilometer south of the claim block.

HISTORY AND PREVIOUS WORK

The DDL claims cover Yukon Minfile occurrence 105E 006 which is a copper skarn prospect. It was discovered prior to 1907 and explored by hand trenching.

The property area has seen multiple generations of staking. Figure 3 illustrates the historical claim blocks, while Figure 4 shows historical workings.

The area was first staked in 1966 as the Jac, B Jac and Go Jac claims by J. Smith and as the Rag claims by R.A. Granger. Those claims were optioned to Rexony Mining Company Limited in 1967, which sub-optioned them to Pine Lake Mining Company Limited. Pine Lake added the Tea and M.T.C. claims subsequently. Exploration the following year focused on skarns and was modeled on the mines of the Whitehorse Copper Belt, which lie approximately 37 to 57 km to the south. It consisted of airborne and ground magnetic surveys, geological mapping, bulldozer trenching and 826.9 m of diamond drilling in nine holes. Six of the holes tested a strong magnetic anomaly in a till-covered valley bottom east of the property boundary while the other three explored copper showings within the current DDL claims (Sander and Hrkac, 1967).

In 1971, the target was restaked as the Pine and Kart claims by Caltor Syndicate which explored with soil sampling that year, followed by detailed mapping and EM 16 surveys in 1972. This work focused on porphyry copper potential (Phillips, 1972).

The area was restaked again in 1974 as the Pilon claims and again in 1979 as the Ron claims, but no further work was reported.

Nordac Resources Ltd. restaked parts of the older properties in fall 1997 and conducted geological mapping, prospecting and soil sampling in early June 1998. A few, small gold-rich showings were found, but soil sampling produced subdued metal values. No follow up work was done and those claims were allowed to expire (Eaton, 1999).

Strategic Metals staked the current DDL claims in November 2010.

GEOMORPHOLOGY

The claims lie about a kilometre east of Lake Laberge and are partially underlain by a small lake (informally referred to as Pine Lake). The eastern half of the claim block covers creek bottoms and swamps adjacent to Pine Lake. The western half is underlain by terrace benches and steep grassy slopes with occasional cliffs. Local elevations range from about 700 to 900 m above sea level. Outcrops are scarce in the glacial till-covered eastern half of the property but are moderately abundant in the west where they occur as scoured knobs and cliffs.

Mature spruce forests are common in the vicinity of Pine Lake, while white poplar and grass predominate on steep, south and west facing slopes. Areas underlain by permanently frozen soil typically exhibit moss and Labrador tea ground cover.

REGIONAL GEOLOGY

In 1984, the Geological Survey of Canada published a geological map of the Laberge (105E) and Carmacks (115I) areas at 1:250,000 scale (Templeman-Kluit, 1984). Gordey and Makepeace later completed a Yukon-wide geological compilation in 2003.

The DDL property is situated in the northern part of Stikina Terrane (Figure 5) and is underlain by north-trending, east-dipping, Upper Triassic and Lower Jurassic(?) limestone with minor interbedded argillite plus a variety of Jurassic and younger igneous rocks. Hornfels and skarn zones are developed in the sediments adjacent to feldspar porphyry intrusions.

Figure 5 illustrates geology as compiled by Gordey and Makepeace. The main lithological units are described in Table I

Table I – Regional Stratigraphic Units (after Gordey and Makepeace, 2003)

Unit Name	Age	Map Name	Description
Aksala	Upper Triassic, Carnian to Norian	uTrAK	Mixed clastic-carbonate assemblage divisible into three dominant facies including calcareous greywacke (1), locally thick carbonate (2) and red-coloured clastics.
		uTrAK1	Brown shale, black and minor red siltstone, greenish, calcareous greywacke and interbedded bioclastic, argillaceous limestone; igneous- or limestone-clast pebble and cobble conglomerate; lahaaric debris flows; rare feldspar-augite porphyry flows.
		uTrAK2	Massive to thick bedded limestone; minor thin bedded argillaceous to sooty limestone; coarsely crystalline, massive dolostone; minor laminated chert; massive to poorly bedded, limestone conglomerate debris flows and fanglomerate.
Povoas	Upper Triassic, Carnian and older(?)	uTrP	Augite or feldspar phyric, locally pillowed andesitic basalt flows, breccia, tuff, sandstone and argillite; local dacitic breccia and tuff with minor limestone; greenschist, chlorite schist, chlorite-augite-feldspar gneiss, amphibolite.

PROPERTY GEOLOGY

Limited outcrop is seen in the property area and little detailed mapping has been done. Base on the compilation by Gordey and Makepeace (2003), the claims are underlain mostly by rocks of Aksala Group. Povoas Formation rocks are seen in the eastern portion of the property. The following property geology description is based on mapping by Nordac Resources in 1998. Figures 4 and 6 show the property geology after Eaton (1999) and Gordey and Makepeace (2003).

The massive limestone unit is pale grey with white weathering. It is often recrystallized, dolomitized or skarnified adjacent to porphyry intrusions. Dark brown to dark grey argillite was noted rarely in the mapping area, often occurring in thin, recessive beds. Three types of intrusions were reported. Feldspar porphyry stocks are generally fine to medium grained feldspar and hornblende phenocrysts in a light to dark green aphanitic matrix. They are characteristically weathered to a highly fractured, rough, reddish appearance. North-trending porphyry dykes have sugary aphanitic matrix with minor fine quartz phenocrysts. Dark green aphanitic to fine grained andesite dykes were also noted (Eaton, 1999).

MINERALIZATION

Prospecting and mapping by previous workers identified two types of mineralization and four showings on the DDL property. Showing locations are illustrated on Figure 4. In 1998, Nordac

Resources collected 12 rock and 18 chip samples from old hand trenches that were representative of these areas of interest (Eaton, 1999).

The first type of mineralization is lead-zinc ($\pm$ copper, silver, gold) mineralization that occurs in replacement zones within skarnified limestone bands. Showings A, B and C comprise this type of mineralization.

Showing A comprises narrow veins and small lenses of massive sulphide within a band of strongly oxidized diopside-epidote skarn. Mineralization consists of pyrite and pyrrhotite with lesser sphalerite, chalcopyrite and galena. Samples returned average of 9100 ppb gold, 66.9 ppm silver, 0.17% lead, 2.5% copper and 2.9% zinc.

Showing B is an outcrop of dolomitized and jasperoid altered limestone that contains blebs of pyrrhotite, pyrite and minor chalcopyrite. One sample from this site yielded 1200 ppb gold, 21.8 ppm silver and 0.25% copper.

Showing C is a series of narrow diopside-epidote magnetite skarn bands within limestone adjacent to the feldspar porphyry intrusion. The bands contain pyrite, trace chalcopyrite and minor malachite. Samples returned subdued values.

The second type of mineralization is copper $\pm$ molybdenum found in veins within feldspar porphyry intrusions. Showing D encompasses several areas of copper mineralization within the largest porphyry intrusion. Samples collected in 1998 returned background to weakly anomalous values. Pine Lake tested this mineralized area with three diamond drill holes in 1967. Those samples also yielded background to weakly anomalous values (Archer, 1967; Eaton, 1999).

No rock samples were collected during the 2011 program.

SOIL GEOCHEMISTRY

Previous soil sampling focused on the western part of the property. Samples mostly returned subdued results, but a few anomalous values were found in an area where a number of small copper showings are associated with pyritic, feldspar porphyry dykes and plug. The best sample yielded 242 ppm copper, 110 ppm lead and 1.2 ppm silver. The highest historical gold in soil value was 90 ppb.

A total of 169 soil samples were collected from the DDL property in 2011. These samples were taken on a 50 m by 100 m grid in the western part of the claim block. Sample locations and results for gold, silver, lead, copper and zinc are plotted on Figures 7 to 12, respectively, while Certificates of Analysis are given in Appendix II.

Soil samples were collected from 30 to 60 cm deep holes dug by hand-held auger. All samples were placed into individually pre-numbered Kraft paper bags. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. Sample locations were recorded using hand-held GPS units.

DATE: FEB 2012

Samples were sent to ALS Chemex in Whitehorse, Yukon where they were dried, screened to - 180 microns, and then analyzed for 51 elements using an aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy and atomic emission spectroscopy (ME-MS41). An additional 25 g charge was further analysed for gold by aqua regia digestion with inductively coupled plasma mass spectroscopy finish (Au-TL43).

The samples yielded mostly background results for gold and copper, but there are some weakly to strongly anomalous values. The highest values were 141 and 201 ppb gold and 785 and 877 ppm copper. Silver, lead and zinc analysis yielded background to moderately elevated values up to 3.1 ppm silver, 222 ppm lead and 819 ppm zinc. The best single sample returned 73 ppb gold, 2.8 ppm silver, 216 ppm lead, 877 ppm copper and 109 ppm zinc.

Anomalous samples generally occur near the eastern and southern edges of the grid. One sample with elevated gold, silver and zinc values was collected adjacent to Showing B, while another high gold value coincides with an historical anomaly that remains unexplained. Elevated silver, lead and zinc values that are scattered through the eastern portion of the grid and are also unexplained.

DISCUSSION AND CONCLUSIONS

Geochemical sampling on the DDL property has identified weak porphyry type copper mineralization and scattered, locally precious metal rich skarn and replacement style mineralization. Soil samples collected both in 2011 and 1998 returned erratically distributed anomalous values. The lack of clustering is likely due in part to variable thickness of frozen colluvium. The anomalous values mostly occur in areas underlain by feldspar porphyry or along contact zones between limestone and feldspar porphyry.

Future work should include detailed geological mapping, hand pitting at anomalous soil sites, extension of soil geochemical grid coverage, and additional claim staking. Detailed mapping and hand pitting will identify areas with prospective geological settings and help to better characterize the types of mineralization associated with the various geochemical anomalies. Additional claim staking should cover the anomalous gold-in-soil values that lie on the southern edge of the property.

Respectfully submitted,

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

APPENDIX I
STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Crystal J Chung, geologist, with business addresses in Vancouver, British Columbia and Whitehorse, Yukon Territory and residential address in Burnaby, British Columbia do hereby certify that:

1. I graduated from the University of British Columbia in 2005 with a B.Sc. majoring in Earth and Ocean Sciences (Geology).
2. From 2004 to present, I have been actively engaged in mineral exploration in British Columbia, Alaska and the Yukon Territory.
3. I am a Geoscientist in Training (GIT) with the Association of Professional Engineers and Geoscientists of British Columbia (Member Number 138321).
4. I have personally reviewed and interpreted all data resulting from this work.

Crystal J Chung, B.Sc. Geology, GIT
