1. INTRODUCTION

Between August 2 and August 7, 2011 a reconnaissance prospecting, soil, silt and rock geochem sampling work was undertaken on behalf of Goldstrike Resources Ltd. The focus of the program was to evaluate Au and Hg geochemical anomalies indicated in earlier Yukon-wide geochemical surveys. The present program consisted of collection of 310 soil samples and 5 silt samples and 68 rock samples.

2. DISCLAIMER

The author has prepared this report based upon information believed to be accurate, but is not guaranteed. This report may contain sanguine statements. For example, a statement such as, “*the data suggest the potential for mineralization,*” is accepted as incomplete. It is taken for granted that the reader accepts this class of statement as an inherent element in an interpretation report, and therefore does not require a cautionary statement at every instance.

3. CLAIM LOCATION

The Gull property consists of 66 quartz claims. The claims are located along the Logan Mountain Range in the SE region of the Yukon Territory. The Gull property is 50 km northwest of the all-weather Nahanni Range Road, and 85 km NNE of the Campbell Highway. The nearest significant mineral deposit is the Howards Pass sedex deposit approximately 30 km to the NE. Gull Lake is the closest significant body of water and is located approximately one kilometer south-east of the claims.

The property covers two mountain tops separated by a large open valley with a mature meandering creek. The majority of the property is vegetated starting at an elevation of 1500 meters. Thick evergreen forest dominates at elevations lower than 1400 meters.

The survey statistics for the 2011 exploration program are as follows:

<u>Survey Type</u>	<u>Number of Samples</u>
Rock Samples	68
Soil Samples	310
Silt Samples	5

4. GEOLOGY

Illustration 3 above shows the GSC Regional Geology of the Gull Claims area., while Illustration 4 below, shows the Prospecting and Structure Map.

The Gull claims cover Upper Proterozoic-Lower Cambrian Hyland Group rocks in the core of a regional-scale northwest-plunging anticline, as well as Lower Cambrian to Lower Devonian rocks of the Gull Lake and Rabbit Kettle Formations and the Road River Group in the core of a parallel northwest-plunging syncline.

4.1 Eastern Claim Block

The eastern claim block consists of primarily sheared cherty shale or argillite. The rock contains limonitic micro fractures and quartz veinlets. In places the rock is sub brecciated with increased fracturing. Several north-south faults were noted on the southern end of the claims where increased oxidation and brecciated rock occurs. Also gulley features running north-south were very common. Intense folding is seen throughout the property. A gossanous creek drains the north facing slope just upslope from the highly anomalous mercury values from the regional stream sediment sample. At the head of this creek the rocks are oxidized cherty shale and a unique breccia consisting of angular black chert clasts in a white quartz like matrix, however no major sulphides were seen in the breccia. The south facing slope (or northern portion of the claim block) contains more limestone exposures. The limestone is oxidized with calcite veining and voids.

4.2 Western Claim block

The western claim consists mainly of chloritic shale. The shale contains quartz veins, sometimes oxidized with limonite. Nothing significant was noted on the western side of the property. A potential “kill zone” was noted on the plateau to the west of the claims. A large area appears to have very little to no vegetation growing on it and air photos from 2006 confirm it was

not a result of a forest fire.

4.3 South of the Property

A ridge top two kilometres south and perpendicular to the property was sampled and prospected based on the anomalous iron oxide and clay alteration observed from satellite imagery. The ridge top consisted of a hematitic shale, silicified sandstone, and limestone units all cutting the ridge. The general strike of bedding ranged between 230° – 300° and dips steeply to the north. The sandstone was very silicified with quartz veins and limonite. It was locally limey towards the north end of the ridge. The hematitic or purple shale dominated the centre of the ridge and likely generated the strong iron oxide satellite imagery. The shale was silicified and resembled chert. A small pyritic limestone bed was found sandwiched between the shale and sandstone units. A mineralized talus was found along the western side of the ridge top containing arsenopyrite and pyrite blebs occurring in an oxidized and bleached out quartzite.

5. PREVIOUS WORK

No previous work has been done on these claims. The interest in exploring the Gull area arises from previous Yukon-wide regional sampling programs that indicated elevated Au and Hg values.

6. 2011 FIELD WORK

The exploration program was carried out by staff of Druid Exploration Inc. on August 2, 3 and 7, 2011.

Days worked:

August 2, 2011 – 3 geologists, 4 samplers, 2 prospectors = 9 man days

August 3, 2011 – 2 geologists, 4 samplers, 2 prospectors = 8 man days

August 7, 2011 – 1 geologist, 3 sampler, 1 prospector = 5 man days

The total days worked by the Druid Exploration Inc. crew was 22 man days.

The crew list is as follows:

Geologists: Clayton Jones, Diana Benz and Daithi MacGearailt.

Prospectors: Inyo Youngreen, Franz Vidmar and Michael Glyn.

Geochem Samplers: Dustin Blampin, Greg Galloway, Brad Osmond and Thomas Barrette.

Cook: Gabriel Genois

Helicopter pilots (Heli Dynamics Ltd.): Mike Dorsey and Lance Wanner.

6.1 Accommodation

A wall tent camp was constructed near the Nahanni Range road at kilometer 157 and a travel trailer was used for the living quarters for the geologists and the use of the refrigerator for the camps food.

6.2 Transportation

All camp equipment was driven in from Dawson City. A crew of 8 took two days to get to the camp location from Dawson City and stayed one night at Watson Lake in hotels (July 29 – July 30). Three geologists flew into camp on the 1st of August from Whitehorse with the helicopter being used for the program. The camp was restocked with fuel and food via a combination of a fixed wing aircraft (Alcan Air) and a truck (Twilight Expediting). A 206 Jet Ranger helicopter was used for the duration of the program however, due to maintenance issues

several different helicopters were actually used. The helicopters were provided by Heli Dynamics Ltd.

Distance to property from camp was approximately 90 kilometers which is equivalent to approximately 0.5 hrs helicopter time. Two helicopter trips each day were made.

7. GEOCHEMICAL SURVEYS

Soil, Rock and Silt sampling was the principal exploration method (383 samples) used on this project. A complete record of the geochemical sampling data-sets is provided in the Acme Labs Geochem PDF Certificates that are included as Appendices in this report and with the other digital information that is part of this report.

7.1 Sample Procedure:

Prospectors and Geologist took soil, silts and rock samples while samplers focused primarily taking soil samples however, rock samples were taken if sulphides were present.

7.1.1 Rock Samples (68)

All Rock samples were taken based on lithology, mineralogy, and structure. A representative sample was taken for all major units/structures despite mineralogy. Sample locations were marked on the GPS and labelled with the lab tag number used. The sample locations were marked with labelled flagging tape. The sample locations (coordinates) were downloaded into the computer and stored in a database with all corresponding notes. Rock samples were photographed and described.

7.1.2 Soil Samples (310)

All soil sample locations were derived using Arc GIS 10.0 and sample locations (waypoints) were programmed into handheld GPS's. Sampler would navigate to points and take samples. The samplers took deep soil samples with Dutch augers, targeting the C horizon. The exact location

of the sample was recorded on the GPS and later imported to Arc GIS to be mapped. Detailed sample notes were taken at each site (depth, soil type, vegetation etc.) as well as a picture of each hole. Acme water proof sample tags were used. The sample location was flagged with the corresponding acme tag number written on the flagging tap. Sample locations (coordinates) were downloaded into the computer and stored in a database with all corresponding notes. Soil lines were changed periodically as the property was explored.

7.1.3 *Silt Samples (5)*

Silt samples did not follow a strict procedure. Stream sediment, both fine and course, was extracted from the stream and assayed using the same procedure the soils used.

A significant number of samples were taken just south of the claims. Anomalous satellite imagery warranted the work to be done; in particular the iron and clay alteration was very strong.

7.1.4 *Analytical Work*

Laboratory analysis and QC was done by Acme Labs (Whitehorse) using the following analytical techniques:

Rock Samples: Preparation R200-250, Analysis – GEO2 (36 element, fire assay and ICP-MS)

Soil Samples: Preparation SS80, Analysis – 1DX2 (36 element, ICP-MS)

Silt Samples: Preparation SS80, Analysis – 1DX2 (36 element, ICP-MS)

9. Summary

The Western claim block warrants more exploration. In particular the creeks showing elevated Au Geochem values should be mapped by a geologist or prospector and the creek walls mapped and sampled.
