1.0 INTRODUCTION

The PIGSKIN property consists of 28 contiguous mineral claims covering an area of approximately 587 hectares that are owned 100% by Silver Predator Canada Corp. Claims are located in the Cassiar Mountains of the Yukon Territory. Silver Predator Canada Corp. is targeting silver-lead-zinc mineralization. This report describes the work completed in the 2011 field season from September 28th to October 02nd which consisted of grid soil sampling.

2.0 PROPERTY LOCATION AND DESCRIPTION

The property is located in the Rancheria area of southeast Yukon. It lies approximately 110 km

west-northwest of Watson Lake, YT (Figure 2-1). It can be accessed by helicopter from the abandoned Silver Hart Camp which is located 20 km to the southeast. The Silver Hart Camp is at the end of a 40 km road extending north from Km 1160 on the Alaska Highway. A bulldozer winter access trail built by Fairfield Minerals Ltd. in 1987 to access its Logan property parallels the southwest side of the Pigskin claims. This trail originates at Km 1107 on the Alaska Highway, some 25 km southeast on the property.

During 2011 field season the property was accessed by helicopter based in Watson Lake.

Figure 2-1. PIGSKIN Property Location, Yukon Territory

The property is located in the Watson Lake Mining Division, and consists of 28 contiguous mineral claims covering an aggregate area of 587 hectares (Table 2-1, Figure 2-2).

3.0 INFRASTRUCTURE, CLIMATE AND PHYSIOGRAPHY

The centre of the property is located in the Rancheria area of southeast Yukon at 428036 E, 6701528 N (NAD83, Zone 9N). The nearest settlement is Watson Lake in the Yukon, located ~110 km east-southeast of the property. The property has been commonly accessed in the past by helicopter from Watson Lake base.

The Pigskin property covers relatively subdued south-facing slopes within the Cassiar Mountains immediately west of the Liard Plain. Creeks draining the property flow southward into the Little Moose River, a tributary of the Liard River watershed (Becker 1999).

Local elevations range from 940 m near Little Moose River to a maximum of 1140 m. Topographic relief is gentle averaging 10 degrees with occasional steeper areas in the vicinity of creek cuts. Pleistocene valley glaciers deposited a blanket of till ranging from 0.2 to 10 m thick over most of the property. Some areas are hummocky, resembling “kame and kettle”- type topography. The entire property lies below treeline and vegetation consists of dense growths of spruce, birch and pine trees with alder and buckbrush undergrowth (Becker 1999).

The property lies within the Liard Basin ecoregion that spans the British Columbia-Yukon boundary to incorporate the Liard Plain, a broad, rolling, low-lying area mantled with glacial drift and outwash deposits in which the Liard River is entrenched. The mean annual temperature for the area is approximately -3°C with a summer mean of 11°C and a winter mean of -18.5°C. Annual precipitation is 350-450 mm. (<http://ecozones.ca/english/region/181.html>).

4.0 EXPLORATION HISTORY (Becker 1999)

The ground was previously staked by Regional Resources Ltd. as the Moose claims in March 1980 and briefly optioned that summer to Amax Minerals Exploration which performed geological mapping, prospecting and geochemical surveys. During that program approximately 900 grid soil samples were taken at 50 m intervals on lines spaced 200 m apart. This work outlined an 1100 by 300 m area of approximately coincident, moderately to strongly anomalous silver-lead-zinc geochemical response. Minor amounts of fracture filling galena- and sphalerite-bearing float was also noted (Verley 1980).

In February 1996 following a research study of old assessment reports, Nordac restaked this anomaly and other nearby targets as the Pigskin and QB claims. During 1996 a four-person crew preformed geological mapping, prospecting and grid soil sampling on the Pigskin property (Wengzynowski 1996b). The grid soil sampling outlined a 700 by 300 m northwest trending silver-lead-zinc anomaly which roughly corresponds to the one found in 1980. No mineralization was discovered to explain this anomaly. Several smaller coincident silver-lead anomalies occur elsewhere on the grid. One of these anomalies in the northern part of the grid is associated with massive galena float discovered in 1996.

In 1997 three people performed one day of hand trenching in the area of the galena float. This work mapped the extent of the mineralized float but failed to find the bedrock source.

In late July 1998 the work for Nordac consisted of geological mapping, prospecting and hand trenching. It was managed by Archer, Cathro & Associates (1981) Limited. Hand trenching of a massive galena float in 1998 exposed the vein intermittently for 25 m along strike. The best chip sample returned 5725 g/t silver and 71% lead over 35 cm.

Archer, Cathro & Associates (1981) conducted the fieldwork between August 1 and 10, 2005 on behalf of Strategic. The work consisted of hand trenching and minor soil sampling performed by a two person crew working from a fly camp on the property. Geochemical sampling at Pigskin has outlined a series of northwest trending silver-lead-zinc anomalies, which are largely unexplained. Hand trenching near one of the anomalies has exposed a lensoidal galena-and cerussite-rich vein intermittently for 28 m along strike. Grades from three lenses are encouraging, typically ranging between 1000 and 5000 g/t Ag; however, their relatively narrow widths and short strike lengths limit their economic potential to selective high grade mining (Gregory and Wengzynowski 2005).

5.0 GEOLOGY

5.1 Regional Geology and Mineralization (Becker 1999)

The Pigskin claims lie within a belt of metamorphic rocks belonging to the Yukon-Tanana Terrane and Cassiar Platform. This belt extends from northern B.C. across the Yukon into Alaska. The northeastern edge is defined by the Tintina Fault Zone, a series of subparallel transcurrent faults which have produced about 450 km of dextral offset in Late Cretaceous and/or Early Tertiary times (Tempelman-Kluit, et al. 1976). The southwestern side is bound by the Teslin Suture, an enigmatic zone composed of folds, thrust and high angle faults.

Yukon-Tanana Terrane and Cassiar Platform rocks are composed largely of Paleozoic stratigraphy which has been intruded by Jurassic to Cretaceous plutons. Both terranes are considered "suspect terranes" representing variably distal metamorphosed equivalents of North American Continental Margin sediments. Yukon-Tanana, the furthest outboard of the two terranes, is overthrust onto Cassiar Platform rocks by the D'Abbadie Thrust Fault. Some imbrication of the two terranes is also recognized and the structural position is further complicated by normal faulting. The regional metamorphic fabric within both terranes trends northwesterly and dips moderately toward the northeast.

Although rocks of the Yukon-Tanana Terrane and Cassiar Platform are generally similar and are approximately the same age, the two packages are distinguished by higher proportions of carbonate strata in the Cassiar Platform and metavolcanics in the Yukon-Tanana Terrane. The Pigskin claims are believed to lie within the Cassiar Platform.

Geology in the Rancheria area was mapped at 1 : 250,000 scale in 1960 by the Geological Survey of Canada [GSC] (Poole et al. 1960). More detailed mapping in the Rancheria District (105B/1, 2, 7 & 8) was done in 1985 and 1986 at 1 : 50,000 scale by the Department of Indian and Northern Affairs [DIAND] (Lowey and Lowey 1986; Amuken and Lowey 1987) in response to numerous base and precious metal discoveries in the area.

Over 140 mineral occurrences have been reported within the Yukon-Tanana Terrane and Cassiar Platform rocks on NTS mapsheet 105B (DIAND 1995). The majority of the occurrences are found in the Rancheria area and consist of silver-lead-zinc-copper-gold veins with lesser tin-tungsten-zinc skarns. Several lead-zinc-silver replacement-type occurrences are also noted. The most significant discoveries in this region to date are vein and replacement-type mineralization at the Silvertip (Midway), Logan and Silver Hart Deposits. The Silvertip Deposit is classified as a replacement-type manto of Devonian age and has drill-indicated reserves of 1.9 million tonnes grading 410 g/t silver, 7.0% lead and 9.6% zinc (NBCMI 1991). Vein/shear-hosted mineralization occurs within the Cretaceous Marker Lake Batholith at the Logan Deposit where reserves are estimated at 12.3 million tonnes grading 6.17% zinc and 26.0 g/t silver (DIAND 1995). The Silver Hart Deposit consists of a series of high grade silver-bearing veins reportedly containing 99,000 kg of silver (DIAND 1995).

The major lithological units in the PIGSKIN area are described in Table 5-1 and their distribution is shown on Figure 5-1.

Table 5-1. Regional Lithological units

Name	Age	Unit	Description
	Quaternary	Q	unconsolidated glacial, glaciofluvial and glaciolacustrine deposits; fluvial silt, sand, and gravel, and local volcanic ash, in part with cover of soil and organic deposits
Cassiar Suite	Mid-Cretaceous	mKqC	granodiorite, biotite-muscovite granodiorite, quartz diorite, biotite quartz monzonite, granite (Cassiar Suite)
Rosella Group	Lower Cambrian	ICR	resistant, thick bedded to massive, limestone and argillaceous limestone with local archaeocyathid buildups, trilobite fragments, and oolites; pisolitic massive dolomite and limestone; marble, calc-silicate, calcareous phyllite and minor schist.
Boya Group	Lower Cambrian	ICB	light grey to medium brown, fine to medium grained quartz arenite and interbedded argillite, slate, siltstone, phyllite and minor limestone (Boya)
Ingenika Group	Upper Proterozoic to Lower Cambrian	PCI1	calcareous sandstone, shale, quartz-eye grit, quartzite, micaceous quartzite and minor grey limestone generally overlain by phyllite, quartzite, and dolomitic marble; muscovite-chlorite schist, biotite schist, metasandstone and minor calc-silicate (Swannel and Tsaydziz of the Ingenika Gp.)

5.2 Property Geology and Structure (Becker 1999)

Bedrock exposure on the property is poor (<1%) and generally restricted to creek cuts. Most rocks are moderately to strongly foliated with northwesterly strikes and undulating but relatively flat dips. Most of the property is underlain by interbanded grit and schist units with lesser augen gneiss, all of which are believed to be part of the Cassiar Platform. Andesite and quartz-feldspar porphyry dykes are rare and were probably intruded during Cretaceous times. The five main rock types are described below:

Quartz Grit is well foliated, grey to tan weathering and exhibit blocky fracturing. Compositions are variable with the following ranges for individual minerals (Quartz matrix 50-90%; Muscovite 5-30%; Quartz eyes 0-10%; Feldspar tr-30%; Biotite tr-2%). Feldspar bearing specimens exhibit porphyritic textures while the more common micaceous grits are planar.

Muscovite±Biotite±Chlorite Schist is well foliated, grey to tan to green weathering and highly fissile. Mica booklets are well developed (up to 8 mm across) and in some specimens elliptical quartz-feldspar augens are present. Crenulation is common within the schist.

Quartz±Feldspar Augen Gneiss is well foliated, grey weathering and forms large blocky slabs. The matrix consists of quartz and lesser muscovite while augens are comprised of quartz and lesser feldspar. Augens range from 1 to 8 mm long and show variable flattening.

Andesite is massive, pale to dark green and occurs as dykes and sills (0.1 to 2 m thick) within grit and schist units. Amygdules are common and contain quartz and carbonate.

Quartz±Feldspar Porphyry is massive, grey weathering and occurs as dykes (0.3 to 2 m thick) also within grit and schist units. The mineral assemblage consists of coarse-grained quartz and feldspar with occasional muscovite and biotite booklets (up to 5 mm across).

Structural interpretation is limited due to poor outcrop exposure; however, orthogonal joint sets are recognized in parts of the property. The general trends are northwest and southwest coincident with dyke and vein orientations.

6.0 2011 EXPLORATION

6.1 Exploration Program

The 2011 exploration program was carried out from September 28th to October 02nd and consisted of grid soil sampling. Silver Predator contracted Aurora Geosciences of Whitehorse, YT to complete the program. A total of 5 man days were spent to collect 295 samples. Soil crews were flown to the property by a helicopter from Watson Lake and completed the sampling by foot traverses.

Soil samples were collected on 50 m intervals on nine main lines, a total of approximately 15.3 line kilometres. Soil lines are about 100 m apart and are subparallel to northwestern claim boundary line and a stream line running southeast from them (Appendix 5-0).

6.2 Sampling Methodology and Protocols

Most 2011 samples were collected at a depth > 0.3 m using hand-held Dutch augers except where soils were very shallow or sparse, such as in boulder fields. At each sample station, sample descriptions, UTM co-ordinates and photographs were recorded. Location and observational data were recorded when no sample was collected due to ground conditions (i.e., permafrost or boulder field with insufficient fines).

Soil sample descriptions were entered into a hand held device with the following information: geographic location, relief, vegetation, depth of sample, soil horizon, sample color, sample quality, soil texture and moisture.

Samples were freighted to Acme's ISO 9001 certified preparation facility in Whitehorse, YT and the pulps were analyzed at Acme's ISO 9001 certified laboratory in Vancouver. Samples were dissolved in an aqua regia acid solution and then analyzed by ICP-MS methods (package 1DX2-15g). Acme completes quality assurance/ quality control data verification of their assays through internally inserted duplicates, standards and blanks. Assay certificates are compiled in Appendix 3 and the detailed methodology and detection limits are in Appendix 4. Appendix 5 presents the sample locations and geochemical plots for select elements.

Soil samples were ranked by percentile to determine statistical anomalies for the property. Dark blue circles plot samples ranking in the lower 50th percentile, light blue circles are samples ranking in the 50th – 75th percentile, green circles represent samples in the 75th - 90th percentile, yellow circles indicate 90 – 95th percentile, orange 95-98th (labelled) and red circles are the upper 98th-99th percentile (labelled).

6.3 Results

Results from the 2011 soil sampling program (Appendix 5-1 to 5-11) highlight two multi-element anomalies: 1. A strong, ~200 m by 50 m Ag-Pb-Zn anomaly on the PIG 28 claim on the northwestern edge of the property, within the sedimentary and metasedimentary rocks of

Ingenika group. 2. A spotty, ~600 m x 300 m Au-As-Bi anomaly on the PIG 11 and 13 claims, within the sedimentary and metasedimentary rocks of Ingenika group.

Anomaly 1 has the highest silver assays for the grid at 70.4 ppm Ag coinciding with the highest lead sample at 934 ppm Pb. Zinc anomalies are up to 1738 ppm. Worth of noting are other elevated anomalies with the same claim block: arsenic anomaly with values between 35 and 779 ppm, gold anomaly with values up to 5.3 ppb, antimony values ranging from 2.6 to 6.4 ppm and slightly elevated molybdenum anomaly. Although the anomaly 1 does not seem to have any particular trend or shape and is rather scattered in nature over the claim block, Ag-Pb anomalies tend to coincide well and suggest ~1 km long, north-northwestern trend crossing PIG 25 and 28 claims.

Anomaly 2 is spotty and not well defined by a particular trend or shape. It is located a few hundred metres northeast from anomaly 1. It is represented by elevated arsenic (38-96 ppm), elevated gold (1.8-2.7 ppb) and elevated bismuth (1.4-2.9 ppm).

Elevated copper values, up to 37.5 ppm Cu, occur in ~ 200 m by 100 m cluster on the upper eastern portion of the grid crossing PIG 11 and 12 claim boundary. They also coincide with elevated zinc (up to 607 ppm) and lie within the Ingenika sedimentary and metasedimentary units.

Worth of noting is a patch of elevated tungsten (1-3.2 ppm) located on PIG 27 claim, with dimensions of 100 m by 100 m, within the Ingenika sedimentary and metasedimentary units.

7.0 CONCLUSIONS AND RECOMMENDATIONS

The PIG property consists of 28 contiguous mineral claims covering an area of approximately 587 hectares, located in Cassiar Mountains of the southeast Yukon. Silver Predator is targeting silver-lead-zinc mineralization.

The 2011 field program consisted of the collection of 295 gridded soil samples on the northwest portion of the claims. The program identified two new multi-element Ag-Pb-Zn and Au-As-Bi geochemical anomalies. Copper anomalies generally do not overlap with two new multi-element anomalies.

Follow-up work consisting of prospecting and mapping is recommended to investigate the sources of the geochemical anomalies.

8.0 2011 EXPENDITURES

Expenditures for the 2011 exploration program for Quarterback and Pigskin were \$61,894.65 as summarized in Table 8-1. The total number of soil samples collected on both properties was 499: 204 for Quarterback (41%) and 295 for Pigskin (59%).

Table 8-1. 2011 Expenditures

Consulting Fees	Aurora Geosciences Ltd	\$17,589.00
Logistics	Communications	\$270.99
Logistics	Room & Board	\$4,242.66
Analyses	Soil	\$10,730.50
Transportation	Helicopter	\$27,641.25
Transportation	Vehicle	\$1,260.00
Total Expenditures 2011		\$61,894.65

CERTIFICATE OF AUTHOR

I, Karin Fecova of 11th Floor, 888 Dunsmuir, Vancouver, British Columbia, certify that:

I, Karin Fecova, geologist, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in Whistler, British Columbia, hereby certify that:

I graduated from the Simon Fraser University, Burnaby, British Columbia in 2009 with a M.Sc. in Earth Sciences.

In 2006 and from 2010 to present, I have been actively engaged as a geologist in mineral exploration in the Yukon Territory.

I am author of this Report "Assessment Report, 2011 Geochemical Sampling Program, PIGSKIN Project, Watson Lake Mining Division, Yukon , Canada"; dated June 12th, 2012; and

I have reviewed the geological data and am not aware of any material facts or change in facts at the time this certification is dated.

Assay Certificates

1020 Cordova St. East Vancouver BC V6A 4A3 Canada

Acme Analytical Laboratories (Vancouver) Ltd.

www.acmelab.com

Client: **Silver Predator Corp**
201A-170 Titanium Way
Whitehorse Yukon Y1A 1G0 Canada

Submitted By: Farrell Andersen
Receiving Lab: Canada-Whitehorse
Received: October 25, 2011
Report Date: November 09, 2011
Page: 1 of 11

CERTIFICATE OF ANALYSIS

WHI11001813.1

CLIENT JOB INFORMATION

Project: Pigskin
Shipment ID: PIG-2011-AC-1554
P.O. Number: Quotation NA-11-435
Number of Samples: 295

SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Silver Predator Corp
201A-170 Titanium Way
Whitehorse Yukon Y1A 1G0
Canada

CC: Jack Cote
Andrew Caldwell
Gilles Dessureau

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	295	Dry at 60C			WHI
SS80	295	Dry at 60C sieve 100g to -80 mesh			WHI
RJSV	295	Saving all or part of Soil Reject			WHI
1DX2	295	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

* Solubility of some elements will be limited by mineral species present.

^Detection limit = 1 ppm for 15g / 30g analysis.

Limitations:

Au solubility can be limited by refractory and graphitic samples.

METHOD SPECIFICATIONS

GROUP 1D AND 1F – GEOCHEMICAL AQUA REGIA DIGESTION

Package Codes: 1D01 to 1D03, 1DX1 to 1DX3, 1F01 to 1F07
Sample Digestion: HNO₃-HCl acid digestion
Instrumentation Method: ICP-ES (1D), ICP-MS (1DX, 1F)
Applicability: Sediment, Soil, Non-mineralized Rock and Drill Core

Method Description:

Prepared sample is digested with a modified Aqua Regia solution of equal parts concentrated HCl, HNO₃ and DI H₂O for one hour in a heating block of hot water bath. Sample is made up to volume with dilute HCl. Sample splits of 0.5g, 15g or 30g can be analyzed.

For 1F07, Lead isotopes (Pb₂₀₄, Pb₂₀₆, Pb₂₀₇, Pb₂₀₈) are suitable for geochemical exploration of U and other commodities where gross differences in natural to radiogenic Pb ratios, is a benefit. Isotope values can be reported in both concentrations and intensities. Sample splits of 0.25g, 0.5g, 15g or 30g can be analyzed.

QUATERNARY

Q: QUATERNARY:
unconsolidated glacial, glaciofluvial and
glaciolacustrine deposits; fluvialite silt, sand, and
gravel, and local volcanic ash, in part with cover of
soil and organic deposits

MID-CRETACEOUS

mKgC: CASSIAR SUITE:
granodiorite, biotite-muscovite granodiorite, quartz
diorite, biotite quartz monzonite, granite (Cassiar
Suite)

LOWER CAMBRIAN

ICR: ROSELLA:
resistant, thick bedded to massive, limestone and
argillaceous limestone; local archaeocyathid buildups,
trilobite fragments, oolites, and pisolites; pisolitic massive
dolostone and limestone; marble, calc-silicate, calcareous
phyllite and minor schist (Rosella)

ICB: BOYA:
light grey to medium brown, fine to medium grained
quartz arenite and interbedded argillite, slate, siltstone,
phyllite and minor limestone (Boya)

UPPER PROTEROZOIC TO LOWER CAMBRIAN

PCI1: INGENIKA:
calcareous sandstone, shale, quartz-eye grit, quartzite,
micaceous quartzite and minor grey limestone generally
overlain by phyllite, quartzite, and dolomitic marble;
muscovite-chlorite schist, biotite schist, metasandstone
and minor calc-silicate (Swannel and Tsaydiz of the
Ingenika Gp.)
