BREAKAWAY EXPLORATION MANAGEMENT INC.

Summary

From August 15, 2010 to November 23, 2010 Taku Gold Corp. completed a surface exploration program on the 451-claim (9335ha) Dan property located on the northeast border of Reindeer Creek, some 45km south of Dawson City, Yukon. The work included soil geochemical and airborne geophysical surveys. The goal of the work was to identify potential gold-bearing structures by outlining geophysical and geochemical trends.

The Dan property is held 100% by Taku Gold Corp. under the terms of an agreement with Shawn Ryan subject to 2% royalty on mineral production. The Property is located in an isolated part of the Yukon with no local resources or infrastructure. Fuel, supplies and equipment can be flown in from Dawson City by helicopter.

Previous work on Dan is very limited. No work has been reported on the current Property claims. Mineral showings including asbestos, gold in quartz veins and limestone are recorded in the vicinity of the Property. Minimal work has been completed on these showings including mapping and trenching.

The Property lies within the Yukon-Tanana Terrane which consists of several successions of complexly deformed Late Proterozoic to Late Permian sedimentary and volcanic rocks episodically intruded by various intrusive rocks in the Permian, Jurassic, Cretaceous, and Tertiary periods. The intrusive events have been accompanied by volcanic activity especially in the Upper Jurassic to Lower Cretaceous. Limited mapping on the Property indicates that there is a thrust fault striking northwest-southeast along the length of the Property.

The Property lies in the underexplored Klondike-White Gold district of the loosely defined Tintina Gold Belt. Taku's exploration effort at Dan is based on practical survey methods that generate drill targets and have led to discoveries in the area including Underworld's May 2009 discovery of the Saddle and Arc zones approximately 55km south of Dan. Detailed geochemical surveys and closely spaced, low altitude, helicopter-borne geophysical surveys have been proven to be effective in the area. Due to the deeply weathered nature of the soils in this unglaciated area, it is very important to take samples from the deeper C-horizon.

A 1090.7 line kilometer high resolution magnetic and radiometric airborne survey flown on flight lines spaced 100m apart was completed over the entire Dan property from August 15, 2010 to September 26, 2010. A 1931-sample deep auger-type soil geochemical survey was completed in four grids from September 23, 2010 to October 17, 2010. The soil samples were collected with hand augers at 50m sample intervals along predetermined GPS traverse lines spaced 100m apart. The samples were analyzed for 36 elements by ISO 9001-accredited Acme Analytical Laboratories Ltd.

The soil samples returned gold values ranging from below the detection limit (i.e. <5ppb Au) to a maximum of 212ppb Au. The soil results were generally low but there were two significant results of 115ppb Au and 212ppb Au. Although these two values occur on the thrust fault as indicated by the airborne magnetic data, no gold-in-soil trends were defined by the soil sampling.

The surface work met its primary goal of outlining geophysical or geochemical trends that may potentially be gold-bearing structures. It is the Authors' opinion that the Dan property is of sufficient merit to recommend that surface exploration work continue. It is recommended that a soil geochemical survey be conducted over the remainder of the property in a ridge and spur manner. Collecting deeper C-horizon samples must be emphasized for this survey. It is estimated that the proposed work will cost $375,000.

Certificate of Qualifications

I, Mark Fekete, having my place of residence at 178 Dennison Boulevard in Val d'Or in the Province of Quebec do hereby certify that:

1. I obtained a Bachelor of Science Degree in Geology from the University of British Columbia in 1986, I have been engaged as a Geologist continuously since 1986 and I am a Member in good standing of the Order of Geologists of Quebec (OGQ #553) and the Association of Professional Engineers and Geoscientists of British Columbia (APEGBC #31440), and I am a "qualified person" as defined in Section 1.2 in and for the purposes of National Instrument 43-101;

2. I have visited the Dan property on numerous occasions including most recently in July 2011;

3. I co-wrote and I am, as the senior author and qualified person, responsible for the contents of this technical report entitled "Surface Work Performed from August 1, 2010 to December 10, 2010 on the Dan Property, Dawson Mining District, Yukon, NTS Sheets 115O11, 115O12, and 115O13, 63°39'N. Lat., 139°30'W. Long.," based on my professional experience, a review of relevant reports and maps made available to me from government and corporate sources and my participation in the work programs described in the report;

4. I am not aware of any material fact or material change with respect to the subject matter of the report that is not disclosed in the report which, by its omission, makes the report misleading;

5. I am an Officer and Director and I beneficially hold a number of shares in Taku Gold Corp.;

6. I hold no direct interest in the Dan property as a result of my prior involvement with the property; and

7. I have read, and this report has <u>not</u> been prepared for the purposes, or in full compliance with, National Instrument 43-10, 1 and according to Form 43-101F1.

Respectfully submitted this 1st day of August 2011,

(s) "Mark Fekete"

Certificate of Qualifications

I, Neda Dokic, having my place of residence at 60 Stope Way in Whitehorse in the Territory of the Yukon do hereby certify that:

1. I obtained a Bachelor of Science Degree in Geology from Acadia University in May 2011, I have been engaged as a Geologist in Training ("GIT") continuously since May 2011 and I am not a "qualified person" as defined in Section 1.2 in and for the purposes of National Instrument 43-101;

2. I have visited the Dan property on numerous occasions including most recently in July 2011;

3. I co-wrote this technical report entitled "Surface Work Performed from August 1, 2010 to December 10, 2010 on the Dan Property, Dawson Mining District, Yukon, NTS Sheets 115O11, 115O12, and 115O13, 63°39'N. Lat., 139°30'W. Long.," under the supervision of Mark Fekete, P.Geo.;

4. I am not aware of any material fact or material change with respect to the subject matter of the report that is not disclosed in the report which, by its omission, makes the report misleading;

5. I do not beneficially hold a number of shares in Taku Gold Corp.;

6. I hold no direct interest in the Dan property as a result of my prior involvement with the property; and

7. I have read, and this report has not been prepared for the purposes, nor in full compliance with, National Instrument 43-10, 1 and according to Form 43-101F1.

Respectfully submitted this 1st day of August 2011,

(s) "Neda Dokic"

1. Introduction and Terms of Reference

Breakaway Exploration Management Inc. ("Breakaway") was retained by Taku Gold. Corp. ("Taku") to write a technical report (the "Report") describing the surface exploration work carried out on the Dan property ("Dan" or the "Property") in Yukon in 2010. The Report describes the soil geochemical and airborne geophysical surveys that were completed.

The goal of the surface work was to identify areas of anomalous gold-in-soil and/or geophysical trends that may be related to the gold bearing structures similar to Kinross's White Gold deposit located about 55km south of the Property.

The Report is based primarily on the results of the work completed on Dan in 2010 but also contains information obtained from a review of relevant reports and maps cited throughout the Report. The Report was prepared by Geologist in Training Neda Dokic (the "Junior Author") under the supervision of Professional Geologist Mark Fekete (the "Senior Author"). The Senior Author has visited and personally inspected the Property on numerous occasions most recently in July 2011. The Senior Author is the designated "qualified person" as defined in Section 1.2 in and for the purposes of National Instrument 43-101. The main purpose of the Report is to complete statutory assessment work filings required under the Yukon Quartz Mining Act. It is not intended to and does not fully comply with National Instrument 43-101. The Report contains specific recommendations and proposes a budget for further work.

The metric system is used for all units of measure mentioned in the Report and all dollar amounts are in Canadian funds unless otherwise stated. All figures presented in the Report are plotted in map projection UTM NAD 83, Zone 7 unless otherwise stated.

2. Reliance on Other Experts

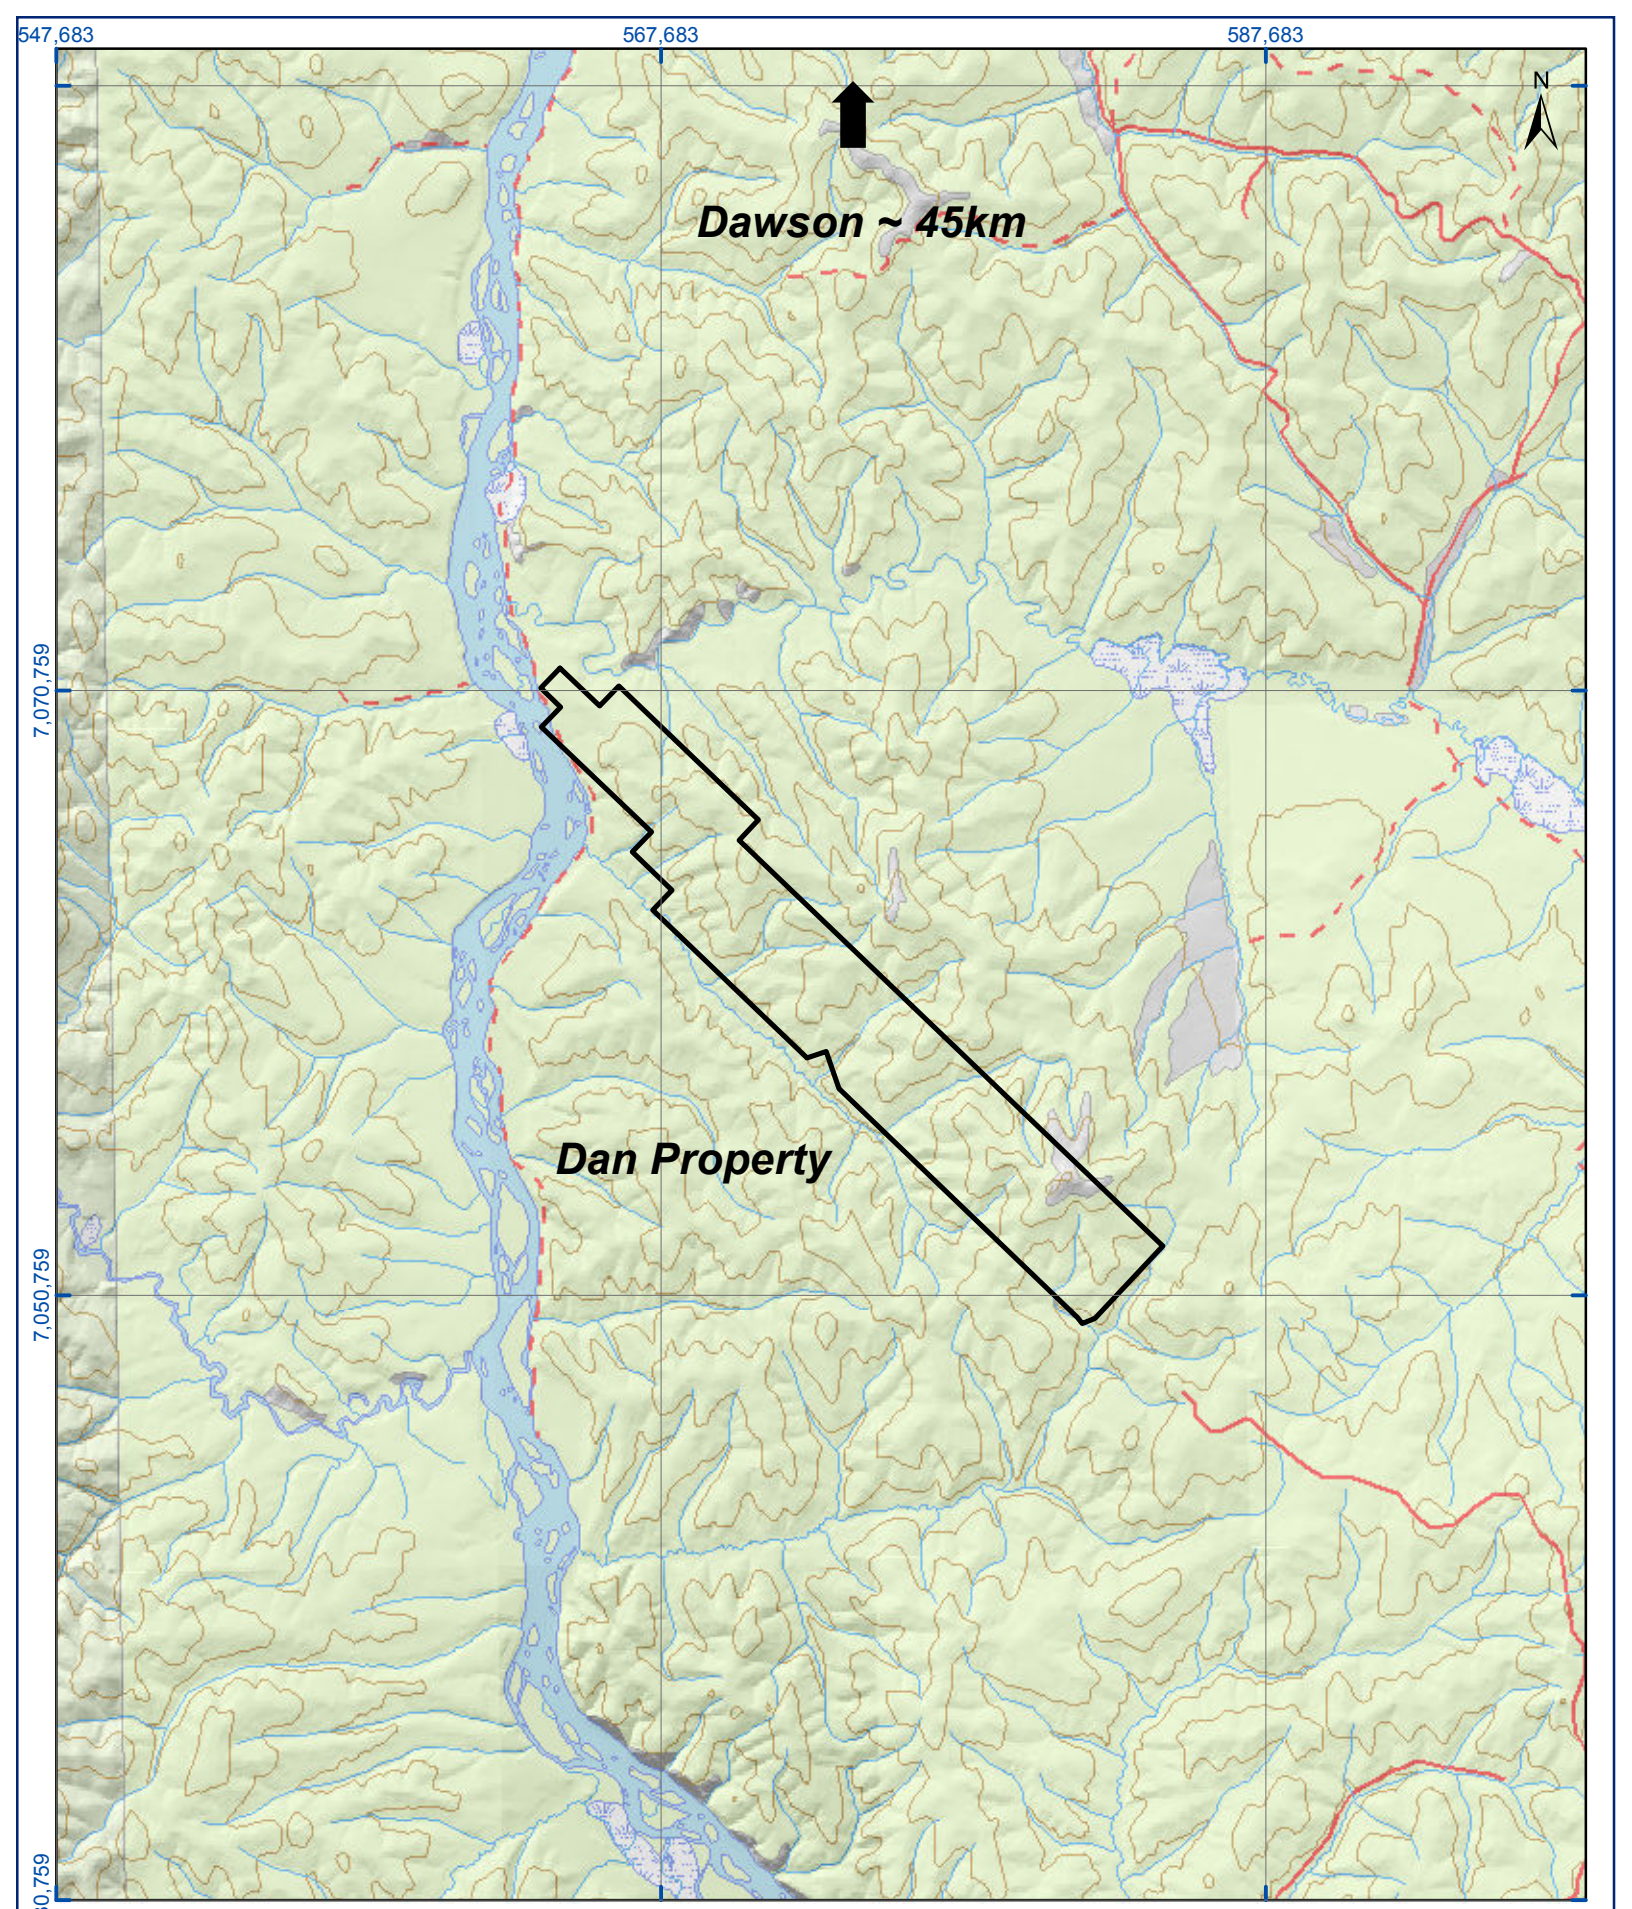

The Authors may have relied on technical data and interpretations found in various sources cited throughout the report. The Authors may not have verified this information and take no responsibility for its accuracy or completeness. Reference to the compliance or non-compliance with NI 43-101 standards of historical information and data referred to in this Report are made where appropriate. The Authors do not offer any opinion concerning legal, title, environmental, political or other non-technical issues that may be relevant to the Report. The Report may contain links to several web-sites. The Authors take no responsibility for the functionality or content of these websites.

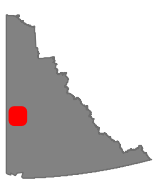

3. Location and Property Description

The Property covers an approximate area of 9,335 hectares within the Dawson Mining Division of Yukon. It is located on the northeast border of Reindeer Creek, a tributary of the Yukon River, some 45km south of Dawson City (Figure 1). The approximate centre of the Property is described by 63°39'00" North Latitude and 139°30'00" West Longitude on N.T.S. Sheets 115O11, 115O12 and 115O13. The Property includes 451 contiguous, un-surveyed mineral titles (Figure 2) more fully described in Table 1 below.

Table 1 - List of Claims

Figure 2. Claims Map
Taku Gold Corp.
NTS Sheet: 115O/11-14
Date: October 21, 2011

On March 3, 2010 Taku entered into an agreement with Shawn Ryan to acquire the Property. Under the agreement Taku has the option to earn 100% interest for total consideration of two-hundred and fifty dollars ($250,000) cash, one million (1,000,000) treasury shares and the completion of one million ($1,000,000) in exploration expenditures on the Property over a four year period. Shawn Ryan is entitled to a production royalty (the "Royalty") consisting of two per cent (2%) Net Smelter Return ("NSR") royalty on all smeltable minerals of metals extracted from the claims. Taku has the right to purchase one-half (or one per cent) of the Royalty for two million dollars ($2,000,000) cash.

The mineral claims included in the Property were acquired under the Yukon Quartz Mining Act which grants only the hard rock mineral rights to the claim holder. The surface rights for the area of the Property are held by the Crown. To maintain the claims in good standing, a minimum of $100 assessment work per claim must be completed annually. There are provisions to apply for more than one year work at a time up to a maximum of five years, to apply work from one claim to other adjoining claims (grouping) up to a maximum of 750 contiguous claims and to pay cash in lieu of work up to a maximum of five years. The Quartz Mining Land Use Regulations consist of a classification system based on varying levels of specific activities. These threshold levels categorize exploration activities into four classes of operation. Classes 1 through 4 represent activities with increasing potential to cause adverse environmental impacts.

Activities within a Class 1 program are defined as "grassroots" exploration with low potential to cause adverse environmental effects, and where activities and reclamation are completed within a year. A Class 1 program does not require government approval but the operator must comply with the certain operating conditions. An assessment under the Yukon Environmental and Socio Economic Assessment Act ("YESAA") is not required for a Class 1 program.

Class 2 programs are considered to represent the upper level of "grassroots" exploration activities. A notification submitted through the Mining Lands Office which outlines the activities and how they will be reclaimed is required. These programs comprise activities that have a moderate potential to cause adverse environmental effects and therefore require an assessment through YESAA. All work and reclamation must be completed within one year.

All Class 3 and Class 4 programs require submission of a detailed "Operating Plan" to the Mining Lands Office. A YESAA assessment is required. The Operating Plan must be approved before any exploration activities can be undertaken. Operating Plans may entail multi-year exploration programs to allow greater flexibility for the operator.

The work described in this Report was completed as a Class 1 Program.

4. Accessibility, Local Resources, Infrastructure, Physiography and Climate

Access to the Property is restricted due to a lack of usable roads on or adjacent to the Property. The primary means of access is by helicopter from Dawson City.

The Dan property is located in an isolated part of Yukon with relatively few local resources or infrastructure. The Property can be worked from Dawson City by helicopter or from an exploration camp set up on or near the Property. A camp can be supported from Dawson City, where services are limited, or from Whitehorse where a full range of services are available including line-cutting, geophysics, drilling, assaying, aircraft charters etc.

The Property borders the northeastern edge of Reindeer Creek in the Dawson Range of Yukon. Unlike most parts of Yukon, the Dawson Range was not affected by the last period of continental glaciations and so it is characterized by low rolling hills incised with steep sided, V-shaped valleys. Bedrock is typically deeply weathered and there is very little (perhaps less than 5%) outcrop exposed; usually on ridges above tree-line or in rare canyons in the creek valleys. Elevations on the Property range from 336m to 1,463m above sea level. Most of the Property lies below tree-line and is covered by a typical boreal mixture of pine, spruce, balsam fir, aspen and birch trees, and willow and alder brush. North and west slopes are often covered with thick moss blanketing permafrost.

The Dawson City area is characterized by a semi-arid, sub-arctic continental climate with mild to hot summers and cold winters. Precipitation is generally light in the summer and overall clear skies and warm temperatures prevail. Heavy morning fog can be a problem for aircraft especially towards the end of the summer season. Forest fires are common and thick smoke at times may impede exploration work. Maximum snow accumulations in the winter are typically less than one meter. Due to the northerly latitude of the region, summer days are long and winter days very short. The best season for exploration is during the summer months from mid-May to mid-October. Although it is possible to work during the winter months, costs rise exponentially due to cold temperatures, inclement weather and short daylight hours.

5. Exploration History

The following exploration history of the Property has been compiled from the Yukon Energy and Mines and Resources Library and Yukon Geological Survey MINFILE database. There has been limited exploration work on the Property. There are no assessment reports for any work done on and adjacent to the present Property.

There are a number of mineral showings documented within and adjacent to the area of the Property listed in Table 2 below:

Table 2 - MINFILE Showings

MINFILE No.	MINEFILE Name	Link
115O 047	Indian	115O 047
115O 048	Bishop	115O 048
115O 050	Rudolf	115O 050
115O 109	Ruby	115O 109
115O 124	Hobbs	115O 124

The Indian showing is reported as a small body of serpentine, which is thrust fault-bounded, and contains minor amounts of asbestos fibers (MINFILE No. 115O 047)

The Bishop showing is reported to be gold in quartz veins. In 1903 this showing was trenched and from 1912 to 1913 a 17m shaft was sunk. (MINFILE No. 115O 048)

The Hobbs showing is found to be a limestone bluff. It has been mapped to have an extent of 90m long by 7.6m high. (MINFILE No. 115O 124)

There has been no reported work completed in the past on the Dan property. Areas adjacent to the Property have been staked in the past and minor amounts of work have been completed on these staked areas including trenching and mapping.

6. Geology

The Property lies within the Yukon-Tanana Terrane which, due to large areas with little or no bedrock exposure and limited modern regional or detailed mapping, remains very poorly understood. Generally it consists of several successions of layered sedimentary and volcanic rocks ranging from Late Proterozoic to Late Permian age that overlay the older Nisling Terrane. These complexly deformed layered rocks have been episodically intruded by various intrusive rocks in the Permian, Jurassic, Cretaceous and Tertiary periods. The intrusive events have been accompanied by volcanic activity especially in the Upper Jurassic to Lower Cretaceous. The Yukon-Tanana has been subjected to numerous prolonged deformational events including subduction and accretion that has led to significant structural thickening. Imbricated allochthonous terranes such as Slide Mountain Terrane are evidenced by altered ultramafic fragments.

The most recent regional mapping and compilation work in the Stewart River area (Ryan and Gordey, 2004) indicates that the Property lies along a thrust fault which strikes northwest to southeast (Figure 3). The southwest side of the thrust fault is thought to be underlain mainly by a Devonian Orthogneiss (DMogg). This unit is generally pink to orange k-feldspar and is commonly banded or layered with biotite.

The northeast side of the fault is thought to be underlain by the Nasina Assemblage (DMNq) which consists mainly of a dark grey to black carbonaceous quartzite. There is a Paleozoic Ultramafic-Gabbro (mPums) body mapped in the northern most extremity of the Property, which is dominantly serpentinite. In sections along the northeastern border the Nasina Assemblage (DMNq) is inferred to be a marble. In the middle of the Property is an inferred granitic intrusion (Figure 4).

7. Deposit Types

The Property lies within an underexplored part of the loosely defined Tintina Gold Belt. This metallogical province has past production of 29.9 million ounces and 39.3 million ounces of resources for total gold resources of 69.2 million ounces. Notable gold deposits are Donlin Creek, Ft. Knox, Pogo and Brewery Creek. The underexplored nature of the Klondike-White Gold district was highlighted by Underworld's discovery of the Saddle and Arc zones in May 2009 on the White property located 55km south of Dan, and more recently by the Supremo discovery on Kaminak's Coffee property located approximately 85km south of Dan.

The Klondike-White Gold district lies within the larger Dawson Range area where a number of known gold and porphyry copper deposits show a wide range of styles, geological settings and geochemical associations. Taku's exploration effort at Dan is not adhering to any firm deposit model but is instead based on practical survey methods that generate drill targets and have led to discoveries by other groups working in the area.

Detailed geochemical surveys have proven to be effective in the area, as shown by prospector Shawn Ryan's success on the White and Coffee properties. The Dawson Range generally shows deeply weathered, oxidized soils in a periglacial environment. This simply means that in order to collect soils that best represent the underlying bedrock it is necessary to take relatively deep soil samples that are likely less weathered and less oxidized. Another useful exploration tool is to fly closely spaced, low altitude, helicopter-borne geophysical surveys to assist in interpreting bedrock units, structure, and alteration.

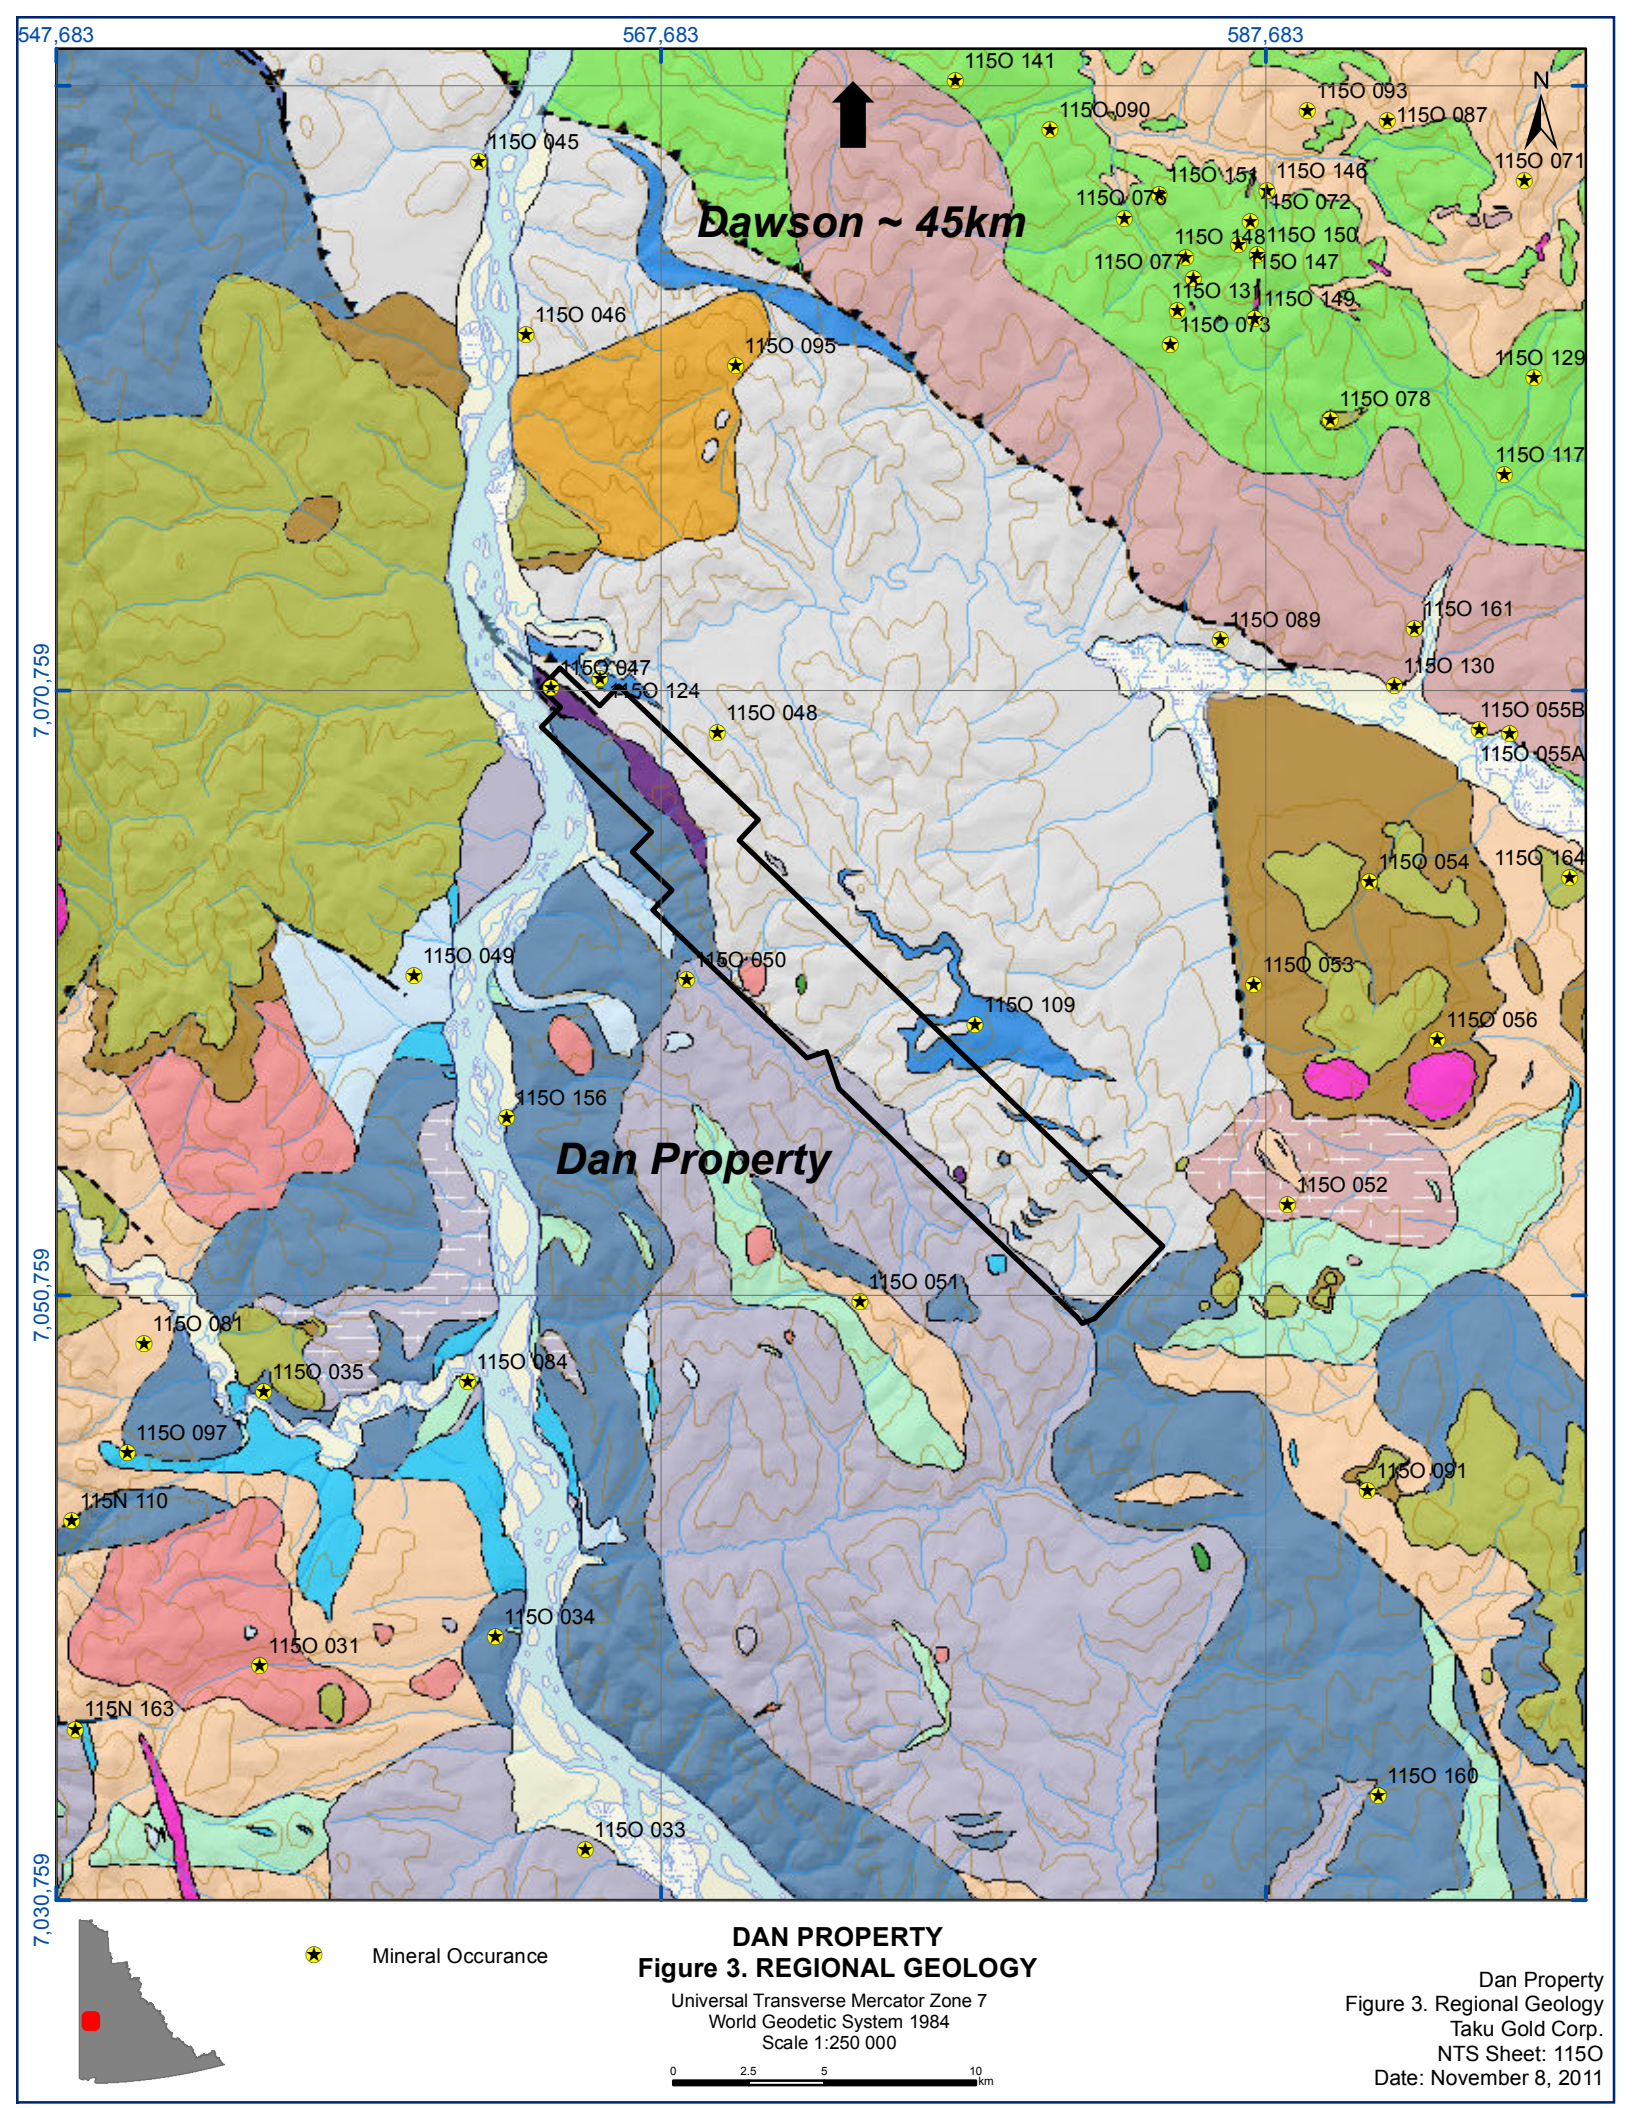

8. Mineralization

Very little *in situ* mineralization has been identified on the Property to date due primarily to the lack of outcrop. A number of quartz veins and quartz breccias have been uncovered with or without disseminated sulphides.

9. 2010 Exploration Work

9.1. Introduction

Exploration work in 2010 included an airborne geophysical survey over the entire property and multiple grid deep auger-type soil geochemical surveys over the northern part of the Property. Limited prospecting and sampling was completed as well. The geophysical survey was done from August 15, 2010 to September 26, 2010. The soil sampling commenced on September 23, 2010 and was completed on October 17, 2010. The the analytical work was done from November 1 to 23, 2010. A detailed Statement of Work is included herein as Appendix A. The Junior Author compiled the field data into digital maps and wrote this Report up to August 1, 2011.

9.2. Airborne Geophysical Survey

The multi-sensor airborne geophysical survey was completed by Precision Geosurveys Inc. of Vancouver, British Columbia with a helicopter flying grid lines at 100 meter line spacings. A total of 1090.7 line kilometers of data were collected. A high resolution magnetometer system was used to assist in interpreting bedrock units, structure, and alteration. A radiometric system consisting of a multichannel spectrometer with state-of-the-art design and large gamma ray sensing crystals was used to map lithology and alteration. Included in the Report are coloured summary contour maps for the total field magnetic intensity (Figure 5), total radiometric count (Figure 6), percent potassium (Figure 7), parts per million thorium (Figure 8), and parts per million uranium (Figure 9). A full description and data CD of the airborne geophysical survey is included herein as Appendix E (Volume II).

9.3. Sampling and Analytical Procedures

A soil geochemical survey was done on foot and by helicopter by Ground Truth Exploration Inc. crews from Dawson City and a camp set up near the Property. A total of 1,931 deep auger-type soil samples were collected on one main grid and three smaller grids with hand augers at 50m sample intervals on lines spaced 100m apart using GPS traverse lines. These sampling grid locations were chosen based on the airborne magnetic survey results.

Sample locations were flagged in the field and recorded with Garmin 76CX GPS receivers in map datum UTM NAD 83 Zone 7. Sample descriptions were recorded with HP iPaq filed computers. The GPS and iPaq data was post processed by Ground Truth into a customized database. Sample locations (Figure 10) and descriptions are included as Appendix B. A data CD is also included. Soil sample material varied from clay to sand with some humus samples. Sample depth varied from 5 to 110cm with an average depth of 60cm.

Soil samples were placed in Kraft-type paper bags with the appropriate sample numbers marked in indelible ink. Batches of samples were subsequently dried, sealed in rice bags and shipped to Acme Analytical Laboratories Ltd. (“Acme”) in Vancouver, B.C. for analysis. Samples were dried and sieved to -80 mesh size and analyzed for 36 elements (including gold) by 15 gram Aqua Regia digestion, ICP-MS finish (Appendix C). Acme is accredited under ISO 9001.

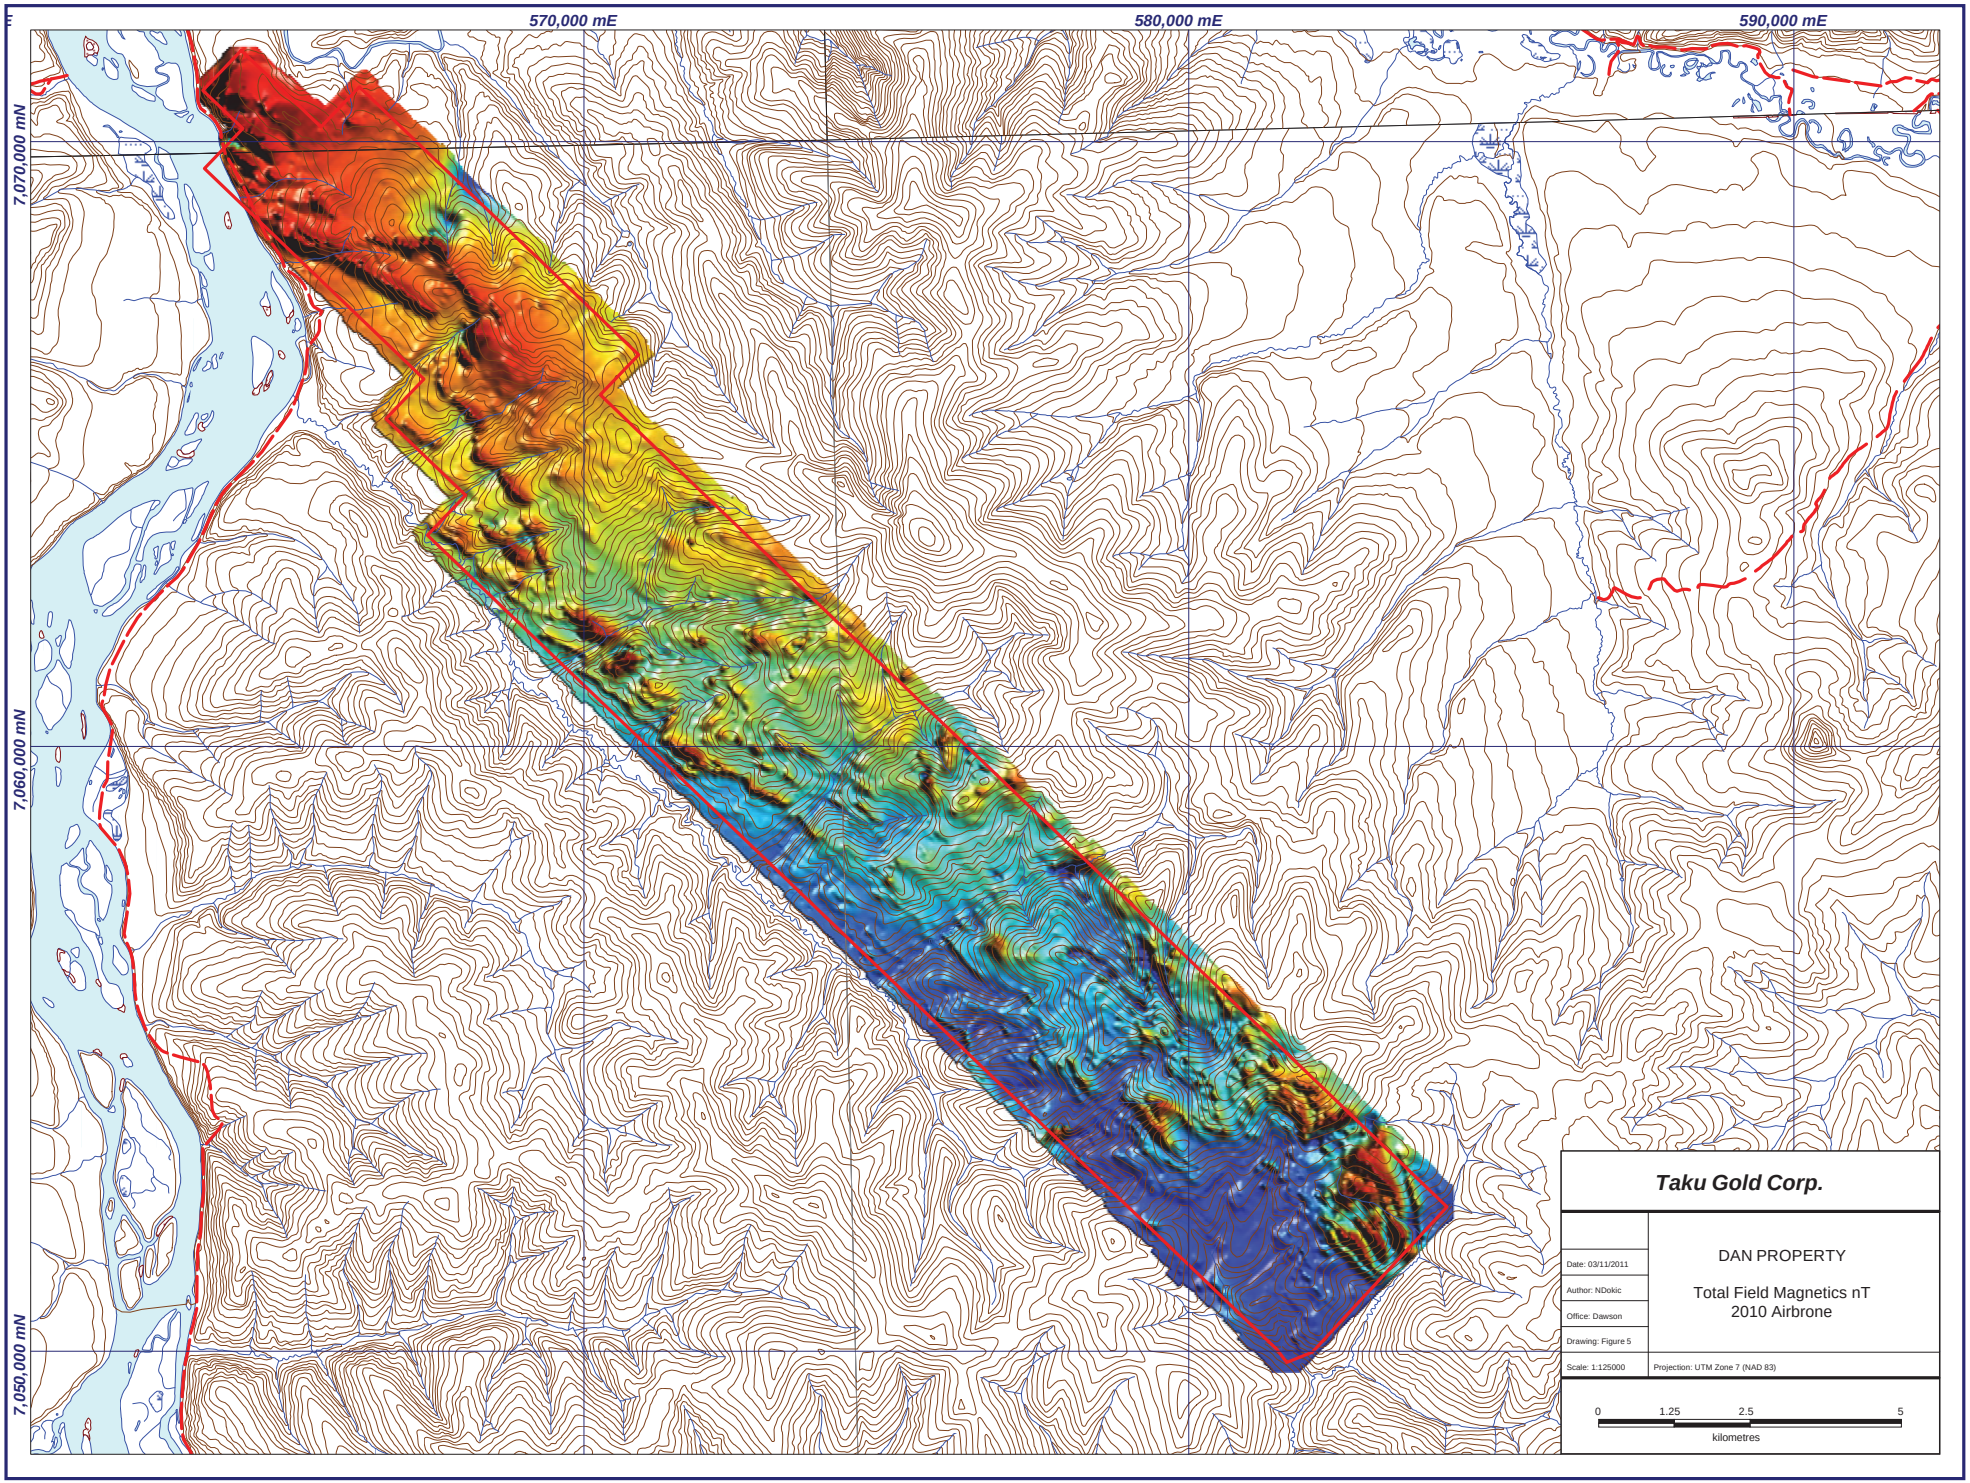

9.4. Data Verification

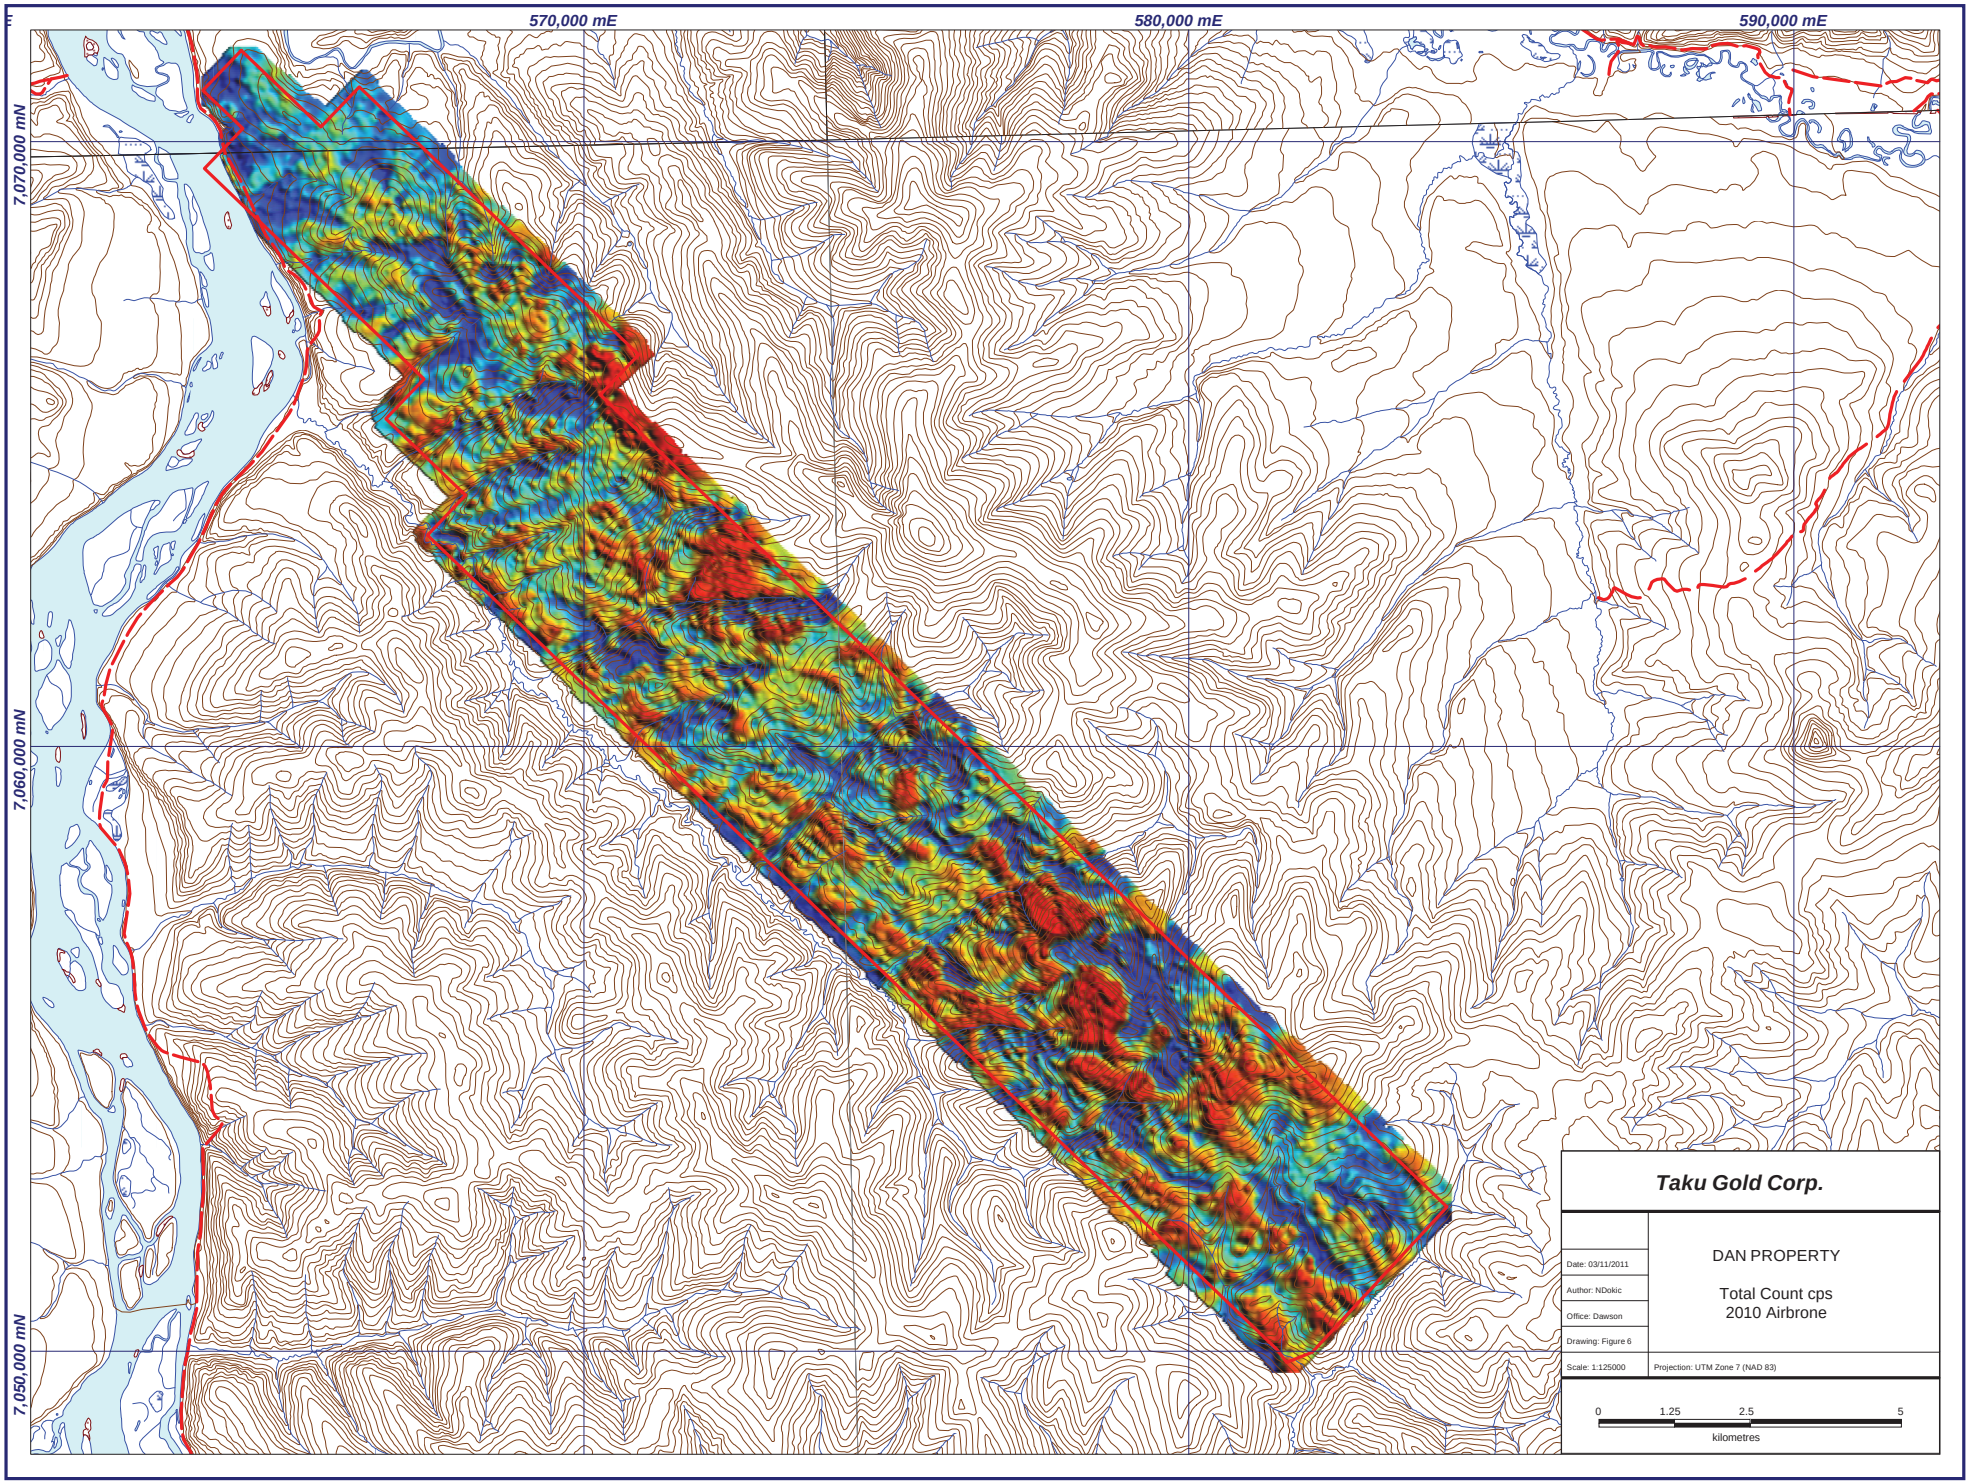

It is the Authors’ opinion that the sampling procedures, security measures, sample preparations and analytical methods applied to the soil and rock samples were diligently followed and are adequate to meet industry standards commonly accepted for this level of exploration. The Authors have relied upon the adequacy and accuracy of the analytical results provided by Acme. Independent verification of those results has not been undertaken. The Senior Author reconciled the field data with the analytical results and found no discrepancies.

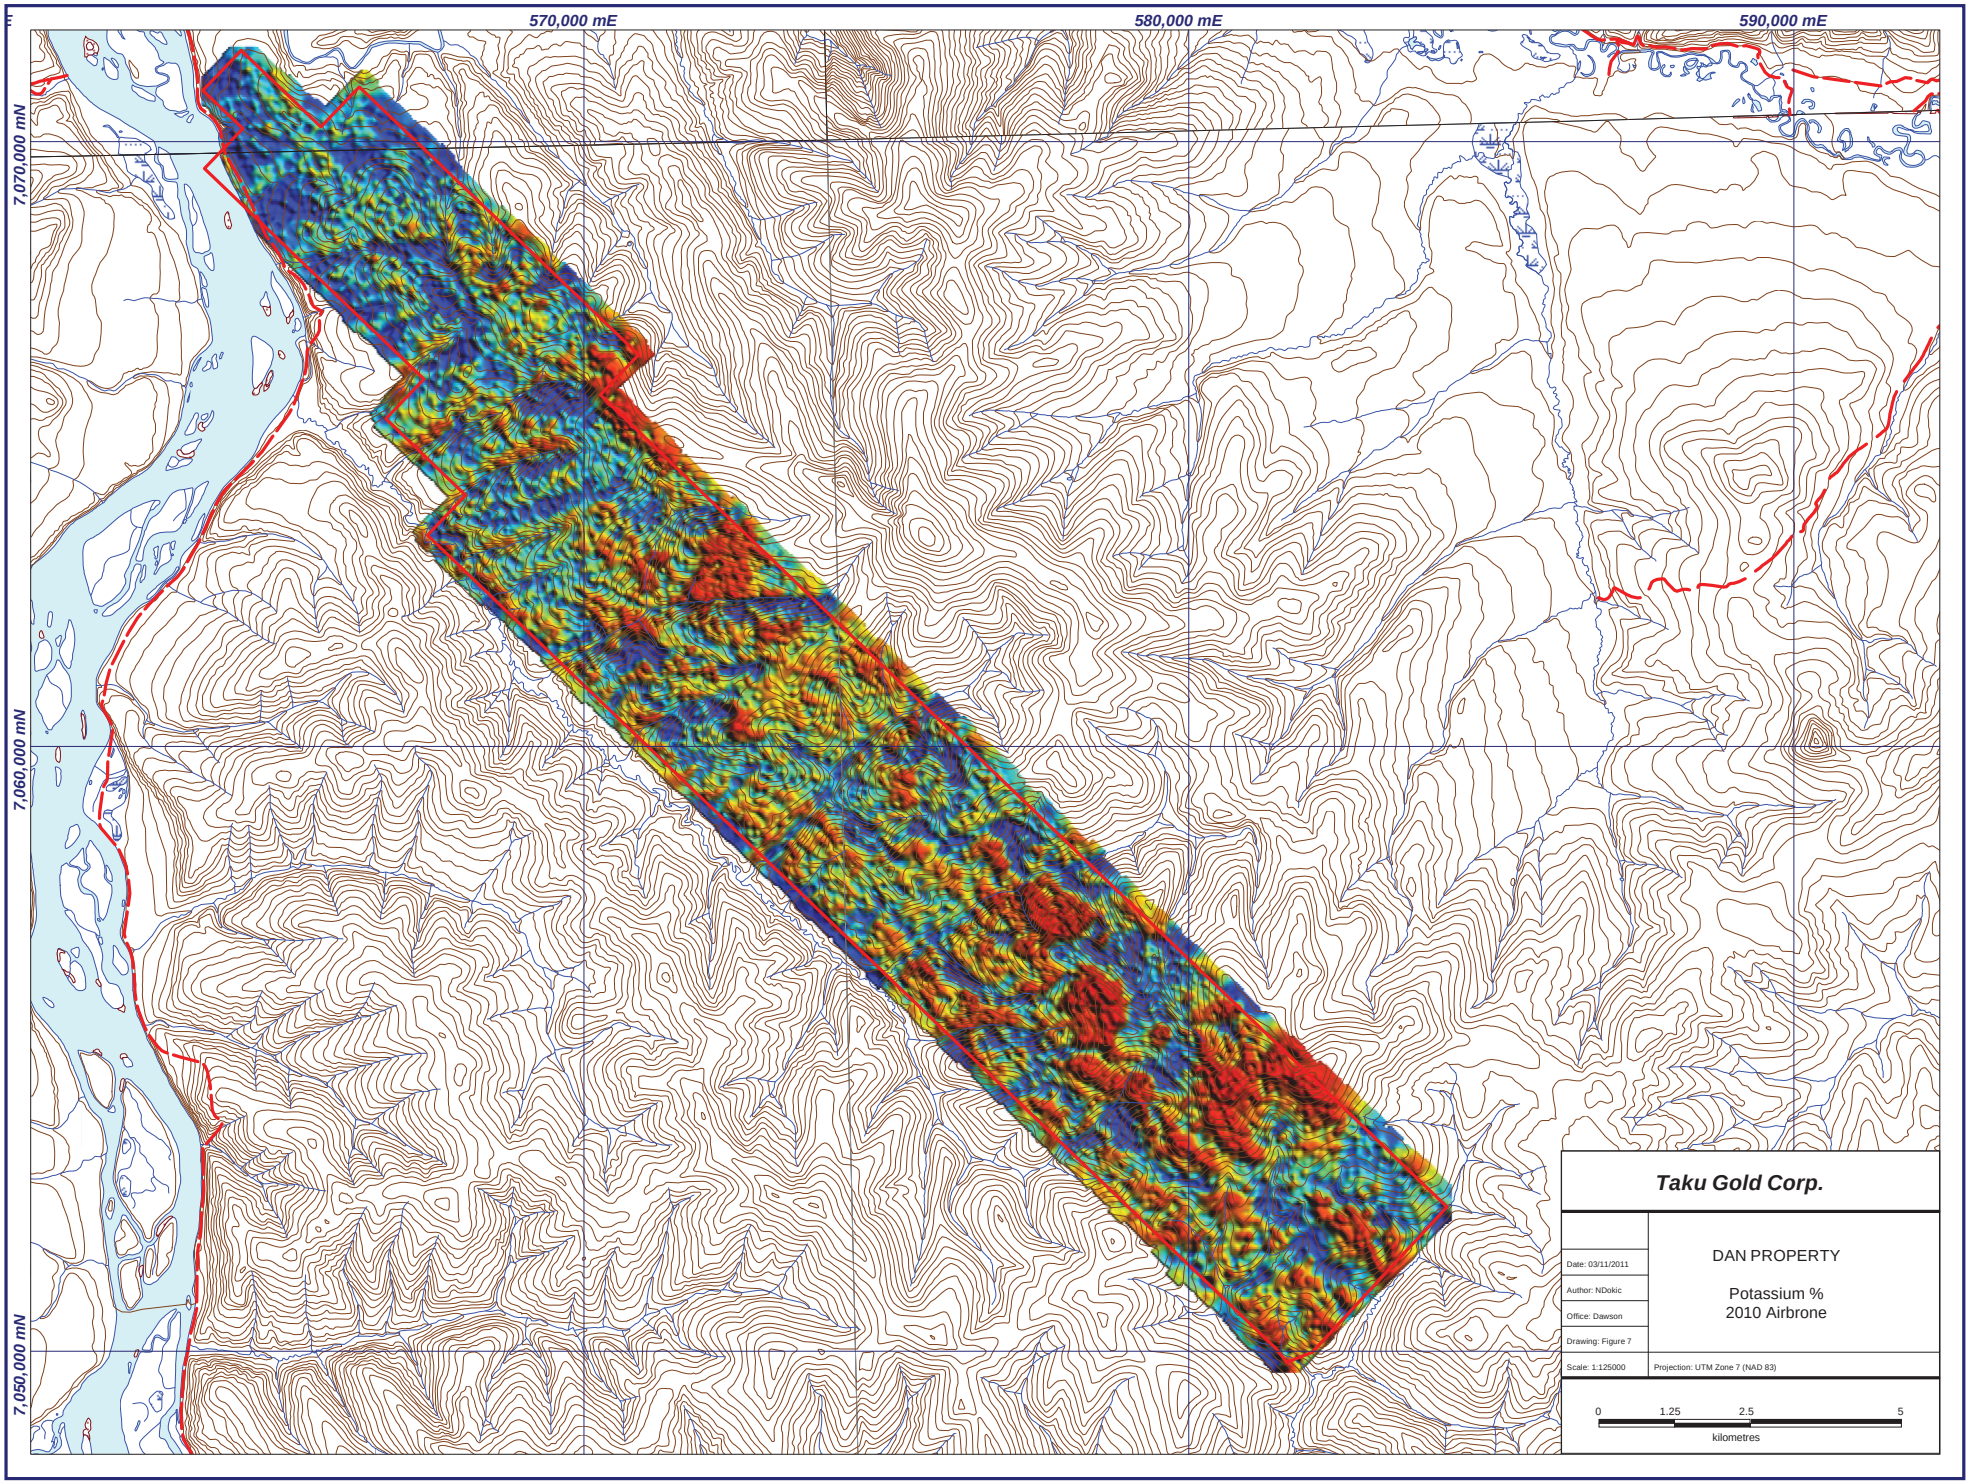

9.5. Results

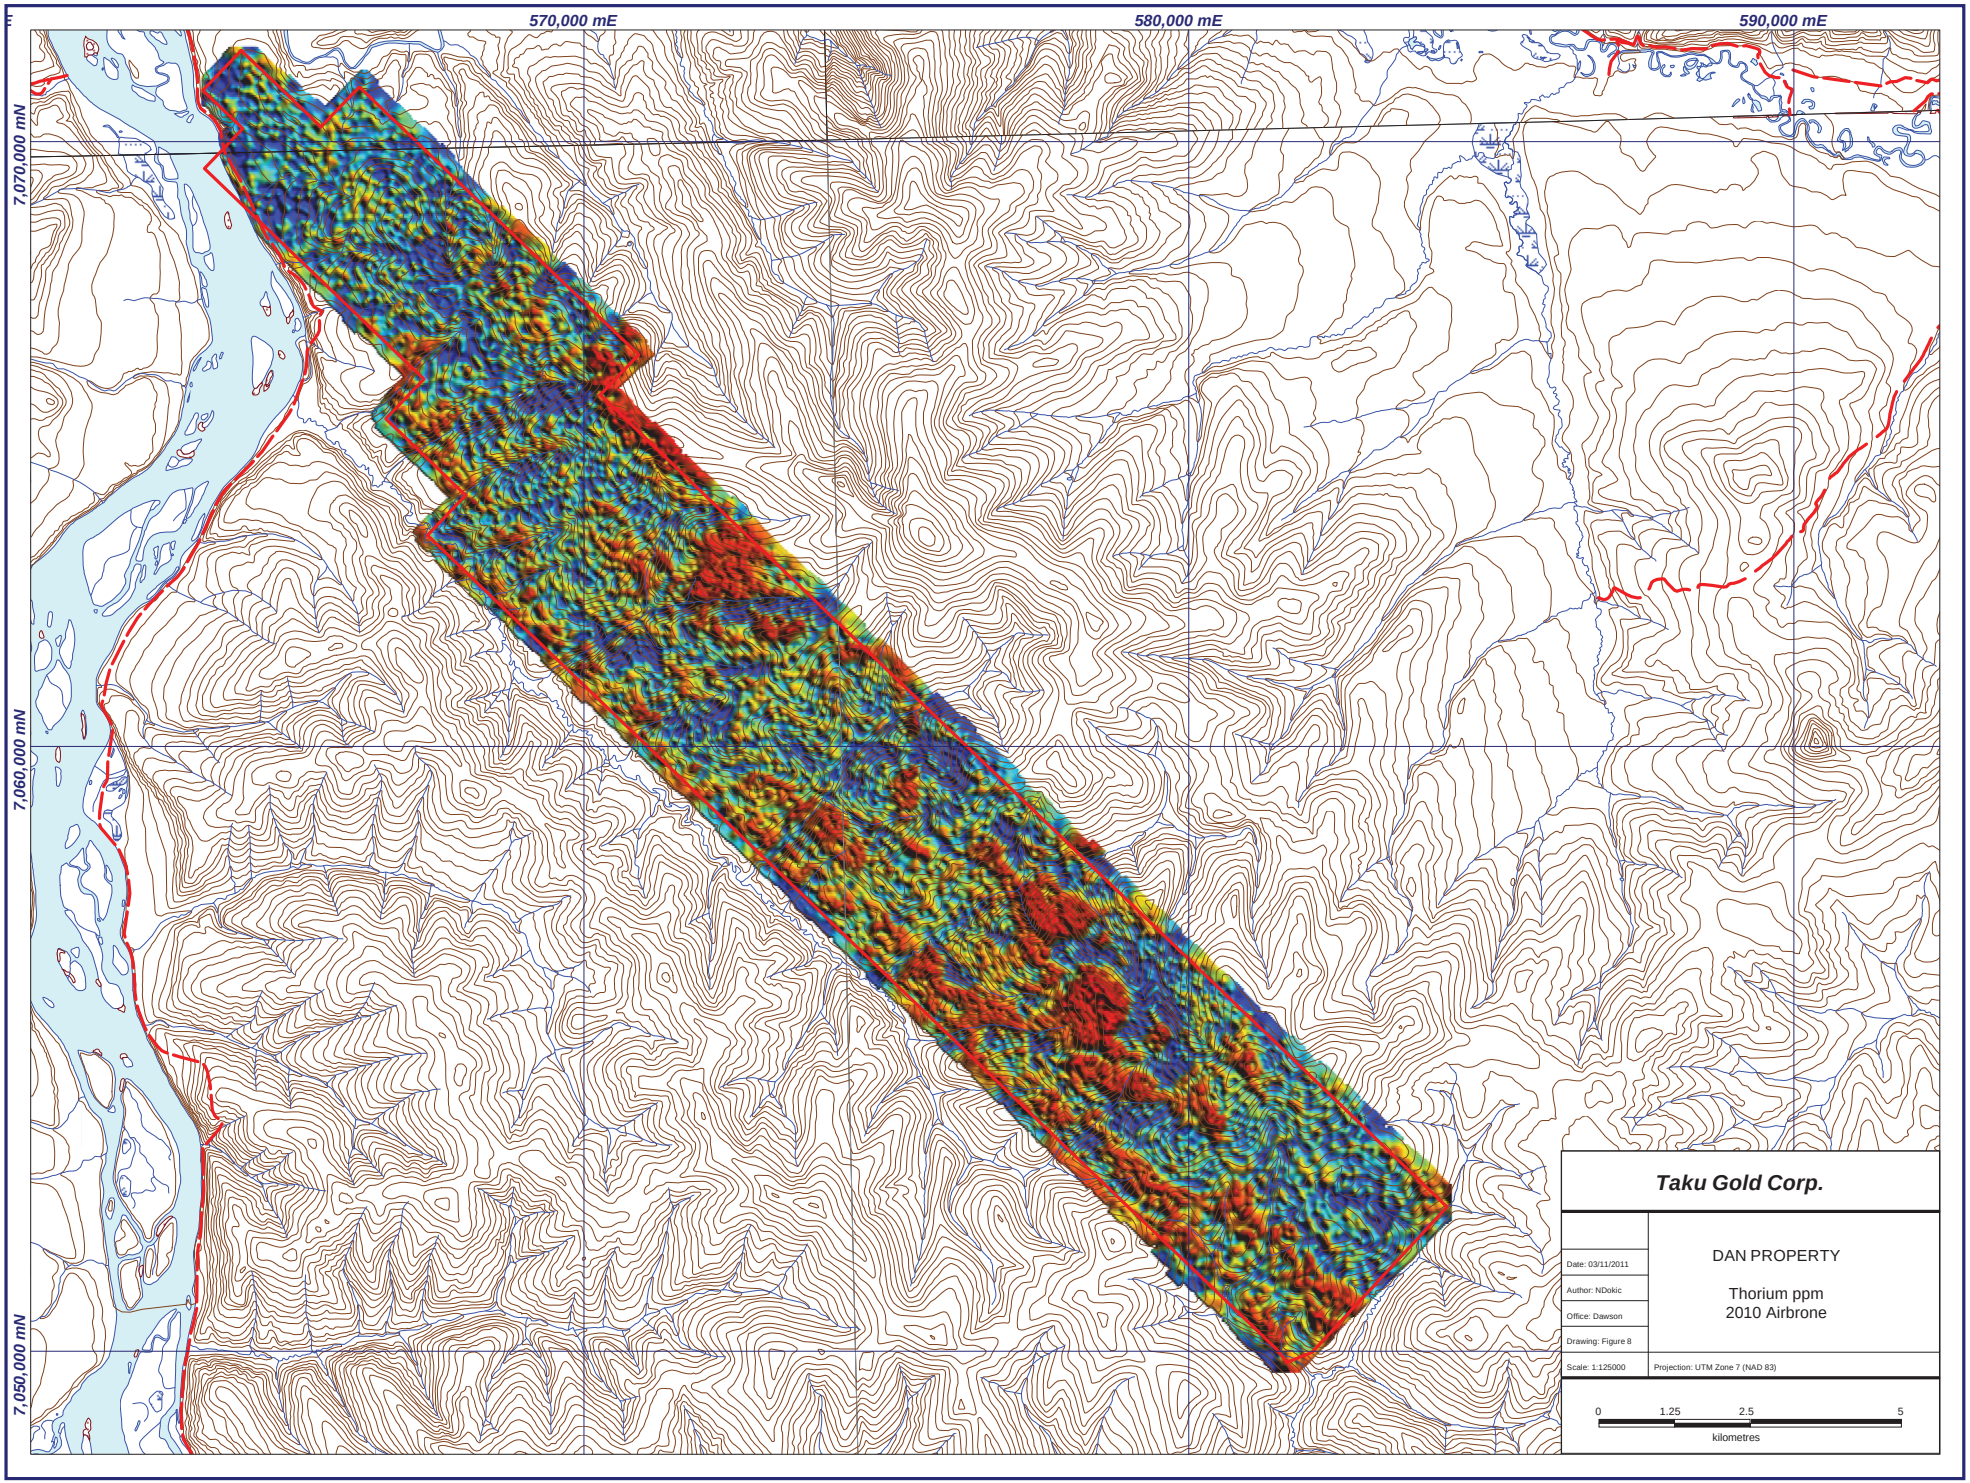

The magnetic survey (Figure 5) shows a strong magnetic high in the north side of the Property and a distinct magnetic high running down the southwest boundary of the Property. This magnetic high can be correlated to a thrust fault system that possibly runs north from Kinross’s JP Ross property located five kilometers to the southwest. The thrust fault becomes more complex towards the northwest. Furthermore, in the northwest corner of the property an ultramafic suite is identified as a magnetic high. The radiometric survey did not produce any beneficial results for the area.

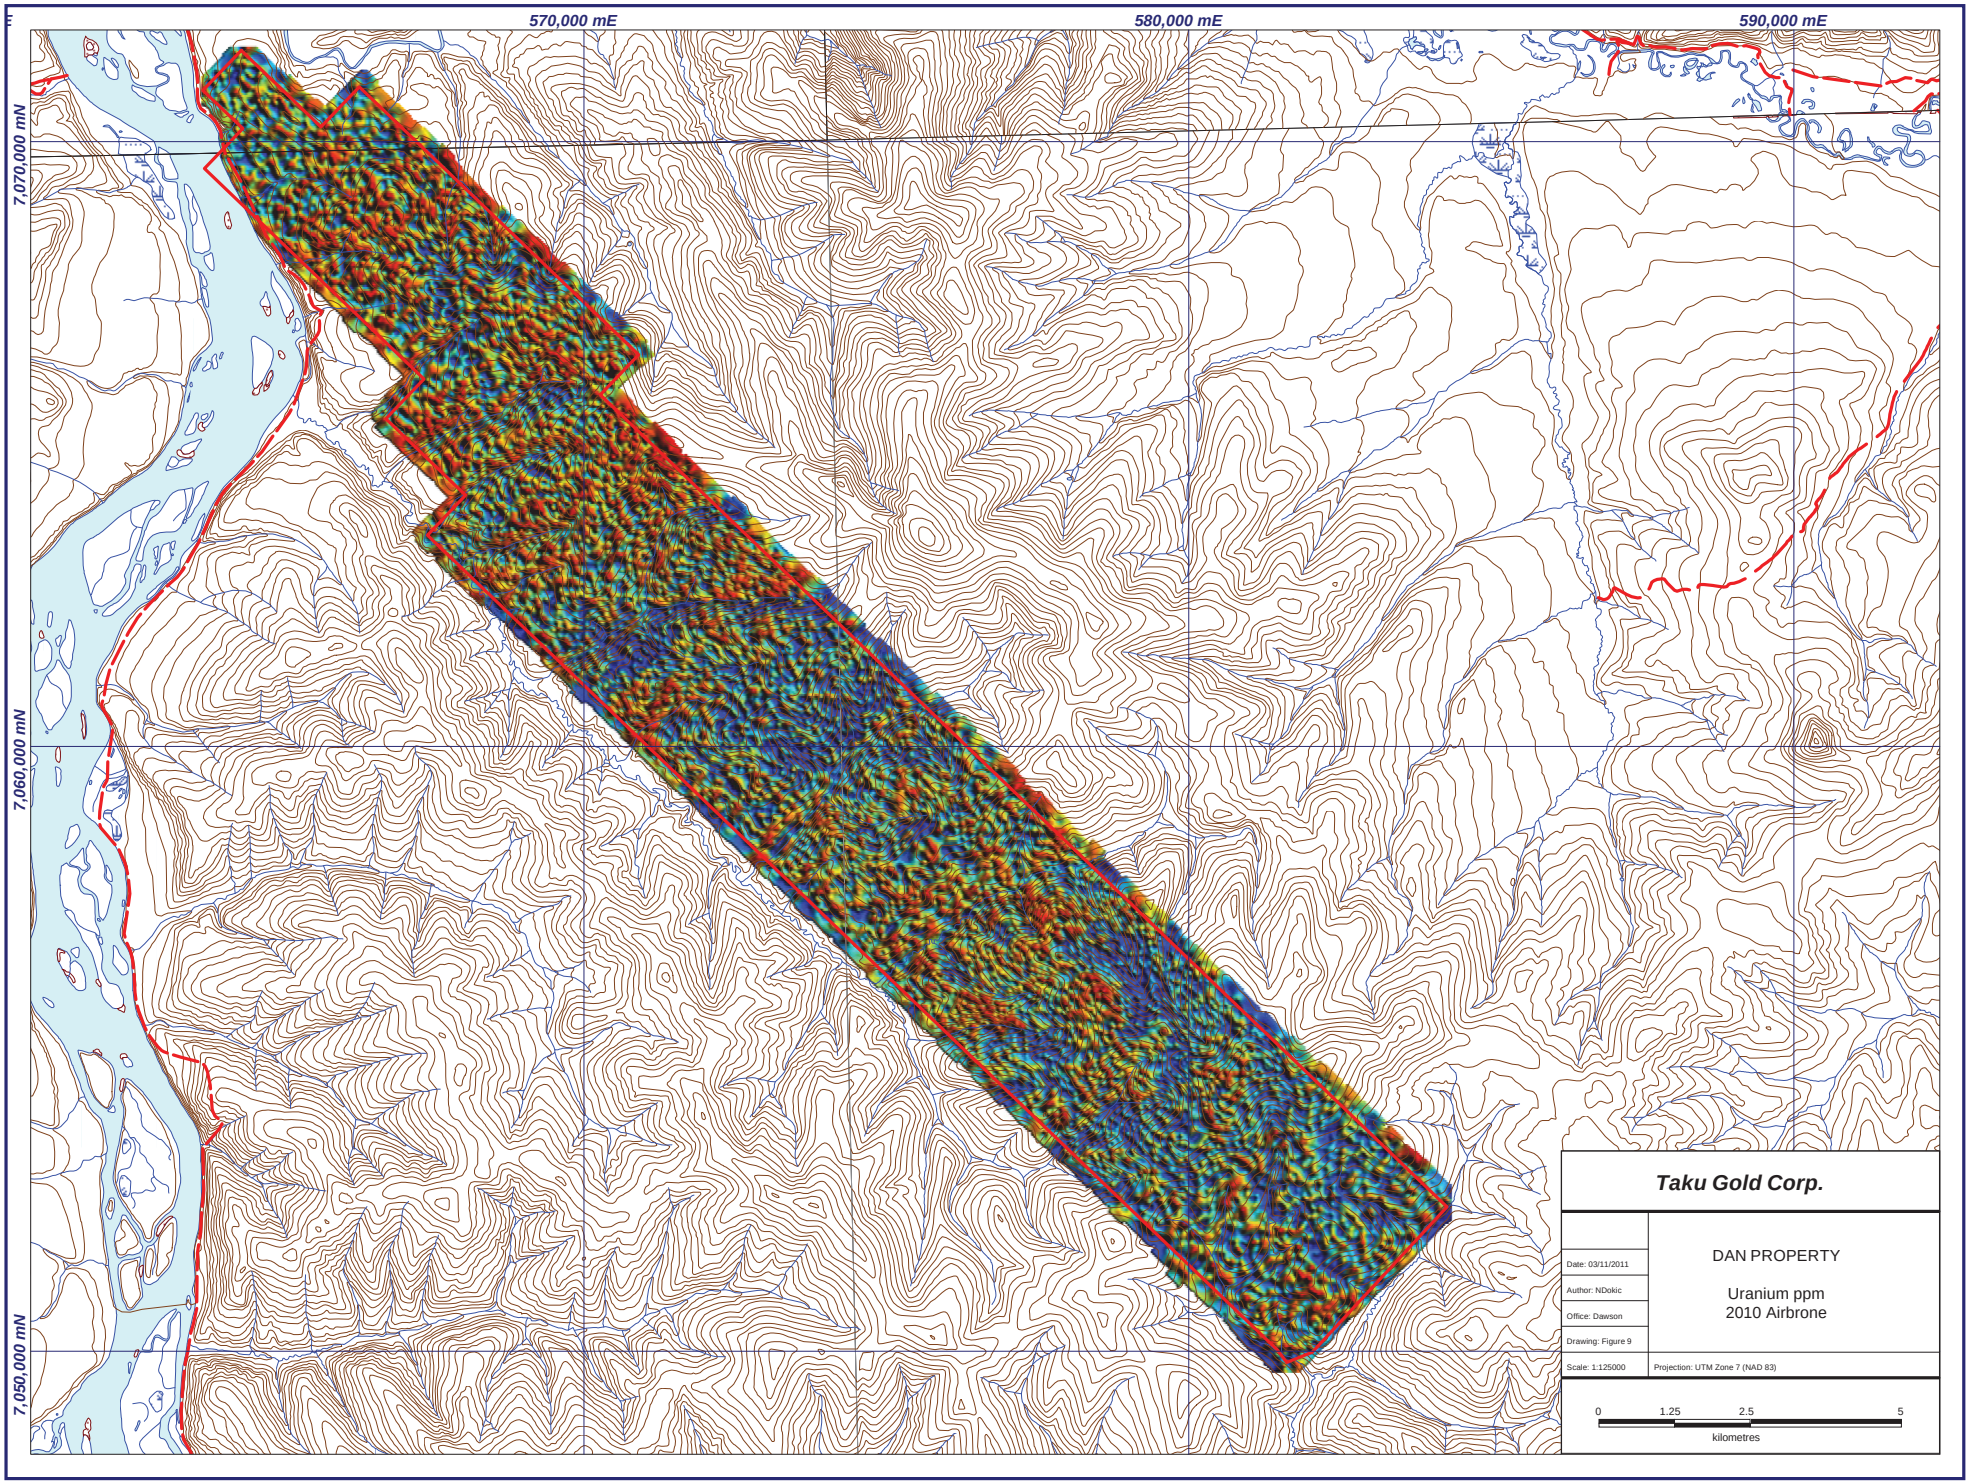

The soil samples returned gold values ranging from below detection limit (i.e. <5ppb Au) to a maximum of 212ppb Au. The soil results were generally low but there were two significant results of 115ppb Au and 212ppb Au identified. Although these two values occur on the thrust fault as indicated by the airborne magnetic data, there were no gold-in-soil trends defined by the soil sampling (Figure 11).

10. Adjacent Properties

No gold deposits are known to exist on the properties immediately adjacent to the Property. Significant gold mineralization has been reported approximately 55km south of Dan at Kinross's White Gold deposit with a current resource estimation at the Golden Saddle zone of 1,004,570 indicated ounces at 3.2gpt Au and 407,413 inferred ounces at 2.5gpt Au; and at the Arc Zone of 170,470 inferred ounces at 1.2gpt Au (Underworld Press Release – January 19, 2010). Kaminak's discovery hole of 15.5m over 17.1gpt Au at the Supremo zone (Kaminak Press Release – May 26, 2010) is located approximately 85km south of Dan.

The Authors have not verified the information made public on these adjacent properties and cautions that **any such information is not necessarily indicative of the mineralization on the Dan property.** However, this information does indicate that the White Gold district is an underexplored area that has solid potential for hosting significant gold deposits.

11. Mineral Processing and Metallurgical Testing

To date no mineral processing or metallurgical testing has been completed at Dan.

12. Mineral Resource and Mineral Reserve Estimates

To date no mineral resource or mineral reserve estimates have been completed at Dan. The Property is at a "grassroots" level of exploration such that it is too early to make any resource or reserve estimates.

13. Other Relevant Data and Information

The Authors are not aware of any other relevant data and information or explanation to make this report more understandable and not misleading.

14. Interpretation of Results and Conclusions

Overall the gold in soil results, with the exception of the two results at 212ppb Au and 115ppb Au, were not outstanding on the Property. However, the airborne magnetic survey does show a clear strong magnetic trend along the southwest border of the Property which can be inferred as a thrust fault. Furthermore, 18km of the prospective thrust fault system was not covered by the soil sampling work and remains to be sampled.

15. Recommendations

The surface work met its primary goal of outlining geophysical or geochemical trends that may potentially be gold-bearing structures. It is the Authors' opinion that the Dan property is of sufficient merit to recommend that surface exploration work continue. It is recommended that a soil geochemical survey be conducted over the remainder of the Property in a ridge and spur fashion, with stations at every 50m. Collecting deeper C-horizon samples must be emphasized for this survey.

Table 3 - Estimated Budget

Geochemical Survey	5,000	Samples @	$75	per sample	$375,000
				Total	$375,000

Appendix B – Statement of Work Expenditures

Yukon
Energy, Mines and Resources

QUARTZ MINING ACT FORM 4 SECTION 56

APPLICATION FOR A CERTIFICATE OF WORK

Version française

Office Date Stamp

I, VERONIKA MORGAN ,

of DAWSON CITY, YUKON

Phone 867-993-2777

make oath and say that:

1. I am the owner, or agent of the owner, of the mineral claim(s) to which reference is made herein.

2. I have done, or caused to be done, work, on the following mineral claim(s): (Here list claims on which work was actually done by number and name)

SEE ATTACHED SCHEDULE OF CLAIMS

situated at REINDEER CREEK Claim sheet No. 115O12

in the DAWSON CITY Mining District, to the value of at least 155,938.30 dollars,

since the 15TH day of AUGUST 20 10 ,

to represent the following mineral claims under the authority of Grouping Certificate No. N/A .
(Here list claims to be renewed in numerical order, by grant number and claim name, showing renewal period requested).

SEE ATTACHED SCHEDULE OF CLAIMS

PLEASE COMMON DATE ALL CLAIMS TO SEPTEMBER 25, 2014

3. The following is a detailed statement of such work: (Set out full particulars of the work done indicating dates work commenced and ended in the twelve months in which such work is required to be done as shown by Section 56).

1931 SOIL SAMPLES SURVEY IS INDICATED ON THE ATTACHED SCHEDULE OF CLAIMS & MAPS

FIELD WORK WORK DONE BY GROUND TRUTH EXPL. INC. SEPT 23 TO OCT 17, 2010

ANALYTICAL WORK DONE BY ACME LABS NOV 1 TO 23, 2010

1090.7 KM AIRBORNE MAGNETIC AND RADIOMETRIC SURVEY OVER ALL CLAIMS DONE BY

PRECISION GEOSURVEYS INC AUGUST 15 TO SEPT 26,2010

Sworn before me at _____ this _____ day of _____ 20 ____ .

Appendix D – Analytical Certifications

Acme Analytical Laboratories (Vancouver) Ltd.
1020 Cordova St. East Vancouver BC V6A 4A3 Canada

www.acmelab.com

Client: **Taku Gold Corp**
680 3rd Ave, Suite 203
Val D'Or QC J9P 1S5 Canada

Submitted By: Distribution
Receiving Lab: Canada-Whitehorse
Received: October 09, 2010
Report Date: November 01, 2010
Page: 1 of 11

CERTIFICATE OF ANALYSIS WHI10000596.1

CLIENT JOB INFORMATION

Project: DAN
Shipment ID: DAN2
P.O. Number
Number of Samples: 289

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
SS80	289	Dry at 60C sieve 100g to -80 mesh			WHI
Dry at 60C	289	Dry at 60C			WHI
1DX2	288	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

ADDITIONAL COMMENTS

Invoice To: Taku Gold Corp
680 3rd Ave, Suite 203

CERTIFICATE OF ANALYSIS WHI10000607.1

CLIENT JOB INFORMATION

Project: DAN
Shipment ID: DAN3
P.O. Number
Number of Samples: 320

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab

Introduction:

This report outlines the survey operations and data processing actions taken during the airborne geophysical survey flown at the Dan Block. The airborne geophysical survey was flown by Precision GeoSurveys Inc. for Taku Gold Corp. The geophysical survey, carried out from August 15, 2010 to September 26, 2010, saw the acquisition of gamma ray spectrometer data and magnetic data.

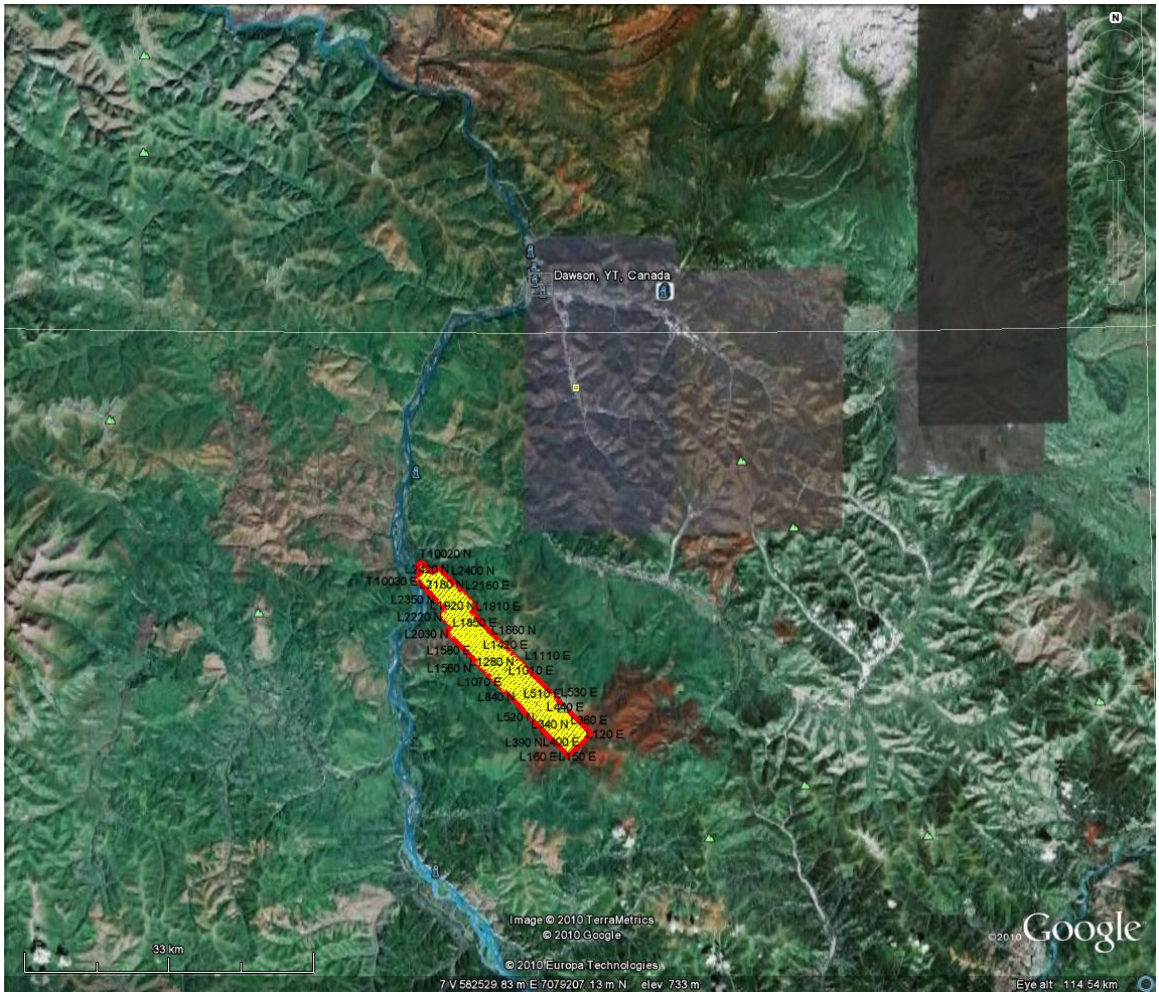

Figure 1: Dan Block area location relative to Dawson, YT.

The Dan Block is located south of Dawson, YT and north of Thistle Creek (Figure 1). It is located approximately 42 km south-west of Dawson, YT (Figure 2). The survey area itself is approximately 4 km by 28 km. A total of 1090.7 line kilometers of radiometric and magnetic data were flown for this survey; this total includes tie lines and survey lines. The survey lines were flown at 100 meter spacings at a 045°/225° heading; the tie lines were flown at 1 km spacings at a heading of 135°/315°.

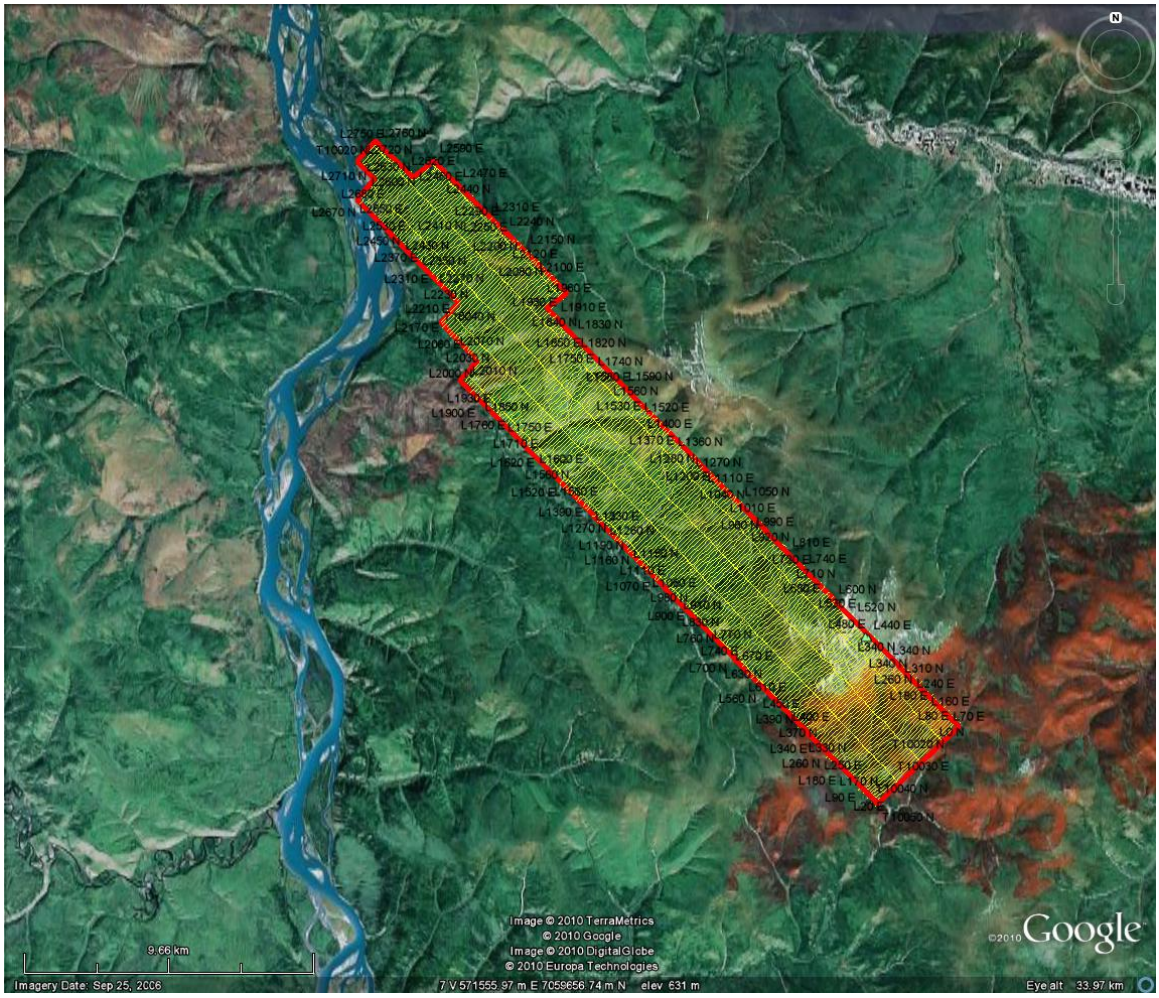

Figure 2: Survey and tie lines outlined in yellow and the boundary in red.

1.0 Geophysical Data:

Geophysical data are collected in a variety of ways and are used to aid in the exploration and determination of geology, mineral deposits, oil and gas deposits, contaminated land sites and UXO detection.

For the purposes of this survey, airborne gamma ray spectrometer and magnetic data were collected to serve in the exploration of the Dan Block which contains rocks that are prospective for gold mineralization.

2.1 Magnetic Data:

Magnetic surveying is probably the most common airborne survey type to be conducted for both mineral and hydrocarbon exploration. The type of survey specifications, instrumentation, and interpretation procedures, depend on the objectives of the survey. Typically magnetic surveys are performed for:

1. Geological Mapping to aid in mapping lithology, structure and alteration in both hard rock environments and for mapping basement lithology, structure and alteration in sedimentary basins or for regional tectonic studies.
2. Depth to Basement mapping for exploration in sedimentary basins or mineralization associated with the basement surface.

2.2 Radiometric Data:

Radiometric surveys detect and map natural radioactive emanations, called gamma rays, from rocks and soils. All detectable gamma radiation from earth materials come from the natural decay products of three primary elements: uranium, thorium, and potassium. The purpose of radiometric surveys is to determine either the absolute or relative amounts of U, Th, and K in surface rocks and soils.

3.0 Survey Operations:

Precision GeoSurveys flew the Dan Block using a Bell 206 BIII Jet Ranger (Figure 3). The survey lines were flown at a nominal line spacing of one hundred (100) meters and the tie lines were flown at 1 km spacing for both the spectrometer and magnetometer as they were acquired simultaneously. The average survey elevation was 35.4 meters vertically above ground. The experience of the pilots helped to ensure that the data quality objectives were met and that the safety of the flight crew was never compromised given the potential risks involved in airborne surveying.

Figure 3: Bell 206 Jet Ranger equipped with mag stinger for magnetic data acquisition.

The base of operations for this survey was the Gimlex camp located along the Indian river and is approximately 36 km south-east of Dawson, YT. The Precision crew consisted of a total of three members:

Harmen Keyser and Paul Greenwood– Pilots
Peter Barker – Operator
Jenny Poon – Operator / On-site Geophysicist

The survey was started on August 15, 2010 and completed on September 26, 2010. There were no delays from low cloud ceilings nor foggy conditions however the last few survey days were flown with variable snow covered conditions.

4.0 Equipment:

For this survey a magnetometer, spectrometer, base station, laser altimeter, and a data acquisition system were required to carry out the survey and collect quality, high resolution data.

4.1 AGIS:

The Airborne Geophysical Information System, AGIS, (Figure 4), is the main computer used in data recording, data synchronizing, displaying real-time QC data for the geophysical operator, and generation of navigation information for the pilot display system.

Figure 4: AGIS installed in the Bell 206.

The AGIS was manufactured by Pico Envirotec; therefore the system uses standardized Pico software and external sources are connected to the system via RS-232 serial communication cables. The AGIS data format is easily converted into Geosoft or ASCII

file formats by a supplied conversion program called PEIView. Additional Pico software allows for post survey quality control procedures.

4.2 Spectrometer:

The IRIS, or Integrated Radiometric Information System is a fully integrated, gamma radiation detection system containing two downward facing NaI detecting crystals for a total volume of 8.4 litres (Figure 5). Real time data acquisition, navigation and communication tasks are integrated into a single unit that is installed in the rear of the aircraft as indicated below. Information such as total count, counts of various elements (K, U, Th, etc.), temperature, barometric pressure, atmospheric humidity and survey altitude can all be monitored on the AGIS screen for immediate QC. All the radiometric data are recorded at 1 Hz.

Figure 5: IRIS strapped into the cargo box of the helicopter.

4.3 Magnetometer:

The magnetometer used by Precision GeoSurveys is a Scintrex cesium vapor CS-3 magnetometer. The system was housed in a front mounted “stinger” (Figure 6). The CS-3 is a high sensitivity/low noise magnetometer with automatic hemisphere switching and a wide voltage range, the static noise rating for the unit is +/- 0.01 nT. On the AGIS screen the operator can view the raw magnetic response, the magnetic fourth difference and the survey altitude for immediate QC of the magnetic data. The magnetic data are recorded at 10 Hz. A magnetic compensator is also used to remove noise created by the movement of the helicopter as it pitches, rolls and yaws within the Earth’s geomagnetic field.

Figure 6: View of the mag stinger.

4.4 Base Station:

For monitoring and recording of the Earth's diurnal magnetic field variation, Precision GeoSurveys uses a Scintrex proton precession Envi Pro magnetometer as its base station (Figure 7). This is mounted as close to the survey block as possible to give high, accurate magnetic field data. The Envi Pro base station, uses the well proven precession technology to sample at a rate of 0.5 Hz. A GPS is integrated with the system to record real GPS time that is used to correlate with the GPS time collected by the airborne CS-3 magnetometer.

Figure 7: Scintrex Envi Pro proton precession magnetometer.

4.5 Laser Altimeter:

The pilot is provided with terrain guidance and clearance with an Acuity AccuRange AR3000 laser altimeter (Figure 8). This is attached at the aft end of the magnetometer boom. The AR3000 sensor is a time-of-flight sensor that measures distance by a rapidly-modulated and collimated laser beam that creates a dot on the target surface. The maximum range of the laser altimeter is 300 m off of natural surfaces with 90% reflectance and 3 km off special reflectors. Within the sensor unit, reflected signal light is collected by the lens and focused onto a photodiode. Through serial communications and analog outputs, the distance data are transmitted and collected by the AGIS at 10 Hz.

Figure 8: Acuity AccuRange AR3000 laser altimeter.

5.0 Data Processing:

After all the data are collected after a survey flight several procedures are undertaken to ensure that the data meet a high standard of quality. All data were processed using Pico Envirotec software and Geosoft Oasis Montaj geophysical processing software.

5.1 Magnetic Processing:

During aeromagnetic surveying noise is introduced to the magnetic data by the aircraft itself, movement in the aircraft (roll, pitch and yaw) and the permanent magnetization of the aircraft parts (engine and other ferric objects) are large contributing factors to this noise. To remove this noise a process called magnetic compensation is implemented. The magnetic compensation process starts with a test flight at the beginning of the survey where the aircraft flies in the four orthogonal headings required for the survey ($041^o/220^o$ and $124^o/309^o$ in the case of this survey) at an elevation where there is no ground effect in the magnetic data. In each heading roll, pitch and yaw maneuvers are performed by the pilot, these maneuvers provide the data that is required to calculate the necessary parameters for compensating the magnetic data. A computer program called PEIComp is

used to create a model for each survey to remove the noise induced by aircraft movement; this model is applied to each survey flight so the data can be further processed.

A magnetic base station is set up before every flight to ensure that diurnal activity is recorded during the survey flights. Precision GeoSurveys uses a Geometrics 858 base station and sampled at 0.1Hz. Base station readings were reviewed at regular intervals to insure that no data were collected during periods with high diurnal activity (greater than 5 nT per minute). The base station was installed at a magnetically noise-free area, away from metallic items such as steel objects, vehicles, or power lines. The magnetic variations recorded from the stationary base station are removed from the magnetic data recorded in flight to ensure that the anomalies seen are real and not due to solar activity.

Some filtering of the magnetic data is also required. A Non Linear filter was used for spike removal. The 1D Non-Linear Filter is ideal for removing very short wavelength, but high amplitude features from data. It is often thought of as a noise spike-rejection filter, but it can also be effective for removing short wavelength geological features, such as signals from surficial features. The 1D Non-Linear Filter is used to locate and remove data that are recognized as noise. The algorithm is 'non- linear' because it looks at each data point and decides if that datum is noise or a valid signal. If the point is noise, it is simply removed and replaced by an estimate based on surrounding data points. Parts of the data that are not considered noise are not modified. The combination of a Non-Linear filter for noise removal and a low pass trend enhancement filter resulted in level data as indicated in the results section of this report. The low pass filters simply smoothes out the magnetic profile to remove isolated noise.

A lag correction was applied to the total magnetic field data to compensate for the lag in the recording system as the magnetometer sensor flies 6.45 m ahead of the GPS antenna. Following a lag correction of 1.7 seconds, a low-pass filter equivalent to 1 second was then applied to the lag corrected data.

5.2 Radiometric Processing:

Radiometric data are processed by windowing the full spectrum to create channels for U, K, Th and total count. A lag correction was also applied to the radiometric data as Pico compensator introduces a lag of 1.4 secs into the positional coordinates for the radiometric data. The data are then lightly filtered and corrected for survey altitude at standard temperature and pressure. Background radioactive contributions from the aircraft, cosmic radiation and atmospheric radon are also be removed. In some sections of the data, U and Th were adversely affected by atmospheric radon effects as the survey was not flown in ideal weather conditions. Thus, these sections were closely evaluated and the radon effects were carefully removed.

Finally the data are corrected by removing spectral overlap; this is done using the stripping ratios that have been calculated for the spectrometer by prior calibration, this breaks the corrected elemental values down into the apparent radioelement concentrations.

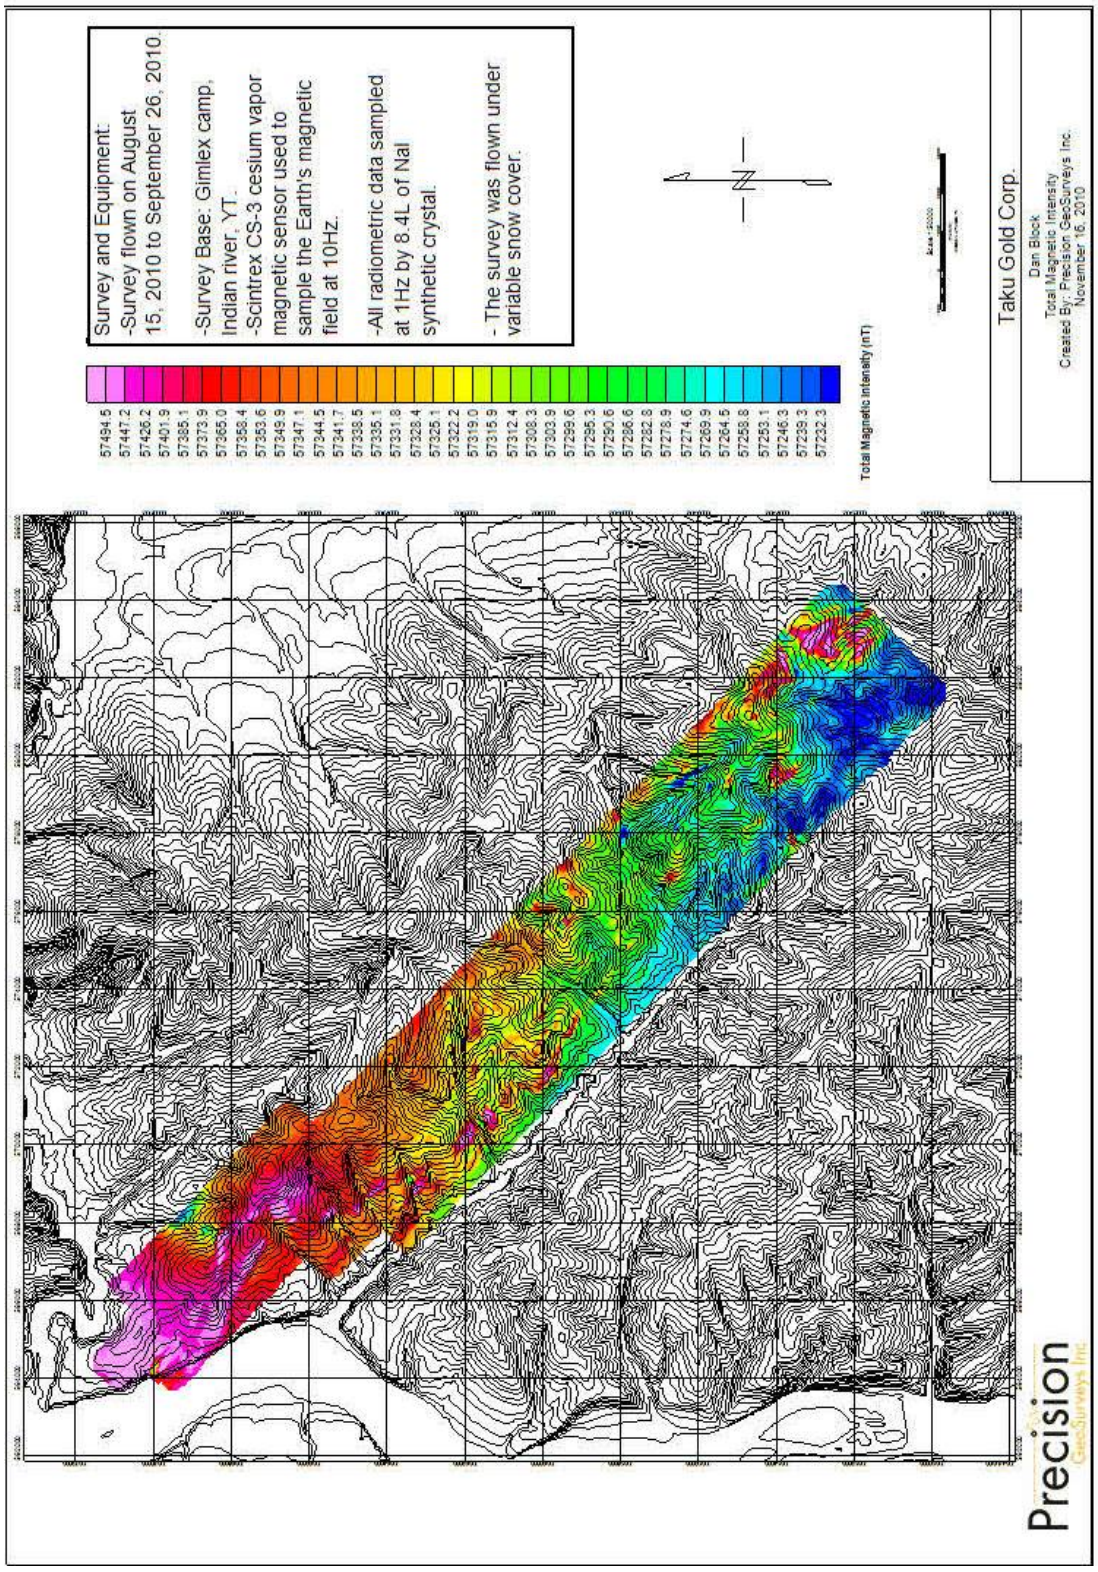

5.3 Final Data Format

Abbreviations used in the GDB files are as follows:

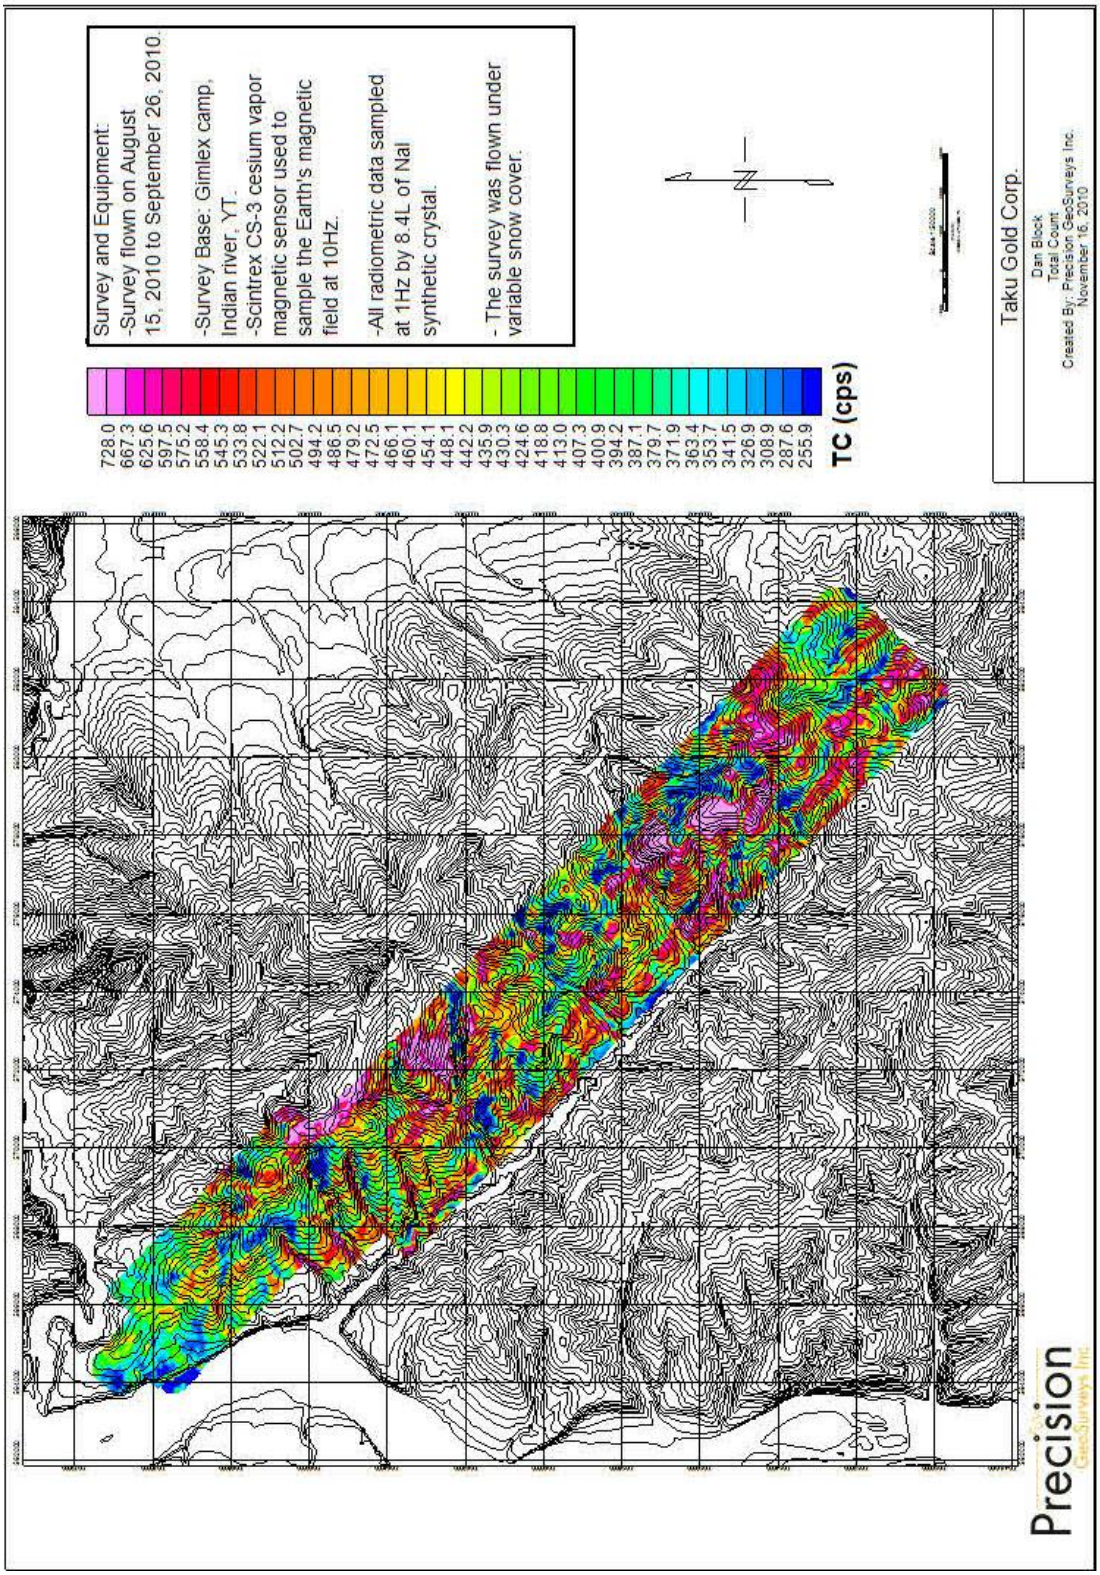

X – Easting in WGS84, UTM zone 7N
Y – Northing in WGS84, UTM zone 7N
GPStime – GPStime
basemag – diurnal data
mag – total magnetic field
galt – gps altimeter readings
lalt – laser altimeter readings
dtm – digital terrain model
TC_cor – corrected total count
K_cor – corrected potassium
Ur_cor – corrected uranium
Th_cor – corrected thorium

The file format will be provided in two (2) formats, the first will be a .GDB file for use in Geosoft Oasis Montaj, the second format will be a .XYZ file, this is text file. Two separate files are provided for each format, one for the magnetics and one for the radiometrics.
