1.0 INTRODUCTION

1.1 Terms of Reference and Participating Personnel

This report presents the results of a 3,629.4 metre diamond drilling and soil sampling exploration program conducted on the Clear Creek property during the summer of 2011. The program was funded and operated by Golden Predator Canada Corp. Peak Drilling provided the diamond drilling services and Fox Exploration provided the soil sampling services. Geological and logistical services were provided by Golden Predator Canada Corp. staff. ALS Minerals of Vancouver, BC performed the drill core analysis and ACME Labs of Vancouver, BC performed the soil geochemical analysis.

The program consisted of eighteen (18) HQ diamond drill holes for a total of 3,629.4 m and one thousand twenty-six (1,026) soil samples.

Based on the terms of underlying agreements with the registered claim owners, Golden Predator has the right to earn a 100% interest in 132 of the quartz mining claims subject to a 3% NSR and, through staking, has acquired a 100% interest in the remaining 168 claims comprising the Clear Creek property (the "Property"). Golden Predator Canada Corp. is listed on the TSX exchange (TSX: GPD) and based in Vancouver, British Columbia. Golden Predator has prepared this Assessment Report to provide a summary of the technical data on the Property including the 2011 work program and a summary of previous exploration activities.

1.2 Supporting Documents

The Report is based on exploration and property information and data supplied by StrataGold Corp., a review of public domain geological and exploration data for the Clear Creek property (primarily Yukon Assessment Reports), incorporation of relevant mining and geological literature, and data generated by 2010 and 2011 drilling programs.

2.0 PROPERTY LOCATION AND DESCRIPTION

2.1 Location

The Clear Creek property comprises 300 contiguous quartz claims covering approximately 6000 hectares. The property is located 115 km east-southeast of Dawson City, Yukon Territory, Canada, on National Topographic System [NTS] map sheet 115P/14 centered at 63° 51' 2" north and 137° 6' 27" west (NAD 83, Zone 8N: 398020 E, 7081990 N). The quartz claims cover the headwaters and upper drainage area to Left Clear Creek.

2.2 Description and Ownership

The property covers approximately 6,000 hectares and consists of 300 contiguous, unsurveyed two-post quartz claims (Table 2-1; Figure 2-2) staked according to the Yukon Quartz Mining Act. Expiration dates shown in Table 2.1 are subject to acceptance of assessment covered by this report.

3.0 ACCESSIBILITY, CLIMATE, PHYSIOGRAPHY, AND INFRASTRUCTURE

3.1 Location and Access

The property is located approximately 115 km east-southeast of Dawson City and 65 km northwest of Mayo, Yukon, (Fig. 3.1). The center of the claims is 63° 51' 2" north and 137° 6' 27" west (NAD 83, Zone 8N: 398020 E, 7081990 N) on NTS map sheet 115P/14.

The Property is accessed from the Clear Creek road, located km 609 on Klondike Highway (#2). The camp was located approximately 41 km east of the turnoff and 500 m east of Nel's Harpers placer camp, via a gravel road. The trip from Dawson City takes approximately 2. 5 hours. Trails and 4x4 roads provide additional access to the property.

3.2 Physiography

The Property is located in the Ogilvie Mountains on the Yukon Plateau at elevations ranging from approximately 1,200 m above sea level (ASL) in the valleys, to over 1800 m ASL on peaks in the West Ridge range. The Clear Creek property covers mountainous terrain, mainly above tree-line. Vegetation in the alpine environment includes lichen, moss, dwarf willow and alder. The property is dissected by a series of mountain creeks that drain into Harper's Creek and Left Clear Creek to the west and Josephine Creek to the east. Forested areas contain black spruce with lesser amounts of hemlock, poplar and alder.

The Property climate is typical for high mountains in the Yukon. Temperatures of -40°C are common in the winter and the summers are cool to warm with daily highs of 10°C to 25°C. Precipitation rates are fairly low with an average of 30 cm annual fall. The property is typically snow-free from mid-June to mid-September. Discontinuous permafrost is present on north and east-facing slopes and in wetlands.

Montane glaciation has occurred on the higher peaks on the property and an active rock glacier occurs east of the Saddle zone. Bedrock is exposed at higher elevations but most of the property is covered by felsenmeer with talus fines and soil.

4.0 EXPLORATION HISTORY

The prospecting history dates back to the early 1900s, with modern exploration efforts commencing in the late 1970s. Bema Industries, working on contract from Canada Tungsten Corporation, was the first company to recognize potentially significant gold mineralization in 1978. Since this initial effort, various companies have conducted limited campaigns including programs by Gold Rite Mining Corp., Noranda Exploration Ltd., Ivanhoe Goldfields Ltd. /First Dynasty Mines Ltd., Kennecott Canada Inc., Newmont Exploration Limited, Redstar Resources Corporation, and most recently StrataGold Corporation (now Victoria Gold Corp.).

Following up on results by previous explorers, Noranda Exploration Ltd. conducted extensive soil and rock chip sampling, ground geophysical surveys, trenching, road building, and a six hole reverse circulation ("RC") drilling program in 1991 and 1992. Two holes drilled on each of the Eiger, Saddle, and Pukelman stocks for a total of 654 m.

In 1995, Kennecott Canada Inc. completed drilling, soil sampling and 320 m of bulldozer trenching. The 27 hole (1971 m) RC program on the Rhosgobel stock identified an east-west trending zone 1200 m long, 200 m wide and 65 m deep. The average grade of the Au mineralization in this 40 Mt zone is at least 300 ppb Au, with a higher grade core zone of approximately 1.5-2.0 Mt grading from 0.75-1.25 g/t Au (Coombes, 1995). The size and grade estimate is conceptual in nature, as there has been insufficient exploration to define a mineral resource.

In 1998, Newmont Exploration Limited conducted magnetic and radiometric airborne geophysical surveys. Interpretation of the data by Newmont suggests that the Eiger, Saddle, Josephine and Pukelman stocks may be part of a single larger intrusive body, and the Rhosgobel and Far stocks are themselves a separate body.

Historic drilling by Redstar Resources Corporation on the Bear Paw Breccia Zone included two diamond drill holes totaling 219 m in 1999; and nine HQ-diameter diamond drill holes totaling 1211 m in 2000. The best result of the Bear Paw Breccia zone was 2.3 g/t Au over 31.8 m in Hole BP00-10.

In 2006, StrataGold Corporation (now a subsidiary of Victoria Gold Corp.) conducted a detailed trenching and soil sampling program on the Bear Paw Breccia and Contact zone (and also the Barney zone which lies west of the current claim configuration). In addition, infill sampling was conducted to follow-up on geophysical and historical gold anomalies identified by previous explorers.

Golden Predator Canada Corp. conducted an exploration program in 2010 which included drilling 42 holes for a total of 3,662.4 m. Holes CC10-01 to CC10-04 were HQ diameter oriented core totaling 1,053.7 m. CC10-05 to CC10-42 were reverse circulation holes totaling 2,588.91 m. Golden Predator also staked 168 ‘Zoe’ quartz claims in May 2010 to supplement the property’s holdings and compiled a GIS database of all available historical data.

5.0 GEOLOGICAL SETTING

5.1 Regional Geology

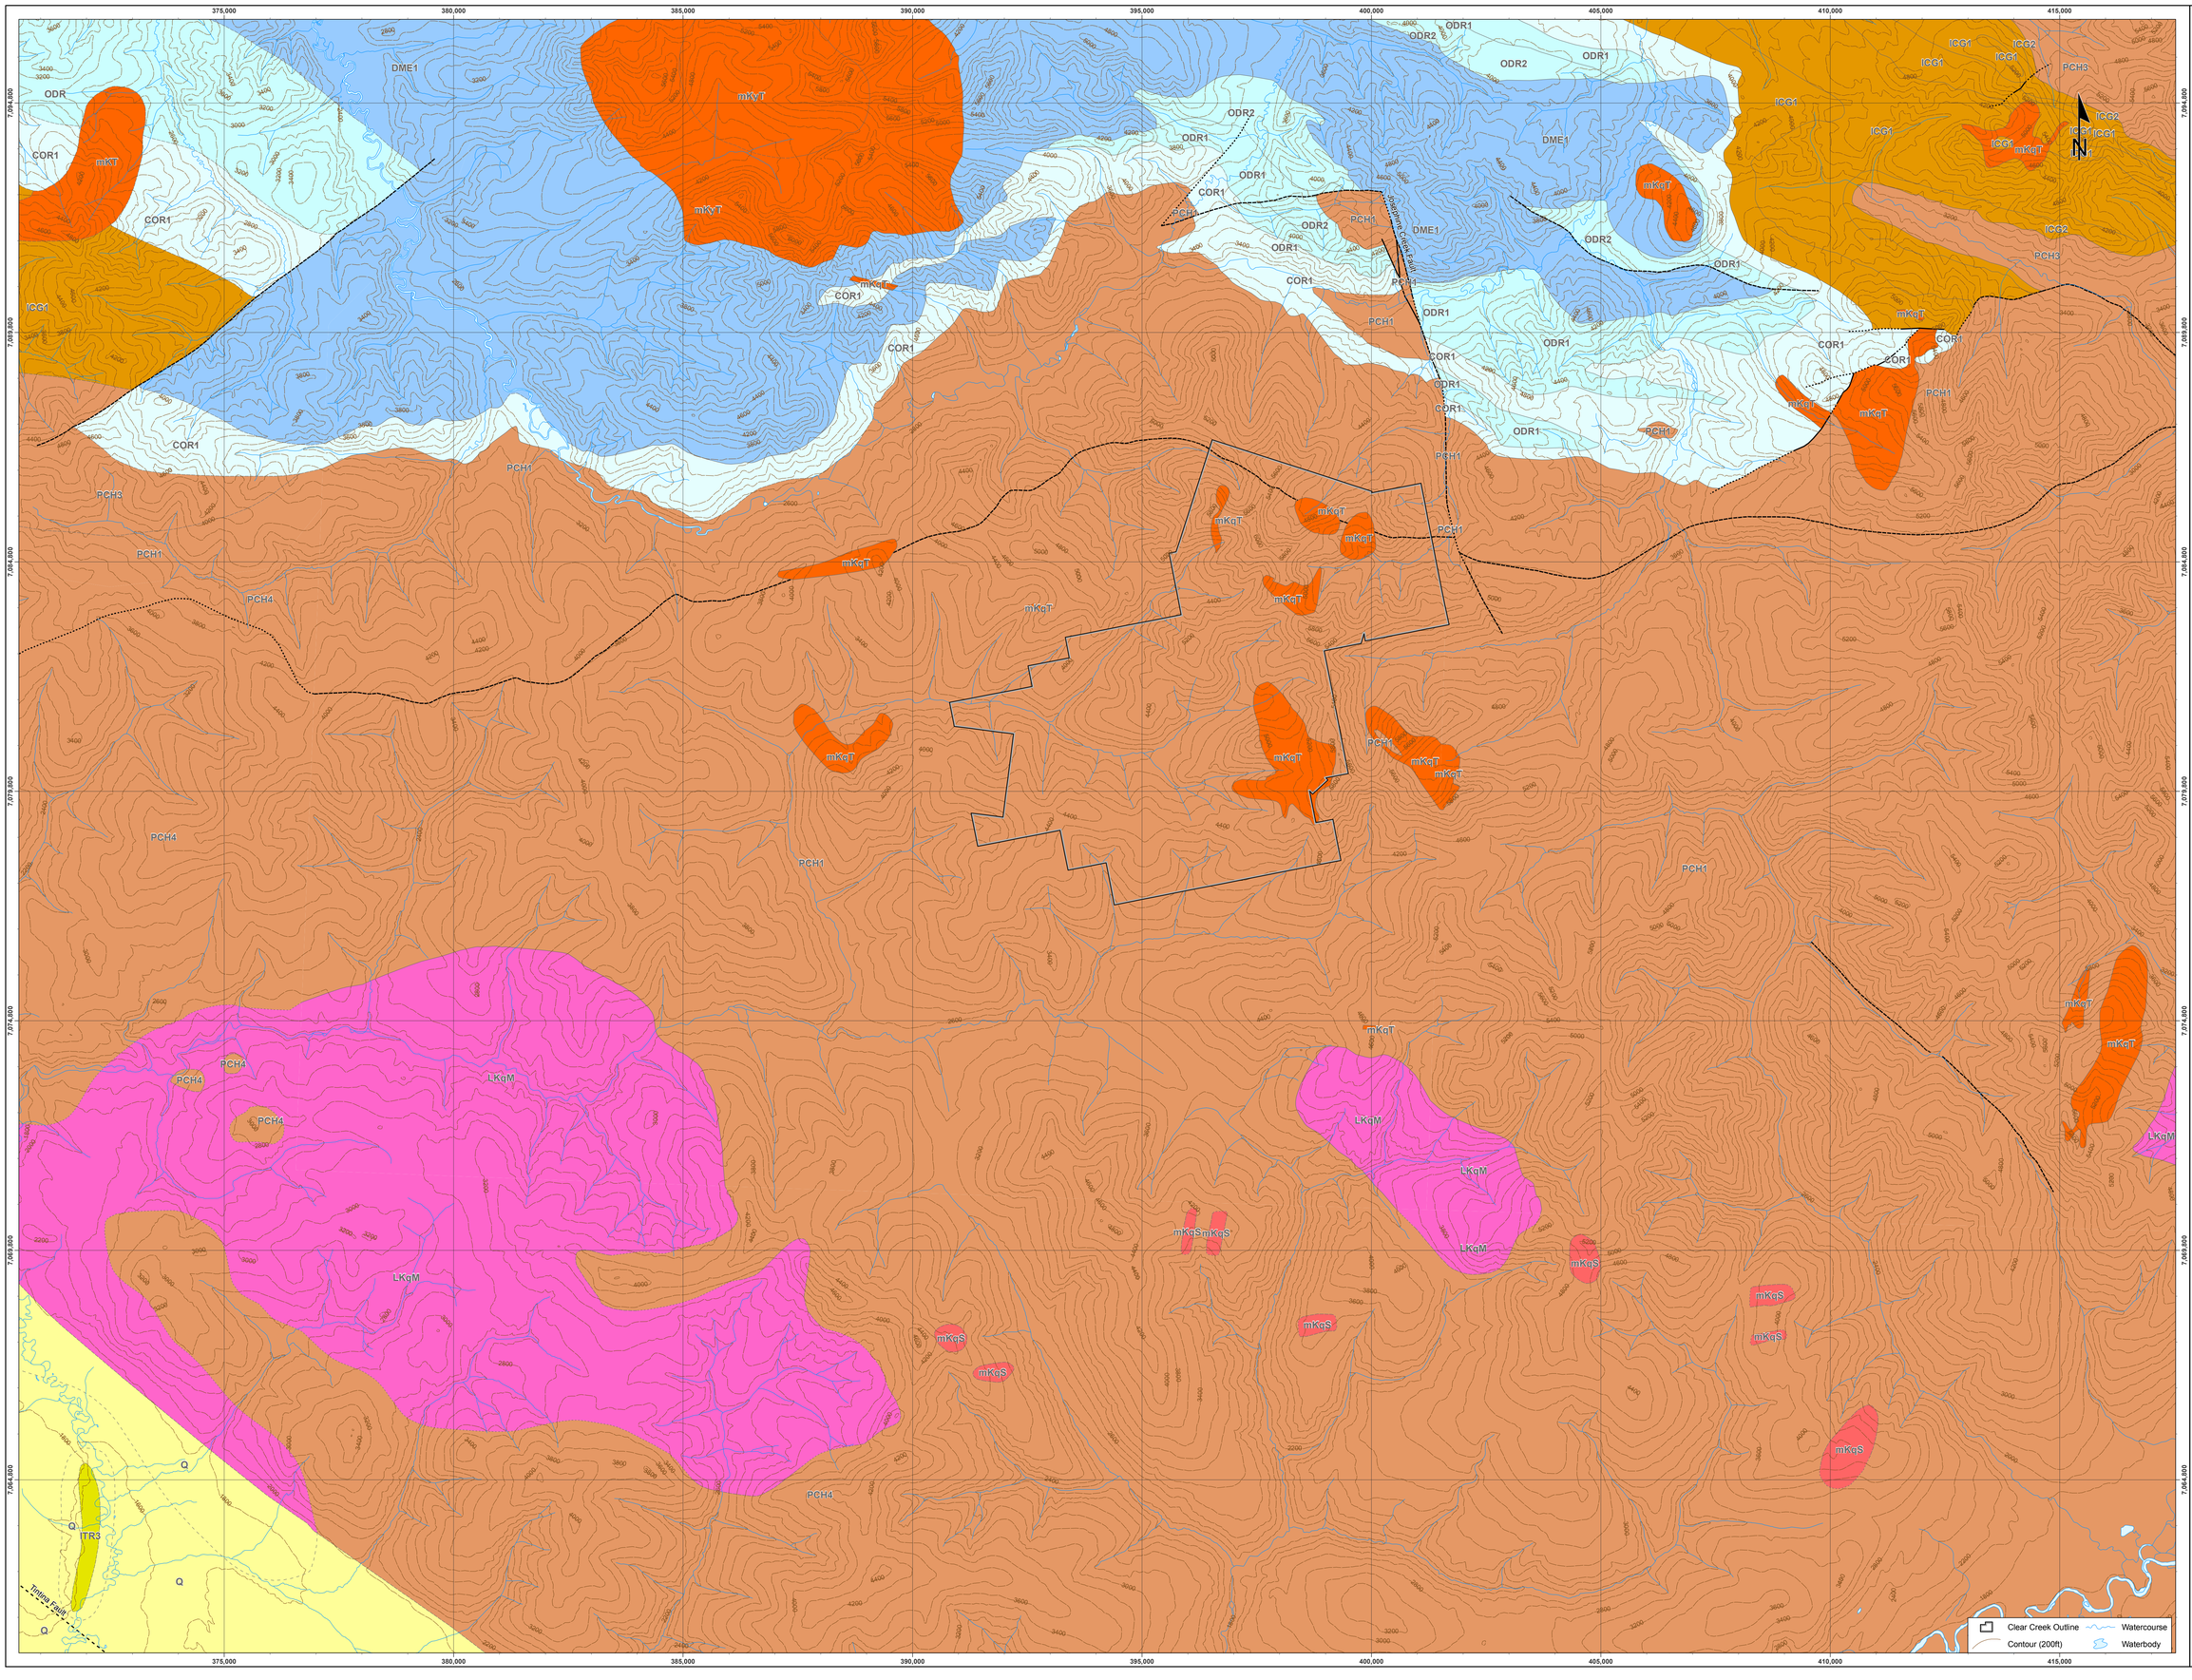
The property is located on the western edge of the Selwyn Basin. The Selwyn Basin is bounded on the south by the Tintina Fault (and the Intermontane Superterrane) and bounded on the north by the Dawson Thrust Fault (and the North American Shelf; Figure 5-1, from Gordey and Makepeace, 2001). The Teslin Suture is the zone of deformation between the accreted terrain and the ancient shelf.

Rocks of the Selwyn Basin include Proterozoic basinal and platformal clastic and pelitic sediments to Jurassic clastic shelf sediments. Various aged volcanic piles are stratabound within the sediments. The basin was subjected to rifting during the Proterozoic and again in the late Devonian and contemporaneous volcanics were exhaled onto the sea floor and as thick sill sequences.

By late Jurassic, the rocks of the Intermontane Belt of the Cordillera collided with the passive margin of the North America Shelf, causing compressive tectonics. This resulted in crustal

shortening, tight folding, and failure along hinges. Three regionally stacked thrust panels were formed: the Robert Service, Tombstone and Dawson thrust sheets (oldest to youngest).

The Selwyn Basin is intruded by granitoids ranging from Mississippian to Eocene age; the most extensive being the middle Cretaceous Tombstone Suite. The Tombstone rocks range in composition from intermediate to felsic.



Regional Geologic Units

QUATERNARY

5.2 Property Geology

Highly deformed metasedimentary rocks of the Yusezyu Formation underlie the Clear Creek property. The metasedimentary strata are part of the Neoprotoerozoic to Early Cambrian Hyland Group. They are comprised of predominantly highly deformed and folded phyllite, schist, quartzite, sandstone, fine quartz-pebble conglomerate with rare limestone. The Hyland Group rocks have been intruded by Tombstone Plutonic Suite diorite, granodiorite, quartz monzonite and granitoid stocks, including, from south to north, the Rhosgobel, Big Creek, Pukelman, Josephine and Eiger stocks. The Bear Paw breccia is spatially and likely-temporally related to the intrusive rocks. The Tombstone strain zone, a broad zone of complex deformation exhibited as multi-episodic folding and prominent foliation and lineation development within the sedimentary sequence extends roughly east-west to the north of the Josephine stock. Alteration is fairly localized to near the contacts with the intrusive bodies and include metasediments altered to quartz-biotite hornfels and rare calc-silicate skarn. Schistosity strikes west -northwesterly with gentle to moderate north-east dips (Weekes and Fall, 2001).

6.0 EXPLORATION

6.1 Exploration Program

The 2011 exploration program ran from June 3 to July 29, 2011 and included drilling 18 HQ diameter diamond drill holes, for a total of 3,629.4 m, and a soil sampling program consisting of 1,026 samples.

Exploration activities for the program included: setting up a field camp for up to 15 people; construction/reclamation of drill pads; drilling and core logging, tear down and demob camp.

6.2 Drilling

The 2011 exploration program was designed to further test Au mineralization encountered in the 2010 program at Contact and Bear Paw. The objective of the program was to collect sufficient drill data to support geologic modeling and initiate resource estimation.

Peak Drilling from Courtney, BC was engaged to complete the diamond drilling program, using HQ diameter (63.5 mm) core. Geological logs are presented in Appendix 2 and the sample intervals and associated sample numbers are presented in Appendix 3.

Bear Paw
Drilling at Bear Paw consisted of 14 HQ diameter diamond drill holes totaling 2690.6m (CC11-47 to CC11-60). The 2011 drilling program was designed to infill and expand the envelope of mineralized breccias tested in the 2010 drilling program. Results from the 2011 drilling program are to be used to further define the mineralization, plan future drilling programs and initiate resource estimation.

Contact
Drilling at Contact consisted of 4 HQ diameter diamond drill holes totaling 938.8m (CC11-43 to CC11-46). The 2011 drilling program was designed to further test the mineralized sheeted vein system drilled in 2010. Additional drill database compilation/validation work is to be followed by geologic and resource modeling on Contact.

6.3 Drilling Collar Surveys

Drill collar surveys for holes CC11-043 to CC11-057 were completed by CAP Engineering on July 11, 2011. GPD staff geologists surveyed the remaining drill collars, CC11-058 to CC11-060, with an Ashtech DGPS on August 4, 2011. Table 6-1 presents the collar file for the 2011 program.

6.4 Drilling Sampling and Analysis Methodology

A gas-powered diamond saw was used to sample core from diamond holes (CC11-043 to CC11-060).

Samples were freighted to ALS Mineral's prep lab in Whitehorse, YT and then forwarded to their ISO 9001 certified preparation facility in Terrace, BC. The pulps were analyzed at ALS's ISO 9001 certified laboratory in Vancouver. Blanks, commercial standards and duplicate samples were included in each batch. For gold analysis, 30 g samples are fire assayed (Au-AA23 package) then digested in Aqua Regia solution and analyzed by atomic absorption with detection limits between 5-10,000 ppb Au. Values over 10 g/t gold are re-assayed by fire assay followed by a gravimetric finish (50 ppb lower detection limit).

Other elements are analyzed by a 35 elements package (ME-ICP41) whereby the sample is digested in an Aqua Regia acid solution and then analyzed by inductively coupled plasma (ICP) – atomic emission spectrometry. Assay certificates are presented in Appendix 4 and the detailed methodology and detection limits are in Appendix 5.

6.5 Drilling Sampling Protocol / Chain of Custody / Data Verification

All sampling was conducted under the supervision of a Company project geologist and the chain of custody from the drill to the sample preparation and logging facility is continually monitored by the project geologist. Samples are shipped to the lab by qualified couriers or Company personnel. Data verification of the analytical results includes a statistical analysis of the duplicates, standards and blanks that must pass tolerance parameters for acceptance to ensure accurate and verifiable results. All assays are reported as drilled intervals and are not to be interpreted as true widths.

6.6 Soil Sampling

Soil sampling was conducted by Fox Exploration from July 18 through July 24, 2011. One thousand twenty-six (1,026) samples were collected from predefined locations on grid or from traverses covering prospective ground (See figure 6-2). ACME Analytical Laboratories performed ICP-MS multi-element analysis on all soil samples from the 2011 program.

6.7 Soil Analysis Methodology

Soil samples were couriered to ACME Analytical Laboratories prep lab in Whitehorse, YT and then forwarded to their Vancouver, BC lab for analysis. Sample prep in Whitehorse included drying at 60° C, reduction to 100g size and sieving to -80 mesh. Multi-element analysis (36 element IDX2 package) was performed in Vancouver on a 50g split following Aqua Regia digestion via inductively coupled plasma-mass spectrometer (ICP-MS) instruments. Assay certificates are presented in Appendix 4 and the detailed methodology and detection limits are in Appendix 5.

6.8 Exploration Program Results

Four diamond drill holes (CC11-043 to CC11-046) were completed at Contact and 14 diamond drill holes (CC11-047 to CC11-060) were completed at Bear Paw. All 18 drill holes encountered gold mineralization.

At Bear Paw, the 2011 program was designed to infill and expand the envelope of mineralized breccias tested in the 2010 drilling program. Results from the 2011 drilling program are to be used to further define the mineralization, plan future drilling programs and initiate resource estimation.

The Contact drilling program was designed to further test the mineralized sheeted vein system drilled in 2010. Additional drill database compilation/validation work is to be followed by geologic and resource modeling on Contact.

A total of 1,026 soil samples were collected over the property during the program. Results illustrate expanded >100 ppb Au geochemical anomalies along the Saddle – Josephine trend.

7.0 CONCLUSIONS

The 2011 drilling program was successfully carried out at Contact and Bear Paw. Gold mineralization was encountered in all drill holes. Encouraging anomalous soil geochemistry was found to occur in areas with little to no historical drilling.

8.0 RECOMMENDATIONS

Clear Creek is large property covering approximately 6,000 hectares. Clear Creek hosts an intrusion-related gold system associated with Tombstone Suite plutonics in several zones kilometers apart. Gold mineralization occurs in broadly disseminated zones, skarns, sheeted veins and breccias.

A new Class III MLU permit is required to facilitate expanded exploration on the property. Construction of new and improvement of existing roads and trails is necessary for follow-up drilling at Bear Paw and Contact.

Sufficient drill data exists to initiate resource modeling work at Bear Paw. Contact requires drill database validation and preliminary geologic modeling. Additional drilling at both prospects is recommended to expand known mineralization and enhance potential resource classification(s).

New and historical soils databases require compilation and further interpretation. Field work and trenching is required to follow-up on anomalous 2011 soil geochemistry prior to development of future drill targets.

9.0 2011 EXPLORATION EXPENDITURES

Claimed expenditures for the 2011 exploration program were $464,385.52, as summarized in Table 9-1.

Table 9-1. Summary of claimed exploration expenditures for 2011 program.

Work Type	Amount
Diamond Drilling (Peak Drilling)	$582,228.00
Soil Sampling (Fox Exploration)	$44,520.00
Assaying (ALS Minerals)	$137,637.52
Total:	**$464,385.52**

APPENDIX 6

DESCRIPTION OF ANALYTICAL METHODS AND DETECTION LIMITS

ALS Chemex

Fire Assay Procedure – Au-AA23 & Au-AA24
Fire Assay Fusion, AAS Finish

Sample Decomposition: Fire Assay Fusion (FA-FUS01 & FA-FUS02)
Analytical Method: Atomic Absorption Spectroscopy (AAS)

A prepared sample is fused with a mixture of lead oxide, sodium carbonate, borax, silica and other reagents as required, inquarted with 6 mg of gold-free silver and then cupelled to yield a precious metal bead.

The bead is digested in 0.5 mL dilute nitric acid in the microwave oven, 0.5 mL concentrated hydrochloric acid is then added and the bead is further digested in the microwave at a lower power setting. The digested solution is cooled, diluted to a total volume of 4 mL with de-mineralized water, and analyzed by atomic absorption spectroscopy against matrix-matched standards.

Method Code	Element	Symbol	Units	Sample Weight (g)	Lower Limit	Upper Limit	Default Overlimit Method
Au-AA23	Gold	Au	ppm	30	0.005	10.0	Au-GRA21
Au-AA24	Gold	Au	ppm	50	0.005	10.0	Au-GRA22

ALS Chemex

Geochemical Procedure - ME-ICP41
Trace Level Methods Using Conventional ICP-AES Analysis

Sample Decomposition: Nitric Aqua Regia Digestion (GEO-AR01)
Analytical Method: Inductively Coupled Plasma - Atomic Emission Spectroscopy (ICP - AES)

A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to 12.5 mL with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. The analytical results are corrected for inter-element spectral interferences.

NOTE: In the majority of geological matrices, data reported from an aqua regia leach should be considered as representing only the leachable portion of the particular analyte.

Aqua Regia Digestion

Groups 1D, 1DX
ICP-ES & ICP-MS

You can choose economically priced ICP-ES (Group 1D) or ICP-MS (Group 1DX) analysis to complement your exploration program.

Sample splits of 0.5g are leached in hot (95°C) Aqua Regia. Select a larger split size for more representative Au analysis. Refractory and graphitic samples can limit Au solubility.

Sample minimum 1g pulp.
