NCHANT 209-249 (YD98759 – YD98799)

Dates of Work: June 13-23rd, June 19th -July 2nd & July 20th to August 5th, 2011

Ryan Gold Corp.

Author: Hua Jin

March 2012

SUMMARY

Anomalous Au in soil up to 156 ppb was identified from the reconnaissance ridge and spur soil geochemistry survey in 2010 at Chant claim block. Encouraged by the soil anomaly result, an exploration campaign consisted of prospecting, reconnaissance geological mapping, trenching was carried out from June 13th to June 23rd in 2011 to follow up the soil anomalies discovered in the previous year. A total of 36 rock grab samples were collected from the surface prospecting and geological mapping program. In addition, a total of 172 trench samples were collected from three trenches covering 380m dug at the Au in soil anomalies delineated from the 2010 soil sampling.

The soil geochemistry survey was expanded from a few ridge and spur traverse lines in Echo and Chant claim in 2010 to systematically cover all ridge and spur lines at Fifty Mile including Chant, Echo, ENT and NChant claim blocks from June 19th to July 2nd and from July 20th to August 5th in 2011. A minor soil grid sampling was carried out at the NChant claim after significant oxidation and weathering was observed from the surface prospecting. A crew of 15 samplers from GroundTruth Exploration Inc. based out of Dawson city, Yukon Territory collected a total of 12,089 soil samples from aforementioned four prospects at Fifty Mile area.

The extensive soil sampling campaign conducted in 2011 to cover most of the ridge and spur lines at Fifty Mile area outlined six discrete Au in soil anomalies above 100 ppb from the four claim blocks with the maximum Au value of 968 ppb. The best assay result intersected from trenching is 810 ppb Au over 2m in quartz biotite schist containing limonite alteration, right beneath the previous year's soil anomaly. From the geological observation on the surface and in the trench, the anomalous Au values in soil delineated in 2010 appear to be associated with epidote, cholorite and magnetite altered quartz biotite schist containing fine grain disseminated or patchy pyrite which is often partially or completely oxidized near surface.

Further work including geological mapping and trenching is strongly recommended to follow up the soil anomalies identified from 2011 soil geochemistry survey as well as soil grid sampling of 50m sample station spacing on the line with 100m line spacing to examine the extent of the Au in soil anomalies identified in 2011.

1. INTROCUTION

1.1 Location and Access

The Chant, Echo, NChant and ENT claim groups are part of Fifty Mile Property which is located in the western central part of the Yukon Territory, approximately 60 km southwest of Dawson City. The center of aforementioned four claim groups is at latitude 63°52'N and longitude 140°35'W on NTS map sheet 115N10, 115N15 & 115N16 (Fig. 1). Access to the Chant, Echo, ENT and NChant claim blocks is by helicopter from Dawson city. Ryan Gold exploration staff and soil sampling crews from the GroundTruth Exploration who worked on the Fifty Mile in 2011 were flown there by a helicopter provided by TransNorth Helicopters.

1.2 Claim Status and Ownership

The Chant 1-518 claim, Echo 1-1680 claim and ENT 1-472 claim groups were registered in the Dawson Mining District, 70% of which is owned by Shawn Ryan and 30% owned by Wildwood Exploration Inc. The NChant 1-249 claim group is also registered in the Dawson Mining District in the name of Shawn Ryan (100%). Detailed claim information and location of the claim block is shown from Figure 2 to Figure 6. Claim tenure information is summarized in table 1 below:

Table 1. Claim tenure information

Claim	Grant number	Expiry Date	Claim Owner
Chant 1-34	YD47767-YD47800	January 20, 2017	Shawn Ryan - 70%, Wildwood Exploration Inc. - 30%

1.3 Topography, Vegetation and Climate

The area which is located in the Yukon Plateou is unglaciated (Lowey, G.W., 2000) with elevation ranging from approximately 700m to 1800m. The geography is characterized by rolling hills typical of the Dawson range with locally high hills west of Mount Hart on the Chant claims and southwest part of Echo claim block.

Vegetation primarily consists of white spruce, birch and poplar black spruce with the tree line at approximately 1216m. Outcrop exposure at the property is generally poor and primarily restricted to ridge tops as the majority of the claim blocks lie below tree line except the southwest of Echo claim block which is characterized by rolling tundra with no tree cover.

The area has a typical northern interior continental climate characterized by warm summers and long cold winters with light precipitation. Temperature ranges from 15°C to 25°C during the summer and drops to between -25°C and -50°C in winter. The exploration season typically runs from mid-June to late September.

2. HISTORY AND PREVIOUS WORK

Previous work in the vicinity of the claim groups is summarized and listed below:

1972 Geological survey of Canada conducted a mapping program which located several outcrops of quartz-pebble conglomerate around Mount Hart and reported visible gold found in the quartz-pebble conglomerate outcrop, 2.7 km south-southwest of Mount Hart (Geological Survey of Canada, 1973).

1973 Geological mapping and geochemical sampling was conducted by Silver Standard Mines Ltd., with no significant gold showings found (Mineral Industry report, 1973).

1998-2000 A. Rudis and Ralph Nording carried out a geochemical soil, silt and rock sampling program. Two significant silt samples returned 25ppb and 58ppb Au from Cheryl Creek where coarse placer gold was historically recovered with some enclosed fragile cuprite crystals. A total magnetic field survey run along Cheryl Creek returned two semi-continuous anomalies interpreted to be a possible bedrock source and/or placer gravels (Rudis, 1999-2001).

1999 Prospector International Resources conducted silt sampling of the creeks surrounding Mount Hart and found moderate to strongly anomalous gold from four creeks. The most significant result was 167 ppb Au and 100 ppm As from a sample collected 1.2 km downstream from the head of the tributary of Enchantment Creek draining the northeast slope of Mount Hart (Jaworski and Meyer, 2000).

2003 Grid Capital Corporation carried out a drill program consisted of five diamond drill holes to test the promising targets outlined by soil geochemistry survey and IP survey at AMI property which is located approximately 1km south of NChant southern claim boundary. Three drill holes intersected porphyry style mineralization including pyrite, chalcopyrite, molybdenite hosted in quartz monzonite. However, the assay values of copper, molybdenum and gold were considered to be too low to be of economic interest. Another drill hole intersected a 0.64m wide galena silver vein with 22.08% Pb, 2,086.5 g/t Ag and 1.13 g/t Au .

2007 Equity engineering was contracted out by Rimfire Mineral Corporation to carry out mapping, prospecting and soil sampling. 11 Rock samples and 116 soil samples were collected on the Echo 1-72 claims. Gold assay results returned from the rock samples were below detection limit of 5ppb and the Au in soil ranged from 14 ppb and 29 ppb. Geological mapping identified medium to coarse grained muscovite + biotite ± garnet granite from the outcrop, trenched bedrock and float exposed at Echo. Weak to moderate sericite-clay-carbonate alteration was observed in the granite with quartz stockwork or quartz vein breccia and pyrite mineralization (1-2%) and trace galena found in wall rock and veins (Black, 2008).

2010 GroundTruth Exploration Inc was contracted by Ryan Gold Inc. (Private Company) to conduct the ridge and spur soil geochemistry survey at the Chant, ENT and Echo claim blocks. A total of 240 samples were collected from ridge and spur traverse lines at ENT and Chant Claim to cover the eastern flanks of Mount Hart and additional 380 samples were collected from Echo claim. The best Au in soil values of 155.9 ppb and 21.1 ppb were returned from the saddle area in Chant Claim, 3km south of Mount Hart. The maximum values of 10.9 ppb Au in soil was identified from the soil geochemistry survey at Echo claim.

2010 J. Pautler was contracted by Valdez Gold Inc. to conduct a geological and geochemical evaluation of the Au in soil anomalies delineated from the soil geochemistry survey in the same year. One day of evaluation occurred on September 29, 2010 identified mineralization of fine pyrite, limonite boxwork hosted in granite with sericite alteration and silicification at the Chant saddle zone. Intermediate to mafic gneiss containing rusty quartz veinlets and limonite fractures was also identified near by the 155.9 ppb Au in soil location. Similar to Chant Saddle zone, augen gneiss and granite dikes, locally silicified, brecciated was identified by J. Pautler on the central Echo claim. No significant Au values were returned from the rock samples collected during the evaluation work.

3. 2011 WORK

GroundTruth Exploration Inc. of Dawson, Yukon Territory was contracted by Ryan Gold Corp. to conduct the regional soil geochemistry survey on the Chant, Echo, ENT, NChant properties. A total of 12089 soil samples were collected by a crew of 15 men from the period of June 19th to July 2nd, 2011 and July 20th to August 5th, 2011 (Figure 7). 465 of these were sampled on a grid with 50m sample spacing on the sample line and 100m line spacing at the northern Chant claim block while the remaining samples were ridge and spur soil samples.

Exploration campaign consisted of geological mapping and trenching was carried out at the Chant claim with a crew of two to five people from Ryan Gold Corp flying from Dawson city during the period of June 13th to June 23rd in 2011. The primary purpose of 2011 geological mapping and trenching was to examine the gold in soil anomaly that was identified from the 2010 soil geochemistry survey in the bedrock from trenching and surface prospecting and geological mapping. Three trenches totalling 380m were dug by Candig from Talus exploration with the effort to expose the bedrock beneath the Au in soil anomaly at Chant claim. Trenching was followed by geological logging, sampling and assaying of the trench samples. The location of three trenches and rock grab sample was shown in Figure 8. The property geology map compiled from the geological observation data collected from the 2011 prospecting and mapping will be discussed in the following section of property geology and mineralization.

4. GEOLOGY

4.1 Regional Geology

The Chant, Echo, ENT and NChant claim groups are situated within the Yukon-Tanana Terrane in the western central Yukon. The Yukon-Tanana Terrane which is the largest terrane in the Canadian Cordillera that was accredited to North American ancient continental craton. The terrane is composed of metasedimentary, metaplutonic and metavolcanic rocks comprising Paleozoic aged Nisling assemblage, Nasina assemblage, Pelly gneiss and Nisutlin assemblage from oldest to youngest. The Nisling assemblage is a meta-sedimentary package of quartzite, quartz-mica schist and marble. The Nasina assemblage is composed of aforementioned meta-sediments with large amounts of carbon which makes the rock black and/or graphitic. Pelly Gneiss is strongly foliated with granitic composition and Nisutlin assemblage is characterized by quartz-mica schist.

The regional geology (Gordey et al., 2005 and 2006) of the Fifty Mile property including Chant, Echo, ENT and NChant claim groups is dominated by abundant Paleozoic metaplutonic and metavolcanic rocks representing two arcs; an older arc composed of Devonian-Mississipian amphibolite and subvolcanic intrusive complex (DMogg, DMoga, DMogt) built upon a siliciclastic foundation (DMps, DMq, DMcg, DMNq) and a Permian granitic orthogneiss (Pogg, Poga) and coeval metavolcanic rocks built on the previous arc. The Devonian and Mississipian

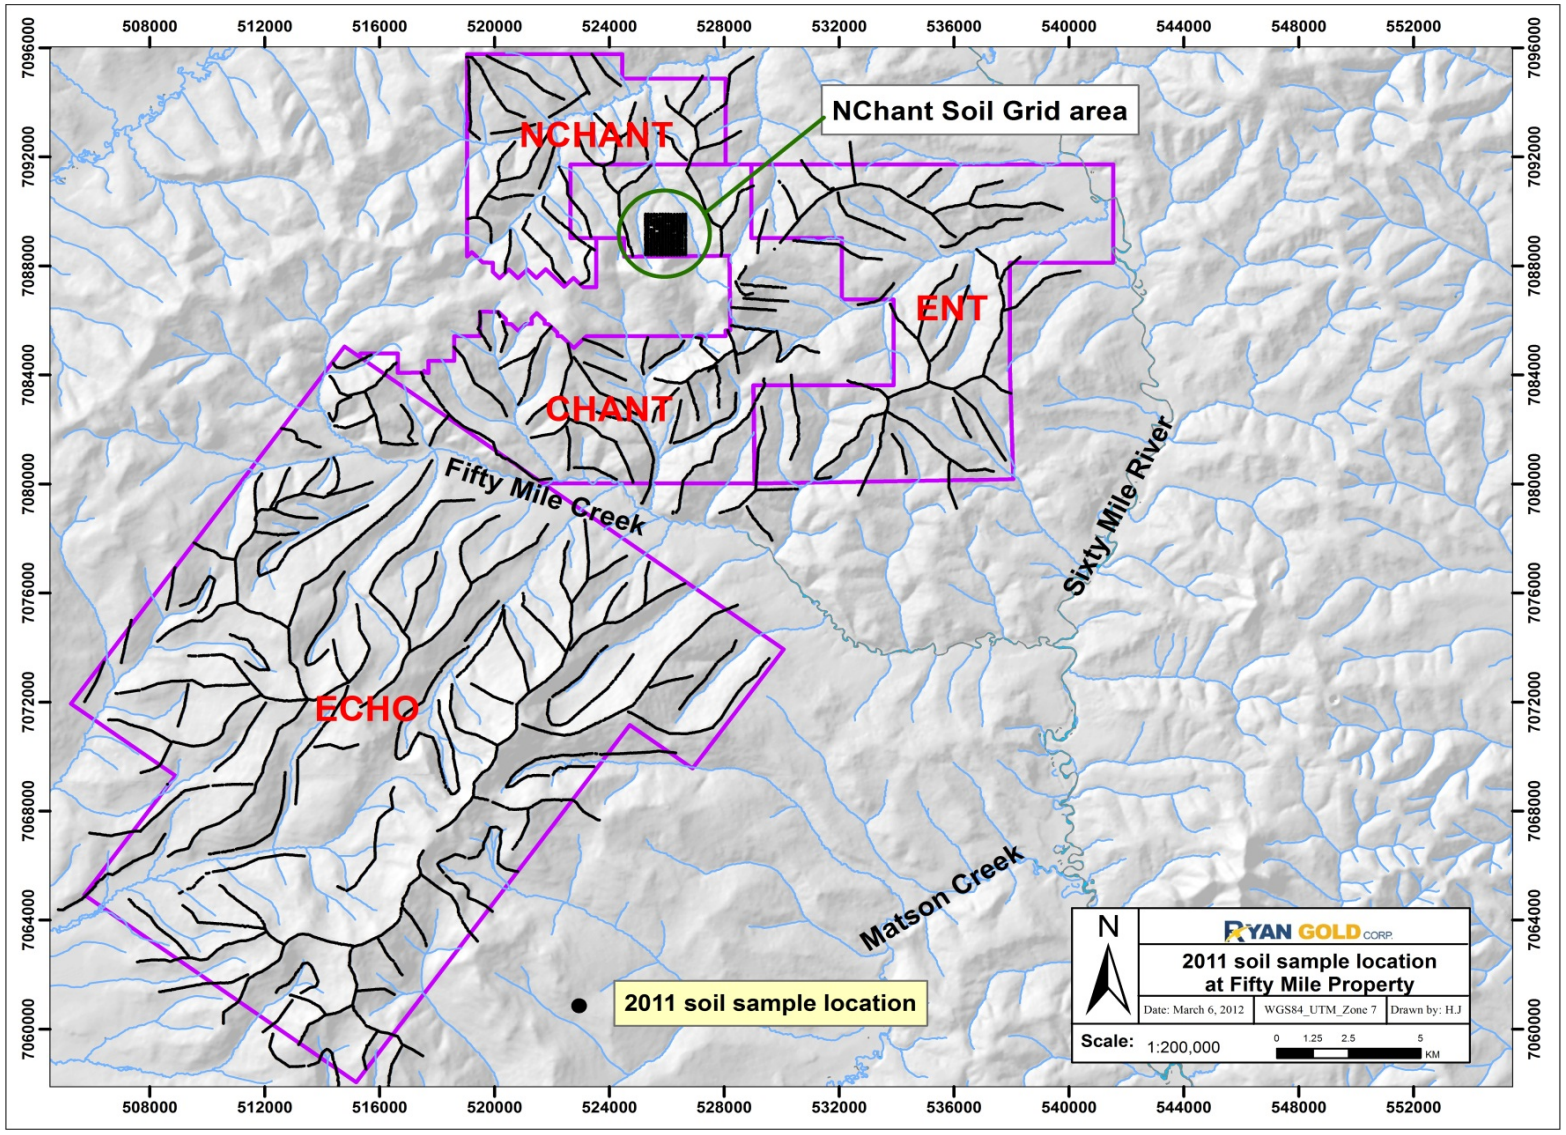

Figure 7. Chant, Echo, ENT and NChant Soil sample location map

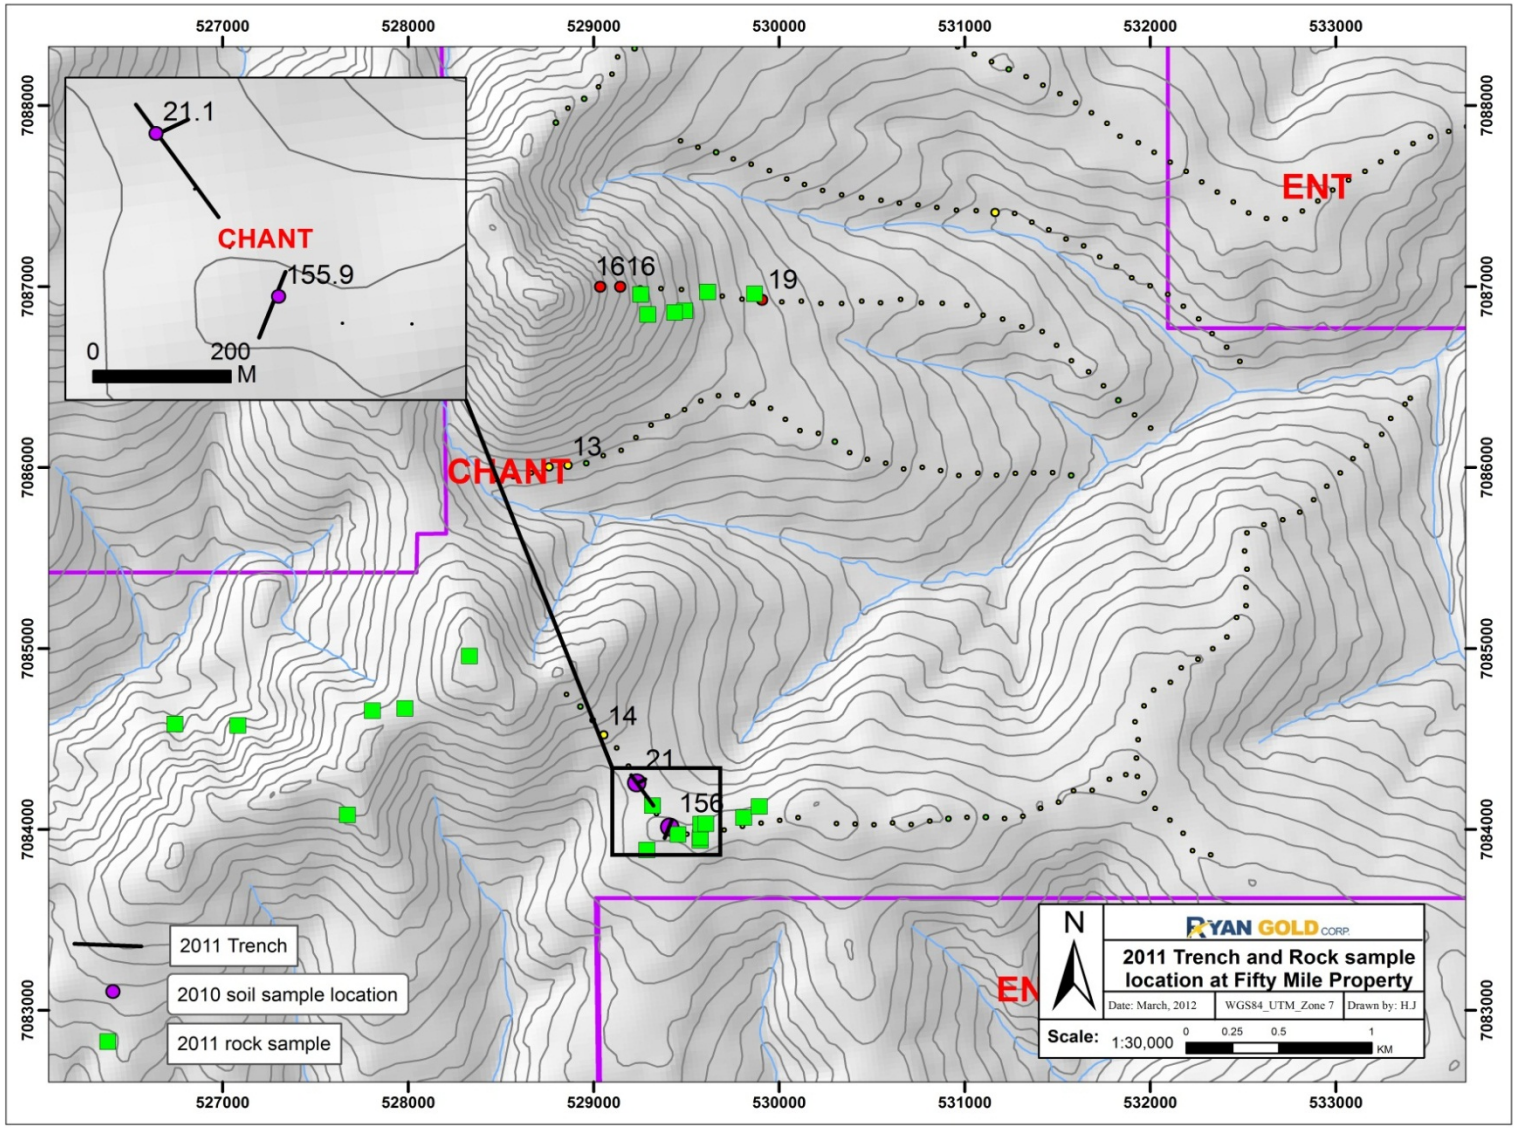

Figure 8. Trench and Rock sample location map

aged Nasina assemblage structurally lies above or equivalent to the meta-siliciclastic unit (DMps) (Figure 9).

Aforementioned Paleozoic gneiss and schist are intruded by plugs and/or stocks of Cretaceous quartz monzontie and granodiorite (Kg) and Jurassic aged granodiorite (eJgd) which is unconformably overlain by massive andesite flows and breccias of Cretaceous Carmacks Group (uKv), with local occurrences of coarse clastic sedimentary rocks to conglomerate (IKcg) at the base of sequence.

4.2 Property Geology and Mineralization

The following section of the property geology is heavily referenced from J. Pautler (2010).

The fifty mile project comprising Chant, Echo, NChant and ENT claim is underlain by Devonian to Missipian orthogneiss. K-spar augen bearing orthogneiss (DMoga) predominates Echo claim area while tonalitic to dioritic orthogneiss, interlayered with amphibolite schist and gneiss (intermediate to mafic metavolcanic rocks) dominates northeast of fifty mile creek.

The Devonican to Missipian basement rocks (DMps) consisted of quartz-mica schist, locally garnetferous and grading to gneiss, metamorphosed fine clastic rocks, micaceous quartzite, rare conglomerate is exposed at Chant and NChant claim. The metamorphic grade for aforementioned unit is amphibolite grade.

Narrow bodies of Paleozoic aged serpentinized ultramafic rocks (mPums) have been mapped along a northwest trending structure at the southern Echo claim. Permian metavolcanic rocks (PKs) composed of muscovite-chlorite-quartz-feldspar and chlorite schist with greenschist metamorphic grade were mapped to the northwest of Chant claim and south of Echo claim.

Abovementioned units are intruded by plugs and stocks of Cretaceous (and/or possibly Jurassic) aged granite to granodiorite (Kg) and related dikes and/or sills and unconformably overlain by massive andesite flows and breccias of the Late Cretaceous Carmacks Group (uKCv) locally with Early Cretaceous conglomerate at the base of the sequence (IKTcg).

Block faulting has been suggested by Mortensen (1996) at the upper Sixty Mile River (northwest of the project area) defining the southeast margin of a northeast trending graben. A low angle northeast dipping normal fault was postulated by Mortensen (1996) along Fifty mile creek while recent mapping by Gordey and Ryan (2005) interpreted it as an intrusive contact between K-spar augen gneiss from the intermediate to mafic orthogneiss and siliciclastic basement. J. Pautler (2010) interpreted a northeast trending fault extending along upper Enhancement Creek, across fifty mile creek and through the central Echo claims based on topographic and aerial linement.

The 2011 prospecting and geological mapping was primarily focused on along/adjacent to the gold-in-soil anomalies that were identified from 2010 soil geochemistry survey at Chant claim. Outcrop exposure is poor at Chant Claim block and bedrocks are generally restricted to ridgetop.

Most of the geological mapping is based on talus, subcrop and float which are most common in the area and minor outcrop at the ridge top. Considerable amount of bedrock exposed at trenches dug across the Au in soil anomaly supplemented the geological mapping. Property geology of Chant Claim based on the geological observation in 2011 is shown in Figure 10. Four rock types which are listed below were identified at Chant claim during the 2011 program.

Granodiorite: Light to dark gray on fresh surface with light brown or orange colour on weathered surface, fine-grained granodiorite consisted of mostly plagioclase, quartz and generally less than 5% of mafic mineral (biotite or hornblende). Moderate sericite alteration, weak silicification and some chlorite stringers was observed in granodiorite containing fine grained disseminated pyrite ranging between 0.5% and 2%. Quartz veins of mm to cm scale were also observed in granodiorite. The rock type is believed to be late Cretaceous intrusion (Kgd) cutting through Devonian-Missipian aged metasedimentary rocks of quartz-biotite schist (DMps).

Andesite/Basalt: Dark grey, hornblende or augite phyric volcanic rocks of andesitic to basalt composition contains up to 1% of very fine grained pyrite and 0.5% of pyrrhotite and generally magnetic. The rock type is interpreted to belong to the Carmacks group (uKCv).

Quartz Conglomerate: White to light grey quartz conglomerate outcrop was identified at the base of Andesite of Carmacks group. The quartz pebble size ranges between 1cm and 7cm with limonitic alteration on the weathered surface. Little mineralization was observed in the quartz conglomerate.

Schist/Gneiss: Light to dark grey metasedimentary rocks with the amphibolite metamorphic grade composed of foliated/banded layers of biotite, hornblende, muscovite and quartz. Weak to locally moderate sericite alteration, weak chlorite alteration and locally magnetite was identified in the schist. Mineralization is dominated by disseminated or stringer pyrite with generally less than 1% and up to 5% locally. Two sets of veining were identified with one set of quartz veins along the foliation and the other set crosscutting the foliation.

A total of 36 rock samples were collected in 2011 at Chant claim, 34 of which were grab samples from subcrop, talus and float and remaining two are outcrop samples from the ridgetop. Rock sample locations were illustrated in Figure 10 and rock sample description with location data is listed in Appendix IV. The assay certificate of rock samples appear in Appendix VI. Most of rock samples returned between below detection limit to 0.089 ppm gold with maximum arsenic values of 346.5 ppm.

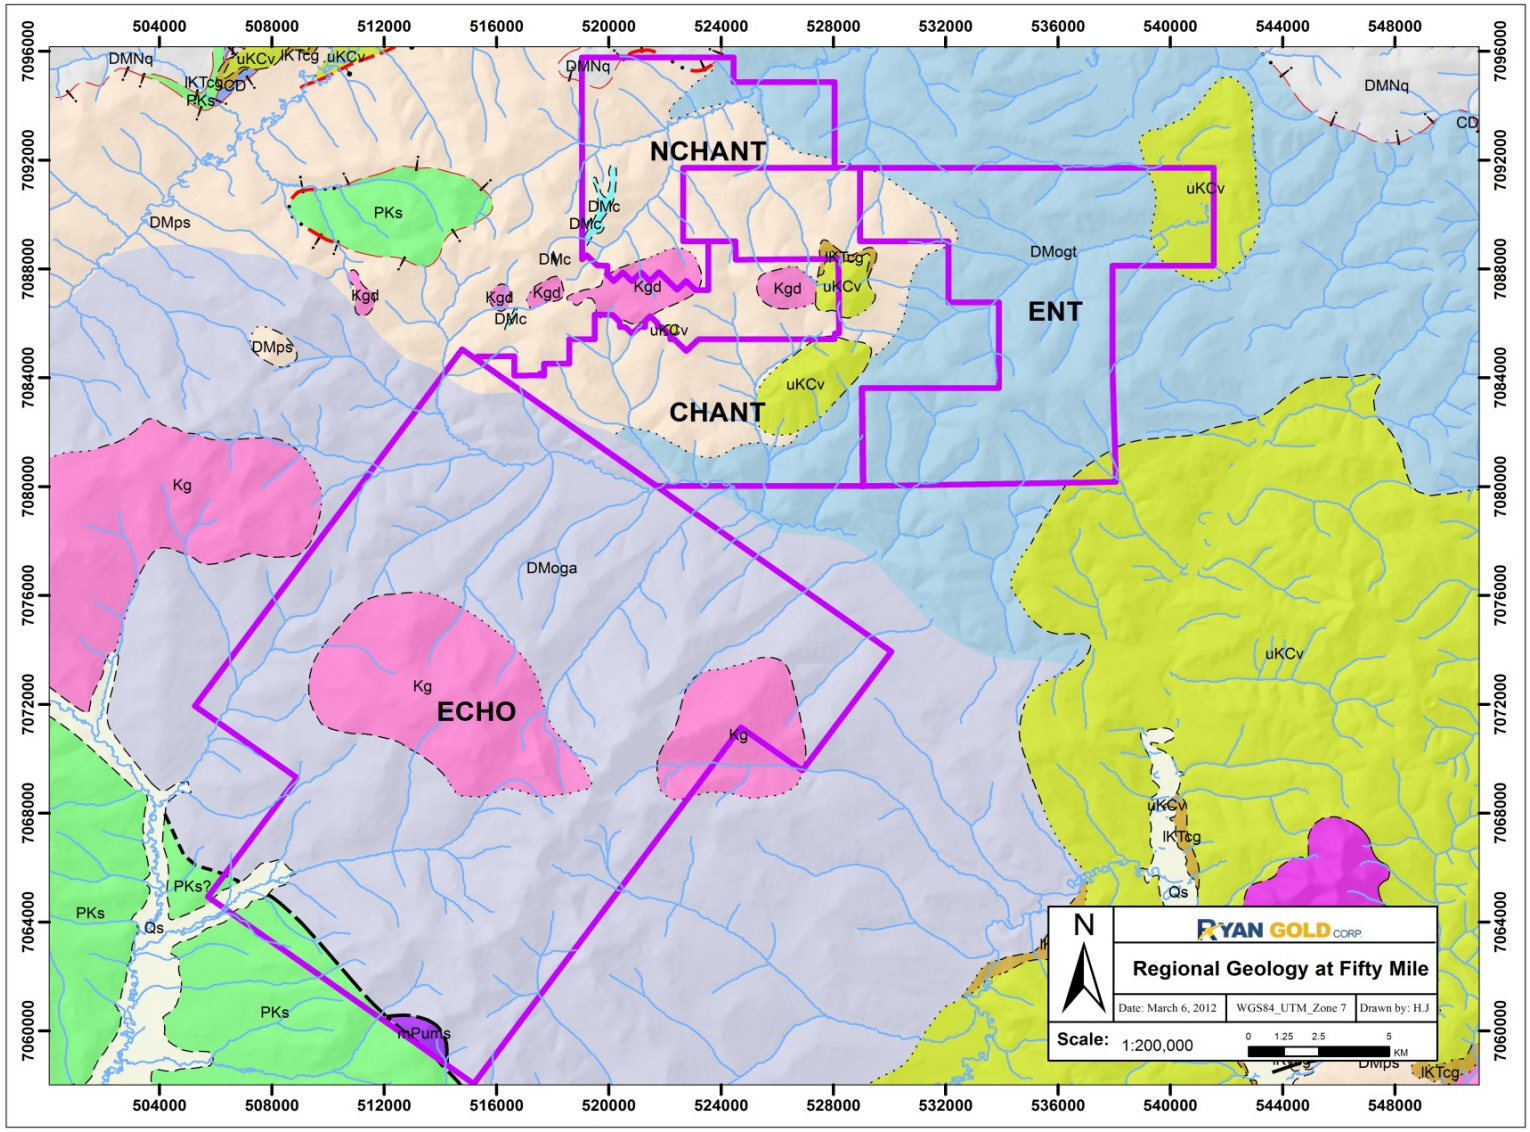

Figure 9. Regional Geology Map

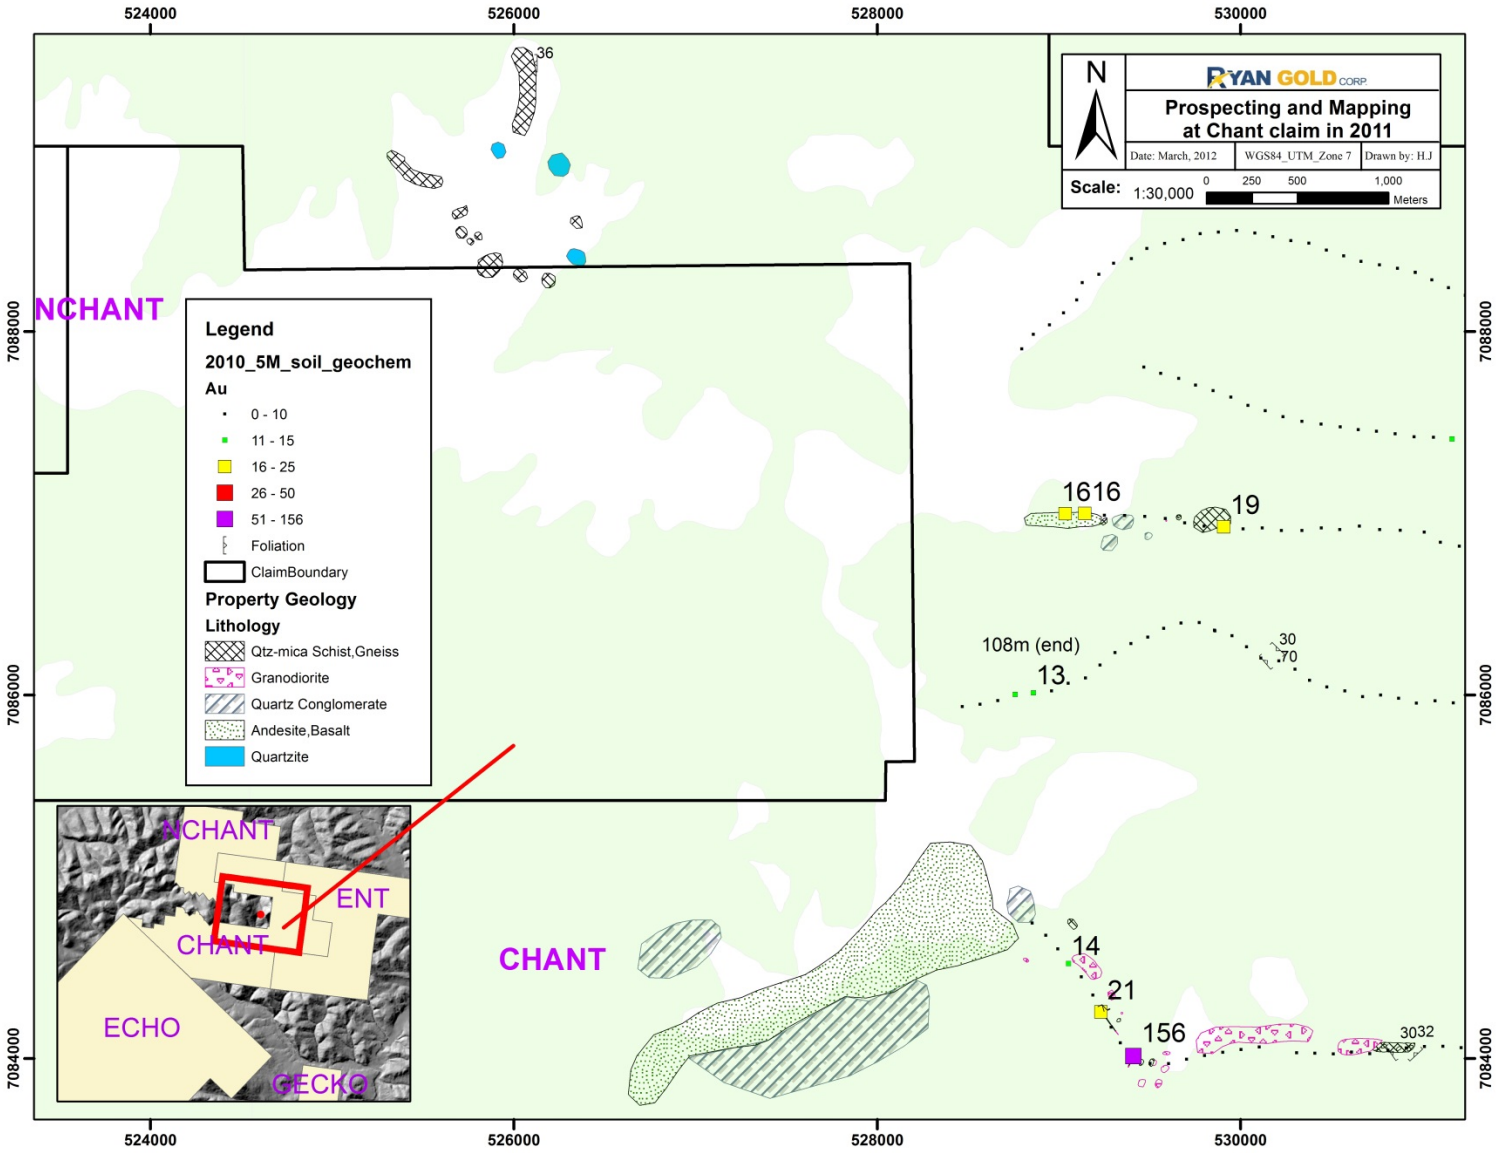

Figure 10. Property Geology

5. Trenching

Between June 13th and June 23rd, 2011, three trenches totalling 380 meters were dug at Chant Claim to examine the 156 ppm, 21ppm and 14ppm Au in soil anomaly identified from the 2010 soil geochem survey (Fig. 11). A CANDIG backhoe from Talus Exploration was used to construct the trenches. A backhoe operator and one assistant from Talus Exploration completed the three trenches under the supervision of the author. The first trench 5MTR001 was dug across the 156ppm gold in soil (Fig. 10). In addition, two crosscutting trench 5MTR002 and 5MTR003 were dug with the effort to expose bedrock/bedrock related talus beneath the 21ppm and 14ppm Au in soil anomalies (Fig. 10).

Trenches were generally 30- 80cm deep and 30-40cm wide. The trenching depth was determined by backhoe digging ability and permafrost condition. First trench - 5MTR001 has exposed rock that is believed to be in-situ subcrop continuously throughout the entire length of trench while the second and third trench which are located 110m northwest of the first trench, encountered sporadic sections of permafrost (Fig. 11). No trench samples were taken from the permafrost section due to little rock exposure. Rock chip samples were systematically collected from one side of the trench wall and as representative as possible over the sample interval. Sample intervals ranged between 0.3m and 2m based on the lithology contact and mineralization. Sample number was written outside of plastic bag and corresponding sample tag was placed inside of the bag. An aluminum tag with sample number and sample interval inscribed was tied to a twig in the bush nearby.

Lithological, alteration, mineralization and veining data were systematically collected along with sampling before the samples were sent to ACME Analytical Lab Ltd., Vancouver for analysis. 250g of trench samples were crushed and pulverized to 200 mesh followed by Aqua Regia digestion ICP-MS analysis for 36 geochem elements with additional 50g fire assay fusion gold by ICP-ES.

The lithology, alteration, mineralization, veining and structure identified from logging three trenches are summarized in the following section.

Lithology

Trench 5MTR001 and 5MTR002 intersected tan coloured fine grained granodiorite dike intruding dark gray quartz mica (mostly biotite) schist for the section of 0- 40.2m of 5MTR001 and again 0- 53.6m of 5MTR002. The granodiorite dike ranging between 0.5m to 8m in thickness consisted of plagioclase and quartz with less than 5% of mica. Quartz biotite schist was dominant rock type identified in the remaining section of the three trenches (40.2-108m of 5MTR001, 53.6-220m of 5MTR002 and 0-52m of 5MTR003).

Alteration and Veining

Weak to locally moderate chlorite, epidote and magnetite alteration was identified from the trench 5MTR002 and 5MTR003. Limonitic alteration was common in quartz vein/veinlets present along the foliation plane in quartz biotite schist in trench 5MTR001.

Mineralization

Mineralization is predominantly pyrite with concentration ranging from trace amount to 3%. Pyrite was present as disseminated or patchy in quartz biotite schist and/or in quartz vein/veinlets. Often the sulfides in quartz vein have been mostly oxidized to iron oxide (jarosite or goethite).

Structure

As a result of brittle feature of the quartz mica schist, accurate structure measurement was difficult to obtain in the trenches. The foliation plane in the schist appears to be shallow dipping striking NE or SW.

In summary, the anomalous gold values in soil from 2010 soil geochem survey conducted at Chant claim appears to be caused by sulfide bearing quartz veins present in the quartz biotite schist and locally associated with chlorite-epidote-magnetite alteration present in the biotite schist.

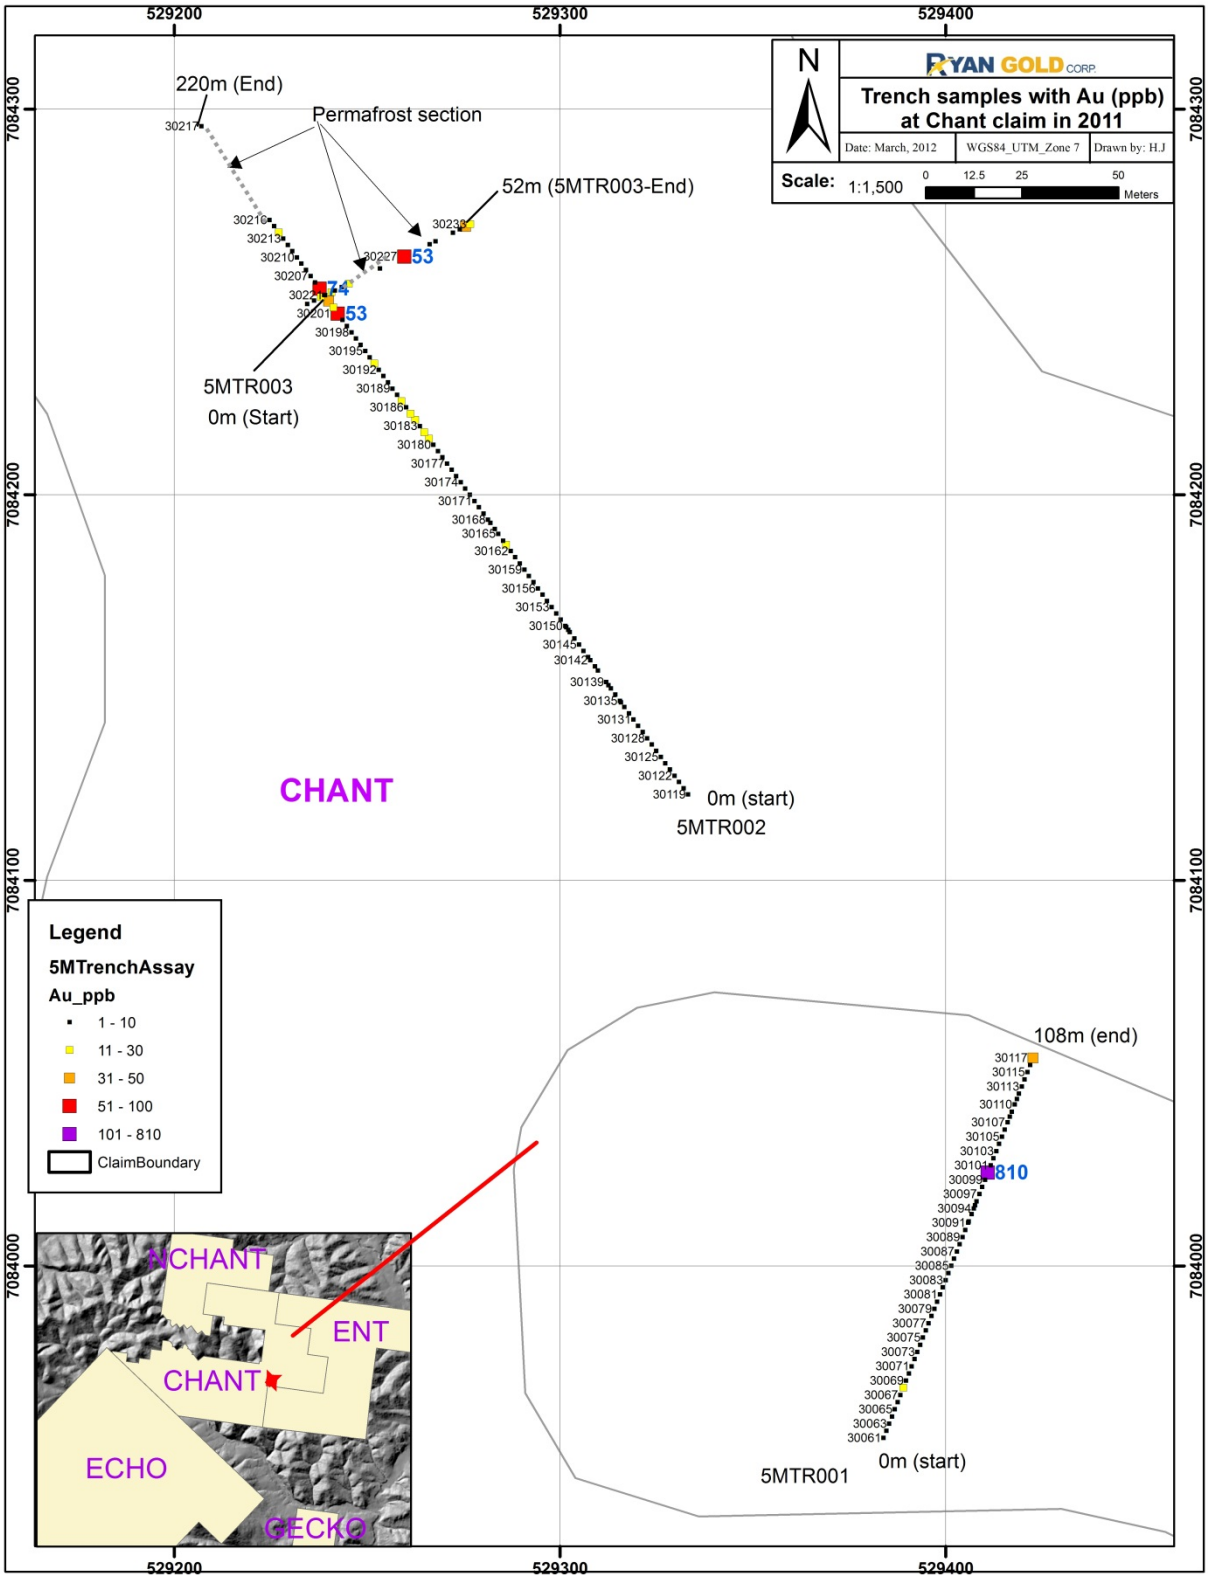

Figure 11. Location of three trenches, trench sample No. and Au values (ppb)

6. Soil geochemistry

6.1 Soil sampling method and analysis

This section is taken from the Chant 2010 soil geochemistry assessment report (Jin, 2010).

"*Soil samples were taken with one meter soil auger and a prospector pick where necessary. Soil samples were gathered from an average depth of approximately 60 centimeter ranging from 20cm to 110cm from B or C horizon soil. Soil sample locations were clearly marked in the field with pink flagging and aluminum tags. The sample number was inscribed on the aluminum tag and tied to a tree or shrub at shoulder height above sample site. The coordinates of sample location was collected by a Garmin Map76 GPS in UTM NAD 83. Sample description including color, depth, slope, sample quality, ground vegetation, tree cover and GPS coordinates were recorded in a Palm PDA data recorder.*

Approximately 400-500 grams of soil was collected from every station spaced 50m apart on the traverse line and stored in kraft soil bags. All samples were brought back to Dawson City and air dried, repacked in rice bags and sent to ACME labs in Vancouver. Samples are analyzed by Aqua Regia ICP-MS for 36 element (Acme Labs 1DX-15 gram)."

The 2011 soil geochem sampling program composed of soil samples collected at 50m spacing on most of ridge and spur traverse lines at Chant, Echo, NChant and ENT claim blocks as well as a small grid sampling at northern Chant claim. Location of the soil sample is shown in Figure 7 and the detailed sample description is listed in Appendix III.

6.2 Results and Interpretation

Statistical analysis was performed on Au values in 12,089 soil samples to identify background value as well as threshold for anomalous values. The Au value in soil at Fifty mile area comprising Chant, Echo, ENT and NChant ranged from the below detection limit (<0.5ppb) to 968.1 ppb. The histogram analysis shown in Figure 12 indicates that 95% of Au in soil values fall between the below detection limit and 6 ppb and the 98th percentile is 10.5 ppb.

The correlation analysis among elements of interest in the soil sample suggest that the strongest correlation (65%) exists between As and Sb (Fig. 13). The most correlation with Au is with Hg (36%), As (34%) and Sb (28%) (Fig. 13).

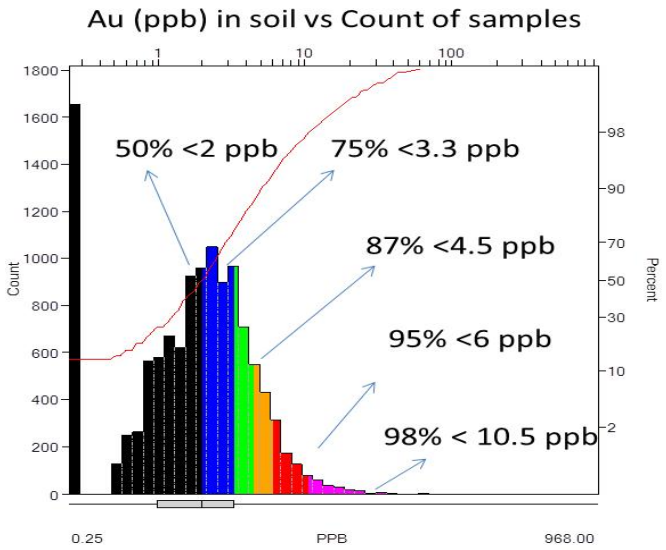

Figure 12. Au (ppb) in soil Vs. Total count of samples in the specified value range

In order to define the anomalous arsenic values in soil, histogram analysis was again performed on As (ppm) values of all the soil samples collected in 2011 (Figure 14). It appears that more than 98% of soil samples (the red curve which is the total accumulative percentage) has arsenic concentration less than 100ppm, as such the value was used as the threshold to identify the spatial distribution of the anomalous As values in soil at Fifty mile (Figure 15).

Based on Au in soil anomaly (Figure 14) and As in soil anomaly map (Figure 15), it is evident that a cluster of soil anomalies occurs in Chant claim, to the east and south of Mt. Hart and extends northwest at NChant claim. The soil anomaly area is outlined on the figure 17 which shows the gridding of Au in soil values at Fifty Mile.

Figure 18 to Figure 21 show anomalous gold and arsenic concentration in soil in the context of regional geology and regional mag data. It should be noted that the occurrence of soil anomaly is predominantly located within the Devonian Missipian basement rocks (DMps), which possibly indicates that the favourable host rock for mineralization is Devonian-Missipian metasilicic rocks composed of quartz-mica schist, locally garnetferous and grading to gneiss, metamorphosed fine clastic rocks, micaceous quartzite rather than augen bearing orthogneiss (DMoga) at Echo claim or tonalitic or dioritic orthogneiss (DMogt) mapped at ENT claim block.

7. CONCLUSIONS and RECOMMENDATIONS

The 2011 exploration program at Fifty Mile consisted of prospecting and trenching at Chant claim and ridge and spur soil sampling as well as minor grid sampling at Chant, Echo, ENT and NChant claim blocks. The trenching and prospecting at Chant claim identified that anomalous Au values in soil from the 2010 soil geochemistry survey is associated with pyritic mineralization in limonite-magnetite-chlorit-epidote altered quartz biotite schist.

The extensive soil geochemistry sampling carried out at Fifty Mile project including Chant, NChant, Echo and ENT prospects encountered an array of Au in soil anomalies occurring predominantly at Chant claim block and Nchant claim block which lies northwest to the Chant claim block. The area where the soil anomalies were identified is characterized by low magnetic signature surrounding regional magnetic high which is postulated to be related to the Cretaceous intrusive activity. Furthermore, majority of the new soil anomalis identified in 2011 occurs in the area dominated by Devonian Missipian aged basement rocks (Gordey and Ryan, 2005) which was interpreted to be the favourable host rock for mineralization from the trenching excavated to examine the 2010 soil anomaly.

Further exploration work at Fifty Mile should include follow up grid sampling of 50m spacing along sample lines and 100m line spacing over the several Au in soil anomalies at Chant and NChant claim identified from 2011 soil geochemistry to examine the extent of anomalous zone. In addition, prospecting and reconnaissance mapping combined with trenching where outcrop exposure is poor are also suggested as follow up work.

APPENDIX - II

Statement of Qualification

STATEMENT OF QUALIFICATIONS

I, Hua Jin, do hereby declare that:

1. I am currently employed as Senior Project Geologist for Ryan Gold Corp. of Suite 600 – 666 Burrard Street, Vancouver, British Columbia V6C 2X8.

2. I am a graduate of the Peking University with a Bachelor of Science Degree (2003) in Earth Science and Master of Science Degree (2005) in Earth Science from the Western University (formerly known as the University of Western Ontario).

3. From 2006 to present, I have practised my profession as a geologist continuously in Nunavut and Yukon Territory in Canada, Niamey in Niger and Nevada in United States for over six years.

APPENDIX – III

30002	529576	7083954	UTMZ7N_WGS84	TalusGrab	Porphyry	Quartz	QuartzEyes	Orange									Pyrite		Molybdenite		qtz porphry w/ very small fractures that are qtz filled w/ minor moly?
30004	529454	7083972	UTMZ7N_WGS84	SubCropGrab	Schist	Quartz	Biotite	GreyDark							Epidote		Pyrite		Goethite		
30005	529287	7083885	UTMZ7N_WGS84	SubCropGrab	VeinQuartz			White									Pyrite				limonitic alteration, veins up to 10cm
30008	529318	7084130	UTMZ7N_WGS84	FloatGrab	VeinQuartz			Tan							Epidote		Pyrite		Magnetite		sample number should be 30008.
30009	529578	7084029	UTMZ7N_WGS84	FloatGrab					Sericitic			Silicification									S. - I qtz-ser altn G with 3-5% dark gray spots? rusty fracture 10-15cm pieces
30010	529605	7084030	UTMZ7N_WGS84	FloatGrab	Granite																wte qtz vein cutting granite 5cm pieces with lim; mn oon frcs; 20cm pieces
30011	529867	7086959	UTMZ7N_WGS84	FloatGrab																	float above 18.9ppb Au soil anomaly of apl? on felsic gneiss (qtz-fsp) some clay altn w. ep and minor amphib with lim frcs; +-min
30012	529491	7086866	UTMZ7N_WGS84																		spec? but brown streak; possible sphal in sts and swirly skarny ep-chl rock; Carmacks cgl in aw; somee wte weathered felsic volc.
30013	529437	7086856	UTMZ7N_WGS84																		clay altered white weath white to orangish sts or volc +-spec limic vugs, cubes
30014	529292	7086845	UTMZ7N_WGS84																		limic gauge cgl/sts
30017	526743	7084581	UTMZ7N_WGS84																		grab of rusty / mn n-s silid cgl over 30m2 area; matrix white colour inside
30019	527082	7084574	UTMZ7N_WGS84																		limic mn frx in cgl; cgl otc/sub; upper otc of cgl
30021	527807	7084655	UTMZ7N_WGS84																		rusty zone in and; NB sample 30021 from variably, sil, tr py lim frcs
30022	526068	7089484	UTMZ7N_WGS84																		limic zones in amphib+- sil; weathered out cubes and frx some remnants py <1%
30023	526070	7089333	UTMZ7N_WGS84																		rusty, limic frx in schist and some qtz with lim boxwork and frx 5cm; local float in some area- appears to be sil of qf bio gneiss and possible mylonitization
30024	526076	7089311	UTMZ7N_WGS84																		qtz ser rock from 059 and 30024 location; 30m square area here
30025	526066	7089220	UTMZ7N_WGS84																		vuggy and dusty qtz vein stwk cutting clay-ser alt? schist (paragneiss) trace py? limic vugs frx and spots (after py)
30026	526066	7089220	UTMZ7N_WGS84																		qtz vein +-ser with limic frx vugs, spots trace py some bxiation with s clay ser-sil alt; angular frags which are cut by qtz strs (1-2mm, irregular, clean)
30027	526030	7089128	UTMZ7N_WGS84																		fericrete looking ser-clay lim alt'd gougy goethite in vugs, cavities up to 1.5cm with orange lim on surfaces (above qtz vein blds w ser alt'd) some gy mineral? bx zone
30028	526030	7089128	UTMZ7N_WGS84																		qtz vein with orange red brown weathered surface, ser alt, some gy patches with fine py
30031	529615	7086969	UTMZ7N_WGS84	FloatGrab	Volcanic			Green							Malachite		Chalcopyrite		Chalcocite		Not sure that green stain is malacite, but some other Cu bearing mineral? Are metseds intercalated w/ metavolcanic rocks? Metavolcanics, are intruded by quartz veins that appear to be sulphide bearing.
30032	529254	7086957	UTMZ7N_WGS84	TalusGrab	Amphibolite	GrainedF	ine	GreyDark									Pyrite	1			
30033	527672	7084080	UTMZ7N_WGS84	TalusGrab	Basalt	GrainedF	Equigranular	GreyDark									Pyrite	1			disseminated pyrite in magnetic basalt
30034	526252	7088920	UTMZ7N_WGS84	FloatGrab	VeinQuartz																py aggregates in qtz vein and silid +- clay alt-grab

APPENDIX – V

Soil Sample Assay Certificates

Acme Analytical Laboratories (Vancouver) Ltd.
1020 Cordova St. East Vancouver BC V6A 4A3 Canada

www.acmelab.com

Client: **Ryan Gold Corp.**
600 - 666 Burrard St.
Vancouver BC V6C 1H2 Canada

Submitted By: Mike Skead
Receiving Lab: Canada-Dawson City
Received: July 22, 2011
Report Date: August 10, 2011
Page: 1 of 8

CERTIFICATE OF ANALYSIS DAW11000050.1

CLIENT JOB INFORMATION

Project: CHA
Shipment ID:
P.O. Number
Number of Samples: 189

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
SS80	189	Dry at 60C sieve 100g to -80 mesh			WHI
Dry at 60C	189	Dry at 60C			WHI
1DX2	189	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

ADDITIONAL COMMENTS

Invoice To: Ryan Gold Corp.
600 - 666 Burrard St.
Vancouver BC V6C 1H2
Canada

CC: Ian Gendall

GENERAL MANAGER

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
