COMMENTS

This drill was stopped early due to lost casing. It intersected an intercalated silty limestone and siliceous siltstone up to the end of the hole (37.23m). Trace-weak calc-silicate alteration and mineralization of pyrrhotite, sphalerite, galena and chalcopyrite was present throughout the hole.

0.00	6.07	6.07				CAS																					Casing (No Recovery
6.07	37.23	31.16				LST/ SLT	LT-MD GY	fg			w	t-w	chl	t					t	t		Cp	t				Light to medium grey, fine grained, weakly oxidized, variably bleached, trace-weakly calc-silica altered (locally fair) intercalated silty limestone (LST) and siliceous siltstone (SLT). Trace-weak oxidation and chloritization occurs primarily on fracture surfaces. Oxidation is also locally mottled. Minor mineralization of pyrrhotite, sphalerite, galena and very minor chalcopyrite occurs as fracture infill (fine grained). Sphalerite is locally coarse grained on fracture surfaces and is also found as fine-grained disseminations in calc-silica altered zones. Contacts between silty limestone and siliceous siltstone are diffuse. Siltstone is darker grey in colour, but is locally bleached. Bedding orientation ranges from 35 50° TCA. Fractures are oriented between 40-56° TCA.
			6.83	9.37	2.54	LST	LT-GY	fg				t	cly	w													Rubbly, light-grey, fine grained silty limestone showing buff colour alteration (clay?). Trace-weak oxidation and fair-moderate clay alteration present along fracture surfaces.

COMMENTS

The hole intersects a weakly to moderately strongly mineralized, intercalated silty limestone and siliceous siltstone to 372.75 m, and an argillaceous limestone to 394.19 m (eoh). The main mineralized horizon occurs between 84.44 m to 256.0 m. The lower contact with the argillaceous limestone is gradational and occurs at 372.75 m. Light green calc-silicate alteration decreases after the main mineralized section. Mineralization is present in fractures and in calc-silicate altered sections as replacements (some along bedding). Pyrrhotite and sphalerite are most prominent, but chalcopyrite is also present. Bedding usually measures between 50°-70° TCA, but varies between 35° and 80° TCA. Fractures usually measure between 20° to 35°, but some orientations seen up to approximately 55° TCA.

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS								Photo	DETAILED DESCRIPTION
													Other										Other		Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
117.53	256.00	138.47				LST/ SLT	LT-MD GY	FG			m	t	chl	w					m	f		Cp	w	Py	t		Light to medium grey, fine grained, variably bleached, weakly chloritized, moderately strongly calc-silicate altered, tracely oxidized, fair to moderately mineralized, intercalated silty limestone and siliceous siltstone. Bleaching, oxidation, and chloritization occurs around fractures. Calc-silicate alteration present in 0.15 to 1.20m sections, and is usually associated with mineralization (replacement). Mineralization is mostly replacement (massive to semi-massive, along bedding but also as disseminations) as well as fracture controlled. Mineralization is generally fine grained to medium grained and euhedral. Mineralization consists of moderate amounts of pyrrhotite, fair amounts of sphalerite (red and black), weak amounts of chalcopyrite, and trace amounts of pyrite. Prominent, partially mineralized fracture sets common. Sections of mineral replacement (10-15cm across) present throughout. Sphalerite amount increases with depth over the interval.
													ble	w-f														
			118.46	119.56	1.10	MX													w	w		As	w					Section of coarser grained, non effervescent rock (siltstone?) which is heavily overprinted by calc-silicate alteration. Large blebs (1.0 to 2.0cm across) of medium grained, euhedral sphalerite and chalcopyrite at the top of the sub-interval. Weak to fair amounts of fine to medium grained disseminated arsenopyrite found throughout interval.
			119.70	122.30	2.60	FX									FX	61												Thin, prominent fracture set with fine to medium grained pyrrhotite, sphalerite and chalcopyrite infill. Bleaching and chloritization variable at the edges.
			124.00	124.00	0.00	BD									BD	64												Bedding measured.

			211.26	212.30	1.04	MX													f	ms		Cp	f				Moderately calc-silicate altered section of medium grained, eu-subhedral pyrrhotite, sphalerite, and chalcopyrite mineralization. Mineralization is fracture controlled at the top of the subinterval and replacement near the bottom of the subinterval. No clear orientations could be measured.
			212.70	213.57	0.87	FX									FX	36											Fracture set with bleaching (no mineralization or oxidation).
			214.20	214.20	0.00	VT									VT	11											Medium grained calcite veinlet (0.5cm thick) no mineralization or oxidation.
			215.65	216.10	0.45	FX									FX	24		40									Fracture set with bleaching, no mineralization
			218.28	219.38	1.10	MX													f-m	m-ms	t	Cp	f				Section of moderately to moderately strong calc-silicate alteration and denser sections of mineralization. There are six sections of mineral replacement (5 cm to 10 cm across). Mineralization is sparser and fracture controlled between these sections. Mineralization is medium to coarse grained. Pyrrhotite and sphalerite are found together locally with chalcopyrite. Trace galena seen as well.
			219.80	219.80	0.00	BD									BD	83											Bedding measured.
			220.96	222.05	1.09	OX																					Section of moderately oxidized, angular rubble, with competent but still oxidized sections of core. Broken-up core (rubble) ranges in size from 1cm to 5cm across. No mineralization seen.
			224.20	224.20	0.00	VT									VT	23											Quartz veinlet, no oxidation, no mineralization
			225.53	225.80	0.27	BX	LT-MD GY	FG																			Light to medium grey, fine grained (particles & matrix) breccia of siliceous siltstone, and siliceous matrix. Fragments of the siliceous siltstone are angular to sub angular. No mineralization, or oxidation. Contacts are gradational, not measureable.
			228.11	228.11	0.00	BD									BD	48											Bedding measured.
			228.50	228.88	0.38	MX					i		chl	m					w	s		As	w	Cp	w-f		Section of intensely calc-silicate altered, moderately chloritized interval lithology with strong to intense mineralization. Mineralization is replacement (semi-massive) and medium to coarse grained. Mineralization consists of pyrrhotite, sphalerite, arsenopyrite, chalcopyrite, and pyrite.
																						Py	f

19	94.38	94.38			18								Pyrrhotite, pyrite fracture infill.
20	100.00	100.00					35						Pyrrhotite, chalcopyrite in quartz veins
21	101.80	101.80					32						Pyrrhotite, chalcopyrite in quartz veins
22	102.15	102.15	50										Bedding
23	108.22	108.22					58						Calcite vein with weak arsenopyrite
24	111.00	117.00			30								Prominent mineralized fracture infill
25	119.70	122.30			61								Thin pyrrhotite, chalcopyrite fracture infill
26	124.00	124.00	64										Bedding
27	128.00	135.00			25								Fracture set, with some pyrrhotite
28	138.50	138.50	60										Bedding
29	144.30	144.30	78										Bedding

STRUCTURE LOG

	INTERVAL		STRUCTURE (TCA)										Description
	From (m)	To (m)	Bedding	Lamination	Fracture	Veinlet (< 1cm)	Vein (> 1cm)	Fault	Slickensides	Attitude (TFA)	Upper Contact	Lower Contact	
30	144.50	145.20			30								Pyrrhotite and chalcopyrite infilled fracture set
31	145.20	145.20	83										Bedding
32	146.00	146.00	60										Bedding
33	148.10	148.10		55									Banded mineral replacement (bedding?)
34	150.90	150.90	41										Bedding
35	154.15	154.15				30							Calcite veinlet, no mineralization, or oxidation
36	157.66	157.66		55									Mineral replacement (along bedding?)
37	158.80	158.80	68										Bedding
38	159.00	167.00			35								Fracture set with some pyrrhotite-chalcopyrite
39	171.00	171.00	75										Dark wispy bedding
40	172.80	172.80			12								Calcite and pyrite/pyrrhotite fracture infill
41	173.20	173.20	56										Dark wispy bedding
42	174.77	174.77	71										Dark wispy bedding
43	178.50	178.50	55										Dark wispy bedding
44	184.10	184.10			25								Calcite, and mineralization fracture infill
45	187.60	187.75					50						Calcite vein(let) set, no mineralization
46	189.34	189.34	45										Bedding
47	190.00	190.00	82										Bedding
48	193.94	193.94					50						Slightly oxidized calcite vein, no mineralization
49	194.21	194.21	80										Mineral replacement along bedding
50	196.20	196.20	64										Bedding
51	198.80	198.80	45										Mineral replacement along bedding
52	205.64	205.64				40							Hard pink mineral veinlet(garnet? Vesuvianite?)
53	209.18	209.18	70										Bedding
54	210.80	210.80	71										Bedding
55	211.00	212.00			11								Prominent mineralized fracture infill
56	212.70	213.57			36								Fracture set with bleaching
57	214.20	214.20				11							Calcite veinlet, no mineralization, or oxidation
58	215.65	216.10			24								Prominent fracture set, with bleaching
59	219.80	219.80	83										Bedding
60	224.20	224.20				23							Quartz veinlet, no mineralization or oxidation
61	228.11	228.11	48										Bedding
62	234.30	235.40			50								Fracture set, no mineralization
63	238.60	238.60	61										Bedding
64	240.55	240.55	49										Bedding
65	244.10	244.10	50										Mineral replacement along bedding
66	245.00	247.60			26								Quartz filled fracture set, with bleaching
67	249.00	249.00	59										Mineralization along bedding
68	256.48	256.48	85										Bedding
69	259.55	259.55			30								Chloritized calcite fracture fill, some minerals
70	263.30	263.30	85										Bedding
71	268.50	268.50	20										Bedding
72	275.90	275.90	70										Bedding
73	278.00	278.00	50										Bedding

COMMENTS

This hole intersects an intercalated silty limestone and siliceous siltstone to a depth of 253.71 m, and an argillaceous limestone until the end of hole. Trace calc-silicate alteration and mineralization of pyrrhotite, sphalerite, galena and chalcopyrite is present up to 71.50m. Stong to intense mineralization and calc-silicate alteration occurs from 106.12m to 201.81m. Intense replacement-style mineralization generally follows bedding and is oriented 55-65° TCA. Chalcopyrite mineralization increases downhole through the intensely calc-silicate altered zone. Contacts between units are diffuse. Fault breccia occurs between 201.81m - 206.76m, afterwhich alteration and mineralization significantly decrease to trace amounts.

0.00	8.66					CAS																					Casing (No Recovery
8.66	50.48	41.82				LST/ SLT	MD-GY	fg			t-w	t	chl	t					t	t	t	Cp	t				Light to medium grey, fine grained, trace-weakly (locally moderate) calc-silicate altered, variably bleached, intercalated siliceous siltstone (SLT) and silty limestone (LST). Trace oxidation and chlorite alteration occurs on fracture surfaces and along fractures. Minor mineralization of pyrrhotite, sphalerite, galena and chalcopyrite occurs primarily as fracture infill. Disseminated grains of sphalerite are present in calc-silicate altered sections. Localized blebs of fine-medium grained pyrrhotite and sphalerite also occur. Contacts between limestone and siltstone are diffuse. Siltstone is generally darker in colour but is locally bleached. Fractures are generally oriented between 20-30° TCA. Bedding is measured at 32-37° TCA.
			9.82	9.96	0.14										Fx	26											2-5 mm fracture infilled with fine grained pyrrhotite.
			12.45	12.55	0.10										Fx	20											2-6 mm fracture with calcite and fine grained pyrrhotite.
			18.34	18.71	0.37	LST	MD-GY	fg							BD	52											Bedding measured.
			20.38	20.60	0.22										Fx	49		7									1mm non-calcareous fractures with fine grained pyrrhotite and chalcopyrite.
			28.10	29.42	1.32	LST	LT-GY/ GN	fg			t-w	t								t							Light grey to light green, trace to weakly calc-silicate altered limestone. Trace oxidation on fracture surfaces and along fractures. Mineralization of fine-medium grained sphalerite occurs as disseminated grains, but are weathered and oxidized.
			32.61	33.70	1.09	LST/ SLT	LT-GY/ GN	fg			f-m	t	chl	t	Fx	30			t	t	t	Cp	t				Light grey to light green, fine grained, fair-moderately calc-silica altered intercalated siliceous siltstone and silty limestone. Fracture controlled mineralization of trace pyrrhotite, sphalerite, galena and chalcopyrite present. Trace oxidation and chlorite alteration along fractures and fracture surfaces. Calcareous fracture (1-1.5cm) infilled with pyrrhotite and chalcopyrite is oriented 30° TCA.
			36.08	36.72	0.64										BD	37											Bedding measured in limestone.

			39.62	39.83	0.21	LST	MD-GY	fg			f-m								m	m							Fine-medium grained blebs of pyrrhotite and sphalerite occur in fair-moderately calc-silicate altered silty limestone. Some fine grained pyrrhotite and sphalerite also present as fracture infill.
			40.00	43.75	3.75										Fx	30		3									2mm-1cm quartz fractures infilled with pyrrhotite and sphalerite.
			41.77	42.45	0.68										BD	32											Bedding measured.
			43.82	44.74	0.92	LST/SLT	LT-GY/GN	fg			f-m	t			Fx	40			t-w	t-w	t-w	Cp	t-w				Light grey to light green, fair to moderately calc-silicate altered intercalated siltstone and silty limestone. Calcareous fractures host mineralization of fine grained pyrrhotite, sphalerite, chalcopyrite and coarse grained galena. Oxidation is locally mottled and is present on fracture surfaces.
50.48	106.12	55.64				LST/SLT	LT/MD-GY LT/MD-GN	fg			w-m	t	chl	t					w-f	w-f	t-w	Cp					Light to medium grey and light to medium green, trace to moderately calc-silicate altered, variably bleached siliceous siltstone with minor sections of silty limestone. Trace oxidation and chlorite alteration occurs on fracture surfaces and along fractures. Fracture controlled mineralization consists of pyrrhotite, sphalerite, chalcopyrite and galena. Replacement style mineralization is present in calc-silicate altered zones consists of fine-grained disseminations of pyrrhotite, sphalerite and galena. Calcareous and quartz fractures are primarily oriented 40° TCA. Localized, trace yellow/brown, euhedral, vitreous mineral present (vesuvianite?). Gouge containing quartz grit occurs at 70.12 m (fault?). Mineralization is fair-moderate from 70.15 m.
			57.91	58.28	0.37	SLT	LT-GY/GN	fg			t	m							t								Moderately oxidized, trace calc-silica altered, pervasively fractured siliceous siltstone. Weathered, oxidized, fine-medium grained sphalerite occurs as disseminations and along calcareous fractures.
			59.88	70.00	10.12										Fx	40		15									1-5mm wide fractures hosting calcite, quartz and minor, fine grained pyrrhotite.
			70.12	70.18	0.06	Go	OR	fg-cg																			Gouge containing fine to coarse grained quartz grit (fault?). Unknown orientation.
			71.46	71.55	0.09										Fx	21											1-3 cm wide calcareous fracture hosting fine to medium grained sphalerite and pyrrhotite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			71.50	106.12	34.62	LST/ SLT	LT/M D-GY LT/M D-GN	fg			t-m				LA	60			f	f	w	Cp	t-w				Fair-moderately mineralized, trace-moderately calc silica altered intercalated limestone and siltstone. Fracture infilled and replacement-style mineralization consists of pyrrhotite, sphalerite, chalcopyrite, galena and honey brown, euhedral, medium grained, hard (~6-7) mineral (vesuvianite?). Laminations are occasionally visible and dip 60º TCA.
			80.52	80.52	0.00										Fx	40											8 mm wide fine-medium grained quartz fracture
			87.24	87.24	0.00										VN	50											11 mm wide quartz vein with minor calcite. Infilled mineralization consists of medium-coarse grained sphalerite, pyrrhotite, chalcopyrite and galena.
106.12	201.81	95.69				SLT/ LST	LT/ MD-GY	fg			f-i	t							s-i	s-i	f-m	Cp	s-i	As	f-m		Light to medium grey, fine grained, fair to intensely calc-silicate altered intercalated silty limestone and siliceous siltstone with strong to intense mineralization. Siltstone is generally dark grey but is variably bleached. Trace oxidation occurs along fractures and fracture surfaces. Intervals of strong to intense calc-silicate alteration are medium-dark green in colour and are associated with replacement-style mineralization along bedding, which is approximately 55-60º TCA. Less altered zones display fracture controlled mineralization and localized fine grained disseminations. Fractures are generally oriented 40-50º TCA. Unmineralized fractures and veinlets host calcite with localized quartz. Contacts between limestone and siltstone are diffuse. Abundant pyrrhotite, chalcopyrite and sphalerite is present with less abundant amounts of arsenopyrite and galena. Localized massive medium

COMMENTS

Light to medium grey siltstone dominates the hole with intercalated limestone and siltstone present at the top of the hole, siltstone present in the middle of hole and intercalated siltstone and argillaceous limestone composing the bottom fifty meters of the hole. Chloritization is prominent from the middle of the hole to the bottom of the siltstone unit. Calc-silicate alteration is associated with calcified zones and is weakly and locally present along hole. Mineralization begins at about 135 m and ends at 292 m.

0.00	2.47	2.47				CAS																					Casing (no recovery
2.47	201.83	199.36				SLT / LST	M-GY LT-GY	fg			w	w-f	chl	w	Fx	35-60			w	w	w						Medium grey, laminated, bleached siltstone intercalated with light grey limestone, weathering is weak on or near fracture surfaces and locally pervasive, weak calc-silicate alteration. Mineralization is weak at the top of the hole and is limited to 1 mm fractures. Contacts between siltstone and limestone are diffuse and siltstone tends to be a darker colour. Siltstone also has a grey blue tinge in silicified zones. Veinlets of Calcite are 1 10 mm across at orientation of 30° and 60° tca. Mineralization of Po, Sp and Gn are associated with calcite in fracture fills. Not all fractures contain mineralization, 2 per meter at 1 mm across. Alteration is minor zoned calc-silicate alteration, minor oxidation and chlorite is occasionally present. Uncommon bladed calcite crystal present in core.
															VT	30		0.5									
															VT	60		2									
			8.56	8.68	0.12										VT	40						Ca					Calcite veinlet at 40° tca.

			172.18	172.29	0.11										VT	30						Ca					Calcite veinlet at 30° tca.
			164.41	194.16	29.75				m		f-m		cly	t-w													Interval is fairly to moderately silica bleached and calc silicate altered with alteration dominating 75% of interval.
			171.62	172.05	0.43										LA	60											Laminations at 60° tca.
			186.37	186.61	0.24																						Cave in. Rounded pebbly material present and removed.
			189.49	219.32	29.83										Fx	40		2	w-f	f	t-w	Cp	t-w				Section is weakly to fairly mineralized with mineralized fractures at 40° to 60° tca and 1-3 mm across. Calcite fill is most prevalent in mineralized fractures. Sp, Po, Cp and Gn are present and associated with fracture infill as well as locally disseminated sections of Sp and Po wit crystal less than 1 mm across.
															Fx	60		3									
			191.51	191.90	0.39										Fx / VN?	~60			s	l	ms	Cp	w				Intensely replaced zone 40 cm of Sp, Po, Gn and Cp. Replacement zone has a fabric of about 60° tca (semi-massive).
			193.70	207.50	13.80								chl	ms	Fx	40		4-5	w	f	t	Cp	w				Moderate to strong chlorite alteration, pervasive throughout rock as well as of fracture surfaces. A secondary mineral growth of a yellow-brown, transparent to translucent, crystalline mineral with a hardness do 5.5 to 6.5 (Garnet?), in present within this interval. This mineral is often found on calcite filled fractures and veinlets. (possibly grossular garnet?)
																						Ga?	w-f

201.83	305.30	103.47				LST/ SLT	LT - M - GY	fg	m		w-f	w	chl	w-f					w-s	f-s	t	Cp	w-f				Light to medium grey, bleached, silicified, laminated siltstone and limestone with chlorite alteration prominent at the top of unit, Calc silicate alteration becomes for prevalent down hole. Mineralization mostly occurs along fracture surfaces and as visual disseminated grains in proximity to fractured areas. Sections of siltstone appear to be devoid of mineralization and are often the most bleached and silicified zones. Mineralization is most common along altered zones. Occasionally bleached section appear mottled.
													chl	t-w													
			207.50	217.45	9.95								chl	l					w	f	w-t	Cp	w-f				Section in intensely chloritized and is similar to section described above as well as moderate clay alteration.
													chy	f-ms													
			215.47	215.61	0.14	FLT	LT - DK BN								FLT?	~60											Possible fault at an orientation of about 60° tca. Interval is highly weathered with gauge and rock fragment present 1-15 mm across with a light to dark brown colour.
			216.83	217.12	0.29										VT	60						Ca	l				Interval contains intense calcite veining and incorporation of wall rock into veins and mineralization present.
			217.45	234.79	17.34								chl	ms					w-f	f	t	Cp	w-t				Chloritization decreases but is still moderately present as well as fair amount of localized clay alteration near fractures.
													cly	w													
			218.81	219.41	0.60										Fx	40		2	f-m	f-m		Ca	f-m				Calcite filled fractures at an orientation of 40° tca and have irregularly oriented Sp and Po fractures off shooting from calcite fractures from fair to moderate in abundance.
			220.09	220.40	0.31							f			Fx	25						Ca					Calcite filled fractures at 25° tca and contains a fair amount of oxidation on and near fracture surfaces.
			221.94	222.02	0.08										Fx	40				w		Ca	m				Calcite filled fractures at 40° tca and weak Sp within fractures.
			224.64	224.92	0.28										LA	55											
			224.43	224.57	0.14										VT	45				w-f		Qz					Quartz 8 cm veinlet with a white to pink brown colouring oriented at 45° tca, Sp is parallel to quartz veinlet and contacts uphold end of quartz veinlet and wall rock and is 2 mm across.
			224.73	225.05	0.32										Fx	60			w	f	t	Cp	f				Fracture fills of Sp, Cp, Po and Gn oriented at 60° tca.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

DENSITY LOG

Comments
Med. Grey. Fine grained, laminated bleached siltstone. 1mm. Fracture fills of calcite and pyrrhotite weakly present.
Light buff color, clay weathered siltstone with calcite infill on fractures.
Buff colored siltstone with 6mm - Sp, Gn fx infill with dissemintated Sp.
Medium grey siliceous siltstone with minor calcite fx's at >1mm across.
Medium grey siliceous siltstone . Laminae present, moderate bleaching.
Light grey siliceous siltstone with (weak-fair) Sp, Po within fractures and disseminated throughout.
LT-MED grey siliceous siltstone with a 2cm quatz and (vesuvianite veinlet?) present.
LT-GY siliceous siltstone with LT Brown-Buff calc-silicate alteration and weakly disseminated Sp.
White to LT-GN limestone that is weakly mineralized.
Medium grey-green siliceous metasiltstone. Sp and (Ga?) mz along quartz carbonate veinlet. Weak calc-silicate alteration.
Medium grey-green silty limestone. Unknown Sx mz along calcite veinlets. Weak calc-silicate alteration.
Mildy chloritized siliceous siltstone. Strong blebby Mz of Sp, Po, Gn and Cp along quartz-carbonate fracture fill.
Siliceous metasiltstone (weakly chloritized?). Weak Po Mz along quartz carbonate fracture infill.

DENSITY LOG

Comments
Moderately calc-silicate altered silty limestone. Moderate blebby Sp, Po and Cp Mz.
Massive Sx intercolated with calc-silicate altered silty limestone and pink calcite.
Argilliceous limestone. Parallel calcitic fracture series with poor Cp Mz
Light grey, fine grained silty limestone.

COMMENTS

The hole intersects a weakly to moderately mineralized, intercalated silty limestone and siliceous siltstone to 443.29 m, and an argillaceous limestone to 461.00 m (eoh). The main mineralized horizon occurs between 160.16 m to 315.70 m. The lower contact with the argillaceous limestone is gradational and occurs at 443.29 m.Calc-silicate alteration decreases after the main mineralized section. Mineralization is present in fractures and in calc-silicate altered sections as replacements . Pyrrhotite and sphalerite are most prominent, but chalcopyrite, pyrite, galena and arsenopyrite are also seen. Bedding measures between 50°-70° TCA, but varies between 35° and 80° TCA. Fractures measure between 10° to 30°, but some orientations seen u to approximately 55° TCA.

4.22	87.71	83.49				LST/ SLT	LT-DK GY	FG/ MO			t-w	w-m	chl ble cly	w m t-w					w	w	t	Cp As	t t	Py	t		Light to dark grey, fine grained, moderately bleached, weakly chloritized, tracely to weakly clay and calc-silicate altered, trace to weakly mineralized, weak to moderately oxidized, mottled, intercalated silty limestone and siliceous siltstone. Unit is 70% to 80% siliceous siltstone, while the silty limestone is 20% to 30% of the interval, in 10 to 80 cm sections. Large (>5cm) bladed calcite crystals visible near the top of the interval. Bleaching occurs along bedding and fractures. Calc-silicate alteration is weak, and confined to several 10-15 cm sections. Chloritization is weak and increases down interval. Trace to weak amounts of mineralization confined to fracture infill with calcite. Mineralization ranges from fine to coarse grained, and consists of weak amounts of pyrrhotite and sphalerite, with trace amounts of galena, pyrite, chalcopyrite, and arsenopyrite. Pyrrhotite and sphalerite often found together (variably with chalcopyrite). Several 10 to 20 cm sections of convoluted bedding seen throughout. Bedding is variable and ranges from 35° to 80° TCA. Several breccia textures found throughout, with calcite cement and small (1 to 2 cm across) angular silty limestone, or siliceous siltstone clasts present.

87.71	160.16	72.45				LST/ SLT	LT-MD GY	FG/ MO			m	m-ms	chl	m					w	t		Cp	t				Light to medium grey, fine grained, variably bleached, moderately clay altered, moderately chloritized, moderate to moderately strongly oxidized, moderately calc-silicate altered, trace to weakly mineralized, mottled, intercalated silty limestone and siliceous siltstone. Limestone is calc-silicate altered. Several sections of oxidation and clay-chlorite alteration have been separated out. Mineralization is fracture controlled (with some replacements near bottom contact), medium to coarse grained, and euhedral to subhedral. Weak amounts of pyrrhotite, trace amounts of sphalerite and chalcopyrite present. Sections of convoluted bedding throughout. Bedding generally ranges from 35° to 70° TCA. Upper and lower contacts are gradational. Mostly calcite fracture infill, with smaller amounts of quartz fracture infill. Large (>5cm) bladed calcite crystals present variably throughout.

160.16	270.48	110.32				LST/ SLT	LT-MD GY/ GN	FG			m-s	w-m	ble	m					t	m		Py	w	Cp	t		Light to medium grey and green, fine grained, weak to moderately oxidized, variably bleached, moderately to strongly chloritized, partially (weakly) clay altered, moderately strongly calc-silicate altered, partially mottled, intercalated silty limestone (calc-silicate altered) and siliceous siltstone. Unit is fairly to moderately strongly mineralized. Mineralization is medium to coarse grained, and occurs as replacements and in fractures. Mineralization is seen with calc-silicate and chlorite alteration. Weak amounts of pyrite, trace amounts of chalcopyrite, arsenopyrite and pyrrhotite, as well as moderate amounts of sphalerite present. Mineralization is generally evenly spread throughout. Quartz venation and fracture infill is prevalent over calcite venation and fracture infill in this interval.

			263.00	263.70	0.70	OX																					Soft, oxidized rubble/core. Rubble is angular, and has a lot of soft oxidized material around it. Fault?
			264.50	267.50	3.00	FX									FX	24		10									Fracture set, with no mineralization or oxidation. Bleaching occurs around quartz infill.
			270.00	270.00	0.00	BD									BD	75											Bedding measured.
270.48	315.07	44.59				LST/ SLT	LT-MD GN	FG			m-s	t	ble chl	m ms					f	m-ms	t	Cp	w-f				Light to medium green, fine grained, moderately bleached, moderately strongly chloritized, moderate to strongly calc-silicate altered, tracely oxidized, moderately to strongly mineralized, intercalated silty limestone and siliceous siltstone. Calcite fracture infill slightly prevalent over quartz fracture infill. Mineralization is mostly replacement (along bedding but fracture filled, and mineralized veins also present. Mineralization ranges from fine to coarse grained, and is euhedral to subhedral. Fair amounts of pyrrhotite, moderate to moderately strong amounts of sphalerite, trace galena, and weak to fair amounts of chalcopyrite present. Mineralization in interval is confined to 15 to 40cm sections of fracture controlled or replacement style mineralization, largely with calc-silicate alteration. Some sections of mineralization separated out, to help represent other, non-described sections.
			270.48	270.90	0.42	MX									MX	69			i	20-25	w	Cp	ms				Massive to semi massive section of medium grained, euhedral pyrrhotite, sphalerite, galena, and chalcopyrite mineral replacement along orientation (probably bedding).
			272.55	272.55	0.00	BD									BD	84											Bedding measured.
			272.93	273.12	0.19	MX									MX	82			i	i	w-f	Cp	i				Section of mineral replacement with medium grained chalcopyrite, pyrrhotite, and sphalerite. At the bottom of the section there is medium grained sphalerite, and galena in fracture infill.
			273.53	273.53	0.00	VN									VN	34			ms	m	f	Cp	w				Coarse grained calcite vein (6 cm thick) with no mineralization or oxidation present.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, mms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

41	155.20	155.20	50										Bedding measured
42	163.00	166.00			52								Healed fracture set, bleached

STRUCTURE LOG

HOLE: KEG-11-24

	INTERVAL		STRUCTURE (TCA)											Description
	From (m)	To (m)	Bedding	Lamination	Fracture	Veinlet (< 1cm)	Vein (> 1cm)	Fault	Slickensides	Attitude (TFA)	Upper Contact	Lower Contact		
43	167.58	167.58						16						Slip fault, with clay and chlorite
44	170.00	173.00			26									Fracture filled calcite
45	177.00	177.69			40									Quartz, chlorite, pyrite fracture set
46	180.15	180.15			58									Pyrrhotite-chalcopyrite-sphalerite-chalco FX infill
47	182.00	183.50			55									Small healed fracture set with pyrite and chlorite
48	188.68	188.68		58										Mineral replacement (along bedding?)
49	190.11	191.40			31									Chlorite, pyrrhotite, chalcopyrite fracture set
50	192.30	194.00	51											Mineral replacement (along bedding?)
51	193.70	199.00			22									Fracture controlled mineralization
52	199.00	234.00			22									Fracture controlled mineralization
53	199.50	199.50	80											Bedding
54	205.00	205.00					X				40	40		4.0 cm thick quartz vein
55	205.25	205.25					X				26	29		5.0 cm thick quartz vein
56	205.54	205.54					X				40	38		2.5 cm thick quartz vein
57	206.51	206.51					X				34	21		5.0 cm thick, irregular quartz vein
58	208.56	211.91					X				35	52		Pitted quartz vein, with some oxidized minerals
59	217.34	217.34	66											Bedding, mx-along (po)
60	226.93	226.93	61											Bedding
61	232.50	232.50	68											Bedding
62	234.50	234.50	56											Bedding
63	237.60	237.60	55											Bedding
64	239.00	240.50			40									variably mineralized fracture set (pyrrhotite-chalcopyrite)
65	242.11	242.11	68											mineralization along bedding (sphalerite-pyrrhotite)
66	240.10	240.10	46											Bedding
67	242.71	242.71			22									1.5cm thick (coarse grain pyrrhotite-sphalerite) mineralized calcite infill
68	250.96	250.96	70											Bedding
69	252.00	252.00	76											Bedding
70	258.00	258.00	65											Bedding
71	260.00	262.00			20									Healed fracture set, quartz
72	261.50	262.21			58									Fracture set, quartz infill
73	264.50	267.50			74									Fracture set, no mineralization/oxidation
74	268.34	268.89			25									Healed fracture set with quartz and bleaching
75	270.00	270.00	78											Bedding
76	272.55	272.55	84											Bedding

SURVEY

Depth (m)	Azimuth	Dip	Method	Depth (m)	Azimuth	Dip	Method
collar	340	-50	compass				

TARGET: Hole collared to test section south of Keg11-23. Hole abandoned due to lost water down hole and rods sticking.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0	3.05	3.05	CAS	Casing (No Recovery)
3.05	235.78	232.73	SLT/LST	Trace- fairly calc-silicate altered intercalated siliceous siltstone and silty limestone. Trace to fair mineralization of pyrrhotite, sphalerite, galena, arsenopyrite and chalcopyrite occurs in fractures and as disseminations.
235.78	250.69	14.91	SLT/LST	Strongly to intensely mineralized, fairly calc-silicate altered intercalated siliceous siltstone with minor silty limestone. Fracture controlled mineralization consists of sphalerite, pyrrhotite, chalcopyrite and galena with localized sections of intense replacement style mineralization.
250.69	293.80	43.11	SLT/LST	Fairly mineralized, weakly calc-silicate altere intercalated siliceous siltstone with minor silty limestone. Fracture controlled mineralization of sphalerite, pyrrhotite, chalcopyrite and galena with some fine grained disseminations
293.80	333.70	39.90	SLT/LST	Strongly to intensely mineralized, moderately calc silicate altered intercalated siliceous siltstone and silty limestone. Sphalerite, pyrrhotite, galena, arsenopyrite, chalcopyrite and pyrite present.
333.70	356.33	22.63	SLT/LST	Trace-moderate/strong fracture controlled mineralization of pyrrhotite, sphalerite, galena and chalcopyrite in trace-weak calc-silicate altered intercalated siltstone and silty limestone.
356.33	363.43	7.1	LST	Strong to intense replacement-style mineralization in moderately to strongly calc-silicate altered silty limestone.
363.43	384.9	21.47	SLT/LST	Intercalated siltstone and limestone with trace to weak fracture controlled mineralization. Disseminations occur in intermittent trace to fair calc-silicate altered sections.
384.9	390.15	5.25	FLT BXA	Fault brecciated siltstone with trace pyrite.
390.15	428.85	38.7	SLT/LST	Weakly calc-silicate altered, moderately chloritized, intercalated siltstone and limestone with weak to stror mineralization along fractures and sections of intense replacement style mineralization.

COMMENTS

The drill ended early due to mechanical failure. It intersects an intercalated siliceous siltstone and silty limestone until the end of the hole (428.85 m). The contacts between units are diffuse. Fair to strong mineralization is present along fractures, with intermittent sections of intense replacement-style mineralization. Intermittent weak to moderately calc-silicate altered limestone sections occur. Fine grained disseminated minerals are present in weakly calc-silicate altered sections. Sphalerite, pyrrhotite, galena, chalcopyrite, arsenopyrite and localized trace amounts of pyrite and malachite are present. Arsenopyrite and chalcopyrite mineralization increases downhole. Fault breccia occurs from 384.90 m to 390.15 m, followed by moderate-strong chlorite alteration and weak to strong mineralization, with intermittent bands of intense mineralization along strongly calc-silicate altered sections, until the end of the hole. Bedding structures are common and dip 50-70° TCA.

0.00	3.05	3.05				CAS																					Casing (no recovery
3.05	220.08	217.03				LST/ SLT	LT/ MD-GN LT-GY	fg			t-w	w	chl	t					t	t	t	Cp	t				Light-medium grey/ light green, fine grained, trace-weakly calc-silicate altered, intercalated siliceous siltstone and silty limestone. Contacts between units are diffuse. Siltstone is darker grey in colour but is locally bleached. Limestone effervesces with muriatic acid. Weak oxidation occurs along fractures and fracture surfaces. Oxidation decreases down section. Trace mineralization of fine grained sphalerite, pyrrhotite, chalcopyrite and minor amounts of galena are present within fractures and also as fine grained disseminations in calc-silicate altered zones. Intermittent 15-90 cm sections of bleached, buff altered limestone with bladed calcite also present. Limestone units significantly decrease down section.

86	276.11	276.80	70										Bedding
87	283.63	283.83	50										Bedding
88	287.26	287.26			50								9mm calcite fracture with fine grain Sp
89	288.85	288.85				30							2mm qtz carbonate veinlet with Sp, Gn,Po,Cp
90	291.68	291.68				20							5-7mm calcite fx with fine grain Po, Sp, Gn, Cp
91	297.77	297.77			20								0.6-1.2cm Fx with coarse Gn, Po & med Sp
92	298.15	298.15			20								0.6cm qtz-carbonate fracture with mg Sp, Gn
93	297.50	298.38		61									LA
94	305.46	306.43	50-60										Bedding

STRUCTURE LOG

HOLE: KEG-11-25

	INTERVAL		STRUCTURE (TCA)										Description
	From (m)	To (m)	Bedding	Lamination	Fracture	Veinlet (< 1cm)	Vein (> 1cm)	Fault	Slickensides	Attitude (TFA)	Upper Contact	Lower Contact	
95	307.52	307.65	60-65										Bedding, intensely mx section with Sp, Po, Gn
96	313.35	313.35			19								0.7-2.5cm quartz fracture hosting Sp,Cp,Gn
97	317.12	317.50			40								Healed fracture set hosting fine grained Po
98	317.71	318.00			30								1-3mm calcite Fx set with fine Po, Cp, Gn, Sp
99	322.36	322.93	75										Bedding
100	327.54	328.02	79										Bedding
101	332.72	333.43			30								0.1-1cm qtz-carbonate fx set with Sp,Gn,Cp
102	337.10	337.40	70										Bedding
103	338.74	339.30			30								1-5 mm quartz fx set with fine grain Cp, Po
104	340.46	340.87	70										Bedding
105	343.80	344.25	70										Bedding
106	347.00	348.20	68										Bedding
107	354.12	354.12			12								1-2.5cm qtz fx with fine grain Po, Cp,Sp
108	354.92	356.09	70										Bedding
109	359.98	359.98			17								2mm calcite fx with chlorite alteration
110	366.64	366.90	55										Bedding
111	369.35	369.35			22								3-5mm qtz carbonate fracture with fine Sp,Po
112	372.35	372.35			29								1mm calcareous fx infilled with fine Po, Sp
113	374.97	375.22	55										Bedding
114	380.54	380.54			13								1-4cm med-coarse, vuggy calcite fracture
115	382.35	383.02		47									Lamination
116	383.88	383.88			14								2mm calcite fracture with fine grain Sp
117	383.86	383.86			15								3mm calcite fx with Sp, crosscut by above fx
118	390.80	390.80			33								0.4-1cm calcareous fx with Sp, vesuvianite(?)
119	392.34	392.70	56										Bedding
120	398.63	398.63			21								0.8-2cm qtz carbonate fx with med-coarse As
121	404.97	405.09				41							1-2mm wide fracture set with fine Po, Cp
122	406.88	408.40	70										Bedding measured.
123	408.83	408.83				27							0.4-1 cm calcite fracture.
124	411.75	413.08		62									Lamination (bedding?)
125	418.10	418.10			21								1-1.3 cm vuggy, coarse grained calcite fracture
126	421.68	421.87	70										Bedding measured.
127	424.78	424.78			50								2 mm calcite fracture

COMMENTS

The hole intersects a weakly to moderately strongly mineralized, intercalated silty limestone and siliceous siltstone to 480.00 m (eoh). The main mineralized horizons occurs between 138.00 m and 362.24, but weakens in ore minerals between 185.75 and 320.78 m. Mineralization is present in fractures and in calc-silicate altered sections as replacements (some along bedding). Pyrrhotite and sphalerite are most prominent, but chalcopyrite, pyrite, galena and arsenopyrite are also seen. Bedding usually measures between 50°-70° TCA, but varies between 40° and 86° TCA. Fractures usually measure between 10° to 30°, but some orientations seen up to approximately 50° TCA.

0.00	3.56	3.56				CAS																					Casing, no recovery
3.56	138.00	134.44				LST/ SLT	LT-MD GY	FG/ MO			f-m	t	ble chl cly	m t w					t-w	t		As	t-w	Cp	t		Light to medium grey, fine grained, tracely oxidized, weakly clay-altered, fair to moderately calc-silicate altered, moderately bleached, tracely chloritized, trace to weakly mineralized, intercalated siliceous siltstone (80% - 90% of interval) and silty limestone (10% - 20% of interval). Large majority of veins/veinlets contain calcite, though some veins/veinlets contain quartz. Bleaching, oxidation and chloritization occurs variably along fractures. Clay alteration occurs only in select zones. Trace to weak, medium grained mineralization occurs predominantly as fracture infill, but also as replacements in sections of calc-silicate alteration. Mineralization in this interval consists of trace to weak pyrrhotite and arsenopyrite, as well as trace sphalerite and chalcopyrite. Small (5 - 20 cm) sections of coarse grained (>5 cm) bladed calcite present throughout.

138.00	185.75	47.75				LST/SLT	LT GN/LT-MD GY	FG			m-ms	t	ble	w					m-ms	m-ms	t-w	Py	w	Cp	t-w		Light green/ light to medium grey, fine grained, moderate to moderately strongly calc-silicate altered, weakly to fairly chloritized, tracely oxidized, weakly bleached, weak to moderately strong clay altered, moderately to moderately strongly mineralized, intercalated silty limestone and siliceous siltstone. Mineralization occurs in replacements and in fracture infill. Mineralization is generally medium grained to coarse grained, and euhedral. Equal amounts of calcite and quartz in veins/veinlets, as well as fracture infill. Chloritization is common around mineralized fracture infill. Replacement mineralization associated with calc-silicate alteration. Some mineralized fractures occur in fracture sets with consistent orientation, while other fracture controlled mineralization occurs along weak brecciation texture, and along discontinuous and irregular fractures. Calc-silicate alteration present in sections of various lengths.

			316.78	316.78	0.00	FX									FX	35											Brecciation inside fracture (3 cm thick) with angular to sub-angular wall rock clasts. Infill consists of calcite with medium grained, euhedral blebs (0.2 to 0.6 cm across) of pyrite mineralization.
			319.00	319.00	0.00	BD									BD	65											Bedding.
320.78	362.24	41.46				LST/ SLT	LT-MD GY/ LT GN	FG			f-s		chl ble	ms f					m	f-m	t	Py	f-m	Cp	w		Light to medium grey/ light green, fine grained, fairly to strongly calc-silicate altered, moderately strongly chloritized, fairly bleached, moderate to moderately strongly mineralized intercalated silty limestone (calc-silicate altered) and siliceous siltstone. Mineralization is mostly replacement (usually along bands following bedding) in sections of calc-silicate alteration, but also in fractures. Mineralization is mostly coarse grained and euhedral, but ranges to medium grained and subhedral. Mineralization consists of fair to moderate amounts of pyrite and sphalerite, moderate amounts of pyrrhotite, trace amounts of galena, and weak amounts of chalcopyrite. Pyrite is more often found in fractures, while pyrrhotite is generally found in replacements. Fractures are more commonly calcite filled (60-65%) then quartz filled (40-35%).
			326.20	339.00	12.80	FX									Fx	5-15		35									Low angle fracture set (0.2 to 0.4 cm thick). Mostly quartz and calcite infill. Medium to coarse grained, euhedral pyrite, pyrrhotite, and chalcopyrite mineralization.
			321.81	324.10	2.29	MX									MX	75-80			ms	ms		Py	t-w	Cp	w		Section of 15 short (4.0 to 10.0 cm thick) bands of mineral replacements along bedding. Mineralization consists of coarse grained, euhedral pyrrhotite, sphalerite, chalcopyrite and some pyrite. Orientation of replacements common throughout. All the mineralized bands occur in sections of calc-silicate alteration and with chlorite alteration.
			325.80	326.24	0.44	MX													s-i	ms-s		Cp	w-f				Section of mineral replacement along bedding. Mineralization is coarse grained, euhedral, blebby (0.2 to 0.3 cm across), and consists of pyrrhotite, sphalerite and chalcopyrite.

			329.36	329.67	0.31	MX													s	f-m		Py	t-f	Cp	w		Section of intense, irregular, coarse grained, euhedral, fracture controlled mineralization consisting of pyrrhotite, sphalerite, pyrite and chalcopyrite. Chlorite alteration occurs around fractures.
			332.79	333.79	1.00	MX													ms	f-m		Py	m	Cp	t-w		Section of significant coarse grained, euhedral replacement and fracture controlled mineralization (no measureable orientation). Pyrite occurs in fractures, usually with calcite, pyrrhotite, and chalcopyrite. Replacement mineralization consists o pyrrhotite, sphalerite, and chalcopyrite.
			335.26	347.02	11.76	MX													ms	m		Py	w-f	Cp	t-w		Section of significant coarse grained, euhedral replacement mineralization, occurring in 38 bands (4 to 10 cm thick) along bedding in sections of calc-silicate alteration with chlorite alteration. Mineralization consists of pyrrhotite, sphalerite, pyrite, and chalcopyrite. Several mineralized quartz veins/veinlets sectioned off.
			336.10	336.10	0.00	BD									BD	58											Bedding.
			337.67	337.67	0.00	BD									BD	55											Bedding.
			340.00	340.00	0.00	BD									BD	49											Bedding.
			343.15	343.15	0.00	VT									VT	25											Quartz veinlet (1.5 to 2.0 cm thick) with coarse grained, euhedral pyrrhotite, chalcopyrite, and sphalerite. Veinlet is slightly irregular.
			344.74	344.74	0.00	BD									BD	86											Bedding.
			345.99	345.99	0.00	VT									VT	7											Quartz veinlet (2.0 cm thick) with coarse grained, euhedral chalcopyrite and pyrrhotite. Pyrrhotite and chalcopyrite surround well formed quartz crystals at the edges of the veinlet.
			346.54	346.54	0.00	BD									BD	70											Bedding.
			348.50	348.50	0.00	BD									BD	70											Bedding.
			349.20	349.20	0.00	VN									VN	10											White fractured quartz vein, with quartz crystals growing into a calcite centre. Vein is unmineralized, and unoxidized.
			351.30	351.30	0.00	BD									BD	67											Bedding.
			351.48	351.73	0.25	MX																					Section of semi-massive, fine grained pyrrhotite, sphalerite and chalcopyrite mineral replacement. Percentages of minerals is difficult to approximate due to fine grain size, but the subinterval is weakly magnetic, smells like sulphur with addition of HCl, and chalcopyrite is just barely visible. Orientation no measureable.

380.97	394.75	13.78				LST/ SLT	LT-MD GY/ LT GN	FG/ MO			m		chl	f-m													Light to medium grey/ light green, fine grained, mottled, moderately calc-silicate altered, fairly to moderately chloritized, moderately strongly bleached, moderately mineralized intercalated silty limestone (calc-silicate altered) and siliceous siltstone. Mineralization is mostly euhedral and coarse grained and in replacement sections with calc-silicate alteration and chloritization. Fracture controlled mineralization does occur, and also has chlorite alteration at the edges. Fracture infill is predominantly quartz, though calcite infill is also present. Siliceous siltstone comprises 60% - 80% of the interval. Mineral replacements occur in approximately 17 bands along bedding (7.0 to 20.0 cm thick).
													ble	ms					f-m	f-m		Cp	w-f	Py	t-w		
			386.84	386.84	0.00	BD									BD	70											Bedding,
			388.70	397.00	8.30	FX									FX	20											Quartz filled fracture set with mineralization, usually with chloritization at the edges. Associated with several brecciation textures, some of which are mineralized. Mineralization includes sphalerite, pyrrhotite, chalcopyrite, and also a red-brown, tabular, hard (>6.5 on Moh's hardness scale), non effervescent mineral that is present as fracture infill.
			392.40	392.40	0.00	BD									BD	85											Bedding.
394.75	480.00	85.25				LST/ SLT	LT-MD GY/ LT GN	FG			w-f	chl	f						t-w	t-w	t	Cp	t-w	Py	t		Light to medium grey/ light green, fine grained, locally strongly-intensely clay altered, locally strongly chloritized, locally moderate calc-silicate alteration, moderately bleached, weak to fairly mineralized, intercalated silty limestone and siliceous siltstone. Interval consists approximately of >90% siliceous siltstone, and <10% of silty limestone. Mineralization is mostly euhedral and medium to coarse grained, and occurs in fractures, though several sections of replacements also occur (in sections of calc-silicate alteration). Quartz and calcite filled fractures, as well as veins/veinlets are of equal proportion. Localized sections of large (>5cm) bladed (radiating) calcite crystals. Trace to weak amounts of pyrrhotite, sphalerite, and chalcopyrite, as well as trace amounts of pyrite and galena present. Mineralization generally decreases down the interval.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	2.88	2.88	OVB	Overburden
2.88	7.03	4.15	CAS	Casing
7.03	231.03	224.00	SLT / LST	Light to medium grey siltstone intercalated with limestone. Weak calc-silicate alteration, chloritization and oxidation present along interval with locally moderate clay alteration. Mineralization is fracture controlled with trace to weak sphalerite, galena, chalcopyrite and arsenopyrite present with trace to moderate pyrrhotite.
231.03	486.77	255.74	SLT	Light to medium grey siltstone locally bleached, silicified laminated siltstone with weak to strong mineralization. Weak to moderate chlorite alteration and local clay alteration. Fractures vary from 25-60° tca. Mineralization is mainly fracture controlled with zones of intense sulphide replacement. Occasional minor cherty bands are present within the unit.

COMMENTS

Majority of limestone sections are calc-silicate altered and contain disseminated sphalerite. Silicified section tend to have less mineralization. Replacement zones occasionally posses a fabric of about 50° tca.

7.03	231.03	224.00				SLT /LST	LT-GY M-GY	fg			t-w	t-w	chl	w-f	LA	~55			t-w	t	t	Cp	t	As	t		Light to medium grey, locally bleached, laminated siltstone intercalated with light to medium grey limestone; with clay, chlorite, calc-silicate and oxidation alteration present with Trace to moderate mineralization. Contacts between siltstone and limestone are diffuse and siltstone tends to be darke in colour than limestone. Siltstone dominates intercalated unit at around 90%. Clay alteration is locally present at the top of the unit with up to moderate intensity. Oxidation is limited to fracture surfaces. Chlorite alteration is limited to fracture surfaces and clay altered sections of rock. Calc-silicate alteration occurs within limestone zones occasionally as weak to trace intensity.Mineralizatio at the top of the hole is trace to weak and is restricted to fractures with Po, Sp, As, Cp, Gn present. After 170 m down hole mineralization increases from weak to moderate with intensely mineralized replacement zones and disseminated grains in bleached sections. Laminations occur at 55° tca across unit with small scale changes in orientation with convolute bedding uncommonly present. Calcite veinlets tend to be oriented at 40-45° tca. Majority of Fractures are calcite filled and tend to be at 40-50° tca. Some fracture fills contain Sp and Po.
													cly	t-m	VT	40-45								Ca			
															Fx	40-50								Ca			
			7.03	45.30	38.27						w	w	cly	m					t	t							Interval is moderately clay altered with 5-25 cm segments of occasional buff coloured alteration along fractures. Chlorite is locally present along fracture zones in weak to fair intensity. Spherulite like concentric-subrounded mineral clusters are present in chloritized zones at three sections at about 20 cm in length with mineral grains 3-12 mm across. Bladed calcite crystals occasionally present in section.

			105.22	157.28	52.06				w-f		w-m	w-f	chl	w	Fx	60			t-w	w	t	Cp	t				Alteration is locally present throughout this interval. Mineralization increases from units described above and is limited to mostly fractures. Alteration mostly occurs in zones of bleaching, numerous fractures or enriched calcareous zones. Silicified zones tend to be devoid in mineralization and alteration. Bleached zones also tend to contain weakly disseminated Sp and bleaching tends to occur in 20-50 cm sections. Oxidation is present on heavily fractured surfaces. Calc- silicate alteration occurs across bleached zones and calcareous material, noticeably increases from alteration seen above interval and is locally weak to moderate. Clay alteration is weak to fair across interval except in silicified zones. limestone is less present down hole.
													cly	w-f	Fx	40											
			113.51	113.55	0.04										Fx	60			w-f	f	t-w						Fracture fill at 60° tca of Sp, Po, Ca and Gn 2-25 mm wide. Calcite seems to veied though sulphide crystals.

			354.60	355.57	0.97							t			VN	~40						Qz	80	Ca	w-f		Quartz vein with pinkish hue and trace oxidation is about 40° tca. Contacts of vein are replaced with quartz which makes determining length of vein difficult. Calcite filled fracture present with no orientation and angular pink quartz fragments present.
															Fx	?											
			355.60	355.65	0.05							f	chl	m	Fx	~70											Calcite fracture fill with angular to subrounded wall rock fragments present at about 70° tca. Rock fragments are 1-7 mm across and fracture fill is 6-12 mm wide.
													cly	f													
			355.68	355.85	0.17							I			Fx	40											Intensely oxidized zone with calcite fracture fill at 40° tca.
			361.58	361.95	0.37							s	cly	m	FLT	20											Strongly oxidized section with gauge and moderate clay alteration. Rubbly and primary features are no longer identifiable. At start of interval a calcite filled fracture is present at 20° tca and is 12 mm and shows a shear fabric parallel to fracture.
			362.04	362.20	0.16								chl	m					m	ms	w	Cp	ms	Ca	f		Moderately chlorite altered strongly mineralized section with Cp, Sp, Po and Gn present replacing siltstone with irregular minute calcite filled fractures.
			363.82	364.45	0.63							m	chl	w	VN	40						Qz					Rubbly section with moderate clay alteration and oxidation present and weakly chloritized. A quartz vein with a pinkish hue is present at the end of the interval at 40° tca and calcite fractures within vein have subangular pink quartz fragments within them.
													cly	ms													
			364.52	394.83	30.31	LT-M-GY	fg						chl	t	Fx	20		1	w	t-w		Cp	t				Light to medium grey siliceous siltstone with 20-50 cm occasional intercalated chert lenses. Fractures are present at 20°, 30°, 40° and 60° tca and laminations are at 75° tca. Interval contains weak to trace fracture control mineralization and trace chlorite alteration. Clay alteration is present on fractures oriented at 20° tca. Fractures at 60° tca contain chlorite alteration on fracture surfaces.

COMMENTS

The hole intersects a weakly to moderately strongly mineralized, intercalated silty limestone and siliceous siltstone to 331.48 m (eoh). The main mineralized horizons occurs between 57.65 m and 221.00 m. Mineralization is present in fractures and in calc-silicate altered sections as replacements (some along bedding). Pyrrhotite, pyrite and sphalerite are most prominent, but chalcopyrite, galena and arsenopyrite are also seen. Bedding usually measures between 40°-70° TCA, but varies between 15° and 80° TCA. Fractures usually measure between 10° to 40°, but some orientations seen up to approximately 55° TCA.

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity	Photo	
0.00	2.79	2.79				CAS																					Casing.
2.79	57.65	54.86				LST/ SLT	LT-MD GY	FG/ MO			w	w-s	cly ble chl	w-f m t-w					t-w	t-w							Light to medium grey, fine grained, mottled, weakly and locally calc-silicate altered, weak to strongly oxidized, weak to fairly clay-altered, moderately bleached, trace to weakly chloritized, weakly mineralized, intercalated silty limestone, and siliceous siltstone. Siliceous siltstone makes up approximately 90% of the interval, while the silty limestone makes up approximately 10% of the interval. Calcite and quartz fracture fill are both present, though quartz is more prevalent. Mineralization occurs as blebby or banded replacements in small (10 - 30 cm) replacements in silty limestone sections with calc-silicate alteration. Mineralization consists of euhedral, medium to coarse grained pyrrhotite and sphalerite. Both sphalerite and pyrrhotite occur in trace to weak amounts. Bedding is visible throughout most of the interval. Oxidation occurs on fracture surfaces, but also seen intensely in an incompetent interval. Chloritization occurs in small amounts in a "bubbly" texture (0.1 to 0.3 cm across) in several silty limestone sections. Bleaching occurs around fractures, and may follow bedding. Clay alteration is confined to a noted sub-interval.

			35.46	35.46	0.00	BD									BD	45											Bedding.
			36.70	38.36	1.66	OX/ RBL						s-i	cly	s													Section of 90% rubble, all of section is strongly to intensely oxidized, as well as strongly clay altered. Section is brown-yellow. No mineralization seen.
			41.00	50.50	9.50	FX									FX	30-40		40									Fracture set (0.1 to 0.3 cm thick) calcite and quartz infill. No mineralization or oxidation, but bleaching occurs around the edges.
			50.00	50.00	0.00	BD									BD	60											Bedding.
			52.88	52.88	0.00	BD									BD	57											Bedding.
57.65	123.13	65.48				LST/ SLT	LT-MD GY	FG			w	w	ble	ms					f-m	f-m		Py	t-w	Cp	t-w		Light to medium grey, fine grained, weakly calc-silicate altered, weakly oxidized, moderately strongly bleached, fairly chloritized, moderately to moderately strongly mineralized, intercalated silty limestone and siliceous siltstone. Siliceous siltstone makes up approximately 90% of the interval, while the silty limestone makes up approximately 10% of the interval. Bleaching occurs around fractures, and may follow bedding. Oxidation occurs on fractures, while weak (locally moderate) calc-silicate alteration occurs in limestone sections. Fracture infill is most commonly quartz, but calcite infill is not uncommon. Mineralization is mostly replacement controlled, but fracture controlled mineralization is also common, and occurs throughout especially with quartz. Mineralization ranges from medium to coarse grained, and is euhedral. Fair to moderate amounts of sphalerite and pyrrhotite, and trace to weak amounts of chalcopyrite and pyrite present. Replacement mineralization occurs preferentially in limestone sections with calc-silicate alteration along bedding. Replacement mineralization becomes fine grained down interval, and occurs in sections of variable size. Fracture controlled mineralization increases with depth.

													Other										Other		Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
			90.19	90.28	0.09	MX													i	i-25								Section of significant mineral replacement, consisting of coarse grained sphalerite and pyrrhotite. Occurs within a white mineral which does not fizz, even when scratched. White mineral can be barely scratched by steel (<6.5 on Moh's hardness scale).
			92.59	93.11	0.52	MX													m	ms		Py	w					Section of thick, irregular and discontinuous fracture controlled mineralization, which consists of coarse grained sphalerite, pyrrhotite, and pyrite.
			98.00	98.00	0.00	FX									FX	10												Unhealed fracture, with relatively smooth oxide coating.
123.13	221.00	97.87				LST/ SLT	MD GY	FG			w	w	chl ble	t w					f-m	w-f	t	As Cp	t-w t	Py	t-w			Medium grey, fine grained, trace to weakly oxidized, weakly (but locally moderate) calc-silicate altered, tracely chloritized, weakly bleached, weak to moderately mineralized, intercalated silty limestone and siliceous siltstone. Siliceous siltstone makes up approximately 90% to 94% of the interval, while the silty limestone makes up approximately 10% to 6% of the interval. Mineralization is mostly fracture controlled (in fracture sets as well as in irregular sub-brecciated textures), though sections of replacement style mineralization in calc-silicate altered sections are noted. Mineralization is euhedral, but ranges from fine to coarse grained, and consists of pyrrhotite, sphalerite, galena, pyrite and arsenopyrite. Bleaching and oxidation occur variably with fractures. Chloritization is rare, but generally occurs with replacement mineralization in calc-silicate altered sections. Calcite and quartz filled fractures both occur, but at least most of the quartz fractures are older, as seen by the fact that some are seen to be cross-cut by calcite fractures. Oxidation along calcite filled fractures is common.
			123.58	123.58	0.00	LA									LA	10												Slightly irregular, undulatory laminations (bedding?).

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other									Other		Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
			201.85	216.50	14.65	FX									FX	38-42		35									Thin, (0.1 - 0.3 cm thick), variably mineralized fracture set. Mineralization (if present) usually consists of medium grained, euhedral pyrrhotite, though chalcopyrite and sphalerite (also medium grained and euhedral) also seen,
			202.20	229.30	27.10	FX									FX	30-50		3									Calcite filled fracture set with variable thickness (0.2 to 0.6 cm thick). Fracture set is partially mineralized and consists of medium to coarse grained euhedral pyrrhotite,
			207.78	207.78	0.00	LA									LA	80											Laminations (bedding?).
			209.37	209.37	0.00	FX									FX	15											Oxidized calcite fracture infill (0.9 cm thick) with medium to coarse grained, euhedral pyrrhotite.
			215.25	215.25	0.00	FLT									FLT	20											Micro fault, 0.3 cm displacement, 0.1 cm thick. No mineralization or oxidation present.
			217.30	217.30	0.00	LA									LA	78											Laminations (bedding?).
			219.70	221.00	1.30	MX													f-m	w		Cp	w				Section of irregular, fracture controlled mineralization (in larger fractures as well as in finer, partial brecciation texture). Mineralization ranges from medium to coarse grained, and is euhedral, and consists of sphalerite, pyrrhotite, and chalcopyrite.
221.00	331.48	110.48				LST/SLT	LT-MD GY	FG			w	w-f	chl	m					t-w	t	t	Py	t-w	Cp	t		Light to medium grey, fine grained, locally (weakly overall) calc-silicate altered, weakly to fairly oxidized moderately chloritized, fairly to moderately bleached trace to weakly mineralized, intercalated silty limestone and siliceous siltstone. Siliceous siltstone makes up approximately 90% of the interval, while the silty limestone makes up approximately 10% of the interval. Calcite fracture infill is heavily predominant over quartz fracture infill. Interval has several possible shear/fault zones, which are noted and described. Mineralization is found both in replacements and as fracture infill, and is medium to coarse grained and euhedral, and consists of pyrite, pyrrhotite, chalcopyrite, sphalerite, and galena.

													Other									Other		Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
			238.95	245.17	6.22	RBL	OX																				Section of moderately strong oxidation and rubble/ grit. Approximately 20% to 30% of the interval consists of angular (1 to 3 cm across) rubble, and sand. (Fault?)
			240.00	259.00	19.00	FX									FX	35		30									Fracture set, consisting of calcite and quartz infill, as well as medium grained, euhedral pyrrhotite and pyrite mineralization, and bleaching at the edges.
			249.70	249.70	0.00	LA									LA	74											Laminations (bedding?).
			257.55	257.90	0.35	MX					w		chl	m					m	f		Cp	t	Py	w-f		Section of weak calc-silicate and moderate chlorite alteration with irregular fracture and replacement style mineralization consisting of pyrrhotite, sphalerite, chalcopyrite, and pyrite. Replacement mineralization is likely along bedding, but no discernable orientations visible.
			259.50	259.58	0.08	MX									BD	70				s		Py	s				Section of semi-massive mineral replacement along bedding, consisting of coarse grained, euhedral pyrite and sphalerite.
			261.10	266.00	4.90	FLT						w	chl	s								Py	w				Possible fault or shear zone, weakly oxidized strongly chloritized, heavily fractured (irregular), partially brecciated unit (same as main interval lithology). Brecciated clasts are 0.3 to 1.0 cm across, and angular with either calcareous or chlorite altered matrix. Uncertain whether brecciated clasts are moved.
			268.15	292.50	24.35	FX									FX	30-40		3									Calcite filled fracture that is 0.5 to 1.0 cm thick. No mineralization present
			269.30	281.20	11.90	FX									FX	15-20		2									Calcite filled fracture set (0.2 to 0.4 cm thick). No mineralization is present.
			274.40	274.40	0.00	LA									LA	70											Laminations (bedding?).
			280.00	280.00	0.00	LA									LA	78											Laminations (bedding?).
			281.71	281.96	0.25	MX									MX	69				m	t						Section of mineral replacement occurring with weak calc-silicate alteration. Medium to coarse grained, euhedral sphalerite and galena present. Orientation of mineralization taken, unsure of whether it is bedding.
			282.20	282.20	0.00	LA									LA	70											Laminations (bedding?).
			286.36	286.36	0.00	LA									LA	71											Laminations (bedding?).
			291.30	291.30	0.00	LA									LA	62											Laminations (bedding?).
			292.68	295.40	2.72	MX													t	f	t-w	Cp	w				Section of elevated mineralization occurring in 3 replacement sections (10-15 cm long). Mineralization is coarse grained and euhedral. Sphalerite, galena, chalcopyrite and pyrrhotite are present. Replacement orientation is not discernable.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

Host rock is mainly siliceous siltstone with short intervals (5cm-1m) of a more calcareous host which often contains the replacement mineralization. Mineralization is primarily replacement style with moderate fracture controlled mineralization as well. Mineralization generally consists of pyrrhotite > sphalerite > arsenopyrite > pyrite > chalcopyrite > galena. Three intervals of highly faulted and oxidized siltstone with calcite gouge and sub-angular brecciated siltstone are found throughout the hole and contain no mineralization. Majority of hole contains weak-moderate mineralization, but an interval from 241.90m-288.56m contains strong to intense mineralization.

COMMENTS

The hole intersected weakly oxidized and chlorite altered intercalated siltstone and lesser limestone with locally trace to weak fracture controlled sphalerite, pyrite, and occasionally trace arsenopyrite, chalcopyrite.

COMMENTS

The hole intersected Intercalated siltstone, limestone and lesser argillaceous limestone. Trace to weak mineralization consist of pyrrhotite, pyrite, sphalerite, chalcopyrite and occasionally galena, arsenopyrite. Replacement style mineralization hosted in calcareous bands carry better grades than fractures.

0.00	10.00	10.00				CAS																					"casing" (CAS) - casing, no recovery
10.00	72.59	62.59				SLT	MD GY/TN/GN	f-mg					chl	w-m	LA	40-70											"siltstone" (SLT) - medium grey, tan and green, fine to medium grained, weak to moderately chlorite altered sheared and laminated siltstone. Where laminations exist orientation is 40° to 70° to core axis. Calcite fracture fills contain trace to fair pyrrhotite and pyrite occur at a moderate density oriented 20° to 60° to core axis. Few shallow angle fractures contain trace to weak, fine grained, red sphalerite and fair fine grained pyrite. Sheared subsections contain trace to weak medium grained pyrite in the abundance of calcite infill. Locally clay altered sections are 5 to 15 cm wide and occur in and around sheared sections.
															Fx	20-60			t-f	t-w		Py	t-f				
			20.30	20.74	0.44										Fx	9						Py	t				shallow calcite fracture fill orientated 9° to core axis that contains trace, fine grained pyrite.
			45.49	45.65	0.16										VN	34											1.2 cm calcareous, crystalline cavity infill.
72.59	245.76	173.17				SLT/LST/ARG	MD GY-BK/GN	fg					chl	m	LA	60-80						Py	w				"siltstone" (SLT), "argillite" (ARG) and "limestone" (LST) - intercalated medium grey and green, laminated siltstone, medium grey to black argillaceous limestone and medium grey and greenish limestone, all fine grained with local moderate chlorite alteration. Contacts between units are diffuse but discernable with muriatic acid as limestone and argillaceous limestone weak to strongly effervesce; colour change is subtle. Argillaceous limestone is weakly graphitic, evident through conductance and consists of fine laminations of white and black. Laminations in siltstone and argillaceous limestone are oriented 60° to 80° to core axis and calcite veinlets 5° to 10° to core axis, both are offset by a series of microfaults throughout interval. 2 contrasting calcite fracture fill sets are visible oriented 5° to 30° and 75° to 80° to core axis and contain weak, fine grained pyrite. The steeper set generally cross cuts and offsets the shallow set. Calcite veinlets contain weak to fair, fine grained pyrite and pyrrhotite. Weak pyrite replacement mineralization is evident throughout.

20	71.98			61										laminated siltstone
21	72.49	104.14			75-85									calcite fracture fill set with weak fine grained pyrite
22	75.84	172.82			5-10									calcite fracture fill set; variably mineralized with pyrite and pyrrhotite
23	76.02			73										laminated siltstone
24	83.18			78										laminated siltstone
25	85.52			59										laminated siltstone
26	89.50	139.77			20-30									calcite fracture fill set with weak to fair fine grained pyrite
27	89.68			79										laminated siltstone
28	98.17			66										laminated siltstone
29	100.52			65										laminated siltstone
30	108.86			74										laminated siltstone

STRUCTURE LOG

110.95	153.94		45-60		calcite fracture fill set with pyrrhotite; some with trace red sphalerite
113.24	113.30		66		brecciated fracture fill with 3.9 cm calcareous vein in middle
113.57		54			laminated siltstone
117.48		65			laminated siltstone
120.93	165.05		30-40		calcite fracture fill set with pyrrhotite; some with trace red sphalerite
126.29		81			laminated siltstone
128.40		64			laminated siltstone
129.41	129.56		41		2 parallel calcite fracture fills with trace to weak pyrite, weak pyrrhotite and weak to fair sphalerite
132.69		88			laminated siltstone
133.40		72			laminated siltstone
139.82		61			laminated siltstone
146.62		54			laminated siltstone
153.00		61			laminated siltstone
158.32		32			laminated siltstone
163.03		61			laminated siltstone
164.35	190.29		45-60		calcite fracture fill set with pyrrhotite
166.73	194.90		30-40		calcite fracture fill set with with weak to fair, fine grained pyrite and pyrrhotite
169.30		68			laminated siltstone
176.06		48			laminated siltstone
185.62		61			laminated siltstone
186.34	195.82		20-30		calcite fracture fill set with weak to fair red sphalerite, pyrite and pyrrhotite (few with no mineralization)
187.14	187.17			71	0.7 cm calcite veinlet
191.39		54			laminated siltstone
194.78	208.70		40-50		calcite fracture fill set with pyrite and pyrrhotite
195.36	195.61		16		calcite fracture fill
200.55	217.00		20-30		calcite fracture fill set with pyrite and pyrrhotite
208.24		39			laminated siltstone
212.98	233.47		30-40		calcite fracture fill set
213.33		44			laminated siltstone
216.52	236.00		5-25		calcite fracture fill set with pyrite and pyrrhotite
218.61		31			laminated siltstone
226.58		47			argillaceous limestone
228.97	244.43		50-60		calcite fracture fill set
231.55		42			argillaceous limestone
234.25		51			argillaceous limestone
240.08		49			argillaceous limestone
242.93	243.50		60-70		calcite fracture fill set
249.75	251.55		x		brecciated fracture fill - fault breccia?
251.80	257.56		25-45		hairline calcite fracture fill set with sphalerite, arsenopyrite, chalcopyrite, pyrite, pyrrhotite and galena
253.09	266.01		20-30		calcite fracture fill set with pyrite
254.28		36			laminated siltstone
255.53	255.57			50	mineralized calcite veinlet with strong sphalerite, fair chalcopyrite and weak to fair galena
261.62	270.88		50-60		calcite fracture fill set with pyrite
266.86	266.91		66		2.1 cm calcite fracture fill with moderate arsenopyrite, weak to fair sphalerite and trace galena

STRUCTURE LOG

267.86		51						laminated siltstone
268.29	269.20		15-25					calcite fracture set with pyrite
270.09	270.13		51					calcite fracture with pyrite, arsenopyrite, galena and sphalerite
271.61		44						laminated siltstone
273.74	422.80		15-30					calcite fracture set with variable mineralization; sphalerite, pyrite and arsenopyrite
274.66	334.74		30-50					calcite fracture set with pyrite and pyrrhotite
276.00		54						laminated siltstone
281.00		44						laminated limestone
295.40		38						laminated siltstone
342.85		64						laminated siltstone
346.70	431.98		45-65					calcite fracture fill set with variable mineralization; pyrite, pyrrhotite and sphalerite
350.54	350.71		54					series of parallel calcite fracture fills with fair coarse grained sphalerite, weak pyrrhotite, trace to weak galena and trace pyrite
353.04		54						laminated siltstone
354.17	354.74		29					1.1 cm calcite fracture fill with fair pyrrhotite, trace to weak pyrite and cross cut by ↘
354.70	354.75			44				0.5 cm calcite veinlet
362.20	362.36		39					calcite fracture fill with strong sphalerite and pyrite, fair arsenopyrite and trace to weak pyrrhotite and galena
363.83		45						laminated siltstone
366.59		80						laminated siltstone
367.52		54						laminated siltstone
372.98		72						laminated siltstone
380.21		39						laminated siltstone
381.01	381.32		x			34	24	brecciated fracture fill; 0.1 to 1.0 cm clasts of wall rock in calcite matrix. Clay altered at lower contact and fair sphalerite and trace pyrite, arsenopyrite and chalcopyrite in calcite
381.30	381.34		64					calcite fracture fill with fair sphalerite, weak to fair galena and trace pyrite, pyrrhotite and chalcopyrite
382.67	382.79				34			offset 1.1 cm calcite vein
383.17		61						laminated siltstone
384.00	384.07				45			1.7 cm calcite vein
385.21	385.30		34					calcite fracture fill with fair sphalerite, weak to fair pyrrhotite and weak pyrite and chalcopyrite
389.90	390.66		15					calcite fracture fill with pyrite and chalcopyrite
391.03		39						laminated siltstone
391.44								fold apex? Circular laminations resembling tree rings
397.39		33						laminated siltstone
397.93	398.20		5					very shallow calcite fracture with fair pyrrhotite, weak to fair sphalerite, weak galena and trace chalcopyrite
399.33	399.54		5					very shallow calcite fracture with fair pyrrhotite, weak to fair sphalerite, weak galena and trace chalcopyrite
405.87		48						laminated siltstone
411.41		49						laminated siltstone
412.12	412.47	26	39					shallow laminated siltstone cross cut by calcite fractures

STRUCTURE LOG

							shallow calcite fracture with fair pyrrhotite, weak to fair sphalerite and trace to weak pyrite. Cross cut by ↘

COMMENTS

The hole mainly comprises siliceous siltstone intercalated with lesser silty limestone. Mineralization occurs throughout the interval ,trace to fair, fracture controlled or richer, weak to strong, in fairly chloritized replacement sections. Mineralisation consist of pyrrhotite, sphalerite, pyrite and lesser galena, chalcopyrite and arsenopyrite.

3.56	56.79					LST/ SLT	LT-MD GY	FG/ MO			w-f	t-w	ble	f					w-f	w-f	t	Py	t	As	t		Light to medium grey, fine grained, mottled, weak to fairly calc-silicate altered (locally), trace to weakly oxidized, fairly bleached (along fractures, and may follow bedding), weak to fairly chloritized, weak to fairly mineralized, intercalated silty limestone and siliceous siltstone. Interval consists approximately of 70 - 80% siliceous siltstone, and 30 - 20% silty limestone. Calcite fracture fill heavily dominant over quartz fracture fill. Large (>5cm) bladed calcite crystals common throughout. Bedding visible throughout most of interval. Chloritization takes place in sections with calc-silicate alteration, as well on the sides of fractures. Mineralization is mostly fracture controlled (usually with calcite) but also seen as replacements (usually along bedding) in sections of calc-silicate alteration as well as disseminated crystals. Mineralization is coarse grained, euhedral, and consists of sphalerite, pyrrhotite, galena, pyrite, arsenopyrite, and chalcopyrite. Arsenopyrite occurs as coarse grained, euhedral, disseminated crystals.

													Other									Other		Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tta)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity	Photo	
102.50	159.73					LST/ SLT					f	t	chl	f-m					w-f	w-f	t	As	t	Cp	t		Light to medium grey, fine grained mottled, fairly calc-silicate altered, tracely oxidized, fairly to moderately chloritized, moderately bleached, fairly mineralized, intercalated siliceous siltstone and silty limestone. Siliceous siltstone makes up ~85% of the interval while the silty limestone (mostly calc-silicate altered) makes up ~15% of the interval. Bleaching occurs along healed fractures and may follow bedding. Chloritization is seen to be associated with mineralized fracture-fills as well as with mineral replacement sections. Mineralization occurs in fracture-infill with calcite & quartz (although calcite is strongly dominant in the interval), as well in replacement sections (~0.10m-1.00m) with calc-silicate alteration of the silty limestone. often these two mineralization styles overlap. Sections of weake mineralization are separated out. Mineralization ranges from fine to coarse grained, and is euhedral. Section of fault breccia with rotated clasts separated out as a subinterval. Laminations visible throughout most of the interval.
													ble	m										Py	w-f		
			103.10	126.70											FX	38-45		35									Variably mineralized fracture-fill set (0.2-0.3cm thick) consisting of sphalerite and/or pyrrhotite (medium to coarse grained & euhedral) or no mineralization at all. Bleaching occurs along fractures.
			103.46	105.07							m		chl	s	BD	50			m	f-m	t	Cp	t	Py	ms		Section of mineral replacement along bedding, and is euhedral and ranges from coarse to fine grained. Section is strongly chloritized & moderately calc-silicate altered. Mineralization consists of sphalerite, galena, chalcopyrite, pyrite & pyrrhotite. mineralization occurs in three sections of ~20-35cm. Bedding constant throughout.
			106.71	109.93		MX							chl	m	BD	50			m	f-m	t	Cp	t	Py	f		Sub-interval of 4 sections of 20-40cm of medium to coarse grained, euhedral mineral replacement along bedding, with moderate chloritization and fair to moderate calc-silicate alteration. Mineralization consists of sphalerite, galena, chalcopyrite, pyrite, pyrrhotite.
			110.15	110.15		LA									LA	46											Bedding.

231.46	304.96					LST/ SLT	LT-MD GY/ GN	FG			w	t	chl	m-s					t-w	w-f	t	Py	w-f	Cp	t		Light to medium grey/green, fine grained, weakly calc-silicate altered, tracely oxidized, moderately to strongly chloritized, moderately bleached, fairly mineralized, intercalated silty limestone and siliceous siltstone. Siliceous siltstone makes up approximately 95% of the interval, while the silty-limestone makes up approximately 5% of the interval. Mineralization is mostly in replacement sections, that faded into and out of intensities, that are oriented along the bedding and range from 5-50cm in the length, some of which are described. Mineralization is mostly coarse grained and euhedra but some sections are fine grained. Mineralization also occurs in fracture sets. Sections of significant interception or length are separated out into subinterval. Bleaching occurs along fractures and may follow bedding. Chloritization is most common with pyrite mineralization and in sections is pervasive through the carbonate but also occurs along fractures. Calcite venation heavily prevalent over quartz. Calcite venation crosscuts replacement mineralization.

43	145.40	145.40		60									Laminations (bedding?)
44	149.00	158.50			54								Laminations (bedding?)
45	151.95	151.95		40-45									Mx (MG-CG) fracture set
46	154.40	154.40		66									Laminations (bedding?)
47	157.38	157.38		70									Laminations (bedding?)
48	158.68	158.68				30							Irregular calcite veinlet
49	161.21	161.21				12							Irregular calcite veinlet
50	162.00	175.00			45-50								Ca + py fx infill
51	168.00	168.00		65									Laminations (bedding?)
52	169.18	169.18		60									Laminations (bedding?)
53	174.51	174.51					30						Ca vein (4.5cm thick) with pyrite
54	177.30	186.80			30-65								thin (0.1-0.3cm thick) ca-fx-fill with chleat edges
55	188.64	188.64			34								Brx ca fx-infill (1cm thick) subangular bx
56	190.13	190.13			36								Ca + as fx fill (4cm thick)
57	190.48	190.48			50								Ca + as fx fill (5cm thick)
58	195.10	241.00			30-45								Fracture set, 0.2-0.4cm thick ca+py+po+cp
59	196.40	196.40		45									Laminations (bedding?)
60	199.52	199.52		60									Laminations (bedding?)
61	200.92	200.92				30							Ga veinlet + po (0.4cm thick)
62	201.02	201.02				51							Ga veinlet + py (0.4cm thick)
63	204.00	204.00		75									Laminations (bedding?)
64	208.63	208.63				40							Ca with qz x-tals, VT +po
65	214.04	214.14		50									Mx (gn +po) replacement orientation
66	214.75	214.75		70									Laminations (bedding?)
67	217.00	217.00		72									Laminations (bedding?)
68	218.15	218.15		60									Laminations (bedding?)
69	221.06	221.06		80									Laminations (bedding?)
70	222.80	222.80		55									Laminations (bedding?)
71	227.80	227.80		65									Laminations (bedding?)
72	231.30	231.30		55									Laminations (bedding?)

STRUCTURE LOG

HOLE: KEG 11-33

	INTERVAL		STRUCTURE (TCA)											Description
	From (m)	To (m)	Bedding	Lamination	Fracture	Veinlet (< 1cm)	Vein (> 1cm)	Fault	Slickensides	Attitude (TFA)	Upper Contact	Lower Contact		
73	235.50	235.50		74										Laminations (bedding?)
74	238.10	238.10		70										Laminations (bedding?)
75	240.00	287.00			20-30									Mx + ca fx set 0.1-0.3cm thick
76	240.17	235.20			25-35									Calcite filled fracture set (0.6-1.2cm thick) no mx
77	250.72	250.72		83										Laminations (bedding?)
78	254.58	254.58			50									Sph +po fx fill + mx/ble halo
79	257.00	302.00			12-22									Calcite filled fx set, no mx/ox
80	265.70	265.70		60										Laminations (bedding?)
81	278.20	278.20		81										Laminations (bedding?)
82	281.10	281.10		60										Laminations (bedding?)
83	292.40	292.40		50										Laminations (bedding?)
84	295.80	295.80		71										Laminations (bedding?)
85	296.97	296.97			23									Dog-tooth spar calcite fx fill (2.0cm thick)
86	304.03	323.50			30-55									Calcite filled fracture set
87	306.30	306.30		49										Laminations (bedding?)
88	316.00	316.00		68										Laminations (bedding?)
89	320.15	339.90			25-35									Qz + ca fx set
90	329.78	330.20					35							Qz vein (42cm thick) no mx, fair oxidation
91	332.20	332.20		80										Laminations (bedding?)
92	334.71	334.71		56										Laminations (bedding?)
93	339.00	339.00		82										Laminations (bedding?)
94	340.80	343.26				30								Trace sulphides
95	343.26	345.44		45										Replacement.
96	345.44	349.15				45								Trace sulphides
97	349.15	353.50												Replacement.
98	353.65	357.00				x								Replacement.
99	360.80	363.40					30							Trace sulphides
100	363.40	364.10												Replacement.
101	364.10	366.40					30							Trace sulphides
102	373.00	425.00		70-82										
103	381.34	381.37			45									Trace sulphides
104														
105	411.58	411.67				x								Replacement.
106	420.00	421.35			30									Trace sulphides, strong oxidized.

COMMENTS

The hole intersected a succession of Intercalated siliceous siltstone and limestone with locally trace to moderately strong replacement style and fracture controlled mineralization, which extends to EOH. Mineralization consist of pyrrhotite, galena, sphalerite, an chalcopyrite.

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
0.00	3.59	3.59				OVB																					"Casing and Overburden" (OVB) - Little recovery, mostly rounded pebbles of siliceous siltstone.
3.59	49.00	45.41				SLT	LT-MD GY	fg	f			f-m	chl	m	LA	53-77											"Intercalated Siliceous Siltstone with minor Silty Limestone" (SLT) - Light to medium grey, fine grained, laminated, fair-moderately oxidized, moderately chlorite altered, intercalated siliceous siltstone with minor silty limestone (~20% of interval), containing trace fracture controlled mineralization. Mineralization consists of fine grained pyrrhotite, sphalerite, chalcopyrite, and galena. Laminations range from 55-75° to core axis, but are generally oriented at ~70° to core axis. Oxidation is marked by intermittent limonite staining (mostly around joints) and chlorite alteration is pervasive. Calcite veining occurs at a moderate density and 2 distinct orientations can be seen, one between 10 and 25° and one between 35 and 50° to core axis. Veinlet widths range from 1mm-1cm. Contacts between siliceous siltstone and silty limestone are parallel with laminations, calcite veinlets cross cut laminations. Intermittent (~5%) buff/ light pink intervals tend to be either silica alteration or calcite alteration.

													Other									Other		Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tta)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
49.00	57.27					SLT/ FLT	LT-MD GY-OR	fg				s	cly	w	FLT	34											"Highly Fractured and Faulted, Oxidized, Intercalated Silty Limestone and Siltstone" (SLT) - Light to medium grey to brown, fine grained, highly faulted and oxidized, intercalated siltstone and limestone with no visible laminations or mineralization. Faults (and contacts with previous/following intervals) are oriented at 34° to core axis. Pervasive brown/orange limonite staining and intermittent weak clay alteration are seen throughout interval. Faults are filled with a calcite gauge and contain sub-angular clasts of siliceous siltstone ranging from 1mm-2cm in width. Faults cross cut laminations. Vugs, up to 1cm, are seen in the calcite.
			52.53	54.34	1.81																						Intermittent bladed calcite is seen in this sub-interval.
57.27	151.91	94.64				SLT	LT-MD GY	fg				t-w	chl	w-f	LA	50-71											"Siliceous Siltstone" (SLT) - Light to medium grey, fine grained, laminated, siliceous siltstone with moderate calcite veinlets containing weak mineralization. Laminations range from 50-71° to core axis. Sections that have undergone calcite alteration show no laminations and are marked by a light grey, silty appearance (~5% of interval). Weak chlorite alteration is seen throughout unit, but is most prevalent along fractures and joints. Calcite veinlets oriented between 22 and 50° to core axis occur at a moderate density and often contain trace-weak mineralization of pyrrhotite, sphalerite, galena and chalcopyrite. Rarely veinlets branch out (dendritic form) and can be seen oriented at all angles to core axis. Low angle quartz veinlets occur at a low density and range from 2mm to 1cm in width.

173.67	269.61	95.94				SLT	LT-MD GY	fg				t-w	chl	w	LA	30-71											"Siliceous Siltstone with Weak to Fair Fracture Controlled Mineralization and Weak Replacement Style Mineralization" (SLT) - Light to medium, grey to green, fine grained, laminated siliceous siltstone with weak-fair fracture controlled mineralization and weak replacement style mineralization. Laminations show a wide range of angles (30-71° TCA) and can shallow and steepen significantly over short intervals. Trace-weak oxidation and chlorite alteration can be seen particularly along fractures and joints. Mineralized veinlets are generally oriented between 22 and 33° to core axis and contain weak-fair pyrrhotite and sphalerite and none-trace galena and chalcopyrite; all fine grained. Veinlet density increases in bleached zones. In areas of replacement style mineralization sphalerite is prevalent with weak pyrrhotite and trace galena and chalcopyrite. Contacts for these zones are parallel with laminations. Entire unit is highly siliceous, even in sections of replacements style mineralization.

277.15	532.49	255.34				SLT/ LST			w-s		w-f	w	cly	t					f	f	t-w	Cp	f	As	w		Light to dark grey and pale greenish-grey, fine grained, laminated, weakly oxidized and mineralized intercalated silty limestone and siliceous siltstone. Mineralization intensity is overall fair to moderate and locally strong. Replacement-style mineralized bands are between 5-20 cm wide, moderately calc-silicate altered and consists of fine to medium grained sphalerite, pyrrhotite, chalcopyrite and galena in lenses roughly sub-parallel to bedding with sharp upper and lower contacts. Fracture-controlled mineralization consists of fine grained sphalerite, pyrrhotite, chalcopyrite and galena. These fractures are 1-10 mm wide and occasionally occur with calcite. Fracture-filled zones display a dendritic-like texture. Occasionally sulfides occur as localized concentrated masses/clumps of crystals (Sp, Cp, Gn, Po). Contacts between siltstone and limestone are diffuse and distinguishable with HCl. Calc-silicate altered zones occur in limey sections and display sharp contacts to the siltstone. Locally clay altered zones are 2-5 cm wide. Note: limey zones are slightly coarser and usually host the majority of mineralization (replacement-style). The siltstone unit varies in colour between light to medium grey and slightly bleached. The bleached siltstone is the primary host for fracture-controlled mineralization.
			311.56	311.62	0.06	LST									LA	88			m	s		Cp	f				Replacement-style mineralized zone with fine grained sphalerite, pyrrhotite, chalcopyrite in lenses sub-parallel to bedding.

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
			316.38	316.58	0.20	LST					w								f	s		Cp	m				Replacement-style mineralized zone with few fracture-controlled sections. Mineralization consists of fine grained sphalerite, pyrrhotite, and chalcopyrite in lenses sub-parallel to bedding. Occasionally these zones contain fine grain, disseminated arsenopyrite crystals.
			317.33	317.65	0.32	LST					w								f	s		Cp	m				
			334.98	335.05	0.07	LST					f								f	m		Cp	f	As	f		
			344.00	352.00	8.00	SLT													m	ms		Cp	f				
			396.50	400.20	3.70	LST/ SLT													m	ms		Cp	f				
			356.85	379.35	22.50	LST/ SLT													f	m	tw	Cp	f				Dendritic-like texture fracture-fill containing sphalerite, pyrrhotite, chalcopyrite and galena. Sphalerite occurs as fine to coarse grained masses of crystals in irregular shaped fracture-fills. Fine to medium grained pyrrhotite and chalcopyrite usually occur alongside sphalerite masses.
			403.40	425.60	22.20								Arg/ Cly	s						ms	ms	Cp	f				Clay/Argillite altered zone with fine to medium grained galena, chalcopyrite, and dark red and black sphalerite. Section is highly porous. Possible replacement-style mineralization, but distinctly different from previous mineralized zones.
			421.80	425.60	3.80	FLT							Chl	w													Fault breccia with subrounded and subangular clasts between 3-60 mm wide. Sharp, non-measurable upper and lower contacts.
			425.60	532.49	106.89	LST/ SLT							Arg/ Cly	w					t	t	t	Cp	t	As	t		Mineralization intensity decreases to trace and weak and consists of fracture-filled, fine grained chalcopyrite, pyrrhotite and arsenopyrite. Few clay/argillite altered zones occur and host irregular shaped clumps/aggregates of fine to medium grained sphalerite and galena. A light pink, soft, non-calcareous mineral occurs in most fracture-filled zones, and increases in concentration with depth. Locally bleached siltstone zones are light to pale grey. Calcite fracture-fills are common throughout.
													Chl	w													
			439.49	441.80	2.31	LST/ SLT					f										f	Cp	t				Bleached and pale green calc-silicate altered zone with speckled and fracture-filled (dendritic-like) fine grained galena, and minor fine grained sphalerite.
			465.30	466.00	0.70	LST/ SLT					f										f	Cp	t				
			481.00	483.25	2.25	LST									BD	50											Black argillaceous limestone with abundant calcite veinlets and fracture-fills. A bleached and strongly chlorite altered fault breccia constrains the upper and lower contacts (+/- 1 m).

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS									DETAILED DESCRIPTION
													Other									Other		Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity	Photo	
			489.81	532.49	42.68	LST/ SLT							Cly	t	LA	45			t	t	t	Cp	t				Light purple/beige cherty lenses occur within the intercalated siltstone and limestone unit. Cherty sections are sub-parallel to LST/SLT layers. Last 40 m displays alternating light to dark grey siltstone and pale greenish-grey limestone layers. Siltstone layers occasionally contains mineralized fractures consisting of fine grained sphalerite, chalcopyrite and pyrrhotite. Limestone layers locally host fine grained speckled sphalerite, galena and chalcopyrite in sections 2-5 cm wide (this type of mineralization mainly occurs to a depth of 518 m, after which it dissipates out).
EOH																											532.49 m. EOH.

HOLE: KEG-11-35

CLAIM: Keg

Contractor: Top Rank Drilling

Drill:

Core size: NQ2

Casing depth: 2.24 (m) in / out

Drilling dates: Sept 3 to Sept 13, 2011

Geology logged by: Jen Builder

TARGET: Hole collared to test historic trenching mineralization at depth.

SURVEY

Depth (m)	Azimuth	Dip	Method	Depth (m)	Azimuth	Dip	Method
collar	340	-50	compass				

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
2.24	135.33	133.09	SLT	Fractured siltstone with trace to weak sulphides: pyrrhotite, pyrite, sphalerite and chalcopyrite.
135.33	335.97	200.64	SLT/CHT	Black siliceous siltstones intercalated with maroon chert. Section comprises trace to weak sulphides hosted in calcite infilled veinlets.
335.97	395.33	59.36	SLT/LST	Weak to strong pyrrhotite and weak chalcopyrite occurs occasionally in thermaly affected silty limestone.

COMMENTS

The hole intersected weak fractured controlled sulphides in siltstone and chert. Down hole from m 335 to EOH silty limestone undergone fair skarn mineralization with pyrrhotite and chalcopyrite.

2.24	135.33	133.09				SLT	LT-DK GY/TN	fg	s			w-m	chl	w	LA	55-75											"siltstone" (SLT) - Light to dark grey and dark tan, fine grained, strongly siliceous, laminated siltstone with local weak chlorite alteration and thin (1.0 to 6.0 cm) localized maroonish chert beds. Laminations are oriented 55° to 75° to core axis and weakly calcareous fracture fills with white (siliceous?) envelopes are pervasive throughout ranging from 5° to 75° to core axis containing weak, fine grained pyrrhotite, trace to weak, medium grained pyrite and trace, fine grained chalcopyrite. Weak to moderate oxidation is evident by orange limonite staining on joints and fractures. Lighter
															Fx	5-75			w			Py	t-w	Cp	t		grey siltstone with increased chalcopyrite and reduced oxidation down hole (66m to 135.33m).
			21.75	22.79	1.04								cly	w	SHR	UC 18						Py	t				weakly clay altered, sheared subsection with trace disseminated, medium grained pyrite in an abundance of calcite infills.
			28.22	29.86	1.64										Fx	15-30			w	t		Py	w				high density of fractures oriented 15° to 30° to core axis in maroon chert with trace disseminated fine grained sphalerite and weak pyrite and pyrrhotite.
			34.05	34.49	0.44										Fx	UC 22						Py	t				sheared calcite fracture fill with lower contact (LC) oriented 22° to core axis with crackle texture fractures throughout and trace disseminated fine to medium grained pyrite.
			38.86	39.32	0.46							m	cly	m													moderately clay altered and oxidized subsection with abundant calcite.
			42.00	48.21	6.21								cly	w	RBL							Py	t-w	Cp	t		Weakly clay altered, rubbly subsection with localized zones of competent rock. Rubble contains abundant crystalline calcite and trace to weak, disseminated, fine to medium grained pyrite and locally occurring trace, disseminated, fine grained chalcopyrite.
			65.23	65.70	0.47										RBL												Subrounded rubbly subsection
			74.70	74.78	0.08										Fx	59			m								Calcite fracture fill oriented 59° to core axis containing moderate, fine to medium grained pyrrhotite.
			89.76	90.16	0.40										Fx	23						Py	t-w				Weakly vuggy calcite fracture fill with trace to weak medium grained pyrite.
			99.41	99.55	0.14										FA	UL 43											Fold axis visible perpendicular to core axis upper limb (UL) oriented 43° to core axis and lower limb (LL) oriented 46° to core axis.
																LL 46

COMMENTS

The hole mainly comprises siliceous siltstone, weakly chloritized. Trace to fair mineralization is hosted in fracture controlled intervals . Richer grade of sulphides, fair to strong, are linked to replacement sections ,mostly in the second half of the hole.

Geology logged by: Oliver Fu

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
4.68	259.00	254.32	LST/SLT	Intercalated limestone and siltstone with occasionally mineralized fracture, at 25-30TCA, crossing lamination(70-85). Skarn mineralization occurs in calcareous sections and carry better grades of pyrrhotite, arsenopyrite, sphalerite , chalcopyrite.
259.00	538.58	279.58	SLT	Trace to weakly oxidized, chloritized and occasionall clayed siltstones hosting trace to moderate sulphides in calcite infilled veinlets or sparsely disseminated.

Comments

The hole intersected siltstone with lesser limestone .
Trace to weak and locally moderate mineralization consist of : pyrrhotite, pyrite, sphalerite, chalcopyrite, arsenopyrite, galena and occurs in calcite infilled fracture and in narrow replacement sections.

0.00	4.68	4.68				OVB																					Overburden. 20 cm recovered. Rounded pebbles
4.68	259.00	254.32				LST/ SLT					t	w	chl	t	LA	70-83						As	t				Intercalated light to dark grey, fine grained siltstone and light grey to buff-pale green silty limestone. Contacts between units are sharp. Limey zones are usually more competent and locally clay altered. Fractured surfaces are oxidized throughout and few are weakly chlorite altered. Fracture fills are common and contain calcite and a light pinkish-beige, moderately soft mineral (?). Laminations mainly dip between 70-83°, and few 40-60° TCA.
													cly	t													
			43.86	44.00	0.14	LST							cly	w	Fx	25				f							Low angle calcite fracture-fills containing fine to medium grain clusters of sphalerite crystals.
			50.00	73.60	23.60	SLT						t	cly	w								Py	t				Chlorite altered sheared zone with minor block faulting (fault breccia). Calcite veins and fracture-fills are common throughout and show no preferred orientation. A light pinkish-beige, non-calcareous mineral occurs in few calcite fracture-fills. Locally clay altered sections are very soft, gritty and light grey-white. Fine grained euhedral pyrite crystals occur on few fractures. Sparse dark green, strongly chlorite altered fractures display slickensides.
													chl	s													
			72.40	78.90	6.50	LST/ SLT						t			Fx	25-30		2-5	t	w	t	Py	t				Calcite fracture-fill containing fine grained sphalerite pyrrhotite, galena and pyrite. Fractures are between 1-10 mm wide. The majority of fractures measure 25-30° TCA. Speckled fine grained sphalerite occurs locally.

GEOLOGY LOG

													Other									Other		Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
			85.34	166.35	81.01	LST/ SLT						t	chl	w-m	LA	67-75			w	w		Py	t	Cp	t		Buff to light brown, clay altered limey zone. Altered sections range between 0.2-1.8 m wide and usually contain fracture-filled calcite. White bladed calcite/aragonite crystals occasionally occur. Mineralization intensity increases to weak and consists of speckled fine to medium grained sphalerite. Pyrrhotite also occurs alongside most sphaleritie crystals. Mineralization is fracture-filling and mainly occurs in bleached zones within calcite-fracture-fills. Oxidized and manganese stained fractures are common throughout. Pyrite and chalcopyrite are occasionally observed on fractured surfaces. Few fracture-fills contain a light pink, soft non-calcareous mineral (?). Locally chlorite altered zonres are medium to dark green and contain fine grained pyrite and sphalerite. Note: fracture-fills generally show a preferred orientation between 10-60° TCA. Cross-cutting fractures are common in buff, clay alrered zones.
													cly	f														
			126.00	127.15	1.15	FLT						w	cly	s														Fault. Light grey, clay altered, weakly oxidized and slightly gougy fault zone. Sections is intensely fractured and rubbly.
			153.06	153.09	0.03										Fx				f	f		Cp	w					4 cm wide aggregate of fine to medium grained sphalerite, pyrrhotite and chalcopyrite crystals. Calcite occurs alongside and interstitially between these sulphides.
			160.10	160.30	0.20	LST									Fx				f	m		Cp	t	Py	f		Pale to dark green, fine grained limestone with replacement and fracture-style mineralization. The zone consists of fine to medium grained sphalerite, pyrrhotite, pyrite and trace chalcopyrite. Fractures are cross-cutting and show no preferred orientation.
			166.88	167.00	0.12	SLT									Fx	25			w	f		Py	w					Low angle mineralized fracture-fill within a bleached siltstone. Fracture is between 6-12 mm wide and consists of fine grained sphalerite, pyrrhotite and pyrite.
			166.88	167.87	0.99	LST/ SLT							chl	s					f	m		Py	ms					Dark green and medium grey, chlorite altered siltstone and limestone with fracture-filled, fine to medium grained pyrite, sphalerite and pyrrhotite.

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
			166.35	224.04	57.69	LST/ SLT						w	cly	t	Fx	22-44		2-8	w-f	w-f		Py	t-w	Cp	t-w		Intercalated light to dark grey, laminated siltstone and light grey, bleached sility limestone. Contact between units are diffuse. Mineralization intensity increases to weak-fair and comprises of speckled and fracture-filled, fine grained sphalerite, pyrrhotite and chalcopyrite. Sphalerite and pyrrhotite commonly occur alongside each other. Most fractures are measured between 22-44° TCA. Light grey, bleached and chlorite altered siltstone hosts the majority of fracture-filled mineralization, which consists of fine grained sphalerite, pyrrhotite, chalcopyrite and pyrite in fractures 1-3 mm wide. Fractured surfaces have undergone weak oxidation, and are occaionally coated with calcite. Limestone sections are locally clay altered, gritty and moderately oxidized. Laminations in the siltstone measure 65-77° TCA.
													chl	w	LA	65-77											
			172.82	173.27	0.45							s	cly	s													Rusty, non-calcareous, weakly brecciated, strongly clay altered and oxidized section with sharp upper and lower contacts.
			198.91	199.40	0.49	LST/ SLT					f (?)								s	m		Cp	w	As	t		Light grey and medium to dark green, mineralized siltstone and limestone(?). Replacement-style (?) mineralization consisting of fine to medium grained pyrrhotite, sphalerite, chalcopyrite and arsenopyrite. Zone does not effervesce (possibly de-calcified?).
			202.95	203.60	0.65	LST						m	cly	s													Light to buff-grey, gritty, clay altered and oxidized limestone.
			223.60	223.84	0.24	LST/ SLT					f (?)								s	m		Cp	w				Light grey and medium to dark green, mineralized siltstone and limestone(?). Replacement-style (?) mineralization consisting of fine to medium grained pyrrhotite, sphalerite, chalcopyrite and arsenopyrite. Zone does not effervesce (possibly de-calcified?).
			224.64	259.00	34.36	SLT/ CHT					w	chl	t						t-w	t		Py	t-w	Cp	t		Intercalated medium to dark grey siltstone and light purple-maroon chert. Contacts between units are diffuse. Fracture-filled mineralization is sparse and consists of fine grained pyrrhotite, sphalerite and pyrite in 1-3 mm wide fractures. Sparse chlorite/calc silicate(?) altered sections host fracture-filled fine to medium grained pyrite, pyrrhotite and sphalerite. Calcite locally occurs on fractured surfaces.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

259.00	538.58	279.58				SLT							chl	w	Fx				t-w	t		Py	w	Cp	t		Light to dark grey, weakly oxidized siltstone. Fracture-fills are between 1-5 mm wide and contain trace amounts of pyrite, pyrrhotite and sphalerite. Locally bleached zones are between 5-30 cm wide, and weakly chlorite altered. Trace pyrite and chalcopyrite occurs on fractured surfaces. Few pale green, non-calcareous areas (5-20 cm) contain dendritic-like, 1-2 mm fracture-fills with pyrrhotite, sphalerite, and chalcopyrite.
			277.77	278.00	0.23	SLT						s	cly	m													Light to brown-rusty, moderately clay altered, strong to intensely oxidized siltstone with crystalline calcite cavities. Sharp upper and lower contacts.
			288.55	288.73	0.18	SLT						s	chl	m													Light to brown-rusty, moderately clay altered, strong to intensely oxidized siltstone. Sharp upper and lower contacts.
			323.10	343.80	20.70	SLT/ CHT						w	chl	f						t-w		Py	w-m	Cp	t		Intercalated light to dark grey siltstone and light purple-maroon chert in a moderately chlorite altered sheared zone. Fracture-fills contains fine to medium grained pyrite, pyrrhotite, chalcopyrite and sphalerite. Zone is weakly oxidized along fractured surfaces.
			351.13	424.80	73.67	SLT						t			LA	70-86			m-ms	m-ms	w	Cp	w-f				Light to dark grey, bleached, moderately mineralized siltstone. Dendritic-like fracture-filled mineralization consists of fine to medium grained and locally coarse grained pyrrhotite, sphalerite, chalcopyrite and galena (note: these occasionally resemble tension gashes). Locally sub-massive lenses are sub parallel, limey, and measure between 1-3 cm and comprises of medium to coarse grained sphalerite, pyrrhotite, chalcopyrite and minor galena. A light pink, moderately soft, subrounded mineral occurs alongside bleached and pale green mineralized zones (altered garnets?). Note: mineralization is scattered throughout the interval with concentrations varyinng between weak to strong.
			424.80	470.40	45.60	SLT									LA	70-77			t	t-w							Light to dark grey, laminated siltstone with trace, fracture-filled, fine grained sphalerite, chalcopyrite and pyrrhotite. Mineralized fracture-fills measure ~25°, and laminations between 70-77° TCA.
			434.53	434.81	0.28	LST							cly	s					t	t							Light grey and pale green-white, clay altered, limey gouge with fine grained sphalerite and chalcopyrite within a 5 cm fracture-fill.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

34	238.5			60										Laminated siltstone.
35	253			70										Laminated siltstone with chert interbeds.
36	262			84										Laminated siltstone.
37	262.5				10									2 mm fracture-fill with fine grained pyrrhotite and chalcopyrite in siltstone.
38	264.2				25									3 mm fracture-fill with fine grained pyrrhotite and chalcopyrite in siltstone.
39	267.2				22									3 mm fracture-fill with fine grained pyrrhotite and chalcopyrite in siltstone.
40	268.15			80										Laminated siltstone.
41	274.7			55										Laminated siltstone.
42	279.75				15									Calcite fracture-fill with minor chlorite in siltstone.
43	280.9			85										Laminated siltstone.
44	282.75			30										Laminated siltstone.
45	290.35			77										Laminated siltstone.
46	294			83										Laminated siltstone.
47	300.4				30									2 mm fracture-fill with pyrrhotite and pyrite in siltstone.
48	303.2			80										Laminated siltstone.
49	313.5			77										Laminated siltstone.
50	331.3			60										Sheared and laminated siltstone.
51	356.0			60										Laminated siltstone.
52	365.9				15									17 mm fracture-fill with medium grained pyrrhotite, sphalerite and fine grained chalcopyrite in siltstone.
53	372.6			80										Laminated siltstone.
54	375.5			86										Laminated siltstone.
55	377.5			70										Laminated siltstone.
56	383.6			75										Replacement style mineralization sub-parallel to laminations in siltstone. Mineralization consists of fine grained sphalerite, pyrrhotite and galena
57	391.9			60										Laminated siltstone.
58	393.4			75										Laminated siltstone.
59	395.9			80										laminations in siltstone. Mineralization consists of fine to medium grained sphalerite, pyrrhotite and chalcopyrite.

COMMENTS

Hole consists mostly of argillite, silicified laminated siltstone, and lithic grey wacke. Minor pyrite, pyrrhotite, and chalcopyrite mineralization. Minor patches of chlorite and sericite alteration.

GEOLOGY LOG

HOLE: KEG-11-38

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other									Other		Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tta)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
0.00	10.30																										No recovered core
10.30	43.80					OVB	GY								BD	40-45											Overburden with frequent "wash away" sections. Mostly composed of dark grey silt with occasional rounded clasts of siltstone, limestone, and intrusives from 6mm-8cm wide. Patches of coarse lithic sand throughout. Bedding observed in dark silty material towards the end of the interval. Conductive in some places (due to graphite and/or clays).
			18.38	23.50		OVB	DKGY																				Coarse sand subinterval with occasional rounded to subangular clasts 5mm-8cm wide. Large wash away section (19.51-21.03m) with zero recovery. Sand grades into dark organic siltstone.
			35.83	41.10		OVB	GY																				Rounded clasts with no matrix. Wash away interval.
			41.90	43.80		OVB	GYWH																				Large granitic dropstones? (~5-50cm in width)
43.80	58.55					ARG	BK					w			VT	75-90		1				py	t				Argillite unit with oxidized fractures. White calcite stringers and veinlets throughout. Highly conductive portions (abundant graphite). Plant stems still visible in fractures. Muscovite also present with oxidized material in fractures. Mostly organic material at the beginning of the interval and becomes more dominantly mixed with silt towards the end of the interval. Calcite alteration intervals?
			55.73	56.30		SLT	WH	MA					carb	s	ST	35		4				py	s				Carbonate alteration (calcification) in siltstone. Intercalated boundary boundary between with white calcite extending into dark siltstone on both upper and lower contacts. Pyrite veinlets within carbonate alteration area.
			57.21	57.41		SLT	DKGY	MA					carb	s													Dark grey carbonate alteration (calcification) ir siltstone.

															LA	65											
147.13	190.91					WAC	GY	MA	m						VT	20-30		4									Grey lithic wacke. Calcite and barite? veins and veinlets throughout. Fault zones, argillite breccias, argillite interbeds, and deformed laminated siltstone intervals. White chert clasts (1mm-1cm wide) and argillite clasts (2mm-4cm wide) throughout. Fine pyrite occasionally covering barite? Moderately silicified. Patches of sericitic alteration.
															VN	20-30		4									
			148.26	151.27		VEN	WH								VN	20-30		8									White calcite and barite veins with fine needle-like crystals. Pyrite blebs in veins. Vein offset approximately 2 cm. Calcite and barite fracture fills?
			164.70	165.37		VEN	WHG	GO														py	t				Gougy calcite vein with wacke clasts and trace disseminated pyrite.
			169.70	170.00		VEN	GNGY						ser	m	VN	?		1	t			py	w				Smoky and milky quartz vein surrounded by sericite alteration and disseminated pyrite, pyrrhotite, and chalcopyrite. Structure difficult to determine-deformed?
																						cp	t?				
			174.50	177.10		WAC	DKGY								ST	30		7	t			py	f				Calcite stringers surrounded by light green (sericite) alteration. Disseminated pyrite and pyrrhotite in veinlets and throughout sub-interval as disseminated clusters.
			177.10	179.47		ARG	BK	LA							VT	45		3	f			py	t				Dark laminated argillite and siltstone. Calcite and barite veins and pyrite and pyrrhotite veinlets. Conductive unit.
															LA	45											
			179.47	183.81		WAC	DKGY						ser	w					w			py	t				Mixed lithic grey wacke and ark siltstone/argillite. First 50 cm of sub-interval consists of weak sericitic alteration with disseminated pyrite and pyrrhotite. Argillite interbed (32cm wide) with pyrite stringers. Argillite and white chert breccia last 20 cm of subinterval.
															ST	55		3									

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other									Other		Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
190.91	209.21					WAC	GY	MA							ST	45		5									Alternating lithic grey wacke and deformed dark laminated siltstone. Calcite veinlets and breccia sub intervals. Pyrite and pyrrhotite stringers and patches throughout. Weak sericitic alteration in wacke. Wacke-siltstone alternations are ~1-3m wide. Angular dark siltstone clasts and white chert clasts common in wacke.
						SLT		LA							LA	0-90											
			142.66	143.57		SLT	GY	BX														as	t	BI	t		Calcified siltstone/calcite breccia. Siltstone clasts (~1mm-3cm) in calcite fracture-fill. Siltstone surrounding breccia weakly calcified. Long and thin silvery mineral-bismuthite?, arsenopyrite, and pyrite in calcite fracture fills.
																						py	t				
			206.50	206.92		WAC	GY	BX							ST	60		3	w			py	t				Argillite interbed ~7cm wide surrounded by argillite breccia in grey lithic wacke. Pyrrhotite blebs in breccia and thin pyrite stringers in argillite.
209.21	218.68					WAC	GY	MA							ST	25-90		4				py	t				Medium-grained grey lithic wacke with white chert clasts and smaller dark siltstone interbeds (3-5cm wide). Calcite stingers throughout. Trace pyrite coating fractures. Argillite breccia at the end of the interval.
			218.07	218.68		WAC	BK	BX																			Argillite (conductive) interbed (~15cm wide) surrounded by wacke with argillite clasts and white chert clasts (1mm-4cm wide).
218.68	227.27					SLT	GY	LA																			Laminated grey siltstone with sericite alteration patches, argillite breccia, and calcified siltstone.
			222.16	222.86		SLT	LTGN						ser	f					f			py	w				Fair sericite alteration patches in siltstone. Pyrrhotite blebs, goethite?, and pyrite.
			224.63	225.10		WAC	DKG\	BX																			Argillite breccia with grey-lithic wacke matrix, and conductive argillite clasts. White chert clasts as well.
			225.66	226.62		SLT	LTGY	BX					cal	ms								py	t				Calcified siltstone surrounding siltstone breccia. Trace fine-grained pyrite throughout.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
	3.55	3.55	CAS	Casing - no recovery
3.55	108.51	104.96	SLT/LST	Weakly oxidized intercalated siltstone and limestone with moderate calc silicate and chlorite alteration and bleaching. Weak pyrrhotite, trace to weak sphalerite and trace chalcopyrite is fracture controlled.
108.51	121.88	13.37	SLT	Fair to strongly chlorite altered siltstone with localized zones of semi massive sphalerite, pyrrhotite and weak pyrite and chalcopyrite.
121.88	149.54	27.66	SLT	Fair to strongly chlorite altered siltstone with variably mineralized calcite fracture fills.
149.54	301.98	152.44	SLT/CHT	Intercalated siltstone and chert with fracture controlled fair to strong pyrrhotite and sphalerite and trace to weak chalcopyrite.
297.69	333.32	35.63	SLT/CHT	Intercalated siltstone and chert with localized zones of semimassive and replacement style strong pyrrhotite and sphalerite and trace chalcopyrite.
333.32	377.92	44.60	LST/SLT	Weakly oxidized intercalated siltstone and limestone with weak chlorite alteration and bleaching. Fracture controlled moderate pyrrhotite and sphalerite and weak chalcopyrite and seldom arsenopyrite occur throughout.
377.92	428.00	50.08	LST/SLT	Intercalated limestone and siltstone with weak to moderate sericite alteration and fracture controlled weak sphalerite. Small subsections of possible wollastonite occur throughout.

COMMENTS

The hole intersected a succession of chloritized ,locally oxidized , siltstone and limestone with lesser chert . Mineralization consist of fracture controlled and replacement style, trace to strong sulphides. Enriched skarn sections are bleached, with wollastonite in mineral assemblage.

COMMENTS

The hole mainly comprises siliceous siltstone intercalated with lesser silty limestone. Sulphide mineralization has better grades downhole hole and consist of: trace to strong pyrrhotite and sphalerite, trace to fair chalcopyrite and arsenopyrite, trace galena. Mineralization is fracture control, and replacement style in sheared chloritized sections.

	193.00	202.00	LA							55				
	206.65	206.80			x					25				1 cm - intense pyrrhotite, moderate sphalerite and trace chalcopyrite
	208.00	216.00	LA							55				
	215.80	215.86			x					45				1 mm - calcite with trace pyrrhotite
	215.84	215.87			x					50				2 mm - calcite
	220.00	275.00			x					10/60				hairline fractures - sulphides (pyrrhotite and trace chalcopyrite and sphalerite) (30/m)
	240.00	260.00	LA							55				
	236.50	236.54			x					30				3 mm - pyrrhotite and trace sphalerite and chalcopyrite
	239.20	241.00			x					35				18 (2-8mm) fractures - pyrrhotite, sphalerite and trace chalcopyrite
	261.55	262.10												replacement mineralization in pyrrhotite, weak sphalerite and trace chalcopyrite
	266.60	266.80			x					20				3-8mm - pyrrhotite and trace chalcopyrite and sphalerite
	272.50	272.58			x					35				2 mm - pyrrhotite and trace chalcopyrite
	273.38	273.51			x					25				1 cm - pyrrhotite and trace chalcopyrite
	274.30	274.35								45				3 mm - pyrrhotite and trace chalcopyrite
	274.65	274.80			x					45				3 x 1-3mm - pyrrhotite and trace chalcopyrite
	277.00	277.02			x					50				3-10mm - intense pyrrhotite and trace sphalerite
	281.40	281.70			x					20				1cm , 2 crosscut calcite fractures - moderate pyrrhotite , trace sphalerite and chalcopyrite.
	283.00	286.50			x					30/50				20 x 3 - 10mm - calcite with trace to intense pyrrhotite and trace sphalerite and chalcopyrite
	288.53	288.60			x					45				8 mm - intense pyrrhotite and trace sphalerite and chalcopyrite
	289.50	289.60			x									1 cm - intense pyrrhotite and trace chalcopyrite and sphalerite
	291.80	292.00			x					45				4 x 3-5mm - intense pyrrhotite and trace sphalerite and chalcopyrite
	292.50	293.00			x					45				3 x 3-8mm - calcite with intense pyrrhotite and trace chalcopyrite and sphalerite
	293.00	306.00			x					20/50				8 x 3-8mm - intense pyrrhotite and trace chalcopyrite and sphalerite
	307.00	341.00			x									intensely fractured and sheared section
	312.00	316.00			x					40/50				18 calcite fractures parallel/crosscut
	320.50	321.00			x					20				2 x 8mm calcite fractures - weak pyrrhotite and trace chalcopyrite and sphalerite
	321.00	321.50			x					45				6 x 3-5mm calcite fractures with trace sphalerite
	333.96	334.10			x					25				4 mm calcite fracture - moderate pyrrhotite and trace sphalerite and chalcopyrite
	334.18	334.40			x					25				4 mm calcite fracture - moderate pyrrhotite and trace sphalerite and chalcopyrite
	337.13	337.35			x					45				4 mm calcite fracture - moderate pyrrhotite and trace sphalerite and chalcopyrite
	382.00	382.50	LA							60				
	375.65	375.75			x					45				quartz, 3mm weak pyrrhotite and trace sphalerite
	375.65	382.00			x					10				3-4mm - quartz with trace sphalerite
	377.14	407.00			x					30/50				18 x 3-8mm - calcite with trace sphalerite
	378.12	378.33			x									fracture - calcite, clay and limonite filled
	349.47	399.61			x					45				quartz filled with moderate blebby pyrrhotite and trace sphalerite
	408.18	409.60			x					20				1 cm - calcite, clay and limonite filled, vuggy
	409.50	411.00	LA							40				maroon siliceous hairline - LA

STRUCTURE LOG

	413.70	420.80	LA							80				
	415.80	416.00			x					20				calcite filled and Bx, vuggy
	423.00	423.08			x					50				1 cm - intense pyrrhotite and weak sphalerite and galena
	432.13	432.18			x					50				intense sphalerite and trace pyrrhotite, galena and chalcopyrite
	436.00	437.00	LA							60				
	442.65	442.70			x					40				3-6mm sulphide infill fracture
	445.50	446.00	LA							60				
	460.00	462.00	LA							60				
	466.40	467.30												sheared section with replacement mineralization
	470.80	471.26												sheared section with replacement mineralization
	471.45	471.60			x					15				1.5 cm sulphide infill
	472.15	473.30												sheared section with replacement mineralization
	473.30	487.00												sheared section with replacement mineralization
	487.10	487.75												sheared section with replacement mineralization,semimassive sulphide.
	491.70	492.30												sheared section with replacement mineralization
	496.80	502.00			x					20				calcite,trace sulphide infill
	502.70	502.90												sheared section with replacement mineralization.
	505.95	506.90												sheared section with replacement mineralization.
	507.05	507.25												sheared section with replacement mineralization,semimassive sulphide.
	546.54	546.62								45				trace arsenopyrite

Core size: NQ2

Casing depth: 4.84 (m) in / out

Drilling dates: Sept 28, 2011 to Oct 1, 2011

Geology logged by: Jen Builder

SURVEY

Depth (m)	Azimuth	Dip	Method	Depth (m)	Azimuth	Dip	Method
collar	340	-50.0	compass				

TARGET: Hole collared to intersect main mineralized zone in order to determine its extent and intensity.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
	4.84	4.84	CAS	Casing - no recovery
4.84	225.34	220.50	LST/SLT	Moderate to strongly oxidized intercalated limestone (LST) and siltstone (SLT). Trace to weak pyrrhotite, sphalerite, arsenopyrite and chalcopyrite occurs seldom in calcite fracture fills.
190.97	196.87	5.90	FLT	Sheared and brecciated fault zone with weak pyrite, trace to weak pyrrhotite and trace sphalerite and galena as interstitial replacement.
225.34	276.45	51.11	LST/ARG LST	Intercalated limestone and graphitic argillaceous limestone.

COMMENTS

The hole intersected limestone with silty and argillaceous sections. Sulphides, trace to weak occurs in fractures and in replacement sections.

0.00	4.84	4.84				CAS																					"casing" (CAS) - no recovery
4.84	225.34	220.50				LST/SLT	LT-DK GY/GN/LT BFOR	f-mg				m-s	SER	w	LA	40-60											Light to dark grey, green and light buff orange, fine to medium grained, weakly laminated limestone with intercalations of siltstone. Intercalations gradually become wider down hole from roughly 72.24m. Contacts between units are diffuse but discernible in the presence of muriatic acid as limestone strongly effervesces. Moderate to strong oxidation is pervasive throughout evident from light buff orange rock, orange alteration envelopes and orange staining on joints and fractures. Laminations are oriented 40° to 60° to core axis. Calcite fracture fills are pervasive throughout in two dominant sets, 10° to 20° and 45° to 60° to core aixs and have light buff (sericite?) alteration envelopes. The shallow set (10° to 20°) is seldomly mineralized containing trace to weak pyrrhotite, sphalerite, aresnopyrite and

225.34	276.45	51.11				LST/ ARG LST	LT-DK GY/ BK	f-mg			w?		chl	w?	LA	30-50											Fine to medium grained, light to medium grey limestone (LST) and dark grey to black argillaceous limestone. Argillaceous regions range in width from 0.2 cm to roughly 8cm and are highly graphitic evident through their high conductance. Both units strongly effervesce in the presence of muriatic acid. Laminations are parallel with contacts and have two general sets ranging from 30° to 50° and 70° to 80° to core axis. Calcite fracture fills are highly pervasive throughout and range from 5° to 80° to core axis and are seldomly mineralized with trace, fine grained pyrite. Weak to moderate chlorite alteration occurs locally and possibly weak calc silicate alteration? also locally.

COMMENTS

Hole consists of two host rocks. The first being a light to medium grey, siliceous, fine grained metasiltstone. The second a dark grey to black, often sheared, fine grained argillite. Mineralization in the hole mainly consists of fine grained pyrrhotite. The pyrrhotite occurs within quartz fractures/veinlets and as large blebs throughout the core (up to 9cm in diameter). Trace sphalerite is occasionally seen with the pyrrhotite in the quartz veins. After ~170m, trace chalcopyrite is seen in conjuncture with the pyrrhotite in quartz veinlets. Most mineralization is fine grained.

37.43	41.61	4.18				SLT	LT-MD GY	fg					cly	f-m					w								"Moderately clay altered siliceous Metasiltstone" (SLT) - Light to medium grey siliceous siltstone with pervasive fair to moderate light grey clay alteration and fair chlorite alteration. Unit contains weak blebby pyrrhotite. Laminations are difficult to obtain due to the pervasive alteration.
													chl	f													
41.61	58.54	16.93				SLT	LT-MD GY	fg					chl	w	LA	~40											"Siliceous Metasiltstone" (SLT) - Siliceous metasiltstone with weak chlorite alteration along fractures and joints. Laminations are oriented between 35 and 55° to core axis (dominant orientation = 40°).
															Fx	~50		3 to 6	t	t							Quartz fractures occur at a low density and are occasionally associated with trace pyrrhotite and sphalerite (Po>Sp).
																			w								Weak blebby pyrrhotite is also associated with the interval.
			48.96	48.99	0.03										VT	40			w	t							1mm quartz veinlet containing weak pyrrhotite and trace sphalerite.
			49.02	49.05	0.03										VT	60			f	t							4mm quartz veinlet containing fair pyrrhotite and trace sphalerite.
			49.14	49.17	0.03										VN	50			f	t							1cm quartz vein with fair pyrrhotite and trace sphalerite
			55.35	55.37	0.02										VT	40			t								2mm wide quartz carbonate veinlet with trace pyrrhotite
58.54	241.40	182.86				ARG	BK	fg							Fx	50-70		10 to 40	t	<t		Qz	s	Ca	w		"Black Siliceous Argillite" (ARG) - Black, fine grained, argillite containing moderate graphite. Much of the interval (~30%) is sheared. The other 70% has little deformation (almost an argillaceous siltstone). Laminations in undeformed sections range from 20 to 60° to core axis (dominant orientation is 40°). Quartz fractures are found at all angles to core axis and occasionally contain minor calcite. These occur at a high density. Trace pyrrhotite is often associated with these fractures. Trace sphalerite is rarely seen in the fractures (see sub-intervals). Trace chalcopyrite becomes associated with the fractures starting at ~170m.
																						Cp	t				
															LA	20-60											
															UC TC												The upper contact is gradational and parallels laminations (~37° to core axis).
			62.84	62.87	0.03										VN	54			w								1cm quartz vein with weak pyrrhotite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

DENSITY LOG

Comments
Dark grey bedded siliceous siltstone. Weak pyrrhotite occurs within quarttz veinlets and fracture fill.
Medium grey siliceous metasiltstone with weak pyrrhotite along quartz fracture fill.
Dark-medium grey siliceous siltstone with blebs (1mm-5mm) of pyrrhotite along quartz fracture fill.
Dark-medium grey siliceous metasiltstone pyrrhotite found in blebs and within quartz fractures.
Argilliceous siltstone with weak blebby pyrrhotite.
Argilliceous siltstone with a large bleb (~6cm in diameter) of pyrrhotite.
Argilliceous siltstone with quartz carbonate microfractures containing trace to weak pyrrhotite.
Argilliceous siltstone with ~1mm carbonate fractures containing weak pyrrhotite.
Argilliceous siltstone with fine quartz carbonate microfractures containing trace pyrrhotite.
Argilliceous siltstone containing a boudinage like feature filled with pyrrhotite.
Argilliceous siltstone containing moderate fracture controlled pyrrhotite.
Argillite containing weak-fair pyrrhotite and trace chalcopyrite.
Argillite containing weak pyrrhotite.

COMMENTS

Host rock for this hole is a siliceous metasiltstone followe by a siliceous argillaceous unit. The metasiltstone is light to medium grey, fine grained and much of the interval has been sheared (~30%). The argillaceous unit is dark grey to black, fine grained and contains moderate to strong graphite. The contact between the two units is gradational and parallels laminations. Mineralization consists of moderate blebby and disseminated pyrrhotite, as well as quartz carbonate veins/veinlets containing fair pyrrhotite and occasionally trace sphalerite and chalcopyrite. Vein orientation is generally between 45 and 60° to core axis.

0.00	2.70	2.70				CAS																					"Casing" (CAS) - Casing, no recovery
2.70	7.09	4.39				SLT	LT-MD GY-OR	fg				m															"Oxidized Metasiltstone" (SLT) - Moderately oxidized metasiltstone. Limonite staining on joints (see description below for metasiltstone).
7.09	61.43	54.34				SLT	LT-MD GY	fg							LA	15-50											"Siliceous metasiltstone" (SLT) - Siliceous metasiltstone, light-medium grey, fine grained. Approximately 30-50% is sheared. The other half is undeformed and shows laminations between 15 and 50° to core axis (average ~27°)
															VT	50-75		3 to 15	w-f	t		Qz	ms	Cp	t		Quartz veinlets between 0.1 and 1cm in width occur at a low to moderate density. Veinlets generally contain weak to fair pyrrhotite, trace sphalerite and trace chalcopyrite (Po>Sp>Cp).
															BL				m-ms								Moderately strong pyrrhotite is found throughout the interval in large blebs (mm - serveral cm in diameter).
			11.83	12.00	0.17										VN	10			ms			Py	t				Vein oriented at 16° to core axis containing moderately strong pyrrhotite and trace pyrite. Width of vein is unknown as it is cut off by the fault.
			12.00	12.07	0.07								chl	m	FLT				t-w			As	t				Chlorite and clay altered rubbly sub-section. Fault, containing trace to weak pyrrhotite and trace arsenopyrite, all fine grained.
													cly	f													
			13.12	13.37	0.25										VN	55			f	t		Cp	t				1cm wide, clay altered calcite vein containing fair pyrrhotite, trace sphalerite and trace chalcopyrite.
			20.59	20.67	0.08										VN	56			ms	f		Cp	w				7cm wide quartz vein containing moderately strong pyrrhotite, fair sphalerite and weak chalcopyrite, all fine-medium grained.
			25.82	25.97	0.15								cly	s													Strongly clay and chlorite altered sub-section
													chl	s													
			26.00	26.92	0.92										Fx	~5			s								Fractures filled with pyrrhotite. Up section almost vein like. Unknown width, dipping at very shallow angle to core axis.
			30.42	30.48	0.06										VN	60			f			Sp	t				5cm quartz vein containing fair pyrrhotite and trace sphalerite.
			34.31	34.74	0.43								cly	m													Moderately clay altered sub-zone. Contacts are a 25° to core axis.
			36.89	37.27	0.38								cly	m													Moderately clay altered sub-zone. Contacts are gradational with the metasiltstone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other									Other		Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Silica		Calc-silicate	Oxidation	Type	Intensity	Type	Attitude (tca)	Attitude (tfa)	Density (frequency/m)	Pyrrhotite	Sphalerite	Galena	Type	Intensity	Type	Intensity		
			40.90	41.03	0.13								cly	s	VN	24											~1cm calcite vein oriented at 24° to core axis. Centre of vein has light grey to orange, very soft clay alteration. Up hole from vein light grey and orange clay is pervasive until 40.90m.
			49.69	49.78	0.09								chl	m	VN	60			f								3cm quartz carbonate vein containing fair pyrrhotite. Vein is oriented at 60° to core axis. Up hole moderate chlorite and strong clay alteration are found beside the vein.
													cly	s													
			59.12	59.54	0.42								cly	m													Moderately clay altered sub-section with silty appearance. Contacts are parallel with laminations.
			60.20	60.32	0.12										VN	20											2.3cm quartz vein oriented at 20° to core axis containing moderate pyrrhotite.
61.43	218.68	157.25				ARG	DK GY-BK	fg					chl	w	LA	30-50											"Argillite" (ARG) - Dark grey to black, fine grained argillite. Contact with the siliceous metasiltstone is gradational and is intercallated for a short section (~20cm). Contact is parallel with laminations. Much of the unit is sheared (30-50%), becoming less sheared down section. In sections that are not sheared, laminations are often visible between 30 and 50° to core axis. Unit contains moderate graphite and weak chlorite alteration is seen particularly along joints and fractures..
															VT	50-75		~12	f	t		Cp	t				Quartz veinlets with minor calcite occur at a moderate density. These often contain fair pyrrhotite trace chalcopyrite and trace sphalerite, all fine grained.
															BL				m								Moderate blebby pyrrhotite is found throughout the interval. Blebs range in size from mm to cm in scale.
			69.59	69.64	0.05										VN	50			w	t							1cm quartz vein with weak pyrrhotite and trace sphalerite.
			75.39	75.42	0.03										VT	60			w	t							0.7cm quartz veinlet with weak pyrrhotite and trace sphalerite, fine grained.
			76.76	76.79	0.03										VT	75											0.9cm quartz veinlet containing weal pyrrhotite
			83.64	84.00	0.36										SHR	31											Shear zone oriented at 31° to core axis containing abundant calcite veins.
			88.00	88.29	0.29								cly	s													Strongly clay altered sub-section; contacts are at 30° to core axis.
			92.73	92.76	0.03										VN	58			w	t							1cm quartz vein with weak pyrrhotite and trace sphalerite.
			96.09	96.14	0.05										VT	48			f								0.4cm quartz veinlet with fair fine grained pyrrhotite.

COMMENTS

Moderately chlorite altered metasilstones with trace to weak pyrrhotite, arsenopyrite, sphalerite, chalcopyrite, pyrite. From m 200.25 to EOH the drillhole intersected argillite with fair pyrrhotite , trace chalcopyrite and arsenopyrite. Mineralization is mostly fracture controled.

COMMENTS

The hole comprises chloritized and clay altered fine and medium grained metasediments with fracture controlled mineralization. Sulphides shows better grades in coarser intervals.

0.00	5.18	5.18				CAS																					"casing" (CAS) - no recovery
5.18	10.56	5.38				SLT	LT GY	fg				w	chl	w													"meta siltstone" (SLT) - light grey, fine grained, weakly siliceous, oxidized and chlorite altered meta siltstone. Oxidation evident from orange limonite staining on joints and fractures.
			7.64	8.57	0.93										VN	7			i	s	ms-s	Cp	t				9.2 cm calcite vein oriented 7° to core axis; contains intense pyrrhotite, strong sphalerite, moderately strong to strong sphalerite and trace chalcopyrite
			9.36	9.61	0.25										Fx	31			s	ms	ms-s	Py	t-w	Cp	t		~5.7 cm calcite fracture controlled mineralization oriented 31° to core axis; contains strong pyrrhotite, moderately strong to strong galena, moderately strong sphalerite, trace to weak pyrite and trace chalcopyrite
10.56	287.05	276.49				SLT	LT-MD GY	fg					chl	w-f	LA	20-45											"meta siltstone" (SLT) - light to medium grey, fine grained, laminated and weak to moderately chlorite altered meta siltstone. Laminations are tan/ black with intermittent green and are oriented 20° to 45° to core axis; majority of angles are very shallow to core axis. Hairline fractures containing fair pyrrhotite are prevalent throughout interval.
													cly	w-f													weak to fair clay alteration is locally present throughout interval
															VT	20-40			t-f	t-w	t	Py	t				calcite veinlets occur at a moderate density oriented 20° to 40° to core axis; they generally contain trace to fair pyrrhotite, trace to weak sphalerite and trace galena and pyrite.
															VN	15-40			w-f	t-w		Cp	t	Py	t		calcite veins occur at a low density oriented 15° to 40° to core axis; they contain weak to fair pyrrhotite, trace to weak sphalerite and trace chalcopyrite and pyrite.
																											medium grey coloured spots occur at a low density with no general orientation (0.5 - 2.0 cm)
															BD												calcite banding is highly convoluted (~70%) with undeformed veins/veinlets throughout
			10.83	11.03	0.20										VN	23			w	t-w	t	Py	t				1.9 cm calcite vein oriented 23° to core axis; contains weak pyrrhotite, trace to weak sphalerite and trace galena and chalcopyrite (Gn>Py).
			13.55	13.70	0.15										VT	18			w			Py	w-f				0.5 cm calcite veinlet oriented 18° to core axis; contains weak pyrrhotite and weak to fair pyrite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

287.05	338.38	51.33				SLT/	TN/BN	fg					chl	w-m	LA												intercalated phyllite and meta siltstone; widths of bands from 2.0 to 20 cm and contacts are parallel with laminations (oriented 20° to 40° to core axis). Meta silt stone is highly laminated with tan and brown bands. Local weak to moderate chlorite alteration is prevalent throughout interval. shallow angled calcite fracture fills contain weak to fair pyrrhotite, trace to weak sphalerite and trace chalcopyrite..

338.38	416.73	78.35				SLT	TN/BG/MDGY	f-mg					chl	w	LA	10-30			w-f			Py	w				Intercalated tan, beige and medium grey, fine to medium grained, weakly chlorite altered sheared and laminated siltstone. Laminations are oriented 10° to 30° to core axis and are offset by microfaults and fractures. Weakly mineralized fracture fills can be seen at a high density in laminated zones and contain weak to fair pyrrhotite and weak pyrite. Sheared subsections are moderately clay altered and show the same mineralization in irregular and convoluted quartz patches and hairline calcite infills. Intercalated band widths range from 20 cm to 1.5 metres with undefined contacts.
			342.40	342.42	0.02														s								pyrrhotite bleb with jigsaw texture (3.0 cm in width).

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
	2.26	2.26		Casing
2.26	175.50	173.24	VCL	Flow banded volcaniclastic rocks. Calcareous amygdules are present throughout the interval. Minor mineralization consist of trace galena, sphalerite , pyrrhotite, pyrite, chalcopyrite and occurs in a few veins. Trace oxidation is common. Strong oxidized intervals are small,30-50 cm and occurs in the first 30 m.
175.50	200.25	24.75	VCL	Fine grained, green tuff comprises disseminated trace galena sphalerite, pyrrhotite, pyrite ,chalcopyrite .

COMMENTS

The hole crosses volcaniclastic deposits with minor mineralization wich consist of trace pyrite, pyrrhotite and lesser galena ,sphalerite, chalcopyrite.

2.26	175.50	173.24				VCL	GN OL BN BF	FL AM	f			t-s	mno		FL	80-90			t	t	t	Py	t	Cp	t		Flow banded volcaniclastic rocks, olive green with maroon, brown, buff intervals. Calcareous amygdule , 2-12mm, are present throughout the interval. Locally amygdules are squeezed and oriented subparalel with the flow banding. Amygdule have a concentric structure with marginal calcareous - quartzose composition and a central sulphide pit ,mostly pyrite, everything enveloped in a reddish aureole: oxidized products. Up to 35 cm , rock fragments (marble, breccia, siliceous rocks) are incorporated in volcaniclastic matrix. The contact between matrix and fragments is underline by red-black weathering border (manganese oxide, limonite, hematite) .Minor sulphide mineralization is present and consist of trace: pyrite, galena, sphalerite , tetrahedrite, chalcopyrite.. Pyrite occurs in amygdule, or fine disseminated in tuffaceous green volcaniclastic and in calcareous and quartzose fragments. Galena and sphalerite occurs as fine grained aggregate in a few veins. Tetrahedrite has two minor apparition in calcareous vuggy veinlets. Blebby chalcopyrite occurs in two small veins with galena and sphalerite. Oxidation is common ,trace to strong in small intervals. Iron - carbonate and argillic alteration is rarely present in the second half of the interval.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
	2.92	2.92		Casing
2.92	34.50	31.58	VCL	Flowbanded volcaniclastic deposits with intense oxidized sections. Mineralization is present in oxidation intervals and consist of trace to locally medium-strong galena.
34.50	209.39	174.89	VCL	Flowbanded volcaniclastic deposits, intercalated with tuffaceous greenish amygdaloidal volcaniclastic.Trace sulphides ,sphalerite, chalcopyrite, pyrrhotite, pyrite, galena, present throughout the interval.

COMMENTS

The hole mainly comprises volcaniclastic flowbanded deposits. Minor mineralization occurs in strong oxidized sections in the first 60 m. Trace sulphides present throughout the hole.

0.00	2.96	2.96																									Casing
2.96	5.18	2.22				VCL	BN BF	FL				f	cly	w													Brown, buff, fairly oxidized, weakly clay altered flowbanded volcaniclastic.
			3.82	3.92	0.10			EA				i	cly	s	Fx												Fracture with conspicuous lower and upper contact due to alteration, comprises intensely oxidized ,strongly clay altered ,volcaniclastic with earthy texture. Hematite, limonite and manganese oxide is pervasively present .
5.18	125.85	120.67				VCL TUF	GN BN BF	FL				w/s	cly	t/m	FL	80 90								Py	t		Fine grained, green, brown, buff, tuffaceous volcaniclastic. Flow banding dip 80-90 TCA throughout the interval. Volcaniclastic is mostly greenish tuffaceous, with up to 1m ,thick, creamy, maroon, buff, brown intercalation with intense flow banding. Flow bands are hairline to 10mm thick most of the interval and occasionally up to 6 cm, and occurs with different shades of yellow, cream, brown, green. Oxidation is mostly trace to weak, but in small15-30 cm sections , occurs strong oxidized volcaniclastic with hematite, limonite and manganese oxide. This small intercalation shows earthy texture. Volcaniclastic includes calcareous and quartzose lenses, up to 40 cm thick. In one calcareous lens k-feldspar is present as a coarse grained white aggregate with crystals up to 1cm. No mineralization is present in the hole with the exception of few grains disseminated pyrite in the bottom section. Hairline to 2mm ,calcite, quartz infill fractures dip at 70 TCA.
													mno	t	Fx	70		14									
			6.31	6.85	0.54																						Calcareous lens comprises K-Feldspar coarse grained ,massive aggregate, with 1cm euhedral crystals. Calcite , 1 cm euhedral crystals are adjacent to K-Feldspar.
			12.00	12.30	0.30	VCL	RD	EA				I															Intensely oxidized volcaniclastic, reddish, with limonite and lesser hematite. Earthy texture.
			12.80	17.00	0.20														FL	80-90							Slightly waved flowbanding dip at 80-90 TCA.
			39.00	39.25	0.25	VCL	RD	EA				i															Intensely oxidized volcaniclastic, reddish, with limonite and lesser hematite. Earthy texture.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

COMMENTS

This hole mainly comprises light grey granite with 2 interva (61.56-87.47, 110.33-130.24) bearing pyrite , sphalerite and galena in stock work type mineralization. Smoked quartz veins are common throughout the hole bearing trace to weak galena ,sphalerite, arsenopyrite and moderate pyrite. Megacrysts of feldspar are common. Proportions of muscovite and biotite vary widely. Granite is oxidized mostly in mineralized intervals. Intense argillic alteration is common throughout the hole.

0.00	13.71	13.71																									casing
13.71	61.56	47.85				GRN	WH LT GY	MG CG					arg	t/i	FO	45-60				t/w	t/w	Py	w				Whitish, grey granite with biotite and muscovite . The granite is mainly medium grained, but we also notice small 20 cm intervals with coarse grained texture. In a few intervals (<30 cm), lath minerals show an orientation, that creates a foliation at 45/60 TCA. Mineralization occurs in quartz veins and veinlets: weak to strong pyrite, trace to weak sphalerite and galena. Argillic alteration is trace to intense, and in some intervals causes high friability of granite. Feldspars are partially or totally washed out, and the core is just a quartz-mica medium grained sand.

			67.32	67.93	0.61		BK	VU	i						VN	70				s	s	Py	i				Massive sulphide vein with euhedral crystals in the vugs include 1-8mm quartz and pyrite, 1mm galena and blebby sphalerite. Sulphides occur also as a black powder in the siliceous matrix, forming a vuggy crackled groundmass. Limonite is staining the rock.
			67.93	69.50	1.57	GRN	LT GY RD	MG				m	arg	t	FO	60				t	t	Py	t	As	t		Oxidized, medium grained, reddish, light grey granite. Mineralization includes pyrite, sphalerite, galena, and arsenopyrite. Arsenopyrite occurs in quartz veins (1-3cm) and veinlets at 60 tca. Two quartz-sulphide veinlets at 30 tca crosscut the first ones. Arsenopyrite occurs as a granular mass in a 3cm thick vein (m 69.30).
															VN	60		3									
															VT	60		2									
															VT	30		2									
			76.50	77.21	0.71										VN	5				m	m	Py	s				Quartz -sulphide vein (1-4cm) at low TCA.
			81.23	81.77	0.54										VN	20				m	m	Py	s				Quartz- sulphide vein(3-5 cm).
			85.95	86.45	0.50										VN	15				m	m	Py	m				Drusy (1-3cm) quartz -sulphide vein, with euhedral 1-3mm crystals: quartz, galena, pyrite.
87.47	98.45	10.98				GRN	LT GY RD					f	ava									Py	t				The light grey with reddish patches, granite, has undergone intense argillic alteration. Consequently the feldspar is washed out entirely and the rock is extremely friable. In some intervals(<1.5m) the core appears as a medium coarse sand with quartz and mica clasts.
			97.64	98.45	0.81		BK RD	VU	i			i			VN					w	w	Py	w				Vuggy quartz vein with sphalerite, galena, pyrite and intense limonite.
98.45	110.33	11.88				GRN	LT GY RD	MG				f	arg	f	VT	60 70				t	t	Py	t				Light grey with reddish patches granite. K-feldspar forms megacrysts ,(< 3cm), and are partially altered. Trace amounts of sulphides present in quartz veinlets at 60-70 TCA.
110.33	130.24	19.91				GRN	MD GY DK GY	MG VU PL	i			t			VT	20 70		15		w	w	Py	ms				Medium grey granite with intense veining at random tca, creating a stock work mineralization type. The veins and veinlets are filled with a black siliceous vuggy groundmass in which we notice euhedral crystals (<2mm) :quartz, pyrite, galena. Few veins carry massive sulphides : pyrite, sphalerite, galena. Trace limonite is present throughout the interval ,staining the rock.
															VN	30 70		5

			110.33	115.18	4.85	GRN	MD GY	MG							VN	70		1		w	w	Py	f				Medium grey granite with megacrysts (1-3cm) rectangular feldspar in a medium coarse groundmass. Mineralization includes pyrite, sphalerite, and galena, and occurs massively in 2-3 cm quartz veins and in veinlets.
															VT	45 60											
			112.16	112.20	0.04										VN	80				s	s	Py	i				2-4cm quartz vein with massive sphalerite, galena, pyrite.
			112.56	112.60	0.04										VN	60				s	s	Py	i				2-4cm quartz vein with massive sphalerite, galena, pyrite.
			115.41	115.45	0.04										VN	70											2-3 cm quartz vein with massive sphalerite, galena, pyrite.
			119.68	119.88	0.20	GRN	MD GY	DR MG							Fx	20						Py	t				Drusy fracture (2cm wide ,20cm long) with 2-6mm quartz crystals and fine disseminated pyrite occurs at low 20 TCA.
130.24	226.00	95.76				GRN	LT MD GY	MG CG				t	arg	t/i	VN	5 60				t	t	Py	w	As	t		Light to medium grey granite with reddish patches in small oxidized intervals. The texture is mostly medium grained, but we notice a few (<1m) coarse grained intervals. Feldspar megacryst are common in small intervals. The mineralization is comprised of weak pyrite and trace sphalerite, galena and arsenopyrite, and occurs in quartz veins and veinlets. The argillic alteration is intense in some intervals (< 1.5m), where the feldspar are washed out and the granite crumbles in a yellowish quartz - mica medium coarse sand .
															VT	20 70											
			144.95	145.10	0.15										VN	35				m	m	Py	s				15 cm thick quartz vein with blebby and disseminated pyrite, sphalerite and galena.
			147.51	147.56	0.05								ava		VN	40				w	w	Py	s				Quartz vein with sphalerite, galena and pyrite. Granite is intense altered around the vein. Feldspars are turned in clay minerals.
			147.60	154.00	6.40	GRN	WH MD GY	MG					arg	m	VN	40		1		w	w	Py	m				Granite with 1-3cm , megacrysts feldspar. Argillic alteration of feldspar occurs in the first half of the interval. Mineralization occurs in two quartz veins at 40 TCA : moderate pyrite, weak sphalerite and galena.
			154.15	158.35	4.20	GRN	LT GY	SA				w	ava		Fx							Py	t				Large fracture with advance argillic alteration. Feldspar is 90% washed out and the rock lost cohesion, being reduced to a quartz mica sand. Trace pyrite occurs.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			160.62	160.77	0.15			VU							VN	40				m	m	Py	s	As	s		5cm thick quartz vein at 40 TCA with massive arsenopyrite and pyrite , moderate sphalerite and galena. Pyrite occurs as micro granular mass or cubic crystal aggregate. In 4-5 mm vugs euhedral sulphide crystals are present.
			161.00	161.53	0.53			VU							VN	10				m	m	Py	s	As	m		2-3 cm thick, vuggy quartz vein with massive pyrite and moderate sphalerite, galena and arsenopyrite. 1-4 mm euhedral crystals are present in vugs: quartz, pyrite, galena and arsenopyrite .
			169.43	175.89	6.46	GRN	LT MD GY YW	MG SA				w	ava	f	Fx					t	t	Py	t	As	t		Light to medium grey with yellowish patches, medium grained granite. In 20-80 cm intervals with advance argillic alteration feldspars are washed out, the granite shows extreme friability, collapsing under hand pressure to sand. Mineralization consist of trace sulphides :pyrite, sphalerite, galena, arsenopyrite.
			177.39	184.89	7.50	GRN	LT GY YW	MG SA					arg	f	VN	15		1		w	w	Py	w	As	t		2-8 cm thick quartz -sulphides veins occurs at low tca. Veinlets are subparalel or cross cut at 15-60 TCA. Mineralization consist of weak pyrite, sphalerite , galena and trace arsenopyrite.
															VT	15-60		4									
			185.00	218.50	33.50	GRN	LT GY YW	MG SA				w	ava		VT	15 50		2		w	w	Py	t	As	t		Competent, medium strong granite have < 1.5 m intervals of advance argillic altered yellowish granite that crumbles to sand. Mineralization occurs in 2-8mm thick quartz veinlets at 15-50 TCA. and consist of weak galena and sphalerite, and trace pyrite and arsenopyrite.
			220.86	222.61	1.75	GRN	LT GY YW	MG				w	arg	w	VN	50		2		m	m	Py	s	As	t		Weakly oxidised yellowish granite. Mineralization occurs in 5 (4-8 cm) veins at 50 TCA and consist of strong pyrite, medium sphalerite and galena ,and trace arsenopyrite. Sulphides occurs semi massive. Feldspar is weakly argillic altered.
226.00	274.93	48.93				GRN	MD GY	MG				t	ava		VN	50				t	t	Py	t	As	t		Medium grey, medium grained granite .Proportions of muscovite and biotite vary widely with depth : biotite increases ,the rock darkens in color. Mineralization occurs as semi massive sulphides in 2 (1-3cm)veins and consist of sphalerite, pyrite, galena, arsenopyrite. Only trace limonite is present. Advance argillic alteration washed out the feldspar and transforms the rock in a yellowish quartz -mica sand in up to 1.5 m intercalations.

COMMENTS

This hole intersected granite with 2 intervals (21.94-52.54, 57.35-86.00) bearing pyrite , sphalerite, galena in stock work type mineralization. Smoked quartz veins are common throughout the hole, bearing trace to weak galena ,sphalerite, arsenopyrite and moderate pyrite. Proportions of muscovite and biotite vary widely. Granite is oxidized mostly in mineralized intervals. Intense argillic alteration is common throughout the hole.

0.00	13.71	13.71																									Casing
13.71	21.94	8.23				GRN	WH LT GY	MG				f	arg	f	VT	15 45		5				Py	w				Whitish, light grey granite, fair oxidized on joints plans. Argillic alteration affects the first half of the interval, where feldspars are washed out and granite shows high friability. Low veining is present at 15-45 TCA. Weak pyrite is disseminated in the quartz veins.
			17.37	17.77	0.40										VN	10						Py	t				2 cm quartz vein with disseminated pyrite. A black dusty siliceous crust cover(2mm) the fracture plans.
			17.80	20.42											VT	45		6				Py	t				Smoked quartz filled veinlets .
			21.34	21.74											VN	15						Py	t				1.5 cm quartz vein with disseminated pyrite. A black dusty siliceous crust cover(2mm) the fracture plans.
21.94	52.54	30.60				GRN STW	RD LT GY	CR VU BX	i			s	arg	w	VN	15-70				f	f	Py	m				Granite medium grained, strong oxidized, reddish with grey patches. Vugs are common (3mm-17mm) and comprises euhedral pyrite, quartz, galena. Crackled texture present in the first 4m of the interval. Hydrothermal breccia occurs in (6-14cm) fractures in the first 4 m of the interval. Quartz filled veins at 15-80 TCA forms a stockwork type mineralization, and comprises moderate pyrite, fair sphalerite and galena. Sulphides occurs as euhedral crystals in frequent vugs, or as blebs disseminated in the smoked quartz matrix. Strong oxidation is present throughout the interval, limonite is present mostly on the fractures plans .
															VT	15-80											
			25.85	26.00	0.05							m			VN	40				s	s	Py	i				5 cm thick quartz vuggy vein with massive sulphides :strong sphalerite, galena, intense pyrite.
			27.95	28.30	0.35							m			VN	15						Py	t				2 cm thick vein with trace pyrite disseminated.
			32.04	32.55	0.51		BK	VU				s			VN	30				m	m	Py	s				Black ,vuggy, quartz vein, 20 cm thick, enveloped in strong oxidized reddish granite. Quartz is coloured by a fine black powder (sulphides) .
			32.55	34.65	0.10	GRN	BK RD	CR	i			s			VN	30				m	m	Py	s				Black, reddish, strong oxidized, crackled granite. Mineralization occurs as a black powder in quartz. Pyrite occurs as euhedral crystals(1-2mm), or as micro granular aggregates in blebs

86.00	172.00	86.00				GRN	LT GY	MG				t	arg	w	FO	45			t	t	t	Py w				,	Light grey , medium grained granite with low veining system bearing trace to weak sulphides. Black quartz veinlets occurs at 30-45 TCA. ,sub parallel or cross cut. Pyrite is the dominant sulphide in the interval and occurs as light brown, compact, fine grained aggregate with uneven fracture or as cubic crystals fine disseminated in rock matrix. Sphalerite occurs as 1-2 mm blebs in quartz. Galena occurs as blebs in quartz or euhedral crystals in vugs. Advance argillic alteration is present in 10-70 cm intercalation where the feldspar is washed out and granite transforms in a mica quartz sand. Trace limonite is present sporadic.

COMMENTS

This hole mainly comprises light to medium grey granite with muscovite and biotite. Granite is oxidized mostly in the first 17m. Intense argillic alteration is common . Only occasional trace mineralization is present.

APPENDIX V

REPORT ON KEG BELT MINERALOGY FROM THIN SECTIONS

REPORT ON KEG BELT MINERALOGY FROM THIN SECTIONS
By Rosie Cobbett
January 2011

The fine-grained nature of the rocks within the Keg belt has made mineral identification in hand samples, both within and around the alteration zone, difficult. A suite of 94 samples were collected from the Keg Main, Drex, Owl, Osprey and Rebel areas for petrographic analyses in an attempt to further understand the nature of the host rocks and the alteration events. The following descriptions are based on observations made using a microscope with both reflected light and refractive light capabilities. All minerals are identified using solely optical properties. The fact that many minerals display very similar optical properties and that no quantitative analyses were carried out on any of the samples there is the possibility that some minerals have been falsely identified.

Samples were collected from outcrops near the Owl, Drex, Osprey, Rebel and Keg Main areas and from drill core from the Keg Main area. Detailed petrographic analyses of these samples outline some key features of both altered and un-altered rocks within the Keg belt.

Keg Main Area

Three main lithologies were recognized in thin section at the Keg Main area. A chert that grades into a very fine-grained quartz dominated siltstone (CPMC2 and MT), a mildly siliceous mudstone (MT) and a calcareous siltstone made up of sub-angular quartz clasts cemented with calcite (MT).

Most samples show an alteration assemblage comprising sericite +/- carbonate +/- silica that alters siliceous and calcareous sedimentary rocks in varying degrees depending on host rock composition and proximity to structures.

Locally, a hydrothermal alteration assemblage overprints the sericite +/- carbonate +/- and silica assemblage and can completely obliterate earlier rock textures. This alteration pattern is visible in hand sample and drill core as widespread bleaching and locally as vein fill, fracture fill and skarnification. In thin section, this assemblage comprises varying amounts of diaspore-andalusite-quartz-calcite-chloritoid-cordierite-staurolite-pyrophyllite-dumoriterite-clays and rarely corundum and includes pyrite, sphalerite, chalcopyrite and galena.

The most dominant hydrothermal alteration mineral is diaspore. In many samples diapore occurs abundantly in veins, selvages and disseminations and in come cases occurs with pyrophyllite. Pyrophyllite is often very fine-grained and is difficult to positively identify. In this study pyrophyllite was grouped with other clays and micas as a general term 'sericite' and may occur in much greater abundance than noted specifically in the thin section descriptions. Passive silicification obliterates

primary rock textures in some the samples from the Keg drill core and appears to be linked in time to the diaspore +/- pyrophyllite. Pyrite-sphalerite-chalcopyrite-calcite +/- staurolite +/- andalusite +/- corundum veins can have diaspore selvages. Andalusite veins clearly cross cut the multi-mineral veins.

Chloritoid occur as disseminated crystals in both moderately and highly altered sections and in one occurrence overgrows a quartz-pyrite +/- tourmaline vein (11RC503).

What appears to a late stage alteration event (possibly skarnification) comprising bladed calcite crystals with pyrite and chalcopyrite rarely occurs at clots or small lenses in drill core samples from Keg Main.

Owl area

A pervasive clay/sericite alteration affects all samples that were examined in thin section. In several samples, very fine-grained mica-like grains align to define a well-developed, dominant foliation. Early pyrite growth occurs in elongate aggregates parallel to the foliation. Locally, a pressure solution fabric defined by laminations of dark, insoluble minerals overprints the dominant foliation. The dominant foliation and clay alteration is overprinted by pyrite-quartz veinlets. More notably, diaspore-sulphide (pyrite +/- arsenopyrite) veins with significant chloritoid vein selvages overprint the fabric and clay alteration. In one case a diaspore-sulphide vein appeared to be the leading edge of what looked like passive silica alteration.

On the Owl property, the hydrothermal alteration described above may be localized in a chert or very fine-grained quartz dominated siltstone (CPMC2). This unit when fresh is described as a very fine-grained, reddish brown chert. In outcrop, near veins the chert alters to light green indicating the presence of what is likely chloritoid based on the findings of this study.

Drex area

A pervasive clay/sericite alteration overprints primary chert or fine-grained quartz-rich siltstone. In all samples very fine-grained mica-like grains align to define a dominant foliation. Carbonate-cordierite/andalusite and pyrite-diaspore-cordierite (?) veins cut the clay-altered chert. A very local zone of brittle deformation overprints the hydrothermal veins described above. This zone is best described as very fine-grained, banded, clay rich material between well-rounded clasts of chert. Overprinting the brittle strain zone is a vein comprising dumorierite (?)-andalusite-cordierite with a selvage dominated by chloritoid crystals with minor diaspore. One sample, near the RGS showing shows a multi-mineral vein comprising coarse, blocky crystals of diospore-arsenopyrite-pyrite-chalcedony-calcite-andalusite with a silica selvage cutting a very fine-grained rock dominated by carbonate and diaspore.

Rebel area

An early ductile deformation shown by mica growth or re-crystallization is well developed in most samples. The ductile foliation is overprinted by a pressure solution fabric that crenulates early fabrics and in some cases completely overprints them. Late carbonate (dominantly ankerite), chlorite and sericite alters the rocks significantly. Secondary carbonate occurs dominantly as veins in contrast to chlorite and sericite that pervasively alter the host rocks especially in close proximity to carbonate veins.

KEG BELT PETROGRAPHIC STUDY 2011
Take Home Points

- Three dominant host rock lithologies were recognized in thin section; 1) Chert and quartz dominated siltstone (CPMC2 and MT (at Keg Main)), 2) Mudstone with varying amounts of very fine-grained quartz grains (MT), 3) Calcareous siltstone (MT).

- Quartz-sericite-carbonate alteration affects most samples to some degree. There are a few quartz sandstones that are almost completely unaltered. This alteration occurs at all sampled locations.

- In all areas, except the single sample at the Osprey and the samples from the Rebel area, diaspore-pyrite +/- quartz+/- pyrophyllite +/- chalcopyrite overprint the quartz-sericite-carbonate alteration. This mineral assemblage occurs in vein and fracture fill, as selvages and as pervasive alteration. The bleached zones in all areas appears to alter chert and siliceous siltstones of CPMC2 and siliceous siltstone, mudstone and calcareous siltstone of MT.

  - At the Owl this zone occurs in the footwall of the mapped thrust fault.
  - At the Drex zone this occurs near the RGS showing located at sample 11RC414-1.
  -At the Keg Main zone this occurs in samples from outcrop from within the mapped bleached zone (11RC319-1,2,3) and in numerous samples from each of the sampled drill holes.

- More complex alteration mineral assemblages occur in one sample from the Drex (11RC414) and various samples from the Keg drill core. Minerals include abundant andalusite, diaspore, calcite and pyrite with varying amounts of staurolite, cordierite, chalcedony, corundum and tourmaline, sphalerite, galena and chalcopyrite.

- Chloritoid occurs as selvage to quartz-pyrite-andalusite veins and diaspore-pyrite +/- arsenopyrite veins and as a disseminated alteration mineral in many samples that occur distally to the Keg Main alteration zone (ie. In drill hole Keg11-14 in the Keg east area, near the Drex and Owl showings). The chloritoid minerals always grow over ductile foliations and in one case grow over a quartz-pyrite-tourmaline (?) vein (11RC503).

HOW TO USE THIS DOCUMENT

COLOR CODES: Each sample can be located on either the geology maps or the drill hole sections at the back of the document.

- Grey sample tags indicate an alteration assemblage comprises some amount of sericite or clay, carbonate (generally calcite) and quartz.
- Green tags indicate the presence of significant amounts of hydrothermal chloritoid. Note: Green and red composite tags indicate the presence of chloritoid that occurs as vein selvages to quartz-sulphide-andalusite veins.
- Yellow sample tags indicate an alteration assemblage comprises diaspore-pyrite +/- quartz+/- pyrophyllite +/- chalcopyrite.
- Red tags indicate that one or more of the following minerals are present: andalusite, diaspore, calcite and pyrite with varying amounts of staurolite, cordierite, chalcedony, corundum and tourmaline, sphalerite, galena and chalcopyrite.
- Blue tags indicate the presence of bladed calcite with pyrite and chalcopyrite that may represent a late skarning event.

For details about the mineralogy, including primary and secondary mineral textures and structure, for a particular sample please refer the sample spreadsheet for that sample number. These sheets are grouped by area and are listed in numerical order.

Thin section photographs were taken to outline key features of some samples. Photo and magnification are noted in the text on the sample spreadsheets and corresponding photos can be located on the accompanying CD under the sample name.

Zone	Sample ID	Description
Owl	11RC345	Grey, limestone with light grey, silicious horizons and minor
Owl	11RC347	Light grey, fine-grained, very silicified, laminated rock with
Owl	11RC347-1	Pinkish-grey silicified rock.
Owl	11RC339	Grey, very fine-grained silicious rock with dark grey laminations
Owl	11C356B	Light grey-green silicified rock with stingers and disseminated
Owl	11RC356A	Maroon chert.
Owl	11RC452B	
Keg	11RC325	Maroon chert.
Keg	11RC327	Medium grey, fine-grained silica altered rock with pyrite,
Keg	11RC316	Silty limestone interbedded with siltstone.
Keg	11RC317-1	Reddish brown chert.
Keg	11RC319-1	Reddish-grey cherty rocks with disseminated dark grey mineral.
Keg	11RC319-2	Grey, fine-grained silica altered rock.
Keg	11RC319-3	Light grey to white, silica altered rock.
Drex	11RC448	Grey silicified rock with veinlets of sulphide.
Drex	11RC407	Grey to pinkish-grey, laminated cherty rock with disseminated
Drex	11RC414	Light grey, fine-grained, silicified rock with sulphide veinlets
Drex	11RC414-1	Light grey limestone (?) with vein of coarse-grained arseno-pyrite
Drex	11RC449	Maroon cherty rock (A- RADS; B- Thin Section)
Drex	11RC449-1	Light grey chert (A-RADS; B-Thin Section)
Drex	Drex1	Quartz-galena-scoradite vein.
Rebel	11RC428	Volcanic or volcaniclastic rock.
Rebel	11RC433	Vesicular basalt in contact with fine-grained, laminated siltstone
Rebel	11RC434-1	Iron carbonate vein.
Rebel	11RC437	Orange altered, laminated tuffs/sedimentary rock near iron
Rebel	11RC437-2	Iron carbonate vein
Rebel	11RC438	Orange altered, amygdaloidal basalt or basalt breccia.
Rebel	11RC439	Basalt (relatively non-altered)
Rebel	11RC440	Siltstone (re-cemented volcaniclastic?)
Rebel	11RC440-1	Iron carbonate vein
Rebel	11RC442	Quartz-hematite vein.
Rebel	11Rc444	
Rebel	11RC445	Dark green to blacl, fine-medium-grained mafic volcanic or
Ophsprey	I078445	Pink to grey, very silificied rock with pervasive veinlets of

Property_Area	Owl	**Sampler**	Rosie	**UTM_E**	584021	**Drill Hole**	hand sample
Sample ID	11RC339	**Assay ID**		**UTM_N**	6946835	**Depth**	n/a

Minerals	musc?plus qtz?	sulphide	quartz				
Textures_Primary	very fine-grained (could be secondary)						
Textures_Secondary		pyrite disseminated throughout sample	late stage veins, post deformation				

Structure	One dominant foliation overprinted by a subtle secondary fabric. Dominant foliation is most noticeable with gypsum plate in and most notably defined by elongate sulphide minerals.
Comments	Rock does not look like it is made up of quartz in this section but it is really hard. Possibly a small amount of fine-grained sericite change the thin section pattern?

Property_Area	Owl	**Sampler**	Rosie	**UTM_E**	584462	**Drill Hole**	hand sample
Sample ID	11RC345	**Assay ID**		**UTM_N**	6947235	**Depth**	n/a

Minerals	calcite	quartz	sulphides	quartz-sulphide			
Textures_Primary	half of section is fine-grained limestone						
Textures_Secondary	late calcite-sulphide veins	half of section is altered (?) to quartz and sericite(?)	early, elongate sphalerite (?) crystals define fabric; disseminated	late veins and clots of pyrite			

Structure	Fabric developed in the altered section (quartz-sericite) defined mostly by elongate sulphide grains (photo with gypsum plate 5X)
Comments	Boundary between limestone and altered section is abrupt and antimosing, calcite veins that cut the limestone do not cross the boundary into the altered rock (5x photo).

Property_Area	Owl	**Sampler**	Rosie	**UTM_E**	583959	**Drill Hole**	hand sample
Sample ID	11RC347	**Assay ID**		**UTM_N**	6947431	**Depth**	n/a

Minerals	quartz	sericite/clay	sulphide	chloritoid			
Textures_Primary	elongate grains						
Textures_Secondary		possibly altering indistinguishable feldpar clasts and may be responsible for alteration of dark layers	disseminated grains often with elongate shapes that are parallel to foliation	minor bow tie crystals disseminated throughout rock			

Structure	Well developed foliation defined by elongate quartz crystals and (photo 10X with gypsum plate).
Comments	Between elongate quartz grains either stretched chert clasts or sericite altered feldpar grains. Darker, foliaion parallel layers have dark brown to black mineral.

Property_Area	Owl	**Sampler**	Rosie	**UTM_E**	583959	**Drill Hole**	hand sample
Sample ID	11RC347_1	**Assay ID**		**UTM_N**	6947431	**Depth**	n/a

Minerals	quartz	felspar	sericite	epidote	sulphide	chloritoid	
Textures_Primary	small sub-rounded clasts between feldspar crystals	euhedral, twinned felspar grains larger than any other mineral (up to					
Textures_Secondary	some silicic alteration near sulphides		feldspars altered completely or in part to sericite	alteration of rare mafic minerals (probably amphibole)	disseminated aresenopyrite and sphaleraite associated with secondary silica	minor bow tie crystals	

Structure	
Comments	it is really interesting that there are large, euhedral feldpars, could be a porphyritic, igneous rock!

Property_Area	Owl	**Sampler**	Rosie	**UTM_E**	583240	**Drill Hole**	hand sample
Sample ID	11RC356A	**Assay ID**		**UTM_N**	6947590	**Depth**	n/a

Minerals	chloritoid	sulphide	quartz	sericite/clay			
Textures_Primary							
Textures_Secondary	bow tie shaped minerals occur in minor amounts	disseminated, elongate grains of arsenopyrite and pyrite	veins (folded) rare grains associated with sulphide minerals	dominates rock, brown in PPL, too fine-grained to see texture in it			

Structure	Foliation defined by elongate sulphide grains.
Comments	Chloritoid 'bow ties' grow over foliation and seem to increase in abundance with increasing sulphide.

Property_Area	Owl	**Sampler**	Rosie	**UTM_E**	583240	**Drill Hole**	hand sample
Sample ID	11RC356B	**Assay ID**		**UTM_N**	6947590	**Depth**	n/a

Minerals	chloritoid	sulphide	diaspore				
Textures_Primary							
Textures_Secondary	bow tie shaped minerals make up 50% of rock	arsenopyrite - diospore veins associated with fluid front	in veins				

Structure	Two phases of diospore-sulphide veins, noticeable fluid front associated with later phase.
Comments	In outcrop a reddish brown cherty textured rock was altered to a light grey green (this sample, green color probably chloritoid alteration) near veins.

Property_Area	Osprey	**Sampler**	Rosie	**UTM_E**	576982	**Drill Hole**	hand sample
Sample ID	I078445	**Assay ID**	I078445	**UTM_N**	6949737	**Depth**	n/a

Minerals	chloritoid	pyrophyllite (?)	quartz	clay?			
Textures_Primary			very fine-grained and occurs with brown mineral in most of the rock, makes the rock hard	may account for brown color in host rock			
Textures_Secondary	occurrs with sulphides in patchy alteration of host rock	occurs with sulphides in patchy alteration		yellow aggregates in veins and clots			

Structure	In host rock at low power most parts of thin section show well developed fabric that is probably a foliation (photo 10x).
Comments	Host rock is possibly made up of very fine-grained quartz and sericite (pyrophyllite) photo 10x and /or some yellowish-brown very fine-grained mineral. photo 10x

Property_Area	Rebel	**Sampler**	Rosie	**UTM_E**	593898	**Drill Hole**	hand sample
Sample ID	11RC433	**Assay ID**		**UTM_N**	6924196	**Depth (m)**	

Minerals	quartz	chlorite	feldpar	mica	sericite		
Textures_Primary			bulk of rock, altered to clay/sericite				
Textures_Secondary	mainly in pophoclasts/porphoblasts	pervasive alteration, probably replacing mafics		rarely with quartz in porphoclasts	alters felspars		

Structure	Foliation defined by insoluable material in bands that are warped around porphoclasts of mainly feldpar. Some porphoclasts are quarz that show no sign of strain therefore I think the quartz is late alterarion feature.
Comments	Altered feldspar make up host rock.

Property_Area	Rebel	**Sampler**	Rosie	**UTM_E**	594220	**Drill Hole**	hand sample
Sample ID	11RC434-1	**Assay ID**		**UTM_N**	6923957	**Depth (m)**	

Minerals	carbonate	quartz	mica				
Textures_Primary	probably ankerite, can see nice rhombs in come cases	fine-grained silica in clots; elongated quartz grains often rim carbonate grains (photo 5x)	rare bande of muscovite are deformed				
Textures_Secondary							

Structure	Fabric only locally developed (or preserved) in parts of sections that have quartz and mica. Elongate quartz crystals between aligned mica flakes define the foliation.
Comments	

Property_Area	Rebel	**Sampler**	Rosie	**UTM_E**	593199	**Drill Hole**	hand sample
Sample ID	11RC437	**Assay ID**		**UTM_N**	6924716	**Depth (m)**	

Minerals	calcite	quartz					
Textures_Primary							
Textures_Secondary	veins	minor quartz within ankerite					

Structure	
Comments	Very fine-grained, foliated rock made up of calcite, carbonate, mica and feldspar (?). Altered by a mineral that is pleochroic from pale yellow to pink, has one good/perfect cleavage, displays 1st oder grey to yellow colors and has moderate relief.

Property_Area	Rebel	**Sampler**	Rosie	**UTM_E**	593199	**Drill Hole**	hand sample
Sample ID	11RC437-2	**Assay ID**		**UTM_N**	6924716	**Depth (m)**	

Minerals	carbonate	quartz					
Textures_Primary							
Textures_Secondary	probably ankerite						

Structure	
Comments	

Property_Area	Rebel	**Sampler**	Rosie	**UTM_E**	593240	**Drill Hole**	hand sample
Sample ID	11RC438	**Assay ID**		**UTM_N**	6924637	**Depth (m)**	

Minerals	calcite	mica	chlorite	feldspar	sericite/clay		
Textures_Primary	filled amygdules	very fine-grained		very fine-grained and makes up host rock with mica			
Textures_Secondary			alteration along the edge of veins and amygdules		pervasive alteration of entire section		

Structure	Long flakes of fine-grained mica align to define early foliation. The early foliation is crenulated such that a second foliation is developed locally and is probably at least in part formed by pressure solution. Dark seams of insoluable material are more abundant at the apex of amygdules due to an increase of pressure there and hence more dissolution of material. Second foliaton deflected around amygdules.
Comments	

Property_Area	Rebel	**Sampler**	Rosie	**UTM_E**	592335	**Drill Hole**	hand sample
Sample ID	11RC444	**Assay ID**		**UTM_N**	6923813	**Depth (m)**	

Minerals	carbonate	quartz	chlorite	sulphide			
Textures_Primary		fine-grained quartz that looks like it could be a					
Textures_Secondary	large crystals of carbonate, calcite or ankerite	secondary quartz is coarser grained and in fills between carbonate	alteration of mafics?				

Structure	Stong fabric in thin band through centre of section overprinted by sulphide minerals. Foliation is defined by stretched 'clasts' of chert and bands of dark insoluable material (photo 10x, 5x)
Comments	

Property_Area	Drex	**Sampler**	Rosie	**UTM_E**	596185	**Drill Hole**	hand sample
Sample ID	11RC407	**Assay ID**	I078436	**UTM_N**	6938583	**Depth**	n/a

Minerals	quartz	chloridtoid	sulphide	diospore	andalusite		
Textures_Primary	chert; small rounded clast-like features- defomed chert or chert clastic?						
Textures_Secondary		alters chert as selvage of a qtz-sulphide-andalsuite(?) vein	disseminated arsenopyrite through deformed part of section, looks like it marks the boundary of a fluid front in one	veins and vein selvages	zoned mineral in veins		

Structure	Very distinct strain gradient from undeformed chert to very fine-grained catcalasite with rounded chert clasts that have been milled during deformation (photo 5x). Arseno-diospore-andalusite?cordiorite? vein cuts the chert, the high strain zone overprints this vein. Cutting through but sub-parallel to the foliation in the strain zone is a vein composed of dumorierite and andalusite (zoned mineral) with a thick selvage made up of chloritoid and minor diospore.
Comments	20x photo of chert and chloritoid selvage; photo 10x chert clasts; half the thin section is chert with minor alteration to chloritoid other half looks like deformed chert (rounded bit of chert look like milled particles in a small shear zone) cut by veins with chlorioid selvages. Strain gradient photo 5x

Property_Area	Drex	**Sampler**	Rosie	**UTM_E**	596185	**Drill Hole**	hand sample
Sample ID	11RC407	**Assay ID**	I078436	**UTM_N**	6938583	**Depth**	n/a

Minerals	quartz	chloritoid	sulphide	diaspore	andalusite		
Textures_Primary	chert; small rounded clast-like features- defomed chert or chert clastic?

Textures_Primary							
Textures_Secondary							

Structure	
Comments	Very fine-grained clastic rock made up of quartz and mica grains and slightly larger clasts of chert.

Property_Area	Drex	**Sampler**	Rosie	**UTM_E**	495422	**Drill Hole**	hand sample
Sample ID	Drex 1	**Assay ID**	I079090	**UTM_N**	6938722	**Depth**	n/a

Minerals	quartz	scorodite (?)	sulphide				
Textures_Primary							
Textures_Secondary	siica flooding between sulphides cut by quartz veins	from hand speciman description: scorodite line sulphide veins that cross cuts early silica veins	aresenopyrite veins				

Structure	
Comments	photo 20x of 'sorodite alteration'

Property_Area	Keg_Main	**Sampler**	Rosie	**UTM_E**	585813	**Drill Hole**	hand sample
Sample ID	11RC316	**Assay ID**		**UTM_N**	6939277	**Depth**	n/a

Minerals	calcite	diaspore	quartz				
Textures_Primary	areas of elongate calcite grains define early fol'n	almost completley replaced by calcite	clasts in minor amounts				
Textures_Secondary	pressure solution seams of insoluable dark minerals						

Structure	Either an early foliation defined by elongate calcite crystals that is overprinted by pressure solution cleavage or calcite was recrystallized parrallel to fold cleavage and what looks like late pressure solution fabric is the earlier fabric.
Comments	Not sure whether diaspore crystals formed at the same time as the calcite alteration or the calcite grew after the diaspore alteration.

Property_Area	Keg_Main	**Sampler**	Rosie	**UTM_E**	585738	**Drill Hole**	hand sample
Sample ID	11RC317-1	**Assay ID**		**UTM_N**	6939718	**Depth**	n/a

Minerals	quartz	sericite					
Textures_Primary	very fine clasts (siltstone protolith)	part of primary clastic texture (?)					
Textures_Secondary	veinlets						

Structure	
Comments	Looks fairly un-altered.

Property_Area	Keg_Main	**Sampler**	Rosie	**UTM_E**	585424	**Drill Hole**	hand sample	
Sample ID	11RC319_1	**Assay ID**		**UTM_N**	6940005	**Depth**	n/a	

Minerals	quartz	pyrophyllite	sericite/clay	diaspore-pyrite-andalusite (?)	Tourmaline	diaspore	dumortierite?	Chloritoid
Textures_Primary								
Textures_Secondary	early veins and possibly late silicic (flooding); selvage to diospore-pyrite veins	may be really fine-grained mineral that defines the foliation (mica-like flakes)	patchy alteration	diaspore is in eqiulibrium with pyrite and what I think is andalusite. These veins cross cut early	small needles in veins	tabular and flakey crystals in veins	small crystals associated with sec(?) silica and pyrophyllite	selvage to diaspore-arseno veins

Structure	Veins are sub-parallel.
Comments	Might be a chert that had been altered by quartz-pyrophyllite-dumortierite etc. flooding event. This is cut later by pyrophyllite +/- diaspore +/- tourmaline-sulphide veins. Sulphides are disseminated through section and are dominantly pyrite with minor chalcopyrite.

Property_Area	Keg_Main	**Sampler**	Rosie	**UTM_E**	585547	**Drill Hole**	hand sample
Sample ID	11RC319_2	**Assay ID**		**UTM_N**	6939805	**Depth**	n/a

Minerals	quartz	diaspore	musc (sericite)	diaspore-sulphide	sulphide-diaspore-andalusite or staurolite		
Textures_Primary	fine-grained clasts						
Textures_Secondary	early veins	small grains disseminated throughout section	alteration of unknown primary minerals, likely feldspar	fibrous veins with silicic selvages, fibres grow at high angle to vein orientation	cross cut early silica veins		

Structure	
Comments	Sulphide is dominantly pyrite to aresenopyrite with minor chalcopyrite.

Property_Area	Keg_Main	**Sampler**	Rosie	**UTM_E**	585547	**Drill Hole**	hand sample
Sample ID	11RC319_3	**Assay ID**		**UTM_N**	6939805	**Depth**	n/a

Minerals	quartz	clay	musc (sericite)	diaspore	tourmaline		
Textures_Primary	fine-grained clasts						
Textures_Secondary		fine-grained alteration	alteration of unknown primary minerals, likely feldspar	veins	small needles in veins		

Structure	
Comments	Looks like a fine-grained clastic rock that has been altered to minerals such as (diaspore, pyrophyllite, dumortierite, clay, sericite). Pyrophyllite+/-diaspore-tourmaline veins.

Property_Area	Keg_Main	**Sampler**	Rosie	**UTM_E**	587080	**Drill Hole**	hand sample
Sample ID	11RC325	**Assay ID**		**UTM_N**	6939224	**Depth**	n/a

Minerals	quartz	musc/clay					
Textures_Primary	small percentage, occurs as clasts	VERY fine-grained (could be alteration)					
Textures_Secondary	veinlets						

Structure	Rock appears foliated.
Comments	In outcrop this sample is near a brittle fault zone.

Property_Area	Keg_Main	**Sampler**	Rosie	**UTM_E**	587277	**Drill Hole**	hand sample

Sample ID	11RC516	**Assay ID**	K279070	**UTM_N**		**Depth (m)**	134.85

Minerals	quartz	pyrite/sphalerite/chalcopyrite	staurolite (?)	chlorite	calcite	diaspore	andalusite
Textures_Primary							
Textures_Secondary	background mineral, not clastic either metamorphic or alteration		occur abundantly with sulphides throughout section	minor radial aggregates are interstitial.	large bladed crystals in clots and often associated with chalcopyrite		occurs in minor amounts with sulphides

Structure	
Comments	Some chance that quartz here is cordierite.

Property_Area	Keg_Main	Sampler	Rosie	UTM_E		Drill Hole	KEG-11-22
Sample ID	11RC519	Assay ID	K279083	UTM_N		Depth (m)	149.05

Minerals	quartz?	andalusite	calcite	tourmaline			
Textures_Primary							
Textures_Secondary	flooding	alters to tourmaline	large bladed crystals with pyrite and chalocpyrite	abundant small needles throughout section dominantly within andalusite crystals			

Structure	
Comments	Some chance quartz is cordierite, inclusions of tourmaline make me think so.

Property_Area	Keg_Main	**Sampler**	Rosie	**UTM_E**		**Drill Hole**	KEG-11-22
Sample ID	11RC520	**Assay ID**	K279103	**UTM_N**		**Depth (m)**	170.2

Minerals	quartz?	diaspore	sphalerite/chalcopyrite/pyrite	carbonate	staurolite		
Textures_Primary							
Textures_Secondary	highly overprinted by diaspore and sulphides (12%)	30%	50%	minor 5%	minor occurrances with diaspore		

Structure	
Comments	Sulphides and diaspore make up majority of this rock. Some chance quartz is cordierite.

Property_Area	Keg_Main	Sampler	Rosie	UTM_E		Drill Hole	KEG-11-22
Sample ID	11RC521	Assay ID	K279121	UTM_N		Depth (m)	189.65

Minerals	cordierite?	andalusite	sphalerite/chalcopyrite/pyrite	carbonate	diaspore	quartz	
Textures_Primary						some clasts (?) in less altered parts of section	
Textures_Secondary	with andalusite in veins (photo 5x)	veins	disseminated in vein selvage and rarely within veins	patchy sections of fine-grained aggregates	abundant throughout section		

Structure	
Comments	Sulphides and diaspore make up majority of this rock. Some chance quartz is cordierite.

Property_Area	Keg_Main	Sampler	Rosie	UTM_E		Drill Hole	KEG-11-22
Sample ID	11RC522	Assay ID	K279144	UTM_N		Depth (m)	230.43

Minerals	quartz	clay	diaspore				
Textures_Primary	fine grained qtz-rich siltstone (looks like chert in some parts of section)						
Textures_Secondary		pervasive alteration	very rare crystal				

Structure	Foliated rock by andalusite veins at high angle. Foliation defined by seams of clay and aligned flakes of mica-like mineral (pyrophyllite?).
Comments	Sulphides and diaspore make up majority of this rock. Some chance quartz is cordierite.

Property_Area	Keg_Main	Sampler	Rosie	UTM_E		Drill Hole	KEG-11-22
Sample ID	11RC523	Assay ID	K279173	UTM_N		Depth (m)	317

Minerals							
Textures_Primary							
Textures_Secondary							

Structure	
Comments	Very quartz rich fine-grained sandstone with clay matrix cut by calcite and what looks like cordierite veins.

Property_Area	Keg_Main	Sampler	Rosie	UTM_E		Drill Hole	KEG-11-38
Sample ID	11RC524	Assay ID	no assay	UTM_N		Depth (m)	3224.6817

Minerals	quartz						
Textures_Primary	medium-grained clasts and in chert clasts; large grains have many parallel fluid inclusions (photo 5x)						
Textures_Secondary	I think there must be some quartz veins that have been deformed						

Structure	Band between clastics and organic rich stuff has stringers of pyrite and quartz that shows some evidence of dynamic recrystallization (photo 5x). This is structurally complex, not sure what is going on exactly.
Comments	Angular to sub-rounded clasts of pure quartz, chert and argillite make up about 40% of thin section. The rest is a very fine-grained, deformed, nearly opaque, mass of what must be almost all organics (none of it is sulphide). The farbric in the organic rich material often bends around sections of the coarse clastics.

Property_Area	Keg_Main	Sampler	Rosie	UTM_E		Drill Hole	KEG-11-38
Sample ID	11RC525	Assay ID	no assay	UTM_N		Depth (m)	297.27

Minerals	quartz	mica	pyrite	clay			
Textures_Primary	fine-grained clasts	might be some detrital mica in coarser beds		pervasive			
Textures_Secondary			disseminated throughout section				

Structure	Well developed foliation defined by very fine-grained mica-like mineral (pyrophyllite?). Foliation is at about 15 degree angle to bedded.
Comments	

Property_Area	Keg_Main	**Sampler**	Rosie	**UTM_E**		**Drill Hole**	KEG-11-38
Sample ID	11RC526	**Assay ID**	no assay	**UTM_N**		**Depth (m)**	314.39

Minerals							
Textures_Primary							
Textures_Secondary							

Structure	
Comments	Same as Bernie's description. Wacke dominated by quartz clasts, with some chert and quartzite fragments with minor clay occurring interstitially.

Property_Area	Keg_Main	Sampler	Rosie	UTM_E		Drill Hole	KEG-11-29
Sample ID	11RC527	Assay ID	K276374	UTM_N		Depth (m)	29.56

Minerals	quartz	diospore	pyrite/sphalerite /chalcopyrite	calcite	chlorite	dumortierite???	andalusite
Textures_Primary	primary or sec? grains with fused grain boundaries						
Textures_Secondary		overprints quartz		large bladed crystals often with chalcopyrite and in veins with sphalerite	rare	often with pyrite (strongly pleochroic rose, mod to high relief, low yellowish orange interference colors, one good cleavage	in veins with sphalerite and calcite (photos 5x)

Structure	
Comments	

Property_Area	Keg_Main	Sampler	Rosie	UTM_E		Drill Hole	KEG-11-29

1. SUMMARY

This report describes the assessment of airborne (ZTEM electromagnetic and magnetic) and IP-resistivity surveys carried out for Strategic Metals Ltd. (Strategic) on their Silver Range property, central Yukon.

Condor Consulting, Inc. (Condor) was commissioned to carry out processing and analysis of ZTEM and magnetic data and a limited amount of IP-resistivity data acquired over the property in 2010.

As a result of this assessment, a better ranking of the four known areas of interest has been achieved. The overall ranking is as follows:

1) Keg Zone
2) Marks Zone
3) Drex Zone
4) Owl Zone

A fifth focus area called Rebel lies outside the ZTEM survey area but was covered with one line of IP-resistivity that is discussed.

Drilling on Keg and Marks Zones without further geophysical work is felt to be warranted. IP-resistivity is suggested at the Owl Zone to try and define a more specific target than is presently recognized.

In addition, two areas of interest derived from the ZTEM and magnetic results have been identified which are felt to warrant field examination.

2. INTRODUCTION

ZTEM SURVEY

The ZTEM survey was commissioned by Strategic and carried out by Geotech Ltd. (Geotech) in two campaigns; an initial program conducted in July 2010 and then a second program in October 2010. These surveys were reported on by Latrous et al (2010a) and Latrous et al (2010b). The July program covered the KEG block (612 lkm) and then the October program covered Keg West and Keg East (1 676 lkm). At Strategic's request, Geotech merged the three blocks and these were delivered as one contiguous survey in November 2010. The area covered is shown in Figure 1.

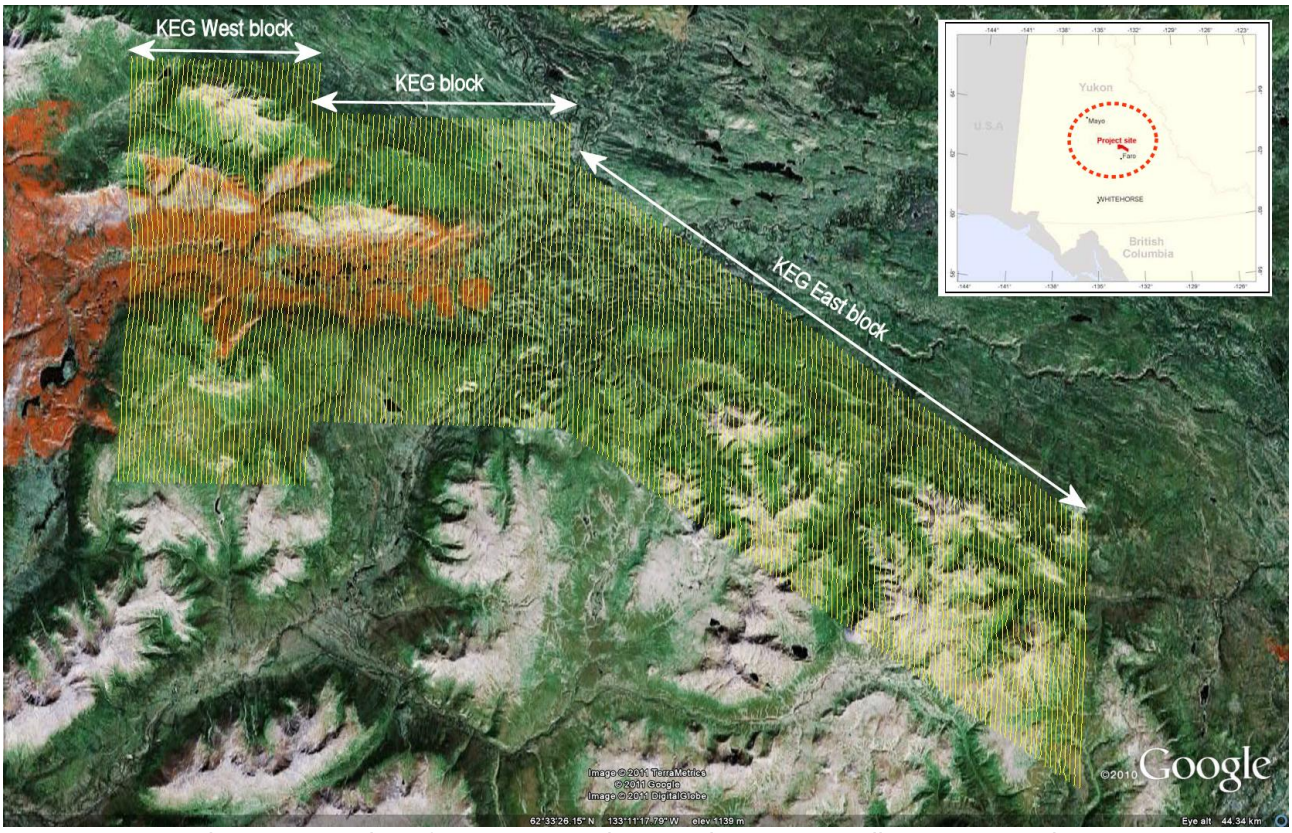

Figure 1: Location of ZTEM EM and magnetics surveys; Silver Range project.

IP-RESISTIVITY SURVEY

Strategic commissioned Aurora Geosciences to perform IP-resistivity surveys over selected areas on the Silver Range property. These surveys were reported on by Hetu (2010). The location of the three areas surveyed is shown in Figure 2.

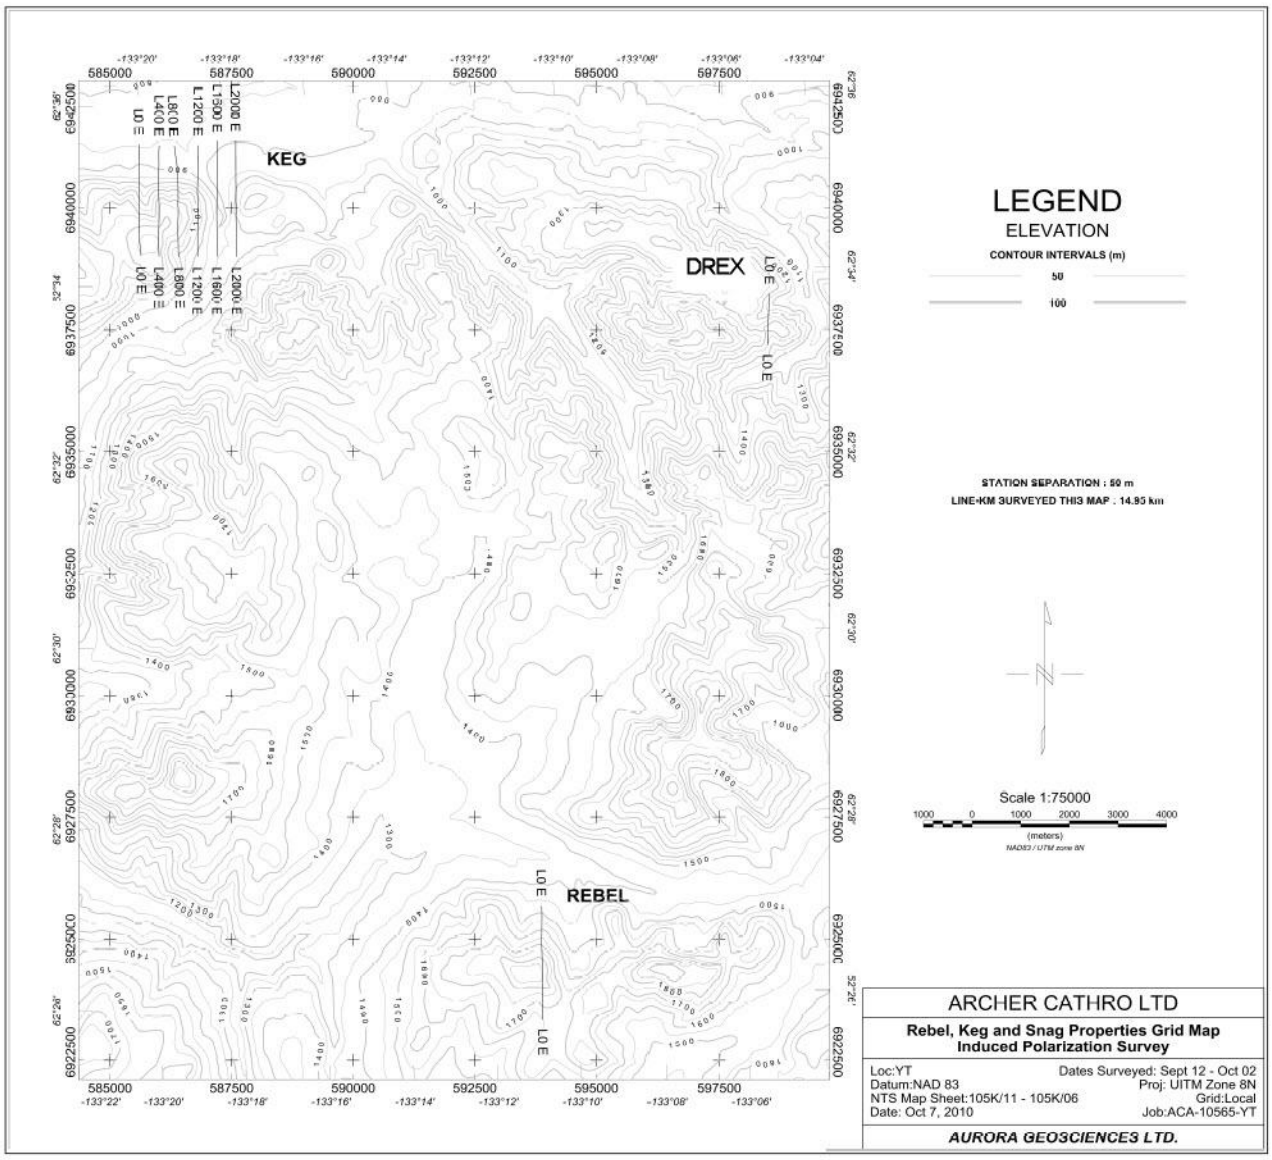

Figure 2: Location of IP-resistivity surveys on Silver Range property; 2010 (after Hutu).

Condor Consulting, Inc. (Condor) was commissioned by Strategic to process and assess the outcomes of the ZTEM and IP-resistivity surveys in light of Strategic's geological understand of the property. Strategic provided additional public domain and proprietary geoscience data acquired over the Silver Range property. This information has been incorporated in the present assessment and discussed where appropriate.

3. GEOLOGY

GEOLOGICAL BACKGROUND

The geological image shown in Figure 3 is derived from Gordey (2008). The primary geology of the area is a NW-SE trend of sedimentary rocks with volcanics along the northeastern side and volcanics and intrusive rocks primarily in the southern half of the study area. Within the overall Silver Range, there are five focus zones defined by the client; these are shown in Figure 3 and are designated the Owl, Keg, Drex, Marks and Rebel. These were defined by either earlier work by others or more recent work done by Strategic. The following is a summary of the work on Keg property from the Strategic web site: http://www.strategicmetalsltd.com/:SilverRangeProject.

"Initial widely-spaced drilling at the Keg Zone in 2010 intersected broad intervals of porphyry-style, disseminated and stockwork mineralization in all four holes. This drilling partially tested a 550 metre strike length, while geochemical and geophysical anomalies associated with the Keg Zone indicate a target area about 4 kilometres long and several hundred metres wide."

Additionally, the status of the property as a whole is commented on:

"Four more large-scale zones of silver-zinc-lead-copper mineralization have been identified on the project, which has been expanded to cover 350 square kilometres."

Based on the geochemical results and limited drilling in 2010, the Keg Zone is deemed prospective for base metals and silver mineralization. A drill section from the Strategic web site (Figure 4) shows the broad thickness of low grade multi-element mineralization encountered in the 2010 drilling.

TARGET MODEL

Based on the regional geology and detailed geochemistry and drilling, the property is prospective for intrusive-related mineralization, likely with a skarn affinity. The area is complicated by what appears to be extensive thrusting in the central sedimentary package. The Rebel property is in a different setting, with the main area of interest in volcanic rocks. The ZTEM survey does not cover this prospect and the only geophysical coverage is the GSC regional aeromagnetic data and the one line of IP-resistivity.

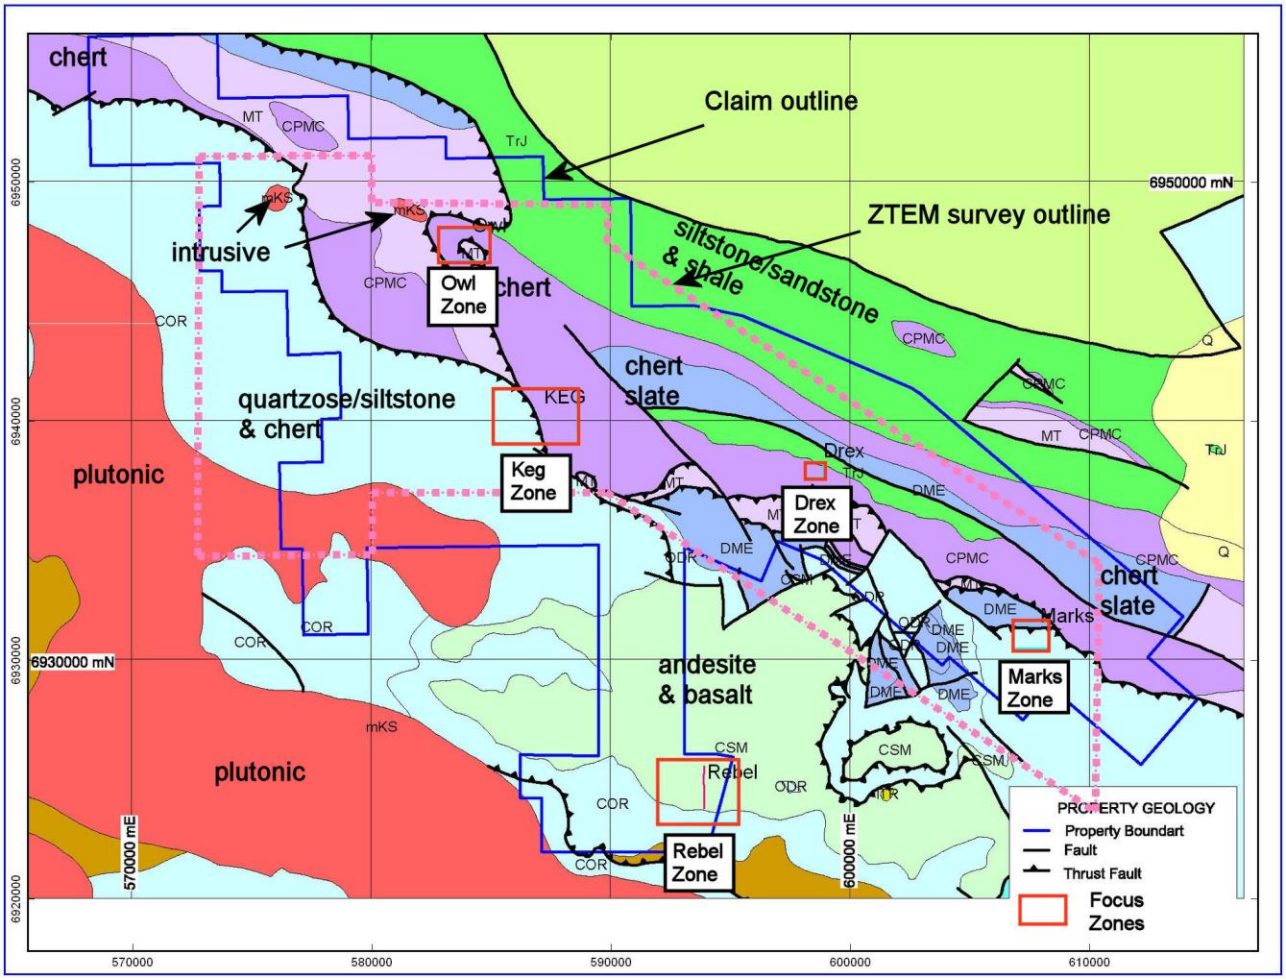

Figure 3: Silver Range geology + focus zones.

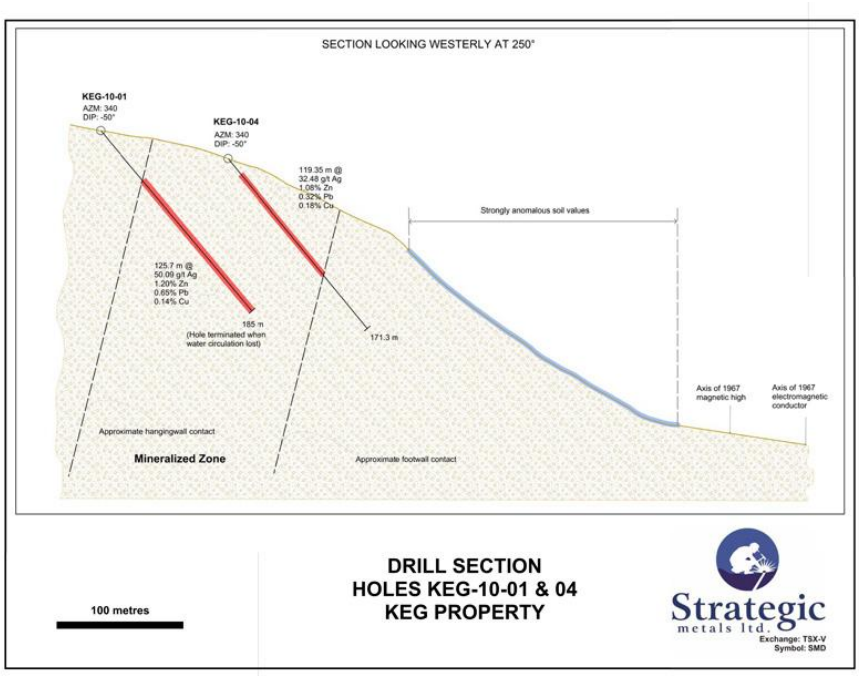

Figure 4: Drill section from Keg showing.

4. PROCESSING, ANALYSIS AND PRODUCTS

PROCESSING

Magnetic Data Processing

In addition to the normal filters available in the Geosoft application, additional processing was done using encom pa software and algorithms; these products are termed the ZS suite. Information pertaining to the ZS processing methodology is provided in Appendix A-Section 2.

3D Magnetic Inversion

The University of British Columbia (UBC) 3D magnetic inversion program MAG3D, version 4.0, was used for the inversions. The inversions were performed with only the topography surface as model constraints along with the normal UBC style objective function. Information on Mag3D is provided in Appendix A-Section 2.

2D ZTEM Inversion

The recorded ZTEM data were inverted using a modified 2D MT algorithm to produce a conductivity depth section (CDS). The algorithm models the along-line tipper data Tzx, taking into account that the vertical component is airborne and the horizontal component sits on a uniform ground. The responses of all frequencies (30 – 720 Hz) were included in the inversion. Using a modified version of the code that allows for the removal of topographic effects in the inversion result, all the survey data were reprocessed in March-April 2011. Theses outcomes are what have been used in the present assessment. Further information on the processing of the ZTEM data is provided in Appendix A-Section 1.

IP-resistivity Inversions

Following a QA/QC assessment of the contractor-provided data, Condor performed 2D inversions on all the lines for the three areas using the UBC IP inversion code. 3D inversion was attempted on the KEG block but did not provide a significantly better outcome.

ANALYSIS

The ZTEM technique is fundamentally different than all other types of airborne EM systems[1] in that naturally occurring EM fields are used to energize the earth rather than sending a signal from a artificial transmitter carried by the aircraft. The frequencies used are in what is termed the Afmag range, roughly from 10 Hz-1 000 Hz. A primary difference with ZTEM compared with active source EM techniques is that Afmag fields produce a response via current channeling rather than through inductive decay. This means ZTEM is typically more sensitive to large scale features such as contacts, faults and changes in lithology that have a corresponding change in resistivity.

As the ZTEM technique is relatively new, the processing and interpretation methodologies are still being developed and trialed for a variety of deposit styles. As with other forms of airborne EM data, Condor works with a combination of 1D, 2D and 3D products to represent the outcomes of the survey data.

1D Results

The 1D products are listed below in Table 4-1 and are provided in Appendix C. These are very useful as they provide what are the highest resolution outcomes of the survey in terms of capturing the spatial changes within the Afmag fields in the survey area. The processing is relatively simple as well, so the results are fairly easy to examine.

The understanding of the results in terms of geology is still evolving. At one level the higher frequencies (which are expected to be derived from shallower depths due to the skin depth phenomena of EM fields) should be expected to provide more detail at shallow depths but at the same time the primary Afmag signal strengths are known to drop off with increasing frequency. Empirically, while somewhat counter intuitive based on how we assess inductive EM data, it seems the lower frequencies (30-90 Hz) often contain more detail and appear to be more robust than the higher frequencies (360-720 Hz).

Geotech provides a series of derived products using the Tzx and Tzy (shortened to X and Y components). The X and Y components provide information about the Afmag fields in the cross-line and alone-line directions. For each X and Y component, there are as well an in-phase (IP) and quadrature (QD) attribute.

At this stage, it is difficult to give a concise definition of how best to use different components other than to state that good practice would be that the various products should be examined whenever possible and best effort made to see if the various outcomes are contributing to understanding the local geology. In reality however, due to the plethora of grids provided (there are 48 derived grid products from Geotech along with the 24 primary components) a sub-set of the provided grids are used in the survey assessment. Condor as well provides a grid product termed Apparent Conductivity or AppCon. The underlying theory of the AppCon calculation provides for what we believe to be a more rigorous derivation of conductivity from the Afmag results, whereas the Geotech processing produces only relative conductivity outcomes. The Afmag technique however, does not produce a robust measure of conductivity in absolute terms, but rather is seen as being sensitive to differences or gradients in conductivity.

2D Results

The primary 2D product is the CDS product that is derived from rectangular cells of a certain X and Z dimension (see Appendix A-Section 1 for the grid used on this project). Geotech has a program similar to Condor's and we have seen that the two can produce very comparable results if the initial inversion model is defined in a similar way and then if the inversion convergence or fitting is done with close to the same degree of precision. With the 2D inversion model, we have the best means to define the changes of conductivity with depth. As stated above, we believe that the relative changes in conductivity are being accurately captured but the absolute values of conductivity are not well resolved. Condor has experimented with 'seeding' the inversion with various starting models to help guide the inversion to a better conductivity solution but this has not proven that effective.

In early 2011, Condor introduced a means to correct for topographic effects in the 2D inversions in a timely and cost effective manner. This can be very important as topographic effects can not only distort the shallow conductivity responses but as well contaminate the conductivity responses at depth.

While the 2D inversion is normally done on the X component data, the same processing can be done on the Y component data, either along the normal lines or across lines, which in effect pro-

[1] Afmag has some similarities to the VLF technique but operates at much lower frequencies.

duces an X component outcome for an orthogonal set of survey lines. This type of processing can be useful to help define structures which are oriented sub-parallel to the standard survey direction.

3D Results

Currently Condor provides 3D outcomes via the gridding of 2D survey results. Later this year, we plan to offer a full 3D outcome using the UBC-GIF developed code MTZTEM. This processing approach should offer advantages in situations where there is a complex conductivity structure, with either multiple conductor orientations or limited strike-length features.

Condor has produced a background document on the ZTEM technique entitled “ZTEM Primer”; this is provided with Appendix D.

PRODUCTS

Table 4-1 lists the products that are provided. All maps are created using the following parameters:

Datum: WGS84
Ellipsoid: GRS 1980
Projection: UTM (Zone: 8N)
Central Meridian: 135ºW
False Northing: 0
False Easting: 500 000
Scale Factor: 0.9996

Table 4-1 Survey Products

FocusMaps: @ 1: 40 000 (hardcopy + PDFs)
On each there are as well the following Condor-derived layers:

- TMI-RTP + magnetic linears major and minor + Target Zones
- TMI-Tilt + magnetic linears major and minor + Target Zones
- IP 90 Hz TPR + ZTEM linears and lows + Target Zones
- AppCon 90 Hz + ZTEM linears and lows + Target Zones
- Geology + magnetic linears major and minor + ZTEM linears and lows + location of IP lines + drill holes + Target Zones

- DEM + magnetic linears major and minor + ZTEM linears and lows + location of IP lines + drill holes + Target Zones

ZPosters: @ 1:120 000 (hardcopy + PDFs)

* The derivation of these grids is provided in the Geotech report (Latrous 2010)

Component	Frequencies
IP DT*	30-720 Hz
IP TPR*	30-720 Hz
QD DT*	30-720 Hz
QD TPR*	30-720 Hz
X IP PR*	30-720 Hz
X QD PR*	30-720 Hz
Y IP PR*	30-720 Hz
Y QD PR*	30-720 Hz
AppCon	30-720 Hz

MultiPlots™ @ 1:20 000 (PDF) Main block

Mini-Plates™: TMI-RTP, TMI-tilt, AppCon 180 Hz, Geology, DEM

On each standard survey line the following content is shown:

- Profiles-EM Z/X IP & QD 30 Hz-720 Hz observed with error fit
- Profiles-AppCon 30 Hz-720 Hz
- Profiles-TMI-RTP, TMI-tilt and TMI-1st VD
- Section-Conductivity Depth Section + drill holes + flying height
- Section-Susceptibility Depth Section + drill holes + flying height
- TrackMap-Geology + flight path

MultiPlots™ @ 1:20 000 (PDF) ZTEM-IP Focus

Keg: ZTEM L4280-L4380; IP Lines: 0, 400, 800, 1200, 1600 & 2000

Drex: ZTEM L1420 IP Line 0

Mini-Plates™: TMI-RTP, TMI-tilt, AppCon 90 Hz, Geology, DEM

On each standard survey line the following content is shown:

- Profiles-EM Z/X IP 30 Hz-720 Hz observed and modeled with error fit
- Profiles-AppCon 30 Hz-720 Hz
- Profiles-TMI-RTP, TMI-tilt and TMI-1st VD
- Section-Conductivity Depth Section + drill holes (for Keg) + flying height
- Section-Susceptibility Depth Section + drill holes (for Keg) + flying height
- Section-IP 2D inverted resistivity section
- Section-IP 2D inverted chargeability section
- TrackMap-Geology + flight path

Report (Hardcopy + PDF)

On the archive DVD (Appendix D) the following files are provided:

-Digital archive in Geosoft format

-FocusMaps, ZPosters and MultiPlots™ (PDF)

-encompa session files to produce ZPosters and MultiPlots™

-Processing Report (PDF)

-encompa Viewer (to create MultiPlots™)

5. INTERPRETATION

DATA QUALITY

ZTEM Survey

The ZTEM data quality is deemed satisfactory. Given the two-stage execution of the flying, the Test block was merged with the later surveys. The three surveys meshed quite well, indicating the data quality was good and whatever signal leveling required was appropriately applied. As is customary with ZTEM acquisition, it is not required to maintain a nominal flying height as stringent as with an active source survey such as VTEM due to the more gradual drop-off of the Afmag signal strength with height. However, the magnetic data is somewhat degraded as a result. Normal microleveling of the grids has reduced most of the flying height artifacts.

PROCESSING

ZTEM Topographic Effects

Several examples of the standard processing and topography removed are shown in Figure 5. The effect of removing topographic effects varies with the degree of the topography and the conductivity structure present in earth. Uncorrected processing will typically show conductive ‘rinds’ overtop of the ridges and resistive lows in low areas. This is however, not universally observed. If there is sub-horizontal conductivity at depth, this will often show a reflection of the overlying topographic character. In some instances as well, strong features will be removed or created such as the case on the example shown for L1900. The 3D voxel models are also derived from the topography corrected inversion results. Overall, the confidence level is much higher with the terrain corrected inversions. This processing does not however, remove 3D effects from the data; this processing is possible, but more complicated and normally only applied when there are apparent issues with 2D processing. At this stage of the assessment, 2D processing is deemed to adequately represent the data.

IP-Resistivity

The data quality was deemed to be generally good and only a few points were removed prior to performing the 2D inversion modeling. At Keg, more noise in the chargeability data was noted associated with low resistivity zone at the northern end of several lines.

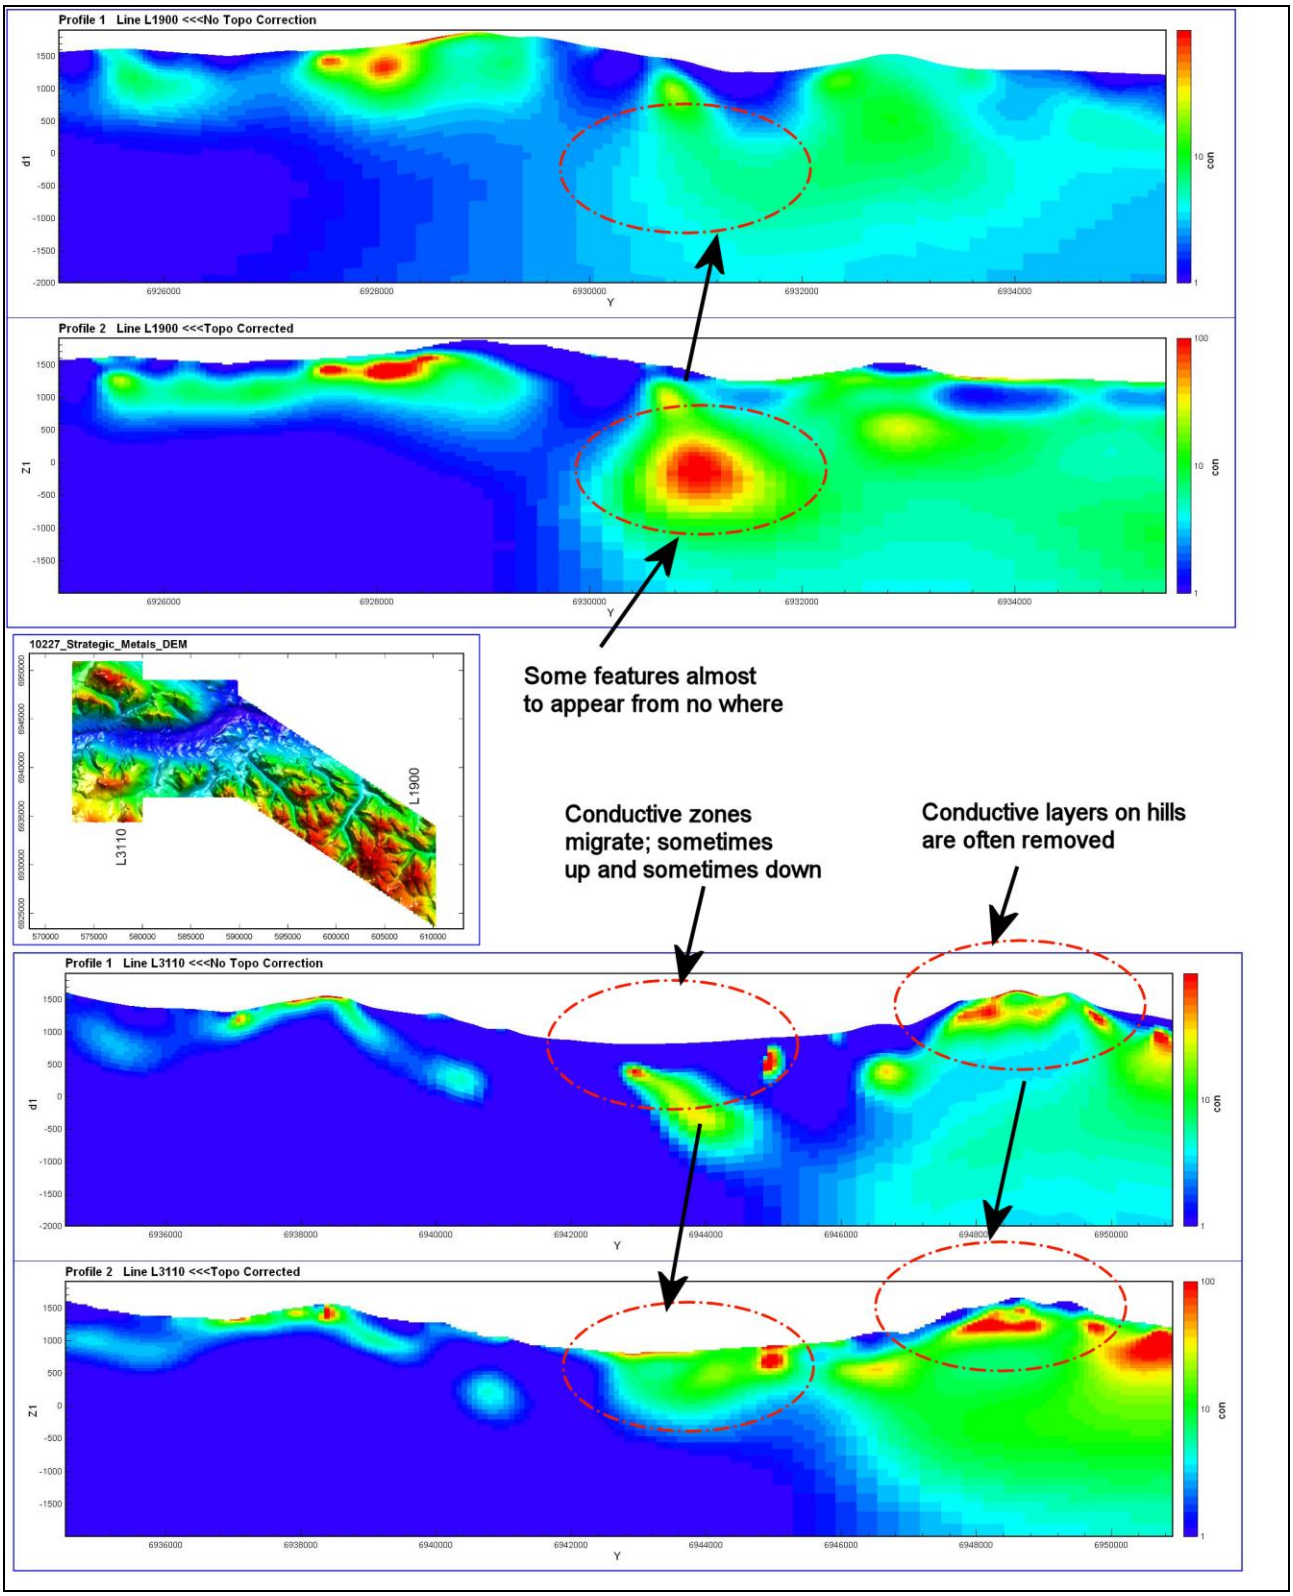

Figure 5: Examples of initial and terrain corrected ZTEM processing with some differences highlighted.

PROPERTY SCALE MAGNETIC AND ZTEM OUTCOMES

The regional geology with TMI-tilt results are shown in Figures 6 and 7. The magnetic results show several large scale groupings of character (labeled Domains) which are highlighted in the figures. Domains A and C are characterized by narrow, short strike length 'worm-like' segments. Domains B and B' appear as deeper, more intrusive-like sources. The core package of rocks over the study area trends at 294° whereas Domain B trends at 283°. The dominant rock types are sediments with little indication of either volcanics or intrusive rocks being present. The suggestion is then that pyrrhotite within the sediments could be responsible for some of the observed shallow responses and the deeper seated sources (viz. Domains B and B') could be intrusive rocks underneath the mapped sedimentary units. However, neither the source of the magnetic responses nor the apparent difference in strike direction is explained in a satisfactory way. Also, whether explaining these inconsistencies can better help understand the economic geology of the study area is unclear. No further assessment of the magnetic domains is undertaken, but in the section below the focus areas are examined in greater detail and the relationship between the economic geology and magnetic responses are examined further.

Figure 8 shows the TMI-tilt superimposed on the geology as a texture. This display enhances the structures through the study area rather than the distinct magnetic packages as shown in Figures 6 and 7. Whereas the magnetic grain is NW based on Figures 6 and 7, the structural grain in Figure 8 is more NNW. What appear to be several major structures are noted in the central part of the study area between the Keg and Drex Zones. These have more of a sinistral (N-S) orientation and as well appear to fold into the mapped geological contacts.

There are an extensive set of grid-based products produced with a ZTEM survey. Two composites are shown here; the IP TPR and AppCon covering the full range of frequencies (Figures 9 and 10). The complete suite is listed in the products section (Table 4-1) and is provided in Appendix B.

The changes with frequency can be complex depending on the earth's conductivity structure. Where there is effectively no conductivity, the lower frequencies can be thought of as penetrating deeper than the higher frequencies in a relationship that relates to what is termed EM skin depth. When a conductive layer is encountered however, this impedes the further penetration of the EM response and the various frequencies are, by and large, providing different information about the same segment of the earth. With Afmag, the higher frequencies often produce the noisier grids as the signal strength is less.

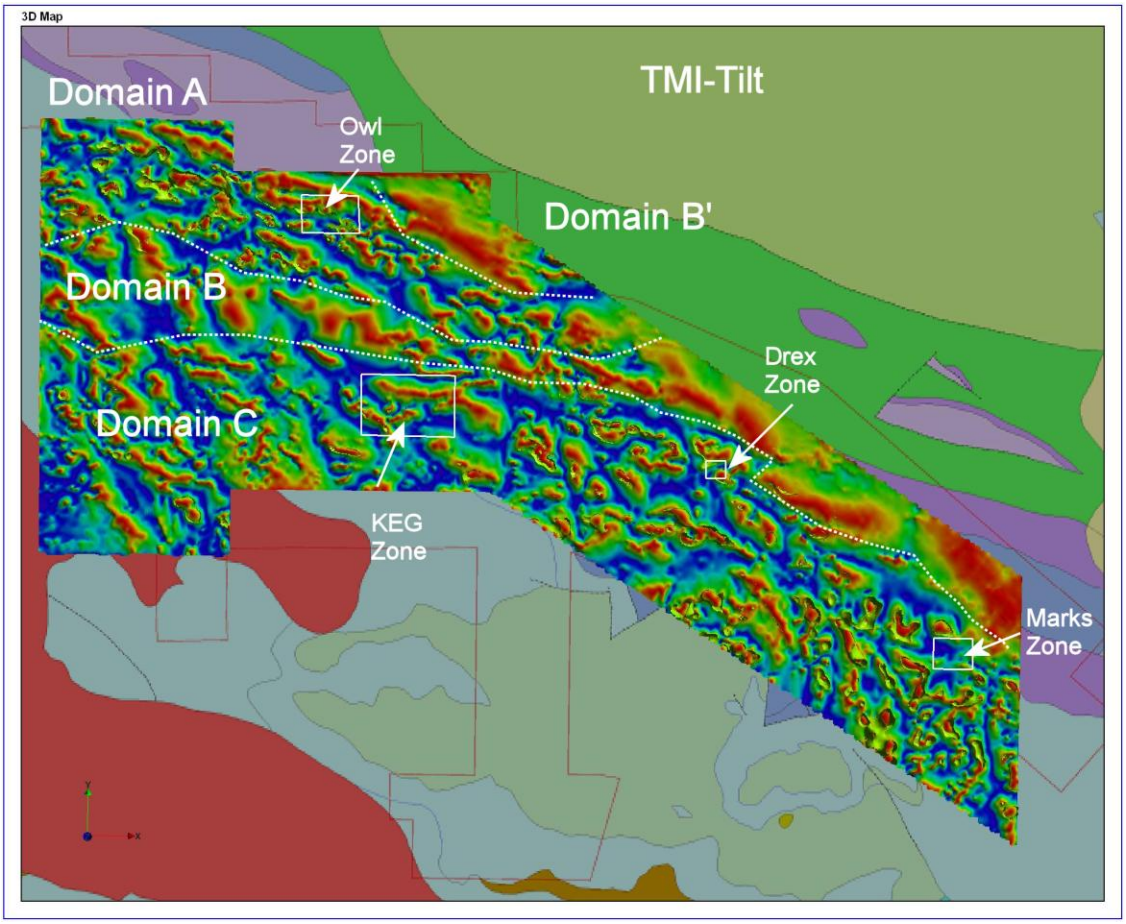

Figure 6: TMI-tilt showing Zones overlying regional geology.

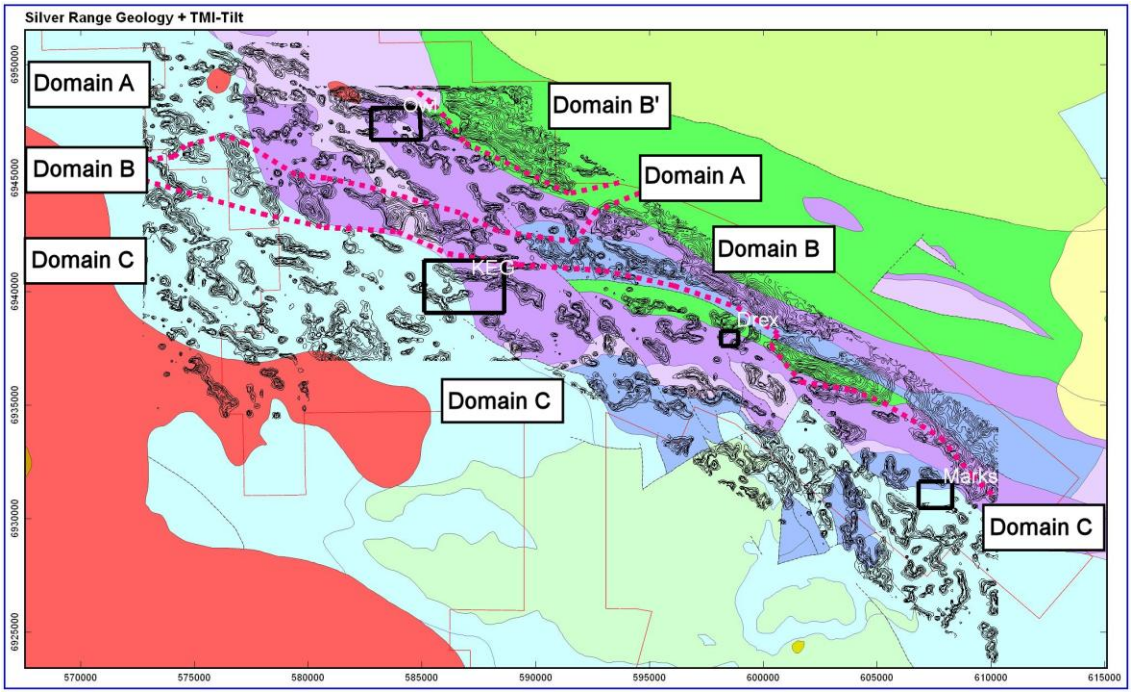

Figure 7: Regional geology with TMI-tilt as contours and magnetic domains.

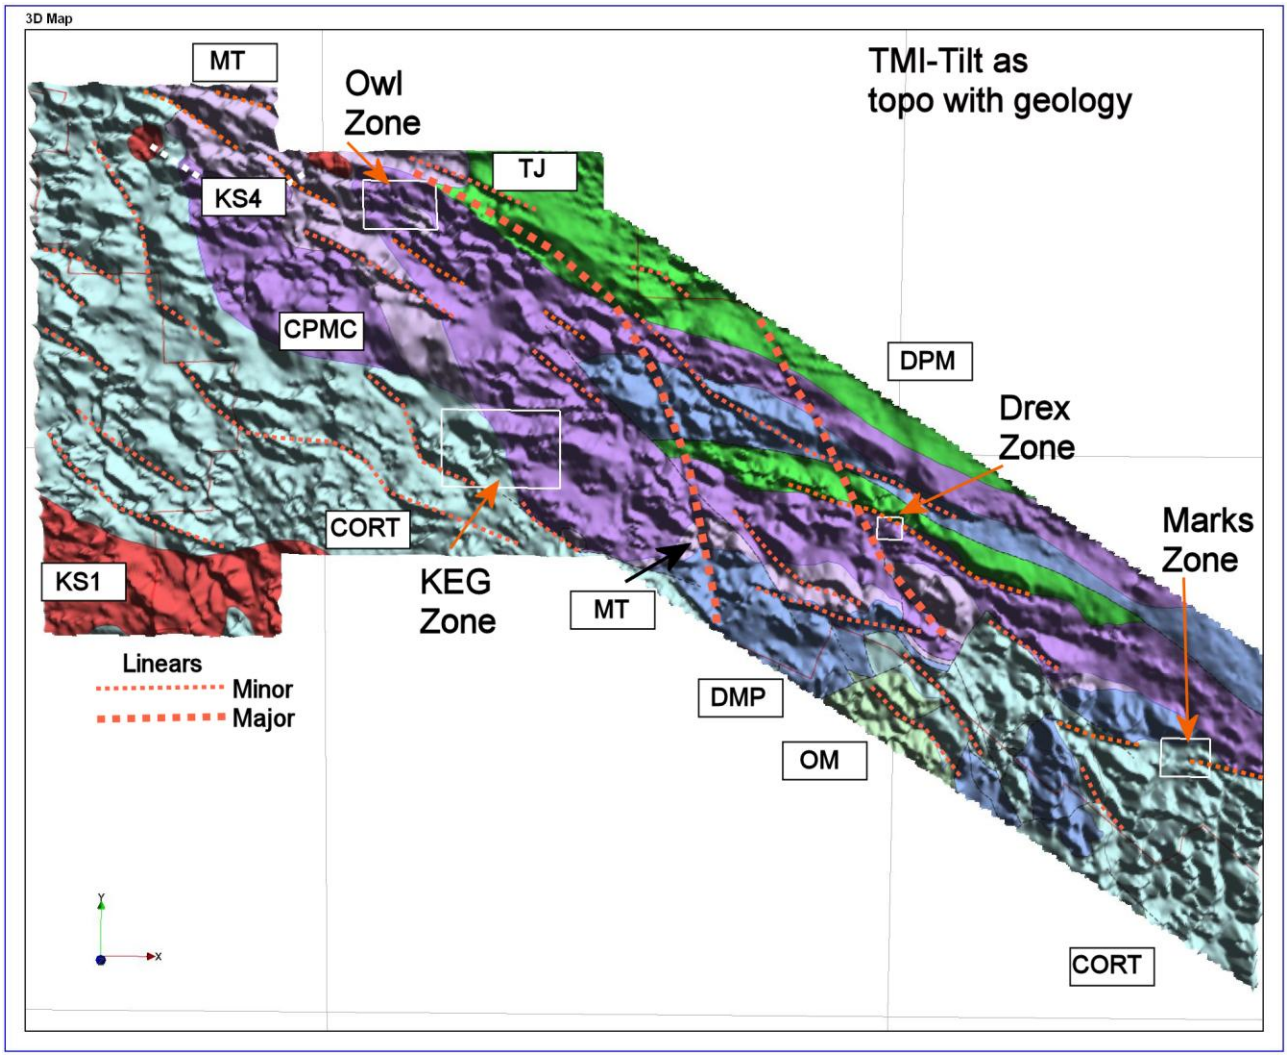

Figure 8: Geology with TMI-tilt as texture; structures mapped as dashed red lines.

In Figure 9 (IP TPR), while the major highs appear over the full frequency range, a number of the features that are quite coherent in the lower frequencies appear broken up in the two highest frequencies. The lows (resistive zones) also appear to be sharper and more localized with the higher frequencies. The 360 Hz signal appears to be somewhat noisier than the other frequencies.

In Figure 10 (AppCon), the changes appear similar to what is seen in Figure 9. The mid-frequencies 90 and 180 Hz appear to show the best balance between detail and the likely effects of noise. A more detailed assessment follows that focuses on the images that appear to carry the major information content.

Figure 11 shows the IP 90 Hz TPR with the major lows and Z-axis trends picked. The term ‘Z-axis’ in this case means the ridge or high that then appears in the IP 90 Hz TPR image.

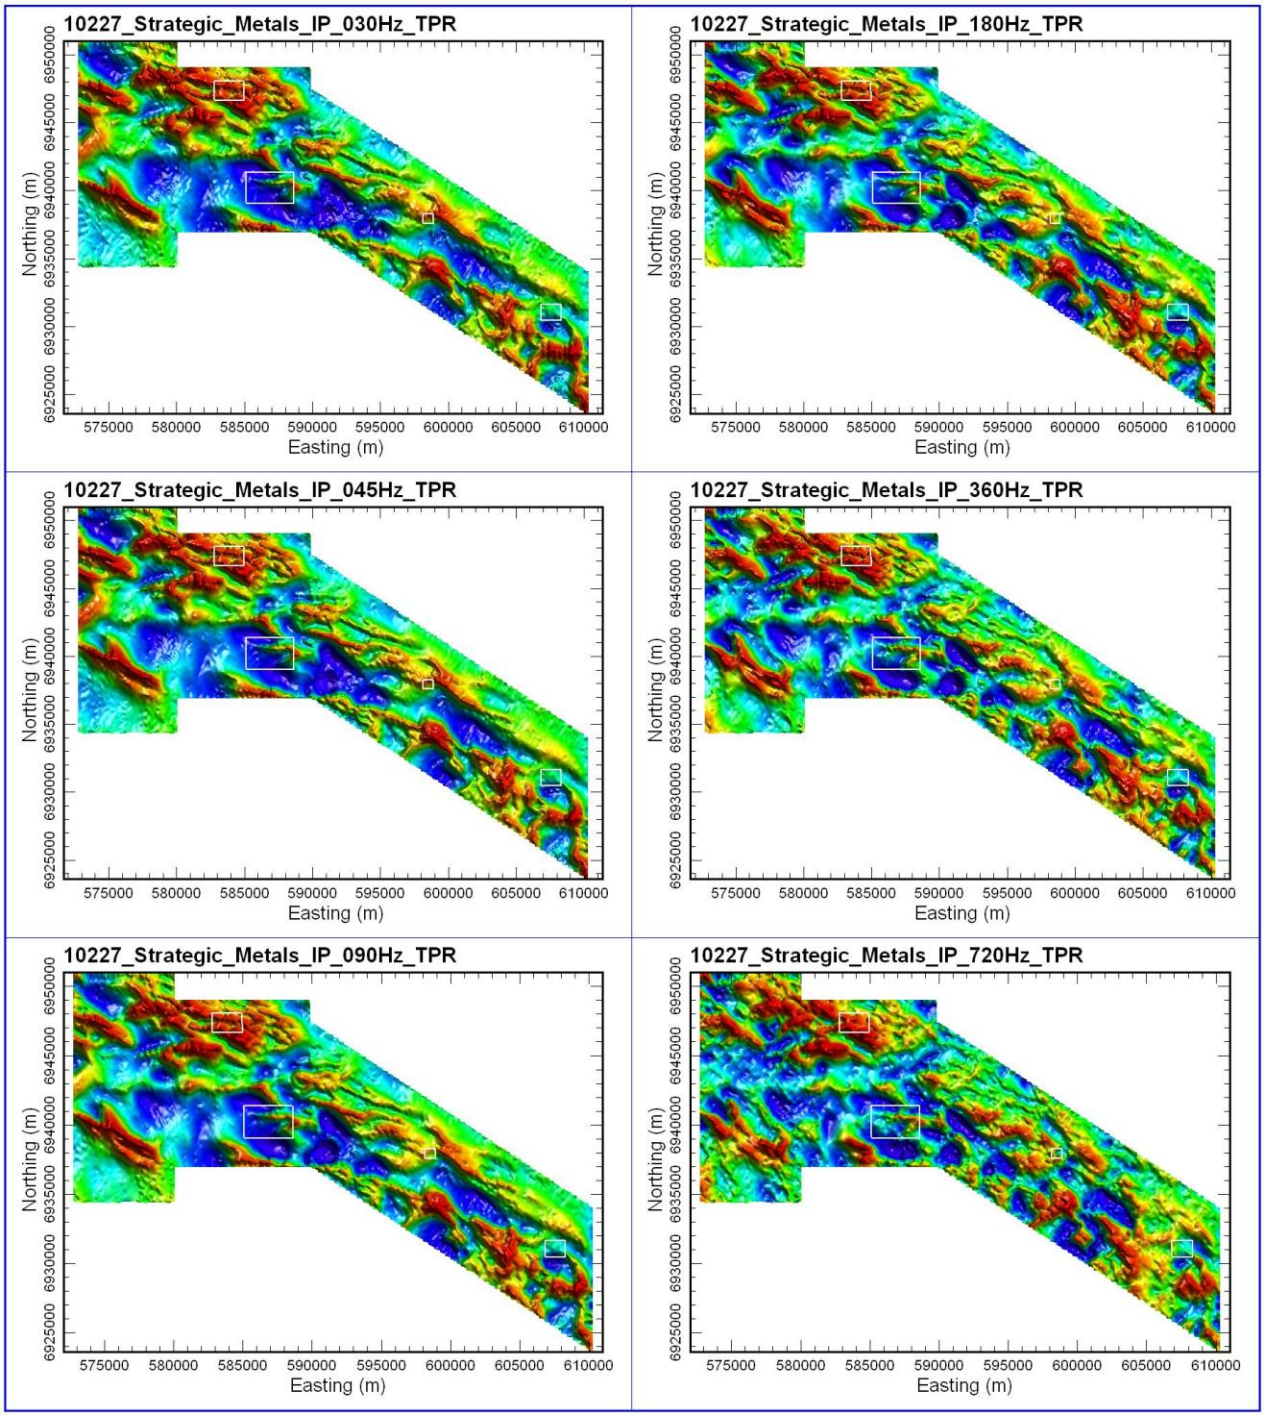

Figure 9: IP TPR grids from 30 Hz-720 Hz.

This type of feature most likely represents a fault or contact. The same information is shown in Figure 12, but in this image the ZTEM grid has been draped over the geology.

In terms of the overall grain of the ZTEM results there appears to be a string of highs conformable with the overall geological trend.

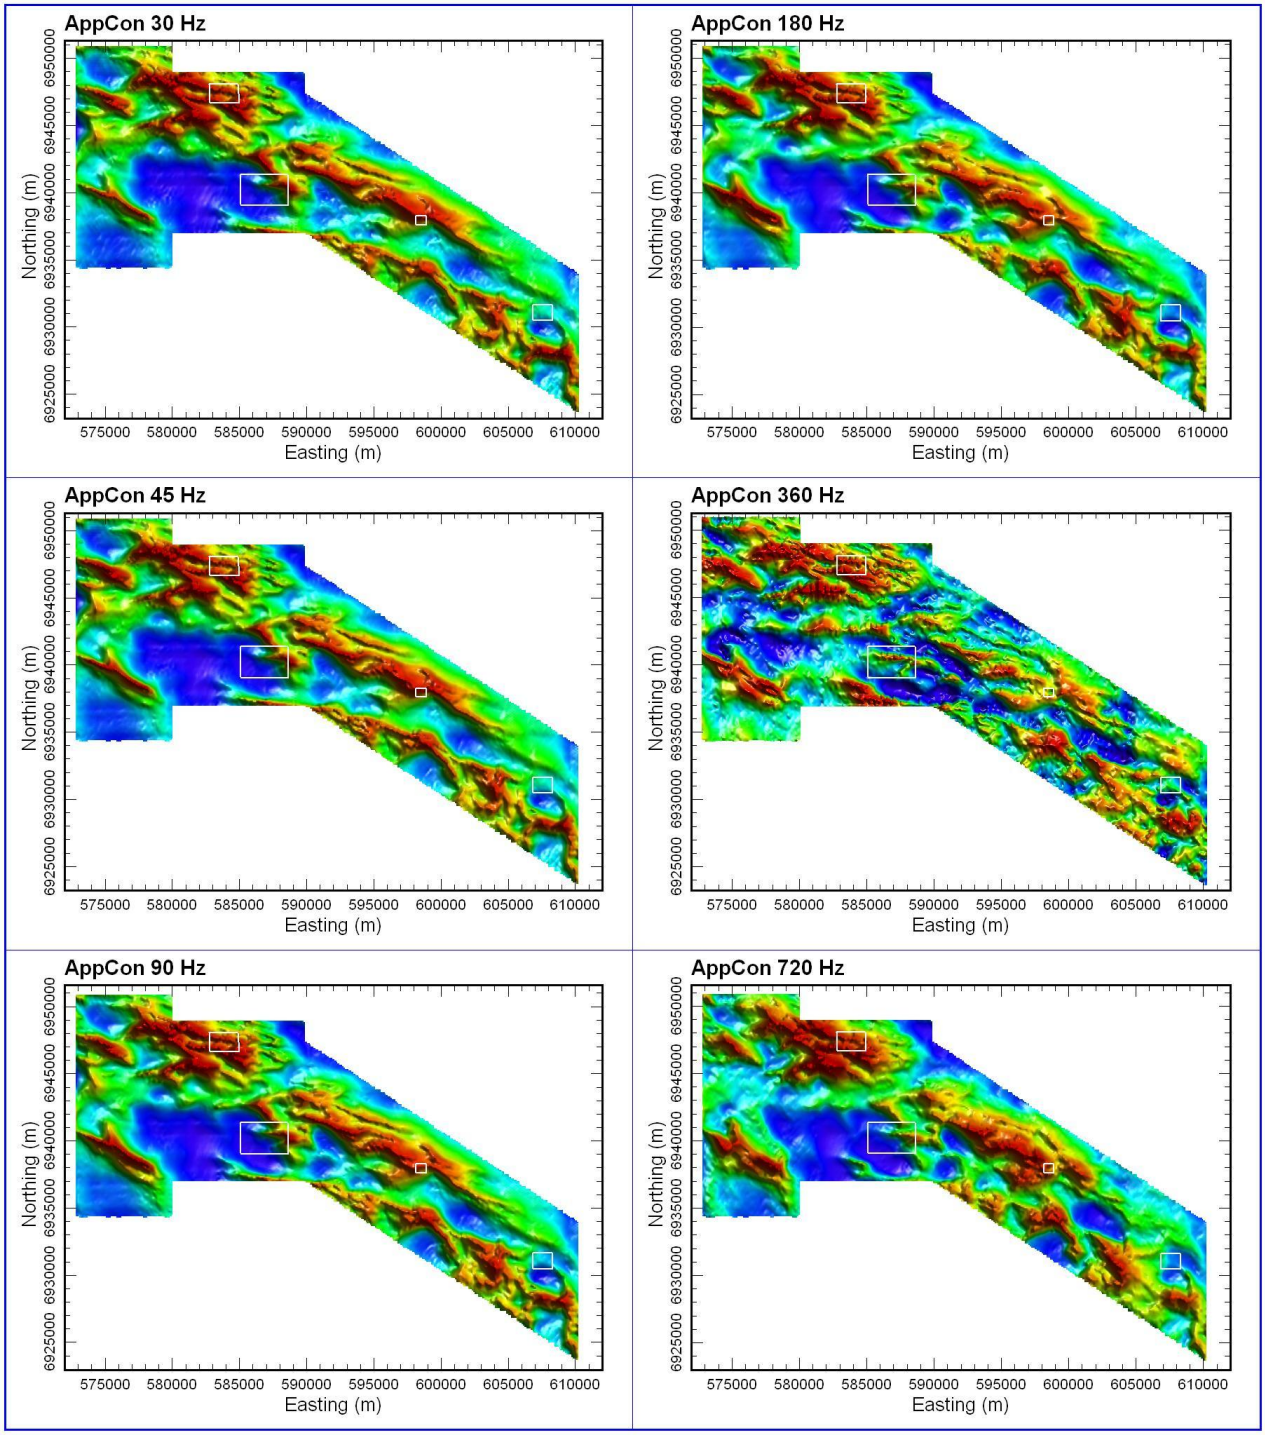

Figure 10: AppCon grids from 30 Hz-720 Hz.

When examined in detail, these ZTEM trends fall into one of three categories;

1) Highs that are interior to a mapped geological unit and that appear to be conformable to the geology

2) Highs that define the boundaries of mapped units

3) Highs that appear to cross-cut mapped units

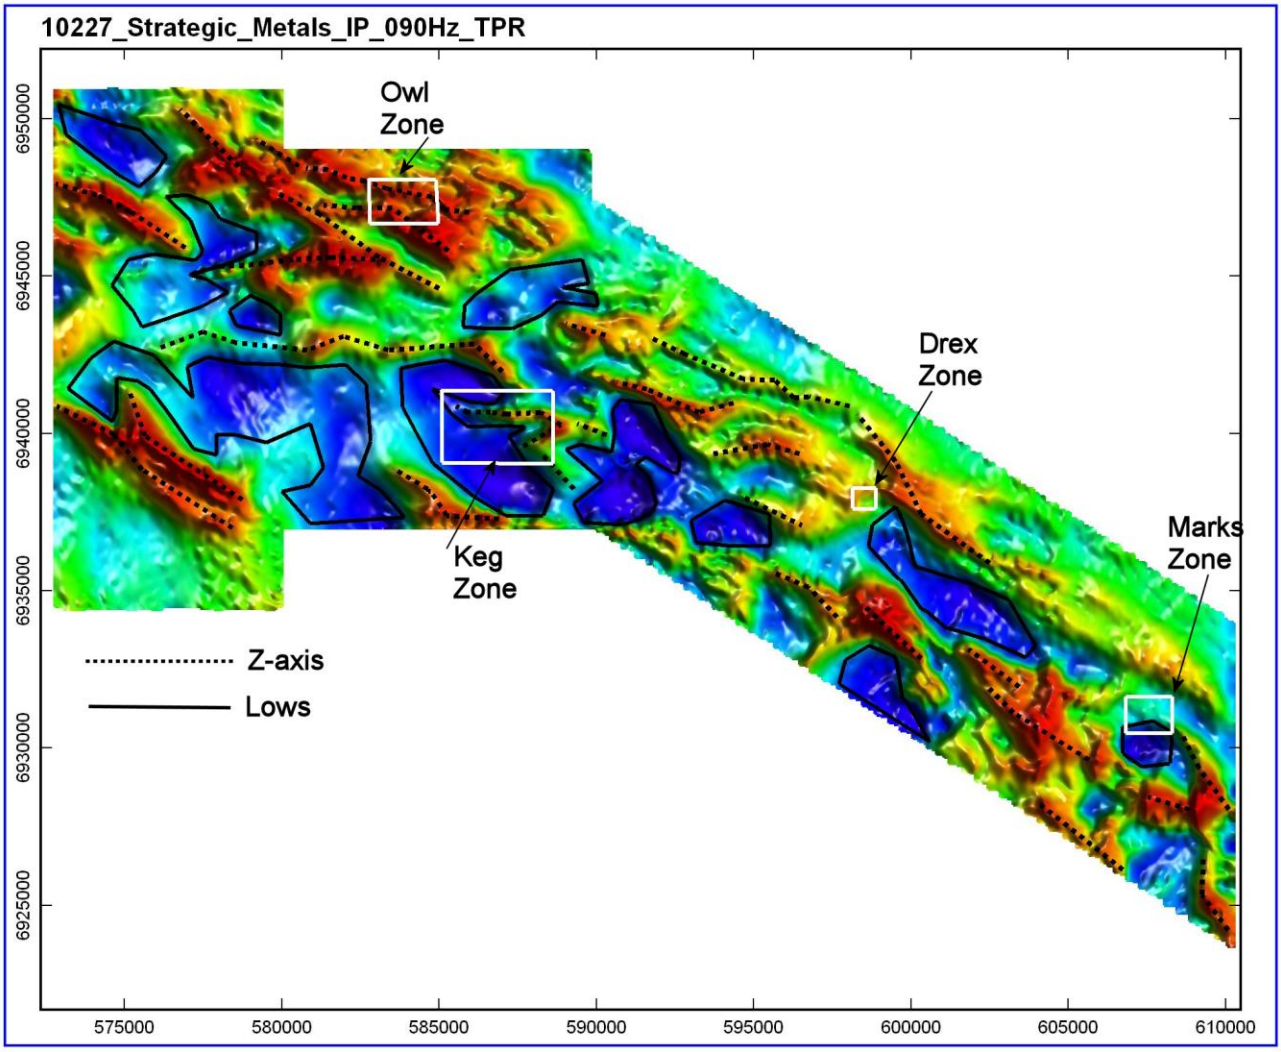

Figure 11: IP 90 Hz TPR with Z-axis and lows picked.

Examples of the first and third styles are shown in Figure 13 from the western part of the study area. Examples of all three styles are shown in Figure 14, an enlargement of the central part of the survey area. [Modeling examples of typical ZTEM responses are shown in the ZTEM Primer Appendix D].

The first class of high is suggestive of parts of a stratigraphy that are more conductive (as is the opposite for the lows discussed below). The second class of highs is thought to be due to contacts between rock types of different resistivities.

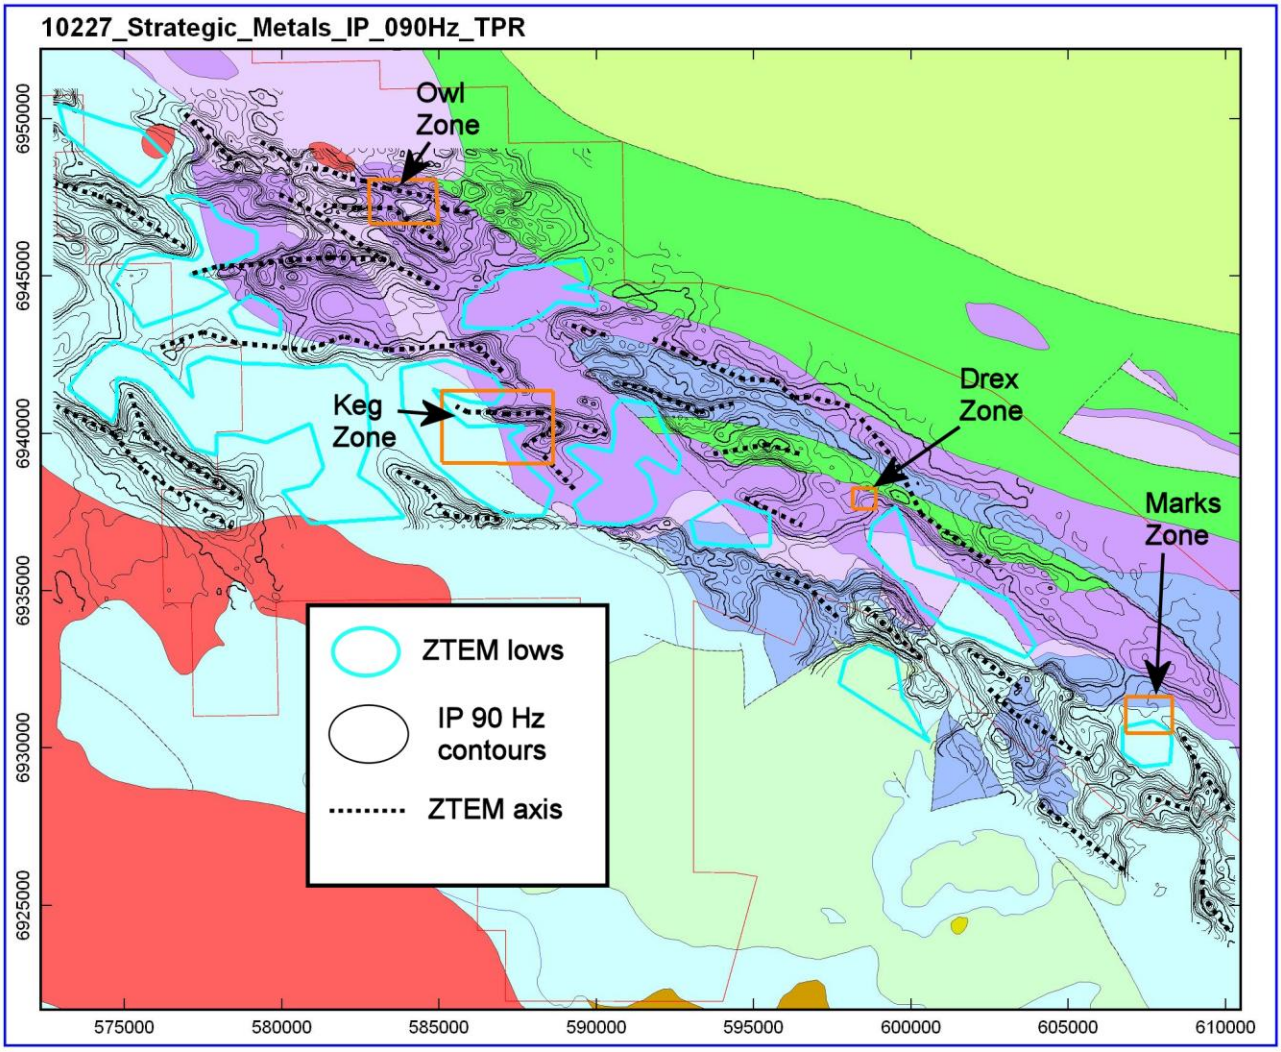

Figure 12: Geology with ZTEM IP 90 Hz TPR draped as contours; lows are pale blue zones; Z-axis features as dashed; geological legend same as in Figure 8.

These are likely fault contacts. The third class of highs are thought to represent later stage faulting which cross-cuts the structural grain of the rocks and also goes across different rock types. These definitions are not absolute however, as can be seen in the central part of Figure 12 where there appears to be a high that shows both Type 2 and 3 character. The lows can be interpreted as more resistive zones and were this area a terrain where intrusives were known or suspected, then these lows could be considered possible expressions of outcropping or buried intrusive stocks. In this context however, this does not appear to be the case and the known areas with intrusive rocks in the western part of the study area do not appear as lows. In this context then, the lows are interpreted to be more resistive zones within the mapped units. Whether a hydrothermal silicification event has contributed to creating these responses is unclear. A large part of the Rabbit Kettle Fm. Two Pete Facies (CORT-see Figure 8) located in the western part of the study area is quite resistive. Significant parts of the Mt. Christie Fm. are as well quite resistive.

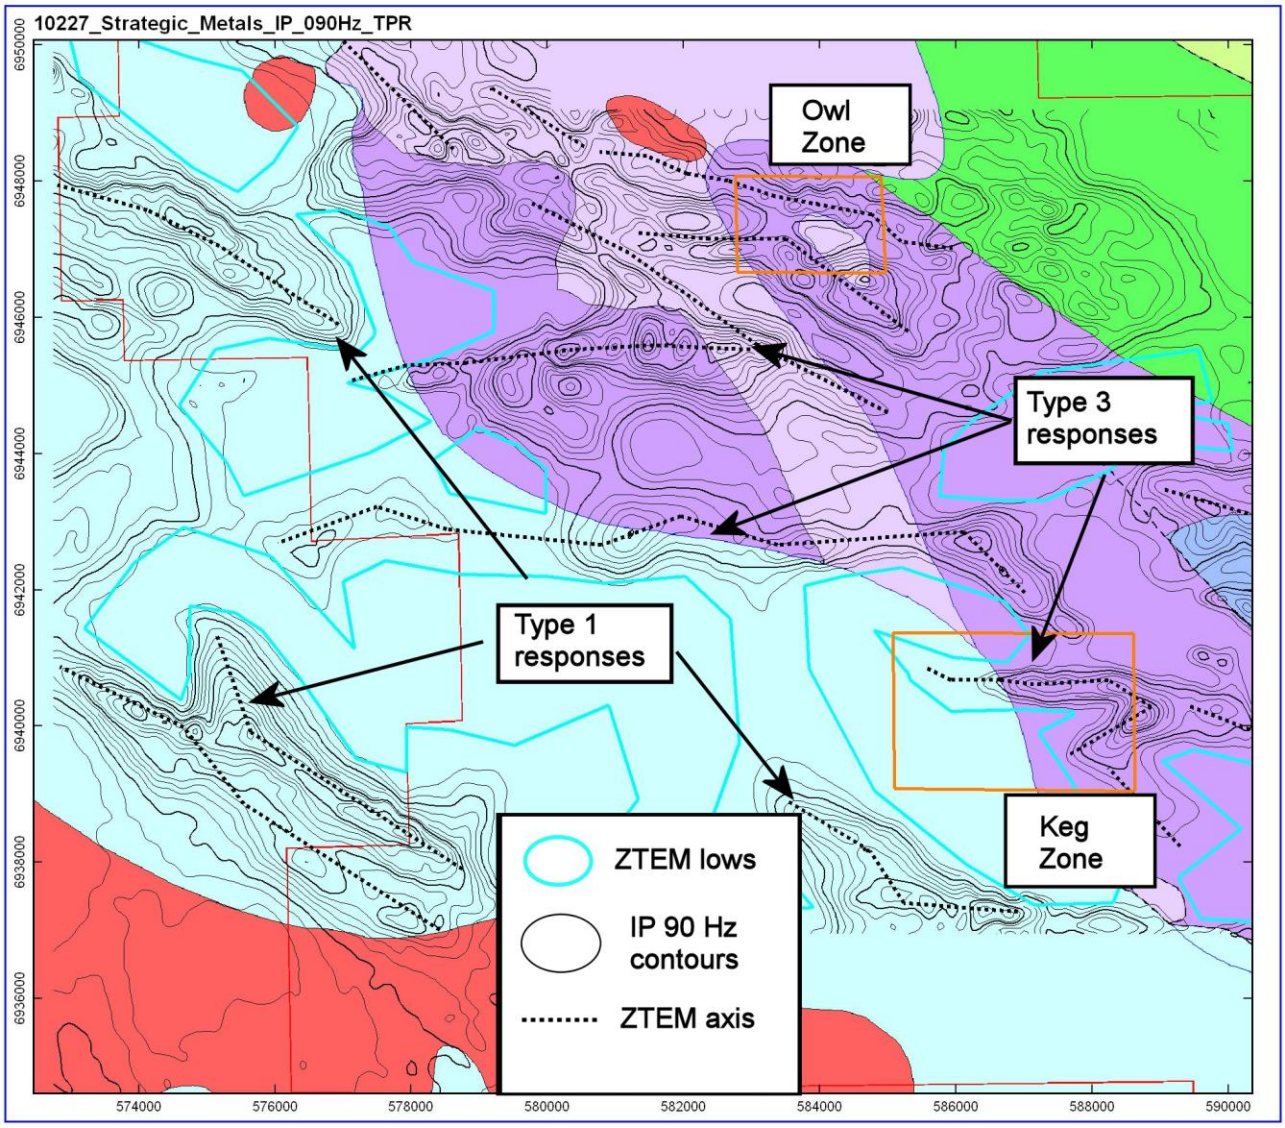

Figure 13: Western part of study area showing ZTEM responses and geology; geological legend same as in Figure 6.

ZTEM & MAGNETIC OUTCOMES-FOCUS AREAS

The geophysical outcomes over the Focus Areas are examined in order to have a calibration which can then be applied elsewhere on the property. For each area, four themes are examined; the mapped geology (with lead geochemistry displayed), the TMI, TMI-tilt and the IP 180 Hz TPR[2]. As the magnetic and ZTEM cover the same area, both outcomes are discussed together.

[2] The IP 90 Hz TPR has been used for the survey-wide images but 180 Hz was selected for the detailed blocks. The overall differences are however, relatively minor.

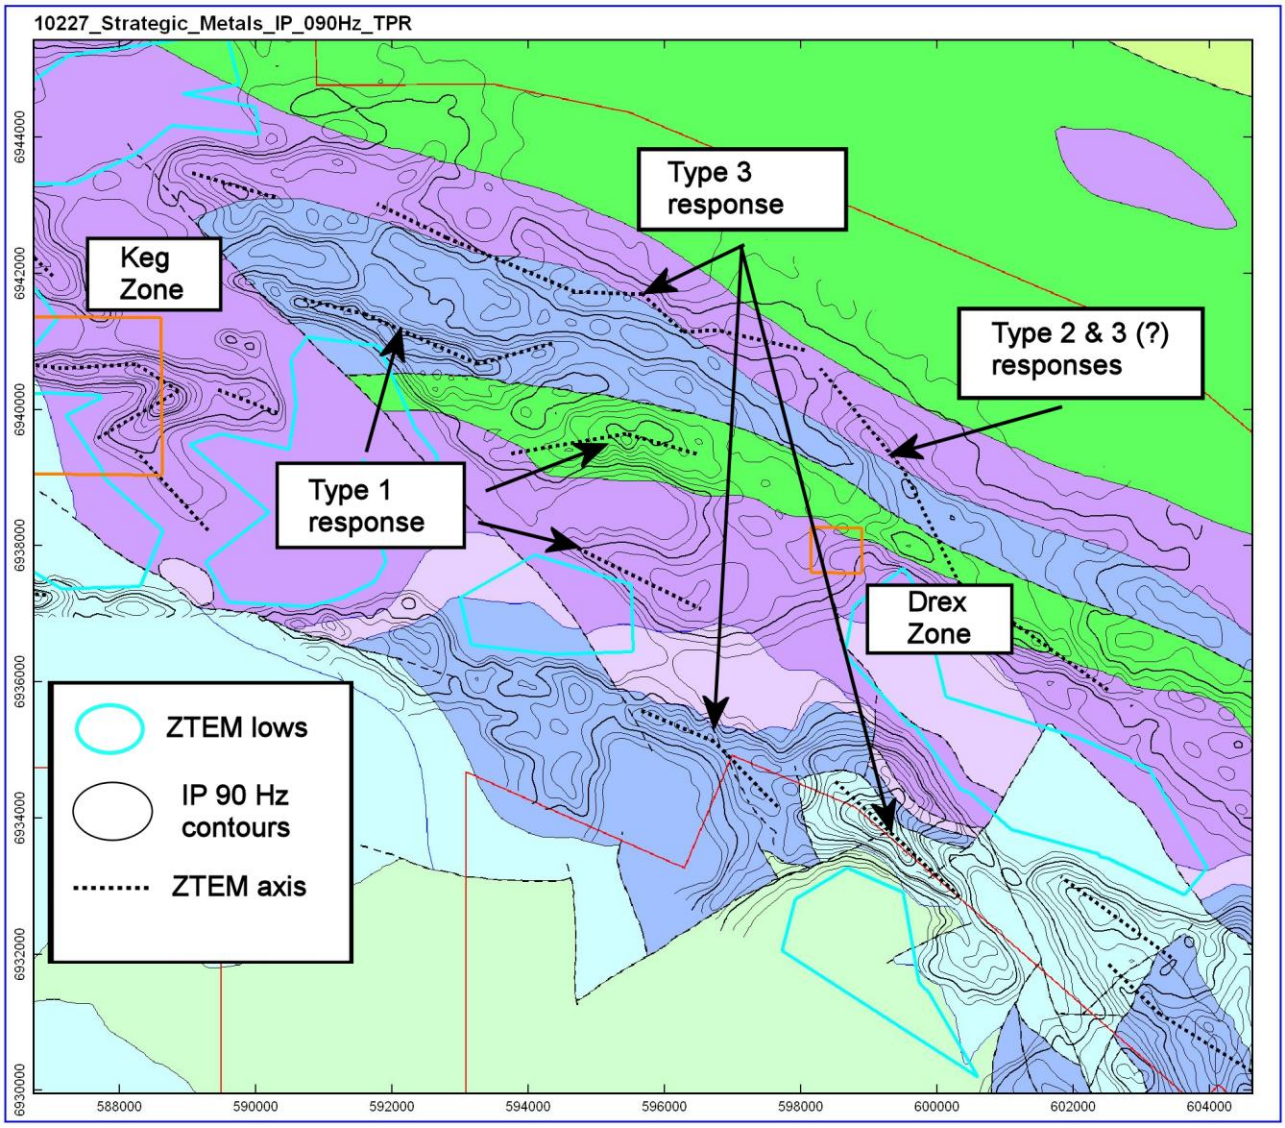

Figure 14: Central part of study area showing all three styles of ZTEM response; geological legend same as in Figure 6.

.

Owl Zone

The suite of images is shown in Figure 15. The geology is sediment dominated with a mapped folded thrust wrapping around the Zone. The anomalous geochemistry lies on the southern flank of a tightly folded magnetic feature. The source of the magnetic response is unclear from the mapping, but pyrrhotite is noted in sediments drilled at Keg, 7 km to the SE.

The ZTEM shows several WNW trends that are conformable with the magnetic grain. The area of anomalous geochemistry lies between the major ZTEM linears. There are not many interpreted faults in the area; these are considered to typically be expressed as strong linear magnetic lows, but give some indication of the truncation of otherwise continuous features.

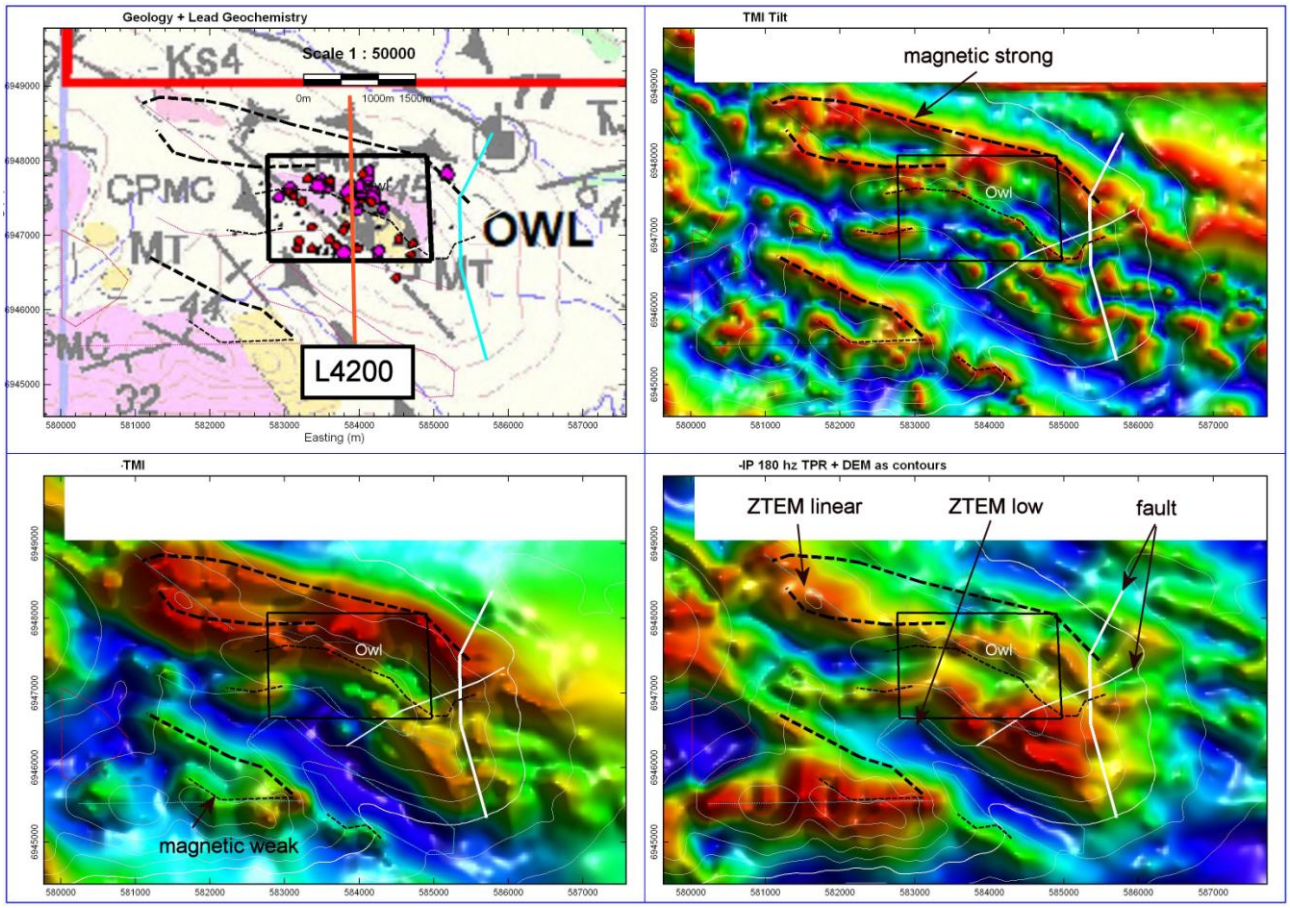

Figure 15: Owl Zone-geology + Pb geochemistry, magnetics and ZTEM results.

Several features were however, were selected using the TMI-tilt results. One is roughly NS and appears to cut off the Zone to the east and there is another with a NE-SW trend also on the eastern side of the Zone.

A representative CDS for L4200 is shown in Figure 16 (location of this line is shown in the upper left image of Figure 15). The center of the Zone is shown on section by the black vertical line. There is considerable shallow, depth limited conductivity on either side of the Zone. This style of response suggests a stratiform-type setting to mineralization which in turn could mean the mineralization is depth limited. However, the large zone of conductive rock noted in the Owl Zone (see Figures 7-9) makes this area unique on the property. Additional attention to this area seems warranted so as to try and understand the nature of the setting and potential limits of mineralization.

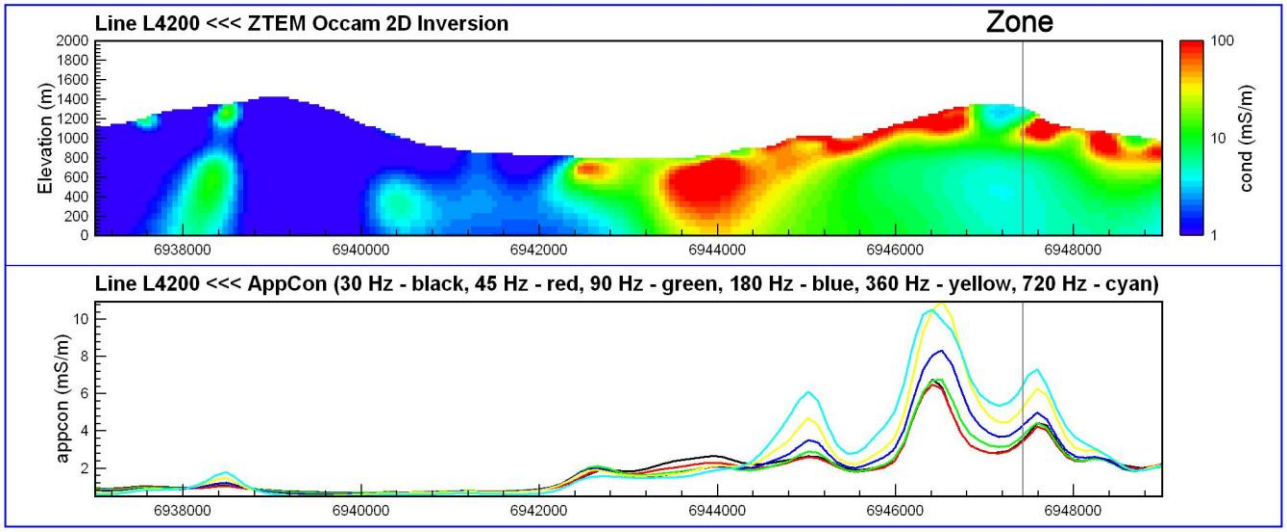

Figure 16: Owl Zone; CDS and AppCon profiles for L4200.

Keg Zone

The suite of images is shown in Figure 17. The geology is again sediment-dominated with a mapped thrust cutting NW-SE through the center of the Zone. There are a series of NW-trending short strike-length magnetic linears en echelon with the Zone and to the south. Immediately north of the Zone there is an approximately 4 km magnetic linear with a more WNW orientation. The TMI-tilt shows a NE-SW trending structure. This appears to be important as it seems to form the SE boundary of the geochemical response. As well, a broad zone of low magnetic response occupies the SE corner of the Zone.

There are several intrusive-like lows in the ZTEM results both to the NW of the Zone and along its southern flank. A tightly folded high with the fold nose facing east is located on the east half of the Zone. In the 3D representation of the ZTEM and IP results shown in Figure 18, the northern limb of the ZTEM fold structure can be seen plunging to the west. In the shallower part of the section (near where the recent drilling has been carried out) there is a good correlation between the ZTEM conductor and resistivity low mapped with the IP-resistivity survey. There is a direct correlation between the northern limb of the ZTEM fold structure and a linear magnetic feature, although there is minor evidence in the magnetic results of the southern limb of the ZTEM fold. The nose of the ZTEM fold structure and the westward plunging northern limb are considered areas of interest for further exploration.

A representative conductivity section (L 4400) is shown in Figure 19 (the location of this line is shown in Figure 17, upper left image). There are several large zones of conductivity extending

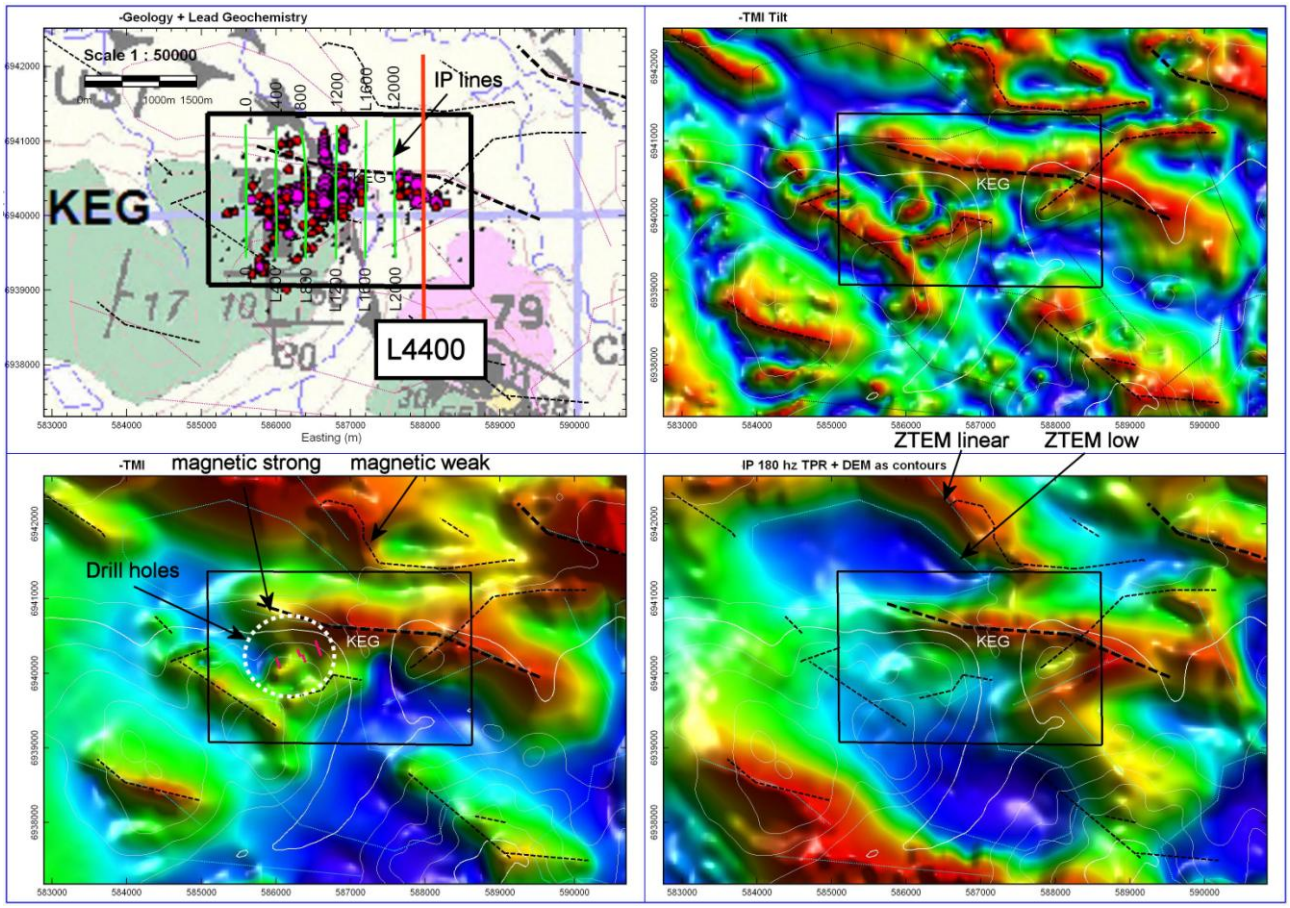

Figure 17: Keg Zone-geology + Pb geochemistry, magnetics and ZTEM results.

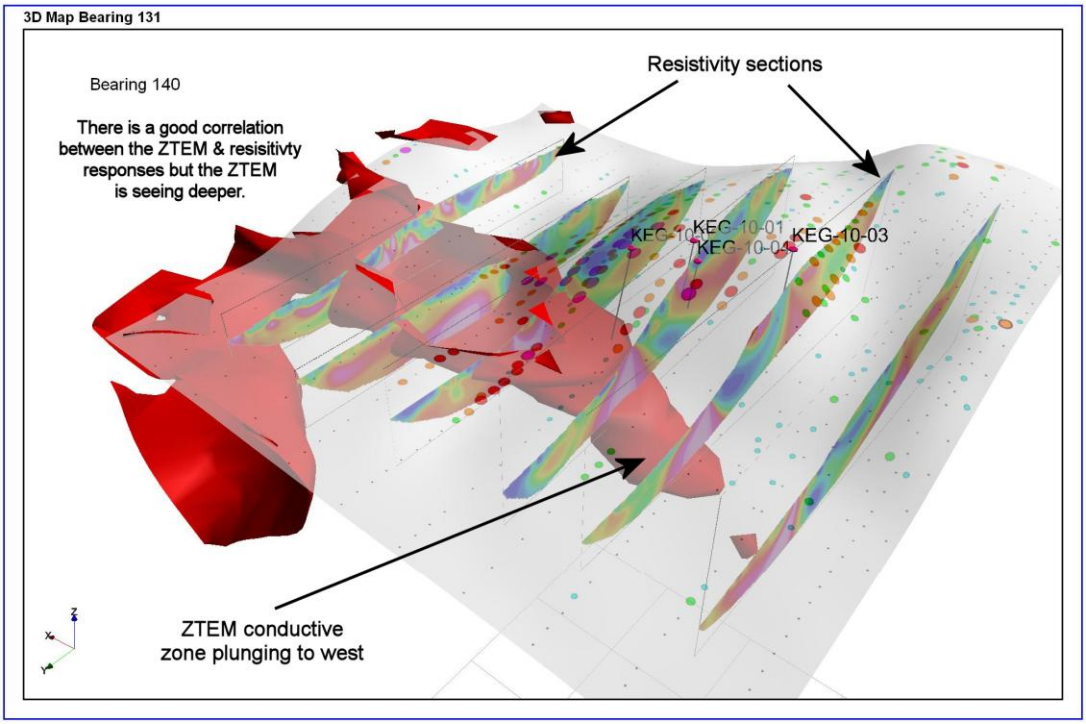

Figure 18: Keg Zone; 3D display looking SE showing the ZTEM conductive zone plunging westward along with the resistivity and geochemical results.

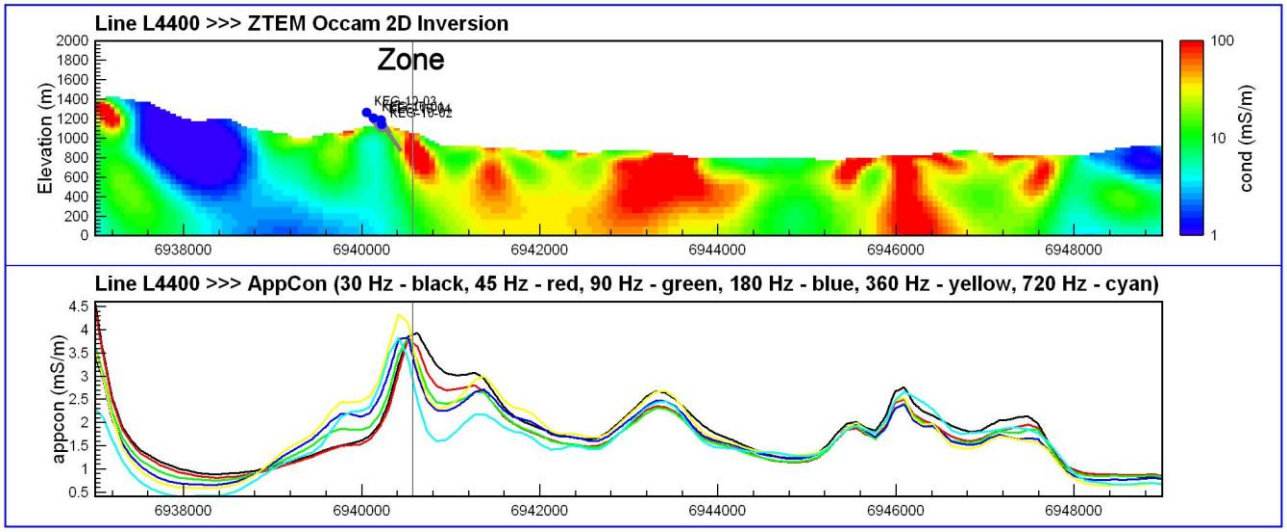

Figure 19: Keg Zone; CDS and AppCon profiles for L4400.

north from the center of the Zone. While not the largest zone, the conductive feature just north of the drilling shows up as the strongest conductor in the AppCon results.

Detailed sections were put together showing the ZTEM, IP-resistivity and Mag3D outcomes over the Keg area. These are provided in Appendix C. Simplified sections showing only the ZTEM CDS and DC resistivity results for L4300 and 4320 are shown as Figures 20 and 21. A very good correlation is noted between the ZTEM low resistivity zone at 6940500 and a strong resistivity low in the DC resistivity results. Drilling in 2010 was to the south of this feature.

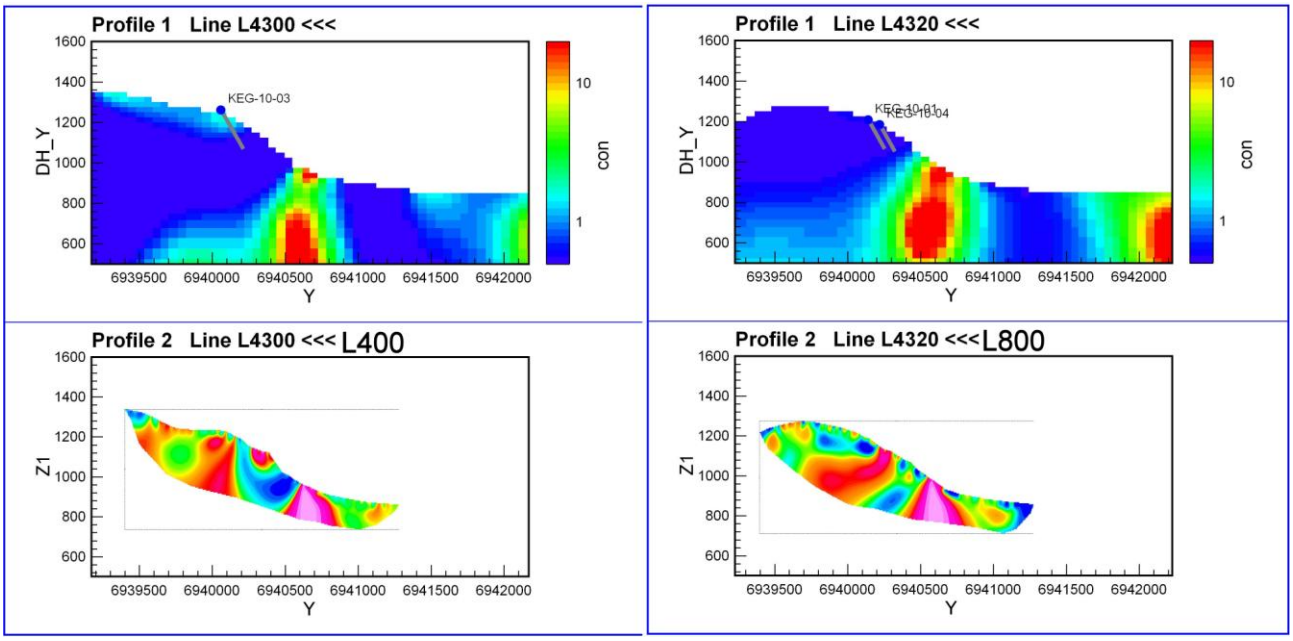

Figure 20: ZTEM CDS and DC resistivity inversions over Keg Zone.

Drex Zone

The suite of images is shown in Figure 21. The Drex Zone is situated in what appears to be a NW trending group of sedimentary rocks. South of the Zone, there appears to be a fair bit of structural complexity due to thrusting, but the Zone itself does not appear to be tectonically disrupted. A fault is noted just to the north of the Zone that has a strike conformable with the overall grain of the rock. A feature of interest with Drex is that there is a magnetic doublet straddling the Zone; this is highlighted in Figure 22 (right hand image). While not obvious in the 180 Hz TPR, the 90 Hz TPR shows an interesting semi-circular linear roughly bracketing the Zone as well.

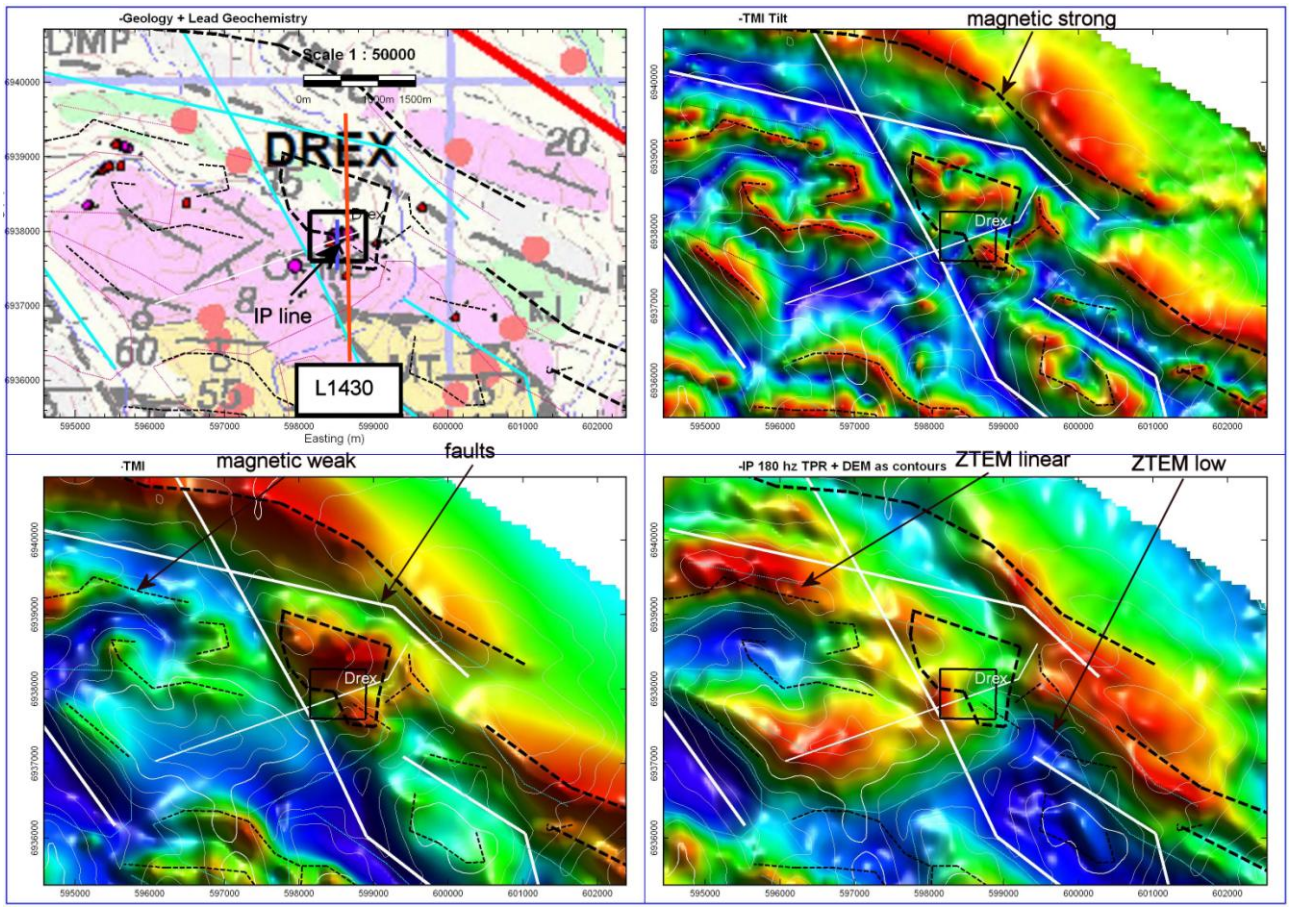

Figure 21: Drex Zone-geology + Pb geochemistry, magnetics and ZTEM results.

A major band of magnetic high straddles the noted fault north of the Zone and there are several breaks in this magnetic trend that could reflect faulting as well. The ZTEM results show a sympathetic response to the magnetic feature noted, suggesting that this area is structurally anomalous. The ZTEM also shows an intrusive-like low to the southeast of Zone. A major NW-SE linear in the ZTEM (Figure 8) passes very close to the Zone.

A CDS through the Zone (L1430) is shown in Figure 23. This image suggests that the Zone sits at the upper contact of a northward dipping thrust (thin conductive zone).

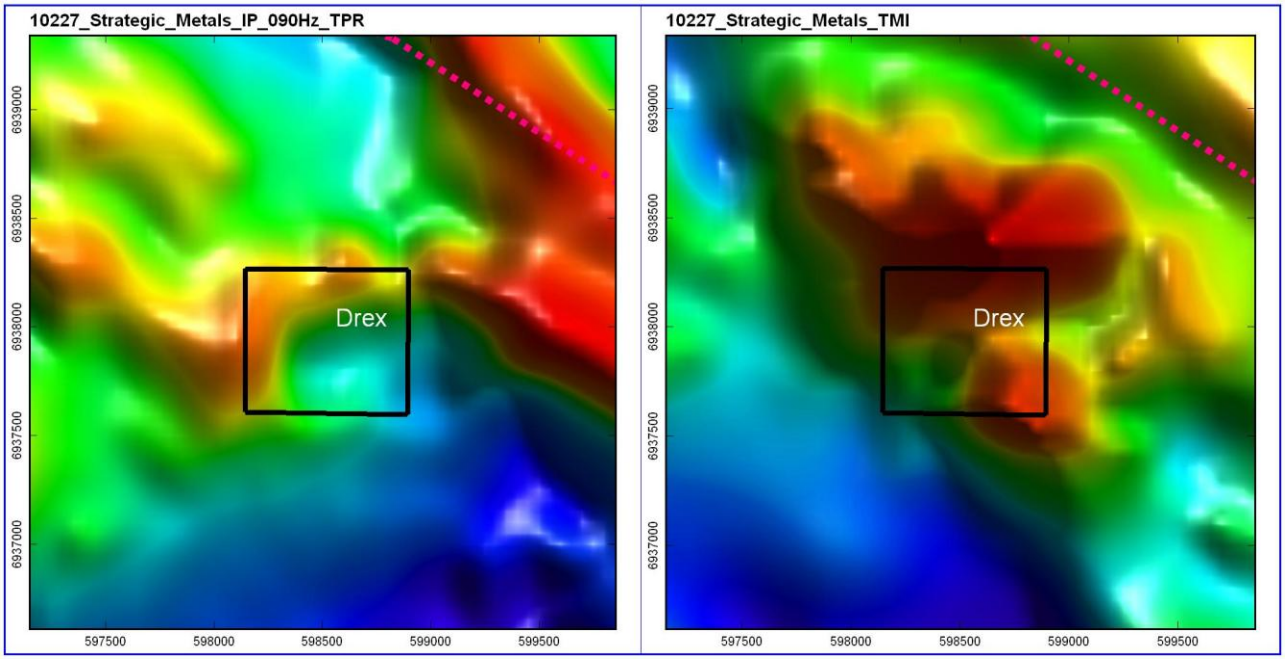

Figure 22: Drex Zone: IP 90 Hz TPR + TMI.

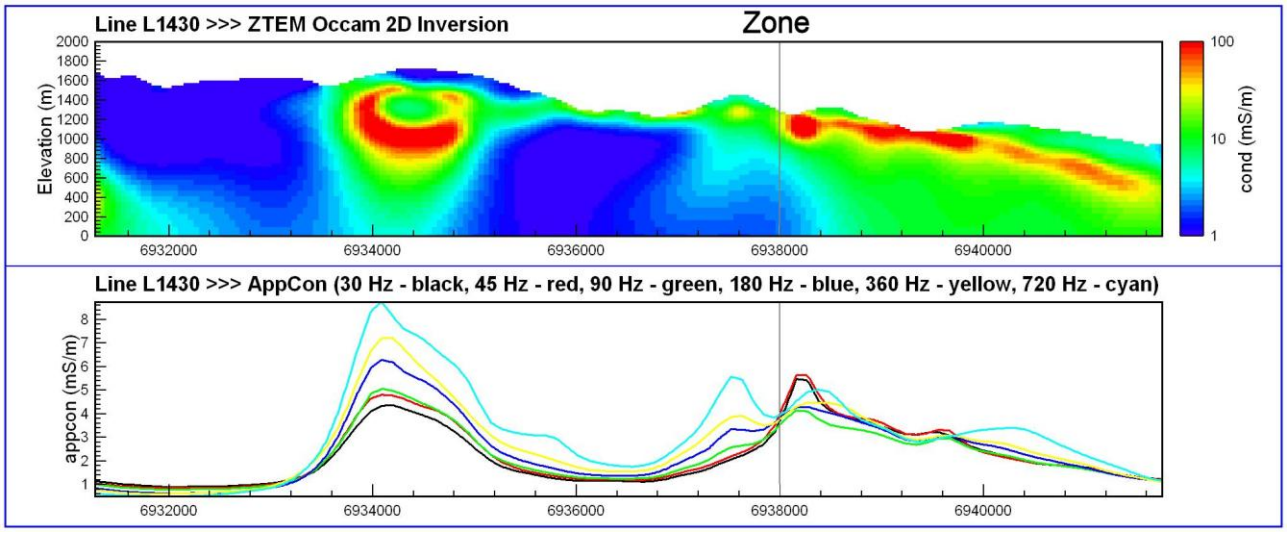

Figure 23: Drex Zone; CDS and AppCon profiles for L1430.

Marks Zone

The suite of images is shown in Figure 24. The geology is again sediment-dominated with the Zone appearing to be spatially next to a thrust. The fault noted north of Drex is also about 2.3 km NE of this Zone. Also like at Drex, there seems to be a major change in the magnetic response north of this fault. To the south, the magnetic pattern is very broken up into short segments with an overall NW trend whereas north of the fault the magnetic character shows more a flat sheet-like response. Both the magnetics and ZTEM show low responses over the Zone; this is interpreted to

mean that both the two surveys are reflecting the likely present of an intrusive. There is little indication from the magnetic or ZTEM results of faulting in the area.

A CDS through the Zone (L1870) is shown in Figure 25. This shows the Zone to lie directly over a pipe-like conductive feature.

OTHER AREAS OF INTEREST ON THE PROPERTY

Figure 26 shows a composite of the TMI-tilt and ZTEM results. Two areas of interest have been defined designated Target A and B. The selection was based largely on the intersection of magnetic and ZTEM structures in these areas, defining what are thought to be zones of complexity that could be favorable locations for mineralization.

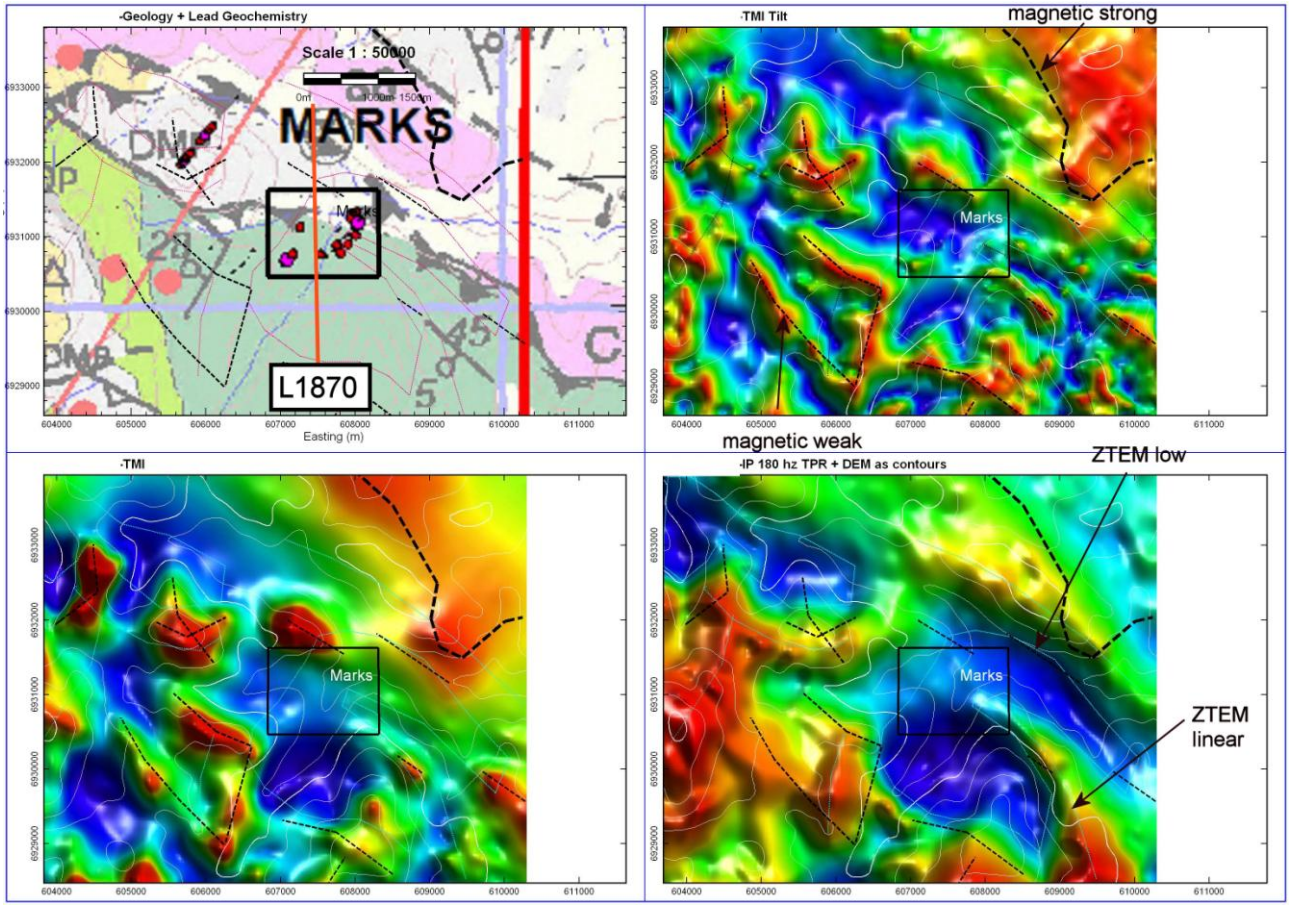

Figure 24: Marks Zone-geology + Pb geochemistry, magnetics and ZTEM results.

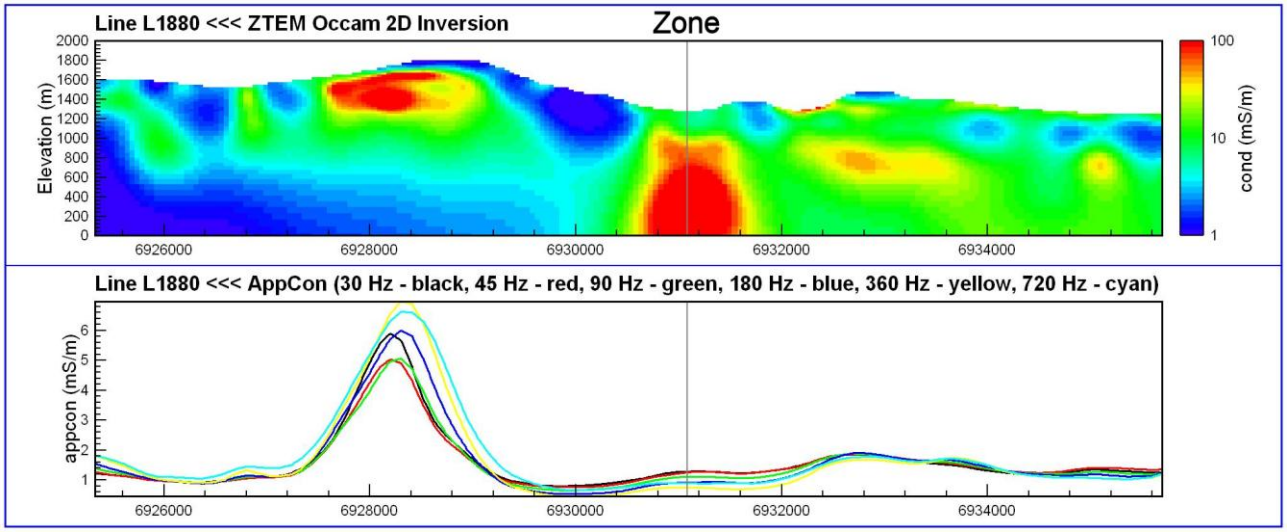

Figure 25: Marks Zone; CDS and AppCon profiles for L1880.

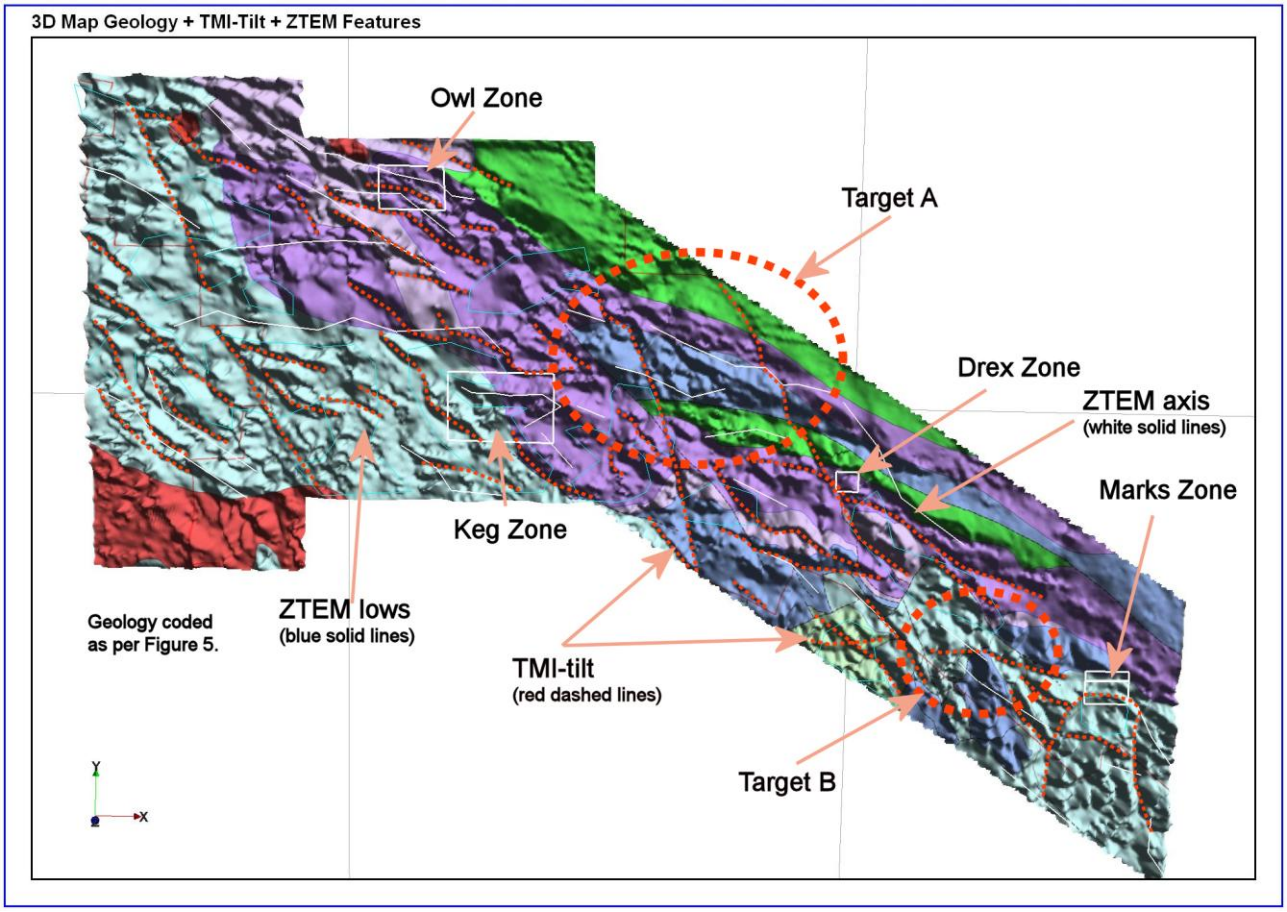

Figure 26: Composite image of TMI-tilt and ZTEM linears highlighting areas of interpreted structural complexity.

IP-RESISTIVITY OUTCOMES-FOCUS AREAS

Three areas were surveyed; Keg (six lines), Drex and Rebel (one line each). The locations of these lines are shown in Figure 2. The results are discussed below.

Keg Zone

Six lines of IP-resistivity were surveyed over the geochemical anomaly. Figure 27 shows the resistivity and chargeability for 50 m depth along with the drill holes. This image shows that the drilling apparently tested a thin conductivity feature striking E-W but seemed to miss a major conductive zone that trends roughly WNW and lies ~300 m north of the drilling. A strong discrete chargeability response is also noted just northwest of the drilling.

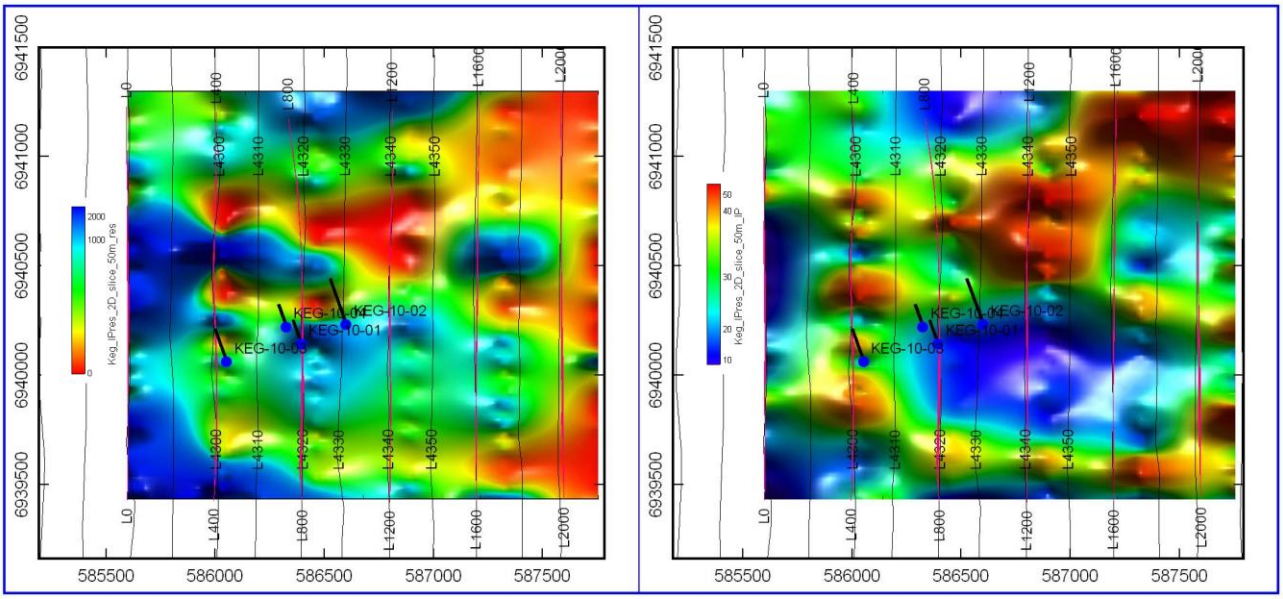

Figure 27: Keg resistivity (left) and chargeability (right) 50 m depth slice with drill holes.

The inverted resistivity and chargeability sections are shown in Figures 28-33.

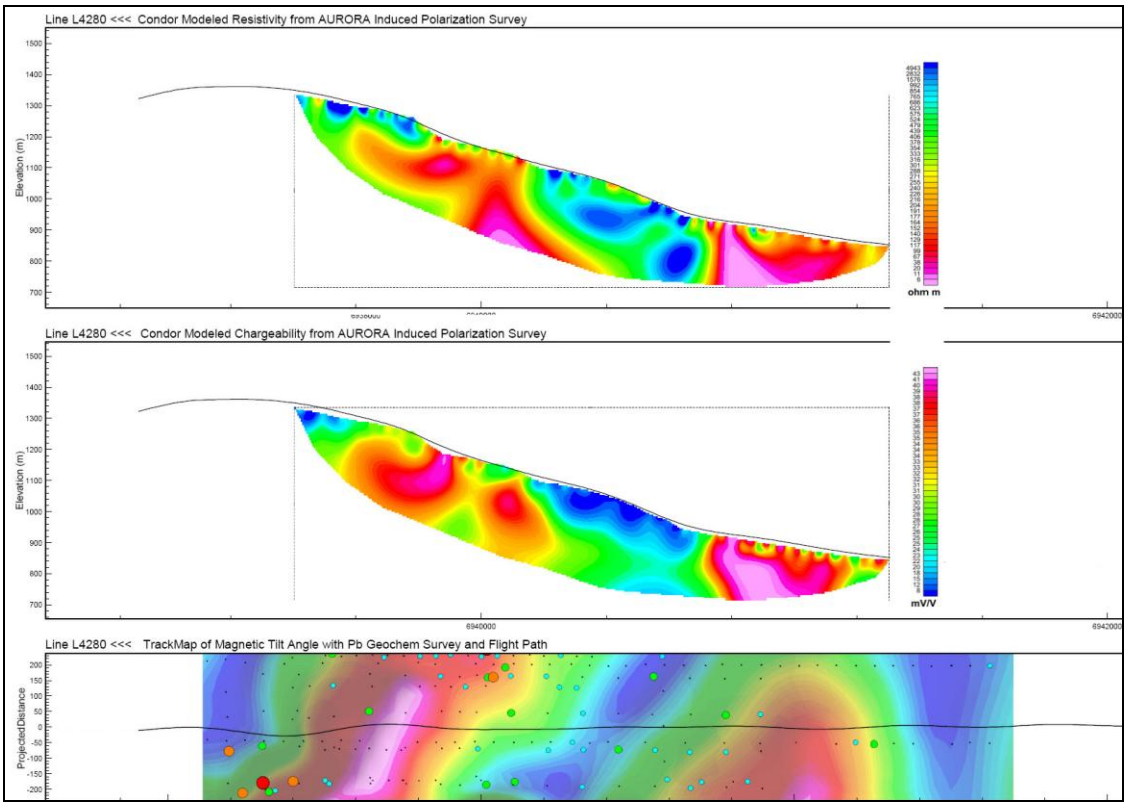

Figure 28: Line IP Line 0-ZTEM L4280.

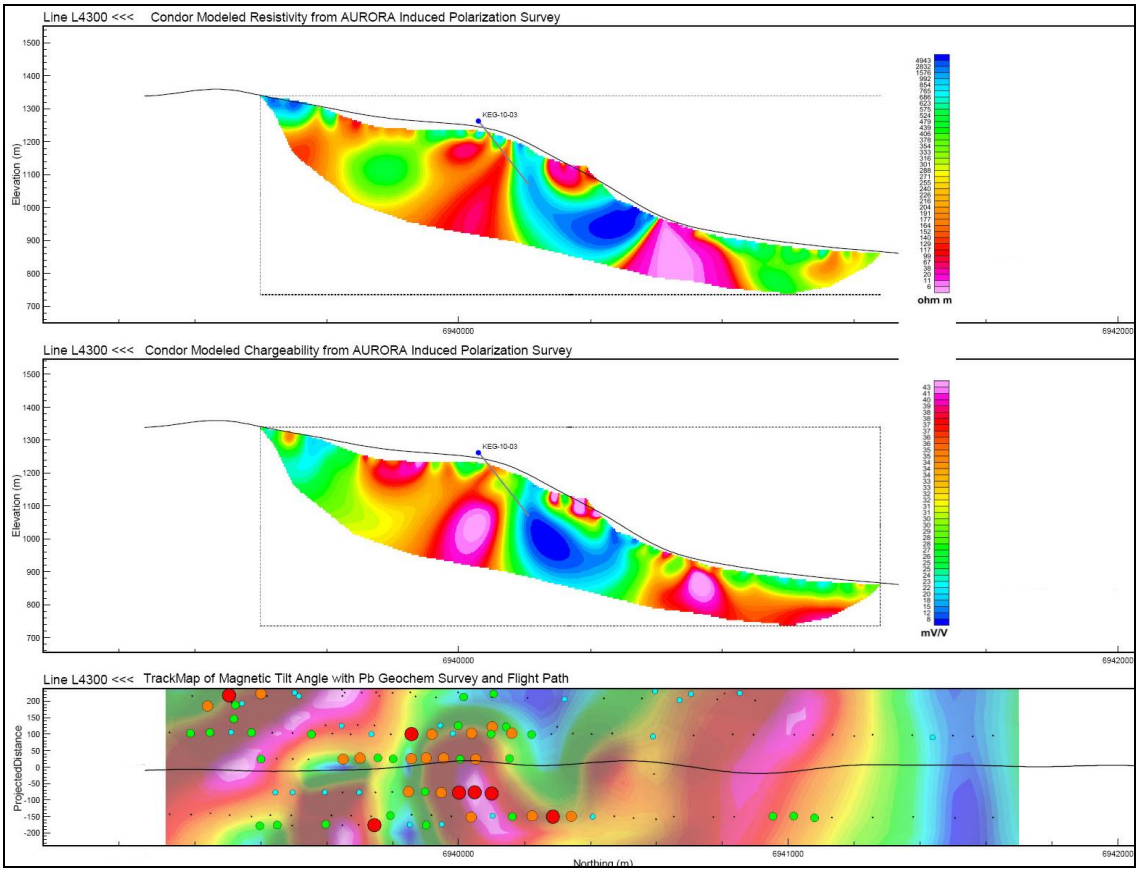

Figure 29: Line IP Line 400-ZTEM L4300.

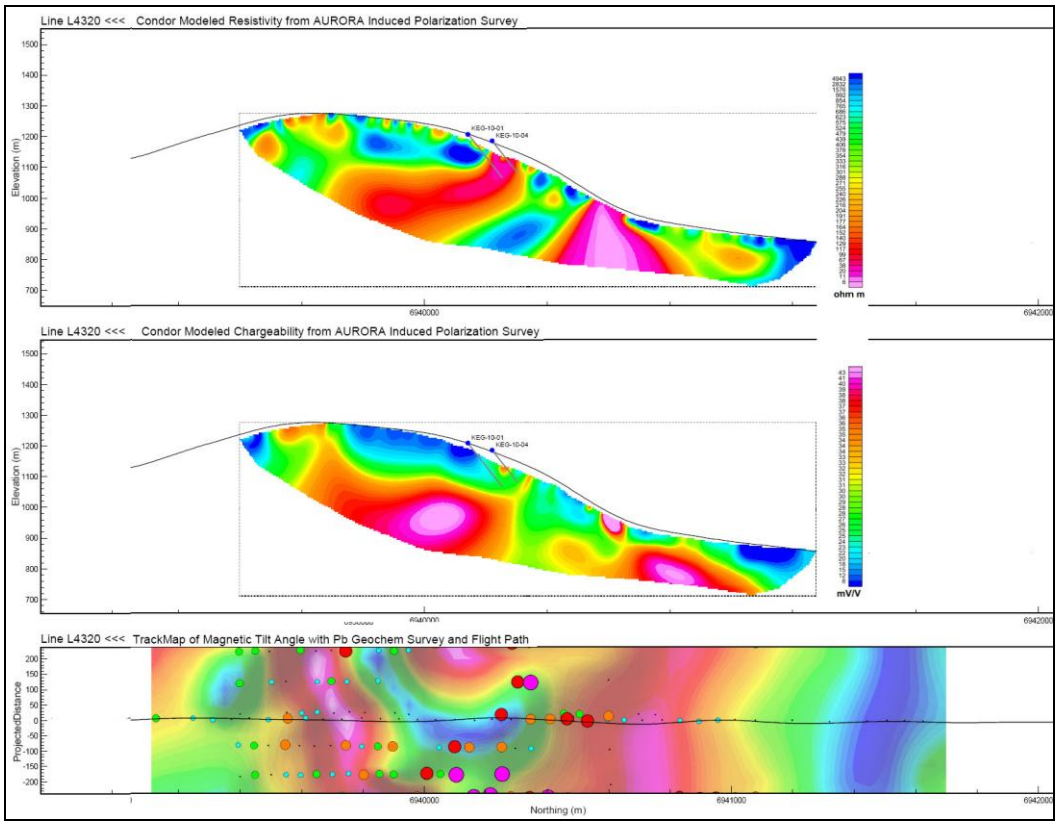

Figure 30: Line IP Line 800-ZTEM L4320.

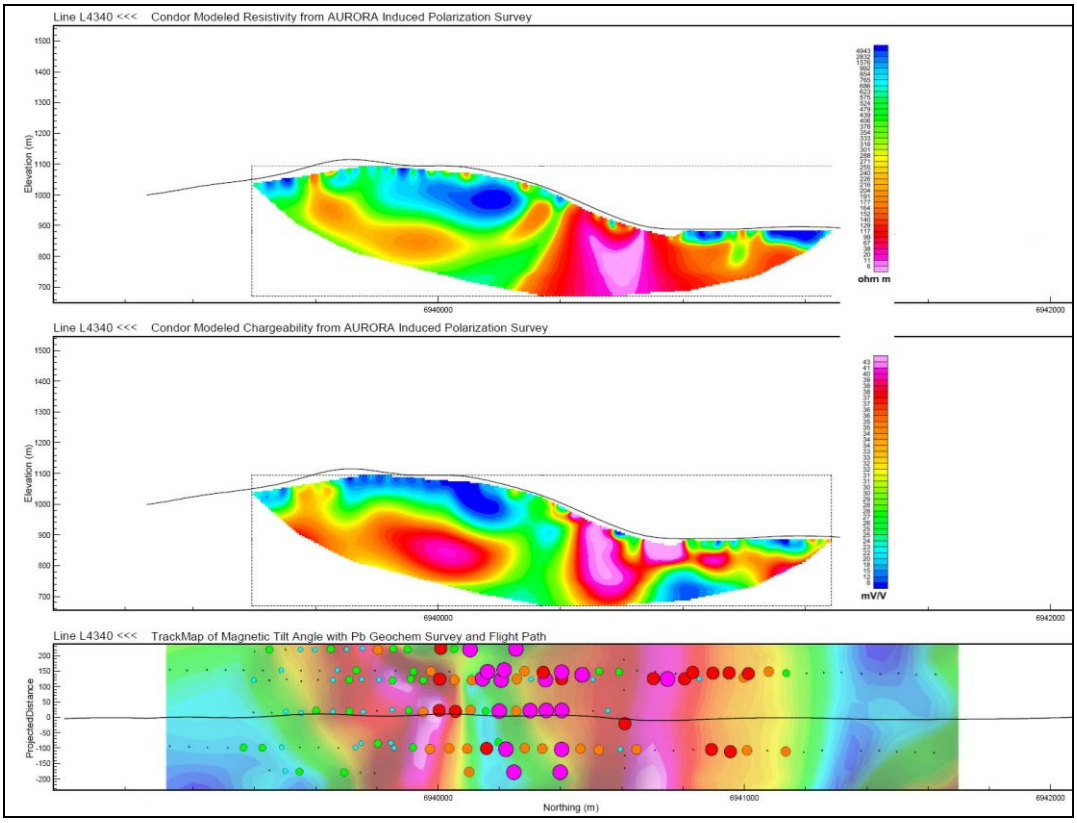

Figure 31: Line IP Line 1200-ZTEM L4340.

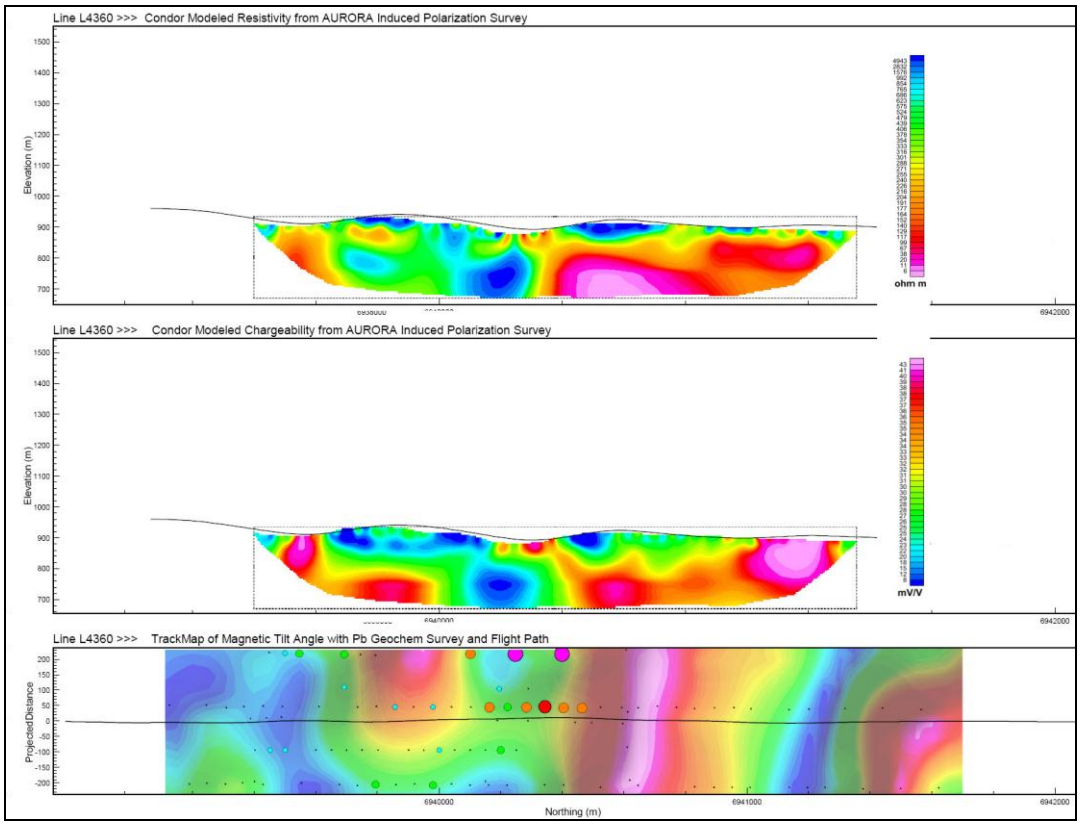

Figure 32: Line IP Line 1600-ZTEM L4360.

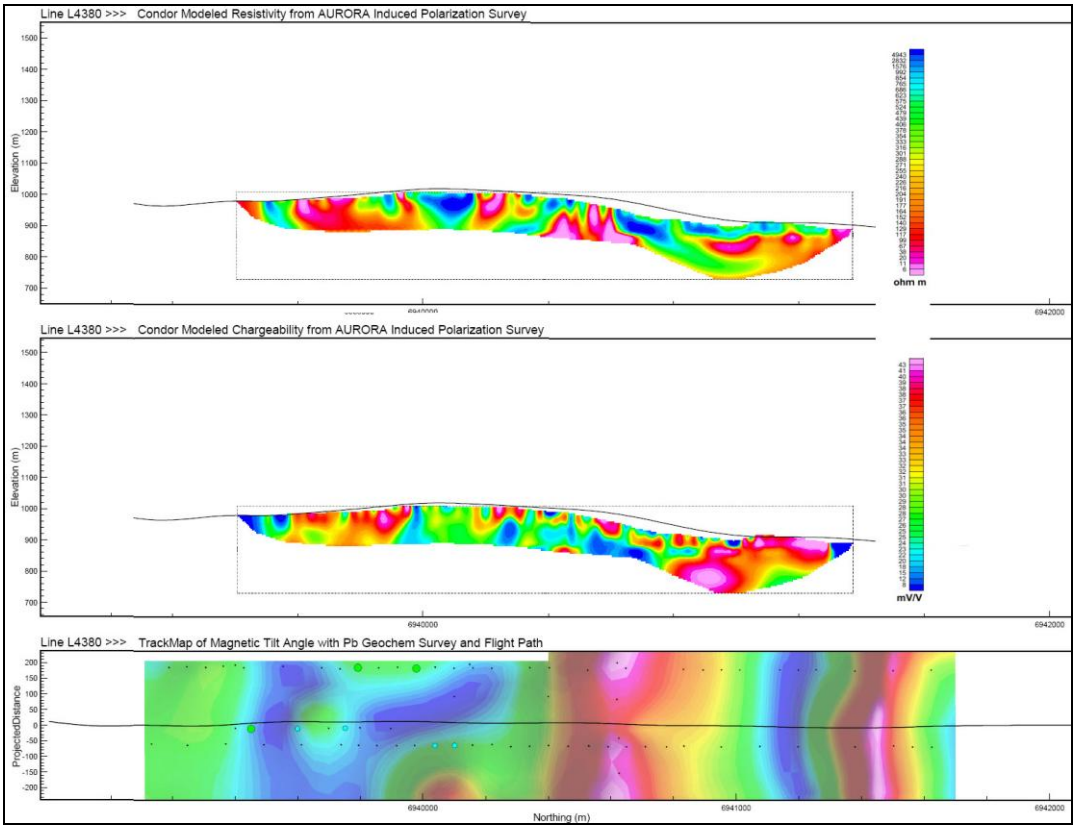

Figure 33: Line IP Line 2000-ZTEM L4380.

Drex Zone

The 2D inversion for the Drex IP-resistivity line is shown in Figure 34[3]. There are several shallow conductive zones on the flank of the hill and what appears to be a major conductive unit at depth under the ridge. The chargeability response overall is modest.

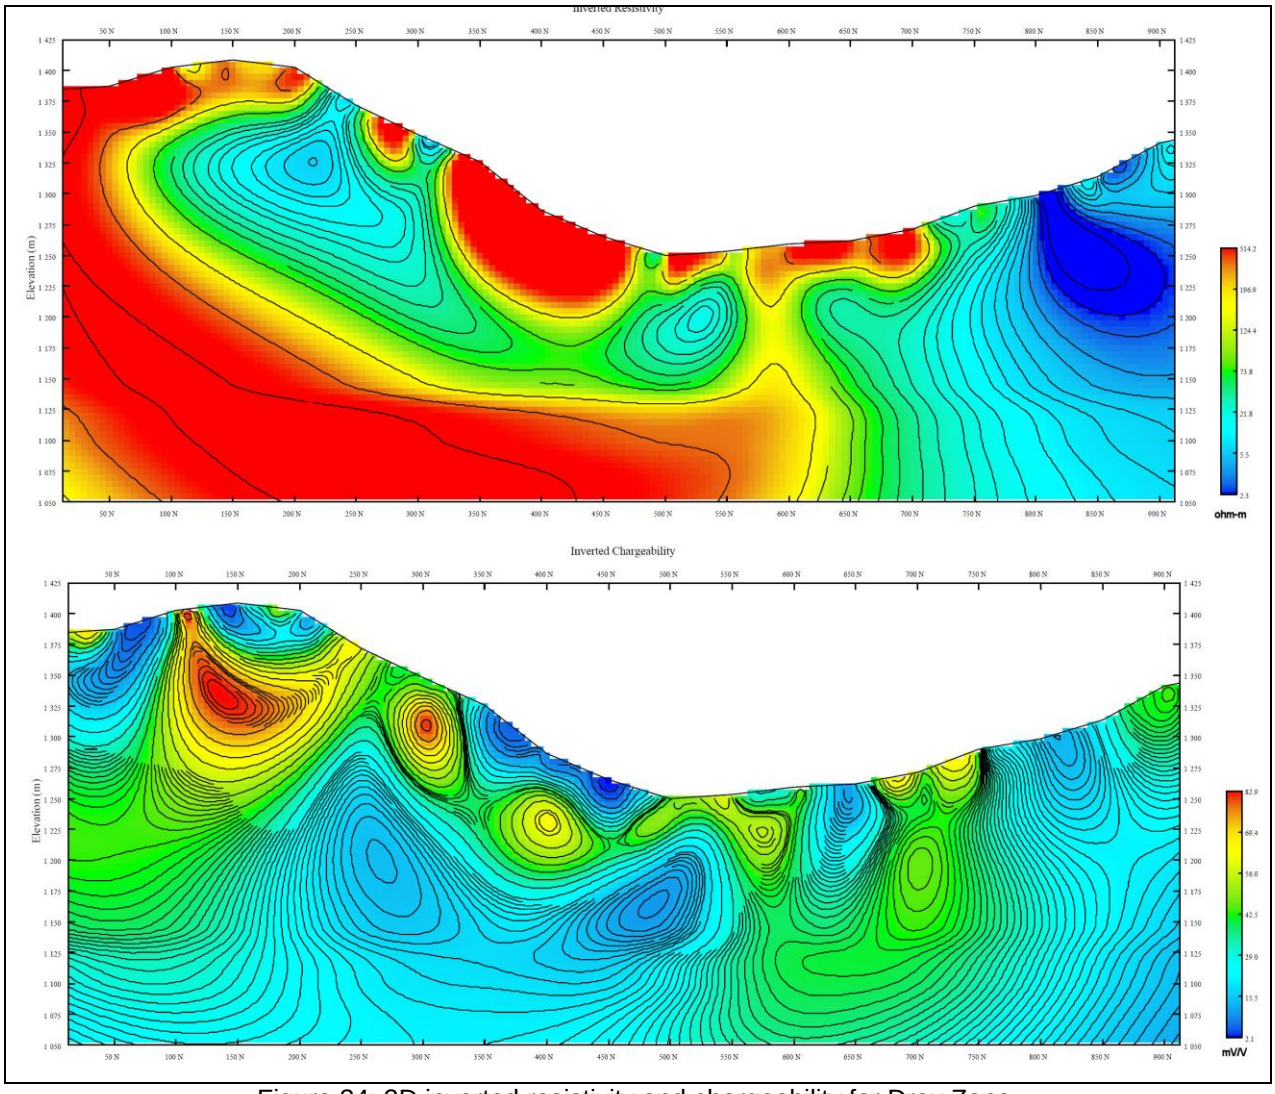

Figure 34: 2D inverted resistivity and chargeability for Drex Zone.

Rebel Zone

The 2D inversion for the Rebel IP-resistivity line is shown in Figure 35. There appears to be a shallow depth-limited zone of high resistivity on the crest of the hill and conforms to the northward dipping slope. The chargeability appears to show a zone of low response at surface and a fairly uniform zone of moderate response at depth; appears to be a lithologic-type response.

[3] Note for the single line sections the color scheme is reversed from the grid scheme

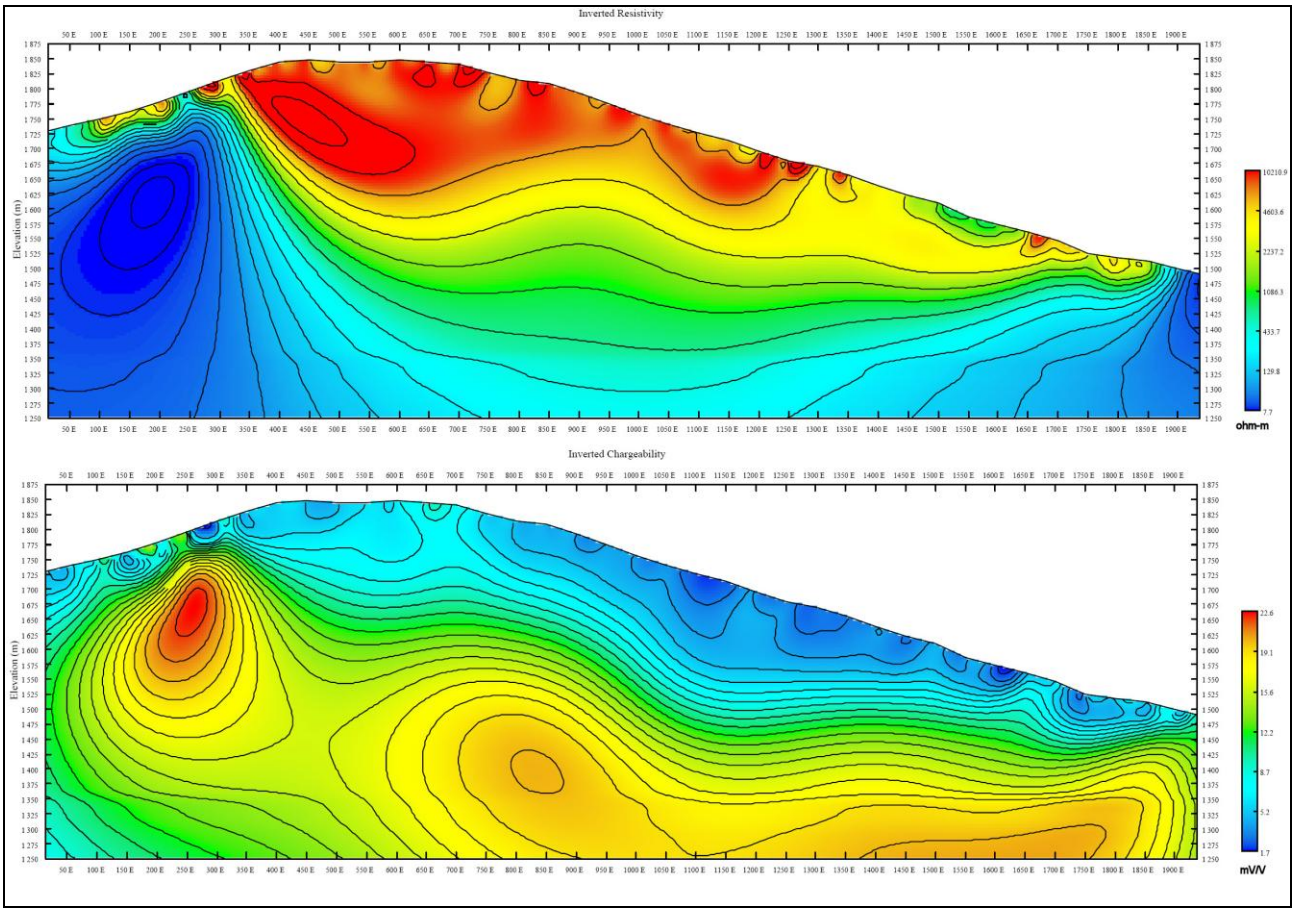

Figure 35: 2D inverted resistivity and chargeability for Rebel Zone.

OVERALL RANKING OF TARGETS

The geophysical results over the four designated Focus Areas on the property have been examined in some detail. The results of this assessment are summarized below.

Owl Zone

The ZTEM shows considerable conductivity in the area of the Zone, but it appears to be largely near surface and appears to lack vertical extent. The magnetic results are also 'active' in the area,but it is hard to define what could be termed a target signature. Overall ranking #4.

Keg Zone

This shows good coincident ZTEM and magnetic responses (as well as collaborating IP- resistivity) and shows potential both to the east along strike and to the west down-dip. The overall size and strength of the responses makes this the primary target on the property. Overall ranking #1.

Drex Zone

There do appear to be some interesting structures in both the ZTEM and magnetic results in the vicinity of Drex. The ZTEM CDS suggests the Zone is located at the upper edge of a thrust plate and may not have much spatial extent (except possibly down the thrust plane). However, the EM and magnetic in plan form (Figure 20) suggest there could be a local intrusive associated with the Zone. Overall ranking #3.

Marks Zone

A strong ZTEM intrusive-like feature lies directly below the Zone and a pronounced magnetic low also appears just to the south of the Zone (may be one and the same geological source). This type of setting is considered significant and further work at this location is recommended. Overall ranking #2.

The two selected Target Zones can't be ranked in the same fashion as the four Focus Zones, but some geological reconnaissance over each area is recommended to look for evidence of alteration or mineralization.

Discussion

The magnetic responses, while deemed interesting and diverse, are not deemed a primary target attribute for economic geology in the study area. However, at the Keg Zone the northern limb of a folded structure mapped by the ZTEM also shows a coincident magnetic response. At Drex, a magnetic high is noted north of the Zone and at Marks Zone, the magnetic results appear to be showing a possible intrusive source (as a relative circular low) that corroborates with the ZTEM results. There is considerable structural grain apparent in the magnetic results which are deemed useful insights into potential location of mineralization.

The ZTEM results are showing a variety of responses from intrusive-like responses at Marks Zone, to a thrust plate and possible intrusive at Drex, to a folded structure at Keg. At Keg as well, the ZTEM and DC resistivity results show a direct corroboration of a strong low just north of the area of recent drilling. Extending over the property are numerous axial highs and areas of low response. The former are interpreted to be faults or contacts and the later, areas of high resistivity. Whether the zones of high resistivity are primary lithological responses or possibly due to silicification is unclear.

Further drilling at Keg is warranted based on the size and strength of the multiple geophysical responses. At Marks Zone, there appears to be clear evidence of a localized intrusive based on the ZTEM and magnetic results. Drill testing of this feature is recommended. The Owl Zone is possibly too anomalous based on the ZTEM and magnetic results and IP-resistivity is recommended to try and define a more localized target. A geological setting at Drex appears to be defined by the ZTEM results and further input from field mapping is deemed the preferred way forward.

Several areas of interest have been defined based on the ZTEM and magnetic results. Field examination of these areas is deemed warranted to look for possible direct evidence of alteration or mineralization.

The ZTEM results in particular contain a considerable amount of coherent information that is difficult to define in geological terms given the limited exploration that has been conducted on the property to date. With feed-back from planned field programs, it should be possible to extract more geological information from both the ZTEM and magnetic results and hopefully better able to define the deposit type signatures for this environment.

The IP-resistivity results at Keg were deemed interesting, but the drilling to date has not intersected the most anomalous resistivity or chargeability results. The IP-resistivity over Drex and Rebel did not appear to show any features deemed worthy of follow-up.

6. CONCLUSIONS AND RECOMMENDATIONS

An assessment has been made of ZTEM EM, magnetic and IP-resistivity results over the Silver Range property. All four areas of known mineralization; Owl, Keg, Drex and Marks appear to have larger geophysical signatures than the exploration work to date suggests. Drilling at Keg, Drex and Marks is felt to be warranted. It should be noted that the geophysical signatures of all three areas are different.

Based on the ZTEM and magnetic results, two areas of interest have as well been defined which are felt to warrant field examination.

With more direct field work, including drilling, it should be possible to further refine the interpretation of both the ZTEM and magnetic results.

Respectfully submitted,

Ken Witherly

SILER RANGE 2010-2011 IP-RESISTIVITY SURVEYS

May 8, 2012

Mr. Bruce Youngman
Silver Range Resources Ltd.
1016-510 West Hastings Street
Vancouver, BC V6B 1L8
Canada

Ref-Silver Range 2010-2011 IP-resistivity surveys

Dear Bruce:

Condor Consulting, Inc. (Condor) has undertaken an assessment of two IP-resistivity surveys that were carried out on the Silver Range property KEG Zone in 2010 and 2011. The extents of these surveys are shown in Figure 1. This memo will discuss the outcomes of the combined survey results.

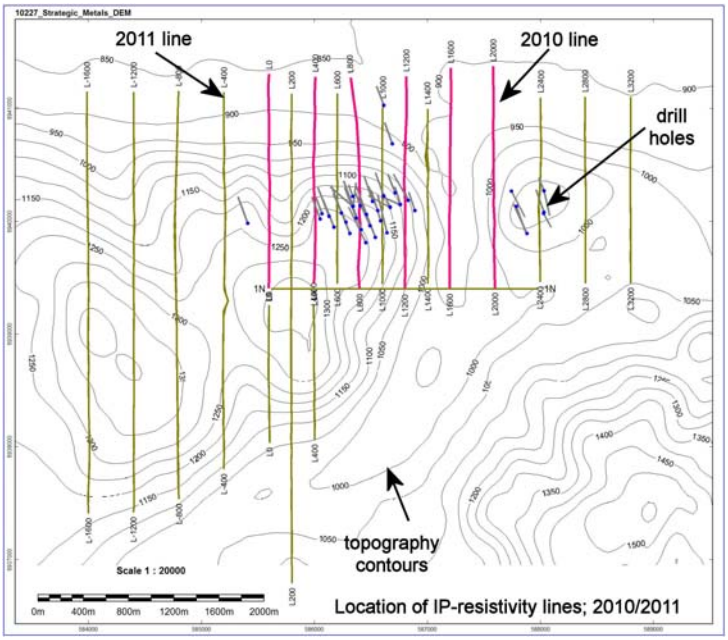

Figure 1: Location of 2010-2011 IP-resistivity lines.

The Surveys:

The basic information on the two surveys is as follows:

2010-
Contractor: Aurora Geosciences
Number of lines: 6
Array: Expanding pole-dipole
Electrode & N spacing: 50 and 100 m; N=1 to 20

Number of line kms: 12 lkms
2011-

Contractor: Aurora Geosciences
Number of lines: 14
Array: Expanding pole-dipole
Electrode & N spacing: 100 m; N= 1 through 6
Number of line kms: 35 lkm

Data Quality: The data quality for the two programs of work was deemed satisfactory, with the 2011 data being considered slightly better than the 2010 data.

Processing: Condor undertook both 2D and 3D processing of the IP-resistivity data. A number of processing products were produced from there results including:

-2D grids of primary IP and resistivity results
-2D inversions of each IP and resistivity section line
-3D inversions of IP and resistivity results (merged 2010-2011 results)

Products:
From these outcomes, a series of plan and sectional displays were created, including depth slices of the IP and resistivity results. The complete list products produced are provided in Appendix A. A selection of these is provided in this report to facilitate the present assessment.

Client Data:
Condor had access to the following client-generated data for the assessment;

-2010/2011 drilling (collar locations and survey information)
-Drill sections with geology for from Silver Trend web site
-Deposit DXF

These components are shown in Figure 2 which as well shows the IP-resistivity lines that are situated over the immediate drilling area.

Outcomes:
Figures 3 and 4 shows the resistivity and chargeability results respectively for both a shallow (15 below ground surface) and deep (100 m below ground surface) depth slice around the mineralized zone (MZ). These results are derived from the 3D modeling.

Figure 3: The shallow resistivity results show the MZ to straddle a NS-trending low that also appears to have a SW-trending component aligned with the long axis of the MZ; these are highlighted in the figure. A NW-trending low is noted just to the NE of the MZ. Along the southern limit of the image, a long arcuate low is apparent. For the eastern segment, the feature strikes E-W but just south of the MZ, the strike turns to the NW. The deeper result emphasizes the SW-trending conductive zone through the MZ. This feature extends to the SW of the MZ approximately 0.5 km further.

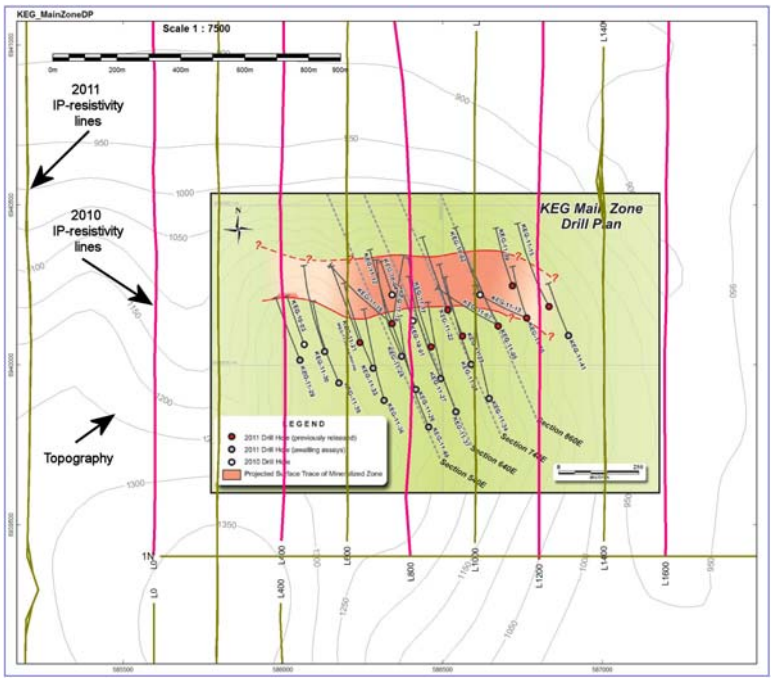

Figure 2: Detailed area around 2010-2011 drilling.

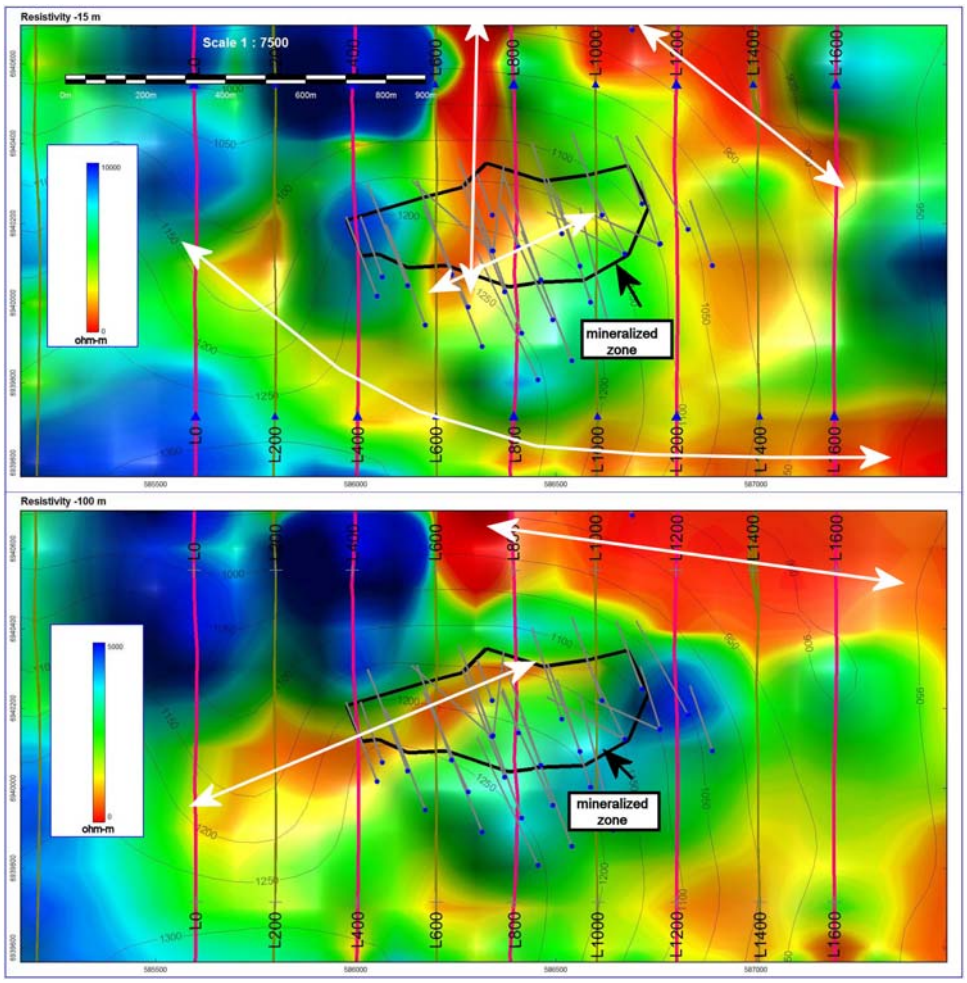

Figure 3: Resistivity -15 m (top) and -100 m (bottom) in drilling area.

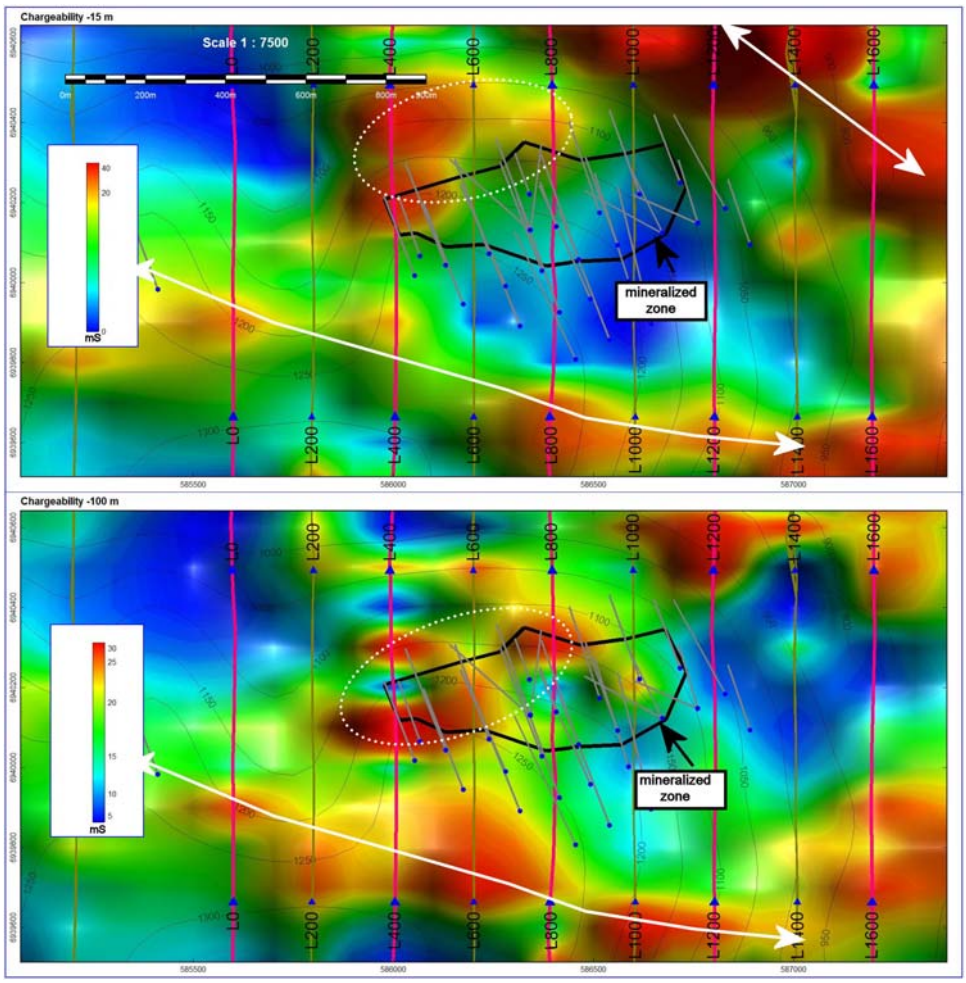

Figure 4: Chargeability -15 m (top) and -100 m (bottom) in drilling area.

Figure 4: The chargeability shows a similar result for the two depth slices; both show a zone of higher response to the immediate NW of the MZ (highlighted) and a zone of lower response to the SW and south. In the -15 m result, there is a strong NW trend just north of the MZ that is less well developed in the deeper result. Both depth outcomes show a WNW trending high to the south of the MZ; in the -15 m result, this feature extends for > 2 km. This correlates closely with the resistivity low noted in the -15 depth slice resistivity image.

Figure 5 shows the inverted sections for resistivity and chargeability along with the 3D shell of the MZ. This shows that the western part of the MZ is both conductive and chargeable.

In Figures 6 and 7, the resistivity for -15 m and -100 m depth and the chargeability for -15 m and -100 m depth are respectively shown, both for the full extent of the survey. On both figures, the major features have been annotated. These are discussed below.

Figure 6: Major conductive zones are noted in the NE and SW parts of the survey block with a series of semi-discrete highs in-between. The large areas are thought to represent different lithologies with the conductive areas likely to be clay rich sediments and resistive areas either volcanic/intrusive rocks or a sedimentary rock such as clean limestone.

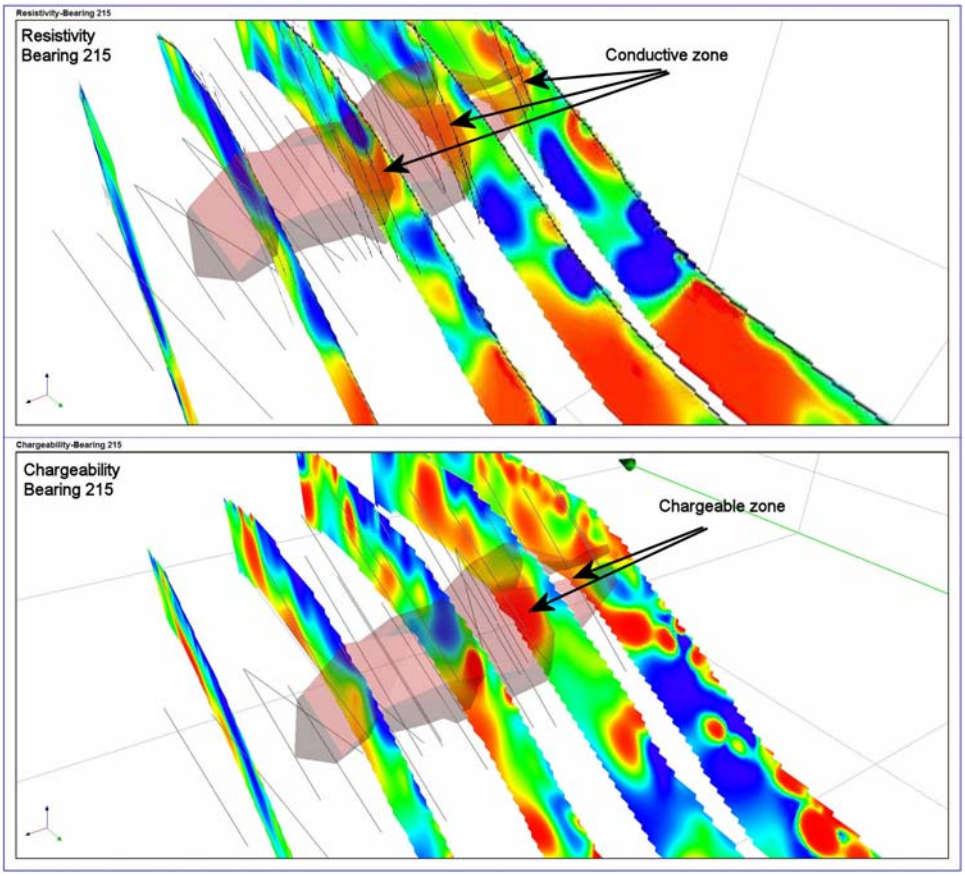

Figure 5: Resistivity and chargeability sections over MZ; view to 215.

Figure 7: Similar to the resistivity, in the -15 m depth slice, highs are noted in the north and NE as well as SW parts of the survey block. The MZ appears close to the northern high but is a more attenuated part of the response. In the deeper depth slice, there appears to be two bands of high chargeability that trend E-W with the MZ located in-between these bands. The high in the SW corner of the grid also appears somewhat larger.

Discussion

A detailed assessment of the IP-resistivity response of the MZ shows that parts of the system are both conductive and chargeable. Within the survey area, both strong conductivity and chargeability responses are noted which are thought more likely to be caused by different lithologies and does not necessarily represent mineralization of interest (i.e. analogues to the MZ). An examination of other geophysical data such as magnetics and the previously reviewed ZTEM results may help to distinguish of likely economic interest.

Based on the current assessment, the MZ conductive horizon appears to continue for at least 0.5 km to the SW, after which it either terminates or plunges to a depth beyond the detection limits of the current survey.

KEG AND REBEL CLAIMS – BASELINE WATER QUALITY/ HYDROLOGY STUDY (MARCH 2011)

Strategic Metals Ltd

KEG AND REBEL CLAIMS

Baseline Water Quality / Hydrology Survey

April, 2011

J.Gibson Env. Consulting ***Whitehorse, Yukon***

Strategic Metals Ltd requested a baseline water quality / hydrology survey be conducted on the surface water tributaries draining the area of the KEG and REBEL Claims. The sites are located in the Anvil Range approximately 30 kilometers north of Faro, Yukon and 15 kilometers north of the former Faro Mine.

The KEG Claims are located on tributaries to the Tay River.

The REBEL Claims are located south of the KEG Claims on tributaries to Anvil Creek.

All surface waters are tributaries to the Pelly River.

The initial water quality / hydrology survey was done in August 2010 followed by surveys in October 2010 and March 2011.

There was no exploration activity onsite during the March 2011 survey.

The exploration camp and all survey sites were accessed by helicopter.

The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals, total organic carbon, total cyanide and total mercury with field measurements for pH, water temperature and flow volumes.

An initial snow survey to determine snow depth, density and snow water equivalent was done in March 2011.

Sample Locations

Nine water quality sample sites were established on the KEG Claims during the initial survey in August 2010.
Four sites were added in October 2010 on the eastern limits of the expanded claim block.

Three sites were established on the REBEL Claims in August, 2010 with no additions for the October survey. All sites are on the attached location maps.

The snow survey site Keg Snow #1, was established south of water station KEG#4 on a north facing slope. Coordinates are listed below.

KEG Claim sample station designations and coordinates are:

Station #	Lat/Long Coordinates	Elevation(m)
KEG #1	62 35 44 / 133 19 64.3	787
KEG #2	Not Available	818
KEG #3	Not Available	865
KEG #4	62 33 47.2 / 133 18 38.6	970
KEG #5	62 36 08.6 / 133 25 26.8	833
KEG #6	62 34 22.7 / 133 17 33.8	940
KEG #7	62 37 05.8 / 133 19 43.9	833
KEG #8	62 38 31.2 / 133 25 43.4	1152
KEG #9	62 37 53.6 / 133 15 09.3	750
KEG #10	62 65 16.6 / 133 31 10.7	850
KEG #11	62 59 92.0 / 133 26 34.2	880
KEG #12	62 60 19.1 / 133 11 51.4	820
KEG #13	62 56 21.2 / 133 17 82.2	1020
KEG Snow #1	62 33 46.5 / 133 18 39.5	990

No coordinates are available for KEG #2 and #3(freshet/runoff channel only) as both stream channels were dry and no landings were made during surveys to date.

REBEL Claim sample station designations and coordinates are:

Station #	Lat/Long Coordinates	Elevation(m)
REB #1	62 27 49.9 / 133 12 48.2	1305
REB #2	62 24 59.6 / 133 13 21.3	1425
REB #3	62 24 31.4 / 133 11 14.8	1365

Station coordinates and elevations are for helicopter landing sites. Due to the topography and thick vegetation it was often necessary to located / construct landing sites up to100 meters distance from sample sites.

Station KEG#5 was moved upstream in August 2010 to a point before the break in slope. Coordinates and map location are for the new site location.

Ice / Snow Conditions

The following conditions were observed:

Keg #1 - Minimal ice cover (<0.1 m thickness). Ice removed for flow measurement.
Keg #4 – Ice thickness 0.25 m / snow cover 0.3 m. Holes augured for flow measurement.
Keg #5 – 0.8 m snow cover, ice 0.28 m thick – frozen to channel invert/ no flow
Keg #6 – Minimal ice cover (<0.1 m thickness) / snow cover < 0.1 m
Keg #7 – Overflow ice > 1.0 m thick – exceeded auger depth. Overflow ice spread into surrounding low lands
Keg #8 - Ice thickness 0.2 m with airspace between ice and channel invert – channel dry
Keg #9 – Ice depth 0.95 m thick / snow cover 0.4 m - augured for sample
Keg #10 – Ice depth at station 0.8 m thick – one half overflow ice – frozen to channel invert / dry. Moved 1 km downstream – channel remained dry.
Keg #11 – Overflow ice > 1.0 m thickness – exceeded augur depth.
Keg #12 – Minimal ice (<0.1 m) and snow cover. Area heavily used by caribou. Ice to channel invert / dry.
Keg #13 – Overflow ice (>0.5 m thickness)/ 0.6 m snow cover. Augured to channel base to obtain seepage flow samples.

REB #1 - Minimal ice cover (<0.1 m) with 1 m snow cover. Ice and snow removed for \ flow measurement and samples.
REB#2 – 1 m snow cover – no ice or water in channel
REB#3 – 1 m snow cover – 0.1 m ice to channel base. Moved downstream 1 km to obtain water samples – 0.2 m ice / 0.4 m snow cover.

All stations surveyed remained under base winter low flow conditions.

Sample Analysis Parameters

Stations KEG #1, #4, #6, #13 and REB #1 and #3 were sampled for total metals, dissolved metals and routine chemistry, total organic carbon, total cyanide and total mercury.
Station KEG #9 is the KEG Claims downstream station prior to flows entering the Tay River and was sampled for routine chemistry, total and dissolved metals.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total and dissolved metal samples were preserved with nitric acid immediately after sampling.

Total Cyanide samples were preserved with Na0H, Total Organic Carbon samples with HCL immediately after sampling.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Exova Canada Inc. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH, conductivity, total dissolved solids were taken with an Oakton PCS TestR 35, water temperatures with a digital thermometer.

Stream flow volumes were measured at each site with a Price AA velocity meter and cross sectional area calculations.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Table 1a and 1b. KEG Stations Routine Chemistry – laboratory analysis and field measurements

Table 2a and 2b. KEG Stations Total Metals ICP–MS laboratory analysis results

Table 3a and 3b. KEG Stations Dissolved Metals ICP–MS laboratory analysis results

Table 4. REBEL Stations Routine Chemistry – laboratory analysis and field measurements

Table 5. REBEL Stations Total Metals ICP–MS laboratory analysis results

Table 6. REBEL Claims Dissolved Metals ICP-MS laboratory analysis results

Table 7. Camp Drinking Water Supply at KEG #4 laboratory analysis results. August and October 2010, March 2011.

Table 8. Snow Survey Results for Station KEG#1 SNOW March 2011.

Listed with the analysis data are the laboratory detection limits for each parameter.

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic Guidelines for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to ***CCME – Canadian Water Quality Guidelines.***
All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by Exova Canada of Surrey B.C.

Laboratory Analytical Reports are attached in Appendix 1.

Data Summaries for each station are contained on Excel on the attached disc.

Discussion

Hydrology

All water quality / hydrology stations on the KEG and REBEL claims were under winter low flow conditions.

Eight of the thirteen KEG stations were either dry (6 sites) or had overflow ice that exceeded the augur depth (2 sites).

One of the three REB stations was dry (no ice or water) and one required a 1 km move downstream to locate a flow.

At the seven sites where flows were located and sampled, all were at base flow.

A summary of flow volumes for the three surveys are:

Measured Stream Flow Volumes – KEG / REBEL Claims 2010			
Station	**Flow Volume (cubic meters/second)**		
	August 2010	**October 2010**	**March 2011**
KEG #1	**0.249**	**0.362**	**0.025**
KEG #2	**Dry**	**Dry**	**Dry**
KEG #3	**Dry**	**Dry**	**Dry**
KEG #4	**0.221**	**0.261**	**0.028**
KEG #5	**0.139**	**0.0005**	**Dry**
KEG #6	**0.007**	**0.009**	**0.001**
KEG #7	**0.110**	**0.011**	**Overflow**
KEG #8	**0.055 Estimated**	**0.014**	**Dry**
KEG #9	**-**	**-**	**-**
KEG #10	**-**	**0.167**	**Dry**
KEG #11	**-**	**0.212**	**Overflow**
KEG #12	**-**	**0.110**	**Dry**
KEG #13	**-**	**0.143**	**0.002 E**
REB #1	**0.403**	**0.311**	**0.068**
REB #2	**0.015**	**0.028**	**Dry**
REB #3	**0.024**	**0.047**	**0.00015**

Routine Chemistry – KEG Claims

Field measurement and lab analysis results for routine chemistry are listed in Table 1a and 1b.

Analysis results for all stations for all routine chemistry parameters measured meet the ***Drinking Water Guideline's MAC's*** with the exception of Total Dissolved Solids (534 mg/L) at Station KEG #13.

Analysis results for all stations for all routine chemistry parameters measured meet the ***CCME Guidelines*** for the protection of Aquatic Life.

Metals – KEG Claims

The laboratory analytical report notes that some total metal results are less than dissolved metal concentrations but are verified and are within the expected measurement uncertainty.

Total metals analysis results are listed in Table 2 and 2a, dissolved metals analysis results in Table 3a and 3b.

Parameters that exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

Station KEG#1 results exceed ***Aquatic Guidelines*** for total selenium and total zinc.

Station KEG #4 results exceed ***Aquatic Guidelines*** for total copper and total selenium.

Station KEG #6 results continue to exceeds ***Drinking Water Guideline MAC's*** for total iron and total manganese. KEG #6 results also exceed the ***Aquatic Guidelines*** for total arsenic, total copper, total iron and total zinc.
The stream channel bed material at KEG #6 shows high levels of iron deposited.

Station KEG #9 results exceed ***Drinking Water Guideline MAC's*** for total manganese.

Station KEG #13 results exceed ***Aquatic Guideline*** for total chromium and total selenium.

Total Mercury concentrations were at or below the detection limit of 0.00001 mg/L at all KEG stations.

Total cyanide concentrations were at the detection limit of 0.001 mg/L at all stations

Routine Chemistry – REBEL Claims

Field measurement and lab analysis results for routine chemistry are listed in Table 4.

Analysis results for all stations for all routine chemistry parameters measured meet the ***Drinking Water Guideline's MA*****C's**.

Analysis results for all stations for all parameters measured meet the ***CCME Guidelines*** for the protection of ***Aquatic Life.***

Metals – REBEL Claims

The laboratory analytical report notes that some total metal results are less than dissolved metal concentrations but are verified and are within the expected measurement uncertainty.

Total metals analysis results are listed in Table 5, dissolved metals analysis results in Table 6.

Parameters that exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

All REBEL stations meet ***Drinking Water Guideline*** and ***Aquatic Guidelines*** limits for all parameters tested with the exception of total selenium at Station REB#1 and REB#3..

Total Mercury concentrations were below detection limits at all REB stations.

Total cyanide concentrations at the detection limits of 0.001 mg/L at all REB stations.

Snow Course KEG#1 SNOW

Snow measurements were taken at 10 stations with the snow course using the standardized Mt. Rose. sampling equipment. Measurements were calculated to a mean snow depth, mean core length, mean snow water equivalent and mean snow density. Measurements and calculations are contained in Table 8.

Camp Drinking Water Supply

Station KEG #4 is the proposed site for acquiring a camp drinking water supply.

Laboratory analysis results for routine chemistry and total metals are listed in Table 7.

KEG#4 waters meet all ***Drinking Water Guideline*** limits for freshwater supply.

APPENDIX IX

KEG AND REBEL CLAIMS – BASELINE WATER QUALITY/ HYDROLOGY STUDY (JUNE 2011)

Silver Range Resources

KEG AND REBEL CLAIMS

Baseline Water Quality / Hydrology Survey

June, 2011

J.Gibson Env. Consulting *Whitehorse, Yukon*

Silver Range Resources requested a baseline water quality / hydrology survey be conducted on the surface water tributaries draining the area of the KEG and REBEL Claims. The sites are located in the Anvil Range approximately 30 kilometers north of Faro, Yukon and 15 kilometers north of the former Faro Mine.

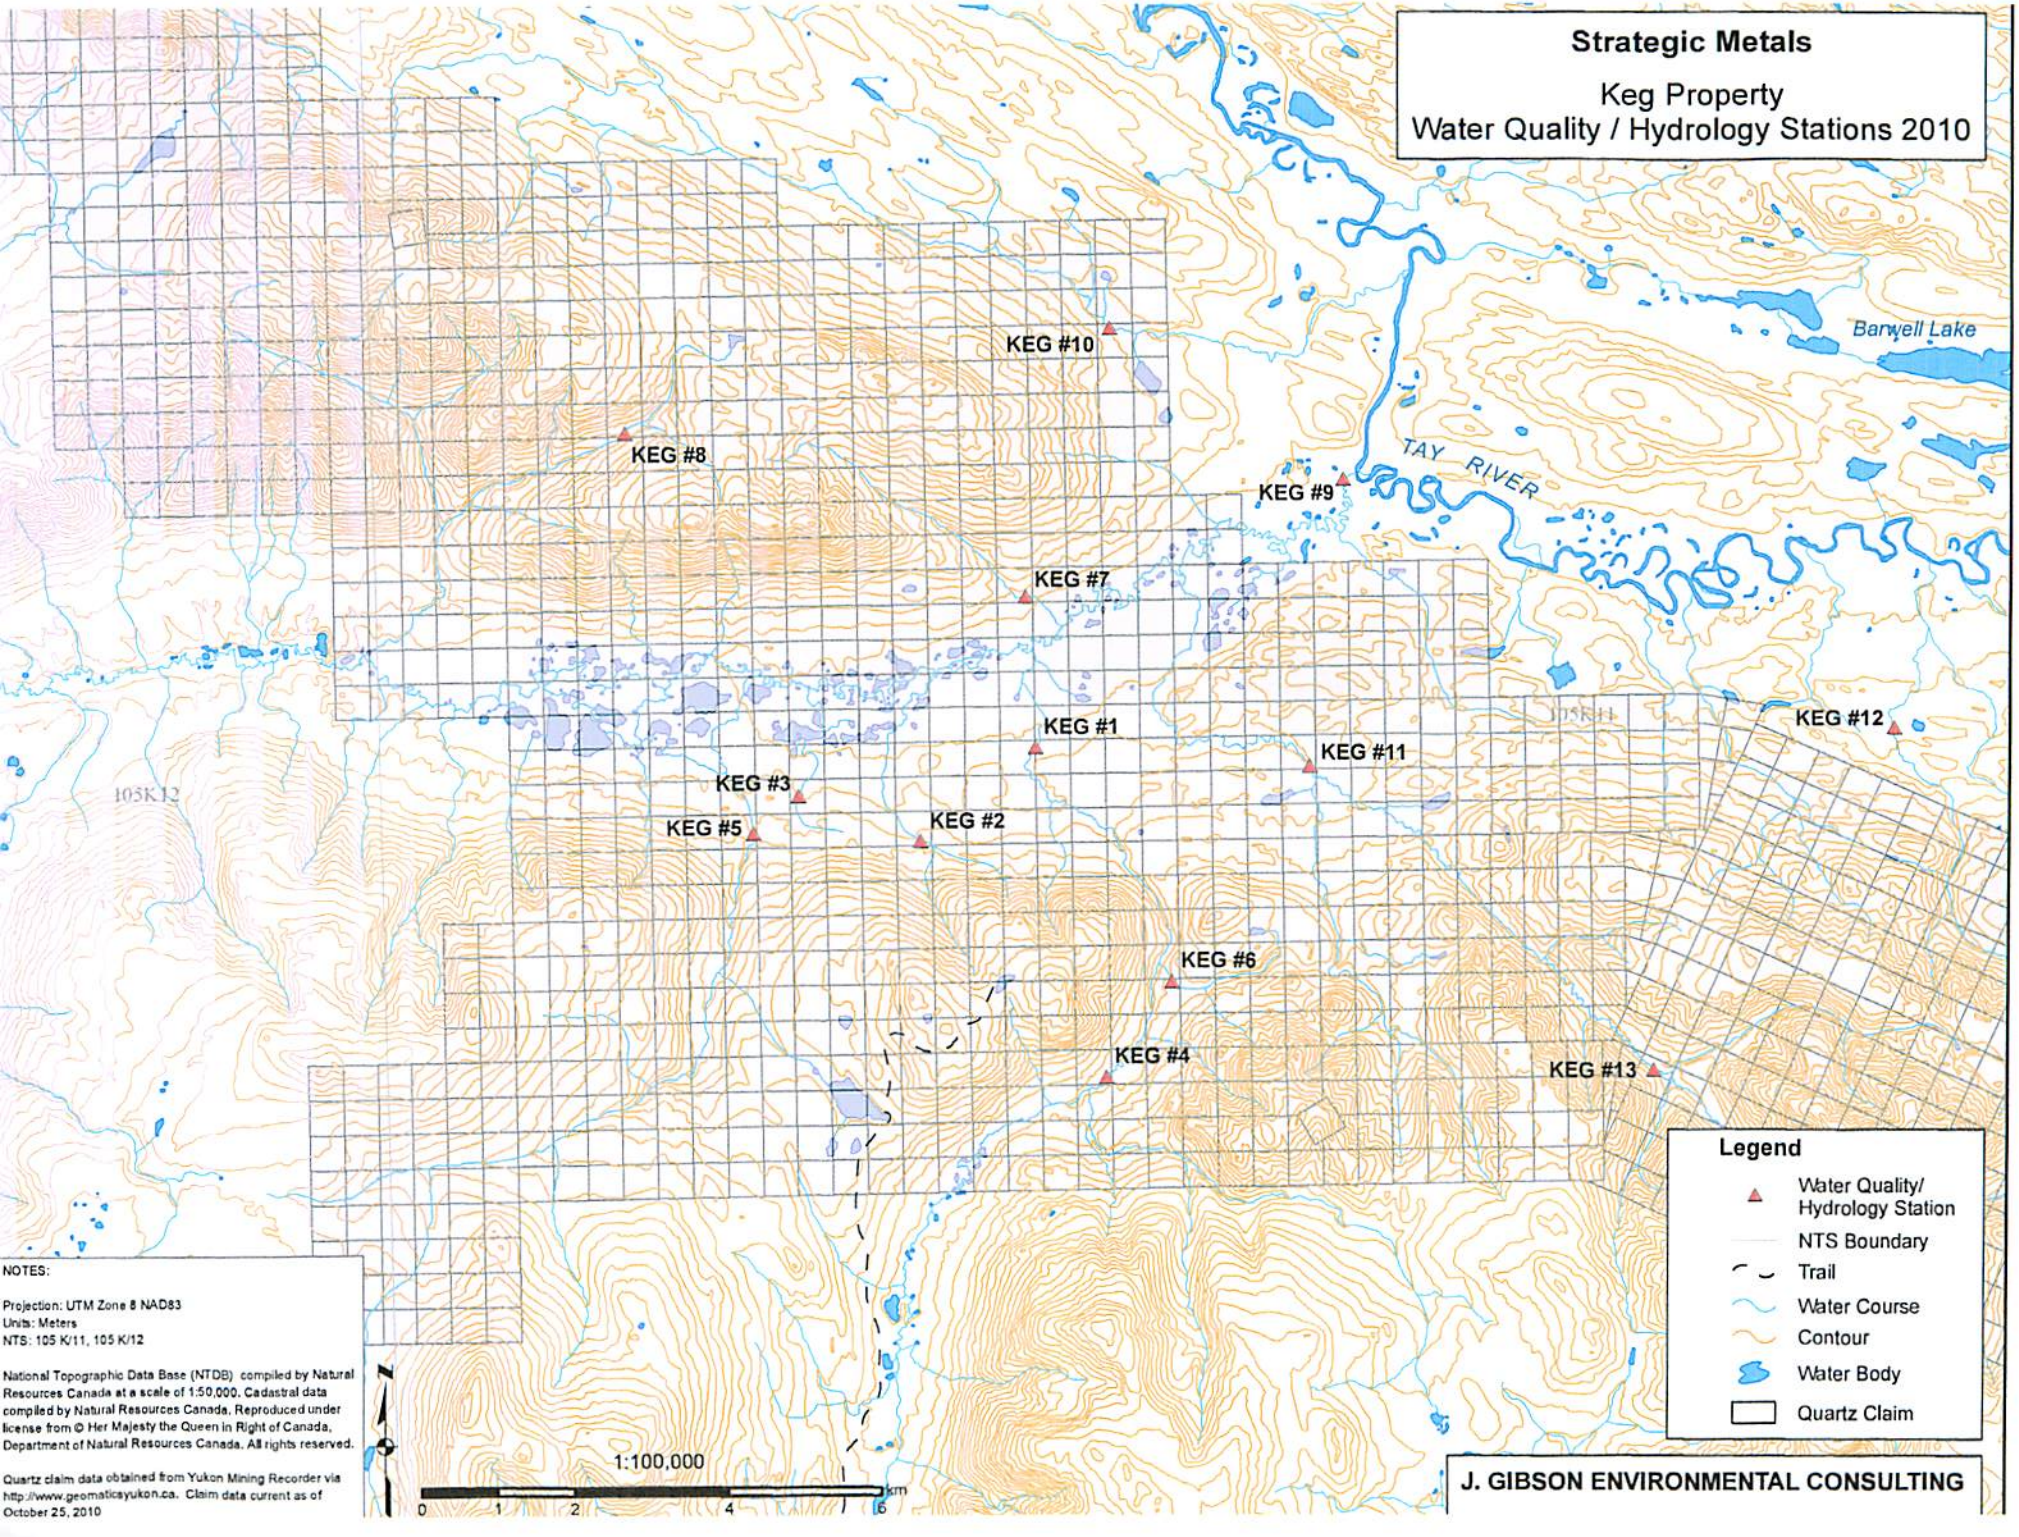
The KEG Claims are located on tributaries to the Tay River.

The REBEL Claims are located south of the KEG Claims on tributaries to Anvil Creek.

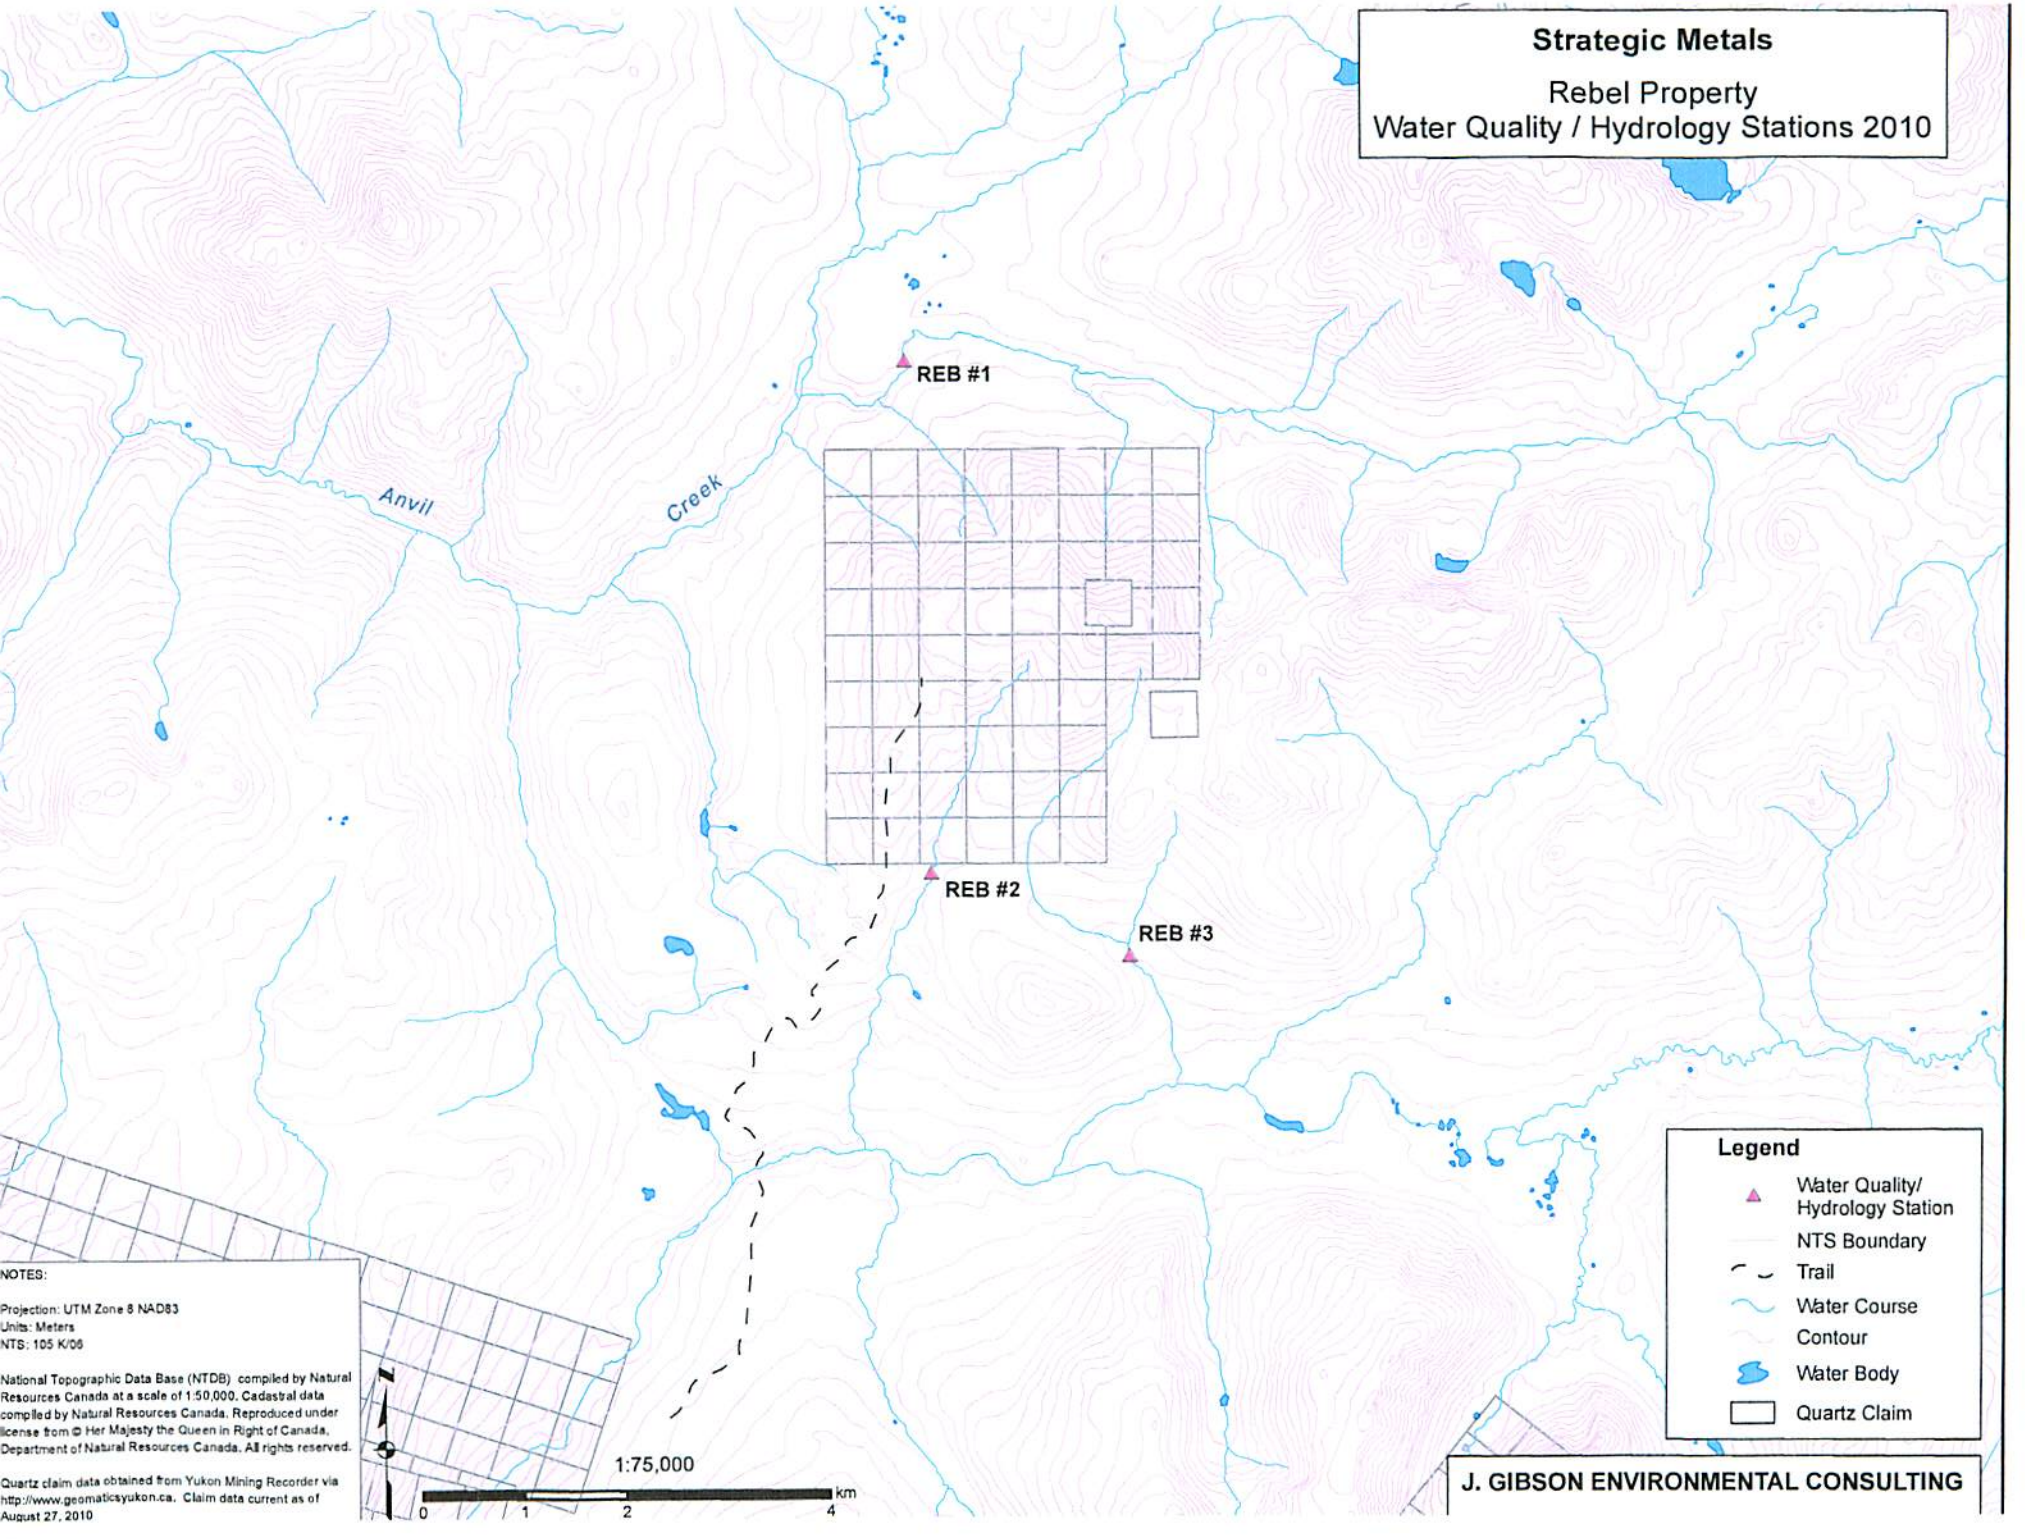
All surface waters are tributaries to the Pelly River.

The initial water quality / hydrology survey was done in August 2010 followed by surveys in October 2010 and March 2011.

Exploration activity during the June 2011 survey consists of diamond drilling and soil grid sampling.



The exploration camp and all survey sites were accessed by helicopter.



The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals, total organic carbon, total cyanide and total mercury with field measurements for pH, water temperature and flow volumes.

Sample Locations

Nine water quality sample sites were established on the KEG Claims during the initial survey in August 2010.
Four sites were added in October 2010 on the eastern limits of the expanded claim block.

Three sites were established on the REBEL Claims in August, 2010 with no additions.
All sites are on the attached location maps.

KEG #13	62 56 21.2 / 133 17 82.2	1020

REBEL Claim sample station designations and coordinates are:

Station #	Lat/Long Coordinates	Elevation(m)
REB #1	62 27 49.9 / 133 12 48.2	1305
REB #2	62 24 59.6 / 133 13 21.3	1425
REB #3	62 24 31.4 / 133 11 14.8	1365

Station coordinates and elevations are for helicopter landing sites. Due to the topography and thick vegetation it was often necessary to located / construct landing sites up to100 meters distance from sample sites.

Station KEG#5 was moved upstream in August 2010 to a point before the break in slope. Coordinates and map location are for the new site location.

Sample Analysis Parameters

Stations KEG #1, #2, #4 to #8 and #10 to #13 and REB #1, #2 and #3 were sampled for total metals, dissolved metals and routine chemistry, total organic carbon, total cyanide and total mercury.
Station KEG #9 is the KEG Claims downstream station prior to flows entering the Tay River and was sampled for routine chemistry, total and dissolved metals.

Station Keg #3 was not sampled as no surface flow was noted.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total and dissolved metal samples were preserved with nitric acid immediately after sampling.

Total Cyanide samples were preserved with NaOH, Total Organic Carbon samples with HCL immediately after sampling.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Exova Canada Inc. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH, conductivity, total dissolved solids were taken with an Oakton PCS TestR 35, water temperatures with a digital thermometer.

Stream flow volumes were measured at each site with a Price AA velocity meter and cross sectional area calculations.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

DWQ* Guidelines are Maximum Acceptable Concentrations according to
Canadian Drinking Water Quality

Aquatic** Guidelines are for protection of aquatic life in waters with pH >6.5 and Hardness as CaC03 >180 mg/L
Canadian Water Quality Guidelines

Table 2a. Strategic Metals - KEG Claims June, 2011

DWQ* = Canadian Drinking Water Quality Guideline

MAC = Maximum Acceptable Concentration

indicates concentration exceeds MAC

Quality Control

Quality control samples for duplicates total metals analysis were taken at Stations KEG#11 and KEG#12. Quality control analysis results for total metals are listed in Table 8.

A quality control sample for dissolved metals analysis was taken at Station KEG#11. Analysis results are listed in Table 9.

Discussion

Hydrology

All water quality / hydrology stations on the KEG and REBEL claims were in post freshet *mid to high stage flow conditions.*

A summary of flow volumes for the fours surveys to date are:

Measured Stream Flow Volumes – KEG / REBEL Claims 2010/11

Station	Flow Volume (cubic meters/second)			
	August 2010	October 2010	March 2011	June 2011

Routine Chemistry – KEG Claims

Field measurement and lab analysis results for routine chemistry are listed in Table 1a and 1b.

Analysis results for all stations for all routine chemistry parameters measured meet the ***Drinking Water Guideline MAC's.***

Analysis results for all stations for all routine chemistry parameters measured meet the ***CCME Guidelines*** for the protection of Aquatic Life.

Metals – KEG Claims

Total metals analysis results are listed in Table 2a and 2b, dissolved metals analysis results in Table 3a and 3b.

Parameters that exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

Station KEG#1 results exceed ***Aquatic Guidelines*** for total aluminum.

Station KEG#2 results exceed ***Drinking Water MAC*** for total arsenic, total iron, total lead and, total manganese. KEG#2 exceeds ***Aquatic Guidelines*** for total chromium, total copper, total iron, total lead, total selenium and total zinc.

Station KEG #4 results exceed the ***Drinking Water MAC*** for total iron, total manganese and the ***Aquatic Guidelines*** for total aluminum and total iron.

Station KEG#5 exceeds the ***Drinking Water MAC*** for total iron and total manganese and the ***Aquatic Guidelines*** for total aluminum, total chromium, total copper, total iron and total selenium.

Station KEG #6 results continue to exceeds ***Drinking Water MAC's*** for total iron and total manganese. KEG #6 results also exceed the ***Aquatic Guidelines*** for total aluminum, total copper, total iron and total selenium.
The stream channel bed material at KEG #6 shows high levels of iron deposited.

Station KEG #7 results to exceeds ***Drinking Water MAC's*** for total iron and total manganese. KEG #7 results also exceed the ***Aquatic Guidelines*** for total aluminum, total chromium, total copper, total iron and total selenium.

Station KEG#8 results exceed ***Aquatic Guidelines*** for total selenium.

Station KEG #9 results exceed ***Drinking Water MAC's*** for total iron.
and exceeds the ***Aquatic Guideline*** for total aluminum and total iron.

Station KEG #10 results exceed ***Drinking Water MAC's*** for total iron.
and exceeds the ***Aquatic Guideline*** for total aluminum, total copper, total iron and total selenium.

Station KEG #11 results exceed ***Aquatic Guideline*** for total selenium.

Station KEG #13 results exceed ***Aquatic Guideline*** for total selenium.

Total Mercury concentrations were at or below the detection limit of 0.00001 mg/L at all KEG stations with the exception of KEG#2 (0.00002 mg/L), KEG#5 (0.00003 mg/L), KEG#7(0.00002 mg/L) and KEG#10 (0.00002 mg/L).

Total cyanide concentrations were below the detection limit of 0.001 mg/L at all stations

Routine Chemistry – REBEL Claims

Field measurement and lab analysis results for routine chemistry are listed in Table 4.

Analysis results for all stations for all routine chemistry parameters measured meet the ***Drinking Water Guideline's MAC's.***

Analysis results for all stations for all routine chemistry parameters measured meet the ***CCME Guidelines*** for the protection of ***Aquatic Life.***

Metals – REBEL Claims

Total metals analysis results are listed in Table 5, dissolved metals analysis results in Table 6.

Parameters that exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

All REBEL stations meet ***Drinking Water Guideline*** and ***Aquatic Guidelines*** limits for all parameters tested with the exception of total iron and total selenium at Station REB#1.

Total Mercury concentrations were below detection limits at all REB stations.

Total cyanide concentrations were below the detection limits of 0.001 mg/L at all REB stations.

Camp Drinking Water Supply

Station KEG #4 is the source of camp drinking water supply.

Laboratory analysis results for routine chemistry and total metals are listed in Table 7.

KEG#4 waters exceed ***Drinking Water Guideline*** limits for parameters total iron and total manganese for freshwater supply. Both parameter concentrations are slightly above the Guideline limits. Limits for both parameters are based on aesthetic considerations and not on health concerns. Onsite filtration will reduce the total iron to well below the limit.

APPENDIX X

KEG AND REBEL CLAIMS – BASELINE WATER QUALITY/ HYDROLOGY STUDY (SEPTEMBER 2011)

Silver Range Resources

KEG AND REBEL CLAIMS

Baseline Water Quality / Hydrology Survey

September, 2011

J.Gibson Env. Consulting *Whitehorse, Yukon*

KEG / REBEL Claims September 2011

Silver Range Resources requested a baseline water quality / hydrology survey be conducted on the surface water tributaries draining the area of the KEG and REBEL Claims. The sites are located in the Anvil Range approximately 30 kilometers north of Faro, Yukon and 15 kilometers north of the former Faro Mine.

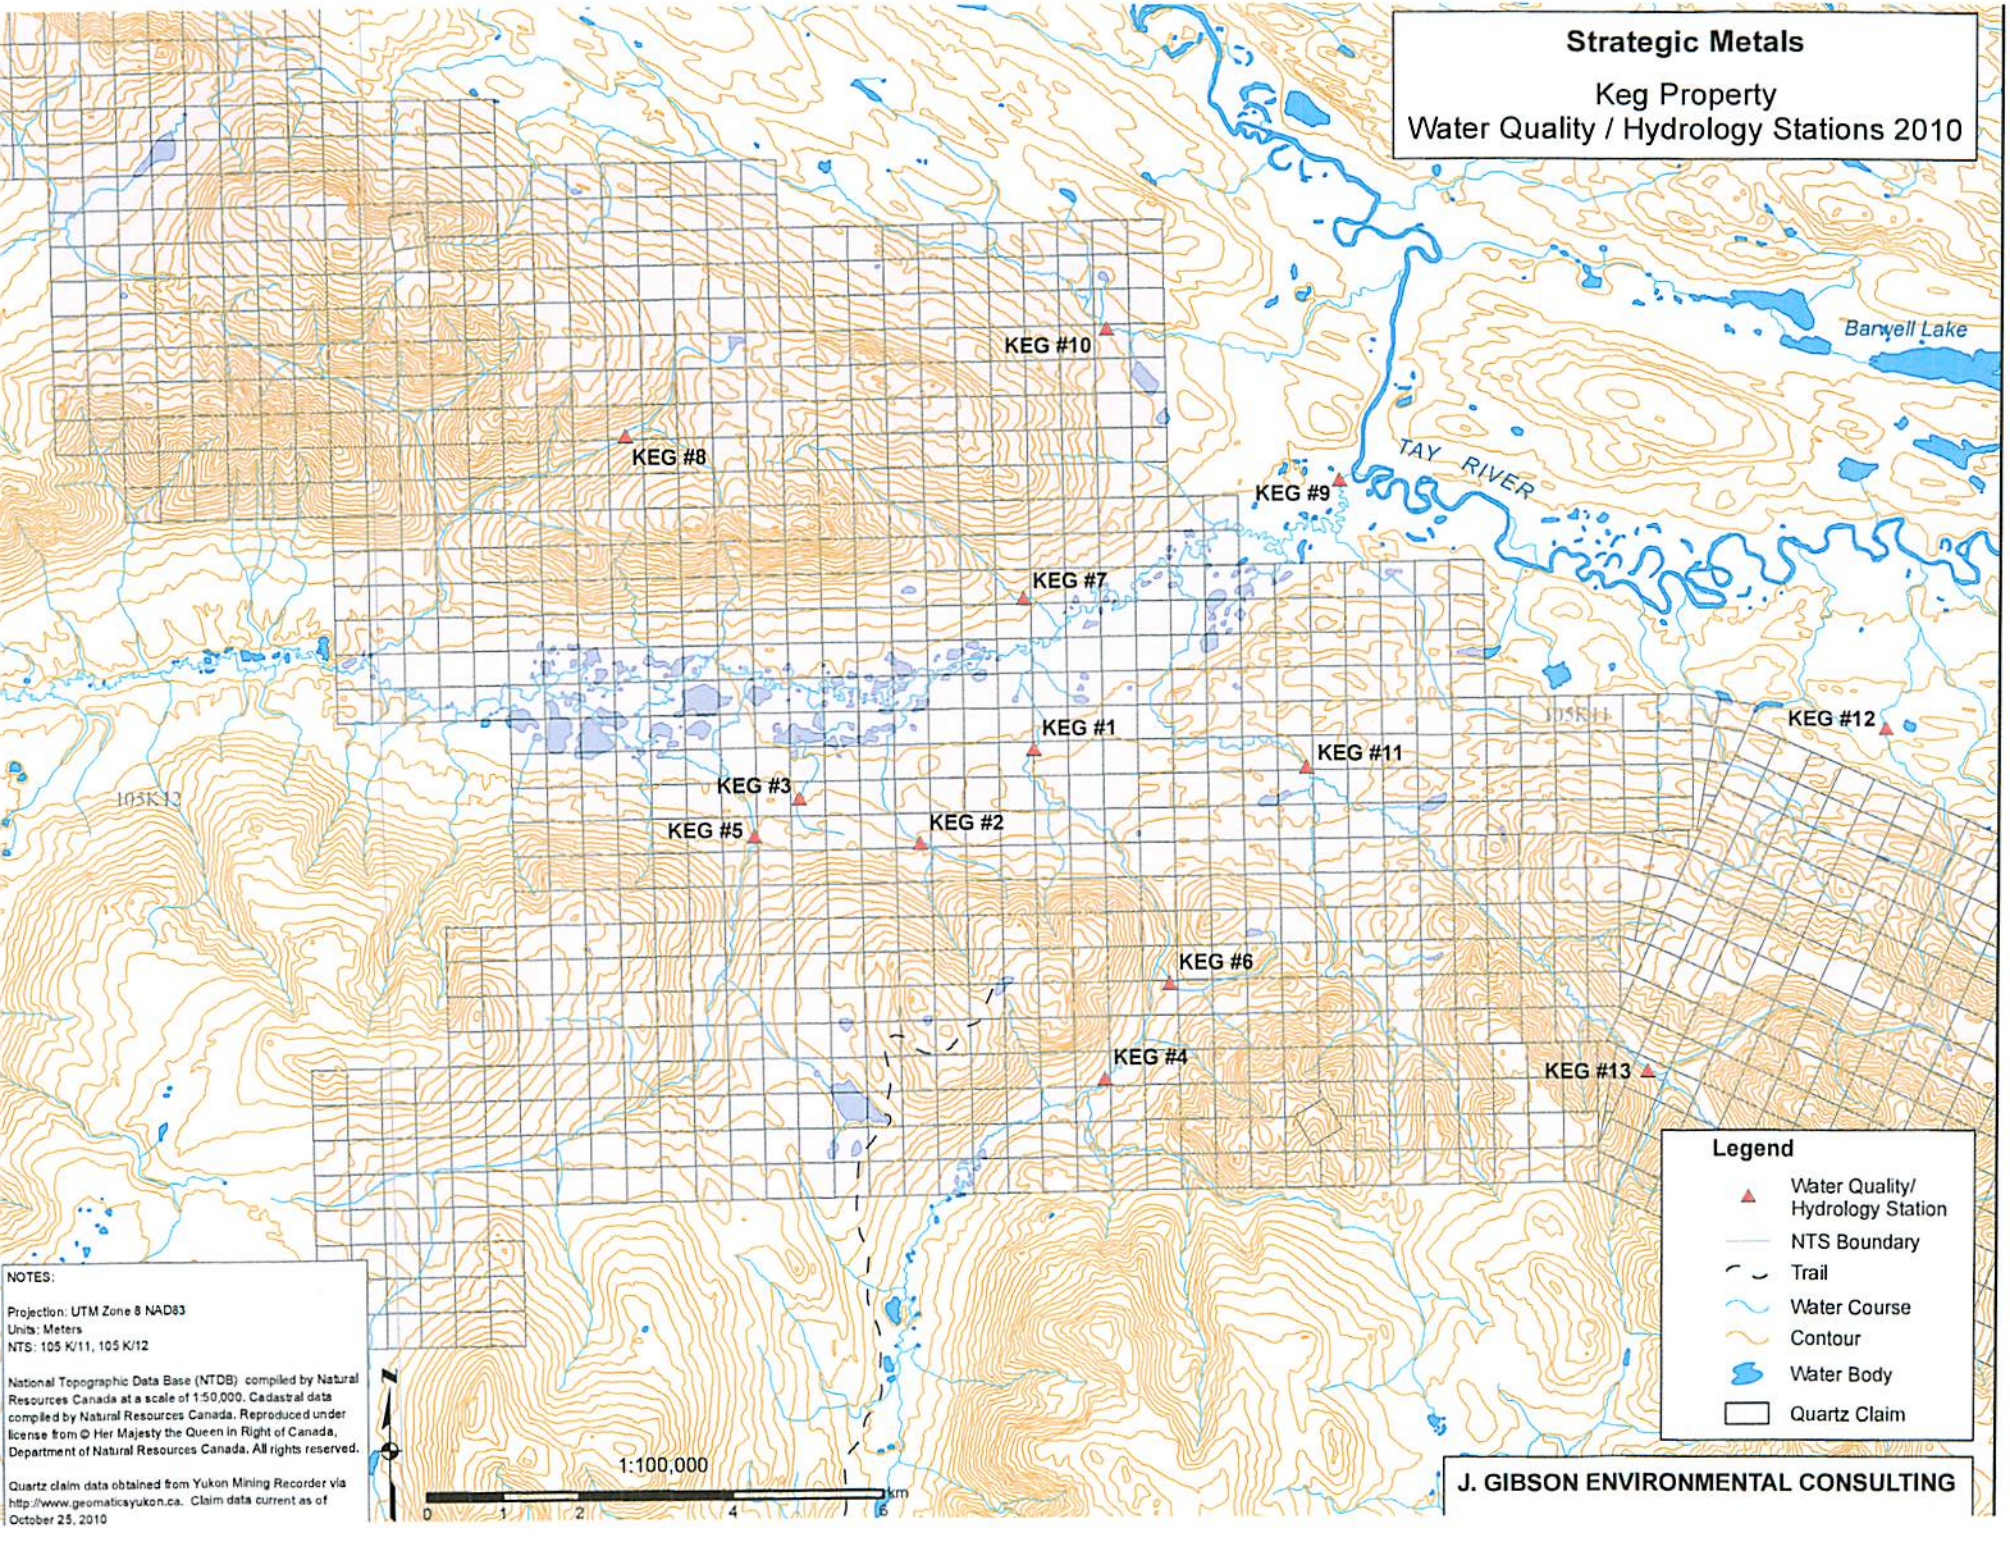
The KEG Claims are located on tributaries to the Tay River.

The REBEL Claims are located south of the KEG Claims on tributaries to Anvil Creek.

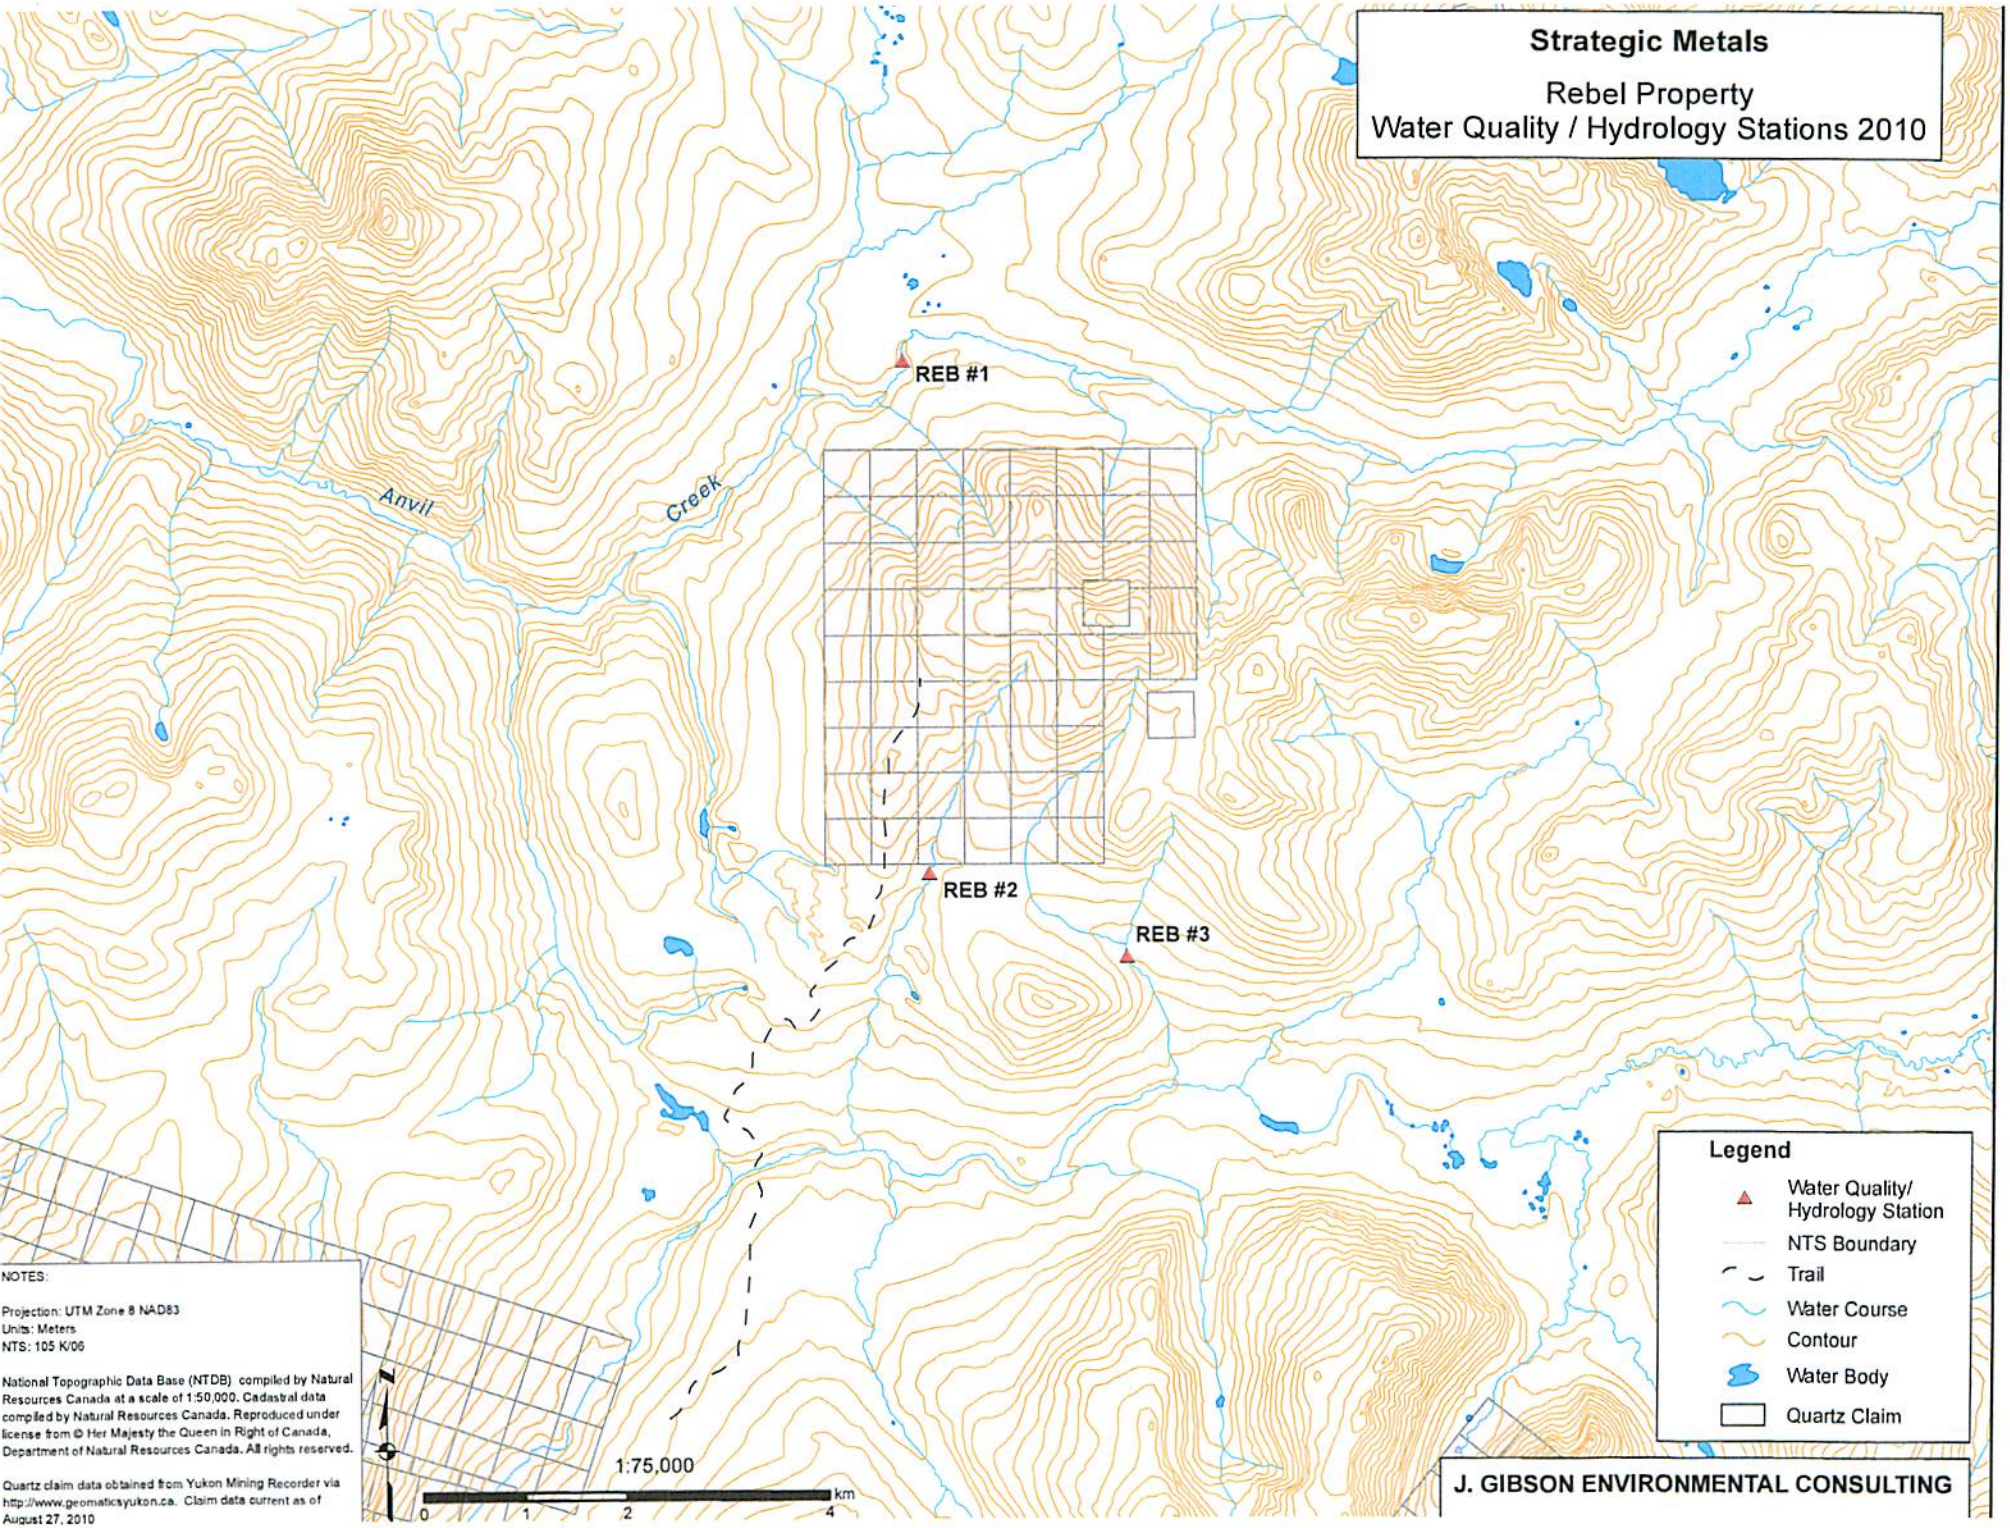
All surface waters are tributaries to the Pelly River.

The initial water quality / hydrology survey was done in August 2010 followed by surveys in October 2010, March 2011 and June 2011 and September 2011.

Exploration activity during the September 2011 survey consists of diamond drilling and soil grid sampling.



The exploration camp and all survey sites were accessed by helicopter.



The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals, total organic carbon, total cyanide and total mercury with field measurements for pH, water temperature and flow volumes.

Sample Locations

Nine water quality sample sites were established on the KEG Claims during the initial survey in August 2010.
Four sites were added in October 2010 on the eastern limits of the expanded claim block.

Three sites were established on the REBEL Claims in August, 2010 with no additions.
All sites are on the attached location maps.

KEG #13	62 56 21.2 / 133 17 82.2	1020

REBEL Claim sample station designations and coordinates are:

Station #	Lat/Long Coordinates	Elevation(m)
REB #1	62 27 49.9 / 133 12 48.2	1305
REB #2	62 24 59.6 / 133 13 21.3	1425
REB #3	62 24 31.4 / 133 11 14.8	1365

Station coordinates and elevations are for helicopter landing sites. Due to the topography and thick vegetation it was often necessary to located / construct landing sites up to100 meters distance from sample sites.

Station KEG#5 was moved upstream in August 2010 to a point before the break in slope. Coordinates and map location are for the new site location.

Sample Analysis Parameters

Stations KEG #1, #2, #4 to #8 and #10 to #13 and REB #1, #2 and #3 were sampled for total metals, dissolved metals and routine chemistry, total organic carbon, total cyanide and total mercury.
Station KEG #9 is the KEG Claims downstream station prior to flows entering the Tay River and was sampled for routine chemistry, total and dissolved metals.

Station Keg #3 was not sampled as no surface flow was noted.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total and dissolved metal samples were preserved with nitric acid immediately after sampling.

Total Cyanide samples were preserved with NaOH, Total Organic Carbon samples with HCL immediately after sampling.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Exova Canada Inc. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH, conductivity, total dissolved solids were taken with an Oakton PCS TestR 35, water temperatures with a digital thermometer.

Stream flow volumes were measured at each site with a Price AA velocity meter and cross sectional area calculations.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Tables 1a and 1b. KEG Stations Routine Chemistry – laboratory analysis and field measurements

Tables 2a and 2b. KEG Stations Total Metals ICP–MS laboratory analysis results

Tables 3a and 3b. KEG Stations Dissolved Metals ICP–MS laboratory analysis results

Table 4. KEG Stations Flow Volume Summary 2010, 2011.

Table 5. REBEL Stations Routine Chemistry – laboratory analysis and field measurements

Table 6. REBEL Stations Total Metals ICP–MS laboratory analysis results

Table 7. REBEL Claims Dissolved Metals ICP-MS laboratory analysis results

Table 8. REBEL Stations Flow Volume Summary 2010, 2011.

Listed with the analysis data are the laboratory detection limits for each parameter.

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic Guidelines for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to ***CCME – Canadian Water Quality Guidelines.***
All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by Exova Canada Inc of Surrey B.C.

Laboratory Analytical Reports are attached in Appendix 1.

Data Summaries for each station are on the attached Excel disc.

Quality Control

Quality control duplicate samples for total and dissolved metals analysis were taken at Station KEG#11 and for total metals analysis at Station REB#1.

Quality control analysis results for total metals are listed in Table 9

Discussion

Hydrology

All water quality / hydrology stations on the KEG and REBEL claims were in medium to high stage flow conditions. Larger stream channels had volumes equal to or exceeding those measured in June 2011. This is a result of precipitation input.

A summary of flow volumes for the five surveys to date are listed in Table 4 (KEG) and Table 8 (REBEL).

Laboratory Analytical Results

Parameters that equal or exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

KEG Stations

Station KEG#1 no analytical results exceed either ***Guideline.***

Station KEG#2 results exceed ***Aquatic Guidelines*** for total copper only.

Station KEG #4 no analytical results exceed either ***Guideline.***

Station KEG#5 exceeds the ***Aquatic Guidelines*** for total aluminum and total copper.

Station KEG #6 results continue to exceeds ***Drinking Water MAC's*** for total iron.
KEG #6 results also exceed the ***Aquatic Guidelines*** for total aluminum, total copper, total iron and total zinc.
The stream channel bed material at KEG #6 shows high levels of iron deposited.

Station KEG #7 results to exceeds ***Drinking Water MAC's*** for total iron and total manganese. KEG #7 results also exceed the ***Aquatic Guidelines*** for total iron, and total selenium.

Station KEG#8 no results exceed either ***Guideline.***

Station KEG #9 results exceed ***Drinking Water MAC's*** for total iron. KEG#9 exceeds the ***Aquatic Guideline*** for total aluminum and total iron.

Station KEG #10 results exceed the ***Aquatic Guideline*** for total zinc.

Station KEG #11 results exceed ***Aquatic Guideline*** for total selenium.

Station KEG #12 results exceed ***Aquatic Guideline*** for total selenium.

Station KEG #13 results exceed ***Aquatic Guideline*** for total selenium and total zinc.

Total Mercury concentrations were at or below the detection limit of 0.00001 mg/L at all KEG stations.

Total cyanide concentrations were below the detection limit of 0.001 mg/L at all stations

REBEL Stations

Parameters that exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

All REBEL stations meet ***Drinking Water Guideline*** and ***Aquatic Guidelines*** limits for all parameters tested with the continued exception of ***total selenium at Station REB#1.***

Total Mercury concentrations were below detection limits at all REB stations.

Total cyanide concentrations were at or below the detection limits of 0.001 mg/L at all REB stations.

Camp Drinking Water Supply

Station KEG #4 is the source of camp drinking water supply. Analysis results for samples taken of the "***Raw***" supply (total metals and routine chemistry) and "***Treated***" supply (total metals) are listed in:

Table 10. Camp Drinking Water Supply at KEG #4 laboratory analysis results to. September 13, 2011.

KEG#4 supply waters "***Raw***" meet ***Drinking Water Guideline*** limits for all parameters tested.

KEG#4 "***Treated***" supply exceeds the ***Drinking Water Guideline*** limits for total iron. Results indicate a higher level of iron in the treated supply than the raw supply and highlights the need for a regular system maintenance program.

Total iron is not a health risk to users; the Guideline limit has been established based on aesthetic considerations.

Table 10. KEG Claims - Camp Drinking Water Supply @ KEG #4, 2011

Parameter		Mar-11 KEG #4	Jun-11 KEG #4	Sep-11 KEG#4 *Raw*	Sep-11 KEG#4 *Treated*	*Detection Limit*	DWQ* Guideline MAC's

Method of Analysis

Method Name	Reference	Method	Date Analysis Started	Location
Alk, pH, EC, Turb in water	APHA	* Alkalinity - Titration Method, 2320 B	19-Sep-11	Exova Surrey
Alk, pH, EC, Turb in water	APHA	* Conductivity, 2510 B	19-Sep-11	Exova Surrey
Alk, pH, EC, Turb in water	APHA	* pH - Electrometric Method, 4500-H+ B	19-Sep-11	Exova Surrey
Ammonia-N in Water	APHA	* Titrametric, 4500-NH3 C	19-Sep-11	Exova Surrey
Anions by IEC in water (Surrey)	APHA	* Ion Chromatography with Chemical Suppression of Eluent Cond., 4110 B	17-Sep-11	Exova Surrey
Carbon Organic (Total) in water (TOC)	APHA	High-Temperature Combustion Method, 5310 B	21-Sep-11	Exova Edmonton
Cyanide (Total) in water	US EPA	* US EPA method, 335.3	22-Sep-11	Exova Edmonton
Mercury Low Level (Total) in water	EPA	* Mercury in Water by Cold Vapor Atomic Fluorescence Spectrometry, 245.7	20-Sep-11	Exova Surrey
Metals SemiTrace (Dissolved) in water	US EPA	* Metals & Trace Elements by ICP-AES, 6010C	19-Sep-11	Exova Surrey
Metals SemiTrace (Total) in Water	US EPA	* Metals & Trace Elements by ICP-AES, 6010C	19-Sep-11	Exova Surrey
Nitrogen - nitrite+nitrate-N	APHA	* Automated Cadmium Reduction Method, 4500-NO3- F	19-Sep-11	Exova Surrey
Solids Dissolved (Total, Fixed and Volatile)2	APHA	* Total Dissolved Solids Dried at 180 C, 2540 C	19-Sep-11	Exova Surrey
Solids Suspended (Total, Fixed and Volatile)	APHA	* Total Suspended Solids Dried at 103-105'C, 2540 D	19-Sep-11	Exova Surrey
Trace Metals (dissolved) in Water	US EPA	* Determination of Trace Elements in Waters and Wastes by ICP-MS, 200.8	19-Sep-11	Exova Surrey
Trace Metals (dissolved) in Water	US EPA	* Metals & Trace Elements by ICP-AES, 6010C	19-Sep-11	Exova Surrey
Trace Metals (Total) in Water	US EPA	* Determination of Trace Elements in Waters and Wastes by ICP-MS, 200.8	19-Sep-11	Exova Surrey
Trace Metals (Total) in Water	US EPA	* Metals & Trace Elements by ICP-AES, 6010C	19-Sep-11	Exova Surrey

Comments:

- Some total metal results were less than dissolved metal results for lot 826690. The results were verified and are within expected measurement uncertainty.

Please direct any inquiries regarding this report to our Client Services group.
Results relate only to samples as submitted.
The test report shall not be reproduced except in full, without the written approval of the laboratory.

Method of Analysis

Method Name	Reference	Method	Date Analysis Started	Location
Alk, pH, EC, Turb in water	APHA	* Alkalinity - Titration Method, 2320 B	19-Sep-11	Exova Surrey
Alk, pH, EC, Turb in water	APHA	* Conductivity, 2510 B	19-Sep-11	Exova Surrey
Alk, pH, EC, Turb in water	APHA	* pH - Electrometric Method, 4500-H+ B	19-Sep-11	Exova Surrey
Ammonia-N in Water	APHA	* Titrametric, 4500-NH3 C	19-Sep-11	Exova Surrey
Anions by IEC in water (Surrey)	APHA	* Ion Chromatography with Chemical Suppression of Eluent Cond., 4110 B	17-Sep-11	Exova Surrey
Carbon Organic (Total) in water (TOC)	APHA	High-Temperature Combustion Method, 5310 B	21-Sep-11	Exova Edmonton
Cyanide (Total) in water	US EPA	* US EPA method, 335.3	22-Sep-11	Exova Edmonton
Mercury Low Level (Total) in water	EPA	* Mercury in Water by Cold Vapor Atomic Fluorescence Spectrometry, 245.7	20-Sep-11	Exova Surrey
Metals SemiTrace (Dissolved) in water	US EPA	* Metals & Trace Elements by ICP-AES, 6010C	19-Sep-11	Exova Surrey
Metals SemiTrace (Total) in Water	US EPA	* Metals & Trace Elements by ICP-AES, 6010C	19-Sep-11	Exova Surrey
Nitrogen - nitrite+nitrate-N	APHA	* Automated Cadmium Reduction Method, 4500-NO3- F	19-Sep-11	Exova Surrey
Solids Dissolved (Total, Fixed and Volatile)2	APHA	* Total Dissolved Solids Dried at 180 C, 2540 C	19-Sep-11	Exova Surrey
Solids Suspended (Total, Fixed and Volatile)	APHA	* Total Suspended Solids Dried at 103-105'C, 2540 D	19-Sep-11	Exova Surrey
Trace Metals (dissolved) in Water	US EPA	* Determination of Trace Elements in Waters and Wastes by ICP-MS, 200.8	19-Sep-11	Exova Surrey
Trace Metals (dissolved) in Water	US EPA	* Metals & Trace Elements by ICP-AES, 6010C	19-Sep-11	Exova Surrey
Trace Metals (Total) in Water	US EPA	* Determination of Trace Elements in Waters and Wastes by ICP-MS, 200.8	19-Sep-11	Exova Surrey
Trace Metals (Total) in Water	US EPA	* Metals & Trace Elements by ICP-AES, 6010C	19-Sep-11	Exova Surrey

APPENDIX XI

KEG AND REBEL CLAIMS – BASELINE WATER QUALITY/ HYDROLOGY STUDY (MARCH 2012)

Silver Range Resources

KEG AND REBEL CLAIMS

Baseline Water Quality / Hydrology Survey

March, 2012

J.Gibson Env. Consulting *Whitehorse, Yukon*

KEG / REBEL Claims March 2012

Silver Range Resources baseline water quality / hydrology surveys of the KEG and REBEL Claims surface waters continued on March 22 and 23, 2012.

The March 2012 surveys are at winter low flow volumes.

The sites are located in the Anvil Range approximately 30 kilometers north of Faro, Yukon and 15 kilometers north of the former Faro Mine.

The KEG Claims are located on tributaries to the Tay River.

The REBEL Claims are located south of the KEG Claims on tributaries to Anvil Creek.

All surface waters are tributaries to the Pelly River.

The initial water quality / hydrology survey was done in August 2010 followed by surveys in October 2010, March 2011 and June 2011 and September 2011.

Exploration activity had been halted in September 2011 for the winter.

The exploration camp and all survey sites were accessed by helicopter.

The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals, total organic carbon, total cyanide and total mercury with field measurements for pH, water temperature and flow volumes.

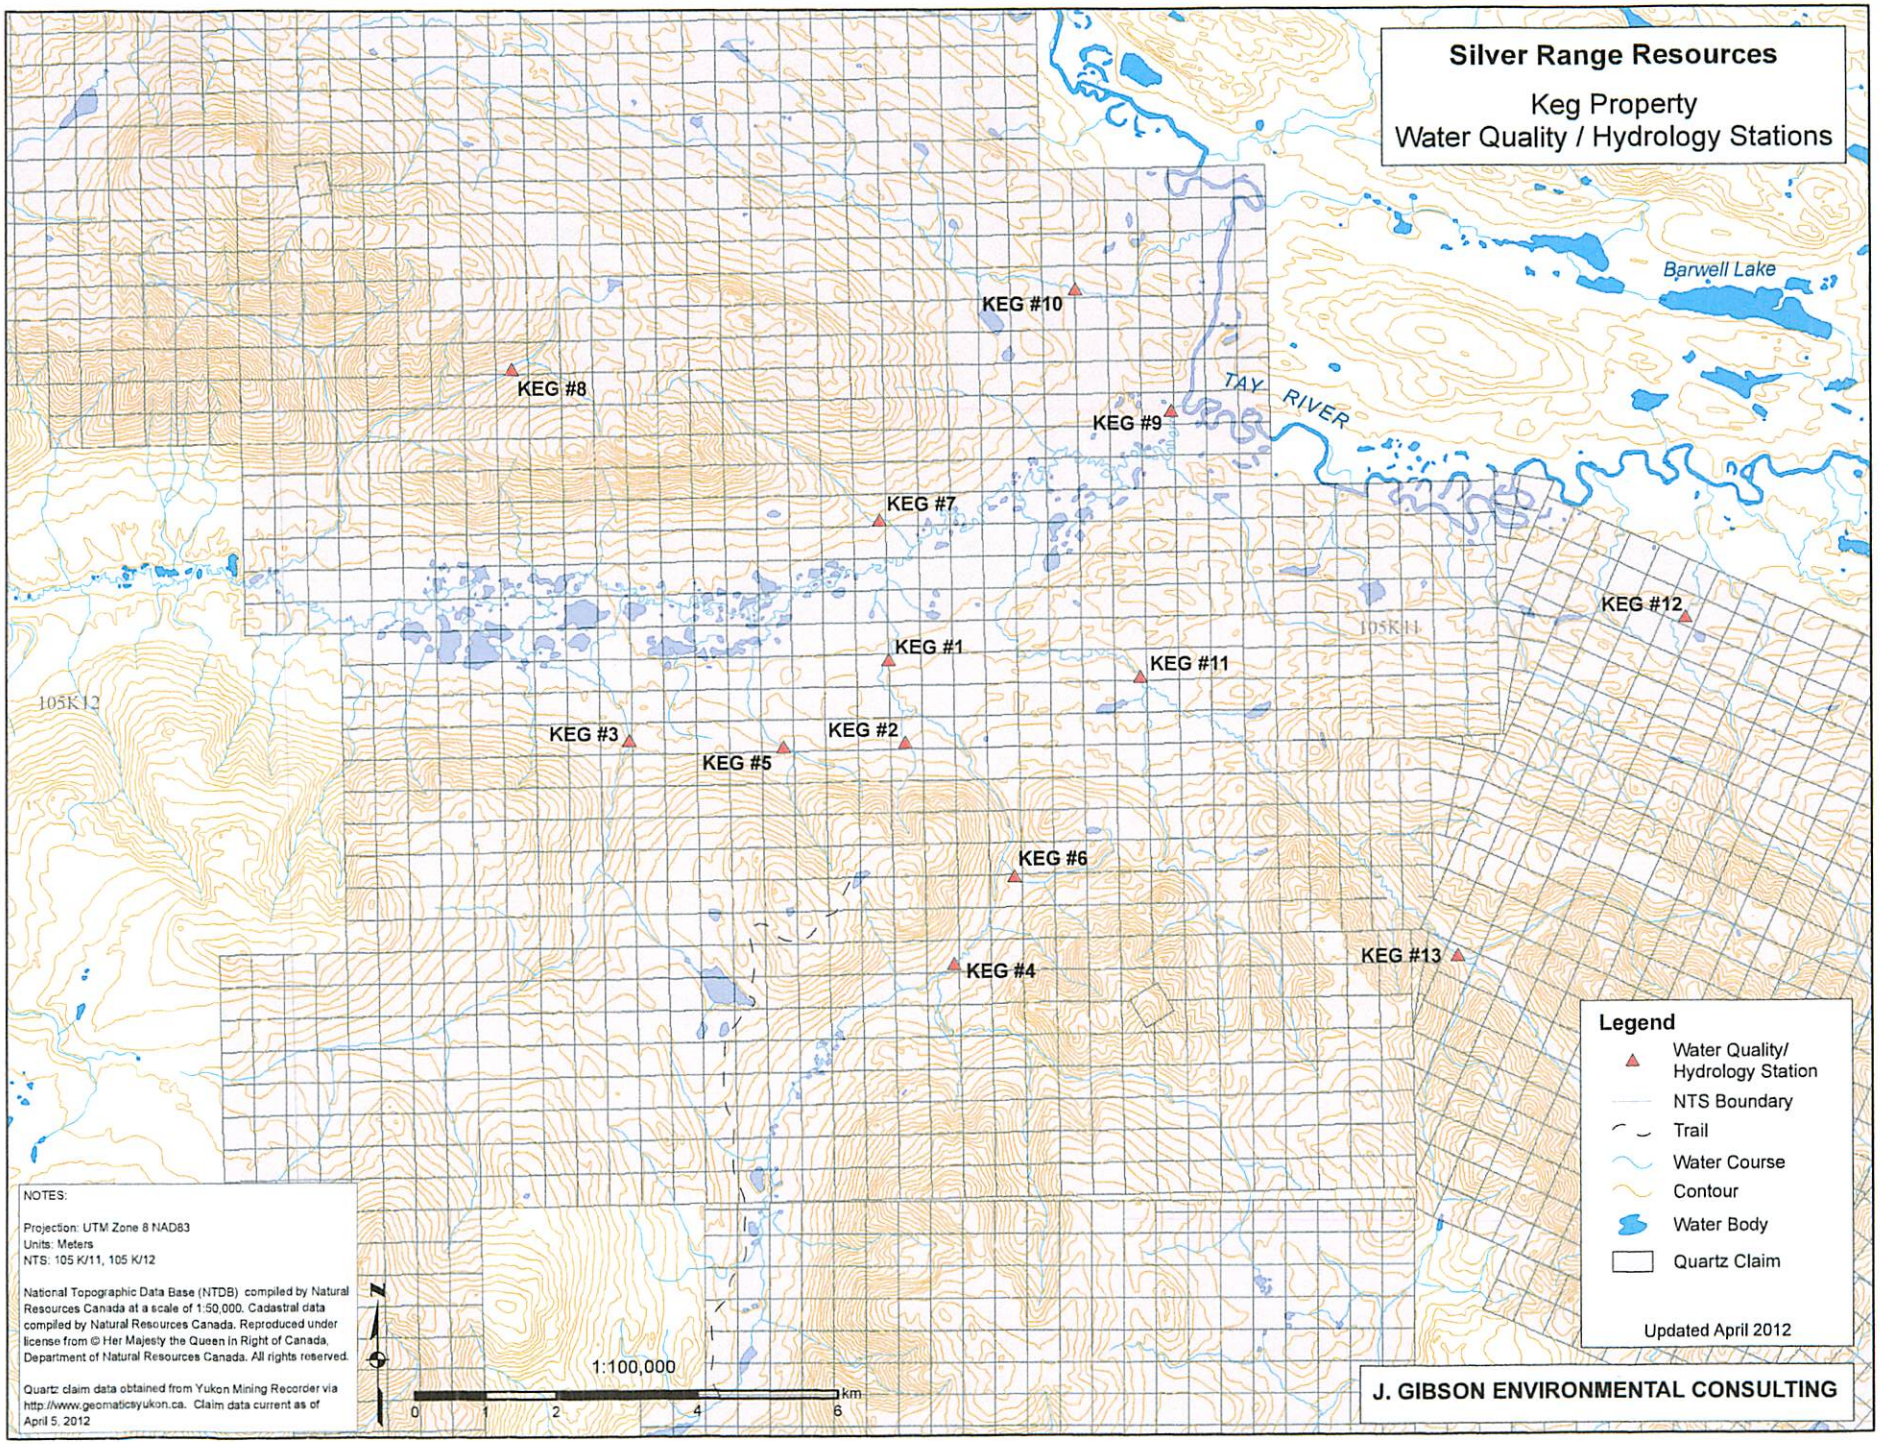
Snow survey measurements were taken at Snow Site #1 (established in March 2011).

Sample Locations

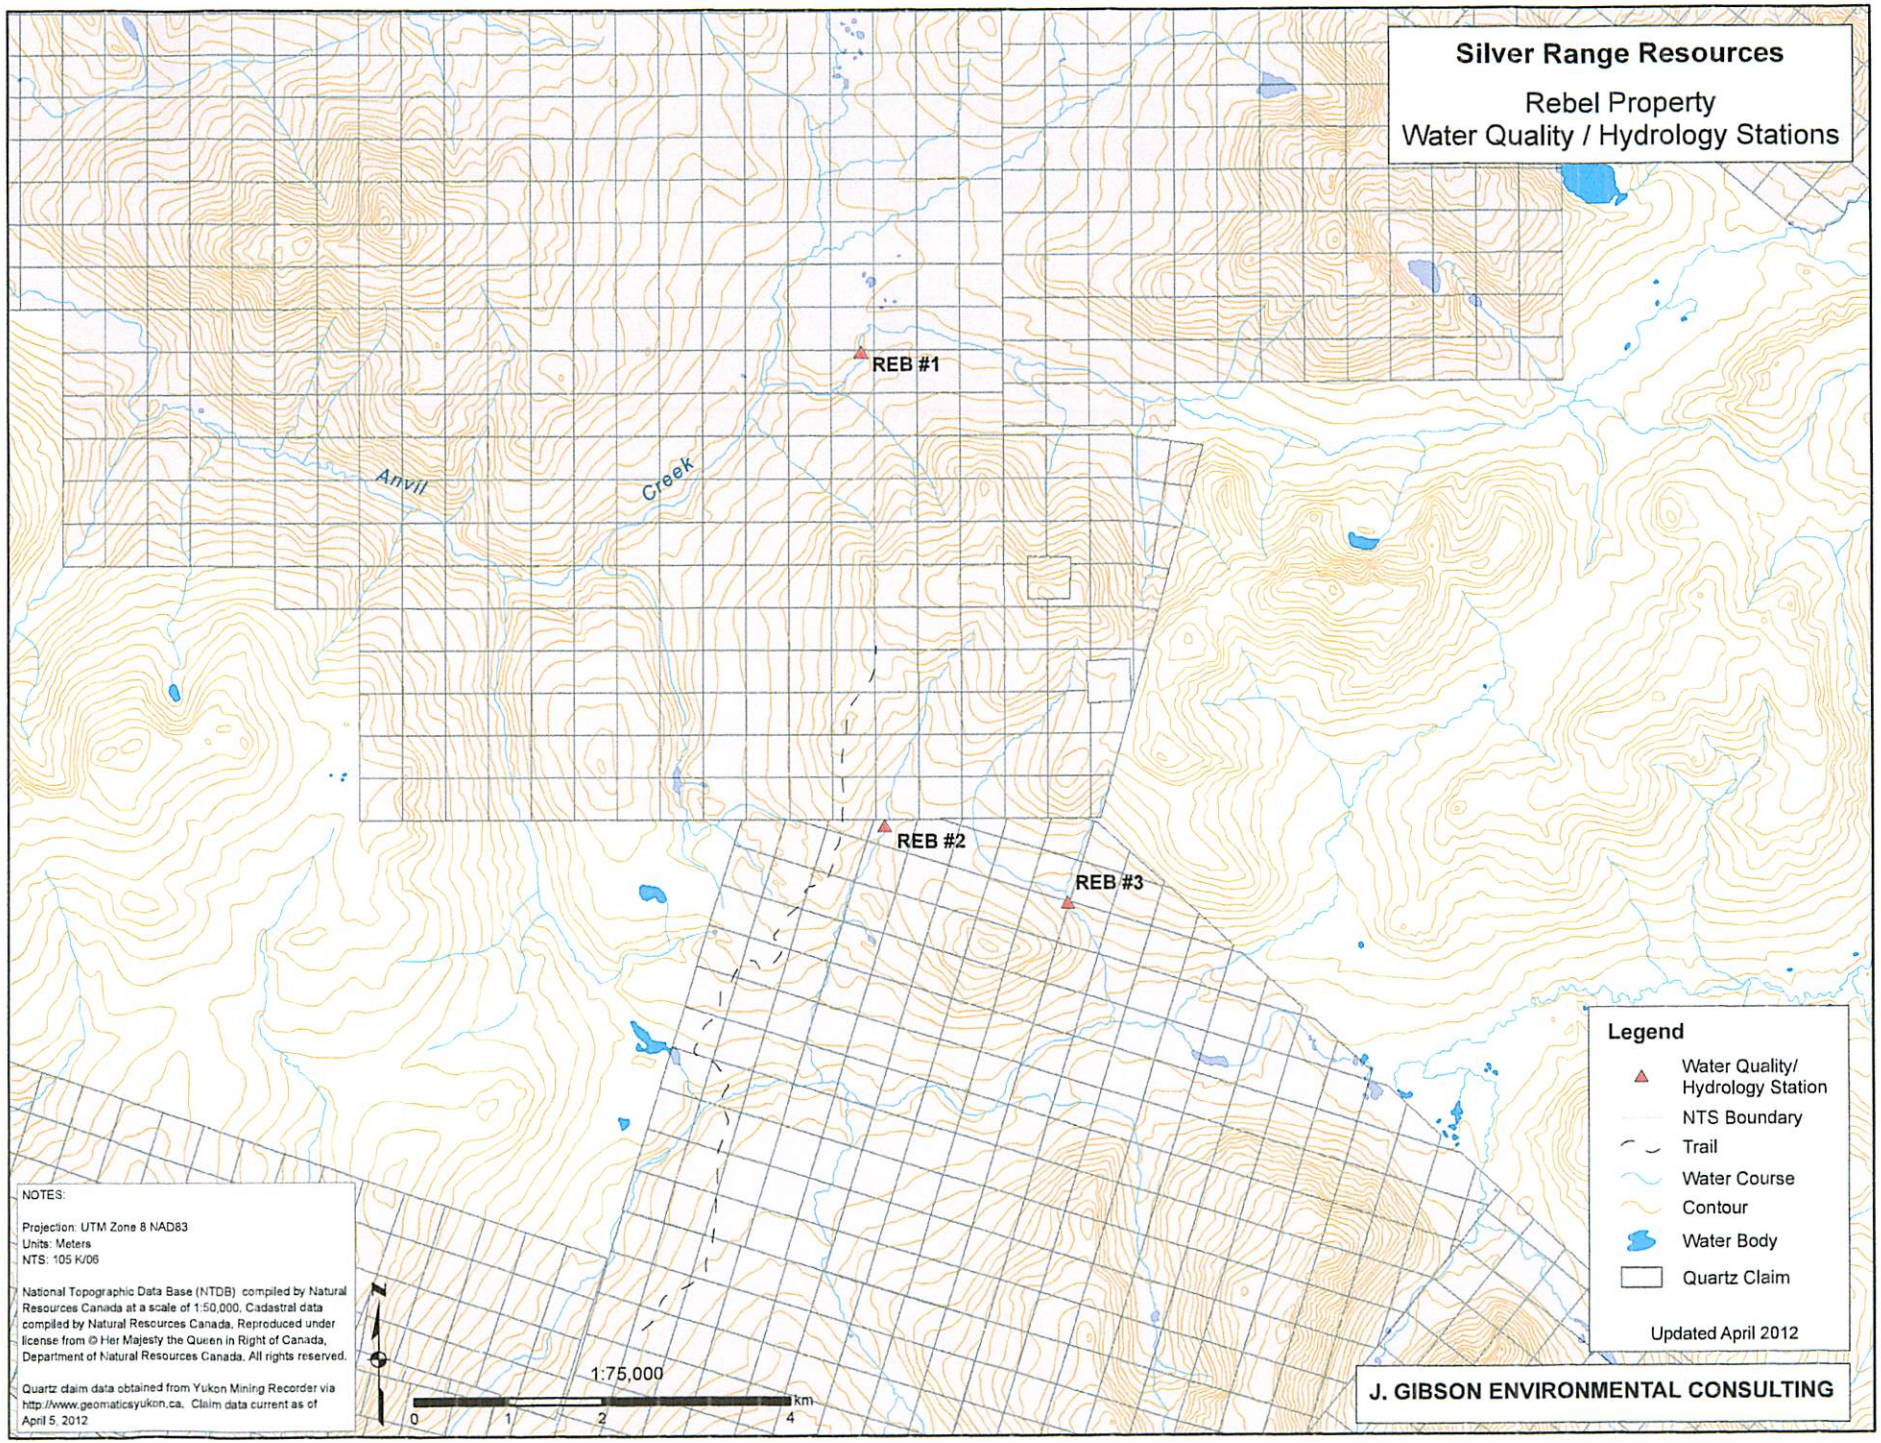
Nine water quality sample sites were established on the KEG Claims during the initial survey in August 2010.
Four sites were added in October 2010 on the eastern limits of the expanded claim block.

Three sites were established on the REBEL Claims in August, 2010 with no additions.
All sites are on the attached location maps.

Site Change / Relocation



Station location coordinates were checked during the March 2012 survey.



There is a discrepancy between the map location and coordinates for KEG#2, KEG#3 and KEG#5. A change was made to the map location of all three stations resulting in a new station KEG#3.
KEG#3 will be established in May 2012 when ground access is possible to establish a landing site.
Data collected at Stations KEG#2 and KEG#5 remains valid for the new locations.

New site coordinates are listed below and on the updated site map.

KEG Claim sample station designations and coordinates (updated March 2012) are:

Station #	Lat/Long Coordinates	Elevation(m)
KEG #1	62 36 8.26 / 133 19 58.3	787
KEG #2	62 35 29.8 / 133 19 44.2	818
KEG #3	62 35 34.4 / 133 24 18.1	865
KEG #4	62 33 46.9 / 133 19 48	970
KEG #5	62 35 29.3 / 133 21 45.3	833
KEG #6	62 34 26.4 / 133 17 59.1	940
KEG #7	62 37 12.9 / 133 20 43	833
KEG #8	62 38 26.8 / 133 26 5.3	1152
KEG #9	62 37 59.2 / 133 15 9.9	750
KEG #10	62 38 56.3 / 133 16 41.9	850
KEG #11	62 35 57.1 / 133 15 48.3	880
KEG #12	62 36 16.9 / 133 06 45.8	820
KEG #13	62 33 43.7 / 133 10 41.6	1020

REBEL Claim sample station designations and coordinates are:

Station #	Lat/Long Coordinates	Elevation(m)
REB #1	62 27 49.8 / 133 12 47.9	1305
REB #2	62 24 59.5 / 133 13 21.1	1425
REB #3	62 23 48.3 / 133 10 36.9	1365

Station coordinates and elevations are for helicopter landing sites. Due to the topography and thick vegetation it was often necessary to located landing sites up to100 meters distance from sample sites.

Sample Analysis Parameters

Stations KEG #1, #4, #9 and #11 to #13 and REB #1 and #3 were sampled for total metals, dissolved metals and routine chemistry, total organic carbon, total cyanide and total mercury.
Station KEG #9 is the KEG Claims downstream station prior to flows entering the Tay River and was sampled for routine chemistry, total and dissolved metals.

Stations Keg #2, #5, #6, #10 were not sampled as there was no surface flow in these tributary channels.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total and dissolved metal samples were preserved with nitric acid immediately after sampling.

Total Cyanide samples were preserved with NaOH, Total Organic Carbon samples with HCL immediately after sampling.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Exova Canada Inc. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH, conductivity, total dissolved solids were taken with an Oakton PCS TestR 35, water temperatures with a digital thermometer.

Flow Volume Measurements

Station KEG#7 had heavy overflow ice greater than the auger depth and was not sampled.

Station KEG#8 was not visited.

Station KEG#3 will be installed in May 2012.

Stream flow volumes were measured at Stations KEG#1 and KEG#11 with a Price AA velocity meter and cross sectional area calculations. Measurement required ice removal from the channel cross section.

Stream flow volumes at KEG#4, #12 and #13 were estimated.

Stream flow volumes at REB#1 and #3 were estimated. Station REB#2 was dry with no water or ice in the stream channel.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Tables 1a and 1b. KEG Stations Routine Chemistry – laboratory analysis and field measurements

Tables 2a and 2b. KEG Stations Total Metals ICP–MS laboratory analysis results

Tables 3a and 3b. KEG Stations Dissolved Metals ICP–MS laboratory analysis results

Table 4. KEG Stations Flow Volume Summary 2010, 2011, 2012.

Table 5. REBEL Stations Routine Chemistry – laboratory analysis and field measurements

Table 6. REBEL Stations Total Metals ICP–MS laboratory analysis results

Table 7. REBEL Claims Dissolved Metals ICP-MS laboratory analysis results

Table 8. REBEL Stations Flow Volume Summary 2010, 2011, 2012.

Table 9.. Camp Drinking Water Supply at KEG #4. Laboratory analysis results to. March 2012.

Table 10. Snow Survey Data March 2011 and 2012.

Listed with the analysis data are the laboratory detection limits for each parameter.

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic Guidelines for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to ***CCME – Canadian Water Quality Guidelines.***
All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by Exova Canada Inc of Surrey B.C.

Laboratory Analytical Reports are attached in Appendix 1.

Snow survey field notes are in Appendix 2.

Data Summaries for each station are on the attached Excel disc.

Quality Control

No samples for quality control were taken in March 2012.

Snow Water Equiv.(mm)	111	116
Air temp ©	*-12*	-22
# measurements within 6 % mean density	10 of 10	10 of 10

Note: Values are mean of 10 measurements per site

Discussion

Snow Survey

Snow survey results for March 22, 2012 show a decreased snow depth from March 2011. Snow density is increased from March 2011 along with snow water equivalent.

The survey course, located across the stream channel near camp was not utilized by caribou compared to 2011.

Hydrology

All water quality / hydrology stations on the KEG and REBEL claims were in winter low / minimum stage flow conditions. There was no input from snow melt at the time of the survey.

Flow measurements were done on Stations KEG#1 and #11. All other KEG stations and REB stations with flow had volumes estimated.

Stations KEG#2, #5 and #6 were frozen to channel base with no flow. KEG #10 was dry with a 0.25 meter airspace between ice and channel base.

Station KEG#7 had heavy overflow ice.

Station REB #2 was dry with no ice – flow dried up prior to freeze up.

Ice conditions ranged from 0.3 meters depth at KEG# 9 and #11, to 2 cm depth at KEG#1.

A summary of flow volumes for the surveys to date are listed in Table 4 (KEG) and Table 8 (REBEL).

Laboratory Analytical Results

Parameters that equal or exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

KEG Stations

Station KEG#1 results exceed ***Aquatic Guidelines*** for total selenium.

Station KEG#4 results exceed ***Aquatic Guidelines*** for total selenium.

Station KEG #9 results exceed ***Drinking Water MAC's*** for total iron and manganese. KEG#9 exceeds the ***Aquatic Guideline*** for total iron.

Station KEG #11 results exceed ***Aquatic Guideline*** for total selenium.

Station KEG #12 results exceed ***Aquatic Guideline*** for total selenium.

Station KEG #13 results exceed ***Aquatic Guideline*** for total selenium..

Total Mercury concentrations were at or below the detection limit of 0.00001 mg/L at all KEG stations.

Total cyanide concentrations were below the detection limit of 0.001 mg/L at all stations

Stations KEG #2, #5, #6, #10 had no surface flow and were not sampled.

Stations KEG #3 and #8 were not surveyed.

REBEL Stations

Parameters that exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

All REBEL stations meet ***Drinking Water Guideline*** and ***Aquatic Guidelines*** limits for all parameters tested with the continued exception of ***total selenium at Station REB#1***.

Total Mercury concentrations were below detection limits at all REB stations.

Total cyanide concentrations were at or below the detection limits of 0.001 mg/L at all REB stations.

Camp Drinking Water Supply

Station KEG #4 is the source of camp drinking water supply. Analysis results for samples taken of the ***"Raw"*** supply (total metals and routine chemistry) are listed in Table 9.

KEG#4 supply waters ***"Raw"*** met ***Drinking Water Guideline*** limits for all parameters tested.

Comments:

- Analysis was performed on samples 861983-1 to 6 that exceeded the recommended holding time for Water Nitrate analysis.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Please direct any inquiries regarding this report to our Client Services group.
Results relate only to samples as submitted.

Notes To Clients:

- Analysis was performed on samples 861990-1 and 2 that exceeded the recommended holding time for Water Nitrate analysis.
- Some total metal results were less than dissolved metal results for sample 861990. The results were verified and are within expected measurement uncertainty.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Comments:

- Analysis was performed on samples 861990-1 and 2 that exceeded the recommended holding time for Water Nitrate analysis.
- Some total metal results were less than dissolved metal results for sample 861990. The results were verified and are within expected measurement uncertainty.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Please direct any inquiries regarding this report to our Client Services group.
Results relate only to samples as submitted.

TECHNICAL MEMO

Date: August 19th, 2011

To: Doug Eaton

From: Bonnie Burns

Re: **Silver Range Project Sheep Survey – Archer Cathro**

A sheep survey was conducted on July 15th, 2011 for the above project. The complete study area was surveyed including areas to the north of the of area displayed in the attached figure. This memo presents the findings of the survey.

Helicopter:	B206 (CGMIG) Trans North
Pilot:	Brian Parsons
Observers:	Stu Withers (Laberge), Dorothy Dick (RRDC)
Observer – Navigator:	Grant Lortie
Observation Conditions:	Excellent – bight and clear but with upsloping fog at highest elevations with rain local in the Drex area.
Time:	Depart Faro – 09:41 Return Faro: - 12:47
Time on aerial survey:	2.8 hours

Introduction

The study area lies wholly within ecoregion 176, Yukon Plateau North. A comprehensive biophysical description is presented in Reference 1. As the focus of the survey was to determine the distribution and abundance of Mountain Sheep on and adjacent the claim block with particular attention to the proposed surface access options, most of the survey time was above 1500 m elevation (approximate timberline) in alpine and subalpine zones. A cursory examination of major upper drainages, principally wetlands, was also conducted. No evidence of sheep were noted in the uplands peripheral to Mt. Aho, nor on the uplands north of Anvil Creek (Owl Anomaly), although Yukon Government mapping does indicate local occurrence in these areas. Similarly, no sheep were observed on an excursion south of Rebel Anomaly into the Snap Anomaly area. However, prior occupation was in evidence as trails were observed on ridges and screes.

A week prior to this survey, the Yukon Government conducted a comprehensive sheep survey regionally. Pending their reporting, comparative results might be interesting.

Results

Sheep observations are summarized below in Table 1. The locations of the waypoints are displayed on the accompanying figure.

Table 1 Sheep Observations, July 15, 2011

Waypoint Number	Nursery Band				Ram Band				
	Ewes	Lambs	Immature Ram	Group Size	Class 4	Class 3	Class 2	Class 1	Group Size
001	3 22	3 7		6 29	3	3	1		7
006				3 (unclass)					
007	30	20	3	53	5	7			12
010						1	1	1 (unclass)	3
Totals:	55	30	3	88	8	11	2	1	22
NOTE: unclass = unclassified. Definitely sheep but unable to determine class and/or sex									

The ratio of total rams to total nursery sheep (25%) is the expected relationship typical of lightly hunted or naturally regulated sheep populations.

Class 1 Rams typically remain with nursery bands and a few are invariably enumerated as ewes unless close observation is done. Given the large area to cover, this precaution was not conducted. Grant Lortie suspects that the Class 1 and Class 2 cohorts are under represented with the nursery band in the above table, and were not found. Based on prior sheep observations elsewhere, Class 2 Rams are occasionally encountered in pure bands, the largest in Grant's experience numbering forty-four. It is likely that Class 1 and 2 cohorts and the compensating nursery sheep were beyond the range of the survey. Again, Yukon Government results will no doubt help in this regard.

Records were also kept of sightings of other wildlife and these observations are presented in Table 2.

Table 2 Incidental Observations, July 15, 2011

Waypoint	Species	Comments
002	Moose	Female and calf
	Grizzly bear	One – on the morning of this survey, the bear was seen chasing the moose pair along a small lake above Keg Camp (B. Parsons, Pers. Comm.)
003	Wolf	One lone wolf near wetland below Keg Camp
	Osprey	One, in same vicinity
004	Moose	One mature male
005	Moose	One mature female, no calf seen
006	Caribou	Six females, two calves
008	Caribou	Eight females
009	Caribou	Two females

Discussion

Mindful of the introductory caveats for the Owl and Snap anomalies, this survey more or less confirms the mapped distribution of sheep on the study area. A comparison with the concurrent Yukon Government results may further affirm these results.

Based on these findings, selection of a surface route option to the west of the primary option into the mainstem of Anvil Creek drainage would mitigate negative habitat impact on local sheep. However, identification of local key features, such as mineral licks, winter ranges and lambing sites should influence the final route selection.

TECHNICAL MEMO

Date: April 19th, 2012

To: Doug Eaton

From: Bonnie Burns

Re: **Silver Range Project Moose Survey – Archer Cathro**

A winter distribution moose survey was conducted on February 22nd, 2012 for the above project. The complete study area was surveyed including areas to the north of the area displayed in the attached figures. This memo, including four figures, photos and appendices, presents the findings of the survey. The results from the YG November, 2011 detailed moose survey are also discussed.

There was no helicopter stationed in Faro at this time and one was ferried from Ross River the morning of the survey.

Helicopter:	B206 (C-GMIG) Trans North
Pilot:	Dion Parker
Observers:	Bonnie Burns (Laberge), Dorothy Dick (RRDC)
Observer – Navigator:	Grant Lortie
Observation Conditions:	Excellent – clear and bright, winds light, -8°C
Flight Time:	Morning: Depart Faro – 09:09 Return Faro: - 11:47 Afternoon: Depart Faro – 12:34 Return Faro – 15:32
Survey Time:	Morning: 09:15 to 11:32 Afternoon: 12:34 to 15:32
Total flight time:	5 hours 49 minutes
Total survey time:	5 hours 15 minutes
Wildlife Research Permit:	0081

Introduction

The primary purpose of this survey was to determine the late winter distribution of moose, caribou and sheep on the entire study area. Incidental observations of other species were recorded, most notably of wolves.

Unlike the November survey, no attempt was made to render classification of animals observed or estimate abundance as these parameters were accomplished during the November survey. In addition, male moose are un-antlered at this time of year so sex could not be determined.

With a few exceptions regarding sheep and moose, evidence of caribou and moose were found below timberline along the main drainages and confluences of lower tributaries.

Full coverage of the entire claim block was achieved given the excellent flying and observation conditions. All of the mapped anomalies were surveyed.

Results

Moose:

Moose were widely dispersed throughout the study area, primarily along stream courses below timberline, with a few individuals found in low subalpine situations where snow conditions were favourable. The data and observations are summarized in Table 1 and are referenced to Map 1.

.

TABLE 1 MOOSE OBSERVATIONS AND SIGN	
Waypoint #	**Observed Animals**
7	Total of 6 – groups of 1, 2 and 3 animals

	Total of 27 moose observed
	Sign
1	Fresh tracks of 2 moose
2	Fresh tracks of 2 moose
3	Fresh tracks of 2 to 4 moose
4	Fresh tracks of 2 to 4 moose
5	Fresh tracks of 2 to 4 moose
6	Fresh tracks of 2 to 4 moose
9	Multi aged tracks for 1 mile above and below way point 9
11	Keg Camp – multi aged tracking continuous from Waypoint 10
18	Scattered older tracking
19	Older sign continuous from Waypoint 18
22	Tracks of 2 to 4 moose
28	Fresh tracks of 2 moose
31	Intermittent fresh tracks
32	Intermittent fresh tracks
33	Intermittent fresh tracks
34	Intermittent fresh tracks
37	Intermittent old tracks
38	More abundant and fresher tracks
48	Low density multi age tracking continuing downstream

TABLE 1 MOOSE OBSERVATIONS AND SIGN	
Waypoint #	**Observed Animals**
53	Fresh tracks of 2 to 4 moose in mid drainage
54	Fresh tracks of 2 to 4 moose in mid drainage

Caribou:

Evidence of caribou was found in two distinct locations on main drainages typified by open canopy spruce interspersed with pothole lakes, open fens and meadows. The data and observations are summarized in Table 2 and are referenced to Map 2.

TABLE 2 CARIBOU OBSERVATIONS AND SIGN	
Waypoint #	**Observed Animals**
15	Total of 26
16	Total of 20 in 2 groups of 12 (see Photo #3) and 8
50	Total of 20 (see Photo #6)
	Total of 66 caribou observed
	Sign
12	Recent tracking on both sides of canyon below Keg Anomaly
14	Entire lower valley tracked up
15	Entire lower valley tracked up
16	Scattered sign on both sides of Tay River
17	Intermittent caribou and wolf sign from waypoint #16
19	Scattered old caribou sign
21	Scattered old caribou sign
43	Blind Creek/Tay River Summit – recent tracking on small lakes and meadows
44	Blind Creek/Tay River Summit – recent tracking on small lakes and meadows
47	Lower end of distribution – no animals were seen

The larger western caribou distribution has an estimated 100 to 150 animals scattered in small groups. The smaller eastern group probably numbers 20 to 30 caribou.

Wolf:

Wolves or their sign were found in close association with caribou, but because caribou track up the landscape over wide areas it is difficult to sort out how many went where. Six wolves were observed at waypoint #14 but it is probable that this pack is larger based on the trail sign on the Tay River (Photo #2). While no wolves were seen, scattered hints of wolves associated with the eastern caribou group were noted.

Wolves in association with moose were noted at waypoint #33, a trail on Blind Creek, and at waypoints #8 and #9, a trail on Anvil Creek (see Map 2).

Sheep:

This survey further confirms the winter presence of sheep near the Marks Anomaly where three unclassified animals were seen at waypoint #46. No attempt was made to exhaustively pursue looking for more animals as this small band occupies a very restricted and marginal winter range, with very little escape terrain. During the November survey a band of 11 sheep were observed near the Marks Anomaly.

Incidental Wildlife:

Ptarmigan: Four or five small flocks were noted but unrecorded as so little time was spent at higher elevations, however Waypoint #23 represents a flock of about 15 ptarmigan. The uplands around the Owl Anomaly had numerous Ptarmigan tracks in the upper shrub zone and a couple of flocks were observed.

Gyrfalcon: A very pale grey individual was observed at waypoint #52, likely hunting ptarmigan.

Wolverine: Wolverine tracks were observed at waypoint #55.

Discussion and Recommendations

Based on the maps, photos, data presentation and interpretation, this survey represents a fairly accurate picture of the utilization of the area at the time of the survey. Variances in winter habitat conditions can be expected between years, largely dependent on snow conditions. Next year the picture may be different particularly with caribou.

Snow depth (approximately 24 to 30 inches) below timberline did not appear to be an impediment to the mobility of moose and caribou. The development of a wind and sun crust at higher elevations precluded the use of these high plateaus and prairies, with the exception of the few pockets of moose in favourable situations.

Snow depth in the Finlayson Lake area is much below normal (Dorothy Dick, pers. comm.), in an area with a background of annual snow surveys. Comparative snow information for the Anvil Range needs to be addressed.

As noted in our November 2011 survey submission, we observed ratios of 14.7 calves / 100 cows and 38 bulls / 100 cows with the expressed hope that the YG Ver-Hoef survey would improve these numbers. With regard to the cow / calf ratio, these numbers did improve with a mean estimate of 19 calves / 100 cows on the whole YG surveyed area, and a mean estimate of 20 calves / 100 cows on our overlap area in Game Management Area 445 (Matt Clark pers. comm.). These recruitment numbers are still too low to maintain a stable population. The agencies of neonate mortality are unknown at this time but early predation by bears is certainly one factor.

During our summer survey of July 15th, 2011, we were too late to appraise moose calving areas on the study area. However, the creek wetlands above the Keg and the large wetland south of the Owl should have retained a few cow / calf pairs. While purely speculative and undemonstrated, it is possible that frequent helicopter overflight of these wetlands may have presented disturbance in its own right but also predisposing neonates to predation.

Our observed ratio of 38 bulls / 100 cows lies comfortably between the YG estimated means of 32/100 and 42/100 for GMA 445 and the whole area respectively (Matt Clark pers. comm.). All data from the intensive moose survey conducted by YG in November 2011 will be available soon in the report entitled "Summary of the Faro Early-Winter 2011 Moose Survey" currently in preparation. Map 3 displays the overlap of Archer Cathro's claim block and the 2011 moose survey by YG.

The GMA 445 bull/cow ratio of 32/100 is at the lower permissible limit to maintain a stable moose population, especially with the jointly observed poor recruitment levels. By way of explanation an examination of Appendix 1, Figures 2 and 5, was made regarding the summaries of moose harvests from 1990 to 2010, obtained from YG. Between 1998 and 2010, GMA 445

has been subject to over harvest in nine of thirteen years, dramatically so in five of the last six years. Summaries of moose harvest, including the harvest by outfitters is included in Table 3 below. Until YG initiates a regulated and more conservative resident harvest management regime, particularly in GMA 445 where 213 moose have been harvested within the past 10 years, provision for all season surface access will remain problematic.

Outfitter Concessions

Concessions 8 (MacMillan River Adventures Ltd.) and 9 (Deuling Stone Outfitters Ltd.) bisect the study area (see map in Appendix 2). Harvest results from 2002 to 2011 for Game Management Areas 441, 445 and 446 are summarized below in Table 3 for moose, Table 4 for caribou and Table 5 for sheep, black and grizzly bear. In the table Non-Res means non resident hunters who would have been guided by an outfitter, and Res refers to resident licensed hunters but does not include native hunters.

Trapper Concessions

The entire region lies within the Ross River Group Trapping Area (see map in Appendix 3), and Jenny Caesar is the group area spokesperson. Fur harvest information is privileged.

Fire History of the Faro Area

The fire history of the Faro area from 1946 to 2010 is depicted on Map 4. With the exception of the upper Anvil Creek area, the majority of the study area has been unaffected by forest fires.

Personal Communications

PHOTOGRAPHS

FEBRUARY 22ND, 2012

Photo #1; Two moose at Waypoint #13.

Photo #2; One of six wolves observed near caribou at Waypoint #14.

Photo #3; Herd of 12 caribou at Waypoint #16 on a pond ne ar the Tay River.

Photo #4; Cow and calf bedded down at W aypoint #29 near the Drex anomaly.

Photo #5; Numerous wolf tracks on the Tay River creating quite a "highway" between waypoints 49 and 50. It is speculated that a kill site existed on the right bank judging by the number of trails into the area, but without landing, this was not confirmed.

Photo #6; Several caribou at Waypoint #50.
