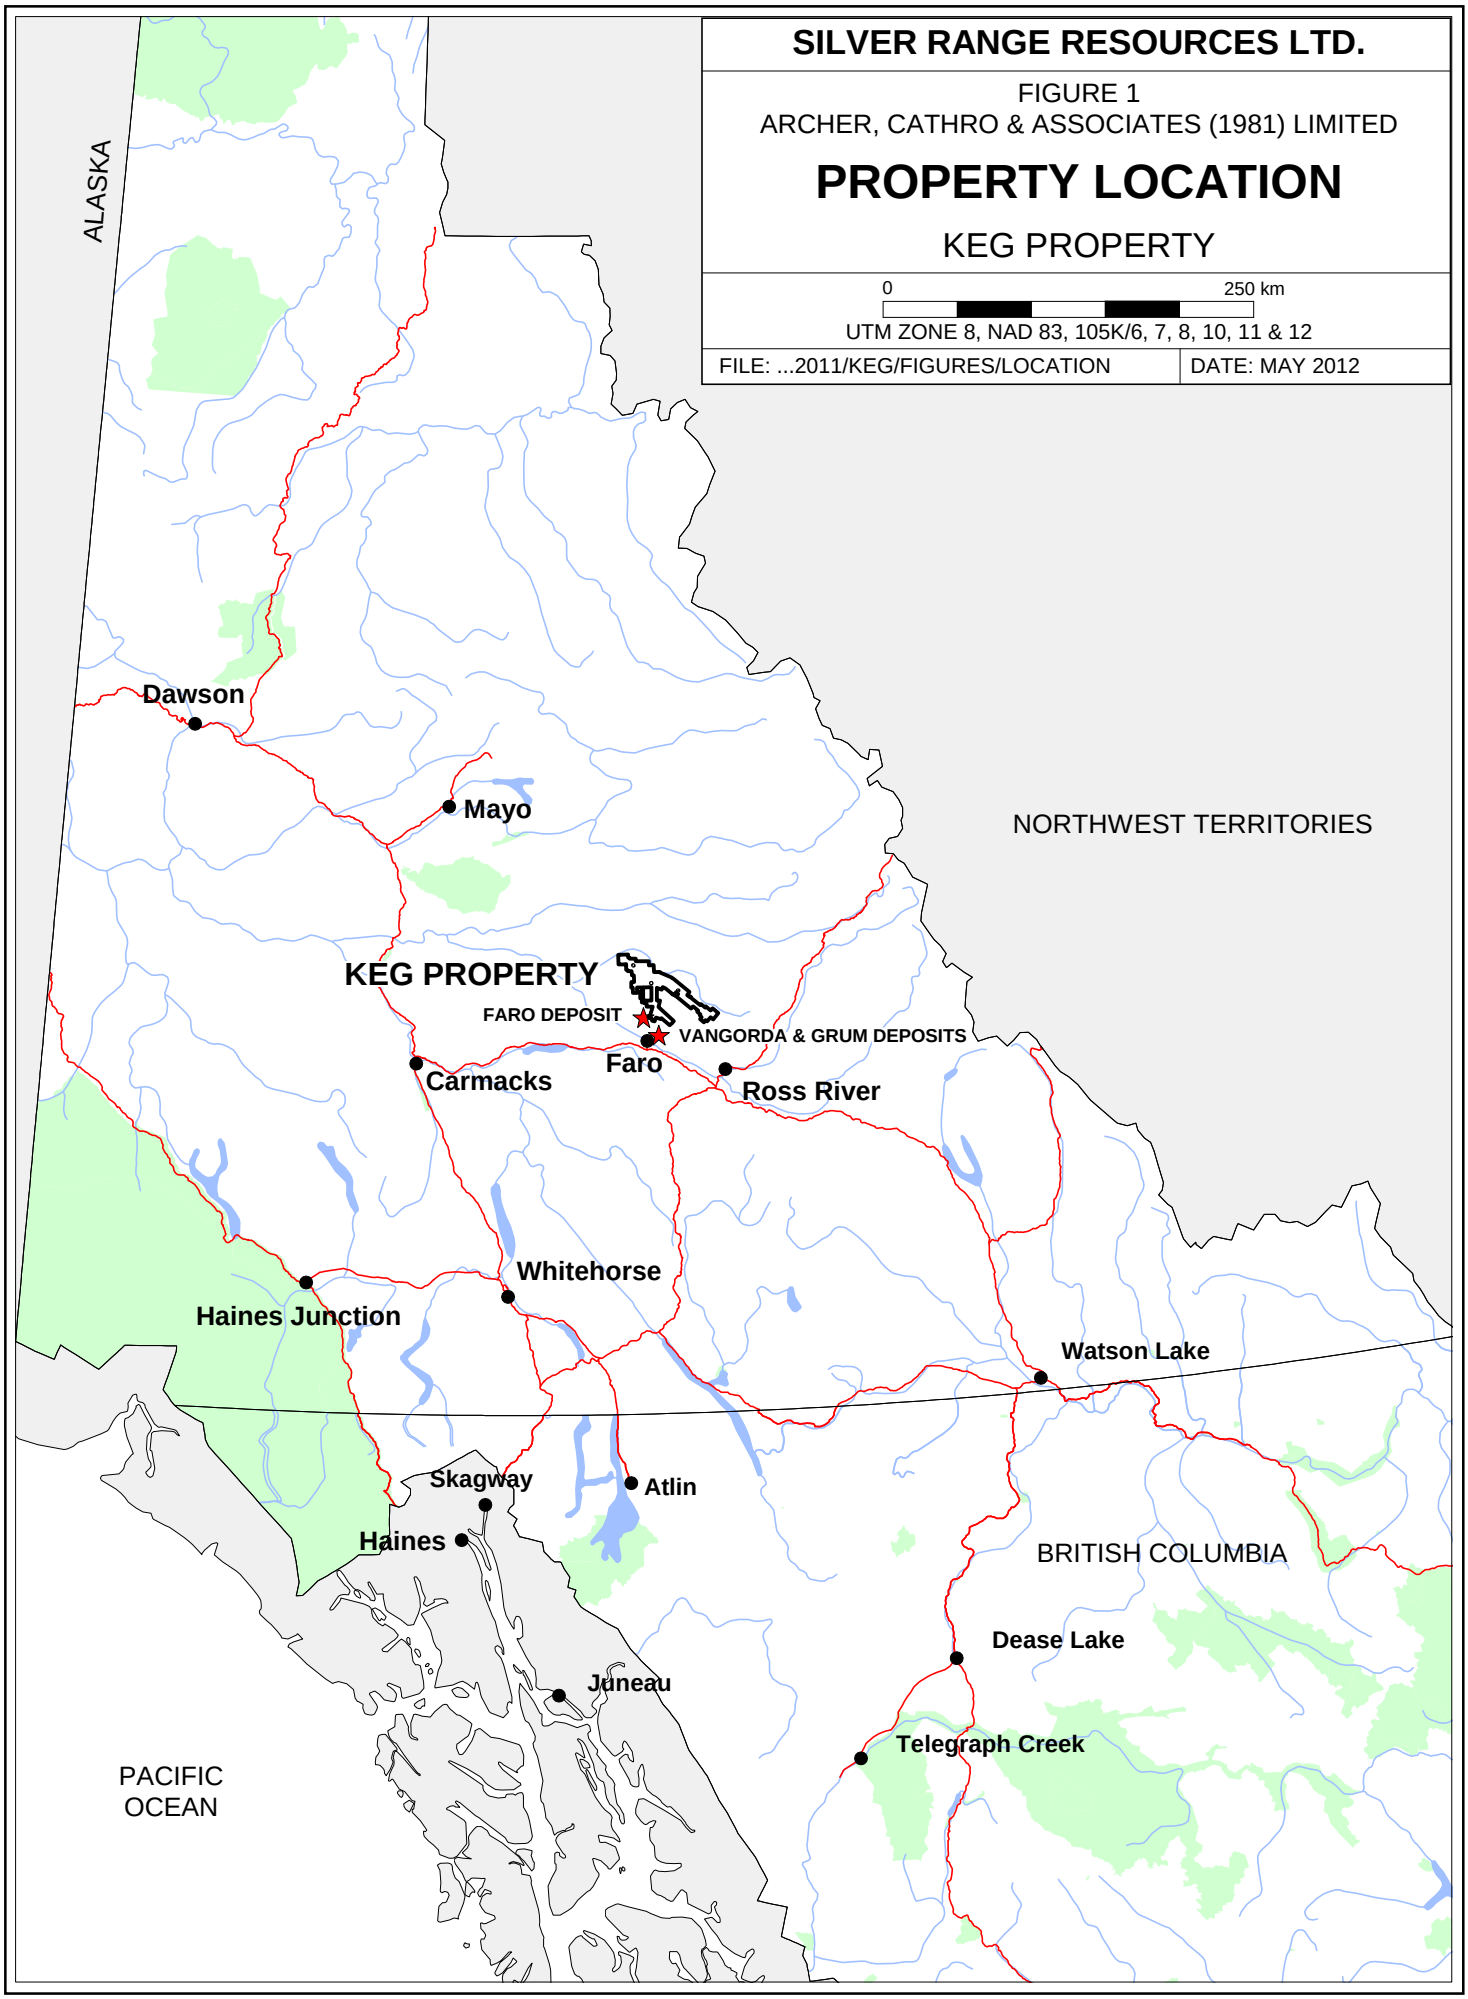
INTRODUCTION

The Keg property covers a bulk-tonnage silver-lead-zinc-copper±tin±indium prospect situated in the Anvil District of south-central Yukon. Numerous other known mineralized zones, some of which comprise high grade silver and gold veins, and multi-element soil geochemical anomalies are also situated within the property boundary. The property is wholly owned by Silver Range Resources Ltd.



This report describes an exploration program that was conducted by Archer, Cathro & Associates (1981) Limited in summer 2011 on behalf of Silver Range. Work was performed between May 16 and October 5. It comprised detailed- and regional-scale geochemical sampling and prospecting, some geological mapping, drill pad construction, 16,808.37 m of diamond drilling in 51 holes, line cutting, petrographic studies, induced polarization (IP) surveys, water quality surveys and wildlife surveys. In spring 2011, a detailed interpretation of 2010 versatile time domain electromagnetic (VTEM), magnetic and IP surveys was completed. The author interpreted all results from the program, and her Statement of Qualifications is in Appendix I.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Keg property stretches from 10 to 55 km north of the town of Faro in Whitehorse Mining District of south-central Yukon. It is centred at latitude 62°35′ north and longitude 133°18′ west on NTS map sheets 105K/06, 07, 08, 10, 11 and 12 (Figure 1).

The property comprises 4197 quartz claims that cover an area of approximately 85,000 ha (850 sq. km.). Between December 2009 and March 2010, the Keg 1 to 53 and Reb 1 to 20 claims were staked to cover historical mineral occurrences. During the 2010 exploration season, the Keg 54 to 1340, Reb 21 to 72, Tay 1 to 314 and Fub 1 to 44 claims were added as positive results were obtained. From fall 2010 to spring 2011, the Keg 1341 to 2270, Reb 73 to 179, Snap 1 to 157, Tap 1 to 160 and Vat 1 to 309 claims were staked. During the 2011 exploration season, the Ku 1 to 680 and An 1 to 113 claims were added. The Hot 1 claim was purchased from R. Hamel on January 6, 2010; the BP4 claim was optioned from R. Berdahl on June 8, 2010 (Strategic Metals still holds this option but is being explored as part of the Keg property); and the JRV claims were purchased from an arms-length private company on August 29, 2011. All of the mineral claims (except BP4) are registered in the name of Archer Cathro, which holds them in trust for Silver Range. Specifics concerning claim registration are tabulated below, while the locations of individual claims are shown on Figure 2.

Claim Name	Grant Number	Expiry Date*
An 1-3	YE53681-YE53683	March 13, 2017

Crews involved with regional grid and contour soil sampling, prospecting, line cutting, IP surveying, diamond drilling (one crew) and water quality and wildlife surveying were based at the Faro Studio Hotel and/or a crew house in the community of Faro. These crews were flown to and from the property on a daily basis via a Bell 206B helicopter and occasionally an A-Star B3 helicopter, both operated by Trans North Helicopters from the Faro airport. The A-Star B3 helicopter provided primary camp support, while the Bell 206B helicopter was used for secondary camp support.

HISTORICAL CLAIMS

KEG PROPERTY

0 5 10 km

UTM ZONE 8, NAD 83, 105K

FILE: ...2010/KEG/FIGURES/Hist_claims.wor | DATE: MAY 2012

Personnel that were involved with detailed soil sampling, prospecting, geological mapping, pad building, road building, diamond drilling (three crews) and geotechnical and geological core logging were based at a camp on the property. These crews were mobilized and supplied using the A-Star B3 helicopter and a 500D helicopter also operated by Trans North. The A-Star B3 helicopter provided primary drill mobilization, while the 500D helicopter was used to transport drill crews and for secondary drill mobilization.

Faro, the nearest supply centre, is accessible via the Robert Campbell Highway in all seasons using two-wheel drive vehicles. A network of gravel roads and all-terrain vehicle trails extends to the southern end of the Keg property from the historical Faro Mine site. No attempt was made to use these roads in 2011. Four leased lots at the Faro airport were used throughout the program as a staging and temporary storage area.

HISTORY AND PREVIOUS WORK

Apart from prospecting for placer gold early in the 20th century and reconnaissance work done by the Geological Survey of Canada in the 1930s (Johnston, 1936), there was no reported exploration activity in the Faro area until the Canol Road was built during World War II, thus providing better access to the district (Wober, 1967). The first significant discovery in the area was made in 1953, when Prospector Airways identified the Vangorda Deposit (Figure 1). No further discoveries were made until 1965, when Dynasty Explorations and Cypress Mining Corp. Ltd. found the Faro Deposit. This major deposit stimulated a large staking rush and extensive exploration throughout the area by various operators (Cathro, 1967a).

Over the next 20 years, exploration resulted in identification of additional sediment-hosted massive sulphide (SEDEX) deposits in a narrow, northwesterly trending belt (Anvil Belt). Three deposits in this belt were mined (Vangorda, Faro and Grum), while two others (Grizzly and Swim) are partially developed. Several exploration programs were conducted northeast of the Anvil Belt, but they were deemed to be unsuccessful because SEDEX style mineralization was not found. Between 1965 and 1980, several operators worked in various areas that lie within the boundaries of the current Keg property. Although widespread mineralization and strong geochemical and geophysical anomalies were detected in several areas, follow up drilling intersected only fracture and carbonate replacement style mineralization, which was dismissed because the focus of exploration was on massive sulphide deposits. After 1980, work in the area generally tapered off.

Historical work within the bounds of the current Keg property was concentrated in six main areas (Keg, Owl/Zeno, Archimedes, Marks, Rebel and Cody/Cirque/Snap/Risby areas) that generally yielded positive geochemical and geophysical results. These areas are documented in the Yukon Minfile database. Table I lists the year of work, owner/operator, claim group name, work performed and results for each program by area, while Figure 3 illustrates the relative locations of many of the old claim blocks.

Table I – Exploration History of Keg Property (*after Deklerk and Traynor, 2005, complete list of references provided below Table I)*

Year of Work (Report #)	Owner/ Operator	Claim Group	Work Performed	Results
KEG AREA				
1965 (Minfile)	Anvil Mining Corporation Ltd.	Ivan	Staked claims following an airborne magnetic (mag) and electromagnetic (EM) survey	n/a
1966 (091262)	Anvil Mining	Ivan	Diamond drilling (464.5 m in 4 holes)	Intersected disseminated Pb-Zn mineralization, but no sulphides of economic significance observed, no assaying done.
1966 (019008)	Yukon Copper Ltd.	Caribou Lake Property (Tara, Dane, Hal & Mark claims)	Staked claims Airborne mag and EM survey Geological mapping Soil sampling	Outlined 3 zones of favourable geophysical and geochemical (Cu-Pb-Zn) response.
1966 (Minfile)	Yukon Copper. -- Northern Empire Mines Ltd.	n/a	Yukon Copper Ltd. reorganized as Northern Empire Mines Ltd.	n/a
1967 (019007)	Northern Empire	Caribou Lake Property (Tara, Dane, Hal & Mark, added Bark claims)	Additional claims staked Line cutting Soil and rock geochemical sampling Geological mapping	Outlined new soil anomalies and better defined known soil anomalies. 4 grab samples yielded between 2.8-4.5% Zn, 0.04-0.18% Cu and 6.2-11 g/t Ag.
1968 (019007)	Northern Empire	Caribou Lake Property (Tara, Dane, Hal, Mark & Bark)	Bulldozer trenching	Exposed disseminated to massive pyrrhotite-pyrite-sphalerite±chalcopyrite±galena ±scheelite in bedrock. A 15 x 3 m sulphide lens averaged 1.25% Zn, 0.05% Cu and 3.4 g/t Ag; and a partially exposed pyrrhotite band returned 2.84% Zn and 0.37% Cu over 2.4 m.
1969 (Minfile)	Inter-Tech Development and Resources Ltd.	Ter	Restaked old Ivan claims as Ter	n/a
1971 (Minfile)	Northern Empire -- Northern Homestake Mines Ltd.	Caribou Lake Property (Hal)	Northern Homestake acquired property from Northern Empire	n/a
1972 (Minfile)	Northern Homestake	Caribou Lake Property (Hal)	Bulldozer trenching	No record of work.

1972 (Minfile)	Ridgemont Mining Corporation (Cyprus Anvil Mining Corporation)	Dana & Irma	Restaked old Ivan & Ter claims as Dana, staked Irma to NW	n/a
1973 (Minfile)	Northern Homestake -- Ridgemont (Cyprus Anvil)	Hal	Ridgemont optioned property from Northern Homestake	n/a
1973 (060933)	Ridgemont (Cyprus Anvil)	Dana	Soil sampling	2750 x 300 m soil anomaly with coincident highly anomalous Zn-Pb-Cu values.
1974 (Minfile)	Ridgemont (Cyprus Anvil)	Hal, added Halo claims	Staked additional claims (Halo) Geological mapping Geochemical surveys Mag, EM and IP surveys	No record of work.
1974 (Minfile)	Ridgemont -- Cyprus Anvil	Dana, Irma, Hal & Halo	Property transferred to Cyrpus Anvil	n/a
1974 (091263)	Cyprus Anvil	Dana, Hal & Halo	Diamond drilling (494 m in 3 holes)	Best intercept yielded 1.24% Zn, 0.46% Pb, 0.14% Cu and 34 g/t Ag over 49 m.
1975 (091264)	Cyprus Anvil	Dana & Halo	Diamond drilling (627 m in 3 holes)	Intersected less extensive but locally higher grade mineralization than 1974 holes. Best intercept yielded 3.52% Zn and 0.13% Cu over 8.0 m.
1975 (090083)	Cyprus Anvil	Irma	Mag & gravity survey	Separate, distinct magnetic and gravity anomalies defined.
1977 (090205)	Cyprus Anvil	Irma	IP survey	Showed presence of large anomalous zone that correlates to 1975 gravity anomaly.
1978 (091265)	Cyprus Anvil	Irma	Diamond drilling (159 m in one hole)	No assays reported.
1990 (092964)	YGC Resources Ltd.	Keg	Staked claims Prospecting Geochemical survey	Subdued Au values obtained.
2010	Strategic Metals Ltd.	Keg	Staked claims Prospecting Geochemical survey IP survey VTEM & mag survey Diamond Drilling (958.27 m in 4 holes)	Best drill intercept returned 50.09 g/t Ag, 1.20% Zn, 0.65% Pb, 0.14% Cu, 217 ppm Sn over 125.70 m. Identified several additional soil anomalies and mineralized zones.
OWL/ZENO AREA				
1969 (060180)	Atlas Exploration Company Ltd.	Owl (Owl area)	Staked claims to cover anomalous geochemical values	n/a
1970 (060180)	Atlas Exploration	Owl (Owl area)	Staked additional claims Line cutting Geological mapping Stream sediment	Discovered disseminated and fracture-filling Zn-Pb-Cu mineralization & 1525 x 365 m area of coincident

			sampling Soil sampling Mag, EM and gravity surveys	anomalous Cu-Pb-Zn values. Identified 3 coincident geophysical targets.
1970 (Minfile)	Atlas Exploration	Hoot (Zeno area)	Staked claims	n/a
1971 (Minfile)	Atlas Exploration	Hoot (Zeno area)	Prospecting Geochemical survey	No results reported.
1983	Getty Canadian Metals, Ltd.	n/a	Regional stream sediment sampling Prospecting	Anomalous stream sediment geochemistry in northwest corner of current Keg property. Discovered Hoot Showing (Zeno area), Getty Showing (100 g/t Ag, 10.78% Zn, 3.27% Pb, 0.38% Cu & 3.4 g/t Au over 10 cm) and Payne Showing (31.2 g/t Ag & 1.57% Pb over 5 cm).
1989 (Minfile)	R. Diment	Splash (Zeno area)	Restaked Hoot claims as Splash	n/a
2010	Strategic Metals Ltd.	Keg	Staked claims Soil sampling (Owl Zone) Prospecting (Owl Zone)	5 sulphide-rich rock samples averaged 500 g/t Ag, 3.52% Zn, 7.72% Pb, 381 ppm Sn. Very strong, coincident, 1400 x 400 m, Ag-Zn-Pb-Cu-Sn soil anomaly.
ARCHIMIDES AREA				
1965 (Minfile)	Anvil Mining	Yeti	Staked claims Established grid for 1966 geophysical survey	n/a
1966 (Minfile)	P. Versluce	MC	Tied MC claims onto Yeti property	No record of work.
1966 (017483)	Anvil Mining	Yeti	Mag & EM survey	Delineated coincident NW striking mag response & EM conductor, likely caused by disseminated pyrrhotite.
1975 (Minfile)	Northern Homestake	Zap & Rog	Restaked part of Yeti property as Zap and Rog	n/a
MARKS AREA				
1965 (Minfile)	Anvil Mining	Zeus	Staked the Zeus claims following an airborne mag and EM survey	n/a
1966 (Minfile)	Anvil Mining	Zeus	Limited soil sampling and ground geophysical surveys	No record of work.
1974 (Minfile)	Ridgemont	Zed & Nor	Restaked Zeus property as Zed (west) and Nor (southeast) claims	n/a
1974 (Minfile)	Ridgemont – Cyprus Anvil	Zed & Nor	Properties transferred to Cyrpus Anvil	n/a
1975 (061482)	Cyprus Anvil	Nor	Linecutting Soil sampling	Outlined 760 x 600 m Pb-Zn soil anomaly.

				Disseminated to replacement style Pb-Zn mineralization discovered.
2010	Strategic Metals Ltd.	Keg	Soil sampling	Expanded 1975 soil anomaly to 3600 x 700 m (Pb-Zn-Sn±Cu).
REBEL AREA				
1966 (018994)	Giant Yellowknife Mines Ltd.	KD, AC & Jet	Staked claims Ground geophysical survey Soil geochemical survey Geological mapping	Discovered extensive gossan with limonite, galena, sphalerite & chalcopyrite as float. Composite grab sample returned 295 g/t Ag, 8.8% Pb, 1.2% Zn & 0.2% Cu. Geophysical and soil anomalies also identified.
1966 (018984)	Altair Mining Corporation Ltd.	AM	Staked claims	n/a
1967 (018984)	Altair Mining	AM	Geological mapping Soil and silt sampling EM and gravity surveys	Identified Cu-Pb-Zn soil anomaly and coincident EM conductor.
1968 (Minfile & 060715)	Giant Yellowknife – Mercury Exploration Ltd.	KD & AC Zan	Optioned properties from Giant Yellowknife Staked Zan claims Prospecting & soil sampling on Zan	Identified two Pb-Zn soil anomalies on valley floors. No mineralization discovered.
1969 (060177)	Mercury Exploration	AC, MX & Zan	Staked additional claims Gravity survey Geochemical survey	Located sporadic weak gravity anomalies.
1970	Mercury Exploration – Giant Yellowknife	Mount Mye Property (KD, AC, MX)	Claims reverted to Giant Yellowknife	n/a
1970 (Minfile & 060975)	Giant Yellowknife – Kangaroo Exploration Ltd.	Mount Mye Property (KD, AC, MX, Zan)	Optioned claims from Giant Yellowknife Diamond drilling (593.8 m in 3 holes)	Identified Pb-Zn soil anomalies. Drilled soil & geophysical anomalies – no significant mineralization intersected.
1971 (060976)	Kangaroo	Mount Mye Property (KD, AC & MX, Zan, added Taf claims)	Staked Taf claims Grid soil sampling	1525 x 750 m soil anomaly with values up to 10,600 ppm Zn, 4,800 ppm Pb, 1650 ppm Cu & 5.0 ppm Ag.
1972 (060994, 060995)	Kangaroo	Mount Mye Property (KD, AM, AC, MX)	Acquired AM claims? Turam EM survey Gravity survey	Indicated presence of a number of conductors, some exhibiting considerable strike length.
1972 (091245)	Kangaroo	KD	Diamond drilling (564 m in 4 hole)	Only 1 hole was sampled. This hole yielded 2.28% Zn over 61 m.
1973 (091243)	Kangaroo	KD	Diamond drilling (630 m in 3 holes)	Not sampled.
1974	Ridgemont –	Fat	Re-staked part of Taf	n/a

(Minfile)	Cyprus Anvil		claims as Fat claims Turam EM survey	
1976 (Minfile)	Cyprus Anvil	KD, AM, AC, MX	Optioned claims from Kangaroo and Giant Yellowknife	n/a
1976 (090186)	Cyprus Anvil	Parts of Mount Mye Property (including Fat claims)	Mag, EM and gravity surveys	Progress report only – no results reported.
1978 (091244)	Cyprus Anvil – Giant Yellowknife	KD	KD claims reverted to Giant Yellowknife Diamond drilling (609 m in 4 holes)	Not sampled. Visually barren to weakly mineralized.
1978 (091246)	Cyprus Anvil	AM	Diamond drilling (190 m in 1 hole)	Not sampled. Visually barren.
1980 (090753)	Cyprus Anvil	MX	Diamond drilling (481 m in 1 hole)	Not sampled. Visually barren.
1990 (092963)	YGC Resources	Reb	Restaked part of KD property Prospecting	Grab samples yielded elevated values up to 61.2 g/t Ag, >10,000 ppm Pb, 6770 ppm Zn & 1600 ppm Cu.
2000 (Minfile)	R. Hamel	Hot	Restaked Reb property	n/a
2010	Strategic Metals Ltd.	Reb Hot 1	Staked claims Purchased Hot 1 claim Soil sampling Prospecting	Confirmed and extended 1750 x 1100 m, Ag-Zn-Pb-Cu-Sn soil anomaly and secondary Zn-Pb±Cu±Ag soil anomaly. 14 mineralized rock samples averaged 135 g/t Ag, 1.65% Zn, 3.26% Pb, 0.69% Cu & 161 ppm tin.
CODY, CIRQUE, SNAP & RISBY ZONES				
1975 (090127)	Welcome North Mines Ltd.	Raz	Line cutting Geological mapping Geochemical sampling	Identified float with elevated Pb-Zn±Ag±Au values and coincident Pb-Zn-Ag soil anomaly (Snap area).
1977 (090266, 090267, 091251)	Welcome North	Raz	EM survey Soil sampling Diamond drilling (247.2 m in 2 holes)	Drill tested conductors identified by EM survey (S of Snap area) – no significant mineralization. Identified Pb-Zn soil anomaly.
1982 (Minfile)	Cyprus Anvil/ Metallgesellschaft	Fat (see Rebel)	Geological mapping Geochemical survey	n/a
1986 (062283)	Doron Exploration Inc.	Cody	Restaked Fat property and surrounding area Prospecting Geochemical sampling	Discovered 3 mineralized areas, samples from Cirque area with values up to 12283 g/t Ag & 4.45 g/t Au.
1987 (092617)	Doron Exploration	Cody	Prospecting Hand trenching	Trench samples from Cirque area up to 1208 g/t Ag, 0.15% Zn & 0.14 g/t Au over 3.0 m.
1988 (092896)	Doron Exploration – Lacana Mining	Cody	Hand and bulldozer trenching Geological mapping	Cirque area trench samples up to 3565 g/t Ag, 2.32% Pb, 0.80% Zn & 0.215 g/t Au over

	Corporation		Geochemical sampling Geophysical surveying	0.7 m, but vein widths narrower than expected.
1995 (Minfile)	B. Kreft	Shari Pat	Restaked part of Cody Ridge property	n/a
1997 (Minfile)	P. Risby	JRV	Restaked part of Cody Ridge property	n/a
1998 (093875, 093901)	P. Risby – Western Prospector Group Ltd.	JRV	Staked additional claims Prospecting Geochemical sampling	Samples from Snap area up to 695.0 g/t Ag & 5.53 g/t Au.
1999 (094031)	Western Prospector – Pacific Ridge Exploration Ltd.	JRV	Prospecting Line cutting Geological mapping Soil and rock sampling IP survey Diamond drilling (994.6 m in 9 holes)	Discovered Risby area, with samples up to 2730 g/t Ag & 5.69 g/t Au. Best intercepts from Snap area drilling were 52.3 g/t Ag & 0.21 g/t Au over 3.0 m and 26.8 g/t Ag & 1.50 g/t Au over 7.0 m.
2011	P. Risby – Silver Range Resources Ltd.	JRV	Purchased claims	n/a

The exploration programs are summarized in the following paragraphs, while the results are described in the appropriate sections to follow.

Keg Area

The Keg area was initially staked in 1965 as the Ivan property by Anvil Mining Corporation Ltd. following regional airborne magnetic and electromagnetic (EM) surveys.

In 1966, Anvil Mining completed 464.5 m of diamond drilling in four holes at the centre of the Ivan property to follow up 1965 geophysical targets. The Ivan claims were allowed to lapse.

Also in 1966, Yukon Copper Ltd. staked the Caribou Lake property (Tara, Dane, Hal and Mark claims) around the Ivan claim block. Yukon Copper conducted soil sampling, geological mapping and airborne magnetic and EM surveys. Later that year, Yukon Copper reorganized as Northern Empire Mines Ltd.

In 1967, Northern Empire expanded the Caribou Lake property (Bark claims) and carried out soil and rock geochemical sampling, geological mapping and line cutting. Near the end of the 1967 exploration season, Northern Empire began bulldozer trenching on the Hal claims. The trenching program was terminated early due to frozen ground. The following year, the bulldozer trenching was completed. A total of nine trenches were excavated.

In 1969, Inter-Tech Development and Resources Ltd. restaked the old Ivan property as the Ter claims. No work was reported for these claims and they consequently expired.

In 1971, Northern Homestake Mines Ltd. acquired the Caribou Lake property from Northern Empire.

In 1972, Northern Homestake completed additional bulldozer trenching on the Hal claims (no record of work is available). That same year, Ridgemont Mining Corporation, a subsidiary of Cyprus Anvil Mining Corporation, restaked the old Ivan/Ter claims as the Dana property. It also staked the Irma property to the northwest.

In 1973, Rigemont Mining optioned the Hal property from Northern Homestake. Ridgemont Mining performed soil sampling on its Dana claims.

In 1974, Ridgemont Mining added the Halo claims to close the gap between the Hal and Dana blocks. It conducted geochemical surveys, geological mapping and magnetic, EM and induced polarization (IP) surveys on both the Hal and Halo claims. No record of this work is available. That year, Ridgemont Mining transferred the Dana, Irma, Hal and Halo claims to Cyprus Anvil, which completed 494 m of diamond drilling in three holes on the Hal and Halo blocks.

In 1975, Cyprus Anvil drilled 627 m in three holes in the same area as its 1974 work. It also conducted magnetic and gravity surveys on the Irma claims.

In 1977, Cyprus Anvil followed up the 1975 Irma geophysical work with an IP survey. In 1978, one hole totalling 159 m was drilled to test the geophysical targets.

All claims in the Keg area subsequently expired. In 1990, YGC Resources Ltd. staked the Keg property to cover the most significant historical geochemical and geophysical anomalies, bulldozer trenches and diamond drill holes. It completed minor prospecting and geochemical sampling. These claims were also allowed to expire.

Prospector R. Berdahl staked the BP4 claim in 2007. No work was filed on this claim before it was optioned to Strategic Metals in spring 2010. Although this claim is located near the centre of the Keg area, it was not sold to Silver Range.

In 2010, Strategic Metals completed claim staking, prospecting, road building, line cutting, diamond drilling (958.27 m in four holes in the vicinity of the 1974 and 1975 holes) and geochemical, IP, VTEM and magnetic surveys. Preparations were made for a more extensive exploration program in 2011 and the property was sold to Silver Range.

Owl/Zeno Area

The Owl area is located 7.5 km north-northwest of the Keg area. It was staked in 1969 by Atlas Exploration Company Ltd. to cover anomalous geochemical values from an earlier regional survey.

In 1970, Atlas Exploration staked additional claims and performed stream sediment and soil sampling, geological mapping, line cutting and magnetic, electromagnetic and gravity surveys. The claims were allowed to lapse and no further work has been reported from the area.

The Zeno area is situated six kilometres west-northwest of the Owl area. It was staked as the Hoot property in 1970 by Atlas Exploration (no claim sketch is available). In 1971, Atlas Exploration completed prospecting and geochemical sampling in this area, for which no results were reported. The claims subsequently expired.

In 1983, Getty Canadian Metals, Ltd. conducted a reconnaissance stream sediment sampling and prospecting program to investigate a 2700 sq. km. area for stratiform base metal deposits. This area overlapped with the northwestern part of the current Keg property, in the vicinity of the Owl/Zeno area.

In 1989, R. Diment, an independent prospector, restaked the Hoot property as the Splash claims (no claim sketch available). No work was reported and the claims lapsed.

In 2010, Strategic Metals restaked the entire area as part of its Keg property. It conducted geochemical sampling and prospecting in the Owl area.

Archimedes Area

The Archimedes area lies 16 km east-southeast of the Keg area. It was staked as the Yeti property in 1965 by Anvil Mining, which established a grid for 1966 geophysical surveys.

In 1966, Anvil Mining conducted magnetic and EM surveys on the Yeti property. P. Versluce, an independent prospector tied the MC claims onto the northern part of the Yeti property. Both claim blocks were allowed to expire.

In 1975, Northern Homestake staked the Zap and Rog claims (no claim sketches are available) over part of the old Yeti property. No work was reported and both claim blocks expired.

Marks Area

The Marks area is located 24 km southeast of the Keg area. It was reportedly staked as the Zeus claims in 1965 by Anvil Mining following regional airborne magnetic and EM surveys. The following year, Anvil Mining conducted limited soil sampling and ground geophysical surveys. These claims subsequently lapsed. No reports or claim sketches are available for the Zeus property.

In 1974, Ridgemont Mining restaked the Zeus claims as the Zed (northwest, no claim sketch) and Nor (southeast) properties. The properties were transferred to Cyprus Anvil.

In 1975, Cyprus Anvil completed line cutting and soil sampling on the Nor claims. No work was performed on the Zed property. Both claim blocks were allowed to expire.

In 2010, Strategic Metals restaked the Marks area as part of its Keg property. It completed minor grid and contour sampling in the area.

Rebel Area

The Rebel area lies 17 km south-southeast of the Keg area. It was first staked as the Mount Mye property (KD and AC claims) in 1966 by Giant Yellowknife Mines Ltd., which then performed soil geochemical sampling, geological mapping and ground geophysical surveys. That same year, Altair Mining Corporation Ltd. staked the AM claims, which adjoined the KD property to the west.

In 1967, Altair Mining carried out soil and stream sediment sampling, geological mapping and EM and gravity surveys on its AM property.

In 1968, Giant Yellowknife optioned the KD and AC properties to Mercury Exploration Ltd. The following year, Mercury Exploration staked additional claims (MX) and completed geochemical and gravity surveys.

In 1970, the Mount Mye property (KD, AC and MX claims) reverted to Giant Yellowknife, which then optioned it to Kangaroo Exploration Ltd. That year it completed 593.7 m of diamond drilling in the southwest corner of the property, which overlaps with the northern part of the Cody area.

In 1971, Kangaroo Exploration staked the Taf claims to the east of the KD block and performed grid soil sampling. The next year, it acquired the AM claims (no record of how the claims were acquired) and conducted EM and gravity surveys on its Mount Mye property (KD, AC, MX and Taf claims). It also drilled four holes totalling 564 m on the KD claim block. In 1973, Kangaroo Exploration completed an additional 630 m of diamond drilling in three holes in the same area.

In 1974, Ridgemont Mining (Cyprus Anvil) restaked part of the Taf claims as the Fat claims and completed a Turam EM survey.

In 1976, Cyprus Anvil optioned the Mount Mye property from Kangaroo Exploration/Giant Yellowknife. Cyprus Anvil conducted gravity, EM and magnetic surveys that year. No results were reported for this work.

In 1978, the KD claims reverted to Giant Yellowknife, which completed 609 m of diamond drilling in four holes. Cyprus Anvil concurrently drilled 190 m in one hole on its AM claims.

In 1980, Cyprus Anvil drilled 481 m in one hole on the MX claim block.

All claims in the Rebel area subsequently expired. In 1990, YGC Resources Ltd. restaked part of the KD claims as the Reb property and completed minor prospecting. YGC allowed the claims to lapse.

In 2000, R. Hamel, an independent prospector, restaked the Reb property as the Hot claims. No claim sketch is available for these claims and no work was recorded. All but one of the claims consequently expired.

In 2010, Strategic Metals restaked the area as the Reb claims and purchased the Hot 1 claim. It completed geochemical sampling, prospecting and IP surveying.

Cody, Snap, Risby and Cirque Area

The Cody, Cirque, Snap and Risby area lies approximately 28 km south-southeast of the Keg area and 10 km northeast of the Faro, Grum and Vangorda mines of the Anvil Belt. Due to its close proximity to the mines, this area has a complex exploration history, which is briefly summarized in the following paragraphs.

The area was first staked as the Rox claims by Kerr-Addison Mines Limited in 1963 to cover an area of transported gossans and sphalerite-, galena- and arsenopyrite-bearing float (Foster, 1976). Between 1963 and 1974, the belt was restaked several times by Anvil Mining, Kangaroo Exploration, Spartan Explorations Limited, Cyprus Anvil and Action Exploration Ltd. During this period, geological mapping, prospecting, soil sampling and electromagnetic and induced polarization surveys were performed. In 1970, Kangaroo Exploration completed 593.7 m of diamond drilling in three holes to follow up geophysical and geochemical anomalies in a wide valley to the north of Cody Zone (southeast part of historical Mount Mye Property, listed under Rebel area).

In 1975, Welcome North staked the Raz claims within this area to cover what was considered to be a favourable geological environment for SEDEX deposits. It carried out geological mapping, geochemical surveying and line cutting.

In 1977, Welcome North completed more extensive geochemical surveying and geological mapping, along with electromagnetic surveying and 247.2 m of diamond drilling in two holes (south of the Snap area). The holes were drilled to test electromagnetic conductors.

In 1982, Cyprus Anvil performed geological mapping and soil geochemical sampling on its Fat claims (part of its Mount Mye Property, see Rebel area)

In 1986, Doron Explorations Inc. staked the Cody Ridge property, which covered the entire area. Cursory prospecting and geochemical sampling were completed.

In 1987, Doron Explorations expanded the property and performed property-wide prospecting and geochemical sampling. It also conducted D6 bulldozer trenching on the lower part of Cirque area.

In 1988, Doron Explorations completed regional- and detailed-scale geological mapping, prospecting, line-cutting (35 line-km), ground magnetometer and VLF-EM surveying, soil geochemical sampling, hand trenching (19 blast trenches in Cirque area) and extensive follow up bulldozer trenching (Cirque area). The claims comprising the Cody Ridge property were allowed to lapse.

According to Yukon Minfile (Deklerk and Traynor, 2005), the Cirque area was restaked in 1995 as the Shari property, but there is no record of any work on these claims and they consequently expired.

In 1997, P. Risby, an independent prospector, restaked part of the Cody Ridge property as the JRV claims on behalf of Gullen/Risby Family Trust.

In 1998, Gullen/Risby Family Trust optioned the property to Western Prospector Group Ltd. Western Prospector staked additional claims and completed prospecting and geochemical sampling.

In 1999, Western Prospector transferred its option to Pacific Ridge Exploration Ltd., which performed prospecting, line cutting, geological mapping, geochemical sampling, IP surveying and diamond drilling (994.6 m in 9 holes). The bulk of this work was completed within the Snap and Risby areas. The holes were drilled in the Snap area to test coincident geophysical and geochemical anomalies.

On August 29, 2011 Silver Range purchased the JRV claims from Gullen/Risby Family Trust.

Other Claims in the Area

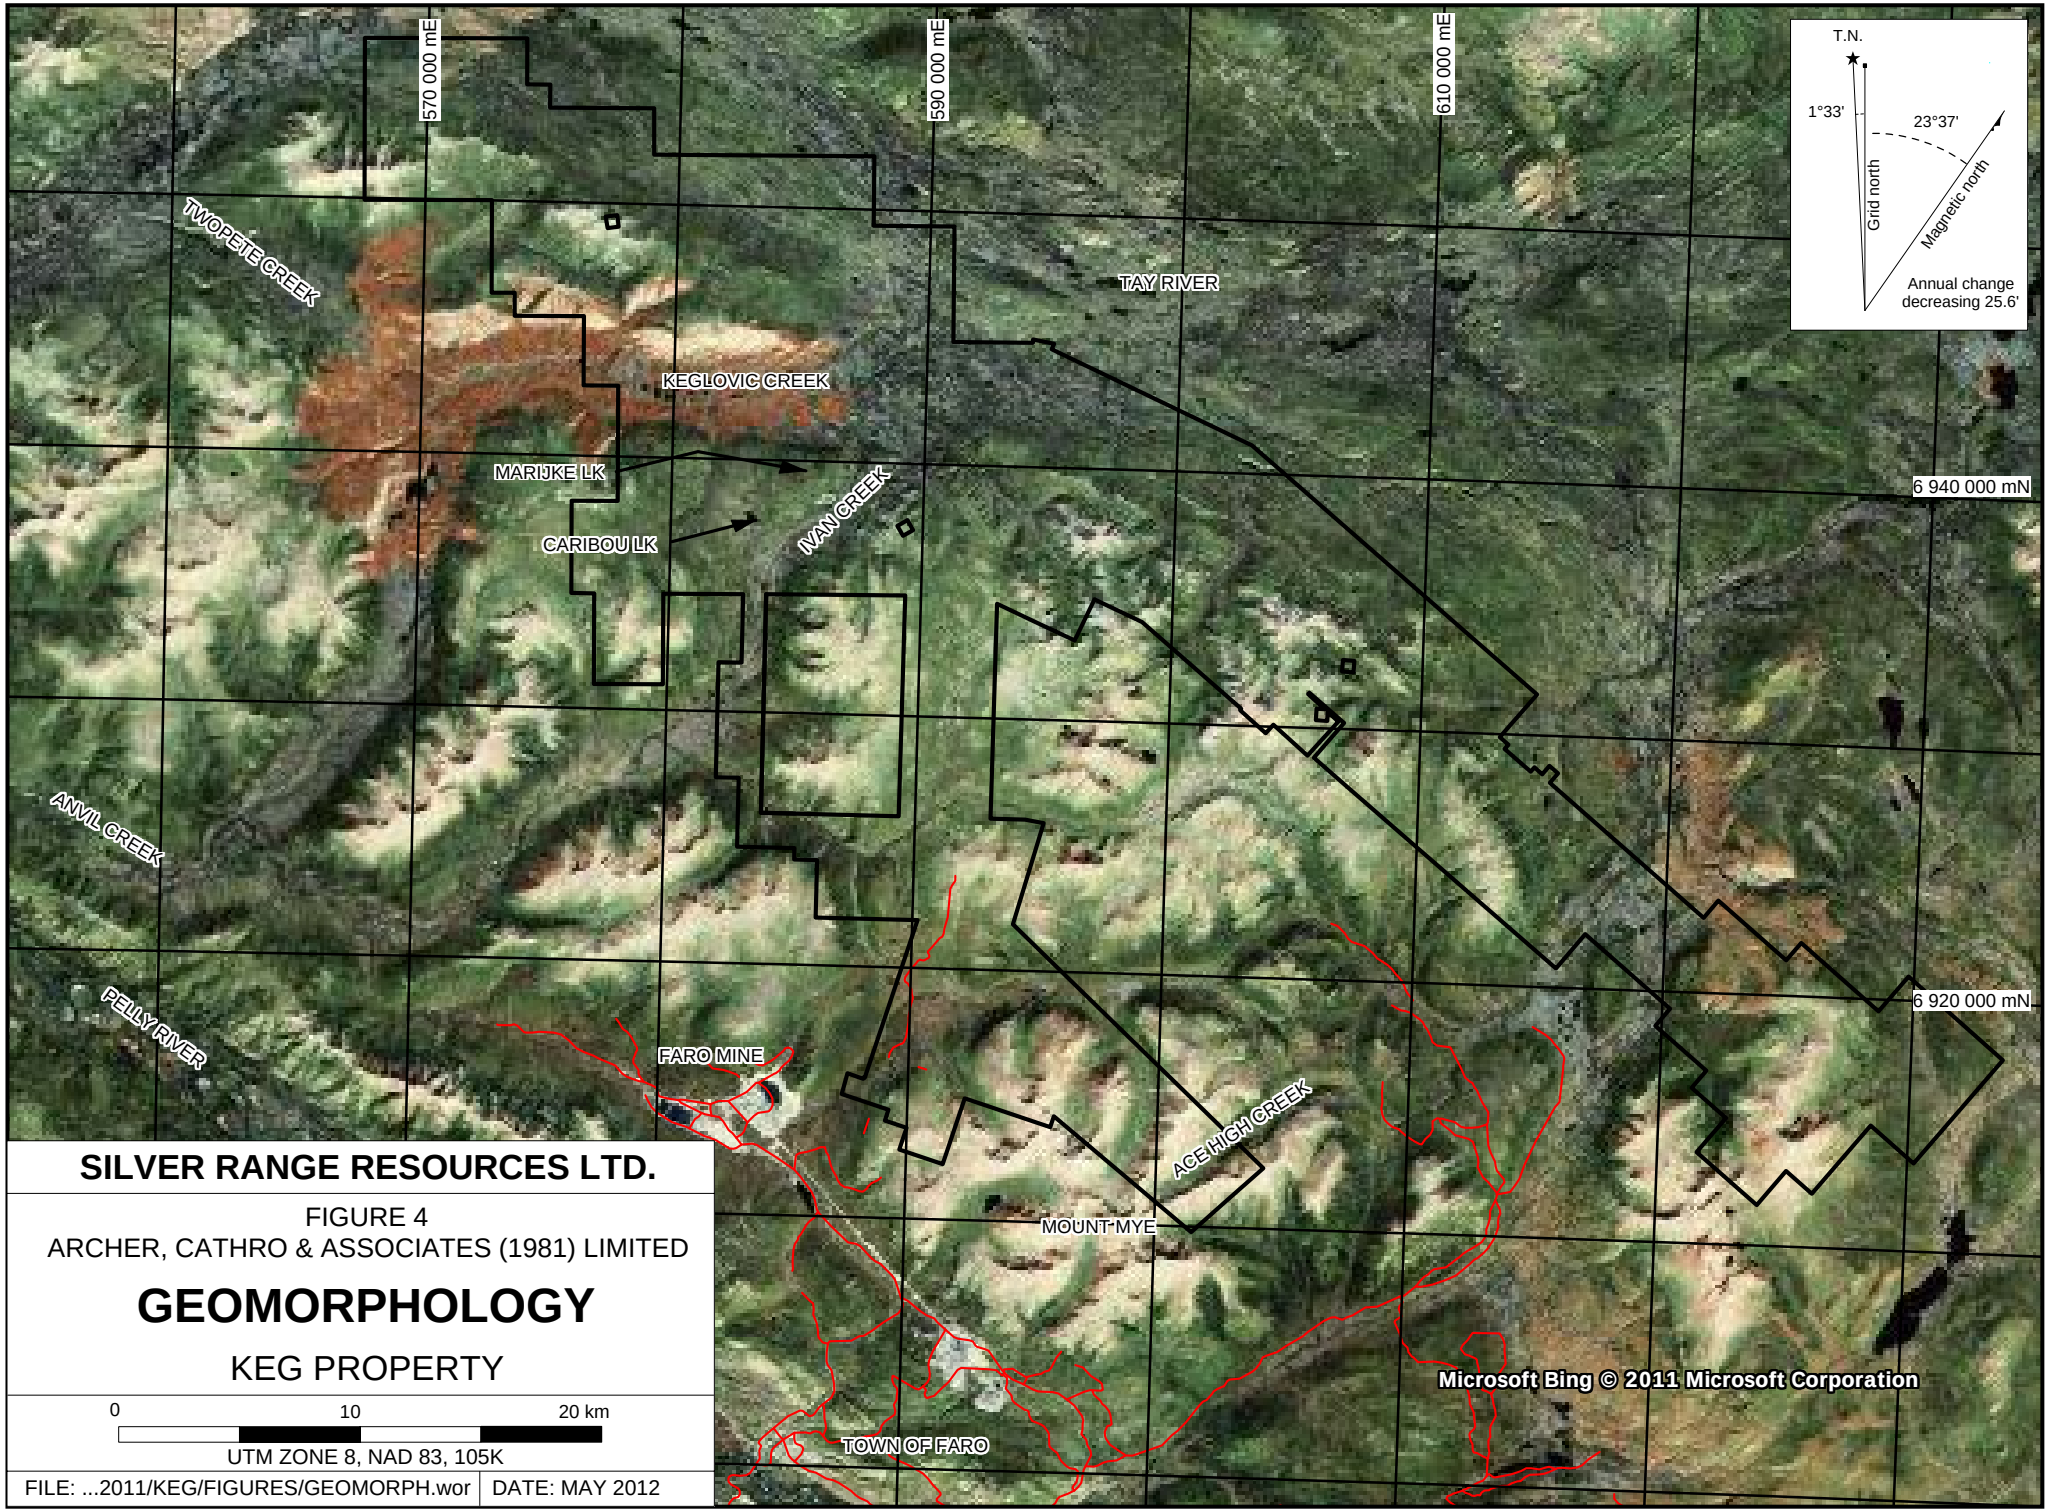
In 2007, prospector R. Berdahl staked the BP 1 to 6 claims, which are scattered within the Keg property. Berdahl still owns all of the claims, except BP 4, which is under option to Strategic Metals. The Wag 1 claim was staked in spring 2010 by K. Wagantall. It is located in the southern part of the Rebel area. No assessment work has been filed on any of these claims.

GEOMORPHOLOGY

The Keg property is situated in the Anvil Range of the Pelly Mountains and is drained by creeks that flow into the Tay and Pelly rivers, which ultimately connect to the Pacific Ocean via the

Yukon River. Several creeks on the property have been assigned formal and informal names, including Anvil Creek, Twopete Creek, Ivan Creek, Keglovic Creek and Ace High Creek (Figure 4). Two lakes have also been unofficially named – Caribou and Marijke Lakes. The southern part of the property lies on the northern flank of Mount Mye, which is highest peak in the region.

The Keg property covers an area of mountains, ridges, upland plateaus and valley bottoms. Elevations on the property range between 850 and 2050 m above sea level (asl). Rounded peaks with rare talus slopes and sparse vegetation are typical of higher elevations, while broad, well-treed, U-shaped valleys characterize lower elevations. Outcrop is generally limited to ridge crests, steep faces and deeply incised creek cuts. Hillsides and many valleys are well drained but local swampy areas and ponds are encountered in some low-lying areas and along flat topped ridges. See the Mineralization section for the geomorphology of specific mineralized zones.



Approximately thirty percent of the property is defined as subalpine to alpine, while the remainder is heavily vegetated. Treeline is at about 1500 m asl. Slopes above treeline are vegetated primarily with low-lying grass, staghorn moss and sparse brush. The density and size of vegetation gradually increases on lower slopes, and areas of low relief are well-treed with stunted spruce and poplar. Mature spruce forests are only found on south facing slopes and along larger creeks. Understory comprises dwarf birch and mountain alder, with a thick layer of sphagnum moss.

Due to a combination of shaded north facing slopes, locally poor drainage and a thick insulating blanket of sphagnum moss, permafrost is prevalent.

A 21 by 5 km area in the western part of Keglovic Creek valley was previously burned (brown area on Figure 4) and is now vegetated by low-lying secondary growth. The age of this fire is unknown.

Much of the overburden in the region is associated with the most recent Cordilleran ice sheet, the McConnell glaciation, which is believed to have covered south and central Yukon between 26,500 and 10,000 years ago (Yukon Geological Survey, 2010a). Tay River map area was covered by the Selwyn Lobe of the Cordilleran ice sheet. A complex system of ice-caps and cirque glaciers was active at high elevations in the Pelly Mountains and contributed to the ice bodies surrounding them.

The climate at the Keg property is typical of northern continental regions with long, cold winters, truncated fall and spring seasons and short, mild summers. Although summers are relatively warm, snowfall can occur in any month at higher elevations. The property is mostly snow free from early June to late September. According to Environment Canada, summer temperatures in the nearest community of Faro average 18 to 21ºC during the day and 6 to 9ºC at night (Environment Canada, 2010). Winter temperatures average -17 to -10ºC during the daytime. Total annual precipitation over the 1971 to 2000 period averaged 316 mm, with little over two-thirds falling as rain and about 110 cm as snow.

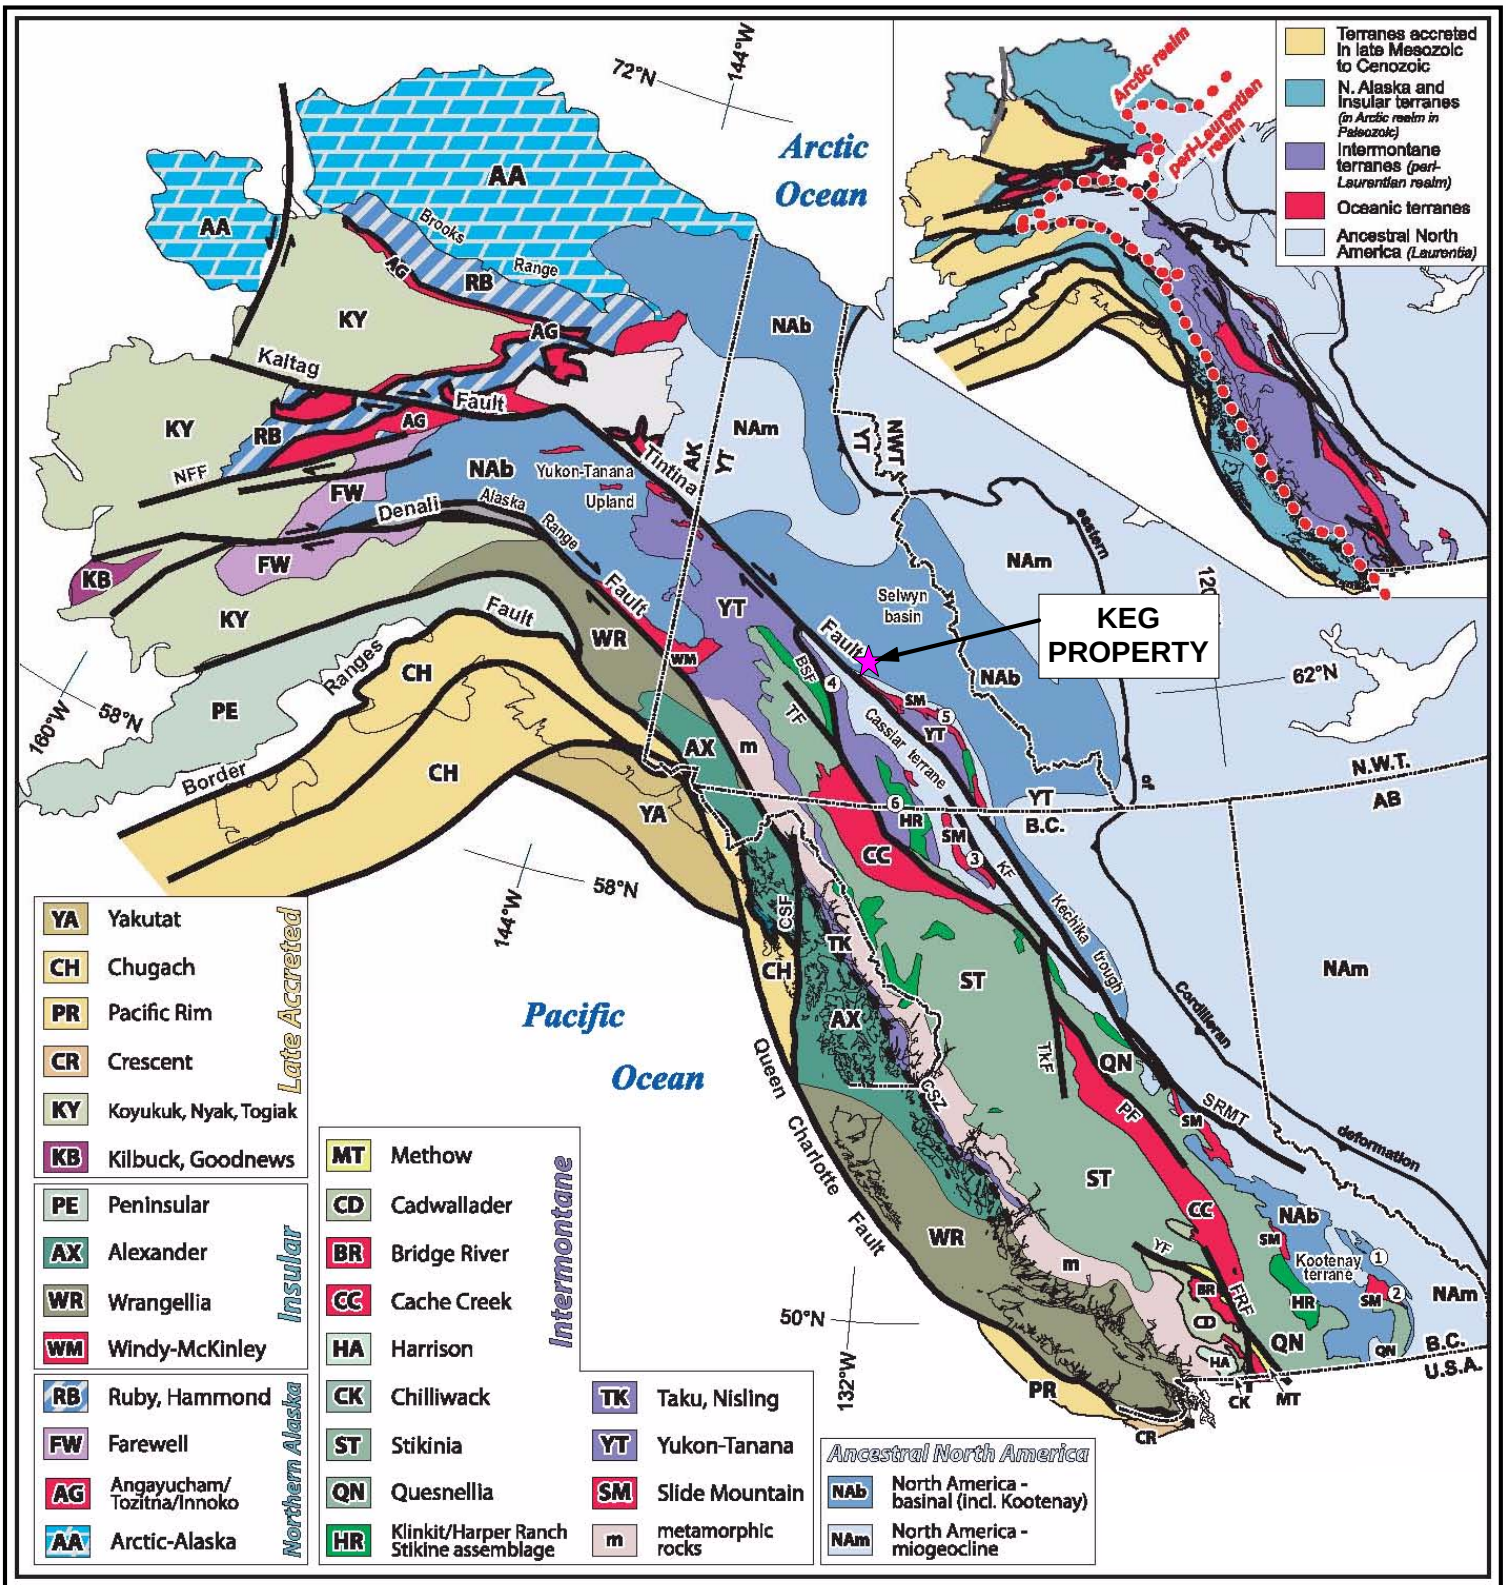
REGIONAL GEOLOGY

The Keg property lies within and to the north of the Anvil Zinc-Lead-Silver District, which has been the focus of numerous government and industry sponsored studies since the 1953 discovery of the Vangorda Deposit. Regional bedrock geology for Tay River map area (105K) was completed at 1:253440 scale by Roddick and Green (1961) and at 1:250000 scale by Gordey and Irwin (1987). More detailed studies by Tempelman-Kluit (1972) at 1:125000 scale and Gordey (1990a, b) at 1:50000 scale were completed due to the discovery of several massive sulphide deposits in the area (Pigage, 2004). These discoveries also led to extensive detailed mapping by mining and exploration companies. The Yukon Geological Survey (YGS) integrated the results of past government studies and company exploration, along with its own more recent mapping in the Anvil District, and published this compilation in 2004 (Pigage, 2004). The following geological descriptions are largely summarized from the published data.



The Keg property is located within Selwyn Basin (Figure 5), a tectonic element comprising deep water clastic rocks, chert and minor carbonate that accumulated along the North American continental margin during Paleozoic time. The basin is bound to the northeast by a shallow carbonate platform (Mackenzie Platform), which formed the near-shore facies of ancient North America (Abbott et al, 1986).

In the Keg property area, Selwyn Basin lies immediately northeast of Slide Mountain and Yukon-Tanana Terranes, the most easterly of the allochthonous terranes (Coney et al, 1980). Deformation and metamorphism associated with accretion of the allochthonous terranes was initiated in Jurassic and culminated in Cretaceous (Tempelman-Kluit, 1979). More recently, strike-slip faulting along the Tintina Fault resulted in about 450 km of dextral offset during Early Tertiary time (Roddick, 1967; Murphy and Mortensen, 2003). The property lies about 30 km northeast of the Tintina Fault.

The rocks in the vicinity of the Keg property comprise various Paleozoic-age strata that have been juxtaposed by a complex series of Jurassic to Cretaceous high angle and thrust faults (Figure 6). Structure in the area is dominated by moderate southwest-dipping or flat-lying strata imbricated by several large northwest-trending, northeast directed thrust faults (Yukon Geological Survey, 2010b).

The Paleozoic strata are sandwiched between two major Mid-Cretaceous igneous bodies – the Anvil Batholith to the southwest and the Teddy Caldera to the northeast. The Anvil Batholith belongs to Selwyn Plutonic Suite, which consists of intermediate (biotite quartz monzonite, granodiorite and minor diorite) to more felsic (biotite±hornblende±muscovite granite, quartz monzonite, granodiorite) compositions. The Teddy Caldera is part of South Fork Volcanics, which comprise biotite-quartz-hornblende-feldspar crystal tuff. Both igneous bodies also follow the regional northwest to southeast structural trend.

The youngest igneous event in the Keg property area comprises bimodal volcanics and feeder plugs of Early Tertiary age. These bodies are often too small to map at a regional-scale. They are assigned to the Ross Volcanics.

GEOLOGICAL LEGEND TO ACCOMPANY FIGURE 6

QUATERNARY
Q: QUATERNARY
unconsolidated glacial, glaciofluvial and glaciolacustrine deposits; fluviatile silt, sand, and gravel, and local volcanic ash, in part with cover of soil and organic deposits

LOWER TERTIARY
lTR2: ROSS
rhyolite flows, tuffs, ash-flow tuffs and breccias, locally laminated; small stocks and necks of white weathering, flow-banded, quartz-sanidine porphyry to granite porphyry, locally obsidian bearing; local shale, sandstone and conglomerate

MID-CRETACEOUS
KSF: SOUTH FORK
dark brown weathering, locally columnar jointed, massive, densely welded, biotite-quartz-hornblende-feldspar crystal tuff

MID-CRETACEOUS
mKS: SELWYN SUITE
plutonic suite of intermediate (g) to more felsic composition (q)
q. equigranular to porphyritic (K-feldspar) biotite +/- hornblende +/- muscovite granite, quartz monzonite and granodiorite; porphyritic biotite hornblende granite with large smoky grey quartz phenocrysts and locally K-feldspar phenocrysts
g. resistant, blocky, fine to coarse grained equigranular to porphyritic (K-feldspasr) biotite quartz monzonite and granodiorite and minor quartz diorite; minor leuco-quartz monzonite and syenite

MIDDLE TO UPPER TRIASSIC
TrJ: JONES LAKE
brown to buff weathering, calcareous fine grained sandstone, argillite and shale; extensive ripple cross-lamination and bioturbation; massive, light grey weathering, fine crystalline, dark grey limestone; minor orange weathering platy limestone

UPPER TRIASSIC
uTrS: SYNOROGENIC CLASTICS
resistant, massive, poorly sorted, conglomerate with pebble to cobble size clasts varying locally but including basalt, chert, mylonite, limestone, foliated hornblende granodiorite and quartz monzonite

CARBONIFEROUS AND PERMIAN
CPA1: ANVIL ASSEMBLAGE
variably altered and foliated, locally augite-phyric basalt (local pillows), diorite and gabbro, chloritic greenstone, amphibolitic greenstone and amphibolite; minor metachert, siliceous argillite or siltstone, greywacke, tuff, and siliceous limestone

CARBONIFEROUS TO PERMIAN
CPMC: MOUNT CHRISTIE
burrowed, interbedded greenish grey cherty shale and green shale; thin to medium bedded, light grey-green to black chert; black siliceous slate and siltstone; minor quartzite, limestone and dolostone; locally abundant, large grey barite nodules

MISSISSIPPIAN
MT: TAY
recessive, dark brown weathering, thin to medium bedded, calcareous, dark grey to brown siltstone and shale, commonly burrowed; thin to thick interbeds of fine crystalline, dark grey limestone; minor quartz arenite

DEVONIAN AND MISSISSIPPIAN
DME: EARN
complex assemblage of submarine fan and channel deposits (1) within black siliceous shale and chert (2)
1. thin bedded, laminated slate with thin to thickly interbedded fine to medium grained chert-quartz arenite and wacke; thick members of chert pebble conglomerate; black siliceous siltstone; nodular and bedded barite; rare limestone
2. silvery blue weathering black shale, argillite, cherty argillite and thin bedded chert; nodular and bedded barite; rare limestone

SILURIAN TO MIDDLE DEVONIAN
SDM: MCEVOY
1. buff, brown and grey laminated, platy, calcareous or dolomitic siltstone, grey orthoquartzite, and minor black, argillaceous limestone; silty dolomite, dolomite

ORDOVICIAN TO LOWER DEVONIAN
ODR: ROAD RIVER - SELWYN
black shale and chert (1) overlain by orange siltstone (2) or buff platy limestone (3); locally contains beds as old as Middle Cambrian (4)

CAMBRIAN TO SILURIAN
CSM: MARMOT
2. amygdaloidal basaltic flows and breccias; mostly subaqueous; thick, flow-banded rhyolite and felsite, includes breccia and tuff

UPPER CAMBRIAN AND ORDOVICIAN
COR: RABBITKETTLE
1. thin bedded, wavy banded,
silty limestone and grey lustrous calcareous phyllite; limestone intraclast breccia and conglomerate; massive to laminated, grey quartzose siltstone and chert and rare black slate; local mafic flows, breccia, and tuff

LOWER CAMBRIAN
lCG: GULL LAKE
1. shale, siltstone and mudstone, locally bioturbated, with minor quartz sandstone; rare green-grey chert; local basal limestone and limestone conglomerate; phyllite to quartz-muscovite-biotite schist (+/-garnet +/-sillimanite +/-staurolite +/-andalusite)

PRE-CAMBRIAN
PCH: HYLAND GROUP
consists upwards of coarse turbiditic clastics (1), limestone (2) and fine clastics typified by maroon and green shale (3); may include younger (4) units; includes scattered mafic volcanic rocks (5)

A large area between the southeastern corner of the Keg property and the Teddy Caldera is blanketed by unconsolidated Quaternary glacial, glaciofluvial and glaciolacustrine deposits.

Metamorphism within Selwyn Basin is typically lower greenschist facies. Contact metamorphism has been observed around Cretaceous plutons (Yukon Geological Survey, 2010b). Contact aureoles are up to several kilometres in diameter and produce calc-silicate, pelitic and siliceous hornfels.

REGIONAL MINERALIZATION

The Yukon Minfile database lists 115 mineral occurrences for the Tay River map area (105K). Most of these occurrences are stratiform lead-zinc showings and deposits hosted within Selwyn Basin sedimentary rocks (Doherty et al, 1994). The dominant deposits are those of the Anvil Zinc-Lead-Silver District, which were mined intermittently between 1969 and 1998. The Faro Mine was the world's third largest zinc mine during its operation. The combined pre-mining mineral resource for deposits in the belt was 120 million tonnes grading 5.6 percent zinc, 3.7 percent lead and 45 to 50 g/t silver (Yukon Mining, 2011).

The majority of the occurrences located on the Tay River map sheet lie within a broad belt, parallel and adjacent to the Tintina Fault. In addition to the previously mentioned stratiform mineralization, the belt contains numerous lead-silver veins and a few base metal skarns (Doherty et al, 1994).

PROPERTY GEOLOGY

GENERAL

The geology within much of the Keg property boundary is poorly constrained due to intense faulting and alteration, and paucity of bedrock exposure. Several historical operators performed localized geological mapping at various former claim blocks within the current Keg property; however, this mapping is a patchwork of isolated locations. The YGS (Gordey, 1990a, b) completed the most comprehensive map available for the area, and the following geological descriptions are largely summarized from that work (Figure 6).

The property largely covers faulted and folded Paleozoic sedimentary and volcanic strata, which have locally been cut by Mid-Cretaceous to Early Tertiary intrusive bodies. All units on the property are described in detail in Table II.

Table II – Lithological Units (*after Gordey, 1990a,b*)

Unit Name	Age	Map Name	Description
Ross Volcanics	Lower Tertiary	lTR2	Rhyolite flows, tuffs, ash-flow tuffs and breccias, locally laminated; small stocks and necks of white weathering, flow-banded, quartz-sanidine porphyry to granite porphyry, locally obsidian bearing; local shale, sandstone and conglomerate.
South Fork	Mid-	KSF	Dark brown weathering, locally columnar jointed,

Volcanics	Cretaceous		massive, densely welded, biotite-quartz-hornblende-feldspar crystal tuff.
Selwyn Suite	Mid-Cretaceous	mK(g,q)S	Plutonic suite of intermediate (g) to more felsic composition (q): g. resistant, blocky, fine to coarse grained equigranular to porphyritic (K-feldspasr) biotite quartz monzonite and granodiorite and minor quartz diorite; minor leuco-quartz monzonite and syenite. q. equigranular to porphyritic (K-feldspar) biotite +/- hornblende +/- muscovite granite, quartz monzonite and granodiorite; porphyritic biotite hornblende granite with large smoky grey quartz phenocrysts and locally K-feldspar phenocrysts.
Jones Lake Formation	Middle to Upper Triassic	TrJ	Brown to buff weathering, calcareous fine grained sandstone, argillite and shale; extensive ripple cross-lamination and bioturbation; massive, light grey weathering, fine crystalline, dark grey limestone; minor orange weathering platy limestone.
Mount Christie Formation	Carboniferous to Permian	CPMC	Burrowed, interbedded greenish grey cherty shale and green shale; thin to medium bedded, light grey-green to black chert; black siliceous slate and siltstone; minor quartzite, limestone and dolostone; locally abundant, large grey barite nodules.
Tay Formation	Mississippian	MT1	Recessive, dark brown weathering, thin to medium bedded, calcareous, dark grey to brown siltstone and shale, commonly burrowed; thin to thick interbeds of fine crystalline, dark grey limestone; minor quartz arenite.
Earn Group	Devonian and Mississippian	DME(1,2)	Complex assemblage of submarine fan and channel deposits (1) within black siliceous shale and chert (2): 1. thin bedded, laminated slate with thin to thickly interbedded fine to medium grained chert-quartz arenite and wacke; thick members of chert pebble conglomerate; black siliceous siltstone; nodular and bedded barite; rare limestone. 2. silvery blue weathering black shale, argillite, cherty argillite and thin bedded chert; nodular and bedded barite; rare limestone.
Road River Group	Ordovician to Lower Devonian	ODR	Black shale and chert overlain by orange siltstone or buff platy limestone; locally contains beds as old as Middle Cambrian.
Marmot Formation	Cambrian to Silurian	CSM2	Amygdaloidal basaltic flows and breccias; mostly subaqueous; thick, flow-banded rhyolite and felsite, includes breccia and tuff.
Rabbitkettle Formation	Upper Cambrian and Ordovician	COR1	Thin bedded, wavy banded, silty limestone and grey lustrous calcareous phyllite; limestone intraclast breccia and conglomerate; massive to laminated, grey quartzose siltstone and chert and rare black slate; local mafic flows, breccia, and tuff.
Gull Lake	Lower	lCG1	Shale, siltstone and mudstone, locally bioturbated,

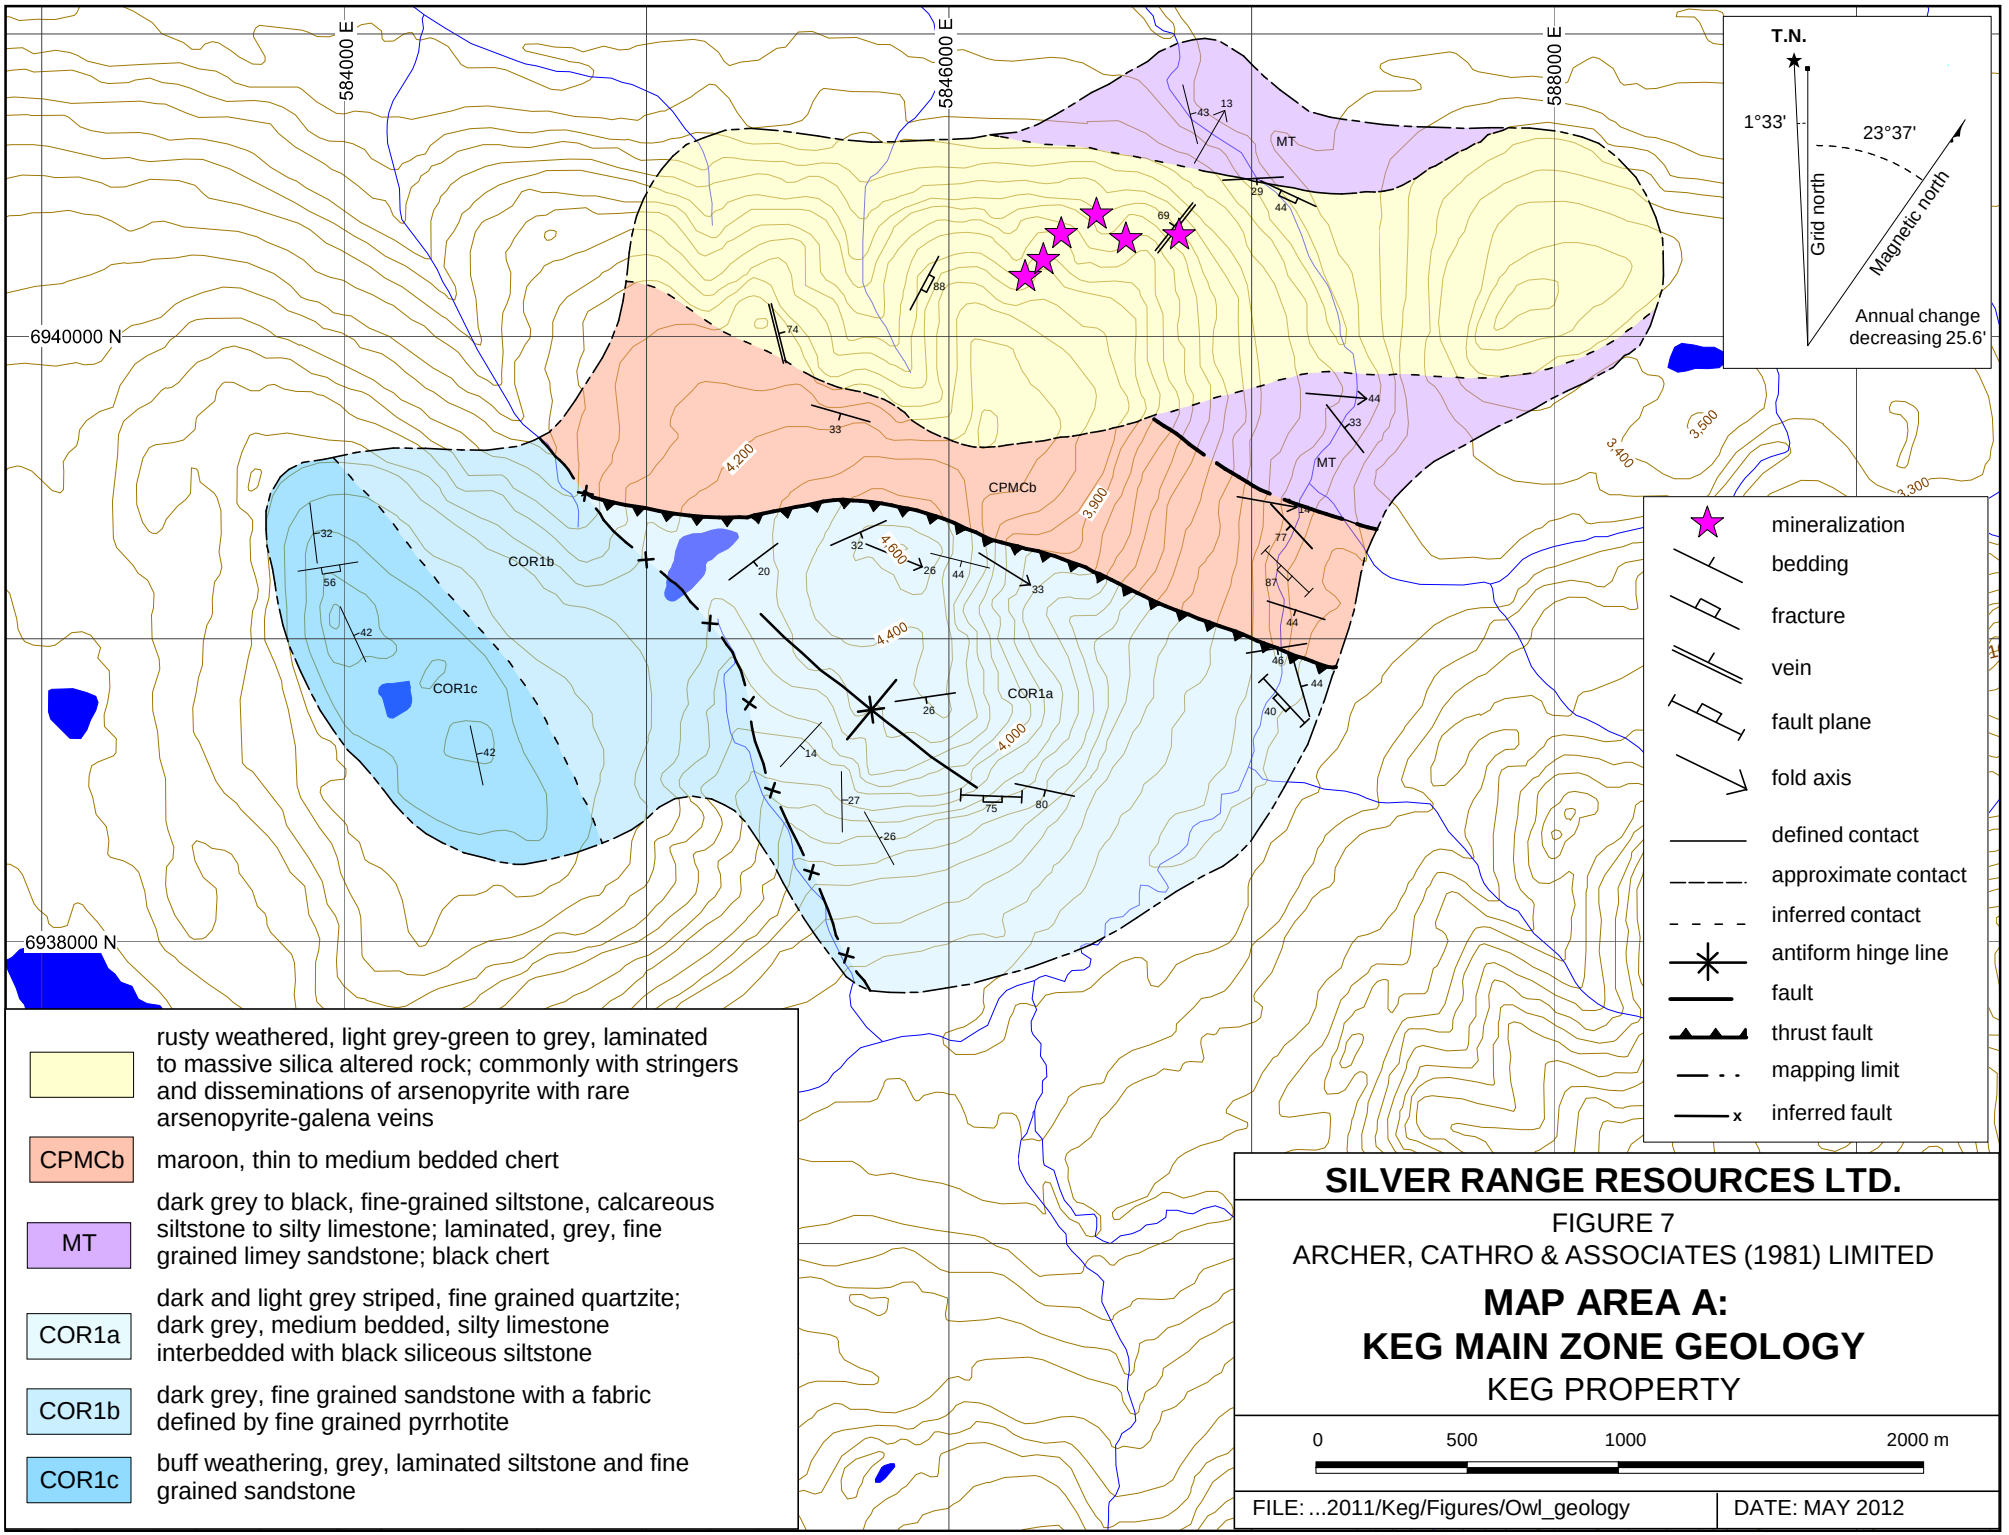
Formation	Cambrian		with minor quartz sandstone; rare green-grey chert; local basal limestone and limestone conglomerate; phyllite to quartz-muscovite-biotite schist (+/-garnet +/-sillimanite +/-staurolite +/-andalusite).

Lower Cambrian Gull Lake Formation is the oldest unit mapped within the Keg property. It is locally warped, and is unconformably overlain by Cambrian to Ordovician Rabbitkettle Formation. In the Anvil Belt, the stratigraphy is further subdivided and the deposits lie within a 150 m interval straddling the unconformable contact between Mount Mye Formation (Gull Lake Formation equivalent) and overlying Vangorda Formation (Rabbitkettle Formation equivalent) (Yukon Geological Survey, 2012)

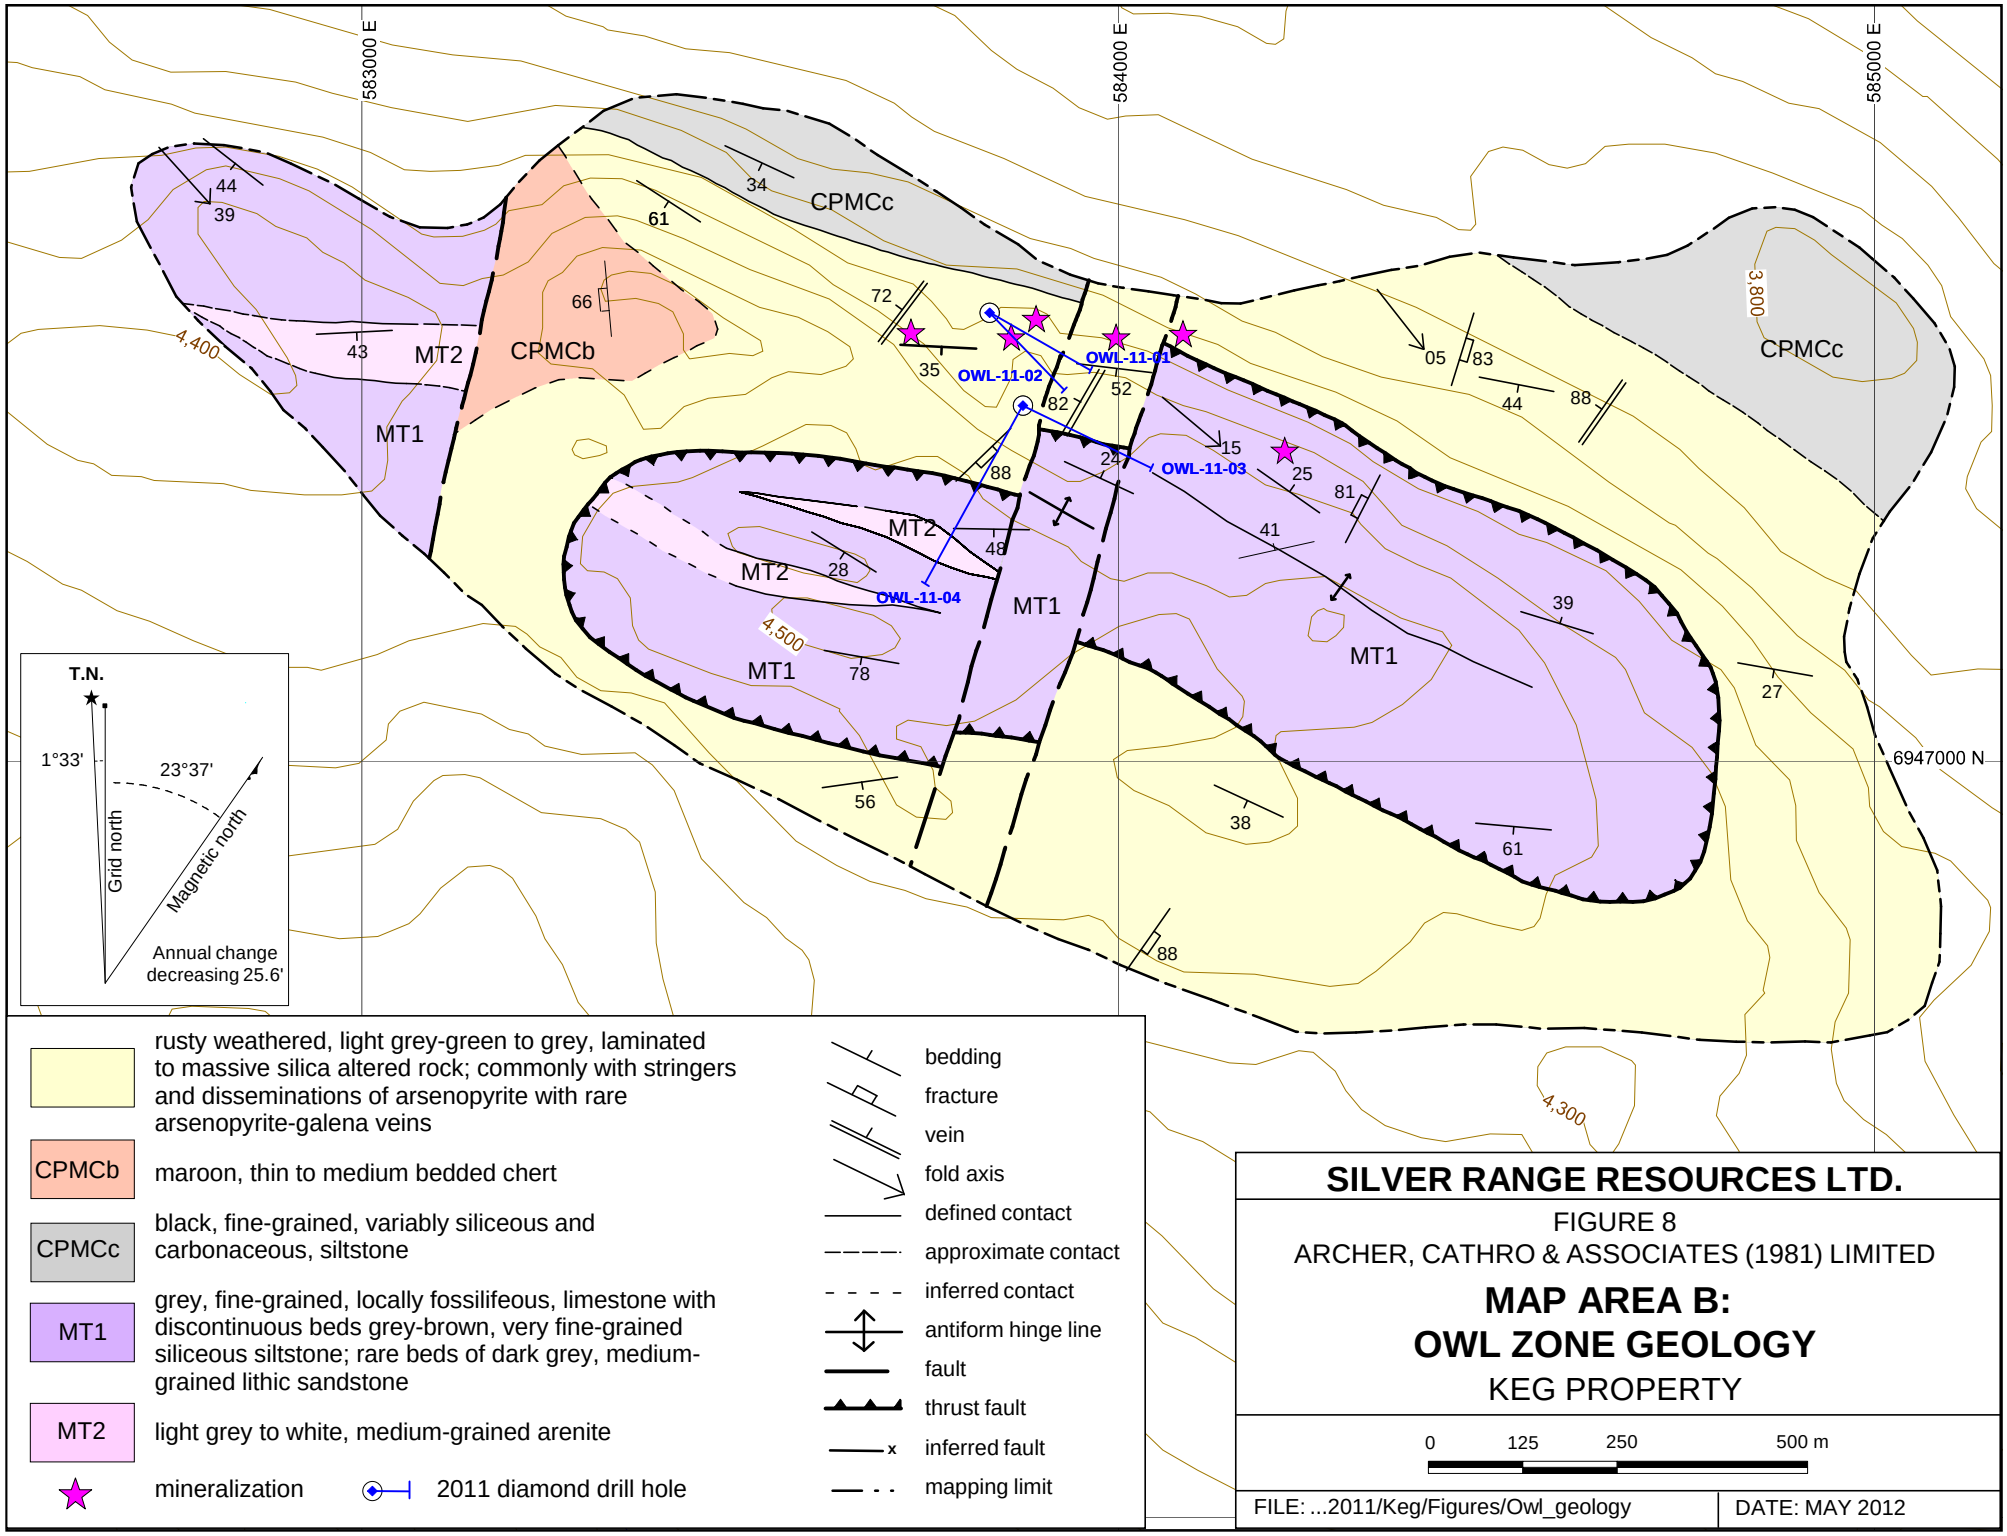
Ordovician to Silurian Road River Group overlies Rabbitkettle Formation. The contact between these units is sharp and conformable, but diachronous (Yukon Geological Survey, 2010b). Cambrian to Silurian Marmot Formation is interstratified with both units.

The contact between Road River Group and overlying Devonian and Mississippian Earn Group is conformable to unconformable and diachronous. Earn Group is unconformably overlain by Mississippian Tay Formation, which in turn is unconformably overlain by Carboniferous to Permian Mount Christie Formation. Finally, Triassic Jones Lake Formation unconformably overlies Mount Christie Formation.

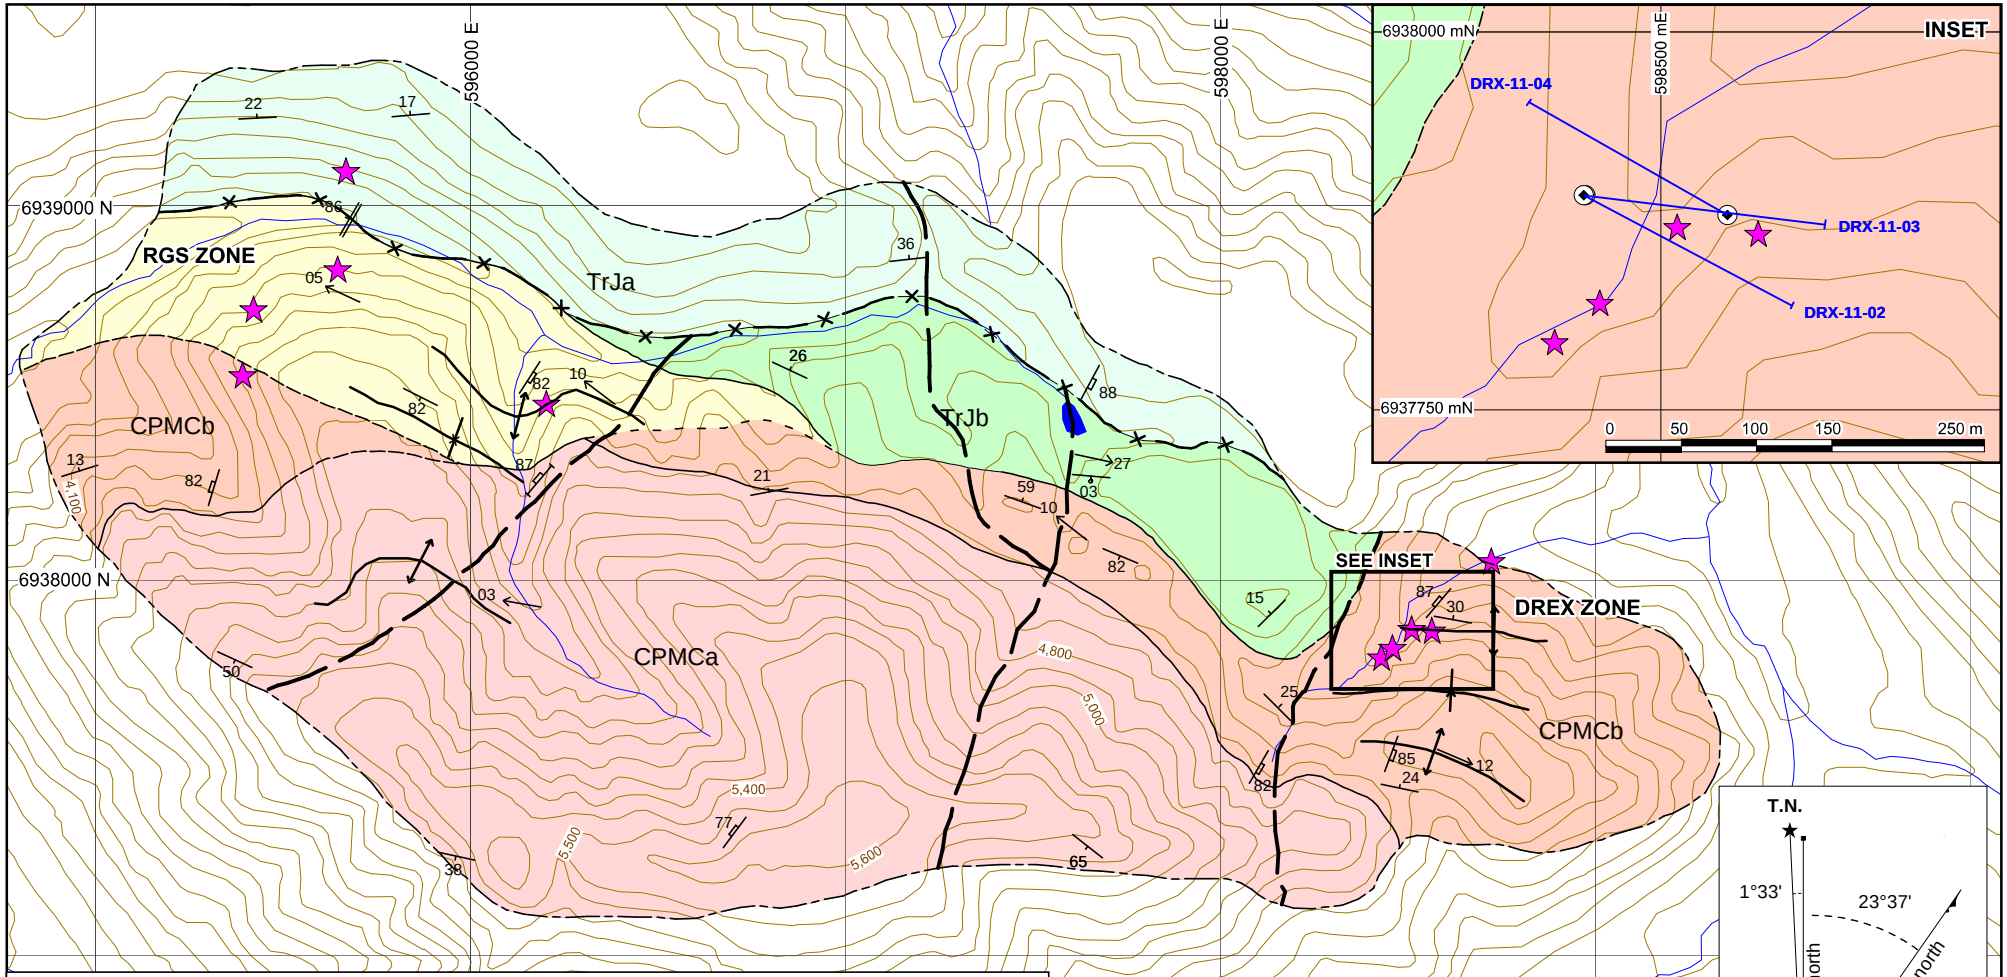
In the Jurassic to Cretaceous, the Paleozoic strata were subjected to significant faulting and folding. Three regional-scale, northwest-trending, northeast-directed thrust faults (Twopete, Stokes and Tay River) run the length of the property, while numerous smaller, unnamed thrust and high angle faults further contributed to the complexity of the lithological relationships on the property.



Mid-Cretaceous plutonism led to the emplacement of the Anvil Batholith (Selwyn Plutonic Suite) along the south side of the property and the Teddy Caldera (South Fork Volcanics) along the northern edge of the property. At least three plugs related to Anvil Batholith lie within the northwest half of the property.



Most of the major structural features (including bedding, faults, fold axes and cleavage) on the property trend to the northwest. Some high angle faults are oriented north to northeast. As a result of locally intense faulting and folding, some of the observed bedding directions stray away from the general northwest trend.



Metasomatic alteration observed by various operators near faults and intrusions includes silification, skarnification, quartz-carbonate veining and minor chloritization, particularly along fracture selvages.

GEOLOGY OF SPECIFIC ZONES

In 2011, Silver Range mapped four areas in detail in the vicinity of five mineralized zones on the property – Keg Main, Owl, Drex/RGS and Rebel. These geological maps are illustrated on Figures 7 to 10. A detailed geology map of the five mineralized zones in the southeastern-most

part of the property (Hammer, Cody, Cirque, Snap and Risby) was compiled by Doron Explorations in 1988 and is presented on Figure 11 (Robertson and Wallis, 1989 and Blanchflower, 1998 and 1999).

Keg Zone

Geology in the vicinity of Keg Main Zone comprises Rabbitkettle, Tay and Mount Christie formations. Contacts and fault traces mapped within the area in 2011 are approximate, due to the rarity of bedrock exposure.

Rabbitkettle Formation in this area has been divided into three sub-units. The lowermost sub-unit (COR1c) consists of buff weathering, laminated, grey siltstone and fine grained sandstone. The middle sub-unit (COR1b) is characterized by dark grey, fine grained sandstone with a distinct fabric defined by fine grained pyrrhotite. The uppermost sub-unit (COR1a) is exposed within the core of an open, southeasterly trending synform. It comprises dark and light grey to white striped, fine grained quartzite and dark grey, medium bedded, silty limestone interbedded with black siliceous siltstone.

The uppermost Rabbitkettle Formation sub-unit (COR1a) is juxtaposed against Mount Christie Formation to the north along a south-dipping, east-trending thrust fault. Both units dip to the south adjacent to the thrust fault. Mount Christie Formation (CPMCb) is typified by distinct, medium bedded, maroon cherts.

Dark grey to black, fine grained siltstone; calcareous siltstone to silty limestone; and rare black chert were mapped to the northeast of the maroon cherts. These rocks are interpreted to belong to Tay Formation (MT), which sits unconformably below Mount Christie Formation.

A 3000 by 5000 m zone of pervasive silica-sulphide alteration overprints both Mount Christie Formation chert and Tay Formation fine clastic rocks. Within the alteration zone, the rocks are commonly light grey, massive and completely silica-altered. These rocks are highly fractured and exposed surfaces are rusty. Minor veinlets and disseminations of pyrrhotite, pyrite and arsenopyrite are commonly seen at surface within the zone. The zone may extend below cover to the east and west.

Mount Christie and Tay formations and the silica-alteration zone are well-exposed in a north-trending canyon in the east part of the map area. Metre- and smaller-scale folds were observed throughout the canyon and rarely in hill-top outcrops. The folds plunge shallowly to moderately to the east-southeast. Late, brittle fault zones up to five metres wide were also observed within the canyon. The fault zones are characterized by shattered chert, crushed rock and clay. Similar faults comprising milled quartz clasts re-cemented by calcite were mapped within Rabbitkettle Formation elsewhere in the map area. All of the faults dominantly strike east to southeast and dip moderately to the south.

KEG PROPERTY

0 5 10 km

UTM ZONE 8, NAD 83, 105K

FILE: ...2011/KEG/FIGURES/GEOLOGY.WOR | DATE: MAY 2012

Owl Zone is situated eight kilometres north-northwest of Keg Main Zone. Stratigraphy in the vicinity of Owl Zone comprises Mount Christie Formation chert and siltstone, which are structurally overlain by older Tay Formation limestone and arenite.

Outcrops of Mount Christie Formation black, fine grained, variably carbonaceous, siliceous siltstone (CPMCc) are the lowest exposures on an east-west trending ridge that hosts Owl Zone (Figure 8). This sub-unit is conformably overlain by a thin package of Mount Christie Formation maroon and grey cherts (CPMCb). Both sub-units have been pervasively altered by silica and sulphide mineralization. The alteration zone is characterized by rusty weathering, light grey-green to grey, laminated to massive, silica-altered rocks, which commonly host veinlets and disseminations of arsenopyrite with rare arsenopyrite-galena veins. Where sulphide veins and disseminations are present, the silicification is most intense and host rocks are altered to light grey or pinkish-grey. The alteration zone comprises much of the mapped area.

Higher elevations on the ridge are characterized by Tay Formation grey, locally fossiliferous limestone and discontinuous bands of grey-brown, very fine grained siliceous rocks (MT1). Thick beds of light grey to white, medium grained arenite (MT2) are regularly exposed within the limestone unit. Rare, grey, fine grained, laminated to thin bedded calcareous siltstone and black, coarse grained, quartz-rich, lithic sandstone were also mapped within Tay Formation.

Based on the YGS regional-scale mapping and interpretations, Tay Formation was thrust faulted over Mount Christie Formation. The fault trace was not seen during 2011 mapping due to vegetative cover. Tay Formation has been openly folded by a northwest plunging antiform.

All units were cut by late, near vertical faults that strike north-northwest and were offset by up to 150 m. The movement along these faults is interpreted to be a combination of west-side down dip-slip and sinistral strike-slip motions. Fracture and vein sets are oriented parallel to these faults and are commonly mineralized.

Drex and RGS Zones

Drex and RGS zones lie 10 km east-southeast of the Keg Main Zone, within an area that comprises Mount Christie Formation cherts and Jones Lake Formation fine grained clastics and limestone (Figure 9).

Mount Christie Formation is divided into two sub-units in this area. The lower sub-unit (CPMCa) is characterized by laminated to thinly bedded, light grey, grey-green and black cherts interbedded with dark grey siltstone and shale. The overlying sub-unit (CPMCb) consists of distinct, thin to medium bedded, commonly buff weathering, reddish-brown to maroon chert. In the western part of the map area, a section of Mount Christie Formation stratigraphy has been pervasively silica-altered and variably mineralized. This alteration zone hosts the RGS Zone.

Jones Lake Formation is also locally divided into two sub-units, which lie conformably and structurally against the underlying Mount Christie Formation. Thin bedded, dark grey, calcareous siltstone (TrJb) unconformably overlies CPMCb chert. The other sub-unit comprises thin-bedded, brown, fine grained, sandstone and siltstone and interbedded black argillite and

laminated to blocky, grey, silty limestone (TrJa). It is juxtaposed against TrJb siltstone and altered Mount Christie Formation rocks to the south along an inferred fault.

All units in the area are tightly folded into metre-scale cylindrical folds with very shallowly plunging fold hinges that trend west-northwesterly and east-southeasterly. The folds are particularly well developed and exposed in the maroon cherts near the contact with Jones Lake Formation.

Mount Christie Formation has been cut by a series of steeply dipping, dominantly northeast-trending structures. These structures are represented by one metre wide pockets of re-cemented fault breccia. The structures post-date folding in the area. Fractures and veins consistently strike north-northeasterly and dip near vertically.

Rebel Zone

Rebel Zone is located 17 km south-southeast of Keg Main Zone. It lies entirely within Marmot Formation.

Locally, Marmot Formation has been divided into three primary lithologies, which are conformable and interbedded. The lithologies comprise: 1) orange and brown altered volcanic and volcaniclastic rocks that are cut extensively by orange weathering, iron-carbonate veins (CSM2a); 2) black, strongly carbonaceous shale (CSM2b); and 3) variably deformed, green volcanic breccia interbedded with green, recemented volcaniclastic sandstone, siltstone and tuffaceous rocks and local amygdaloidal basalt flows (CSM2c).

The Marmot Formation package dominantly strikes east-southeasterly and dips shallowly to moderately to the north. Cleavage generally strikes northeasterly and dips to the northwest or southeast. Iron-carbonate veins are mostly oriented to the north-northwest or east-northeast and have variable dips.

Mineralization comprising Rebel Zone is entirely hosted within CSM2c.

Hammer, Cody, Cirque, Snap and Risby Zones

Hammer, Cody, Cirque, Snap and Risby zones are situated about 25 km south-southeast of Keg Main Zone. The zones lie within the Anvil Batholith, near its northern contact with Gull Lake Formation (Figure 11).

The area is dominantly underlain by granite, quartz monzonite, granodiorite and minor syenite of Anvil Batholith (Unit 3 on Figure 11). These rocks are light brown to grey in colour, massive and fine to medium grained. They are composed of anhedral to subhedral feldspar, quartz, biotite, muscovite and minor apatite and magnetite (Blanchflower, 1999).

Several large roof pendants are preserved along ridge tops in the area. These roof pendants comprise Gull Lake Formation non-calcareous schist, phyllite and gneiss with lesser carbonaceous phyllite, marble, calc-silicate schist and metabasite (Units 1 and 2). The

metasedimentary rocks have been intruded by granitic sills that are coeval with the Anvil Batholith. The sills are parallel to foliation attitudes within the metasedimentary rocks.

Both the roof pendants and Anvil Batholith have been cut by green, fine grained andesite to coarse grained hornblende-plagioclase porphyry dykes (Unit 4), and quartz-feldspar porphyry dykes (Unit 5). These dykes could be Mid-Cretaceous or Early Tertiary in age.

Quaternary alluvium, glacial and glaciofluvial deposits blanket broad valleys in the area.

The Gull Lake Formation sedimentary and lesser volcanic rocks have undergone a high degree of regional deformation and metamorphism. The gneiss and schist reportedly contain staurolite, which is indicative of relatively high metamorphic grade. With the exception of a relatively thin and local band of hornfels, little contact metamorphism has been mapped within the metasedimentary units near the intrusive contact (Blanchflower, 1999).

Anvil Batholith intrusives are generally fresh to poorly altered, except adjacent to or within south-southeasterly and east-northeasterly trending fault zones. The rocks become increasingly more altered near these fault zones, resulting in an apparent zonation from fresh to propylitic, sericitic and, eventually, pervasive argillic alteration facies. Within the most intensely fractured and sheared fault zones, the intrusives become leucocratic (the mafic minerals are altered to quartz and sericite), albitized and locally biotitized. This alteration is likely attributed to silicification and mineralization, since most of the significant mineralization (sheeted quartz-sulphide veins) occurs within sericitically-, or more commonly, argillically-altered granite or granodiorite.

The younger dykes (Units 4 and 5) display chill features near their margins and are usually sheared, silicified and limonitic at surface.

Two dominant sets of moderately to steeply dipping normal regional faults appear to be related to extensional faulting during the intrusion of the Anvil Batholith (Jennings and Jilson, 1986 in Blanchflower, 1998). The fault sets are oriented at 060 to 070º and 160 to 170º. Foliation and apparent bedding attitudes within the metasedimentary units commonly strike northwesterly and dip shallowly (10 to 30º) to the southwest (Blanchflower, 1999). These attitudes are commonly parallel to contacts with the underlying batholitic rocks. The Anvil Batholith rocks appear to be pervasively well-fractured.

Mineralized zones within the map area are mostly hosted within the Anvil Batholith and are dominantly controlled by the two structural sets.

MINERALIZATION

The Keg property hosts sixteen main zones of surface mineralization that lie within two parallel, northwest-trending belts. The Tay Belt is the more northerly of the two and covers a 60 by 5 km area that comprises Keg Main, Keg South, Owl, Zeno, RGS, Drex, Archimedes, Euclid, Marks and Ku zones (Figure 6). The Mount Mye Belt is located 15 km south of Tay Belt and 12 km northeast of the former Faro Mine and mill site. The Mount Mye Belt consists of Rebel,

Hammer, Cody, Cirque, Snap and Risby zones. Six zones (Keg South, RGS, Archimedes, Euclid, Ku and Hammer) were discovered by Silver Range in 2011, while the others were identified by previous operators.

In 2011, Silver Range collected 251 rock samples from the 16 mineralized zones and other isolated sites across the property. Rock sample sites were marked with orange flagging tape labelled with the sample number. The location of each sample was determined using a handheld GPS unit.

Multi-element analyses for rock samples were carried out at ALS Minerals in Whitehorse and North Vancouver, where each sample was dried, fine crushed to better than 70% passing -2mm and then a 250 g split was pulverized to better than 85% passing 75 micron. The samples were analyzed for 51 elements by aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy or atomic emission spectroscopy (ME-MS41). Over limit silver, zinc and lead values were determined using aqua regia digestion with inductively coupled plasma and either atomic emission spectroscopy or atomic absorption spectroscopy (Ag-, Zn- or Pb-OG46) and where necessary by gravimetric methods (Ag-GRA21). The samples were routinely analyzed for tin using pressed pellet XRF (Sn-XRF05) and over limit tin values were determined using Sn-XRF10. Some samples were analyzed for tungsten using pressed pellet XRF (W-XRF05). From the beginning of the program until late July, the rock samples were analyzed for gold by aqua regia and mass spectroscopy (Au-TL44). Due to difficulties encountered with using this technique for drill core (see Diamond Drilling section), the rock samples were analyzed for gold by fire assay followed by atomic absorption (Au-AA24) for the remainder of the program.

The locations of the 2011 rock samples are plotted on Figure 12. The 2011 results for silver, lead, zinc, copper, tin and/or gold (where analyses are significant and/or available) are shown for each zone on Figures 13 to 26. Results from 2010 sampling and sampling performed by previous operators (where reliable data is available) are also presented on those figures. Rock Sample Descriptions are given in Appendix II and Certificates of Analyses are presented in Appendix III. Table III lists the anomalous thresholds and peak values for all rock samples.

Table III – Geochemical Data for Rock Samples

Element	Anomalous Thresholds					
	Weak	Moderate	Strong	Very Strong	Historical Peak	2011 Peak
Silver (g/t)	≥ 10 < 20	≥ 20 < 50	≥ 50 < 100	≥ 100	12300	17000
Lead (ppm)	≥ 1000 < 2000	≥ 2000 < 5000	≥ 5000 < 10000	≥ 10000	49.00%	81.40%
Zinc (ppm)	≥ 1000 < 2000	≥ 2000 < 5000	≥ 5000 < 10000	≥ 10000	21.60%	19.90%
Copper (ppm)	≥ 1000 < 2000	≥ 2000 < 5000	≥ 5000 < 10000	≥ 10000	4.06%	0.88%
Tin (ppm)	≥ 50 < 100	≥ 100 < 200	≥ 200 < 500	≥ 500	1.46%	1.54%
Au (g/t)	≥ 0.1 < 0.2	≥ 0.2 < 0.5	≥ 0.5 < 1	≥ 1	15.43	12.8

The sizes of the mineralized zones, their locations relative to Keg Main Zone, and the distributions of weak, moderate, strong and very strong values for silver-zinc-lead-copper-tin±gold are listed in Table IV.

The zones and showings that lie within Tay Belt are characterized by mesothermal, fracture-filling and skarn/replacement style mineralization, while those within Mount Mye Belt comprise mesothermal and epithermal mineralization that is mostly hosted in veins and fracture zones. The individual zones and showings within the belts are described in the following paragraphs.

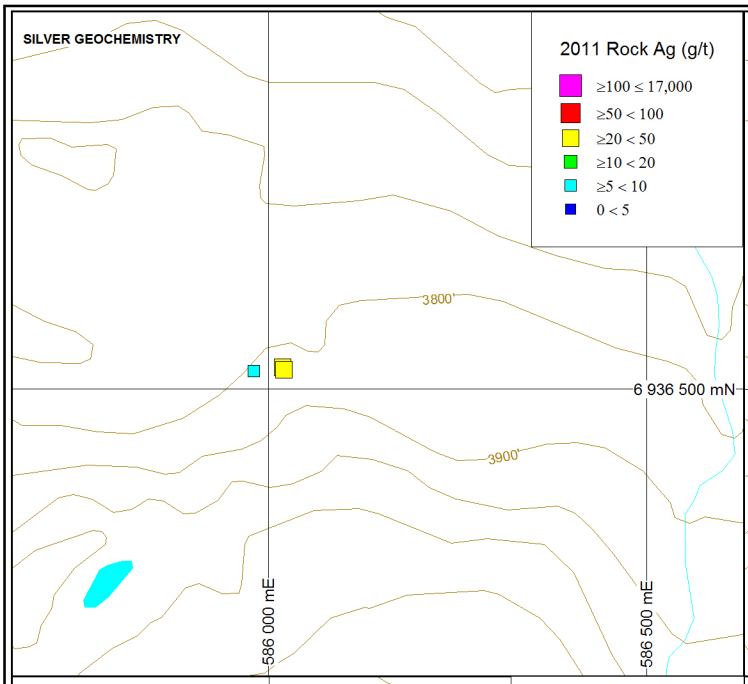
TAY BELT

Keg Main Zone

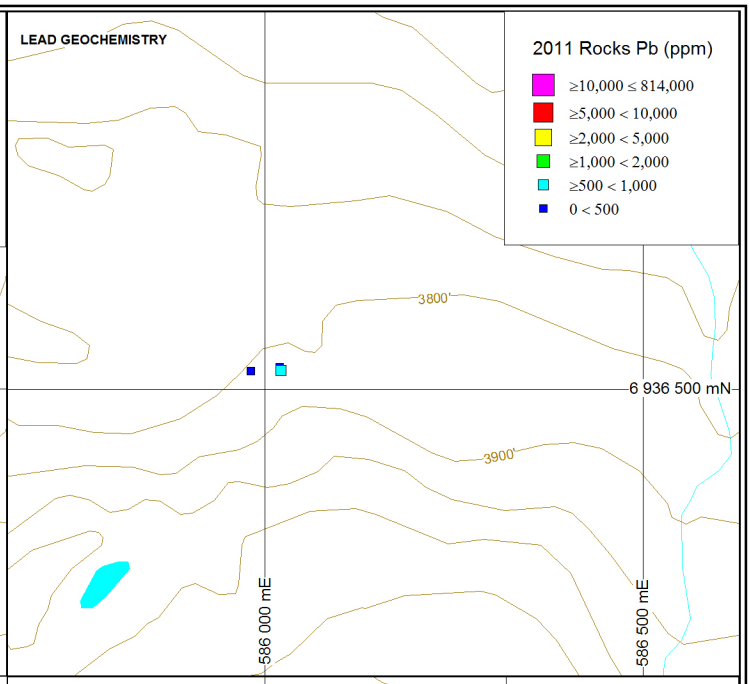
Keg Main Zone occupies the north side of an east-west trending ridge cut by Ivan Creek. The main areas of interest lie along the northern edge of the plateau-like ridge, which crests at or just below treeline. Outcrop is rare within this zone – three relatively large, gossanous talus slopes containing scattered outcrops are exposed near the centre of the zone, but other exposures are mostly small and isolated. Numerous rock samples taken from the zone yielded weakly to very strongly anomalous results for silver, zinc, lead, copper and tin with scattered weak gold support (Figure 13).

Mineralization has been found in talus and outcrop at surface, within bedrock exposed in bulldozer trenches (see Historical Trenching section) and in drill core (see Diamond Drilling section). The observed mineral assemblage consists of disseminated, blebby, fracture-filling and rarely massive pyrrhotite with lesser sphalerite, chalcopyrite, pyrite, arsenopyrite, galena and stannite. The mineralization is mostly hosted in stockwork fractures that cut rusty weathering, intensely silicified, fine-grained clastic sediments and chert. Disseminated to semi-massive banded mineralization is also locally present within skarnified limestone horizons. Detailed mineralogy and geochemistry of this zone are discussed in greater detail in the Diamond Drilling section.

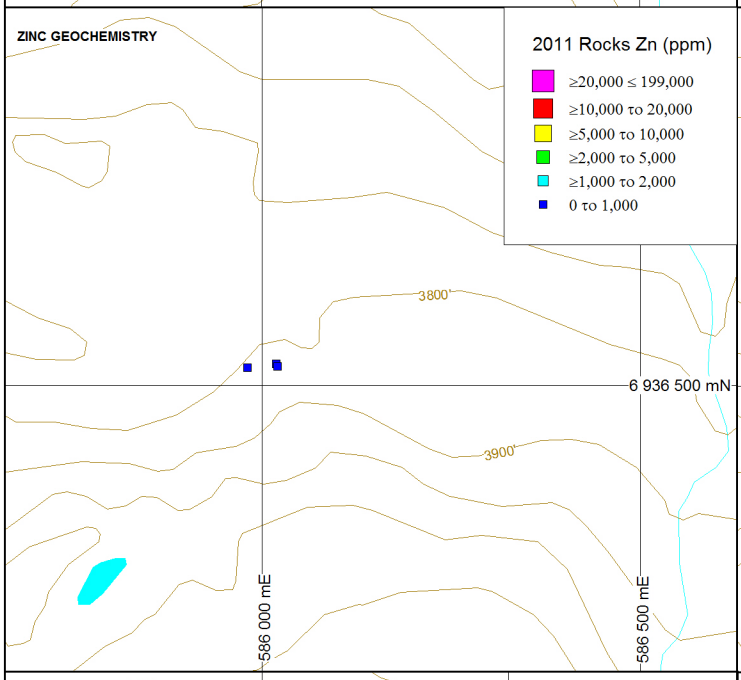
Keg South Zone



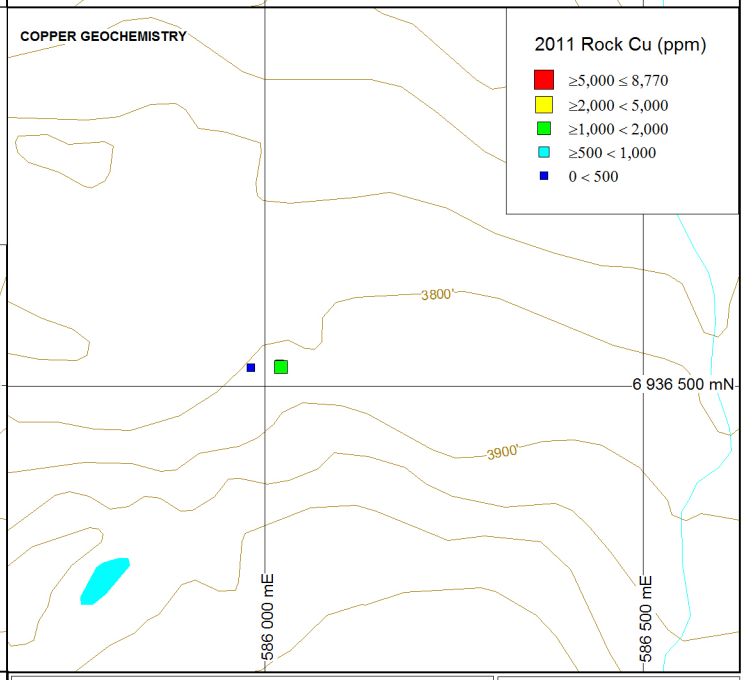
Keg South Zone lies below treeline on a north-facing slope to the east of Ivan Creek. In 2011, three boulders of green metasiltstone with bands and blebs of weak pyrite and rare chalcopyrite were collected from under a thin layer of vegetation. The samples returned between 7.58 and 43.5 g/t silver and 0.045 and 0.10% copper (Figure 14).



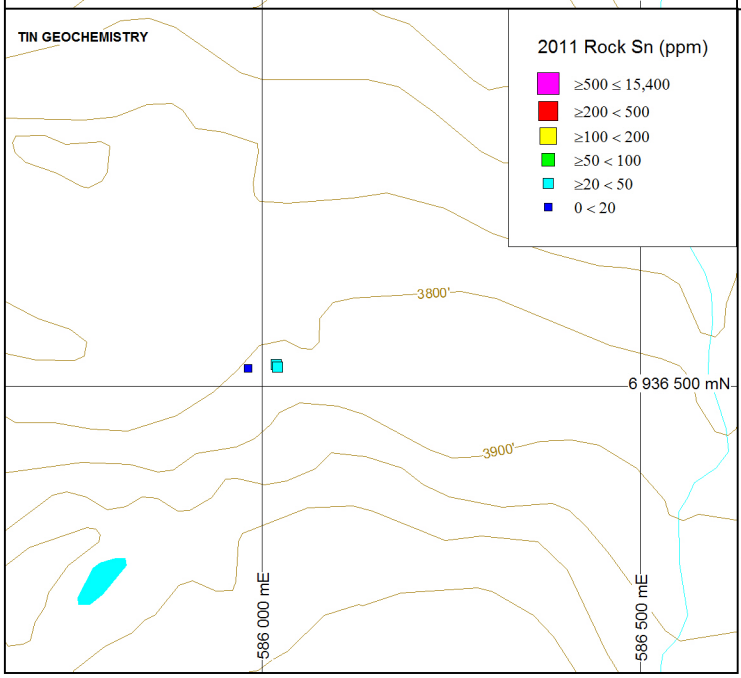
Owl Zone



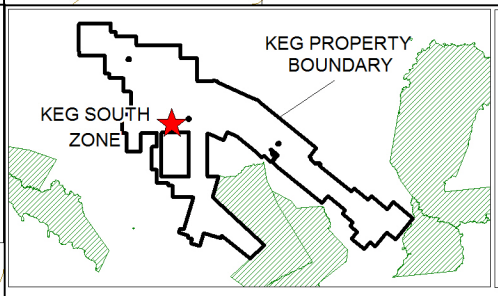
Owl Zone covers gossanous talus and bedrock exposed along a cliff band on the north side of a northwest trending ridge. Several samples from this area returned weakly to very strongly anomalous silver, zinc, lead, tin and gold values with moderate copper support.

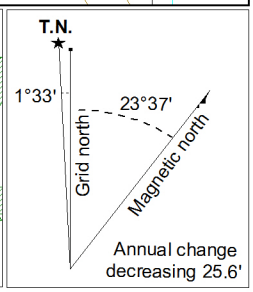


Atlas Exploration recognized four types of mineralization within this zone (after Brock and Coates, 1970):



1) Sphalerite-galena-chalcopyrite-arsenopyrite-pyrite in veins up to 0.3 m wide in chert. Approximately 15 veins were discovered. They generally trend 030°.
2) Minor disseminated to locally fracture-filling arsenopyrite, pyrite, sphalerite and chalcopyrite in quartzite.
3) Arsenopyrite with lesser galena and chalcopyrite in quartz vein in talus near a granitic plug.
4) Quartz vein with arsenopyrite and stibnite. Stibnite has not been found “in situ.”





Note: Peak threshold values are property-wide, not Keg South Zone specific

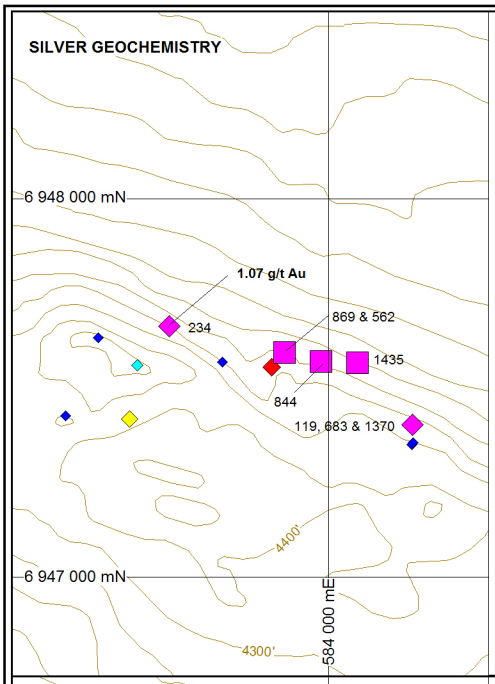
The highly fractured, gossanous wallrock was not considered to be "mineralized" by early workers and was not sampled. Mineralization at Owl Zone is largely hosted in strongly altered chert and quartzite of Mount Christie and Tay formations, in an area where the two units are juxtaposed by a thrust fault.

Atlas Exploration analyzed samples of Types 1 to 3 mineralization, but did not mark exact sample locations on a map. Table V lists the historical results from Owl Zone by mineralization type.

Table V – Owl Zone Historical Rock Sample Results (Brock and Coates, 1970)

Mineralization Type	Silver (g/t)	Lead (%)	Zinc (%)	Copper (%)
1	601	11.4	0.12	0.32
1	32	Trace	20.2	0.25
1	263	4.0	NR*	NR*
2	2.0	NR*	NR*	NR*
3	57.6	NR*	NR*	1.7
3	542	7.5	0.40	0.14



* Value was not reported.

In 2010, Strategic Metals collected 13 grab and composite samples of weakly disseminated (Type 2), moderately disseminated and fracture-filling (Type 2), and semi-massive to massive vein (Type 1) mineralization from bedrock and talus in the area (Figure 15). In 2011, Silver Range took an additional four Type 1 samples. Six samples of weakly mineralized, disseminated and fracture-hosted arsenopyrite±pyrite in quartzite (Type 2) averaged 0.5 g/t silver, 72.0 ppm zinc, 35.9 ppm lead, 79.5 ppm copper and 27.8 ppm tin. Two moderately mineralized samples of quartzite containing disseminated and fracture-filling arsenopyrite, pyrite, sphalerite and trace galena (Type 2) were collected. They averaged 18.8 g/t silver, 0.16% zinc, 0.27% lead, 0.01% copper and 23.1 ppm tin. Nine samples of semi-massive to massive arsenopyrite with lesser galena, sphalerite and pyrite in quartz veins within chert (Type 1) averaged 690 g/t silver, 5.01% zinc, 11.3% lead, 0.08% copper and 530 ppm tin. One Type 1 sample from 2010 also yielded 1.20 g/t gold.

Zeno Zone

Getty Canadian performed prospecting to the north and west of Owl Zone during its 1983 regional stream sediment survey (Payne, 1983). It discovered several gossans with localized pyrite-, pyrrhotite-, sphalerite- and galena-bearing showings. One of these showings was examined by Silver Range in 2011 and is now referred to as the Zeno Zone. Two other showings have not been revisited and are briefly described below.

Zeno Zone lies at the contact between a small granitic plug (mKgS) and Rabbitkettle Formation. Getty Canadian noted sphalerite, pyrite, galena and pyrrhotite within a large area of rusty weathering, hornfelsed, fine grained clastic rocks; however results from a chip sample at this location were subdued (Payne, 1983). One of two samples of rusty weathering, pyrite-bearing, siliceous, fine grained clastic rock collected from this showing by Strategic Metals in 2010

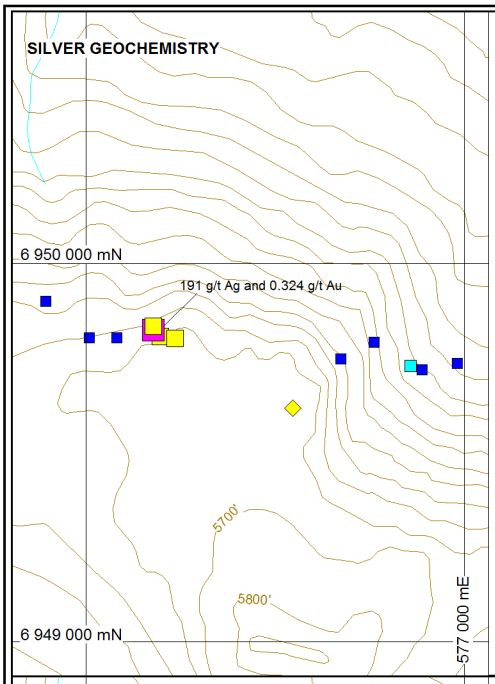
FILE: ...2011/KEG/FIGURES/Owl_rock.wor | DATE: MAY 2012

returned weakly to moderately elevated values for silver (27.4 g/t), zinc (1280 ppm) and lead (3710 ppm).

Most samples of weakly sulphide-bearing hornfelsed clastic rocks taken from Zeno Zone by Silver Range in 2011 yielded subdued results for all elements of interest (Figure 16). Four samples collected from talus and bedrock within a 70 m long area of hornfelsed, fine grained clastic rocks with arsenopyrite-bearing quartz veins averaged 75.5 g/t silver with some lead, tin and gold support.

Another showing discovered by Getty Canadian (**Getty Showing**), located two kilometres north-northwest of Owl Zone, comprises a set of pyrrhotite-, pyrite-, galena- and sphalerite-bearing, rusty quartz veins (Payne, 1983). These veins are hosted in Tay Formation shale, which is exposed in a creek cut. Two chip samples reportedly yielded 100 g/t silver, 10.78% zinc, 3.27% lead, 0.38% copper, 3.4 g/t gold and 380 ppm antimony over 10 cm, and 111 g/t silver, 14.90% zinc, 4.40% lead and 1.1 g/t gold over 8 cm. Adjacent wallrocks were not sampled.

The third Getty Canadian showing (**Payne Showing)** was found 13 km to the northwest of Owl Zone. It comprises four quartz veins with disseminated galena, pyrrhotite and pyrite within brecciated chert (COR1). A grab sample from a five centimetre wide vein returned 31.2 g/t silver and 1.57% lead (Payne, 1983).



RGS Zone

RGS Zone was discovered by Silver Range at treeline within a west-draining valley. Mineralization was mostly observed on the southern side of the valley, but one showing was found just north of the creek (Figure 17). Talus is common within the zone but bedrock is limited to small, infrequent cliffs and subcrops.

Mineralization to the south of the creek is primarily hosted within an area of rusty weathering, strongly silicified Mount Christie Formation chert and possibly Jones Lake Formation siltstone (Figure 9). The mineralization consists of rusty weathering chert with fracture-filling pyrite, chalcopyrite, galena, sphalerite and arsenopyrite. The density of mineralized fractures within this area appears to be low; however, the mineralization was observed over a broad area.

One showing to the south of the creek comprises abundant fragments of mineralized vein talus, which are concentrated over a 20 m length. The vein fragments consist of interlaminated arsenopyrite and quartz hosted within chert. The fragments indicate a possible vein width of 6 to 14 cm. Four vein samples collected from talus within this showing averaged 126 g/t silver, 0.45% lead, 582 ppm tin and 0.117 gold. Hand trenching carried out in 2011 failed to expose a bedrock source for the showing. It is open along strike in both directions.

Mineralization to the north of the creek was discovered in talus exposed beneath an uprooted tree. Mineralization comprises galena and lesser sphalerite blebs within pervasively rusty, angular limestone cobbles (Jones Lake Formation). A sample of this material yielded 105 g/t silver, 1.03% lead, 0.33% zinc and 126 ppm tin.

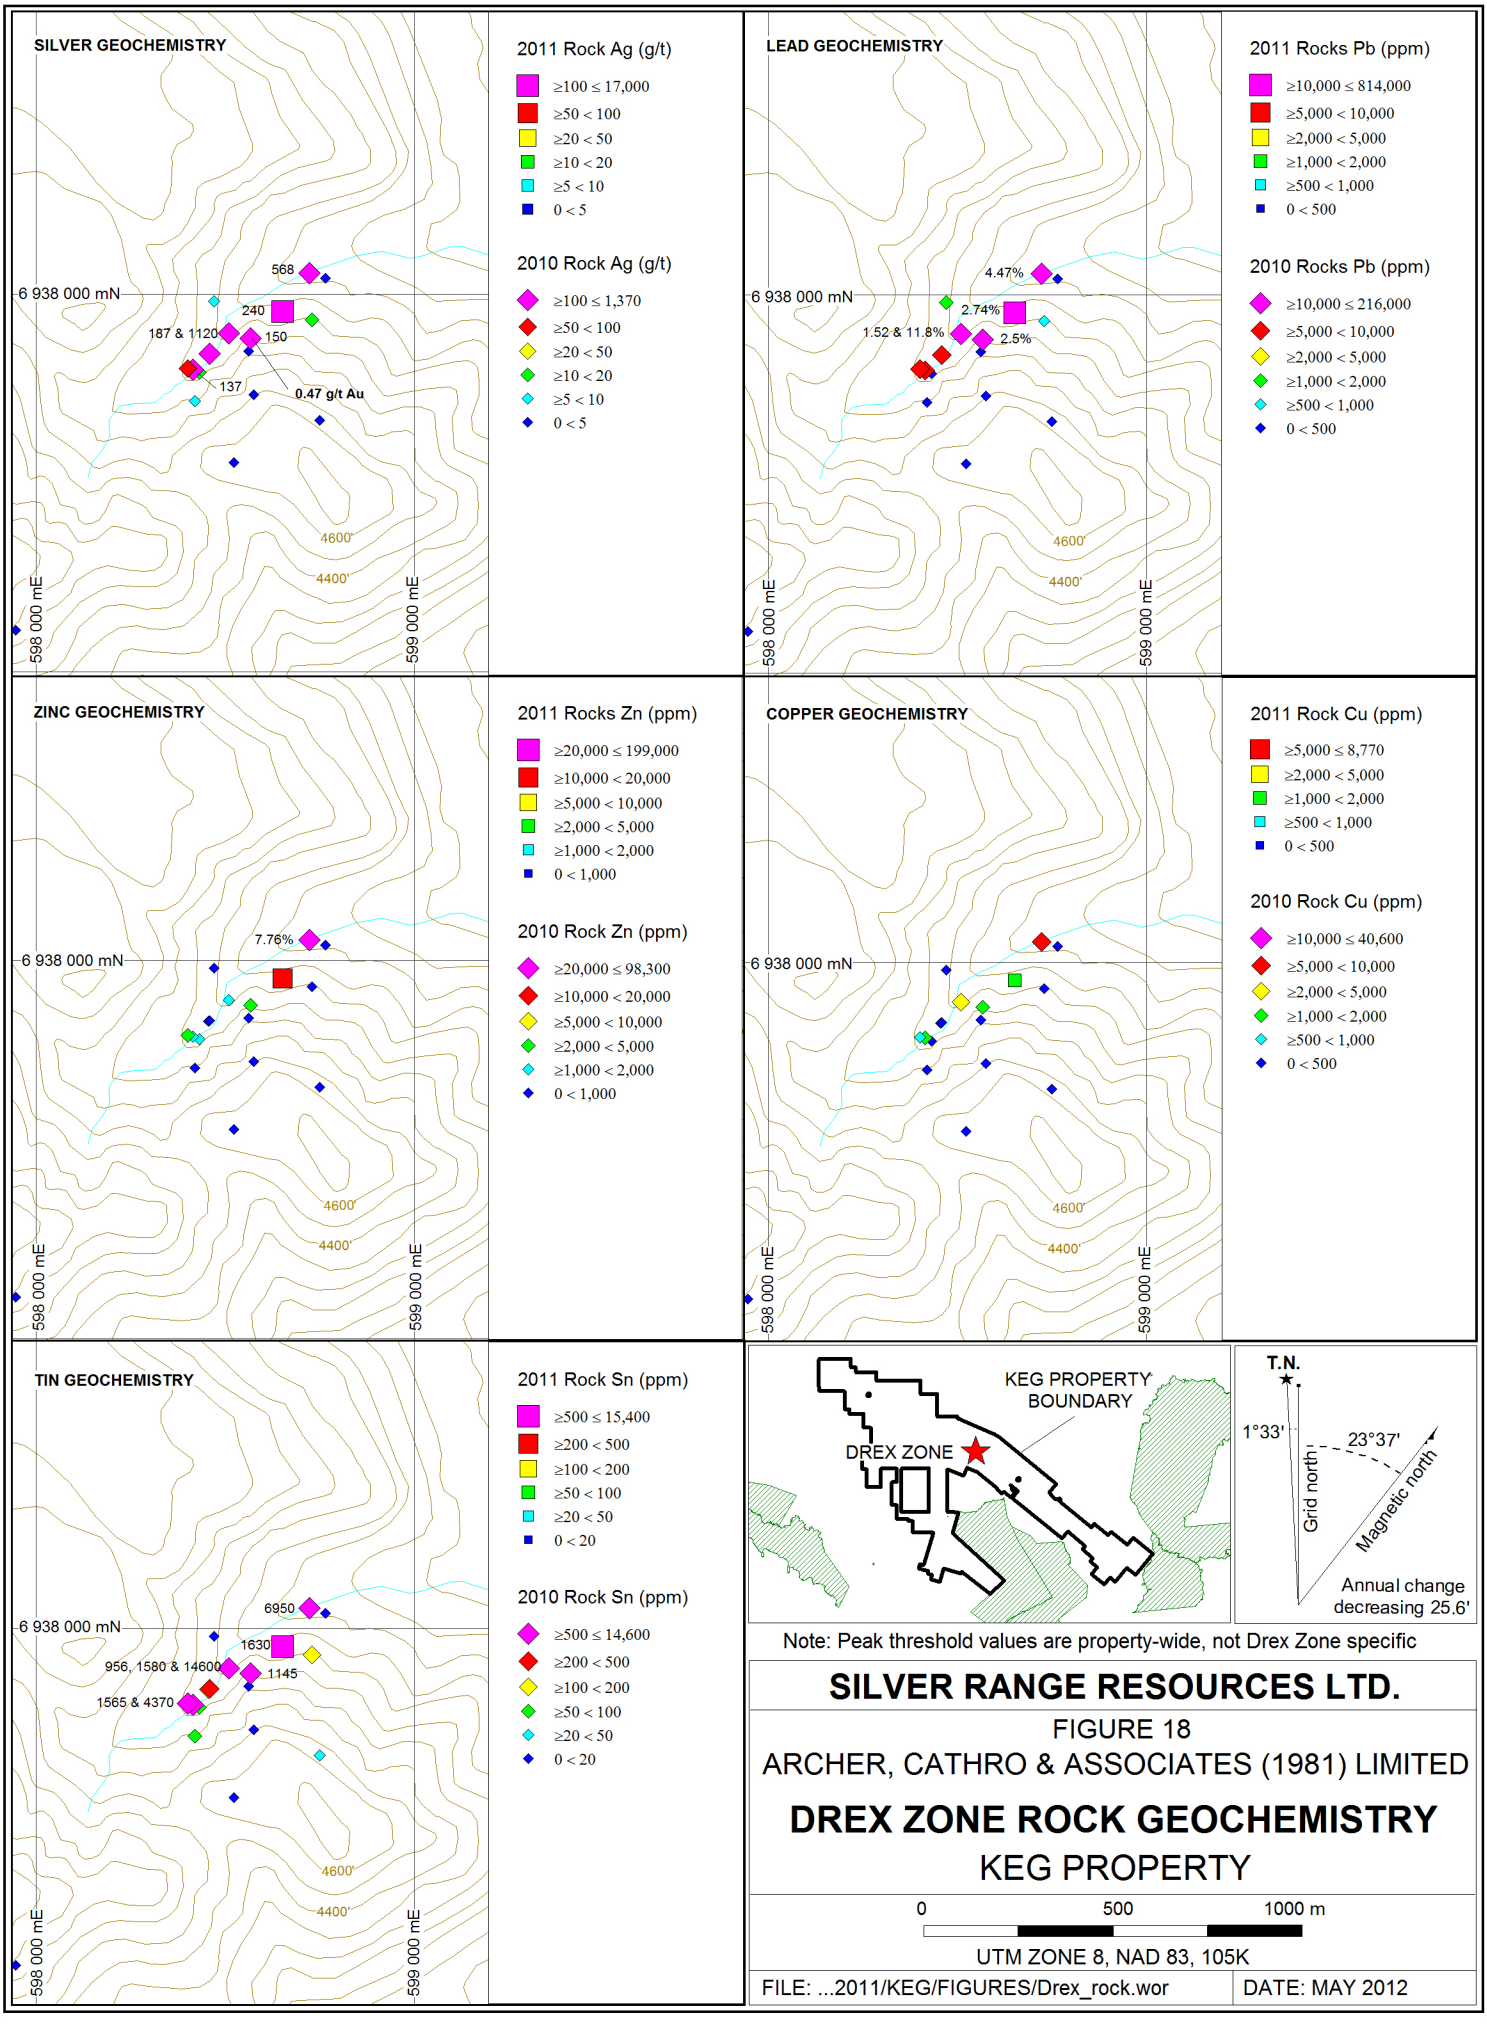
Drex Zone

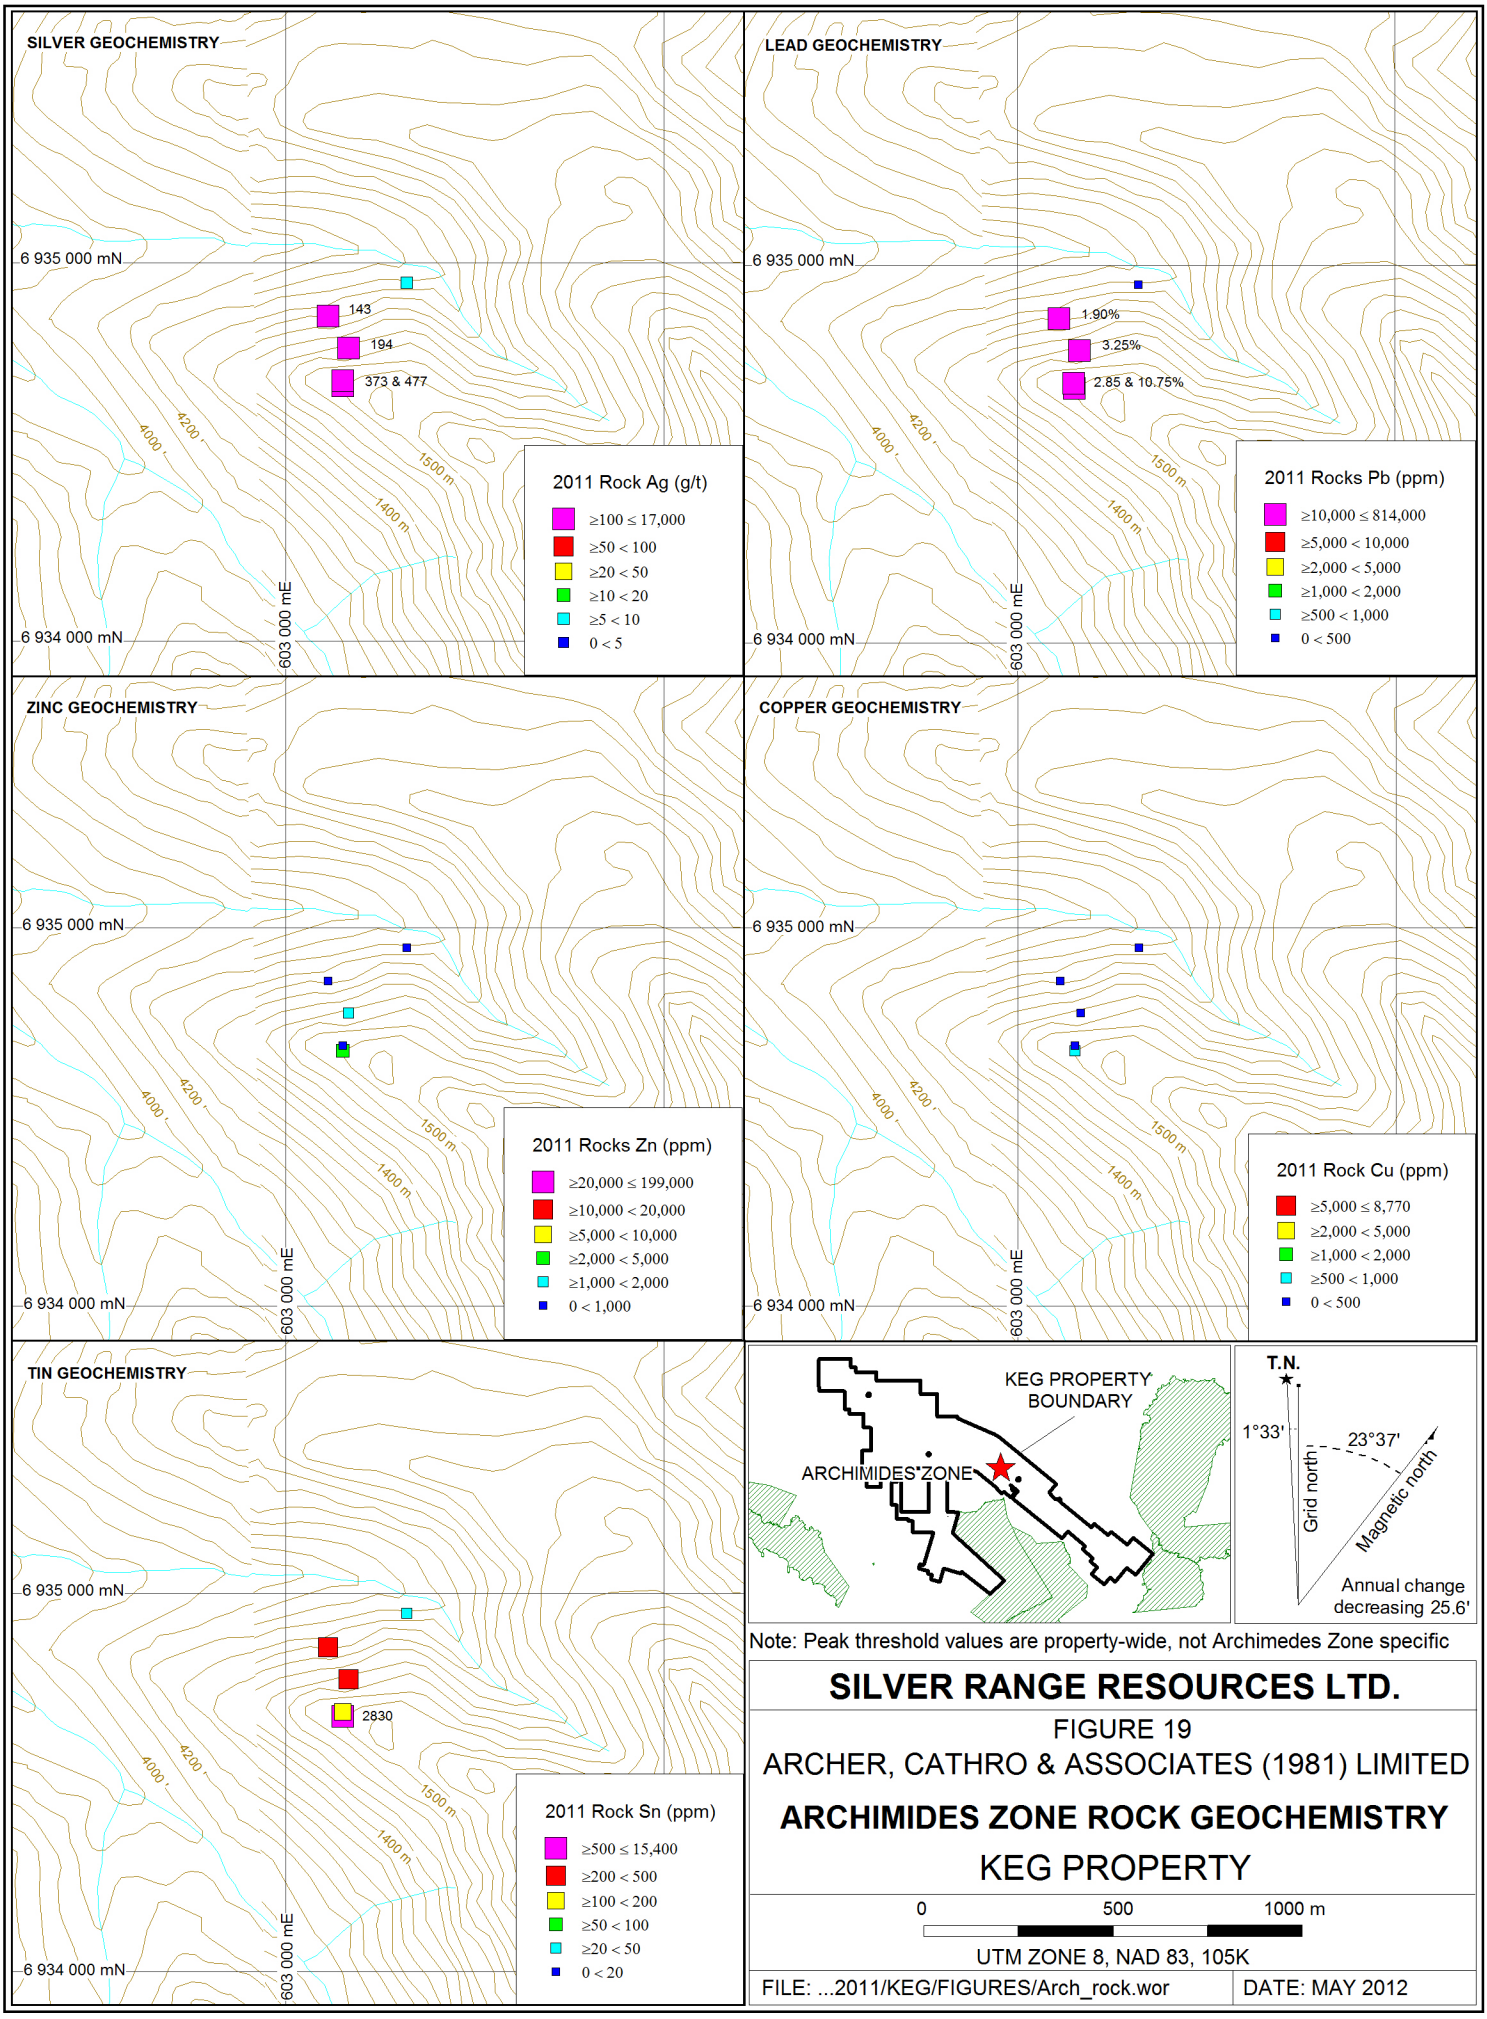
Drex Zone is situated in an east-west trending, deeply incised valley cut into an upland plateau. The zone lies at treeline, in an area with limited outcrop exposure. It is characterized by weakly to very strongly elevated silver, zinc, lead and tin values, with strong copper and moderate gold support.

Mineralization consists of disseminated, blebby, fracture-filling and vein-hosted arsenopyrite with lesser galena, pyrite and sphalerite. Scorodite and limonite are common on weathered surfaces. All mineralization is hosted in light brown to grey, locally strongly bleached chert of Mount Christie Formation. The veins are discontinuous, up to 40 cm wide and comprise banded to nearly massive arsenopyrite±galena±sphalerite with quartz gangue.

In 2010, twenty-one rock, composite and chip samples were collected from bedrock and talus. In 2011, Silver Range took two additional samples of vein float from within this zone (Figure 18). Thirteen of the better mineralized samples averaged 211 g/t silver, 2.10% lead, 0.80% zinc, 0.14% copper and 2204 ppm tin. All gold values were below detection limit (0.2 g/t) except one that yielded 0.4 g/t.



Archimedes Zone



Archimedes Zone lies near the crest of a northwest-trending alpine ridge. Outcrop is rare in this zone, but talus in abundant. Mineralization comprises blebby galena, and sphalerite and limonite-healed fault breccia within Mount Christie Formation quartzite and limestone talus. The mineralization was traced intermittently up a 200 m long talus train that led to an area of unmineralized quartzite sub-crop and bedrock on the ridge crest. No in-situ source of the mineralization was identified. A total of five mineralized samples were collected from the talus train (Figure 19). Four samples averaged 297 g/t silver, 4.72% lead and 892 ppm tin with localized, moderate zinc support, while the other yielded subdued values for all elements of interest.

Euclid Zone

Euclid Zone lies above treeline on a west-facing slope where abundant talus and scattered outcrop are exposed amongst large patches of grass. The zone comprises silver-, lead- and gold-bearing, yellow and green stained, bleached shale that lies in close proximity to a wide quartz-feldspar porphyry dyke. The shale is locally crackle brecciated but does not host visible mineralization. The shale horizon is well exposed over a 500 m strike length.

A two metre chip sample taken across a brecciated section of altered shale returned 23.6 g/t silver (Figure 20). A grab sample collected from the same location yielded 7.54 g/t silver, 0.38% lead and 0.132 g/t gold. A six metre chip sample taken nearby across a well-exposed section of weakly altered, unbrecciated shale returned 4.64 g/t silver. Two grab samples of unbrecciated, strongly stained shale collected to the west yielded 11.2 and 13.1 g/t silver. One of these grab samples also returned 0.198 g/t gold.

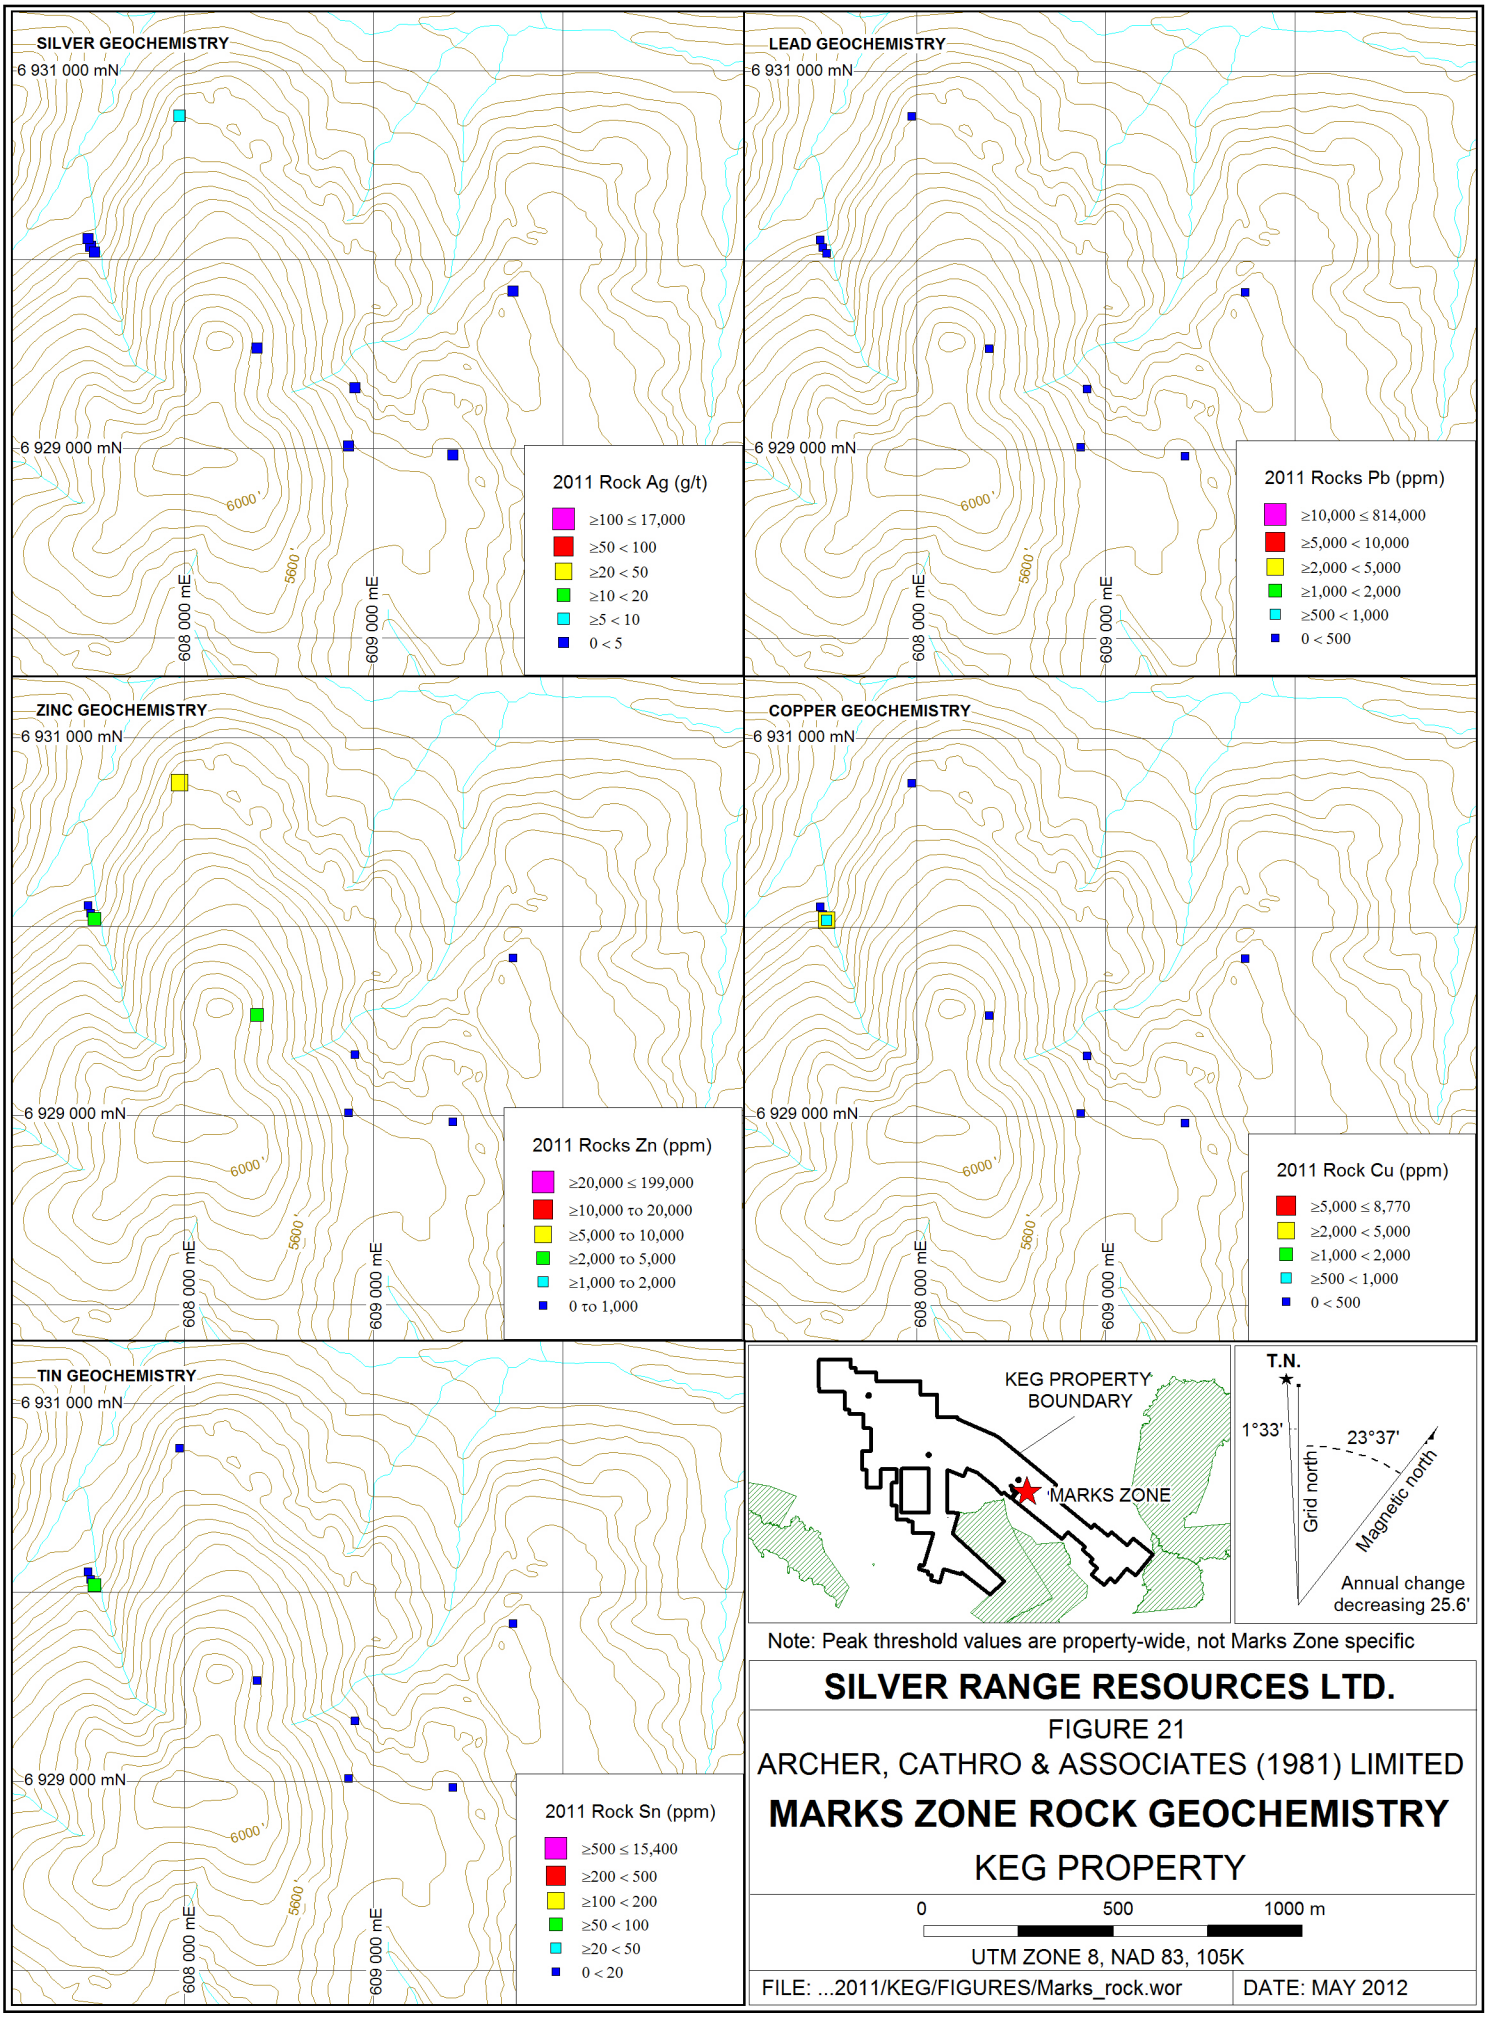
Soil geochemical samples taken nearby returned high values for rare earth elements, but none of the rock samples was anomalous for these elements. No rock samples were collected from the dyke.

Marks Zone

Marks Zone comprises several historical showings that were discovered by Ridgemont Mining in 1975. The showings reportedly consist of fine grained, siliciclastic rocks (Rabbitkettle Formation) with minor vein and replacement-style lead-zinc mineralization and more extensive disseminated to layered iron sulphides (Ridgemont Mining did not report any results). The showings are located immediately south of Tay River Thrust Fault. They lie at or below treeline, in an area with gently rolling to locally steep topography.

In 2011, Silver Range collected 10 rock samples from the area (Figure 21). The samples primarily consist of chert with thin bands of fine grained pyrite and pyrrhotite. In general, these rocks yielded subdued to weak results. Only two samples returned moderately elevated results. A sample of highly siliceous quartz porphyry(?) with weak limonite yielded 7.49 g/t silver and 0.82% zinc, while a sample of pyrite-rich, dark brown skarn collected within a creek bed returned 0.23% copper.

Ku Zone



Ku Zone is situated within grass covered, rolling hills that are cut by several deep, west-trending, recessive linears. The area is underlain by locally deformed quartzite and fine grained clastic rocks. Outcrop exposures are largely limited to the recessive linears. Mineralization comprises limonite and trace sulphides, including chalcopyrite, which are hosted in quartz veins within rusty weathering sections of the country rocks. Three samples collected from a prominent linear returned 26.6, 36.2 and 291 g/t silver (Figure 22). These samples also yielded local, elevated values for gold (0.527 g/t), lead (0.66%) and copper (0.83%). A sample taken from a parallel linear 700 m to the north returned 47.8 g/t silver and 431 ppm tin.

MOUNT MYE BELT

The Mount Mye Belt comprises six mineralized zones. Rebel Zone lies approximately six kilometres to the north-northeast of the other five zones, on a rounded, alpine peak. The other five zones are located on four sub-parallel, north- to northeast-trending, steep-sided, alpine ridges. The ridges are separated by broad, U-shaped valleys. Outcrop along the belt is limited to sharp ridge tops and steeper slopes, while valley floors are commonly blanketed by varied thicknesses of glacial till and outwash gravels. Rounded ridge crests and moderate to gentle slopes are covered by talus and frost-heaved rock (Blanchflower, 1999). Pervasive permafrost and variably thick overburden has hampered exploration within parts of the belt.

Rebel Zone

Rebel Zone comprises mineralized float that was discovered in a gossanous, north-facing cirque (Figure 23). The gossan lies above treeline, but is well camouflaged by light grass cover and

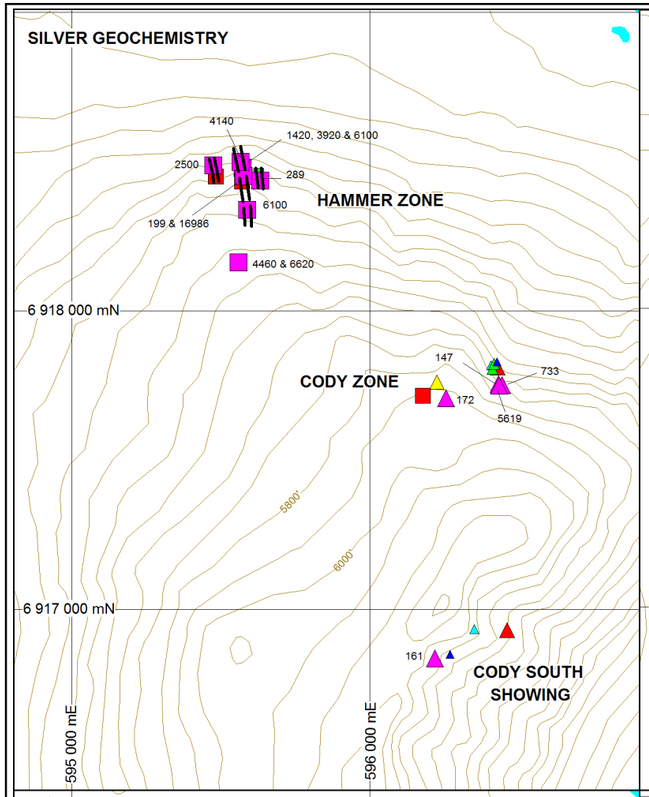
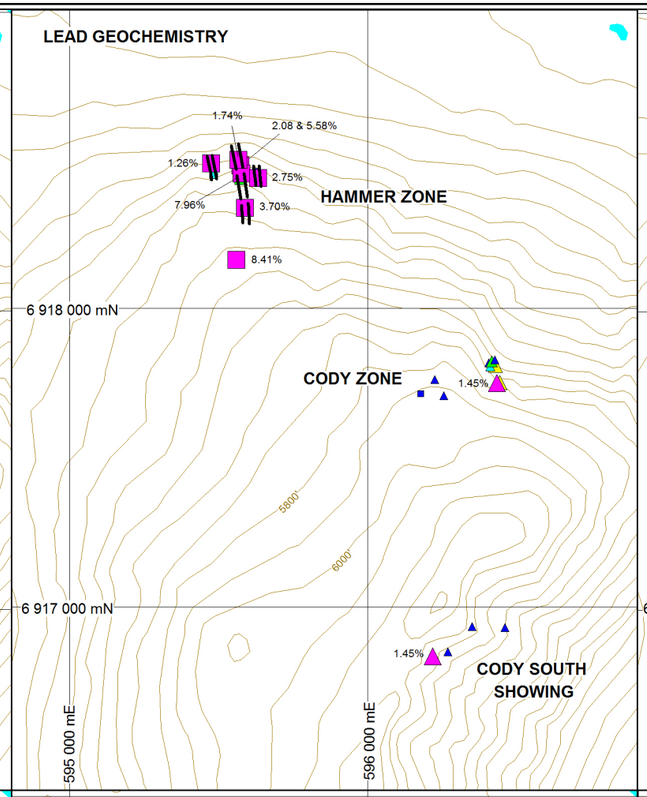
intense frost boiling and solifluction (Cathro, 1967b). The mineralization includes sphalerite-, galena- and chalcopyrite-bearing, quartz-carbonate stringers, veins and breccia matrix hosted in Marmot Formation volcanics (Carne, 1990). The mineralized material is usually intensely oxidized and leached to boxwork limonite with rare lenses of residual sulphide (Cathro, 1967b). A composite sample of galena-rich float collected in 1966 reportedly yielded 295 g/t silver, 1.2% zinc, 8.8% lead, 0.2% copper and trace gold. In 2010, Strategic Metals collected 20 wider-spread and generally more representative grab and composite samples of limonite (with and without sulphides). In 2011, Silver Range collected four additional samples of massive galena with pyrite, limonite with residual galena, and limonite-healed breccia with volcanic clasts. Of the 2010 and 2011 samples, 17 returned elevated (weak or better) values for most elements of interest. These samples averaged 176 g/t silver, 2.69% lead, 1.36% zinc, 0.60% copper and 257 ppm tin.

Hammer and Cody Zones



Hammer and Cody zones lie at the north end of a north-trending, glacially truncated, alpine ridge (Figure 24). The area is underlain by granite and syenite phases of Anvil Batholith. Cody Zone is split into two areas – Cody Zone and Cody South Showing. Both areas were identified by Doron Explorations in 1988, while Hammer Zone was discovered by Silver Range in 2011 during follow up of a single-point soil anomaly. Weakly to very strongly elevated silver, lead and zinc values have been obtained from all three mineralized areas. Hammer Zone is also very strongly anomalous for gold. Doron Explorations did not analyze samples from Cody Zone or Cody South Showing for copper or tin.

In 2011, Silver Range collected 16 rock specimen and chip samples from Hammer Zone, which is located on the glacially truncated slope and upland plateau to the south. The samples comprise sulphide-bearing, epithermal quartz veins and quartz-healed breccias hosted in granite. Sulphides include pyrite, galena, sphalerite, arsenopyrite and tetrahedrite. Some samples are coated with malachite. In veins, the sulphides occur as fine laminations, disseminations and clots, while in breccias the clasts are composed of semi- to nearly-massive sulphides.



Most of the 2011 samples were collected from three sub-parallel, partially talus filled, recessive linears that trend north-northeasterly across the break-in-slope between the over-steepened slopes to the north and felsmeer-covered plateau to the south. The linears average about five metres in width and appear to be the result of differential weathering of mineralized veins and their adjacent altered wallrocks compared to the host granite. The central linear contains a high abundance of vein and breccia float, which was traced along a strike length of 65 m. Mineralized float is rarer in the two adjacent linears. To the south of the break-in-slope, mineralization has been traced intermittently in frost boils developed in glacial till and felsmeer on the upland plateau, and to the north they project under till and fluvial outwash on a broad marshy valley floor.

Eight of the better mineralized talus samples collected within the central linear of the Hammer Zone averaged 6353 g/t silver, 4.31% lead, 3.88% zinc, 0.49% copper, 1503 ppm tin and 2.69 g/t gold. A hand trench was dug across part of the central linear. It exposed a 0.10 m wide sulphide-quartz vein and an adjacent 0.10 m wide gouge band within strongly altered granite. A

2.4 m chip sample taken across this exposure yielded 93 g/t silver, 0.17% lead and 0.20% zinc with subdued copper, tin and gold values.

Cody Zone is situated about 1000 m southeast of Hammer Zone. It comprises manganese stained, barren to variably sulphide-bearing, quartz-rhodochrosite veins found in float within strongly altered granite. The sulphide assemblage predominantly includes galena, sphalerite and arsenopyrite. A limonitic gossan was also reportedly found, but it is not described in detail.

Cody South Showing lies 850 m south of Cody Zone. Lamprophyre dykes and an approximately 200 by 100 m, oblong syenite body within Anvil Batholith were mapped between the two mineralized areas by Doron Explorations (Figure 11). Cody South Showing comprises three silver-rich historical rock samples collected from float. The sample with the best silver value also returned very strongly anomalous lead and zinc response. The samples are spread along a 250 m trend that runs parallel to the contour of the slope.

The most significant results from historical and 2011 rock sampling at Hammer and Cody zones and Cody South Showing are listed in Table VI.

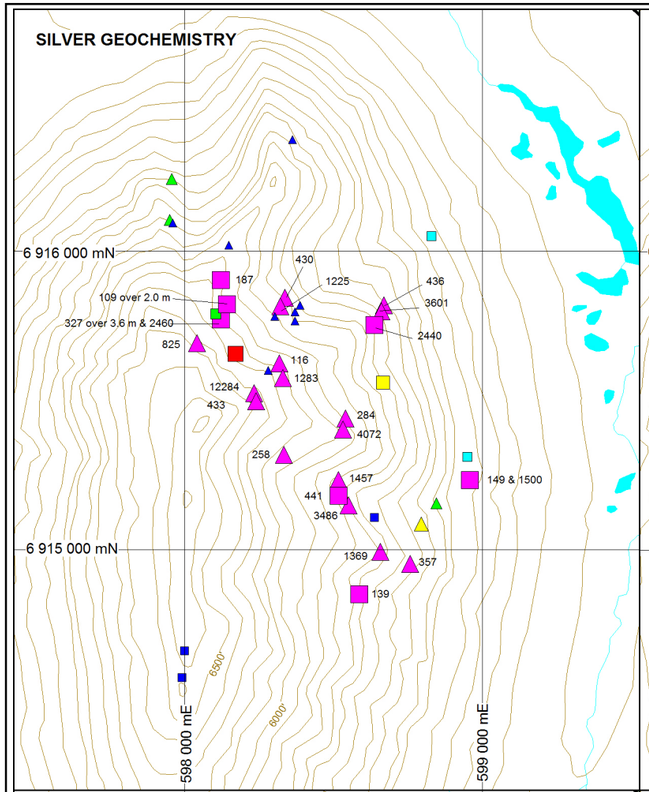
Cirque Zone

Cirque Zone is situated within a small, steep, northeast-facing cirque, which lies at the north end of a north-trending ridge. Abundant talus and patchy outcrop characterize the cirque. Rock

specimen and chip samples collected within this zone yielded weakly to very strongly elevated silver, lead, zinc, tin and gold values.

Mineralization was initially discovered in talus at surface and later within bedrock exposed in hand and excavator trenches (see Historical Trenching section). Mineralization has been found within an approximately 1000 by 500 m area.

Mineralization at Cirque Zone is hosted within a variety of vein types, which are largely restricted to brittle fracture zones in granitic rocks (Robertson and Wallis, 1989). The granite is overlain by sub-horizontal schist and gneiss, which behaved more ductilely and inhibited vein formation. The veins may be related to the emplacement of intermediate dykes, which cut both the intrusive and metasedimentary units (Lueck, 1988). Robertson and Wallis (1989) thought that although a spatial relationship is evident between the veins and dykes, it is likely a function of two different processes operating on the same local fracture pattern rather than a genetic relationship between the two. Unlike the mineralized veins, the dykes cut both units. There is no evident change in dyke width or orientation from one unit to the other.



The primary mineralized vein types in this zone include: 1) glassy, milky and sugary textured quartz vein with or without pyrite, galena, sphalerite and arsenopyrite; 2) poorly exposed quartz-chaledony-limonite veins with clay and carbonate alteration; 3) veins with pyrite, galena, sphalerite and arsenopyrite within quartz, chalcedony and rhodochrosite; and 4) massive sulphide veins that consist primarily of galena. Some veins also host minor tetrahedrite-tennantite and proustite-pyrargyrite (“ruby silver” sulphosalt minerals). The sulphide and sulphosalt minerals are highly variable in abundance and grain size (Robertson and Wallis, 1989). The veins are often banded along their margins and brecciated at the centre, which indicates that there were multiple stages of vein filling. The central brecciated vein zones sometimes contain small rounded fragments of granite wall rock rimmed by chalcedony or rhodochrosite. Rhodochrosite also occurs as patches, fragments and open space fillings within the veins or as cross-cutting veinlets. Open spaces within the veins are commonly lined with quartz prisms. Weathered vein surfaces are black due to strong manganese staining. Limonitic and hematitic staining is also locally prevalent. Unmineralized or pyrite- and arsenopyrite-bearing, siliceous veins are common within the zone.

Silver Range collected 23 rock specimen and chip samples from granite-hosted veins within Cirque Zone in 2011 to confirm the nature and extent of historical samples (Figure 25). Table VII lists the best results from historical and 2011 samples (trench sampling results are discussed in the Historical Trenching section).

The veins occur individually, in sets, or as the matrix in breccia zones. They typically occur as less than one centimetre thick fracture infillings within a wider fracture zone. Individual veins measure up to about 0.4 m wide. Breccia zones are tabular to lensoidal and attain widths of greater than four metres, though they usually average about one metre wide (Lueck, 1988). The most common vein orientations are 000°, 050 to 065° and 150 to 170° with steep dips (60° to vertical).

Alteration halos within the host granitic rocks are proportional to the density of veins. Weak alteration comprises replacement of feldspar by sericite and growth of arsenopyrite and pyrite (Lueck, 1988). Alteration is stronger around breccia zones, where the rocks are yellow-white, soft and clay-, sericite-, silica- and pyrite-altered.

Less abundant quartz veins with variable amounts of galena-sphalerite±arsenopyrite were collected from the overlying metasedimentary units. Although these veins are not significantly mineralized, they show that some fracturing was capable of breaching the schist/gneiss cap. These veins are low in arsenic and gold by comparison with veins hosted within granite. Table VIII lists the most significant results from historical vein samples collected within the metasedimentary cap rocks.

Snap and Risby Zones

Snap Zone comprises five distinct showings (Arseno, Dyke, Bubble, Creek and Krist), which are spread over 2500 m along a northeast trending, alpine ridge (Figure 26). The Arseno, Dyke and Bubble showings lie along the ridge crest, while Creek Showing is located on its eastern flank and Krist Showing is on its west side. Risby Zone is located on a sub-parallel ridge immediately east of Snap Zone. The ridges are separated by a broad, U-shaped valley that is drained by Ace High Creek. Risby Zone comprises two main mineralized areas (Risby Zone and Risby Northeast Showing), which are situated 1800 m apart along the ridge crest.

Both zones are hosted within Anvil Batholith granite, which is overlain by roof pendants of foliated gneiss along parts of the ridge crests. Felsic dykes cut both units in the vicinity of the Dyke and Bubble Showings (Figure 6).

Granitic rocks within the zones appear to have undergone at least two periods of localized, post-intrusive hydrothermal alteration, silicification and mineralization (Blanchflower, 1999). The first period comprised mesothermal-style alteration and veining, which was overprinted by a second period of epithermal-style veins. Silver Range collected 53 rock samples of both types of mineralization from the zones.

Most of the mineralization within the mineralized zones consists of mesothermal, fracture-controlled quartz-sulphide veins, stringers and infilled tectonic breccias hosted by sericitically- to argillically-altered granite (Blanchflower, 1999). Individual quartz-sulphide veins vary from a few millimetres to more than 30 cm thick and, depending upon the density of fracturing, may be less than five centimetres to more than two metres apart within the mineralized showings. The veins have generally been described as sheeted structures, rather than vein stockworks. The veins are commonly oriented east-northeasterly and dip 45° to 70° northward. Localized quartz-sulphide vein stockworks are present at the Creek and Krist showings.

Fine grained pyrite, sphalerite, galena and lesser arsenopyrite, chalcopyrite and rare pyrrhotite are the common sulphide minerals associated with the mesothermal sheeted quartz veins. The sulphides occur at the cores or along the selvages of veins. Near surface or within intensely fractured and oxidized zones, the sulphide minerals are oxidized to limonite, hematite, goethite, smithsonite and scorodite. Semi-massive sulphide breccias were identified in float boulders along Ace High Creek. These sulphide breccias comprise open-space filling, medium to coarse grained pyrite, sphalerite, arsenopyrite and minor disseminated galena, chalcopyrite and pyrrhotite hosted within quartz and calcite. Based upon rock geochemical results, significant gold and silver values are genetically associated with increased arsenopyrite- and galena-bearing vein mineralization.

Epithermal-style veining overprints the mesothermal mineralization at Arseno Showing and Risby Zone and is the dominant type of mineralization at the Dyke and Bubble showings. The epithermal vein mineralization has distinct open-space filling textures with vugs; crustiform coarse grained quartz-calcite bands; and breccias with quartz, calcite and rhodochrosite healing clasts of altered granite. Very fine to fine grained pyrite and sulphosalts are often associated with these high-level, epithermal vein structures. Rhodochrosite commonly accompanies dark grey, sulphide-rich, epithermal veins. Near some shear structures the rhodochrosite oxidizes to black manganite, which has been observed along the western bank of Ace High Creek.

FILE: ...2011/Keg/Figures/Snap_Risby_rock.wor | DATE: MAY 2012

Most exploration programs conducted within Snap Zone have focussed on **Arseno Showing,** which is defined by recessive and rusty weathering, fracture-controlled, sulphide-bearing, quartz-carbonate veins hosted within strongly altered granite. The alteration and mineralization are well developed, trend southeasterly across the ridge and have been traced for about 1000 m along strike. On the northwest side of the ridge the showing comprises extensive sulphide-bearing quartz veins within talus and small rubbly outcrops of altered granite. The southeast side of the showing is largely grass covered and poorly exposed. There appears to be a vertical sulphide zonation within Arseno Showing, with arsenopyrite and pyrite being dominant in sheeted quartz veins near the top of the ridge and increasing sphalerite and galena contents in sheeted vein float downslope towards Ace High Creek. The best results from historical and 2011 sampling within Arseno Showing are listed in Table IX.

Dyke Showing lies 500 m northeast of Arseno Showing. It is characterized by silicified and brecciated quartz-feldspar porphyry dykes that occupy a steeply dipping fault zone within granite. The dykes are cut by a later east-trending fault (Blanchflower, 1999). Dark grey, fracture-controlled, fine grained sulphide mineralization is hosted within the silicified and brecciated dyke and granite. Highlight results from 1999 and 2011 sampling are listed in Table X.

Table X – Significant Dyke Showing Rock Sample Results

Bubble Showing is located 2000 m northeast along the ridge crest from Arseno Showing. Granitic rocks in this area were cut by rusty weathering, aphanitic to fine grained quartz-feldspar porphyry dykes, which were subsequently brecciated and silicified (Blanchflower, 1999). Quartz-chalcedony stockwork veins and breccia matrix host very fine grained galena, sphalerite, pyrite and arsenopyrite. The showing was named for the many vugs and miarolitic cavities that are present within the dykes. The best results from 1999 and 2011 sampling at this showing are listed in Table XI.

Table XI – Significant Bubble Showing Rock Sample Results

Creek Showing is located 2500 m northeast of Arseno Showing, on the east side of the ridge. It comprises gossanous, intensely brecciated and limonite-altered granite exposed within a deeply incised creek. The creek follows a southeasterly trending, three to five metre wide, argillically-altered shear zone (Blanchflower, 1998). This shear zone is cut at regular intervals by a series of cross-cutting vertical shear structures that trend at 167°. The intersection points of the structures are marked by four to seven metre long, intensely limonitic and/or hematitic breccia zones. Local, narrow fracture-filling veins with pyrite and galena have been found at the core of the southeasterly trending shear structure. The best results from this showing are listed in Table XII.

Table XII – Significant Creek Showing Rock Sample Results

1998	0.5 m chip, 5 cm thick massive Gn-Py vein in altered granite	127.0	NR	NR	0.016

Note: Qz – quartz, Gn – galena, Py – pyrite, NR – not reported

Krist Showing lies on the northwest side of the ridge and comprises several small areas of fracture-controlled quartz-calcite-galena-sphalerite-arsenopyrite stockwork veins hosted by weakly to moderately argillized granite (Blanchflower, 1998). The main mineralized stockwork is the most northeasterly of the mineralized areas. It is three to ten metres wide and trends at 058°, parallel to a nearby creek. The stockwork is cut by vertical, north-trending shear structures spaced 0.5 to 2 m apart. These cross-cutting structures host quartz-calcite veins with local galena, sphalerite, pyrite and arsenopyrite (Blanchflower, 1998). Krist Showing has been sampled by previous operators, but it has never been the primary focus of exploration in the area nor been tested systematically. This showing was not sampled in 2011. Table XIII lists highlight results from this showing (the 1998 samples could not be plotted on Figure 26 due to a lack of reference points on the historical map; however they appear to have been collected in the vicinity of the 1988 sample).

Table XIII – Significant Krist Showing Rock Sample Results

1998	1.0 m chip sample, Gn-Sp-As-Qz-Ca vein in limonitic + silicified shear zone with 15 cm wide Gn-Sp vein core	112.0	NR	NR	0.01

Note: Qz – quartz, Ca – calcite, Gn – galena, Sp – sphalerite, As – arsenopyrite, Py – pyrite, NR – not reported

Risby Zone was discovered by P. Risby in 1999. It comprises several quartz-sulphide vein structures that cut fractured and limonitic granite. Two main mineralized, silicified structural trends were observed: 1) sub-parallel to Ace High Creek – east-northeasterly trending (050° to 070°) and moderately dipping (-45° to -60° northward); and 2) within recessive weathering, young fault zones orthogonal to Ace High Creek – southerly trending (160° to 180°) and steeply dipping. Vertical zonation of mineralization similar to that observed at Arseno Zone was also seen at Risby Zone. The distribution of mineralization varies from very fine to fine grained, wispy colourations at the core or along the selvages of the quartz±carbonate veins at higher elevations to fracture infillings and disseminations with wider sheeted veins at lower elevations. Table XIV lists the best results from 1999 and 2011 sampling.

Table XIV – Significant Risby Showing Rock Sample Results

Four samples collected from Risby Zone in 2011 averaged 3322 ppm tungsten (between 52.7 and 9970 ppm). The highest tungsten value was obtained from the same sample that yielded 767 g/t silver and 8.82 g/t gold.

Risby Northeast Showing was discovered and sampled in 1988 by Doron Explorations, which found silver-bearing quartz veins in granite float and subcrop in close proximity to a schist contact. Better silver values were recorded in manganese-poor veins than in samples with higher manganese values (Robertson and Wallis, 1990). This showing was not resampled in 2011. The most significant 1988 sample results are listed in Table XV.

Table XV – Significant Risby Northeast Showing Rock Sample Results

1988	Grab, Qz-sulphide vein	374	0.43	0.04	0.027

SOIL GEOCHEMISTRY

Numerous soil sampling surveys were completed within the area covered by the current Keg property by various operators prior to 2000. In 2010, Strategic Metals collected 3874 grid and contour soil samples to confirm the tenor and extent of historical anomalies and to identify new targets. In 2011, Silver Range took an additional 20,210 grid and contour soil samples to follow-up and to expand anomalies identified in 2010 and to test ground that was acquired after the 2010 field season. Soil sampling completed by all operators, including Silver Range, was limited in many areas by thick overburden, poor soil development and pervasive permafrost. Vegetated, north-facing slopes are typically the most affected by permafrost.

All 2011 soil sample locations were recorded using hand-held GPS units. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. Soil samples were collected from 10 to 50 cm deep holes using hand-held auger. They were placed into individually pre-numbered Kraft paper bags.

The soil samples were sent to ALS Minerals in Whitehorse and North Vancouver, where they were dried, screened to -180 microns, dissolved in aqua regia solution and analyzed for 51 elements inductively coupled plasma combined with mass spectroscopy or atomic emission spectroscopy (ME-MS41). Soil samples were further analysed for gold by aqua regia digestion followed by inductively coupled mass spectrometry (Au-TL43).

Soil samples locations are shown on Figures 27 to 37, while results for silver, gold, zinc, lead, copper, tin, tungsten, bismuth, antimony and molybdenum are plotted on Figures 38 to 47, respectively. Certificates of Analysis are given in Appendix III. Anomalous thresholds and peak values for soil samples are listed in Table XVI.

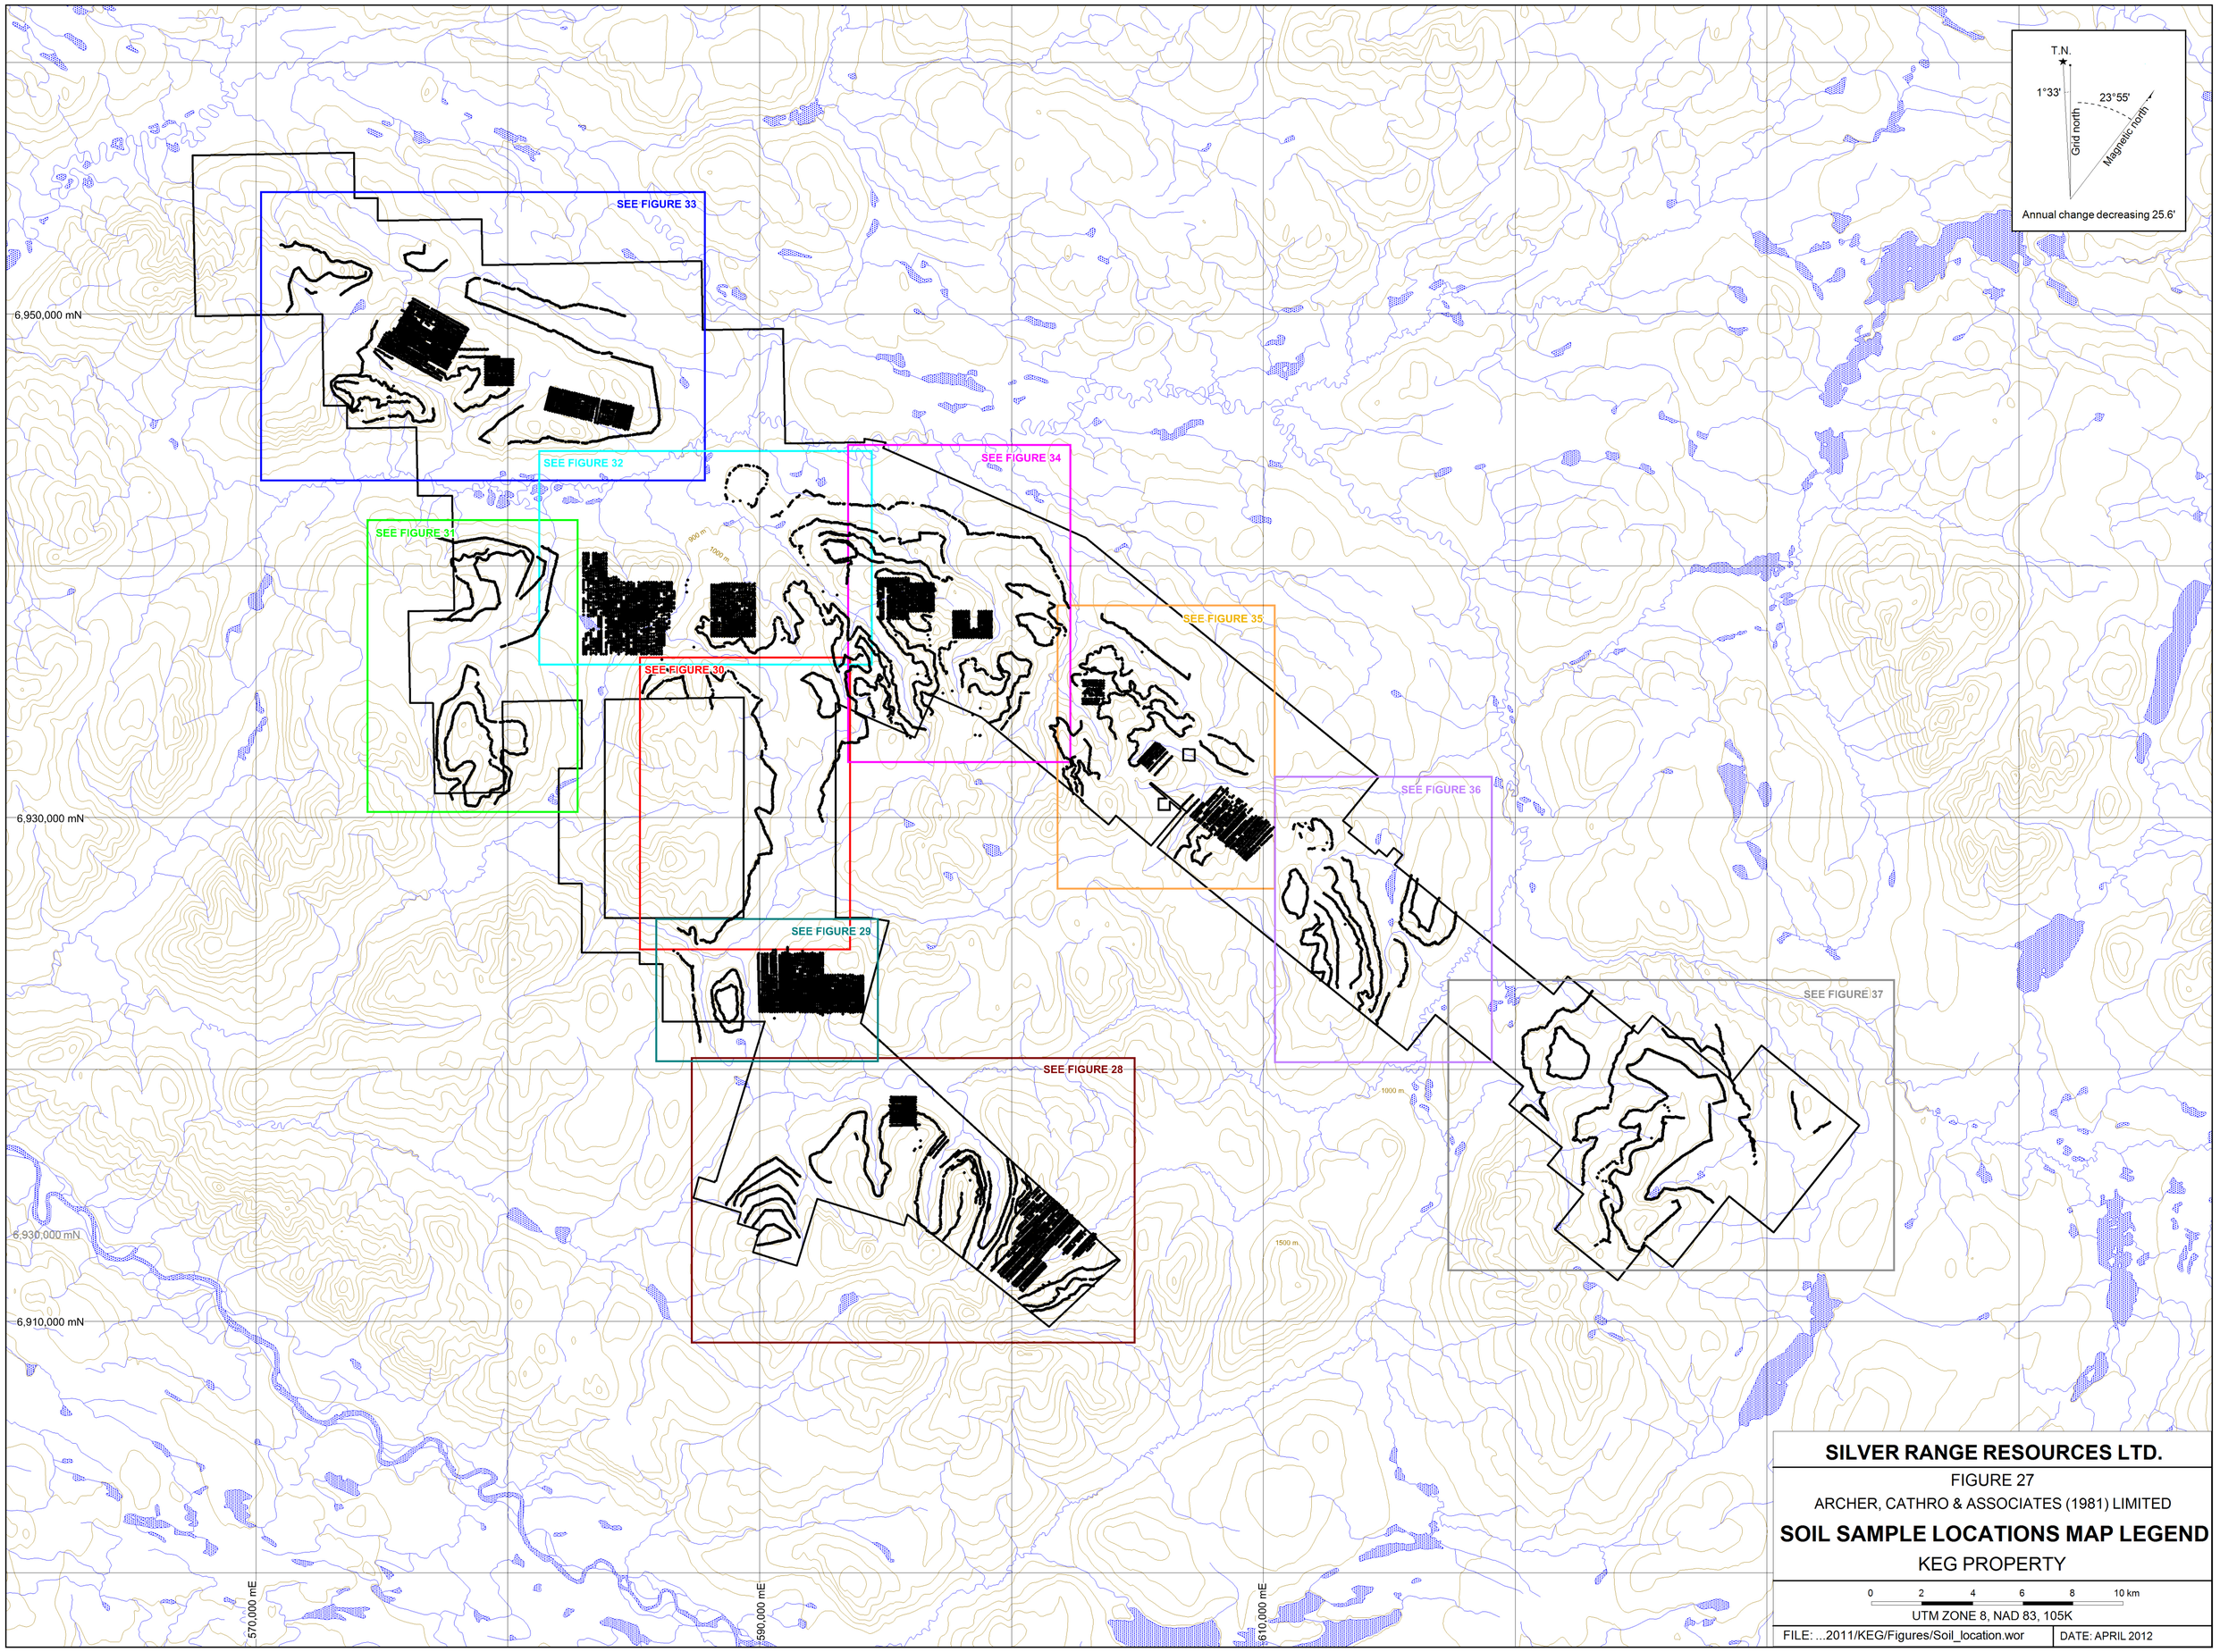

Table XVI – Geochemical Data for Soil Samples

Element	Anomalous Thresholds				
	Weak	**Moderate**	**Strong**	**Very Strong**	**Peak**
Silver (ppm)	≥ 1 < 2	≥ 2 < 5	≥ 5 < 10	≥ 10	3920

Lead (ppm)	≥ 100 < 200	≥ 200 < 500	≥ 500 < 1000	≥ 1000	13600
Copper (ppm)	≥ 50 < 100	≥ 100 < 200	≥ 200 < 500	≥ 500	4760
Tin (ppm)	≥ 5 < 10	≥ 10 < 20	≥ 20 < 50	≥ 50	660
Tungsten (ppm)	≥ 2 < 5	≥ 5 < 10	≥ 10 < 20	≥ 20	160
Bismuth (ppm)	≥ 2 < 5	≥ 5 < 10	≥ 10 < 20	≥ 20	787
Antimony (ppm)	≥ 10 < 20	≥ 20 < 50	≥ 50 < 100	≥ 100	3220
Molybdenum (ppm)	≥ 5 < 10	≥ 10 < 20	≥ 20 < 50	≥ 50	239

Sixteen primary clusters of coincident, moderately to very strongly anomalous silver-gold-zinc-lead-copper-tin values have been recognized across the property. They are known as Keg Main, Keg East, Keg South, Owl, Zeno, RGS, Drex, Archimedes, Euclid, Marks, Ku, Rebel, Hammer, Cirque, Snap and Risby Anomalies. All of the primary anomalies are associated with known mineralization. Eighteen secondary anomalies (I to XVIII) have also been identified, but not prospected.

Keg South, RGS, Archimedes, Euclid, Ku and Hammer anomalies and most of the secondary anomalies were discovered by Silver Range in 2011, while the others were identified by previous operators. Only Keg Main, Keg East, Owl, Drex, Rebel and Snap anomalies have been partially drill tested.

As with the mineralized zones and showings, all of the soil anomalies (except XVIII) lie within the Tay and Mount Mye belts. The sizes of the primary anomalies; their locations relative to Keg Main Anomaly; distributions of weak, moderate, strong and very strong values for silver-gold-lead-zinc-copper-tin; and accessory elements are listed in Table XVII.

* Bold indicates a high proportion of very strong values present within the anomaly.

Soil anomalies that are particularly high grade or exhibit significant metal zonation are described in more detail in the following paragraphs.

Keg Anomaly (Keg Main and Keg East)

Keg Main Anomaly is defined by the most intense concentration of very strongly elevated values within Tay Belt, while Keg East Anomaly is a smaller, slightly weaker extension of it. Collectively, they comprise the five kilometre long Keg Anomaly, which exhibits a slight metal zonation from west to east. Tungsten is concentrated to the west of Keg Anomaly. It transitions into copper within the western and central parts of the anomaly. Bismuth and antimony are largely restricted to the centre, while silver, lead, zinc, tin and arsenic are most abundant in the

east and central parts. Molybdenum forms a halo around the highest silver values and is strongest in the Keg East Anomaly. No samples collected within the anomaly have been tested for gold.

RGS Anomaly

RGS Anomaly appears to be zoned from north to south, though this zonation may be exaggerated due to differential sample densities – the northern part of the anomaly was grid sampled, while only three contour lines tested the southern half. Silver, copper, antimony, molybdenum, arsenic and antimony are elevated throughout the anomaly. Lead, zinc, tungsten and bismuth seem to be restricted to the northern half, while gold is stronger in the south.

Marks Anomaly

Elevated lead, zinc, antimony and molybdenum values are present across Marks Anomaly, while silver, tin, tungsten, antimony, bismuth and arsenic are generally restricted to the northwest half. Scattered, elevated gold and copper values lie at the centre of the anomaly. The highest grade gold (319 ppb) and tungsten (160 ppm) values on the property were obtained from this anomaly.

Ku Anomaly

Ku Anomaly is defined by two contour lines with coincident, elevated values for most elements of interest. Like Keg Main Anomaly, its distinguishing feature is an area of weak to very strong tungsten geochemical response that lies immediately to the southwest.

Hammer Anomaly

Although Hammer Anomaly is relatively small compared to many of the other primary anomalies on the property, it is by far the highest grade for silver (peak of 3920 ppm) and second highest grade for gold (peak of 304 ppb).

Snap Anomaly

Snap Anomaly is the most extensive and significant multi-element anomaly in Mount Mye Belt. Anomalous silver, lead, zinc, tin and arsenic are prevalent throughout the anomaly, while elevated gold, tungsten and molybdenum are largely restricted to its southern half. Strong bismuth values were only obtained in the northern half of the anomaly and copper was subdued throughout it.

Secondary Anomalies

The 18 secondary anomalies vary in extent and intensity, and are considered to be important targets for 2012 exploration. None of these anomalies has been prospected. The sizes of the secondary anomalies; their locations compared to Keg Main Anomaly; relative distributions of weak, moderate, strong and very strong values for silver-gold-lead-zinc-copper-tin; and accessory elements are listed in Table XVIII.

Table XVIII– Secondary Soil Anomalies

Anomaly	Size (m)	Location Relative to Keg Main (km)	Elements (ppm)				
			Weak	Moderate	Strong	Very Strong	Accessory
I	700 linear	19 NW	Cu, Sn	Au, Pb	Ag		**Sb**, As
II	900 linear	17 NW	Au	Cu, Sn	Ag, Pb, Zn		**Sb**, As
III	3000 x 1000	12 NW		Au	Pb	Ag, Cu, Zn, Sn	Sb, Mo, As
IV	1200 x 600	12 NW	Sn	Pb	Ag, Au, **Cu**	Zn	Bi, Sb, Mo, As
V	600 x 250	10 NW		Ag, Au, Pb	**Cu**, Zn, Sn		Sb, Mo, As
VI	750 x 500 open	7.5 NW		Au, Cu	Zn	**Ag**, Pb, Sn	**Sb**, **As**
VII	1650 x 1650	3 SE	Pb, Sn		Cu, Zn	Ag, Au, Zn	Bi, Sb, Mo
VIII	800 x 700	5.5 ESE	Au		Ag, Cu		Sb, As
IX	1500 x 600	12 SE	Pb	Cu	Ag	Au, Zn, Sn	Sb, **Mo**, As
X	1200 x 400	13 ESE		Ag		Au	Mo
XI	800 linear	14 ESE	Au, Pb	Cu	Ag, Zn		Mo
XII	600 linear	20 ESE	Cu		Ag, Au, Sn		
XIII	1250 x 900	21 SE		Cu		**Ag**, Au, **Pb**, Zn	**Bi**, **Sb**, Mo, **As**
XIV	3300 x 1200	30 SE	Au	Cu	Ag	Pb	Mo, As
XV	3200 x 950	45 SE	Zn	Ag	Au, Cu, Pb		Sb, Mo, As
XVI	1300 x 350	2.5 SW	Ag, Zn	Cu		Au	As
XVII	3700 x 3300	11 SW	Sn	Au	Cu		W
XVIII	750 x 600	18 SSE	Au, Cu, Sn			Ag, Pb	Sb

Reconnaissance-scale sampling identified several isolated, strong, single-sample anomalies in widely separated parts of the property. Clusters of weakly to moderately anomalous values for one element of interest are also scattered across the property.

HISTORICAL STREAM SEDIMENT GEOCHEMISTRY

Stream sediment samples were collected in various parts of the current Keg property by various historical operators in 1967, 1970, 1975 and 1983. The Geological Survey of Canada (GSC) completed reconnaissance-scale stream sediment surveys in 1988 on map sheets 105K west and 105L (Friske and Hornbrook, 1989) and in 1989 on map sheet 105K east (Friske et al., 1990). Samples from 105K east were reanalyzed in 2010 (Jackaman, 2011).

Although most stream sediment samples on the property returned fairly subdued values for all elements of interest, scattered, strongly elevated values for gold (up to 2445.7 ppb), silver (up to 2.2 ppm), zinc (up to 1712 ppm), lead (up to 107 ppm), copper (up to 399 ppm) and tin (18 ppm) were identified. All of these peak values are located in the vicinity of known occurrences or soil geochemical anomalies. The very high gold value, which was obtained from a creek draining the east side of the ridge where the Ku Zone is located, is particularly noteworthy.

DIAMOND DRILLING

HISTORICAL DIAMOND DRILLING

Between 1966 and 1999, a total of 41 drill holes were completed on ground covered by the current Keg property; of these, 10 were at Keg Zone, 16 at Rebel Zone, 3 north of Hammer Zone, 9 at Snap Zone, 2 south of Snap Zone and one was drilled about three kilometres to the northwest of Keg Zone. Grades and widths obtained from drilling at Keg Zone were considered to be disappointing because the target was massive strataform mineralization like that at the nearby Anvil District deposits. Wide intercepts of fracture-style mineralization and occasional skarn horizons were cut within Keg Zone but grade continuity was not established due to intermittent sampling of the drill core. Results from the drilling at Rebel Zone were generally subdued but some well mineralized intervals were cut in the northern part of the drill area. Although drilling intersected a number of mineralized veins at Snap Zone (Arseno Showing), it did not cut the precious metal rich, arsenopyrite- and galena-bearing sheeted vein mineralization that was observed at surface. Due to the poor quality and/or lack of reference points on most historical maps, only holes in the Snap Zone and north of the Hammer Zones are plotted (Figure 11). Drill hole data are listed in Table XIX.

NR – not reported

Results from all historical holes are discussed in the following paragraphs.

Keg Zone

66-V-1 to 66–V-4

In 1966, four holes totalling 464.5 m were drilled immediately east and north of Keg East Zone. No thick sections of massive sulphides were intersected and, therefore, none of the core was analyzed (Adamson, 1966b). The presence of minor disseminated, blebby and banded pyrite and pyrrhotite and rare galena, sphalerite and chalcopyrite was noted in most intervals in all holes. Several bands up to 12 cm thick of semi-massive to massive sulphides were intersected. The host rock comprises locally limey or siliceous, light grey to greenish black argillite with lesser quartzite.

D-74-1 to D-74-3

D-74-1 to D-74-3 lie at the heart of Keg Main Zone. The host rocks in all three holes primarily comprise light to dark grey, locally greenish siliceous rocks (argillite, chert and quartzite?) with interbedded light to dark green skarn horizons, which consist of diopside and other unspecified calc-silicate minerals (Jilson, 1974). Calcite commonly occurs within coarse blebs, veins and crackle breccias, while thin intervals of marble and shear-hosted serpentinite are rare.

D-74-1 bottoms in a thick horizon of limestone and limey argillite. Sulphide minerals comprise pyrrhotite with lesser sphalerite and minor chalcopyrite, galena and arsenopyrite. These minerals occur as disseminations, fine to coarse blebs, fracture coatings, cement in crackle breccias and rarely as bands. Bleaching of the host units is common adjacent to fractures and in association with sulphides. The core, which was sampled intermittently, yielded sporadic, elevated zinc values with rare silver, lead and copper support. The best interval returned 0.37% copper, 1.38% lead, 1.08% zinc and 168 g/t silver over 3.0 m.

D-74-2 generally cut the same mineralization types as D-74-1 (Jilson, 1974), but mineralization is far more abundant in this hole. Fracturing of the host rocks is intense and appears to be the dominant control of both calc-silicate alteration and mineralization. Mineralization is more strongly associated with calc-silicate alteration than with the siliceous units. The hole was continuously sampled between 2.4 and 51.5 m, from which point on it was sampled intermittently. The top portion yielded a weighted average of 34.3 g/t silver, 1.25% zinc, 0.47% lead and 0.14% copper over 49.1 m. Below this, several scattered anomalous zinc values with rare copper, lead and silver support were encountered.

D-74-3 also comprises the same mineralogy as the previous two holes. Bleaching of the host rocks is fracture controlled and increases in intensity with depth. The top half of the hole was not sampled; however, a 14.0 m long interval in the bottom half of the hole (between 47.5 and 59.7 m) averaged 1.66% zinc with subdued copper, lead and silver values (Jilson, 1974).

466-75-4 to 466-75-6

In 1975, three holes were drilled to follow up along strike and down-dip of the mineralization discovered in the 1974 holes. These holes also lie within Keg Main Zone. Less extensive, but locally higher grade mineralization was intersected in 1975. Most mineralization comprises heavy disseminations of pyrrhotite and brown sphalerite with minor chalcopyrite in fine grained quartzite and calc-silicate rocks, which are interlayered with barren quartzite and recrystallized and bleached chert (Jilson, 1975). 466-75-4 and -5 were sampled intermittently. 466-75-4 yielded 1.24% zinc over 11.6 m, including 5.48% zinc over 1.1 m, while 466-74-5 returned 0.82% zinc over 24.1 m. Copper and lead values in both holes were subdued. 466-75-6 was drilled to test coincident EM, IP, magnetic and copper-lead-zinc geochemical anomalies. It intersected unmineralized cherty argillite and grit, which both host minor pyrrhotite and sheared graphitic rocks. This hole was not sampled.

78-NA-04

In 1978, 78-NA-04 tested coincident gravity and IP anomalies, which are located three kilometres northwest of Keg Main Zone. It intersected unmineralized, fine to coarse grained greywacke with local chert and graphitic bands (Simpson, 1978a). The greywacke exhibits various textures, including well bedded, massive and brecciated.

Rebel Zone

67-1 to -3

No record of these drill holes, other than references in later assessment reports, could be found. They were reportedly drilled to test EM, gravity and geochemical anomalies that are situated immediately west of Rebel Anomaly. All holes intersected Marmot Formation metavolcanics. Traces of fracture-hosted galena and sphalerite were noted in 67-2, while the others were barren (Carne, 1991).

K-72-4 to -7

K-72-4, -5 and -6 tested geochemical, magnetic-electromagnetic and electromagnetic-gravity anomalies, respectively. K-72-4 and-6 lie within Rebel Anomaly and K-72-5 is located one kilometre west of that anomaly. All of these holes cut locally brecciated Marmot Formation metavolcanics and underlying Rabbitkettle Formation metasediments (Jilson, 1972). The metavolcanics are locally listwaenitized. K-72-4 intersected minor pyrrhotite, sphalerite, chalcopyrite, galena and pyrite in fractures and as disseminations. K-72-5 and-6 were barren. No samples were analyzed from any of these holes.

K-72-7 was drilled within Rebel Anomaly, to test the soil anomaly at depth. It intersected altered and brecciated Marmot Formation metavolcanics with disseminated to fracture-filling sphalerite, pyrite, galena, pyrrhotite and tetrahedrite. The best continuous interval yielded a weighted average of 2.28% zinc, 0.10% copper and 0.10% lead over 69.0 m, including 6.60% zinc, 0.29% copper, 0.41% lead, 36.4 g/t silver and 0.17 g/t gold over 3.0 m (Jilson, 1972).

K-73-8 to -10

K-73-8 tested an electromagnetic anomaly that appears to coincide with the southwest corner of Rebel Anomaly. It intersected brecciated Marmot Formation with minor chalcopyrite, pyrrhotite and sphalerite in fractures and veins. The best interval returned 2.25% zinc over 3.0 m (Carne, 1991).

K-73-9 was drilled 150 m to the east of K-72-7 in order to extend the known mineralized zone. It cut altered Marmot Formation with minor disseminated and fracture-filling sphalerite, pyrrhotite, chalcopyrite and pyrite throughout. An 18.3 m interval yielded a weighted average of 2.2% zinc (Carne, 1991).

K-73-10 was also designed to extend the mineralized zone. It was drilled about 170 m to the southwest of K-72-7. It intersected brecciated Marmot Formation with weak disseminated and fracture-filling sphalerite and galena, but was not sampled (Jilson, 1973).

KD-78-1 to -4

KD-78-1 to -4 were drilled to test geophysical anomalies within Rebel Anomaly, to the south and west of the previous holes (Spence, 1979). None of the drill core was analyzed.

KD-78-1 tested a strong, broad EM conductor. It intersected interbanded volcanics and sediments including some strongly graphitic rocks. Minor pyrite was the only sulphide mineral encountered within the hole.

KD-78-2 tested coincident strong EM conductors. It cut similar rocks and mineralization to those in KD-78-1.

KD-78-3 tested a strong, broad horizontal loop anomaly. It cut interbedded volcanics and graphitic sediments, both of which contained minor pyrite.

KD-78-4 tested strong EM conductors. It cut volcanics interlayered with graphitic sediments. Minor vein hosted galena was observed.

78-NA-03

78-NA-03 was drilled at the east edge of XVIII Anomaly to test elevated soil values and a coincident EM anomaly. It intersected non-calcareous, locally chloritic phyllite with rare diorite porphyry dykes. Minor pyrrhotite and sphalerite were reported, but no samples were analyzed (Simpson, 1978b).

80-NAR-1

80-NAR-1 tested a widely spaced, linear geochemical anomaly within the west half of XVIII Anomaly. It cut chlorite±muscovite±biotite phyllite (Hall, 1980). The phyllite is commonly calcareous and is locally interbedded with tuff. Rare marble was observed. No core was analyzed.

North of Hammer Zone

K-70-1 was drilled to test a coincident lead-zinc soil anomaly that reportedly lies on the floor of a broad, U-shaped valley, approximately 1500 m northeast of Hammer Zone. The hole only cut glacially-derived boulders and clay (Turnbull and Simpson, 1970). The thickness of the overburden indicated that the soil anomaly was transported and further drilling was directed towards nearby geophysical anomalies.

K-70-2 was drilled in the same area to test a moderate residual gravity anomaly with coincident, weak IP response. The hole intersected 22.6 m of overburden, then cut grey-green-purple phyllitic quartzite and phyllite and a 7.6 m thick mafic diorite dyke or sill, before bottoming in altered granite. Zones of weakly disseminated pyrite and pyrrhotite were observed, but significant base metal mineralization was absent.

K-70-3 was drilled between the other two holes and was designed to intersect a possible fault zone that offset areas of variable soil geochemistry and geophysical response. After drilling through 89.6 m of overburden, the hole cut green-purple phyllite and phyllitic schist. Between 152.4 and 213.3 m, thin laminations of pyrite and pyrrhotite were present along foliation planes. No significant base metal mineralization was observed.

Snap Zone

Drilling at Arseno Showing was conducted to evaluate coincident soil geochemical and geophysical (chargeability) anomalies that had been identified in an area of little to no bedrock exposure on the southeast side of the ridge (Blanchflower, 1999). Widespread, fracture-controlled, weak to locally strong quartz-pyrite (± sphalerite and lesser galena, chalcopyrite, arsenopyrite and/or pyrrhotite) sheeted veins and local sulphide-bearing breccias were identified within argillically-altered granite over a 1200 m strike length. The silver and gold values were lower than expected, based on prior surface rock geochemical sampling. None of the arsenopyrite- and galena-rich quartz sulphide vein stockworks and semi-massive mineralization observed in float within Snap Zone were intersected by diamond drilling. The most significant intervals of quartz-sulphide vein mineralization were intersected by drill holes 99-04 and 99-05, which reportedly returned values of 52.3 g/t silver and 0.21 g/t gold over 3.0 m and 26.8 g/t silver and 1.50 g/t gold over 7.0 m, respectively (Blanchflower, 1999). The drilling did not intersect sufficient sulphide mineralization or other geological evidence to explain the high chargeability anomaly.

South of Snap Zone

77VZ-1 and -2 were drilled 1000 m south and 800 m southwest of Arseno Showing, respectively. They were designed to test coincident magnetic and electromagnetic anomalies within schist. 77VZ-1 did not successfully explain the anomalies, while the results from 77VZ-2 suggest that the anomalies are due to high carbon content and associated disseminated pyrite (up to 4%) within schist between 26.5 and 84.1 m.

2010 AND 2011 DIAMOND DRILLING

General

In 2010, a total of 958.27 m of diamond drilling was completed in four holes within Keg Main Zone to confirm the nature and extent of mineralization intersected in historical drill holes and to establish grade continuity over long intervals.

In 2011, a 51 hole diamond drill program was completed on the Keg property to further delineate Keg Main Zone and to test the Keg East, Owl, Drex, Rebel and Snap zones at depth. A total of 16,808.37 m of diamond drilling was completed.

The first hole was collared on June 6, 2011 and the final hole was completed on October 1. The work was contracted to Top Rank Diamond Drilling Ltd. of Ste. Rose du Lac, Manitoba. The work was done with two heli-portable Multi-Power Discovery II drills using NQ2 equipment (Keg Main Zone) and two heli-portable diesel-powered JKS-300 drills using NTW and BTW equipment (Keg East, Keg West, Owl, Drex, Rebel and Snap zones). The drills were set up on platforms of 8”x 8” timbers covered with 2”x 8” planks, which were built on sites dug by hand or, occasionally, by John Deere 450 excavator into the hillside within Keg Main Zone. Although the drills were primarily moved by helicopter, a few moves within Keg Main Zone were completed using the excavator. Drill crews working on Keg Main Zone primarily did crew changes using an all-terrain vehicle, while drill crews working in the other zones were

transported by helicopter. Three drill crews were based at the Keg camp, while the fourth stayed in Faro.

Drill collar locations for Keg Main, Keg East, Owl, Drex, Rebel and Snap zones are plotted on Figures 48 to 53, respectively. Cross-sections showing 2010 and 2011 drill holes are illustrated on Figures 54 to 82. Certificates of Analyses for 2011 samples are provided in Appendix III, and Geological and Geotechnical Logs are given in Appendix IX.

The collar locations were marked with drill rods cemented in place, to which metal tags listing the hole number were secured. Survey control was established by differential GPS and chain and compass measurements.

The holes were mostly sampled top to bottom. Core was transported by helicopter from the drill sites to Keg camp. Recovery was measured and geological and geotechnical logging was performed. Drill core from all holes was split with one-half bagged and sent for analysis and the other half returned to the core box. Two blanks, two standard samples and one duplicate sample were randomly included in every batch of 36 core samples. From there, the bagged samples were transported by helicopter and truck to the Archer Cathro lot in Whitehorse, Yukon, escorted by a representative of Archer Cathro. All core is stored on the property.

Analytical work was done by ALS Minerals with sample preparation in Whitehorse and assays and geochemical analyses in North Vancouver. The samples were dried, fine crushed to better than 70% passing -2mm and then a 250 g split was pulverized to better than 85% passing 75 micron. All samples were analyzed for 51 elements by aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy or atomic emission spectroscopy (ME-MS41) and tin using pressed pellet XRF (Sn-XRF05). Samples that exceeded upper detection limits were assayed for silver, zinc, lead and/or copper by Ag/Zn/Pb/Cu-OG46. All standard, blank and duplicate samples passed QA/QC reviews.

From the beginning of the program until late July, the core samples were analyzed for gold by aqua regia and mass spectroscopy (Au-TL44). During the QA/QC review, there were difficulties reproducing gold values from standard samples analyzed by this technique. These difficulties, combined with more severe problems encountered using the Au-TL44 technique on other projects with higher gold contents (conducted by another company managed by Archer Cathro) lead Silver Range to change techniques. For the remainder of the program, the core samples were analyzed for gold by fire assay followed by atomic absorption (Au-AA24). All standard, blank and duplicate samples passed QA/QC reviews.

Key data concerning the 2010 and 2011 drill holes are listed in Table XX.

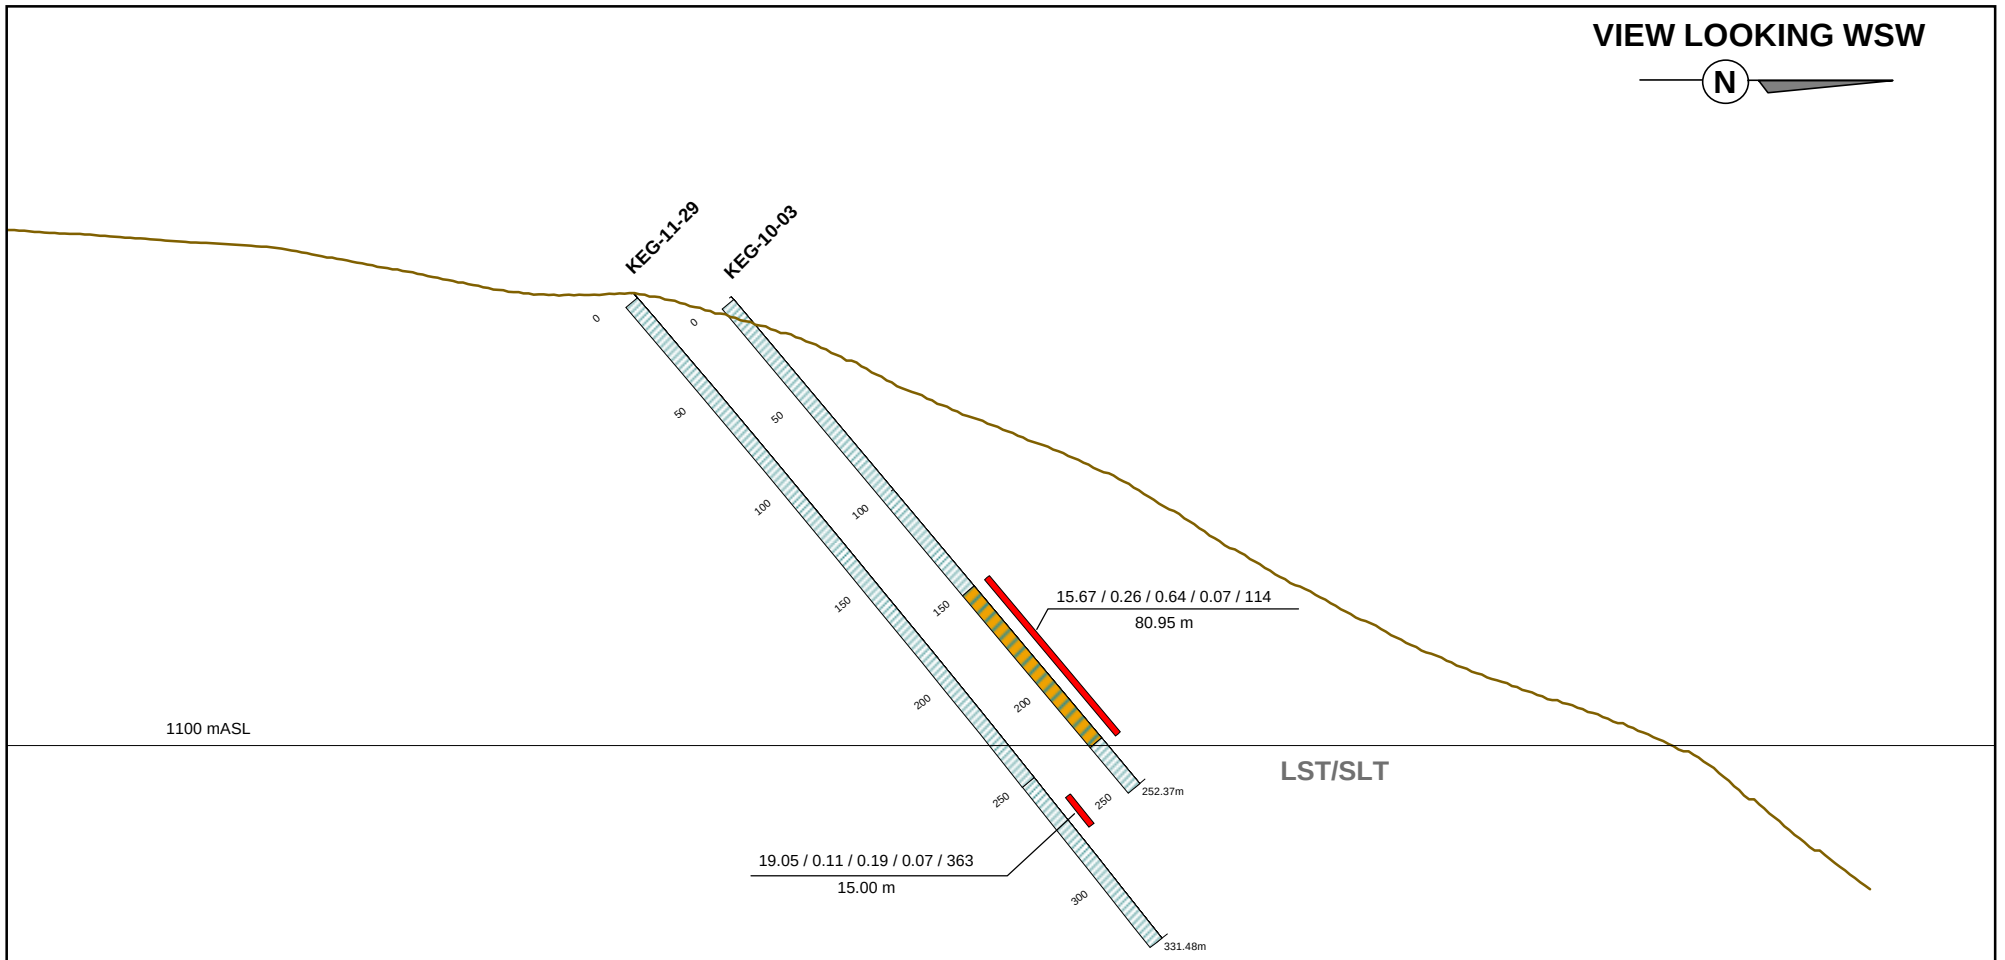
Keg Main and Keg East Zones

Keg Main Zone



In 2011, 29 holes were drilled northward at moderate angles in the vicinity of the Keg Main Zone 2010 drill holes. Most of these holes were drilled at 100 m centres on an 800 m long grid in the area of strongest silver-in-soil values within Keg Main Anomaly. Two holes (KEG-11-19 and -38) lie about 400 and 800 m north of the main drill grid and were drilled to test a coincident conductivity, chargeability and magnetic feature. One hole (KEG-11-35) is situated 500 m to the west of the main drill area and was designed to cut beneath a localized, very strong multi-element soil anomaly. Drill hole locations are plotted on Figure 48, while sections are illustrated on Figures 54 to 68. Three long sections through the main drill area are shown on Figures 69 to 71.

Almost all holes on the Keg Main Zone drill grid intersected broad intervals of silver-lead-zinc-copper-tin mineralization within strongly silicified and locally skarnified limestone and siltstone of Tay and Mount Christie Formations. These primary elements of interest are often supported by accessory elements, including indium, bismuth, molybdenum and tungsten. Table XXI lists the significant primary element intercepts from the 2010 and 2011 drill holes.

Table XXI – 2010 and 2011 Keg Main Zone Drill Highlights

* True widths are estimated to be between 74 and 97% of reported widths.

Relatively continuous mineralization has been traced across the full 800 m length of the drill grid, with approximate true widths of 50 to 250 m and vertical depths of 350 m. Mineralization is controlled by a combination of structure and stratigraphy. The structural control is typified by fracture-fillings and associated disseminations within the adjacent wallrocks, while the stratigraphic control is characterized by disseminations to semi-massive mineralization within calc-silicate altered, limey horizons. Sphalerite, chalcopyrite and galena occur in varying amounts with pyrrhotite, pyrite and arsenopyrite. The sulphide minerals are generally coarse grained. They typically comprise 1 to 10% of the rock, often increasing to between 20 and 50% over 100 cm intervals within skarnified horizons. The mineralized zones are notably calcium depleted relative to the adjacent host rocks.

The cross sections for main drill area in Keg Main Zone illustrate the relative dominance of structurally- versus stratigraphically-controlled mineralization. The stratigraphic component appears to be more significant than was initially thought after the 2010 drill program. The best grades are typically from areas where strong fracturing and reactive horizons coincide.

Holes KEG-11-19 and -38 were drilled to test an east-trending, coincident conductivity, magnetic and chargeability feature that lies to the north of Keg Main Zone. The holes were drilled in an area where the feature narrows, and as such, KEG-11-19 was collared too far north and missed it. Both holes intersected argillite, silicified laminated siltstone and lithic greywacke with minor, localized chlorite and sericite alteration. Variable amounts of graphite were observed in the sedimentary rocks near the top of hole KEG-11-38 (from the top to approximately 84 m). The rocks below the graphitic package (84 to 102 m) contain blebs of pyrrhotite and pyrite, which decrease to trace to minor disseminated pyrite and pyrrhotite throughout most of the remainder of the hole.

Hole KEG-11-35 was designed to test beneath a very strong silver-, lead-, zinc-, copper-, tungsten- and bismuth-in-soil anomaly. It cut siltstone with several interbedded, moderately calc-silicate and pyrrhotite altered limestone horizons in the bottom 60 m. Weakly mineralized

fractures like those observed within the main drill area are present throughout the hole. The dominant sulphide minerals in this hole are pyrite and pyrrhotite. Only one interval returned significant results, as shown in Table XXI. Although the hole was positioned to test below a very strong tungsten-in-soil anomaly, the tungsten values are mostly subdued (less than 2 ppm).

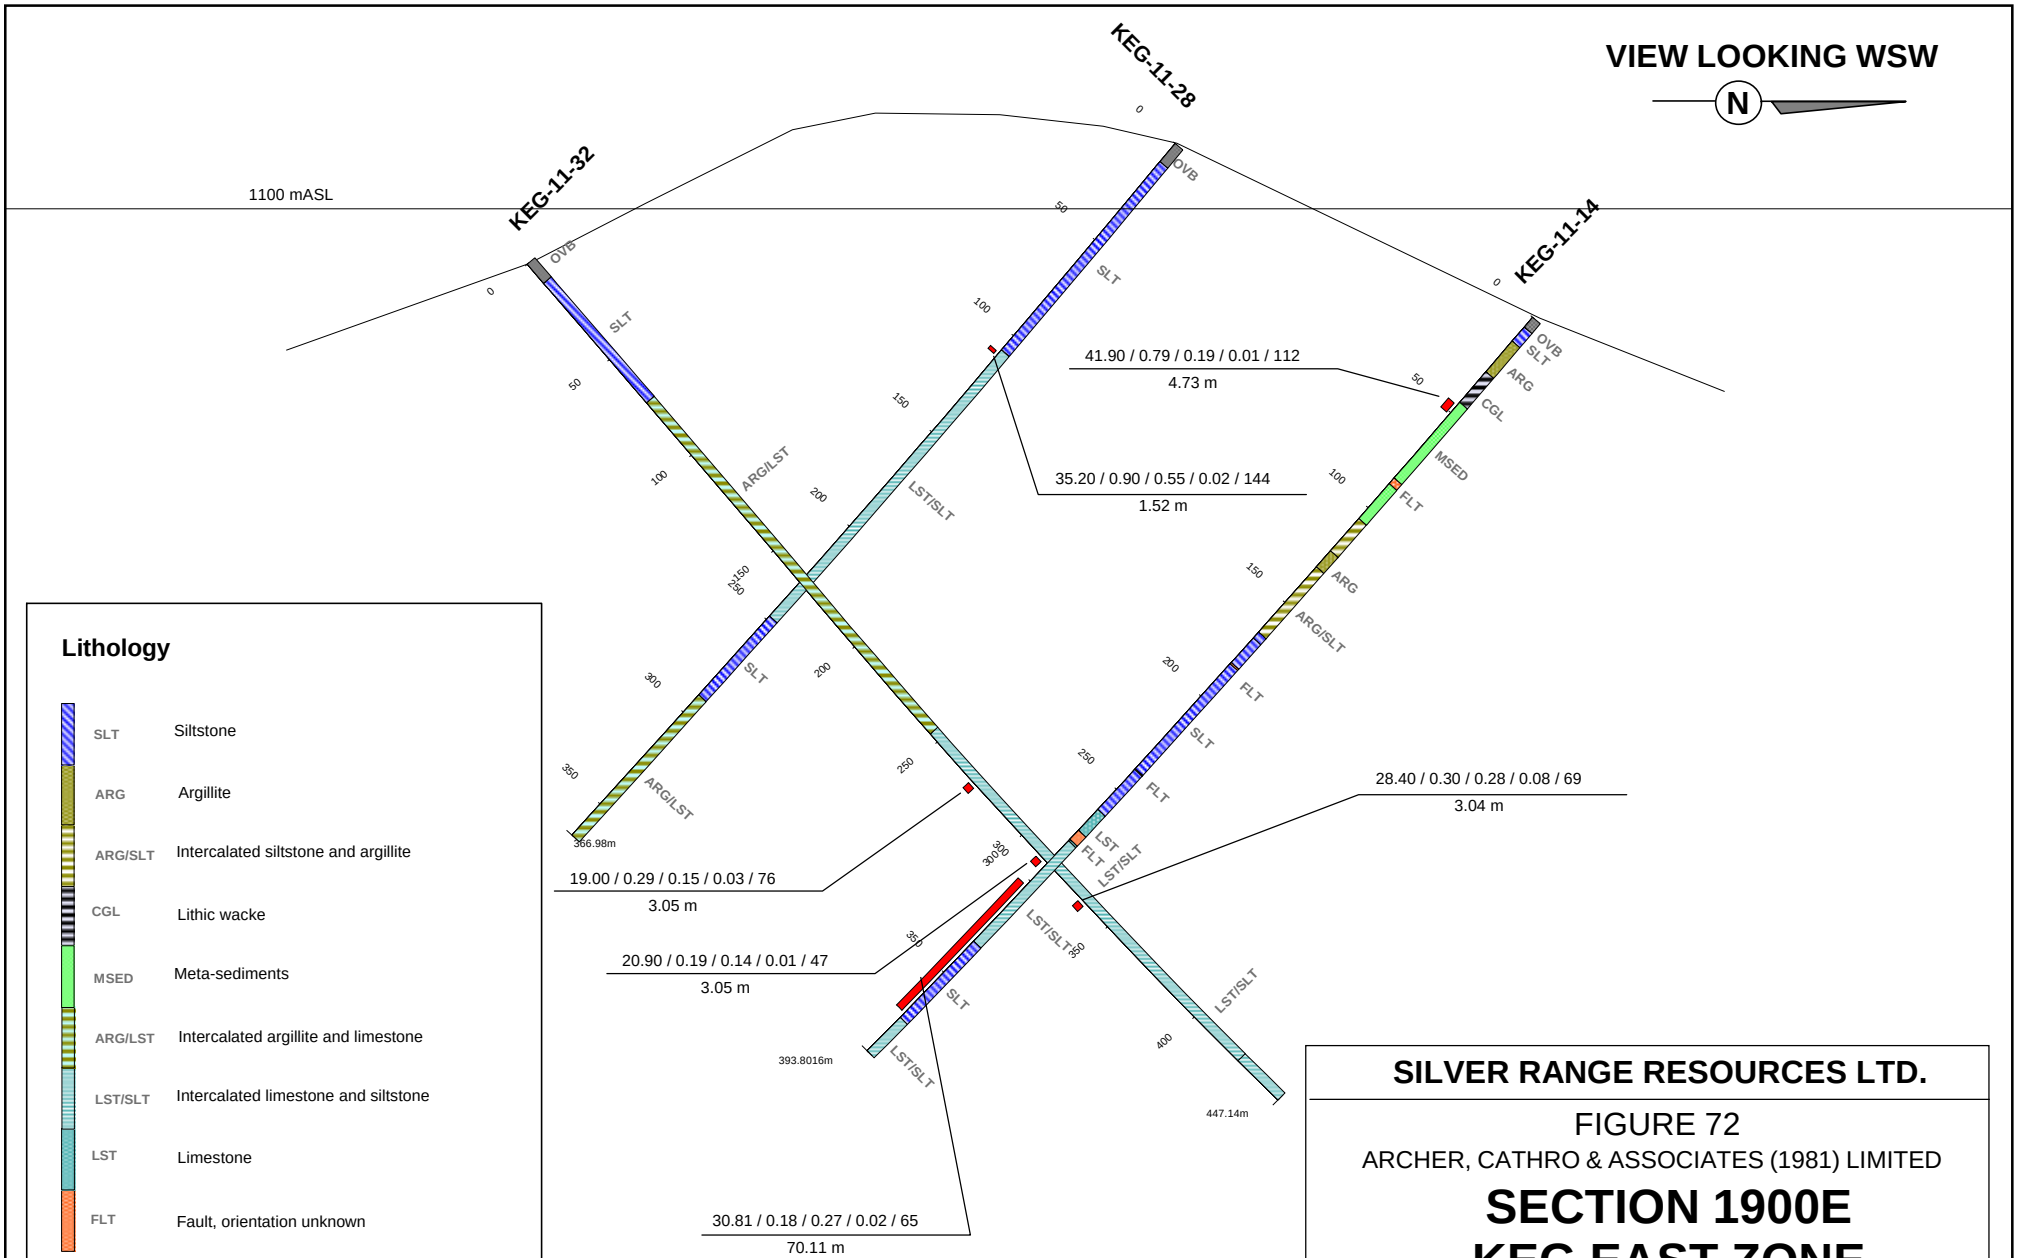
A metallurgical test program is currently being conducted on drill core from Keg Main Zone. The test is being performed by SGS Mineral Services, under the supervision of Melis Engineering Ltd. It is preliminary in nature and is aimed at quantifying the metallurgical response of mineralization in terms of payable metal recoveries.

Keg East Zone

Seven drill holes were completed at Keg East Zone. Hole locations are plotted on Figure 49 and sections are illustrated on Figures 72 and 73.

Mineralization at Keg East Zone is generally similar to that observed within Keg Main Zone and is likely part of the same mineralizing system. Several features, including the presence of calcite gangue, lower chalcopyrite contents, and very high ratios of silver to lead, suggest that Keg East Zone is in a more distal setting than Keg Main Zone. The best intervals from Keg East Zone are listed in Table XXII.

Table XXII – 2011 Keg East Zone Drill Highlights



Hole #	From (m)	To (m)	Length* (m)	Ag (g/t)	Pb (%)	Zn (%)	Cu (ppm)	Sn (ppm)

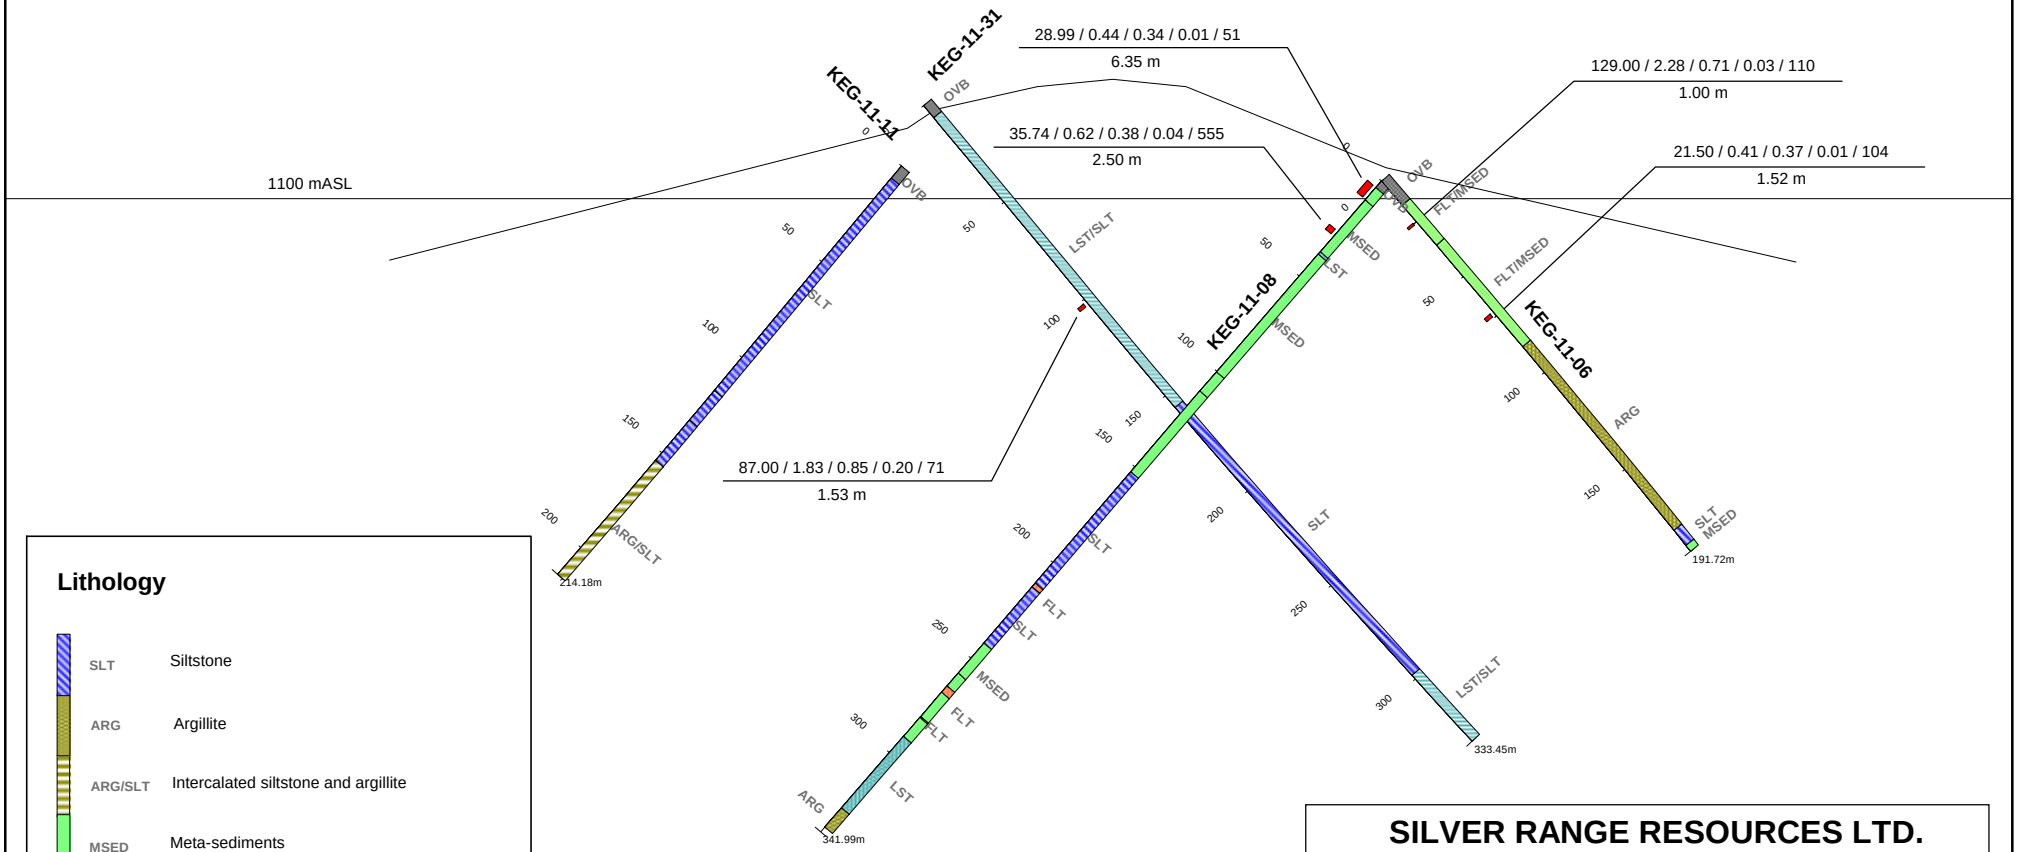
*True widths are unknown at this point.



Keg East Zone is depleted in accessory elements relative to Keg Main Zone, as shown in Table XXIII which lists the distribution of high grade intervals by element within both zones (dashed line indicates the presence of high grade interval(s) in each area).

** Keg Main East comprises section lines 940E and 1040E.

[+] Almost all high grade tungsten intervals are located deep in the holes.

Owl Zone

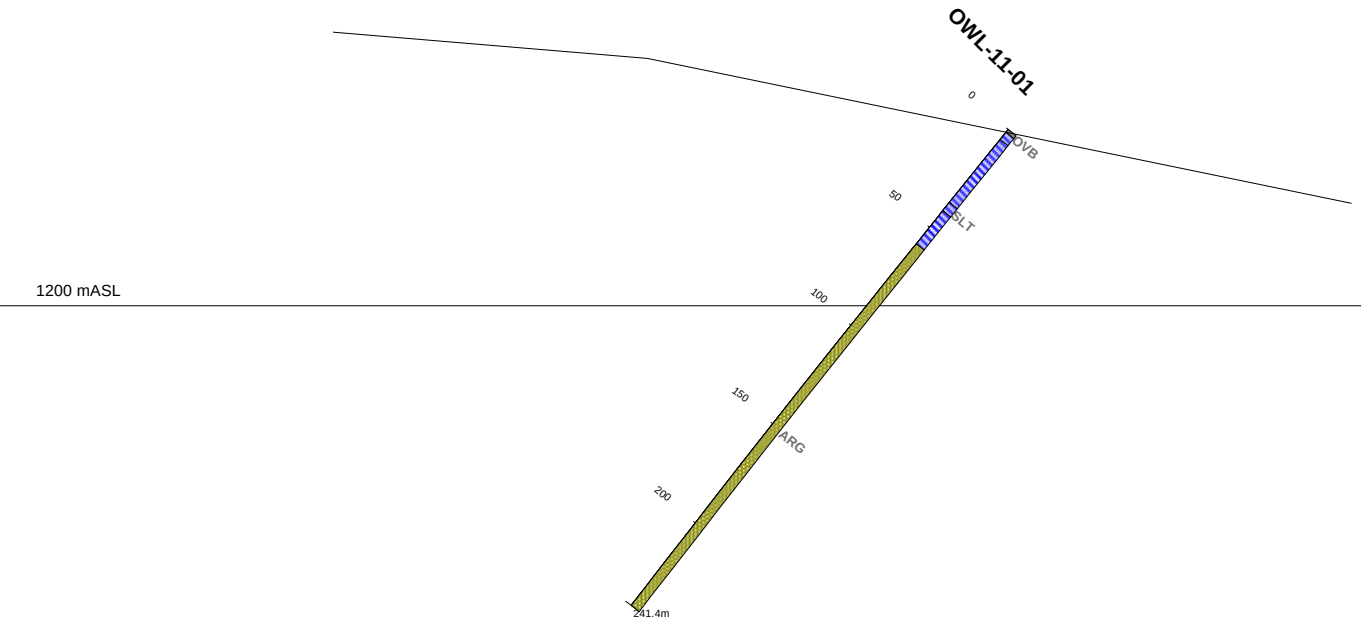
In 2011, four holes were drilled at Owl Zone to test mineralization hosted within rusty weathering, strongly silica altered rocks of Mount Christie and Tay formations. Mineralization within this alteration zone comprises pervasive, weakly disseminated sulphides and sporadic massive sulphide veins that cut perpendicular to the strike of bedding. The holes are plotted on Figure 50 and cross sections are shown on Figures 74 to 76. Figure 8 shows the location of the holes relative to geology and mineralization.

Holes OWL-11-01 and -02 were drilled on a mineralized talus slope near the base of the alteration zone. They intersected weakly disseminated pyrrhotite before passing into the underlying unaltered unit. Holes OWL-11-03 and -04 were drilled within the alteration zone and returned weakly mineralized intervals, the best of which are listed in Table XXIV.

Table XXIV – 2011 Owl Zone Drill Highlights

Hole #	From (m)	To (m)	Length* (m)	Ag (g/t)	Pb (%)	Zn (%)	Cu (ppm)	Sn (ppm)
OWL-11-03	65.44	93.57	28.13	11.77	0.21	0.23	0.02	106
OWL-11-04	7.65	9.75	2.10	37.53	0.67	1.71	0.04	172
	60.05	66.14	6.09	45.21	0.78	0.38	0.01	104
	146.92	151.49	4.57	14.70	0.34	0.14	0.02	152

*True widths are unknown at this point.



Drex Zone

Four holes were drilled within Drex Zone, but the first hole (DRX-11-01) was lost immediately. Holes DRX-11-01, -02 and -03 were collared from the same site. Holes DRX-11-02 and -03 were drilled southeast and east, while DRX-11-04 scissored back to the northwest. Drill hole locations are shown on Figure 51 and cross sections are illustrated on Figures 77 and 78. Hole locations are plotted with geology and mineralization on Figure 9.

Drex Zone appears to be structurally complex, with surface evidence of strong folding and faulting. All of the holes were collared on or near the hinge of an east to west oriented anticline, which coincides with strongest multi-element soil geochemistry in this area.

An unmapped, northeast-trending fault likely cuts the anticline at the tops of Holes DRX-11-02 and -3. Casing in these holes reached depths of 15.24 to 19.54 m and no material was recovered. The first intercept below the casing in hole DRX-11-02 was mineralized. An interpretation of combined surface and drill data indicates that both DRX-11-02 and -03 may have been collared in the prospective horizon.

Hole DRX-11-04 was also collared near the fold hinge, close to surface mineralization exposed within the prospective horizon. The strongest mineralization was intersected near the top of the hole. The best drill intercepts are listed in Table XXV.

Table XXV – 2011 Drex Zone Drill Highlights

Hole #	From (m)	To (m)	Length* (m)	Ag (g/t)	Pb (%)	Zn (%)	Cu (ppm)	Sn (ppm)
DRX-11-02	15.24	18.29	3.05	87.70	0.00	0.02	0.02	17
DRX-11-04	24.00	30.48	6.48	31.74	0.35	0.27	0.03	320
	94.95	95.85	0.90	64.20	0.82	0.66	0.06	581

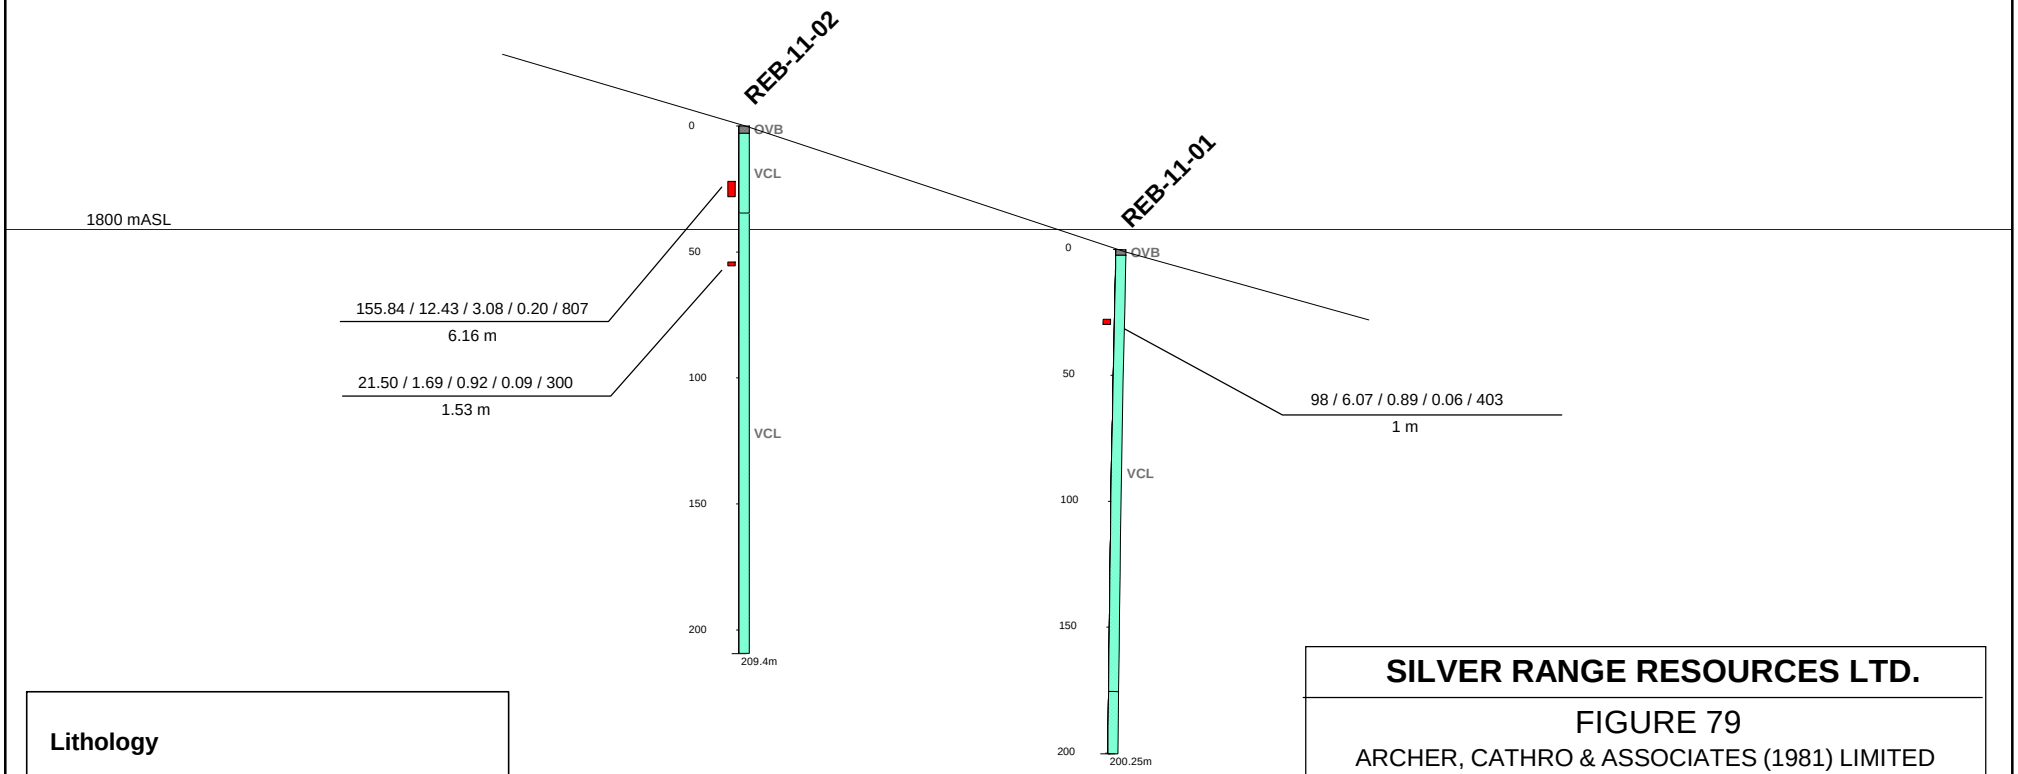
*True widths are unknown at this point.

Rebel Zone

In 2011, three vertical holes were drilled within Rebel Zone in the vicinity of historical hole K-72-7, which reportedly yielded a 69 m long interval of 2.28% zinc, 0.10% copper and 0.10% lead. The 2011 holes were designed to confirm the historical drill result and to test beneath the northern margin of an area with coincident mineralized float and anomalous soil geochemistry. Figure 52 shows hole locations, while cross sections are illustrated on Figures 79 and 80. Table XXVI lists the significant drill results from Rebel Zone.

Table XXVI – 2011 Rebel Zone Drill Highlights

Hole #	From (m)	To (m)	Length* (m)	Ag (g/t)	Pb (%)	Zn (%)	Cu (ppm)	Sn (ppm)
REB-11-01	27.78	28.78	1.00	98.00	6.07	0.89	0.06	403
REB-11-02	21.94	28.10	6.16	155.84	12.43	3.08	0.20	807
	53.95	55.47	1.53	21.50	1.69	0.92	0.09	300



*True widths are unknown at this point.

Only one hole, REB-11-02, intersected a thick section of mineralization. This hole was drilled at the contact between volcanic breccia (CSM2c) and an underlying carbonate-altered volcanic and volcaniclastic package (CSM2a). Mineralization in REB-11-02 comprises fracture-controlled galena and sphalerite mineralization in partially oxidized host rocks.

Based on detailed mapping of Rebel Zone, which was completed after diamond drilling, it appears that mineralization is only hosted in CSM2c (Figure 10). Holes REB-11-01 and -03 were drilled entirely within CSM2a, too low to test the prospective unit.

DATE: April 2012

The long mineralized interval obtained in K-72-7 was not reproduced; however, its location is very poorly constrained relative to the 2011 holes. The drill logs refer to K-72-7 host rocks as brecciated metavolcanics, which fit with the CSM2c lithological description. This suggests that the 2011 holes were drilled too far to the north.

Snap Zone

In 2011, three drill holes were completed across part of Arseno Showing. The holes were located on the ridge, to the northwest of most of the 1999 holes. The 2011 drill hole locations are plotted on Figure 53 and cross sections are illustrated on Figures 81 and 82.

The first two holes (SNP-11-01 and -02) were drilled on a section line from pads located 42 m apart. The third hole (SNP-11-03) was drilled from the same site as the second hole, rotated about 34° off-section to the north. All three holes cut sheeted fractures and veins that are surrounded by pervasively clay altered granite. The veins show both epithermal and mesothermal features suggesting that overlapping mineralizing events may have occurred. Table XXVII lists significant intervals from the holes.

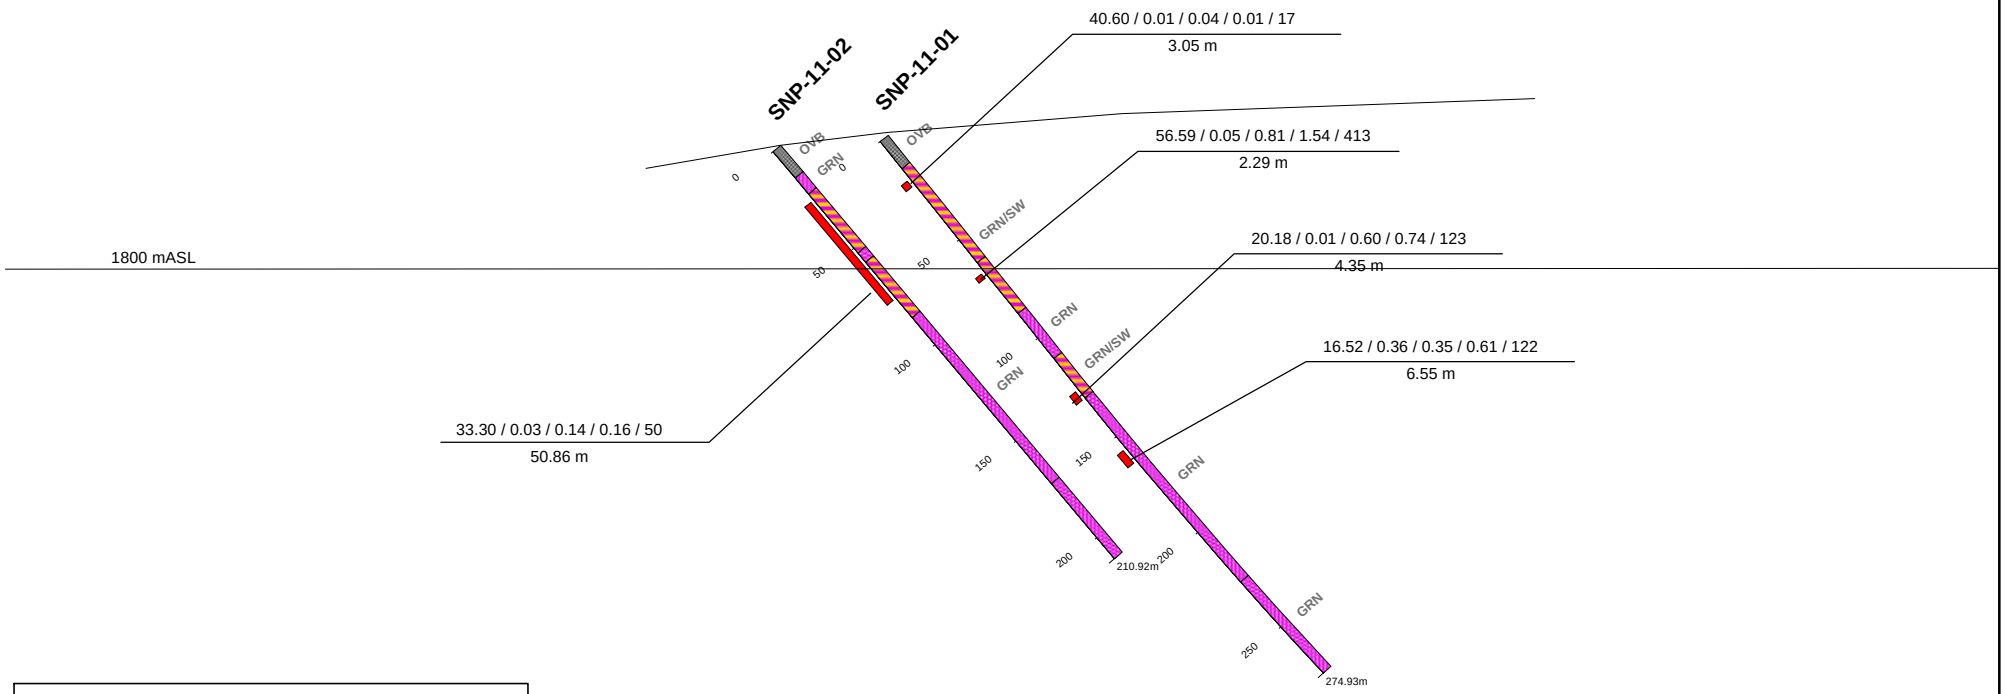
HISTORICAL TRENCHING

KEG ZONE



Bulldozer trenching was carried out within and to the south of Keg Main Anomaly by Northern Empire Mines Ltd. in 1967 and 1968 (Cathro, 1968) and by Northern Homestake Mines Ltd. in 1972 (Deklerk and Traynor, 2005). Most of the trenches have sloughed and bedrock exposure is now limited. The following descriptions are taken from the published data.

1967-1968 Bulldozer Trenching

In late 1967 and summer 1968, a D-6 bulldozer was used to strip and trench soil geochemical anomalies. A total of about 15,300 cubic metres of bedrock and frozen overburden was moved in nine trenches (Cathro, 1968).

DATE: April 2012

Bedrock consists of white to medium grey, thin bedded and strongly jointed chert with narrow bands of argillite and cherty argillite. The beds strike east and dip gently north. Widespread, weakly disseminated pyrrhotite, chalcopyrite and sphalerite and rare galena were reportedly encountered, but this material was not systematically sampled. Heavily disseminated to massive sulphide mineralization was found in two places, 1100 m north-northwest (Location 1) and 800 m north-northeast (Location 2) of Marijke Lake, respectively. It consists of a pyrrhotite-pyrite-sphalerite assemblage, with lesser amounts of chalcopyrite, galena and scheelite.

At Location 1, four grab samples collected in 1967 yielded between 6.2 and 11 g/t silver, 2.8 and 4.5% zinc, 0.04 and 0.18% copper and 0.34 and 0.68 g/t gold (no sampling or analytical techniques were provided). When exposed by further bulldozing in 1968, this showing proved to consist of a sulphide lens less than 15 m long and 3.0 m wide that averaged about 3.4 g/t silver, 1.25% zinc and 0.05% copper.

At Location 2, the upper 2.4 m of a massive pyrrhotite band was exposed. The bottom of the band was covered by overburden, thus its full width was not determined. This mineralization assayed 2.84% zinc, 0.01% lead, 0.37% copper with trace gold and silver across the exposed 2.4 m width.

Terrain difficulties and equipment limitations resulted in the trenches being positioned somewhat randomly relative to the geochemical highs (Cathro, 1968). This reduced the overall effectiveness of the program.

1972 Bulldozer Trenching

Northern Homestake Mines Ltd. conducted additional bulldozer trenching within the same area as the 1968 work (Deklerk and Traynor, 2005), but no report is available for this program.

CIRQUE ZONE

In the late 1980s Doron Explorations carried out hand, blast and mechanized trenching programs at Cirque Zone. The trenching was primarily directed at defining the trends, widths and grades of silver-rich veins that were identified in 1986 (Robertson and Wallis, 1989).

In 1987, Doron Explorations walked a D6 cat from Faro to the lower part of Cirque Zone. Fifteen trenches were excavated in this area, but the main part of the zone was too steep to be accessed by this machine. In early summer of 1988, Doron Explorations blasted and hand excavated 19 small trenches within the upper part of the zone. Many of these trenches failed to reach bedrock due to permafrost, talus slides and deep overburden. Later that summer, Doron Explorations walked a D8K bulldozer to the zone. The bulldozer completed 800 m of trenching in six trenches. It often had to be assisted by blasting to break up solid bedrock between and within the trenches. In early fall of 1988, Doron Explorations conducted an additional small blasting and hand trenching program (six trenches) within the zone prior to ending the program due to winter conditions. The exact locations of the historical trenches are unknown because the maps have too few reference points.
The best results from these trenching programs are listed in Table XXVIII.

Table XXVIII – Significant Cirque Zone Historical Trench Sample Results

Year	Type	Ag (g/t)	Pb (%)	Zn (%)	Au (g/t)
1987	Cat – 3 m chip	482	NR	0.10	0.068
1987	Cat – 2 m chip	932	NR	0.19	0.58
1987	Cat – 3 m chip	284	NR	0.15	0.27
1987	Cat – 2 m chip	1208	NR	0.15	0.14
1987	Cat – 1 m chip	926	NR	0.18	0.137
1987	Cat – 1 m chip	666	NR	0.52	0.617
1988	Hand/blast – 2.5 m chip	541	NR	NR	NR
1988	Hand/blast – 1.5 m chip	259	NR	NR	NR
1988	Hand/blast – grab	1050	NR	NR	NR
1988	Bulldozer – 0.3 m chip, vein	425	0.09	0.87	0.127
1988	Bulldozer – 0.7 m chip, 0.45 m vein at schist contact	3565	2.32	0.80	0.215
1988	Bulldozer – 0.5 m chip, 2 veins (0.10-0.15 m) in altered granite	550	0.25	0.34	0.740
1988	Bulldozer – 0.5 m chip, 0.2 m vein	589	0.57	0.54	0.615
1988	Bulldozer – 0.3 m chip, quartz vein with galena	3096	1.96	0.51	0.410

The remainder of the samples typically yielded less than 343 g/t silver (10 opt) or were narrower than 0.40 m.

Doron Explorations considered the trenching results to be generally disappointing compared to what it expected based on the abundance of mineralized float at surface (Robertson and Wallis, 1989). The veins were narrower and their density was lower than anticipated. It concluded that the vein size and abundance was exaggerated by downhill dispersion from the buried veins, which lie parallel to the slope of the cirque. The widths, grades, textures, mineralogy and orientations of individual veins were found to be quite variable over short distances.

GEOCHEMICAL AND MINERALOGICAL INVESTIGATIONS

A detailed geochemical and mineralogical study of select 2010 core samples from Keg Main Zone (Keg-10-01, -02 and -04) was carried out at the University of British Columbia in 2010 and early 2011 (Brand, 2011). The following points are regarded as the most noteworthy conclusions from this study:

1) Pyrrhotite, sphalerite and galena correlate well with each other, while pyrite does not. The pyrite appears to have mostly formed during contact metamorphism rather than during a mineralizing event.
2) Although silver correlates better with pyrrhotite and sphalerite than with galena, mineralogical studies show that it is mainly hosted in galena. Minor silver phases include acanthite and possibly rare silver-telluride sulfosalts.

3) Tin is moderately correlated with copper and weakly with sulphur. Stannite (Cu_2FeSnS_4) is widely present and was observed in some polished sections replacing cassiterite (SnO_2).
4) Indium is very strongly correlated with sphalerite and pyrrhotite, and moderately with galena. Mineralogical studies show that it is hosted in sphalerite and stannite.

In early 2012, Silver Range contracted Archer Cathro to complete a petrographic study on several samples collected from the Keg property. The following description is summarized from the petrographic report, which is provided in Appendix V.

The fine grained nature of the rocks underlying the Keg property has made mineral identification in hand samples difficult, both within and around alteration zones. A suite of 94 samples were collected from Keg Main Zone drill core and from outcrops within the Keg Main, Owl, Zeno, Drex and Rebel zones for petrographic analysis in an attempt to further understand the nature of the host rocks and the alteration events. The study was conducted at the University of British Columbia using a microscope with both reflected and refractive light capabilities.

The petrographic analyses outline some key features of both altered and unaltered rocks in the vicinity of the mineralized showings. The author of the petrographic report considered the following five observations to be the most significant.

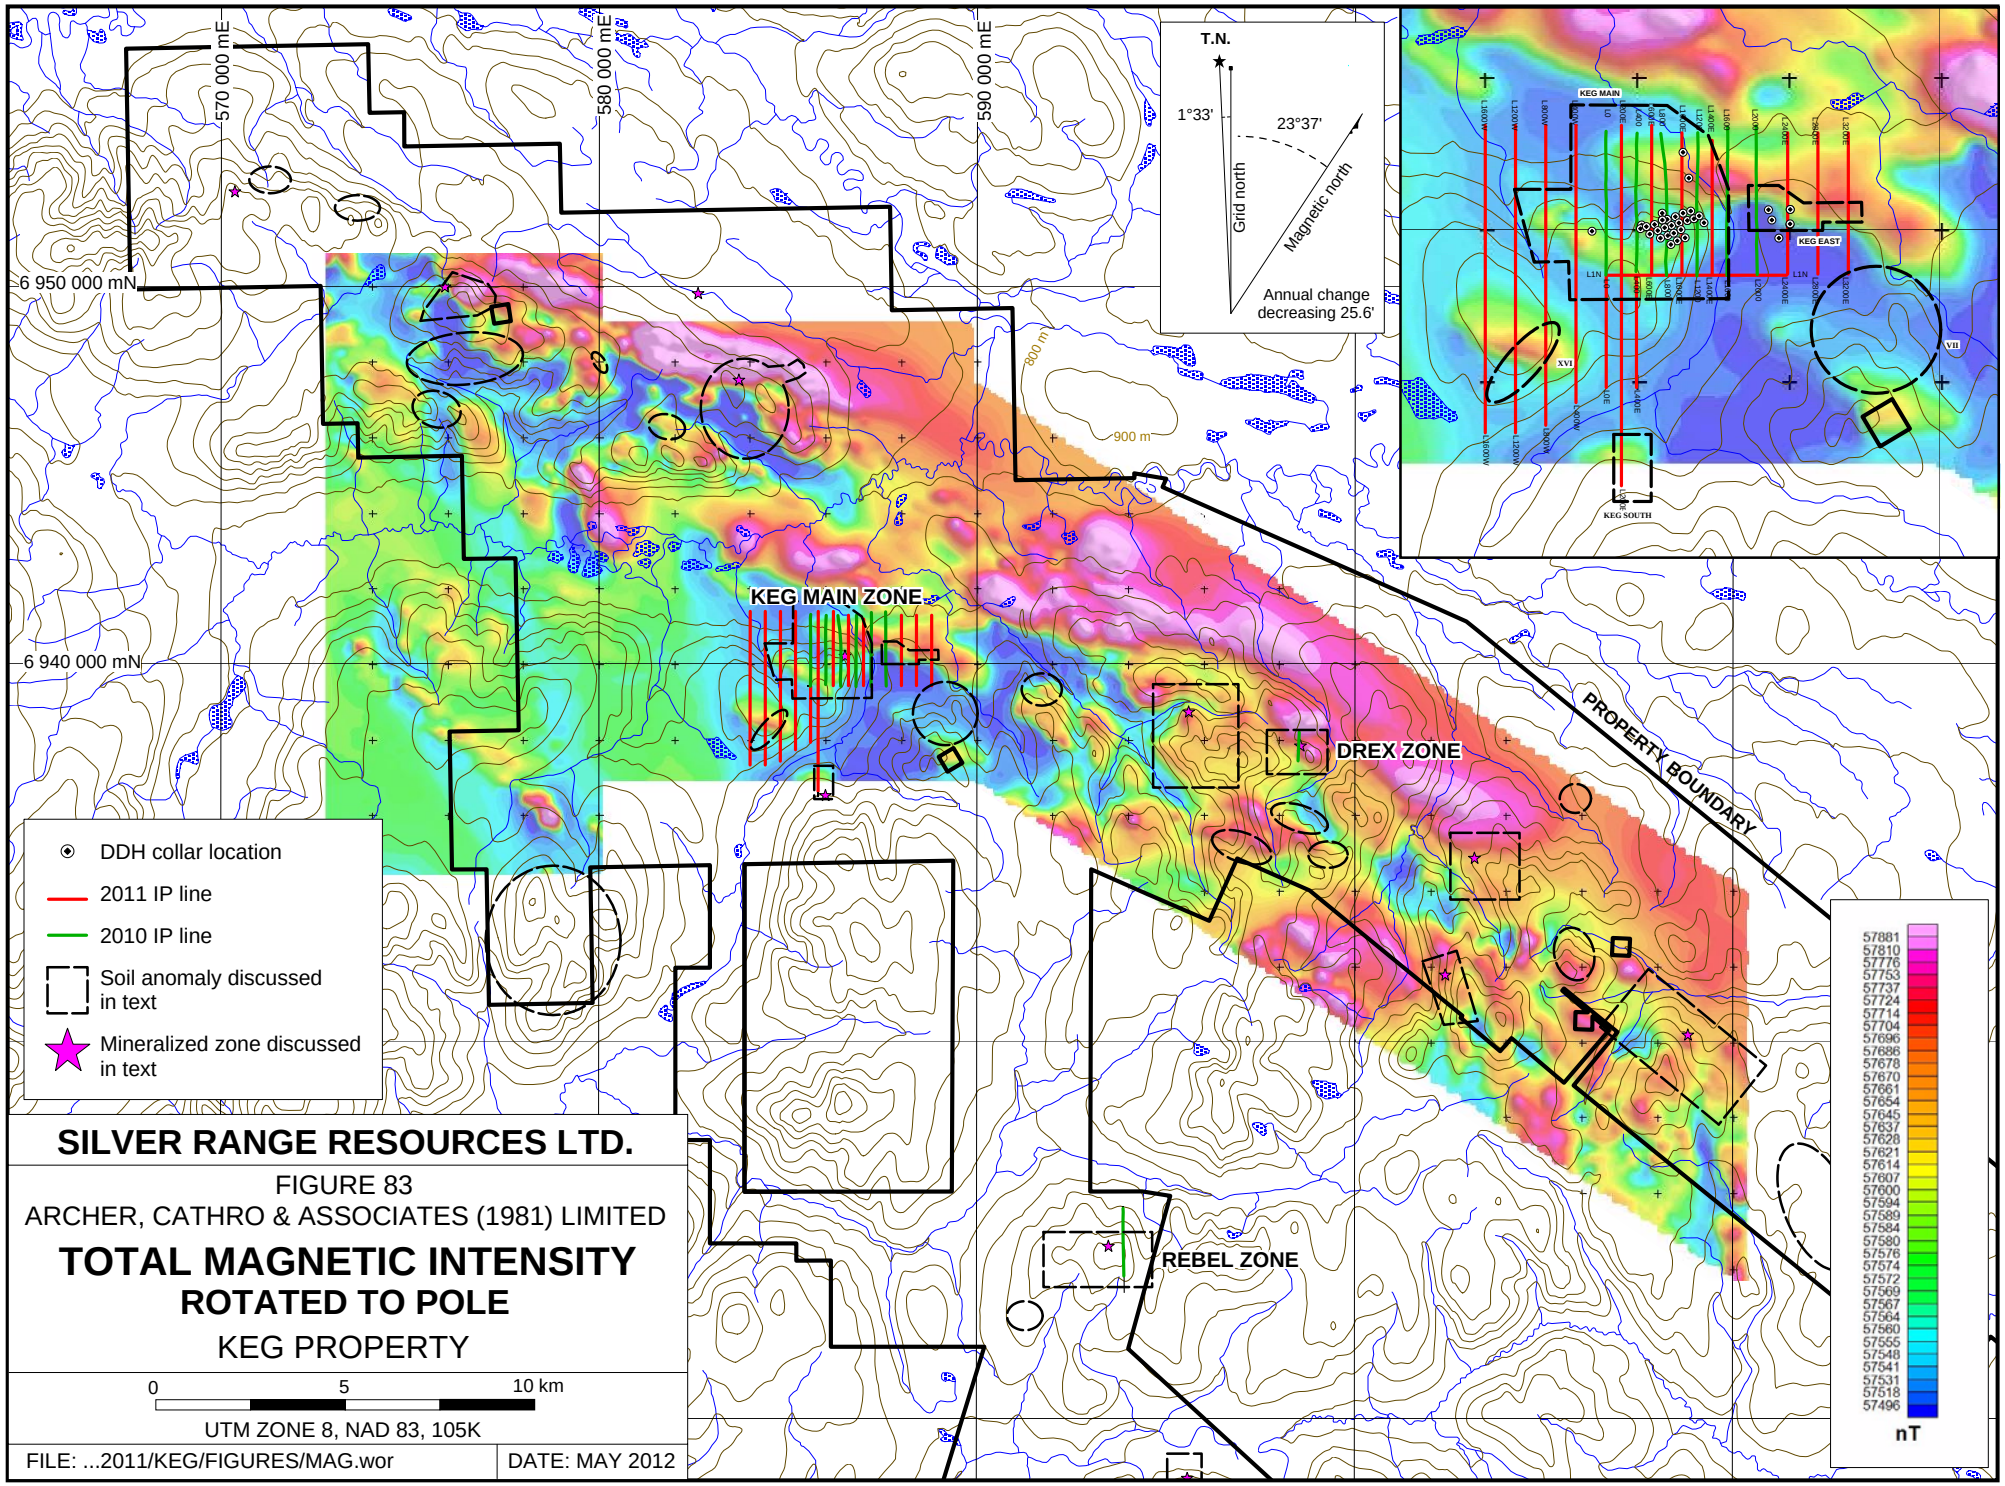
1) Three dominant host rock lithologies were recognized in thin section: 1) chert and quartz dominated sandstone (CPMC and MT at Keg Main); 2) mudstone with varying amounts of very fine grained quartz grains (MT); and 3) calcareous siltstone (MT);
2) Quartz-sericite-carbonate alteration affects most samples to some degree, with the exception of a few quartz sandstone samples that are almost completely unaltered. This alteration was observed in samples from all locations;
3) At the Keg Main, Owl and Drex zones, diaspore-pyrite±quartz±pyrophyllite±chalcopyrite overprints the quartz-sericite-carbonate alteration. This mineral assemblage occurs in vein and fracture-fill, as selvages and as pervasive alteration. It is manifested as a bleached zone in all three areas (see appropriate geology maps for alteration zone distribution);
4) More complex alteration mineral assemblages occur in some samples from Drex Zone and Keg Main Zone drill core. This alteration assemblage includes abundant andalusite, diaspore, calcite and pyrite, with varying amounts of staurolite, cordierite, chalcedony, corundum, tourmaline, sphalerite, galena and chalcopyrite; and
5) Chloritoid minerals occur as selvages to quartz-pyrite-andalusite and diaspore-pyrite± arsenopyrite veins and as disseminations in many samples that occur distally to the Keg Main alteration zone (ie. Keg East, Drex and Owl zones). The chloritoid minerals always grow over ductile foliations.

GEOPHYSICAL SURVEYS

Between 1966 and 1999, several airborne and ground geophysical surveys (electromagnetic (EM), magnetic, induced polarization (IP) and gravity) were completed within the bounds of the current Keg property. In 2010, Strategic Metals' commissioned Geotech Ltd. of Aurora, Ontario

to fly a 2288 line-km helicopter-borne Z-axis Tipper Electromagnetic (ZTEM) and magnetic survey over most of the current Keg property and Aurora Geosciences of Whitehorse, Yukon to perform 14.95 line-km of ground IP surveying at Keg Main, Rebel and Drex zones. In 2011, Aurora completed an additional 34.8 line-km of ground IP surveying at the Keg Main Zone on behalf of Silver Range. Only the 2010 and 2011 geophysical data is included in this report, for the following reasons:

1) The methodologies, equipment types and locations of many of the historical surveys are poorly documented.
2) The 2010 ZTEM and magnetic survey encompassed the historical survey areas and tied them together using uniform surveying techniques.
3) Where historical and modern surveys of the same type overlapped, the results are comparable.
4) The historical data is not available in digital form and, therefore, cannot be efficiently reprocessed.
5) Many of the old surveys were flown using fixed wing aircraft at high elevations, whereas the 2010 survey was flown with a GPS guided, helicopter-borne system that has greater sensitivity and accuracy.



Condor Consulting, Inc. was commissioned to carry out processing and analysis of the 2010 and 2011 data. Condor's detailed interpretation of the 2010 geophysical data is provided in Appendix VI and its preliminary interpretation of the 2011 IP data is given in Appendix VII. Figures 83 and 84 show the magnetic and electromagnetic data compiled with mineralized zones, soil anomalies, diamond drill holes and IP grid lines. Results from both years are briefly summarized in the following paragraphs.

The magnetic response is diverse but generally reflects the regional, northwest-oriented geological and structural trends. Discrete magnetic highs are locally coincident with electromagnetic features in the vicinity of known mineralization (Keg, Drex and Marks zones). Condor does not consider the magnetic data to be a useful tool for directly targeting mineralization; however, because it highlights structural and lithological features it can be used to identify favourable mineralization traps.

The ZTEM data also shows a variety of responses, which also typically conform to the northwest regional fabric. Numerous northwest-trending axial highs and areas of low response are present on the property. The axial highs appear to fall into three categories:

1) Highs that are interior to a mapped geological unit and appear to be conformable to the geology;
2) Highs that define the boundaries of mapped units; and
3) Highs that appear to cross-cut mapped units.

The first category of highs likely represents parts of the stratigraphy that are more conductive. The second category may be due to fault contacts between rock types of different conductivities. The third type of highs are thought to represent later stage faults that cross-cuts the general

northwest-oriented lithological and structural trends. These definitions are not absolute and some of the highs show characteristics of more than one category.

The lows are interpreted as more resistive areas within the mapped units. These lows may represent hydrothermal silicification of the host rocks, as seen at Keg Main and RGS zones. A large part of Rabbitkettle Formation in the western part of the survey area is quite resistive, as are significant parts of Mount Christie Formation.

Distinct, discrete conductive features are also present within the survey area and may represent specific geological features such as folds (Keg Zone), thrust plates (Drex Zone) and blind intrusions (Drex and Marks zones).

Condor deemed the most significant IP-resistivity features within Keg Main Zone to be a coincident conductivity and chargeability feature that coincides with mineralization in the west half of the Keg Main Zone drill grid and a coincident conductivity and chargeability feature that lies 500 m north of Keg Main Zone, which was drilled and appears to be due to graphite. Based on the current interpretation, the first of these features appears to continue for at least 500 m southwest of the drill grid, after which is either terminates or plunges to a depth beyond the detection limits of the survey. Although other, more localized parts of the mineralized system are also conductive and chargeable, Condor cautions that they are more likely due to different lithologies than by mineralization.

A largely untested feature defined by high chargeability and coincident moderate conductivity lies to the south and directly below the Keg Main Zone drill grid. This feature locally coincides with mineralized drill intervals.

Condor does not think any of the IP-resistivity results from Drex and Rebel zones are worthy of follow-up.

BASELINE WATER QUALITY/HYDROLOGY SURVEYS

An ongoing baseline water quality survey is being conducted at the Keg property on behalf of Silver Range. J. Gibson Environmental Consulting of Whitehorse, Yukon visited the property in August 2010, October 2010, March 2011, June 2011, September 2011 and March 2012. Thirteen water quality sites were established within the central part of Tay Trend (tributaries of Tay River) and three near Rebel Zone (tributaries of Anvil Creek). All sites were accessed by helicopter. The baseline survey involved collection of water samples for routine chemistry, total metals, dissolved metals, total organic carbon, total cyanide and mercury plus field measurements for pH, water temperature and flow volumes. Snow measurements were also collected at one site in March 2011 and 2012. Results of the four most recent studies, including maps of the sample locations, are given in Appendices XII to X. Table XXIX summarizes the results from all studies conducted on the property to date.

Note: √ – below guideline limit, X – exceeds guideline limit, NS – not sampled

The Keg camp is located on Ivan Creek (Station Keg 4), which met the CCME Guidelines for Drinking Water Quality in all studies except June 2011. In that study, it exceeded the guidelines for iron and manganese. Limits for both parameters are based on aesthetic considerations and not on health concerns.

The snow survey results for March 2012 show a decreased snow depth from March 2011. Snow density is increased from March 2011 along with snow water equivalent.

WILDLIFE SURVEYS

On July 15, 2011 Laberge Environmental Services of Whitehorse, Yukon conducted a sheep survey on the Keg property. The focus of the survey was to determine the distribution and abundance of mountain sheep on and adjacent to the property. On February 22, 2012 Laberge Environmental performed a winter distribution wildlife survey, the primary purpose of which was to determine the later winter distribution of moose, caribou and sheep within the property. The following conclusions are summarized from reports for both surveys, which are provided in Appendix XI and XII.

The sheep survey more or less confirms the Yukon government's mapped distribution of sheep within the area. Contrary to the government's mapped distributions, no evidence of sheep was noted in the uplands north of Anvil Creek (Owl Zone), within the southeast part of Mount Mye Belt or in the uplands peripheral to Mt. Aho, which lies southwest of the property.

Based on the winter survey, evidence of caribou and moose was primarily found below treeline, along main drainages and confluences of lower tributaries. Sheep appear to be largely restricted to the Marks Zone. Signs of wolves, ptarmigan, gyrfalcon and wolverine were also locally observed on the property.

DEPOSIT TYPES

TAY TREND – KEG ZONE

Keg Zone comprises a large-scale, low grade, multi-element mineralized system that is being explored as a bulk tonnage target. Although no deposits with directly analogous characteristics could be found in the public realm, aspects of Keg Zone's geometry, size and metal signature suggest that the system is best understood as "porphyry-type." Table XXX lists the average grades of the proven and probable reserves from some significant, multi-element, bulk tonnage deposits in comparison to the average grades from 29 holes drilled within Keg Main Zone.

Table XXX – Comparison of Keg Zone with Multi-Metal, Bulk-Tonnage Deposits

Deposit/ Prospect	Ag (g/t)	Au (g/t)	Pb (%)	Zn (%)	Cu (%)	Sn (ppm)	Mo (ppm)	Reserve Resource (T)	Notes

[5] From Sinclair, 2005.
[6] Average from 29 drill holes within Keg Main Zone (excluding KEG11-10, KEG11-20 (abandoned) and KEG11-41). Based upon 2,668 m of assay data.

Keg Zone lies within the Northern Cordillera, which hosts numerous low grade, bulk tonnage, porphyry-type deposits, including Thompson Creek Metals Company Inc.'s Mt. Milligan copper-gold deposit in central British Columbia and Western Copper and Gold Corporation's Casino copper-gold-molybdenum deposit in western Yukon. The Mt. Milligan deposit is under construction as an open pit mine and is expected to be operating in 2013, while the Casino deposit is in the mine feasibility stage.

Bear Creek Mining Corporation's Corani Deposit in Peru comprises low sulfidation epithermal silver-lead-zinc mineralization within stockworks, veins, and breccias (Peru, 2009), while Goldcorp Inc.'s Penasquito Deposit in Mexico consists of gold-silver-lead-zinc mineralization within an intrusive-related breccia pipe complex and associated fracture systems (Bryson, 2009). Both of these Southern Cordilleran deposits contain comparable grades to Keg Zone for silver, lead and zinc; however, Keg Zone is distinguished from them and other Northern Cordilleran bulk tonnage deposits by its uncommonly high tin values.

The overall geometry and mineralization of Keg Zone suggest that it could overlap with Sillitoe et al.'s (1975) category of tin porphyries, which includes the former Catavi Mine in Bolivia.

Tin porphyries are characterized by fine grained cassiterite occurring as disseminations, in veinlet and fracture stockwork zones and in hydrothermal breccia zones (Sillitoe, 1975). These deposits are genetically related to high level subvolcanic felsic intrusive centres (often one to two square kilometres in diameter) and associated breccias, but may also be hosted within related or unrelated sedimentary, volcanic, igneous and metamorphic rocks. The deposits vary in shape from inverted cone, to roughly cylindrical, to irregular. They are typically large– generally hundreds of metres across and ranging from tens to hundreds of metres in vertical extent. Mineralization is Paleozoic to Tertiary in age and comprises cassiterite±stannite± chalcopyrite±sphalerite±galena (Sinclair, 2005). Complex tin- and silver-bearing sulphosalts commonly occur in late veins and replacement zones. Gangue and alteration minerals may include sericite, pyrite, quartz, tourmaline, arsenopyrite, fluorite and topaz.

The Catavi Deposit lies within a well-established tin province in the central Andes, which extends for 900 km from southern Peru through Bolivia to northwest Argentina. This province is famous for its tin porphyry deposits, which formed the basis of Sillitoe et al.'s (1975) deposit model. Besides exclusively tin ores, mines in this belt have been worked for tin-silver, tin-zinc, tungsten, bismuth, lead-zinc and antimony. Mining has been carried out in this region for hundreds of years, and as such, it is difficult to find average grades and production for many of the deposits.

Although Keg Zone is porphyry-style in dimension, it lacks some of the characteristics common to these deposits. No intrusive bodies have been found in close proximity to the mineralization at Keg Zone; however, suitably sized, Mid-Cretaceous and Early Tertiary intrusive plugs have been mapped elsewhere on the property. The overall metal assemblage and grades at Keg Zone are also atypical of tin porphyry systems.

MOUNT MYE TREND – HAMMER ZONE

Hammer Zone is characterized by precious metal-rich, sulphide-bearing, epithermal quartz veins and quartz-healed breccias hosted in granite. It exhibits many features that are similar to silver-rich veins of the Keno Hill Camp, which is the second largest primary silver producer in Canada, with more than 214 million ounces produced since the early 1900s. Table XXXI lists several of the similarities between Hammer Zone and Keno Hill Camp (Cathro, 2006).

Table XXXI – Comparison of Hammer Zone and Keno Hill Camp

Variable	Hammer Zone	Keno Hill Camp
Wallrocks	Granite	Interlayered quartzite and schist
Primary Ore Minerals	Galena, tetrahedrite	Galena, tetrahedrite
Accessory Metals	Zn, As, Sb, Sn (Au)	Zn, As, Sb, Sn (Au)
Gangue Minerals	Siderite > quartz	Siderite > quartz
Oxidation	Expected to be shallow	Up to 100 m below surface
Vein Orientation	Steeply dipping	Steeply dipping
District Size	About 50 km^2	About 80 km^2
Average Grade	Unknown	1373 g/t (40 oz/ton) but some exceptional ore shoots exceed 500 oz/ton
Average Ag:Pb Ratio	43 oz Ag/1% Pb based on eight character samples	Usually 3 oz Ag/1% Pb for galena and 6 oz Ag/1% Pb overall
Age	Mid or late(?) Cretaceous	Mid-Cretaceous
Ground Conditions	Homogeneous granite wallrocks could be positive for ground conditions and continuity	Heterogeneous wallrocks often result in poor ground conditions

DISCUSSION AND CONCLUSIONS

The Keg property covers 16 zones of mineralization plus numerous showings and multi-element soil geochemical anomalies. Nearly all of the known zones, showings and soil anomalies lie within two sub-parallel, northwest-trending belts hosted by faulted and folded Paleozoic sedimentary and volcanic strata, which have locally been cut by Mid-Cretaceous to Early Tertiary intrusive bodies. Many of the showings and soil anomalies have not yet been systematically followed up.

The zones at the Keg property are distinguished from other large base metal showings and deposits elsewhere in Yukon by their uncommonly high silver contents relative to contained base metals and by their enrichments of tin, bismuth, indium and other relatively rare metals. Although a best fit deposit model has yet to be determined for Keg Zone, some aspects of its geometry, size and metal signature are common to tin porphyry and poly-metallic bulk tonnage deposits.

Keg Zone may represent high level or laterally distal mineralization developed around an as yet unidentified porphyry centre, which could either be blind to surface or covered by vegetation/ overburden. Tay Belt stratigraphy overlies Anvil Belt rocks and, as such, the possibility of a blind, Faro-type massive sulphide deposit at depth has not been ruled out.

The Keg property is very favourably situated in regards to infrastructure. Keg Zone lies 35 km north of the town of Faro, which formerly serviced the mines and mill of the Anvil Zinc-Lead-Silver District. A heavy duty haulage road and a high voltage power line, connected to the main Yukon electrical grid, extend to the former mill site. Hammer Zone is situated only 13 km east-northeast of the mill site.

A comprehensive exploration program is planned for 2012 to further expand Keg Main Zone, evaluate Hammer Zone and test for more high-grade and bulk tonnage silver mineralization elsewhere throughout the Keg property. The program may include soil geochemical sampling, geological mapping, prospecting, geophysical surveys, reverse circulation drilling and diamond drilling, as follows:

1) Soil sampling. Soil sampling appears to be a relatively effective tool for detecting target areas. Detailed grid soil sampling should be used to follow up anomalies that are poorly constrained by contour sampling or are open on the edges of grids.
2) Prospecting. Systematic prospecting should be conducted in areas with known soil geochemical anomalies. Payne and Getty showings should be relocated and confirmed.
3) Geological mapping. Detailed mapping should be completed early in the season at all mineralized zones that have not yet been mapped. This data should be used in planning drill hole locations and orientations. Property-wide geological mapping should be performed.
4) Geophysical surveys. Consideration should be given to obtaining ZTEM coverage over the remainder of the property. Additional IP studies should also be considered, but largely depend upon the results from drilling existing anomalies.
5) Reverse circulation drilling. Flatter, alpine areas such as parts of Hammer and Rebel zones could be tested using a track-mounted reverse circulation drill to pinpoint the best areas for diamond drilling.
6) Diamond drilling. Drilling should continue to expand Keg Main Zone by testing the coincident conductivity and chargeability features to the southwest and south of the current drill grid and the favourable 1000 m strike length between Keg Main and Keg East zones. Drilling should also focus on establishing the grade, continuity and extent of Hammer Zone. If funding and time permit, additional holes should be drilled at Drex and possibly Rebel zones. Drilling should also be considered if prospecting and geological mapping identify new zones or better constrain the size and mineralogical controls of known zones.

Respectfully submitted,

APPENDIX I

STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Sarah Eaton, geologist, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in Squamish, British Columbia, hereby certify that:

1. I graduated from the University of British Columbia in 2007 with a B.Sc. in Honours Geological Sciences.

2. From 2002 to present, I have been actively engaged in mineral exploration in Yukon Territory, British Columbia and Northwest Territories.

3. I am a Geoscientist in Training (GIT) with the Association of Professional Engineers and Geoscientists of British Columbia (Member Number 154922).

4. I have personally participated in the field work reported herein and have interpreted all data resulting from this work.

Sarah Eaton, B.Sc. (Hon.) Geology, GIT

Comments: Grey chert with pale to medium brown limonite on fractures, fracture filling pyrite

---

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I358067	UTM:	553763	E	UTM:	6954721	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: strongly fractured chert with strongly pitted oxidized fractures with white to brown to pale yellow limonite.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I358068	UTM:	553773	E	UTM:	6954753	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Fragments of strongly limonitic clay alterred yelow to medium brown sediment, abundant boxwork.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I358069	UTM:	554458	E	UTM:	6954011	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Dark grey siltstone with traces of pyrite on medium to dark brown fractures.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I358070	UTM:	677592	E	UTM:	6932224	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Barren quartz carbonate vein

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K276005	UTM:	598652	E	UTM:	6937953	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: angular talus float of a limonite-stained siliceous to qtz vn? Rk with 1-2% bebby, fc gn, tr py, poss aspy

---

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K276006	UTM:	603150	E	UTM:	6934688	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: lg pc of talus float; hasn't moved far; buff coloured, sucrosic txt'd qtzite with strong limonite on weathered surface; contains cg fc gn, tr sph;

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I078436	UTM:	596185	E	UTM:	6938583	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Silica altered thin bedded chert with minor disseminated pyrhotite and pyrite and veinlets/fracture fill of the same minerals.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I078437	UTM:	595663	E	UTM:	6983646	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Silica altered thin bedded chert with minor disseminated pyrhotite and pyrite and veinlets/fracture fill of the same minerals.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I078438	UTM:	595663	E	UTM:	6983646	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Silica altered thin bedded chert with minor disseminated pyrhotite and pyrite and veinlets/fracture fill of the same minerals.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Grab	Dimension:
I078439	UTM:	595606	E	UTM:	6983763	N	Sample Width:		Abundance:
	Elevation:		m						

Comments: Pinkish grey, silica altered chert with closely spaced micro-fractures filled with pyrite, chalcopyrite and arsenopyrite (?).

Sample Number:	Grid East:		E	Grid North:		N	Type:	Grab	Dimension:
I078440	UTM:	595645	E	UTM:	6983943	N	Sample Width:		Abundance:
	Elevation:		m						

Comments: Silica altered rock with minor disseminated fine-grained sulphide cut by 1-3cm wide veins of sphalerite, galena, arsenopyrite, chalcopyrite and pyrite.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Grab	Dimension:
I078441	UTM:	596600	E	UTM:	6938616	N	Sample Width:		Abundance:
	Elevation:		m						

Comments: Grey fine-grained partially silicified calcareous siltstone to sandstone with minor disseminated pyrite and arsenopyrite (?).

Sample Number:	Grid East:		E	Grid North:		N	Type:	Grab	Dimension:
I078442	UTM:	595297	E	UTM:	6938205	N	Sample Width:		Abundance:
	Elevation:		m						

Comments: Maroon chert that alters to pinkish-grey near veinlets of pyrite and arsenopyrite.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Grab	Dimension:
K276007	UTM:	601921	E	UTM:	6935346	N	Sample Width:		Abundance:
	Elevation:		m						

Comments: large area of goethitic wad and exposed mineral seep? About 75mx20m;

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K276008	UTM:	601893	E	UTM:	6935336	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 8m composite sample across goethitic/limonitic sand

---

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K276009	UTM:	601853	E	UTM:	6935324	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: composite sample of limonite/goethite wad/o/c; crude fabric at 335/77E;

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K276010	UTM:	602100	E	UTM:	6934977	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: 6m composite sample of goethitic gravel, crumbly wad; near soil sample CC91336

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079070	UTM:	602168	E	UTM:	6932026	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Intensely gossanous outcrop of black siliceous shale from area of anomalous soil samples CC150682-684 (Ag,As,Au). Intense local scorodite staining (?) and trace fine sulphide in micro fractures.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079071	UTM:	602051	E	UTM:	6931916	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Rusty black shale and quartz vein fragments from shallow colluvial soil at site of anomalous soil sample CC150682 (Ag,As,Au). Trace sulphide in micr-fractures of shale, light green staining (scorodite?) on some surfaces.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079072	UTM:	602330	E	UTM:	6931833	N	Grab - float Sample Width:	Abundance:
	Elevation:		m					

Comments: Abundant green stained shale talus in active erosional chute.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079073	UTM:	602502	E	UTM:	6931826	N	Chip - bedrock Sample Width:	Abundance:
	Elevation:		m					

Comments: Shear zone in grey shale, moderate, pervasive green staining (scorodite?), fine sand sized empty cavities visible with hand lense. Exposed over 5 m along strike, 2m width.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079074	UTM:	602502	E	UTM:	6931826	N	Grab - bedrock Sample Width:	Abundance:
	Elevation:		m					

Comments: Same unit as 349.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079075	UTM:	602547	E	UTM:	6931866	N	Chip - bedrock Sample Width:	Abundance:
	Elevation:		m					

Comments: Grey shale with green staining exposed in bedrock at top of talus slope. Up to 8 m width, exposed over ~50m along strike. Same unit as other samples (346-350). Large porphyry dike nearby to south on same slope.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079076	UTM:	602775	E	UTM:	6931089	N	Grab - bedrock Sample Width:	Abundance:
	Elevation:		m					

Comments: Grey siliceous shale outcrop froming prominent buttress, very rusty, trace fine disseminated sulphide.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079077	UTM:	602775	E	UTM:	6931089	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Gritty mudstone band with green staining within same outcrop as 354.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079078	UTM:	602703	E	UTM:	6931364	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Intensely rusty talus and subcrop. Sheared looking fragments with very abundant, pervasive rust, ferricrete, white crusts. Gossan 25 m across slope by 80 m down slope.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079036	UTM:	587108	E	UTM:	6938954	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Outcrop of intensely faulted chert and shale with pervasive intense rust and several gouge zones.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079037	UTM:	587108	E	UTM:	6938954	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Outcrop of intensely faulted chert and shale with pervasive intense rust and several gouge zones.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079038	UTM:	587126	E	UTM:	6939099	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Small outcrop of rusty chert in canyon with a thin band of limonite.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079039	UTM:	587038	E	UTM:	6939240	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Rusty chert outcrop with ~1ft intensely limonitic zone

---

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079040	UTM:	587126	E	UTM:	6939350	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Rusty chert bluffs along river 8 - 12 m high with weak fine sulphide in micro fractures.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079041	UTM:	587126	E	UTM:	6939350	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Rusty chert bluffs along river 8 - 12 m high with weak fine sulphide in micro fractures.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K284973	UTM:	586019	E	UTM:	6936529	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Siliceous siltstone with trace pyrite.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K284974	UTM:	586019	E	UTM:	6936529	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Siliceous siltstone with rusty pitted nodule and trace pyrite.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K284975	UTM:	585981	E	UTM:	6936524	N	Grab - float Sample Width:	Abundance:
	Elevation:		m					

Comments: Green meta-siltstone with abundant py in blebs and finely disseminated. Near source boulder.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K276023	UTM:	585395	E	UTM:	6940033	N	Grab Sample Width:	Abundance:
	Elevation:		m					

Comments: Light grey to dark grey, rusty brown weathering, banded silicious rock with rusted fine grained to medium grained sulphides along fracture faces. Oxidation haloes sometimes seen around fine flecks of silvery sulphides. Core fractures preferentially al

---

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K276024	UTM:	585388	E	UTM:	6940033	N	Grab Sample Width:	Abundance:
	Elevation:		m					

Comments: Rusty orange to dark brown weathering, grey silicious rock with dark redish brown coatings sometimes around fine grained flecks of silvery sulphides. Core fractures preferentially along rusty fractures hosting fine grained and weathered sulphides. On

---

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K276025	UTM:	585397	E	UTM:	6940031	N	Grab Sample Width:	Abundance:
	Elevation:		m					

Comments: Rusty brown to orange weathering, light grey-brown, fine grained silicious rock fracturing readily along rusty fractures. Some sample faces are pitted and leached. Collected from old trenches in Keg West.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K276026	UTM:	585384	E	UTM:	6940029	N	Grab Sample Width:	Abundance:
	Elevation:		m					

Comments: Rusty orange to purple-black, 12x9x10cm block with patchy, white, powdery alteration (anglesite?) Black sphalerite vein throughout sample, 1cm to 1.9 cm wide with medium to coarse black jack and trace yellow pyrite and a columnar, brown mineral. Rock

---

Comments: white quartz vein

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
G285824	UTM:	600247	E	UTM:	6912837	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: ?

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
G285826	UTM:	600378	E	UTM:	6913350	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: epithermal quartz with minor fine sulphide, mild scorodite staining

---

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
G285828	UTM:	600060	E	UTM:	6912627	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: moderately rusty schist

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079065	UTM:	601487	E	UTM:	6911552	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Rusty epithermal quartz vein rubble with fine disseminated sulphide, locally stained with scorodite. ~2m wide zone at or near source with angular fragments up to 20cm in diameter. Apparent vein strike 020. Quartz-feldspar-porphyry dike directly to th

---

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
I079066	UTM:	601865	E	UTM:	6911583	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Location of anomalous soil sample CC120491 (Ag). Thin alpine residual soil with angular limonitic granite fragments. Small kill zones nearby.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Dimension:
K284912	UTM:	600899	E	UTM:	6911696	N	Sample Width:	Abundance:
	Elevation:		m					

Comments: Several epithermal quartz breccia cobbles mixed in with blocky granite talus. Fine sulphide is disseminated within quartz. Numerous rhodonite cobbles and boulders also present, but little or no visible mineralization.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Grab - float	Dimension:
K284910	UTM:	600949	E	UTM:	6911647	N	Sample Width:		Abundance:
	Elevation:		m						

Comments: Green, banded metasediment boulder with abundant pyrrhotite, found in talus near contact between granite and fine sediments package to SW. Boulder 25 X 30 X 30 cm.

Sample Number:	Grid East:		E	Grid North:		N	Type:	Grab - float	Dimension:
K284911	UTM:	600949	E	UTM:	6911647	N	Sample Width:		Abundance:
	Elevation:		m						

Comments: Epithermal quartz breccia cobble with abundant arsenopyrite, pyrrhotite, and strong rust and scorodite staining. Cantelope sized piece found in mixed meta-sediments and granite talus. Vein float moderately frequent on slope (including rh), but dives

---

Sample Number:	Grid East:		E	Grid North:		N	Type:	Grab - float	Dimension:
K284909	UTM:	601016	E	UTM:	6911570	N	Sample Width:		Abundance:
	Elevation:		m						

Comments: Metasediments with moderate pyrrhotite and black-jack sphalerite in blebs.

CERTIFICATE VA11238520

Project: Silver Range

P.O. No.:

This report is for 35 Soil samples submitted to our lab in Vancouver, BC, Canada on 9-NOV-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Ag-OG46	Ore Grade Ag - Aqua Regia	VARIABLE
Pb-OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Ag-GRA21	Ag 30g FA-GRAV finish	WST-SIM
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

CERTIFICATE VA11244728

Project: Silver Range-Keg

P.O. No.: Batch A1

This report is for 36 Pulp samples submitted to our lab in Vancouver, BC, Canada on 21-NOV-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis
LOG-24	Pulp Login - Rcd w/o Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS41	51 anal. aqua regia ICPMS	
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Zn-OG46	Ore Grade Zn - Aqua Regia	VARIABLE
Pb-OG46	Ore Grade Pb - Aqua Regia	VARIABLE

CERTIFICATE OF ANALYSIS VA11244728

Method	CERTIFICATE COMMENTS
ME-MS41	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS41	Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).

CERTIFICATE VA11247462

Project: Silver Range-Keg

P.O. No.: Batch A2

This report is for 36 Pulp samples submitted to our lab in Vancouver, BC, Canada on 21-NOV-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis
LOG-24	Pulp Login - Rcd w/o Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS41	51 anal. aqua regia ICPMS	
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Zn-OG46	Ore Grade Zn - Aqua Regia	VARIABLE
Ag-OG46	Ore Grade Ag - Aqua Regia	VARIABLE
Pb-OG46	Ore Grade Pb - Aqua Regia	VARIABLE

To: **SILVER RANGE RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE OF ANALYSIS VA11247462

Method	CERTIFICATE COMMENTS
ALL METHODS	NSS is non-sufficient sample.
ME-MS41	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS41	Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).

CERTIFICATE OF ANALYSIS VA11247463

Method	CERTIFICATE COMMENTS
ALL METHODS	NSS is non-sufficient sample.
ME-MS41	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS41	Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).

CERTIFICATE VA11247464

Project: Silver Range-Keg

P.O. No.: Batch A5

This report is for 36 Pulp samples submitted to our lab in Vancouver, BC, Canada on 21-NOV-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis
LOG-24	Pulp Login - Rcd w/o Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS41	51 anal. aqua regia ICPMS	
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Zn-OG46	Ore Grade Zn - Aqua Regia	VARIABLE
Pb-OG46	Ore Grade Pb - Aqua Regia	VARIABLE

CERTIFICATE VA11267322

Project: Silver Range - Keg

P.O. No.: Batch A41

This report is for 36 Pulp samples submitted to our lab in Vancouver, BC, Canada on 14-DEC-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis
LOG-24	Pulp Login - Rcd w/o Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG46	Ore Grade Pb - Aqua Regia	VARIABLE
ME-MS41	51 anal. aqua regia ICPMS	
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Zn-OG46	Ore Grade Zn - Aqua Regia	VARIABLE
Ag-OG46	Ore Grade Ag - Aqua Regia	VARIABLE

CERTIFICATE VA11267323

Project: Silver Range - Keg

P.O. No.: Batch D23

This report is for 36 Pulp samples submitted to our lab in Vancouver, BC, Canada on 14-DEC-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis
LOG-24	Pulp Login - Rcd w/o Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
Pb-OG46	Ore Grade Pb - Aqua Regia	VARIABLE
ME-MS41	51 anal. aqua regia ICPMS	
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Zn-OG46	Ore Grade Zn - Aqua Regia	VARIABLE

CERTIFICATE OF ANALYSIS VA11267323

Method	CERTIFICATE COMMENTS
ME-MS41	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS41	Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).

CERTIFICATE VA11267324

Project: Silver Range - Keg

P.O. No.: Batch B26

This report is for 36 Pulp samples submitted to our lab in Vancouver, BC, Canada on 14-DEC-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis
LOG-24	Pulp Login - Rcd w/o Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
Pb-OG46	Ore Grade Pb - Aqua Regia	VARIABLE
ME-MS41	51 anal. aqua regia ICPMS	
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Zn-OG46	Ore Grade Zn - Aqua Regia	VARIABLE

To: **SILVER RANGE RESOURCES LTD.**

CERTIFICATE WH11105296

Project: Silver Range - KEG

P.O. No.:

This report is for 145 Soil samples submitted to our lab in Whitehorse, YT, Canada on 11-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
EXTRA-01	Extra Sample received in Shipment
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

Account: RANSIL

CERTIFICATE OF ANALYSIS WH11105296

Method	CERTIFICATE COMMENTS
ME-MS41	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS41	Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).

CERTIFICATE WH11105297

Project: Silver Range- KEG

P.O. No.:

This report is for 117 Soil samples submitted to our lab in Whitehorse, YT, Canada on 11-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS	

To: **SILVER RANGE RESOURCES LTD.**

CERTIFICATE OF ANALYSIS WH11105297

Method	CERTIFICATE COMMENTS
ME-MS41	Interference: Ca>10% on ICP-MS As,ICP-AES results shown.
ME-MS41	Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).

CERTIFICATE WH11105298

Project: Silver Range - Keg

P.O. No.:

This report is for 201 Soil samples submitted to our lab in Whitehorse, YT, Canada on 11-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
EXTRA-01	Extra Sample received in Shipment
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS	

To: **SILVER RANGE RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE WH11105620

Project: Silver Range - Keg

P.O. No.:

This report is for 243 Soil samples submitted to our lab in Whitehorse, YT, Canada on 11-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-XRF05	Trace Level XRF Analysis	XRF
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS	

To: **SILVER RANGE RESOURCES LTD.**

Project: Silver Range - Keg

P.O. No.:

This report is for 205 Soil samples submitted to our lab in Whitehorse, YT, Canada on 11-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
EXTRA-01	Extra Sample received in Shipment
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-XRF05	Trace Level XRF Analysis	XRF
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

CERTIFICATE WH11107600

Project: Silver Range-Keg

P.O. No.:

This report is for 204 Soil samples submitted to our lab in Whitehorse, YT, Canada on 15-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
EXTRA-01	Extra Sample received in Shipment
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

Account: RANSIL

CERTIFICATE OF ANALYSIS WH11107600

Method	CERTIFICATE COMMENTS
ALL METHODS	NSS is non-sufficient sample.
ME-MS41	Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).

CERTIFICATE WH11107601

Project: Silver Range-KEG

P.O. No.:

This report is for 202 Soil samples submitted to our lab in Whitehorse, YT, Canada on 15-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
EXTRA-01	Extra Sample received in Shipment
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

Project: Silver Range-KEG

P.O. No.:

This report is for 195 Soil samples submitted to our lab in Whitehorse, YT, Canada on 15-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
EXTRA-01	Extra Sample received in Shipment
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-XRF05	Trace Level XRF Analysis	XRF
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

CERTIFICATE WH11107603

Project: Silver Range-KEG

P.O. No.:

This report is for 195 Soil samples submitted to our lab in Whitehorse, YT, Canada on 15-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

CERTIFICATE WH11107604

Project: Silver Range-Keg

P.O. No.:

This report is for 204 Soil samples submitted to our lab in Whitehorse, YT, Canada on 15-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

CERTIFICATE WH11107607

Project: Silver Range - Keg

P.O. No.:

This report is for 57 Soil samples submitted to our lab in Whitehorse, YT, Canada on 15-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

CERTIFICATE WH11110718

Project: Silver Range-Keg

P.O. No.:

This report is for 14 Rock samples submitted to our lab in Whitehorse, YT, Canada on 18-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL44	Trace Level Au - 50 g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS	
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
Zn-OG46	Ore Grade Zn - Aqua Regia	VARIABLE
Pb-OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Sn-XRF05	Sn-Trace Level XRF Analysis	XRF
ME-XRF05	Trace Level XRF Analysis	XRF

CERTIFICATE WH11111163

Project: Silver Range - KEG

P.O. No.:

This report is for 193 Soil samples submitted to our lab in Whitehorse, YT, Canada on 18-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

CERTIFICATE WH11111164

Project: Silver Range - KEG

P.O. No.:

This report is for 131 Soil samples submitted to our lab in Whitehorse, YT, Canada on 18-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

CERTIFICATE WH11111165

Project: Silver Range - KEG

P.O. No.:

This report is for 160 Soil samples submitted to our lab in Whitehorse, YT, Canada on 18-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
EXTRA-01	Extra Sample received in Shipment
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS

CERTIFICATE WH11115315

Project: Silver Range - Keg

P.O. No.:

This report is for 169 Soil samples submitted to our lab in Whitehorse, YT, Canada on 22-JUN-2011.

The following have access to data associated with this certificate:

DOUG EATON BRUCE YOUNGMAN	SARAH EATON	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-TL43	Trace Level Au - 25g AR	ICP-MS
ME-MS41	51 anal. aqua regia ICPMS
