													Other															
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total	Pyrite	Arsenopyrite	Sphalerite	Galena	Hematite	Other	Photo	
0.00	3.02	3.02				OVB	BN					x															Overburden; Unconsolidated soils and strongly weathered bedrock. OCcasinal boulders of weakly propylititc altered granodiorite noted.
			0.47	1.00	0.53	GRD	GNGY																				Moderately propylitic altered granodiorite boulde
			2.42	2.89	0.47	GRD	GNGY	BK																			Propylitic granodiorite boulder
3.02	7.40	4.38				GRD	ORBN	BK	tw	tw		l			FX	60-70		6							Li		Weathered Granodiorite; Orange-brown, moderate-strongly oxidized, medium-coarse grained granodiorite. Oxidation is pervasively moderate, increasing at fractures. Trace-weak phyllic with trace weak clay overprint. Blocky core rock.
							BG								VT	50-60	1.0	3							Cb		Weak-moderate veinlet density, two types. First is cream-white quartz-carbonate veinlets. Second type is dark grey irregular stringers (<1cm), possible hematite(?). Preferred orientation for both at 50-60° to core axis.
							DKGY								VT	50-60	<1	3						t?			
																			t	t							Trace total sulphides, appear to be finely disseminated pyrite, throughtout the matrix.
			5.08	6.13	1.05	VN?			m	f	m								tw	t	t?			t			Zone of decreased oxidation and increasec silicification, possible veining(?). This interval has what appears to be brecciated textures. Areas of boxwork textures have increased oxidation. Trace-weak sulphides noted. Dominantely pyrite with rare arsenopyrite(?). No measureable orientation noted. Zone ends in an interval of moderate phyllic altered granodiorite.
7.40	21.52	14.12				GRD	GNGY		t			w			FX	35-60									Li		Granodiorite; Weakly propylitic altered granodiorite with patchy zones of weak-moderate phyllic alteration. Oxidation noted, generally along veining/fracture structures. Core rock is fairly competent with fracturing dominatly at 35-60° to core axis.
								EN				m			VT	55-70	1.0	2									Moderate veining density, generally narrow stringers (<1cm) often with weak-moderate oxidation envelopes (up to 0.5cm wide); some appear to be fractures and decreases in density moving downhole
															FX	30-60		3									
																			t	t							Trace sulphides noted throughout the interval, generally occuring as pyrite blebs (<1.5cm across), often noted to be associated to veining/fracture structures.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS									DETAILED DESCRIPTION

			41.33	41.41	0.08		BFOR	EN				w	pot?															Interval of mixed grey and white veinlets with envelopes that appear to be weak-moderately oxidized. Wekaly gradational contacts at ~85° to core axis. Pyrite carried in veinlets as elongated blebs and occurs as disseminations in envelopes.
							GYWH								VT	85	0.2			w								
			46.52	47.86			LTGN	EN	f			w							f	w								Moderately phyllic altered interval with increased oxidation. No significant changes in veinlet density. Increased disseminated pyrite throughout matrix.
															VT	40	<1	6										
48.73	53.18	4.45				GRD	ORBN		f	tw		w			FX										Li			Granodiorite; Weak-moderate phyllic altered oxidized granodiorite. Weakly blocky core rock with low angle fractures sub-parallel to core axis.
							BFWH								VT		<1											Moderate veining density, appears to dominantly be quartz-carbonate fracture infill, prefered orientation a ~40-50° to core axis.
																			t	t								Trace amount of disseminated pyrite, decreasin downhole.
			49.30												VT	65	0.4			tw			tw					At 49.30m broken dark grey veinlet noted, carrying fine galena and pyrite.
			51.96	52.86	0.90		DKGB		t			tw	pro	tw														Interval of decreased oxidation and phyllic alteration. Has weak propylitic appearance.
53.18	65.53	12.35				GRD	GYDN		t				pro	t														Weak Propylitic Granodiorite; similar to 40.07-48.73m. Propylitic altered granodiorite with locallized zones of moderate-strong phyllic patches, mostly associated with veining structures.
							DKGY								VT		<1											Two types of veinlets (dark grey and white quartz carbonate) General orientation at ~40-60° to core axis.
							WHBF								VT		<1								Cb			
																			t	t								Trace sulphides mineralization; fine disseminated pyrite noted, often in phyllic zones.
			53.30	53.45	0.15		LTGN	EN	w	tw					C	70	3.0											Moderate phyllic envelope surrounding a white quartz veinlet. Oriented at ~70° to core axis. Trace disseminated pyrite throughout envelope.
							WHBF								VT	70	0.3		t	t								
			57.61	57.75	0.14		ORBN	EN	w			w					2.5											Similar to 53.30-53.45m with increased oxidation along phyllic envelope. Oriented at ~85° to core axis No significant mineralization.
							BFWH								VT	85	1.0											

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

													Other															
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total	Pyrite	Arsenopyrite	Sphalerite	Galena	Hematite	Other		
			58.50	59.00	0.50		LTGN		m	tw		t																Moderate phyllic altered zone with veinlets (0.2-1cm) infilled with quartz-carbonate. Trace dissminated pyrite generally along veinlets.
															VT	50-85	<1	8	t	t								
			62.74	62.93	0.19	APL	PKBN	FG							DY	36												Minor interval of aplite dyke
			64.93	65.16	0.23	APL	PKBN	BK							DY	47												Interval of aplite dyke, core rock is shattered and broken up due to drill processes. Upper contact at ~ 45˚ to core axis, lower contact lost.
65.53	67.36	1.83				GRD	GNGY		tw	f		t			FX	45		2										Altered granodiorite; Mixed light and dark greer phyllic altered granodiorite with clay overprint. Clay altered zones have bleached bleached appearence and makes up ~ 70% of this interval. Core rock is fairly competent with minor fracturing at ~45˚ to core axis. No significant veining structures and sulfide mineralization.
			66.11	67.10	0.99		LTGN	EN	f						VT	83	5.0		tw	tw								Interval of increased phyllic alteration, likely envelope to veinlet. Veinlet (~5cm wide) made up of mixed infill material (quartz, carbonate-quartz) with irregular contacts. Disseminantly pyrite noted throughout envelope and vein material.
67.36	70.64	3.28				GRD	GYEN		tw				pro	tw	FX	30		4										Granodiorite; Meduim grey-green granodiorite with grey-white carbonate fracture infill. Moderate fracturing at ~30-35˚ tca. No significant veining. Several large mafic zenoliths (<10cm across) noted, showing regular contacts.
																			tw	tw								Disseminated pyrite noted throughout
			69.12	70.07	0.95		LTGN		f				pot?															Interval of increased phyillic alteration. Stringers (<0.2cm) present, prefered orientation at ~83 and ~34˚ tca. No significant sulfide mineralization noted.
			70.07	70.29	0.22	BXA	DKGY		w																			Dark grey, moderate phyllic altered breccia. Fragments are angular - subangular and elongated ranging from 0.1cm-3cm in size. No measurable contacts, core rock has broken and rounded edges.
																				m								Pyrite occurs as blebs (<1cm) and fine dissemination.
			70.29	70.41	0.12		LTGN		w											tw								Light green zone of increasesd phyillic alteration. Blocky core rock with rounded fragments due to dull drilling. Trace weak sulphide mineralization (pyrite).

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

							WH								VT	30-50	<1	5							Cb		Moderate veining density, several styles. Cream-white narrow quartz-carbonate veinlets, often <1cm wide generally barren but have pyritic envelopes. Medium grey quartz veinlets (<2cm), some with irregular contacts at high angles to core axis. Polymetallic veins also present, often with a mixed matrix of quartz and carbonate, up to ~3cm wide. This type of veining often has brecciated textures.
							LTGY						pro	w	VT	50-70	<2	3							Qz		
							MT								VT	50-70	<3	1		f	f	f	w				
																				w	tw	t	t				Moderate sulphide mineralization, dominantly disseminated to blebby pyrite, decreasing downhole. Other metals generally occur within vein structures.
			83.77	84.96	1.19		MDGN			t			pro	f					t	t							Interval of decreased bleaching, decreased clay with increased propylitic alteration. Possible weak potassic(?). Slightly faulted, broken section. Narrow cream carbonate veinlets with weak-moderate phyllic envelope. Trace to none disseminated pyrite.
			84.96	85.49	0.53		LTGN			tw																	Slight decrease in clay alteration with increased irregular dull grey quartz veinlets, mostly barren at ~60° to core axis. Trace pyrite in this sub-interval.
							GY								VT	60	<2.5	4									
			87.69	87.91	0.22	VEN	WHGY	SU							VN	35	12.0		t	t							Grey-white quartz-minor carbonate veins crosscut by later cream coloured carbonate veinlets. Five disseminated pyrite noted as discontinous stringers in vein.
			89.61	89.72	0.11	VEN	MT		f	tw					VN	40	7.0			s		x	tw				Polymetallic quartz vein with slightly increased phyllic altered enveloopes. Sulphides dominated by dark brown sphalerite followed by pyrite then galena.
			89.87	90.10	0.23		DKGY	BX	tw	t	m				C	40				tw							Minor brecciated(?) zone, with dark grey silicified(?) matrix. Angular fragments of carb veinlets noted. Distinct lower contact at ~40° to core axis. Possible quartz vein(?). Weakly vuggy matrix with blebby pyrite.
			90.85	91.22	0.37		DKGY			t					VN	35	<2	3		m			x				Interval of increased plymetallic sulphdies veins.veinlets. Sulphides generally carried in dull grey quartz and buff cream carbonate. These vein structures are cross-cut by pale green white carbonate veinlets. Sulphides dominated by galena then pyrite.
															VT	55-65	<1	2		t					Cb

															VT	65-85	<4	1							Qz		moderate veining density, dominantly sulphide bearing grey quartz veins, often with slight alteration envelopes of strongly phyllic alteration. Dark breccia "veins" also present.
																			tw	tw	t?	t					Trace-weak sulphide mineralization, dominantly fine disseminated pyrite in matrix. Veining structures also carry stringer sulphides
			201.07	201.42	0.35	BXA	DKGY			w					GO	60				w							Brecciated contact zone. Dark grey, weakly sheared(?) matrix with deformed clasts. Approximately 3cm thickness of clay and gouge at the upper contact. Slight "increase" in fine-medium disseminated pyrite.
			202.45	202.52	0.07	VEN	GY	BX			f				VN	70				t							Silicified band with brecciated textures. Possibley breccia unit with decreased sulphides.
			203.28	203.44	0.16	BXA	DKGY								VN?	40			tw	tw	t						Breccia "vein" with coarse clasts (<4cm). Trace weak sulphides, dominantly pyrite and trace amounts of arsenopyrite.
			203.54	203.61	0.07	VEN	MT/GY				f				VN	85			w	tw							Grey quartz vein/silica flooded zone carrying sulphides.
			205.94	206.26	0.32	BXA	DKGY								VN?	75			f	w	tw						Zone of several dark grey breccia "veins". Matrix supported with small granodiorite clasts. Fine-medium disseminated sulphides.
207.87	215.50	7.63				GRD	MDGY		t				pro	tw	FX	60		4									Granodiorite. "Fresh" granodiorite with weak propylitic and patchy phyllic alteration. Propylitic alteration decreases moving downhole. Fairly competent core rock.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

													Other												Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
0.00	6.10	6.10				OVB	BN																				Overburden- Uncosolidated brown sandy clay with granodiorite fragments. Possible contact with bedrick granodiortie at 4.2m.
6.10	14.07	7.97				GRD									VT	40	1mm	2									Granodiorite - meduim grey granodiorite with white carbonate veinlet (1mm across) oriented at ~40° and ~180° tca. Fractures oriented at ~50° and ~185° tca.
			7.80	8.20	0.40	GRD	GNGY	DI	w											tw							Phyllic Altered Granodiortite with clay overprint. Core has undergone heavy weathering and oxidation. Disseminated pyrite in phyllic envelope but not seen in clay alteration.
			11.00	11.84	0.84	GRD	GNGY	DI	w	m										tw							Phyllic altered Granodiortie with moderate clay alteration. Disseminated pyrite throughout interval and weathering along fracture surface.
			12.17	12.59	0.42	GRD	GNGY	BL	w						VT	90	1mm	3		w							Phyllic Altered Granodiortite - Weakly phyllic altered with disseminated pyrite. White quartz and dark grey veinlets 1-2mm think with disseminated pyrite blebs oriented at ~70° and ~90°.
14.07	33.42	19.35				GRD	GNGY								FX	30		3									Grandodiorite - Grey Green granodiorite. Upper contact is gradational over 0.5m, fractures oriented at ~30° and ~80°. White quartz veinlets and dark grey stringer, oriented at ~55° and ~70°.
			15.87	15.89	0.02	VEN	DKGY	DT	f						VN	65				w							Dark Grey Green Phyllic altered band with weak amounts of disseminated pyrite oriented at 65° tca.
			21.01	21.47	0.46	GRD	GNOR			w										t							Clay Altered Granodiorite. Contains trace amnounts of disseminated pyrite.
			23.84	25.30	1.46	GRD	GNGY		w	w					VT	65		5		m			t				Weak Phyllic and Clay Altered Granodiorite. Dark grey veinlets oriented at 65°tca. Veinlets are 30-40% pyrite and between 3-7mm thick. Galena veinlets are oriented 50°-60° tca. There is increased clay alteration in the bottom 40cm of interval.
			29.00	29.25	0.25	GRD	GNGY			w					VT	45	1cm	1		m							Weak Clay Altered Granodiorite. Veinlet of interconnected, white (quartz) and dark grey veins. Pyrite blebs occure in veinlets. There is no sulphide mineralization visible in the rest of the interval.
			30.00	30.21	0.21	GRD	GNON		w	w										t							Weak Phyllic and Clay Altered Granodiorite. Contains trace amounts of disseminated pyrite.
			30.76	31.25	0.49	GRD	WHPK			m			pot	m-w	VT	70	5mm	4									Moderatly Clay Altered Grandodioritewith moderate to weak potassic alteration. Contains white quartz veinlets with pyrite blebs in the centers.
33.42	34.43	1.01				GRD	GNPK								VT	70	1mm										Moderatly Clay Altered Grandodiorite with weak potassic alteration. Dark grey veinlets oriented 70° tca.
			33.77	33.94		BXA	DKGY																				Dark Grey Breccia. Sub-angular to sub-rounded grey/green clasts in a dark grey matrix. Matrixd contains both pyrite blebs ab disseminated pyrite.

34.43	40.25					FEL	BNGN	PO					lim		VT	25	1mm	2									Quartz Feldspar Porphyry Dyke- Medium brown green with sub angular to sub-rounded grey green phenocrysts (1mm-1cm across) in a fine grained matrix. White quartz veinlets are oriented at ~25˚ and ~85˚. Dark grey veinlets are 1-2mm thick form a lattice texturenear the top of the interval. Small zones of phyllic alteration are seen throughout interval as well as zones of dark grey pruple alteration which is seen in the lasdt third of the interval. The last 20cm of the interval are highly brecciated with calcite veining intruding the dyke. Limonite staining n fracture surfaces.
			37.53	37.62	0.09	FEL	BNGN	NE																			Quartz Feldspar Porphyry Dyke with net texture of quartz veinlets. The have intruded the porphyry rock forming the net texture.
40.35	51.94	11.59				GRD			w	w					VT	35	4mm	3									Grey Green Granodiorite with small zones of weak phyllic and clay alteration. Mafic zenoliths are present throughout the interval, ranging from 2-10cm across. There are 1-2 zenoliths per meter. The intervbal contains white quartz veinlets thata re oriented at ~30˚ , 65° and 87°. Fractures are oriented at ~40° tca.
			40.25	40.62	0.37	GRD	LTGY			m																	Clay Altered Granodiorite, with weak potassic alteratin. Light grey green in color. No visible sulphide mineralization.
			40.94	41.46	0.52	GRD	GNGY		m	m-w					VT	80	2cm	1		m							Phyllic, Clay and Propalytic Altered Granodiorite. The alterations are moderatky phyllic, weak to moderatly clay, and weak propalytic. Dark grey veinlet containing disseminated pyrite. White - tan quartz veinlet parallels dark grey veinlet. Dissemated pyrite and pyrite blebs in in envelope surrounding vein.
			41.46	41.94	0.48	GRD	LTGN			m																	Moderatly C lay Altered Grandiorite - with weak propalytic alteration. No visible sulphide mineralization.
			45.39	47.36	1.97	GRD	GNGY		m	m					VT	65	5mm	3		m							Pyllic Altered Granodiorite - with zones of moderate clay alteration and weak propalytic alteration throughout interval. Dark grey veinlets oriented at 65˚ and 15° tca that are 1-5mm thick. Disseminated pyrite and pyrite blebs are surrounding the net of quartz veinlets in the center of the interval. There is 22cm of moderate clay alteration at the end of the interval. weak amounts of galeana and pyrite are

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
			48.61	50.63	2.02	GRD	LTGN		m	w					VT	60	6cm			w			w				Phyllic Altered Granodiorite with minor clay alteration throughout interval. Light grey green in color. There is a dark breccia veinlet in the first third of the interval oriented at approx 60° tca. Containig disseminated pyrite and galena. Clasts are grey green, subrounded, 1mm-1.5cm across. The second breccia veinlet is located in the last third of of the interval. It is oriented at approximatley 30° tca and is 3-4cm thick. Contains disseminated pyrite and pyrite blebs. Clasts are subangular to subrounded 1mm-1cm in size. Dark grey and white (quartz) veinlets are oriented at approx 60°, 40° and 70°. Thickness ranges from <1mm to 1cm
			51.10	51.94	0.84	GRD	LTGN		m	m					VT	75	2mm	2		w							Moderate Phyllic and Clay Light Greeen Granodiorite - White quartz veinlets oriented at ~75° tca. Dark Grey veinlets oriented at ~75° tca containign disseminated pyrite. Higher zone of phyllic alteration near botton of interval contains more disseminated pyrite.
51.94	57.00	5.06				FEL	GNBN	PO																			Quartz Feldspar Porphyry Dyke - similar to interval 34.43-40.25m, but contains no lattice texture. Dark purple grey alteration occures at start and end of interval but not in the middle. Fractures are oriented at ~35° tca. White quartz veinlets are oriented at ~25° and ~55° tca.
57.00	66.46	9.46							w	m			hem	m	VT	60		###									Clay Altered Light Grey Green Granodiorite with weak amounts of phyllic, propyllitic and potassic alteration throughout. Dark Grey veinlets are oriented at ~70° tca. Red heamatite veinlets oriented at ~60° tca.
			58.04	59.10	1.06	GRD	GN	DI	m	w					VT	50		3		tw							Moderatly Phyllic Altered Green Granodiorite with weak clay alteration. Dark grey and white (quartz) veinlets oriented at ~50° and ~80° tca. Disseminated pyrite occures throughout interval
			60.10	60.30	0.20	GRD	GNGY		ms	f																	Heavily zoned of phyllic altered granodiorite. Pyrite blebs and disseminated pyrite occure throughout the whole interval. Entire vein zone is oriented between ~80° and 90°.
			64.75	65.77	1.02	GRD	GYGN		w	m																	Zone of strong propyllitic altered granodiorite chlorite is prominent and is very dark green that it almost appears black in some areas.
66.50	70.85	4.35				GRD	GYGN		m	f					VT	60	3mm	###		w							Phyllic and Clay Altered Granodiorite. Moderate phyllic and fair clay alteration. Small zones in the middle of interval area fairly incompetent due to heavy clay alteration. Breaks up easily ffrom touch or spray of water. Veinlet phyllic zones contain disseminated pyrite.
			66.58	66.68	0.10	VEN	DKGY								VT	~90°	9cm	1									Intermixed dark grey and white (quartz) veinlets. Disseminated pyrite, galena and sphalerite around veinlets. Elongate clear quartz crystals ranging from 1mm to 1cm have grown in the vein.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			67.81	67.89	0.08	VEN	DKGY	DI	w						VT	65°	8cm	1		t							Dark Grey fine grained vein containing trace amounts of disseminated pyrite. Small phyllic altered granodiorite lens in vein, ~4cm across.
			69.49	69.57	0.08	BXA	DKGY	BX												t							Dark Grey Breccia with grey green granodiorite clasts. Last are sub-angular to subrounded and 1-3mm across. Calcite veinlets (1-3mm) oriented at 30° tca, which cross cut breccia. Trace amounts of disseminated pyrite.
70.85	77.66	6.81				GRD	GYGN								ST	40		3										Granodiorite with weak phyllic and propyllitic alteration. Medium grey green in color with dark grey stringers oriented at ~40˚ and ~8˚. White calcite stringers are oriented at ~60˚ and ~90˚ tca.
			72.38	75.12	2.46	GRD	GYGN		m	m					VT	75	2mm	3		tw							Moderatly Phyllic and Clay and Weakly Propyllitic Altered Green light Grey Granodiorite. White calcite veinlets oriented at ~75˚ and ~35˚ tca (1-4mm thick). Pink white quartz carbonate veinlets oriented at ~60˚ and ~83˚ tca. Dark Grey stringers oriented at ~ 49˚. Trace weak amounts of disseminated pyrite throughout.
			72.66	72.73	0.07	BXA	DKGY	BX												t							Same as interval, 69.49-69.57m but no crosss cutting calcite veinlet.
			72.95	73.05	0.10	BXA	DKGY	BX		m																	Bleached dark Grey Breccia. Same as interval 72.66m-72.73m except it has undergone moderate clay alteration.
77.66	80.40	2.74				GRD	GN		m	m					VT	80	2mm			t							Moderatly Phyllic and Clay and Weakly Propyllitic Altered Green Granodiorite. White calcite veinlets oriented at ~45˚ and ~80˚ tca (1-3mm thick). Dark Grey stringers oriented at ~60˚. Trace amounts of disseminated pyrite throughout interval.
			77.64	78.24	0.60	BXA	DKGY	NE	m	w											t			GN	t		Dark grey breccia with green/orange clast. Clasts are sub-angular to sub-rounded and range from 1mm-5cm across. Breccia hasd undergone moderate amounts of phyllic alteration as well as weak amounts of clay alteration. Pyrite is found in both disseminated and bleb form. There are trace amounts of galena and aresenopyrite throughout interval. There are sporatic blebs of sphalerite throughout interval. Unknow plae orange mineral, possibly carbonate, of moderate hardmess occures next to sulphide minerals in the bottom third of the interval.
			78.24	79.48	1.24	GRD	GYGN		w	m																	Clay Altered Granodiorite. Weakly phyllic, moderatly clay altered light grey green granodiorite. Much of interval has been broken up by drilling and its will crmble under the application of slight pressure.
			78.48	79.89	1.41	FEL	GNBN	PO		w					VT												Light Brown Green Quartz Feldspar Porphyry Dyke. Weakly Clay altered with veinlets of clay forming net texture in first 14cm.

GEOLOGY LOG

													Other												Other		
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
			80.18	80.40	0.22	VEN	DKGY			ms										m		m	m				Dark Grey and White Sulphide vein Zone. Clay alteration made rock fairly incompetent and has been further broken up by drilling. Sulphide mineralization consists of blebs of disseminate pyrite, galena and spalerite. Also there is possible tetrahedrite mineralization.
80.40	83.30	2.90				FEL	GYGN	PO		w-s																	Clay Altered Quartz Feldspar Porphyry Dyke. Clay alteration is strongers at start of interval and is weaker throughout the rest of the interval. Dyke is heavily broken up from drilling. No visible sulphide mineralization.
			80.95	81.44	0.49	FEL	PNGY	PO		w																	Purple Grey Clay Altered Quartz Feldspar Porphyry Dyke. Weak amounts of clay alteration tghroughout the interval. No visible sulphide mineralization.
83.30	87.12	3.82				GRD	GNGY		w-m	m-ms					VT	50	8mm	1									Phyllic and Clay Altered Granodiorite with strong sulphide mineralization throughout. Grey green to pale green grey. Areas of stronger clay alteration are more incompitent. Interval appears to be in a fault zone which has caused much of the fracturing in the rock.
			83.30	83.70	0.40	BXA	DKGY	BX	w											s	s	s	s				Dark Grey Sulphide Breccia. Strong amounts of blebs and disseminated pyrite, galena, sphalerite and arsenopyrite.
			83.92	84.13	0.21	VEN	WTGY																				Dark Grey and White Quartz Sulphide Vein Zone. Contains blebs of and disseminated pyrite, sphalerite and galena. Vein zone is broken uop and orientaion is not possible to determine.
			84.39	84.91	0.52	VEN	WTGY			m																	Same as interval 82.92-84.13m except contains arsenopyrite and bottom half has undergone clay alteration.
			85.26	85.82	0.56	FEL	GYBN	PO		w			hem	m													Brown Grey Quartz Feldspar Porphyry Dyke. Similar to 80.40-83.30m, but phenocrysts are much smaller and less visible. Interval has been broken up by drill. Small amounts of of hematite staining along fracture surfaces.
			86.47	87.07	0.60	BXA	GNGY	NE	m	w										m	m	m	m				Green Dark Grey Breccia with net texture veins. Calsts are sub-angular to sub-rounded 1mm-5cm across. Blebs and disseminated pyrite, galena, sphalerite and arsenopyrite.
87.12	95.14	8.02				GRD	GYGN		w	m					ST	35		4									Clay Altered Granodiorite with weak phyllic and propyllitic alteration. White quartz stringers oriented at ~35° and ~70° tca. No visible sulphide mineralization throughout interval.
			90.91	91.04	0.13	VEN	GYWH													m			w				Dark grey and whit quartz veinlet zone. Disseminated pyrite and galena throughout interval.
			93.83	93.93	0.10	VEN	GYWH		m	s																	Dark grey and white quartz veinlets (1-6CM). Veins at start of interval contain disseminated pyrite. Last 2/3 of interval have undergone strong clay alteration and can be be deformed or broken by touch. No visible sulphide mineralization.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
95.14	104.77	9.63				GRD	GYGN								VT	75°	1mm	3-5									Grey Green Granodiorite that has undergone weak phyllic alteration around veinlet. Veinlets are either white quartz/carbonate or dark grey. They range from stringers to 2mm and are oriented at ~55° and ~75° tca. A few mafic zenoliths (4-12cm) are scattered throughout interval.
			96.84	96.91	0.07	VEN	WTGY								VT	65	2mm	2									2 Dark Grey Sulphide veinlets on eitehr side of a 1cm white quartz vein. They are oriented at 65° tca. Dark Grey veinlet contains disseminated pyrite while the quartz veinlet contains pyrite blebs.
			98.52	98.58	0.06	VEN	WHGY								VT	75	6cm	1									White/Grey Quartz Vein bounded on either side by dark grey sulphide veinlets oriented at 75°tca. Diseminated pyrite in dark grey portion of veinlets.
104.75	112.55	7.80				GRD	WTGN		w	m					VT	70	1mm	10									Moderate Clay altered pale wghite and green granodiorite with weak, phyllic alteration. White quartz carbonate stringers and veinlets oriented ~55° and ~70° tca. They occure approximatley every 5-10cm and there is no visible sulphide mineraliztion.
			105.67	105.71	0.04	BXA	DKGY													t							Dark Grey Breccia with grey green subangular to sub rounded elongate clasts 1mm-3cm across. Trace amounts of disseminated pyrite through breccia.
			108.98	109.80	0.82	GRD	BKGY								VT	70		5		m							Black Grey Massive Tourmaline Granodiorite. Forst 9cm of interval are breccia with a black matrix and grey clasts. White quartz carbonate veinlets oriented ~70° tca. Massive tourmailine makes up 10<50% of granodiortie depending on area of interval. Moderate amounts of disseminated pyrite throughout interval.
			110.37	111.30	0.93	GRD	GYGN			s										w							Strongly Clay Altered Granodiorite. Some protions of interval are so strongly clay altered that they deformor break under slight pressure. Weak amounts of disseminated pyrite throughout interval.
			110.71	111.18	0.47	GRD				s										m		w	w				Strongly Clay Altered and Broken Up Granodiorite and vein zone with weak alteration. Broken up due to clay alteration and drilling, whioch make it difficult to determine what the original core was. Contains moderate amounts of blebs and disseminated pyrite. Also has weak amounts of disseminated sphalerite and galena.
			111.93	111.96	0.03	VEN	GY								VT	87		1		m							Smolkey queartz veinklet oriented at approx 87°. Contains moderate amunts of pyrite blebs throughout veinlet.
112.55	139.29	26.74				GRD	GYGN		w	w					ST	60		4									Grey Granodiorite - Mostly unaltered but contains weak patches of phyllic and clay alteration. Drak Grey stringers are oriented at approx 60° and 50°. Trace amounts of diseminated pyrite throiughout interval.
			124.79	126.00	1.21	GRD	GYGN		w-m	w-m																	Weak to Moderate Clay and phyillic altered Granodiorite. No visible sulphide mineralization.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

0.00	4.57	4.57				OVB																					Overburden
4.57																											
	15.17	10.60				GRD	MDGY					i	lim	s	FX	30											Grey Unaltered Granodiorite with limonite staining along fracture surefaces. Fractures oriented ~30° tca. Patches are permanently oxidized and stained orange brown.
			7.67	8.38	0.71	GRD	BNGY		m	w		i	lim	s	FX	0											Phyllic and Clay Altered Granodiorite Brown Grey Granodiorite. Alteration is moderatly phyllic and weakly clay altered. Granodiorite with limonite staining on surface and in fractures.
			11.54	14.48	2.94	GRD	GY			f		i	lim	s													Clay Altered Granodiorite. Fair Clay alteration with limonite staining in and around fractures. Fractutes oriented at ~0° and ~60° tca.
15.17	19.46	4.29				GRD	BNGY			m		s															Clay Altered Granodiorite. Clay alteration occures every 30-40cm for 40-50cm intervals. Alternates between clay altered and unaltered granodiorite. Heavy Limonite staining on and around fracture surfaces.
			17.64	17.73	0.09	GRD	PU			s			hem	s													Purple Clay Altered Granodiorite. Strongly Clay altered granodiorite with a purple (hematite?) staining.
			18.59	18.82			GNBN		m																		Phyllic Altered Grey Green Granodiorite. Phyllic alteration with orange brown limonite stainig along fractute surface. Disseminated pyrite and pyrite blebs throughout interval.
19.46	30.00	10.54				GRD	MDGY		t				s		ST	50				t							Medium Grey Granodiorite. There are a few areas of trace phyllic alteration throughout interval. Orange brown limonite stainbg on fracture surefaces. White quartz stringers are orientede at ~50° tca. Trace amounts of disseminated pyrite throughout interval.
			24.50	24.54	0.04	BXA	DKGY													w							Dark Grey Breccia with sub angular to sub rounded clasts. Contains weak amounts of disseminated pyrite and trace amounts of disseminated galena.
			24.54	24.58	0.04	VEN	DKGY													50							Dark Grey Sulphide Vein. 1cm thick and oriented at 80° tca. Contains latge pyrite blebs that make up 50% of the vein.
			25.77	25.93	0.16	GRD	GNG\	NE	m	m					VT	50	1	3									Phyllic and Clay Altered Granodiorite. Alteration is moderate for both phyllic and clay. White quartz veinlents are interconnected (0.7mm thick). They form a somple lattice or net texture. Veinlets are oriented at ~50° tca.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

													Other											Other				
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
			25.93	28.05	2.12	GRD	GYGN			s																	Clay Altered Light Grey Green Granodiorite. No visible sulphide mineralization. Grey quartz (3mm) veinlets oriented at 15˚ tca.
30.00	33.45	3.45				GRD	GYGN		w		f	i	lim	i	VT	75	0	2									Clay and Phyllic Altered Light Grey Green Granodiorite. Alteration Is fair clay and weak phyllic. Approximatly 60% of the interval is limonite stained orange/brown. White grey veinlets oriented at ~75˚ tca. No visible sulphide mineralization.
			30.25	30.45	0.20	GRD	GYOF	NE		f		i	lim	s													Clay altered Granodiorite with Heavy Net Texture Veining. White quartz and dark grey veinlets form the net texture. Orange and brown limonite staining in and around fracture surface. No visible sulphide mineralization.
33.45	48.15	14.70				GRD	GYPU					s	lim	m	ST	70											Medium Grey purple Granodiorite. Quartz stringers throughout interval are oriented at ~40˚ and ~70˚. Area around stringer and fracture surface is moderatly limonite stained.
			33.45	35.00	1.55	GRD	OR/BN			s			lim	i	VT	70	0	2									Strongly Clay Altered Granodiorite. Some areas are very altered and crumble when pressure is applied. Quartz veinlets are oriented at ~70˚ tca. Entier surface of interval is stained brown/orange from limonite. No visible sulphide mineralization.
			36.27	37.55	1.28	GRD	GYGN			s																	Clay Alterted Pale Grey Green Grabodiorite. No visible sulphide mineralization.
			37.12	37.43	0.31	BXA	DKGY	BX	m											t							Dark Grey Breccia. Matrix is dark grey and fine grain. Pale Green Clasts range from <1mm to 6cm across. Trace amounts of disseminated pyrite in dark grey matrix.
			39.46	40.00	0.54	GRD	GN		m	m					VT	20	0	3		w-f			t				Phyllic and Clay Altered Green Granodiorite. Alteration is moderate for both phyllic and clayl. Light grey calcite veinlets are oriented at ~10˚ and ~20˚ tca and range from 1-3mm thick. Weak to fair amounts of disseminated pyrite and pyrite blebs are located in the center of the interval along with trace amounts of galena.
			42.37	42.39	0.02	VEN	TNWH								VN	70	1	1									Chalcecony Calcite Vein. Banded milky tan chelcedonyt with white grey calcite in center of teh vein surrounded by the chalcedony. The vein is oriented at ~70˚ tca and is ~1cm thick.
			43.27	43.30	0.03	VEN	TNWH								VN	70	1	1		m							Similar to vein at 42.37-42.39m except calcite along the outside of teh chalecdony contains moderate amounts of disseminated pyrite and small pyrite blebs lined up in a string parrallel to the chaledony vein.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

116.55	132.76	16.21				GRD	GNGY		m	w			pro	t	VT	30	0	###									Phyllic and Clay altered Green Granodiorite. WHIte calcite veinlets oriented ~30°-50° tca.
			120.13	120.32	0.19	GRD	GNG\	AN			m									t							Sillica Altered Green Aphanitic Granodiorite. Can still be scratched by steel. Trace amounts of disseminated pyrite throughout interval.
			121.08	121.10	0.02	VEN	BNPU																				Brown Purple Vein with a hardness greater then 7.. Cross cut by infilled fractures.
			121.41	122.22	0.81	GRD	GYGN					m															Grey Unaltered Granodiorite with moderate oxidation in and around fractures
			123.34	123.86	0.52	GRD	GN								VT	80	0	6		s							Phyllic Altered Green Granodiorite. Strong pyrite dissemination throughout interval. Dark grey sulphide veinlets are oriented at ~50° and 80° tca.
			124.80	125.03	0.23	VEN	WH		w	w					VN	20	1	1		m							Large White Quartz Carbonate Vein oriented at ~20° tca. Dark Grey Stringers are parallel to the vein. Moderate amounts of pyrite dissemination around vein.
															ST	20		3									
			126.92	128.17	1.25	VEN	VEN			m-s		m	lim	m	VN	20	>1	1		i							Low Angle Quartz Vein and Dark Grey Breccia. Interval is moderate to strongly clay altered clay altered. Quartz vein is white to grey. Orange limonite staining/oxidation on fracture surfaces. Vein appears to cut through breccia. Intense amounts of disseminated pyrite.
			128.69	128.80	0.11	GRD	GNGY		s						VT	85	###	3		i							Phyllic Altered Green Grey Granodiorite. Grey quartz veinlets oriented at 95v tca. Intense amounts of disseminated pyrite.
			129.68	130.56	0.88	GRD	GN		ms						VT	15	2	4		s-i							Phyllic Altered Green Grey Granodiorite. Quartz veinlets oriented at ~15° tca. Strong to intense amounts of disseminated pyrite, it is more heavily concentrate around veinlets.
132.76	136.90	4.14				GRD	GYGN		f				pro	w	VT	75	0	###		w			w				Phyllic Propyllitic Altered Grey Green Granodiorite. Weak amounts of disseminated pyrite throughout interval. Galena veinlet oriented at 20 tca at bottom of interval. The rest of the veinlets are dark grey at ~20tca.
			135.76	135.78	0.02	VEN	MT													90			w				Massive Pyrite Vein with weak amounts of disseminated pyrite.
136.90						GRD	GY								ST	45		2									Grey Granodiorite. Quartz stringers orient at 45° tca.
			142.67	143.49	0.82	GRD	WHGN			s			pro	s													Alternating Clay and Propyllitic Alterbation throughout interval. No visible sulphide mneralization.
			143.49	144.04	0.55	GRD	GNYW			m																	Clay Altered Green Yellow Granodiorite
			144.04	145.12	1.08	GRD	GN		m	m										f							Phyllic and Clay Altered Green Granodiorite

GEOLOGY LOG

			144.07	144.09	0.02	VEN	DKGY								VN	70		1		i	t	ms	w				Dark Grey Sulphide Vein oriented approx 70° tca. Contains pyrite, arsenopyrite, sphalerite and galena.
145.12	147.12	2.00				GRD	GNGY			m			pro	s													Propyllitic and Clay Altered Green Light Grey Granodiorite. No visible sulphide mineralizatiom. Propylitic alteration is in patches throughout interval.
147.12	148.15	1.03				GRD	GNGY		i	m-s					VT	65	0	3		w							Phyllic and Clay altered Green Granodiorite. Moderate to strong clay alteration has made it brittle and fragile in some areas. Tan/orange carbonate veinlets are oriented at 65° tca. Wqeak amounts of disseminated pyrite throughout interval
			148.10	148.35	0.25	GRD	LTGN		s	s					VN	65	1	1		m							Same as interval 147.12-148.15m but has stronger clay alterationn and a large tan/orange carbonate vein.
148.35	158.24	9.89				GRD	GNPU		m				pro	ms						t							Propylitic and Phyllic Altered Purple Green Granodiorite. White quartz veinlets are oriented between 40° and 65°. Trace amounts of disseminated pyrite throughout interval.
			152.98	153.83	0.85	GRD	GNYW		s						VN	60	0	2		t							Phyllic Altered Green Yellow Granodiorite. Fark grey veinlets oriented between 60° tca. Trace amounts of disseminated pyrite throughout interval
			153.83	155.66	1.83	GRD	GYWH			s			pro	s													Propylitic and Clay Altered Granodiorite. Propylitic and clay alteration occure side by side throughout the interval.
			156.76	156.84	0.08	GRD	DKGY	BN	s											40							Dark Gray Band over phyllic altered Granodiorite with 40% disseminated pyrite.
			157.68	157.70	0.02	Clay	GY			100																	Grey Clay Layer
			158.19	158.22	0.03	GRD	DKGY		m						ST	70		3		i							Pyrite Stringers oriented ~70° tca.
158.24	168.18	9.94				GRD	GNPU						pro	s	VN	70	0	5									Propylitic Altered Purple Green Granodiorite. Quartz and carbonate veinlets oriented at 60°-80° tca.
			158.62	158.98	0.36	GRD	GNYW		ms	ms					VN	60	2	1									Phyllic and Clay Altered Granodiorite. Tan and white quartz vein oriented at 60° tca, near the botton of the inrterval.
			159.11	159.16	0.05	GRD	WTGN			s																	Clay Altered White Green Granodiorite
			159.41	159.73	0.32	GRD	WTGN			s																	Clay Altered White Green Granodiorite. Slightly broken up and crumbly.
			159.00	159.73	0.73	GRD	GN		s						VT	65	1	1		m							Phyllic Altered Granodiorite. Tan and grey quartz veinlet with disseminated pyrite oriented at ~65° tca.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS								PHOTO	DETAILED DESCRIPTION
													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
			161.67	162.02	0.35	POR	DKBN								ST	60		4		m							Black and Brown/Green Quartz Feldspar porphyry Dyke. Interval starts with black mafic dyke with 2 1cm bands of brown/green alteration. Hlaf way through the interval, the dyke is completely altered to brown/green. Moderate amounts of disseminated pyrite in brown/green altered areas. tan quartz carbonate stringers oriented at ~40˚ to ~60˚ tca.
			162.07	162.08	0.01	VEN	WHTN								VN	70	1	1		ms-s	t	f					White/Tan Quartz vein with fait amounts of blackjack spalerite blebs, disseminated trace amounts of arseno pyrite and disseminated and blebs of pyrite.
			166.06	166.98	0.92	POR	BK								VT	75	0	8		i							Black Quartz Feldspar porphyry Dyke. Intense amounts of disseminated pyrite and small pyrite blebs throughout the entier interval. Quartz veinlets oriented at 70˚-80˚ tca.
168.18	173.31	5.13				GRD	GNGY			m-s					VT	75	0	6									Clay Altered Yellow Green Granodiorite. Tan quartz veinlet oriented at ~70˚-80˚ tca. No visible sulphide mineralization
			169.96	170.10	0.14	GRD	WHGY				ms		pro	s													Propyllitic and Clay Aktered Granodiorite. 15cm of propylitic alteration in the center of theinterval. It is bounded on either side by by 10-12cm of clay alteration.
			171.42	171.88	0.46	GRD	ORGY			m-s	f																Sillica and Clay Altered orange and Grey Granodiorite. Sillica alteration is heavily fractured. Clay alteration increases in teh last 12cm of interval. Rockis much weaker in the clay altered areas.
			172.95	172.98	0.03	VEN	TNBK								VN	75	2	1									Tan Grey Quartz veins with dark grey stringers running throught it. No visible sulphide mineralization
173.31	175.79	2.48				GRD	GYGN						pro	s	VT	70	0	2									Propylitic Altered Grey Green Granodiorite. White quartz veinlets oriented 70˚ tca.
			173.36	173.72	0.36	GRD	GNWH		m	s																	Clay and Phyllic Altered Granodiorite. Clay and phyllic alteration alternates throughout interval in bands.
			173.98	174.73	0.75	GRD	GN		s						FX	0-5		1									Phyllic Altered Granodiorite with clay filled fractures oriented 0˚-5˚ tca.
175.79	181.35	5.56				GRD	GYGN						pro	w						w							Weakly propylitic Grey Green Granodiorite. Disseminated Tourmaline throughout interval.
			178.30	178.35	0.05	GRD	GYGN						pro	w	ST	70		4		m							Dark Grey Pyrite Stringer Zone

53.28	58.26	4.98				GRD	GYPU																				Medium Grey Purple Granodiorite. Darker then interval 42.90-53.28.
			53.94	54.31	0.37	GRD	GN								VN	70	3	1									Phyllic and Clay Altered Granodiorite. White Grey and Tan quartz vein.
			57.13	57.32	0.19	GRD	GN		ms	ms					VT	65	1	1									Phyllic and Clay Altered Granodiorite. Grey quartz veinlet.
58.26	60.77	2.51				GRD	GN		s	s		f			VT	85	0	2									Strongly Phyllic and Clay altered Green Granodrioite. Grey quartz veinlets.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS								Photo	DETAILED DESCRIPTION
													Other											Other				
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
			58.61	59.00	0.39	GRD	GN		s	s					VT	85	0	8		m								Abundant veinlet zone in Phyllic and Clay altered Granodiorite. First half of interval is more heavily clay altered. Dark grey sulphide veinlets are abundant throughout the interval. Moderate amounts of disseminated pyrite in and around veinlets.
			60.35	60.51	0.16	VEN?	DKGY	VU			s	m								m								Sillicified Dark Grey mafic rocks with weak amounts of disseminated pyrite. Grey vein runs through the middle with breccia texture containing moderate amounts of disseminated pyrite. The interval contains and abundance of small vugs.
60.77	71.57	10.80				GRD	GYPU																					Same as interval 53.28-58.26
			61.40	61.75	0.35	GRD	GNYW		m	m			pro	m	VT	75	0	3										Phyllic, Propyllitic and Clay Altered Granodiorite. Tan and white quartz veinlets.
			64.44	64.76	0.32	GRD	YWGN								VT	75	0	3										Phyllic, Propyllitic and Clay Altered Yellow Green Granodiorite. Tan and white quartz veinlets.
			68.69	68.71	0.02	VEN	TN								VN	70	1	1										Tan uartz Vein with partial breccia texture
			69.34	69.47	0.13	GRD	GN		m																			Phyllic Altered Granodiorite with trace amounts of disseminated pyrite.
71.57	77.45	5.88				GRD	GNYW		s	f-s					ST	80		1-2		t-w								Phyllic and Clasy Altered Green yellow Granodiorite. Clay alteration is strongest for the first 30 cm of the interval. Phyllic alteration then becomes more dominanat for the rest of the interval with a few small patches of clay alteration throught. Areas in and aorund stringers contain high amounts of disseminated pyrite.
			72.48	73.12	0.64	GRD	GN		s	w					ST	80		12		ms								Phyllic altered Green Granodiorite. It contains an abundance of white quartz and dark grey sulphide stringers and white quartz stringers.
			72.52	72.68	0.16	VEN	BKTN	BX							VN	55	7	1		ms	m	m	m					Dark Grey/Black Sulphide vein intruded by tan quartz, breaking it up forming a brecciated texture. Tan breccia veins and dark grey sulphide veins are layered ontop of each other giving it a banded appearence. Dark grey clasts and sulphide veins contain pyrite, galena, arsenopyrite and sphalerite. Top and bottom of vein are capped by strongly clay altered granodiorite.
			72.98	73.02	0.04	BXA	GNTN		s											ms								Green and Tan Breccia. Tan quartz intruded green phyllic altered granodiorite forming a breccia texture. There is moderate strong pyrite mineralization.
			73.07	73.08	0.01	VEN	BKMT								VN	80	1	1		s	f	ms						Dark Grey Sulphide Rich Vein
			73.53	73.56	0.03	VEN	BKWT	VU			ms																	Black Silicified Vein with a white chalcedony vein that contains a vugg.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
			385.75	387.06		GRD	PKGR	VN					pot	m	VT	0								To?	wf		Shallow To? Veins cross cut mod potassic altered GRD
			389.24	397.14		GRD	GRLT		w				pro	s	VN	80	<1	3		w							Light green strong propylitic and weak phyllic altered GRD with sub intervals of strong phyllic altered GRD. Py veinlets throughout (3/m)
			390.48	391.40		GRD	GY	DI	s											w							Grey, strong phyllic altered GRD with disseminated Py pervasively. Cross cut by a shallow, grey/white Qz vein, with 90% massive medium grained Py crystals
			391.71	392.85		GRD	GY	DI	s											w							As above
															VN	5	2			95							
			395.97	396.14		GRD	GY	DI	s											m							Strong phyllic altered GRD with 5-7% disseminated Py, no vein present
			397.14	398.04		GRD	PKGR	MG					pro	ms													Dark green/pink mod/strong propylitic altered GRD overprinting by potassic alteration
							DK						pot	ms													
398.04	419.40					GRD	GYMD	MG					pot	w	VN	85		1		t							Relatively unaltered GRD, may be weak potassic overprinting? As some feldspars are pink. Infrequent Py veinlets
			408.66	409.71		GRD	PKGR	PA					pot	m	VN	45	2			f				To?			Patches of mod, potassic alteration, stronger around To vein with Py replacing
			410.46	410.57		APL	PK	FG							DK	80											Aplite dyke
			410.14	410.17		APL	PK	FG							DK	85											Aplite dyke
			417.50	417.88		GRD	GRLT	EN					pro	s	VT	88				t							Strong propylitic envelope around a grey/white veinlet with trace Py
			418.12	418.33		GRD	GRLT	EN					pro	s	VT	88				t							As above, except veinlets is white/off white milky Qz
419.40	EOH																										

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	3.69	3.69	CAS	Casing; no recovery
3.69	23.02	19.33	GRD	Weakly propylitic altered granodiorite with minor veinl
23.02	36.67	13.65	GRD	Strongly clay altered zone - fault(?)
36.67	80.86	44.19	GRD	Variably propylitic and phyllic granodiorite. Mineralize
				veinlets and minor breccia "veins"
80.86	91.51	10.65	GRD	Weakly bleached clay granodiorite
91.51	134.92	43.41	GRD	Clay and phyllic altered granodiorite. Porphyritic dyke
				at 98.86-99.57m
134.92	139.32	4.40	POR	Quartz-feldspar porphyritic dyke
139.32	157.58	18.26	GRD	Phyllic altered granodiorite with possible faulting at
				139.32-140.06m and 143.98-144.80m
157.58	166.48	8.90	POR	Quartz-feldspar porphyritic dyke
166.48	184.7	18.22	GRD	Phyllic altered granodiorite

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
0.00	3.69	3.69				CAS																					Casing - no recovery
3.69	11.65	7.96				GRD	GN/BN	BK	tw			ms	lim	m	FX												Weathered granodiorite, possible overburden; Blocky, borken, locally oxidized granodiorite with moderate phyllic and propylitic alteration. Likely overburden boulders due to large amounts of redrilled core. Limonite along fractures. Minor zones of cushed rock present.
11.65	19.51	7.86				GRD	GY					f	pro	tw	FX	30-50		5									Weakly propylitic granodiorite; Grey with faint green colouring (weakly propylitic altered) granodiorite. Moderately competent with minor-moderate amounts of fracutring. Weak-strong oxidation on fractures.
							DKGN								ST	45-60	<0.1	2						Cl?			Low vein desnity, generally dark green narrow stringers noted - chlorite(?).
																			t					He	t		Rare-trace sulphides noted. Possible hematite(?).
			13.61			APL	PK								DY?	25	~1										Irregular pink band crosscutting core rock - aplite(?).
			15.98	16.11	0.13		LTGN					m			FX	60		2		t							Fracture zone with increased oxidation and moderate phyllic alteration. Trace disseminated sulphides.
19.51	23.02	3.51				GRD	YWGN		m				lim	w	FX	35-55		2									Phyllic granodiorite; Fair-moderate phyllic granodiorite, likely due to fault structure downhole, weakly texturally destructive. Patchy zones of diffused silica "veinlets", generally with brown-orange oxidized envelopes. Narrow dark green strigners also noted. Minor-moderate fracturing with oxidized fracture sufraces. Increasing phyllic alteration moving downhole.
							BNOR	EN				f															
							GY								VT	40-60	<2	3									
							DKGN								ST	35-55	<0.1	3						Cl?			
																				w							Fine-medium disseminated sulphides scattered throughout the matrix.
			22.41	22.67											FX												Zone of shattered core rock bearing subangula fragments, generally <3cm across.
23.02	36.67	13.65				GRD	TN		s	ms		f			CN	50											Strongly clay altered granodiorite - Faulted(?); Moderate-strongly phyllic and clay altered and oxidizied granodiorite. Weak rock, approximately 50% comprised of crumbled, shatttered or blocky zones - fault(?)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

													Other												Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
															FX	35-45											
						FLT?									FLT											x	Faulted, crumbled zones appear to occur at low angles (<30°) to core axis (cutting core at oblique angle).
								DI											t	t							Trace disseminated sulphides, often only occurs in locallized sections.
			30.28	31.80	1.52		LTBN			s					GO?	50-70											Strongly clay altered and oxidized interval. Crumbled and strongly weathered with appearance of dried clay.
			31.86	34.15	2.29		LTGN					t															Decreased oxidation / weathering
			35.92	36.67	0.75			BK																			Slightly more competent core rock with shattered zones.
36.67	76.21	39.54				GRD	GY						pro	tw	FX	55	1											Weakly propylitic granodiorite; Similar to 11.65-19.51m. Weakly prophylitic granodiorite, with trace amounts of oxidation noted on some fracture surfaces.
							DKGN								VT		<0.1	2						Cl?			Low vein density, dominantly lnoted are dark green stringers with two preferreed orientations at ~60° and ~20° to core axis - possible cholrite(?)
																											Rare sulphides.
			43.49	47.73	4.24		MDGN		t?				pro	w													Slight increase in propylitic alteration with possible weak phyllic overprinting(?). Appears to partly be due to narrow and irregular carbonate veinlets. No changes to sulphide content.
							TNBN								VT	10-30	<0.2	4									
			45.46	45.89	0.43		DKGN								VT	20	0.4										Dark green low angle veinlet. No sulphides
			46.51	46.69	0.18		LTGH	EN		f			pot														Clay altered (bleached) evnvelope surrounding narrow carbonate veinlet. No changes to sulphide content.
							WHGY								VT	50	0.3										
			48.14	48.35	0.21		LTGN	EN	t?	f																	Similar to 46.51-46.69m. Bleached/clay altered envelopes to narrow band carbonate veinlet. Weakly crumbled at edges of zone.
							GY								VT	70	0.3										Similar to 46.51-46.69m. Bleached/clay altered envelopes to narrow band carbonate veinlet. Weakly crumbled at edges of zone.
			48.86			VEN	DKGY	BX							VT	50	0.5										Dark grey breccia "veinlet". Dark grey matrix (quartz + ?) with subangular carbonate clasts (<0.3cm across).
			49.46			VEN	DKGY	BX							VT	40	0.3										Similar to 48.86m.
			49.71			VEN	GY/H								VT	10	0.4										Low angle quartz-carbonate veinlet

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
			98.62	99.57	0.95		WH/PK			m																	Moderate-strong clay altered zone, likely due to dyke contact downhole.
98.86	99.57	0.71				POR	PUBN	PO							DY	55											Porphyritic dyke; Purple-brown quartz-feldspar porphyritic dyke. Wekaly brecciated lower contact, infilled with carbonate. No significant sulphides.
99.57	104.25	4.68				GRD	LTGN								FX	40		3									Altered granodiorite; Moderate-strongly caly and phyllic altered granodiorite. Competent core rock with minor clay/gouge on fracture surfaces.
							DKGY	BX							VT	30-40	<1	1									Minor veining density with irregular narrow veinlets, has weakly brecciated textures.
																			t								Rare sulphides.
			100.40				DKGY	BX							VT	35	1.5			t							At 100.40m, dark grey brecciated veinlet. Fine sulphides noted.
104.25	107.42	3.17				GRD							pro	tw	FLT?	65								He	tw		Granodiorite; Similar to 91.51-98.86m, possibly faulted. Broken and blocky core rock with approximately 30% of interval rubble zones. Weakly propylitic altered granodiorite. Red-brown staining (likely hematite) on fracture surfaces. No significant sulphides present.
107.42	112.22	4.80				GRD	LTGN		m	w					FX	35-60		3									Altered granodiorite; Bleached light green moderately clay and phyllic altered granodiorite. Fairly competent core rock with minor fracturing.
							TNBF								VT	30-60	<0.5	2									Low veining density, generally cream coloured carbonate veinlets at moderate angles (~35-60°) to core axis.
								DI											t								Rare sulphides, generally occurs close to veinlet structures.
			108.84	109.28	0.44	FLT?	LTGY								GO	70				tw							Zone of grey gouge, likely was very weakly mineralized. Reminants of quartz veinlet noted - possible fault(?).
112.22	131.37	19.15				GRD	GY		w	t			pro	tw	FX	30-60		4									Granodiorite; Weak-moderately propylitic granodiorite with patches of variable clay and/or phyllic alteration. Minor-moderate fracturing.
							WH								VT			4									Low-moderate veining density, generally narrow quartz-carbonate veinlets in phyllic altered zones. Dark green veinlets (chlorite?) also noted. Minor zones of breccia "veins".
																			t	t							Trace dissminated sulphides, generally noted in phyllic zones.
			113.76	113.95	0.19		WH			m					C	55											Increased bleaching/clay alteration. No change in sulphide content.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			14.24	14.53	0.29		GN						PRO	t	Fx	60								lim	t		Propylitic altered envelope around a limonite hematite stained fracture at 4.33 m orientated at 60 degrees
					0.00																			He	t		
			15.35	15.37	0.02	APL	PK								DY	65											Aplite dyke
			16.77	17.24	0.47		GNOR		w		w									t				Se	tw		Phyllic altered envelope hosting minor disseminated pyrite and limonite stained fractures. Silver sericite crystals.
			17.00	17.03	0.03	VEN		FL				t			VN	55				f							
			19.25	19.85	0.60		GNOR						PRO	w										lim	tw		Propylitic altered granodiorite around limonite stained fractures. Dark green colour fades into a pale green late in the zone. Hematite blebs disseminated through interval.
																								He	t		
			20.40	20.54	0.14	MAF	DKGN								DY	85											Fine grained mafic dyke. Limonite stained fractures.
			23.68	24.19	0.51		ORWH			m		ms	ARG	m													Weak propyltic granodiorite grading into a highly limonite stained, argillic altered kaolinite rich interval.
			24.57	24.75	0.18	VEN	GN				tw		PRO	m	VN	75				t				lim	t		Propylitic altered envelope around a quartz vein hosting disseminated pyrite at 24.65m. Very weak limonite staining around vein and in fractures.
			26.01	26.52	0.51		GNWH			w		tw	ARG	tw										lim	m		Argillic altered zone grades into extremely rubbly material at the end. Narrow quartz veinlet at center of zone.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
			27.03	27.37	0.34		ORWH					t	ARG	m										lim	m		Argillic altered granodiorite. Very competent for an argillic altered zone. kaolinite veinlets throughout zone.
			30.45	31.04	0.59		ORGN				tw		PRO	t										lim	ms		Highly oxidized, propylitic altered envelope, strong quartz flooding in center of zone. Blocky area at end of zone.
			31.04	35.50	4.46		LTGY					tw												Ca	tw		Much coarser grained granodiorite absent of k-feldspar phenocrysts. Strong limonite staining in numerous fractures with all varieties of orientation. Fractures host massive calcite veinlets with areas of calcite veins.
																								lim	tw		
			33.18	33.46	0.28	VEN	WHOR	VU				tw												Ca	>20		Massive calcite vein with zones of intense limonite staining. Vuggy.
																								lim	tw		
			44.25	44.35	0.10		GN				tw		PRO	m	VT	85											Propylitic altered envelope around a chalcedony veinlet <1cm. Smaller veinlets around main one.
			45.16	48.00	2.84		LTGY	BK				tw												lim	tw		Coarser grained granodiorite absent of k-feldspar phenocrysts. Strong limonite staining in fractures
			47.67	47.70	0.03	VEN	GY	FL			s																smokey quartz vein with milky quartz stringers running parallel through it.
			52.04	52.11	0.07		GN				tw		PRO	m										Cl	tw		Propylitic altered granodiorite, apparent chlorite crystals.
			54.02	54.58	0.56	BXA	GN	BX	t			t			BX	60				t				lim	t		Phyllic (weak) altered silicious breccia zone. Zone is soft and broken and hosts very rare disseminated pyrite. Breccia clasts are largely milky quartz. Limonite staining in fractures.
			55.03	55.27	0.24	VEN	GN	VU	tw		tw				VN	55				tw				Go?	t		Phyllic altered vein zone hosting disseminated pyrite and sheeted milky quartz veins. Veins are vuggy, no sulphides in veins. Fractures have goethite/chlorite? Staining on surfaces.
			55.72	56.01	0.29		BKGN	BK					PRO	tw						t				Go	tw		Propylitic altered zone with narrow milky quartz stringers. Goethite stained fractures. Minor disseminated pyrite on fracture surfaces.
			56.48	57.00	0.52	VEN	WHGN		w		w				VN	60				t				Se	t		Weak phyllic altered milky quartz vein zone. Pale green colour, sericitized, very rare fine grained pyrite. Chlorite at end of zone.
																								Cl	t		
			60.44	61.06	0.62	VEN	WHGN	NE	t		ms				VN	80								Se	tw		Vein zone hosting netted milky quartz veins and veinlets. Puke green coloured, phyllic altered granodiorite between quartz veins. Quartz flooded, some smokey quartz in place of milky quartz.
			61.42	61.54	0.12	MAF	DKGN								DY	85											fine grained mafic dyke hosting small white phenocrysts (feldspar?).

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
			63.78	64.08	0.30		DKRD	BK																He	s		Strongly hematite altered zone. Extreme hematite staining in fractures. Chlorite crystals in competent, hematite free areas.
																								Cl	tw		
			65.61	65.64	0.03	VEN	LTGN								VN	40								Ep	m		1cm epidote vein crosscutting unaltered granodiorite. No sulphides.
			68.22	68.58	0.36		PK	FD			f		POT	w										He	f		Potassic altered zone hosting pervasive hematite and epidote. Area is quartz flooded and hosts a dappled texture. Quartz flooded zone acts like a zenolith and does not pass through the core.
																								Ep	f		
			68.58	67.20	-1.38		WHBK	SA		s														Cl	tw		Argillic altered zone, extremely broken/sand hosting minor ammounts of chlorite in altered material. Clasts of unaltered granodiorite through zone. Speckled look.
			67.81	68.26			DKGN	FG					PRO	tw													Propylitic (weak) altered fine grained granodiorite. Very dark green colour. Argillic/carbonate alteration in fractures.
			68.96	69.03		APL	PK								DY	40											Aplite dyke
			71.99	72.54			GNWH			w			PRO	tw													Argillic to propylitic altered zone. Pale green to white in colour. Easy to identify granodiorite characteristics (weak alteration).
			72.99	73.20			DKGN						PRO	tw													Weak propylitic alteration around a very broken cracked area in the middle. Green colour to the granodiorite. Otherwise unaltered.
			75.02	75.47			DKGN				t		PRO	tw										Cl	tw		Slightly increased siliciousness in a dark green propylitic granodiorite. Chlorite disseminated in zone, particularly prevelent in quartz rich areas.
			76.14	76.22		VN	GN				w		PRO	f	VN	80											Milky quartz vein 1cm in width surrounded by a propylitic altered envelope. Very weak potassic altered clasts extremely spaced out. kaolinite disseminated in zone.
			78.66	78.83		VN	GNWH				tw		PRO	f	VN	85											Milky quartz vein 3cm in width surrounded by a propylitic altered kaolinite disseminated in zone.
			82.21	82.26		APL	PK								DY	80											Aplite dyke
			86.52	86.92			LTGN		f		t									f				Se	w		Phyllic altered envelope around a quartz/massive pyrite vein zone. Zone hosts disseminated pyrite and sericite throughout zone. Increased abundance near vein. Weak quartz flooding.
			86.74	86.80		VN		FL			30				VN	80				i							Milky quartz vein hosting massive to disseminated pyrite. Smokey quartz vein on footwall side of milky quartz vein. Vein appears somewhat brecciated with milky quartz hosting angular smokey quartz clasts. Massive pyrite vein on hanging wall side.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
			92.64	93.09			GNWH			w			ARG	w													Argillic altered zone. Speckled white and green. Very broken. Unaltered fragments of granodiorite throughout zone. Carbonate in fractures
			97.83	98.92			GNWH			w			ARG	w													Argillic altered zone. Speckled white and green. Very broken. Unaltered fragments of granodiorite throughout zone. Carbonate in fractures. Very competent for clay altered zone.
			98.92	99.45			LTGN		f		tw									tw							Phyllic altered envelope around a quartz/pyrite vein. Zone is pale green in colour and hosts pervasive pyrite. Rock is quartz flooded.
			99.08	99.25		VN		FL	i		30				VN	75				f							Silicious banded milky quartz/smokey quartz vein zone hosting pervasive pyrite.
			103.68	103.92			GN	FD	s		f									tw				Cl	tw		Quartz flooded, phyllic altered zone, pale green colour hosting disseminated pyrite. Some minor pyrite stringers. Chlorite blebs (rare). Some smokey quartz stringers in zone.
			104.86	105.64			LTGN	FD	s		f									tw				Go	w		Strongly phyllic altered zone hosting quartz/pyrite veins. Goethite disseminated in rock and along fractures at front of zone. Disseminated pyrite and sericite throughout (pale green colour). Milky quartz veins and veinlets in zone are orientated at 55 degrees.
																								Se	f		
			105.32	105.42		VN		FL	i		30				VN	75				tw							Banded smokey and milky quartz vein hosting massive pyrite veinlets and disseminated pyrite. Ankorite stringers in zone. Quartz is slightly vuggy. Flow banded structures are prevelent.
			105.64	106.69			DKGN						PRO	t										CL	w		Weakly propylitic altered granodiorite. Strong chlorite pervasive in zone. Competent rock grades to mostly unaltered in areas. Minor argillic alteration in fractures.
106.69	109.00					GRD	GNGY		i		i									s		tw	tw	Se	w		Intensely phyllic altered vein zone hosting numerous vuggy quartz, pyrite, sphalerite veins and veinlets. Most are orientated at 75 degrees. Area has pervasive pyrite throughout and rare blebs of galena in vein zones. Minor argillic alteration in some areas. sericite is found throughout (strong).
			106.89	106.93		VN	GY	FL			60				VN	80				s				He	t		Banded smokey and milky quartz vein hosting blebby to massive pyrite. Very rare disseminated hematite.
			106.97	107.01					i						GO	80				s							Intense phyllic altered granodiorite down to gouge. Large pyrite cubes disseminated in zone. Pale green colour.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			107.15	107.50		VN		FL	i		20				VN	60				s				He	t		Milky quartz vein zone. Quartz veins upto 3cm wide run parallel to each other and host massive to blebby pyrite. Zone is extremely quartz flooded. Weak disseminated hematite in zone. Pervasive pyrite/sericite throughout zone.
			107.72	107.81		VN		FL	i		50				VN	55				s			t				Milky quartz vein zone. Quartz veins upto 3cm wide run parallel to each other and host massive to blebby pyrite. Zone is extremely quartz flooded. Weak disseminated hematite in zone. Pervasive pyrite/sericite throughout zone. Zone includes some smokey quartz bands.
			108.03	108.22		VN		FL	i		50				VN	75				s		t	t	He	tw		Quartz vein hosting disseminated galena, massive pyrite veins and sphalerite stringers. Pervasive pyrite throughout. Quartz netted hematite veinlets in zone. Both smokey and milky quartz varieties prevelent.
			108.70	109.00				BK	i		i									w				Se	w		Phyllic altered granodiorite hosting pervasive pyrite and sericite. Highly quartz flooded. Fragmented and extremely blocky.
109.00	110.55					VN	MT	MA			i				VN	80				i	m	ms	f	Cp	f		Massive vein zone extremely strong, alternating from milky quartz, sphalerite, pyrite and arsenopyrite veins. Veins host blebby galena throughout. Smokey and milky quartz intertwine between massive sulphide veins. Blebby chalcopyrite is also found throughout zone. blocky fragments.
110.55	111.43					FEL	LTGY	MA							DY	75											Feldspar porphyry dyke. Netted fractures. Feldspars have gone pale green.
111.43	114.31					GRD	LTGN	DN	i											w				Se	w		Intensely phyllic altered zone hosting numerous quartz veins. Large areas of clay gouge. Strong clay in fractures. Strong disseminated pyrite/sericite throughout zone. Pale green sericitized colour.
			111.43	111.81			DKGY		i						GO	75				s	tw						Strong clay gouge zone. Extremely broken. Comeptent clasts of quartz (smokey) hosting massive to disseminated arsenopyrite and pyrite. Pervasive pyrite through zone.
			112.10	112.17			DKGY		i						GO	60				s							Strong clay gouge zone. Extremely broken. Comeptent clasts of quartz (smokey) hosting massive to disseminated pyrite. Pervasive pyrite through zone.
			113.09	113.10		APL	PK								DY	85											altered aplite dyke. Very pale in colour
			113.24	113.32			DKGY		i						GO	75								Se	w		very broken clay gouge area. Pale green dark grey colour. No sulphides. Strongly sericitized.
			113.57	113.68			DKGN		i						GO	65								Se	w		very broken clay gouge area. Pale green dark grey colour. No sulphides. Strongly sericitized.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
			114.02	114.31			GY		i						GO	70											Gouge zone contact with quartz feldspar porphyry dyke. Gouge is half dyke, half phyllic altered granodiorite. Forest green band in the middle. Extremely broken.
114.31	116.01					FEL	LTGY	MA							DY	75											Quartz feldspar porphyry dyke. Netted fractures
116.01	117.40					GRD	LTGN	DN	i															Se	f		Intensely phyllic altered granodiorite hosting large area of clay gouge. Some minor quartz veining. Strong pervasive sericite. Chlorite in some small loacations (disseminated).
																								Cl	t		
			116.01	116.13		VN	DKGY				i																Netted smokey/milky quartz vein. Zone very silicious. No sulphides.
			116.77	117.41			GN		i						GO	70								Se	w		extremely altered gouge area. Milky quartz fragments throughout. Strong chlorite in some locals. Sericite throughout. No sulphides.
																								Cl	tw		
117.40	121.30					FEL	LTGY	MA							DY	80											Quartz feldspar porphyry dyke. More finegrained than usual.
121.30	136.25					GRD	GY																				Fresh or unaltered granodiorite, small infrequent narrow phyllic and propylitic altered zones at beginning of intercept near the dyke's footwall. Very little mineralization.
			121.30	122.14			LTGN		s		f				VN	75				w				Se	w		Quartz flooded, phyllic altered zone hosting disseminated pyrite/sericite. Strong quartz at beginning of zone adjacent to dyke. Milky quartz veinlets crosscut zone. Dark green early in zone grades out to light and then puke green late in the interval.
			122.94	123.02			BKWH			s					C	75											Speckled strongly argillic altered zone. Very soft. Possible biotite alteration. Kaolinite prevalent. Pale pink feldspars in zone.
			123.02	123.34			GN		tw		t				VT	60				t				Ep	tw		Weak phyllic altered zone. Minor disseminated pyrite. Disseminated epidote in zone. Weak sericite. Some milky quartz veinlets at beginning of zone.
																								Se	t		
			123.73	124.13			GN			t			PRO	tw										He	t		Propylitic altered envelope. Minor disseminated hematite. Minor quartz flooding. Large sericite crystals loosely spread out over interval.
																								Se	tw		
			132.39	132.57		MAF	DK	FG							DY	60											Mafic, fine grained dyke. Dark green to black in colour.
																											136.25 E.O.H.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	3.64	3.64	CAS	Overburden (no recovery)
3.64	42.32	38.68	GRD	Oxidized, unaltered granodiorite.
42.32	57.00	14.68	GRD/FEL	Highly phyllic altered granodiorite hosting two
				feldspar porphyry dykes with narrow mineralized
				breccia envelopes.
57.00	76.45	19.45	VN	BRX zone. Massive pyrite/sphalerite/arsenopyrite
				hosted in milky quartz veins with extremely phyllic
				altered granodiorite envelopes. Numerous feldspar
				porphyry dykes in zone.
76.45	208.55	132.10	GRD	Patchy propylitic and phyllic altered granodiorite
				hosting numerous, infrequent quartz veins with
				massive to blebby pyrite and chalcopyrite.
208.55	215.82	7.27	VN	Vein zone hosting massive galena/sphalerite/pyrite
				and chalcopyrite.
215.82	316.28	100.46	GRD	Alternating propylitic/phyllic altered granodiorite.
				Few argillic altered zones.
316.28	320.21	3.93	VN	Vein zone hosting massive galena/sphalerite/pyrite
320.21	361.8	41.59	GRD	Largely unaltered granodiorite

													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
0.00	3.64																										Casing, no recovery
3.64	31.49					GRD	GYOR					w												Lim	w		Unaltered granodiorite, very competent, large zones of oxidized granodiorite. Oxidation in fractures. Some minor goethite and hematite associated with limonite/oxidized zones. Limonite is typically coloured bright orange.
			4.13	4.21			OR					i			FX	55								Lim	s		Highly oxidized granodiorite around a fracture orientated at 55 degrees.
			4.38	4.49			OR					i			FX	80								Lim	s		Highly oxidized granodiorite around a fracture orientated at 80 degrees.
			5.91	7.22			OR			tw		i			C	60								He	t		Highly limonite stained/oxidized granodiorite. Moderate argillic alteration appears beneath limonite staining. Highly argillic altered areas are very broken. Rock is fairly soft. Prevalent goethite staining on some fractures. Rare hematite bands and quartz stringers in zone. Possible, very weak chlorite in some areas.
																								Go	tw		
			8.78	8.84			OR					i			FX	75								Lim	s		Highly oxidized granodiorite around a fracture orientated at 75 degrees.
			9.31	9.79			OR			tw		i												Lim	s		Argillic altered, strongly oxidized zone. Very broken/soft. Possible biotite alteration in zone. Large abundance of kaolinite. Zone grades into a more competent fine grained material with goethite staining on fractures.
																								Bi	t		
			9.79	10.07			GN			tw		t												Lim	s		Highly altered and fractured broken clay zone. Clay material is green stained. Fragments in zone appear fine-grained and goethite stained.
																								Go	t		
			10.69	11.05			OR	FD			w													Lim	s		Oxidized, quartz flooded zone. Dappled quartz in zone. Weak hematite around some fractures. Hematite stained quartz stringers at center of zone.
																								He	t		
			11.26	11.29			OR					i			FX	80								Lim	s		Highly oxidized granodiorite around a fracture orientated at 80 degrees.
			11.70	11.74			OR					i			FX	80								Lim	s		Highly oxidized granodiorite around a fracture orientated at 80 degrees.
			12.08	12.81			ORGN				t	m	PRO	w	VT	45				t				Lim	m		Oxidized propylitic altered granodiorite. Pale greer colour where not oxidized. Rare disseminated sericite in oxidized zones (metallic). Thin pyrite stringer in center of zone . Minor silica flooding through zone.
																								Se	t		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

			13.21	13.29			ORGN		t			m			VT	75				t				Lim	tw		Weakly phyllic altered. Oxidized granodiorite. Very weak/minor disseminated pyrite in zone. Pyrite stringer adjacent to milky quartz stringer at center of zone.
			13.79	15.86			ORGN			tw		i												Lim	s		extremely limonite altered, highly fractured, oxidized granodiorite. Broken. Hematite throughout zone. Disseminated biotite in clay altered regions (biotite alteration?). Hematite is a deep red colour. Zone is bright orange.
																								He	w		
			14.73	14.76		VN	WHGY	FL			100				VN	80				t							Banded milky quartz and smokey quartz vein zone hosting very rare, fine grained disseminated pyrite.
			15.53	17.31			ORGY	BK				s												Lim	s		Oxidized granodiorite. Extremely strong/orange limonite in fractures. Fractures orientated sub-parallel with core. Blocky composition. Competent rock.
			19.35	19.43		MAF	DKGN								DY	75											Fine grained mafic dyke hosting large white phenocrysts . Dyke is very dark green in colour.
31.49	40.26					GRD	ORGY	BK		tw		i	ARG	tw										Lim	s		Extremely oxidized. Blocky granodiorite. Large areas of clay gouge. Minimal areas of phyllic to propylitic altered granodiorite. Milky quartz clasts throughout gouge zones. Very minor pyrite, galena, hematite in zone.
			33.18	33.41			ORGN		w		tw	m			C	50				tw				Lim	s		Silica flooded, highly phyllic altered zone hosting disseminated to blebby pyrite. Milky quartz and smokey quartz veins and veinlets. Low angle pyrite veinlet along whole interval. Sulphide pitted, highly oxidized.
			33.53	33.56		VN	GYWH	FL			80	m			VN	70								Lim	tw		Flow banded milky and smokey quartz veins. Vuggy texture at footwall contact.
			34.14	34.93			OR				tw	m			GO	60								Lim	w		Extremely broken gouge. Quartz fragments throughout zone. Some clasts appear sulphide pitted and possibly phyllic altered. Oxidized.
			35.05	35.11		VN	GNWH		tw		t	m			VN	65				w				Lim	w		Phyllic altered, oxidized granodiorite hosting a massive pyrite vein 1cm wide. Disseminated pyrite throughout zone. Abundant silica in zone and quartz fragments.
			35.14	35.27		VN	GNWH		tw			m			VN	70				w				Se	t		Sulphide pitted phyllic altered granodiorite. Light, pale green colour. Minor disseminated sericite in zone. Massive pyrite vein 1cm wide in center of zone. Oxidized edges.
			35.71	36.95		VN	GNWH	BK	tw		t	w			VN	80				tw		tw	tw	He	tw		Phyllic altered vein zone, pale green/white granodiorite cross cut by purple, hematite stained veins hosting blebby to massive pyrite, galena and sphalerite. 3 one cm veins in a 20cm zone. Milky and smokey quartz also present.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

52.48	64.42	11.94			0.00	GRD	GNGY		w-s	s																	Strongly Pyllic Altered Granodiorite with weak to strong amounts of clay alteration throughout the interval. High abundance of black breccia throughout the interval.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS									DETAILED DESCRIPTION
													Other												Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
			52.48	52.73	0.25	BXA	BK													f	w	w	w				Black Sulphide Breccia. Contains blebs of pyrtite, sphalerite, arsenopyrite and galena as well as disseminated pyrite.
			52.90	52.96	0.06	VEN	MT								VN	60	6	1		i	25		50				Massive Sulphide Vein. Contains 50% Galena. 25% aresenopyrtite and intense amounts of pyrite blebs.
			52.96	52.98	0.02	GRD	BK			100																	100% Clay Altered Granodiorite. Brown Grey is soft an malleable.
			53.20	53.64	0.44	BXA	BK													w-m	t-f		w				Black Sulphide Breccia. Contains blebs of pyrtite, sphalerite, arsenopyrite and galena.
															VT	50	0	4									Bottom third of interval contains veinlets of tan quartz.
															VT	85	2	1		i	t		w				Bottom quarter of the interval contains a quartz sulphide vein containing intense amounts of pyrtie as well as aresenopyrtite and galena.
			53.64	54.01	0.37	BXA	GYGN			w										m	w	f	f				Grey Breccia with yellow green phyllic and clay altered large clasts. Breccia has been weakly clay altered. Contains blebs of pyrite, arsenopyrite, galena and sphalerite as well as disseminated pyrite.
			54.01	54.14	0.13	BXA	BK			w										m	t	f	w				Black Breccia with a large decrease in clast size from previous interval. The bottom half of the interval is weakly clay altered blakc matrix with a few small clasts.
			54.14	54.28	0.14	GRD	GY			s	s									w							Strongly silicified and clay altered granodiorite with weak amounts of disseminated pyrite.
															VN	60	4	1		s	w		s				Grey Quartz sulphide vein with blebs of galena anc pyrite as well as disseminated arsenopyrite.
			54.28	54.32	0.04	VEN	MT	MA											70	i	s	45	w				Massive Sulphide Quartz Vein
			54.65	54.93	0.28	BXA	BXGN			s										t		w	w				Strongly Clay Altered Black Breccia with large green grey clay altered clasts. Black matrix contains on large galena sphalerite bleb and contains trace amounts of dissemnated sulphides.
			55.47	55.54	0.07	BXA	BKGY			ms			lim	m						w			t				Black Grey Breccia with weak amounts of disseminated pyrite. First third of interval has been strongly clay altered.
			55.61	55.67	0.06	GRD	DKGY				i									t							Intensely Silicified Dark Grey Breccia
			55.67	56.60	0.93	GRD	GNBK	NE												w			w				Phyllic Altered Granodiorite. Veinlets and veins form a net texture. Abundance and thickness of veins increases as you move down the interval. Veins are primarily dark grey but there are white carbonate veinlets in the second half of the interval. A few of the veinlets have a high abundance of pyrite.
			56.69	56.77	0.08	BXA	BK													t							Black Grey Breccia with trace amounts of disseminated pyrite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	7.70		CAS/GRD	Overburden; fractured oxidized core, unaltered to propyllitic altered GRD
7.70	43.56		GRD	Arg > Phyllic > weak Prop, alt'd GRD; oxidation; limonite veining; minor qtz veining with trace sulphides
43.56	138.81		GRD	Prop w/ Phyllic envelopes; increase in qtz/ qtz-carb veining with minor > strong sulphide min'zation
138.81	166.33			Strong Phyllic > Arg alt'n; black breccia zones; mod-strong sulphide min'zation in qtz/ qtz-carb veining
170.46	189.81		GRD	Alternating Phyllic-Arg alt'n; less amounts of sulphides bearing veins
189.81	202.00		POR	Qtz-feldspar porphyry dyke; some red staining
202.00	223.57		GRD	Phyllic > Arg > Prop alt'n. Frequent qtz/ qtz-carb veining w/ moderate sulphide min'zation
223.57	224.90		POR	Qtz-feldspar porphyry dyke
224.90	253.66		GRD	Prop alt w/ Phyllic overprinting; sulphide bearing qtz veins less frequent but host stronger min'zation
253.66	254.52		VEN	Zone of % scale massive sulphide veining; Gn > As > Py> Sph
254.52	271.49		GRD	Prop alt w/ Phyllic envelopes; frequent qtz-sulphide veining w/ moderate min'zation
269.9	271.08		POR	Qtz-feldspar porphyry dyke; brecciated
271.08	280.42		GRD	Unalt'd/weakly Prop alt'd GRD; no min'zation; EOH

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
0.00	3.21					CAS?																					Broken core with dirt - probably from casing
3.21	7.70					GRD	BK-WH					M	prop	t													GRD. Unaltered to trace propyllitic altered GRD. Moderate oxidation along fracture surfaces. Core moderately compentent
7.70	10.73					GRD	RD-BG		ms	s	s																ARGILLIC/PHYLLIC ALT W/ OXIDATION. Reddish and beige-green zone of alternating argillic-phyllic alt. Steeply dipping qtz-carb veinlets abundant. Interval mod-strongly oxidized.
															VT	55-90	<.6	12									
			8.22	8.32		VEN	BK-WH	VU							VN	90	10			m			w	cp	t		SULPHIDE BEARING QTZ VEIN. Whiteish grey-black vuggy qtz vein w/ diss py, gn, and traces of cp in black crystalline zone. Euhedral smokey qtz in large vug. Oxidized fracture surface downhole of vein. Strong oxidation above and below veining
			10.03	10.30		GRD	BG			ms		ms															ARGILLIC ALT W/ VEINLET. Beige and red mod-strong argillic alt. Oxidation strong around shallow dipping carb veinlets. Subvertical milky qtz veinlet bottom of interval
						VEN									VT	90	0.5										
10.73	15.04					GRD	BK-WH					m	prop	t													GRD. White black pink flecked w/ greenish hue GRD. Trace prop alteration; black subvertical Qtz veinlets infrequent. Fracture surfaces oxidized. Subhorizontal long qtz carb veinlet runs along core then x-cuts.
															VT	10	0.2										
15.04	16.23					GRD	BG-RD		m	ms	ms																ARGILLIC ALT. Beige-red argillic alt. GRD
						VEN									VT	80-90	<.3	5									Subvertical white grey qtz veinlets w/ mod. Phyllic envelopes. Alternating zones of oxidation.
			15.13			VEN									VN	90	1						m				Milky, med-grained qtz vein bearing diss galena. Strong phyllic alt envelope associated limonite and pervaisive oxidation (envelope 4cm wide on either side of vein)
16.23	25.30					GRD	WH-BK					m	prop	t													UNALTERED-TRACE PROP ALT GRD. White black flecked massive GRD with trace propyllitic alteration uphole. Oxidized fracture surfaces. Infrequent carb veinlets w/ phyllic envelopes.
			17.96	18.09		VEN	BN					s			VN	70	1										QTZ-CARB VEIN. Greyish white qtz veining w/ milky carb veining. Minor netting. Halo of pervaisive oxides (envelope?)
			18.97	19.17		GRD	GN		ms																		PHYLLIC ENVELOPE. Drk green mod-strong phyllic envelope around steeply dipping milky carb veinlet
						VEN									VT	60	<.7										
25.30	29.44					GRD	Gn-BN		m			s	prop	w													OXIDIZED GRD/PHYLLIC ALT. Alternating zones of red oxidation w/ weak phyllic alteration and drk green moderate phyllic alteration. Long qtz vein runs along core axis. Weak prop. Overprinting. Qtz-carb veinlets in oxide envelopes frequent.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

								MA															%				GALENA. Strongest mineralization. Textures range between patchy/diss to semi massive in discontinuous stringers and veinlets <1cm to massive and 'swirly' vein zones <8cm (parallel to core axis i.e. True thickness unknown)
								BL-MA													%						ARSENOPYRITE. Textures include large blebs 2mm-10mm across, disseminated swirls in grey qtz and discontinuous stringers. 1cm massive As vein occurs 90 degrees to core axis. Diss As throughout vein zone
								DI-BL												%							PYRITE. Textures similar to those for As. Blebs form patches <6cm across. Py often occurs w/ As. Diss Py throughout vein zone
																						s					SPHALERITE. Minor sulphide, mostly blebs. Maybe diss throughout ?/Indistinguishable from black sulphide?
								DI																			HEMATITE. Diss and fractured hematite veinlets occur throughout greatest concentration downhole form strongest mineralization
			254.52	256.64		GRD	LTGN																				STRONG PHYLLIC ALT'D GRD. w/ SULPHIDE VEINING
			254.96	255.12		VEN	BL-BZ	MA							VN	?	3			ms								SULPHIDE QTZ VEIN. Grey white massive qtz vein hosting semi massive Py. Vein zone fractured, orientation unknown
			255.08	255.11		VEN	GY-WH	MA							VN	55	2.5										SULPHIDE QTZ VEIN. Grey white qtz vein w/ Ch rims. Diss py w/ minor Sph hosted w/in grey qtz. Strong phyllic envelope 6cm adjacent to vein
256.64	266.86					GRD	PK-GN		ms				prop	m														PROP ALT W/ PHYLLIC ENVELOPES. Qtz-carb veinlets common. Strong phyllic envelopes around veining. Weak argillic alt'n for ~50cm. One zone of fractured core w/ carb veining
															VT	50	<0.2										
			259.60	259.70		GRD	DKGN	EN																				QTZ CARB VEIN. Grey white qtz carb vein w/ diss Py, Sph, and Py stringers in strong phyllic envelope
			259.64	259.67		VEN	GY-WH								VN	35	<1.3										
			261.87	262.20		VEN	WH-GN	MA							VN	35	1.2			w		m					QTZ CARB VEIN. White and grey massive qtz carb vein hosting blebby sph <2mm along vein rims. Core fractured, strong phyllic envelope. Diss Py proximal to vein
266.86	271.49					GRD	LTGN	MA	s																		PHYLLIC ALT'N w/ DYKE Lt green phyllic alt'd GRD w/ very frequent beige Ch? Stringers, occasional Py stringers and smoky qtz vns. Dyke described below
															VT	60	35										
			269.90	271.08		POR	LTGN	FL-BX												w							BRECCIA DYKE Lt green flow banded qtz-felds porphyry dyke w/ subangular clasts of phyllic alt GRD <8cm. Diss Py around some clasts. Upper contact sharp. Lower contact marked w/ grey white qtz veining and 2cm creamy blebby Sph in all veins - creamy vein has sulphides on rims

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							PHOTO	DETAILED DESCRIPTION
													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
0.00	6.10	6.10				CAS																					Casing: Casing with minor amounts of recovered overburden showing gragments of very wekaly phyllic altered granodiorite.
6.10	7.85	1.75				GRD	GNGY		w			f	lim	m	FX	40-60		10									Strongly weathered granodiorite; Weakly phyllic altered granodiorite with moderate-strongly oxidized fractures.
							DKGN								VT	35-40	<0.5	5									Moderate veining density with narrow dark grey veinlets - chlorite(?).
								DI											t	t				He	t		Rare-trace mineralization noted, generally along veinlets. Mainly occurs as fine disseminations.
			6.14	6.74	0.60		ORBN			m		s	lim	l	FX												Interval of strongly oxidized and caly altered rock that is very weak - crumbled.
7.85	12.01	4.16				GRD	GN/BN	MO	m			f	lim	m	FX	40-50		10									Weathered phyllic granodiorite; Moderately oxidized phyllic altered granodiorite. Pervasive oxidation, generally stronger in fractured zones.
															VT	35	<0.5	2									Veining density difficult to determined due to oxidation. Narrow quartz-carbonate(?) stringers noted.
																								He	t?		Rare sulphides. Possible weak hematite(?)
12.01	22.70	10.69				GRD	GY		t			w	pro	tw	FX	30-60		6									Granodiorite; Fairly unaltered granodiorite with weak-moderate oxidation, mainly noted on fracture surfaces. Several low angle fractures noted along interval (at ~10° to core axis).
							DKGN	EN					pro	tw	VT	50	<0.5	2									Low-moderate veining density, most commonly narrow quartz-carbonate veinlets or dark green (chlorite?) veinlets. These structures also tend to have weakly propylitic envelopes (<2cm wide).
															Vt	60	<0.2	4						Cl?			
																			t								Rare sulphides.
			17.45	18.42	0.97		LTGN		m	tw			pot	t?													Interval of moderate-strong phyllic and clay alteration. Increased oxidation also noted. Several narrow carbonate veinlets noted. No changes to sulphide content.
															VT	60-70	<0.7	4									
			19.10	19.22	0.12	XN?	DKGN	PO					pro	w	C	30											Propylitic altered mafic rock with weak porphyritic textures, likely to be a xenolith(?).
			20.66	20.82	0.16	XN?	DKGY	PO					pro	tw	C	55											Similar to 19.10-19.22m. Likely a xenolith with intense prphyritic textures and feldspar(?) phenocrysts.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
			34.13	34.25	0.12	VEN	MT	BN			s				VN	50	13			30	x	tw	m	Cp	tw?			Quartz vein(?) bearing wekaly banded polymetallic sulphides with carbonate.
34.90	37.39	2.49				POR	TNGN	PO	tw	t					DY	70											Porphyritic dyke; Weakly phyllic altered quartz-feldspar porphyritic dyke. Moderately fractured with minor gouge at contacts. Minor carbonate veinlet present with no significant sulphide mineralization.
															GO												
			36.27	37.39	1.12					tw					GO												Increased clay alteration resulting in weakening o core rock. Phenocrysts are more distinct in this interval.
37.39	38.98	1.59				GRD	GY			ms					FLT?	65											Clay altered granodiorite fault(?); Strongly bleached and clay altered granodiorite with approximately 50% of the interval comprised of gouge/crumbled rock - possible faulted contact(?). Possible sulphidic stringers (grey gouge bands). No significant sulphides noted.
															GO												
38.98	41.24	2.26				GRD	GYGN		m	tw	f																Altered granodiorite; Similar to 30.24-34.90m. Moderate-strongly phyllic altered and silicified granodiorite. Large intervals of this unit appear to b veining strcutres. Locallized zones of strong clay alteration.
																			x	l	f	tw	t				Moderate-strongly mineralized
			39.46	40.46	1.00	VEN	WH/MT				s									x	l	m	tw	Cp	tw		Quartz vein bearing polymetallic sulphides, semi massive with some large blebs.
41.24	52.85	11.61				GRD	GY		tw	w		tw	pro	tw	FX	40-70		12									Propylitic granodiorite; Weakly propylitic granodiorite with locallized zones of moderate-stron clay alteration. Weak-moderate oxidation noted on fracture surfaces. Weakly competent core rock in non-clay altered zones. Caly altered zones tend to be crumbled. Possible fault(?).
															FLT?												
							TNWH								VT	30-60	<1	2									Low veining density, dominantly banded cream white quartz-carbonate veinlets.
								DI											t								Rare-trace mineralziation, occuring as fine disseminations, generally near veining structures.
			42.62	44.29	1.67		WH/PK		w	m			pot	tw?	GO?												increased clay and phyllic alteration with possible weak potassic alteration (pink colouring of the matrix). Approximately 30% of the interval is crumbled. No change in sulphides.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
0.00	4.57	4.57				CAS																					Casing; Casing with minor amounts of recovered overburden, showing relatively fresh granodiorite.
4.57	26.52	21.95				GRD	GY		t			w	pro	tw	FX	45-50		12						Li	f		Weathered granodiorite; Moderately weathered, weakly propylitic and trace phyllic altered granodiorite. Oxidation present mostly along fractures but occurs pervasively in weak amounts. Limonite stained fractures. Blocky, broken core rock.
							TN								VT	55	<0.2	3?									Difficult to deteremine veining due to borkeness of core but appears to be low-moderate, generally narrow irregular cabonate stringers/veinlets. Possilbe diffused quartz veinlets also appear to be present.
							GY/WH								VT	55	<1	2?									
								DI											t								Rare-trace sulphides. Disseminated pyrite noted in more phyllic alatered patrches. Limonite and manganese stained.
			5.79	6.95	1.16		GN/BN		f			m							tw	tw				Cp	t?		Increased phyllic alteration and pervasive oxidation, giving rock a dappled texture. Increased sulphides, pyrite stringers and rare chalcopyrite.
			8.72	10.50	1.78		GN/BN		f			f							tw	tw				He	t?		Similar to 5.72-6.95m. Increased phyllic alteration and oxidation. Red-brown specks (<0.5cm) present - hematite(?). Finely disseminated pyrite present.
			12.19	12.37	0.18		DKGN	EN?	tw			f	pro	w					tw	tw							Possible phyllic and propylitic envelope to diffused quartz veinlet. Slight increase in sulphides.
															VT?	50	~2										
			15.24	15.67	0.43					m?						75											Interval of crumbled core rock, more intense clay alteration(?).
			17.58	18.78	1.20		GN		w				pro	w					tw	tw							Increased phyllic and propyltic alteration. Disseminated pyrite noted.
			20.81	21.57	0.76		LTBN		tw	tw		f															Weakly bleached phyllic zone, likely envelope to several quartz-carbonate veinlets. One sulphides veinlet noted, dominantly pyrite with trace chalcopyrite.
							TNWH								VT	45	<0.7	4	tw	tw	t?			Cp	t		
			23.47	26.52	3.05																						POOR RECOVERY ZONE - NO RECOVERY FOR 2M. Lower "contact" for this unit likely lost.
26.52	35.07	8.55				GRD				m		f			FLT?												Altered granodiorite (fault); Moderate-strongly clay altered, gougey, broekn granodiorite - possilbe fault zone(?). Decreased oxidation from unit uphole. Strongly fractured with approximately 30% shattered core rock. Locallized zones of various alteration types including phyllic and propylitic.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

															VT	40	<1	3?									Difficult to deteremine veining density but possible quartz-carbonate veinlets noted with weak envelopes.
																			t								Fine-medium disseminated sulphides scattered throughout in trace amounts.
			26.52	28.69	2.17		BN		f			m															Phyllic altered zone with strong pervasive oxidation. Possible veining. No changes to sulphide content.
															VT	~60	<0.5	4?									
			27.49	28.09	0.60					m?																	At 27.49-28.09m, interval of curshed, crumbled core rock, moderate clay content.
			28.69	29.46	0.77	APL?				ms					DY	<20											Possible low angled aplite dyke. Very weak rock, clay rich.
			30.05	31.00	0.95		WH/EN		f	m									tw								Bleached interval with moderate phyllic alteration. Slight increase in disseminated sulphides.
			32.53	35.07	2.54		DKGN			m		f	pro	tw					tw	tw							Increased propylitic alteration in fractured, broken interval with low angled (<20° to core axis) fractures. High clay content, weak core rock. Disseminated pyrite present.
35.07	48.70	13.63				GRD	PUBN	MO	t	ms		w	hem	f	FLT?												Altered granodiorite (fault); Similar to unite immediately uphole at 26.52-35.07m. Moderate-strong clay, gougey broken granodiorite. Purple colouring - possibly hematite stained/altered. Core rock is blocky, shattered an crumbled - fault(?).
															VT	35-50		4?									Low-moderate veining density, difficult to deteremine density due to borkeness of core rock.
																			t								Rare-trace sulphides noted. Dark grey clots may be crushed sulphides(?).
			36.96	37.48	0.52		LTGN	MO	w	m			pro	tw					tw								Phyllic and propylitic altered zone. Low angled (<20° to core axis) fractures. No changes to sulphide content.
			38.42	39.46	1.04		BN	MO	tw	m		f			GO				tw				t?				Strongly oxidized interval with moderate clay content. Dark grey clots present, possible galena.
			40.55	41.45	0.90		BN	MO	tw	m	t?	t			GO				tw								Similar to 38.42-39m. Oxidized and phyllic altered, possible weakly silicified(?). High clay content, clay supoorted crumbled core rock. Disseminated sulphides.
			42.18	43.77	1.59		TNBN	BX?		s		f							tw	tw							Strongly clay altered, gougey core rock - clay supported breccia. Fine dissemianted sulphides noted.
			43.77																								Decreased hematite staining (purple colouring) from 43.77m to end of unit.
			44.81	45.04	0.23		GY								GO	25											"Vein gouge" [similar to Pica vein?]. Smeared grey gouge.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
48.70	52.92	4.22				GRD	BN	MO		s		f			FLT?				t								Mixed granodiorite and dyke (in fault?); Siimilar to unite uphole at 26.52-35.07m. Clay altered granodiorite with patches that appear to be a silicified dyke. Core rock in this unit is blocky and shattered. Fine disseminated sulphides, rarely noted.
						MAF					w				DY?	40											
52.92	53.95	1.03				FEL	BFGY	FG			m	tw			DY	65											Felsic, siliceous fine grained dyke; Light-medium grey fine grained siliceous dyke. Irregular carbonate stringers common along with white quartz veinlets. Rare sulphides noted in quartz veinlets.
							BFGY								VT	65	<0.2	5						Cb			
							WH								VT	45	<0.7	4	tw								
53.95	56.13	2.18				FLT?	TNBN	BX?		s		w			GO	30			t?								Fault zone(?); Possible "vein gouge" [similar to Pica vein]. Brown-grey clay with small indistinguable fragments (<0.5cm). Dark grey band - possible sulphides(?).
56.13	57.64	1.51				FEL	BFGY				m	tw			DY	30											Siliceous dyke(?); Similar to 52.92-53.95m. Felsic, fine grained siliceous dyke. Narrow irregular stringers commonly noted. Rare sulphides.
															VT	40	<0.2	5									
			56.62	57.00	0.38		BN	BX?		s		w			GO	45											Similar to 53.95-56.13m. Possible "vein gouge"(?) but likely strongly clay altered dyke unit.
57.64	59.95	2.31				GRD	LTGN		w	tw					FX	40-50		12									Phyllic granodiorite; Weakly phyllic altered granodiorite with minor argillic overprint. Core rock is blocky and weakly shattered. Gougey lower contact.
							WH								VT	45	<0.2	1									Low veining density, narrow white carbonate veinlets noted. Discontinuous dark green veinlets also present - chlorite(?).
							DKGN								VT	45	<0.5	2						Cl			
								DI											t	t							Rare-trace pyrite noted in locallized zones, often in areas of increased clay alteration or veining structures.
			59.09	59.20	0.11										DY?	55			tw								Fine grained silicified dyke(?). Sligh increase in disseminated sulphides.

GEOLOGY LOG

													Other												Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
59.95	63.93	3.98				POR	TNBF	PO		w			pro	t?	DY	50											Porphyritic dyke; Tan-green, clay and weakly propylitic quartz-feldspar porphyritic dyke. Locally with increased clay alteration and granular gouge zones. Minor gouge/clay noted on fracture surfaces. Core rock is weakly competent with fractures and intervals of shattered core rock. Narrow irregular carbonate veinlets are commonly noted throughout this unit. no significant sulphides.
															VT	20-30	<0.5	6									
			61.04												VT	20	0.3		t			t	t				Carbonate veinlet bearing specks of black sphalerite and rare galena.
63.93	64.37	0.44				BXA	DKGY	BX			w				C	45			w	w			t				Breccia; Dark grey breccia matrix with angular clasts of granodiorite (<2cm across). Weak-moderate silicified at the downhole contact. Dissminated sulphides noted throughout the matrix.
64.37	65.76	1.39				FLT?	GNGY			s					c				t	t							Faulted contact(?); Strongly clay altered, gougey faulted(?) contact between porphyritic dyke and granodiorite unit downhole. Difficult to determine orientation. Core rock is weak and comprised mostly of clay and grey gouge. Finely disseminated sulphides are noted in grey gouge zones.
65.76	82.36	16.60				GRD	GY		t				pro	tw	FX	40-60		3									Granodiorite; Very weakly porpylitic altered granodiorite with locallized zones of phyllic alteration, generally associated with veining strcutrus. Fairly competent core rock with minor fracturing.
															VT	60-70	<1	3									Low-moderate veining density. Banded quartz-carbonate veinlets often have associated envelopes and may carry sulphides. Decreasing density moving downhole.
																											Rare disseminated sulphides, generally in locallized zones and occasionally carried in veining structures.
			65.76	66.10	0.34		LTGN		w						VT		<0.2		t	t							Phyllic zone, likely due to contact with uphole unit. Trace sulphides in discontinuous stringers.
			66.31	66.45	0.14		GN/PK	FG	s?																		Fine grained green and pink interval. Zone of intense phyllic alteration(?). One narrow carbonate veinlet noted.
															VT	60	0.2										
			68.07	68.32	0.25		LTGN	EN	w				pro	w					t								Zoned phyllic and propylitic envelopes to anded quartz-carbonate veinlet bearing polymetallic sulphides.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	3.19	3.19	CAS	Casing
3.19	108.09	104.90	GRD	Majority of interval is weak propylitic altered GRD;
				patches of unaltered GRD, minor argillic altered patch
				and phyllic envelopes around infrequent Qz/Ch veinin
				Shallow Cb veining common.
108.09	190.92	82.83	GRD	Weak to moderate propylitic altered GRD with freque
				grey/white translucent Qz veins and orange/white
				milky Ch veins with phyllic envelopes. Mineralization
				in grey/white Qz veins
190.92	191.28	0.36	C; BXA	Contact between GRD and FEL PO. Top is blk brecci
				smoky Qz rich, bottom is flow banded FEL PO and G
191.28	197.95	6.67	FEL	Quartz-feldspar porphyry
197.95	208.60	10.65	GRD	Patchy mod-strong propylitic altered GRD with phyllic
				envelopes around white Ch, grey Qz (diss Py) veins
208.60	219.32	10.72	FEL	Quartz-feldspar porphyry
219.32	221.00	1.68	GRD	Strong phyllic alt. GRD with mineralized veins & brec
221.00	222.40	1.40	FEL	Quartz-feldspar porphyry
222.40	231.72	9.32	GRD	Light green mod phy. alt. GRD crosscut by blk breccia 'dykes.' Grey/white Qz and OR/WH milky Qz
231.72	242.51	10.79	FEL	Quartz-feldspar porphyry
242.51	281.28	38.77	GRD	Patchy altered GRD, propylitic with phyllic envelopes
				around Qz/Ch veins
281.28	281.72	0.44	FEL	Quartz-feldspar porphyry
281.72	292.24	10.52	GRD	Patchy altered GRD, blk breccia and mineralized Qz VN
292.24	293.42	1.18	FEL	Quartz-feldspar porphyry
293.42	341.08	47.66	GRD	Phyllic dominated altered GRD with freq Qz/Ch veining
341.08	366.55	25.47	MAF	Patchy mafic and felsic footwall 'dyke'
366.55	369.73	3.18	GRD	Phyllic altered GRD
369.73	410.20	40.47	MAF	Mafic porphyry with Py replaced phenocrysts "footwal

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
0.00	115.49					GRD	GYWH								st	50-60	0.5	2-3						lim	w		Granodiorite. Limonite staining on some surfaces. Moderately fractured, most pieces approximately 20-30cm. Minor quartz-carbonate stringers. Black xenoliths present (up to 10cm wide), occurring more frequently near the top of the interval.
			0.00	4.41			GNWH																	lim	w		Highly broken granodiorite. Very minor limonite staining.
			5.18	6.00			OR			w		m			st	60-70	0.5	5						lim	m		More highly limonite stained, oxidized granodiorite Quartz-carbonate stringers, quartz eyes up to 1cm. Weakly clay altered.
			6.55	7.17			OR			w		m			st	80-90	0.5	5						lim	m		More highly limonite stained, oxidized granodiorite Quartz-carbonate stringers, quartz eyes up to 1cm. Weakly clay altered.
			8.13	8.66			OR					m			st	70-90	0.5	2						lim	m		Fractured, more fine grained oxidized granodiorite. Irregular quartz veinlet. Quartz stringers and orange oxidized stringers. No significant mineralization.
						VN									vn	?	1	1									
			8.73	9.30			OR			w		s	ARG	w	st	80	<0.5	2						lim	s		Highly limonite stained, oxidized granodiorite. Quartz carbonate stringers. Quartz eyes up to 0.5cm. Minor argillic alteration. Moderately fractured.
			10.50	10.60		VN	ORGN		w			m			vn	75	1	1						lim	m		5cm oxidized limonite stained granodiorite followed by competent minor phyllic altered granodiorite bearing a white quartz veinlet. No significant mineralization.
			12.12	14.33		VN	ORWH			w		m	ARG	w	vn	70-80	0.5-1	3						lim	m		Patchy oxidized granodiorite and argillic alterec granodiorite. Limonite staining over entire interval. Irregular quartz veinlet with quartz-carbonate stringers in close proximity.
			14.16	16.70		VN	ORWH		w			m	ARG	m	vn	70	1	1	w	w				lim	m		Argillic altered, minor phyllic altered granodiorite, oxidized/limonite staining over entire interval. Quartz veinlets and stringers. Quartz veinlet oxidized and white, hosting disseminated pyrite. No other significant mineralization.
															st	50-80	0.5	10									
			13.32	19.43			OR					m			st	50-60	<0.5	3						lim	m		Oxidized granodiorite. Very minor quartz carbonate stringers. No significant mineralization.
			20.31	20.87		VN	OR		w			w			vn	80	1	2	w	w							Weakly oxidized, partly phyllic altered granodiorite. Quartz veinlets relatively oxidized and white. Small quartz stringers orange and oxidized. Very minor disseminated pyrite hosted in some of the larger veinlets and stringers.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

													Other												Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
0.00	4.57																										Casing: No recovery
4.57	5.18																										Overburden.
5.18	10.69					GRD	BLOR		ms	s		s							t	t			t	lim	s		Moderate-strong phyllic altered, pervasive oxidation/limonite staining, some areas very crumbly, others more competent. Trace disseminated pyrite and galena stringer. Minor quartz/carbonate stringers throughout interval.
10.69	14.33					GRD	PUGN			w			PRO	s	vt	40-80	0.5-1	2						hem	s		Strong propylitic altered granodiorite, with hematite staining (purple) over most of interval except for 20cm unstained (green) patch. White quartz stringers and veinlets throughout interval. No significant mineralization. Highly clay altered small dykes or other intrusions? at 13.85m and 13.97m.
			13.85			DK?	PUBK			m					dk?	85	5	1									
			13.97			DK?	ORGN			s					dk?	60	4	1									
14.33	20.21					GRD	BLOR		ms	m		m	POT	t	st	70-80	<0.5	3						lim	m		Moderately strong phyllic altered, limonite stained - in fractures mostly, competent with some more clay altered crumbly patches. Some potassic overprinting on more competent sections. Quartz-carbonate stringers and veinlets - some oxidized, orange - over entire interval. Minor black stringers in one phyllic altered patch. No significant mineralization.
20.21	22.05					GRD	WHPK			m			ARG	ms										lim	w		Moderately strong argillic altered granodiorite with minor potassic overprinting in some areas. Some limonite staining in fractures. Moderately competent but some crumbly areas. Minor oxidized veinlets and stringers - highly clay altered.
													POT	t													
22.05	24.75					GRD	GNOR		m	w					st	60-80	<0.5	5									Phyllic altered granodiorite. Limonite staining on fracture surfaces. Minor oxidized quartz stringers. Highly fractured. No significant mineralization.
			22.92	23.57		FLT	GNOR			s		m			ft	55	30	1						lim	m		Fault? Highly crumbly with larger inclusions/clasts of quartz and phyllic altered granodiorite. Highly sheared. Limonite staining present in pits and fractures.
24.75	29.57					GRD	GNWH		m	m			ARG	m										lim	m		Patch phyllic/argillic altered granodiorite. Argillic often accompanied by trace potassic overprinting. Highly fractured with limonite staining on fracture surfaces. Minor quartz-carbonate stringers - highly clay altered.
													POT	t

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
182.05	186.19					GRD	DKGN	NE					PRO	wm					w	w							Weak-moderate propylitic altered granodiorite with some trace argillic alteration near fractures. Hematite stained patches and on some fracture surfaces. Dark green/black stringers cross-cutting throughout giving netted texture in some areas. Minor disseminated pyrite and pyrite stringers.
													ARG	t					w	w							
186.19	204.01					GRD	GN	PA	ms	w			ARG	w													Moderately-strong argillic altered granodiorite, patchy with small sections of potassic overprinted argillic altered granodiorite. Some small sections of propylitic altered granodiorite. Quartz-carbonate stringers throughout interval. Some hematite stained areas - mostly fracture surfaces. Mostly competent, some weakly clay altered areas especially near argillic altered rock. Very minor disseminated pyrite.
													PRO	w													
													POT	t													
			192.42	193.15		GRD	PU	NE	ms															hem	ms		Moderately-strong hematite stained phyllic altered granodiorite. Irregular white quartz veinlets and many cross-cutting black-dark green stringers. Approaching netted texture over part of interval.
			200.58	203.28		GRD	PU	NE	ms															hem	ms		Moderately-strong hematite stained phyllic altered granodiorite. Irregular white quartz veinlets and many cross-cutting black-dark green stringers. Approaching netted texture over part of interval.
			203.28	203.60		VN	PURD						PRO	m	vn	40	25	1									Propylitic altered envelope. Highly silicified interval with white-translucent quartz vein hosting trace pyrite, with quarts/chalcedony breccia? on both sides of vein. Hematite flooding throughout vein and interval.
204.01	214.46					GRD	RDPU			ms			PRO	s										hem	s		"Dracula Zone", very highly hematite flooded/stained propylitic altered granodiorite. Moderately-strong clay alteration throughout (brittle and crumbly in parts). Montmorillonite/kaolinite very present in some fractures. Quartz-carbonate stringers throughout, weak-moderate disseminated tourmaline and stibnite in some white quartz veinlets.
																								st	wm		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	8.84	8.84	OVB	Overburden
8.84	21.03	12.19	GRD	Partialy altered and strongly oxidized granodiorite.
21.03	26.23	5.20	GRD	Altered GRD with small amounts of black breccia.
26.23	42.97	16.74	POR	Purple quartz feldspar porphyry dyke.
42.97	76.36	33.39	GRD	Altered GRD with disseminated pyrite and some
				toumaline in areas. Hosts quartz carbonate sulphide
				veins.
76.36	91.96	15.60	GRD	Grey purple slightly altered GRD with small
				concetrations of hematite.
91.96	118.05	26.09	GRD	Primarily phyllic altered granodiorite.
118.05	153.75	35.70	GRD	Primarily phyllic altered GRD with alot of veining.
153.75	164.46	10.71	GRD	Grey purple slightly altered GRD with black stringers.
164.46	203.94	39.48	GRD	Primarily phyllic altered granodiorite with an abundanc
				of quartz sulphide veining and disseminated sulpdies.
				Stibnite and tourmaline are present in the interval.
203.94	249.02			Grey Purple GRD with an abundance od aplite dykes.
249.02				EOH

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	2.13	2.13	CAS	Casing: No recovery.
2.13	39.17	37.04	GRD	Heavily oxidized GRD, limonite/goethite/manganese
				staining, minor patchy argillic/phyllic alteration.
39.17	59.34	20.17	GRD	Less oxidized, some highly clay+ argillic altered GRD
59.34	74.98	15.64	VN	Phyllic envl. Containing frequent qtz vns hosting
				significant mineralization including py, as, gn, sp.
74.98	81.95	6.97	GRD/FT	Phyllic alt. GRD and faults containing clasts of GRD.
81.95	82.83	0.88	VN	Large qtz vein hosting massive py, as, cp, sp.
82.83	88.95	6.12	FEL	Quartz-feldspar porphyry dyke.
88.95	95.93	6.98	VN	Phyllic envl. Containing mineralized veins.
95.93	100.22	4.29	GRD	Phyllic/argillic altered, minor potassic overprinting.
100.22	149.35	49.13	GRD	Patchy propylitic/phyllic altered granodiorite, with som
				isolated unaltered GRD. No major mineralization.

0.00	2.13																										Casing: no recovery
2.13	4.95					GRD	GYOR					m												lim	m		Granodiorite. Relatively fresh and unaltered Moderately limonite stained on fracture surfaces.
4.95	27.94					GRD	OR		t	w		s	ARG	t	st			3						lim	m		Highly limonite stained, oxidized granodiorite. Minor manganese staining. Minor argillic/phyllic alteration in some areas. Very minor stringers.
																								mang	w		
			6.27	6.42		VN									vn	?	15	1									Irregular, shallow quartz vein. No significant mineralization.
			10.17	10.99		VN/GRD	BKOR	VU							vn	?	15	1									Vuggy quartz veining, highly oxidized/limonite stained accompanied by goethite/manganese stained granodiorite.
			12.78	15.17		GRD	BLOR		wm						st			5									More highly phyllic altered granodiorite with limonite stained stringers.
			19.64	20.16		GRD	GYOR			ms			ARG	m										lim	wm		Moderate-strong clay altered granodiorite, some limonite staining present.
			25.90	26.00		GRD							POT	m										hem	wm		Moderately potassic altered granodiorite with weak hematite.
27.94	35.95					GRD	GYOR					m												lim	m		Granodiorite. Relatively fresh and unaltered Moderately limonite stained on fracture surfaces.
			34.15			VN	WH								vn	35	2	2									Calcite vein. No significant mineralization
			34.20			VN	GYBK								vn	60	1	2	wm								Grey quartz vein hosting black sulphides - disseminated and fine-grained.
35.95	66.20					GRD	ORWH						ARG	w										lim	s		Highly limonite stained, mildly argillic altered granodiorite. Minor potassic overprinting. No significant veining or mineralization.
													POT	tw										mang	w		
			37.46	37.80		VN/GRD	WHPU								vn	35	5	1						mang	s		White quartz vein followed by a band of heavily manganese stained granodiorite. No significant mineralization.
						BN									bn	35	10	1									
			38.81	38.96		GRD	BKOR																	goe	s		Heavily goethite stained granodiorite, limonite staining on fracture surfaces.
			39.17	45.96		GRD	GY			s														lim	wm		Grey, crumbly, highly clay altered granodiorite. Minor potassic overprinting in some areas. Weak-moderate limonite staining in fractures. No significant mineralization.
			45.96	51.02		GRD	GYOR			wm			ARG	m													Weak-moderate clay altered granodiorite. Moderate argillic alteration. Limonite staining on fracture surfaces. No significant veining or mineralization.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	5.18		OVB	Overburden.
5.18	13.68		GRD	Highly fractured, some crumbly, unaltered. Limonite
				staining on fracture surfaces.
13.68	46.06		GRD	Weak phyllic alteration. Highly fractured, some crumb
				limonite flooded and highly oxidized.
46.06	151.29		GRD	Unaltered GRD, limonite staining on most fracture sur
				Some patchy phyllic, minor propylitic/argillic alteration
151.29	193.56		VN	BRX Zone. Phyllic envelope containing frequent
				mineralized quartz veins, minor quartz-feldspar
				porphyry dyke, many faults.
193.56	196.25		GRD	Unaltered GRD.
196.25	235.92		GRD	Phyllic envelope containing infrequent, weakly
				mineralized quartz-carbonate veins.
235.92	258.17		GRD	Patchy phyllic/propylitic alteration with isolated patche
				of unaltered GRD. Quartz-carbonate stringers/veinlets
				veins throughout hosting weak mineralization.

															VN	70	16.0	1		30							Envelope surrounds a dark grey quartz sulphide vein.
			254.67	254.69	0.02	VEN	GYMT	BL							VN	45	1.0	1		30							Grey quartz vein hosting pyrite blebs
			256.85	256.86	0.01	VEN	GYMT								VT	68	0.8	1		50							Grey and dark grey quartz pyrite veinlet
			257.50	257.77	0.27	VEN	GYBK	BX							VN	85	27.0	1		s			w				Dark grey quartz sulphide vein containing disseminated pyrite. Lower 2/3 of vein have been brecciated and contain weak amounts of galena. A white carbonate vein was also brecciated.
259.34	280.13	20.79				GRD	GYGN			m-s	ms		pro	m-s						n-t							Moderatly strong silicified, moderate to strong propylitic dark green grey granodiorite with patches of moderate to strong clay alteration. Majority of the interval is heavily broken up and fractured.
			262.40	264.31	1.91	GRD	GYGN		m		s		pro	m													Moderate Phyllic and propylitic altered green grey granodiorite. Contains patches of strong silicification.
			263.37	263.43	0.06	VEN	GYWH								VN	83	6.0	1		t							Grey, white and light orange quartz, carbonate and chalcedony vein.
			264.22	264.23	0.01	VEN	GYMT								VT	30	0.3	1		w			f				Quartz pyrite galena veinlet
			271.43	271.55	0.12	GRD	GYGN	EN	m		s																Strongly silicified , moderatly phyllic envelope containing an abundance of a white hard mineral. Envelope is around a grey quartz and white carbonate vein.
															VN	65	1.5	1		t							
			273.70	273.95	0.25	BXA	BK			m										w			w				Moderatly clay altered black breccia, hosting weak amounts of pyrite and galena.
			273.95	276.92	2.97	GRD	GY		m	s										t-f							Moderatly phyllic and strong clay altered granodiorite. Interval is very broken up and rubbly.
			275.43	275.44	0.01	VEN	DKGY								VT	77	0.7	1		f	f						Dark grey quartz vein hosting disseminated pyrite and arsenopyrite.
			275.50	275.62	0.12	BXA	BKGY			i										s-i							Black breccia in clay gouge matrix hosting strong to intense amounts of pervasive pyrite.
			277.68	277.86	0.18	GRD	DKPU						hem?	i													Dark purple altered granodiorite with possible intense hematite staining. Red hematite staining along fractures.
			278.69	280.13	1.44	GRD	GYGN		m	m-i																	Moderatly phyllic and moderatly to intensely cay altered granodiorite.
280.13	281.84	1.71				POR	GY								DK	45	1.7	1									Grey quartz feldspar porphyry dyke
251.84	295.37	43.53				GRD	GYGN		ms				pro	m													Moderate strong phyllic altered grey green with patches of moderate propylitic alteration. Portions of the interval are broken up and rubbely.
			251.84	251.91	0.07	BXA	BK								VN	37	3.0	1		f							Black breccia hosting disseminated pyrite

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
			237.80	238.31		GRD	LTGR	EN	m						VN	45	<1	3		f		m					Moderate phyllic altered GRD enveloping 3 grey/white translucent Qz veins hosting blebs of honey brown Sp, and Py. Pink/white Ch veinlet at 70°
															VT	70								Ch			
			243.91	247.21		GRD	LTGR	EN	m						VT	60		5		w				Ch			Moderate phyllic altered GRD enveloping veins described below. Frequent pink/white chalcedony veinlets and white/grey translucent Qz.
			244.07	244.20		VEN	GYDK	BX							VN	60				w							Silic flooded GRD/or/smoky Qz breccia. Py is diss and blebby
								FL?																			
			244.61	244.63		VEN	GY	BX							VN	30				t							Grey, qtz, breccia vein, trace Py
			244.79	244.82		VEN	PKWI	NT							VN	50			n					Ch			Pink/white netted/brecciated chalcedony veir
			245.22	245.28		VEN	PKWI	NT							VN	50			n					Ch			Pink/white netted/brecciated chalcedony veir
			245.35	245.50		APL	PKDK	FG							DK	50											Aphanitic dark pink aplite dyke
			246.43	246.46		BXA	BKWI	BX							VN	40				t							Fine grained, black breccia dyke with pink/white chalcedony and white Cb veinlet
			246.57	246.65		BXA	BK	BX							VN	55				w							Black, matrix supported breccia with sub angular clasts of grey/white Qz and phyllic altered GRD
			249.02	253.00		GRD	LTGR	PA												t							Patchy phyllic/prop/argillic alteration. Frequent grey/white quartz translucent Qz veins hosting blebby Py. 2 veins:
			251.67	251.68		VEN	GY	BN							VN	80				t							Grey/white translucent Qz and smoky Qz hosting diss to blebby Py
			251.83	251.86		VEN	GYM	BL							VN	70				40							Grey/white translucent Qz and smoky Qz hosting diss to blebby Py
			256.00	257.69		GRD	WHG	MG					arg	m													Moderate argillic altered GRD enveloping
								EN																			
			256.53	256.57		VEN	GR	BX							VN					f							A weak-moderate phyllic altered envelope around 256.53-256.57m breccia vein. Clast supported containing sub rounded phyllic altered GRD. Phyllic envelope ~50cm wide

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS										DETAILED DESCRIPTION
													Other												Other				
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
			257.69	258.95		GRD	MDGI	EN	m						VN	60-80		5+		w								Moderate phyllic enveloped GRD with frequent of white vuggy chalcedony veins, slightly netted filled with white Cb and or colourless Qz
			258.95	259.41		GRD	GYDI	BX							VN	90				w		t	t					Smoky and/or grey/white translucent Qz flooded, slightly brecciated/netted texture. Minor amounts of orange/white veinlets, minor vugs
								FL																				
259.41	260.55					FEL	BGGI	PO							DK	90												Beige/green Qz-feldspar porphyry, top 20cm sheared/faulted
								SH																				
260.55						C									C	90												Sharp contact
260.55	267.00					GRD	GRLT	PA							VT	70		5		t								Patchy altered GRD Pro=phyll=arg. Frequent Qz veinlets some with Py
							DK																					
			260.55	260.66		BXA	BK	BX							DK	80												Matrix supported breccia with sub angular/rounded <1cm-6cm clasts of GRD and FEL PO
			260.66	260.73		VEN	DKG\	XT							VN					f				An	20		Aphanitic smoky Qz vein with euhedral, rectangular anhydrite (20%). Diss Py and blebs
								AP																				
			261.12	261.35		VEN	SI	DI							VN	70				f	30	f	w					3 grey/white Qz veins hosting diss As>>Py>Sp>Gn. Majority of subinterval. Minor vuggy white/pink chalcedony and anhydrite
			262.47	262.50		VEN	GYBF	BL							VN	70				20								Grey/white Qz hosting blebs of Py
			265.21	265.25		VEN	ORM	BL							VN	70				m			10					Orange/white chalcedony dominated vein with grey/white Qz blebs Gn>Py blebs
267.00	273.41					GRD	GYMI	MG																				Relatively unaltered GRD
273.41	EOH

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
0.00	6.89	6.89				OVB																					Casing/Overburden, no recovery
6.89	10.00	3.11				GRD	OR			i		i	ARG	i													Intensely oxidized argillic altered granodiorite
10.00	12.80	2.80				FEL	TNGY	DY			i	i			DY	?								Go	tw		Strongly oxidized felsic, silicious dyke. "sister vein" dyke. Goethite stained fractures very broken.
12.80	14.21	1.41				GRD	OR			i		i	PRO	t													Intensely oxidized argillic altered granodiorite, trace propylitic at beginning of zone overprinting argillic.
14.21	27.70	13.49				GRD	OR		i	ms		i	ARG	ms						t	t	t	t				Strongly altered/oxidized granodiorite, largely silicious phyllic alteration but occasional strong argillic as well. Zone hosts numerous vein zones with pyrite/sphalerite/galena/arsenopyrite. Breccia zones also present.
			14.53	15.37	0.84	VEN	ORWH	BX	i		i	i			VN	78				s	t	m	m				Extremely oxidized vein/breccia zone dominated by milky quartz but hosting blebby to massive pyrite, arsenopyrite, galena and sphalerite. Quartz zones are vuggy and host angular grey quartz and sulphide clasts.
			16.85	17.02	0.17	VEN	ORWH	BX	i		i	i			VN	80				s	t	m	m				Extremely oxidized vein/breccia zone dominated by milky quartz but hosting blebby to massive pyrite, arsenopyrite, galena and sphalerite. Quartz zones are vuggy and host angular grey quartz and sulphide clasts.
			22.40	22.73	0.33	VEN	WHGN		i		i	ms			VN	75				tw							Sheeted quartz veinlets across interval (grey and milky) hosting blebby pyrite. Disseminated pyrite through whole interval. Strongly oxidized.
			23.03	23.35	0.32	BXA	WHBK	BX			i	i			BX	?				ms							Broken breccia zone. Highly silicious. Matrix is silicious white chalcedony quartz. Clasts are a black finegrained mineral hosting pervasive pyrite.
			26.34	26.80	0.46	VEN	WHGN		i		i	ms			VN	80				tw		tw	tw				Sheeted quartz veinlets across interval (grey and milky) hosting blebby pyrite. Disseminated pyrite through whole interval. Strongly oxidized. One vein hosts massive sphalerite and trace galena.
27.70	34.91	7.21				GRD	GYGN		w	t	t	m	ARG	t													Unaltered, moderately oxidized granodiorite hosting few chalcedony quartz veins (almost transparent) and one argillic/phyllic altered zone in the middle of the interval.
			30.36	30.40	0.04	VEN	WHOR		i		i	t			VN	60											Intensely phyllic altered granodiorite envelope around a 4cm chalcedony quartz vein with slightly breccia textures and an ankorite stringer on the hanging wall side.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
			81.42	82.16	0.74	VEN	GNBK	MA	i		i				VN	80				s	ms	s	s				VEIN ZONE! Very strong vein zone hosting massive arsenopyrite, pyrite, sphalerite, and galena veins upto 5cm wide each. Extremely quartz flooded zone but only two milky quartz veins present. Dominated by massive sulphide veins. Pervasive pyrite throughout.
82.29	106.43	24.14				GRD	DKGN		t				PRO	s						t							Propylitic altered granodiorite. Highly broken occasionally moving to unaltered and rarely upgrading to phyllic in localized zones. Very few quartz veinlets.
			101.25	101.55	0.30		LTGN	FD	ms				PRO	tw						tw			w	He	tw		Quartz flooded, phyllic altered zone with both hematite veinlets and milky quartz. One 1cm wide massive galena vein in center of zone.
			103.81	106.43	2.62		LTGN		s		ms		PRO	t						tw		t	t				Phyllic altered granodiorite, slightly quartz flooded hosting numerous quartz veins and veinlets. One large vein in center of zone hosts galena, sphalerite and pyrite.
			105.05	105.21	0.16	VEN	WHGN		i	f	80				VN	80				ms		ms	ms				Milky quartz vein (massive) hosting blebby galena, sphalerite and pyrite throughout with massive galena/pyrite stringers present as well. Footwall contact is composed of green clay gouge material, well developed.
106.43	136.89	30.46				GRD	GY		t				PRO	t													Unaltered granodiorite with localized patches phyllic or propylitic altered granodiorite around quartz veins.
			123.05	124.17	1.12		LTGN		s		s													Se	tw		Strongly sericitized, phyllic altered granodiorite. Highly silicious hosting a vuggy, brecciated quartz/ankorite vein.
			124.45	124.86	0.41		WHOR	BX	i		80				VN	72				tw				Se	tw		Vuggy quartz vein (smokey) with brecciated areas near the footwall side. Ankorite stringers in zone. Breccia clasts are grey/white quartz. Vein hosts weakly disseminated pyrite accross whole interval.
			127.04	127.91	0.87		LTGN		s		s													Se	tw		Strongly sericitized, phyllic altered granodiorite. Highly silicious hosting a vuggy, brecciated quartz/ankorite vein.
			127.38	127.48	0.10		WHOR	BX	i		80				VN	80				tw				Se	tw		Vuggy quartz vein (smokey) with brecciated areas near the footwall side. Ankorite stringers in zone. Breccia clasts are grey/white quartz. Vein hosts weakly disseminated pyrite accross whole interval.
			132.22	132.59	0.37		LTGN		i		s									t		t	t				Phyllic altered zone, moderately sericitized with a patchy tan/orange colour. Zone hosts a quartz vein 1cm wide with blebby galena, sphalerite and pyrite. Zone is moderately quartz flooded.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	1.22	1.22	OVB	No recovery
1.22	26.88	25.66	GRD	Oxidized phyllic and argillic altered granodiorite.
				strongly oxidized with quartz veinlets throughout.
26.88	55.60	28.72	GRD	Phyllic altered granodiorite with disseminated pyrite
				and significant gouge intervals. Sulphide veins rare.
55.60	75.83	20.23	VEN	Strongly altered granodiorite hosting numerous wide
				massive sulphide veins and gouge zones. Vein Zone.
75.83	108.25	32.42	GRD	Strongly altered granodiorite dominated by large, pink
				chalcedony quartz veins.
108.25	131.17	22.92	POR/BXA	Intermittent wide zones of quartz feldspar porphyry
				dykes and high grade sulphide rich breccia zones.
				quartz sulphide veins also present at dyke contacts.
131.17	203.18	72.01	GRD	Phyllic to propylitic altered granodiorite hosting
				abundant smokey and milky quartz veins and veinlets
203.18	227.69	24.51	GRD	weakly propylitic altered granodiorite with unaltered
				intervals present. 227.69 EOH.

													Other												Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
172.36	174.60					GRD	DKGN	MA					pro	w	VT	85	0.2	2									Weak to moderate propyllitic alteration. Stronger alteration around quartz veinlets.
174.60	179.52					GRD	WHPI	MA		s			pro/pc	w/f													Argillic and potassic alteration with patches of propyllitic alteration towards the end of the interval.
179.52	184.45					GRD	WHG	PA							VT	85	0.2	2									Patchy alteration. Phyllic and argillic alteration patches with small patches of propyllitic alteration. Carbonate veinlets throughout. Quartz-sulphide veins as well/ Rare pyrite stringers.
															ST	65	0.1	1		w							
			180.81	181.03		VEN	GY								VN	90	10	1		f	w	t					Smoky quartz vein with pink chalcedony and pyrite, arsenopyrite, and sphalerite. Pyrite and chalcedony veinlets proximal to large vein.
															VN	85	0.8	1		f		w					
184.45	203.18					GRD	LTGN	MA	ms	f			pot/pr	w/w													Phyllic alteration interval with gougy sub-interval, propyllitic patches, and quartz-sulphide veins. Some phyllic with moderate argillic alteration. Also potassic alteration patches.
			185.08	185.13		GRD	WH	GO																			Gouge interval with white-grey clay and granodiorite clasts 1mm-1cm.
			185.22	185.62		GRD	WH	GO					SE	I						f							Gouge interval/intense sericite alteration. White grey clay/sericite with granodiorite clasts (1mm-2cm) and pyrite throughout.
			186.82	186.87		VEN	GY								VN	80	1	1		w	f	###					Milky quartz vein with massive sphalerite, arsenopyrite, and pyrite.
			192.91	194.78		GRD	DKGN	MA					pro	w													Weak propyllitic alteration sub-interval
			194.86	194.89		VEN	PK								VN	75	1.5	1		w							Pink chalcedony vein with smoky quartz and "stringy" pyrite.
			195.81	197.21		GRD	PKGN	MA					pro	w													Weak propyllitic alteration.
			197.54	197.63		VEN	GY								VN	75	1	2		m							Smoky quartz veins with "wormy" pyrite and disseminated pyrite in surrounding alteration.
			198.01	198.13		VEN	GY	BX							VN	90	12	1		w	w?						Smoky quartz vein breccia with orange chalcedony and white carbonate fracture fill. Disseminated pyrite and arsenopyrite.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	2.00	2.00	OVB	Casing/No recovery.
2.00	32.61	30.61	GRD	Oxidized granodioirte, phyllic to propylitic alteration
				hosting disseminated tourmaline and quartz/tourmalin
				veins.
32.61	39.99	7.38	VEN	Phyllic altered granodioirte hosting wide massive
				sulphide veins and vein breccias. Abundant quartz/
				sulphide veins and veinlets. Vein Zone.
39.99	149.53	109.54	GRD	Largely unaltered granodioirte.
149.53	165.60	16.07	POR	Quartz feldspar porphyry dyke.
165.60	195.60	30.00	VEN/DYK	Alternating strongly sericitized gouge zones and quart
				flooded vein zones hosting massive galena, sphalerite
				pyrite and arsenopyrite. Vein zones seperated by
				silicious dykes. Strongly mineralized interval.
195.6	209.4	13.80	GRD	Largely unaltered granodioirte. 209.40 EOH.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	4.31	4.31	OVB	Overburden, no recovery.
4.31	46.12	41.81	GRD	strongly oxidized/altered granodioirte hosting white
				clay gouge/vein zones.
46.12	156.18	110.06	GRD	unaltered granodioirte.
156.18	187.87	31.69	GRD	Strongly propylitic to phyllic altered granodioirte hostir
				quartz stringers and gouge veins.
187.87	270.64	82.77	GRD	extremely broken, argillic/gouge altered granodiorite.
				intermittent vein zones hosting strong massive sulphic
				veins. Large gouge zones throughout.
270.64	334.37	63.73	GRD	Weakly altered, k-feldspar rich granodioirite. Some
				hematite staining. Veinlets are limited to smokey and
				milky quartz, few in numbers. 334.37 EOH.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	5.55	5.55	OVB	Casing/No recovery.
5.55	48.46	42.91	GRD	lightly propylitic altered and strongly oxidized
				granodioirte. Frequent dyke zenolyths present.
				disseminated magnetite throughout country rock.
48.46	51.71	3.25	VEN	Vein zone hosting massive sulphide and quartz veins
51.71	106.26	54.55	GRD	Largely unaltered granodioirte hosting abundant mafi
				zenoliths.
106.26	125.45	19.19	VEN	Vein zone dominated by gouge and breccia veins as
				well as quartz sulphide veins hosting arsenopyrite,
				galena, sphalerite and pyrite.
125.45	176.08	50.63	GRD	Moderately altered granodioirte hosting frequent quar
				veins and veinlets.
176.08	199.35	23.27	POR	two 8 m wide quartz feldspar porphyry dykes with
				extremely altered gouge material between them. High
				broken, bright orange yellow colour.
199.35	229.1	29.75	GRD/VEN	Patch altered granodioirte and vein/breccia zones.
229.1	285.6	56.50	GRD	Weakly altered granodioirte. 285.60 EOH.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	7.66	7.66	OVB	Overburden/No recovery.
7.66	40.73	33.07	GRD/VEN	Oxidized, lightly altered granodiorite. Strong brown
				coulour, very strong sulphide veins. Massive pyrite,
				arsenopyrite, galena and sphalerite present.
40.73	63.91	23.18	GRD	propylitic/phyllic altered granodiorite.
63.91	96.04	32.13	GRD/VEN	Propylitic altered granodioirte with frequent phyllic
				envelopes and quartz veins and veinlets. Quartz veins
				and quartz sulphide veins are common throughout
				interval.
96.04	151.36	55.32	GRD/BXA	Alternating phyllic, argillic and propyltic altered
				granodioirte with wide breccia zones common.
				semi-massive sulphides present in breccia zones.
151.36	169.9	18.54	POR	Quartz feldspar porphyry dykes cross cut by breccia
				zones and strong gouge.
169.9	219.4	49.50	VEN/BXA	Highly altered granodioirte hosting common breccia a
				quartz sulphide vein zones.
219.4	230.12	10.72	GRD	largely unaltered granodioirte. 230.12 EOH.

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
0.00	7.66					OVB	BN																				Overburden, oxidized GRD, lots of redrill
7.66	40.73					GRD	BNOF	PA	ms	ms-s		s	pro	s													Oxidized core. Very patchy phyllic-argillic-propyllitic alteration in ~1m intervals. Milky quartz veinlets and limonite veinlets frequent. Milky quartz sulphide veins host strong sphalerite, galena, and pyrite mineralization (describe below). 60% core brown overall 40% show alteration colours without oxidation staining. Limonite on approximatly all fracture surfaces.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	2.13	2.13	OVB	Casing/No recovery.
2.13	51.67	49.54	GRD	Unaltered (fresh) granodiorite.
51.67	95.19	43.52	GRD	K-feldspar rich granodioirte with occasional 1-5 m
				wide argillic and propylitic altered intervals.
95.19	129.03	33.84	GRD	Patchy altered granodiorite. Biotite alteration and
				abundant k-feldspars.
129.03	188.06	59.03	BXA/GRD	Intensely sericitized, light green coloured, silicious vei
				and breccia zone. Large 15 m wide competent breccia
				zones with abundant smokey quartz veins and
				disseminated pyrite throughout rest of interval.
				Vein/Fault Zone.
188.06	260.55	72.49	GRD	unaltered granodiorite hosting large silica flooded,
				phyllic altered zones. Gouge material common in thes
				intervals.
260.55	288.77	28.22	BXA	Phyllic altered, quartz flooded granodioirte hosting
				wide green breccia zones.
288.77	300.84	12.07	GRD	Unaltered granodioirte. 300.84 EOH.

0.00	2.13	2.13																									Overburden, no recovery.
2.13	51.67	49.54				GRD	WHBK																				Unaltered (biotite, horneblende, quartz) granodiorite.
			18.08	18.49	0.41		WHGY			50			ARG	50	C	70								Cl	t		Argillic altered granodiorite with a faint potassic/propylitic overprinting. Chlorite in fractures.
			18.18	18.20	0.02	VN	WH	MA			100				VN	70											Grey quartz vein orientated parallel to argillic altered envelope
			23.63	23.75	0.12	APL	PK								DY	80											Aplite dyke
			42.71	44.35	1.64		GNPK						POT	tw										Kf	tw		Patchy potassic/propylitic altered granodiorite. Very rubbled texture. Minor argillic alteration in localized zones. Potassic and propyltitc altered zones are represented by strong K-feldspar and chlorite respectively.
													PRO	tw										Cl	tw		
			44.87	45.20	0.33		WHBK			50	t		ARG	50													Argillic altered granodiorite, soft, highlt broken, localized zones of grey quartz flooding.
			47.37	47.45	0.08		WHBK			s	w		ARG	s	VN	78											Argillic altered envelope around a chalcedonic quartz vein 1 cm wide. Strong argillic alteration.
51.67	53.88	2.21				LTGN			i		f	tw	PRO	tw						t				Se	w		Phyliic altered zone with abundant quartz flooding and veinlets. Rock around fractures are strongly oxidized. Some localized areas host extremely fine grained, weakly disseminated pyrite. Whole interval is light greeen in colour and intensely sericitized.
53.88	95.19	41.31				GRD	BKPK				t		PRO	w										Kf	w		K-feldspar dominated granodiorite, Granodiorite hosts occasional argillic or propyltic altered zones up to about 1 m wide. Intermittent sheeted quartz stringers cross cut zone.
													ARG	w													
			54.85	55.52	0.67		LTPK	FD			w				VT	65											Silica flooded zone hosting abundant chalcedony quartz veinlets. Zone has oxidized fracture surfaces.
			68.20	69.19	0.99		LTGN			s			ARG	s	C	55											Extremely altered (argillic) granodiorite. Very soft, grey green colout (light). Clay alteration boarders to clay gouge. Zone hosts large quartz vein in centre.
			68.75	68.89	0.14	VEN	GY	MA			100				VN	60											Grey/green quartz vein. Clay gouge 1 cm wide (white) on both contacts.
			78.15	78.46	0.31		WHPK			s			POT	s	C	80								He	t	t	Strong argillic altered granodiorite with a strong potassic altered overprint. Minor biotite disseminated in zone (biotite alteration?). Hematite on fratcure surfaces. Chalcedonic quartz stringers cut zone.
																								Bi	t		
			78.80	79.11	0.31		WHPK			s			POT	s	C	80								He	t		Strong argillic altered granodiorite with a strong potassic altered overprint. Minor biotite disseminated in zone (biotite alteration?). Hematite on fratcure surfaces. Chalcedonic quartz stringers cut zone.
																								Bi	t		

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	4.57	4.57	OVB	Overburden, no recovery.
4.57	40.01	35.44	GRD	Oxidized gougy orange material with rare massive
				sulphide veins. Gouge grades into oxidized, highly
				broken granodiorite.
40.01	112.02	72.01	GRD	Dark propylitic altered granodioirte grading to phyllic
				altered envelopes around quartz/carbonate veins
				hosting disseminated sulphides.
112.02	130.50	18.48	GRD/VEN	Silicious granodioirte hosting abundant vuggy quartz
				veins and pyrite stringers.
130.50	184.04	53.54	GRD	Largely propylitic altered granodiorite.
184.04	203.05	19.01	POR	quartz feldspar porphyry dykes with sulphide veins
				and related breccias in between.
203.05	225.42	22.37	VEN/POR	Abundant massive sulphide veins and breccias
				dominated by sphalerite. VEIN ZONE. Interval ends w
				a 4 m wide feldspar porphyry dyke.
225.42	238.25	12.83	GRD	weakly propylitic altered granodiorite. 238.25 EOH.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	6.86	6.86	OVB	Casing/No recovery.
6.86	35.52	28.66	GRD	Strongly limonite and manganese stained, sandy
				textured granodiorite. Gouge material rare.
35.52	68.90	33.38	GRD	repeating sequences of every alteration style. Phyllic
				and argillic alteration is dominate and associated with
				proximity to quartz/gouge veins crosscutting interval.
68.90	122.79	53.89	GRD	Largely unaltered granodioirte. Some speckled argillic
				and propylitic altered intervals.
122.79	158.30	35.51	GRD/VEN	Weak vein zone dominated by quartz veins and
				intensely phyllic altered granodioirte hosting pervasive
				pyrite.
158.3	169.15	10.85	POR/VEN	Strong vein/breccia interval starting with a 5 m wide
				quartz feldspar porphyry dyke. Massive sulphide veins
				present. Wide black breccia veins common.
169.15	188.06	18.91	GRD	Unaltered granodiorite with multiple strong chalcedon
				quartz veins crosscutting interval. 188.06 EOH.

0.00	6.86	6.86				OVB																					Overburden mixed argillic/dirt/and granodiorite rocks. Unsampled.
6.86	9.30	2.44				GRD	WH			i		tw	ARG	i													Rubbled, sandy textured, manganese limonite stained granodiorite. Strongly argillic altered white black speckled. Some competent granodiorite fragments.
9.30	35.52					GRD	GY		t			t															Unaltered granodiorite minor limonite staining in fractures. Some weakly altered intervals hosting quartz veins. Altered intervals are more strongly oxidized.
			15.08	16.27		GRD	GNWH		m	m		f	ARG	m						t							Phyllic altered envelope around a vuggy/smokey quartz vein. Vein hosts blebby pyrite. Interval includes strongly argillic moderately oxidized zone outside phyllic area on downhole and uphole sides. Weak potassic altered overprinting in these regions.
													POT	tw													
			15.80	15.87		VEN	DKGY	VU			100				VN	80				m							Vuggy smokey quartz vein with milky strings throughout hosting blebby pyrite.
			24.75	25.59			LTGN		m	t			ARG	t													Moderately phyllic altered interval. Trace localizec argillic alteration.
			30.37	31.84			LTGN		m	t			ARG	t													Moderately phyllic altered interval. Trace localizec argillic alteration.
35.52	68.90					GRD		PA	m	m	m		ARG	m													Patchy/alternating granodiorite of every variety of alteration. Phyllic and argillic are the dominant alteration styles. Occasional unaltered zones usually less than 50cm. Alteration is powered by quartz/gouge veins found in phyllic altered intervals.
													POT	t													
													PRO	m													
			35.70	35.77		VEN	WHGN		i		i				VN	78											Thin, anastomosing chalcedony quartz veins hosting pervasive pyrite in veins and phyllic altered envelope. Very silicious zone.
			37.00	37.06		VEN	WHGN		i		i				VN	78											Thin, anastomosing chalcedony quartz veins hosting pervasive pyrite in veins and phyllic altered envelope. Very silicious zone.
			37.87	37.05		VEN	DKGY	VU			100				VN	80				m		t	t				Vuggy smokey quartz vein hosting pervasive pyrite and black stringers with trace galena/sphalerite.
			38.71	38.80		VEN	DKGY	VU			100				VN	80				m		t	t				Vuggy smokey quartz vein hosting pervasive pyrite and black stringers with trace galena/sphalerite.

													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
			73.20	73.24		VEN	MT	MA	i		i				VN	68				i	i	70					Massive sphalerite (honey brown) vein hosting blebby pyrite. Vein hosted in a silicious phyllic altered granodiorite. Host rock has abundant spidered arsenopyrite veinlets and pervasive arsenopyrite throughout interval on hanging wall side. Much smaller scale and very narrow than above.
			78.47	78.58		VEN	WHMT		i		i				VN	75				i		i					Milky quartz vein with grey gouge material on hanging wall side and blebby-massive sphalerite and pyrite on footwall side. All about equal widths.
			82.48	82.51		VEN	WHBR				100				VN	80						i	t				Chalcedony quartz vein (very clear) with massive sphalerite and trace galena disseminated throughout.
86.17	101.02					GRD	GY																				Unaltered granodiorite, crumbled carbonate in some fractures. Appears close to argillic type speckled look.
101.02	104.66					GRD	WHPK			i			ARG	i													Intensely argillic altered interval, competent. Strong potassic altered overprinting. Solid, consistant zone.
													POT	s													
104.66	122.79					GRD	GYGN		tw	tw			ARG	tw													Dominantly unaltered granodiorite (dark grey) with moderate to lightly phyllic altered zones. These zones host quartz and rarely sulphide veins. The contacts between the fresh and phyllic altered granodiorite are intensely argillic altered, crumbly but rarely wider then 20cm.
			106.91	107.34		VEN	WHMT	MA			100				VN	80				i	s						Banded chalcedony quartz and massive pyrite vein. Pyrite vein is brecciated into cubic clasts. Dark grey quartz hosts clasts. Localized pervasive pyrite in zone. Pretty sexy vein!
			114.19	114.47		VEN	WH		i		100				VN	40											Large, low angle milky quartz vein hosting phyllic altered clasts. Vein has a sort of flow structure look. Appears bright white and plastic like.
			120.71	121.40		VEN	WHMT	MA	i		i				VN	70				i	s						Vein zone hosting 4x sheeted chalcedony quartz veins the same as 106.91 - 107.34m. Each about 6cm wide.
122.79	127.34					GRD	WHGY			i			ARG	i													Speckled white and grey rubbled argillic altered granodiorite. Some localized areas where calcite fragments and carbonate material is found in rubble. Very strong alteration.
127.34	134.06					GRD	WHGN	PA		i			PRO	f													Very patchy, dominantly argillic altered granodiorite with some narrow strongly propylitic altered sections. No significant veins. Fairly competent rock for clay alteration.
													ARG	i													

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS									DETAILED DESCRIPTION
													Other												Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
134.06	143.90					GRD	LTGN		i	i	i		ARG	i						tw	t	t		Se	ms		Phyllic altered granodiorite (strong). Patches of intense argillic in zone. Interval hosts abundant quartz veins and occasional massive sulphide veins. In very strong phyllic altered intervals, sericite has gone to a yellow/orange colour. Ankorite veinlets present in these zones. Some gouge in fractures.
			138.79	138.95		VEN	DKGY	VU	i		i				VN	80				ms	ms						Vuggy, smokey quartz vein hosting pervasive pyrite and arsenopyrite. Gouge (grey) in fractures. Ankorite veinlets cross cut vein.
			142.34	142.57		VEN	DKGY	VU	i		i				VN	80				ms	ms						Vuggy, smokey quartz vein hosting pervasive pyrite and arsenopyrite. Gouge (grey) in fractures. Ankorite veinlets cross cut vein.
143.90	153.80					POR	TN	DY							DY	75											Quartz feldspar porphyry dyke. Typical Klaza zone dyke, but where is the Klaza zone?
153.80	158.30					GRD	LTGN		i		i																Intensely phyllic altered and silicious granodiorite hosting significant veins at dyke contacts.
			153.80	154.02		VEN	GY		100		i				VN	78				i							No real vein. Just incredable pervasive pyrite in a very silicious/phyllic granodioirte. A single milky quartz vein 1cm wide at dyke contact.
			157.85	158.30		VEN	BKGY	BX	i		i				VN	80				i	t						Intense vein zone. Banded chalcedony quartz, massive pyrite veins. Black breccia against dyke contact. Clasts are composed of massive pyrite and quartz fragments with disseminated pyrite and arsenopyrite. Swirling quartz veins. Many individual micro-faults cut vein zone.
158.30	159.02					POR	LTTN	DY							DY	80											Quartz feldspar porphyry dyke
159.02	169.15					GRD		PA	m	m	m		ARG	m													Patchy/alternating granodiorite of every variety o alteration. Phyllic and argillic are the dominant alteration styles. Occasional unaltered zones less than 30cm. Alteration is powered by quartz veins found in phyllic altered intervals.
													PRO	t

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	3.05	3.05	OVB	Overburden/No Recovery
3.05	23.30	20.25	GRD/VEN	Rubbled and oxidized vein zone hosted in gouge
23.30	121.34	98.04	GRD	Unaltered granodioirte hosting carbonate in fractures
				and some altered intervals. Dominantly argillic.
121.34	133.20	11.86	VEN	Very highly phyllic/argillic altered granodiorite hosting
				abundant smokey quartz veins and gouge zones.
133.20	178.87	45.67	GRD	Intensely phyllic altered granodioirte. Very silicious.
				Interval hosts numerous quartz veins thoughout. Some
				gouge zones present.
178.87	198.64	19.77	VEN	Vein Zone. Phyllic altered granodiorite hosting
				numerous highgrade massive sulphide veins and
				breccia zones. Upper Klaza Zone.
198.64	234.84	36.20	GRD	Intensely phyllic altered granodioirte. Very silicious.
				Interval hosts numerous quartz veins thoughout.
234.84	249.97	15.13	VEN	Very strong, developed vein zone. Klaza Zone.
249.97	306.96	56.99	POR/GRD	feldspar porphyry dykes followed by phyllic altered
				granodiorite with quartz veining. 306.96 EOH.

			127.35	127.56	0.21	VEN		BX	i		100				VN	80				tw							Smokey quartz vein hosting milky quartz clasts (angular) and massive pyrite blebs. Hosted in phyllic altered granodiorite.
			128.64	128.83	0.19	VEN		BX	i		100				VN	80				w		tw					Milky quartz vein hosting smokey quartz clasts (angular) and massive pyrite blebs. Hosted in phyllic altered granodiorite. Massive sphalerite stringer parallel to wuartz vein.
128.91	133.20	4.29				GRD	GYLT			t	t		ARG	ms													Unaltered granodiorite with argillic altered hanging wall. Very competent.
			128.91	130.95	2.04		WHPK				t		ARG	ms													Competent, light to moderately argillic altered granodiorite. Localized areas of potassic overprinting. Interval hosts very few quartz veins and veinlets.
													POT	ms													
133.20	134.50	1.30				MAF	DK	DY							DY	65												Mafic dyke with white rounded phenocrysts throughout.
134.50	155.52	21.02				GRD	GY		t				PRO	t													Unaltered granodiorite, few phyllic/propylitic altered envelopes around quartz veins. Very fresh in general.
			134.40	134.80	0.40	VEN	WH	BX							VN	?								Ca	100		Large calcite vein brecciating both the mafic dyke at the hangingwall contact and the granodiorite at the footwall contact. Clasts are ultra angular and can be imagined back into place against the country rock.
			149.13	149.53	0.40		LTGN		s		w				VN	80				w							Moderate to strong phyllic altered granodiorite hosting a dark quartz vein with pervasive finegrained pyrite around vein.
			150.14	150.39	0.25		LTGN		s		w				VN	80				w		tw	t				Moderate to strong phyllic altered granodiorite hosting a dark quartz vein with pervasive finegrained pyrite around vein. Vein also hosts trace galena and semi-massive sphalerite stringers.
150.39	161.90	11.51				GRD	LTGN		i	tw	ms									ms	t	f	f				Strongly phyllic altered granodiorite, moderate quartz flooding. Hosts numerous large quartx veins (some vuggy). All of the quartz veins are hosting galena, sphalerite, pyrite and some arsenopyrite. Gouge veins are also present.
			150.54	150.65	0.11	VEN			i		70				VN	70				i							Milky quartz vein with a 1cm massive pyrite envelope. Pyrite vein formed first and was then reopened by quartz. Evidence for a multi-stage system that was very long lived. Interval hosts pervasive pyrite and pyrite stringers.
			159.02	159.26	0.24	VEN	DKGY	VU	i		75				VN	80				i	tw	tw	tw				Dark quartz vein, fairly vuggy. Vein hosts speckled semi-massive pyrite, arsenopyrite with less sphalerite and galena . Vein is cross cut by milky quartz veinlets.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
			159.95	160.26	0.31	VEN	DKGY	VU	i		76				VN	81				i	tw	tw	tw				Dark quartz vein, fairly vuggy. Vein hosts speckled semi-massive pyrite, arsenopyrite with less sphalerite and galena . Vein is cross cut by milky quartz veinlets. Vein hosts microfaults displacing veinlets at 45 degrees.
161.90	178.87	16.97				GRD	GY																				Unaltered granodiorite, very low abundance o fractures. Some altered intervals early in zone probably associated with previous vein zones.
			164.61	166.00	1.39		LTGN	PA	i	tw	ms		PRO	tw						ms		t	t				An almost banded variation of alteration alternating through phyllic, argillic, propylitic and combinations of the three. Zone is moderately quartz flooded and hosts significant smokey quartz veins. Semi-massive galena, sphalerite and more commonly pyrite around these veins.
			166.67	167.38	0.71		LTGN	PA	i	tw	ms		PRO	tw						ms		t	t				An almost banded variation of alteration alternating through phyllic, argillic, propylitic and combinations of the three. Zone is moderately quartz flooded and hosts significant white chalcedony quartz veins. Semi-massive galena, sphalerite and more commonly pyrite around these veins.
			177.30	177.45	0.15	VEN	LTGN		s		s				VN	78				ms							Phyllic altered interval hosting a milky quartz/ankorite vein 1cm wide with pervasive pyrite through it.
178.87	198.64	19.77				GRD	LTGN		s	tw	s		PRO	tw						m	t	tw	tw				Phyllic altered granodiorite (vein zone) hosting numerous wide high grade veins (upper Klaza Zone). Phyllic alteration rarely grades into argillic or combinations of alteration with trace propylitic alteration. High grade veins consist of smokey quartz, sulphide and gouge veins.
			179.29	179.61	0.32	VEN	WHBK		i		90				VN	75				ms	ms						Blended smokey/milky quartz vein hosting blebby pyrite and arsenopyrite throughout. Vein hosted in silicious phyllic altered granodiorite.
			181.08	181.24	0.16	VEN	WHBK		i		90				VN	75				ms	ms						Blended smokey/milky quartz vein hosting blebby pyrite and arsenopyrite throughout. Vein hosted in silicious phyllic altered granodiorite.
			182.66	184.86	2.20	VEN	BKMT	MA	i		80				VN	70				60					To	i	Vein zone consisting mostly of quartz tourmaline veins upto 1m wide hosting massive pyrite. Pyrite forms spherical blebs that have all grown into one another. Fractures host intense sericite alteration (metallic). Interval is 80% massive vein, the rest is phyllic alteration hosting coarse grained pervasive pyrite.
																									Se	i

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	3.05	3.05	OVB	Casing/No recovery.
3.05	32.61	29.56	GRD/VEN	Oxidized granodiorite. Last 15 m host massive galena
				and sphalerite veins. Very gougy material.
32.61	100.04	67.43	GRD	Mostly unaltered granodiorite, some patchy alteration
100.04	132.55	32.51	GRD	Very strong phyllic altered granodiorite developing int
				gouge veins frequently. Numerous large smokey
				quartz veins throughout.
132.55	186.20	53.65	GRD/VEN	Phyllic/argillic altered granodiorite developing into
				vein zones on occasion. Semi-massive sulphides in
				vein zones. Zones upto 3 m wide.
186.2	256.5	70.30	GRD/VEN	Phyllic/argillic altered granodiorite, very soft. Large
				abundant chalcedony sulphide veins. Quartz feldspar
				porhyry dykes in interval associated with highest
				grade mineralization along dyke margins.
256.5	273.4	16.90	GRD	lightly to unaltered granodiorite. 273.40 EOH.

0.00	3.05	3.05				OVB																					Overburden, no recovery
3.05	18.31	15.26				GRD	ORGY		t			ms															Strongly oxidized granodiorite, particularly in fractures. Some phyllic altered intervals. These zones are highly weathered and host abundant limonite staining.
			8.56	10.19	1.63		ORGN		ms		t	i								t		t	t				Intensely oxidized phyllic altered granodiorite hostin few 1cm quartz veins with blebby sphalerite, galena, pyrite. Some veins are to oxidized to determine sulphide.
			16.00	16.17	0.17	VEN	ORGN		i		i	i			VN	80				tw			t	Go	ms		Intensely oxidized , phyllic altered quartz vein. Goethite and limonite staining very strong. Limonite pits throughout. Blebby galena and pyrite +/- sphalerite present.
18.31	19.20	0.89				MAF	DKBR	DY				i			DY	75											Oxidized/limonite stained mafic dyke. Orange altered feldspars throughout.
19.20	22.08	2.88				GRD	WHOR		ms	ms		i	ARG	ms													Phyllic/argillic altered interval. Extremely oxidized. Limonite staining very strong on argillic altered intervals. Highgrade sulphide vein at dyke contact.
			19.20	19.49	0.29	VEN	ORGN		i		90	i								ms		m		Go	ms		Strongly limonite/goethite stained vein zone. Quartz vein 8cm wide hosted in oxidized phyllic altered granodiorite. Quartz vein hosts rusted blebby pyrite and blackjack sphalerite.
22.08	26.97	4.89				GRD	GYOR					m															Unaltered granodiorite with strong limonite staining in fractures.
			26.34	26.52	0.18		GNOR		i			tw			VT	80				ms		ms	t				Phyllic altered granodiorite hosting a narrow quartz vein with trace galena and massive sphalerite/pyrite stringers.
26.97	32.61	5.64					GNOR		i		i	m								tw		tw	t				Phyllic altered granodiorite hosting numerous quartz veins associated with semi-massive sulphides. Moderate oxidation throughout interval. Strong quartz flooding. Weak vein zone.
			28.29	28.45	0.16	VEN	GNBK	MA	i		50	ms			VN	78				m		i					Massive sphalerite vein 6cm wide hosting blebby pyrite. 3x massive pyrite veinlets in phyllic altered granodiorite on footwall side of sphalerite vein.
			29.42	29.64	0.22	VEN	WHGN	VU	i		50	ms			VN	65				tw				Se	i		Anastomosing, milky, vuggy quartz veins orientated approximately 65 degrees to core axis. Veins hosted in strongly sericitized granodiorite. Disseminated pyrite throughout interval with increased abundance around veins.
			32.00	32.22	0.22	VEN	BK	FG			i	ms			VN	78				m		t					Black ground up sulphide vein hosting swirling quartz veins. Blebby, spherical pyrite groups and trace sphalerite. Rare rounded quartz clasts in black vein.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

													Other												Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
32.61	64.38	31.77				GRD	GY					t															Unaltered grey granodiorite with weak limonite staining in fractures. Very hard and competent.
			49.06	49.90	0.84		GNWH		ms	ms	m	t	ARG	ms						t							Phyllic altered granodiorite with an 8cm argillic altered envelope hosting a chalcedony quartz vein and disseminated pyrite. Trace limonite staining.
			49.34	49.52	0.18	VEN	WH		i						VN	?				ms				Ca	ms		Chalcedony quartz vein with calcite veinlets around it. Very broken. Almost down to fragments only. Semi-massive pyrite throughout interval.
			57.97	58.40	0.43		GNWH			t			PRO	ms										Cl	tw		Soft propylitic altered granodiorite with localized argillic alteration. Interval looks like it is moving from propylitic to argillic alteration.
													ARG	t													
64.38	100.04	35.66				GRD	GNGY	PA	m	t	tw		ARG	t						t							Unaltered granodiorite base with patchy, wide intervals of propylitic, phyllic, and argillic altered granodiorite. These zones host quartz veins +/- sulphides.
			66.14	67.05	0.91		DKGN	PA	ms		t		PRO	s						tw		tw					Patchy propylitic and phyllic altered interval hosting 2x quartz/sulphide veins.
			66.33	66.38	0.05	VEN	MT	MA			100				VN	80				ms		ms					Milky/clear quartz vein hosting massive sphalerite, pyrite veinlets.
			67.80	71.85	4.05		GNGY	PA	ms	t	t		PRO	ms						tw		tw					Patchy phyllic dominated with lesser argillic and propylitic altered granodiorite. Interval hosts strong quartz/sulphide veins associated with the strongest phyllic altered regions.
			67.80	68.05	0.25	VEN	GY	FL	i		100				VN	75				m		tw					Flowbanded grey quartz vein hosting pervasive pyrite and trace to blebby sphalerite. Strongly silicified.
			69.83	69.91	0.08	VEN	WHGY		i		70				VN	75				m		m	m				Grey/milky quartz vein hosting semi-massive galena, sphalerite and pyrite. Vein hosted in a silicious phyllic altered granodiorite.
			70.13	70.22	0.09	VEN	WHGY		i		70				VN	75				m		f	f				Grey/milky quartz vein hosting semi-massive galena, sphalerite and pyrite. Vein hosted in a silicious phyllic altered granodiorite.
			71.62	71.64	0.02	VEN	WHGY		i		70				VN	70				m		f	t				Grey/milky quartz vein hosting semi-massive galena, sphalerite and pyrite. Vein hosted in a silicious phyllic altered granodiorite.
			72.24	73.67	1.43		LTGN		i				PRO	tw										Ep	tw		Strongly phyllic altered, pale to light green coloured granodiorite. Weak propylitic alteration in some intervals distal to quartz veins. Localized pervasive epidote. Quartz stringers throughout zone.
			74.07	78.75	4.68		GNGY	PA	ms	t	t		PRO	ms						tw							Patchy phyllic dominated with lesser argillic and propylitic altered granodiorite. Interval hosts strong quartz/sulphide veins associated with the strongest phyllic altered regions.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
			76.70	77.12	0.42	BXA	BKMT	MA			i				VN	75				i							Silicified black breccia zone with a mix of milky quartz and phyllic granodiorite clasts. Lower contact is with a 12cm massive pyrite vein. Very coarse grained
			81.59	82.59	1.00		LTGN		i				PRO	tw										Ep	tw		Strongly phyllic altered, pale to light green coloured granodiorite. Weak propylitic alteration in some intervals distal to quartz veins. Localized pervasive epidote. Quartz stringers throughout zone.
			82.09	82.24	0.15	VEN	WH	VU			100				VN	80				t							Vuggy milky quartz vein. Very strong epithermal textures. Some small grey breccia clasts. Trace disseminated pyrite throughout.
			83.59	83.67	0.08	VEN	WH	VU			100				VN	80				t							Vuggy milky quartz vein. Very strong epithermal textures. Some small grey breccia clasts. Trace disseminated pyrite throughout.
			85.45	86.72	1.27		LTGN		i				PRO	tw										Ep	tw		Strongly phyllic altered, pale to light green coloured granodiorite. Weak propylitic alteration in some intervals distal to quartz veins. Localized pervasive epidote. Quartz stringers throughout zone.
			86.10	86.16	0.06	VEN	PKGY		i		i				VN	60								He	t		Pink/grey quartz/ankorite vein. Minor hematite on fractures. A single small anhydrite angular/tabular clast in vein.
			92.86	96.62	3.76		GNWH	PA	ms	ms	t		ARG	ms						t		t					Equally argillic and phyllic altered patchy granodiorite. Phyllic alteration more common near quartz veins. Argillic alteration has hints of very weak potassic altered overprinting. Minor quartz flooding near veins.
													POT	t													
			93.31	93.44	0.13	VEN	WHBK				100				VN	80				m		m					Chalcedony quartz vein hosting abundant blebby sphalerite and pyrite. Quartz vein has an almost mottled texture.
			94.92	94.97	0.05	VEN	WHBK				101				VN	70				m		m					Chalcedony quartz vein hosting abundant blebby sphalerite and pyrite. Quartz vein has an almost mottled texture.
100.04	107.65	7.61				GRD	GNWH		i	i	i									f		t					Intensely phyllic, quartz flooded interval hosting infrequent sulphide veins. Interval dominated by vein clay in fractures and narrow zones. Gouge zones host abundant quartz clasts. Very light green silicious coloured granodiorite, clay is white. Hanging wall interval of strong vein zone.
			102.10	102.90	0.80	VEN		GO		i					GO	?				t							Large gouge zone hosting abundant light grey quartz fragments and weak disseminated pyrite.
			103.00	104.13	1.13		LTGN	BK	i	i	i																Intensely phyllic altered and quartz flooded granodiorite extremely fragmented by strong gouge in fractures. Very broken interval.

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	7.55	7.55	OVB	Overburden/No recovery.
7.55	51.49	43.94	GRD	Oxidized granodiorite with decreasing oxidation down
				hole. Abundant quartz tourmaline veins and
				disseminated tourmaline. Patchy alteration.
51.49	66.14	14.65	GRD	Weakly altered granodiorite. Silicious dyke at footwall
66.14	133.73	67.59	GRD	patchy phyllic/argillic/propylitic altered granodiorite
				hosting some weak vein zones. Sulphide rich. Quartz
				veins throughout. Some breccia zones.
133.73	179.80	46.07	GRD/VEN	Much stronger vein zones, highly altered granodiorite
				Some porphyry dykes present adjacent to high grade
				intervals.
179.8	276.73	96.93	GRD	Moderately altered granodiorite with numerous gouge
				veins present.
276.73	302.22	25.49	GRD	lightly altered granodiorite.
302.22	332.51	30.29	POR/VEN	alternating quartz feldspar porphyry dykes and vein/
				breccia zones. Highly altered host rock., gouge prese
332.51	370.94	38.43	GRD	moderately altered granodiorite. 370.94 EOH.

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS							Photo	DETAILED DESCRIPTION
													Other											Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity		
0.00	7.55	7.55				OBV	BNOR																				Overburden / Casing; Unconsolidated dirt and soils with fragments of very oxidized altered granodiorite. Quartz vein fragments are also noted. Start of bedrock may likely be further uphole at ~5m.
7.55	16.82	9.27				GRD	BNGN		m		f	s			FX	40-50		4						To	w		Oxidized Phyllic Granodiorite; Moderate-strongly oxidized moderate phyllic granodiorite. Oxidation washes throughout this interval, generally along fractures. Patchy zones of mottled black tourmaline. Moderate competent core.
															VT	45	<10	6									Moderate veining density - large light grey quartz veins noted.
								DI											tw	tw								Trace-weak mineralization - finely disseminated pyrite present.
			8.03	8.14	0.11	VEN	GY				90	w			VN	45												Grey quartz vein - weakly oxidized (multistage?) no sulphides.
			9.25	9.37	0.12	VEN	GY				90	tw			VN	45												Grey quartz vein (multi-staged?) - rare sulphides.
			10.13	10.21	0.08		WH/GY	MO																To	s			Mottled zone with tourmaline flooding
			10.31	10.40	0.09	VEN	GY				90				VN	65			tw	t	t?							Quartz vine, multi-staged with trace sulphides.
			10.52	10.64	0.12		WH/GY	MO																To	ms			Mottled zone with tourmaline flooding.
			11.78	11.84	0.06		WH/GY	MO																To	ms			Mottled zone with tourmaline flooding.
			13.03	13.10	0.07		WH/GY	MO																To	s			Mottled zone with tourmaline flooding.
			14.11	14.27	0.16	VEN	GY				90	t			VN	35												Grey quartz vein, weakly shattered core - trace sulphides.
			14.91	15.26	0.35	VEN?	GNGY				85	t			VN?	55												Silica flooded zone/ diffused quartz vein(?) - rare sulphides.
			15.92	16.58	0.66		BNOR			s		m			GO	25												Oxidized , strongly clay altered zone. Quartz vein fragments noted.
16.82	29.03	12.21				GRD	GYGN		w		tw	f	pro	tw	FX	45-50		4						To	w		Mixed Granodiorite; Mixed granodiorite unit, dominantly with weakly propylitic granodiorite sand patchy zones of moderate phyllic. Weak-moderate oxidation washes throughout. Fairly competent core rock with minor fracturing.
															VT	40-55	<2	3									Weak-moderate vein density - quartz-carbonate veinlets common.
								DI							VT				tw	t								Trace-weak sulphide content - disseminated pyrite, generally noted in phyllic zones and also in some veining structures.
			19.66	22.04	2.38		LTGN		m			w	pro	w					tw	tw								Phyllic altered interval, slight increase veining and disseminated sulphides in the matrix.
			20.54	20.78	0.24	VEN	GY				i	tw			VN	45			tw	tw								At 20.54m, zone of silica flooding/diffused quartz vein carrying minor sulphides.
			21.72	21.73	0.01		GY/MT				i				VT	50	0.7		m				m					At 21.72m, quartz veinlet bearing galena.
			24.72	25.26	0.54		BNOR		m			ms																Strongly oxidized phyllic altered zone.
			25.89	26.26	0.37		LTGN		ms			f																Phyllic zone with oxidization generally along fractures.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	3.93	3.93	OVB	Casing/No recovery.
3.93	33.27	29.34	GRD	Oxidized granodiorite. Silicious dyke at footwall of
				interval.
33.27	75.08	41.81	GRD	Strongly phyllic altered granodioirte. Numerous quartz
				veins thoughout. Light green with disseminated pyrite
75.08	82.76	7.68	VEN	Phyllic altered granodiorite hosting sheeted polymetal
				sulphide veins composed of arsenopyrite, galena,
				sphalerite and pyrite.
82.76	165.17	82.41	GRD	Unaltered to propylitic altered granodiorite hosting few
				quartz veins with phyllic to argillic altered envelopes.
				envelopes are narrow.
165.17	220.66	55.49	VEN/BXA	Silicious granodiorite. Strongly phyllic altered with
				hosting disseminated pyrite and sulphide veinlets.
				strongest vein zone in hole. Breccia zones present.
220.66	312.39	91.73	GRD	Phyllic to propylitic altered granodiorite with decreasin
				intensity downhole.
312.39	364.85	52.46	GRD	Largely unaltered granodiorite.

0.00	3.93	3.93				OVB																					Overburden/Casing; Unconsolidated dirt and soil with trace organics. Fragments of granodiorite noted.
3.93	5.63	1.70				GRD	ORGY					f	pro	tw	FX	35		2									Weathered granodiorite; Weakly propylitic altered granodiorite with patchy brown-orange oxidation. Low veining density in competent core rock. Oxidized fracture surfaces. Rare mineralization - trace limonite(?).
															VT	30	0.1	4									
																								Li	?		
5.63	9.70	4.07				GRD	BROR		t			s	arg	m	FX	20-35		3									Strongly weathered and Altered Granodiorite; moderately argillic altered granodiorite with patchy strong propylitic zones and overprinted with moderate-strong oxidation. Fairly competent core rock with minor zones of shattered core.
													pro	w													
															VT	60-70	0.3										Low-moderate veining density - narrow carbonate veinlets noted.
																			t	t				Li	t		Rare-trace finely disseminated sulphides - likely to be pyrite. Weak limonite noted on fractures.
			7.54	8.34	0.80		DKGY					m	pro	s													Interval of increased propylitic alteration with slight decrease in oxidation.
9.70	15.04	5.34				GRD	WHGN		w			f	arg	s	FX	30-40		3									Moderately altered Granodiorite; Similar to 5.63 9.70m, with much decreased oxidation. Strong argillic altered granodiorite with mixed patchy zones of weak-moderate propylitic and phyllic alteration. Fairly competent core rock with occasional fractures.
													pro	w													
															VT	~60	<0.3	5									Low-moderate veining - narrow and irregular carbonate veinlets most common.
																			tw	tw		t					Trace-weak sulphide mineralization, generally noted in phyllic patches.
			10.97	12.11	1.14		DKGN					f	pro	m													Interval of increased propylitic alteration and decreased phyllic.
			13.22	14.12	0.90		MDGN		f				pro	w					tw								Zone of increased propylitic and phyllic alteration. Sulphide stringers and disseminated sulphides noted. Dominantly pyrite with trace sphalerite and rare arsenopyrite(?)
															VT	60-70	<0.5	2		tw	t	t					
								DI												tw							

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, l = 15-20%, (write % for >20%)

GEOLOGY LOG

INTERVAL			SUB-INTERVAL			LITHOLOGY			ALTERATION						STRUCTURE				MINERALS									DETAILED DESCRIPTION
													Other												Other			
From (m)	To (m)	Interval (m)	From (m)	To (m)	Interval (m)	Unit	Modifier	Texture	Phyllic	Clay	Silica	Oxidation	Type	Intensity	Type	Attitude (tca)	Thickness	Density (frequency/m)	Total Metals	Pyrite	Arsenopyrite	Sphalerite	Galena	Type	Intensity	Photo	
15.04	17.49	2.45				GRD	GNGY		m		t?	t			FX	40-60		4									Phyllic Granodiorite; Fair-moderately phyllic altered granodiorite with possible patchy silicification. Fairly competent core rock with minor fracturing. Weak oxidation on surfaces.
															VT									Cb			Moderate veining density with discontinuous and irregular carbonate stringers.
																			f	w							Weak-fair mineralization, mainly occurring in sulphide veins and veinlets. Fine disseminations also noted throughout interval. Minor amounts of oxides also present on fractures.
17.49	24.38	6.89				FEL	BFTN	BK			m	tw			DY	~80											Felsic Siliceous Dyke (Sister Vein Dyke); Buff-tan coloured, moderately silicified dyke. Contact zones are narrow bands of light-medium grey gouge at ~80° to core axis. Core rock is blocky and locally shattered,. Oxides noted at fracture surfaces. Fracture density increased moving downhole at 21.87m.
															FX	40-60		7									
																				tw?				Mn	?		Dark grey oxides noted on fracture surfaces possible manganese staining(?). Oxidized pits also noted - weathered pyrite grains(?).
24.38	25.02	0.64				GRD	GY		m										ms	ms							Phyllic Granodiorite; Similar to 15.04-17.49m. Strongly phyllic altered granodiorite, weakly competent core rock with patchy clay zones. Strongly mineralized, dominantly pyrite.
25.02	27.35	2.33				GRD	WHGN		m			tw	arg	m	FX	45		2									Phyllic Granodiorite; Similar to 15.04-17.49m. Bleached white/pale green phyllic granodiorite. Fairly competent core rock with localized strong oxidation on fracture surfaces. Finely disseminated pyrite noted throughout this interval.
								DI											w	w							
27.35	30.32	2.97				GRD	DKGN		tw				pro	s													Propylitic Granodiorite; Weakly dappled texture dark green propylitic granodiorite with patchy zones of weak-moderate argillic alteration. Competent core rock.
													arg	t													
								EN	w						VT	60-70	<0.5	4						Cb			Low-weak veining density, often narrow carbonate veinlets with weak-moderate phyllic envelopes.
								DI											t	t							Rare-trace fine disseminated pyrite in matrix
			28.12	28.69	0.57		PKGN						pot	?													Patch of weak potassic alteration(?)

n = none, t= <1%, w = 1-3%, f = 3-5%, m = 5-7%, ms = 7-10%, s = 10-15%, I = 15-20%, (write % for >20%)

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	3.88	3.88	OVB	Casing/No Recovery
3.88	68.81	64.93	GRD	Oxidized, propylitic and argillic altered granodiorite
				with decreasing oxidation downhole. Carbonate
				veinlets increasing downhole.
68.81	94.60	25.79	GRD	Strongly altered granodiorite hosting quartz carbonate
				veins and veinlets. Competent.
94.60	134.23	39.63	GRD	Area hosting many sulphide veins and veinlets. Stron
				phyllic alteration throughout interval. Patches hosting
				disseminated pyrite. Rare massive pyrite and galena.
134.23	260.73	126.50	GRD/VEN	Alternating in and out of strong vein zones and phyllic
				argillic altered granodiorite. Vein zones host numerou
				quartz sulphide veins. Abundant galena, arsenopyrite
				pyrite and sphalerite in these areas.
260.73	271.49	10.76	POR	Quartz feldspar porphyry dyke.
271.49	324.64	53.15	GRD/VEN	Same as 134.23-260.73. Stronger vein zones. More
				sulphides.
324.64	340.46	15.82	GRD	Mostly unaltered granodiorite.

SUMMARY

From (m)	To (m)	Interval	Unit	Comments
0.00	9.14	9.14	OVB	Casing/No recovery
9.14	52.47	43.33	GRD	Patchy phyllic and propylitic altered granodiorite.
				oxidized interval decreasing in intensity downhole.
52.47	78.35	25.88	GRD	Highly altered granodioirte. Some sulphide veins and
				veinlets. Gouge intervals present upto 1 m wide.
				zones hosting pervasive pyrite.
78.35	167.78	89.43	GRD	Moderate propylitic alteration grading to unaltered
				granodiorite. Altered envelopes around quartz sulphid
				veins.
167.78	251.46	83.68	GRD	Highly phyllic altered granodioirte. Numerous quartz
				veins throughout interval.
251.46	299.83	48.37	VEN	Vein zone hosted in altered granodioirte. Numerous
				massive sulphide veins. Galena, pyrite, arsenopyrite
				and sphalerite all present.
299.83	366.19	66.36	VEN	Weaker vein zone than above. Massive sulphides
				still present.
366.19	427.21	61.02	GRD	weakly altered granodioirte. EOH 427.21 m.

1. INTRODUCTION

A high sensitivity helicopter magnetic and gamma-ray spectrometric airborne survey was carried out for Rockhaven Resources Ltd. (Client) over the project area known as Klaza Extension block, located approximately 50 km west of Carmacks, YT, Canada.

New-Sense Geophysics (NSG) flew the survey under the terms of an agreement with Client dated July 13th, 2011 (Appendix G).

The survey was flown on July 15th/16th, 2011. A total of 485 line kilometers of field magnetic and radiometric data was flown, collected, processed and plotted.

The geophysical equipment was comprised of 1 high-sensitivity Cesium-3 magnetometer mounted in a fixed stinger assemble, and a 1024-channel spectrometer with four downward looking crystals (total 16 liters), and one upward looking crystal (total 4 liters). Airborne ancillary equipment included; digital recorders, fluxgate magnetometer, radar altimeter, and global positioning system (GPS) receiver. The GPS receiver provided accurate real-time navigation and subsequent flight path recovery. Surface equipment included a magnetic base station with GPS time synchronization, and a PC-based field workstation which was used to check the data quality and completeness on a daily basis.

The technical objective of the survey was to provide high-resolution total field magnetic and radiometric maps suitable for anomaly delineation, detailed structural evaluation, and identification of lithologic trends. Fully corrected magnetic and radiometric maps were prepared by New-Sense Geophysics Limited, in their Toronto office, after the completion of survey activities.

This report describes the acquisition, processing, and presentation of data for the Rockhaven Resources Ltd. airborne survey over Klaza Extension block flown from Klaza camp and Carmacks, YT, Canada (Table 2.1 and Figure 2.1).

4. SURVEY PARAMETERS

Traverse Line spacing:	100 m
Control Line spacing:	1000 m
Average Terrain clearance:	35 m
Navigation:	GPS
Traverse Line direction:	29^0, 209^0
Control Line direction:	119^0, 299^0
Measurement interval:	0.02/0.1 sec for magnetic; 1.0 sec for radiometric; 1.0 sec for GPS
Groundspeed (average):	141 km/hr
Measurement spacing (average):	3.9 m/0.1 sec for magnetic; 39/1.0 sec for radiometric
Airborne Digital Record:	Line Number Flight Number Radar Altimeter Total Field Magnetics Live Time Thorium counts Potassium counts Uranium counts Upward looking Uranium counts Cosmic counts Down Spectrum Up Spectrum Total Counts Time (System and GPS) Raw Global Positioning System (GPS) data Magnetic compensation parameters (fluxgate mag.)
Base Station Record:	Ambient Total Field Magnetics Raw Global Positioning System (GPS) data Time (System and GPS)

5. AIRCRAFT AND EQUIPMENT

5.1 AIRCRAFT

The aircraft used was a Bell 206 B3 helicopter (C-GMPS) equipped with a Cesium magnetometer mounted in a fixed stinger assembly and RS-500 airborne spectrometer mounted in the storage compartment. The aviation company providing the aircraft service was Northern Air Support based in Kelowna, BC, Canada.

5.2 AIRBORNE GEOPHYSICAL SYSTEM

5.2.1 MAGNETOMETER

One Scintrex CS-3 optically pumped Cesium split beam sensor was mounted in a fixed stinger assembly. The magnetometer's Larmor frequency output was processed by a KMAG-4 magnetometer counter, which provides a resolution of 0.15 ppm (in a magnetic field of 50,000 nT, resolution equivalent to 0.0075 nT). The raw magnetic data was recorded at 50 Hz, anti-aliased with 51 point COSINE filter and resampled at 10 Hz .

5.2.2 MAGNETIC COMPENSATION

The proximity of the aircraft to the magnetic sensor creates a measurable anomalous response as a result of the aircrafts movement. The orientation of the aircraft with respect to the sensor and the motion of the aircraft through the earth's magnetic field are contributing factors to the strength of this response. A special calibration flight, Figure of Merit (i.e., FOM), was flown to record the information necessary to compensate for these effects.

The FOM maneuvers consist of a series of calibration lines flown at high altitude to gain information in each of the required line directions. During this procedure, pitch, roll and yaw maneuvers are performed on the aircraft (typical angle ranges are 10^{o} pitch, 10^{o} roll, and 10^{o} yaw). Each variation is conducted three times in succession (first pitch, then roll, then yaw), providing a complete picture of the aircraft's effects at designated headings in all orientations.

A three-axis Bartington fluxgate magnetometer (recorded at 50 Hz) was used to measure the orientation and rates of change of the magnetic field of the aircraft, away from localized terrestrial magnetic anomalies. The QC Tools digital compensation algorithm was then applied to generate a correction factor to compensate for permanent, induced, and eddy current magnetic responses generated by the aircrafts movements.

5.2.3 GPS NAVIGATION

A U-BLOX RCB-LJ sixteen channel GPS receiver, which is an integral component of the iNAV V3 computer system, was used to run the flight control system and provide precise positioning of the aircraft.

5.2.4 ALTIMETER

A TRA 3500 radar altimeter was mounted inside the stinger. This instrument operates with a linear performance over the range of 0 to 2,500 feet and records the terrain clearance of the sensors. The raw radar altimeter data was recorded at 50 Hz, anti-aliased with a 21 point COSINE filter and re-sampled at 10 Hz.

5.2.5 GEOPHYSICAL FLIGHT CONTROL SYSTEM

New-Sense's iNAV V3 geophysical flight control system monitored and recorded magnetometer, spectrometer, altimeter, and GPS equipment performance. Input from the various sensors was monitored every 0.005 seconds for the precise coordination of geophysical and positional measurements. The input was recorded fifty times per second (one time per second in the case of GPS and radiometric data).

GPS positional coordinates and terrain clearance were presented to the pilot by means of a panel mounted indicator display. The magnetometer response, forth difference, altimeter profile and profiles of the radiometric windows were also available on the touch screen display, for real-time monitoring of equipment performance.

5.2.6 SPECTROMETER

The RS-500 Airborne Spectrometer with RSX-5 detector pack, manufactured by Radiation Solutions Inc. (RSI), was used for the survey. The RS-500 spectrometer has a multi-peak gain stabilization algorithm and is capable of recording 1024 channels with accuracy of 0.1 to 10 counts/second.

The RS-500 is connected to a crystal pack comprising four downward looking crystals (16 liters total) and one upward looking crystal (4 liters total). The downward crystals record the radiometric spectrum from 410 KeV to 2810 KeV over 1024 discrete energy windows, as well as from a cosmic ray channel that detects photons with energy levels above 3.0 MeV. From these 1024 channels, the standard Total Count, Potassium, Uranium and Thorium channels are extracted. The upward crystal is used to measure and correct for atmospheric Radon interference. The shock-protected Sodium Iodide (Thallium) crystal package is unheated and automatically stabilizes with respect to the multiple peaks. The RS-500 provides raw data that has been automatically corrected for gain, base level, ADC offset, and dead time.

5.2.7 IDAS DIGITAL RECORDING

The output of the CS-3 magnetometer, fluxgate magnetometer, altimeter, temperature, pressure, GPS coordinates, and time (system and GPS), were recorded digitally on a Compact Flash drive at a sample rate of fifty times per second (one time per second for GPS) by the iNAV V3 system.

5.2.8 PRESSURE AND TEMPERATURE

A Honeywell Precision Pressure Transducer, model PPT0020AWN2VA-A, was used to record the ambient pressure and temperature during the survey. The device was mounted within the helicopter stinger. The pressure and temperature output units were mbar and degrees Celsius respectively.

5.2.9 SPECTROMETER DIGITAL RECORDING

The output of the RS-500 spectrometer, GPS coordinates, and time (UTC), were recorded digitally on an internal RS-500 flash drive at a sample rate of 1 Hz. After each flight the data were copied and synchronized using UTC clock with the iDAS digital records.

5.3 GROUND MONITORING SYSTEM

5.3.1 BASE STATION MAGNETOMETER

A Scintrex CS-3 optically pumped cesium split beam sensor was used at the base of operations within the airport boundaries, in an area of low magnetic gradient and low/free from cultural electric & magnetic noise sources. The sensitivity and absolute accuracy of the ground magnetometer is +/- 0.01 nT. Data was recorded continuously at least every one second throughout all survey operations in digital form on a TC-10 data acquisition system. Both the ground and airborne magnetic readings were synchronized based on the GPS clock.

5.3.2 RECORDING

The output of the magnetic and GPS monitors was recorded digitally on a dedicated TC-10 computer. A visual record of the last three hours was graphically maintained on the computer screen to provide an up to date appraisal of magnetic activity. At the conclusion of each production flight raw GPS and magnetic data were transferred to the main field compilation computer.

5.4 FIELD COMPILATION SYSTEM

A field laptop computer was used for field data processing and presentation. The raw data was imported to Geosoft Oasis montaj for QA/QC and processing purposes. After the data was checked for quality control, the database with uncompensated magnetic readings was exported to QC Tools software package for magnetic compensation and base station data merging purposes. The compensated database was then imported back to Oasis for the subsequent and final processing.

6. PRE-SURVEY SPECTROMETER CALIBRATIONS

Calibrations, and testing of the RS-500 (SN 5516) airborne gamma-ray spectrometry system were carried out on July 20th and 21st, 2011 in the vicinity of the survey area. The installed equipment and configurations were selected to conform to the contracts technical specifications.

Calibration of the spectrometer system is a vital process to airborne gamma-ray spectrometry. The calibration of the spectrometer system involved three tests:

- **Calibration Pad** measurements, which are used to determine the "spectral overlap" (Compton scattering) coefficients. The calibration test was performed within a 12 month period before the survey by the manufacturer (Radiation Solutions Inc.), at its headquarters location in Mississauga, Ontario.

- **Cosmic Flight Test**, which is used to determine cosmic coefficients and aircraft background noise, was conducted on July 20th, 2011.

- **Height Attenuation Test**, which determined the altitude attenuation coefficients, was conducted on July 21st, 2011.

6.1 ENERGY WINDOWS

The airborne radiometric technique requires measurement of count rates for specific energy regions or windows in the natural gamma-ray spectrum. The standard energy regions (in accordance with the International Atomic Energy Agency (IAEA) 323), and their corresponding channel limits are:

Table 6.1 Downward spectrometer energy windows

Designation	Energy Limit (keV)		Channel Limit (inclusive)	
	Lower	Upper	Unit Values	
			Lower	Upper
Total Count (TC)	410	2810	137	937
K	1370	1570	457	523
U	1660	1860	553	620
Th	2410	2810	803	937
U (upward)	1660	1860	553	620
Cosmic	3200	infinity		

6.2 CALIBRATION PAD TEST

The Compton stripping coefficients as provided by RSI are listed below:

Table 6.2 Compton stripping coefficients

Stripping Ratios	Spectrometer (SN 5516)	"normal" values
Th into U (alpha = a23/a33)	0.271	0.250
Th into K (beta = a13/a33)	0.399	0.400
U into K (gamma = a12/a22)	0.752	0.810
U into Th (a = a32/a22)	0.046	0.060
K into Th (b = a31/a11)	0	0
K into U (g = a21/a11)	0	0.003

6.3 COSMIC FLIGHT TEST

In each of the spectral windows, the radiation increases exponentially with height due to radiation of cosmic origin. As well, the aircraft itself contributes a constant background to the count rate. By completing a series of flights within the same region, over a range of altitudes, these background contributions can be determined.

6.3.1 SETUP AND MEASUREMENT PROCEDURE

1. A resolution check was completed at the aircraft base prior to the cosmic test to insure the sensitivity and accuracy of the spectrometer.
2. Once the aircraft reached the desired altitude (first at ~9,200 feet), survey data were recorded for approximately ten minutes.
3. Step 2 was then repeated at the following remaining altitudes: ~10,300, 11,300 and 12,300 feet above sea level (see table 6.3).

Table 6.3 Cosmic Test data

	Cosmic Test Flight Data (average counts)					
Altitude (ft)	Cosmic	UU	K	U	Th	TC
9236	217	4	23	14	14	318
10293	256	4	26	15	16	358
11316	297	5	29	19	20	412
12279	344	6	32	21	23	463

6.3.2 RESULTS FROM COSMIC FLIGHT TEST

At each altitude, the raw data for the five windows of interest (Th, K, U, TC, and U upward) were evaluated for quality. The mean values were then extracted and plotted against the cosmic background window (see Appendix A). The result is a linear trend, where the slope and intercept represent the cosmic stripping ratio and the aircraft background respectively. The results from the graphs are summarized below.

Table 6.4 Cosmic and aircraft background coefficients

Cosmic Flight Test Result		
Element	Cosmic	Aircraft Background
K	0.071	7.7387
U	0.0592	0.751
Th	0.0735	0
TC	1.1587	65.06
UU	0.0168	0.0828

6.4 ALTITUDE ATTENUATION TEST

The height attenuation of the spectrometer systems was calculated by flying a series of passes across a line over flat ground with uniform radioelement ground concentration. The test range was flown by acquiring data on a series of seven passes over a set path, at the following altitudes: 50, 100, 150, 200, 300, 500, 700, and 1000 feet above ground.

6.4.1 RESULTS FROM ALTITUDE ATTENUATION TEST

The airborne data from the altitude attenuation test was checked for quality, edited and divided into lines, where each line represents a pass. The radiometric windows were then corrected for background (aircraft and cosmic) and stripped of Compton contributions. After averaging the data for each line, the four windows of interest (K, U, Th, and Total Count) were plotted against the altimeter in order to obtain the height attenuation. The results were obtained using an exponential regression, where the slope represents the attenuation coefficient and the ‘y’ intercept represents the counts at 0 feet (see Tables 6.7-6.8 and Appendix A).

Table 6.5 Height Attenuation coefficients

Element	Altitude attenuation coefficients
K	-0.014
U	-0.007
Th	-0.009
TC	-0.009

6.5 RADON HOVER TEST

On all survey flights one radon normalization test was flown before or after data collection.

The test consisted of the helicopter hovering over a designated test area at nominal survey altitude once per flight. The tests consisted of the pilot being guided using the iDAS navigation system, at fixed speed, and for approximately 5 min to allow for adequate statistics to be collected.

Since no noticeable radon fluctuations were observed on any of the flights, no radon corrections corrections were applied to the data set.

6.6 RADIOELEMENT GROUND CONCENTRATIONS AND SYSTEM SENSITIVITIES

The radiometric ground concentrations were measured using a calibrated portable spectrometer (RSI-125) during the same time as the airborne altitude attenuation flights took place (i.e., July 21st, 2011). The sensor was positioned one meter above the soil and away from the operators' body in the vicinity of altitude attenuation test strip. Fourteen 300-second measurements were taken over the length of the calibration range.

The resulting mean radiometric equivalent ground concentrations for the calibration range on were as follows:

Table 6.8 Ground concentrations

Radio Element	Ground Concentration	
Potassium	0.9	%
Equivalent Uranium	1.86	*ppm*
Equivalent Thorium	5.28	*ppm*
Total	35.98	nGy/h

Using these ground concentrations and the altitude attenuation calibration flight data, the System Sensitivities were obtained:

$$S = N/C$$

Where:

- S is the sensitivity for each window
- N is the striped count rate in the window at the survey altitude (i.e, 30m)
- C is the respective ground radioelement concentration.

With the following results:

Table 6.9 Sensitivities @ 30m from

	Sensitivities @ 30m
K	$89.34\ cps/(\%)$
U	$6.43\,cps/(ppm)$
Th	$3.98\ cps/(ppm)$
TC	$22.78\ cps/(nGy/h)$

Note: Determining of radioelement ground concentrations and system sensitivities were not part of the singed agreement. Such data are made available to the client as a courtesy.

7. OPERATIONS AND PROCEDURES

7.1 FLIGHT PLANNING AND FLIGHT PATH

The block outline coordinates (section 2.0) were used to generate pre-calculated navigation files. The navigation files were used to plan flights at the designated traverse line spacing of 100 meters and control lines of 1000.

Preliminary flight path maps and magnetic maps were plotted and updated, to monitor coverage of the survey area.

7.2 BASE STATION

The magnetic base station was established in magnetically quiet area at the camp site at latitude: 62.118220; Longitude: -137.250146.

The base station readings were monitored to ensure that the diurnal variation were within the peak-to-peak envelope of 20 nT from a long chord distance equivalent to a period of two minutes.

7.3 AIRBORNE MAGNETOMETERS

The FOM test of the performance of the CS-3 and fluxgate magnetometers was performed on July 18th, 2011 in order to monitor the ability of the system to remove the effects of aircraft motion on the magnetic measurement.

The FOM maneuvers consisted of a series of calibration lines flown at high altitude (10,000+ ft above sea level) to gain information in each of the required line directions. During this procedure, pitch, roll, and yaw maneuvers were performed on the aircraft.

The following ranges were used:

Pitch: 10-15^{o}
Roll: 10-15^{o}
Yaw: 10-15^{o}

The total FOM noise was 1.25nT with an envelope of 0.2nT (Appendix B).

7.4 THORIUM RESOLUTION TESTS

In order to monitor the resolution of the crystal pack, a twice-daily a resolution test of the spectrometer was performed in RadAssist (RSX-5 spectrometer interface program) using ~2000 thorium background counts per crystal.

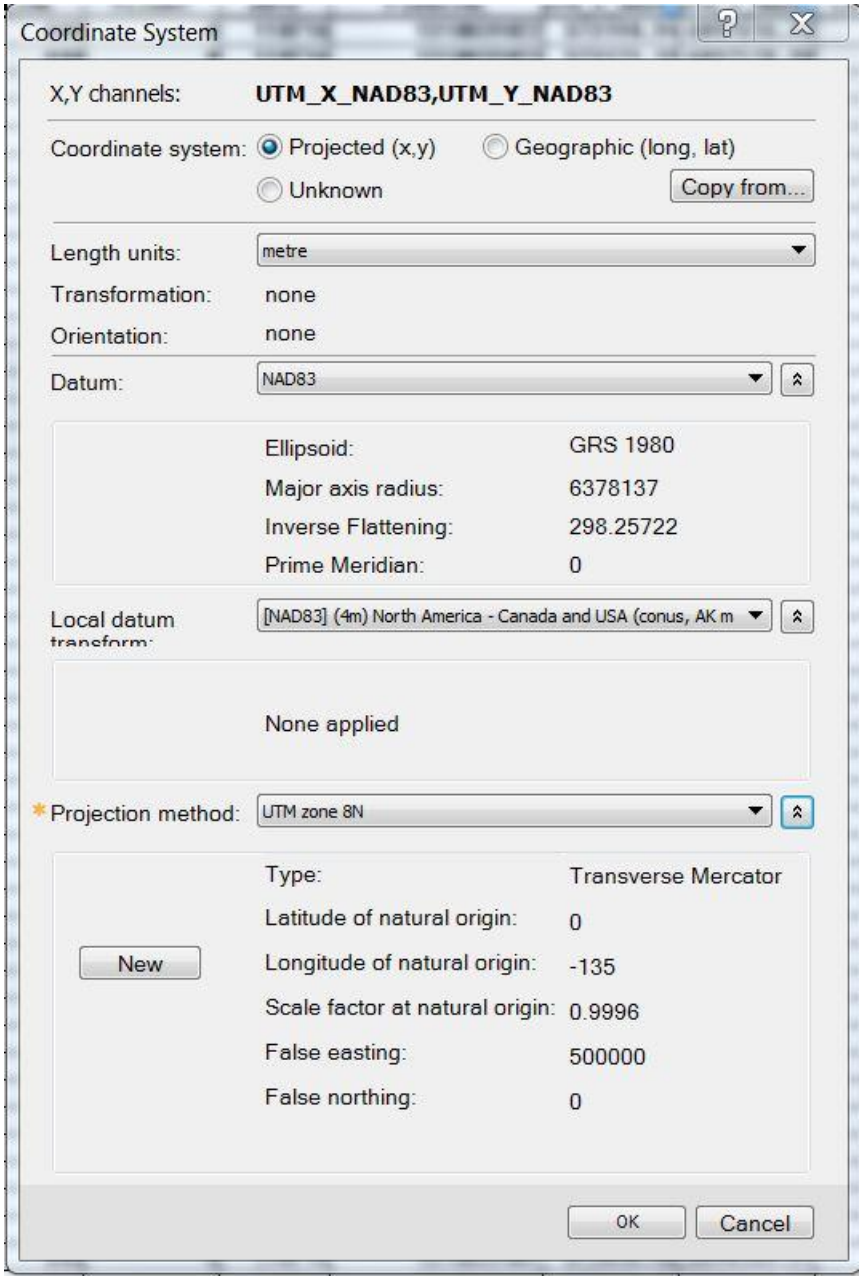
The results from the resolution tests were always found to be within the contract specifications (see Appendix D for the daily test results).

7.5 DATA COMPILATION

Data recorded by the airborne and base station systems was transferred to the field compilation system. As each flight was completed, the following compilation operations were carried out:

7.5.1 FLIGHT PATH CORRECTIONS

The navigational correction process yields a flight path expressed in WGS84, World and transformed to correspond to NAD83, North America – Canada and USA.



All 1.0 Hz GPS records were linearly interpolated and resampled at 10 Hz (0.1 sec) intervals.

7.5.2 MAGNETIC CORRECTIONS

7.5.2.1 FILTERING AND COMPENSATION

The raw 50Hz magnetic data were filtered, along with the fluxgate magnetometer data, with a 51 cosine anti-aliasing algorithm and re-sampled at 10 Hz.

The filtered and re-sampled data were stored in the MAG_FILT channel.

Then the MAG_FILT data were compensated for permanent, induced, and eddy current magnetic noise generated by the aircraft using data from the fluxgate magnetometer error (see Appendix B).

The compensated magnetic data were then stored in the MAG_COMP channel.

7.5.2.2 DIURNAL CORRECTIONS

The compensated magnetic data were adjusted to account for diurnal variations. When the magnetic variations recorded at the base station recognized to be caused by man-made sources, (such as equipment, vehicles passing by the sensor), they were removed and gaps interpolated.

The diurnal data were recorded at 1Hz and filtered with a 31-point low pass filter. The filtered data were then subtracted directly from the aeromagnetic measurements to provide a first order diurnal correction.

After base station removal, the total magnetic field values become very small. To bring the total magnetic measurements back to ‘normal’ values, project averages (i.e., 57,309.73 nT) from the base station readings were added back to the magnetic data.

The resulting base station corrected data were stored in the MAG_DIURNAL_CORR channel.

7.5.2.3 HEADING CORRECTIONS

Optically pumped magnetic sensors have an inherent heading error, typically 1 to 2 nT peak-to-peak, as the sensor is rotated through 360 degrees. On flight line directions of the opposite heading, the affect is reasonably predictable.

The Klaza Extension block did not have visible systematic heading error. For that reason no heading corrections were applied to the dataset.

7.5.2.4 LAG CORRECTIONS

There are two potential types of Lag offsets when collecting airborne data: time lag and distance lag.

NSG insures that there is no time lag in the data acquisition system by recording unique markers every 1-second based on the GPS time stamp (associated with the EXACT change in GPS positioning). This information is used to realign (if necessary) the individual data records.

The distance lag is determined by dividing the distance from the GPS antenna to the sensor head by the averaged sample rate distance.

5.3 / 3.9 = 1.36 records

A lag correction of -1 records was applied to the MAG_DIURNAL_CORR channel and stored in the MAG_LAG_CORR channel.

7.5.2.5 IGRF CORRECTIONS

The total field strength of the International Geomagnetic Reference Field (IGRF, 2010 model) was calculated for every data point, based on the spot values of Latitude, Longitude and altitude. This IGRF was removed from the measured survey data on a point-by-point basis from the lag corrected channel.

After IGRF correction the total magnetic field values become negative. To bring the total magnetic measurements back to 'normal' values an average (i.e., 57,848.05 nT) of IGRF values based on the whole project were added back to the magnetic data.

The IGRF corrections were applied to the MAG_LAG_CORR channel and stored in the MAG_IGRF_CORR channel.

7.5.2.6 LEVELING CORRECTIONS

After the data were corrected for IGRF, a survey traverse/control line intercepts array/matrix (i.e., Simple Leveling) was created for determining differences in magnetic field at the intersection points. The somewhat rugged terrain of the survey blocks, resulted in some line-to-line difference in altitude, and relatively strong magnetic anomalies made magnetic signal at some Traverse/Control line intersection

points quite different. As a result, some of those intersection points needed to be manually adjusted in order to reduce line-to-line magnetic differences.

The resulting simple leveled magnetic data were stored in MAG_SMPL_LVL channel.

Further it was decided to apply microlevelling techniques to the conventionally leveled magnetic data (see Appendix F for full description of the procedure).

The following key parameters were used:

Table 7.1 Magnetic data microlevelling parameters

Block Name	Line Spacing (m)	Line Direction (deg.)	Grid Cell Size (m)	Decorrugation Cutoff (m)	Amplitude Limit (nT)	Amplitude Limit Mode	Naudy Filter Limit
Klaza Extension BK	100	29	20	400	13.7	clip	200

The resulting microleveled magnetic data were stored in the TMI_FINAL channel.

7.5.3 VERTICAL DERIVATIVE

A 1-st Order Vertical Derivative (VDV) dataset was calculated using 2D FFT2 algorithm based on final TMI grid. The resulting VDV grid was sampled back to the database.

The VDV data were stored in the VDV channel.

7.5.4 DIGITAL TERRAIN MODEL (DTM)

The DTM data was produced by first adjusting the GPS sensor height to that of the radar altimeter height (lowering GPS height by 2.1m). Next the radar altimeter channel (in meters) was subtracted from the GPS height data producing a raw DTM channel. Due to changing satellite positions (constellation configuration) and varying atmospheric conditions, the receiver may measure slightly varying GPS heights line-to-line. In addition, due to rugged topography, the radar altimeter measures inaccurately when the helicopter is pitched forward position (example: approach a steep hill), as the radar beam would be directed away or down the slope. Because of these inherent errors, the raw DTM channel required leveling.

It was decided to apply a microlevelling technique to the raw DTM data, developed by Paterson, Grant & Watson Limited and available through Geosoft Oasis montaj as miclev.GX extension (see Appendix F for full description of the procedure).

The following key microlevelling parameters were used:

Table 7.2 DTM data microlevelling parameters

Block Name	Line Spacing (m)	Line Direction (deg.)	Grid Cell Size (m)	Decorrugation Cutoff (m)	Amplitude Limit (nT)	Amplitude Limit Mode	Naudy Filter Limit
Klaza Extension BK	100	29	20	400	15	clip	0

The final DTM data were stored in the DTM channel name.

7.5.5 GRIDDING

The final TMI, VDV, and DTM grids were produced from the TMI_FINAL, VDV, and DTM channels respectively.

The data were gridded using a bi-directional line gridding method with a grid cell size of 20 meters, Akima interpolation method for across and down line spline and trend angles perpendicular to those of traverse line directions (i.e., -29^0).

7.5.6 RADIOMETRIC DATA CORRECTIONS

7.5.6.1 LIVE TIME CORRECTIONS

The spectrometer uses the notion of "live time" to express the relative period of time the instrument was able to register new pulses per sample interval.

The live time correction is applied to the total count, potassium, uranium, thorium and upward uranium channels.

The formula used to apply the correction is as follows:

$$C_{LT} = C_{raw} \times \left(\frac{1000}{LT} \right)$$

Where:

- C_{LT} is the live time corrected channel

- C_{raw} is the raw channel
- LT is the Live Time channel

7.5.6.2 PRE-FILTERING

The cosmic channel data were processed with a 15-point low pass filter to remove spikes.

The radar altimeter channel while recorded at 50Hz was filtered with 21-point COSINE filter and then sampled to 1Hz.

7.5.6.3 AIRCRAFT AND COSMIC BACKGROUND

Aircraft background and cosmic stripping corrections (see section 6.3.2) were applied to the live corrected total count, potassium, uranium, thorium and upward uranium channels using the following formula:

$$C_{ac} = C_{LT} - \left(ac + bc \times cof\right)$$

Where:

- C_{ac} is the background and cosmic corrected channel
- C_{LT} is the live time corrected channel
- ac is the aircraft background for this channel
- bc is the cosmic stripping coefficient for this channel
- cof is the filtered cosmic channel

All negative counts after this correction step were replaced with zeroes.

7.5.6.4 RADON CORRECTION

No Radon corrections were applied to the data.

7.5.6.5 COMPTON STRIPPING

Following the cosmic and background corrections the potassium, uranium and thorium were corrected for spectral overlap (see section 6.2). First the stripping ratios α, β, and χ were modified according to altitude. Then an adjustment factor based on the reversed stripping ratio (a), uranium into thorium, was calculated.

$$\alpha h = \alpha + hef \times 0.00049$$
$$\beta h = \beta + hef \times 0.00065$$
$$\chi h = \chi + hef \times 0.00069$$

Where:

- α, β, χ are the Compton stripping coefficients
- $\alpha h, \beta h, \chi h$ are the height corrected Compton stripping coefficients
- hef is the height above ground in meters

The stripping corrections are then carried out using the following formulas:

$$ar = \frac{1}{1 - a\alpha h}$$

$$Th_c = (Th_{bc} - aU_{rc}) \times ar$$

$$U_c = (U_{rc} - Th_{bc}\alpha h) \times ar$$

$$K_c = K_{bc} - \beta h Th_c - \chi h U_c$$

Where:

- U_c, Th_c, and K_c are corrected Uranium, Thorium and Potassium
- $\alpha h, \beta h, \chi h$ are the height corrected Compton stripping coefficients
- U_{bc}, Th_{bc}, and K_{bc} are background and cosmic corrected Uranium, Thorium and Potassium
- ar is the backscatter correction
- a is the reverse stripping ratio U into Th

All negative counts after this correction step were replaced with zeroes.

7.5.6.6 EQUIVALENT HEIGHT AT STP

The following formula was used to calculate Equivalent Height at STP:

$$H_e = H \times \left(\frac{273.15}{T + 273.15} \right) \times \left(\frac{P}{1013.25} \right)$$

Where:

- H is the observed height

- H_e is the equivalent height at STP
- T is the temperature in degrees Celsius
- P is the barometric pressure in mbar.

7.5.6.7 HEIGHT ATTENUATION CORRECTIONS

The Total Count, Potassium, Uranium and Thorium data were then corrected to a nominal survey altitude of 35m (see section 6.4.1) using the following equation:

$$C_a = C \times e^{-\mu(h_0 - h_e)}$$

Where:

- C_a is the output altitude corrected channel
- C is the input channel
- μ is the attenuation correction for that channel
- h_e is the STP height
- h_0 is the nominal survey altitude

The altitude attenuation corrected data were then stored in U_CORR, Th_CORR, K_CORR and TC_CORR channels.

7.5.6.8 LEVELING OF HEIGHT ATTENUATION CORRECTED DATA

The resulting height attenuation corrected data were further microleveled using the following key parameters (see Appendix F for full description of the procedure).

Table 7.3 Radioelement microlevelling parameters

Radioelement	Line Spacing (m)	Line Direction (deg.)	Grid Cell Size (m)	Decorrugation Cutoff (m)	Amplitude Limit (nT)	Amplitude Limit Mode	Naudy Filter Limit
U	100	29	20	400	3	Clip	100
K	100	29	20	400	8	Clip	100
Th	100	29	20	400	3	Clip	100
TC	100	29	20	400	62	Clip	100

The resulting microleveled altitude attenuation corrected line data were then stored in the final U_FINAL, K_FINAL, Th_FINAL and TC_FINAL channels.

Note: in the instances where no microlevelling was applied (i.e., all of the control lines), the data in the final channels were copied directly from U_ CORR, Th_ CORR, K _CORR and TC _CORR.

7.5.6.9 CONVERSION TO APPARENT RADIOELEMENT CONCENTRATIONS

The next step is to convert the corrected potassium (K_FINAL channel), uranium (U_FINAL channel) and thorium (Th_FINAL channel) to apparent radioelement concentrations (see section 6.6) using the following formula:

$$eE = C_{cor} \Big/ s$$

Where:

- eE is the element concentration $K_{\%}$ and equivalent element concentration of U_{ppm} & Th_{ppm}
- s is the experimentally determined sensitivity
- C_{cor} is the fully corrected channel

The resulting apparent concentration data were stored in K_Percent, eU and eTh channels.

Note 1: experimentally determined sensitivities (Table 6.9, Section 6.6) were used when calculating the above apparent radioelement concentrations. These channels were used in producing of the corresponding grids.

Note 2: determining of apparent radioelement concentrations were not part of the singed agreement. Such data are made available to the client as a courtesy.

7.5.6.10 AIR ABSORPTION DOSE RATE

Finally the natural air absorption dose rate was determined using the following formula:

$$E = 13.078 \times K_{\%} + 5.675 \times eU_{ppm} + 2.494 \times eTh_{ppm}$$

Where:

- E is the air absorption rate (nGy/h)
- $K_{\%}$ is the concentration of potassium (%)

- eU_{ppm} is the equivalent concentration of potassium (ppm)
- eTh_{ppm} is the equivalent concentration of potassium (ppm)

The resulting natural air absorption rate data were stored in E channel.

Note 1: K_percent, eU and eTh channels (Section 7.5.5.9) were used when calculating the above air absorption rate. This channel was used in producing of the corresponding grid.

Note 2: Determining of the absorption rate was not part of the singed agreement. Such data are made available to the client as a courtesy.

A detailed description of how most of the procedures, formulae and constants were determined could be found in:

I.A.E.A. *Report, Airborne Gamma Ray Spectrometer Surveying*, Technical Report Series No. 323, 1991.
and
I.A.E.A *Guidelines for Radioelement Mapping Using Gamma Ray Spectrometry Data*, Technical Document No. 1363, 2003.

7.5.6.11 GRIDDING

The radiometric data were gridded from U_FINAL, Th_FINAL, K_FINAL and TC_FINAL channels (all in counts/sec) using a bi-directional line gridding method with a grid cell size of 30 meters, Akima interpolation method for across and down line spline and trend angles perpendicular to those of traverse line directions (i.e., -29^0).

7.5.6.12 TERNARY MAP

The radioelement ternary map was produced by creating individual grids for each of the three radioelements (potassium, thorium and uranium), then assigning a specific colour to each. Cyan represents thorium, yellow uranium, and magenta potassium. The relative concentrations of the radioelements are represented by the blends of the three colours.

8. MAP PRODUCTS AND DIGITAL DATA DELIVERABLES

The following is the list of items delivered to **Rockhaven Resources Ltd.**

1) **Hard Copy Maps for Klaza Extension Block @ 1:20,000 scale (x2)**:

- Maps of Total Magnetic Intensity
- Maps of 1st order Vertical Derivative
- Maps of Digital Terrain Model
- Maps of Ternary Image (Th, U and K)
- Maps of Potassium counts
- Maps of Thorium counts
- Maps of Uranium counts
- Maps of Total Count

2) **Hard Copy Logistics Report (x2)**:

3) **Digital Copy (DVD) Maps for Klaza Extension Block @ 1:20,000 scale (x2)**:

- Maps of Total Magnetic Intensity
- Maps of 1st order Vertical Derivative
- Maps of Digital Terrain Model
- Maps of Ternary Image (Th, U and K)
- Maps of Potassium counts
- Maps of Thorium counts
- Maps of Uranium counts
- Maps of Total Count

4) **Digital Copy Grids (DVD) for Klaza Extension Block (x2)**:

6) **Digital Copy (DVD) Logistics Report (x2)**

9. SUMMARY

This report describes the logistics of the survey, equipment used, field procedures, data acquisition and presentation of results.

The various maps included with this report display the magnetic and radiometric properties of the survey area. It is recommended that the survey results be reviewed in detail, in conjunction with all available geophysical, geological and geochemical information.

Further processing of the data may enhance subtle features that can be of importance for exploration purposes.

Respectfully submitted,

Andrei Yakovenko
New-Sense Geophysics Ltd.

APPENDIX C: DATABASE DESCRIPTIONS

Magnetic Database for Klaza Extension Block

Database Name: MAGNETIC_KLAZA_EXT_BK.gdb
Format: Geosoft .gdb
Number of Channels: 28

Note: If the database is opened in Oasis montaj, please load included "*Magnetic Database Channel Display.dbview*" file to insure that ALL the channels are displayed in the same order as listed below (Database menu -> Get Saved View).

Channel Name	Units	Description
LINE	number	Line number
DATE	date	Date flown (YYMMDD)
FLIGHT	number	Flight number
FIDUCIAL	number	Fiducial count (flight specific)
SYSTEM_CLOCK	milsec	KANA8 (A/D converter) counter
UTM_X_NAD83	meters	NAD83 easting, North America, UTM Zone 8N
UTM_Y_NAD83	meters	NAD83 northing, North America, UTM Zone 8N
LATITUDE_WGS84	degrees	GPS latitude, WGS 84, World
LONGITUDE_WGS84	degrees	GPS longitude, WGS 84, World
GPS_HEIGHT_WGS84	meters	GPS height (orthometric) above MSL, WGS 84, World
UTC_DAYSEC	decimal seconds	UTC daily second counter (0-86399)
FLUX_X	volts	Fluxgate x-axis
FLUX_Y	volts	Fluxgate y-axis
FLUX_Z	volts	Fluxgate z-axis
RAD_ALT_feet	feet	Radar altimeter, height above ground
MAG_RAW	nT	Raw magnetometer data
MAG_FILT	nT	Filtered raw magnetometer data
MAG_COMP	nT	Compensated magnetometer data
DIURNAL	nT	Base station magnetometer data
MAG_DIURNAL_CORR	nT	Base station (diurnal) corrected magnetometer data
MAG_HEADING_CORR	nT	Heading corrected magnetometer data
MAG_LAG_CORR	nT	Lag corrected magnetometer data
IGRF	nT	Calculated IGRF, using 2010 model
MAG_IGRF_CORR	nT	IGRF corrected magnetometer data
MAG_SMPL_LVL	nT	Conventionally (simple) leveled magnetometer data
TMI_FINAL	nT	Microleveled MAG_SMPL_LVL data
VDV	nT/m	1st order Vertical Derivative (VDV)
DTM	m	Digital Terrain Model

Radiometric Database for Klaza Extension Block

Database Name: RADIOMETRIC_KLAZA_EXT_BK.gdb
Format: Geosoft .gdb
Number of Channels: 35

Note: If the database is opened in Oasis montaj, please load included "*Radiometric Database Channel Display.dbview*" file to insure that ALL the channels are displayed in the same order as listed below (Database menu -> Get Saved View).

Channel Name	Units	Description
LINE	number	Line Number
FLIGHT	number	Flight Number
DATE	date	Date flown (YYMMDD)
FIDUCIAL	number	Fiducial count (line specific)
UTM_X_NAD83	meters	NAD83 easting, North America, UTM Zone 8N
UTM_Y_NAD83	meters	NAD83 northing, North America, UTM Zone 8N
LATITUDE_WGS84	degrees	GPS latitude, WGS 84, World
LONGITUDE_WGS84	degrees	GPS longitude, WGS 84, World
GPS_HEIGHT_WGS84	meters	GPS height (orthometric) above MSL, WGS 84, World
UTC_DAYSEC	seconds	UTC daily second counter (0-86399)
RAD_ALT_feet	feet	Radar altimeter, height above ground
PRESSURE	mbar	Ambient pressure output
TEMPERATURE	degrees C	Ambient temperature output
DOWN_LIVE_TIME	seconds	Live time channel
RAW_Potassium	counts/sec	Raw Potassium channel
RAW_Thorium	counts/sec	Raw Thorium channel
RAW_Uranium	counts/sec	Raw Uranium channel
RAW_TotCount	counts/sec	Raw Total Count channel
RAW_UpDet	counts/sec	Raw upward looking crystal Uranium channel
DOWN_COSMIC	counts/sec	Raw Cosmic channel from downward looking crystals
DOWN_SPECTRUM	counts/sec	1024 channel down spectrum
UP_SPECTRUM	counts/sec	1024 channel up spectrum
EQUIVALENT_HEIGHT_m	meters	Equivalent height above ground at STP
K_CORR	counts/sec	Live Time, Background, Cosmic, Compton Scattering and Altitude Attenuation corrected Potassium counts
Th_CORR	counts/sec	Live Time, Background, Cosmic, Compton Scattering and Altitude Attenuation corrected Thorium counts
U_CORR	counts/sec	Live Time, Background, Cosmic, Compton Scattering and Altitude Attenuation corrected Uranium counts
TC_CORR	counts/sec	Live Time, Background, Cosmic, Compton Scattering and Altitude Attenuation corrected Total Count counts
K_FINAL	counts/sec	Final Potassium counts; microleveled K_CORR

Th_FINAL	counts/sec	Final Thorium counts; microleveled Th_CORR
U_FINAL	counts/sec	Final Uranium counts; microleveled U_CORR
TC_FINAL	counts/sec	Final Total Count counts; microleveled TC_CORR
K_Percent	%	Estimated concentrations of Potassium
eTh	ppm	Estimated equivalent concentrations of Thorium
eU	ppm	Estimated equivalent concentrations of Uranium
E	nGy/h	Natural air absorption Dose Rate

APPENDIX F: MICROLEVELLING DESCRIPTION

As per PGW Microlevelling GX help file available through Geosoft Oasis montaj 7.2

DECORR.GX Version 3.0
Paterson, Grant & Watson Limited
March 2003

PARAMETERS: (miclev group parameters are used, so that values set will be passed to MICLEV.GX)

```
   miclev.Xchan = x channel (default "x")
         .Ychan = y channel (default "y")
         .Ochan = original data channel (no default)
         .Nchan = decorrugation noise channel (default "dcor_noise")
         .Space = flight line spacing
         .Dir   = flight line direction in degrees azimuth (clockwise
                  from North)
         .Cell  = cell size to use for gridding (default = line spacing/5)
         .Wlen  = decorrugation high-pass wavelength (default = 4 * line
                  spacing)
         .Ogrid = original output grid, new or existing
         .Nnoise= decorrugation noise grid
         .XY    = Xmin,Ymin,Xmax,Ymax            (optional)
         .LOGOPT= Log option                     (optional)
         .LOGMIN= Log minimum                    (optional)
         .DSF   = Low-pass desampling factor     (optional)
         .BKD   = Blanking distance              (optional)
         .TOL   = Tolerance                      (optional)
         .PASTOL= % pass tolerance               (optional)
         .ITRMAX= Max. iterations                (optional)
         .ICGR  = Starting coarse grid           (optional)
         .SRD   = Starting search radius         (optional)
         .TENS  = Internal tension (0-1)         (optional)
         .EDGCLP= Cells to extend beyond data    (optional)
```

DESCRIPTION:

decorr.gx and miclev.gx implement a procedure called micro-levelling which removes any low-amplitude component of flight line noise still remaining in airborne survey data after tie line levelling. Micro-levelling calculates a correction channel and adds it to the profile database. This correction is subtracted from the original data to give a set of levelled profiles, from which a final levelled grid may then be generated. Microlevelling has the advantage over standard methods of decorrugation that it better distinguishes flight line noise from geological signal, and thus can remove the noise without causing a loss in resolution of the data.

To microlevel data, first run decorr.gx, then miclev.gx. decorr.gx offers two options for the grid of the channel to be microlevelled. If a grid prepared from this channel already exists, it may be specified, and when prompted to overwrite, the user should answer no. If the user wishes to prepare a new grid of the channel to be microlevelled, the

minimum curvature gridding algorithm (rangrid.gx) is applied. The advanced button provides access to the standard minimum curvature gridding parameters. Once the gridding is completed, decorr.gx applies a directional high-pass filter (see end note) perpendicular to the flight line direction, in order to produce a decorrugation noise grid. (The default grid cell size is 1/5 of the line spacing. The user may specify a different cell size if desired. A smaller cell size will give a more accurate result, but a larger cell size will make the gx run faster and use less disk space.) The noise grid is then extracted as a new channel in the database (default name is "dcor_noise"). This channel contains the line level drift component of the data, but it also contains some residual high-frequency components of the geological signal. miclev.gx applies amplitude limiting and low-pass filtering to the noise channel in order to remove this residual geological signal and leave only the component of line level drift, which is then subtracted from the original data to produce a levelled output channel named "miclev".

decorr.gx calculates default amplitude limit and filter length values for use in miclev.gx, but the skilled user may be able to set better values for these parameters based on an inspection of the noise grid. (The micro-levelling process is broken up into two separate GXes in order to allow the user to do this.) Flight line noise should appear in the decorrugation noise grid as long stripes in the flight-line direction, wheras geological anomalies should appear as small spots and cross-cutting lineaments, generally with a higher amplitude than the flight line noise, but with a shorter wavelength in the flight-line direction. The user can estimate the maximum amplitude of the flight line noise, and set the noise amplitude limit value accordingly. Similarly the user can estimate the minimum wavelength of the level drift along the flight lines, and set the low-pass Naudy filter width to half this wavelength. The defaults are to set the amplitude limit equal to the standard deviation of the noise grid, and to set the filter width equal to five times the flight line spacing.

There is an option of using either of two kinds of amplitude limiting. In "clip" mode any value outside the limit is set equal to the limit value. In "zero" mode any value outside the limit is set equal to zero. The clip mode makes more sense intuitively, but it has been found in practise that the zero mode may reject geologic signal better, depending on the particular data set. As a rule the zero mode works better on datasets in which the noise grid contains a lot of high-amplitude geological signals (e.g. shallow basement areas). For datasets in which the noise grid contains mainly flight line noise (e.g. sedimentary basins), the clip mode works better.

Microlevelling applies a level correction to the traverse lines only. If it is desired to grid the tie lines together with the micro-levelled traverse lines, then it may be necessary to also apply a level correction to the tie lines so that their values agree with the micro-levelled traverse lines at the intersections. This may be done as follows:

1) Copy the tie line values to the microlevelled channel.

2) Use intersct.gx to find cross-difference values for the microlevelled data.

3) Use xlevel.gx to load these cross-difference values to the tie lines.

4) Apply fulllev.gx to the tie lines. The output will be a set of tie

lines that matches the microlevelled traverse lines at all intersections.

5) Copy the microlevelled traverse line values into the same channel as the corrected tie line values.

Decorrugation Filter:

The decorrugation noise filter is a sixth-order high-pass Butterworth filter with a default cutoff wavelength of four times the flight line spacing, combined with a directional filter. The directional filter coefficient as a function of angle is F=(sin(a))^2, where a is the angle between the direction of propagation of a wave and the flight line direction,i.e. F=0 for a wave travelling along the flight lines, and F=1 for a wave travelling perpendicular to them. (Note this is the exact opposite of what is usually called a decorrugation filter, since the intention here is to pass the noise only, rather than reject it.)

The default cutoff wavelength (4 * line spacing) gives good results if the data is already fairly well levelled to start with. In cases where many lines are badly mis-levelled, it may be necessary to set a longer cutoff wavelength, at the risk of removing more geological signal.

APPENDIX G: COPY OF THE CONTRACT

New-Sense
Geophysics Limited

CONTRACT
FOR
A HELICOPTERBORNE AEROMAGNETIC AND SPECTROMETRIC SURVEY FOR ROCKHAVEN RESOURCES LTD. OVER KLAZA EXTENSION BLOCK, YUKON, CANADA.

NEW-SENSE GEOPHYSICS LTD. ("NSG"), with its corporate offices at

195 Clayton Drive, Unit 11
Markham, ON, Canada
L3R 7P3

Telephone: (905) 480-1107/ (905) 480-9989
Fax: (905) 480-1207

Offers to carry out airborne geophysical services on behalf of

ROCKHAVEN RESOURCES LTD. ("Client"), with its offices at:

1016-510 West Hastings st.
Vancouver, BC, Canada
V6B 1L8

Telephone: (604) 688-2568
Fax: (604) 687-2582

Contact: Matthew Turner, CEO
Email: mturner@archercathro.com

in accordance with the following description, terms and conditions.

1. COMPANY DESCRIPTION

New-Sense Geophysics (NSG) traces its history through its current founder and president Dr. W.E.S. (Ted) Urquhart. First as Urquhart-Dvorak, which specialized in processing airborne geophysical data, to High-Sense Geophysics, which became one of the largest airborne survey companies in the world, until it was purchased by Fugro of Holland in 2000, and then to Geoexplo Limitada., which specialized in airborne geophysical consulting and quality control. This sequence spans over 30 years and leads us to NSG, continuing on in the tradition of airborne survey innovation and quality airborne data acquisition.

NSG has established its HQ office in Markham, Ontario where it operates out of a new purpose-designed and constructed 3000 square foot facility. Here it designs and manufactures its own operator-less systems made 'field-bullet-proof' by engineer Glenn Slover.

The facility itself is more advanced than what may be found in leading high tech companies anywhere. It is completely wired for production with any processing station able to share information on the internal network and processors and field people in direct voice and data communication anywhere in the world. Highly secure firewall features prevent unauthorized access and fail-safe systems prevent any potential data loss through accident, intent or act of God. Clients with authorization can view the progress of their survey on a 24/7 basis.

The company has five data processing workstations with capacity to expand to twice that. A large inventory of systems and components provides for rapid remediation of field problems with the hardware should any occur. All this equipment is rigorously tested, using the built-in network and permanently installed sensors including GPS antenna signals available to each workbench.

The company works world-wide and presently has a second office of operation in Santiago Chile where equipment is maintained and processing takes place.

The company and its personnel through its many years in airborne surveying, airborne software and hardware development, and airborne survey data processing, has dealt with literally millions of kilometres of airborne data acquired in perhaps 80 countries. NSG itself has flown, processed and interpreted more than three quarters of a million line kilometres since 2005. These have been for multi-national companies (like Rio Tinto, Barrick, Teck, and BHP), to junior mining exploration companies, to governments. All have received their data on time and to their satisfaction. And in all of its history dating back 30 years, the companies owned and run by Dr. Urquhart, who developed the concept and practice of operatorless surveying, have not had a single accident …a perfect safety record.

2. SURVEY AREA

A helicopter borne magnetic and spectrometric survey is to be carried out on the Client's project area known as Klaza Extension block located approximately 50Km west of Carmacks, Yukon, Canada.

The block is to be flown from Carmacks with refueling in between the flights at Klaza camp. See Tables 2.1 and Figure 2.1 below.

Table 2.1 Klaza Extension block outline coordinates

UTM Zone 8N			
NAD83_X	**NAD83_Y**	**WGS84_X**	**WGS84_Y**
374057	6898775	374057	6898775
380842	6894860	380842	6894860
378147	6889992	378147	6889992
371362	6893942	371362	6893942
374046	6898810	374046	6898810

Note: the survey will be flown in WGS84, World, UTM Zone 8N and delivered to the client in NAD83, North America, UTM Zone 8N.

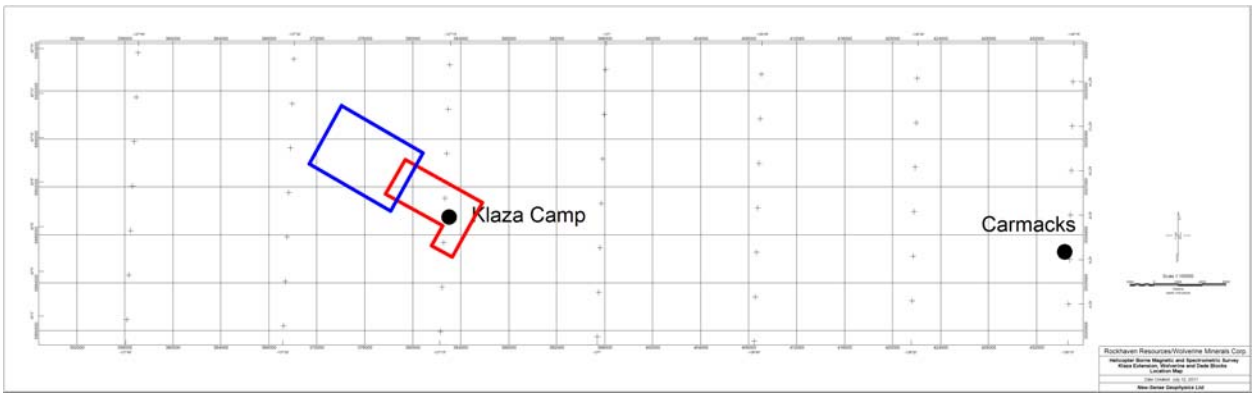

Figure 2.1 Map depicting outlines of the Klaza Extension block (blue) and Klaza block (red) that was flown in 2010. Coordinate system, WGS84, World, UTM Z8N. UTM grid cell size 4km.

3. TECHNICAL SPECIFICATIONS FOR AIRBORNE SURVEY

3.1 Traverse and Control Lines Statistics

Traverse Line Direction:	29/209 degrees from true North
Traverse Line Interval:	100m
Control Line Direction:	119/299 degrees from true North
Control Line Interval:	1000 m
Estimated Line KM:	420 L/KM (Traverse)
	45 L/KM (Control)
	465 L/KM (Total)
Mean Terrain Clearance:	35m* nominal
Sampling Interval:	Magnetics 50 Hz/10Hz; Radiometric 1 Hz second
Minimum Line Length:	2 Km

*Note: The 35 meter flight height will be subject to an on-sight safety audit. In any event, the flight height will be subject to pilot safety concerns.

Actual number of survey line kilometers will be those flown and delivered that fall inside the survey boundaries as listed above.

3.2 Tolerances

3.2.1 Traverse line separation

The pilot will fly to the best of his ability to stay within no more the 50% on either side of the theoretical flight path for a distance of 1000 meters unless obstructions or topography require greater deviations for reasons of safety.

There will be no crossing flight lines unless physical obstructions or topography require such deviation for reasons of safety. Such instances will be communicated and discussed with the client representative in writing.

However, if flight-line path deviations are the result of safety concerns, local aviation authority regulations, or military requirements, NSG will not be required to fly fill-in lines.

3.2.2 Control line spacing

Control lines will be surveyed at an average interval as specified, but may be located to avoid, where possible, areas of strong magnetic gradient.

3.2.3 Flight Height

The terrain clearance will be maintained at the planned altitude of 35 meters, subject to topography constrains, safety requirements, local aviation authority regulations, and/or military requirements.

3.2.4 Missing or Substandard Data

Data will be recorded digitally in the aircraft and at the ground station. Isolated errors, spikes, and short non-sequential gaps consisting of a few points, will be corrected by interpolation.

3.2.5 GPS

GPS will be used for navigation.

3.2.6 Diurnal

Magnetic diurnal activity will be monitored at the base station. If the magnetic activity exceeds 20 nT per 2 minute period, a flight will not depart until the activity has returned to levels below this rate. Once a flight has started it will not be aborted due to diurnal activity.

3.2.7 Re-flights

Any flight lines or parts of flight lines with data outside the above tolerances will be considered for re-flights. All re-flown lines or portions of lines will be tied to the closest control lines at both ends.

4. PAST PERFORMANCE OR EXPERIENCE AND QUALIFICATIONS

4.1 Organizational experience

NSG provides high quality airborne magnetic/gradiometer and spectrometer surveys using fixed-wing and helicopter platforms. The company is owned and operated by W. E. S (Ted) Urquhart Ph.D. who was the founder and President of High-Sense Geophysics Limited that was sold to Fugro in 2000. After a five-year non-compete period, NSG was inaugurated to re-enter the airborne survey industry to carry on the tradition of providing innovative technologies focusing on collecting the highest quality airborne geophysical data in the safest possible manner.

NSG operates from two offices, one in Markham, Canada where its equipment is manufactured, tested and dispatched throughout the world; the other is in Santiago, Chile where NSG offers airborne geophysical services in Spanish to its South American clients.

NSG has performed airborne geophysical surveys in Africa, North America, Europe, the Middle East and South America. NSG has flown in excess of 700,000 line km in the last 3 years for clients such as major companies like: USGS, BHP Billiton, PG&E, Kennecott, Teck Cominco, Barrick Gold, Kinross, Gold Field, etc.

4.3 Qualifications of the personnel and pilots

4.3.1 NSG representative

NSG conducts surveys with an operatorless system and as a result typically sends only one field geophysicist on the job site who possesses good knowledge in not only QC/QA, data processing but in the equipment maintenance as well. At this stage it is planed that NSG representative on the job site would be Mr. Sean Plener with Mr. Andrei Yakovenko being the general project manager under the oversight of Dr. William E. S. (Ted) Urquhart

Field:

Mr. Sean Plener is detail oriented specialist with international and domestic survey and mapping experience and a background in Physical Geography and Earth and Atmospheric Science. Sean has been working with New-Sense since 2007 on both airborne FW and Helicopter total field magnetic and radiometric surveys in different parts of North America and South America.

Geophysicist:

Mr. Yakovenko, Andrei, has been responsible for fixed wing and helicopter airborne operations including permanent, contract, and air crew supervision, logistics, data QA/QC, data processing, and reporting.

He is a tri-lingual, solutions oriented specialist with international and domestic survey and mapping experience, with a background in geology, underwater, land-based archaeology, and geophysics. Currently a Masters candidate in geophysics at McMaster University, Andrei obtained his B.Sc. (Honors) from the University of Toronto. He is skilled in geophysical data processing using Oasis Montaj and coordinating multiple airborne projects. Andrei has authored multiple scientific publications.

Office supervision:

Dr. Urquhart has over 40 years of experience in geophysics, during which time he has been involved in field surveys, operations, management, data quality, safety, data enhancement, compilation and interpretation for various projects throughout the world. Ted was an owner and president of High-Sense Geophysics Ltd. (the third largest geophysical airborne survey company in the world). He has participated in projects as diverse as oil basin studies, mineral and diamond exploration and radioactive satellite fragment recovery. Academically, Ted has conducted research (M.Sc., Ph.D., and professionally) into the correlation of magnetic anomalies with geological factors on both a large and small scale.

5. NSG'S QUALITY CONTROL

During data acquisition, the system will be monitored by the field QA/QC personnel to ensure that the equipment is secure and unchanged. If equipment has been noted to shift or a mechanical part of the aircraft has changed, another FOM will be flown.

Base station and survey flight data is collected immediately after each flight and duplicate copies made. Field staff verify completeness of flown lines, note and log any deviations from the flight path, identify (manual & 4th difference algorithm) and remove noise spikes (note: raw data is maintained), magnetic compensated channels created, daily progress report updated and posted for client, complete data set sent to NSG.

The iNAV V3 system, used for both flight and base station systems, store real time data on two independent storage media (hard disk, and a flash memory device). In the event that one of the devices fails or data were corrupted, a backup remains intact.

Post field production is done on a day-by-day basis. After the field data QA/QC process described in sections 7.4.1 and section 7.4.2, the data is sent to NSG's secure FTP. The post field QA/QC and leveling will be done by either Andrei Yakovenko or Dr. Ted Urquhart. The field staff is in contact with the in-house processor every evening to ensure data was received and to discuss previous flights. If there is an issue, the field staff can be reached by cell or satellite phone to make the necessary corrections before production continues. This immediate processing of the data to pre-final stages, benefits the client in three very important ways: First, there are multiple levels of personnel monitoring the survey data in a short period. If something is missed by the field staff, it will be caught by our in-house personnel before the survey progresses much further; second, we can update the client with current pre-final maps so areas of interest can be discussed and in-fills or re-flights can be planned before the survey lines are completed, thereby minimizing standby days; finally, the pre-final maps are ready the day after flying is completed and can be submitted for the clients approval.

The final products will be prepared as to the contract's obligations, section 8, and with Client's consent on all the data processing steps and procedures. A first version of the final products will be delivered to Client or other client representative for a review and approval.

For additional Data Processing and QA/QC information refer to the following sections regarding:

- Procedures including measures for aircraft's aeromagnetic system calibration (refer to sections 7.2.)
- Inflight data acquisition (sections 7.1 (except 7.1.4, 7.1.9, 7.1.10), 7.2, and 7.3)
- Flight path location (section 7.1.7)
- Ground magnetometer data acquisition (section 7.1.4)

- Data processing and map preparation (sections 7.4 and 8)

6. EQUIPMENT SUITABILITY AND CONTINGENCY PLAN

6.1 Availability and quality of proposed data acquisition and processing equipment

Aircraft:

A Bell 206B or similar helicopter provided by Northern Air Support (NAS) based in Kelowna, BC, will be used.

The aircraft with its field crew will operate from Carmacks, YT, and be using a certified fuel truck or fuel drums for refueling at those locations and/or designated fuel cash closer to the survey areas.

Client will be responsible for providing certified Jet fuel for the helicopter.

The aircraft will be limited to VFR flying conditions. All other conditions will be left to the discretion of the pilot in command.

Data Acquisition:

NSG builds and maintains its own proprietary data acquisition systems known as iDAS. The iDAS system features the KroumVS Instraments KMAG4 magnetometer counter and the KANA8 analog to digital converter. The systems are built with a wide range voltage input (9V to 36V) to accommodate a variety of aircraft power supplies.

The iDAS system uses sophisticated software to provide an autonomous "Operatorless" system resulting in a SAFER survey environments by removing the need for an operator on board the aircraft.

The systems will be available within two weeks of the signing of the contract.

For the data processing NSG is using Geosoft Oasis montaj with a number of build in GX scripts.

6.2 Electronic navigation

Pilot Friendly Navigation display (PI) delivers all the navigation and control features necessary for the pilot to safely maintain the highest quality flight line specifications without additional safety risk of having an operator on board the aircraft (see also section 7.1.7).

6.3 Safety Plan

Safety is the number one priority at NSG. NSG is an active member of the International Airborne Geophysics Safety Association (IAGSA)

Prior to mobilizing to the job site, IAGSA Risk Analysis and NSG Job Safety Plan will be prepared in the Markham office. There are areas of the report that require a physical presence on the job site (i.e. reconnaissance flight, identifying local hazards, etc.). At the job site, before each departure, the pilot will contact the local air traffic controller.

Prior to flying the first production line, a safety meeting is held by a NSG representative where each of the reports is explained to all members of the survey crew. A reconnaissance flight will then take place and the IAGSA Risk Analysis and NSG Job Safety Plan will be completed.

Every Sunday, a weekly safety meeting takes place where any and all the safety concerns and issues during the past week are brought to attention and logged to a weekly safety report.

Pilot safety is enhanced by the use of a flight following system that provides updates at 2-minute intervals on the GPS location of the aircraft. This information is monitored in real time on the internet by authorized personnel. In case of an emergency the pilot could press a “Panic Button” connected to the Flight Following and the signal will be transmitted at around 10 sec. intervals or less, which would drastically reduce the search area in a case of emergency landing.

The client will be provided with a login for real time monitoring of aircraft activities through this Flight Following System.

In addition, the Flight Following has an integrated satellite phone that is connected directly to the pilot’s headset. This minimizes any distraction to the pilot when sending or answering a call.

Prior to the flight’s departure, a NSG representative records all the information regarding the aircraft status, such as time of departure, endurance, fuel level, etc.

Once in the air, NSG representative monitors the aircraft at least once every half hour. In case of internet problems, a call will be given right away to the satellite phone integrated to the pilot’s headset and once every hour.

If the flight following signal is lost and the pilot cannot be reached by satellite phone, then NSG’s emergency response procedure is initiated (detailed in the NSG Job Safety Plan).

The aviation company will adhere to all the standards and requirements for local approved air operators.

In summary:

- NSG is active members of International Airborne Geophysics Safety association (IAGSA)
- On each job NSG completes both IAGSA Risk Analysis and NSGs Job Safety Plan forms.
- NSG conducts daily safety meetings with the crew before any flying takes place.

- A Flight Following system will accompany NSG iDAS system that provides updates on every 2 minute intervals, which could be monitored through internet access.
- In addition, the Flight Following has an integrated satellite phone that is connected directly to pilot's headset. Thus minimizing any distraction if pilot decides to send or receive a call.
- The client will be provided with a login for real time monitoring of the helicopter activities through the flight following system.

6.5 Safety Record

No accidents or near accidents have ever occurred at NSG. Since its inception, the company has flown over 45 magnetic and/or radiometric surveys totaling well over half a million line kilometers without an accident.

In addition, High-Sense Geophysics formed in 1993, owned by NSG president Dr. Ted Urquhart, also had an accident-free history. High-Sense rose to become one of the world's largest airborne survey contractors and had met and exceeded the rigorous safety standards of BHP, Shell, and Phillips, among others. It had performed surveys without incident or accident in difficult areas including Vietnam, China, Mongolia, Mauritania, Democratic Republic of the Congo, Brazil, and Sudan.

7. TECHNICAL APPROACH

7.1 AIRBORNE AND GROUND INSTRUMENTATION

7.1.1 Aircraft Type

The aircraft allocated to conduct this survey is a JetRanger 206B helicopter (or different see Section 6.1) with a fix mount stinger assembly with a Cesium magnetometer mounted in it.

7.1.2 Geophysical Flight Control System

A geophysical flight control system, designed and built by NSG will be provided. This system will control, monitor and record the operation of all the geophysical and ancillary sensors.

7.1.3 Airborne Magnetometer

The magnetometers will be cesium sensors, operated in strap down tail stinger mount. The orientation of the sensor is adjustable, to provide optimum coupling with the earth's field on reciprocal headings. The magnetometer has a sensitivity of better than 0.01 nT at a sampling interval of 0.1 s. The magnetometer has the capability to measure ambient magnetic fields in the range of about 100 to more than 100,000 nT.

The airborne magnetometer is supplemented with an 18-term digital compensation system that uses the input from a 3-axis fluxgate to determine the aircraft's attitude and rate of change with respect to the earth's magnetic field. The compensation system identifies the permanent, induced and eddy current magnetic contributions of the aircraft and provides a correction to be applied to the raw magnetic data to remove the maneuver noise.

A FOM will be calculated by summing the absolute errors of each of the 12 maneuvers and will be less than 3 nT.

7.1.4 Ground Magnetometer

Scintrex Cesium CS3 or GSM19 Proton magnetometers will be operated at the base of operations within or near the survey area in an area of low magnetic gradient and free from cultural noise. The sensitivity of the ground magnetometer will be equal to better than 0.1 nT. Data will be recorded continuously every 1 second (or a rate defined by the client) throughout the survey operations in digital form. Both the ground and airborne magnetic readings are automatically time stamped with GPS time to within 0.005 seconds ensuring a very high degree of correlation based on broadcast GPS satellite time.

7.1.5 Radar Altimeter

A Terra 3500 radar altimeter will be operated in the aircraft throughout the survey to provide ground clearance information. The altitude will be recorded every 0.1 second or better. This instrument has a linear performance over the range of 0 to 2500 feet.

7.1.6 Fluxgate Magnetometer

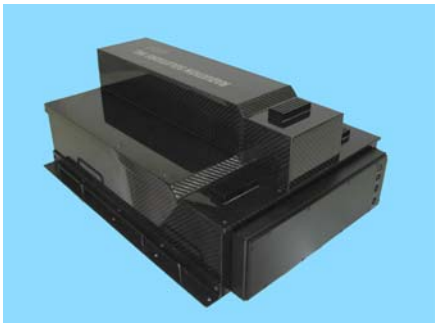
To achieve quality compensation NSG uses a Bartington Mag-03 Three Axis Magnetic Field Sensors. These compact, high performance fluxgate magnetometers with integral electronics provide reliable precision measurements of static and non-static magnetic fields in three orthogonal axes. The magnetometer is mounted inside the stinger assembly.

7.1.7 GPS Navigation

A 16-channel GPS navigation system will be used for navigation and flight path recovery. The Ublox RCB-LJ GPS receiver board is powered by the ANTARIS® positioning engine.

The leading ANTARIS® GPS Engine provides excellent navigation performance under dynamic conditions in areas with limited sky view like urban canyons, high sensitivity for weak signal operation without compromising accuracy, and support of DGPS and multiple SBAS systems like WAAS and EGNOS. The 16 parallel channels and 8192 search bins provide fast start-up times. The aiding functionality accelerates start-up times even further. The low power consumption and FixNow™ power saving mode make this product suitable for handheld and battery-operated devices.

7.1.8 Spectrometer



The RS-500 Airborne Spectrometer with RSX-5 detector pack, manufactured by Radiation Solutions Inc. (RSI), will be used for the survey. The RS-500 spectrometer has a multi-peak gain stabilization algorithm and is capable of recording 1024 channels with accuracy of 0.1 to 10 counts/second.

The RS-500 is connected to a crystal pack comprising four downward looking crystals (16 liters total) and one upward looking crystal (4 liters total). The downward crystals record the radiometric spectrum from 410 KeV to 2810 KeV over 1024 discrete energy windows, as well as from a cosmic ray channel that detects photons with energy levels above 3.0 MeV. From these 256 channels, the standard Total Count, Potassium, Uranium and Thorium channels are extracted. The upward crystal is used to measure and correct for atmospheric Radon interference. The shock-protected Sodium Iodide (Thallium) crystal package is unheated and automatically stabilizes with respect to the multiple peaks. The RS-500 provides raw data that has been automatically corrected for gain, base level, ADC offset, and dead time.

A resolution test will be performed before the first and after the last flight each day in order to monitor sensitivity and resolution of the crystal pack.

7.1.9 Field Data Verification System

NSG will provide a complete PC based magnetic map compilation facility, to serve as a field verification system The PC computer based system is equipped with all the software necessary to produce preliminary data images in the field. Data will be provided to the client in a Geosoft format.

The digital data records will be verified at the project site to confirm that data recording has taken place within specifications. All raw digital data recorded in flight and on the ground station magnetometer will be duplicated on site to prevent loss, and stored in separate locations.

In the base where there is e-mail connection, data will be sent on a daily basis for further examination in the head office where areas of infill will be chosen.

7.1.10 Flight Following System

NSG places the highest priority on safety and uses satellite tracking and communication technology to monitor all its survey flights. The aircraft will be equipped with Latitude Technologies Skynode S200, a system that includes satellite phone, flight tracking, and messaging transceiver. This system uses the Iridium satellite network, which provides both voice and data communications between the aircraft and ground stations.

The S200 system can be set up for different time frames; it now automatically updates its position at least once every 2 minutes allowing NSG's field or office

staff to monitor the progress of the survey flights. All flight staff are trained in the use and the operation of the S200 system.

During the survey, if the pilot experiences any problems with operation of the survey equipment or encounters any other difficulties, he/she can call the field or office staff for support through the satellite phone, which is integrated into the pilots head set. In the event of flight operations problems, field staff can often troubleshoot and correct difficulties allowing survey flights to continue uninterrupted.

In the event of an emergency the pilot may press the “Panic Button” which will cause the system to immediately transmit the location and heading of the aircraft and will continue to transmit the current position of the aircraft continuously at around 10 sec. intervals until the emergency system is turned off.

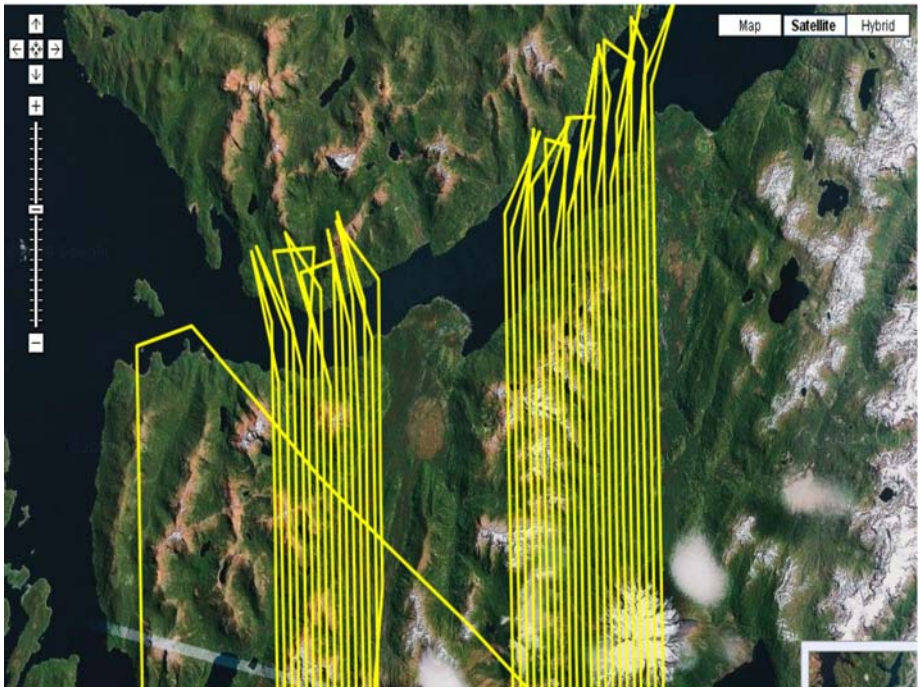


Figure 7.1 Screenshot of Flight Following Through Internet Web Browser

7.2 INSTRUMENT CHECKS AND CALIBRATIONS

Failure to meet the specifications in any check or calibration test will be cause for corrective action by NSG or approval of the Client before survey operations can be undertaken.

7.2.1 Magnetometer

Figure of Merit (FOM)

A test will be flown on-site prior to the survey to determine the FOM of the installed magnetometer. The system will be flown on the four cardinal headings doing a pitch, roll, and yaw, maneuver on each. The FOM will be calculated by summing the absolute errors of each of the 12 maneuvers and will be less than 3 nT.

7.2.2 Altimeter

Checks of the radar altimeter calibration will be undertaken above the base airstrip or some other suitable location with known elevation and flat terrain.

7.2.3 Radiometric

7.2.3.1 Pre-survey Spectrometer Calibrations and Tests

Calibration of the spectrometer system is a vital process to airborne radiometrics or airborne gamma-ray spectrometry. The calibration of the spectrometer system involved three tests:

- Calibration Pad measurements, which are used to determine the "spectral overlap" (Compton scattering) coefficients. The calibration test is performed within a 12 month period before and/or during the survey by the manufacturer, Radiation Solutions Inc., at its headquarters location in Mississauga, Ontario.

- Cosmic Flight Test, which is used to determine the aircraft background values and cosmic coefficients. A series of high altitude test lines (e.g., 8,000 ft, 9,000, ft, 10,000 ft, and 11,000ft (if capable) above sea level) will be flown in the vicinity of the survey areas.

- Height Attenuation Test, which determines the altitude attenuation coefficients. A series of test lines (e.g., 50 ft, 100, ft, 150 ft, 200, ft, 250 ft, 300 ft, 400, 600 ft, 800 ft, and 1000 ft above ground) over dry and flat ground, will be flown in the vicinity of the survey areas.

7.2.3.2 During-Survey Spectrometer Calibrations and Tests

7.2.3.2.1 Resolution Daily Tests

The usual measure of the energy-resolution of a spectrometer system uses the “full width at half maximum (FWHM)” of a photo-peak. This is the width of the peak at half the maximum amplitude divided by the energy of the photo-peak.

The overall system resolution based on the Th photo-peak at 2.61 MeV should always be better than 7% on all downward looking crystals. If the resolution changes by more than 1% (eg, 4% to more than 5%) from that measured at the start of the survey, flying operations will be ceased until the source of the problem is found and rectified.

This test is not required with the RS-500 system and will only be performed at the Clients request and upon availability of Th source material.

7.3 DATA RECORDS

7.3.1 Digital Records

The airborne data acquisition system will record the following information digitally in a format that enables the recording of each variable over its full dynamic range:

Fiducial count
GPS UTC time
GPS latitude, longitude, UTM easting, northing and elevation above ellipsoid
Raw magnetic total field
Calibrated radar altimeter output
Three Fluxgate channels
Raw Potassium counts
Raw Thorium counts
Raw Uranium counts
Raw upward-looking Uranium counts

Raw Total Count
Raw Cosmic counts
Live Time
Downward Spectrum

The base station will record the following information digitally in a format that enables the recording of each variable over its full dynamic range.

GPS time (used as fiducial number)
GPS raw satellite range information
Raw magnetic total field

All survey parameters including raw magnetic total field, electronic positioning, radar altimeter, and time and fiducial markers will be recorded digitally during data acquisition in flight. The magnetic base station will record total magnetic field and GPS time.

The data acquisition system organizes the data in a form directly suited to building the processing database. This digital file structure has for each traverse and control line a unique line number and segment number. The base station magnetic profile and GPS coordinates are added to the database using GPS time for alignment.

7.4 DATA COMPILATION AND MAP PRESENTATIONS

The NSG Field-Mapper PC based computer compilation system will be used to process the collected geophysical data on-site as the survey progresses. The 'on-site' processing will enable the Client to review the magnetic data to evaluate targets to make a qualified decision regarding any changes to the survey quantity and size. This will allow the selection of “in-fill” or area extensions. The preliminary data will be sent via FTP site (assuming reasonable speed internet connection is available) for the client’s review at least once a week (more often should the client require).

7.4.1 Magnetic

7.4.1.1 Field Data Processing

After collecting flight and base station data, flight data will be imported to Oasis montaj using a NSG template that includes all project data channels. Next flight data will be windowed to only include flight path data within the survey block using custom NSG script that will be developed for the survey areas.

Magnetic flight data from the tail will then be duplicated to ensure original raw data is not modified in any way. Profiles for the duplicated channels are then checked for visible noise spikes. Any noise spikes are then cleaned manually and interpolated. From there, field staff will run an automated script that will look for any missed noise spikes. This automated script employs a 4th difference algorithm to identify noise spikes in magnetic data. After other channels (radio altimeter, flux gate profiles etc.) are inspected for normal behavior that database is prepared for magnetic compensation. Using QC Tools, compensation coefficients are applied to the cleaned magnetometer channel and the database is saved.

From here, NSG staff will import base station data into Oasis montaj using a NSG template. Base station data is duplicated to maintain a raw channel and then checked for visible noise spikes. After noise spikes have been removed and interpolated, a 101 (or other job specific) low pass filter is applied to base station magnetic channel and the database is saved.

Next, the flight and base station databases are merged, synchronized (using the GPS clock channel recorded by both systems), compressed, encrypted and sent to NSG's secure server in Toronto, for in-office QA/QC and processing procedure.

NSG field staff from there will updated and complete all daily logs (weekly progress report, daily procedures checklist, weekly summary meeting etc.).

7.4.1.2 Post-Field

As the data being received from the field on day-to-day basis it is reviewed for QA/QC once again to insure that nothing got missed in the field. The data is checked for quality of magnetic signal from all sensors, including the base station magnetometer, fluxgate magnetometer, radar altimeter, line deviations etc. The profiles of the above data are plotted and checked on line-by-line basis. Algorithms like 4th-difference are used to check the CS3 signal.

After the data has been QA/QC checked it is merged with an ongoing master database. Where the following data processing steps take place:

1) Diurnal correction - subtracted directly from the aeromagnetic measurements to provide a first order diurnal correction. The mean of base station readings is added back to the data.
2) Heading error correction - using pre-constructed heading table.

3) Lag correction – to correct for sensor-to-GPS offset.
4) Simple Leveling - a survey line/control line network will be created in order to determine differences in magnetic field at the line intercepts. The differences will be calculated and tabulated, then used to guide subsequent manual leveling on any lines or line segments which required adjustments. See image below for an example of contour Total Magnetic Intensity (TMI) map produced after Simple Leveling was applied.
5) Microleveling – depending on the Simple Leveling results a Microleveling might be needed in order to further correct the data for linear line-to-line noise. The technique used will be the one developed by Paterson, Grant & Watson Limited and available through Geosoft Oasis montaj with the mutually accepted parameters.
6) IGRF correction - The total field strength of the International Geomagnetic Reference Field (IGRF) 2005 model will be calculated for every data point, based on the spot values of latitude, longitude and GPS altitude, using the 2005 model. This IGRF will be removed from the measured survey data on a point-by-point basis. The mean of IGRF readings is added back to the data.

7.4.1.3 Magnetic data filtering and gridding

A cosine filter (e.g., 31-51 points) will be applied to 50Hz data before re-sampling the data to 10Hz.

The TMI grid will be produced using bi-directional gridding technique, with 20 m cell size (or other suitable size depending on liner spacing) and Akima spline across and down lines.

7.4.2 Radiometric

7.4.2.1 Field Data Processing

After collecting flight data, the radiometric data will be imported to Oasis montaj using a NSG template that includes all project data channels. Next flight data will be windowed to only include flight path data within the survey block. After, an in house-developed radiometric processing GX will be run on the database, which will apply the following corrections:

7.4.2.1.1 Pre-filtering

The cosmic and radar altimeter channels will be processed with a 10-20 point and 5 point low pass filter respectively to remove spikes.

7.4.2.1.2 Live Time correction

All the elements including upward looking Uranium and Total Count will be corrected for Live Time using the following formula:

$Clt = Craw \times (1000/LT)$

Where:

- Clt is the live time corrected channel
- Craw is the raw channel
- LT is the Live Time channel

7.4.2.1.3 Aircraft and Cosmic Background

Aircraft background and cosmic stripping corrections will be applied to the Total Count, Potassium, Uranium, Thorium and upward Uranium channels using the following formula:

$Cac = Clt - (ac + bc \times Cosf)$

Where:

- Cac is the background and cosmic corrected channel
- Clt is the live time corrected channel
- ac is the aircraft background for this channel
- bc is the cosmic stripping coefficient for this channel
- $Cosf$ is the filtered cosmic channel

All negative counts after this correction step will be replaced with zeroes.

7.4.2.1.4 Compton Stripping

Following the radon corrections for Uranium and Total Count, the potassium, uranium and thorium will be corrected for spectral overlap. First the stripping ratios α, β, and χ were modified

according to altitude. Then an adjustment factor based on the reversed stripping ratio (a), uranium into thorium, was calculated.

$$\alpha h = \alpha + hef \times 0.00049$$
$$\beta h = \beta + hef \times 0.00065$$
$$\chi h = \chi + hef \times 0.00069$$

Where:

- α, β, χ are the Compton stripping coefficients
- $\alpha h, \beta h, \chi h$ are the height corrected Compton stripping coefficients
- hef is the height above ground in meters

The stripping corrections are then carried out using the following formulas:

$$ar = \frac{1}{1 - a\alpha h}$$

$$Th_c = (Th_{bc} - aU_{rc}) \times ar$$

$$U_c = (U_{rc} - Th_{bc}\alpha h) \times ar$$

$$K_c = K_{bc} - \beta h Th_c - \chi h U_c$$

Where:

- U_c, Th_c, and K_c are corrected Uranium, Thorium and Potassium
- $\alpha h, \beta h, \chi h$ are the height corrected Compton stripping coefficients
- U_{bc}, Th_{bc}, and K_{bc} are background and cosmic corrected Uranium, Thorium and Potassium
- ar is the backscatter correction
- a is the reverse stripping ratio U into Th

All negative counts after this correction step will be replaced with zeroes.

7.4.2.1.5 Attenuation Corrections

The Total Count, Potassium, Uranium and Thorium data will then be corrected to a nominal survey altitude according to the equation:

$$Ca = C \times e^{-\mu(h0-h)}$$

Where:

- Ca is the output altitude corrected channel
- C is the input channel
- μ is the attenuation correction for that channel
- h is the radar altimeter height, in metres
- $h0$ is the nominal survey altitude used as datum

All negative counts after this correction step will be replaced with zeroes.

7.4.2.2 Office Data Processing

All of the above calibration procedures, tests and corrections applied in the field will be reviewed for QA/QC by assigned office QA/QC and data processing person .

7.4.2.3 Radiometric grids

Grids of Potassium, Thorium, Uranium and Total Count will be produced using bi-directional gridding technique, with 25 m cell size (or other suitable size) and Akima spline across and down lines.

8. FINAL PRODUCTS

The following is the list of items that will be delivered to the Client:

Hard copies (2 copies):

- Ternary map of Th, U and K (1:20,000 scale)
- Map of Potassium (1:20,000 scale)
- Map of Thorium (1:20,000 scale)
- Map of Uranium (1:20,000 scale)
- Map of Total Count (1:20,000 scale)
- Map of Total magnetic Intensity (1:20,000 scale)
- 1st order Vertical Derivative (1:20,000 scale)
- Digital Terrain Model (1:20,000 scale)
- Final Logistics Report

Soft copies (2 copies):

- Ternary map of Th, U and K at 1:20,000 scale
- Grid and map of Total Magnetic Intensity at 1:20,000 scale
- Grid and map of Potassium counts at 1:20,000 scale
- Grid and map of Thorium counts at 1:20,000 scale
- Grid and map of Uranium counts at 1:20,000 scale
- Grid and map of Total Count at 1:20,000 scale
- Grid and map of 1st order Vertical Derivative at 1:20,000 scale
- Grid and Map of Digital Terrain Model at 1:20,000 scale
- Final Logistics Report
- Radiometric data database in Geosoft gdb format including all raw data and height corrected Potassium, Thorium, Uranium, and Total Count
- Magnetics data database in Geosoft gdb format including raw data, base station, compensated, base station corrected, IGRF corrected, heading corrected, lag corrected, simple leveled, and microleveled (optional) total field.
- Database and channel descriptions file in Excel format
- Weekly and Line Progress report

9. TIME SCHEDULE

The project will start on July 13, 2011.

10. TERMINATION

In the event that the geophysical platform or equipment becomes inoperable, NSG will proceed with diligence to rectify the problem within a reasonable period of time. If within the aforementioned period of time NSG fails to rectify the problem, the Client may, at their discretion, terminate the work under this Proposal in full or in part. In the event of such termination, the Client shall be obliged to pay NSG for services rendered only up to the date of receipt of a written notice of such termination and for documented expenses incurred by NSG prior to the date of receipt of termination notice, and for reasonable cancellation and demobilization costs.

11. LOCAL LICENSES, PERMITS AND CUSTOMS

Client will take the responsibility for obtaining all local licenses and permits required to perform the services. Out of pocket costs for permitting will be reimbursed by the client.

12. GENERAL CONDITIONS

NSG will carry out the agreed services in a proper and workmanlike manner with a high standard of safety and in accordance with the laws, rules and regulations applicable to the project location.

At all times during the term of this Proposal, the NSG or its subcontractors shall carry and maintain at its own expense, work insurance protection of the kinds and in the minimum amounts set forth below:

12.1 NSG Liability Insurance

- Employer's Liability and Workmen's Compensation insurance to cover employees furnished by NSG including:

  (a) Statutory Workmen's Compensation benefits in compliance with the laws of the state, province or country in which the aircraft operations under this Proposal will be performed;

  (b) Employer's Liability to have limits of not less than $5,000,000 per person, and $5,000,000 per accident;

  (c) Employer's Liability applicable to all provisions outlined above with limits not less than $5,000,000 each person, $5,000,000 each occurrence.

- Comprehensive General Liability Insurance. Such insurance shall cover all operations in all provinces, states and countries in which the aircraft operation or services may be performed by NSG hereunder and shall include the following:

  (a) Limits of liability: not less than $5,000,000 for death or injury of any one person, $5,000,000 in the aggregate for all persons injured or killed as the result of any one accident, and $5,000,000 for loss of or damage to property resulting from any one accident.

  (b) Contractual liability coverage for NSG's obligations hereunder;

13. CHARGES AND PAYMENT TERMS

Total estimated cost for Survey and Map Production

Block Names	Line Spacing (Traverse/Control)	Estimated Total Line Km	Price per Line Km ($CAD)*/**	Mob/Demob ($CAD)*	Estimated Total***/****
Klaza Extension	100m/1000m	465	$92.31	$2,700	**$ 45,624.15**

Stand-by of CAD $1,430.00/day will be charged on those days where flying is not possible due to inclement weather, atmospheric conditions, labor unrest, government intervention or other stoppages beyond the control of the contractor.

*Note: The line Km and mobilization/demobilization rates are based on condition that the two additional blocks (known as BBB, and Dade as per the contract with Wolverine Minerals Corp.) will be flown during the same period as Klaza Etension block. The total estimated survey line Km will be 1,295.

**Note: The line Km rate is based on condition that client provides sufficient amount of Jet fuel for the helicopter at the following sites: Klaza camp, Carmacks.

***Note: The estimated total will depend on the final number of line Km to be flown. The actual line Km distances may be slightly less or more than estimated.

****Note: These prices are net of all local taxes.

Payment Schedule

An initial payment, due on signing and mobilization: 50% of selected survey Plan price

Second payment, due on completion of flying: 40% of selected survey Plan price

On delivery of final maps and reports: Balance

All invoices are due and payable upon submission at the Client's address indicated in Section 1 of this Survey Agreement. A service charge of 0.4 % per week on unpaid balance is payable on all overdue accounts.

The payment schedule is subject to negotiation should the proposed schedule not conform to the client's norms and regulations.

Funds will be paid by wire transfer to:

Introduction

This report covers the processing and basic interpretation of the merged New-Sense Geophysics Ltd. Klaza magnetic and radiometric survey data. The data were collected in two tranches, a main 2010 Klaza survey followed by a 2011 Klaza extension survey that on laps the NW of the main survey block.

Klaza Merged Data Review

The Klaza survey topography, local coordinates and flight line path is seen below in Figure 1. The survey coordinates are NAD83 UTM zone 8N. There is a total of 811 line km of data on two survey grids, one of 326 km flown in 2010 and the extension of 485 km flown in 2011.

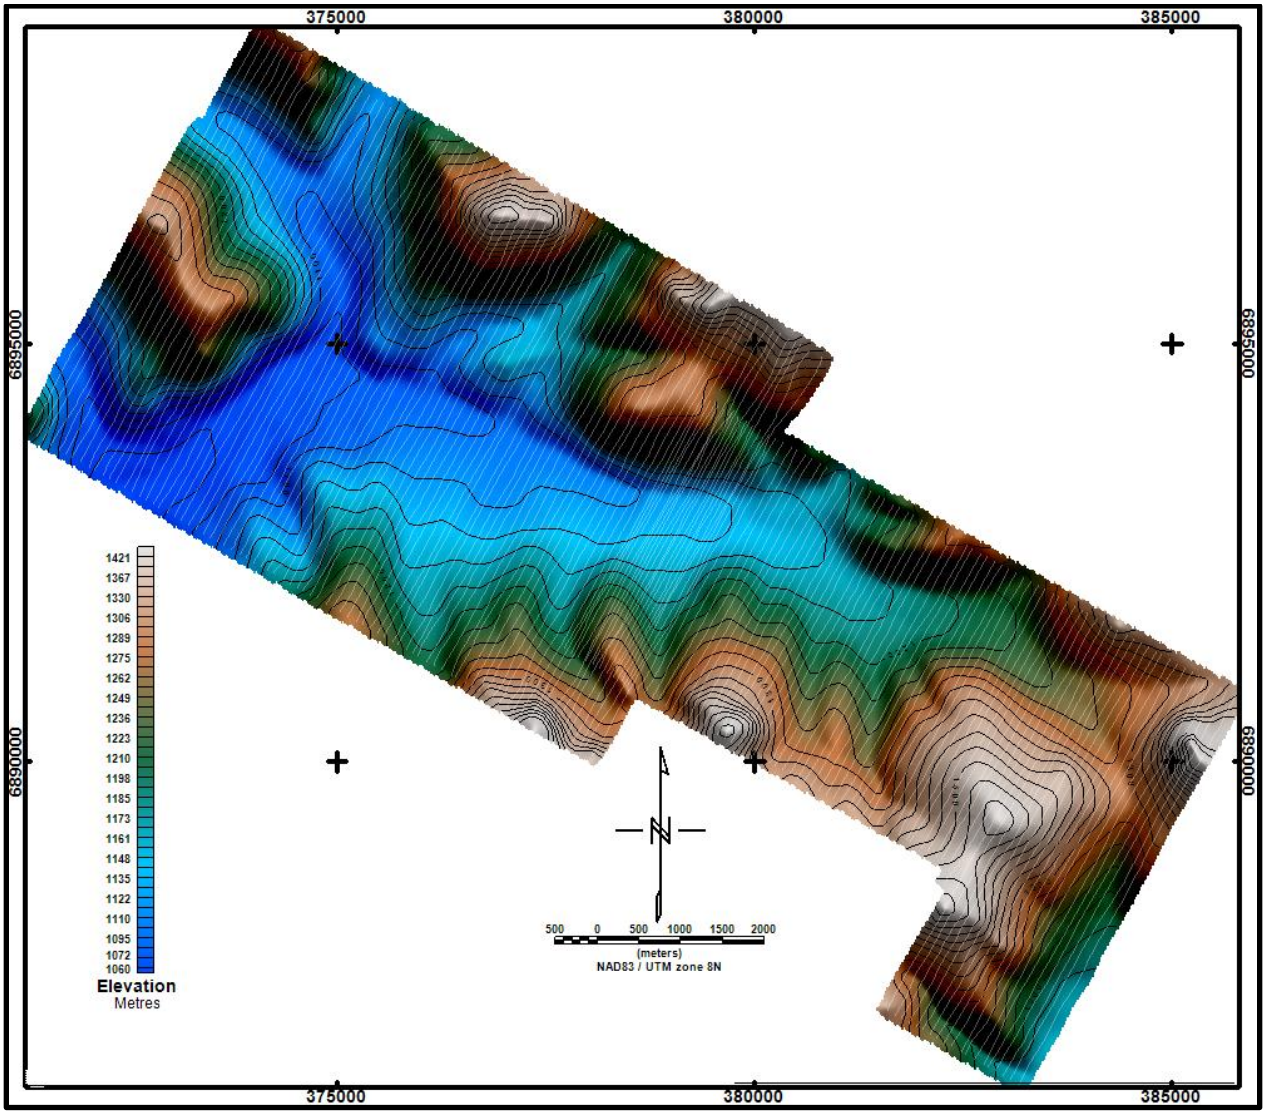

Figure 1. Klaza merged grid flight and tie lines, 811 km total. Background image is topography. The topographic relief from lower elevations (blue) to higher elevations (light brown) ranges over 500 m.

The nominal survey flight line spacing is 100 m. The survey grid covers significant topography with over 500 m of relief. Condor processing of the delivered data includes merging and micro-leveling of the 2010 and 2011 grids and magnetic filtering techniques that accentuate magnetic structure and response amplitudes on the grid. The reduction to pole (RTP) transformation was performed on the Total Magnetic Intensity (TMI) data provided by the survey contractor using Encom PA[1]. This product represents a calculation of what the magnetic observations would be if the inducing field were vertical (i.e. observations made at the magnetic pole). This parameter is expressed as TMI-RTP. Additional processing using the ZS suite in Encom PA was performed to calculate the tilt angle (TA) (angle above the horizontal of the total gradient vector) and the first vertical gradient of the TMI (1VD). The TA is also known as the RTP-tilt. RTP processing is undertaken prior to ZS products being generated. All the ZS filter products are identified by the prefix identified *ZS-[product]*. Sun-shaded "magnetic structure maps" also employ directional horizontal gradients that are usually parallel to flight line directions, accentuating magnetic structure perpendicular to flight lines. Radiometric data is plotted as ternary CMY color plots and individual potassium (K), uranium (U) and thorium (Th), and total count (TC) plots. TC and K were chosen as the primary radiometric display channels as TC would identify lithologies with the highest overall radiometric response and elevated K-counts may be particularly associated with alteration systems such as porphyries. In the following figures the geophysical response grids are draped on topography to show where higher amplitude responses are located in relation to topography.

Magnetic Grids

Figure 2 is a plot of the TMI-RTP draped on topography. The RTP range on the grid is ~ 2200 nT. The higher amplitude magnetic signatures appear to be partially correlated with exposed higher elevation ridgelines and mountain peaks. Lower amplitude TMI responses generally occur in lower elevation drainages. Terrain clearance (sensor altitudes) over the mountain peaks can be 250+ feet lower than over the drainage channels. Any response enhancement and attenuation evident in Figure 2 may in part be related to lower altitude sensors over the ridges and peaks, and higher altitude sensors over the drainages, respectively. Elevated RTP responses do though occur over intermediate topography indicating that elevated RTP responses don't solely arise from rocks being closer to the airborne magnetic sensor. As will be discussed further later in this report, elevated magnetization on the grid periphery is also correlated with porphyries and breccia and may indeed be related to these lithologies.

[1] Encom PA is a product of PbEncom, a unit of Pitney Bowes Software.

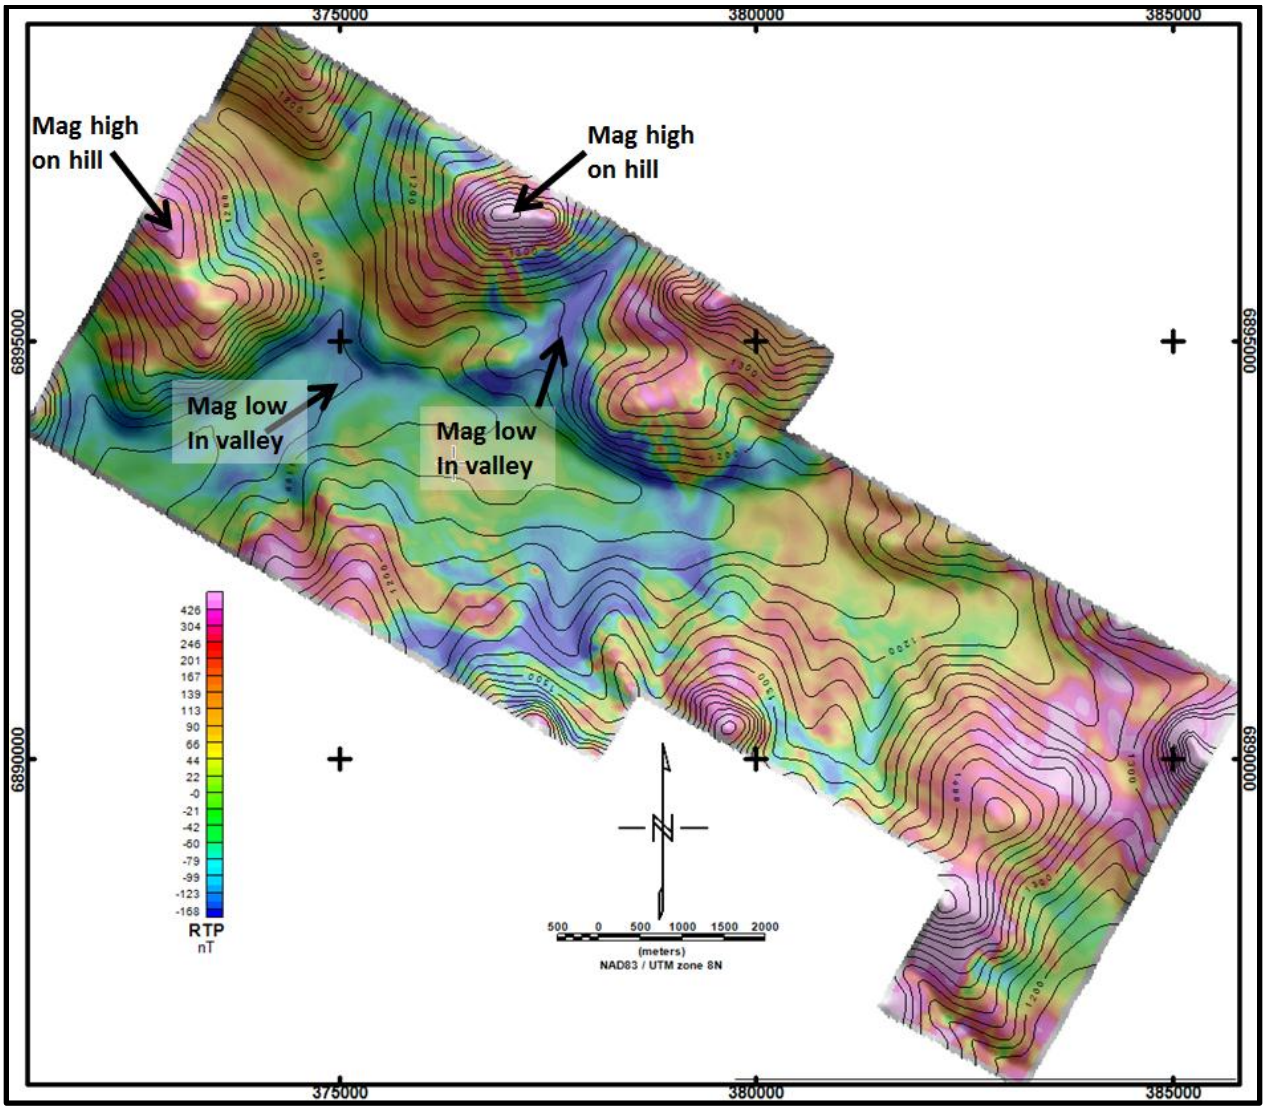

Figure 2. Klaza TMI-RTP image draped on topography. The highest amplitude responses (red) generally occur over peaks and ridges. The lower TMI amplitudes in darker blues generally trace drainage channels.

Figure 3 is a drape of the TA on topography. The TA returns higher angles in red shades regardless of the magnetic response amplitude and therefore acts like an automatic gain control for lower-amplitude responses, putting them on par with higher amplitude responses. The TA returns well defined linear signatures over structures such as contacts or magnetic horizons and as such is a useful filter for magnetic structural mapping. The primary magnetic texture on the grid is NW-SE striking; E-W and NE-SW striking magnetic lineaments are secondary and tertiary.

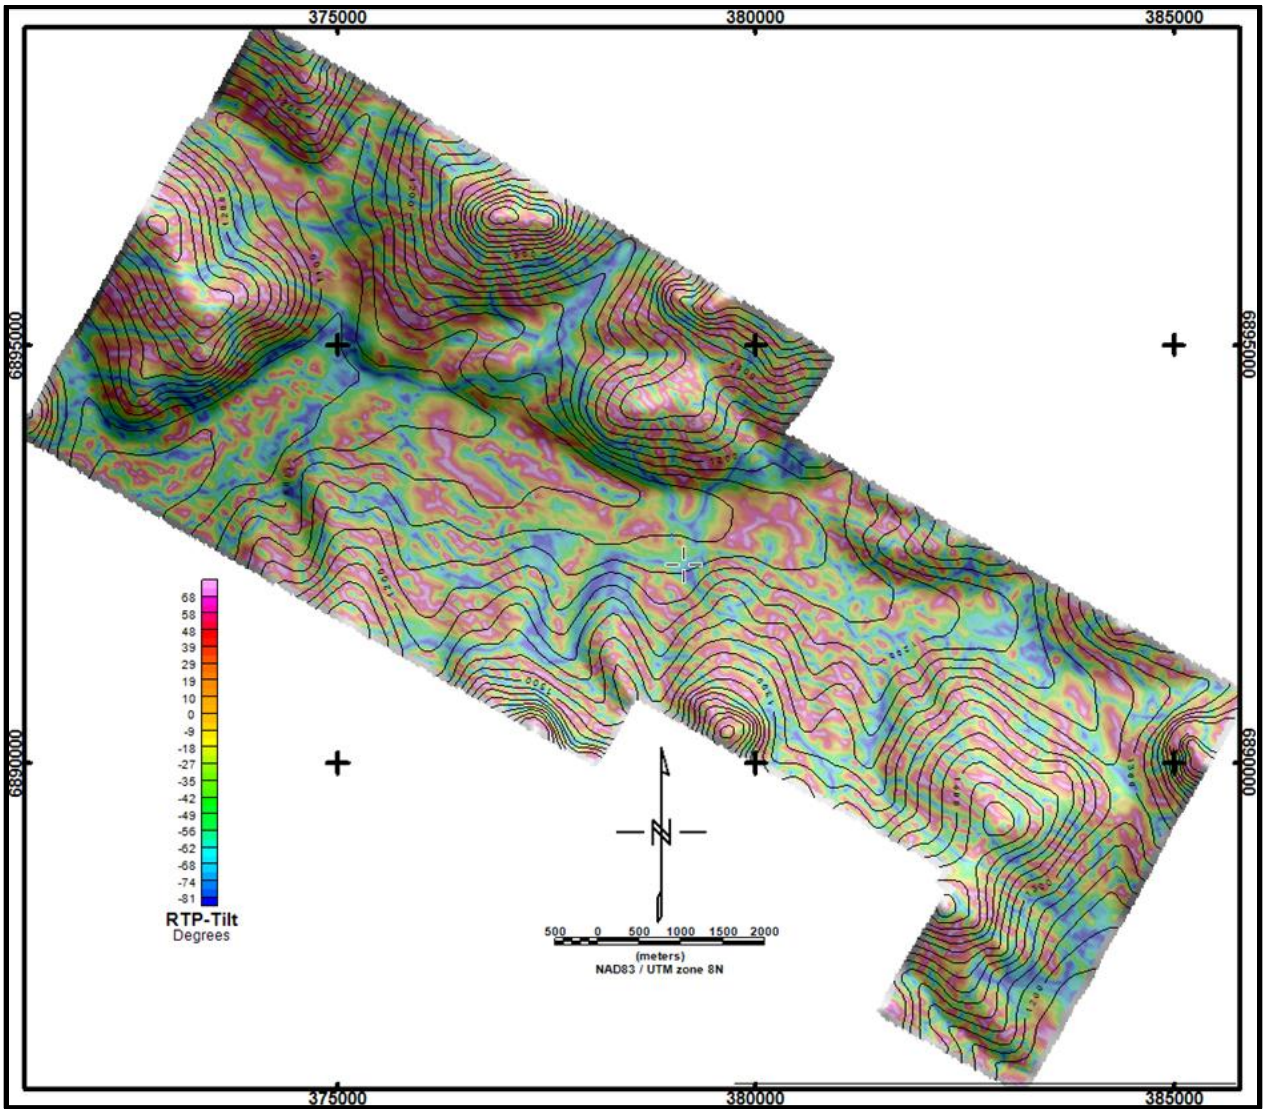

Figure 3. Klaza TA image draped on topography. The main magnetic texture is NW-SE striking.

Radiometric Grids

Figure 4 is a drape of the TC radiometric channel on topography. The correlation of higher TC over exposed ridgelines and mountain peaks, with lower counts in the drainage channels, is similar to the RTP amplitudes. It is kept in mind that the correlation of higher geophysical responses over higher elevations, if due to lower sensor clearances, may at least in part be coincidental, as the main N-S and E-W striking drainage channels show elevated K-counts downslope from mountain peaks with higher TC. It appears the nearby hills peaks may be radiometric sources that could be shedding more radioactive detritus into the main drainage channel. Drainage channels may conversely show lower radiometric readings due to higher moisture content or vegetation suppression of decay counts, not just higher sensor altitudes. In places the higher peaks and ridges on the grid periphery are mapped as porphyry

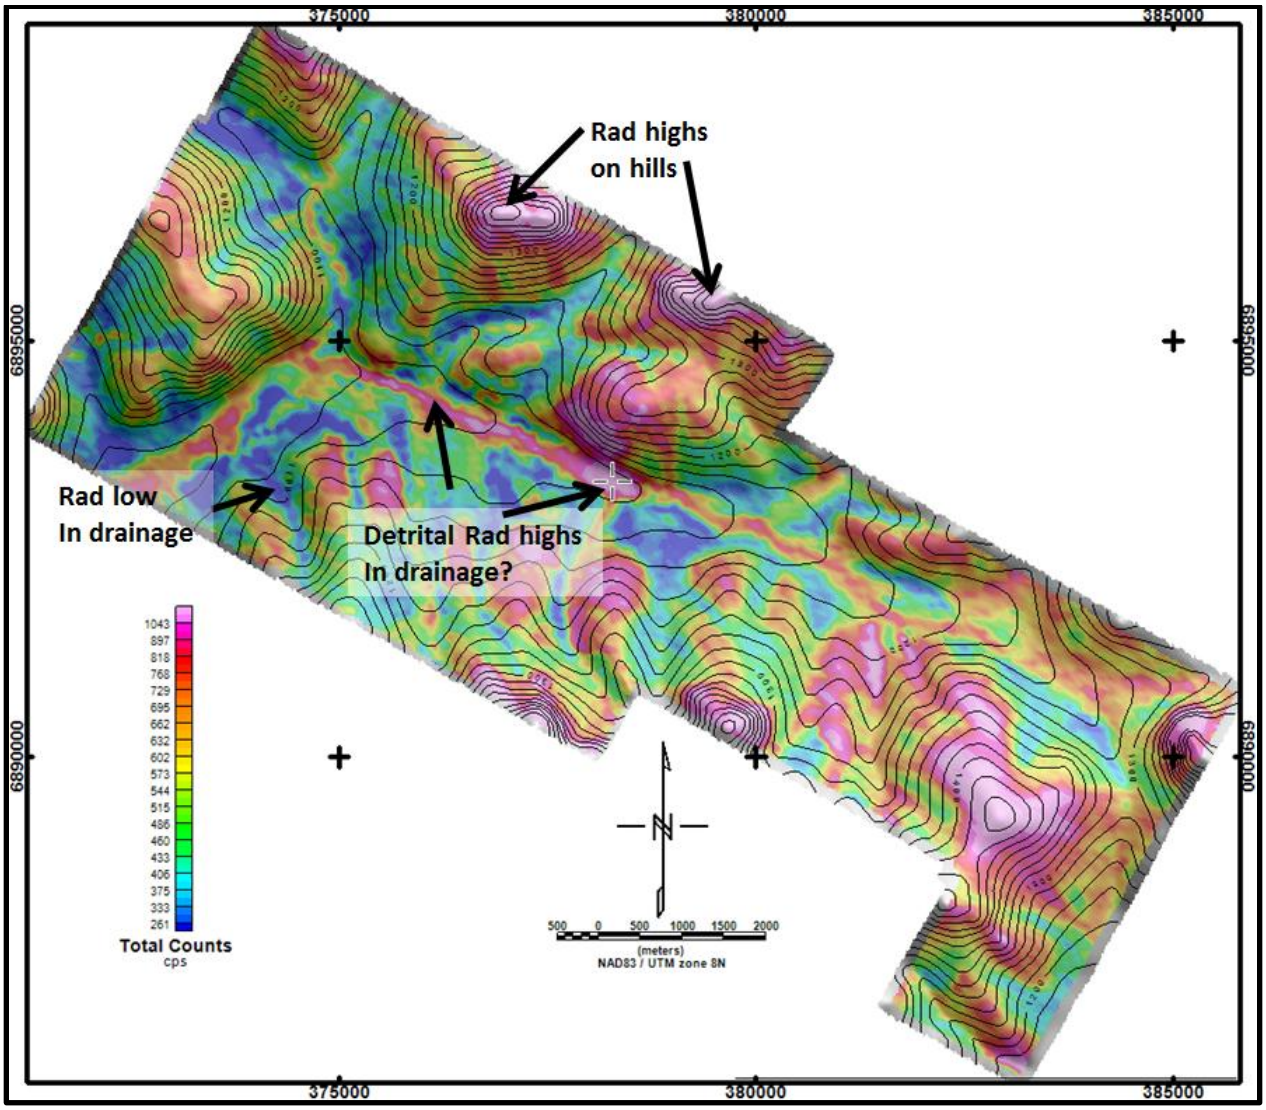

Figure 4. Klaza TC grid draped on topography. Higher responses in red, lower responses in blue.

and breccia, and these lithologies may in reality have higher radiometric counts and not just reflect lower airborne sensor altitudes. Elevated TC are also noted on the flanks of some hill slopes such as the Klaza Au zone and these may indicate that relatively more radioactive lithologies are located on some slope sites.

Figure 5 plots the K-counts on topography. The K map is similar to the TC map mapping higher and lower counts in similar places. The main difference between the two maps is that the TC returns one order of magnitude higher counts than K does, resulting in sharper detail in the gridded TC dataset. Relatively K-rich rocks in the central grid hills are apparent as they appear to be shedding higher K detritus into the main E-W stream channel, as will be discussed later shown these are porphyritic on the higher slopes.

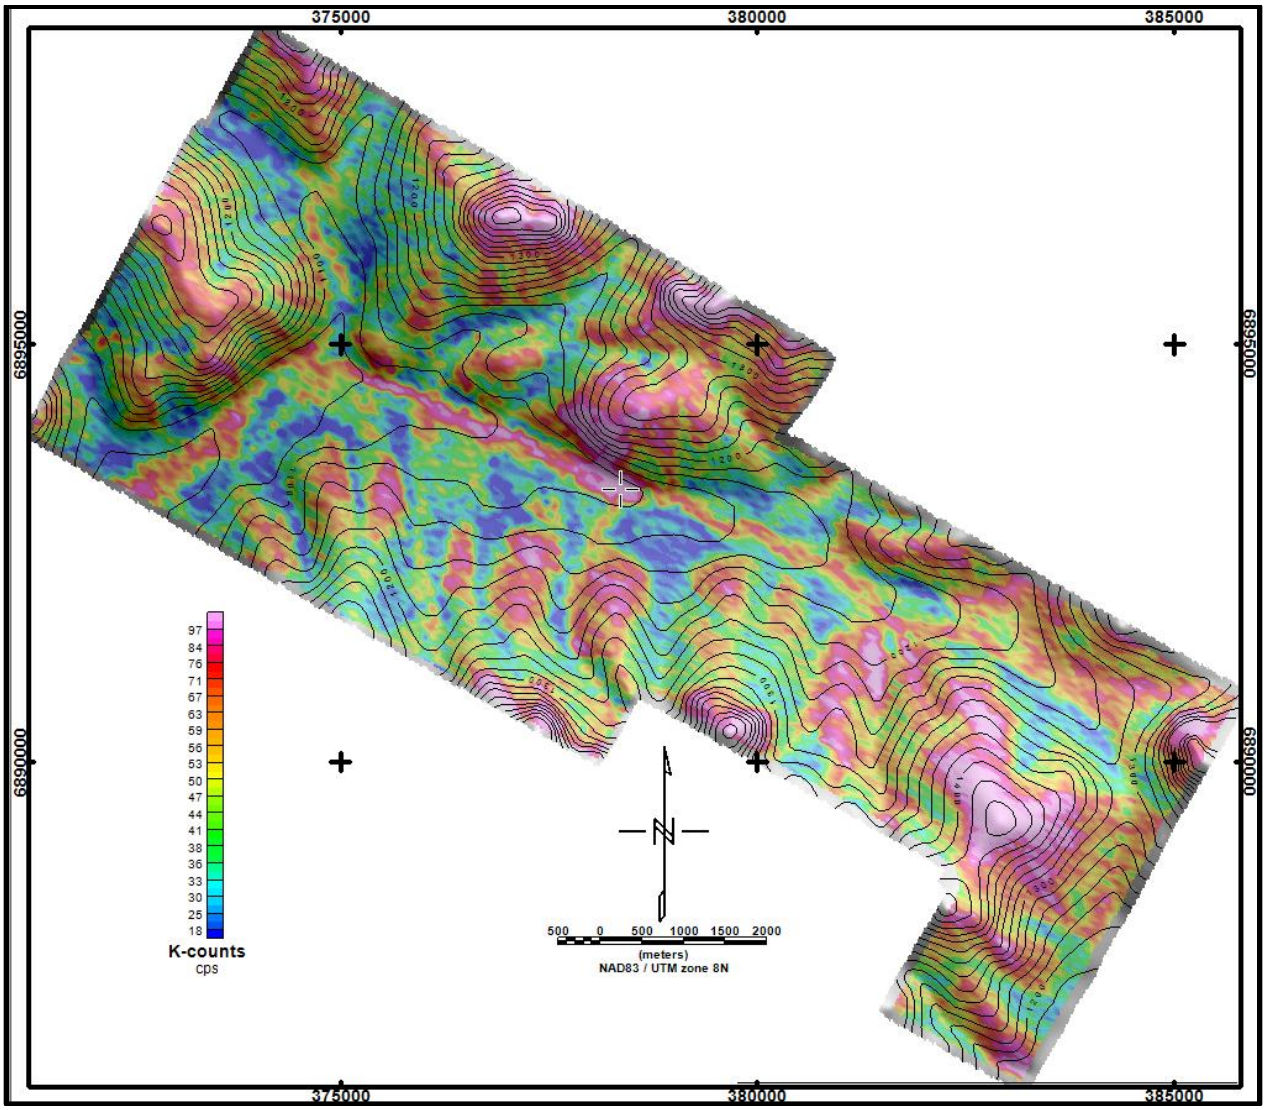

Figure 5. Klaza K grid draped on topography. Higher response locations similar to the TC in Figure 4 are observed.

Figure 6 is the Klaza KUTh Ternary diagram with a cyan, magenta, and yellow color scheme (CMY) used for Th, K, and U respectively. The dark tones in this image are higher cumulative KUTh counts, the whiter shades are lower counts. Arrow 1 points out the obviously higher radiometric response on the mountaintop on the grid north. Arrow 2 points out the higher radiometric response in the main E-W drainage channel previously mentioned for Figures 4 and 5 below breccia and porphyritic rocks on the grid north. Arrow 3 points out a larger elevated ternary response that straddles a hilltop and its lower elevation northern slope, including the Klaza Au zone. Arrow 3 also highlights what looks like the eastern side of a larger annulus-shaped elevated radiometric response. The annulus may at least in part be a topographic effect as the less radioactive center, highlighted by the white shades, tracks a north-flowing drainage channel on the hill slope flanked by N-S ridgelines.

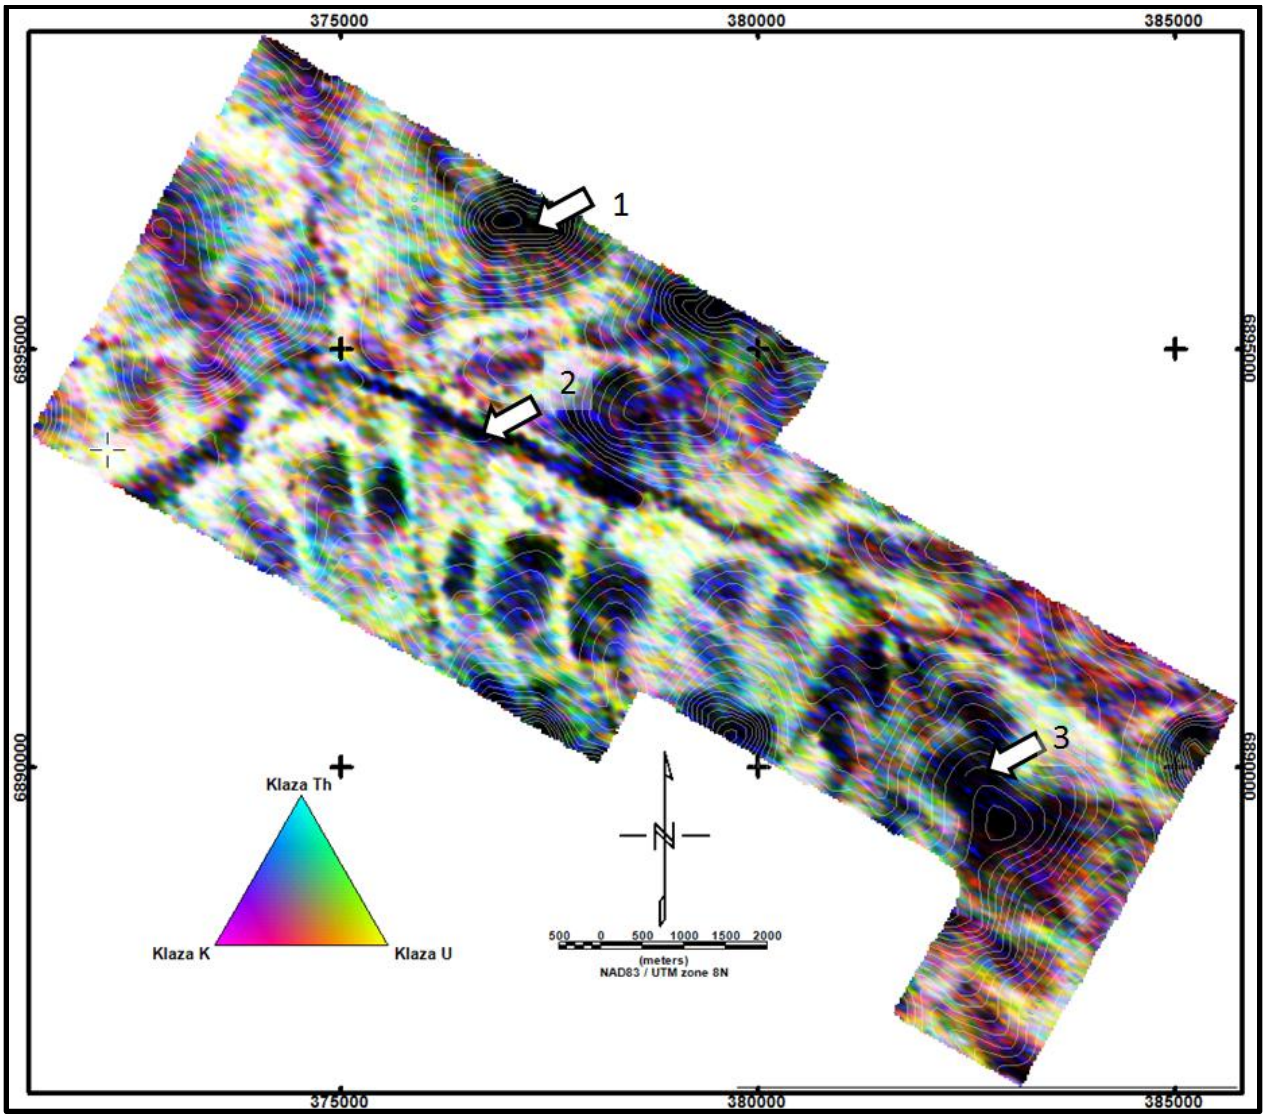

Figure 6. Cyan, Magenta, Yellow Th, K,U ternary diagram. The three arrow sites are discussed in the text. Dark shades are relatively more radioactive rocks. Change in radiometric character if not solely due to a change in lithology, may be due to ground moisture levels, vegetation, and flying heights. The contours on the image are topography.

The merged U and Th maps show less detail than do the TC, K, and ternary grids so are not shown but are provided as gridded and Geotiff products.

Klaza Data Interpretation

Grid-Wide Responses

Figure 7 is a basic bedrock geology map derived from Gordon and Makepeace (1999). The survey grid is predominantly Cretaceous granodiorite, with andesite, dacite, and rhyolite porphyry on the grid northern, eastern, and southeastern periphery. One small outcrop of Jurassic rhyolite is mapped on the grid NE.

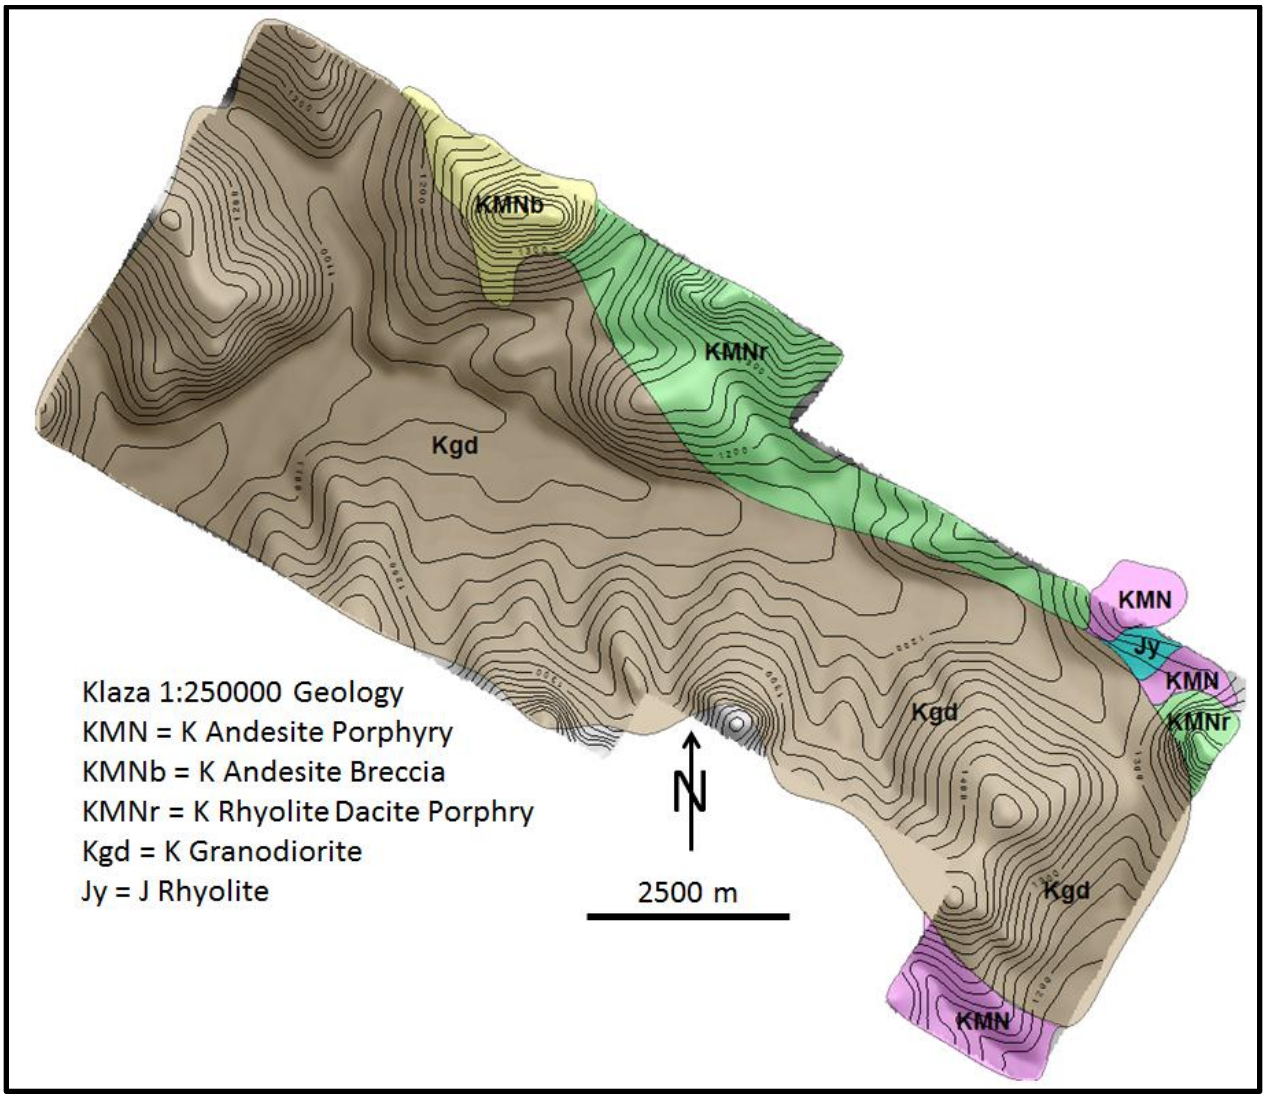

Figure 7. Basic geology map of the Klaza grid from Gordon and Makepeace (1999). This is a coarse geology map and may not well define detailed lithology on the grid, particularly in the main granodiorite Kgd.

Figure 8 is a map of the TMI-RTP data with a basic magnetic linear interpretation in white line with the supplied 81 Rockahaven drill holes that had coordinates plotted on the SE of the grid. Holes with what

Rockhaven call “Significant AU” intersections are colored red and outlined by the black box. Rockhaven’s website describes the SE Klaza grid mineralized zone as follows (http://www.rockhavenresources.com/s/Klaza.asp)

“*four parallel 1 to 75 m wide, structural zones of epithermal to mesothermal type gold-silver mineralization. All zones consist of quartz-sulphide veins, breccias and fracture networks that are spatially associated with quartz-feldspar porphyry dykes that intrude granitic country rocks. The zones exhibit exceptional lateral and down-dip continuity and collectively define a 1500 m wide, northwesterly trending structural corridor.*”

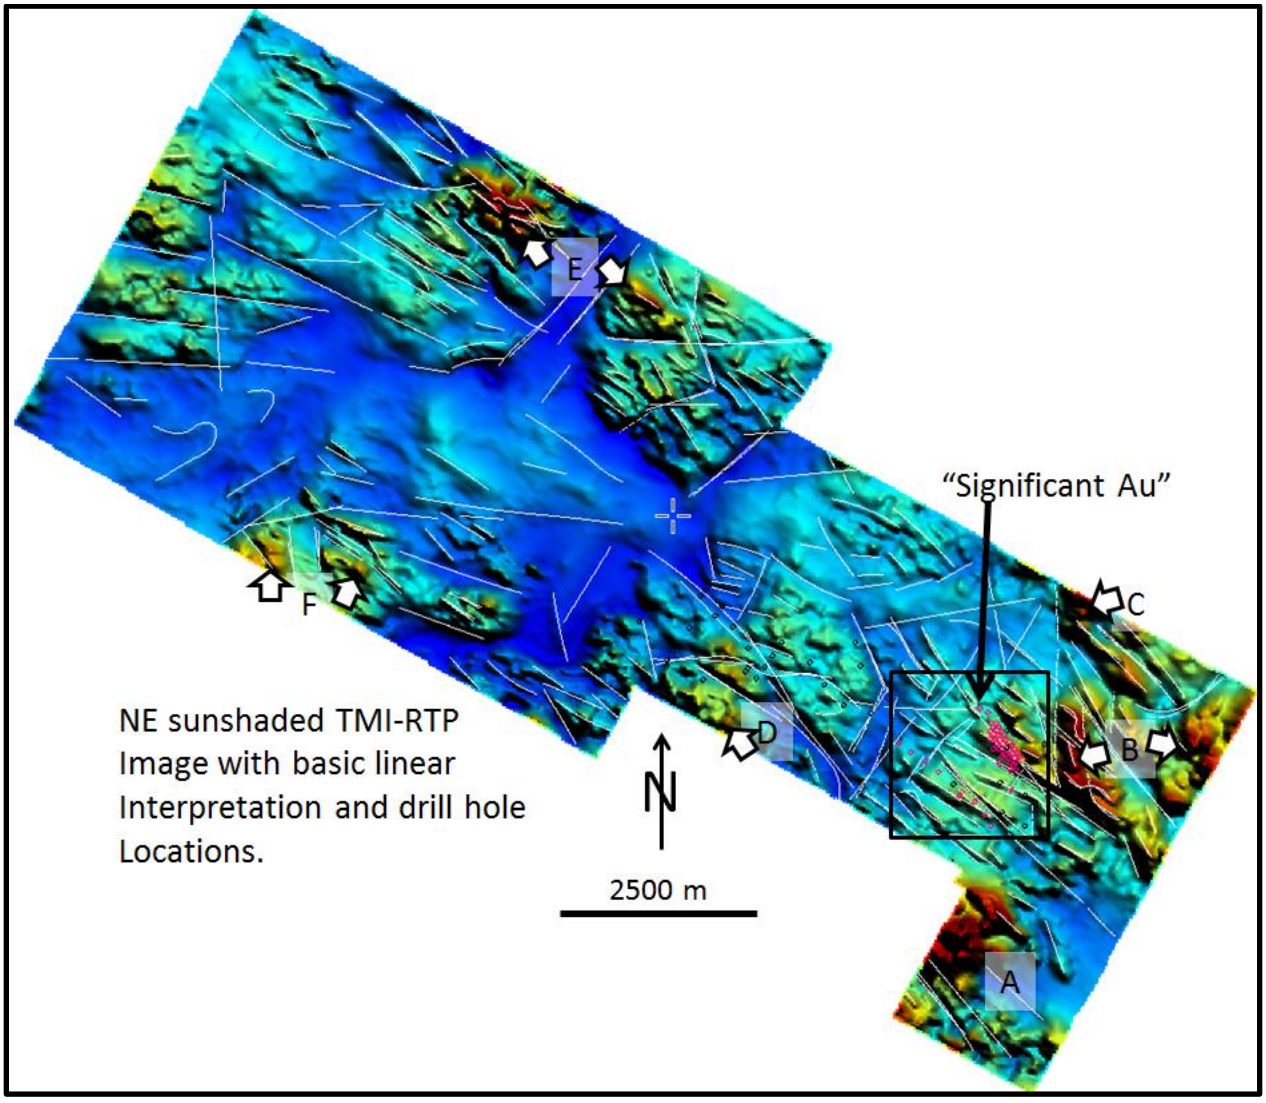

Figure 8. TMI-RTP image with basic linear interpretation in white line. The black box contains drill holes with Au intersections described as “significant” by Rockhaven. The sites at letters A-F are discussed in the text.

The four Klaza grid zones from south to north are BRX, Herc, BRY, and Klaza. The northern Klaza zone highlighted by the densest drill hole cluster (red colored collars) has returned the most holes with

elevated AU assays. NW-SE trending magnetic linears are evident in this mineralized zone and will be discussed in more detail in a later section.

As mentioned the dominant magnetic texture on the survey grid is NW-SE, parallel with lithology Kgd, though the NW-SE linears can have different NW-SE strike angles at different locations. E-W striking linears generally occur on the west and south-central grid areas. NE-SW striking linears occur on the grid north, grid far-west and this strike direction is also evident in the larger lower elevation valleys on the grid.

Beside magnetic structure the TMI-RTP image highlights zones of elevated RTP response that may be lithologic in origin as seen at sites A-F in Figure 8. At site A on the grid SE, a mountain top returns a semicircular RTP response with the highest amplitude on the grid. This RTP high response is near the Kgd granodiorite contact with porphyry unit KMNr. At site B two zones of elevated RTP response are identified, to the west and east of the letter B as pointed out by the two arrows. The western band of NNW-SSE striking elevated RTP response is an en-echelonmagnetic structure in granodiorite located ~ 775 m due west of the Klaza zone Au-intersecting drill hole cluster. The magnetic band is situated on the NE slope of a hill and likely to be lithologic or structural in origin. The eastern RTP response pointed out for site B is on a mountain top on the grid edge in mapped porphyry. At Site C elevated magnetization is identified to the west of C, in porphyry KMN. At site D elevated magnetization has been drilled near a granodiorite-porphyry contact without any holes reporting significant Au assays. At site E higher magnetization is mapped on the west of the E, in the breccia unit KMNb, than is mapped to the east in dacite porphyry unit KMNr. The magnetic signature over KMNb is the highest amplitude on the grid after site A. At site F elevated RTP is mapped in granodiorite.

Figure 9 is a plot of the TC radiometric channel draped on the NE sun shaded magnetic gradient relief. The same TMI-RTP linears are plotted on this image along with the site locations A-F seen in Figure 8, along with three additional TC sites G, H and I. At site A low to moderately elevated TC is observed over the strong RTP response, the higher TC numbers are ~500 m to the east of the RTP high. At site B, a low TC occurs over the higher western RTP signature, but a high TC is observed over the higher RTP over the porphyry on the NE grid edge. At site C low to moderate TC occurs over the elevated RTP over the porphyry. At site D, a high TC, that is coincident with high RTP, is noted SSE of the Au-barren drill holes. At site E, a strong TC is coincident with the strong RTP signature on the west over breccia, and a

moderate TC occurs to the east over dacite porphyry KMNr. At site F lower TC counts occur over the easternmost RTP high, while low to moderately elevated TC occurs over the western RTP high. At site G two elevated TC signatures occur over two N-S trending ridgelines that straddle a north-flowing drainage channel. At site H an elevated TC response is located just to the east of the "H" on the south flank of the hill that rises up to the dacite porphyry on the east side of site E. This TC anomaly may contribute elevated TC detritus into the E-W drainage below it. Perhaps the most significant TC signature occurs at site I in the black rectangle on the grid SE where "significant Au" has been intersected in several drill holes. The I is centered on an annulus-shaped TC signature, the ESE of the annulus has some of the highest total counts on the grid. Some of the elevated TC are coincident with NW-SE striking TMI-RTP linears with drill holes that intersected elevated Au. Some of the NW-SE striking RTP linears are several

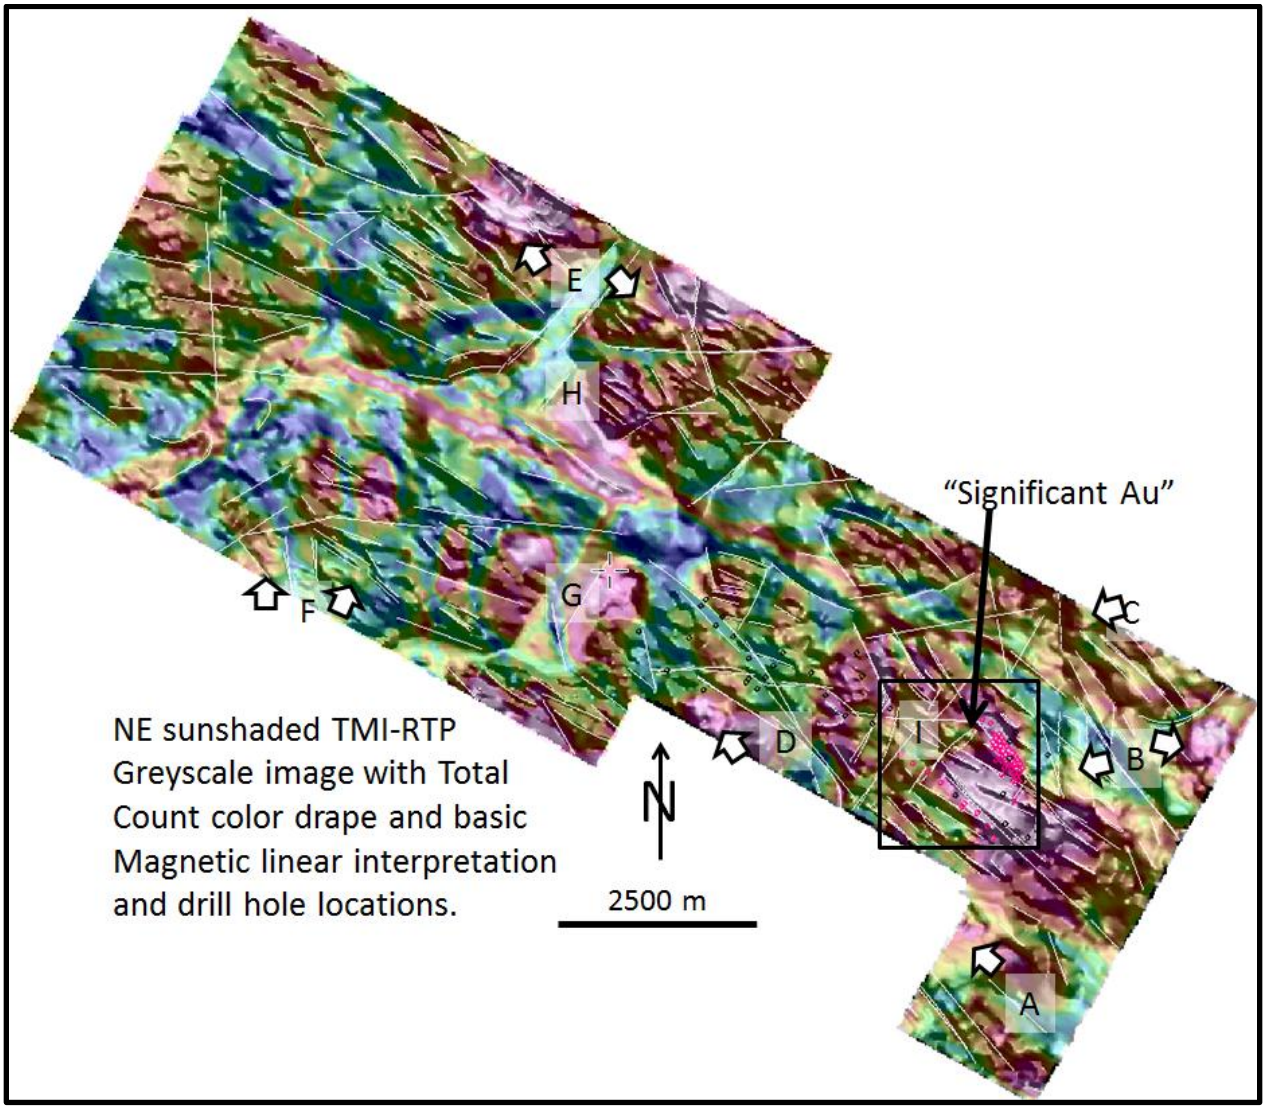

Figure 9. TC radiometric image draped on TMI-RTP NE sun shaded image. Sites A-I are discussed in the text.

km long, whereas the coincident TC signatures may be 1-2 km long maximum. These will be studied in more detail in a following section.

Local Klaza Au Zone Responses

Figure 10 is a zoom-in on the TMI-RTP image with the red colored drill holes identifying holes that return elevated Au assays. Rockhaven's four mineralized zones are identified in the image. The Klaza Au-drill

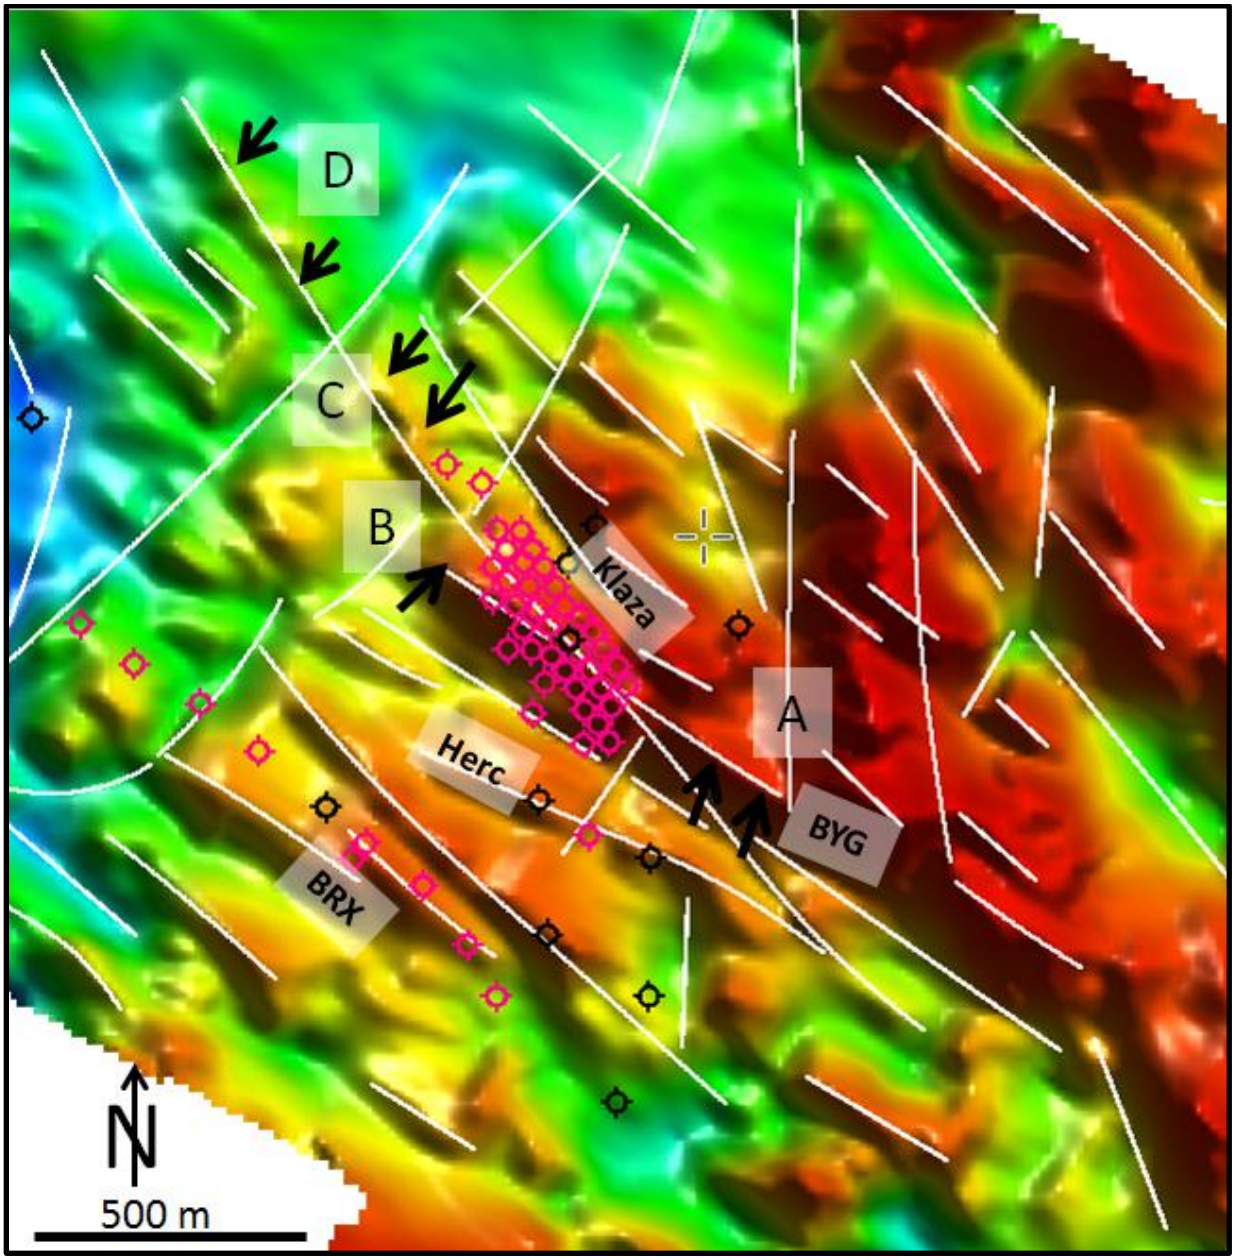

Figure 10. NE Shaded TMI-RTP with Rockhaven drill holes and local magnetic trends in white. Red holes return significant Au assays.

trend is sub-parallel to the southern limb of a V-shaped RTP high signature where the V is open to the NW. The two north-pointing arrows at site A locates the undrilled “hinge zone” of the V-shaped RTP signature, specifically the western side of the southern magnetic limb that extends for at least 450 m to the ESE away from the nearest drill hole in the Klaza trend. Site B identifies the western undrilled end of the southern RTP limb that extends ~ 250 m westward from the nearest on-strike hole. The southern limb of the Klaza RTP signature is bisected by a more steeply NW-SE striking, lower amplitude and longer RTP linear pointed out by the arrows at sites C and D in Figure 10. The two Au-intersecting drill holes KL-11-34 and KL-11-36 (red circles) are located a few tens of meters east of this RTP linear at site C. This linear can be traced for ~ 1200 m to the NW of the two holes. The linear is crosscut by relatively demagnetized NE-SW striking RTP signatures with unknown mineralization relevance.

Figure 11 is a zoom of the RTP-tilt. The TA structural linears show high tilt angles as solid traces and low tilt angles as dashed traces. Low tilt angles are low gradient zones away from more-magnetic edges or horizons that plot at higher angles. Higher tilt angle focus sharply on linear magnetic edges and horizons, ideally a 90 degree tilt would be centered over the magnetic source. At site A the magnetic “hinge zone” has split into two signatures, on the east into a tighter V-shaped signature centered on the Au-intersecting drill holes, and on the west into a discrete NW-SE striking linear segment of what is called the “southern limb” in Figure 10. The signature at site A is the southern bound of a series of en-echelon NW-SE striking RTP highs that defined the northern limb of this as an RTP signature in Figure 10. This second NW-SE striking “north limb” of stacked RTP highs was drilled by holes KL-10-01, KL-10-02 and PDH-11-21. Their black collars indicate that they did not intersect significant Au. Hole PDH-11-21 appears to be drilled north of the RTP-tilt high.

At site B the NW extension of the V-signature southern limb persists. At site C a Z-shaped magnetic horizon occurs a few tens of meters to the WNW of holes KL-11-34 and KL-11-36. The larger regional TA linear that bisects the Klaza Au zone extends for more than three km from SE of site A to NW of site D. At Site E the BRX zone is seen to be comprised of two NW-SE striking RTP-tilt highs, with most of the Au-intersecting drill holes being collared on the southern high drilled into the RTP-tilt low sandwiched between the two highs. The general TA texture of the Klaza Au zone is NW-SE striking, with NE-SW crosscutting diagonal TA lows to the WSW. Discrete NW-SE striking TA highs are identified for all four mineralized zones, Klaza, BYG, Herc, and BRX. The Herc zone is aligned along a magnetic linear, the one Au intersection returned from the three holes drilled there is located on a magnetic amplitude drop-out

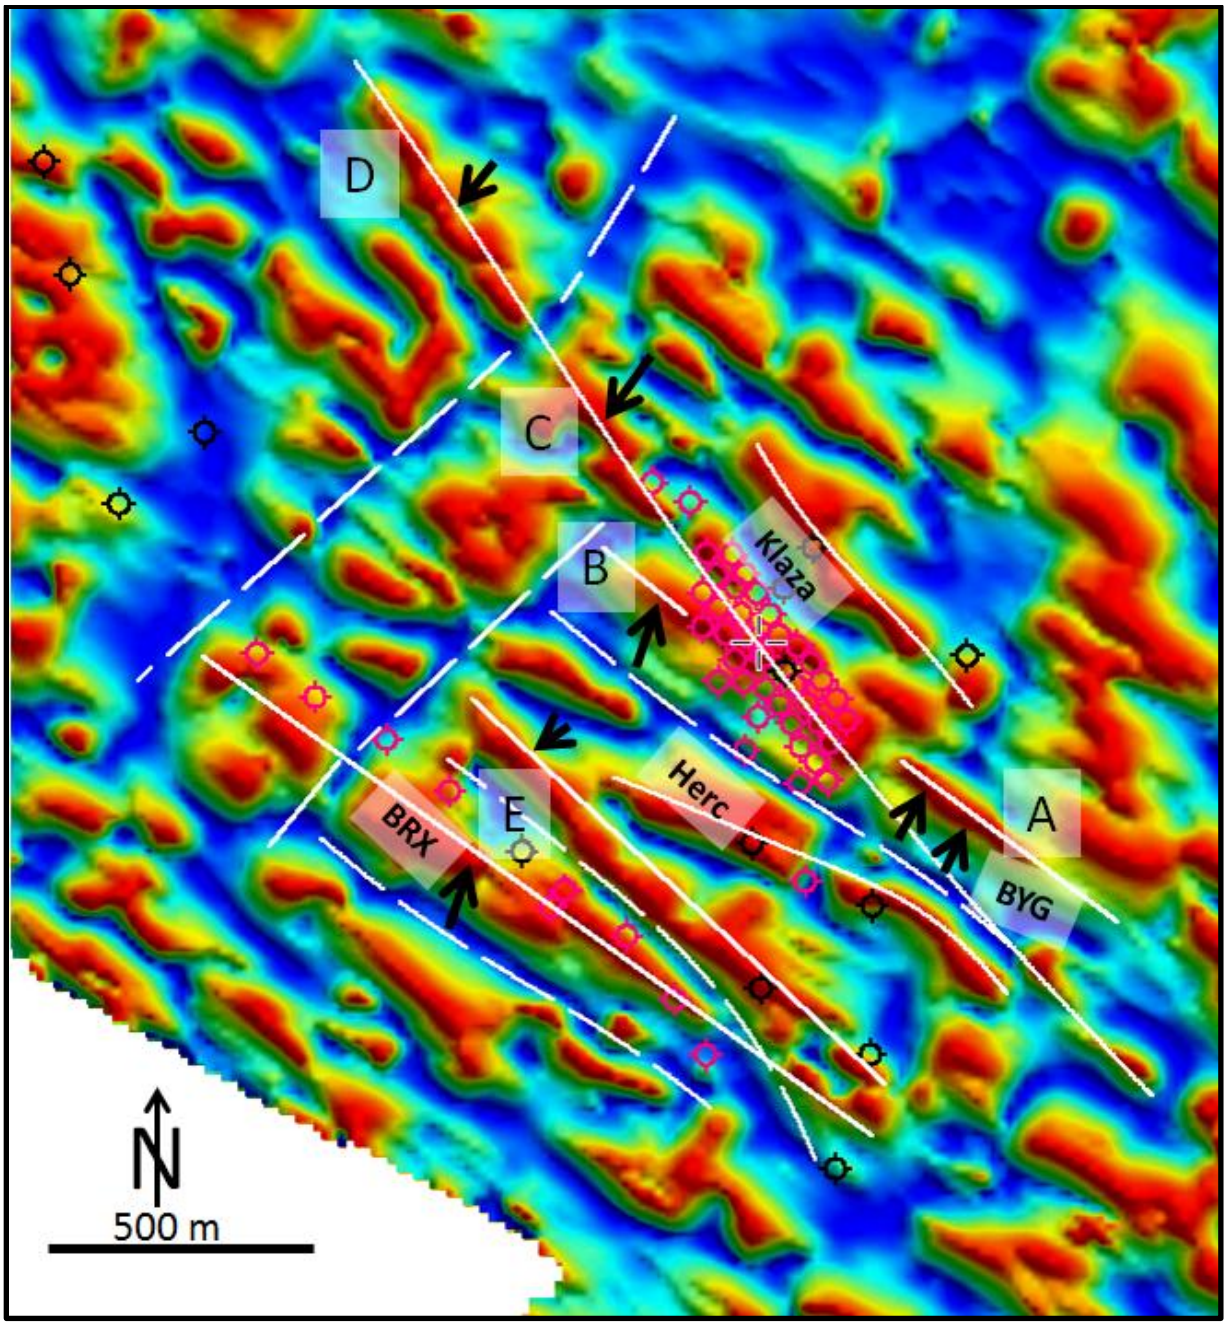

Figure 11. NE Shaded RTP-Tilt with Rockhaven drill holes and local magnetic trends in white. Red holes return significant Au assays. Solid lines are high TA, dashed lines are low TA.

that disrupts the linear. The magnetic drop-out is coincident with a break where a high TC to the WSW abruptly drops down in count number to lower TC to the ENE.

Figure 12 is a drape of the TC on the NE sun shaded greyscale RTP gradient image. The TC response is similar to the K response but is an order of magnitude higher in count. A strong NE-SW striking TC signature is coincident with the Au-intersecting drill holes. The site A south limb magnetic signature

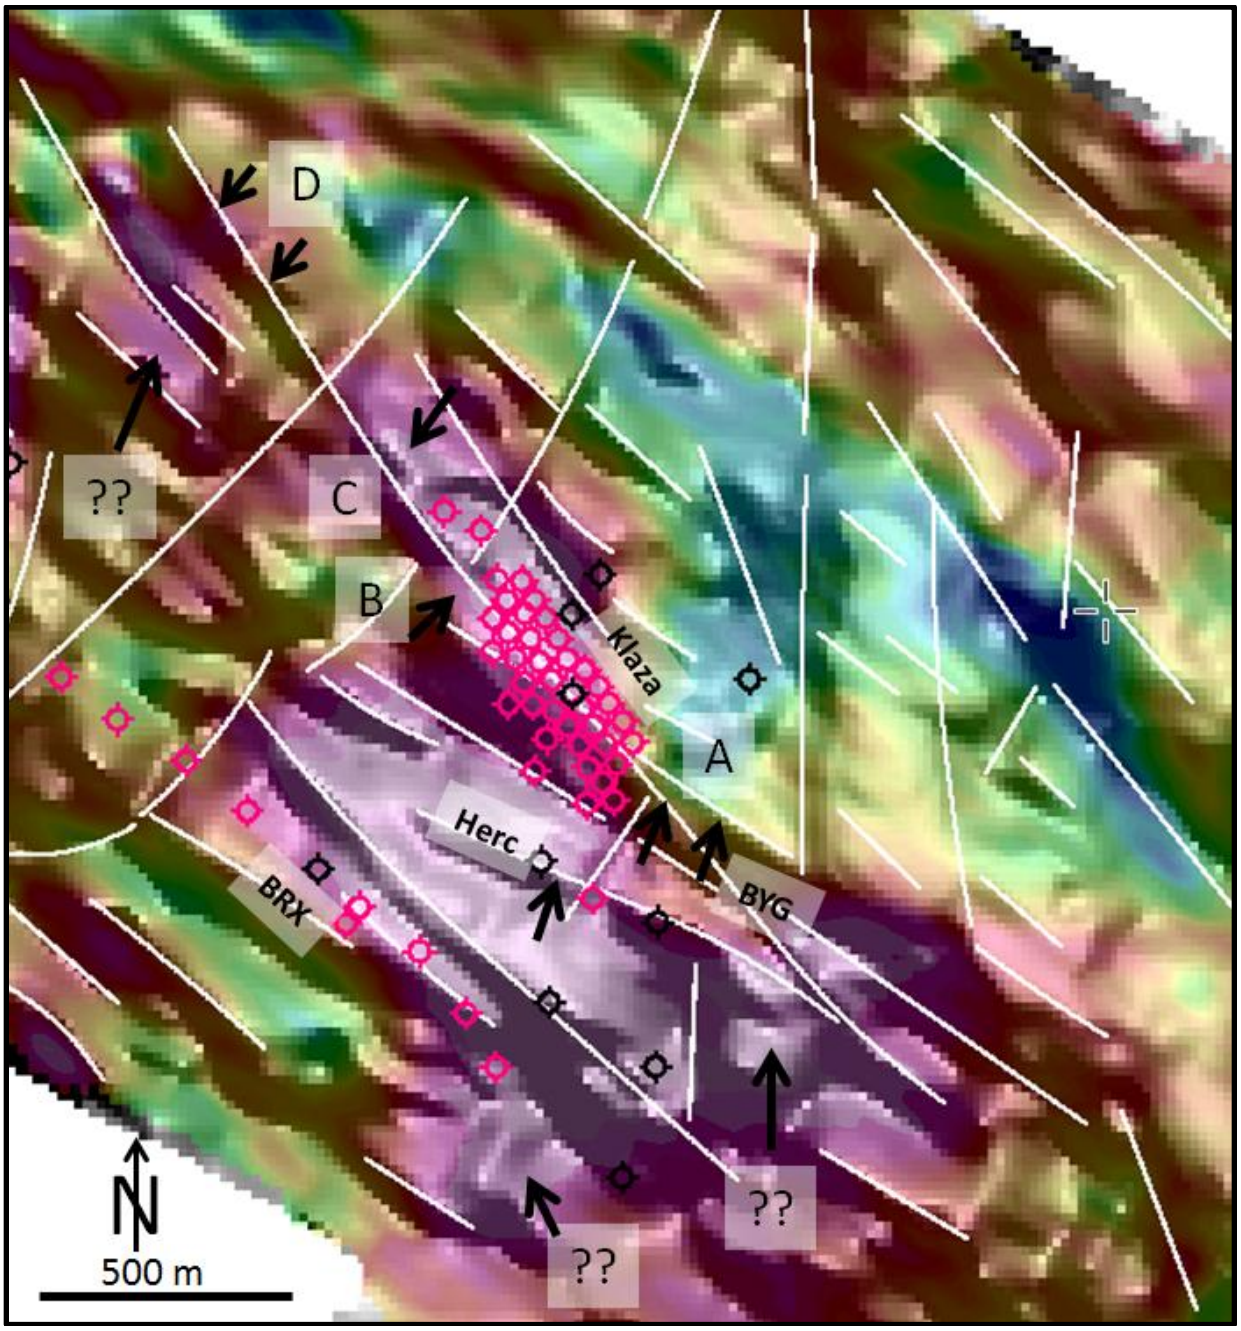

Figure 12. TC image draped on the NE Shaded RTP-Tilt with Rockhaven drill holes and local magnetic trends in white. Red holes return significant Au assays. The question mark arrows point out undrilled TC anomaly zones.

to the SE of the drill holes has a lower TC, i.e. the TC drops out in count here. The westward extension of the southern limb at site B has higher TC that might indicate higher prospectivity if K counts are correlated with Au. At site C the higher TC coincident with the Au-drill holes extends strongly NW for ~ 450 m past Au-intersecting drill holes KL-11-34 and KL-11-36 perhaps indicating increased prospectivity

in this TC zone. Higher TC is also mapped at site D on the far NW extension of the ~ 3 km TMI-RTP signature that bisects the Klaza Au zone.

The BRX zone is aligned on the southern edge of the large TC high, and returns Au intersections in most drill holes. BRX is sub coincident and generally to the north of the peak response of a NW-SE striking magnetic linear, that marks an abrupt break between a large zone of higher TC and K counts to the NNE, and a zone of lower counts to the SSW. A large area of higher TC occurs between the BRX zone and BYG zone, centered on the Herc zone. The zone has a similar-sized higher K-count signature; perhaps indicating this is a zone of potassic alteration. The elevated Klaza TC and K signature strikes NW out of the larger "radiometric blob" centered on the Herc zone. Holes KL-11-48, KL-10-06, KL-10-08, KL-10-09, KL-10-11 drilled into the larger radiometric zone did not return Au, so at face value it appears the higher radiometric – Au correlation doesn't hold fully in this zone. Herc hole KL-11-51 was the one hole into the central radiometric zone that returned Au. Regardless, the four "??" radiometric sub-zones pointed out in Figure 12 are zones of high TC that have not been drilled. As some higher TC and K count areas are coincident with higher Au zones and some are not, the correlation between Au intersections and increased radiometric counts appears to be locally controlled by unmapped (in Figure7) geologic features in the granodiorite.

Klaza Target Zones

Ten Target Zones (TZ) have been identified on the grid and these are traced in black in Figures 13 and 14. Elevated TMI-RTP signatures, particularly those that had a TMI-RTP gradient structure when sun shaded, were the main criteria for delineating the 10 TZ as magnetic contact or horizon structural control possibly occurs in the Klaza Au zone. Increased TC and K counts were less of a priority for TZ creation, though elevated TC and K occur is some zones. The sites A, B, and C in Figure 13 have elevated magnetic responses but were not included in the TZ. Any geologic information that increases interest in these areas could elevate them to TZ status; site A for example is a porphyry area. Likewise, site A, B, C, D and E in Figure 14 have elevated total counts but were not included in the 10 TZ. TZ8 and TZ9 near a porphyry and breccia respectively might be extended to include nearby higher TC zones if field recon infers the high TC areas to be prospective. Any geologic information that increases interest in any excluded areas could elevate them to TZ status. Site A is on the NW gap between the Klaza and Brx zone. The high TC at site C is below a porphyry contact, the high TC at site D is in the same porphyry. The TZ are meant to be more of a field reconnaissance guide rather than a targeting guide, though magnetic

and radiometric signatures in TZ3 that include Klaza Au zone extensions could be used for drill sighting if it's though there is a link between the magnetic structure, higher radiometric counts, and Au intersections. Solid body modeling (2.5D) of the magnetic response using ModelVision Pro™, which was not undertaken for this report, is recommended before drill targeting. Table 1 provides geophysical parameters and priority for the 10 TZ.

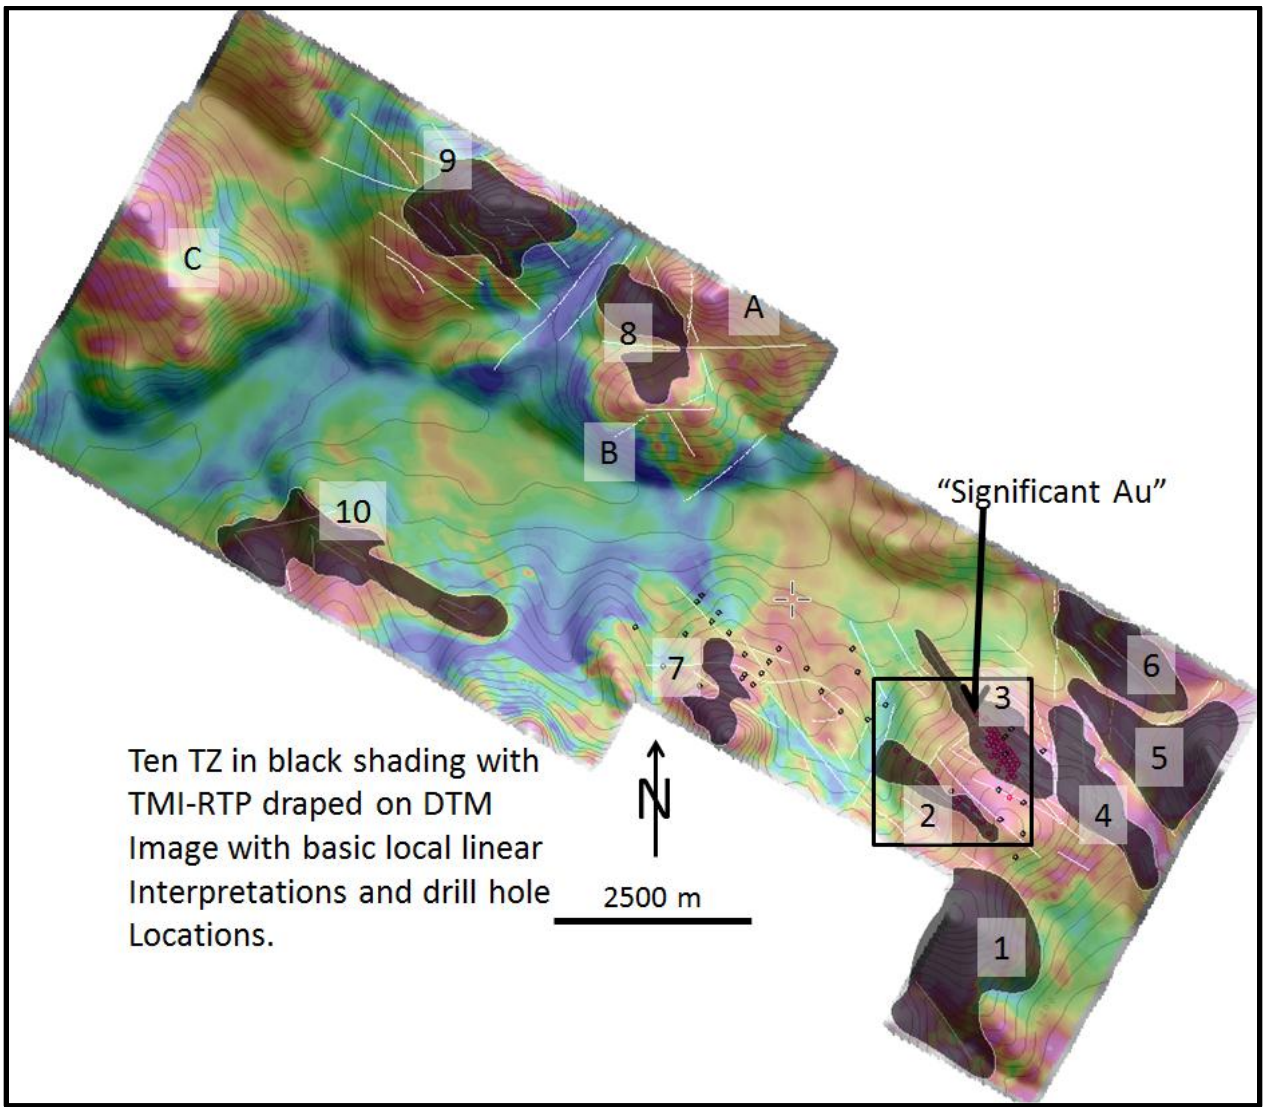

Figure 13. The 10 TZ in shaded black outline superimposed on the TMI-RTP image with the more prominent local linears drawn in white and the drill hole collar locations plotted as circles. Red collars are for Au-intersecting holes, black collars are for "barren" holes. Letters A-C which at present are not TZ are discussed in the text. The 10 TZ parameters and qualities are listed in Table 1.

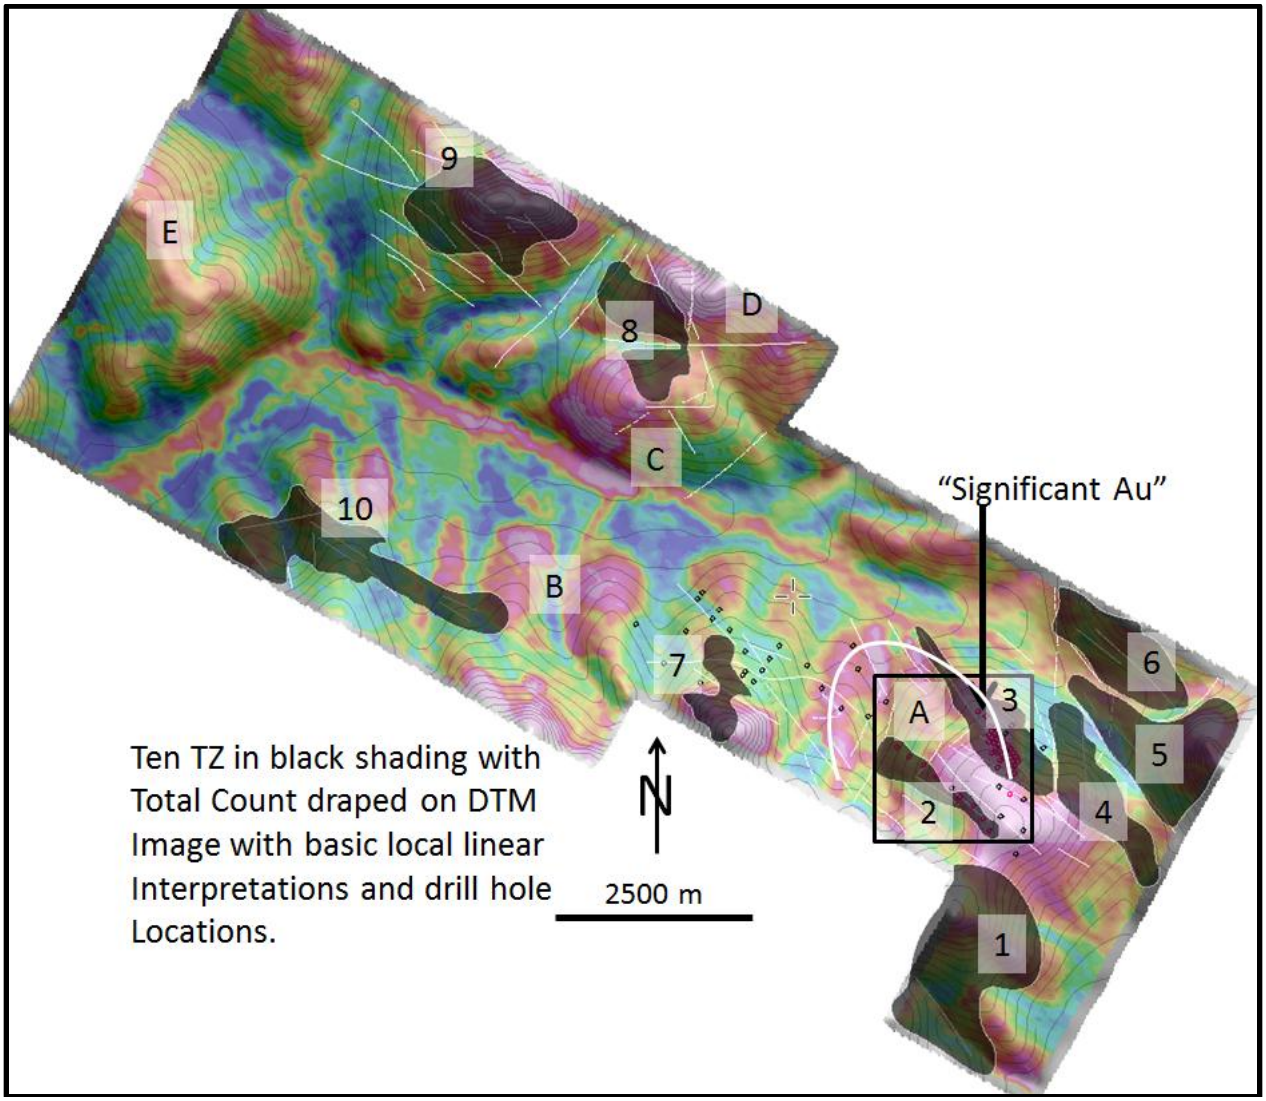

Figure 14. The 10 TZ in shaded black outline superimposed on the TC image with the more prominent local linears drawn in white and the drill hole collar locations plotted as circles. Red collars are for Au-intersecting holes, black collars are for "barren" holes. Letters A-E which at present are not TZ are also discussed in the text. The 10 TZ parameters and qualities are listed in Table 1.

Table 1. Proposed Klaza reconnaissance sites based on higher RTP amplitude and TC counts

TZ	X	Y	DTM	Terrain Relief	Geology	Magnetization Amplitudes	Potassium Counts	Notes	Priority	Rank
1	382428	6888152	1449	Mountain top and eastern slopes	Granodiorite contact with porphyry: Near Kgd-KMN contact area	High, particularly on mountain top	Moderate on east slope	Highest amplitude RTP signature with lower coincident TC	Moderate	6
2	381868	6889819	1329	Mountain top and western slopes	Granodiorite Kgd	Lower to moderate, strong NW-SE linear structure	Abrupt K High-low break Straddles SW edge of strong higher counts over mountain top	NW_SE magnetic linear coincides with abrupt break in TC high. Has been drilled so lower priority. Recommend further drilling mag linear	Low	4

Low	9

Klaza Magnetic Classification

The Klaza TMI-RTP response was run through a susceptibility filter and then classified into 10 classes, returning the map in Figure 15. The main purpose of this map is to simplify the magnetic response to more clearly show the areas of lower, intermediate, and higher magnetization. The classification creates 10 "pseudo-lithologies" based on arbitrarily selected calculated susceptibility ranges alone, and may have no relation to "real geology" out in the field, though some high classes appear to at least partially map mountain tops that are porphyries and breccias on the grid periphery. Magnetic responses correlated with flying heights would bias the classification returning higher responses over low-flown mountain tops and lower responses for high-flown valley floors. Remanence could also bias the classification; one example would be areas of remanence that might return negative susceptibilities.

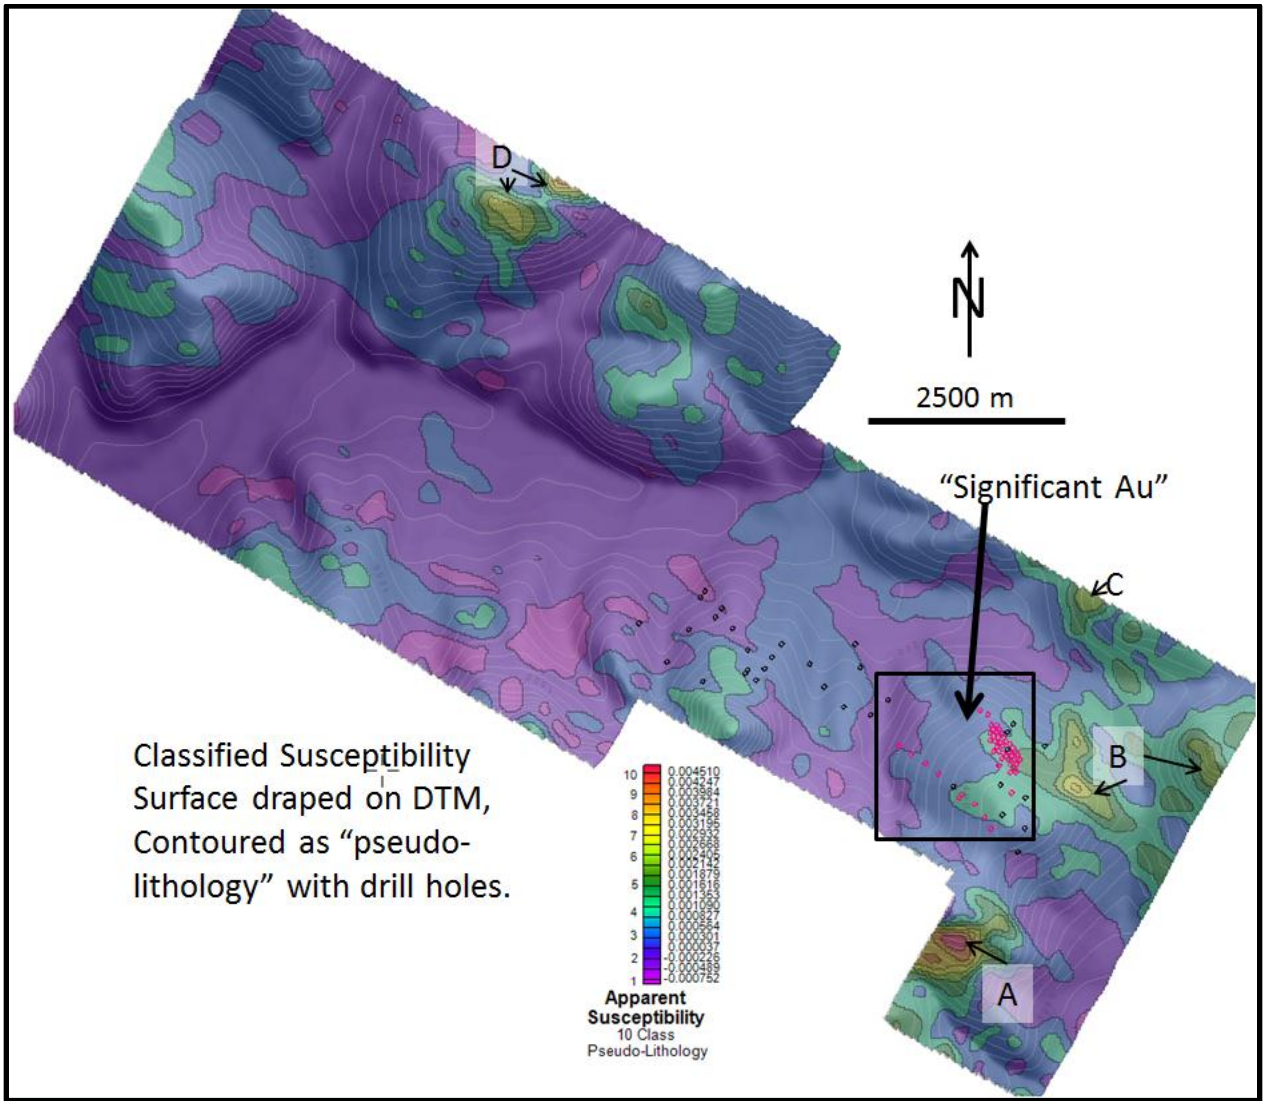

Figure 15. Ten class susceptibility map. Sites A-D discussed in the text.

Table 2. The 10susceptibility class ranges in SI units.

Class	Sus Low	Sus High
1	-0.000883	-0.000324
2	-0.000324	0.000235
3	0.000235	0.000794
4	0.000794	0.001353
5	0.001353	0.001912
6	0.001912	0.002471
7	0.002471	0.003030
8	0.003030	0.003589
9	0.003589	0.004148
10	0.004148	0.004707

The four highest susceptibility class “lithologies” are mapped by the yellow and red shades at sites A, B, C and D. Sites A and D are on mountain tops mapping porphyry and breccia respectively. Site B west as pointed out by the west arrow is on the north slope of a hill and maps an unidentified magnetic lithology or structure in granodiorite. Site B east is on a porphyry mountain top. Site C is on the SW slope of a porphyry hill to its NE. Generally the mountain tops on the grid periphery are mapped by mid to higher susceptibility classes and the lower elevation valleys and drainages are mapped by lower classes. The Klaza drill zone with significant Au assays is located in a mid-level susceptibility class.

Klaza 3D Drill Zone Review

Figure 16 is a SE looking perspective view of the Klaza drill zone with the magnetic 3D voxel isosurface (Li and Oldenburg, 1996) threshold set to an arbitrary higher susceptibility. The four Klaza zone areas are approximately located. The black arrows point out the NW-SE strike directions of the Klaza trend on the north and the BRX trend on the south. The Klaza trend is more steeply NW-SE striking than the BRX

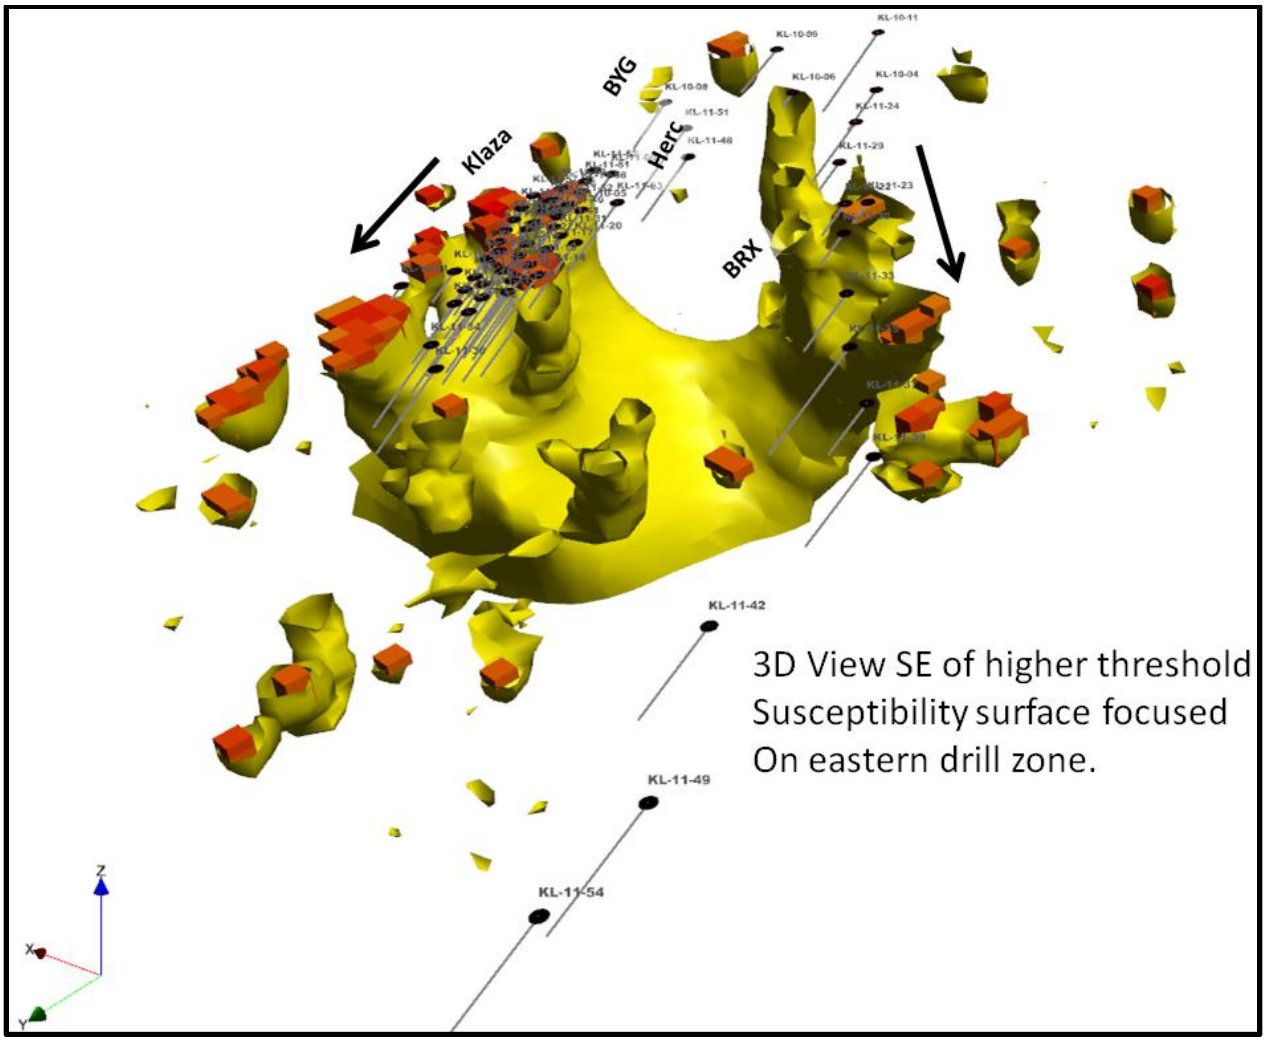

Figure 16. SE looking view of the threshold MAG3D voxel with drill holes plotted. The Klaza and BRX zones are both associated with NW-SE striking magnetic ridges. Arrows point out the ridge strikes to the NW.

trend. Both trends generally appear to be defined by parallel magnetic horizons, with the Au-intersecting drill holes generally being collared on the southern horizon with the drill traces dipping into the relatively less magnetic central area between the two NW-SE striking horizons. This is not always the case though, as some BRX holes intersect the northern magnetic horizon at depth, and some of the more eastern Klaza holes are drilled into the southern magnetic horizon, as defined by the arbitrary threshold used in this example. Modeling the magnetic response with a 2.5D solid body such as a plate would better define the magnetic body geometry and susceptibility for drill targeting.

Figure 17 is a 2nd SE-looking perspective of the 3D susceptibility voxel. The two SE-NW pointing thin arrows, yellow in Klaza and black in BRX, highlight the central magnetic gap area sandwiched between the enclosing northern and southern magnetic horizons in both trends. With the arbitrarily threshold 3D

voxel model used these enclosing magnetic linears appear as vertical magnetic apophasis with a "magnetic valley" between the apophasis. As mentioned 2.5D plate modeling would help resolve the "real" magnetic horizon geometry in the Klaza Au zone for future drill targeting based on the magnetic response.

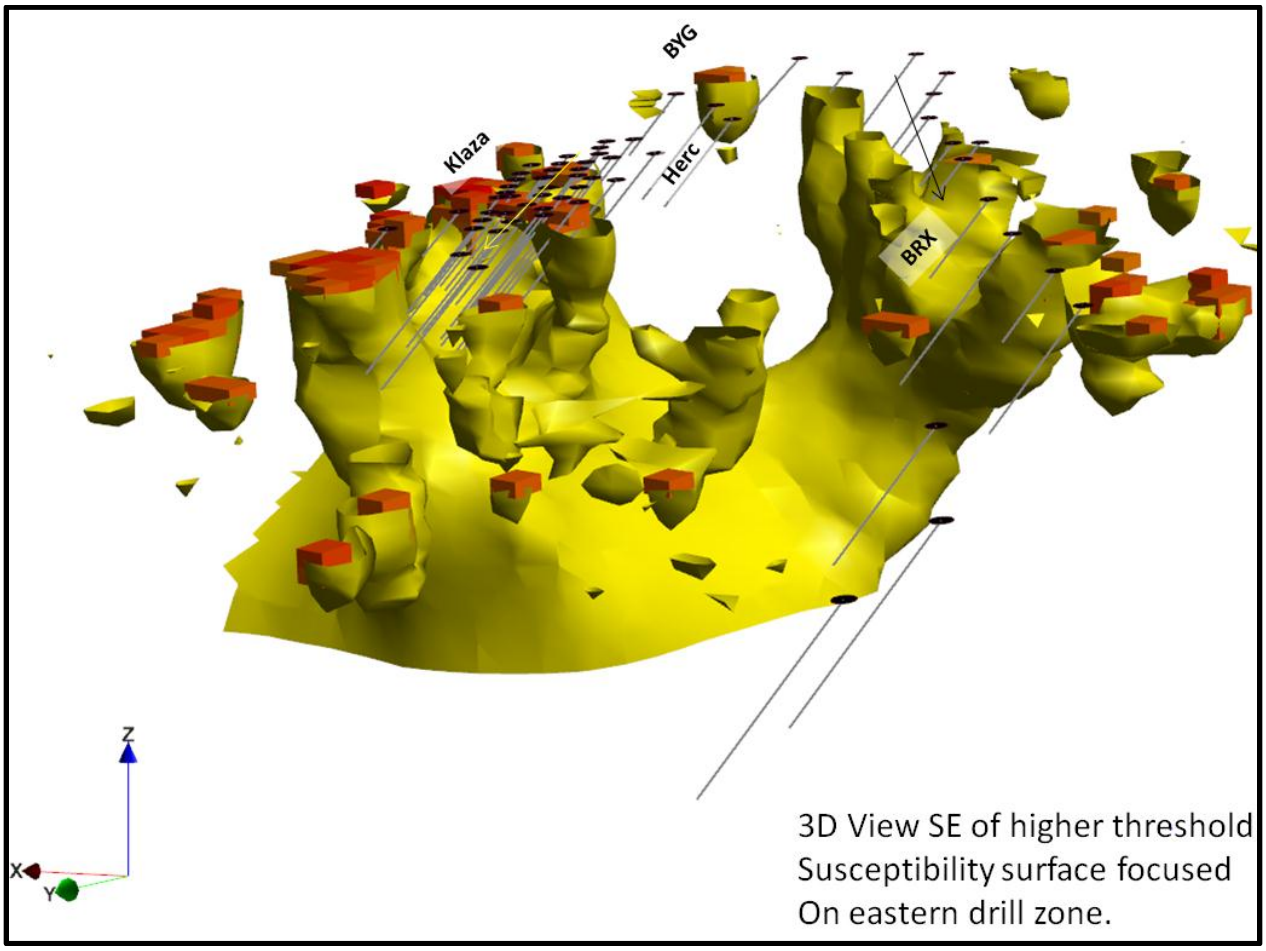

Figure 17. SE looking view of the threshold MAG3D voxel with drill holes plotted. Generally, the Klaza and BRX zones both appear to be drilled into a less magnetic central zone that is sandwiched between more magnetic NW-SE striking linears.

Conclusions

The Klaza magnetic and radiometric data were reviewed. A basic magnetic linear interpretation identifies a general NW-SE striking magnetic texture with secondary E-W and tertiary NE-SW striking linears. A magnetic susceptibility classification maps 10 classes as "pseudo-lithology" that identify zones of varying background magnetization on the grid. The higher susceptibility zones generally coincide with mapped porphyries and breccia zones on the grid edge that surround the central granodiorite that is the background lithology for most of the grid. Higher TC and K counts also occur over the porphyries and

breccia on the grid periphery. The highest levels of magnetization in the central granodiorite occur ~ 750 m east of the Klaza Au zone.

A focused magnetic and radiometric study infers that the Klaza Au mineralization may be structurally controlled by magnetic horizons coincident with higher TC and K-counts. Discrete magnetic linears are identified for the Klaza, BYG, Herc, and BRX zones. There is a strong correlation in the Klaza Au zone between a V-shaped magnetic structure and elevated TC and K counts. Threshold voxel 3D views infer that the Au intersecting Klaza and BRX drill holes are generally, but not always, drilled into a less magnetic central area sandwiched between more-magnetic NW-SE striking magnetic linears.

Ten proposed TZ are identified for field follow-up investigation. The TMI-RTP data were primarily used for drawing in the TZ, some TZ have elevated TC and K counts that may increase their priority. TZ3 that contains the known Klaza Au mineralization is the highest priority follow-up target. Solid body 2.5D inversion modeling of the magnetic response is recommended before the drilling of any magnetic signatures.

Respectfully Submitted,

Ed Cunion
