APPENDIX VI

2011 DIAMOND DRILL HOLE SUMMARIES

KL-11-12 – This hole tested the Klaza zone on section KL 10+000mE at 150 m downdip of the surface exposure in TR-KL-10-10. The Klaza zone was intersected between 151 and 242 m in drill hole and 150 m downdip of the surface showing.

Chalcedonic and smokey quartz veins and stringer zones hosting locally disseminated pyrite, sphalerite, galena and arsenopyrite were encountered within the hanging wall of the Klaza zone. Moderate to strong argillic alteration was observed up to 5 m on either side of the vein zones, while phyllic alteration occurred within a 1 m wide envelope around quartz veins and sulphide stringers. The best assay from one of these veins returned 3.06 g/t gold and 253 g/t silver between 107.08 and 108.10 m.

The best mineralized intercept within the Klaza zone consisted of black/ dark grey, fine grained brecciated veins and veinlets hosting pyrite, sphalerite, galena and arsenopyrite in quartz and carbonate gangue. Breccia veins were mainly observed on the selvage between the quartz feldspar porphyry dykes and granodiorite. The strongest area of mineralization was encountered between 217.34 to 225.80 m and returned 1.75 g/t gold and 42 g/t silver.

A 100 m wide section of the hole hosts moderate to strong argillic and phyllic alteration developed in the granodiorite wall rocks that host the Klaza Zone. Pervasive phyllic alteration was also observed in the intrusive clasts found within the breccias.

DDH-KL-11-13 – tested the Klaza on section KL 10+100mE at 100 m downdip of the surface exposure in TR-KL-10-09. The Klaza zone was intersected from 137.76 to 198.12 m in drill hole and approximately 100 m downdip of the surface showing.

Mineralization encountered within the hanging wall of the Klaza zone included significant intervals of quartz-carbonate veining ranging in size from stringer zones to 10 cm wide hosting disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. The best mineralizaed intersection of this type of material returned 1.71 g/t gold and 34 g/t silver over 4.77 m.

The Klaza zone consisted of strongly phyllic altered granodiorite hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes range between 0.54 to 14.95 m wide and locally host black sulphide stringers and gouge zones with local sulphide mineralization both within the dykes and along their salvages. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 2 cm to 2.5 m in width. Averaged grades from hole DDH-11-13 returned a broad intercept of 0.52 g/t gold and 6 g/t silver over 47.16 m including 1.24 g/t gold and 12 g/t silver over 9.01 m.

DDH-KL-11-14 – tested the Klaza zone at 200 m downdip of the projected surface trace on section KL 10+000mE. The Klaza zone was intersected between 232 and 298 m.

The hole intersected two wide dykes which flank the upper and lower boundaries of the Klaza zone structure. The majority of the mineralization exists between these two dykes and consists of veins and veinlets of massive to semi massive arsenopyrite, pyrite and galena hosted in strongly phyllic altered granodiorite. The two best intercepts were 7.99 g/t gold and 45 g/t silver over 1.03 m and 2.39 g/t gold and 22 g/t silver over 8.11 m.

KL-11-15 – tested the Klaza zone at 50 m downdip of the projected surface trace on section KL 10+000mE. The hole was collared 20 m behind DDH-KL-96-08 which returned 3.80 g/t gold and 85.7 g/t silver over 5.05 m. The Klaza zone was intersected between 48 and 95 m in drill hole and approximately 50 m downdip of the surface showing.

The hole returned 4.24 g/t gold and 15 g/t silver over 10.46 m including 18.75 g/t gold and 52 g/t silver over 1.96 m. Similar to the nearby historical hole, mineralization within this portion of the Klaza zone was mainly hosted in one massive galena-arsenopyrite-pyrite vein.

KL-11-16 – tested the Klaza zone at 50 m downdip of the projected surface trace on section KL-10+050mE. The Klaza zone was intersected between 46 and 93 m in drill hole and approximately 50 m downdip of the surface showing.

The Klaza zone consisted of a 15.11 m wide interval hosting massive veins and stringer zones. KL-11-16 intersected 6.09 g/t gold and 101 g/t silver over 6.78 m, within a broader zone which averaged 2.89 g/t gold and 49 g/t silver over 15.11 m.

KL-11-17 – targeted the Klaza zone 100m behind drill hole KL-10-03 along section KL-10+100mE. Mineralization was intersected down hole from 207.27 - 219.3 m, approximately 150 m downdip from the surface trace of the Klaza zone.

The Klaza zone consisted of quartz veins, breccia zones and massive to disseminated sphalerite, galena, arsenopyrite and pyrite veins. Consistent with other drill holes that returned good mineralization within the Klaza zone, numerous quartz-feldspar porphyry dykes were intsected within the zone. These dykes ranged between 0.83 to 12.63 m wide and a total of six dykes were intercepted between 195.27 and 271.70 m.

One significant mineralized vein was encountered in the hanging wall of the Klaza zone and returned 9.68 g/t gold and 211 g/t silver over 1.08 m. The best mineralization intersected within the Klaza zone was 11.25 g/t gold and 72 g/t silver over 3.94 m, within a broader zone which averaged 3.78 g/t gold and 25 g/t silver over 12.03 m. A vein intersected near the footwall contact of the Klaza zone returned 3.98 g/t gold and 20 g/t silver over 2.47 m.

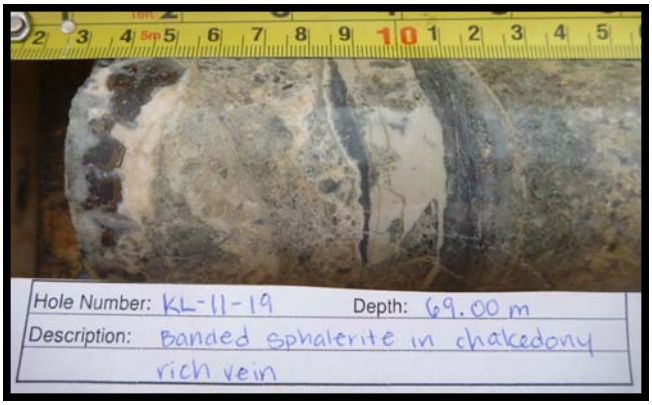
KL-11-18 – tested the Klaza zone on section KL 10+050mE. The Klaza zone was intersected between 131 and 173 m in drill hole and 100 m downdip of the projected surface trace.

A broad zone of mineralization was intercepted in this hole that returned 0.75 g/t gold and 18 g/t silver over 41.55 m. The best mineralization was observed over a 5.03 m interval and consisted of phyllic altered granodioirte hosting numerous massive semi-massive breccia zones and veins bearing pyrite, galena and sphalerite. This zone averaged 1.07 g/t gold and 84 g/t silver. Assay results from the bottom of the Klaza zone returned 1.03 g/t gold and 9 g/t silver over 19.77 m.

KL-11-19 – This hole tested the Klaza zone on section KL 10+050mE. This hole was intended to test the Klaza zone at 150 downdip but down-hole survey data showed that it shallowed considerably and tested the zone at 125 m downdip. The Klaza zone was intersected between 172.00 to 234.00 m in drill hole.

Hole KL-11-19 intercepted strongly phyllic altered granodiorite hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers within the Klaza zone. The quartz-feldspar porphyry dykes range between 1.0 and 6.0 m in width. On the dyke selvages and between them exist vein structures containing smokey and grey/white quartz veins ranging between 0.01 m and 0.20 m wide and host disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite.

The heterolithic breccia zones host disseminated to blebby pyrite, arsenopyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 0.02 m and 0.5 m in width. Significant assays returned a broad interval averaging 1.27 g/t gold and 12 g/t silver over 30.42 m including 7.81 g/t gold and 43 g/t silver over 2.89 m.



KL-11-20 – tested the Klaza zone on section KL 10+100mE at a 200 m downdip piercement. The Klaza zone was intersected between 262.00 m and 356.32 m in drill hole.

Hanging wall mineralization included discreet quartz-carbonate veins which range in size from stringer zones to 30 cm wide hosting disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. The best vein returned 1.48 g/t gold and 78 g/t silver over 1.02 m.

Typical Klaza zone mineralization and alteration was intersected in DDH-11-20 with strongly phyllic altered GRD hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes range between 0.5 and 9 m wide and are mainly barren of mineralization. On the dyke selvages and between them exist vein structures containing smoky and grey/white quartz veins ranging between 1 cm and 31 cm wide and host disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. The heterolithic breccia zones host disseminated to blebby pyrite, arsenopyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 2 cm and 20 cm in width.

Multiple mineralized zones were returned within the Klaza zone. The best zones returned 11.90 g/t gold and 12 g/t silver over 1.00 m and 1.75 g/t gold and 11 g/t silver over 10.85.

KL-11-21 – tested the Klaza zone on section KL 9+950mE. The hole intersected the Klaza zone 100m downdip of its inferred surface trace. The Klaza zone was intersected between 133.00 and 173.88 m down hole.

The drill hole intersected a low angle fault that was drilled between 22.5 and 41 m in drill core. The Klaza zone consisted of strongly phyllic altered granodiorite hosting two quartz-feldspar porphyry dykes measuring 4.40 and 8.92 m wide. Mineralization between the two dykes was largely represented by silicious breccia zones up to 80 cm wide and polymetalic arsenopyrite, pyrite, galena, and sphalerite. Footwall and hanging wall sides of the Klaza zone hosted wide silicious chalcedony veins and sulphide veinlets typical of most epithermal-type mineralizing systems.

The best assays were returned from veins emplaced along the hanging wall side of the upper dyke. These averaged 1.25 g/t gold and 31 g/t silver over 12.34 m including 7.24 g/t gold and 176 g/t silver over 1.92 m. Veins intercepted on the footwall side of the lower dyke returned 2.37 g/t gold and 23 g/t silver over 5.40 m.

KL-11-22 – targeted the BRX zone 50 m below the surface exposure in KL-TR-10-21 which averaged 4.00 g/t gold and 438.8 g/t silver across 8.68 m. The BRX zone was intersected between 52 and 70 m in drill hole.

Both the hanging wall and footwall consisted of unaltered granodiorite. Moderate argillic and propylitic alteration that graded into strong phyllic alteration around narrow quartz veinlets was observed throughout the mineralized structure. The zone consisted of strong milky quartz veins hosting semi-massive to massive pyrite blebs and veinlets emplaced along the selvage of one quartz feldspar porphyry dyke. The best assay results averaged 0.47 g/t gold and 124 g/t silver across 5.20 m.

KL-11-23 – was drilled on section with DDH-11-22 and tested the BRX zone a further 50 m downdip of KL-11-22. The zone maintained its apparent attitude and was intersected in drill hole from 106 to 121 m.

The mineralized zone was again intimately associated with feldspar porphyry dykes and consisted of disseminated to massive galena, arsenopyrite and pyrite hosted in quartz veins. This type of massive mineralization was intersected between 109.00 and 110.55 m and returned 3.99 g/t gold and 229 g/t silver. The zone was accompanied by intense phyllic altered granodiorite hosting numerous quartz veins with disseminated to massive pyrite. Outside the phyllic envelopes, the granodiorite graded into a propylitic altered granodiorite and then quickly became unaltered.

KL-11-24 – was drilled to intercept the BRX zone 50 m downdip of the surface exposure in TR-10-14 which averaged 1.93 g/t gold and 136.5 g/t silver across 7.80 m. The BRX zone was intersected in drill hole between 57.8 and 76.5 m.

The hanging wall in DDH-11-24 was more altered than the hanging wall penetrated in the other drill holes that targeted the BRX zone. Numerous thin quartz stringers with propylitic altered

halos were encountered. One six inch milky quartz vein hosting disseminated arsenopyrite, pyrite and galena was intersected at 47.5 m. The vein was adjacent to a feldspar porphyry dyke which may represent a splay off the main BRX structure.

The BRX zone was composed of similar widths and mineralization styles as found in DDH-22 and DDH-23. This included quartz veins up to 4 m wide hosting disseminated to massive arsenopyrite, galena, sphalerite and pyrite along the selvage between a feldspar porphyry dyke and host granodiorite. Black breccia zones hosting disseminated, fine grained sulphides were also present.

The footwall consisted of highly propylitic, argillic and phyllic altered zones adjacent to quartz veinlets. The high density of veinlets caused a wide zone of alteration of the host granodiorite. The best assay returned 3.15 g/t gold and 72 g/t silver over 1.37 m.

KL-11-25 – was drilled to test the Klaza zone at 50 m downdip piercement on section KL 10+150mE. The hole intersected the Klaza zone between 46.1 and 76.4 m.

The Klaza zone mineralization intercepted in this hole consisted of black/ dark grey, fine grained brecciated veins and veinlets hosting pyrite, sphalerite, galena and arsenopyrite in quartz and carbonate gangue. Breccia veins were mainly observed on the selvage between the quartz feldspar porphyry dykes and granodiorite. KL-11-25 intersected 4.22 g/t gold and 75 g/t silver over 6.27 m within the Klaza zone. A 100 m wide section of the hole hosts moderate to strong argillic and phyllic alteration developed in the host granodiorite. Pervasive phyllic alteration was also observed in the intrusive clasts found within the breccias.

A vein was intersected in the footwall of the Klaza zone and returned 7.48 g/t gold and 445 g/t silver over 1.01 m.

KL-11-26 – tested the Klaza zone on section KL 9+950 mE at 50 m downdip of the inferred surface trace, 50 m east of TR-KL-10-19. The Klaza zone was intersected between 63.22 and 117.55 m.

Hanging wall mineralization included quartz and carbonate veining ranging from stringer zones to 4 cm in width. Moderate to strong phyllic alteration and throughout the interval hosting disseminated pyrite.

The Klaza zone was intersected between 63.22 and 117.55 m in drill hole and consisted of strongly phyllic altered granodiorite hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes range between 0.13m and 8.80 m in width. Smokey quartz veins ranging between 0.5 cm and 9 cm wide host disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. Heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 2 cm and 46 cm in width. The best mineralization returned from this hole averaged 0.98 g/t gold and 15 g/t silver over 11.33 m.

KL-11-27 – tested the Klaza zone on section KL 10+150 mE at 100 m downdip of the inferred surface trace. The Klaza zone was intersected between 79.93m to 213.76 m in drill hole.

Klaza zone mineralization was dominated by an increased number of individual high sulphidation veins intersected over a wider area. Veins include 27.40 g/t gold and 549 g/t silver over 0.79 m and 21.30 g/t gold and 39 g/t silver over 0.61 m. Broader zones including 1.76 g/t gold and 26 g/t silver over 26.21 m and 2.27 g/t gold and 15 g/t silver over 13.05 m were also drilled.

KL-11-28 – was collared to test the Klaza zone 150 m below the surface exposure along section KL 9+950mE. The zone was intersected between 166.33 and 234.11 m.

The Klaza zone hosted competent quartz-feldspar porphyry dykes up to 12 m wide. Massive to disseminated arsenopyrite, galena, sphalerite and pyrite in quartz veins and black breccia zones were intersected across the zone with the strongest mineralized vein grading 10.25 g/t gold and 585 g/t silver over 1.46 m.

KL-11-29 – was collared to test the BRX zone 50 m below the surface exposure in KL-TR-10-17 which averaged 0.90 g/t gold and 99.0 g/t silver across 7.00 m. The zone was intersected between 29 and 40 m in drill hole, identifying a much shallower dipping area of the BRX zone then that found on other parts of the property.

The mineralized zone intercepted in DDH-11-29 consists largely of massive to disseminated galena, arsenopyrite, pyrite and sphalerite hosted in milky quartz breccia zones and veins peripheral to the main quartz feldspar porphyry dyke. Assay results returned 3.29 g/t gold and 407 g/t silver over 3.00 m, within a broader zone which averaged 1.95 g/t gold and 147 g/t silver over 9.34 m. Three calcite veins up to 20 cm wide were found in the footwall.

KL-11-30 – tested the BRX zone 50 m downdip of the surface exposure in TR-10-20 which graded 0.08 g/t gold and 11.3 g/t silver over 1.80 m. The zone was intersected from 59 to 65.5 m. The hanging wall of the BRX zone consisted of pervasively oxidized granodiorite and brown clay gouge zones within fractures. The mineralized zone consisted of a narrow feldspar porphyry dyke with narrow black breccia bands on either side. The breccia hosts disseminated pyrite and some rare galena blebs. The zone is enveloped within a propylitic altered halo that quickly graded into unaltered granodiorite in the footwall. The mineralized zone returned 0.28 g/t gold and 18 g/t silver over 1.83 m.

KL-11-31 – tested the Klaza zone on section KL 10+150 mE at 150 m downdip of its projected surface trace 50 m east of TR-KL-10-10. The Klaza zone was intersected between 191 and 251 m in drill hole.

Hanging wall mineralization above the Klaza zone included significant intervals of quartz-carbonate veining ranging in size from stringer zones to 10 cm wide hosting disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. The best assay result returned 2.58 g/t gold and 19 g/t silver over 1.99 m.

The Klaza zone was intersected between 191.00 to 251.00 m in drill hole and consists of strongly phyllic altered GRD hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes range between 0.44 and 10.73 m wide and are mainly barren of mineralization. On the dyke selvages and between them exist vein structures containing smokey quartz veins ranging between 1 and 32 cm wide and host disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 1 and 50 cm in width. The best assay from this material returned 5.07 g/t gold and 98 g/t silver over 1.01 m.

A magnetic mafic porphyry intrusion was intersected from 341.06 to 410.20 m (EOH), hosting pyrite blebs replacing phenocrysts. This unit hosts 0.5 to 2.0 m felsic bands and exhibits low magnetic susceptibility and is unmineralized. This intrusion may be a plug or a large xenolith of basement material.

KL-11-32 – tested the Klaza zone on section KL 9+900 mE at 50 m downdip of the inferred surface trace 5 m east of TR-KL-10-19. The Klaza zone was intersected between 101 m and 209 m.

Typical Klaza zone geology and mineralization was intersected consisting of strongly phyllic altered granodiorite hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes range between 0.53 m and 5.97 m wide. Smokey quartz veins located on between or along the dyke contacts range between 0.1 cm and 2 cm wide and host disseminated to semi-massive pyrite, sphalerite, galena, stibnite and arsenopyrite. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix and range between 1 cm and 25 cm in width. The best assay returned 4.20 g/t gold and 16 g/t silver over 0.98 m.

DDH-KL-11-33 – tested the BRX zone 100 m downdip from surface. The area above the drill hole was untrenched. The BRX zone was intersected from 115 to 129 m in drill hole.
The best mineralization was observed on the footwall contact of a feldspar porphyry dyke. The zone consisted of a brecciated milky quartz vein hosting semi-massive galena, sphalerite, arsenopyrite vein between 120.30 and 121.64 m. It graded 5.51 g/t gold and 180 g/t silver over 1.34 m.

The footwall and hanging wall both hosted numerous aplite dykes in an otherwise lightly propylitic altered granodiorite.

KL-11-34 – tested the Klaza zone on section KL 9+800 mE 5 m to the west of the inferred surface trace of TR-KL-11-27. The Klaza zone was intersected between 117.28 and 162.15 m in drill hole.

The Klaza zone consisted of strongly phyllic altered GRD hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes range between 0.14 m to 6.0 m wide and are mainly barren of mineralization. On the dyke selvages and between them exist vein structures containing smokey quartz veins ranging between 0.10 m to 10 m wide

and host disseminated to semi-massive pyrite, sphalerite, galena, and arsenopyrite. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 2 cm to 34 cm in width. The best intercept averaged 1.31 g/t gold and 66 g/t silver across 8.47 m.

KL-11-35 – tested the BRX zone 75 m downdip from surface. A trench exposure above the drill hole returned 2.94 g/t gold and 37 g/t silver over 3.07 m.

Two significant mineralized zones were returned within the BRX structure. A quartz vein hosting massive pyrite and disseminated arsenopyrite and sphalerite was intersected between 112.42 and 115.44 m and returned 3.03 g/t gold and 84 g/t silver. The second zone consisted of a quartz vein hosting semi-massive pyrite, arsenopyrite and sphalerite on the footwall contact of a 7.25 m wide porphyry dyke. This zone returned 5.85 g/t gold and 92 g/t silver over 3.86 m

A lower zone of interest was intersected between 204 and 214 m in drill hole. It was characterized by intense hematite flooding and extreme alteration. No significant assays were returned from this material.

KL-11-36 – tested the Klaza zone on section KL 9+700 mE at 50 m downdip of TR-KL-11-28 which returned 2.05 g/t gold and 163 g/t silver over 1.96 m. The Klaza zone was intersected between 42.97m to 76.36m and 118.05m to 203.94m in drill hole.

Klaza zone type geology and mineralization was intersected between 42.97 m to 76.36 m and 118.05 m to 203.94 m and consisted of strongly phyllic altered granodiorite hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes ranged from 0.23m to 16.74 m wide. Veins were generally narrow ranging between 0.1 cm and 3 cm in width and host disseminated to semi-massive pyrite, sphalerite, galena, stibnite and arsenopyrite. One narrow heterolithic breccia vein was intersected hosting blebby pyrite, sphalerite and galena in a black sulphide matrix.

Four discrete mineralized zones were intercepted. The best zone, and interpreted continuity of the Klaza zone, returned 0.41 g/t gold and 165 g/t silver over 3.04 m.

KL-11-37 – tested the BRX zone 65m downdip from surface. The area above the drill hole was not trenched. The BRX zone was intersected from 82 to 96 m in drill hole.

The best mineralization was found in large quartz veins hosting massive pyrite, arsenopyrite, chalcopyrite, sphalerite and galena emplaced along the hanging wall and footwall contacts of a quartz-feldspar porphyry dyke. Three individual high grade veins ranging between 1.22 to 1.70 m width contributed to weighted average grade of 5.43 g/t gold and 50 g/t silver over 14.80 m.

KL-11-38 – tested the 50 m downdip piercement of the Klaza zone on section KL 10+200mE. The Upper Klaza zone was intersected between 65 and 84 m. The Lower Klaza zone was intersected between 138 m and 198 m.

Upper Klaza zone mineralization included significant intervals of quartz-carbonate veining ranging in size from stringer zones to 10 cm in width. The zones host disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. The best mineralized part of the zone averaged 0.99 g/t gold and 25 g/t silver over 19.40 m. Moderate to strong phyllic alteration of the host granodiorite occurs throughout the interval.

The Lower Klaza zone consists of strongly phyllic altered granodiorite hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes range between 2.5 m and 10 m wide. On the dyke selvages and between them exists vein structures containing smokey quartz veins ranging between 0.01 m to 1 m wide and host disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 2 cm to 2.5 m in width.

KL-11-39 – tested the BRX zone approximately 125 m downdip from surface. The BRX zone was intersected from 152 to 193 m in drill hole. This hole represents a 200 m step out to the west of any known work on the BRX zone and extends mineralization across the structure to 2000 m.

The best mineralization was found in white-grey quartz veins hosting massive pyrite, arsenopyrite, pervasive sphalerite, blebby galena and isolated ankerite. This vein graded 23.50 g/t gold and 239 g/t silver across 1.65 m. As common with the BRX zone, the mineralized interval was emplaced along the contact between a quartz-feldspar porphyry dyke and the host granodiorite.

KL-11-40 – tested the Klaza zone on section KL 10+250 mE at 250 m downdip of the inferred surface trace 50 m west of TR-KL-10-11. The Upper Klaza zone was intersected between 63.33 to 83.36 m while the lower Klaza zone was intersected between 97.50 and 159.11 m in drill hole.

Upper Klaza zone mineralization included significant intervals of quartz and quartz-carbonate veins ranging in size from stringer zones to 10 cm wide. These veins host disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. The widest intersection of this type of material was intersected between 63.33 m and 83.36 m. Moderate to strong phyllic alteration with minor argillic alteration occurred throughout the interval. The best mineralized zone returned 5.39 g/t gold and 26 g/t silver over 4.69 m and 4.48 g/t gold and 5 g/t silver over 1.00 m.

The Lower Klaza zone was intersected between 97.50 m and 159.11 m in drill hole and consists of strongly phyllic altered GRD hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes range between 0.14 m to 7.85 m wide and are mainly barren of mineralization. Emplaced along the dyke selvages and between them within the host granodiorite exists vein structures containing smokey quartz veins ranging between 1 cm to 20 cm wide and host disseminated to semi-massive pyrite, sphalerite, galena, and arsenopyrite. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 8 cm to 24 cm in width. The best assay returned from this area 0.70 g/t gold and 13 g/t silver between 130.60 and 137.68 m.

KL-11-41 – tested the Klaza zone on section KL 10+200 mE at 150 m downdip of the inferred surface trace. The Upper Klaza zone was intersected between 183.63 to 193.31 m while the Lower Klaza zone was intersected over a broad interval ranging from 207.44 to 280.13 m.

The Upper Klaza zone consisted of a series of sheeted quartz veins hosting disseminated to massive pyrite, arsenopyrite and galena. These veins range between 0.01 and 0.71 m and are emplaced within argillic to phyllic altered granodiorite. This zone averaged 1.59 g/t gold and 9 g/t silver across 9.68 m.

The Lower Klaza zone consisted of numerous narrow feldspar porphyry dykes (up to 3 m wide) and high grade vein and breccia zones. The mineralization consisted of black to dark grey, fine grained brecciated veins and veinlets hosting pyrite, sphalerite, galena and arsenopyrite in quartz and carbonate gangue. Breccia veins were mainly observed on the selvage between the quartz feldspar porphyry dykes and granodiorite. The best grade material returned from this area averaged 1.16 g/t gold and 12 g/t silver between 207.44 and 212.58 m.

KL-11-42 – tested a magnetic anomaly below the Canaan placer mine. The drill hole was collared 40 m behind a galena occurence discovered in auger drilling directed at testing for placer gold in 2007 (pers. com. Trerice, 2010). The initial 21.51 m of core were not recovered due to ground conditions. Trace to massive galena was found periodically from 27.49 m to 89.05 m hosted within highly clay altered granodiorite. Disseminated arsenopyrite, pyrite and sphalerite was also present in localized areas. A number of dykes were intersected as well as yellow clay material and green/brown breccia zones up to about 5 m wide and hosted very fine-grained sulphides. The best assay returned 0.01 g/t gold and 422 g/t silver across 1.80 m.

Numerous thin quartz stringers with siliceous halos were encountered with associated silica flooding and phyllic alteration of the host granodiorite was prevalent throughout the length of the hole.

KL-11-43 – tested the Klaza zone on section KL 10+250 mE at 150 m downdip of the inferred surface trace 50 m east of TR-KL-10-11. The hole was collared 46 m behind DDH-KL-11-40. The Upper Klaza zone was intersected between 120 m and 135 m and the Lower Klaza zone was intersected over a broad interval between 150 m and 263 m.

Upper Klaza zone consists of a series of sheeted smokey and chalcedonic quartz veins hosting trace to disseminated pyrite, arsenopyrite and honey sphalerite. This zone averaged 1.08 g/t gold and 18 g/t silver across 14.87 m.

The Lower Klaza zone consists of strongly phyllic altered granodiorite hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes range between 1.14 m and 7.69 m wide. On the dyke selvages and between them exist vein structures containing smoky quartz veins ranging between 0.01 to 0.40 m wide and host disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 1 and 22 cm in width. The best result from the Lower Klaza zone returned 4.42 g/t gold and 12 g/t silver across 2.15 m.

KL-11-44 – targeted both the BYG and Klaza zone on section KL-10+200mE. Mineralization was intersected in the Klaza zone from 267.31 to 308.61 m, approximately 200 m downdip from its surface exposure in trench KL-TR-10-11.

As with the deeper holes that tested the Klaza zone, the best mineralization was associated with the dyke system identified as the Lower Klaza zone. Typical geology and veining was encountered, consisting of quartz veins and breccia zones hosting disseminated to semi-massive sphalerite, galena, arsenopyrite and pyrite emplaced around quartz feldspar porphyry dykes. The best intercept returned 2.67 g/t gold and 50 g/t silver over 10.15 m.

KL-11-45 – tested a prominent magnetic anomaly below the Canaan placer mine. The drill hole was collared 60 m behind the western edge of the magnetic low. Wide, yellow to gold coloured clay vein material and green/brown breccia zones were intercepted throughout the length of the hole. Breccia zones up to 10 m wide and hosting fine-grained sulphides were encountered. The best assay result from these zones returned 2.94 g/t gold and 94 g/t silver over 1.30 m. Quartz feldspar porphyry dykes associated with mineralization were also intersected.

Numerous thin quartz stringers with silicious halos were encountered with associated silica flooding and phyllic alteration of the host granodiorite was prevalent throughout the entire length of the hole.

KL-11-46 – tested the Klaza zone on section KL 10+250mE at 150 m downdip of the inferred surface trace between TR-10-11 and TR-10-12. The Upper Klaza zone was intersected between 178.00 and 198.12 m in drill hole.

Strongly phyllic altered GRD hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers was intersected between 137.76 to 198.12 m. Although numerous veins were intercepted, the best assay returned from this hole was 0.88 g/t gold and 22 g/t silver over 9.12 m.

KL-11-47 – tested the Klaza zone at 50 m downdip of the projected surface trace on section KL-10+300mE. The Upper Klaza zone was intersected between 57.72 to 85.60 m and the Lower Klaza zone was intersected from 145.39 to 198.46 m in drill hole.

The Upper Klaza zone was intersected between 57.72 to 85.60 m and consisted largely of strongly argillic altered breccia veins and vein clay. The upper Klaza zone was not associated with quartz feldspar porphyry dykes. The interval was largely composed of extremely clay altered to clay vein material hosting argillic altered breccia veins. Mineralization included sphalerite, galena, pyrite and arsenopyrite. The best assay results averaged 6.93 g/t gold and 36 g/t silver over 3.76 m.

The Lower Klaza zone hosts two wide dykes which flank the upper and lower boundaries of the zone. The majority of the mineralization exists in the footwall of these two dykes and consists of veins and veinlets of massive to semi massive arsenopyrite, pyrite and galena hosted in strongly phyllic altered granodiorite. The veins in this zone are widely spaced but they themselves appear more developed then previous intersections of the Lower Klaza zone. Assays returned 1.18 g/t gold and 14 g/t silver over 12.13 m including 9.28 g/t gold and 78 g/t silver over 1.00 m.

KL-11-48 – This hole tested the HERC zone at 50 m downdip of the surface trace exposed in TR-KL-10-12. Weak mineralization consisting of semi-massive pyrite and disseminated sphalerite was intersected and graded 1.63 g/t gold and 13 g/t silver over 1.00 m. The BYG zone was also tested near the end of this hole and returned 2.44 g/t gold and 31 g/t silver over 2.84 m. The drill hole was terminated at 209.40 m before testing the Klaza zone.

KL-11-49 – tested the same magnetic anomaly below the Canaan placer mine that was tested in hole KL-11-45. A X m wide, phyllic altered breccia zones with a quartz and sulphide vein matrix were intersected within the demagnetized structure. Wide, yellow to gold coloured clay vein material and green/brown breccia zones were also intercepted throughout the length of the hole. Breccia zones were up to about 10 m wide and hosted very fine grained sulphides. Similar to other drill holes on the property, mineralization is facilitated by the presence of dykes. Dykes associated with mineralization were very siliceous and often strongly hematite stained. The only significant mineralized intercept graded 0.55 g/t gold and 140 g/t silver over 0.95 m.

KL-11-50 – tested the Klaza zone at 100 m downdip of the projected surface trace on section KL 10+300mE. The upper Klaza zone was intersected from 108.49 to 125.01 m and the Lower Klaza zone was intersected between 199.35 and 214.22 m.

The Upper Klaza zone was largely composed of extremely clay altered to clay vein material hosting argillic altered breccia veins. Mineralization included sphalerite, galena, pyrite and arsenopyrite. This interval returned 1.18 g/t gold and 6 g/t silver across 16.52 m.

The Lower Klaza zone hosts three wide dykes which flank the upper and lower boundaries of the zone. The majority of the mineralization exists between these three dykes and consists of veins and veinlets of massive to semi massive arsenopyrite, pyrite and galena hosted in strongly phyllic altered granodiorite. The best assays averaged 1.02 g/t and 8 g/t silver over 14.87 m.

KL-11-51 – This hole tested the Herc zone at 50 m downdip of the surface projection from trench 13. No significant mineralization was intersected. Host granodiorite was weakly propylitic to argillic altered in some areas. The altered intervals hosted numerous quartz veins and stringers.

KL-11-52 – tested the Klaza zone at 150 m downdip of the projected surface trace on section KL 10+300mE. The Upper Klaza zone was intersected between 125.91 to 171.90 m and the lower Klaza zone was intersected between 225.68 to 278.52 in drill hole.

The Upper Klaza zone consisted of strongly phyllic and serecitic altered granodiorite hosting up to 2 m wide breccia and gouge zones within a 25 m wide zone. Smoky quartz and sulphide veins are observed throughout the intercept ranged from 1 cm to 4 cm and host disseminated to semi-massive pyrite, sphalerite and galena. Heterolithic breccias range from 2.00 m to 5.98 m in width and host disseminated to blebby pyrite in black or grey sulphide matrix. Gouge zones range from 1.22 m to 4.54 m and host disseminated to coarse grained pyrite. The intense brecciation, alteration and abundant sulphidation indicates this zone is synonomous to breccia pipe zones identified in other deposits within the MNGB. The best mineralized part of the breccia 1.20 g/t gold and 8 g/t silver over 16.85 m.

The lower Klaza zone was intersected between 225.68 m and 278.52 m in drill hole and consists of strongly phyllic altered GRD hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes range between 5.30 m to 9.87 m wide and are mainly barren of mineralization. On the dyke selvages and between them exist vein structures containing smokey quartz and massive sulphide veins ranging between 1 cm and 26 m wide and host disseminated to semi-massive pyrite, sphalerite, galena, and arsenopyrite. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 2 cm to 10 cm in width.

KL-11-53 – was collared to test the Klaza zone 50 m below the surface exposure along section KL 10+350mE. The Upper Klaza zone was intersected between 45.27 to 58.26 m in drill hole and the Lower Klaza zone was intersected between 128.14 and 173.35 m.

This drill hole returned a poorer mineralized intersection than typically intersected in the Klaza zone. The Klaza zone hosted wide, competent quartz-feldspar porphyry dykes up to 6 m wide. The zone itself was spread out over a large length of core and although hosted massive to disseminated arsenopyrite, galena, sphalerite and pyrite in quartz veins and black breccia zones, the strongest mineralization was narrow when encountered and divided by weakly phyllic to

propylitic altered granodiorite. The Upper Klaza zone returned 0.77g/t gold and 5 g/t silver over 12.99 m.

KL-11-54 – tested a magnetic anomaly below the Canaan placer mine. A 59.03 m intercept of intensely sericitized, light green breccia hosting narrow quartz veining and disseminated pyrite was intersected below magnetic anomaly. The surrounding granodiorite was extremely phyllic altered and host numerous thin quartz stringers with silicious halos. Strong silica flooding and hematite staining was prevalent throughout the length of the hole. The best assay was returned from within the breccia zone which graded 0.33 g/t gold and 58 g/t silver over 1.44 m.

KL-11-55 – tested the Klaza zone on section KL 10+300 mE at 200 m downdip of the inferred surface trace 50 m west of TR-KL-10-12. The Upper Klaza zone was intersected between 244.00 to 255.34 m. The Lower Klaza zone was intercepted between 276.80 m and 284.22 m.

The Upper Klaza zone consisted of strongly phyllic and serecitic altered GRD hosting wide breccia and gouge veins. Smoky quartz and sulphide veins are observed throughout the intercept and host disseminated to semi-massive pyrite, sphalerite and galena. This zone returned 0.76 g/t gold over and 10 g/t silver over 11.34 m.

The Lower Klaza zone consists of strongly phyllic altered GRD hosting quartz-feldspar porphyry dykes, breccias and sulphide stringers. The quartz-feldspar porphyry dykes range between 3 m to 15 m wide. The Lower Klaza zone hosts very few mineralized veins and is mainly barren of mineralization.

KL-11-56 – tested the Klaza zone at 100 m downdip of the surface exposure in TR-KL-10-12 which returned 2.56 g/t gold and 30.4 g/t silver over 17.70 m. The Upper Klaza zone was intersected between 109.12 and 130.50 m in drill hole and approximately 100 m downdip of the surface showing.

The Upper Klaza zone hosts numerous milky and smokey quartz veins and stringers mineralized with disseminated to semi-massive arsenopyrite, pyrite and sphalerite with lesser galena. Three individual high grade veins ranging between 0.98 to 2.01 m width contributed to the overall weighted average grade of 5.03 g/t gold and 14 g/t silver over 12.51 m.

The Lower Klaza zone was intercepted between 184.04 to 233.23 m. The zone comprises five quartz feldspar porphyry dykes with spacially associated quartz-carbonate and sulphide veins. The best assay was returned from a vein in the footwall of the Lower Klaza zone that returned 9.34 g/t gold and 76 g/t silver over 1.00 m.

KL-11-57 – tested the Klaza zone along section line KL 10+400 mE. The Klaza zone was intersected between 60.05 and 71.95 m in drill hole and approximately 50 m downdip of the surface showing.

The Upper Klaza zone consists of banded chalcedony quartz and massive pyrite/sphalerite veins in a strongly phyllic and silicious granodiorite. Sulphide bearing veins host blebby galena and

arsenopyrite. Although significant visual mineralization was observed this hole returned 0.96 g/t gold and 10 g/t silver over 4.32 m.

KL-11-58 – tested the Klaza zone at 150 m downdip of the surface exposure in TR-KL-10-12 along section KL 10+350 mE. The Upper Klaza zone was intercepted between 179.28 and 196.70 m and the Lower Klaza zone was intersected between 249.97 and 306.96 m.

Hanging wall mineralization included discrete quartz-carbonate and massive sulphide veining ranging in size from stringer zones to 1.26 m wide hosting disseminated to semi-massive banded pyrite, sphalerite, galena and arsenopyrite. The widest intersection of this type of material was intersected between 70.07 m and 71.35 m and graded 13.05 g/t gold and 60 g/t silver.

The Upper Klaza hosts numerous quartz-carbonate veins and stringer veins that are emplaced in argillic and phyllic altered, silica flooded granodiorite. The veins are generally mineralized with disseminated to banded pyrite and arsenopyrite. The best result was between 160.63 to 184.90 m which returned 1.21 g/t gold and 8 g/t silver.

The Lower Klaza zone consists of strongly phyllic altered granodiorite hosting breccias and sulphide stringers associated with quartz feldspar porphyry dykes. On these dyke selvages and between them exist vein structures containing smokey quartz and massive sulphide veins ranging between 1 cm and 20 cm wide and host disseminated to semi-massive pyrite, sphalerite, galena, and arsenopyrite. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. The best vein assayed 5.45 g/t gold and 18 g/t silver over 1.00 m.

KL-11-59 – tested the Klaza zone at 100 m downdip of the projected surface exposure approximately 50 m east of TR-KL-10-12 and along section line KL 10+400 mE. The hole was collared 50 m behind DDH-KL-11-57. The Klaza zone was intersected between 107.65 and 119.22 m in drill hole and approximately 100 m downdip of the surface showing.

The drill hole intersected a less developed area of the Klaza zone. The Klaza zone again was located up drill hole from the quartz feldspar porphyry dykes. The zone itself was spread out over a large length of core and although hosted massive to disseminated arsenopyrite, galena, sphalerite and pyrite in quartz veins and black breccia zones, The high grade mineralization was narrow when encountered and divided by weakly phyllic to propylitic altered granodiorite.

KL-11-60 – tested the Klaza zone on section KL 10+400 mE 200 m downdip of the inferred surface trace of TR-KL-10-12. The Klaza zone was intercepted between 133.19 m and 265.95 m.

Hanging wall mineralization included significant intervals of quartz-carbonate and massive sulphide veining ranging in size from stringer zones to 10 cm wide hosting disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. The widest intersection of this type of material was intersected between 90.03 m and 96.38 m. Moderate to strong phyllic alteration occurred throughout the intervals.

The Klaza zone in this drill hole consists of four bands of strongly phyllic altered GRD hosting breccias and sulphide stringers. Each band is approximately 5 m wide and is associated with quartz feldspar porphyry dykes. The quartz-feldspar porphyry dykes occur between the four zones on the footwall side of the center of the entire interval. On the dyke selvages and between them exist vein structures containing smokey quartz and massive sulphide veins ranging between 1 cm and 20 cm wide and host disseminated to semi-massive pyrite, sphalerite, galena, and arsenopyrite. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 2 cm to 10 cm in width. The hole was terminated at 370.94 m.

KL-11-61 – tested the Klaza zone on section KL 10+400 mE at a 150 m downdip from surface. The Upper Klaza zone was intercepted between 160.63 m and 220.66 m and the Lower Klaza zone was intersected between 279.86 and 309.98 m.

Hanging wall mineralization included discrete quartz-carbonate and massive sulphide veining ranging in size from stringer zones to 10 cm wide hosting disseminated to semi-massive banded pyrite, sphalerite, galena and arsenopyrite. The widest intersection of this type of material was intersected between 75.08 m and 82.20 m and averaged 1.39 g/t gold and 19 g/t silver. The best individual vein within this interval returned 8.46 g/t gold and 80 g/t silver over 0.53 m. These veins are emplaced around a 0.36 m wide quartz-feldspar porphyry dyke.

The Upper Klaza hosts numerous quartz-carbonate veins and stringer veins that are emplaced in argillic and phyllic altered, silica flooded granodiorite. The veins are generally mineralized with disseminated to banded pyrite and arsenopyrite. The best result was between 160.63 to 184.90 m which returned 1.21 g/t gold and 8 g/t silver.

The Lower Klaza zone consists of strongly phyllic altered granodiorite hosting breccias and sulphide stringers associated with quartz feldspar porphyry dykes. On these dyke selvages and between them exist vein structures containing smokey quartz and massive sulphide veins ranging between 1 cm and 20 cm wide and host disseminated to semi-massive pyrite, sphalerite, galena, and arsenopyrite. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 2 cm to 10 cm in width. The best vein assayed 2.92 g/t gold and 41 g/t silver over 1.25 m.

KL-11-62 – tested the Klaza zone on section KL 10+450mE at 150 m downdip of the inferred surface trace 20 m west of TR-KL-11-26 which returned 7.17 g/t gold and 16 g/t silver over 7.11 m. The Klaza zone was intersected between 161.03 to 173.20 m in drill hole.

The BYG zone was intersected between 48.98 and 58.24 m and included significant intervals of quartz-carbonate veining ranging in size from stringer zones to 50 cm wide hosting disseminated to semi-massive pyrite, sphalerite, galena and arsenopyrite. The widest intersection of this type of material was between 51.81 m and 55.40 m and returned 3.81 g/t gold and 14 g/t silver. Moderate to strong phyllic alteration occurred throughout the interval.

The Upper Klaza zone was intersected between 161.03 to 173.20 m in drill hole and consisted of dark grey quartz veins and black breccia veins locally mineralized by fine grained pyrite. The 12.17 m interval averaged 0.65 g/t gold and 25 g/t silver.

The Lower Klaza zone was intersected between 257.87 and 324.64 m and included numerous discrete vein and breccia zones that were emplaced either adjacent to quartz-feldspar porphyry dykes or within phyllic altered granodiorite. The best mineralized vein returned 7.17 g/t gold and 14 g/t silver over 1.65 m.

KL-11-63 – tested the Klaza zone on section KL 10+250mE at 250 m downdip of the inferred surface trace 50 m east of TR-KL-10-10. This hole is the deepest drill hole that has targeted the Klaza zone to date. The Klaza zone was intersected between 300.67 and 310.92 m

The BYG zone was intersected between 66.63 and 76.94 and hosted a pink chalcedonic quartz vein emplaced on the hanging wall side of a siliceous dyke. Significant mineralization within the vein consisted of massive to semi-massive pyrite, sphalerite, galena and arsenopyrite and returned 6.29 g/t gold and 342 g/t silver 1.43 m.

Similar to nearby drill hole DDH-KL-11-44, typical Upper Klaza zone mineralization appears more towards the quartz-feldspar dyke intrusions near the Lower Klaza zone. Mineralization within this area consisted of breccias and sulphide stringers veins. The quartz-feldspar porphyry dykes range between 3 to 8 m wide and were mainly barren of mineralization. Mineralized veins exist on the dyke selvages and between the dykes within vein structures developed in phyllic altered granodiorite. The heterolithic breccia zones host disseminated to blebby pyrite, sphalerite and galena in a black sulphide matrix. These breccia zones range between 2 cm to 10 cm in width. A number of massive sulphide veins were intersected, the best of which returned 8.17 g/t gold and 91 g/t silver over 1.00m hosted within a broader zone that averaged 1.17g/t gold and 15 g/t silver over 10.25 m.
