1.0 INTRODUCTION

This Assessment Report outlines work carried out on the MAX Property (the "Property"), which is located in the Whitehorse Mining District, Yukon.

This Assessment Report summarizes previous work, and describes geological, geochemical rock and soil sampling, and prospecting surveys carried out on 23 September through 5 October 2011. This report is based on geological and geochemical reports, a compilation of published and unpublished data, maps, and reports made by cited persons.

The author is a "qualified person" within the meaning of National Instrument 43-101 of the Canadian Securities Administrators.

2.0 DESCRIPTIONS, LOCATIONS, and OWNERSHIP of CLAIMS

The claims comprising the Property are located in the Whitehorse Mining District of Yukon, Canada, as shown on Map Sheet NTS 115I/03. The Property area is centered at latitude 62° 06' 30" North, longitude 137° 21' West, and UTM 6,887,000 m North, and UTM 377,000 m East (NAD 83 UTM Zone 8) (Figures 1 and 2).

The Property is located approximately 54 kilometers west of the village of Carmacks and 198 kilometers northwest of the city of Whitehorse. Whitehorse is the main regional supply center for personnel and equipment.

The assessment work area consists of a contiguous block of 194 unsurveyed quartz claims totaling approximately 3,931 hectares ("ha"). Claim information is presented in Appendix B.

YES Exploration Syndicate Inc ("YES") is the registered and beneficial owner of the claims comprising the MAX Property. Olympic Resources Ltd ("Olympic"), by an option agreement effectively dated 16 September 2011 ("Agreement"), can earn a 100% interest in the MAX Property, net of a 3% net smelter return ("NSR") in favor of YES.

3.0 ACCESSIBILITY, CLIMATE, and PHYSIOGRAPHY

Access to the area is by helicopter from the village of Carmacks. Alternatively, a fuel cache can be established at the Mt Nansen mine site. The mine site is approximately 1 hour driving time from Carmacks. Personnel can access the mine site by road and then be disbursed by helicopter.

The Property is on rolling, occasionally steep terrain with elevations ranging from 1,000 meters (3,300 feet) to 1,770 meters (5,800 feet). Vegetation cover is variable, ranging from relatively open grassed areas to areas with jack pine, alder, and scrub undergrowth. Summers are generally warm, while winters are cold. Depending on the type of work, the work season can be year round.

4.0 GEOLOGICAL SETTING

4.1 Regional Geology and Structure (Figure 3)

In general, Yukon geology consists of two lithological components, which are separated by the Tintina Trench. Rocks northeast of the Tintina Trench are predominantly sedimentary, from 300 million to >1 billion years old, and represent the ancient margin of North America.

(After Geological Survey of Canada, 2005)

Rocks southwest of the Tintina Trench are mainly igneous and metamorphic, from 20 to 350 million years old, and represent numerous crustal fragments called accreted terranes that have an uncertain place of origin. The Dawson Mountain Range, which includes the subject Property, is located in the area southwest of the Tintina Trench.

The Yukon-Tanana Composite Terrane ("YTT") is the largest of Yukon's terranes and is composed of several metamorphic rock assemblages, which were originally sedimentary but have been metamorphosed at extremely high temperatures and pressures corresponding to crustal depths of approximately 25 kilometers. The Intermontane Superterrane is composed of five dissimilar terranes that were amalgamated approximately 180 million years ago: Stikinia, Quesnellia, Slide Mountain, Cache Creek, and Windy-McKinley. Stikinia is the largest terrane in the Cordillera, but in Yukon is restricted to the area of the Intermontane Belt.

The Dawson Range generally comprises rocks of the Yukon-Tanana Composite Terrane and Stikinia Intermontane Superterrane. The Dawson Range is part of the Yukon Plateau Physiographic Province, and is characterized by moderately rugged topography with elevations from 900 to over 2000 meters. The Dawson Range has extensive placer and lode gold production, and is commonly referred to as the "Dawson Range gold belt". This belt comprises a northwesterly trend of placer gold occurrences, porphyry copper-gold deposits, and gold-bearing polymetallic epithermal veins. The oldest rocks exposed in the Dawson Range Gold Belt are Paleozoic YTT rocks, consisting of an assemblage of Paleozoic Yukon Group schist, gneiss, and amphibolite, and a Triassic assemblage of andesite to basalt flows, tuffs, and breccias, which are intruded by granitic batholiths. Granitic rocks intruded during Early Jurassic metamorphic/plutonic events.

The Aishihik Batholith underlies much of the district. Triassic to Lower Jurassic in age, the Aishihik intrusive body ranges in composition from dark grey granodiorite to pink quartz monzonite and porphyritic quartz monzonite. Tertiary and Eocene volcanic rocks unconformably overlie the granitic bodies. Volcanic rocks consist primarily of felsic tuffs, flows and breccias, are cut by dark green mafic volcanic plugs and dikes. Cretaceous- to Tertiary-age volcanic rocks host lode gold deposits in the Dawson Range.

Lode mineralization consists of epithermal to mesothermal gold-bearing quartz-chalcedony vein systems in faults and fracture zones associated with felsic intrusives. Ring dikes and fault zones were developed during caldera collapse. In the Dawson Range, gold mineralization occurs in quartz veins and fractures formed during the intrusion of quartz feldspar porphyry and breccia bodies. Alteration zones vary from narrow seams of clay gouge along the margins of individual quartz veins to wide areas of propylitic and argillic alteration around intrusive breccias. Sericite and pyrite are common accessory minerals. Cretaceous to Paleocene rocks of the region comprise two major plutonic-volcanic events:

1. The Cretaceous Mount Nansen event includes the Dawson Range Batholith, Casino Granodiorite, Coffee Creek Granite, and the Mount Nansen intermediate to felsic volcanic suite, and
2. The late Cretaceous to Paleocene Carmacks event is represented by subvolcanic and volcanic mafic to felsic rocks that intrude or unconformably overlie all other units.

Cretaceous to Paleocene Carmacks intrusives and volcanics have a close spatial relationship with the older granitoids and a spatial-temporal relationship with known gold mineralization. Gold mineralization is generally related to Carmacks volcanic units and to same-age hydrothermal alteration, suggesting a genetic link between gold mineralization and hotspot-related hydrothermal activity.

4.2 Property Geology

Lithology predominantly comprises Mesozoic mid-Cretaceous (90-110 Ma) volcanic rocks. This Mt Nansen Suite of rocks consists of volcanic flows and tuffs of andesite to dacite composition. Breccias are common, as are dikes and sills of rhyolite and quartz-feldspar porphyry.

To the north and south, Mt Nansen rocks are in contact with Mesozoic mid-Cretaceous (105-112 Ma) plutonic granodiorite and quartz-diorite. This Whitehorse Suite of rocks consists of biotite-hornblende granodiorite, hornblende quartz diorite, and hornblende diorite. Biotite hornblende granodiorite can show sparse grey and pink potassium feldspar phenocrysts.

To the southwest, Paleozoic rocks of the Finlayson and Snowcap suites are located. Finlayson rocks are Devonian to Mississippian in age, and consist of felsic to mafic meta volcanics, schists, and porphyries. The Snowcap suite consists of metamorphosed sedimentary rocks and amphibolites.

5.0 HISTORY

5.1 Previous Work

In the early 1970s, bulldozer trenching revealed a porphyry copper occurrence that was subsequently named the Lonely Cu showing. From 1984 through 1986, Kerr Addison Mines Ltd carried out a work program that consisted of soil sampling (414 samples), rock sampling (32 samples), silt sampling (5 samples), ground VLF-EM (15 km), and geological mapping at 1:5000 scale (Paulter 1986) on the southern portion of the current MAX Property. Rock sampling returned gold values that ranged from <5 to 1,650 ppb and silver values that ranged from 0.1 to 14.8 ppm. Samples were taken from quartz stringers hosted by altered rhyolite porphyry.

A correlation of anomalous gold, silver, arsenic, and antimony values from soil sampling showed 5 anomalous areas. The highest soil values obtained were 150 ppb gold, 5.51 ppm (5.51 g/t) silver, 350 ppm arsenic, and 9.6 ppm antimony. Gold values ranged from <5 to 150 ppb and silver ranged from 0.1 to 5.51 ppm.

Two major VLF-EM structures were identified. Several soil anomalies corresponded to the two major VLF structures and to a few minor north-trending VLF anomalies. Four main zones of interest were outlined.

In 1987, Kerr Addison carried out a work program consisting of hand trenching (Grextan 1987). Seventeen pits and one 25 meter long trench were dug along three east-trending lines across the anomalous zones outlined in the 1984 to 1986 work programs. From rock sampling in the pits, 12 of 15 rock samples returned gold values < 20 ppb (range from <5 to 115 ppb). Twenty-five trench rock samples returned gold values from <5 to 70 ppb.

6.0 OBJECTIVES and SCOPE of WORK

The deposit models for the Property are epithermal gold-silver and/or porphyry copper-gold. The objective of the recommended work programs is to outline potentially economic gold mineralization on the MAX Property.

6.1 Survey Method and Equipment

Soil sampling was carried out using ratchet-type manual soil augers. Sample locations were GPS controlled. The "B" soil horizon was targeted as the optimum sampled zone, and each soil sample was placed in a uniquely identified kraft paper sample bag. Samples were air-dried and delivered to Inspectorate Laboratory, Whitehorse, Yukon, where samples were prepared for analysis.

- mKN** Mesozoic
Mid Cretaceous (90-110 Ma)
Mount Nansen - volcanic, andesite to dacite flows, breccia and tuff, rhyolite and porphyry dikes, sills and breccias.
- mKgW** Mesozoic
Mid Cretaceous (105-112 Ma)
Whitehorse (Coast Intrusions)- plutonic equigranular granitoids, biotite-hornblende granodiorite, local K-spar phenocrysts
- EJgA** Mesozoic
Late Triassic - Early Jurassic (223-178 Ma)
Aishihik Suite - intermediate granitoids, diorite to gabbro, biotite-hornblende granodiorite, gneisses, K-spar megacrysts
- DMFv** Paleozoic
Devonian-Mississippian (350-382 Ma)
Finlayson - mafic to felsic metavolcanics, green intermediate to mafic volc and volcanoclastics, qtz-muscovite schist, meta-porphry
- PDss** Paleozoic
Upper Devonian and Older (394 + Ma)
Snowcap - metasiliclastic rock, metamorphosed quartzite, pelite, psammite, minor greenstone and amphibolite

<i>E. Harrington, B.Sc, P.Geo.</i>		

Rock samples were placed in uniquely identified plastic bags and delivered to Inspectorate Laboratory, Whitehorse, Yukon, where samples were prepared for analysis.

Prepared samples were then shipped to Inspectorate Laboratory, Vancouver, BC, where samples were analyzed using the 30-element Aqua-Regia ICP (30-AR-TR) and gold 1-assay ton, fire assay with AA finish (Au-1AT-AA) methods.

6.2 Description of Surveys

In 2011, YES carried out an exploration program that consisted of 853 geochemical soil samples, 3 geochemical rock samples, and approximately 2 kilometers of prospecting and reconnaissance geological traverses on the MAX Property. Soil sampling covered approximately 40% of the Property. Gold values ranged from <0.005 to 0.069 ppm. Silver ranged from <0.1 to 4.7 ppm (4.7 g/t). Significant gold values are concentrated in the southern and western portions of the Property.

Gold values appear to be closely associated with silver and arsenic values in the southern portion. Copper values are concentrated in a 1,000 meter by 500 meter zone along the southern boundary of the Property, where the copper is closely associated with gold and silver, and to a lesser extent with arsenic.

Table 1: Rock Sample Details

Sample	Property	UTM Location		Type	Description
		Easting	Northing		
5238722	MAX	378180	6884634	Float select	fine-medium grained rhyolite. Hydrothermal alteration. Carbonate effervescence. Limonite and hematite on fracture surfaces. West end of trench
5238212	MAX	378163	6884628	Float select	fine-medium grained rhyolite. Hydrothermal alteration. Carbonate effervescence. Limonite and hematite on fracture surfaces. East end of trench.

Sample	Property	UTM Location		Type	Description
		Easting	Northing		
5238864	MAX	378204	6884820	O C Select	Iron oxidized rhyolite with kaolinitic phenocrysts hosting disseminated pyrite.

Selected analyses results follow:

Table 2: Selected Rock Assay Results

Sample	Assay Results (ppm)							
	Gold	Silver	Arsenic	Barium	Copper	Moly	Lead	Antimony
5238722	0.012	0.8	39	152	122	9	44	<2
5238212	0.039	3.1	140	135	414	7	134	2
5238864	<0.005	0.2	13	131	23	1	59	<2

Samples 5238212 and 5238722 were taken at the eastern and western ends of a historical trench. Sample 5238212 returned elevated gold, silver, arsenic, copper, and lead values.

7.0 INTERPRETATIONS and CONCLUSIONS

7.1 Interpretations

Soil analyses results from the 2011 work program show significant gold, silver, and arsenic anomalies scattered across the southern portion of the Property. Elevated copper values occur, but are concentrated in a 1,000 by 500 meter area along the southern boundary of the Property. In the area of copper concentration, copper values are closely associated with anomalous gold, silver, and arsenic values. This area of associated values is the same general area where gold and silver values of 1,650 ppb (1.65 g/t) and 14.8 ppm (14.8 g/t) respectively were returned from work carried out in 1986. In 1986, it was reported that high gold and silver values were obtained from felsic intrusive rocks hosting quartz stringers.

It is possible that quartz veining or a quartz stockwork with significant gold and silver values occurs on the Property. Quartz veining is hosted by clay-altered, sheared rhyolite porphyry intruding the volcanic sequence. The intrusion, or plug, covers an area of approximately 1 km² and has had the contained sulfides altered to a gossan (hydrated iron oxides). Historical ground VLF-EM conductors correspond with gold, silver, and arsenic anomalies.

Mineralization on the MAX Property appears to be intrusion and structurally related. The rocks have been fractured and/or faulted, which has created a plumbing system capable of carrying and depositing mineralizing fluids. Hydrothermal activity, shown by the presence of quartz veining and stockworks, has made use of the available plumbing system.

The Mt Nansen volcanic suite, which also hosts the nearby Mt Nansen gold-silver deposit, comprises most of the Property's lithology. Historical work shows that Mt Nansen rocks include feldspar-rich porphyries, porphyritic tuffs, and rhyolite and lapilli (volcanic ejecta) tuffs, and that the volcanics are underlain by Cretaceous-age granodiorite-quartz diorite intrusive rocks.

Lithological observations from prospecting and geological traverses carried out in 2001 report bleached and weathered rhyolite and dacite containing disseminated pyrite, pyrrhotite, and showing manganese staining. Manganese staining is a common feature of mineralization at the Mt Nansen deposits. At prospecting station 3 (Figure 4), weakly serpentinized gabbro was reported.

The rhyolite porphyry, or plug, could be a fine-grained equivalent of the underlying Cretaceous-age granodiorite-quartz diorite body, which could be related to the source of extrusive rocks found in the Mt Nansen area. The alkaline, late-stage felsic intrusive plug, could be significant in terms of gold potential.

The relatively small areal extent of the plug might be due to:

- A small amount of late-stage volcanic activity;
- Fluids being dispersed below surface;
- The lack of a capping mechanism that would allow volcanic pressure to build up and eventually cause explosive fracturing thereby allowing more deposition of intrusive material; and
- Erosional effects.

7.2 Conclusions

The MAX Property has potential to host an economic gold deposit for the following reasons:

- Gold and silver mineralization is closely associated with quartz veining in clay altered felsic intrusives. Rocks have been altered by hydrothermal fluids and the resulting fracturing and chemically enhanced porosity could provide a suitable location for gold precipitation. The movement of gold-bearing hydrothermal fluid through a plumbing system, with the subsequent deposition of the gold from solution, would be necessary for the creation of a gold deposit;
- Significant gold in soil anomalies occur on the Property, as do hydrothermal trace element anomalies such as arsenic, antimony, and barium;
- Significant gold and silver values, 1.65 g/t and 4.8 g/t respectively, have been returned from historical rock sampling;
- Historical VLFL-EM surveys show major structural lineaments in the southern portion of the Property. During the 2011 work program, gabbro was reported, suggesting that there are deep-seated conduits, fractures, and/or faults capable of transporting magmatic material;

- Quartz veining and stockworks show that hydrothermal fluids are capable of being transported through the Property's plumbing system;
- The presence of a felsic intrusive body containing quartz vein-hosted gold and silver mineralization shows that there is a magmatic source for the intrusive material and mineralized hydrothermal fluids underlying the Property; and
- The MAX property has lithological similarities to the nearby Mt Nansen gold deposits.

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him and based on an evaluation of all engineering data which is available concerning any proposed project. For our complete terms and conditions please see our website at www.inspectorate.com.

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him and based on an evaluation of all engineering data which is available concerning any proposed project. For our complete terms and conditions please see our website at www.inspectorate.com.

Attention: **E. Harrington**

Project: **Olympic Project**
Description: **Olympic Project**

Location	Samples	Type	Preparation Description
Whitehorse, YT	105	Soil	SP-SS-1K/Soils, Humus Sediments 1kg dried, sieved and riffle split

Location	Method	Description
Vancouver, BC	30-AR-TR	30 Element, Aqua Regia, ICP, Trace Level
Vancouver, BC	Au-1AT-AA	Au, 1AT Fire Assay, AAS

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him and based on an evaluation of all engineering data which is available concerning any proposed project. For our complete terms and conditions please see our website at www.inspectorate.com.

Attention: **E. Harrington**

Project: **Olympic Project**
Client Reference: **Max soils**
Description: **Olympic Project**

Location	Samples	Type	Preparation Description
Whitehorse, YT	101	Soil	SP-SS-1K/Soils, Humus Sediments 1kg dried, sieved and riffle split

Location	Method	Description
Vancouver, BC	30-AR-TR	30 Element, Aqua Regia, ICP, Trace Level
Vancouver, BC	Au-1AT-AA	Au, 1AT Fire Assay, AAS
Vancouver, BC	Hg-AR-TR-CVAA	Hg, AQR, CVAA, Trace Levels

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him and based on an evaluation of all engineering data which is available concerning any proposed project. For our complete terms and conditions please see our website at www.inspectorate.com.

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him and based on an evaluation of all engineering data which is available concerning any proposed project. For our complete terms and conditions please see our website at www.inspectorate.com.

Attention: **E. Harrington**

Project: **Olympic Project**
Client Reference: **MAX soils**
Description: **Olympic Project**

Location	Samples	Type	Preparation Description
Whitehorse, YT	100	Soil	SP-SS-1K/Soils, Humus Sediments 1kg dried, sieved and riffle split

Location	Method	Description
Vancouver, BC	30-AR-TR	30 Element, Aqua Regia, ICP, Trace Level
Vancouver, BC	Au-1AT-AA	Au, 1AT Fire Assay, AAS
Vancouver, BC	Hg-AR-TR-CVAA	Hg, AQR, CVAA, Trace Levels

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him and based on an evaluation of all engineering data which is available concerning any proposed project. For our complete terms and conditions please see our website at www.inspectorate.com.

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him and based on an evaluation of all engineering data which is available concerning any proposed project. For our complete terms and conditions please see our website at www.inspectorate.com.

Attention: **E. Harrington**

Project: **Olympic Project**
Client Reference: **MAX soils**
Description: **Olympic Project**

Location	Samples	Type	Preparation Description
Whitehorse, YT	100	Soil	SP-SS-1K/Soils, Humus Sediments 1kg dried, sieved and riffle split

Location	Method	Description
Vancouver, BC	30-AR-TR	30 Element, Aqua Regia, ICP, Trace Level
Vancouver, BC	Au-1AT-AA	Au, 1AT Fire Assay, AAS
Vancouver, BC	Hg-AR-TR-CVAA	Hg, AQR, CVAA, Trace Levels

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him and based on an evaluation of all engineering data which is available concerning any proposed project. For our complete terms and conditions please see our website at www.inspectorate.com.

Vancouver, BC	Hg-AR-TR-CVAA	Hg, AQR, CVAA, Trace Levels

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him and based on an evaluation of all engineering data which is available concerning any proposed project. For our complete terms and conditions please see our website at www.inspectorate.com.
