1.0 Introduction

This assessment report documents the field work completed during the 2011 field season on nine Ryan Gold Corp. properties in the Kluane region: Agate, Arm, Asia, Axe, Beryl, Jade, Kilo, Opal, and TYE. 2011 field work consisted of a soil sampling program performed by Ground Truth Exploration Inc. on behalf of Ryan Gold Corp., and geological mapping performed by Ryan Gold Corp. staff.

Work on the Kluane properties took place from June 20 to July 29, 2011. Geological mapping performed by Ryan Gold Corp. staff resulted in a total of 70 grab samples collected on the nine properties. 567 geological observations were also taken. 7249 soil samples were collected on the Kluane properties by Ground Truth Exploration during this period.

The analytical lab used to the conduct the assaying of the samples selected was ACME labs. No mechanized site work was undertaken during the 2011 field season on the properties that would have resulted in environmental degradation requiring remediation.

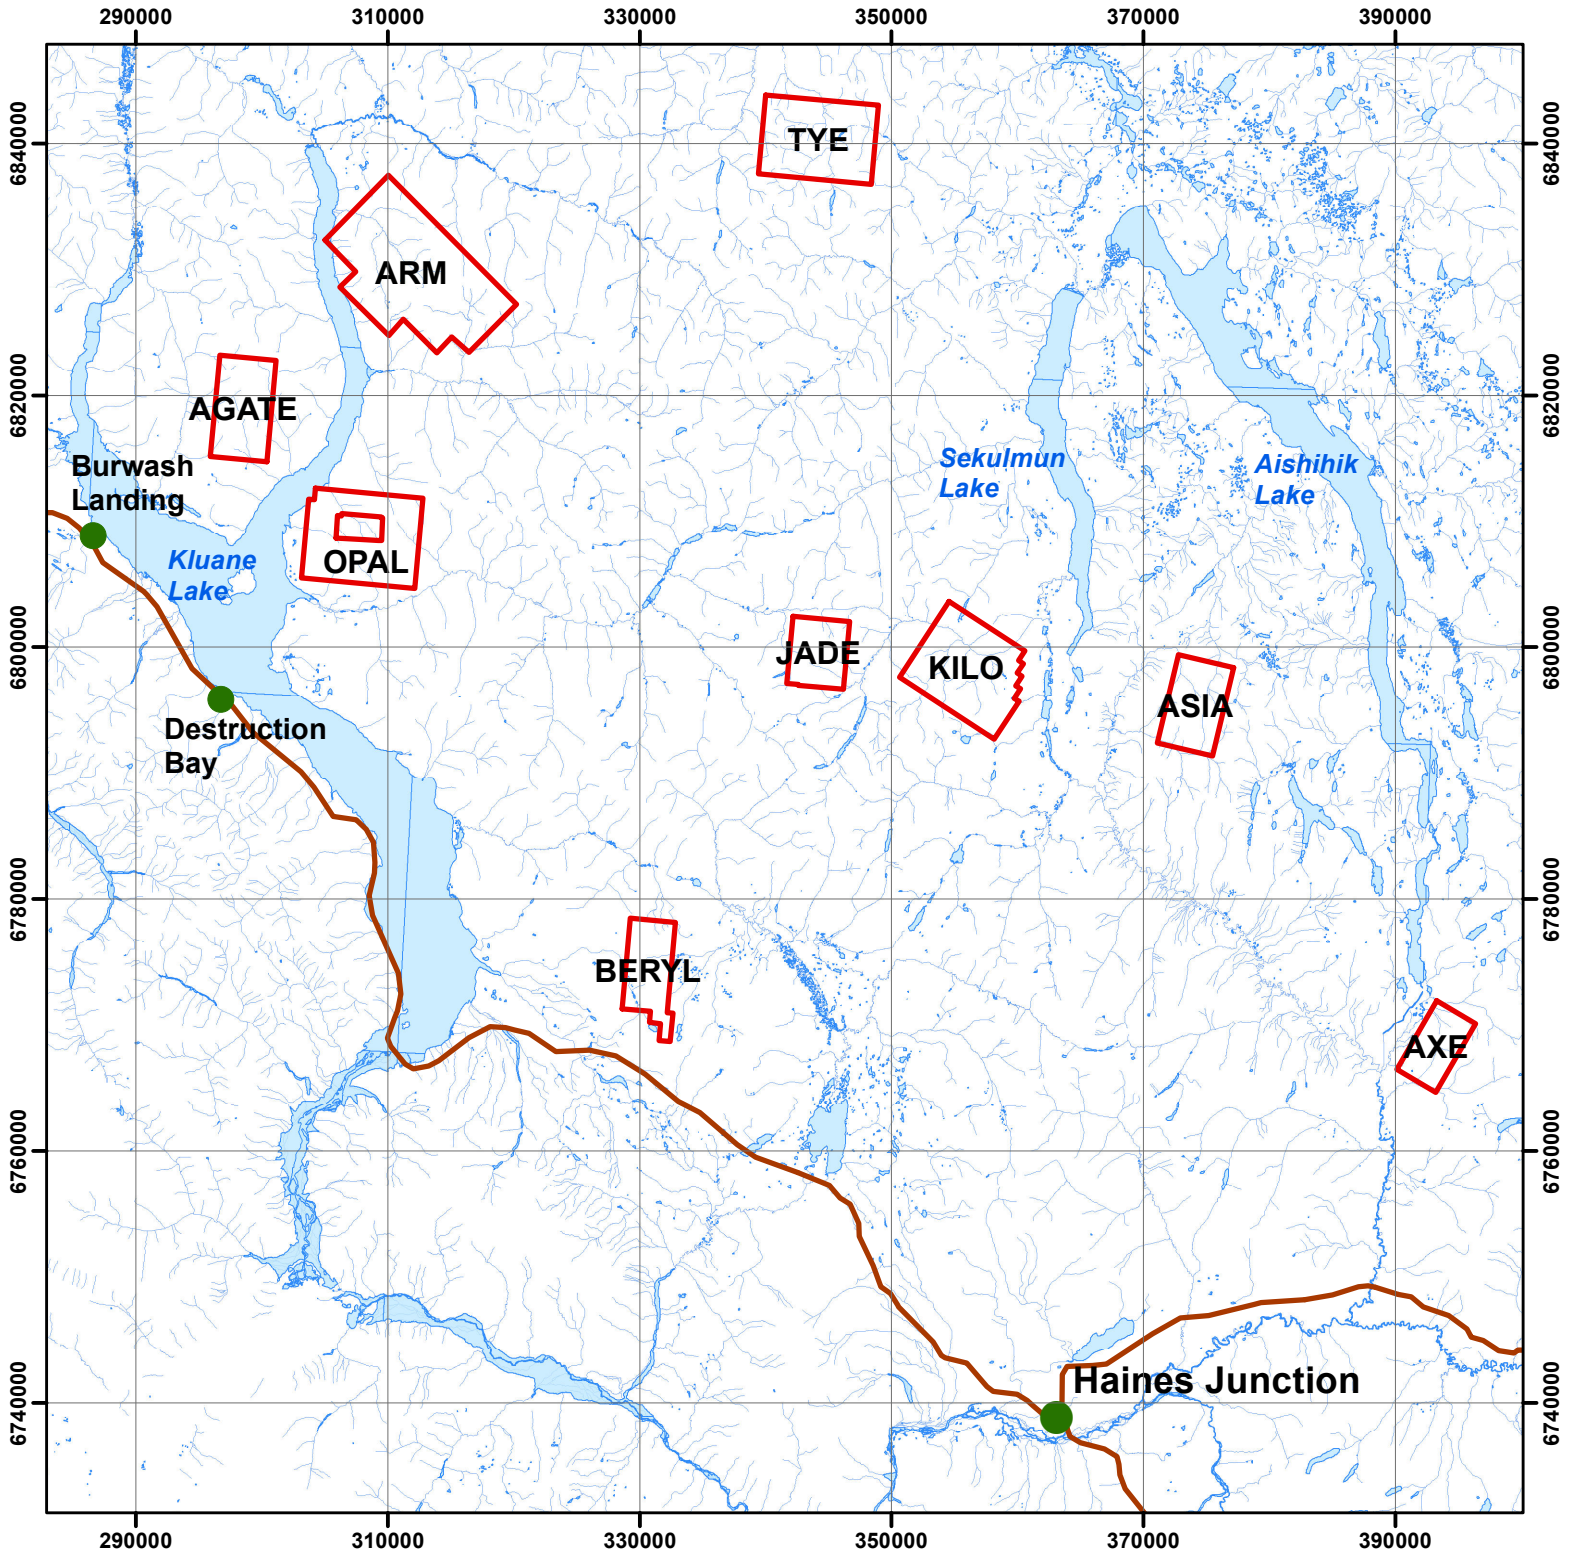

2.0 Location & Access

Access to all the properties is currently limited to helicopter. The most accessible route would be to stage from the Alaska Highway and reach the properties via helicopter. Ryan Gold Corp. field teams were based in the nearby communities of Burwash Landing, between the dates of June 23 to July 14, 2011, and Haines Junction, between the dates of July 7 to July 24, 2012, for the duration of the program. Ground Truth Exploration staffs were based in Burwash Landing and various remote fly camps. The locations and related accessibility of each property is displayed in Figure 1.

The locations of the properties, all of which reside west-northwest to northwest of the Yukon territorial capital, Whitehorse, are summarized below in Table 1:

Table 1: Kluane properties location.

Property Name	Centre Point (Longitude/Latitude)	NTS map sheets	Distance from Whitehorse (km)

3.0 Claim Information

The total number of 'active' claims and leases in accordance with the Quartz Mining Act as of 2011 for the 9 properties is 2132, are displayed in Appendix B. Claims maps, by property are displayed in Appendix F. Table 2 below displays claims by property and claim owner.

4.0 Physiography & Climate

Aside from the Arm prospect which is largely defined by broad linear valleys, steep gradients and sheer ridges, the properties are characterized by wide, modest gradient valleys with limited exposure. Vegetation is concentrated along lower elevations, in drainages and north-facing aspects. Higher elevations are generally associated with scarce cover, limited to grassy knolls and minor buck brush.

Based off the town of Burwash Landing, the temperatures range from 6.3 to 19.3°C in July and -15.6 to -28.4°C in January, with an annual average high of 2.9°C and low of -10.5°C. Annual rainfall and snowfall patterns of the area average at 192.1mm and 106.4cm, respectfully.

Discontinuous permafrost defines the region which has discernible permafrost issues regarding mass wasting and environmental concerns if any of the projects are to advance in stage.

5.0 Property History

The majority of the reported properties have no prior work history inside the claim boundaries, yet have nearby historic showings and workings. Historic showings within claim boundaries are limited to the Arm and the TYE prospects.

Exploration activity on the Arm prospect commenced in 1970 and was carried through by independent parties intermittently until 1980. The previously assigned staking and respective restaked claims which fall within the Arm prospect include: 'Punk' claim 1-8 in 1970 by W. Hinnek, 'Rob' claim 1-

16 in 1971 by R.G. Hilker, 'Roc' claim 1-8 in 1974 J. Carson, 'Venus' claim 1-12 in 1975 O. Milliard, 'Thunder' claim 1-4 in 1980 by J. Carson. The target of historic exploration was focused around a Cu-Mo-Au porphyry model and the extent of work was limited to hand trenching by R.G. Hilker in 1971 under the Rob claim. No data is available from workings completed prior to 2010. Arm claims 1-80 were staked in March 2011 by Ryan Gold Corp., and expanded to 544 claims in September 2011 (Yukon Geological Survey, 2006).

Exploration activity on the TYE prospect also commenced in 1970. The previously assigned staking and respective restaked names which fall within the TYE prospect are; 'Vic' claims 17-24 in 1970 by Conwest Exploration Company and 'TYE' claim 1-280 by Shawn Ryan in 2010. The target of historic exploration was focused around a Cu-Mo-Au porphyry model and the extent of work was limited to a reconnaissance geochemical program involving preliminary prospecting and soil sampling carried out by Conwest Exploration Company in 1970 under the Vic claim. No data is available from workings completed prior to 2010 (Yukon Geological Survey, 2006).

The 2010 exploration program consisted of reconnaissance soil sample lines throughout the Kluane Schist region. Areas worked on during the 2010 exploration program included Agate, Beryl, Jade, Kilo and Opal. The 2010 reconnaissance soil sampling program led to Ryan Gold Corp. staking the claims in the Spring of 2011.

6.0 Geology

6.1 Regional Geology

The Kluane region is defined by an accretion arrangement of units west of the Tintina fault displayed in Figure 2. Five dominant lithologic units which define the Kluane region, from youngest to oldest, are: the Rhyolite Creek volcanoplutonic complex, Ruby Range batholith, Kluane Schist, gneiss and Yukon-Tanana terrane, described by Israel et al. (2010) as:

1. Rhyolite Creek volcanoplutonic complex
    a. Light grey, brown and green, intermediate to felsic volcanic rocks; flow banding is common; local volcanic breccia; rare pillows and mafic volcanic rocks.
    b. Light grey to purple, quartz, feldspar porphyry; quartz is often smoky grey in colour; occurs as thin dykes to large intrusive bodies; intrusive equivalents to intermediate to felsic volcanic rocks.
2. Ruby Range batholith
    a. Fine to coarse-grained, salt and pepper, hornblende +/- biotite, quartz diorite, rare garnets; medium-grained, light grey to pinkish biotite +/- hornblende granodiorite; fine to medium-grained, beige to grey tonalite with distinctive smoky grey quartz; pinkish/grey, biotite granite.
    b. Strongly to moderately deformed equivalents of undeformed Ruby Range batholith; often has 'gneissic' texture near the base of the batholith.

3. Kluane Schist
    a. Dark grey to dark green, strongly deformed and altered ultramafic lenses; light grey, fine-grained talc-schist.
    b. Light to dark grey, fine-grained, quartz, muscovite schist; variably carbonaceous (more carbonaceous in the northwest of map area); rare light grey carbonate lenses;
    c. Dark grey to black; fine-grained, quartz, biotite schist; occasional garnets and plagioclase porphyroblasts; layer parallel, boudinaged quartz veins ubiquitous.
4. Gneiss
    a. Beige, orange to grey black, medium- to coarse-grained orthogneiss and paragneiss; mafic layers composed primarily of biotite +/- hornblende, leucocratic layers consist of quartz, potassium feldspar and plagioclase; abundant garnet; could be part of Yukon-Tanana terrane or the Kluane Schist.
5. Yukon-Tanana terrane
    a. Beige- to brown-weathering quartz, muscovite +/- garnet, psammitic schist; dark grey to black carbonaceous biotite +/- garnet schist and quartzite; dark green to black garnet amphibolite; grey to cream marble; rare metaplutonic rocks.

6.2 Property Geology

The Arm property is dominated by the Ruby Range batholith granodiorite with isolated Yukon Tanana Terrane metasedimentary and carbonaceous units representing a roof pendant style model (Israel, 2004).

The Agate property lies exclusively within Ruby Range batholith granodiorite (Israel, 2004).

The Beryl prospect is defined by two units; the Hayden Lake intrusion and Kluane Schist (Israel et al., 2010). The Hayden Lake intrusion was observed to be an unaltered, fresh, massive, biotite-rich granodiorite where the Kluane Schist is divided by mineralogic modifiers into a lighter muscovite-rich schist unit and a darker biotite-rich schist unit. The Hayden Lake intrusion and Kluane Schist exists a sharp, nonconformity contact.

The Opal property is almost uniformly split between an east-west, sharp nonconformity contact between the Ruby Range Batholith granodiorite, to the north, and the Kluane Schist, to the south (Israel, 2004). The schist at Opal is primarily the lighter muscovite-rich schist unit.

The TYE property is almost exclusively dominated by Ruby Range porphyry. The volcanic rocks which define the TYE property are dominantly quartz-feldspar porphyry, rhyolite and dacite (Israel, 2004).

The Jade, Kilo, Asia and Axe prospects are all underlain by phases of the late Paleocene Ruby Range Batholith that were emplaced late-syn to post-deformation. Coarse-medium grained plutonic material

with pockets of coarser pegmatite material locally appears to have a fabric that might best be described as a flow fabric, and is overprinted by the development of brittle hairline fractures, and aplitic granodiorite – granite veins (Chakungal, 2011). In all four properties, the Ruby Range Batholith contains enclaves of metasedimentary and metavolcanic material that commonly host disseminated pyrite, pyrrhotite ± arsenopyrite. According to the work of Israel et al. (2010), paragneisses in the southwest corner of the Jade prospect are part of a gneissic unit representing either migmatized metasediments of the Kluane Schist, migmatized sedimentary cover rocks of the older YTT, or migmatized basement rocks to the YTT and possibly Kluane Schist. In the absence of geochronological constraints, metasedimentary and metavolcanic xenoliths seen in the Kilo, Asia and Axe blocks are believed to represent roof pendants of the overlying Yukon Tanana Terrane, more specifically the Devonian Finlayson Assemblage, which has been incorporated into the Ruby Range batholith at its highest structural levels. Within the latter three prospects, areas enriched with enclaves can be correlated with areas characterized by magnetic low signatures (Chakungal, 2011).

7.0 Exploration Program

The 2011 exploration program consisted of ridge and spur reconnaissance soil sampling carried out by Ground Truth Exploration. Geological mapping and rock sampling was performed by Ryan Gold Corp. staff.

The reconnaissance bedrock mapping of the various properties during the 2011 exploration program resulted in the collect of 70 grab samples. A total of 567 geological observations were taken during the season. Grab Sample locations are listed in Appendix D. Maps of grab sample locations, by property, are displayed in Appendix F.

Table 3: Dates and sample/observation totals for geological work completed during the 2011 field season program, by property.

Property Name	Field Dates (2011)	Total Grab Samples	Total Observations
Agate	June 23rd – June 27th	16	106
Arm	July 9th – July 12th	15	125
Asia	July 22nd – July 23rd	15	51
Axe	July 24th	2	32
Beryl	July 11th	2	52
Jade	July 12th & 20th	4	22
Kilo	July 20th & 22nd	4	21
Opal	June 20th, 29th-30th & July 9th	10	108
TYE	July 7th – July 8th	2	50

Due to the nature of the reconnaissance mapping and sampling program via helicopter, there was little to no disturbance of the area. Remote lodging at Burwash Landing and Haines Junctions allowed operations to be carried out with zero site work construction. All work completed on the properties was in accordance with the issued Class 1 permits.

Soil sampling on the properties was contracted to Ground Truth Exploration Inc. and took place from June 23rd to July 29th, 2011. A total of 7249 soil samples were collected on the nine Kluane properties documented in this report during the 2011 field season. Sample locations and results are displayed in Appendix E.

Table 4: Dates and sample totals for the 2011 soil sampling program, by property.

Property Name	Ground Truth Field Dates (2011)	Total Soil Samples
Agate	July 1st – July 4th	989
Arm	June 23rd – June 25th	463
Asia	July 9th – July 11th	847
Axe	July 25th	167
Beryl	July 12th, July 28th – July 29th	823
Jade	July 10th – July 11th	645

Opal	June 26th – June 30th, July 4th – July 5th	1336
TYE	July 3rd – July 7th	1469

8.0 Sample Geochemistry

All rock samples sites were marked by tying orange or pink flagging tape to a rock and recording the sample number on a metal tag. Sample information such as lithology, alteration, and mineralogy were recorded for each sample (Appendix B). Rock samples were sealed in plastic bags with barcoded sample number tags both on the outside and inside of the bag. The sealed rock sample bags were then packed into rice bags and sealed with an additional industrial plastic strap with security code. Ryan Gold used Acme Labs in Whitehorse and Dawson City to process samples with 1:1:1 Aqua Regia digestion ICP-MS analysis for 37 elements. The assay certificates are outlined in Appendix C.

Soil sample where taken with a soil auger at an average depth of 50-70 centimeters. All sample sites were marked by tying an orange flagging tape with sample number written on with black permanent markers. Sample site information was recorded for each sample such as depth, color, texture, moisture, horizon, and site cover (Appendix B). About 400-500 grams of soil was collected and placed in soil packet bags. All soil packets were air dried and placed in rice bags for transportation. Ryan Gold used Acme Labs in Whitehorse and Dawson City to process samples with Aqua Regia ICP-MS for 37 elements. The assay certificates are outlined in Appendix C.

9.0 Results

There were no significant grades retrieved from grab samples collected on the properties during the 2011 field season. Au-in-soil maps, by property, are displayed in Appendix F. Soil sampling has yet to

fully define anomalous areas. Follow-up grid sampling is recommended for areas displaying higher Au-in-soil grades.

10.0 Conclusion & Recommendations

The Ruby Range batholith group, which includes the prospects Agate, Arm, Asia, Kilo, and TYE, has potential to host Cu-Mo-Au porphyry deposits. Beryl resides within the Kluane Schist unit, favouring an Orogenic Au model. Jade and Opal exist in a zone along the contact between the Ruby Range batholith and Kluane Schist, possibly within the undefined Gneiss unit, preferential to late structurally controlled Au (Israel et al., 2010).

Detailed mapping is recommended on the Arm property, along with a soil grid over areas that returned high Au values from the 2011 reconnaissance program performed by Ground Truth Exploration Inc. Findings from soil survey and geological mapping on the Beryl and Kilo properties may also warrant further investigation and follow up detailed mapping and soil grid cover. There was nothing promising found on the Agate, Asia, Axe, and Jade that indicates they should be included in the 2012 work program.

11.0 Statement of Expenditures

Eligible work expenses, by property, for the 2011 field season are displayed below. For a complete list of expenditures, please refer to Appendix C.
