List of Figures

Introduction

The Outpost Property comprises 71 mineral claims located under the *Yukon Quartz Mining Act* 50 kilometers west of Haines Junction.

The 2011 exploration program comprised prospecting traverses, preliminary geological mapping and stream sediment geochemical surveys on the properties to guide future exploration.

The present report is the summary of the Prospecting, Geological Survey and Geochemical Survey conducted in 2011 on the Outpost Claim Group.

Summary of Previous Investigations

The Outpost Claims are located in a poorly explored belt extending northwest from Haines Junction to the ghost town of Silver City. The property lies along the northern flank of Outpost Mountain and encompasses the drainages of Silver and Boutellier Creeks.

The Outpost Claim Group covers a highly prospective airborne geophysical anomaly in an area with anomalous stream sediment geochemical data. The airborne total magnetic and first vertical derivative anomalies trend sinuously northwesterly through the property and suggest that large scale favourable mineralizing structures or large mafic/ultramafic intrusives may underlie this underexplored geological package and the proximity of the Kluane Ranges Intrusive Suite makes this a compelling target for both epithermal gold and nickel-copper-platinum group mineralization.

The Outpost Mountain area has been intermittently explored since 1892 during which year Jack Dalton and E.J. Glave made an overland trip with four packhorses from the Chilkat River to the shores of Kluane Lake over a foot path which the Chilkat First Nations had used for the preceding two centuries as a trading route to the interior of the Yukon. Klondike prospectors used the Dalton Trail extensively during the 1898-1900 period enroute to the goldfields of the Klondike, but prospecting in the Front Ranges was not established until about 1903 when Silver City was settled at the eastern end of Kluane Lake and became the center of mining activity in the region. Silver City boasted a post office, N.W.M.P. post and Mining Recorder; a wagon road led east through the settlement of Champagne to Whitehorse. The threat of Japanese invasion sparked the building of the Alaska Highway in 1942 and the Haines Road followed in 1944. Improved access in the post war period brought on a brief exploration boom, although no lode mining production is known from the immediate area of the Outpost Claim Group.

This area has a rich history of placer gold mining, with early production reported from Silver and Boutellier Creeks.

A number of regional exploration programs focussed on the Kluane Front Ranges from 1966 through 1988, including programs conducted by the author on behalf of Noranda Exploration Company Ltd.

There are few MINFILE occurrences of note in the vicinity of the Outpost Claim Group.

The central portion of the Outpost Claims stretching from Boutellier Creek to Silver Creek was at one point part of the Ultra Property of Klondike Star Mineral Corporation. Bill Mann's 2006 Assessment Report on the Ultra Property describes work conducted in the 2005 field season

including ground geophysics and prospecting which targeted Cu-Zn massive sulphides, magmatic Ni-Cu-PGM and Cu-Ag veins.

To the east of the Outpost Claim Group a 1958 exploration program by the Gaymont Prospectors Syndicate led to the discovery of magmatic Ni-Cu-PGM mineralization in the headwaters of Cub Creek and a 1977 exploration program by Acquitane Oil led to the discovery of the Telluride Creek massive sulphide showing (MINFILE 115B008) in a cirque 4.5 kilometers south of Cub Creek. Massive sulphide boulders had been first observed by placer miners working Cub Creek during the early years of Silver City. The Frohberg and Telluride showings were worked intermittently by a variety of interests up until 1988, and are currently held by Tom Morgan.

List of Claims

Solomon Resources Limited owns 100% of the Outpost Claim Group.

Solomon geologist Monica Nordling filed an Application to Group Mineral Claims (YQMA Form 12) in respect of these claims on September 7th, 2011 and the writer filed an Application for a Certificate of Work (YQMA Form 4) on May 18th 2012.

The 71 mineral claims (see Figure 1) under Grouping Certificate HW07200 that are subject of this Assessment Report are:

Claims for renewal		Ownership	Expiry Date
Claim name	Grant number		(Current)
Outpost 1 - 71	YE33717-YE33787	Solomon Resources Limited	May 11th, 2015

Table 1: Claims for Renewal

Physiography and Location

The Outpost Claim Group is located 50 kilometers west of the town of Haines Junction. The claims generally occupy a sinuous belt extending north-northwesterly from the alpine uplands immediately southeast of Boutellier Creek and parallel the slope break on the north flank of Outpost Mountain across Silver Creek to the bank of a major unnamed creek draining the western flank of Outpost Mountain.

The Kluane Front Ranges in the vicinity of the claims form a narrow front facade to the St. Elias Mountains, rising steeply from the Shakwak Valley to a maximum elevation of 8500 feet. The slopes are steep and uniform with long talus screes; in general terms the Front Ranges comprise two or three major ridges parallel to the main front connected by high saddles and dissected within the claim group by transverse V-shaped valleys containing Boutellier Creek, Silver Creek and other unnamed drainages.

The forest cover of the property is light, with treeline at approximately 4000 feet elevation. Black spruce, white spruce, balsam, poplar and white poplar dominate the forested slopes; alder willow and sub-alpine flora are found at and above the timberline. Game is plentiful as the claims lie wholly within the Kluane Game Sanctuary.

The claim group is shielded from the Pacific Ocean by the high St. Elias Mountains and thus has a dry continental climate despite the proximity of tidewater. Summers are short and hot with temperatures up to 35 degrees Celsius; winters are severe with short daylight hours and temperatures down to -50 degrees Celsius.

The Alaska Highway runs parallel and approximately 5 kilometers northeast of the Outpost claim group. A four wheel drive road extends from the NW Tel microwave tower at Christmas Creek on the old Alaska Highway and a spur leads up Boutellier Creek to the claim group. From the town of Haines Junction, 50 kilometers to the east, the Haines Highway extends 243 kilometers south from Haines Junction to the deepwater port of Haines, Alaska.

Charter helicopter and fixed wing service is available at Haines Junction and seasonally at Silver City. Commercial accommodation is available in Haines Junction and Silver City, and the former remains the best venue for staging exploration on the Outpost Claims with most of the support services and casual labour pool available that early stage exploration requires.

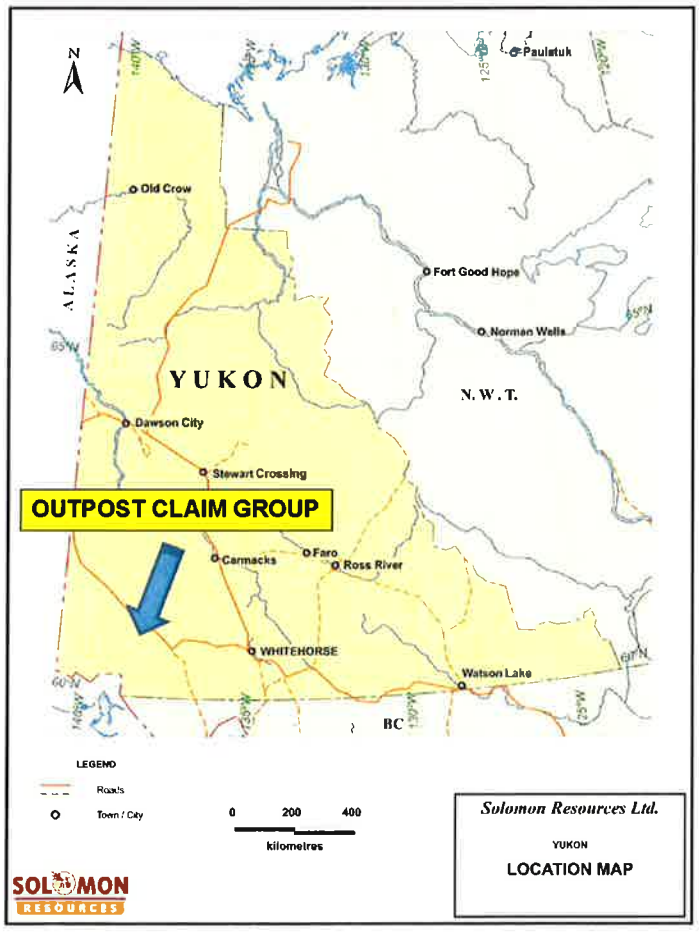

Figure 2: Location Map

Geological Setting

The Outpost Claim Group is located within the Insular Superterrane which is primarily composed of two older terranes, Wrangellia and Alexandria, which were amalgamated about 320 million years ago. These terranes are composed of island arc and ocean floor volcanic rocks with thick assemblages of overlying oceanic sedimentary rocks that range in age from 400 to 220 million years old.

The Wrangellian Terrane is an extensive accreted oceanic plateau characterized by widespread Triassic flood basalts and complementary intrusive rocks. Flood basalts in this region are believed to have originated by in a mantle plume which erupted onto the extinct Pennsylvanian and Permian Sicker-Skolai island arc.

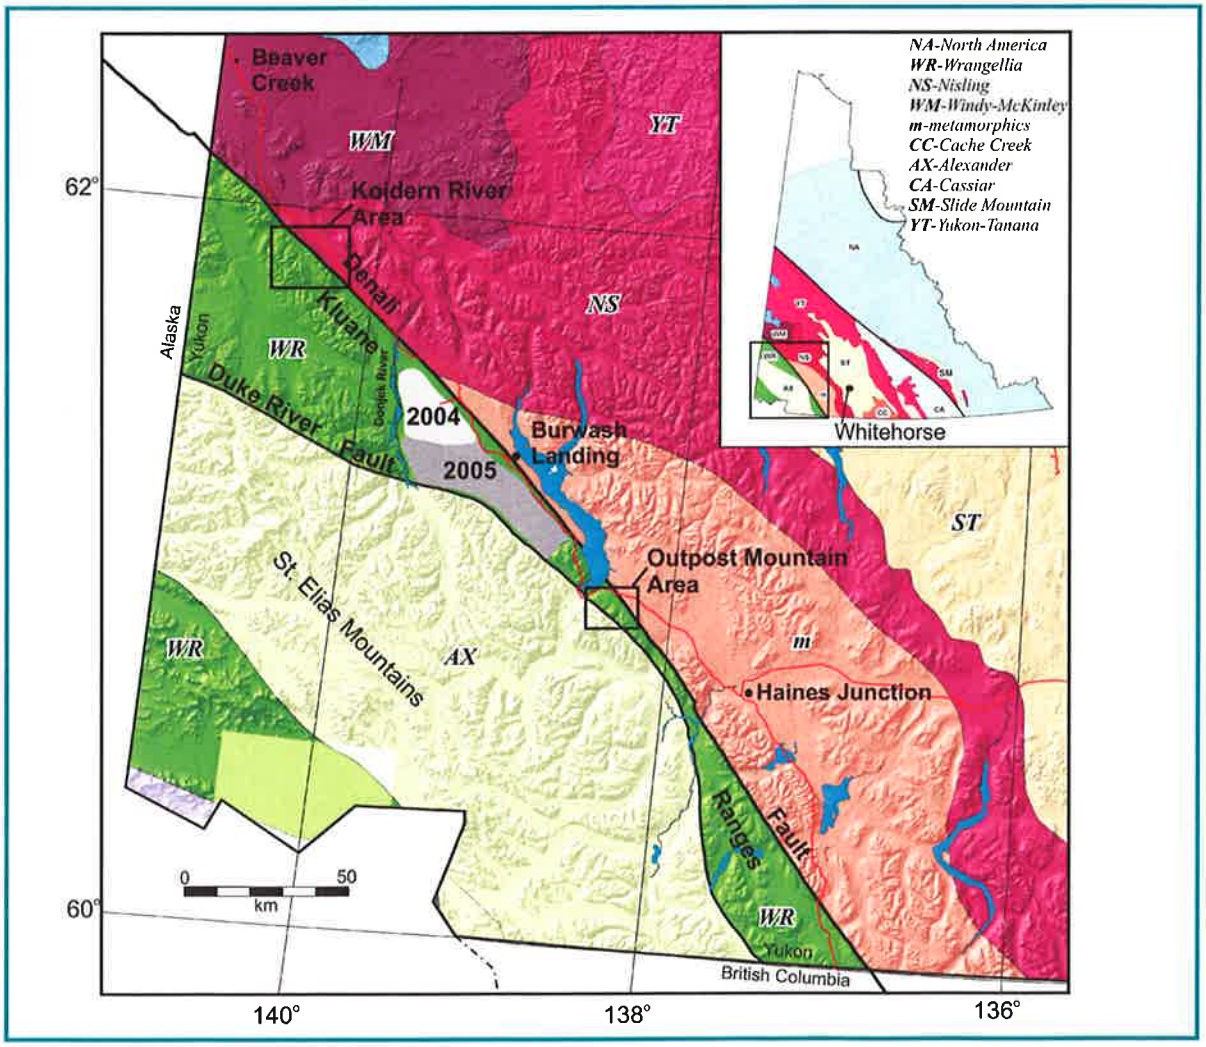

Figure 3. Terrane Map of Southwest Yukon Showing Outpost Mountain Area. (From Israel *et al* 2006)

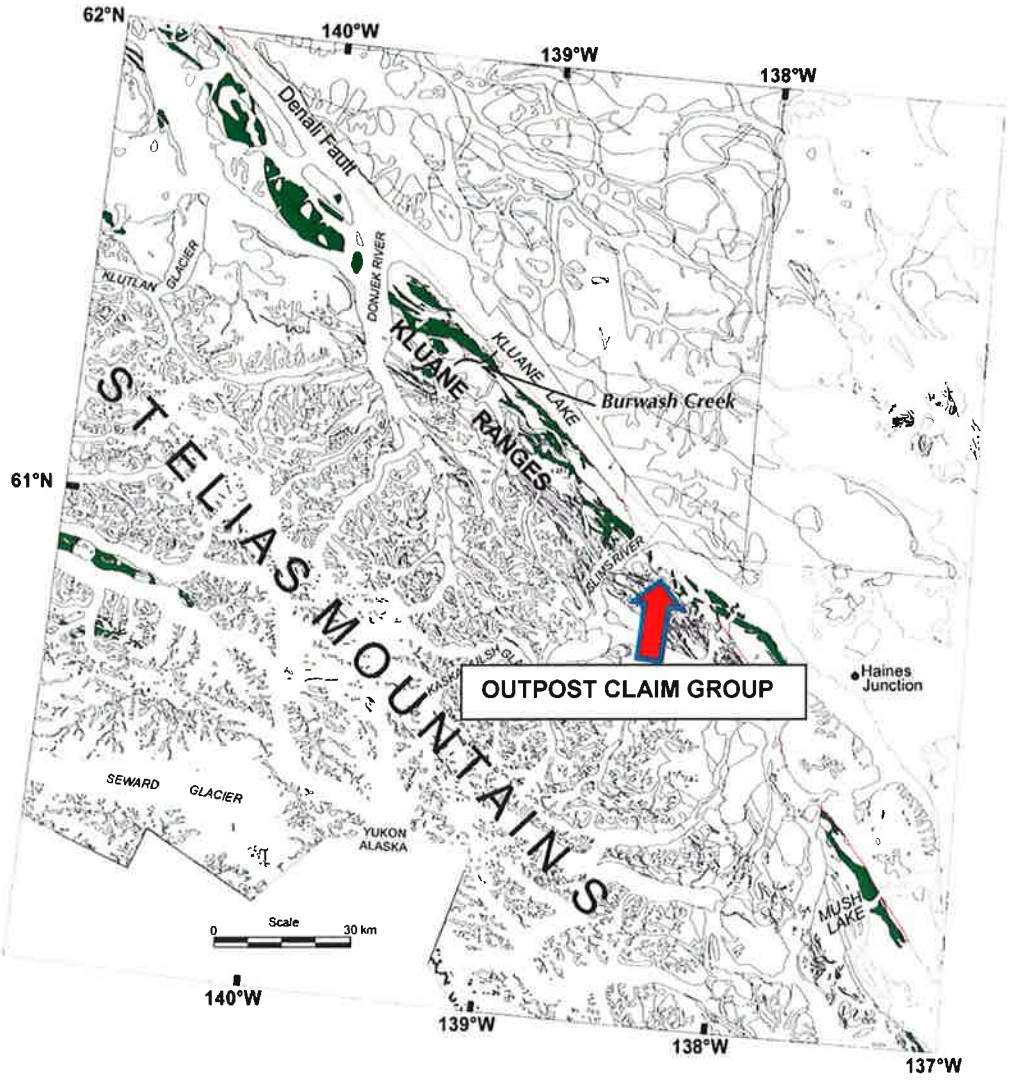

Figure 4. Southwestern Yukon Exposure of the Triassic Nikolai Formation *(from Greene, A.R., S. Coates, J.S., Weiss, D., and Israel, S., 2005.)*

The Upper Triassic Nikolai Formation forms a discontinuous linear belt extending 300 kilometers across southwest Yukon and is characterized by basal conglomerate and/or volcanic breccia, amygdaloidal basalt and andesitic flows and local tuff, breccia, shale and limestone. The Nikolai Formation was initially mapped in the Kluane Front Ranges by Kindle (1976) as partly serpentinized peridotite, talc schist and green serpentine schist of Lower Cretaceous or later age, and reported upon by Read and Monger (1976) as Upper Triassic and "typically sparsely porphyritic (augite and plagioclase) meta-basalt with large amygdules of chlorite, pumpellyite, prehnite, quartz, albite, epidote and quartz."

Mafic rocks of similar age and composition to the Nikolai Formation occur in northwestern BC where they are referred to as the Tats Volcanic Complex.

Several stratigraphic sequences overlie the Alexander Terrane and Wrangellia in Southwest Yukon; the oldest of these overlap assemblages are the Upper Jurassic to Lower Cretaceous turbidites of the Dezadeash Formation, one of several packages of similar age that were deposited in basins that developed between the Insular and Intermontane superterranes during the middle Mesozoic.

The regional geological setting of the Outpost Claim Group appears in Figure 5 (in pocket) adapted from Israel *et al* 2006.

Early Cretaceous Kluane Ranges Suite granite and granodiorite at Outpost Mountain locally intrude well bedded siltstone and sandstone of the Upper Jurassic to Lower Cretaceous Dezadeash Formation which in turn overlies a Late Triassic package comprising Nikolai Formation basalt and massive to bedded Chitistone Limestone which appears to lie in fault contact with Permian Hasen Creek siltstone and carbonates.

Work Program: Prospecting, Geological Survey and Geochemical Survey

Solomon field crews conducted prospecting, geological surveys and geochemical exploration surveys on the Outpost Claims from June 20th to July 31st, 2011. Field personnel included: geologists Randy Rogers and Monica Nordling, project manager James Rogers and field assistant Susan Rogers. Corporate CFO Paul Maarschalk assisted in the early stages of the reconnaissance. Field work was staged out Haines Junction as well as a fly camp on the property and logistical support was provided by Trans North Helicopters based out of Haines Junction.

Prospecting

Preliminary prospecting traverses were conducted early in the field season by Randy Rogers and Susan Rogers (Figure 6) initially concentrating on the northern flank of Outpost Mountain from June 20th to June 25th, 2011. Prospecting traverses in late July along Boutellier and Silver Creeks were designed to examine a cross section of the property geology exposed in the stream cuts prior to the preliminary mapping and geochemical sampling which followed. No significant mineralization was encountered and the traverses were primarily for geological orientation.

Road access to the claim group along Boutellier Creek was improved by local First Nations interests and a placer miner during the 2011 field season, and this greatly facilitated access by ATV from the Alaska Highway to the central portion of the claim group.

An exploration fly camp was established on Boutellier Creek from July 25th to July 31st, 2011.

Figure 7 Prospecting Traverse on Northwestern Flank of Outpost Mountain

Figure 8 Prospecting Traverse at Headwaters of Boutellier Creek

Geological Survey

Preliminary geological mapping of the Outpost Claim Group was undertaken by geologist Monica Nordling with the assistance of project manager James Rogers from July 25th to July 31st, 2011

The Preliminary Geological Map prepared by Nordling for the 2011 program appears as Figure 9 (in pocket.)

The Upper Triassic Nikolai Formation was mapped by Nordling as comprising two discontinuous, subparallel bands straddling the eastern portion of the Outpost Claim Group, outcropping primarily in stream cutbanks. Locally, the Nikolai basalts are porphyritic or very fine grained and aphanitic. Porphyritic crystals include hornblende/tremolite, feldspar, chlorite, and quartz. The more schistose variation are observed to contain biotite and rarely muscovite mica. Fibrous serpentine appears as an alteration mineral along fracture surfaces. Albite veining/augens were also observed. The Nikolai greenstone may contain clean, unaltered, disseminated sulphides (primarily arsenopyrite), but large pyrite crystals (0.5-1.5 cm) were observed in more schistose variations. Malachite staining was seen in greenstone along an un-named tributary to Silver Creek, located in a very weathered, iron-stained rock. Weathering is usually red-orange and black with less common purple and brown variations.

The Upper Jurassic to Lower Cretaceous Dezadeash Formation is the dominant map unit of the western portion of the Outpost Claims, generally seen in contact with the Nikolai volcanics in stream cutbanks. Locally, the Dezadeash Formation appears as argillite or pelite with less common greywacke, sandstone and pebble conglomerate. Quartz-filled veins and vugs have been observed in the pelite variation with no visible sulphides. Locally, hydrothermal brecciation appears to follow the dominant fracture set with visible arsenopyrite and pyrite mineralization throughout. The Dezadeash Formation lies in unconformable contact over the Nikolai Formation. Where visible in the field, the contact ranges from unaltered to heavily altered orange and weathered rock.

Nordling mapped the contact between the Dezadeash Formation and the Early Cretaceous Kluane Ranges Suite of granodiorite on the northern flank of Outpost Mountain.

Israel (2006) identified an outlier of Late Triassic Chitistone Limestone in the cutbank of Boutellier Creek but this unit was not confirmed by Nordling in the 2011 program.

Geochemical Survey

Solomon Field crews conducted very preliminary stream sediment surveys on the Outpost Claims in the 2011 field season. A total of 25 stream sediment samples were taken and analyzed at ALS Minerals in North Vancouver, B.C. Silt samples were taken from active water courses free of organic debris and contamination and placed in numbered kraft envelopes. A typical stream sediment sample in this project weighed 0.5 kg (dry)

The stream sediment and soil sample locations are shown in Figure 10 and the gold and arsenic analyses appear in Figures 11 and 12.

The analytical data is summarized in Appendix I and the Certificates of Analysis appear in Appendix II.

Interpretation and Conclusions

Regional geology, regional stream sediment geochemistry and the exploration history of the Telluride and Frohberg showings combined with the preliminary exploration described herein make the Outpost Claims a fairly compelling exploration target.

The recent progress at the Wellgreen Pt-Pd-Ni-Cu project of Prophecy Platinum Corp. and the suggestion that the Wrangellian of southwest Yukon represents a underexplored Ni-Cu-PGE Metallogenic Terrane (Green et al 2004; Hulburt and Stone, 2006) and the as yet unexplained airborne total magnetic and first vertical derivative anomalies which trend northwesterly through the property suggest that large scale favourable mineralizing structures or large mafic/ultramafic intrusives may underlie the Outpost Claim Group. That and the proximity of the Kluane Ranges Intrusive Suite makes this a compelling target for both epithermal gold and nickel-copper-platinum group mineralization.

The very preliminary stream sediment survey suggests that an elevated level of arsenic exists in the un-named drainage on the northwest flank of Outpost Mountain and further exploration should be directed in this drainage to determine the source. There is excellent rock exposure in the western cliff face above this drainage that should provide some insight into underlying geology, but the severe topography here would require mountaineering equipment for a proper geological survey to be conducted. Gold values in stream sediments were unremarkable.

The geological mapping and prospecting traverses conducted in 2011 were very preliminary and served only to delineate the broad contacts of the Nikolai volcanics, Chitistone limestone and Dezadeash clastics. A more detailed mapping program is indicated for the 2013 field season. Particular attention should be paid to the contact of the Ruby Range granodiorite and the sedimentary rocks, and the outlier of Chitistone limestone identified by Israel and Cobbett (2006) should be carefully mapped.

Time constraints in the 2011 field program precluded any rock sampling or manual trenching for assay and this should be part of the 2013 program.

The results of the 2011 field program suggest that the 2013 field program should include ridge and spur reconnaissance soil geochemistry and the establishment of soil geochemical grids on the central portion of the property between Boutellier and Silver Creeks and on the northern flank of Outpost Mountain at the contact with the Ruby Range granodiorite with a sample spacing of 50 meters by 50 meters for a total of 1200 soil samples.

Detailed mapping of the drainage of Boutellier and Silver Creek and the northeastern and northwestern slopes of Outpost Mountain is recommended, with further prospecting traverses in the southern extremities of these drainages and the gorge of the un-named stream draining the northwestern flank of Outpost Mountain. Provision should be made for 100 rock samples for assay.

Depending on results of these inquiries, contingency planning might contemplate a program of ground geophysics and mechanical trenching late in the 2013 field season.

A budget of $ 48,000.00 is proposed for this followup program.

Item	Notes	Cost
Supervising Geologist	5 days @ 750	3,750.00
Project Geologist	15 days @ 400	6,000.00
Project Supervisor	15 days @ 350	4,750.00
Field Assistant	15 days @ 300	4,500.00

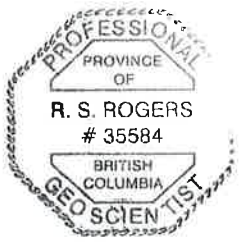
Statement of Qualifications

I, Randall Stewart Rogers, with business address at Solomon Resources Limited, PO Box 938, Vernon, B.C., V1T 6M8, hereby certify that:

- I am a practising Geologist, resident in Vernon, British Columbia;
- I am a member in good standing with the Association of Professional Engineers and Geoscientists of British Columbia (Licence 35584) and the Association of Professional Engineers, Geologists and Geophysicists of Alberta (Licence 36474);
- I hold a Bachelor of Science (Honours) degree in Geology (1980) from the University of British Columbia;
- I hold a Master of Science degree in Mineral Exploration (1981) from Queen's University at Kingston;
- I have practiced my profession as a geologist since graduation;
- I have a direct interest in the operations of Solomon Resources Ltd.: I am the Chief Executive Officer and President of the Company and a shareholder.
- I have based this report on:
    - Field work conducted by exploration contractors under my direct supervision
    - Historical research into past operations on and adjacent to the subject claims
- I consent to the use of this report for any Filing Statement, Statement of Material Facts, or support document.

Randall S. Rogers M.Sc., P.Geo.

2012-11-01



Statement of Expenditures

An Application for a Certificate of Work (Grouping Certificate HW07199) was filed at Whitehorse Mining Recorder allocating $ 21,300.000 in work to the renewal of these claims.

The Application for Certificate of Work and Cost Summary was registry stamped by the Whitehorse Mining Recorder on May 18th, 2012.

Item	Notes	Cost
Geologist	R.S. Rogers M.Sc., P.Geo.	$ 4,079.00
Geologist	M. Nordling	4,000.00
Field Assistant	S. Rogers	1,080.00
Field Assistant	J. Rogers	2,578.00
Field Assistant	P.Maarschalk	900.00
Helicopter Support	Trans North	3,975.00
Accommodation	Camp and Commercial Accommodation	3,945.00
Analytical	ALS Minerals	743.00
	TOTAL	**$ 21,300.00**

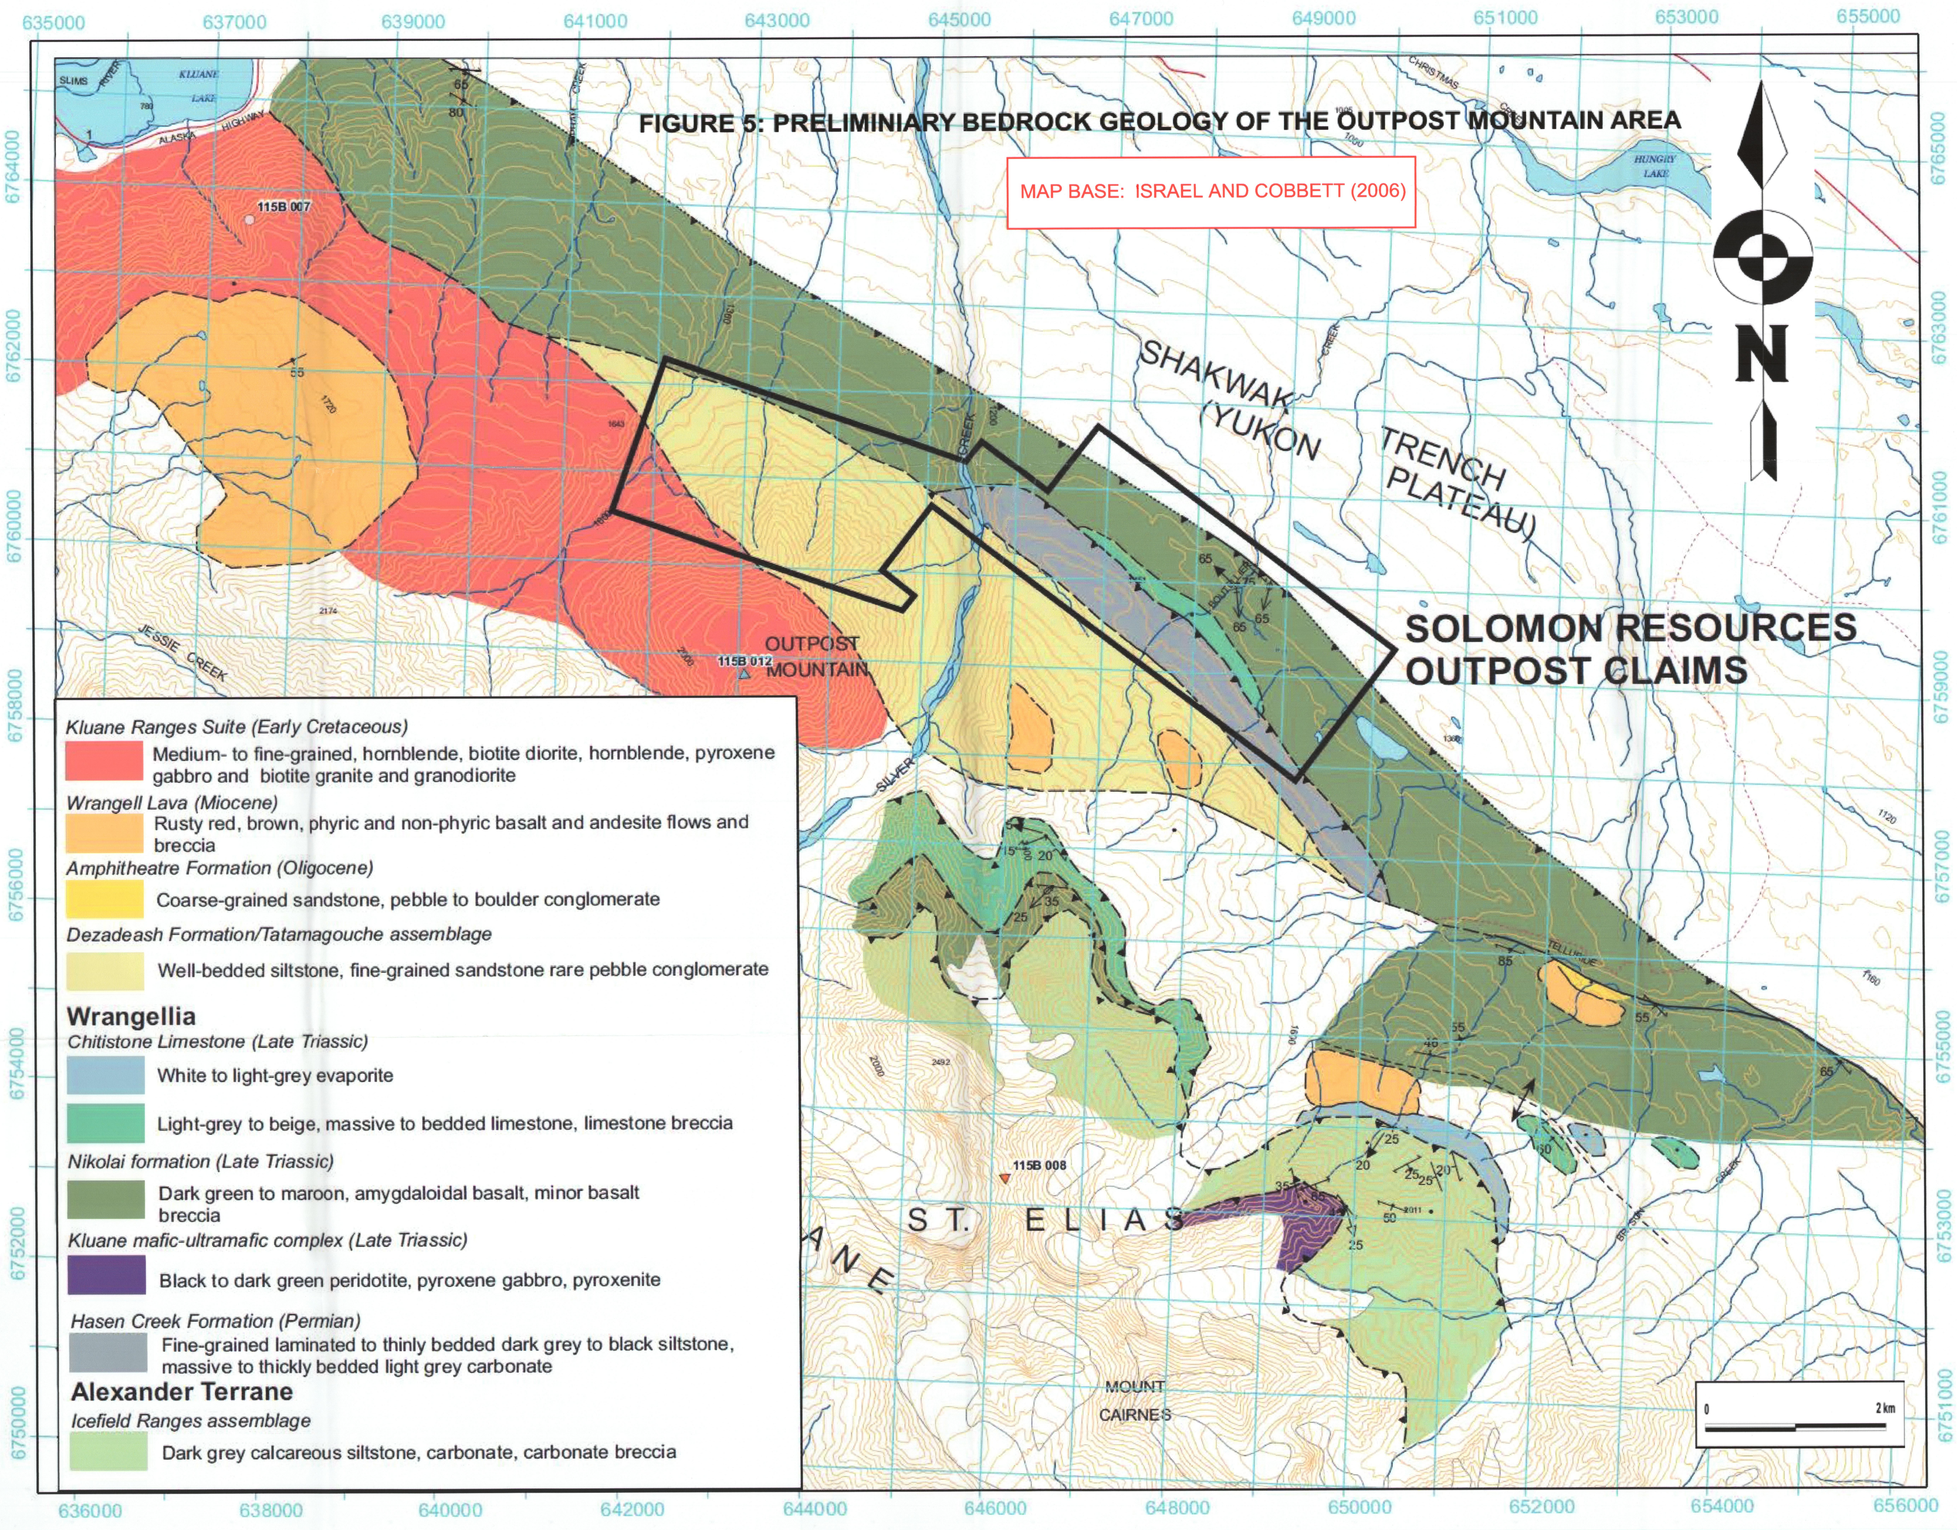
FIG 1 CLAIM MAP

FIGURE 5: PRELIMINIARY BEDROCK GEOLOGY OF THE OUTPOST MOUNTAIN AREA

MAP BASE: ISRAEL AND COBBETT (2006)



Kluane Ranges Suite (Early Cretaceous)

Medium- to fine-grained, hornblende, biotite diorite, hornblende, pyroxene gabbro and biotite granite and granodiorite

Wrangell Lava (Miocene)

Rusty red, brown, phyric and non-phyric basalt and andesite flows and breccia

Amphitheatre Formation (Oligocene)

Coarse-grained sandstone, pebble to boulder conglomerate

Dezadeash Formation/Tatamagouche assemblage

Well-bedded siltstone, fine-grained sandstone rare pebble conglomerate

Wrangellia

Chitistone Limestone (Late Triassic)

White to light-grey evaporite

Light-grey to beige, massive to bedded limestone, limestone breccia

Nikolai formation (Late Triassic)

Dark green to maroon, amygdaloidal basalt, minor basalt breccia

Kluane mafic-ultramafic complex (Late Triassic)

Black to dark green peridotite, pyroxene gabbro, pyroxenite

Hasen Creek Formation (Permian)

Fine-grained laminated to thinly bedded dark grey to black siltstone, massive to thickly bedded light grey carbonate

Alexander Terrane

Icefield Ranges assemblage

Dark grey calcareous siltstone, carbonate, carbonate breccia
