EXECUTIVE SUMMARY

The 1,253 hectare Day Property is located within the Dawson Range Mountains of the Klondike Plateau region in west-central Yukon. The property center is near UTM coordinate 654548E 6907299N. The Day Project is 7 km southeast of the Hay Claims.

The Day claims have potential to host porphyry copper-moly mineralization similar to other porphyry deposits found in the Carmacks District of Yukon.

The Day area was first (briefly) explored in 1985 by Kerr Addison Mines (KAM). Exploration in results in 1986 prompted KAM to stake the area.

The Day area has not been mapped at scales greater than 1:50,000. Limited mapping by KAM in 1986 estimated Day to be underlain by Cretaceous intrusive and volcanic rocks. A granodiorite batholith covers most of the northern claim area; the granodiorite is intruded by rhyolite, alaskite, granite, rhyolite quartz feldspar porphyry dykes and other small plutons. Andesitic and basaltic rocks occupy parts of the north, central and south-central regions of the property. Quartz veins in the area are primarily hosted by rhyolite, granodiorite and andesitic rock units found on the north end of the existing Day claims. Rhyolitic rocks are commonly clay altered, locally silicified and sericitized. Granodiorite is clay altered and pyritized in the vicinity of quartz vein occurrences.

In 1985 values of up to 2,000 ppb Au were obtained from the Fog (vein) Zone, which consists of sheeted quartz vein talus spread over an area of 30m x 300m. A quartz-carbonate to quartz breccia vein southwest of the Fog Vein, (Vein 2), appears to have a 500m extent and displays high Sb values. Other veins and stringers on the property contain gold values in the 50 to 250 ppb range. A northwest trending VLF anomaly was found that parallels the Fog Zone. Four coincident VLF and multi element soil anomalies were found in 1986. It is quite possible that the north end of the Day claims hosts several sub-parallel veins with the VLF reflecting the trend. Many quartz vein occurrences on the property remain unsampled.

In 2010, 544 soil samples were collected over the northern part of the Day claims. The survey identified what appears to be a large (900m x 250m) porphyry copper-moly related soil anomaly (Frog Zone) over the north-east sector of the claims. Frog is coincident with an area of alteration and is anomalous in copper, molybdenum, silver, bismuth, iron, mercury, lead antimony and zinc. A magnetic anomaly (Andy Zone) appears to be associated with the alteration and soil anomaly; Andy is at the contact between a mapped andesite (altered) and a local granodiorite. An arsenic/antimony anomaly exists over the north-central part of the Day claims. In the central Day area a strong bismuth soil anomaly occurs coincidentally with a strong color anomaly; the color anomaly is due to alteration associated with strongly bleached and oxidized andesitic pyroclastic rocks. Gold-in-soil values on the Day claims appear to be relatively weak, as would be expected over a weathered porphyry system. Silver values peak at 1.5ppm.

The Frog Zone and related alteration appears to extend off the Day Property to the east. The picture on the front of this report shows the (off claims) surface alteration related to the Frog Zone.

LOCATION and ACCESS

Figure 1

The Day Project is located in the Yukon Territory in the northern part of Canada (fig. 1).

The target area is located in the Dawson Range Mountains of west-central Yukon. The Day Property is situated on NTS Map Sheets 115J 08 & 01 and 115I 05. The target area is located 94 km west-north-west of Carmacks, Y.T.

The UTM coordinate of the property center is 654462E 6907868N

The Day Property is within the Whitehorse Mining District.

Figure 2

The Day claims are accessible only by helicopter. Access is available from Carmacks. There is also limited access to the Day area by way of the Northern Freegold exploration camp (Mt. Freegold area). This access only 35 km east of the property. The Day area lies 7 km southeast of the Hay claims.

Carmacks is 171 km north of Whitehorse, which is roughly 275 kilometers to the north of the all season shipping port at Skagway, Alaska.

Figure 3

PHYSIOGRAPHY, VEGETATION and CLIMATE

The Day Project is located, on a flat north trending ridge with gentle slopes. The property is within the Dawson Range Mountains of the Klondike Plateau region of Yukon. The Dawson Range hosts barren to heavily forested areas that cover low rolling hills to slightly mountainous terrain. Elevation on the property ranges from 1400m to 1900m. Vegetation in the upland areas is very sparse. There are no trees on the property because of being above the tree line (1250m). The main trees in the lower areas are black spruce, trembling aspen and white spruce. Undergrowth on the property consists mainly of buckbrush willow.

Drainage in the area is good, due to the fact that the property is located along a central ridge. Local creeks have a continuous supply of water during the spring and summer months. Permafrost is present on most north facing slopes.

The climate of the area is typical of the interior continental region at this latitude. Winters are long with short hours of daylight and average daily temperatures of -20 Celsius. Summers are pleasant and warm with long days (24 hours of daylight on June 21), although it can be quite rainy at times. The average summer temperature is 20 Celsius with highs ranging into the high 30's.

(UN) GLACIATED TERRAIN

The Day Project is located in very old glaciated terrain, which characteristically has deeply weathered bedrock and soil. The last glaciers passed over the area 3 million years ago. Old glaciated areas such as where the Day Property is located can be considered unglaciated in terms of how the local soils have developed.

Soil sampling, and interpretation in the upland areas of (un)glaciated regions is less complicated than in glaciated regions and valley bottoms because surficial materials

(soil anomalies) are primarily derived from local weathered bedrock. The main complicating factor in these settings is that dilutive surface materials get mixed into underlying soil horizons through cryoturbation, which dilutes the geochemical signature (Bond and Sanborn, 2006). This is particularly common on, permafrost laden, north-facing slopes (Smith *et al.*, 2009).

Another important factor to consider in unglaciated areas is that local bedrock may have been exposed to extensive downward weathering. This type of condition could mask over the soil geochemical signature of an area because the geochemical profile is severely depleted (leached) in upper bedrock environment.

PROPERTY and CLAIM STATUS

The Day Project covers an area of 60 claim blocks (12.5 sq km) in Yukon. The claims are owned by Beringia Gold Corporation, Nokuyukon Holdings Ltd and Dawsun Gold Mining Ltd. A record of the claims and expiry dates, current to April 20, 2011, is highlighted in the list below.

Page 1 of 2

Figure 4

CARMACKS PORPHYRY BELT

The Day Project is located along the southwestern part of the Carmacks Porphyry Belt (CPB). The CPB is highly underexplored for porphyry deposits. It hosts several deposits that are considered significant. The two largest deposits in the belt are Casino and Cash. Other deposits within the belt include Nucleus, Stu, and Revenue.

Most deposits within the belt appear to be controlled by northwest trending fault structures. There are many such structures in the CPB that have not been explored. Unexplored east - west trending structures also exist that could have a bearing on mineralization in some areas.

The Casino deposit is one of the largest, highest grade porphyry deposits in Canada. It contains 914,000,000 tonnes @ .212% Cu, .237 g/t Au, .0236% Mo for 4.27 billion lbs Cu, 6.96 million oz Au, 475 million lbs Mo).

The Cash Deposit has not had much exploration work due to being selected in a native land claim. The deposit is owned by the Selkirk First Nation.

Base on very limited drilling from the mid 1970's, Cash is estimated to contain 36,000,000 tonnes @ 0.17% Cu and 0.018% Mo.

Casino is 68km to the northwest of the Day property. Cash is 27km to the northeast.

Figure 5

DAY PROJECT

Figure 6

Figure 7

HISTORY

The Day Property is in a semi-remote location that does not have road access. As a result the area is very under-explored.

Kerr Addison Mines first discovered mineralization in the Day area in 1985; a 2000ppb Au value was obtained from the Fog Vein Zone that year. Follow up of this anomaly in 1986 revealed the existence of additional quartz veins in the area which prompted the subsequent staking of the Fog property. Twelve man days were spent exploring the Fog claims property between September 3 and 9, 1986. The program involved the implementation of a soil and VLF survey over an irregular 1.3 km x 0.8 km grid on the northeast half of the property. Snow cover prevented mapping and rock sampling of the grid. The property was also mapped and sampled at a 1:50,000 scale.

1986 Exploration Program

A total of 366 soil and 37 rock sample were collected from the property in 1986. Soil samples were collected at 25m intervals on lines 100m apart over an irregular 1.3 km x 0.8 km grid.

Values of 2000ppb (also 440ppb, 430ppb, 105ppb, 50ppb) Au and 4.3ppm Ag were obtained from the Fog Vein Zone. The southeast extent of the vein has not been sampled. Other veins on the present Day property carried the following gold values:

- Stringer zone (just north of Fog) - 260ppb Au
- Stringer zone (slightly north of Fog) - 65 ppb Au.
- Quartz stringers (200m east of Fog) - 300ppm Sb and 5.7ppm Ag.
- Vein 2 - 67 and 80 ppm Sb.
- Tetrahedrite in veins (in (north) altered granodiorite) - 1100 and 1300 ppm As
- Small quartz vein (in same vicinity as above) - 105 ppb Au.
- Quartz vein float (in altered (east) granodiorite and andesite) - 240ppb and 125ppb Au.
- Quartz vein breccia (750m south of the Fog - in altered rhyolite) - 200ppb Au.
- Drusy, vuggy quartz (to the west - in granodiorite) - 140ppb Au.
- Most Ag values were less than 2ppm.

1986 soil anomalies populations were generally low with maximum values of 45ppb Au, 1.6 ppm Ag, 260ppm As and 4.4 ppm Sb. Ag values were negligible with only three high values of 1.1, 1.3 and 1.6 ppm. These values correspond with weak Sb anomalies in the 1 - 2.5 ppm range. Au anomalies occurred as spot highs with one weak northwest trend in the southeast corner of the grid. A northwest geochemical trend was strongly indicated by the contoured As data and even more so by the contoured Sb data.

A VLF electromagnetic geophysical survey was also conducted in 1986. Strong north-northwest to northwest trends were outlined by the survey; although they do not directly relate to known quartz veins, quartz float occurs within and along the VLF highs. The EM data suggests that there may be several sub-parallel veins in the northern Day area. Several VLF anomalies correspond to anomalies outlined by the soil survey. The trend of the most western VLF anomaly may be reflecting, in part, the granodiorite/andesite contact.

GEOLOGY

Figure 8

Regional

The Day Property is located in an area of complex geology where Cretaceous granodiorite is overlain by volcanic rocks of the Cretaceous Mt. Nansen and Carmacks Groups. Yukon Geological Survey mapping shows an east-west trending faulted contact between the granodiorite and Carmacks volcanics (1.4km) north of the Day property boundary. A north to northwest trending felsic feldspar porphyry dyke swarm, also of Cretaceous age, cuts across the north-central part of the property.

Property

According to Kerr Addison Mines (KAM) from 1986, the (northern) Day claims are primarily underlain by a granodiorite batholith which appears to be the source of andesitic pyroclastic rocks that occupy the northern areas of the property. A rhyolite quartz feldspar porphyry dyke swarm, rhyolite, as well as alaskite, granite and other small plutons all intrude the batholith. All of these rock units are probably related to the porphyry dyke swarm.

Andesite pyroclastics have been noted in the central Day claims area (lower part in figure 8). The volcanics are strongly bleached (altered) and correspond with the location of a light orange-yellow-buff colour anomaly. South of this zone, basalts of the Carmacks Group overlie the pyroclastics.

Photos of the day area appear to show altered (andesite) rocks immediately to the east of the Day Claims, on what is known as Camp Hill (see image on front page of report).

Structure

The structural trend of the area appears to be north-northwest to northwest to less commonly westerly as evidenced by dyke, vein, fault and VLF trends. Inferred structural lineaments from satellite images appear to show northwest and northeast trends.

GEOCHEMISTRY

Soil Sampling

A total of 544 soil samples were collected (from 609 sites) on the Day Property between July 6 to July 12, 2010 (blue dots in figure 9). All samples were collected from the C horizon and at an average depth of 60cm. The samples were collected in Kraft type sample

bags which were dried at camp. Samples were brought to Whitehorse when the Day soils project was completed. All samples were prepared for assay at ACME (Prep) Labs in Whitehorse then sent to ACME Labs in Vancouver, B.C. and analyzed by ICP-MS Group 1DX2. The soils were assayed for 37 elements. Soil samples were collected at 100m soil site intervals and along lines that were space 100m apart. In several areas soil sample collection was hampered by talus slopes or boulder fields. Soil locations with a "no soil" designation have been removed from the map in figure 9.

It should be noted that all soil samples were screened to 80 mesh size prior to assay. The results of using an 80 mesh sample may be that the full quantitative potential of the assay may not have been exercised, as there have been past reports published by the Yukon Geological Survey that stipulate that the best soil survey results are obtained from sampling residual soils in unglaciated terrain by screening to 200 mesh. This more detailed screening procedure apparently captures more of the courser gold grain fraction of the soil sample, more readily. It is recommended that all future soil sample surveys use 200 mesh screening.

EXPLORATION RESULTS, ECONOMICS & DISCUSSION

Preliminary exploration over the Day Property in 2010 shows that it hosts a large multi-element soil anomaly across the northern 1/4 of the property. The anomalous area is approximately 1km x 2km. The area of interest can be (roughly) sectioned into 4 zones (figure 10). Two other soil zones occur to the south. All of the anomalous elements are those typically found in intrusive environments.

Figure 10

Zone A appears to host a porphyry copper-molybdenum related soil anomaly. The center of the anomaly is located at UTM 655534E 6909151N. The soil anomaly is likely reflecting bedrock conditions, as there has been hydrothermal alteration and intrusion related mineralization found in local bedrock. The Frog anomaly is located to the east of previous mineralization found in the Fog Zone in 1986.

Zone B is located over the east-central part of what was Kerr Addison's Fog Zone from 1986. The zone is mainly an arsenic/antimony (weak gold) anomaly that follows a northwest trend through the Fog Vein and Vein 2 zones of KAM and (potentially) continues off the north end of the Day Property. The center of the anomaly is located at UTM 654915E 6909400N.

Zone C is located at UTM 654523E 6908328N, which is in the northwest corner of the Day claims. The zone has a coincidental bismuth-mercury-moly anomaly. The anomaly covers the western sections of KAM's Fog Zone.

Zone D is located below Zone B. The zone is mainly anomalous in moly-lead-silver. It may be that the Zone D is an offshoot of the lower parts of Zone A. The anomaly covers the southern sections of the Fog Zone from 1986.

Zone E hosts a bismuth anomaly. The zone is of interest because it is centered around an altered, bleached andesite volcanic pyroclastic unit. The zone is also located over a prominent color anomaly.

Zone F is another anomalous soil zone that is located in the southeast part of the Day soil grid (east-central part of the Day claims). The zone is very anomalous in moly as well as antimony. Soil values of up to 40.7ppm Mo and 14.7 Sb exist within the zone. The zone is of interest because the anomalies appear to be associated with the western section of the "Andy Zone" magnetic anomaly that is described later in this section.

Zone A is an important new discovery that hosts a coincidental multi-element soil anomaly (figure 11). Soil values within the zone reached as high as 37.1ppm Mo, 390ppm Cu, 1.5ppm Ag, 12ppm Bi, 4.9ppm Sb, 268ppm Zn, 320ppb Hg, 442ppm Pb, and 7.3% Fe. The coincidental nature of these anomalies is important and suggests that they are reflecting an nearby mineralized source. Gold values were weak over the area.

Figure 11
(95%tile Values)

The Frog Zone (figure 12), within the Zone A, is the most important anomaly discovered to date on the Day property. Frog is a 900m x 250m area where copper and molybdenum soil values are highly coincidental. Copper values range from 100 - 390ppm; Moly ranges from 10 - 37ppm. The zone also has anomalies in the elements Ag, Hg, Sb, Bi, Pb and Zn.

Figure 12

The source of the Frog anomaly may be an intrusive (porphyry copper) system at depth. The anomaly was found as a result of soil sampling along the edge of an alteration zone located on the east side of the Day grid. The greater part of the alteration zone appears to trend off the Day claims. This (off claims) area was acquired (through staking) and is now called the Nite Claims. The >200m wide altered zone (tan color on hillside in figure 13) is associated with a government mapped andesite rock unit; andesites are a rock type that is often associated with the main mineralized zones of porphyry copper deposits. The apparent level of erosion in the area would support the exploration and discovery of a porphyry deposit; as well, the Day area is in the midst of the Carmacks Porphyry Belt which lends obvious credence to the idea that porphyry deposits may occur in the area.

The position of Kerr Addison's (1986) Fog Zone fits well into the scenario that the Day Property is potentially over top or on the edge of a porphyry related zone of alteration & mineralization. In 1986 KAM geologists surmised that the Fog Claims existed within the lower levels of a high level epithermal system; epithermal occurrences are often found above or off to one or both sides of porphyry copper deposits.

The andesitic volcanic rocks and alteration zone on the eastside of the Day claims (and off claims) is also associated with an interesting magnetic anomaly. The stand-alone anomaly (Andy Zone - figure 14) is important because it is reflecting the location of a magnetic body that is in the immediate vicinity of the andesite and where the volcanic rocks are in contact with the local granodiorite intrusion. The magnetic signature may be representative of potassic alteration, which is a characteristic alteration assemblage

Figure 13

within porphyry systems. The Day Property is also found on the edge of a large regional gravity low (fig. 14), which is typical of porphyry deposits within the Carmacks Porphyry Belt; it signifies being on the perimeter of an intrusive body. Geological contact areas such as these are highly favorable to host mineralization. The volcanic-Intrusive contact may also be a structural zone; the contact is trending in the same direction as VLF anomalies found by KAM in 1986. VLF EM surveys are often used to map geological structure. Landsat imagery in this area shows a wide, 25km long lineament (double arrow line - figure 14) immediate to the east of the magnetic anomaly. This may be a

Figure 14

Figure 15

strike-slip fault. Faults are conduits that vector magma and hydrothermal fluids towards the earth's surface and into conglomerations that form ore deposits. Many porphyry deposits are associated with strike-slip fault structures. Faults often control the emplacement and distribution of mineralization in porphyry copper systems.

The presence of the rhyolite porphyry dike swarm within KAM's Fog Zone is another good indicator of a being in a area that may host porphyry deposits. Many porphyry deposits throughout the world are hosted by porphyry dike swarms as is described in the British Columbia Geological Surveys deposit model descriptions for **Porphyry Cu / Mo / Au** - *"Local swarms of dikes, many with associated breccias, and fault zones are sites of mineralization"*. KAM geologists also noted that the granodiorite and porphyry dike swarm associated rocks were the main host for quartz veins, clay alteration and pyrite. These geological observations, along with the presence of the altered andesite volcanics, a stand-alone magnetic anomaly on the edge of a large fault, other alteration zones, and two, porphyry related, geochemical anomalies (Zones A & F) are good reasons to believe that the Day area has excellent potential for the exploration and discovery of a porphyry copper deposit. The deposit may not be "daylighting" because of the affects of weathering in the area, but there is enough evidence to suspect that there is porphyry mineralization nearby.

If the Day area is host to a buried porphyry it definitely will show up in the soils. The anomalies found in the A & F Zones may be the telltale sign that porphyry mineralization is in close proximity to previous exploration. The soils values found in those zones in 2010 may prove to be just the halo around more significant mineralized zones to the east.

INTERPRETATION AND CONCLUSIONS

The Day Project represents a property of importance based on being in a district that hosts porphyry deposits, having favourable geology, geochemistry and a magnetic geophysical signature that may be representing the location of a altered porphyry intrusion. The Day project exists within the under-explored Carmacks Porphyry Belt which hosts deposits such as Casino, Cash, Nucleus, Stu, and Revenue. The Casino Deposit, 68km to the northwest, is a large copper-moly-gold porphyry that contains over 3.6 billion pounds of low grade copper and 5.7 million ounces of gold. The Cash Porphyry Deposit is 27km to the northeast.

Day hosts host a newly discovered porphyry copper-molybdenum related soil anomaly in an area known as Zone A (Frog Zone). The Frog Zone is located at UTM 655534E 6909151N. The Frog soil anomaly is likely reflecting bedrock conditions, as it is located over an apparent zone of hydrothermal alteration that has been identified in the area, but not mapped or sampled. The Frog anomaly is located to the east of previous mineralization found by Kerr Addison Mines in 1986.

The Day Property is underlain by a granodiorite batholith which is intruded by a rhyolite quartz feldspar porphyry dyke swarm, and related rocks (rhyolite, alaskite, granite and other small plutons). Andesite volcanics have also been noted on the Day claims. The volcanics are strongly bleached (altered) and correspond with the location of a light orange-yellow-buff colour anomaly in the central claim area. In this same location, basalts of the Carmacks Group overlie the andesite.

Altered andesite volcanic rocks also occur immediately to the east of the Day claims (on the recently staked Nite Claims); the alteration zone is visible in photos of the Camp Hill area. An important stand-alone mag anomaly (Andy Zone - figure 15) exists at the location of the andesite and granodiorite contact zone. The magnetic signature may be representative of a potassic alteration event associated with a porphyry copper system. The Day property is also found on the edge of a large regional gravity low, which is typical of porphyry deposits within the Carmacks Porphyry Belt.

In conclusion, the Day Project has potential to host porphyry copper mineralization similar to that in other parts of the Carmacks District. In 2011 a soil survey should be conducted over the altered andesite and associated magnetic anomaly in the east-central part of the Day claims. Any soil anomalies found in the Day area should be examined carefully as the area is located in an (un)glaciated region and thus may have been affected (reduced) by surface weathering. In Yukon deep weathering can affect soil profiles and bedrock to depths of up to 100m. All future soil sampling should be conducted with a 200 mesh sample prep to get the best results for gold..

Client: **Nokuyukon Holdings Inc.**

110 Falcon Dr.

Whitehorse YT Y1A 6C7 Canada

Submitted By: Mark Lindsay

Receiving Lab: Canada-Whitehorse

Received: July 28, 2010

Report Date: August 19, 2010

Page: 1 of 13

CERTIFICATE OF ANALYSIS

WHI10000149.1

CLIENT JOB INFORMATION

Project: NHL-10551-YT-DAY
Shipment ID: Day Grid -1
P.O. Number
Number of Samples: 360

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Nokuyukon Holdings Inc.
110 Falcon Dr.
Whitehorse YT Y1A 6C7
Canada

CC: Phil Jackson

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
SS80	327	Dry at 60C sieve 100g to -80 mesh			WHI
Dry at 60C	327	Dry at 60C			WHI
SPLP	33	Sort, label and box pulps			VAN
1DX2	311	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only.
** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS

WHI10000150.1

CLIENT JOB INFORMATION

Project: NHL-10551-YT-DAY
Shipment ID: Day Grid -1
P.O. Number
Number of Samples: 249

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Nokuyukon Holdings Inc.
110 Falcon Dr.
Whitehorse YT Y1A 6C7
Canada

CC: Phil Jackson

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
SS80	230	Dry at 60C sieve 100g to -80 mesh			WHI
Dry at 60C	230	Dry at 60C			WHI
1DX2	229	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
SPLP	19	Sort, label and box pulps			VAN

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only.
** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS

WHI10000393.1

CLIENT JOB INFORMATION

Project: NHL-10551-YT-DAY
Shipment ID: Day Grid -1
P.O. Number
Number of Samples: 21

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Nokuyukon Holdings Inc.
110 Falcon Dr.
Whitehorse YT Y1A 6C7
Canada

CC: Phil Jackson

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES
