BH11-24	27.00	28.00	<p>Black, aphanitic, weakly carbonaceous mudstone. The occasional chert conglomerate interbed occurs throughout (up to a max of 10% of mode). The conglomerate consists of sand-sized particles that are moderately-well sorted and subrounded. Chert is the dominant clast with lesser black and dark grey mudstone clasts. The mudstone interval is uniform in texture and composition throughout. Bedding occurs predominantly at 30 deg tca. Weak qtz veining from 18m to 29m. Pyrite forms euhedra and coats the conglomerate clasts (up to a max of 2%). Minor qtz veining between 38m to 50m.</p>
