# 1. EXECUTIVE SUMMARY

The Dublin Gulch Property is located in the Mayo Mining District, Yukon Territory, approximately 85 kilometers north of Mayo and 370 kilometers due north of Whitehorse. The project is owned and operated by StrataGold Corporation, a wholly-owned, directly-held subsidiary of Victoria Gold Corp.

The 2011 program at Dublin Gulch comprised diamond drilling for exploration (14,824.98 m), engineering (1,886.85 m), and metallurgical (153.92 m) purposes, reverse circulation (RC) drilling for exploration (300.23m), environmental (765.20m) and metallurgical (10m) purposes, a regional rock chip sampling program, bulk density analysis, baseline environmental studies, and geotechnical test pitting of locations proposed for facilities related to the Eagle Gold Mine.

Results of the Eagle Gold Deposit drilling, which focused on north zone, deep, ore zone, alteration drilling and geotechnical in-pit drilling, provided data for geotechnical and alteration modeling purposes and provided further information for poorly defined areas proximal to the ore body. Results of the Eagle North zone, Eagle deep and alteration drilling identified several thick continuous zones of low-grade gold mineralization and narrower, higher-grade intervals within the pit and to the immediate north of the SRK $1500 pit shell, indicating potential to expand the resource to the north and at depth.

Drilling at Olive, which is located approximately 2.7 km northeast of Eagle on the north western margin of the Dublin Gulch stock, targeted depth extensions of surface mineralization identified by resampling a historic trench and returned several narrow high-grade intersections within a broader zone of low grade mineralization, suggesting similarities to the Eagle Gold Deposit. Drilling at Shamrock identified both a higher-grade core and lower-grade surrounding halo, also indicating similarities to the Eagle Gold Deposit.

Two of the four drill holes at Popeye identified narrow, high-grade mineralized intervals near surface in shallow holes. Popeye is an isolated small cupola of granodiorite which may extend at depth and also link to the main intrusive body to the east around the Shamrock Zone. Continued exploration at Popeye should focus on targeting extensions to the high-grade gold and identifying a broader low grade halo.

Drilling at Peso Rex targeted a series of polymetallic vein faults with similarities to high-grade Ag-Pb-Zn mineralization of the Keno Hill silver district, located approximately 34 km to the east southeast. The twelve holes drilled in 2011 targeted two of the five Peso veins and the Rex vein and were designed to intersect outcropping vein mineralization at depth. Four of the twelve holes identified silver mineralization of similar width and tenor to that reported from the Keno Hill district, and should be followed up with drilling designed to focus on evaluating extensions of identified mineralization at depth and along strike, and testing the undrilled veins.

Results of the surface geochemical sampling program targeted mapped intrusive bodies and identified several zones of interest across the property, most notably Olive, Shamrock and Rex-Peso. Sampling and mapping of the distal prospect areas was hampered by a lack of outcrop, particularly in the Whiskey Wrinkles and Lynx Dome areas. Previous geophysical investigations have identified a number of areas of

interpreted sub-surface intrusive bodies, and ongoing regional surface programs should focus on these areas. Of particular interest is Lynx Dome, which shows an underlying interpreted intrusion and adjacent mapped limestone, which should be evaluated for skarn mineralization.

# 2. INTRODUCTION

The Dublin Gulch claims are located in the Mayo Mining District, Yukon Territory, approximately 85 kilometers north of Mayo and 370 kilometers due north of Whitehorse (Figure 1). The property outlined for assessment comprises 1912 contiguous quartz mining claims, 10 quartz leases and one federal crown grant covering approximately 34,576 hectares of land. StrataGold Corporation, a wholly-owned, directly-held subsidiary of Victoria Gold Corp. is the registered owner and operator for all claims and leases. This assessment report details work carried out on the Dublin Gulch Property (under LQ00303) between January 1st, 2011 and January 31st, 2012. For the purposes of claim renewal, only work completed between June 1st, 2011 and January 31st, 2012, and the costs associated with that work was applied to the claim groupings.

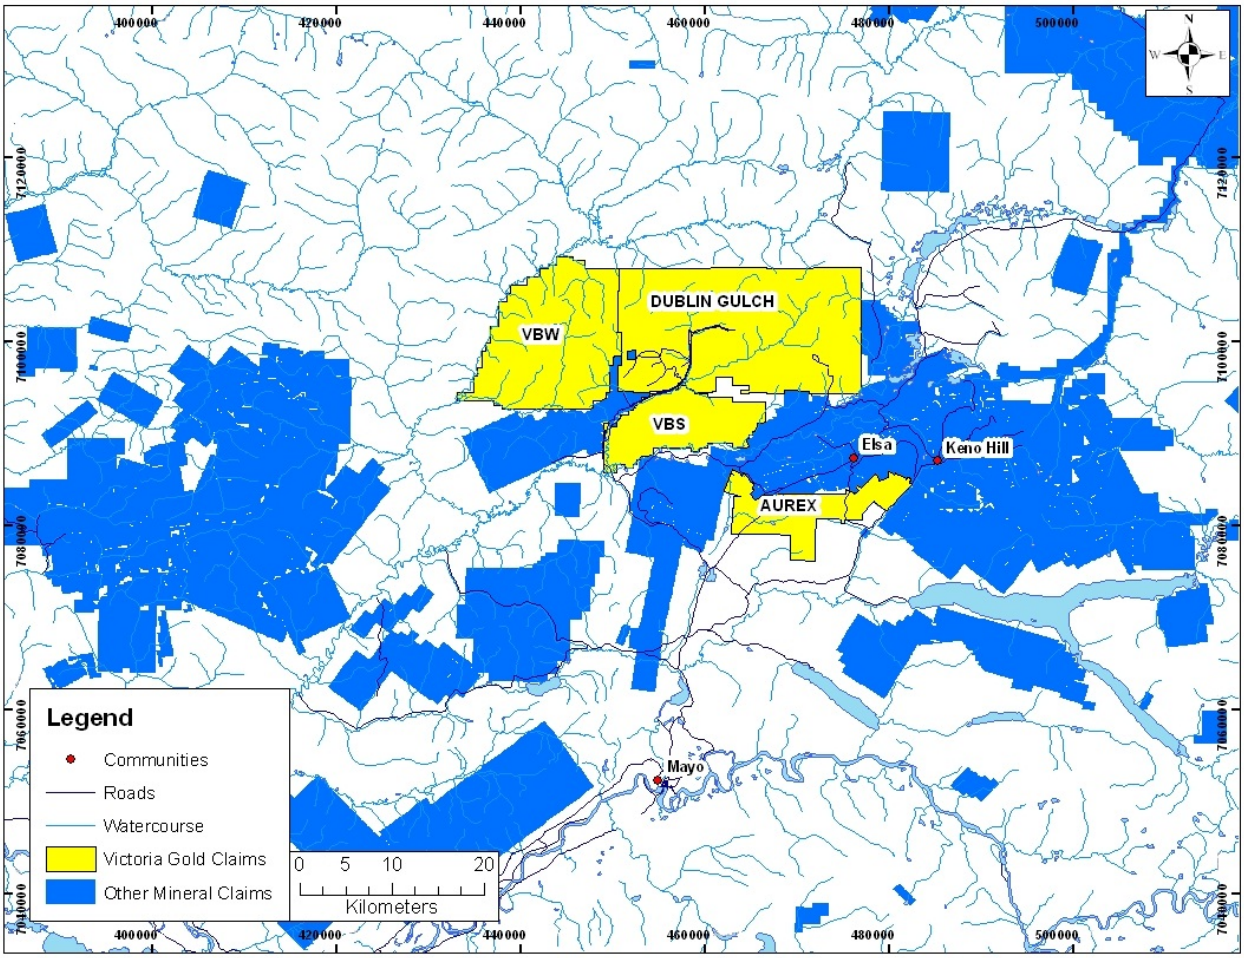

Figure 1 - Property location map

## 2.1. Diamond and RC Drilling

Exploration drilling comprised the bulk of the program, with most of the work completed at the Eagle Gold Deposit, and the Olive and Shamrock prospects. Smaller drill programs were conducted at the Popeye, Steiner, Rex-Peso and West Potato Hills prospect areas for exploration. Drilling was also completed to support further geotechnical, environmental and metallurgical assessment of the Eagle Gold Deposit and proposed infrastructure locations for the Eagle Gold Mine.

The main objectives of the drilling program were to:

1. Complete holes on Eagle alteration drilling thus improving the alteration model.
2. Acquire more data on the Eagle North/blind zone.
3. Complete infill drilling within the proposed Eagle pit area.
4. Test the grade of the Eagle deposit at depth.
5. Further test the Olive, Shamrock and Popeye prospects and the Potato Hills trend (PHT).
6. Obtain samples for metallurgical test work.
7. Evaluate the potential of the Peso and Rex veins.
8. Acquire geotechnical information for pit wall stability and the slope stability of potential heap leach pad and infrastructure sites.
9. Continue acquiring environmental information for baseline study.
10. Acquire hydrogeological information for the water balance model.

## 2.2. Regional Surface Sampling and Mapping

The 2011 regional surface sampling program was conducted across the Dublin Gulch project at both road- and helicopter accessible areas. The sampling program was conducted in conjunction with field mapping, and was designed to evaluate the property geology, obtain a better understanding of the geology and mineralogy of the property area and to define regional exploration targets for follow up with diamond drilling. Mapping and sampling was carried out on the Nugget, Whiskey Wrinkles, Lynx Dome, Rex-Peso, Bean Sidhe, Iron Rust and East Potato prospects, and facilitated by helicopter where road access was difficult or unavailable. At Rex-Peso, the surface sampling program drove the subsequent diamond drilling program, with drill holes designed to target sub-surface extensions of outcropping mineralized veins.

### *2.2.1 Olive Trench Sampling*

As part of the regional program, the historic Olive trench was systematically channel sampled and logged as a drill hole. Previous exploration had returned elevated Au from the trench, and grab samples in the area had returned up to 63.0 g/t Au. Outcrop in the trench comprises veined and altered granodiorite, with zones of significant arsenopyrite, scorodite and sulfosalt mineralization, and is a high-priority target for follow-up with diamond drilling.

## *2.3. Bulk Density Analysis*

Bulk density analyses were undertaken to provide regular bulk density measurements for holes drilled within the Eagle Gold Deposit. Samples were weighed in air and in water on site on a calibrated Cole-Parmer scale, and then sent to ALS Group's Vancouver laboratory for testing. The results were used to provide accurate density measurements of rock in the proposed pit area and to test for unexpectedly high or low density zones within the deposit.

## *2.4. Environmental Baseline Studies*

Ongoing environmental baseline studies were continued during 2011. The following were completed:

- Continued data collection from the installed weather stations located near Mar Tungsten and at the project camp site. Data collected included precipitation, temperature, humidity, solar radiation, barometric pressure, wind speed and wind direction. Snow sensors were added to both stations in April 2011 so snow depth measurements adjacent to the sensor fields can be taken.

- Hydrology data was collected throughout the year using automated and manual methods. Automated methods for recording stream flow included the use of hydrometric stations and levellogers deployed at various locations. Dublin Gulch, Eagle Creek, and Haggart Creek were the main streams on the property that were monitored with 9 continuous recording stream gauging stations and 27 hydrologic stations which were manually gauged. Freshet monitoring by means of photo monitoring which documented the transition from late winter snow covered conditions to peak stream flows was also undertaken.

- The continued collection of hydrogeology baseline data was also undertaken by measuring groundwater levels and sampling existing wells for select analytical parameters.

- Data collection was also carried out to assist with the update of the environmental baseline report related to water quality and aquatic biota. The field component involved the collection of water samples from 14 sites on a monthly basis from the Haggart Creek, Dublin Gulch, Eagle Creek and South McQuesten drainage basins to provide information on seasonal and spatial variability.

- Fish sampling programs were continued to determine seasonal fish presence, fish ages and

health and habitat data.

- Data relating to wildlife distribution in the project area was gathered from three sources; a March moose distribution survey, an incidental wildlife observation database that utilizes reports from on site personnel, and a summer breeding bird survey.

# 3. HISTORY

The following section is taken directly from Moran et al. (2012).

The Property has a lengthy history of exploration and placer mining dating from 1895.Placer gold mining began in 1895, and tungsten was identified in placer concentrates in 1904. In 1916,the Geological Survey of Canada discovered bedrock sources of scheelite in Dublin Gulch. Since 1970, there has been essentially continuous exploration on the Property, first for tungsten and then for gold. Approximately 110,000 oz of placer gold has been recovered from the Dublin Gulch area since production documentation was first initiated in 1978.

The chain of tenure leading to the current ownership began in 1977, when Queenstake Resources Ltd. staked the Mar claims to cover tungsten-bearing skarns in the Ray Gulch area. Canada Tungsten Mining Corp. optioned the ground and carried out exploration for both tungsten and gold between 1977 and 1986. The Eagle zone, the most significant of the known gold occurrences, is located approximately 3 km to the west-southwest of the tungsten occurrences and became the subject of significant exploration interest during this period.

In 1991, Ivanhoe Goldfields acquired the Dublin Gulch claims from Queenstake Resources Ltd. and commenced exploration for "Fort Knox Type" intrusive-hosted gold mineralization that continued until 1993. In 1993, Ivanhoe Goldfields estimated "Inferred and Potential" Resources within the Eagle Zone of 98.6 Mt with an average grade of 1.19 g/t Au. This historic estimate is considered relevant, but not compliant with the strictures of Nl43-101 and is included here for purposes of historical reference only.

No fieldwork was conducted in 1994.

In 1995, First Dynasty acquired the Property through acquisition of Ivanhoe Goldfields. In 1996, First Dynasty transferred the Property to New Millennium Mining Ltd., a wholly owned subsidiary. In 2002, First Dynasty changed its name to Sterlite Gold Ltd. In 2004, StrataGold acquired the Property from Sterlite Gold Ltd.as part of a larger transaction that included the Clear Creek Property. Victoria Gold acquired ownership of StrataGold in 2009.

The most extensive phase of exploration of the Eagle Zone took place between 1991 and 1996, during which time 48 core holes with an aggregate length of approximately 9,000 m, and 118 RC holes with an aggregate length of 21,300 m were drilled within the presently-defined Eagle Zone and surrounding area.

In 1997, Mineral Resources Development Inc. (MRDI) carried out a resource estimate of the Eagle Zone (historic in the context of NI 43-101, in support of a feasibility study) resulting in a Measured and Indicated Resource of 88.8 Mt at an average grade of 0.698 glt Au, and an Inferred Resource of 106 Mt at an average grade of 0.345 g/t Au. On the basis of the Measured and Indicated Resource, MRDI calculated a Mineable Reserve of 50.4 Mt at an average grade of 0.93 g/t Au. This estimate is considered relevant, but not compliant with the guidelines established in Nl43-101, and is included here for purposes of historical reference only.

In 2004, Snowden Mining Industry Consultants (Snowden) reviewed the 1997 MRDI resource estimate and concluded that the estimation methodology of MRDI was in accordance with the guidelines of NI 43-101, with the exception of the classification of the resource. Snowden re-estimated the resource using the MRDI data and parameters, and determined that at a cut-off grade of 0.5 g/t Au, the Eagle Zone contains an Indicated Resource of 55.2 Mt with an average grade of 0.934 g/t Au. Inferred Resources above the 0.5 g/t Au cut-off were estimated to amount to 17.3 Mt with an average grade of 0.743 glt Au. This estimate is considered to be both relevant and compliant with Nl43-101.

In 2005, StrataGold drilled 34 HQ holes with an aggregate length of 8,105 m. The program had three main purposes:

a. to test the west margin of the area for which a resource had been estimated, and an open pit had been designed by MRDI in 1997

b. to provide fill-in data in several areas of the designed pit

c. to extend the westerly strike of the Eagle Zone.

Holes were numbered starting with #276 (DG05-276C) to maintain the historic sequence. "DG05 refers to Dublin Gulch 2005; the c designation stands for core. In February 2006, Wardrop completed a NI43-101 compliant resource estimate on the basis of drill data acquired by StrataGold during 2005 that included an Indicated Resource of 66.5 Mt grading 0.92 g/t Au and an Inferred Resource of 14.4 Mt grading 0.80 g/t Au at a cut-off of 0.5 g/t (Carter and Mosher, 2006).

During 2006, in addition to soil and silt sampling, StrataGold drilled 10 diamond drill holes (4,282 aggregate meters) and excavated 11 trenches from which 347 samples were collected.

Twenty HQ holes were drilled during 2007 (aggregate length 5,627 m) which, together with the 2006 drilling program, was designed to increase the confidence in the resource model, and to continue testing of the western extent of the resource model. In 2008, 15 HQ holes (4,249 aggregate metres} were drilled to test the extents of the mineralized zone.

In 2009, Wardrop conducted a NI43-101 compliant update of the 2006 mineral resource estimate on the basis of 39 additional holes (14,158 aggregate metres) completed since the previous estimate. At a cut-off grade of 0.5 g/t Au, the estimate comprised an Indicated Resource of 98.5 Mt with an average grade

of 0.85 g/t Au and an Inferred Resource of 2 Mt with an average grade of 0.67 g/t Au (Jankovich et al., 2009).

During 2009, Victoria Gold drilled 14 core holes (5,122 aggregate metres) which included 7 exploration holes to test the western portion of the Eagle Zone, 4 geotechnical holes, and 3 metallurgical holes.

In April 2010, Scott Wilson completed a NI43-101 compliant update to previous resource and reserve estimates as part of a prefeasibility study (Scott et al., 2010). The update included holes drilled by Victoria Gold during 2009 and the resource estimate was constrained by a pit shell based on a gold price of US$1,050. All resources were classified as Indicated. The pit shell effectively represented a cut-off grade of 0.21 g/t Au and the resource totaled 154 Mt at an average grade of 0.65 g/t Au.

Scott Wilson estimated a corresponding reserve of 66 Mt with an average grade of 0.82 g/t Au . All reserves were classified as Probable and were estimated at cut-off grades by pit phase and by material type, averaging 0.35 g/t Au, and an assumed gold price of US$900/oz.

In 2010, Victoria Gold drilled 25 diamond drill holes (4,938 aggregate metres). All holes were HQ in size and drilled with a triple-core barrel, in order to minimize disturbance of the core and to maintain its orientation. Seven of the holes were drilled to quantify alteration: four to verify the absence of mineralization (condemnation holes), nine for exploration, and five for geotechnical purposes.

Data from the 2010 drill program was incorporated into a May 2011 NI 43-101 compliant update to previous resource and reserve estimates in advance of a feasibility study. At a cut-off grade of 0.35 g/t Au, the estimate comprised an Indicated Resource of 222.2 Mt with an average grade of 0.68 g/t and an Inferred Resource of 77.9 Mt with an average grade of 0.60 g/t Au.

# 4. CLAIMS

The Dublin Gulch property consists of a contiguous block of quartz claims (1,912), quartz leases (10) and one Crown Grant covering an area of approximately 34,576 hectares. The claims and leases are recorded in the name of StrataGold Corporation and are currently in good standing until their respective renewal dates from 2015 to 2027.

# 5. GEOLOGICAL SETTING

The Eagle Gold Deposit and the surrounding Dublin Gulch property is an interpreted intrusive-related gold system (IRGS) or porphyry system associated with the Eagle stock, a member of the 90 Ma Tombstone Plutonic Suite (TPS), which forms a narrow belt of intrusions extending 550 kilometres across the north-central Yukon. Like the majority of IRGS deposits, gold mineralization at Eagle occurs within the stock, although minor mineralization is noted within surrounding hornfelsed Hyland Group meta-sedimentary rocks. The following discussion on regional and local geology is mostly taken from Mair et al (2006a, 2006b) and Doherty (2007).

## *5.1. Regional Geology*

The Eagle project resides within upper Proterozoic Hyland Group (Figure2) rocks, which are part of the western Selwyn Basin, an epicratonic basin developed in a divergent margin setting established as the result of neo-Proterozoic rifting along the North American margin (Ross, 1991; Colpron et al., 2002). Jurassic convergence between the North American and Farallon plates led to the collision of outboard terranes with the continental margin, which resulted in northward thrusting and low-grade metamorphism of Selwyn Basin strata (Monger, 1993). In the Mayo region, the Jurassic-Cretaceous Dawson, Tombstone and Robert Service thrusts (Murphy and Héon, 1995), juxtapose Hyland Group rocks against Mississippian shelf units and Devonian to Jurassic clastic units. With waning deformation across the orogen by the mid-Cretaceous, emplacement of a series of northwardly-younging, orogen-parallel, felsic to intermediate plutonic suites occurred between 112 and 90 Ma (Mortensen, 2000). The Tombstone Plutonic Suite (TPS) is the most cratonward and youngest of the mid- Cretaceous plutonic belts emplaced into deformed Selwyn Basin strata. It extends in excess of 500 kilometers in an east-west direction, from the Yukon-Northwest Territory border to Dawson City, where it is truncated by the Tintina Fault Zone, a Cretaceous-Tertiary strike-slip fault with an estimated 450 kilometers of displacement. The TPS intrusions are typically <5 km in diameter and occur as composite plutons or as isolated pluton and dyke clusters. Compositionally they are predominantly monzogranite to quartz monzonite, with smaller volumes of later monzonite to quartz monzodiorite (Mortensen et al., 2000; Hart et al., 2004). They are weakly reduced to weakly oxidized and metaluminous to weakly peraluminous. Minor porphyritic, aplitic and calc-alkaline lamprophyre dykes (Mair et al., 2003) cross-cut and intrude the main stocks.

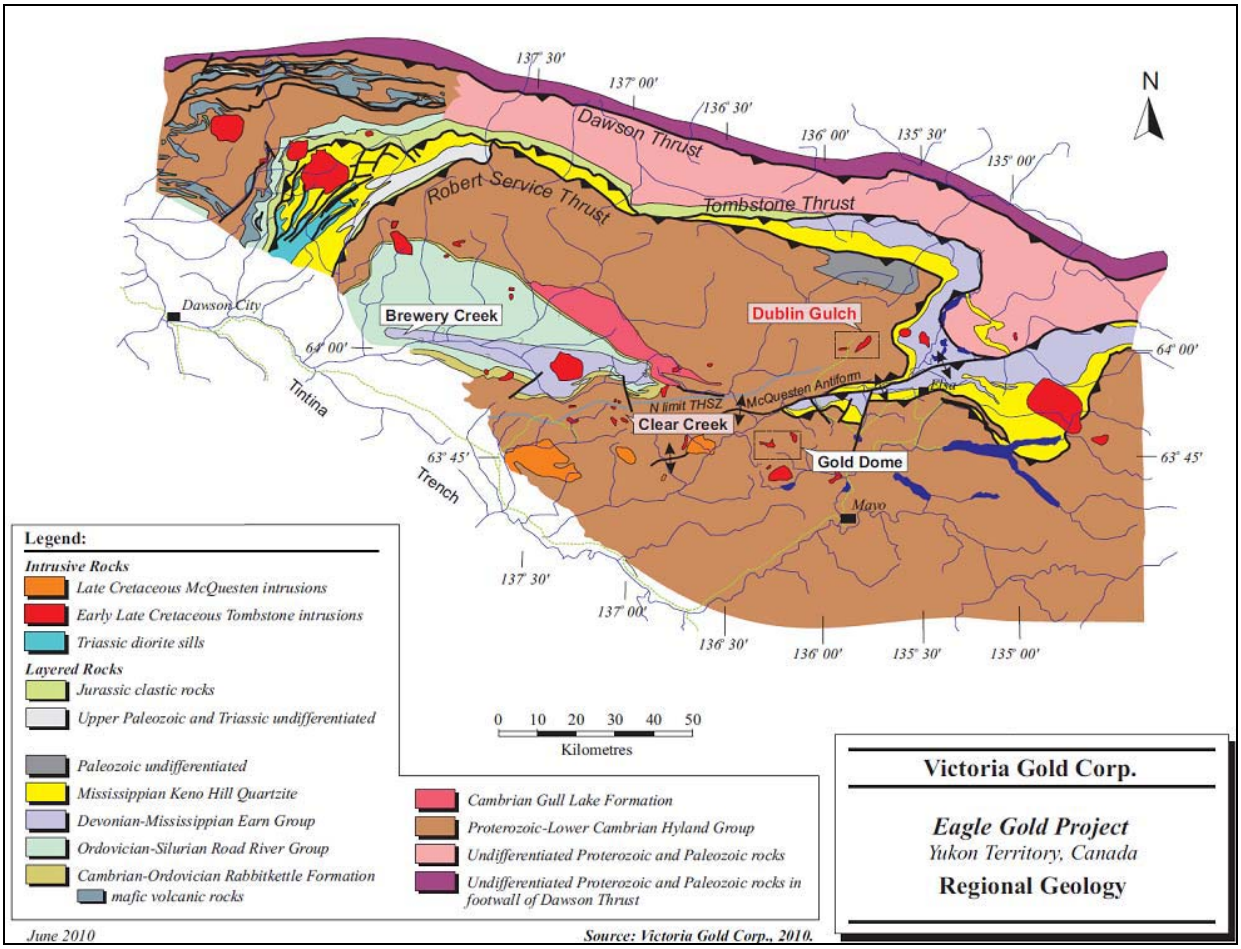

Figure 2 - Simplified geology of the western Selwyn Basin (after Mair, 2004)

### *5.1.1. Deposit Types*

Regionally, the TPS is spatially and possibly also genetically associated with a range of precious and base-metal occurrences. These include: intrusion-hosted sheeted vein systems (Fort Knox, Dublin Gulch, Sheeted Zone at Scheelite Dome), metasediment-hosted sheeted veins (Harvey-Rudolph Zone at Scheelite Dome), intrusion-hosted disseminations and stringers (Brewery Creek), skarns (Marn, Wolf tungsten), hornfels-hosted sulfide veins, sediment-hosted stratabound sulfide replacement and disseminated, stringer and breccia-hosted mineralization external to the hornfels. The characteristic metal association of TPS related deposits comprises Au-W-Bi-As-Sb-Te-Mo±Cu±Pb±Sn.

## *5.2. Deposit Geology*

The following description of property geology and mineralization is modified from Moran et al., (2012).

The property is located on the northern limb of the McQuesten Antiform and is underlain by Proterozoic to Lower Cambrian-age Hyland Group metasedimentary rocks and the Dublin Gulch granodiorite stock. The stock has been dated at approximately 93 Ma, and is assigned to the Tombstone Plutonic Suite The

Hyland Group comprises variably gritty, micaceous, and massive quartzite and intercalated muscovite, sericite and chlorite phyllite. The Dublin Gulch anticline, located midway between Dublin Gulch and lynx Creek to the south, has folded the metasediments about an axis that trends at an azimuth of 070° and plunges gently to the west-southwest.

The metasedimentary rocks have undergone regional metamorphism to greenschist facies and proximal to the Dublin Gulch stock are metasomatised and contact metamorphosed. A hornfels thermal halo surrounds the stock, and within the halo the coarse clastic components of the Hyland Group have been altered to quartz-biotite; the argillaceous components to sericite-biotite-chlorite schist and the carbonates to marble, wollastonite-quartz skarn and pyroxenite skarn. The hornfels extends from 80 to 200 m outward from the intrusive.

The Dublin Gulch stock is composed of four phases, the most significant of which is granodiorite. Quartz diorite, quartz monzonite, leucogranite and aplite comprise younger intrusive phases that developed predominantly as dikes and sills and cut both the granodiorite and surrounding country rocks.

The granodiorite stock is an elongate, east-northeast trending body approximately 5 km long and with a maximum width of approximately 2 km. The long axis of the stock is coincident with the axis of the interpreted Dublin Gulch anticline. Sheet-like sills of granodiorite extend from the stock and cut the metasedimentary strata at low angles. The contact between the stock and the surrounding metasedimentary country rock dips shallowly to steeply to the north and northwest on the northern side of the intrusive, and steeply to the north or south along its southern margin. No chilled margin is apparent at the contact.

At least four periods of faulting have been documented in the Dublin Gulch area including low-angle thrusting and bedding-plane faults and normal faults with north, northeast, northwest, and easterly trends. North-trending faults are inferred to have displaced portions of the Dublin Gulch stock, one of which is interpreted to form the eastern boundary of the Eagle Zone.

#### *5.2.1. Eagle Zone*

The Eagle zone gold occurrence is localized at the narrowest exposed portion of the stock, near its known western limit. The contact between the stock and surround Hyland Group rocks is sharp but irregular and varies between steep attitudes that crosscut foliation within the sedimentary rocks, to shallow southwest dips parallel to foliation.

Mineralization at Eagle is characterized by sub-parallel extensional quartz veins that are best developed within the granodiorite proximal to both the hanging wall and footwall intrusive contacts. Veining is apparently best developed on the hanging wall contact, but this may be more apparent than real as more drilling has taken place on the hanging wall side.

Veins are typically composed of white or grey quartz with subordinate potassium feldspar and strike at an azimuth of 060° to 085°. They typically dip between 60° south and vertical, and range in width from 1mm to more than 10 cm. Contacts are typically sharp. Vein densities range from less than one per

meter to more than fifteen per meter, and average three to five per meter. The greatest concentration of veins appears to coincide with both the narrowest constriction as well as the local apex of the intrusion. Sulphides account for less than five percent of vein material and occur in the center, on the margin, and disseminated throughout the veins. The most common sulphide minerals are pyrrhotite, pyrite, arsenopyrite, chalcopyrite, sphalerite, bismuthinite, molybdenite and galena. Sericite-carbonate is generally restricted to narrow vein selvedges although alteration zones of this type also occur with no obvious relation to veins.

Vein formation can be attributed to rheological contrasts between the intrusion and the surrounding metasedimentary country rocks. Embayments and narrow portions of the stock represent stress shadows that constitute favourable areas for rheological failure leading to the formation of extensional quartz veins. Protrusions in the stock created favourable areas for the development of extensional veining in the adjacent country rocks. Gold mineralization also occurs hosted within the metasedimentary rock package immediately adjacent to the granodiorite. This mineralization may be of potential economic importance, representing a significant resource.

#### *5.2.2. Mineralization*

The Eagle Gold Deposit is the principal concentration of mineralization within the property. Within the Eagle Gold Deposit, gold occurs in extensional quartz veins that are most abundant on the hanging and footwall contacts of the narrowest portion of the Dublin Gulch granodiorite near its known western limits. Subordinate quantities of gold mineralization occur in quartz veins within the adjacent metasedimentary rocks. Veins strike at an azimuth of 060° to 85°, sub-parallel to the intrusive contact and are commonly fractured by repeated movement along the host structures.

The Eagle Gold Deposit is irregular in plan and is approximately 1,600 m long (east-west) and 600 m wide north-south. The Eagle Gold Deposit is near-vertical and has been traced for about 500 m below surface. Current drilling indicates that the mineralization is relatively continuous along this length and is open in several directions, including at depth.

Mineralization occurs as elemental gold, both as isolated grains and most commonly in association with arsenopyrite, and less commonly with pyrite and chalcopyrite. The sulfide content in the veins is typically less than 5%;and is less than 0.5% within the deposit overall. In descending abundance, the principal sulphides observed are pyrrhotite, pyrite, arsenopyrite and chalcopyrite. Minor sphalerite, galena and molybdenite are also present. Scorodite and limonite are common weathering products.

A number of gold-bearing quartz-sulphide veins occur around the margins of the Dublin Gulch stock. These veins are narrow (centimetre-scale), steeply dipping and generally strike at about 070°. Silver-quartz-sulphide veins also occur. These distal veins are infrequent relative to the sheeted vein system within the Dublin Gulch Stock and due to their small size, are not a significant part of the mineral resource.

Outside of the Eagle Gold Deposit, gold, silver-lead-zinc and tungsten mineralization manifest in different geological environments. The Wolf tungsten deposit, located approximately 2 km northeast of Eagle, is a skarn-hosted scheelite resource situated within a hornfelsed roof pendant of Hyland group metasedimentary rocks in an embayment of the Dublin Gulch stock. Polymetallic vein-hosted silver-lead-zinc mineralization, similar in character to those in the Keno Hill silver district outcrop at Rex-Peso, situated 5 km southeast of Eagle and hosted within phyllite and quartzite of the Hyland group. Quartz-arsenopyrite vein-hosted gold mineralization similar to Eagle has been identified at the Olive, Shamrock, Steiner and Popeye prospects.

# 6. 2011 EXPLORATION PROGRAM

## *6.1. Diamond and Reverse Circulation Drilling*

During the period March 2 to December 21, 2011, 113 diamond drill holes and 13 RC holes were drilled on the Dublin Gulch property. Diamond drilling was conducted by Lyncorp Drilling Services of Smithers, British Columbia (March 2nd to November 15th 2011) and New Age Drilling Solutions of Whitehorse, Yukon (November 23rd to December 18th 2011) utilizing at various times Atlas Copco CS1000, Atlas Copco CS10 and Zinex A5 diamond drills. New Age Drilling Services and More Core Diamond Drilliing Services resumed work on the project site on January 8th, 2012 and from then until January 31st, 2012 an additional 8 diamond drill holes were either completed or had begun. Ewing Transport Ltd. of Mayo, Yukon provided heavy equipment. Geological and logistical support for the program was provided by Victoria Gold Corp. employees and contract staff. ALS Laboratories (Whitehorse preparation laboratory and Vancouver analytical facility) performed the sample analyses.

A total of 121 diamond drill holes and 13 reverse circulation (RC) drill holes were drilled on the property for a total of 17,941.18 meters (Table 1). Exploration drilling accounted for the bulk of the metreage and analytical samples (15,125.21 m, 10,330 samples), with 26 holes for 7292.57 m at Eagle (5,142 samples), 18 holes for 2,785.27 m at Shamrock and West Potato Hills (1,938 samples), 10 holes for 2,005.61 m at Olive (1,412 samples), 12 holes for 1,443.08 m at Rex-Peso (768 samples), 5 holes for 754.08 m at Popeye (477 samples) and 3 holes for 844.60 m at Steiner (593 samples).

The engineering program contributed 269 samples (including QA/QC samples) as only one of the three geotechnical in-pit holes was sampled before the end of 2011. The geotechnical in-pit holes were drilled using a core orientation tool to acquire oriented geotechnical data from fractures and faults and oriented geological data from veins and faults. Of the 1,856.65 m total, 1,240.95 m were drilled for the purpose of acquiring geotechnical infrastructure data, none of which was sampled. No samples were taken from the environmental program but 795.40 m were drilled with an RC rig for water monitoring wells. Tables 2, 3, 4 and 5 present collar and drill hole data for all programs conducted during the period covered by this report.

Table 1 - Summary of the 2011/2012 drilling statistics

| Drill purpose | # of holes drilled | Meters drilled | # of Samples Taken |
|---|---|---|---|
| Exploration | 74 | 15,125.21 | 10,330 |
| Engineering | 49 | 1,886.86 | 269 |
| Environmental | 8 | 765.20 | 0 |
| Metallurgical | 3 | 163.92 | 2 |
| **Total** | **134** | **17,941.18** | **10,601** |

All of the engineering and most of the exploration drilling was drilled using HQ3 triple-tubed core barrels. RC drilling was used for all of the Environmental program and 300.23m of the exploration program. 163.92 m were drilled using PQ core barrels.

The major objectives of the drill program were to:

1. Complete holes on Eagle alteration drilling thus improving the alteration model.
2. Acquire more data on the Eagle North/blind zone.
3. In fill the drilling within the Eagle pit area.
4. Test the grade of Eagle at depth.
5. Gain a better understanding of the mineralization and metallogeny of the Olive, Shamrock and Popeye zones, and the Potato Hills Trend
6. Obtain metallurgical samples.
7. Evaluate Rex and Peso mineralization.
8. Acquire geotechnical information for pit wall stability, slope stability of potential heap leach pad, and infrastructure sites.
9. Continue acquiring environmental information for baseline study.
10. Acquire hydrogeological information for the water balance model.

Where available, historical roads and drill pads were utilized, minimizing environmental damage. Some new access trails and drill pads were necessary to execute the program. The D7 bulldozer maintained roads and the 325 Excavator cleared and leveled drill pads. The majority of holes were drilled using HQ sized drill bits. A reflex EZ shot tool was used to survey all exploration holes at 75 meter intervals. PQ

drill core was used for a minimal amount of the bulk metallurgical sampling. Table 2 displays all effective and non-effective 2011/2012 drill collars. Maps in Appendix II show the locations of all 2011/2012 core holes. Drill logs, sample numbers, and gold results are tabulated in Appendix III of this report. Geological and assay cross-sections displaying 2011/2012 drilling are given in Appendix V. All original ALS assay certificates for core and QAQC samples are given in Appendix VI. Table 6 summarizes the techniques, elements and detection limits used for drilling in 2011/2012.

Table 2 - Collar location and drill hole data for exploration drill holes

### *6.1.1 Core Processing*

Drill core was delivered to the core processing facility by the drill crew at the end of each drill shift. Drill-run lengths and depth measurements were checked for errors and then recovery and rock quality were measured. Geotechnical data were recorded initially on paper and then input digitally to be stored in the project database. Geotechnical logs were then archived with the other paper documentation for each hole.

Drill core was logged for lithology, alteration (iron oxide, sericite, chlorite, clay, carbonate or other), veining (number per meter, type, maximum thickness, aggregate thickness, primary and secondary angles), selvage (width, nature and intensity of alteration, intensity of oxidation), percent of sulfides, type and degree of oxidation. With the exception of selvage alteration type, all these data were numeric. All logging information was recorded directly onto paper and then transferred to an excel worksheet (Appendix III).

Figure 3 - Representative example of diamond drill core showing variable alteration

Prior to cutting, core was placed on a photo table to be photographed using a mounted color digital

camera. Photos for each hole are archived as electronic files together with other data for each hole.

The core was marked for sampling by stapling a portion of the ALS Chemex sample tag to the core box at the beginning of every interval and by marking the core where interval breaks are to occur. The core was cut in camp using two diamond bladed core saws then placed in a 6mm, 18”x24” poly ore bag and sealed with a zip tie. Each bag included a duplicate ALS Chemex sample tag with bar code for tracking once in the lab as well as the sample ID written on the outside of the bag with permanent ink. Four to five individual samples were then placed in rice bags (23” x 40”) and sealed with steel wire loop ties. Each rice bag included the address of the intended preparation lab (Whitehorse, YT) and where it belonged in the sample shipment (example: Bag 11 of 54). Colour coded flagging tape was attached to each bag when more than one shipment was to leave site on one load. All samples were shipped from site to Whitehorse via contracted expeditor (Small’s Expediting Services). Samples were dispatched with an ALS Chemex sample submittal form describing samples being sent and required analytical procedure. Upon receipt ALS Chemex would send a confirmation email to the Senior Geologist.

All unshipped core was stored onsite. 2011/2012 core was placed on core racks that are near the core shack and cut shack area. Historic core was palletized, wrapped with pallet wrap and stored in the core storage yard located approximately 100m away from the core shack area.

Figure 4 - Core storage at Dublin Gulch Property

### *6.1.2 Analytical Method*

Upon arrival at the Whitehorse prep lab samples were sorted, weighed and entered into the Sample Receiving Log. All samples were then crushed by CRU-36 method (fine crushing of rock chip and drill sample to better than 85% -2mm) then shipped to ALS Chemex' analytical facility in North Vancouver via Byers Transport Services. Once samples arrive to the lab, in North Vancouver, BC, they are sorted, weighed and entered into the Sample Receiving Log. A 1000g split is then made (SPL-21) using a riffle splitter. The entire 1000g split is pulverized using a ring mill pulverizer using a chrome steel ring set (PUL-32) to >85% passing 75µm (-200 mesh). A prepared sample of 0.25 g/t is digested with perchloric, nitric, hydrofluoric and hydrochloric acids. The residue is topped up with dilute hydrochloric acid and the resulting solution is analyzed by inductively coupled plasma atomic emission spectrometry. Results are corrected for spectral inter-element interferences (ALS Chemex, Geochemical Procedure – ME-ICP61, Revision 03.01, May 2007). This procedure yields results for 32 elements.

Gold results were analyzed by way of Fire Assay Fusion and Atomic Absorption Spectroscopy. A prepared sample is fused with a mixture of lead oxide, sodium carbonate, borax, silica and other reagents as required, inquarted with 6 mg of gold-free silver and then cupelled to yield a precious metal

bead.

The bead is digested in 0.5 mL dilute nitric acid in the microwave oven, 0.5 mL concentrated hydrochloric acid is then added and the bead is further digested in the microwave at a lower power setting. The digested solution is cooled, diluted to a total volume of 4 mL with de-mineralized water, and analyzed by atomic absorption spectroscopy against matrix-matched standards (ALS Chemex, Fire Assay Procedure and Fire Assay Fusion, Revision 04.00, Aug 2005).

Table 6 - Analytical method and detection limits for the 2011 diamond drilling program

| 2011 STRATAGOLD/ALS ANALYTICAL METHODS | |

#### *6.1.2.1 QA/QC*

An extensive routine of Quality Assurance and Control procedures (QA/QC) were followed during sampling and subsequent assaying of all core samples. An exhaustive procedure that exceeds industry standard was employed. A diagrammatic summary of the QAQC procedure is shown in Figure 5. The program consisted of the insertion of prepared standards, blanks, duplicates and lab duplicates. For every 100 samples two field duplicates, two prep duplicates, three prepared standards, and three blanks were inserted. Table 15 lists how this procedure was repeated every one hundred samples.

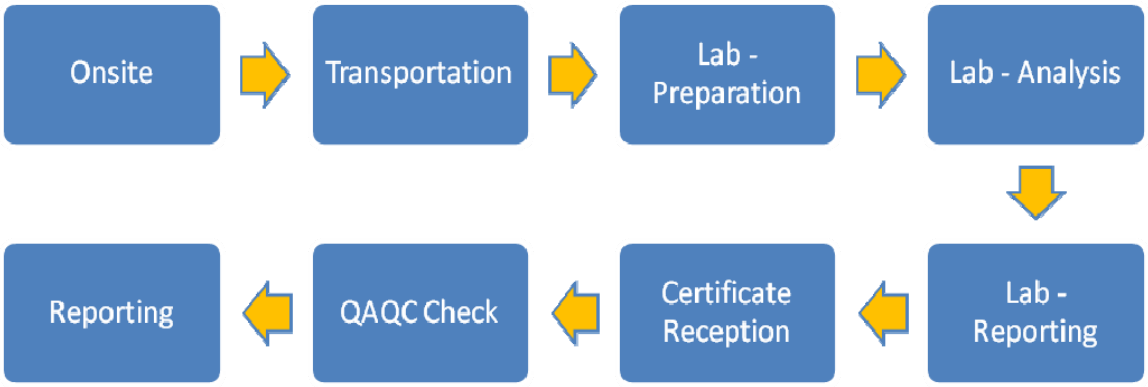

Figure 5 - Flow chart of QA/QC procedures

Table 7 - QA/QC sample insertion sequence

| Last 2 digits of sample no. | Control Type | Notes |
|---|---|---|
| ****10, ****50, ****90 | Standard | |
| ****16, ****56, ****96 | Blank | |
| ****22, ****62 | Field Duplicate | Original sample ends in ****21, ****61 |
| ****29, ****69 | Prep. Duplicate | Original sample ends in ****28, ****68 |

### *6.1.3 Results*

#### *6.1.3.1 Eagle*

The Eagle Gold zone drilling focused on north zone, deep, ore zone, alteration drilling and geotechnical in-pit drilling. The results from these holes have provided more data for geotechnical and alteration modeling purposes as well as given insight on other less well defined areas proximal to the ore body. The 2011/2012 drilling season confirmed consistent mineralization throughout the proposed pit area and provided rock suitable for bulk density measurements. Results from drill holes in the north zone and deep eagle revealed that there is mineralization at depth and in the north zone although subdued and less homogenous. The alteration drilling program several thick, low-grade intervals (table 8) including 128.65 m (true width, TW) of 1.04 g/t Au from 15.24 m to end of hole (DG11-421C), 85.45 m (TW) of 1.01 g/t Au from 79.09 m to end of hole (DG11-419C) and 116.27 m (TW) of 0.63 g/t Au from 33.53 m (DG11-416C). Best results from the Eagle exploration drilling (table 9) included 59.60 m of 0.74 g/t Au from 271.70 m (DG11-435C, Eagle Deep) indicating potential for extension of the deposit at depth. At Eagle North, best results included 43.10 m of 0.80 g/t Au from 27.60 m (DG11-421C) with narrower zones returning higher grades at depth (7.60 m of 2.36 g/t Au from 94.50 m, 9.20 m of 1.68 g/t Au from 264.70 m) in holes DG11-422C and DG11-427C, respectively.

### *6.1.3.1 Near-mine prospects*

Outside of the main Eagle Gold Deposit, all prospects tested returned results that require follow up in 2012 and beyond. Drilling at Popeye returned several shallow, narrow, higher grade intervals, with best results including 3.05 m of 6.34 g/t Au from 14.02 m (DG11-431C) and 1.72 m of 4.58 g/t Au from 13.10 m (DG11-436C). Mineralization was predominantly near surface and hosted within variably altered and veined granodiorite, with most drill holes intersecting metasedimentary rocks at depth. At Steiner, the drill holes intersected variably altered, oxidized and veined quartzite, phyllite and hornfelsed metasedimentary rocks intercalated with apophyses of fresh, veined and altered granodiorite. Drilling at Steiner returned several thick mineralized intervals at depth, with best results including 28.95 m of 1.37 g/t Au from 153.02 m including 16.77 m of 2.11 g/t Au from 165.20 m (DG11-441C).

Drilling at Shamrock intersected almost exclusively variably altered, veined and mineralized granodiorite from surface, with the exception of hole DG11-465C, which intersected several lenses of quartzite and hornfelsed metasedimentary rocks between 107 .94 m and end of hole at 206.75 m. The Shamrock program returned several narrow high grade intervals both at depth (3.05 m of 21.59 g/t Au from 141.73 m, DG11-450C) and near-surface (1.53 m of 9.62 g/t Au from 25.29 m, DG11-458C; 4.57 m of 7.70 g/t Au from 51.82 m, DG11-444R) and several thicker, lower grade intervals, including 38.06 m of 1.22 g/t Au from 47.24 m (DG11-454C) and 35.35 m of 1.64 g/t Au from 109.12 m (DG11-445C).

Table 10 - Exploration drilling significant results, by prospect area

| Hole Number | Prospect | | From (m) | To (m) | Interval (m) | Grade (g/t Au) |
|---|---|---|---|---|---|---|

#### *6.1.3.2 Rex-Peso*

The exploration program also targeted silver mineralization at the company's Rex and Peso vein prospects. Mineralization at these prospects comprises fault-controlled outcropping and subsurface polymetallic Ag-Pb-Zn veins similar to those occurring in the Keno Hill silver district, located approximately 34 km to the east-southeast of Rex-Peso. Drilling at Rex-Peso was designed to intersect the mineralized veins at depth and characterize the grade and mineralogy of the veins. All the drill holes intersected a sequence of variably oxidized and sericite altered phyllite and quartzite with minor intercalated graphitic phyllite. In all drill holes, mineralization was hosted within fault zones at the contact between phyllite and quartzite. The Rex-Peso program returned best results of 27.44 m of 382 g/t Ag from 102.10 m including 17.73 m of 588.08 g/t Ag from 103.63 m (11RPDH-10), 1.52 m of 652.00 g/t Ag from 30.48 m (11RPDH-09) and 7.74 m of 166.55 g/t Ag from 58.40 m (11RPDH-02).

*Table 11 - Rex-Peso significant results*

## *6.2. Regional Surface Sampling Program*

A regional surface sampling and mapping program was conducted across the Dublin Gulch property, at both road- and helicopter only-accessible areas. Outcrops were mapped for lithological and structural data, and located using a hand-held GPS. Where outcrop or subcrop showed evidence of mineralization (quartz veins, alteration haloes, scorodite, sheeted veins, oxidation) a minimum 500 g sample was collected for geochemical analysis. Unmineralized samples were also collected, in order to characterize background geochemical signatures. At the end of the day sample and mapping data were transferred from field notebooks to the project database, and samples collected were prepared for shipment to ALS Laboratories. All samples were identified with a unique sample number and shipped to the lab in plastic poly bags labeled with the sample number in permanent ink and containing the corresponding sample tag. During the course of the program 269 surface samples were collected for assay from Bean Sidhe, Lynx Dome, Druid Valley, Dublin, Eagle, East Potato Hills, Haggart, Mar (Wolf), Nugget, Olive, Potato Hills, Rex-Peso, Shamrock, Steiner and Whiskey Wrinkles prospect areas. All samples (including QAQC samples) were analyzed for a 32 multi-element suite using inductively coupled atomic emission spectroscopy (ICP-AES). Samples were also analyzed for gold using a 50g fire assay with an atomic absorption finish.

Table 12 - Analytical methods and detection limits for regional surface sampling program

### *6.2.1 Significant Results*

Of the 269 samples collected and sent for assay from the regional program, 8 returned > 1.0 g/t Au and 11 returned > 500 ppm Ag. The best gold results came from Olive, with two quartz-scorodite vein samples returning 40.00 ppm Au and 29.1 ppm Au and correspondingly elevated Ag, Cu, Pb, Zn and Sb (Table 13). Two gossanous sulfide samples from Lynx dome returned 0.97 and 0.57 g/t Au. Four variably scorodotized vein and phyllite samples collected from Rex-Peso returned between 1.2 and 2.0 ppm Au; 10 variably mineralized and altered samples from the same area returned assays > 500 ppm Ag with best results of 6410 ppm Ag, 7040 ppm Cu, > 10,000 ppm Pb and Sb and 4620 ppm Zn from a sulfide-rich gossan (Table 14). Results of the Olive resampling program were very encouraging, with trench samples returning up to 34.1 g/t Au over 1.5 m, 23.2 g/t Au over 1.3 m and 20.4 m over 1.5 m from channel samples.

## 6.3. Bulk Density Sampling

A bulk density program was undertaken to provide regular bulk density measurements for all the holes that were drilled in Eagle. Exploration holes DG10-412C to DG10-438C and DG11-467C to DG11-470C had a minimum 10cm, full-core sample every 5-10m. These samples were then weighed in air and in water on a properly calibrated, 10kg maximum, Cole-Parmer scale (Figure 6), then sent to ALS Laboratories for check analysis. The results from this program are used to give a more accurate measurement for the weight of rock in the proposed pit area and to test whether there are any unexpectedly high or low density zones in the deposit.

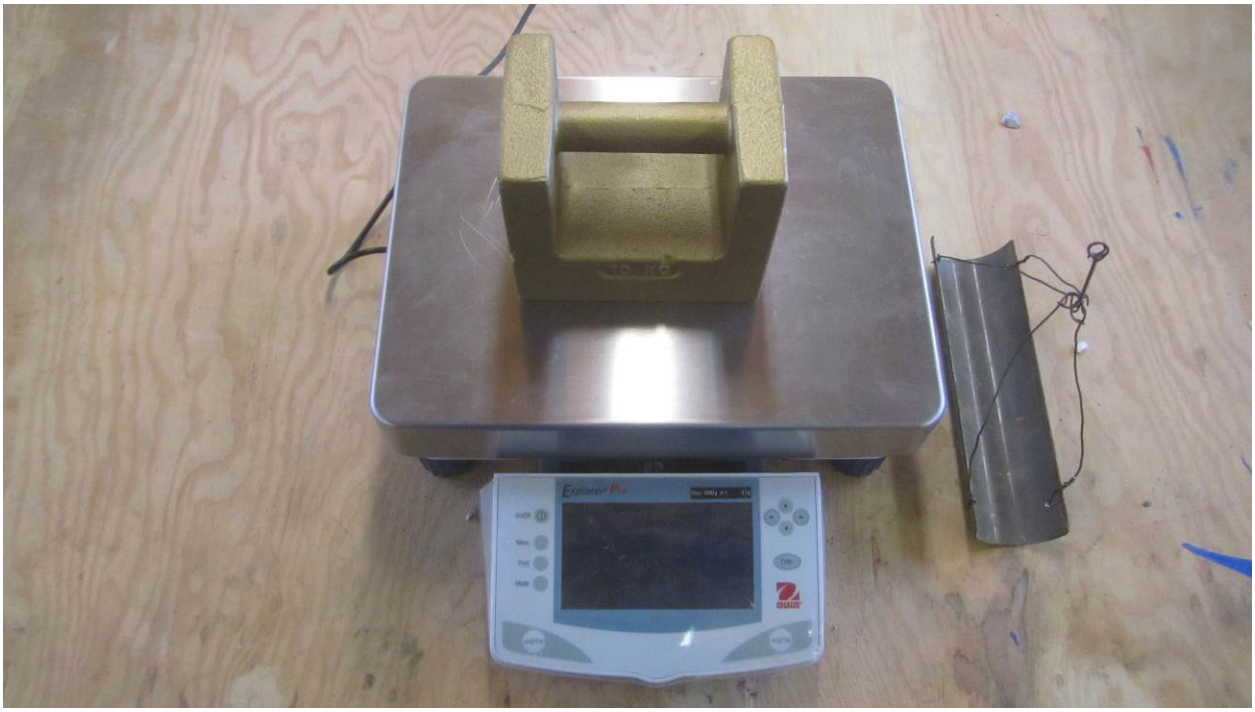

Figure 6 - Cole-Parmer scale with calibration weight and underneath-hook basket

## 6.4. Geotechnical Site Investigation

The 2011 program for the geotechnical investigation for mine site infrastructure was supported by a test pitting program and outcrop mapping at various sites within the footprint of the proposed Eagle Gold Mine. A total of 96 test pits were excavated which were generally the width of an excavator bucket and terminated at a depth upon reaching either bedrock, frozen ground or when sloughing/collapsing side walls were encountered. Once the required data was gathered from the test pit sites they were backfilled to allow for natural re-vegetation. At a number of locations the test pits were paired with drill hole locations when poor recovery was expected from the drill hole and to reduce site disturbance and cost.

Geotechnical information will be used to characterize subsurface conditions relevant for foundation and earthworks design with samples taken from select test pits and drill holes for index testing of soil and rock. Samples were also analyzed for a range of parameters related to re-use as fill or aggregate. This component of the program also included 5.4 km of seismic refraction surveying along and across the Dublin Gulch valley bottom and to the east of Anne Gulch. The seismic refraction involved the use of small explosive charges to create a shock wave at one end of a series of geophones placed on the ground at even intervals to identify transition from overburden to undisturbed bedrock within the valley and to obtain an indication of material stiffness over an extended area.

The geotechnical investigation was supported by downhole geophysics, plate load testing, thermistors and ground ice classification techniques, point load testing, standpipe piezometers, vibrating wire piezometers, slug testing, seep observations, soil index testing, rock strength testing, modified Proctor and permeability testing and aggregate testing using existing test sites and materials. Location for the geotechnical field work can be seen in Appendix II.

# 7. INTERPRETATION AND CONCLUSIONS

## *7.1. Exploration Drilling*

### *7.1.1 Eagle*

Results of the Eagle North zone, Eagle deep and alteration drilling identified several thick continuous zones of low-grade gold mineralization and narrower, higher-grade intervals within the pit and to the immediate north of the SRK $1500 pit shell, indicating potential to expand the resource to the north. Drill hole DG11-421C, which returned best results of 43.1 m of 0.8 g/t Au from 27.6 m coincides with the outcropping Eagle vein, historically noted for visible gold in hand specimen.

Results of this program have provided data for geotechnical and alteration modeling, and provided insight on less well defined areas proximal to the ore body. The 2011/2012 drilling season confirmed consistent mineralization throughout the proposed pit area and provided rock suitable for bulk density measurements. Results from drill holes in the north zone and Eagle Deep revealed that there is mineralization at depth and in the north zone although subdued and less homogenous. Future targets in the Eagle zone would be to continue in-fill drilling that was outlined at the end of 2011.

### *7.1.2 Near-mine prospects*

Results from the near mine prospects (Steiner, Olive, Popeye and Shamrock) indicate that there are further targets on the property outside of the main Eagle Gold zone that warrant follow-up exploration in 2012 and beyond. At all four prospect areas the limited drilling conducted to date indicates the potential for mineralization along strike and at depth, and considerable potential for extending mineralization between the proposed Eagle pit and distal prospects, particularly Steiner. Exploration efforts at Steiner should focus on following up results obtained in 2011 to test for depth and strike continuity and possible continuations of mineralization between the Eagle pit and Steiner, which to date is untested.

Drilling at Olive targeted depth extensions of surface mineralization identified by resampling a historic trench. The 2011 program returned several narrow high-grade intersections within a broader zone of low grade mineralization, and suggests similarities to mineralization at Eagle. Olive is located approximately 2.7 km northeast of Eagle on the north western margin of the Dublin Gulch stock. To date, the pluton margin between the two zones has not been tested; however, soil geochemical sampling conducted along the Potato Hills trend indicates semi-continuous gold anomalism along the contact between the pluton and the surrounding Hyland group host rocks. Initial drilling at Olive should focus on testing for strike and depth continuations of previously identified mineralization, but longer-term plans should include testing for continuity between the Eagle zone and Olive prospect.

Drilling at Shamrock identified both a higher-grade core and lower-grade surrounding halo, indicating similarities to the Eagle deposit. Exploration in 2012 and beyond should focus on extending the known mineralization at depth and along strike. A recommendation map for the Olive/Shamrock drill holes can be found in Appendix VIII.

Two of the four drill holes at Popeye returned mineralized intersections near surface in shallow holes. Mineralization identified to date is restricted to narrow, high-grade intervals; however, elsewhere on the property, gold mineralization comprises narrow high-grade zones within broader low-grade envelopes. The Popeye zone is an isolated small cupola of granodiorite which may extend at depth and also link to the main intrusive body to the east around the Shamrock Zone. Continued exploration at Popeye should focus on targeting extensions to the high-grade gold and identifying a broader low grade halo.

### *7.1.3 Rex-Peso*

Drilling at Peso Rex targeted a series of polymetallic vein faults with similarities to high-grade Ag-Pb-Zn mineralization of the Keno Hill silver district, located approximately 34 km to the east southeast. Peso comprises five separate, roughly east-west trending veins of variable grade; Rex comprises a single larger east-west trending vein with the highest grade of all the veins in the area. The twelve holes drilled in 2011 targeted two of the five Peso veins and the Rex vein and were designed to intersect outcropping vein mineralization at depth. Holes 11RPDH-09 and 10, both drilled at Rex, returned the best results with grades up to 652 g/t Ag from narrow intervals and 17.73 m of 588.08 g/t Ag in hole 10. The width and tenor of silver mineralization is similar to that reported from the Keno Hill district, eg. Flame and Moth, and Bermingham resources (Alexco Resource Corp., News Release dated June 28, 2012). Follow-up drilling at Rex and Peso should focus on evaluating extensions of identified mineralization at depth and along strike, and testing the three undrilled veins.

## *7.2. Surface Sampling Program*

The surface sampling program was designed to evaluate the geology of the Dublin Gulch claims, and in particular focused on areas of interpreted granodiorite outcrop at Nugget, Potato Hills, Iron Rust and Rex-Peso. Detailed stratigraphic sections were also mapped on ridges at Mar tungsten. The program was hampered by the outcrop in some areas, particularly Whiskey Wrinkles and Lynx dome. Sampling

focused both on collecting mineralized samples, identified by high degrees of iron oxidation, sericite alteration and/or quartz-arsenopyrite-scorodite veins, and on constraining background geochemical characteristics of the claim block.

For gold mineralization, best results came from samples collected at the Olive trench, a zone of outcropping sub parallel quartz-arsenopyrite-scorodite veins located to the north east of Eagle zone. One sample returned 40.0 g/t Au, a second, adjacent sample returned 29.1 g/t Au. Both samples had elevated Cu, Pb, Zn and Sb. Results of the surface sampling program, in conjunction with results of the diamond drilling program indicate that Olive is deserving of further drill follow up. Future exploration at Olive should focus on targeting strike and depth extensions of mineralization identified in the diamond drilling and on targeting outcropping vein mineralization.

Four vein samples collected at Rex-Peso returned between 1.2 and 2.0 g/t Au. Ten mineralized vein samples from Rex-Peso and one from Olive returned silver grades > 500 ppm, with four Rex-Peso samples returning >1000 ppm Ag.

Results of the Rex-Peso surface program guided the diamond drilling for 2011, with three of the six outcropping veins targeted for subsurface extensions of mineralization. Mapping at Rex-Peso did not encompass the extent of the veins, and future work on the prospects should focus on mapping the remaining veins and identifying further drill targets.

Two samples at Lynx dome returned anomalous gold in gossanous float and although results were low, between 0.5 and 0.1 g/t Au, outcrop at Lynx Dome was scarce. Past geophysical work over the project area has defined a possible sub-surface intrusion beneath Lynx Dome, and regional broad-scale mapping has identified outcropping limestone in the region. Further work at Lynx Dome should focus on identifying potential skarn mineralization and following up on historic exploration in the area, specifically adjacent to the old shaft in the area.

Surface sampling over the project area should continue, targeting areas that were not mapped or sampled during the 2011 program, and targets that were identified by the Fugro geophysics reinterpretation should be explored. Ongoing work should also focus on Iron Rust and in the valley north of Tin Dome.

# 8. 2011 STATEMENT OF EXPENDITURES

January 1, 2011 - Dec 31, 2011

# 9. STATEMENT OF QUALIFICATIONS

Victoria GOLD CORP

**Certificate of Qualified Person**

Richard Eliason – CPG-11261 (AIPG)
Victoria Gold Corp and StrataGold Corporation - 1055 Dunsmuir Street
Suite 584 – Bentall Four-PO Box 49215
Vancouver, BC V7X 1K8
Telephone: 604-696-6601
Email: reliason@vitgoldcorp.com

I, Richard Eliason, CPG, do here-by certify that:

1. I am a geologist employed by Victoria Gold Corp., 1055 Dunsmuir St., Suite 584 – Bentall Four- PO Box 49215, Vancouver, BC V7X 1K8
2. I graduated with a Bachelor of Science degree, majoring in Geology, from the University of Montana, USA.
3. I am a practicing member of the American Institute of Professional Geologist and am a Certified Professional Geologists (CPG – 11261).
4. I have worked as a geologist for over 25 years since my graduation; this has included work in the United States, Canada and Europe.
5. I have read the definition of "qualified person" set out in National Instrument 43-101 (NI 43-101) and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirements to be a "qualified person" for the purposes of NI 43-101.
6. I was present on site from time to time during the reporting period in 2011 and was involved in all aspects of the exploration program including but not limited to diamond drilling and QAQC.
7. I had no involvement with the properties that are subject to this Assessment Report prior to 2011.
8. As at the date of this certificate, to the best of my knowledge, information and belief, the Assessment Report contains all scientific and technical information that is required to be disclosed to make the Assessment Report not misleading.
9. I am not independent of StrataGold Corporation or Victoria Gold Corp., as described in section 1.4 of Nation Instrument 43-101 as I am employed by Victoria Gold Corp (owner of StrataGold Corporation) as Vice President – Exploration.
10. I have read National Instrument 43-101 and form 43-101F1, and the Assessment Report has been prepared under my supervision in compliance with that instrument and form.
11. I consent to the filing of the Assessment Report with any stock exchange and other regulatory authority and any publication by them for regulatory purposes, including electronic publication in the public company files on their websites accessible by the public, of the Assessment Report.

Dated: August 10, 2012

Richard Eliason

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 11BGC-GTH-11 | 5.49 | 7.01 | 1.52 | HNFLS | WTH | Low angle fracture at 05deg, but possibly due to point load test(?). Zebra stripped foliation with qtz and bt layers each approx. 5cm in thickness. Small (2x2mm) pyrr within a 0.9cm qtz vein. | 2 | | 1 | 1 | | | | | | | 1 | 6 | 0.9 | 0.9 | | | | | 70 | | 0.1 | hem | 1 | | | 0.1 | |
| 11BGC-GTH-11 | 7.01 | 8.41 | 1.40 | HNFLS | WTH | Thin qtz veins/fracture fill has a qtz selvage that runs parallel to foliation. Pyrr occasionally found in bt layers in HNFLS foliation. | 2 | | 1 | | | 1 | 1 | 6 | 2.5 | 2.5 | | | | | | | | | 80 | | 0.1 | hem | 1 | | | 0.1 | |
| 11BGC-GTH-11 | 8.41 | 9.69 | 1.28 | HNFLS | WTH | To measure fracture angle I'm trying to find a fracture face with alteration on it, so it isn't a mechanical fracture result of BGC tests. Most fractures contain hematite staining. | 2 | 1 | 1 | 1 | | | | | | | | | | | | | | | | | | | | | | | |
| 11BGC-GTH-11 | 9.69 | 10.67 | 0.98 | HNFLS | WTH | | 2 | | 1 | | | | | | | | | | | | | | | | | | | | | | | | |
| 11BGC-GTH-11 | 10.67 | 12.04 | 1.37 | HNFLS | WTH | Numerous fracture directions, core turned into 1x1cm rubble | 3 | 1 | 1 | 1 | | 1 | 1 | 1 | 3.3 | 3.3 | | | | | | | | | 90 | | 0.1 | hrm | 1 | | | | |
| 11BGC-GTH-11 | 12.04 | 13.11 | 1.07 | HNFLS | WTH | Minor pyrr in bt layer along direction of foliation at 75deg. | 3 | 1 | 1 | 1 | | | 4 | 1 | 2 | 8 | | | | | | | | | 70 | | 0.1 | hem | 2 | | | 0.01 | |
| 11BGC-GTH-11 | 13.11 | 14.63 | 1.52 | HNFLS | WTH | Minor pyrr in 1 layer of bt HNFLS | 3 | 1 | 1 | | | 1 | 4 | 1 | 1.5 | 3.9 | | | | | | | | | 85 | | 0.1 | hem | 2 | | | 0.01 | |
| 11BGC-GTH-11 | 14.63 | 15.7 | 1.07 | HNFLS | WTH | Thin beds between 1-5mm thick. Qtz vein cloudy with a small aspy/pyrr crystals that are 1-2mm wide. | 2 | | | 1 | | | 1 | 6 | 1 | 1 | 4 | 1 | 1 | 4 | | | | | 60 | 70 | 0.1 | hem | 2 | 2 | | 0.01 | |
| 11BGC-GTH-11 | 15.7 | 17.37 | 1.67 | HNFLS | WTH | 3 minor crack seal qtz veins that are 1mm thick. | 2 | | 1 | 1 | | 1 | | | | | 3 | 1 | 0.1 | 0.3 | | | | | 20 | | | | | | | | |
| 11BGC-GTH-11 | 17.37 | 19.2 | 1.83 | HNFLS | WTH | Short fractures filled with hem that are prependicular to qtz veins, fractures only through the qtz vein and stop at the HNFLS. | 2 | | 1 | 1 | | 1 | 7 | 6 | 7 | 17 | | | | | | | | | 70 | | 0.2 | hem | 3 | 3 | | 0.1 | |
| 11BGC-GTH-11 | 19.2 | 20.42 | 1.22 | HNFLS | WTH | Calcite and hem clays coat fracture faces. Minor pyrr in wall rock next to qtz vein. | 2 | | | 1 | 1 | | 1 | 1 | 6 | 6 | | | | | | | | | 70 | | | | | | | | |
| 11BGC-GTH-11 | 20.42 | 21.79 | 1.37 | HNFLS | WTH | Crumbley core, browken into 1x1 cm pieces. Pyrr crystals parallel to foliation. | 2 | | | | 1 | 3 | | | | | 2 | 6 | 0.5 | 0.7 | | | | | 70 | | | | | | 0.1 | | |
| 11BGC-GTH-11 | 21.79 | 23.32 | 1.53 | HNFLS | WTH | | 2 | | | | 1 | 3 | 1 | 1 | 2.5 | 2.5 | 1 | 1 | 1 | 1 | | | | | 65 | 25 | 0.4 | s | 4 | | | | |
| 11BGC-GTH-11 | 29.87 | 31.24 | 1.37 | HNFLS | WTH | Pyrr within qtz vein. Hem and calcite on fracture faces. | 1 | | | | 1 | 1 | 1 | 6 | 1 | 1 | | | | | | | | | 90 | | | | | | | 0.1 | |
| 11BGC-GTH-11 | 31.24 | 32.46 | 1.22 | HNFLS | WTH | | 1 | | | | 1 | 1 | 1 | 6 | 1 | 1 | 2 | 1 | 6 | 10 | | | | | 20 | 50 | 0.1 | hem | 1 | 2 | | 0.01 | |
| 11BGC-GTH-11 | 32.46 | 33.99 | 1.53 | HNFLS | WTH | Intervals are dark blue/grey with less oxidation. Qtz veins large but barren and not parallel to foliation. | 1 | | | | 1 | 1 | 1 | 1 | 1 | 1 | | | | | | | | | 20 | | 0.1 | s | 2 | | | | |
| 11BGC-GTH-11 | 33.99 | 35.2 | 1.21 | HNFLS | WTH | Large qtz vein generally parallel to foliation while secondary thin veins are at low angles to core pole axis. | 1 | | 1 | | 1 | 1 | 1 | 1 | 9 | 9 | 1 | 1 | 0.5 | 0.5 | | | | | 80 | 30 | | | | | | | |
| 11BGC-GTH-11 | 35.2 | 36.88 | 1.68 | HNFLS | WTH | Minor pyrr in biotite HNFLS layer | 1 | | | 1 | 1 | 2 | 1 | 1 | 11 | 11 | | | | | | | | | 50 | | | | | | | 0.01 | |
| 11BGC-GTH-11 | 36.88 | 38.4 | 1.52 | HNFLS | WTH | BGC sample from 37.66 to 37.69m | 1 | | 2 | | 2 | 1 | 4 | 1 | 1.5 | 5 | | | | | | | | | 20 | | | | | | | | |
| 11BGC-GTH-11 | 38.4 | 39.79 | 1.39 | HNFLS | WTH | No veins, dull grey core | 1 | | 1 | | 1 | 2 | | | | | | | | | | | | | | | | | | | | | |
| 11BGC-GTH-11 | 39.79 | 41.76 | 1.97 | HNFLS | WTH | Mineralized qtz vein with pyrr (silver colour but duller than aspy and weakly magnetic) | 1 | | | | 1 | | 2 | 6 | 6 | 7 | 2 | 1 | 0.5 | 1 | | | | | 20 | | 0.3 | s | 5 | | | 0.1 | |
| 11BGC-GTH-11 | 41.76 | 46.63 | 4.87 | FZ | WTH | Only 1m of recovery of crumbled clays. Fault zone begins at 41.66m. Greenish chloritic (scor?) colour of rubble and clay. | 2 | 2 | 3 | 5 | | | | | | | | | | | | | | | | | | | | | | | |
| 11BGC-GTH-11 | 46.63 | 47.7 | 1.07 | FZ | WTH | Fault zone ends at 46.90m, rest of interval is 2x2cm rubble. | | | 2 | 3 | 2 | | | | | | | | | | | | | | | | | | | | | | |
| 11BGC-GTH-11 | 47.7 | 50.29 | 2.59 | HNFLS | WTH | Dark green HNFLS. Qtz phenos are stretched along foliation. Very fine grained pyrr in dark biotite layers. Weak magnatic pull but cannot see pyrr. Microfractures with calcite have chl selvages. | | 1 | 2 | 1 | 1 | 1 | | | | | | | | | | | | | | | | | | | | 0.01 | |
| 11BGC-GTH-11 | 50.29 | 51.97 | 1.68 | HNFLS | WTH | Fine grained pyrr in biotite layers | | 2 | 1 | | 1 | | | | | | | | | | | | | | | | | | | | | | |
| 11BGC-GTH-11 | 51.97 | 53.04 | 1.07 | HNFLS | WTH | Rock looks like a qtz porphyry due to large 1x0.5cm qtz phenos. Dolomite fills fractures. Altered HNFLS. | 1 | 2 | 3 | | 1 | | 3 | 1 | 1 | 2.5 | 1 | 6 | 0.5 | 0.5 | | | | | 65 | 50 | 0.5 | chl | 3 | | 0.01 | 0.1 | |
| 11BGC-GTH-11 | 53.04 | 55.44 | 2.40 | HNFLS | WTH | High oxidation and large qtz component within HNFLS. | 4 | 3 | 2 | 2 | 1 | 3 | | | | | | | | | | | | | | | | | | | | | |
| 11BGC-GTH-11 | 55.44 | 56.55 | 1.11 | HNFLS | WTH | Fractures filled with Fe-clay and muscovite/sericite. Large crumble section at 55.20 to 55.55m. | 4 | 3 | 2 | 2 | 1 | 3 | 4 | 3 | 2 | 5 | | | | | | | | | 70 | | 0.5 | s | 3 | | | | |
| 11BGC-GTH-11 | 56.55 | 57.55 | 1.00 | HNFLS | WTH | 0.5cm thick fractures filled with dolomite and py later fractures (60deg) offset early ones (at 25deg) in a sinestral sense with less than 1cm displacement. | 2 | 2 | 3 | | 3 | 4 | 2 | 1 | 4 | 6 | 3 | 6 | 0.5 | 1.5 | | | | | 65 | 25 | 0.2 | s | 3 | | 0.5 | | |
| 11BGC-GTH-11 | 57.55 | 58.83 | 1.28 | HNFLS | WTH | Large qtz vein with py + aspy with dolomite. Thinner veins have more py. | 2 | 3 | 2 | | 3 | 3 | 7 | 6 | 4 | 1.5 | | | | | | | | | 60 | | 0.2 | s | 4 | | 0.5 | | |
| 11BGC-GTH-11 | 58.83 | 60.35 | 1.52 | HNFLS | WTH | Altered HNFLS with dolomite + py veins that cross-cut qtz veins at 30deg. | 2 | 3 | 2 | | 3 | 3 | | | | | 6 | 6 | 0.5 | 3 | | | | | 30 | | 0.1 | hem | 2 | | 0.2 | | |
| 11BGC-GTH-11 | 69.49 | 71.02 | 1.53 | HNFLS | WTH | Rubble core, high clay content. | 3 | 2 | | 1 | | 3 | 4 | 1 | 1 | 3 | | | | | | | | | 40 | | 0.1 | s | 2 | | 0.1 | | |
| 11BGC-GTH-11 | 71.02 | 72.85 | 1.83 | HNFLS | FSH | HNFLS ceases to be oxidized. First fresh HNFLS. Sericitized to a tan and light green colour. | | 3 | 2 | | | 2 | 6 | 1 | 1 | 5.5 | | | | | | | | | 60 | | 0.1 | s | 3 | | | 0.01 | |
| 11BGC-GTH-11 | 72.85 | 74.68 | 1.83 | HNFLS | FSH | Light green sericitized HNFLS. | | 2 | 2 | | 1 | | 2 | 1 | 1.5 | 3 | | | | | | | | | 85 | | 0.1 | s | 3 | | | | |
| 11BGC-GTH-11 | 74.68 | 76.2 | 1.52 | HNFLS | FSH | Dark green HNFLS, green and dark green foliation. Greater chlorite alteration. Small amount of pyrrhotite within HNFLS. | 0 | 1 | 3 | 0 | 0 | 2 | | | | | 4 | 1 | 0.2 | 0.8 | | | | | | 20 | 0.2 | q | 2 | | | 0.01 | |
| 11BGC-GTH-11 | 76.2 | 77.72 | 1.52 | HNFLS | FSH | Large quartz veins with small pyrite in vein center- minor mineralization. Chloritized core. | 0 | 2 | 4 | 0 | 1 | 2 | 3 | 6 | 4 | 2.5 | 1 | 1 | 0.5 | 0.5 | | | | | 75 | 25 | 0.1 | s | 3 | | 0.01 | | |

| 11RPDH-08 | 97.54 | 100.58 | 3.04 | QTZITE | FSH | Medium-grey quartzite with pyrite veins as well as a large quartz and pyrite vein. Quartz on some fractures. Oxides on one fracture. Some pink colouration (k-feld alteration?) in areas. Low recovery. | 1 | 1 | 0 | 0 | 0 | 2 | 1 | 6 | 21 | 21 | 6 | 6 | 0.8 | 1.3 | | | | | | 40 | | | | | 4 | | |
| 11RPDH-08 | 100.58 | 102.1 | 1.52 | QTZITE | FSH | Sericite veinlets numerous and brecciate quartzite. Quartz on fractures. Pyrite in major veins and as stringers/veinlets. | 0 | 2 | 0 | 0 | 0 | 1 | 2 | 6 | 5 | 10 | | | | | | | | | 45 | | | | | | 1.1 | | |
| 11RPDH-08 | 102.1 | 103.63 | 1.53 | QTZITE | FSH | Fine grained pyrite veins brecciate quartzite. Quartz and pyrite healed fractures. Major vein is broken. | 0 | 2 | 0 | 0 | 0 | 2 | 1 | 6 | 15 | 15 | 4 | 6 | 1 | 1.3 | | | | | | 30 | | | | | 2 | | |
| 11RPDH-08 | 103.63 | 105.15 | 1.52 | QTZITE | FSH | Light grey quartzite with many feldspar/sericite veinlets and stringers. Some phyllite layers as well. Some pink/red tinge. | 0 | 3 | 0 | 0 | 0 | 0 | | | | | | | | | | | | | | | | | | | 0.1 | | |
| 11RPDH-08 | 105.15 | 106.68 | 1.53 | QTZITE | FSH | Medium grey quartzite and dark-grey phyllite. Numerous quartz/sericite veinlets. Some pyrite blebs and stringers at beginning of interval. | 0 | 2 | 0 | 0 | 0 | 2 | | | | | | | | | | | | | | | | | | | 0.3 | | |
| 11RPDH-08 | 106.68 | 108.2 | 1.52 | PHYLL | FSH | Veinlets/healed fractures with quartz +/- sericite. Some pyrite stringers as well. | 0 | 2 | 0 | 0 | 0 | 2 | | | | | | | | | | | | | | | | | | | 0.2 | | |
| 11RPDH-08 | 108.2 | 109.73 | 1.53 | PHYLL | FSH | Quartz +/- pyrite blebs and stringers concordant to foliation generally. | 0 | 1 | 0 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | 0.5 | | |
| 11RPDH-08 | 109.73 | 111.25 | 1.52 | QTZITE | FSH | Quartzite and phyllite. Quartz veinlets/fracture coating with some pyrite, some are vuggy. | 0 | 1 | 0 | 0 | 0 | 2 | | | | | | | | | | | | | | | | | | | 0.1 | | |
| 11RPDH-08 | 111.25 | 112.78 | 1.53 | PHYLL | FSH | Mostly dark-grey phyllite with a ~15cm section of tan quartzite with numerous small blebs of fine grained pyrite. Micro-faulted quartz veinlets perpendicular to foliation present. | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 6 | 2 | 2 | | | | | | | | | | | | | | | 0.1 | | |
| 11RPDH-08 | 112.78 | 114.4 | 1.62 | PHYLL | FSH | Phyllite with interlaminated quartzite layers. Some pyrite, fine-grained, in quartzite areas. | 0 | 1 | 0 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | 0.05 | | |
| 11RPDH-08 | 114.4 | 115.82 | 1.42 | FZ | FSH | Brecciated phyllite and some quartzite. Phyllite is very finely foliated and crumbly. Carbonaceous. | 0 | 1 | 0 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | 0.03 | | |
| 11RPDH-08 | 115.82 | 118.87 | 3.05 | FZ | FSH | Composed of phylltie and quartzite. Very crumbly sections. Low recovery. | 0 | 0 | 0 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | 0.01 | | |
| 11RPDH-08 | 118.87 | 121.92 | 3.05 | QTZITE | FSH | Medium grey broken quartzite. Faulted for ~20cm in middle of interval. Quartz fracture coating and veinlets. Some graphitic phyllite. 3 feet of core lost. | 0 | 1 | 0 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 121.92 | 124.97 | 3.05 | QTZITE | FSH | Broken, foliated quartzite. Lots of quartz/sericite on fractures/veinlets. Also quite a bit of phyllite present. Pink mineral on some fractures (k-spar). No carbonate. | 0 | 1 | 0 | 0 | 0 | 2 | 1 | 1 | 1 | 1 | | | | | | | | | 50 | | | | | | | | |
| 11RPDH-08 | 124.97 | 126.49 | 1.52 | QTZITE | FSH | Foliated, medium grey quartzite. Some phyllite as well. No mineralization visible. | 0 | 1 | 0 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 126.49 | 128.22 | 1.73 | FZ | FSH | Mostly fault gouge and breccia. Originally phyllite? Muddy. | 0 | 0 | 0 | 0 | 0 | 0 | | | | | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 128.22 | 129.54 | 1.32 | QTZITE | FSH | Pinkish to light grey quartzite, numerous healed fractures. Possibly some very fine grained pyrite. | 0 | 1 | 0 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 129.54 | 131.06 | 1.52 | QTZITE | FSH | Quartz +/- sericite veinlets and fracture fill and blebs. Some folding. | 0 | 2 | 0 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 131.06 | 132.37 | 1.31 | QTZITE | FSH | Light-grey foliated quartzite. | 0 | 1 | 0 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 132.37 | 133.49 | 1.12 | FZ | FSH | Fault breccia and gouge, originally quartzite >> phyllite. | 0 | 1 | 0 | 0 | 0 | 0 | | | | | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 133.49 | 135.32 | 1.83 | PHYLL | FSH | Also some quartzite present with pyrite stringers concordant to foliation. | 0 | 1 | 0 | 0 | 0 | 0 | | | | | | | | | | | | | | | | | | | 1 | | |
| 11RPDH-08 | 135.32 | 136.35 | 1.03 | PHYLL | FSH | Pyrite in phyllite layers (as blebs/stringers) as well as in short quartzite section. | 0 | 1 | 0 | 0 | 0 | 0 | | | | | | | | | | | | | | | | | | | 0.7 | | |
| 11RPDH-08 | 136.35 | 137.16 | 0.81 | QTZITE | FSH | Medium-green quartzite, foliated. Sericite and pyrite veinlets. | 0 | 1 | 2 | 0 | 0 | 0 | | | | | | | | | | | | | | | | | | | 0.4 | | |
| 11RPDH-08 | 137.16 | 138.68 | 1.52 | PHYLL | FSH | Part light-green quartzite and dark grey phyllite. | 0 | 2 | 1 | 0 | 0 | 0 | | | | | | | | | | | | | | | | | | | 0.01 | | |
| 11RPDH-08 | 138.68 | 140.21 | 1.53 | QTZITE | FSH | First ~half is phyllite, rest is quartzite. Some pyrite stringers in quartzite. | 0 | 2 | 3 | 0 | 0 | 1 | 1 | 1 | 1.8 | 1.8 | | | | | | | | | 50 | | | | | | 0.07 | | |
| 11RPDH-08 | 140.21 | 141.73 | 1.52 | QTZITE | FSH | Many sericitized stringers/fractures, perpendicular to foliation. Vein is broken. Some areas have a pink tinge to them. | 0 | 2 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 141.73 | 143.26 | 1.53 | QTZITE | FSH | Quartzite with pyrite stringers /blebs, parallel to very weak foliation. Some muddy or phyllitic sections. | 0 | 2 | 0 | 0 | 0 | 0 | | | | | | | | | | | | | | | | | | | 0.15 | | |
| 11RPDH-08 | 143.26 | 144.3 | 1.04 | PHYLL | FSH | Quartz and pyrite veinlets present (2). | 0 | 1 | 0 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | 0.1 | | |
| 11RPDH-08 | 144.3 | 146.3 | 2.00 | QTZITE | FSH | Medium to dark grey quartzite with some major veins. No sulphides visible. | 0 | 1 | 4 | 0 | 0 | 1 | 3 | 1 | 1.5 | 4 | | | | | | | | | 70 | | | | | | | | |
| 11RPDH-08 | 146.3 | 147.85 | 1.55 | QTZITE | FSH | Foliated with some phyllitic layers. Sericite and quartz on fracture. | 0 | 2 | 0 | 0 | 0 | 0 | | | | | | | | | | | | | | | | | | | 0.05 | | |
| 11RPDH-08 | 147.85 | 149.35 | 1.50 | QTZITE | FSH | Some very soft and broken phyllite as well. Areas have a greenish colouration. | 0 | 1 | 1 | 1 | 0 | 0 | | | | | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 149.35 | 150.87 | 1.52 | PHYLL | FSH | Phyllite and quartzite. Soft parts. | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 1.5 | 1.5 | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 150.87 | 152.4 | 1.53 | PHYLL | FSH | Very finely foliated and crumbly in places. Very little quartzite. | 0 | 1 | 2 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 152.4 | 153.92 | 1.52 | FZ | FSH | Very broken and chloritized, faulted?. Originally quartzite and phyllite. | 0 | 0 | 4 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | | | |
| 11RPDH-08 | 153.92 | 155.45 | 1.53 | PHYLL | FSH | Lenses of quartz +/- sericite, one larger one has some pyrite as well. | 0 | 2 | 0 | 0 | 0 | 1 | | | | | | | | | | | | | | | | | | | 0.1 | | |
