LIST OF TABLES

LIST OF APPENDICES

1.0 Introduction

1.1 Introduction

The SSO 1-28 quartz claims are located 105 kilometers north of the community of Ross River, Yukon Territory, Canada. The project consists of 28 contiguous quartz claims located in the Mayo Mining District. Golden Predator Canada Corp. has 100% undivided ownership in the claims. Intrusion-related, skarn and Carlin-style gold mineralization is being targeted.

The claims are accessed by helicopter from the Faro, Yukon airstrip or from the North Canol Highway. The 2011 exploration program consisted of regional stream sediment sampling carried out on August 24, 2011.

1.2 Participating Personnel

The 2011 exploration program was funded and operated by Golden Predator Canada Corp. with its corporate headquarters in Whitehorse, Yukon, Canada. Alcan Air of Whitehorse, Yukon provided fixed wing transportation and Fireweed Helicopters of Whitehorse, Yukon provided helicopter transportation. Geological and logistical services were provided by the Golden Predator Canada Corp. Whitehorse, Yukon staff. Expediting services were provided by C.O.R.E. Expediting of Whitehorse, Yukon. All sample assay work was performed by ALS/Chemex with offices in Whitehorse, Yukon and Vancouver, British Columbia.

1.3 Agreement

Golden Predator Canada Corp has a 100% undivided interest in the 28 SSO claims.

2.0 Property Location, Claim Data and Access

2.1 Location

The SSO quartz claims are located approximately 105 kilometers north of the community of Ross River in central Yukon Territory and consist of 28 contiguous quartz claims. The claims are located in the Mayo Mining District on NTS map sheets 105K/16 and are located at 333000E 6976500N, NAD 83, UTM Zone 8N. The claims are located immediately north of the South Macmillan River in the general vicinity of Mount Selous (Appendix 1).

2.2 Claim Data

A total of 28 SSO quartz claims are covered by this assessment report and the claims are listed in Table 2.1 below and are shown in Appendix 1.

Grant Number	Claim Name	Claim No.	NTS Map Number
YD122743-YD122770	SSO	1-28	105K/16

Table 2.1

2.3 Access

Access to the property is via helicopter from the Faro, Yukon airstrip or from the North Canol Highway. The 2011 support camp was located at Golden Predator's Class I camp at Jeff Creek on the North Canol Road. Helicopter transport was used to move crews and equipment from the Jeff Creek camp to the SSO 1-28 project area which is located 90 kilometers west of the camp. The camp was supported by road access on the North Canol Road.

The communites of Faro and Ross River, Yukon are the nearest centers for obtaining food, fuel and supplies. Helicopter and fixed wing flight service is available from Faro. The nearest large metropolitan center is Whitehorse, Yukon located 295 kilometers south of the claim block.

3.0 Physiography

The property is located on the eastern flank of the Mount Selous massif immediately north of the South Macmillan River. Elevations on the property range from 1100 to 1700 meters and the topography in the area is characterized by sharp, narrow ridges with steep flanks marginal to large, broad U-shaped valleys. The upper elevation ridges (+1250m) do not have glacial deposits, but the lower elevations have glaciofluvial outwash deposits on the valley floors (see Appendix 1).

The tree line in the area is located at approximately 1500 meters. Vegetation below the tree line and in the valley floors is composed of alder, birch, balsam and spruce. In areas of sparse tree cover and above tree line vegetation consists of buck brush, dwarf willow and moss.

Long cold winters, short cool summers and low total precipitation characterize the climate in the project area. January average temperatures range between -17 and -26 C and July average temperatures range from 21 to 9 C (Mayo, Yukon data). The mountainous area attracts significant rain during the summer months and deep snow in the winter months.

4.0 History and Previous Work

The general area has been extensively explored since the late 1960's and hosts two known mineral resources controlled by Overland Resources. The Andrew Deposit contains a resource of 7.7 Mt grading 5.5% Zn and 1.4% Pb and the Darcy Deposit contains 5.5 Mt grading 4.7% Zn. There are two MINFILE reports in the general area, 105K 089 and 105K 090, which outline the exploration history in detail for the general area. Numerous assessment reports have been filed in the map area over the last forty years.

The first claims were staked in the area in 1967 by the Hess Syndicate (Atlas Explorations Ltd, Quebec Cartier Mining Company and Phillips Brothers (Canada) Ltd), which carried out geochemical sampling that year. The syndicate carried out geological mapping, geochemical sampling, geophysical surveying, hand trenching, road construction, bulldozer trenching through 1969.

Cima Resources Ltd drilled the first two holes totaling 14.8 m in 1977.

Ron Berdahl began acquiring claims in the area starting in 1996 and continued staking and prospecting in the area through 2000 when those claims were optioned to Noranda Incorporated. Noranda carried out airborne magnetic and EM geophysical surveying and geological mapping, prospecting, ground magnetic and gravity geophysical surveying, rock and soil geochemical sampling and drilled 15 holes (2717.7 m) in 2000 and 2001. Noranda drilled an additional 8 holes (1838.3 m) in 2002.

Overland Resources acquired the Andrew property in 2007 and drilled 10 holes (2800 m). In 2008, Overland drilled 23,425 m in 134 diamond drill holes to expand the resource. A preliminary economic evaluation was completed in 2009 that indicated the potential viability of both open and underground mining operations at the Andrew property, including both the Andrew deposit and the Darcy deposit, together known as Overland's 'Yukon Base Metal Project'.

5.0 Geology

5.1 Regional Geologic Setting

The SSO 1-28 claims are located within the Selwyn Basin which consists of a thick package of Late Proterozoic-Paleozoic marine sediments extending east-southeast from the Dawson City area to the Yukon-Northwest Territory border. The northwest-southeast trending Tintina Fault defines the southwest boundary of the Selwyn Basin while the North American craton defines the northeast boundary. The Selwyn Basin stratigraphy consists of shallow shelf to off-shelf marine clastic and chemical sediments, as well as basinal clastic sediments derived from the Ancient North American Platform to the northeast with ages of deposition ranging from Late Precambrian through Permian (Root, et al., 1995). Two major episodes of rifting occurred in the basin; one during deposition of the Late Precambrian Hyland Group sediments and the second during deposition of the Devonian-Mississippian Earn Group sediments (see Appendix 1).

Extensive thrust faulting along the entire extent of the Selwyn Basin began during the Late Jurassic and extended through Early to Mid(?) Cretaceous. The thrust belt strike west-northwest and dip to the southwest, sub-parallel to the stratigraphy. Major regional thrust faults that are well mapped to the north of the SSO 1-28 claims include, from youngest to oldest, the Dawson, Tombstone, and Robert Service from north to south.

The Tombstone Plutonic Suite forms a narrow, west-northwest trending belt of weakly reduced, felsic intrusions extending 550 kilometers across the north-central Yukon (Mair, et al., 2006; Mortensen, et al., 2000) that are spatially and temporally associated with gold and tungsten mineralization in the Selwyn Basin. The intrusions post-date the Mesozoic contractional deformation. In the Macmillan Pass area significant tungsten mineralization in developed as skarn replacement deposits with little associated gold, however in the Mayo area, gold mineralization is spatially associated with tungsten in sheeted vein systems. In general, gold mineralization is associated with As, Bi, and Sb trace element geochemistry.

The SSO 1-28 claims occur within a broad deformation belt unofficially called the "Gold River Fold Belt" extending along the south side of the Hess River. Several west-northwest trending thrust faults, possibly re-activated as strike-slip faults, are associated with intense folding and imbrication of the sedimentary package. South of the Hess River the TPS rocks form small stocks with associated dike and sill complexes. North of the Hess River, the TPS rocks form large, well-exposed plutonic complexes with significant peripheral contact metamorphism and associated skarn-style mineralization.

5.2 Property Geology

Property scale geology is known only through regional reconnaissance mapping. Rock units exposed on the SSO 1-28 claims are part of the Late Proterozoic through Paleozoic sedimentary rocks of the Selwyn Basin. Rock units include the coarse grained clastics and limestone of the Upper Proterozoic-Lower Cambrian Hyland Group and fine-grained, siliceous mudstone, chert and siltstone of the Late Ordovician through Early Devonian Road River Group (Appendix 1). These deep water marine siliciclastic units were compressively deformed along low-angle thrust faults from the Early Jurassic through the mid-Cretaceous time.

The claims are proximal to the large Mount Selous intrusive complex. Hydrothermal alteration with associated gold mineralization is not mapped on the claims, but significant mesothermal vein mineralization is documented 6 kilometers to the north at the Andrew and Darcy Zn-Pb and Zn deposits (MinFile 105K 089) held by Overland Resources. The base-metal mineralization is hosted in a series high-angle veins quartz-carbonate veins localized along late-stage, high-angle, extensional structures. Anomalous gold values are locally associated with the Ag-Zn-Pb vein mineralization.

RGS regional stream sediment geochemistry in the general area is very anomalous in Zn and Pb, and locally for Au. The claims are located within a large drainage basin that returned a 227 ppb Au stream sediment assay.

6.0 Exploration

6.1 Exploration Summary

The Phase I 2011 exploration program was completed on August 24th, 2011. Golden Predator collected 4 silt samples from active stream beds. A crew of 4 samplers, plus a cook and helicopter pilot were based in the Jeff Creek camp adjacent to the North Canol Road. All of the work was helicopter assisted using a Hughes 500 NOTAR supplied by Fireweed Helicopters of Whitehorse, YT, with a flight time of 0.7 hours for the program.

6.2 Sampling Methodology and Protocols

Stream Geochemical Program

Stream sediment samples were collected at intervals of approximately 750 m along first, second and third order streams, and immediately upstream of confluences. Samples were also collected in the vicinity of historical RGS stream anomalies to test repeatability.

Each sample was collected from several points along the active stream bed to produce a representative composite sample. The uppermost sediment was discarded to avoid spurious high content of Fe and Mn oxide coating. The active silt and fine to medium sand that has been recently transported by the stream was the target sediment. This type of sediment was generally located: 1) in the lee of large boulders or logs; 2) in low energy pools at the tail-end of bars; and 3) infilling voids below the surface of cobble-gravel bars.

Samples were sieved in the field to a fraction of less than one-eight inch (<1/8" or 3.36 mm) and placed in labeled, double layered plastic sample bags. Sample sites were flagged and photographed. The sample weights varied between 4-12 kg. Large sample sizes were required to obtain sufficient fine material for the selected assay techniques.

If the drainage contained seasonal stream sediment deposition, but was currently dry, a sediment sample was collected by dry sieving the material. Occasionally the south-facing slopes had underground drainage that sporadically comes to surface, in which case sample spacing sometimes varied.

Sample data was recorded on data cards and included the following: geographic location, sample color, angularity of the clasts, sediment composition (percentage of gravel, sand, silt, clay and organics), slope direction, slope angle, stream flow, vegetation type and comments (see Appendix 3).

Samples were transported by land from the Jeff Creek camp to Whitehorse and were delivered by in-house personnel or insured professional expeditors to ALS Chemex's ISO 9001 certified preparation facility in Whitehorse. Samples were dried and screened to 180 microns (80 mesh).

The pulps were analyzed at ALS Chemex's ISO 9001 certified laboratory in North Vancouver using the ultra-trace ME-MS41 package. A 0.5 g sample is digested by aqua regia techniques and 51 elements are analyzed through a combination of ICP-AES and ICP-MS.

The Au-ST44 method was used to analyze gold using a 50 g sample of <80 micron material. This method provides the lowest possible detection limit for gold of 0.0001 – 0.1 ppm, using aqua regia digestion with analysis by ICP-MS. The larger sample size for the gold analysis is used in an effort to reduce potential nugget effects. Samples exceeding the upper limit of Au detection (0.1 ppm) were re-analyzed using Au-OG44, an ore grade assay technique. A 50 g sample of 180 microns sediment is digested in an aqua regia solution and finished with ICP-MS methods to provide an Au detection range between 0.01 – 100 ppm.

ALS completes quality assurance/ quality control (QA/QC) data verification of their assays through internally inserted duplicates, standards and blanks. In addition, Golden Predator's QA/QC program included the insertion of field duplicates, blanks and standard reference material obtained from CDN Resource Laboratories of Langley, BC. Assay certificates are compiled in Appendix 2 along with the detailed methodology and detection limits.

The geographic location and a detailed description of the stream sediment sample are presented in Appendix 3. Analytical results for all of the stream sediment samples are presented in Appendix 2 and 3.

6.3 Results

Stream Sediments

Results from the stream sampling program defined no gold anomalies within the claim block. The gold geochemical results are uniformly low ranging from 1.2 ppb to 2.7 ppb and these values are much lower than the 227 ppb Au value reported in the RGS dataset. The anomalous RGS sample is located 4.5 km south of the claims. Arsenic, antimony and bismuth trace element geochemistry is also uniformly low. The area is anomalous in Zn.

7.0 Conclusions

The SSO 1-28 claims cover portions of a large drainage with anomalous gold reported in the RGS dataset. The 2011 field program collected 4 stream sediment samples from the claim block which did not define any new gold in stream sediment values. The geochemistry from these samples suggests that gold mineralization that sources the anomalous RGS sample does not have a source on the SSO 1-28 claims.

The property is in the early stage of exploration and is prospective for intrusion-related and/or skarn gold mineralization based on its proximity to the Mount Selous pluton. Additional prospecting in conjunction with ridge and spur soil sampling would need to be completed to further explore the claim block.

10.0 Statement of Qualifications

I, Jeffrey A. Cary, who resides in Durango, Colorado, USA, DO HEREBY CERTIFY THAT:

1) I am an employee and Senior Geologist with Golden Predator Canada Corp. whose address is 1 Lindeman Way, Whitehorse, Yukon Territory, Canada, Y1A 5Z7.

2) I hold the following academic qualifications:

Master of Science Degree in Geology in 1990 from Western Washington University in Bellingham, Washington, USA.

Bachelor of Science Degree in Geology in 1983 from Fort Lewis College, Durango, Colorado, USA.

3) I have been practicing my profession continuously in the United States, Canada, Mexico and Chile for thirty years as a professional geologist on a variety of exploration and development programs searching for precious metals, base metals, uranium and coal.

4) The information for this report is based on information as itemized in the Selected Reference section of this report and from work of Golden Predator Canada Corp. employees performed at the SSO 1-28 claims on August 21st, 2011.

Dated this 4th Day of December, 2012.

Respectfully Submitted

Jeffrey A. Cary, M.Sc.

Senior Geologist,

QUATERNARY

- Q: QUATERNARY: unconsolidated glacial, glaciofluvial and glaciolacustrine deposits; fluviatile silt, sand, and gravel, and local volcanic ash

MID-CRETACEOUS

- mKS: SELWYN SUITE: plutonic suite of intermediate (g) to more felsic composition (q) and rarely syenitic (y); equivalent felsic dykes (f)
- mKqS: SELWYN SUITE: equigranular to porphyritic (K-feldspar) biotite hornblende muscovite granite, quartz monzonite and granodiorite
- mKgS: SELWYN SUITE: resistant, fine to coarse grained equigranular to porphyritic (K-feldspar) biotite quartz monzonite and granodiorite and minor quartz diorite

MISSISSIPPIAN

- MK: KENO HILL: massive to thick bedded quartz arenite; thin to medium bedded quartz arenite interstratified with black shale or carbonaceous phyllite
- MT1: TAY: recessive, dark brown weathering, thin to medium bedded, calcareous, dark grey to brown siltstone and shale
- MT2: TAY: grey and buff weathering, generally thick bedded to massive, dark grey to black fetid limestone

DEVONIAN AND MISSISSIPPIAN

- DME: EARN: complex assemblage of submarine fan and channel deposits within black siliceous shale and chert, minor felsic volcanic rocks; barite and stratiform Pb-Zn
- DME1: EARN: thin bedded slate with interbedded quartz arenite and wacke; members of chert pebble conglomerate; siliceous siltstone; nodular and bedded barite; limestone
- DME2: EARN: black shale, argillite, cherty argillite and thin bedded chert; nodular and bedded barite; rare limestone
- DME3: EARN: massive felsic to intermediate volcanic flows, tuffs and subvolcanic plug(s); chert and minor slate; quartz eye phyllite; vesicular basalt
- DME4: EARN: chert and dark grey siliceous shale
- DME5: EARN: mudstone, chert-quartz sandstone and chert pebble conglomerate; shale and sandstone

ORDOVICIAN TO LOWER DEVONIAN

- ODR: ROAD RIVER - SELWYN: black shale and chert overlain by siltstone or platy limestone
- ODR1: ROAD RIVER - SELWYN: black graptolitic shale and black chert; thin to medium bedded, chert; minor argillaceous limestone
- ODR2: ROAD RIVER - SELWYN: argillite and dolomitic siltstone with partings of black shale and chert; minor dolostone
- ODR3: ROAD RIVER - SELWYN: black limestone; platy, silty limestone
- ODR4: ROAD RIVER - SELWYN: black shale; limestone, limestone conglomerate, and interstratified argillite and limestone

LOWER CAMBRIAN

- ICG: GULL LAKE: dominantly fine clastic assemblage (1) with local volcanic units (2)
- ICG1: GULL LAKE: shale, siltstone and mudstone, minor quartz sandstone; rare green-grey chert; limestone and limestone conglomerate; phyllite to mica schist
- ICG2: GULL LAKE: dark green massive to fragmental mafic metavolcanic and volcaniclastic rocks; siltstone and argillite

UPPER PROTEROZOIC TO LOWER CAMBRIAN

- PCH: HYLAND: coarse turbiditic clastics, limestone and fine clastics; may include scattered mafic volcanic rocks
- PCH1: HYLAND: shale, fine to coarse grained quartz-rich sandstone, grit, and quartz pebble conglomerate; minor argillaceous limestone; phyllite; minor marble
- PCH2: HYLAND: thin to thick bedded, limestone, locally sandy; calc-silicate and marble
- PCH2?: HYLAND: thin to thick bedded, limestone, locally sandy; calc-silicate and marble
- PCH3: HYLAND: recessive, interbedded maroon and apple-green slate; "Oldhamia" trace fossils; rare grey chert; local siltstone, sandstone and quartz-pebble conglomerate
- PCH4: HYLAND: quartzose clastic rocks as described in (1)
- PCH5: HYLAND: dark green volcanic rocks, commonly with calcite filled vesicles, breccia, tuff, and agglomerate; minor interbedded shale, chert, siltstone, and limestone
