SUMMARY

The North Canol Property ("the Property"), owned by Golden Ridge Resources Ltd., comprises base and precious metal targets located southeast of the MacMillan Pass airstrip in eastern Yukon. The Property is comprised of 800 Yukon Quartz claims totaling approximately 15,000 hectares on NTS map sheets 105O/01 and 02. The Property is located 162 kilometres northeast of the community of Ross River and 360 kilometres northeast of Whitehorse, the territorial capital. Access is by seasonal road, fixed wing to Mac Pass airstrip and/or helicopter. The southern and eastern boundaries of the property are bordered by the seasonal, government-maintained North Canol Road (Yukon Highway #6).

The North Canol Property is situated within the Macmillan Fold Belt, a well mineralized portion of the Paleozoic Selwyn Basin that hosts several significant deposits and prospects close to the property, including the Tom, Jason, and Nidd sedex Zn-Pb-Ag-Ba deposits, the Mactung tungsten deposit, the Brick-Neve sediment-hosted gold prospect, and several small, high-grade barite deposits.

Historic work has identified several mineral occurrences on or very close to the Property including the Bailes, Racicot (Moose), and Gary (Gargantua) barite deposits, the Bremner and Hasten Zn-Pb-Ag-Ba prospects, and the Sim W prospect. That work also identified other geophysical and/or geochemical anomalies that may indicate potential for sedex Zn-Pb-Ag-Ba, bedded barite, intrusion-related gold, sediment-hosted (Carlin-type) gold or other styles of mineralization on the property.

In 2010 and 2011, Golden Ridge acquired the North Canol claims. In 2011, they contracted Fugro Airborne Surveys to do an airborne magnetic and electromagnetic survey on the North Canol Property. Initial interpretation of the Fugro data has identified several interesting anomalies and structural breaks.

Also in 2011, a small prospecting, rock, silt and soil sampling program was completed. Silt sampling conducted in 2011 identified several promising anomaly clusters worthy of follow-up, including both Au-As-Mo-W and base-metal targets.

In 2012, additional soil geochemical sampling, prospecting and rock sampling was done to follow up the results of the 2011 work program. Soil and rock geochemistry has identified gold-silver-arsenic-lead mineralization associated with the Cretaceous intrusive unit. Elevated silver and zinc values are found within the Niddery Lake member black shales. Additional soil sampling, geological mapping and rock sampling is required in order to better evaluate the mineralization controls on the North Canol Property.

For 2013, an expanded exploration program is recommended for the North Canol Property. Phase I will consist of detailed geological mapping and expanded soil sampling. A total of 4000 soil samples will be collected from wide spaced grid lines. Geological mapping and prospecting/rock sampling will be done to define contact areas, structures and mineralized zones.

If results warrant, a Phase II exploration program consisting of continued expanded and infill soil geochemical sampling and excavator trenching is recommended. Trenching, utilizing a helicopter-portable mini-excavator, will be designed to test the best coincident geochemical, geological and geophysical targets.

The Phase I exploration program is budgeted at $375,000. Phase II is dependent upon the results of the Phase I program and is budgeted at $450,000.

1) INTRODUCTION

The North Canol Property ("the Property"), comprising lead-zinc-silver, gold-arsenic and barium targets, is located in eastern Yukon, along the North Canol Highway near the 200 kilometre highway marker. The property is owned 100% by Golden Ridge Resources Ltd.

Golden Ridge acquired this property after examination of historic assessment reports documenting previous exploration programs, and noting that along with sedex type geochemical anomalies, the host rock lithologies are amenable for either Carlin type or intrusive related gold mineralization.

In 2011, Golden Ridge conducted an airborne geophysical survey followed by small silt, soil and rock sampling and prospecting programs on the property. In 2012, follow-up soil sampling, prospecting and rock sampling confirmed the presence of gold and associated indicator elements, plus lead-silver and zinc mineralization. The 2012 work program is the subject of this report.

2) LOCATION AND ACCESS

The North Canol Property is located in the Macmillan Pass area, Yukon Territory on NTS map sheets 105O/01 and 02, at a latitude of 63˚10'N and a longitude of 130˚25'W (Figure 1). The Property is located 162 kilometres northeast of the community of Ross River, and 360 kilometrm northeast of Whitehorse, the territorial capital.

The North Canol Property is accessible by seasonal road and/or helicopter. The southern and eastern property boundaries are bordered by the government-maintained, North Canol Road (Yukon Highway #6), which is generally open from mid-June to late September (see Figure 2). Access to the central and northwestern portion of the property is by helicopter only. In addition, a rough, four-wheel-drive tote road to the Jason and Nidd zinc-lead-silver deposits comes within one kilometre of the northern boundary of the property, however, a key bridge over the South Macmillan River connecting the Nidd Road to the Canol Road was not passable in 2012. Nevertheless, it may be possible to ford the river during low water. The Macmillan Pass gravel airstrip, adequate for small fixed-wing single and twin-engine aircraft, is located 5 kilometres northeast of the property.

In 2012, access was accomplished using a Long Ranger L3 helicopter supplied by Fireweed Helicopters of Whitehorse, which was based at a trailer and tent camp located on the North Canol Road near the eastern boundary of the property. The lower reaches of the south part of the property were also accessed on foot from the Canol road.

3) PHYSIOGRAPHY

The topography of the MacMillan Pass region is characterized by rugged mountainous areas separated by broad valleys. The project area lies within the headwaters of the South Macmillan River in the Selwyn Mountains, and roughly 15 kilometres west of the Yukon – Northwest Territories' border, which follows the continental divide. Elevations range from 1040 metres near the Canol road to 2100 metres on the nearby peaks to the northwest. Topography is moderate to steep with broad U-shaped valleys and locally steep peaks and ridges. Tree line varies from 1300 to 1500 metres depending on aspect.

Vegetation in the lower valleys is locally dense with birch and willow brush and stunted black spruce. The majority of the project area is covered by colluvium. Outcrop is sparse except on the steeper ridges and cliffs. Permafrost is present on the lower north-facing slopes.

4) CLAIM INFORMATION

The North Canol Property is located within the Mayo Mining District and consists of 800 quartz claims totaling approximately 15,000 hectares (Figure 2). The majority of the claims have expiry dates in January 2015, except for 140 claims located along the south and west edge of the property which have expiry dates of September 20, 2013. The claims have not been surveyed. Claim information is listed in Appendix II.

5) HISTORY

The Canol ("Canadian Oil") road and pipeline were built in 1942-44 under the direction of the U.S. Army Corps of Engineers. The purpose was to deliver oil from fields at Norman Wells, N.W.T to Fairbanks, Alaska in support of the war effort against Japan.

The mineral potential of this region was first identified in 1943 during the construction of the Canol Road. At this time a large gossan was noted in Macmillan Pass, and it has been reported that the lead-zinc-silver mineralization currently being developed by HudBay Minerals Inc. ("HudBay") on the Tom claims was recognized at that time. HudBay conducted preliminary prospecting programs throughout a broad part of the eastern Yukon in 1953, when they staked the Tom claims.

The majority of the mineral prospects in the Macmillan Pass area were discovered during the exploration boom of 1960s, 1970s and early 1980s, when the area was extensively prospected for lead, zinc, silver, copper, barite and tungsten. This work resulted in the discovery of the important Jason and Nidd zinc-lead-silver deposits, the Mactung tungsten deposit, and many of the barite occurrences. Active gold exploration took place in the 1980s and 1990s leading to the discovery of the sediment-hosted Brick-Neve prospect to the west, as well as several intrusion-related vein and stockwork prospects.

According to assessment records, the majority of previous exploration on the North Canol Property took place between 1972 and 1983 and was primarily directed at Ba or Zn-Pb-Cu-Ag deposits (with the exception of minor work at the Sim W prospect). The location of occurrences, drill holes, trenches and geophysical and geochemical anomalies are shown on Figure 3.

Recorded mechanized work includes seven diamond drill holes (two on Bremner and five in the Hasten-Fetch area), a bulldozer tote road to the Hasten drill hole, and approximately 425 metres of bulldozer trenching on the Racicot (Moose) Ba occurrence. Most of the targets have received some combination of geological mapping, geochemical surveys, and magnetic, VLF, gravity or Maxmin II EM surveys.

Several stream sediment, heavy mineral and soil surveys have been done in the past by various parties. Most of the work was limited to analysis for Pb, Zn, Ag, Ba, Cu, and in some cases a few other elements. Very little analysis for Au or pathfinders was done in the past.

Soil sampling was completed on the Gary claims by the Ogilvie Joint Venture in the vicinity of the Racicot (Moose) Ba prospect between 1974 and 1977 (Smith, 1975b, 1976; Rowe, 1977a, 1977b). Several weak Ba and Zn anomalies were outlined. Rock, soil, silt and water sampling for Pb, Zn and Ba were done on the adjacent Moonlight claims by the Itsi Joint Venture in 1977 (Cathro, 1977).

Aberford completed geochemical sampling in 1981-1983 in the vicinity of the Bailes barite prospect. 41 rock samples collected and analyzed for Pb, Zn, Ba, Ag, Au, Sr, and in some cases Cu, W, and As. Four heavy media stream sediment samples were analyzed for Cu, Pb, Zn, Mo, Ag, Au, As, Sb, W, Ba and Co. 1011 soil samples were analyzed for Pb, Ag (or Cu), Zn, and Ba (Kapusta 1982, 1983, 1984).

Canadian Nickel (1977-78) and later Cominco (1983) completed soil sampling on the Hasten-Fetch-Basin properties in the search for sedex Zn-Pb-Ag deposits (Debicki, 1977a, 1978a, 1978b; Murrell, 1983). Several anomalies were identified, and a low-order lead anomaly on the Hasten claim group was tested by one drill hole (HA-83-1) by Cominco in 1983.

Small ground geophysical surveys were completed on the current property by previous operators between 1975 and 1983. In 1975, the Ogilvie Joint Venture conducted a gravity survey on the Gary claims in the vicinity of the Racicot (Moose) Ba deposit (Smith, 1975c), outlining two strong gravity anomalies thought to be partly coincident with barite mineralization and a Ba-Zn soil anomaly. In 1977, the joint venture completed 44.4 kilometres of Maxmin II EM surveys on the Gary claims (Betz, 1977a, b). Several complex conductors were identified. These were interpreted to map NW and NE geological trends.

The Itsi Joint Venture completed several short Maxmin II EM test lines on the Moonlight property in 1977 (Hendrickson, 1977) and on the Ess Property in 1978 (Cathro, 1979). The results were inconclusive.

Canadian Nickel completed 54.3 kilometres of magnetics on the Hasten-Fetch-Basin group in 1977. The magnetic results were flat except for a 600 gamma anomaly, interpreted to be associated with pyrrhotite in a contact metamorphic zone adjacent to Cretaceous intrusion in the SW corner of the property (Debicki, 1977b). An Inco Mark IV vertical loop EM survey and a Turam EM were completed in 1978. Several conductors were identified and were interpreted to represent graphitic shale horizons (Debicki, 1978b).

In 1983, Aberford completed 43.9 kilometres of VLF-EM in the vicinity of the Bailes barite prospect on the JK claims (Kapusta, 1984). Eighteen first-order VLF-EM anomalies were outlined, several of which were associated with the known Bailes barite prospect or areas with Zn, Cu, Pb or Ba soil anomalies. In addition, Aberford completed 43.7 kilometres of magnetometer surveying. The magnetic values were fairly consistent over the grid, with "a few magnetic trends ranging between 100 to 400 gammas, and one anomalous zone in excess of 1000 gammas". The latter is associated with a pyrrhotite skarn section of the Road River Group and has a coincident Zn-Cu-Pb-Ba anomaly, which is downslope of the Bailes barite horizon. Kapusta (1984) concluded *"none of the magnetic anomalies outlined during the survey are associated with the more significant geochemical trends or VLF anomalies"*.

Four trenches were blasted to allow sampling at the Bailes Ba prospect in 1982 (Kapusta, 1983). Rock sampling here showed values up to 57% Ba.

In 1973-74, Spartan Exploration Limited, Nuspar Resources Ltd. and Yukon Barite Ltd. completed mapping, hand pitting and roughly 425 metres of bulldozer trenching on the Racicot (Moose) Ba showing (Sinclair and Gilbert, 1974; Sinclair *et al.*, 1975). Two zones of shale-hosted bedded barite, trending northwest and dipping westerly, were exposed on surface. The barite zones "*which are moderately to steeply dipping, are estimated by Nuspar to contain roughly three million tons of material uniformly grading 84% barium sulphate and 12 to 14% silica"*. It should be noted that this is a historic resource figure only, and was not prepared in accordance with NI 43-101.

In the Hasten-Fetch area, Canadian Nickel is reported to have drilled eight diamond drill holes (566 metres) in 1978, three of which were lost in overburden. These drill holes were apparently not filed for assessment, although the collars and depths for four of the holes (#54313, 83 feet (25.3 metres); #54314, 502 feet (153.0 metres); #54317, 390 feet (118.9 metres); and #54319, 299 feet (91.1 metres)) are shown near the Macmillan River on a map in a later Cominco report (Murrell, 1983), and would be on the current North Canol Property. No other information is available for these holes.

In 1983, Cominco built a bulldozer tote road and drilled hole HA83-1 (302 metres) on the Hasten prospect in order to test a week lead anomaly near the contact of the Road River

Formation and overlying Earn Group. This hole is on the east side of the North Canol Property. It is reported to have intersected weak sphalerite mineralization in a thin grit unit and as interstitial fillings around mudflow clasts. The drill log also suggests that sphalerite is associated with thin calcite and quartz veinlets. Bedded pyrite and limy sections are also described (Murrell, 1983). No assays for gold were reported, and the location of the core is not known.

On the Bremner prospect, the Itsi Joint Venture drilled two diamond drill holes (324 metres) from a single set-up in 1978 (Cathro, 1979). The holes were designed "*to test for sedex mineralization at the base of the Earn Group. They cut 61.0 metres of Earn Group mudstone before intersecting black limestone of the Road River Formation. The Earn Group mudstone contains abundant thin pyrite laminae, often accompanied by thin quartz veinlets, and occasional layers of fine grained, bedded pyrite up to 4 inches thick*". The drill logs also note silicification, quartz veining and pyrite within the Road River limestone (i.e. Sapper Formation). "*No other sulphides or barite were intersected*," and no assays for gold were reported. The core is reported to be in the Bostock Core Library in Whitehorse.

In 2010 and 2011, Golden Ridge acquired the ground and initiated exploration work in 2011. Initial exploration work consisted of an 84.6 line kilometre DIGHEM airborne electromagnetic/magnetic survey flown by Fugro Airborne Surveys ("Fugro"). Golden Ridge also conducted a small silt, soil and rock sampling and prospecting program.

6) WORK DONE BY GOLDEN RIDGE RESOURCES LTD. IN 2012

On August 5 and 6, 2012, a soil sampling and prospecting/rock sampling program was conducted on the North Canol Property. Three contour soil sampling lines were established around the headwaters of streams that returned elevated gold and arsenic values from the 2011 silt sampling program. Line lengths were 3.2, 5.0 and 6.0 kilometres, with samples collected at 100 metre intervals along the lines. A total of 142 soil samples were collected. During the course of the prospecting program, 43 rock grab samples were collected.

Work was conducted by a 4 person crew working out of a camp on the North Canol Highway. Access to the property was via helicopter.

7) GEOLOGY

Regional Geology

The first recorded work in the Macmillan Pass region was conducted by E.D. Kindle of the Geological Survey of Canada who carried out a reconnaissance survey of the Canol Road between 1944 and 1945. The regional geology presented here is taken from a summary of Selwyn Basin, compiled by D. Héon (Yukon Geological Survey website).

The North Canol Property is located within the Selwyn Basin which consists of a broad package of Paleozoic sediments extending ESE from north-west of Dawson City to the Yukon-NWT border north of the major NW-SE trending Tintina Fault Zone. This stratigraphy consists of shallow shelf to off-shelf marine clastic and chemical sediments, as well as basinal clastic sediments derived from the Ancient North American Platform to the north-east. Age of deposition ranges from Late Precambrian to Permian. At least two major episodes of rifting have occurred: the first during deposition of the Late Precambrian Hyland Group sediments, and the second during deposition of the Devono-Mississippian Earn Group sediments. These major rift zones often host poorly sorted coarse clastic sediments, such as debris flows or turbidite horizons.

Several episodes of continental uplift have led to periods of increased erosion and resulting continental margin or miogeosynclinal deposition, resulting in the creation of sequences of comparatively high energy, shallow water sediments, often coarsely grained and variably calcareous. These are separated by strata formed under deeper, quieter water conditions, resulting in formation of fine clastic sediments and chert. The Mid-Cretaceous Tombstone-Tungsten Suite (95-89 Ma) has been emplaced within the Selwyn Basin. Intrusives of this suite occur along an ESE trending belt extending for over 500 kilometres from north-west of Dawson City, Yukon to the Yukon-NWT border. Historically, the intrusions are believed to control much of the economic gold mineralization within the Selwyn Basin.

Extensive thrust faulting along the entire extent of the Selwyn Basin began during Late Jurassic time, resulting in creation of a compressional regime. Most thrust faults are oriented roughly ESE, dipping to the south-west, sub-parallel to the overall ESE trend of stratigraphy. Several major regional thrust faults were formed including the Dawson Thrust, Tombstone Thrust, Hess River and Robert Service Thrust. This regional lineation has been overprinted by a slightly less pronounced NE-SW lineation, marked by high angle orthogonal faults suggesting the compressional regime was followed by an extensional tectonic regime.

Several Tombstone Suite monzonite stocks occur within this belt, including one which covers a good portion of the North Canol Property.

Property Geology

The North Canol Property is underlain by the west-trending Macmillan Fold Belt (MFB), comprised primarily of Paleozoic sedimentary rocks of the Road River Group and Earn Group (Portrait Lake and Itsi Formations), which are intruded by a mid-Cretaceous granitic intrusion along the south and west margins of the North Canol Property. Details of the stratigraphy, structure and mineral deposits are presented in Abbott (1982, 1983, in preparation) and Abbott and Turner (1990), and the following is summarized from those sources. The detailed geology and structural relations in the MFB are shown on Figure 4.

Rocks in the MFB range in age from Hadrynian to Triassic, and include a broad range of lithologies including carbonate platform rocks (Mackenzie Platform), shallow and deep water carbonates and clastics (Selwyn Basin), and volcanics. During the Hadrynian to

Lower Ordovician, a general east to west shelf-slope transition was present in the area, with platformal carbonates and clastics to the east and deeper water shales, siltstones and limestone to the west. A few small outcrops of Proterozoic to Lower Cambrian ***Vampire Formation*** (shale, siltstone and sandstone) are mapped in the broad valley on the north side of the property, south of the Hess Fault.

The Road River Group was deposited from Ordovician to Early Devonian time, and comprises mudstone, black graphitic shale, chert and silty limestone. The Road River Group has been further subdivided by Abbott (in preparation) into the Early Ordovician to Middle Silurian ***Duo Lakes Formation*** (chert and siliceous shale), the Upper Silurian ***Steel Formation*** (bioturbated shale and mudstone, locally calcareous) and the Upper Silurian to Middle Devonian ***Sapper Formation*** (sility carbonaceous limestone). Small outcrops of these units were mapped in the creek valley on the north side of the property by Abbott (in preparation). In addition, silty limestone of the Sapper Formation was intersected at depth in drill holes at the Bremner prospect.

Middle Devonian tectonism resulted in a deposition of the ***Portrait Lake Formation*** comprising conglomerates, turbidites, sedimentary breccias, sandstone, siltstone, shale, chert and local volcanics. These rocks host the important sedex Zn-Pb-Ag and barite deposits of the MFB. The Portrait Lake Formation has been subdivided into the following units, from oldest to youngest: Lower Devonian ***Macmillan Pass Volanics*** (carbonate-rich mafic volcaniclastic and intrusive sills), The Lower and Middle Devonian ***Niddery Lake Member*** (blue weathering chert and siliceous shale), the Middle Devonian ***Macmillan Pass Member*** (chert pebble conglomerate, sandstone, siltstone and laterally equivalent shale), the Middle(?) and Upper Devonian ***Fuller Lake Member*** (blue weathering siliceous shale and chert). The Upper Devonian ***Itsi Formation***, a thick package (> 1300 metres) of resistant, parallel and cross-laminated sandstone, siltstone and shale is partly enclosed by the Fuller Lake Member.

Early Mississippian shale, quartzite, chert and limestone of the ***Tsichu Formation*** cap the sequence in the western part of the property, and were deposited in a more stable shelf-slope to off-shelf marine setting.

Structurally, the MFB has been subdivided into three west-trending domains, the North, Central and South Blocks, on the basis of Paleozoic stratigraphic relations and style of Mesozoic deformation. The North Block is characterized by southeasterly-directed imbricate thrust faults. The Central Block has complex structures including at least three phases of folds and faults, dominated by west-trending upright, tight folds and high angle reverse faults. The South Block has two relatively simple phases of northwest and north trending folds.

The property lies in the South Block of the MFB, south of the Hess Fault, a major WNW trending feature, which is thought to have been active during deposition of the Devonian sedimentary rocks, and later re-activated during Mesozoic deformation. The Hess Fault may be either a series of branching reverse faults, or have as much as 25 kilometres of

right lateral displacement on it, based on interpreted offset of facies within the Macmillan Pass Member.

Mineralization

Historic exploration work on the North Canol Property was largely for Sedex barite and lead-zinc-silver due to the geological similarity to HudBay's Tom and Cominco's Nidd deposit settings. More recently, limey units such as the Sapper Formation, have also been recognized for their Carlin-style gold potential. The large Cretaceous intrusive on the Property also is a good target for intrusive-related gold-arsenic mineralization.

Four known mineral occurrences are present within the boundaries of the North Canol Property: the **Bremner Cu-Pb-Zn** prospect (Minfile 105O 025), the **Sim W** prospect (105O 043), the **Bailes Ba-Zn** prospect (105O 052), and the **Hasten Ba-Zn** prospect (Minfile 105O 060). In addition, the **Racicot (or Moose) Ba** deposit (Minfile 105O 013) occurs on a small group of four claims surrounded by the North Canol Property (Figure 3).

Several other deposits and prospects are situated very close to the North Canol Property. These include the **Fetch (or Basin) Ba-Zn** prospect (Minfile 105O 028) and the **Gary (or Gargantua) Ba** deposit (Minfile 105O 027), which occur east of the southern portion of the property.

Three important sedex Zn-Pb-Ag-Ba deposits occur directly to the north and northeast of the property: **Jason** (Minfile 105O 019), **Tom** (Minfile 105O 001) and **Nidd** (Minfile 105O 024). The important **Mactung** deposit, one of the largest tungsten skarn deposits in the world, is located 17 kilometres north of the property.

The following information on mineral prospects is taken from Yukon Minfile (Deklerk and Traynor, 2005), and various other assessment filings, and government and company reports.

The **Bremner Cu-Pb-Zn prospect** (Minfile 105O 025) is located in the southern portion of the property. The Ess claims were staked in 1977 to cover "*an exposure of disseminated and conformable banded pyrite … in carbonaceous phyllitic shale in the bank of Hess Creek*" (Cathro, 1979). Two short diamond drill holes were "… *collared in the core of the anticline on the valley floor to test for sedex mineralization at the base of the Earn Group. They cut 61.0 m of Earn Group mudstone before intersecting black limestone of the Road River Formation. The Earn Group mudstone contains abundant thin pyrite laminae, often accompanied by thin quartz veinlets, and occasional layers of fine-grained, bedded pyrite up to 4 inches thick.*" The drill logs also note silicification, quartz veining and pyrite within the Road River limestone (i.e. Sapper Formation). "*No other sulphides or barite were intersected*" and no assays for gold were reported.

The **Hasten Ba-Zn prospect** (105O 060) is located on the east side of the property and was explored by Canadian Nickel and Cominco between 1976 and 1983. One diamond drill hole tested a week lead anomaly near the contact of the Road River Formation and

overlying Earn Group and is reported to have intersected weak sphalerite mineralization in a thin grit unit and as interstitial fillings around mudflow clasts. The drill log also suggests that sphalerite is associated with thin calcite and quartz veinlets. Bedded pyrite and limy sections are also described (Murrell, 1983).

The **Bailes Ba-Zn prospect** (Minfile 105O 052) occurs in the central part of the North Canol Property and was explored between 1981-83 by Pan Ocean and Aberford. Bedded barite mineralization occurs in siliceous shales, chert and breccia of the Earn Group, which Kapusta (1982, 1983, 1984) considered to be at a similar stratigraphic position to the Jason deposits, located approximately 4 kilometres to the northeast.

The Bailes barite prospect is reported to be 2 kilometres long and 3 to 10 metres thick of laminated or nodular barite with values ranging from 48.02 to 57.01% Ba in Trenches 1 and 2, and with 1.6 to 16.61% Ba, 0.02 to 0.14 oz/ton Ag (4.8 g/t Ag) and <0.01% to 0.05% Zn in Trench 3 (Kapusta, 1983). Local accumulations of disseminated and laminated pyrite are present, and *"within the southeastern and northwestern extent of the horizon, accumulations of lead, zinc and silver are found"* (Kapusta, 1983). Heavy mineral stream sediment samples in the area of the barite horizon also show anomalous values in Pb, As and W.

Kapusta (1983) described several nearby occurrences of minor mineralization. In one location, sphalerite is reported in a fracture within pyrrhotite skarn developed in Road River limestone (Unit Sidi – Sapper Formation) with values up to 2.15% Zn and 320 ppm As. A sample of arsenopyrite-bearing quartz in porphyritic dykes to the northwest is also reported to contain 0.5% Pb, 31 ppm Ag and 90 ppb Au. In another place, a quartz-tetrahedrite vein returned 0.16% Cu, 570.84 g/t Ag and 186 ppb Au. Four anomalous base metal soil geochemical trends were outlined, along with six significant coincident VLF-EM geophysical anomalies.

The **Sim W prospect** (Minfile 105O 043) was staked in 1981 to cover anomalous lead and zinc values in stream silts, and received limited mapping in 1981-1982. According to Yukon Minfile, minor scheelite mineralization is reported to have been discovered in Mississippian calcareous sandstone and shale of the upper Earn Group, near the margin of a Cretaceous pluton, however, no assessment reports are available.

The **Racicot (or Moose) Ba deposit** (Minfile 105O 013) sits on the Rac 1-4 claims, which are completely surrounded by the North Canol property.

Two zones of shale-hosted bedded barite, trending northwest and dipping westerly, were exposed on surface by trenching in the mid 1970s, "*one up to 100 feet wide and 750 feet long and the second up to 100 feet wide and 600 feet long. The second zone lies en echelon to and about 300 feet northwest of the first zone. No sulphides have been noted associated with the barite*" (Sinclair *et al.*, 1975). The barite zones "*which are moderately to* steeply dipping, *are estimated by Nuspar to contain roughly three million tons of material uniformly grading 84% barium sulphate and 12 to 14% silica*".

Work on the adjacent Gary claims identified several barite, and/or zinc geochemical, gravity and EM anomalies to the south and north of the Racicot (Moose) Ba deposit in 1974-77 (Smith, 1975a, b, c; Rowe, 1977a, b). Two new prospects were discovered to the north, the **Gargantua** and **South Garguanta** (or **Gary**) **Ba deposits** (Minfile #105O 027). Mineralization is reported to consist of shale-hosted bedded barite, ranging from 3 to 18 metres in thickness, and "*folded into a series of minor east-west folds, such that the bed is exposed several times along the dip slope. The barite is light grey in colour, finely interlaminated with argillite and apparently devoid of lead and zinc. Estimated tonnage of exposed barite is reported to be three million tons"* (Morin *et al.*, 1978). It is thought to be at a different stratigraphic position than the Racicot (Moose) barite deposits. It should be noted that this is a historic resource figure only, and was not prepared in accordance with NI 43-101.

The **Tom Zn-Pb-Ag-Ba deposit** (Minfile 105O 001) is located 7 kilometres northeast of the North Canol Property. Sedex-style, shale-hosted sulphide mineralization occurs in three zones; Tom East, Tom West and Tom southwest. According to Yukon Minfile, "*these deposits occur within the Devono-Mississippian Earn Group, at or near the contact between conglomeratic submarine fan deposits (Macmillan pass member) and overlying blue-grey weathering carbonaceous chert mudstone and radiolarian chert"*.

A joint feasibility study on the Tom and Jason properties was completed in 1985. Hudbay Minerals Inc. currently owns the property and has released an estimated NI 43-101 compliant resource of 4.98 million tonnes grading 6.6% Zn, 4.4% Pb and 47.8 g/t Ag in the indicated category, and 13.55 million tonnes grading 6.7% Zn, 3.1% Pb and 31.8 g/t Ag in the inferred category (HudBay Minerals Inc. website, February 2012).

The Jason property directly adjoins the north side of the North Canol Property. It includes the **Jason Zn-Pb-Ag-Ba deposits** (Minfile 105O 019), which are located from 700 to 2500 metres north of the North Canol Property boundary.

Geological resources have been defined in three zones: Jason South, Main and End Zones. Yukon Minfile summarizes these deposits as follows:

The Main zone consists of a single lens of stratiform sulphide, barite and chert up to 20 m thick, interbedded with carbonaceous mudstone and diamictite overlying siltstone at the base of the Tom Member of the Portrait Lake Formation. It has a strike length of approximately 700 m and a down dip extent of 500 m ... The South zone consists of at least two stacked stratiform sulphide-barite-chert lenses. The upper lens is 1 200 m long and up to 20 m thick and is interbedded with the same diamictite and mudstone as the Main zone. The lower lens is a 300 x 400 m wedge shaped body up to 40 m thick, which lies 10 m below the upper lens, from which it is separated by siliceous shale and diamictite. The South zone lenses are cut off to the southwest against Road River Group rocks by a northwest-striking fault … The End zone consists of baritic massive sulphide … Local synsedimentary structures comprise hydrothermally altered rounded mudclasts and siderite vein fragments in an altered and sulphide-bearing matrix of clay, quartz, muscovite, siderite and disseminated pyrite, sphalerite, galena, chalcopyrite and

pyrrhotite. Near vent sites, wallrocks are strongly silicified, and conglomerate units are cemented by pyrite, ankerite, quartz, galena and sphalerite. The conglomerate units are wedge shaped, thickening toward the hydrothermal vent and are inferred to represent debris derived from a submarine scarp associated with synsedimentary faulting. Geochemical studies have demonstrated a clear zoning of metal ratios and hydrothermal facies both upward and laterally away from the vent. Lead to zinc ratios and thickness of each sulphide lens decrease away from the vent. A number of hydrothermal facies have been identified: 1) Proximal (vent) facies …, 2) Quartz-sulphide facies ..., 3) Barite-sulphide facies …, and 4) Distal barite-sulphide-chert facies.

A feasibility study was conducted on the Jason and Tom properties by Hudson Bay in 1985. HudBay optioned the property in 2007 and currently reports an NI-43-101 compliant resource for the Jason deposits of 1.45 million tonnes grading 5.3% Zn, 7.4% Pb and 86.7 g/t Ag in the indicated category, and 11 million tonnes grading 6.8% Zn, 4.0% Pb, and 36.4 g/t Ag (HudBay Minerals Inc. website, February 2012).

The **Nidd (or Boundary Creek) Zn-Pb-Ag-Ba deposit** (Minfile 105O 024) sits on claims controlled by Teck Resources Ltd., which adjoin the northern side of the North Canol Property. The Nidd deposit occurs approximately 1600 metres north of the North Canol Property boundary. Yukon Minfile has summarized the geology as follows:

This large tonnage, low-grade zinc deposit is associated with basaltic volcanism along a late Devonian syndepositional fault which cuts Silurian to Late Devonian sedimentary and pyroclastic volcanic rocks of the upper Road River and lower Earn Groups. The altered, mineralized zone extends over 400 m of stratigraphic thickness, and has a strike length of at least 1500 m in a northeast direction.

Hydrothermal minerals including quartz, iron carbonate, pyrite, sphalerite and minor galena have invaded and strongly replaced the host sedimentary rocks, and at depth, banded sphalerite-carbonate veins and carbonate breccias occur within the fault zone. Mineral zoning has been documented: chalcopyrite occurs only in the fault zone, galena is restricted to the deepest part of the deposit, sphalerite and quartz occur in the deep to intermediate parts and pyrite is the dominant sulphide near the top. The Nidd deposit is inferred to be the same age as the Tom and Jason sedex deposits … at Macmillan Pass but differs from them in that all of the sulphides were deposited below the sea floor.

Drill hole NB89-14 intersected a stockwork of high-grade sphalerite-siderite veins cutting pyroclastic rocks at the base of the Earn Group. These rocks contained an average of 2.0% Zn over 63.7 m. 1990 drill holes encountered only a few short intervals of sphalerite-veined mudstone and appear to lie outside the main hydrothermal system.

The **Mactung W project**, owned by North American Tungsten Corporation Ltd., is located 17 kilometres north of the North Canol property. It was discovered in 1962 by Amax Exploration Ltd. and has been explored intermittently by surface surveys, drilling, and underground development until 2006. Atkinson and Baker (1990) is a good

summary of the local geology and mineral deposit. Feasibility, engineering and environmental studies have been underway in recent years.

The Mactung deposit (Minfile 105O 002) is a metasomatic skarn formed in Lower Cambrian calcareous sediments adjacent to a Cretaceous stock. Scheelite and rarely wolframite occur in pyroxene-pyrrhotite skarn and occasionally in garnet-pyroxene skarn. Overall mineral resources total 33 million tonnes grading 0.88% WO_3 in the indicated category and 11.9 million tonnes grading 0.78% WO_3 in the inferred category, with a probable underground minable reserve of 8.5 million tonnes grading 1.083% WO_3. A feasibility study, completed in 2009, envisioned a 2000 tonnes-per-day underground mine with an 11-year mine life and a $402 million capital cost (North American Tungsten website, February 2012).

Along with Tom-Jason-Nidd type sedex lead-zinc-silver-barium mineralization, two potential styles of gold mineralization could also be found on the North Canol Property. The silty limestones of the Sapper Formation are favourable host units for Carlin type gold mineralization, where suitable structures exist. As well, the coincident gold-arsenic-bismuth values suggest intrusive-related "Tombstone" type gold mineralization. Further surface exploration is necessary to determine whether gold mineralization occurs as replacement zones in reactive sediments (Carlin-style), or within stockwork or veins within brittle sediments and associated intrusions (Tombstone-style).

8) GEOCHEMISTRY

Rock Sampling Techniques

43 rock grab samples were collected during the soil sampling and prospecting program. Grab samples consist of 5 or 6 fist size pieces of rock representing a certain rock or mineralization type. All sample sites were marked with fluorescent flagging marked with the sample number.

Samples were placed in poly bags labelled with the corresponding sample number and a bar coded assay tag inserted into the bag. Samples were shipped to ACME Laboratory Ltd.'s preparation lab in Whitehorse for sample preparation then shipped on by the laboratory to ACME's Vancouver facility for analyses. In the laboratory, samples were crushed to minus 200 mesh and fire assayed for gold, plus geochemically analyzed for 36 additional elements by the ICP-MS method.

Rock Sample Results

Rock sample Certificates of Analysis can be found in Appendix III. Table I gives the location and description of the rock samples. Figure 5 shows the rock sample locations.

TABLE I
ROCK SAMPLE LOCATIONS AND DESCRIPTIONS

SAMPLE #	NORTH	EAST	SAMPLE TYPE	DESCRIPTION
1466301	436976	6993139	Grab	Black-grey shale, outcrop, aspy/hem
1466302	436948	6993219	Grab	Subcrop, white rusty, broken, limonite, qtz vein 30cm-40cm wide
1466303	436950	6993268	Grab	Same as 1466319
1466304	437008	6993167	Grab	Outcrop, black shale, siltstone contact, black shale is very hematitic
1466305	437024	6993151	Grab	Outcrop, black siliceous weathered tan/black, brown-basalt?
1466306	437065	6992998	Grab	Qtz vein very broken up cutting black shale, float
1466307	437057	6992923	Grab	Same as 1466319
1466308	437016	6992941	Grab	Outcrop, grey-black siltstone? grey, silica, heavy yellow coating on contact with foliated shales, small ridge, very hematitic, barite?
1466309	437011	6992949	Grab	As above, small specks of green fluorite? barite? epidote?
1466310	437045	6992951	Grab	Subcrop, qtz vein with limonite cutting black shales, very broken up, seems heavy-barite?
1466311	436944	6992950	Grab	Subcrop, black foliated shale with qtz and barite (rusty)
1466312	436892	6992920	Grab	2 -3 m quartz vein
1466314	436885	6992925	Grab	2 -3 m quartz vein
1466315	436823	6992920	Grab	2 -3 m quartz vein
1466316	436902	6992789	Grab	2 -3 m quartz vein
1466317	437016	6992752	Grab	2 -3 m quartz vein
1466318	437065	6992730	Grab	2 -3 m quartz vein
1466319	437104	6992758	Grab	Rusty altered sandy siltstone with some qtz veins, small. Diss pyrite and cpy.
1466320	437085	6992749	Grab	Black shale
1466321	437088	6992701	Grab	Dyke in siltstone with diss pyrite and cpy
1466322	437073	6992677	Grab	Quartz vein
1466323	437096	6992666	Grab	Quartz-barite vein
1466324	437097	6992662		Outcrop, very rusty lots of qtz veinlets, sandy siltstone? Dyke 1m-2m wide. Diss py with tiny pyrite cubes and cpy
1466351	431419	6997193		Black siltstone with fine grain diss py and coarse grained pyrite pods, rusty weathering
1466352	431352	6997210		Black siltstone with fine grained diss py, rusty weathering

SAMPLE #	NORTH	EAST	SAMPLE TYPE	DESCRIPTION
1466353	431368	6997266		Black siltstone with fine grained diss py, rusty weathering
1466354	431371	6997199		Very hard greenish grey qzite? with trace cpy and py, slightly magnetic, brownish weathering
1466355	431442	6997289		Black siltstone with fine grained diss py, rusty weathering
1466356	431448	6997308		5cm wide pyritic vein 20% py
1466357	431433	6997340		Angular float in scree pile, magnetic siliceous siltstone, 2% py and possible barite
1466358	431453	6997366		Siliceous siltstone with 1% fine grained diss py, rusty weathering
1466359	431607	6997330		Black shales with trace pyrite, grey-brown weathering
1466360	431676	6997382		Black shale with very coarse pyrite cubes, orange brown weathering
1466361	431729	6997511		Black shale with trace py and qtz veining, grey weathering
1466362	431894	6997607		Black shale with fine grained diss py, weakly magnetic, orange weathering
1466401	433290	6995925	Grab	Dark grey 90%, light brown 10%, fine grained
1466402	433241	6996295	Grab	Black fine grained planar fractures contorted w/veins
1466403	433233	6996289	Grab	Black fine grained, angular blocky irregular fractures to sharp chards, heavy
1466404	433227	6996275	Grab	Black powdery, fine planar ,contorted bed
1466405	433227	6996439	Grab	Black powdery, fine planar ,contorted bed
1466406	433212	6996454	Grab	Black blocky irregular fractures to chippy, trace graphite?
1466407	433234	6996474	Grab	Black crumbly, blocky, wavy surface, one piece w/qtz vein + sulphides
1466408	433263	6996702	Grab	Black blocky irregular fractures to chippy, black powdery on surfaces

Table II shows the significant rock sample results for a number of elements.

TABLE II
ROCK SAMPLE SIGNIFICANT RESULTS

SAMPLE #	Au ppb	Ag ppm	As ppm	Pb ppm	Zn ppm	Ba ppm
1466301	7	<0.1	4.7	11.2	722	4039

Discussion of Rock Sample Results

Figures 6A through 6E show gold, silver, arsenic, lead and zinc rock sample results. Rock sampling was conducted in three areas in the southeast portion of the claim block.

The northwestern most cluster of rock samples were collected in a hornfels zone within Portrait Lake Formation (Fuller Lake Member) and MacMillan Pass Member Shale Facies, adjacent to the large Cretaceous intrusive body. The western area closest to the intrusion was sampled in 2011, with the remainder of the samples being collected in 2012.

In this area, rock sample results show values for gold up to 16.3 ppb (2012 sample), silver to 4.8 ppm (2011 sample), arsenic to >10,000 ppm (2011 sample), lead to 118.2 ppm (2011 sample) and zinc to 1904 ppm (2012 sample). The best spatial correlation occurs between silver and arsenic, likely relating to mineralization associated with the intrusion.

The second area of rock sampling occurs along the creek valley to the west of the intrusive body in the area of the historic Bremner minfile occurrence and a small drill program in 1979. Eight rock samples were collected in this area in 2012, but no values of significance were returned.

In the extreme southeast corner of the property, rock samples were collected in 2011 and 2012 in an area termed the 3Ts. Rock samples were collected from quartz veins and sulphide rich shales of the Fuller Lake Member and the Itsi Formation. In this area, spotty elevated values for the various elements were returned from rock samples, but no high values of significance were obtained.

Soil Sampling Techniques

During the 2012 exploration program, a total of 142 soil samples were collected. The samples were taken at 100 metre spacings along three contour soil lines put in around the headwaters of streams that returned anomalous silt sample values in 2011. Figure 7 shows the soil sample locations.

Soil samplers tried to collect 'B' horizon soil samples whenever possible, however intermittent talus on the south facing slope and occasional deep moss and permafrost on the north facing slope did not allow for consistent 'B' horizon sampling. Samples were collected using a mattock or shovel and were taken from the "best" looking soil material available at each station. Sample sites were labeled with fluorescent flagging with the station number recorded on it, and soil was placed in correspondingly labeled Kraft soil bags.

All soil samples were shipped to ACME Laboratory Ltd.'s preparation facility in Whitehorse where they were dried and sieved to -230 mesh. The prepared samples were then shipped by ACME to their Vancouver laboratory for analyses. The samples were analysed by fire assay for gold and for 36 elements (including gold) by the ICP-MS method. ACME Labs Ltd. Certificates of Analyses for soil samples can be found in Appendix IV.

Discussion of Soil Sample Results

Figures 8A through 8E are soil geochemistry maps for gold, silver, arsenic, lead and zinc, respectively.

On the northernmost soil contour line, there is a 600 metre long section of elevated gold, silver and lead on the northwest side of the tributary around which the contour line is located. From regional geologic mapping (Abbott, in publ.) the shale lithologies appear similar on both sides of the tributary indicating that the anomalous soil values on the northwest side are related to currently unmapped features (structures?). In this area soil values range up to 28.5 ppb gold, 7.3 ppm silver and 147.8 ppm lead. Arsenic is weakly anomalous along much of this contour soil line, likely related to its spatial association with the nearby Cretaceous intrusion.

The most significant soil results associated with the middle contour soil line are the high arsenic values returned from the portion of the line which is underlain by intrusive rocks, with arsenic values up to 2460.1 ppm. Rock samples in this area also returned high arsenic and silver values. Soil sample values for other elements are generally low along this middle contour soil line.

The southernmost contour soil line shows very low arsenic values and spotty elevated zinc numbers along its entire trace. Zinc values within the black shales trend up to 891 ppm. A two contiguous stations near the eastern end of this contour soil line show elevated gold values of 31.9 and 14.1 ppb. Towards the western end of the soil line, silver and lead values within the shales are elevated up to 8.9 ppm silver and 87.3 ppm lead.

It is important to note that (although not plotted separately) additional elements, such as barium, bismuth, molybdenum and antimony also returned spotty high values from soil samples.

The contour soil sampling lines all returned elevated values related to lithological and/or structural features. Expanded systematic grid soil sampling is recommended in order to better evaluate and understand the mineralization controls on the North Canol Property.

9) CONCLUSIONS

The North Canol Property, owned by Golden Ridge Resources Ltd., comprises base and precious metal targets located southeast of the MacMillan Pass airstrip in northeastern Yukon. The Property is situated within the Macmillan Fold Belt, a well mineralized portion of the Paleozoic Selwyn Basin that hosts several significant deposits and prospects close to the property, including the Tom, Jason, and Nidd sedex Zn-Pb-Ag-Ba deposits, the Mactung tungsten deposit, the Brick-Neve sediment-hosted gold prospect, and several small, high-grade barite deposits.

Historic work has identified several mineral occurrences on or very close to the Property including the Bailes, Racicot (Moose), and Gary (Gargantua) barite deposits, the Bremner and Hasten Zn-Pb-Ag-Ba prospects, and the Sim W prospect. That work also identified other geophysical and/or geochemical anomalies that may indicate potential for sedex Zn-Pb-Ag-Ba, bedded barite, intrusion-related gold, sediment-hosted (Carlin-type) gold or other styles of mineralization on the property.

Work done by Colorado in 2011 and 2012 has determined that soil and rock geochemistry identified gold-silver-arsenic mineralization associated with a Cretaceous intrusive unit and silver-lead-zinc mineralization associated with black shales of the Niddery Lake Formation.

In conclusion, as well as Tom and Nidd style sedex lead-zinc-silver-barium targets, two potential styles of gold mineralization may be present on the North Canol Property. Silty

limestones of the Sapper Formation are favourable host units for Carlin type gold mineralization where suitable structures exist. Along the southeast margin of the property, coincident gold-silver-arsenic values suggest the presence of intrusive-related "Tombstone" type gold mineralization.

Additional soil sampling, geological mapping and rock sampling is required in order to better evaluate the mineralization controls on the North Canol Property.

10) RECOMMENDATIONS

For 2013, an expanded exploration program is recommended for the North Canol Property. Phase I will consist of detailed geological mapping and expanded soil sampling. A total of 4000 soil samples should be collected from wide spaced grid lines. Geological mapping and prospecting/rock sampling will be done to define contact areas, structures and mineralized zones.

If results warrant, a Phase II exploration program consisting of continued expanded and infill soil geochemical sampling and excavator trenching is recommended. Trenching, utilizing a helicopter-portable mini-excavator, will be designed to test the best coincident geochemical, geological and geophysical targets.

The Phase I exploration program is budgeted at $375,000. Phase II is dependent upon the results of the Phase I program and is budgeted at $450,000.

Respectfully submitted,

"Linda Dandy"

Linda Dandy, P.Geo.

13) COST STATEMENT – August 2012

GEOLOGIST:	2 days @ $750	$ 1,500.00
PROSPECTORS:	5 days @ $500	2,500.00
SAMPLERS:	3 days @ $375	1,125.00
ANALYSES:	43 ROCK SAMPLES @ $31	1,333.00
	142 SOIL SAMPLES @ $35	4,970.00
HELICOPTER:	4.0 HOURS @ $1250	5,000.00
	FUEL	1,400.00
FOOD AND ACCOMMODATION (Mac Pass): 12 mandays @ $350		4,200.00
SUPPLIES, FREIGHT, TRAVEL AND MISCELLANEOUS:		2,000.00
REPORT PREPARATION:		3,500.00
TOTAL PROSPECTING AND SAMPLING COSTS:		$ 27,528.00

14) QUALIFICATIONS

I, Linda Dandy, hereby certify that:

1. I am a Consulting Geologist having an office at 4900 Warm Bay Road, Atlin, British Columbia, V0W 1A0.

2. I am a graduate of the University of British Columbia with the degree of Bachelor of Science in Geology (1981).

3. I am a member of the Association of Professional Engineers and Geoscientists of British Columbia (Registration No. 19236) and a Fellow of the Geological Association of Canada (Membership No. F5201).

4. I have practiced my profession in North America since 1981, having worked as an employee and consultant for Major Mining Corporations, Junior Resource Companies and government.

5. This report is based upon a personal examination of available company and government reports pertinent to the subject property, and direct supervision of field work undertaken on the property on August 5 and 6, 2012.

"Linda Dandy"
Linda Dandy, P.Geo.
Consulting Geologist

November 30, 2012
Atlin, BC

CERTIFICATE OF ANALYSIS WHI12000644.1

CLIENT JOB INFORMATION

Project: North Canol Property
Shipment ID: #3
P.O. Number NA12346
Number of Samples: 44

SAMPLE DISPOSAL

RTRN-PLP Return
DISP-RJT Dispose of Reject After 90 days

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
R200-500	44	Crush, split and pulverize 500 g rock to 200 mesh			VAN
3B	44	Fire assay fusion Au by ICP-ES	30	Completed	VAN
1DX	44	1:1:1 Aqua Regia digestion ICP-MS analysis	0.5	Completed	VAN

ADDITIONAL COMMENTS

Invoice To: Colorado Resources Ltd.
