WHITEHORSE MINING DISTRICT

Work Performed: July 12th, 2012 – September 23rd, 2012
Date of Report: 27 February 2013

AUTHOR OF REPORT: Scott Dorion, BSc.

RYAN GOLD CORP.

666 Burrard Street,
Suite 600
Vancouver, British Columbia, V6C 2X8

Executive Summary

Exploration during the 2012 field season was completed on the Kluane properties between the dates of July 12th and September 23rd, 2012. The Kluane prospects are located within an 85 kilometers radius around the town of Burwash Landing, Yukon Territory, and are most easily accessible by helicopter.

Ryan Gold Corp. staked the Kluane prospects in 2010. The properties are comprised of 4,942 claims, covering an area of 104,413 hectares. Previous work on the Kluane properties by Ryan Gold included geological mapping complimented with ridge and spur sampling in 2011 and minor trenching on the Pluto-Venus prospect. Exploration activity on the Kluane prospects dates back to the late 1960s and has intermittent phases of ownership until being acquired by Ryan Gold Corp.

Detailed mapping, geochemical soil and rock sampling, and airborne geophysics were completed during the 2012 exploration season which advanced the understanding of the Kluane prospects. A total of 22653 soil samples, 244 rock chip samples, and 2 geophysical survey programs were carried out on the Arm and Pluto-Venus prospects. Mineral potential for the Kluane prospects include: orogenic-Au, late stage fracture controlled-Au, Cu-Au-Mo porphyry, and epithermal Au-Ag.

1.0 Introduction

This assessment report documents the field work completed during the 2012 field season on eleven Ryan Gold Corp. prospects in the Kluane region: Agate, April, Arm, Beryl, BWICK, Garnet, Glad, Kilo, Pluto, Sapphire, Serp, Topaz, and Venus. Contiguous claims are grouped and reported as single prospects including: Garnet-Topaz and Pluto-Venus. The 2012 field work program consisted of soil sampling performed by Ground Truth Exploration Inc. on behalf of Ryan Gold Corp., airborne geophysics on the Arm and Pluto-Venus properties, by Precision GeoSurveys Inc., and geological mapping and grab sampling performed by Ryan Gold Corp. staff.

Field work on the various Kluane prospects was completed between the dates of July 12th and September 23rd, 2012. The total number of geological observations, geochemical grab and soil samples retrieved during 2012 field season was 1440, 219, and 23,493, respectively. The total number of line kilometers flown at the Arm and Pluto-Venus prospects was 8186. The analytical lab used to the conduct the assaying of the samples selected was ALS Chemex. No site work was undertaken during the 2012 field season that would have resulted in environmental degradation requiring remediation.

2.0 Location & Access

Access to all the Kluane prospects is currently limited to helicopter. The most accessible route would be to stage from the Alaska Highway and reach the properties via helicopter. Ryan Gold Corp. field teams were based in the nearby communities of Burwash Landing, between the dates of July 12th to August 8th, 2012, and Haines Junction, between the dates of August 9th to August 25th, 2012, for the duration of the program. Ground Truth Exploration staffs were based in Burwash Landing and various remote fly camps. The locations and related accessibility of each prospect is displayed in Figure 1. All the properties are located within the Whitehorse Mining District.

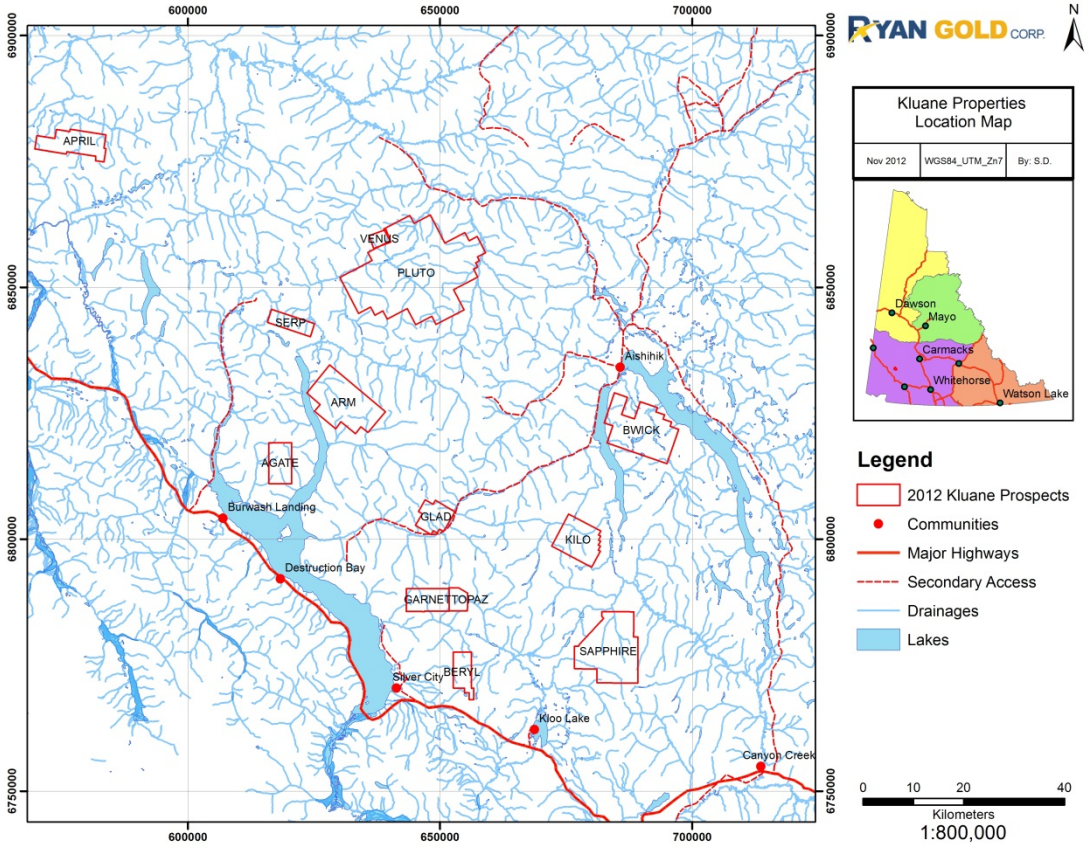

Figure 1: Location map of the Kluane Properties.

The locations of the Kluane prospects, all of which reside west-northwest to northwest of the Yukon territorial capital, Whitehorse, are summarized below in Table 1:

Table 1: 2012 Kluane property locations.

Property Name	Centre Point (Longitude/Latitude)	NTS map sheets	Distance from Whitehorse (km)
Agate	138.47 / 61.27	115G07	205
April	139.30 / 62.20	115J03, 115J04, 115G14	280
Arm	138.32 / 61.33	115G09, 115G10,	200
Beryl	138.82 / 61.35	115G01	160
BWICK	137.25 / 61.28	115H05, 115H06, 115H11, 115H12	150
Garnet-Topaz	138.12 / 61.11	115G01	180
Glad	138.12 / 61.20	115G08	180
Kilo	137.41 / 61.17	115H04, 115H05	145
Pluto-Venus	138.15 / 61.47	115G09, 115G15, 115G16, 115H13	210
Sapphire	137.35 / 61.50	115H04	140
Serp	138.43 / 61.42	115G10	230

3.0 Claim Information

The total number of 'active' claims and leases in accordance with the Quartz Mining Act as of 2012 for the Kluane properties is 4942, as illustrated in Figure 2.

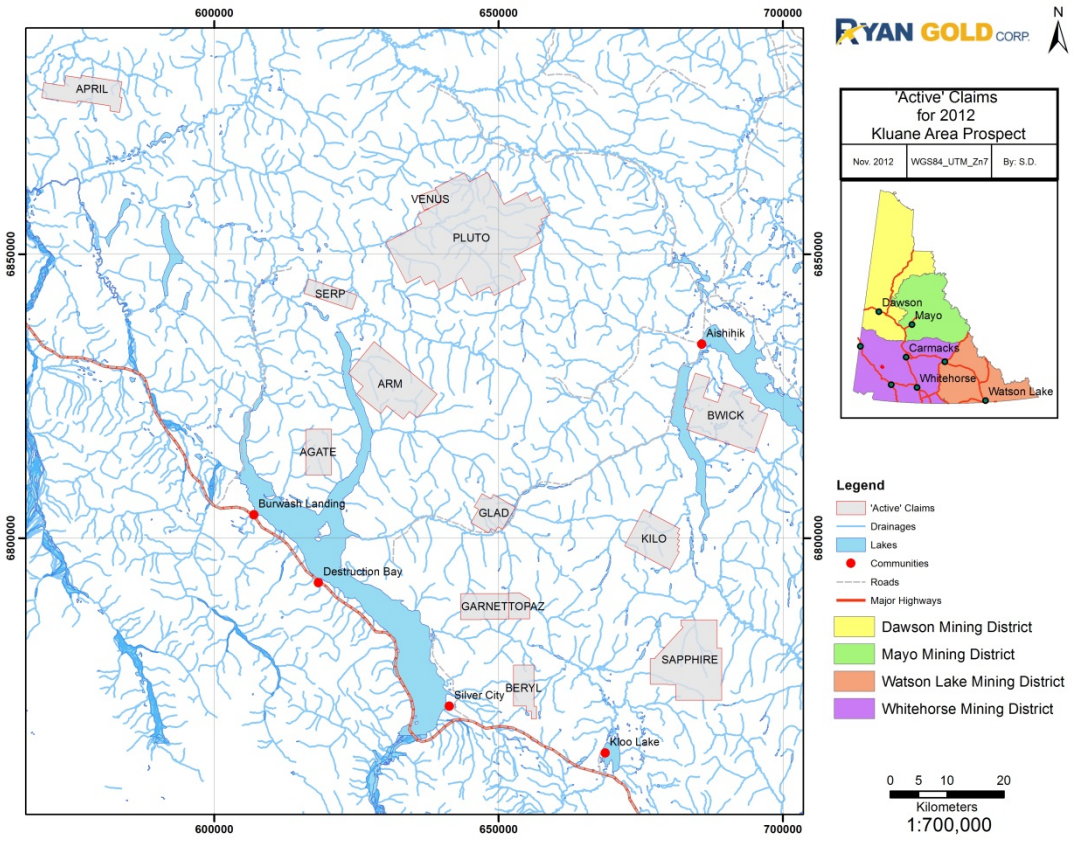

Figure 2: Kluane prospect 'active' claim map. Individually referenced and mapped per individual prospect in Appendix 2 and 6, respectively.

Table 2 below displays total number of 'active' claims and leases per prospect and claim ownership.

Table 2: 2012 Kluane properties claim information.

Property Name	# of Claims	Claim Owner
Agate	180	45127 Yukon Inc – 30%, Ryan Gold Corp. – 70%
April	276	45127 Yukon Inc – 30%, Ryan Gold Corp. – 70%
Arm	544	Ryan Gold Corp. – 100%
Beryl	142	1-128: 45127 Yukon Inc – 30%, Ryan Gold Corp. – 70% 129-142: Ryan Gold Corp. – 100%
BWICK	576	Ryan Gold Corp. – 100%
Garnet-Topaz	190-80	45127 Yukon Inc – 30%, Ryan Gold Corp. – 70%
Glad	164	Ryan Gold Corp. – 100%
Kilo	300	Ryan Gold Corp. – 100%
Pluto-Venus	1862-48	Pluto 1 – 80 and Venus 1 – 48: 45127 Yukon Inc – 30%, Ryan Gold Corp. – 70% Pluto 81-1862: Ryan Gold Corp. – 100%

Sapphire	460	45127 Yukon Inc – 30%, Ryan Gold Corp. – 70%
Serp	120	Ryan Gold Corp. – 100%

Claims are individually referenced in Appendix B and displayed as separate property maps in Appendix F.

4.0 Physiography & Climate

Aside from the Arm prospect which is largely defined by broad linear valleys, steep gradients and sheer ridges, the Kluane prospects are characterized by wide, modest gradient valleys with limited exposure. Vegetation is concentrated along lower elevations, in drainages and north-facing aspects. Higher elevations are generally associated with scarce cover, limited to grassy knolls and minor buck brush.

Temperatures at Burwash Landing range from 6.3 to 19.3°C in July and -15.6 to -28.4°C in January, with an annual average high of 2.9°C and low of -10.5°C. Annual rainfall and snowfall patterns of the area average at 192.1mm and 106.4cm, respectfully.

Discontinuous permafrost defines the region which has discernible permafrost issues regarding mass wasting and environmental concerns if any of the reported projects are to advance in stage.

5.0 Exploration History

Documented exploration history prior to work completed by Ryan Gold Corp. in 2011 is limited to work completed in the Kluane area by Shawn Ryan from 2004 to 2010 and historic exploration activity on the prospects: Arm, BWICK, Pluto-Venus, and Sapphire. Encouraging results from regional reconnaissance soil sampling lead to the progressive staking of the properties. The Kluane area prospects have been progressively expanded on since being acquired by Ryan Gold Corp. to the present day claim boundaries.

5.1 Agate

The Agate property was staked by Ryan Gold Corp in 2011 and there is prior documented exploration history within the claim boundaries prior to activity by Shawn Ryan. The 2011 exploration program conducted by Ryan Gold Corp. on the Agate prospect was completed between June 22nd and June 27th, 2011. The 2011 program was focused on geological mapping and sampling of anomalous soil and stream sediment showings.

5.2 April

The April property was staked by Ryan Gold Corp in 2011 and has no prior documented exploration history within the claim boundaries prior to activity by Shawn Ryan.

5.3 Arm

Exploration activity on the Arm prospect commenced in 1970 and was carried through by independent parties intermittently until 1980 before being acquired by Ryan Gold in 2011. The previously assigned staking and respective restaked names which fall within or immediately adjacent to the Arm prospect include; 'Punk' claim 1-8 in 1970 by W. Hinnek, 'Rob' claim 1-16 in 1971 by R.G. Hilker, 'Roc' claim 1-8 in 1974 J. Carson, 'Venus' claim 1-12 in 1975 O. Milliard, 'Thunder' claim 1-4 in 1980 by J. Carson, 'Arm' claim 1-464, expanded to 544, in 2011 by Ryan Gold Corp. The target of historic exploration was focused around a Cu-Mo-Au porphyry model and the extent of work was limited to hand trenching by R.G. Hilker in 1971 under the Rob claim. No data is available from workings completed prior to 2010. The 2011 field program on the Arm property, carried out by Ryan Gold Corp., consisted of geochemical sampling and geological mapping. The highest gold and silver grades retrieved from rock samples were 0.29g/t and 11.5g/t, respectively.

5.4 Beryl

The Beryl property was staked by Ryan Gold Corp in 2011 and has no prior documented exploration history within the claim boundaries prior to activity by Shawn Ryan.

5.5 BWICK

Exploration activity on the BWICK prospect and surrounding area commenced in 1969 and was active until 1978, before being acquired by Ryan Gold in 2011. Staked as Cad claim, Y35242, in June, 1969, by M. Nichiporick, who carried out geochemical sampling and optioned the claims to Crest Dev L in December, 1969. The option was transferred in 1970 to Yreka ML, which conducted grid soil sampling, EM 16, mag and IP surveys and drilled 730.3 (9 holes) before dropping the option. The property was optioned again in September, 1970, by Caltor Synd (Rayrock ML, Ashland O & GL, and Can Ind O & GL), which drilled an additional 363.0 m (3 holes) in early 1971. Nichiporick drilled one x-ray hole (8.5m) in 1974. In December, 1969, a rush developed and over 900 claims were staked along the east side of Sekulmun Lake. The companies' involved were Yreka ML - Gem claim, Y44238, and Cad claim, Y457358, Giant EL – Bow claim, Y45690; Noranda ML – Joyce, Y45546; Brameda Res L – Anne claim, Y45442; Panther ML – Sue 1-32 claim, Y45380; and Eagle Ind L – Sue 33-64 claim, Y45412. In addition, 90 claims – Hot cl, Y50008, and Liz claim, Y51044, were staked on the west side of the lake. Noranda staked the SEK claim, YA19288, 3.2 km to the east in Nov/77 and explored with mapping and soil sampling in 1978. The property was restaked as Blin cl (YB26676) in July, 1989, by Noranda ECL. The BWICK prospect was staked as the Brass prospect, Y58054, on December 31st, 1970, by Anaconda American Brass Ltd, who conducted geochemical surverys.

5.6 Garnet-Topaz

The Garnet-Topaz property was staked by Ryan Gold Corp in 2011. There is no prior documented exploration history within the claim boundaries prior to activity by Shawn Ryan.

5.7 Glad

The Glad property was staked by Ryan Gold Corp in 2011. There is no prior documented exploration history within the claim boundaries prior to activity by Shawn Ryan. Southeast of the prospect, historic placer claims where active between August 9th, 2009, and August 18th, 2012.

5.8 Kilo

The Kilo property was staked by Ryan Gold Corp in 2011. There is no prior documented exploration history within the claim boundaries prior to activity by Shawn Ryan.

5.9 Pluto-Venus

Exploration activity on the Pluto-Venus prospect commenced in 1971 and was active until 1972, before being acquired by Ryan Gold in 2011. Original staking was done by Can Occidental Pet L who staked the Tyr claim, Y638549, in October, 1971, and conducted soil sampling and mapping in 1972 and added more Tyr claim, Y67091, to the north in August, 1972. Between 2002 and 2004, Gems Unlimited staked three separate claim blocks within the current Pluto-Venus prospect boundaries; the Meg, YC19586, Mega, YC19586, and Gem, YC19608, claim blocks.

5.10 Sapphire

Exploration activity on the Sapphire prospect commenced in 1986 and was active until 1987, before being acquired by Ryan Gold in 2011. Staked as the Kin claim, YA95649, in August, 1986, by Silverquest Resources Limited, who explored with prospecting and mapping in 1987. The southernmost of four separate blocks of Ruby claim, YA95693, was staked by United Keno Hill ML, in August, 1986. United Keno Hill performed mapping and soil sampling in 1989. The prospect was restaked by J.P. Ross as Joy claim, YB27811, in August, 1990.

5.11 Serp

The Serp property was staked by Ryan Gold Corp in 2011. There is no prior documented exploration activity within or immediately adjacent to the prospect.

6.0 Geology

6.1 Regional Geology

The Kluane region is defined by an accretionary arrangement of terranes, termed the Coast Belt, west of the Tintina fault. The five dominant lithologic units which define the Kluane region, from youngest to oldest, are the Rhyolite Creek volcanoplutonic complex, the Ruby Range batholith, Kluane Schist, Gneiss and Yukon-Tanana terrane. The units are described by Israel et al. (2010) below:

1. Rhyolite Creek volcanoplutonic complex (Paleocene, 57 Ma)
    a. Light grey, brown and green, intermediate to felsic volcanic rocks; flow banding is common; local volcanic breccia; rare pillows and mafic volcanic rocks.
    b. Light grey to purple, quartz, feldspar porphyry; quartz is often smoky grey in colour; occurs as thin dykes to large intrusive bodies; intrusive equivalents to intermediate to felsic volcanic rocks.
2. Ruby Range batholith (Paleocene)
    a. Fine to coarse-grained, salt and pepper, hornblende +/- biotite, quartz diorite, rare garnets; medium-grained, light grey to pinkish biotite +/- hornblende granodiorite; fine to medium-grained, beige to grey tonalite with distinctive smoky grey quartz; pinkish/grey, biotite granite.
    b. Strongly to moderately deformed equivalents of undeformed Ruby Range batholith; often has 'gneissic' texture near the base of the batholith.
3. Kluane Schist (mid-Cretaceous)
    a. Dark grey to dark green, strongly deformed and altered ultramafic lenses; light grey, fine-grained talc-schist.
    b. Light to dark grey, fine-grained, quartz, muscovite schist; variably carbonaceous (more carbonaceous in the northwest of map area); rare light grey carbonate lenses;
    c. Dark grey to black; fine-grained, quartz, biotite schist; occasional garnets and plagioclase porphyroblasts; layer parallel, boudinaged quartz veins ubiquitous.
4. Gneiss (late Cretaceous and older)
    a. Beige, orange to grey black, medium- to coarse-grained orthogneiss and paragneiss; mafic layers composed primarily of biotite +/- hornblende, leucocratic layers consist of quartz, potassium feldspar and plagioclase; abundant garnet; could be part of Yukon-Tanana terrane or the Kluane Schist.
5. Yukon-Tanana terrane (Proterozoic to Mississippian)
    a. Beige- to brown-weathering quartz, muscovite +/- garnet, psammitic schist; dark grey to black carbonaceous biotite +/- garnet schist and quartzite; dark green to black garnet amphibolite; grey to cream marble; rare metaplutonic rocks.

The Coast Belt area is loosely defined by a 40km-thick northeast-dipping structural stack. The original structural contrast between the younger Kluane Schist and older Yukon-Tanana terrane pre-dates the Ruby Range batholith, which is made evident by two significant metamorphic events affecting the Kluane Schist at 82 and 70 Ma. The Ruby Range batholith intruded between the Kluane Schist and Yukon-Tanana terrane contact during its emplacement in the mid-Cretaceous. Detrital zircon analyzed from the Kluane Schist indicates the onset of deposition of this metasedimentary sequence to have occurred after 94 Ma. The origin of the Kluane Schist is believed to be an uplifted Yukon-Tanana terrane and Jurassic-Cretaceous plutons of the Aishihik batholith and

Coast plutonic complex (Israel et al., 2010).

Cooling and syn-tectonic emplacement of the Aishihik batholith within the Yukon Tanana terrane occurred during the Jurassic deformation. The ensuing deformation occurred during the mid-Cretaceous which was included the emplacement of the Dawson Range batholith and Nisling Range granodiorite. Late Cretaceous to Paleocene deformation was characterized by continued deformation in the Kluane Schist and a syn-tectonic phase of the Ruby Range batholith. Paleocene to Eocene deformations mark the N-NW and E-W trending strike-slip faults observed which are likely related to movement along Denali fault (Israel et al., 2010).

The Israel et al. (2010) bedrock map of the Ruby Range is displayed below in Figure 3.

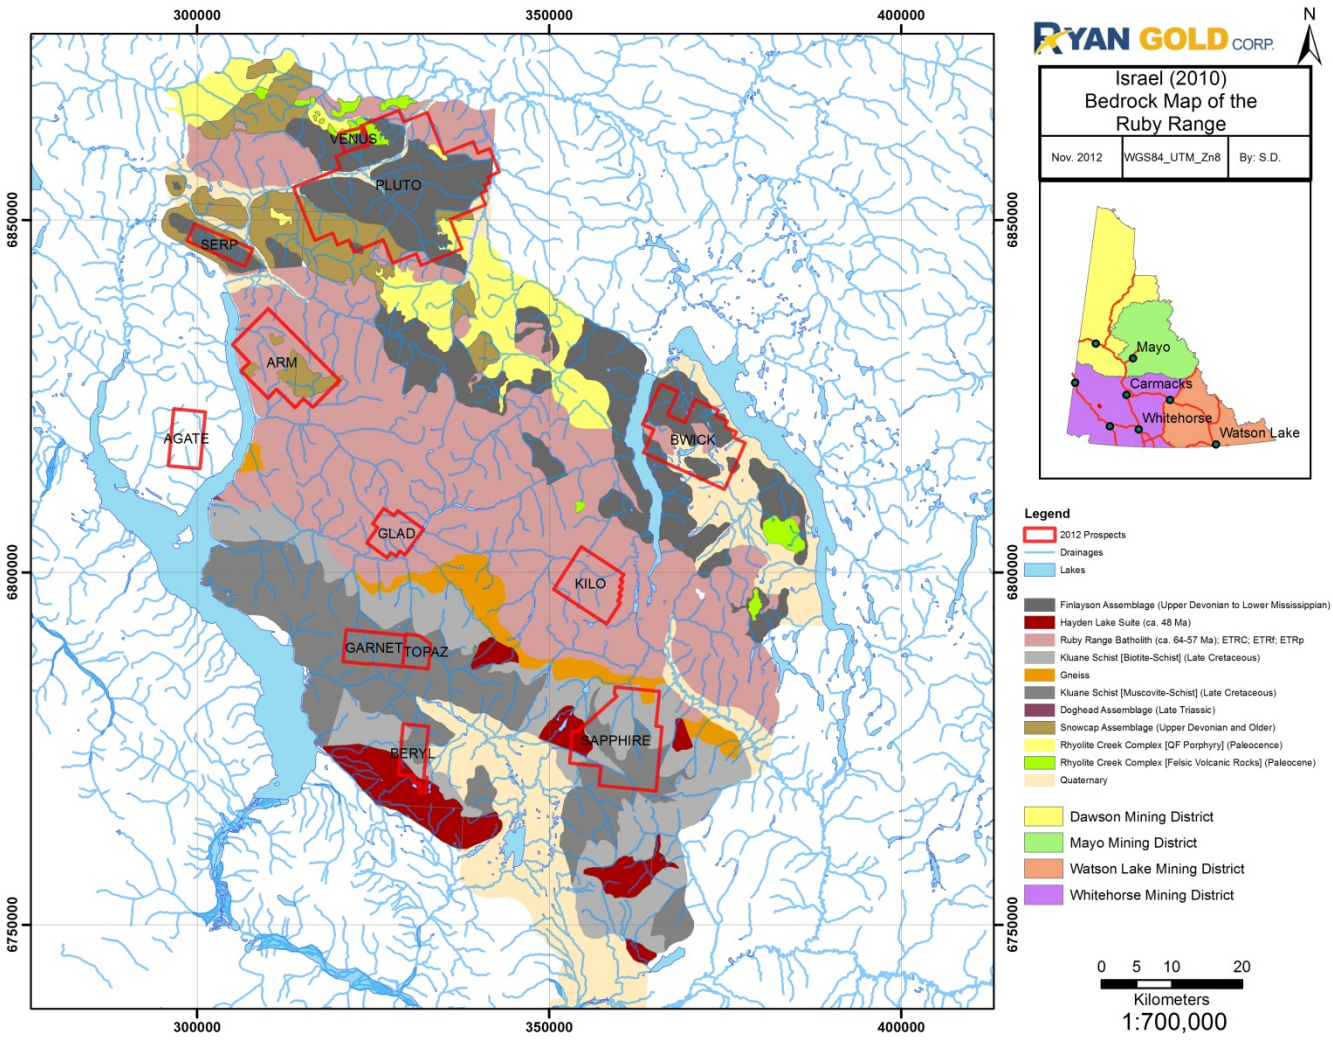

Figure 3: Israel et al. (2010) Bedrock Geology map of the Ruby Range, highlighting prospects which fall within studied area.

Due to the vast area covered by Ryan Gold Corp's Kluane properties, the April and Agate prospects exist as outliers from Israel et al.'s (2010) study. Gordey & Makepeace (2001) of the Yukon Geological Survey completed a compilation map which includes all the prospects and assign different names to units to what Israel et al. (2010) describe. The units described by Gordey & Makepeace (2001) roughly correlated to Israel et al.'s (2010) descriptions, within the respective property geology section of this report. Gordey & Makepeace's (2001) compilation map is displayed below Figure 4.

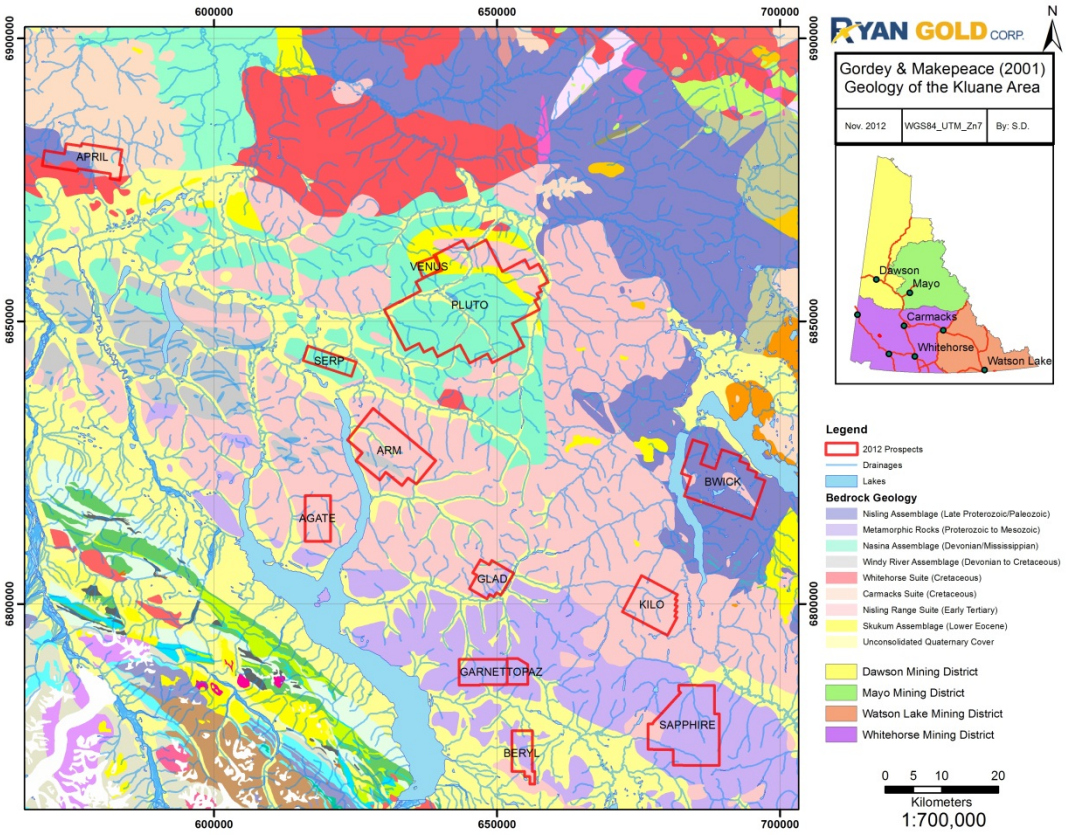

Figure 4: Regional geology map highlighting the Arm prospects location in the Kluane range **(Gordey & Makepeace, 2001)**.

From the extensive study done by Gordey & Makepeace (2001), the units falling within Ryan Gold's Kluane prospects, include: the Nisling, Nasina, Windy River and Skukum assemblages, undivided Metamorphics, and the Whitehorse, Carmacks, and Nisling Range suites. The units described by Gordey & Makepeace (2001), from oldest to youngest are:

1. Nisling Assemblage: (Late Proterozoic and Paleozoic) is a compilation of dark grey to brown, biotite-muscovite-quartz-feldspar schist, quartzite and micaceous quartzite, garnetiferous; felsic chlorite-biotite orthogneiss; rare amphibolite; potentially minor two-mica gneiss and hornblende diorite gneiss which may include the Nasina Assemblage.
2. Nasina Assemblage: (Devonian to Mississippian) is described as a black-weathered, massive, dark grey to black strongly graphitic quartzite with lesser grey micaceous quartzite and quartz mica schist; commonly shows alternating light and dark grey colour lamination, informally termed the 'Nasina' quartzite.
3. Windy River Assemblage: (Devonian to Cretaceous) a sheared and foliated greenstone with related volcanic rocks and minor cherty tuffs.
4. Undivided Metamorphics: (Proterozoic to Mesozoic) a dark purplish brown staurolite cordierite biotite hornfels with relict schistose texture; quartz-sericite-chlorite schist; minor quartzite (metamorphosed Jura-Cretaceous Dezadeash Group and undivided Nisling assemblage).
5. Whitehorse Suite: (mid-Cretaceous) a biotite-hornblende granodiorite, hornblende quartz diorite and hornblende diorite; leucocratic, biotite hornblende granodiorite locally with sparse grey and pink potassium feldspar phenocrysts.
6. Carmacks Suite: (upper Cretaceous) an acid vitric crystal tuff, lapilli tuff and welded tuff including feeder

plugs and necks; felsic volcanic flow rocks and quartz feldspar porphyries; green and purple massive tuff-breccia with feldspar phyric fragments.

7. Nisling Range Suite: (early Tertiary) biotite-hornblende granodiorite (locally K-feldspar megacrysts), quartz monzonite, quartz diorite; minor granodiorite-gneiss; hornblende and biotite hornblende diorite; biotite quartz feldspar porphyry and porphyritic biotite quartz.
8. Skukum Assemblage: (lower Eocence) a heterogeneous intermediate to felsic, hornblende-feldspar porphyritic tuff, flow breccia; volcaniclastic mudstone, sandstone and conglomerate; aphanitic to feldspar porphyritic dacite flows and dykes; flow-banded rhyolite and felsic dykes and sills.

6.2 Property Geology

6.2.1 Agate

The Agate prospect lies exclusively within Jurassic to Eocene intrusions and the Yukon-Tanana terrane (Escayola et al., 2012). The Jurassic to Eocene intrusions correlate in location with Gordey & Makepeace's (1999) Nisling Range suite. Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock.

6.2.2 April

The April prospect is defined by five different units; the Nisling, Nasina, Windy, and Carmacks assemblages, and the Whitehorse Suite (Gordey & Makepeace, 2001). Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock. Several inferred NE-SW trending faults cut through the property. The faults are undefined in sense of movement and are late stage to the major NW-SE trending faults, such as the dextral slipping, Denali fault (Escayola et al., 2012).

6.2.3 Arm

The Arm prospect is divided and described by Gordey & Makepeace (1999) into two different assemblages: the Windy-McKinley and Nisling Range Suite. The Windy-McKinley assemblage correlates loosely with the Snowcap assemblage (Israel et al., 2010). The post-amalgamation Nisling Range Suite can be correlated with the intrusive and extrusive rocks of the Ruby Range batholith (Israel et al., 2010). Aside from inferred contacts which are discernible in Figure 3, Israel et al. (2010) highlights other structural elements which include: a single fault, approximately 2 kilometer, which was mapped on the western edge of the largest Snowcap assemblage block with very limited outcrop measurements. Structure measurements loosely reveal a moderately dipping, SE-striking foliation. Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock.

6.2.4 Beryl

The Beryl prospect is defined by three units; the Hayden Lake intrusion and the biotite-schist and muscovite-schist members of the Kluane Schist (Israel et al., 2010). Gordey & Makepeace (1999) define the area wherein the Beryl prospect resides as a contact between the Nisling Range Suite and Undivided Metamorphics. Aside from inferred contacts which are discernible in Figure 3, Israel et al. (2010) highlights other structural elements which include: the presence of multiple faults, upwards of 40 kilometers, intersecting through the Beryl prospect. Two of the three interpreted faults from the Israel et al. (2010) study run nearly subparallel to each other, roughly 5 kilometers apart north from south, where the third is truncated by the northern parallel fault at the contact between the biotite-schist and muscovite-schist units of the Kluane Schist. Structures measured proximal to or within the Beryl prospect include: foliations, intersection laminations, stretching lineations, s-intersections, fold axis; dominant phase, m-fold, s-fold, and dykes. The dominant fold axis is trending east and shallowly plunging. The dominant foliation orientation is striking NW and dipping at angle of approximately 45°. Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock.

6.2.5 BWICK

The BWICK prospect is defined by three different units: the Nisling assemblage, the Nisling Range Suite, and the Skukum assemblage (Gordey & Makepeace, 2001). The Nisling and Skukum assemblages are strongly correlated with the Finlayson assemblage and Rhyolite Creek complex within the BWICK property boundaries. Aside from inferred contacts which are discernible in Figure 3, Israel et al. (2010) highlights other structural elements which include: the presence of multiple faults, upwards of 25 kilometers, intersecting through the BWICK prospect. The four interpreted faults from Israel et al. (2010) study run subparallel to each other, roughly 2-5 kilometers apart east from west, in a nearly N-S orientation. Structures measured proximal to or within the BWICK prospect's location include: foliations, intersection laminations, stretching lineations, fold axis; dominant phase, s-fold, and dykes. The lineation structures dominantly trend north and are shallow plunging. The dominant foliation orientation is striking west and dipping at angle of approximately 30°. Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock.

6.2.6 Garnet-Topaz

The Garnet-Topaz prospect is dominated by a single unit mapped by Israel et al. (2010): Kluane Schist, the muscovite-rich schist member. The Kluane Schist was previously termed by Gordey & Makepeace (1999) as the Undivided Metamorphics. Aside from inferred contacts which are discernible in Figure 3, Israel et al. (2010) highlights other structural elements which include: the presence of a single fault, trending roughly N-S and stretching approximately 25 kilometers, intersecting through the western edge of the Garnet-Topaz prospect. Structures measured proximal to or within the Garnet-Topaz prospect include: foliations, stretching lineations, fold axis; dominant phase, and s-fold. The lineation structures dominantly trend north to northwest and are shallowly to moderately plunging. The dominant foliation orientation is striking west and dipping at angle of approximately 35°. Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock.

6.2.7 Glad

The Glad prospect was previously described by Gordey & Makepeace (1999) as being defined by two units; the Undivided Metamorphics and Nisling Range Suite. Recent mapping by Israel et al. (2010) describes the Glad prospect as being entirely encompassed by the Ruby Range batholith. The Ruby Range batholith at the Glad prospect is correlated to the Nisling Range Suite which is described as a biotite-hornblende granodiorite (locally K-feldspar megacrysts), quartz monzonite, quartz diorite; minor granodiorite-gneiss; hornblende and biotite hornblende diorite; biotite quartz feldspar porphyry and porphyritic biotite quartz. Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock.

6.2.8 Kilo

The Kilo prospect lies exclusively within the Ruby Range batholith, which was previously termed by Gordey & Makepeace (1999) as the Nisling Range Suite. Aside from inferred contacts which are discernible in Figure 3, Israel et al. (2010) highlights other structural elements which include: the presence of a single fault, trending roughly NW-SE and stretching approximately 25 kilometers, on the southern edge of the Kilo prospect's claim boundaries. A single foliation orientation measured within the prospect's boundaries strikes near-north and dips at angle of 14°. Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock.

6.2.9 Pluto-Venus

The Pluto-Venus prospect was previously defined by four distinct units: the Nasina and Windy assemblages of the Yukon-Tanana terrane, the Nisling Range Suite and Skukum assemblage (Gordey & Makepeace, 2001). Recent mapping by Israel et al. (2010) defines the prospect by five bedrock units; the Snowcap Assemblage & Finlayson Group of the Yukon-Tanana terrane, the Ruby Range intrusive and Ruby Range porphyry of the Ruby Range batholith, and the Rhyolite Creek complex. The previously described Skukum assemblage and Nisling Range Suite strongly correlates to the mapped Rhyolite Creek complex and Ruby Range batholith, respectively, where the Windy-McKinley and Nasina assemblages loosely correlate to the mapped Snowcap assemblage and Finlayson Group. Aside from inferred contacts which are discernible in Figure 3, Israel et al. (2010) highlights other structural elements which include: foliations, and fold axis; dominant phase and s-fold. The lineation structures dominantly trend north to northwest and are shallowly to moderately plunging. The dominant foliation orientation is striking northwest and dipping at angle of approximately 25°. Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock.

6.2.10 Sapphire

The Sapphire prospect was previously defined by two units: undivided metamorphics rocks and Nisling Range Suite (Gordey & Makepeace, 1999). Recent mapping by Israel et al. (2010) defines the prospect by three units; the

Hayden Lake Suite, Kluane Schist and Gneiss. The Kluane Schist correlates with the undivided metamorphics and the Nisling Range Suite relates to the Hayden Lake Suite. Aside from inferred contacts which are discernible in Figure 3, Israel et al. (2010) highlights other structural elements which include: the presence of a multiple faults, running upwards of 45 kilometers, cutting through the Sapphire prospect. Two of the three interpreted faults are undefined in movement while the third is an interpreted as a thrust fault. The nearly 45 kilometer, undefined fault is truncated by a, roughly 35 kilometer, NW-SE trending undefined fault on the southern limits of the prospect's boundaries. The movement of the thrust fault is over-thrusting in a northward direction along the contact between the Kluane Schist and Gneiss. Structures measured proximal to or within the Sapphire prospect include: foliations, stretching lineations, fold axis; dominant phase and s-fold, crenulation lineations and dykes. The lineation structures dominantly trend northeast and are shallowly plunging. The dominant foliation orientation is striking northwest and dipping at angle of approximately 20°. Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock. Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock.

6.2.11 Serp

The Serp prospect lies exclusively within the Yukon-Tanana terrane. Gordey & Makepeace (1999) defined the area of the Serp prospect as being entirely Nasina assemblage, while Israel et al. (2010) divides the prospect into two members of the Yukon-Tanana terrane; the Snowcap and Finlayson assemblages. The Finlayson assemblage comprises the majority of the prospect. No structural mapping was done in the area which defines the Serp prospect by Israel et al.'s (2010) study. Unconsolidated Quaternary sediments and vegetation overlay a majority of the bedrock.

7.0 Exploration Program 2012

The intent of the 2012 Ryan Gold Corp. exploration program for the various Kluane prospects was to advance the understanding of the properties, supplemented by extensive geochemical sampling and detailed geologic mapping, generally at a scale of 1:20,000. The Arm and Pluto-Venus prospects were also complemented by airborne geophysics programs.

Due to the nature of the reconnaissance mapping and sampling programs via helicopter, there was little to no disturbance of the areas. Remote lodging at Burwash Landing and Haines Junction allowed operations to be carried out with zero site work construction. All work completed on the various Kluane properties was in accordance with the issued Class 1 permit.

7.1 Soils

The geochemical soil sampling was contracted to and completed by Ground Truth Exploration Inc. The soil grids were chosen based off targeted zones from the previous season results and the historic mineral showing. A total of 23, 493 soils were taken. Dates worked and total soils taken, per property, are displayed in Table 3.

Table 3: Dates and soil totals for work completed during the 2012 field season program by property.

Property Name	Field Dates (2012)	Total Soils
Agate	N/A	0
April	N/A	0
Arm	July 26th – September 24th	2,632
Beryl	N/A	0
BWICK	September 9th – September 19th	919
Garnet-Topaz	August 7th – August 15th	840
Glad	August 1st – August 6th	975
Kilo	August 16th – September 19th	1,390
Pluto-Venus	June 24th – August 4th	12,071
Sapphire	August 10th – August 20th	4,201
Serp	July 30th – August 4th	465

7.2 Geological Mapping

The reconnaissance bedrock mapping of the Kluane properties during the 2012 exploration program resulted in the collection of 207 grab samples. A total 1,439 geological observations were taken which aided in the geological interpretation of the properties. Grab sample coordinates for the Kluane properties are listed in Appendix D and illustrated by location maps in Appendix F. Dates worked and total field observations and grab samples taken for the 2012 field program, per property, is displayed in Table 4.

Table 4: Dates and sample/observation totals for geological work completed during the 2012 field season program, by property.

Property Name	Field Dates (2012)	Total Grab Samples	Total Observations
Agate	August 24th	1	5
April	August 3rd & 4th	15	50
Arm	July 12th – July 17th	37	161
Beryl	August 23rd	3	21
BWICK	August 20th – August 23rd	13	70
Garnet-Topaz	July 31st, August 1st & 7th	18	99
Glad	August 2nd	8	73
Kilo	August 17th – August 19th	14	55
Pluto-Venus	July 18th – July 30th	77	722
Sapphire	August 9th – 16th	25	126
Serp	August 5th	8	58

7.3 Airborne Geophysics

The airborne geophysical survey completed on the Arm property was contracted to and completed by Precision GeoSurveys Inc. Statistics for the geophysical surveys are summarized in Table 5.

Table 5: 2012 Survey acquisition specifications for the Arm prospect.

Survey Block	Line Spacing (m)	Planned Survey (line Km)	Planned Tie Line (km)	Total Planned Line (km)	Total Actual Flown (km)	Survey Line Orientation	Nominal Survey Height (1m)
Arm	100	1100	110	1210	1218	039° / 219°	35
Total	-	-	-	1210	1218	-	-

The report written by Precision Geosurveys Inc. on the Arm property is attached in Appendix 7.

8.0 Geochemical Analytical Procedure

8.1 Grab Sampling

Sampling, chosen based on geological relevance, followed a methodical set of procedures from initial sample collection to final database recording. Samples were typically chipped away from outcrop showings, using a standard Estwing rock hammer, into polyurethane bags and recorded digitally using a Pidion/IPAQ handheld PDA device. Before sealing the bag with a cable tie, an ALS Chemex supplied sample tag was placed inside the bag and then another stapled to the open, outside edge, finally followed by marking the number on the bag using a permanent felt. The closed sample, along with a marked show sample, was stored amongst the others throughout the day by the sampler in a field pack. After returning each day, sample numbers and descriptions were uploaded to a database and the samples were securely stored until a batch shipment was prepared. The on-site project geologist was responsible for creating the chain of custody and shipment forms. Samples were placed in a sample string with a systematic pattern of standards and blanks to ensure QA/QC, grouped in rice bags and secured with security tags. The batch shipments would be transported via expeditor or Ryan Gold personnel to ALS Chemex in Whitehorse, where the samples were prepped and shipped to their Vancouver lab for assaying and QA/QC checks. Throughout the shipment process, a chain of custody paperwork trail was maintained to ensure sample security.

Once in at the ALS Lab in Whitehorse the samples are received, weighed and logged. Samples are then crushed until 80% or better passes through a 2 mm mesh screen. This resulting material is put through a riffle splitter, where a 1000 g sample is isolated and the rest is collected as reject. The sample is pulverized further until 85% or better passes through a 75 micron mesh screen. After this step the pulp material is shipped to the North Vancouver lab for analysis. The remaining reject material is stored in Whitehorse.

The material that is shipped to the North Vancouver lab is split using a riffle splitter where a 50 g sample is isolated. The reject material from this process is stored at the lab. This 50 g sample is now subjected to ICP22 and ME-MS41 assaying methods. The ICP22 is a fire assay and ICP-AES method to assay for gold, and can detect values between 0.01 ppm and 10 ppm. ME-MS41 is a 51 element analysis by aqua regia digestion and a combination of ICP-MS and ICP-AES assaying. Assays for Au, Ag, Cu, Pb, As, Zn and Sb that are above detection are then finished using a gravity method to obtain true value. Final results using the methods above are reported to Ryan Gold electronically, consisting of an excel spreadsheet and a PDF certificate of work.

8.2 Soil Sampling

All sampling traverses are pre-planned, with pre -specified sampling intervals, typically 50m. Field technicians navigate to sample site using handheld GPS units. The soil sampler arrives at each sample site, identifies the most appropriate location to collect the sample and lays out a sheet of plastic (12”x20” ore bag). The soil sample is taken using an Eijklcamp brand hand auger at a depth of between 20cm and 110cm. Samplers strive to consistently collect C-Horizon sample material. Where necessary (rocky or frozen ground) a prospector's pick ('mattock') is used to obtain the sample. The soil is laid out on the sheet of plastic in the order it was recovered from the sample hole. Standardized photos are taken of the sample site- across slope, 5m from sample hole with auger inserted. With the necessary amount of soil (400-500 grams) has been collected, the deepest soil is taken and placed in a bag labeled with the 3-letter project and tagged with a unique barcode ID tag containing a unique 7 digit sample identification number. An aluminum metal tag inscribed with the sample identification number is attached to a rock or branch in a visible area at the sample site along with a length of pink flagging tape.

A field duplicate sample is taken once for every 25 samples. Both samples are given unique Sample identification number. The data for both samples is recorded and a note is made indicating the duplicate and its corresponding sample identification number.

The GPS location of the sample site is recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD83 format, and the waypoint is labeled with the project name and the sample identification number.

A weather-proof handheld device equipped with a barcode scanner is used in the field to record the descriptive attributes of the sample collected. This includes: sample identification number (scanned into device at sample site), soil colour, soil horizon, slope, sample depth, ground and tree vegetation and sample quality and any other relevant information. As well, the GPS coordinates are entered into the handheld device as a secondary backup in case of GPS failure.

Each night in the field, the GPS and Palm PDA devices are downloaded to a laptop computer. The data is verified and mapped on a sampler-by-sampler basis in proprietary database auditing and mapping software. At the end of each day, the crew boss inspects all samples for size and consistency as a quality check. Each sampler then repackages all samples for shipping- barcode scanning them as they are placed into a rice bag which is sealed with a barcoded security zip tie. Samples are shipped from the field to the lab on a daily basis, tracked by the unique ID on each security seal.

A backup of the sample data is made, copied onto a USB memory stick and kept in a separate location from the laptop computer until job completion. Where possible, a backup is also sent via e-mail.

Samples were processed by Acme Labs in Vancouver with Aqua Regia digestion and analyzed with ICP-MS for 36 elements (Acme Labs 1DX-15 gram). Samples are dried at 60°C, sieved at -80 mesh.

9.0 Exploration Results 2012

9.1 Agate

The Agate prospect was worked by members of the Ryan Gold team on August 24th, 2012 and returned a total of 5 geological observations and 1 geochemical sample. The terrain proved to be limited in outcrop, and when observable, the granodiorite which dominates the property was limited in mineralization, structure and alteration. No significant results were found during the 2012 field season. Appendix 3 displays the complete work certificate list for all sample assays received from the Agate prospect during the 2012 field program.

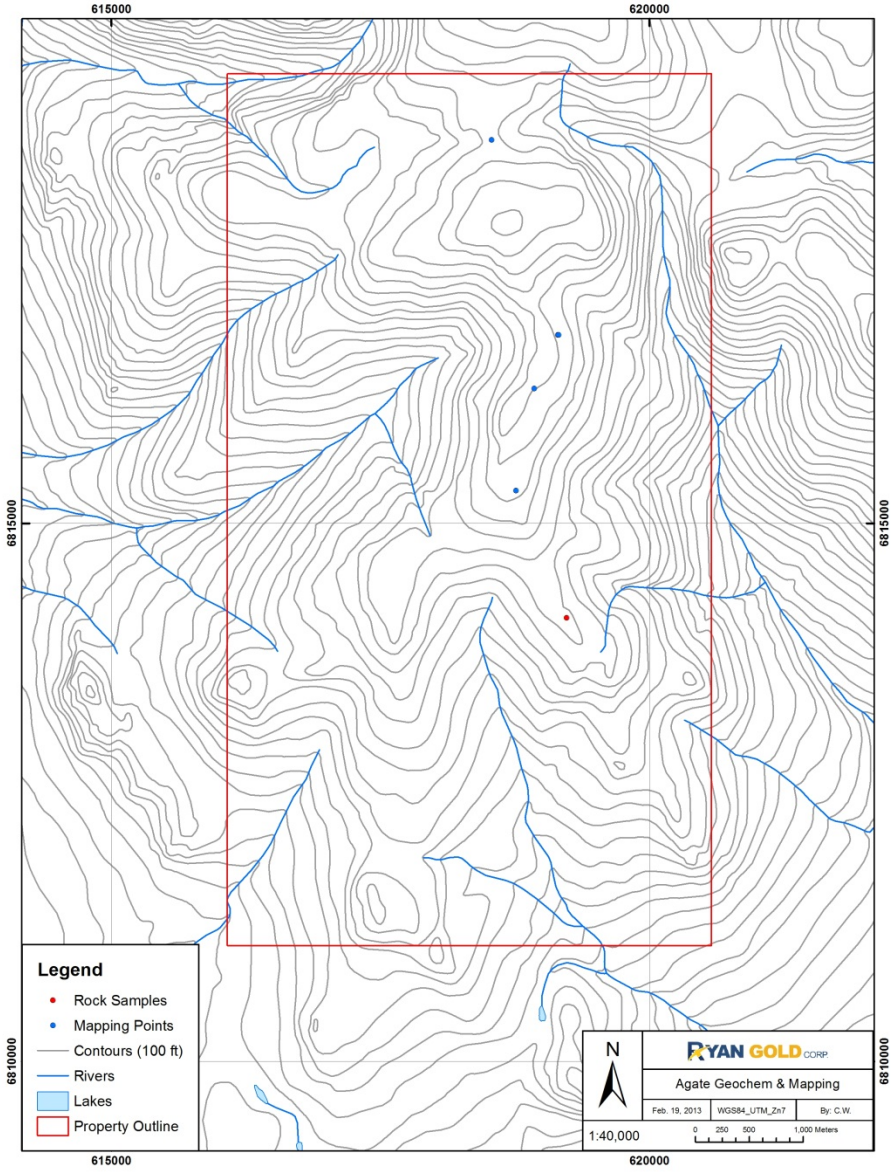

Figure 5: Agate Grab Sample & Observation Locations

9.2 April

The April prospect was worked by members of the Ryan Gold team between the dates of August 3rd and August 5th, 2012, and returned 50 geological observations and 15 geochemical samples. Outcrop on the property proved to be limited. The samples retrieved were limited in mineralization and no significant results were found during the 2012 field season.

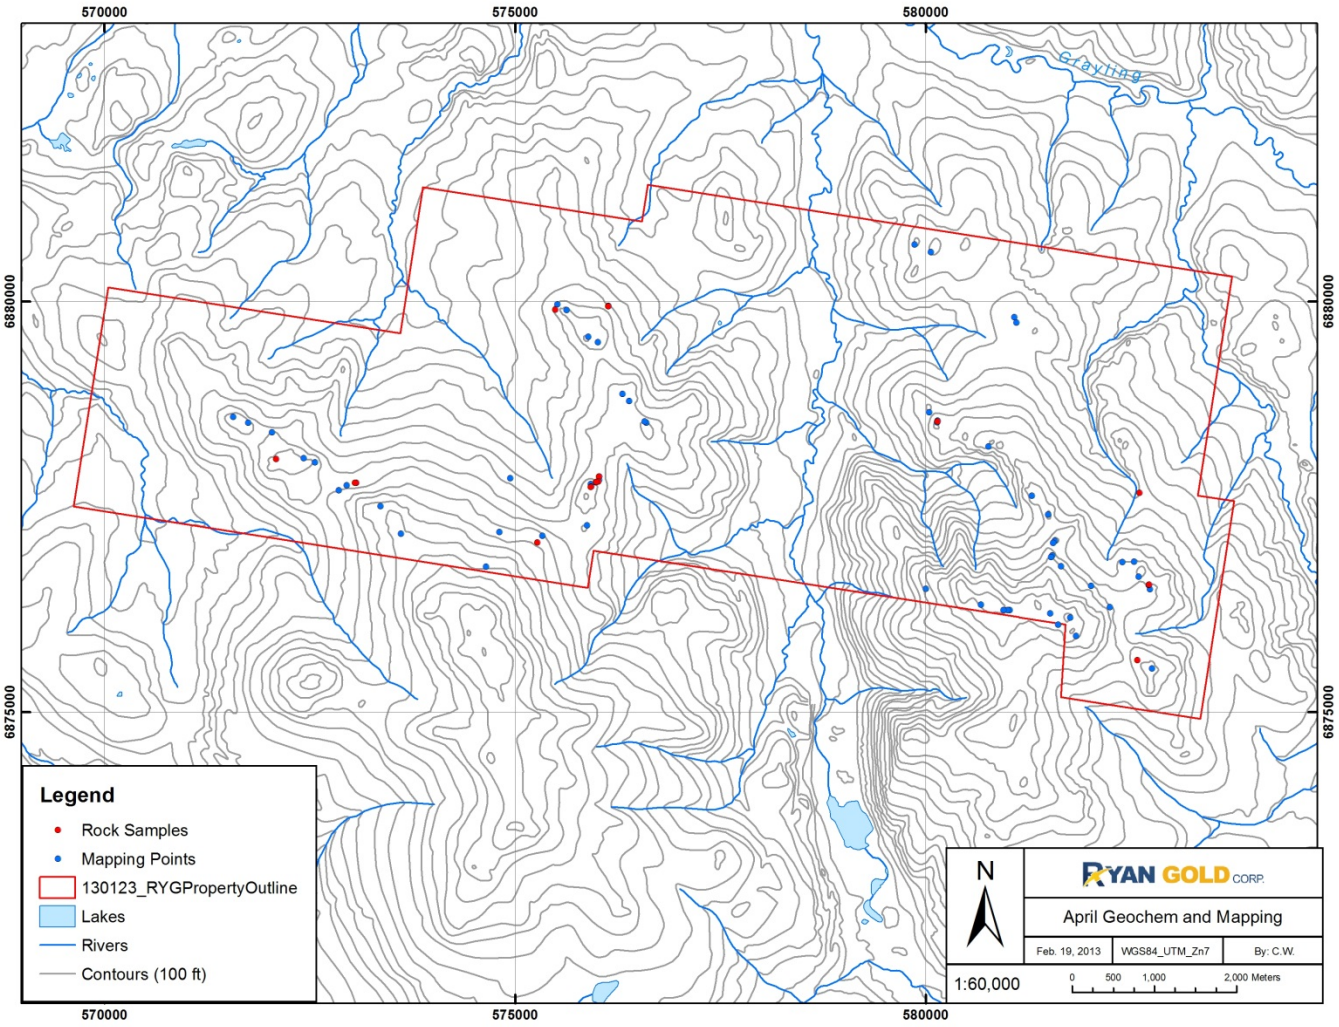

Figure 6: April Grab Sample & Observation Locations

Prospecting and reconnaissance mapping completed on April resulted in the construction of a 1:20,000 scale map, limited to traverses and outcrop exposures. The produced map which illustrates the general location of samples and observations retrieved during the 2012 field season is displayed in Figure 7.

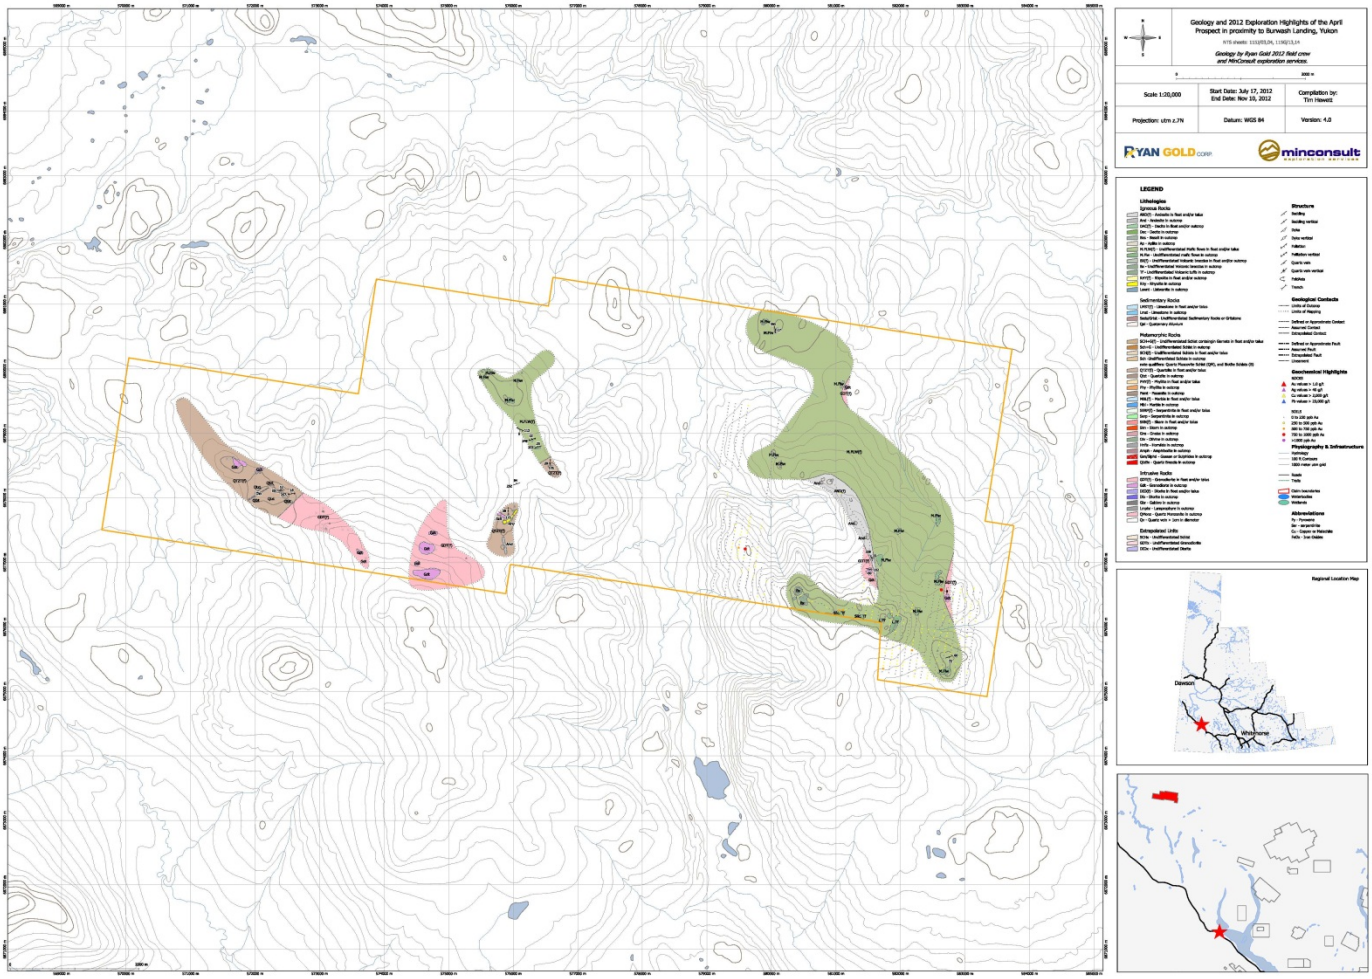

Figure 7: Geologic and exploration summary map of observations and notable assays of the April prospect from the 2012 field season. Note: Master legend for all Kluane prospects (Arm & Pluto-Venus excluded).

Figure 7 highlights extrusive sills and dykes east of the Carmacks assemblage (Gordey & Makepeace, 2001) and the presence of smaller intrusive units within the assemblage. The claim is nearly completely covered by permafrost, White River ash and vegetation. Outcrop was limited to: intermediate to mafic flows and flow breccias, mostly feldspar-phyric andesite, with minor fragmental units (lithic crystal tuffs?). The rocks are pervasively propylitically altered (chlorite-hematite-calcite). Frost heave exposed minor, medium grained granodiorite with fairly diffuse grains.

Appendix 3 displays the complete work certificates for all work performed on the April prospect during the 2012 field program.

9.3 Arm

The Arm prospect was worked by members of the Ryan Gold team between the dates of July 12th and July 17th, and September 3rd, 2012. The total geological observations and geochemical samples collected were, 161 and 37 respectively. The terrain proved to be suitable mapping outcrop. The Arm prospect displayed some of the most notable grades found during the 2012 exploration season.

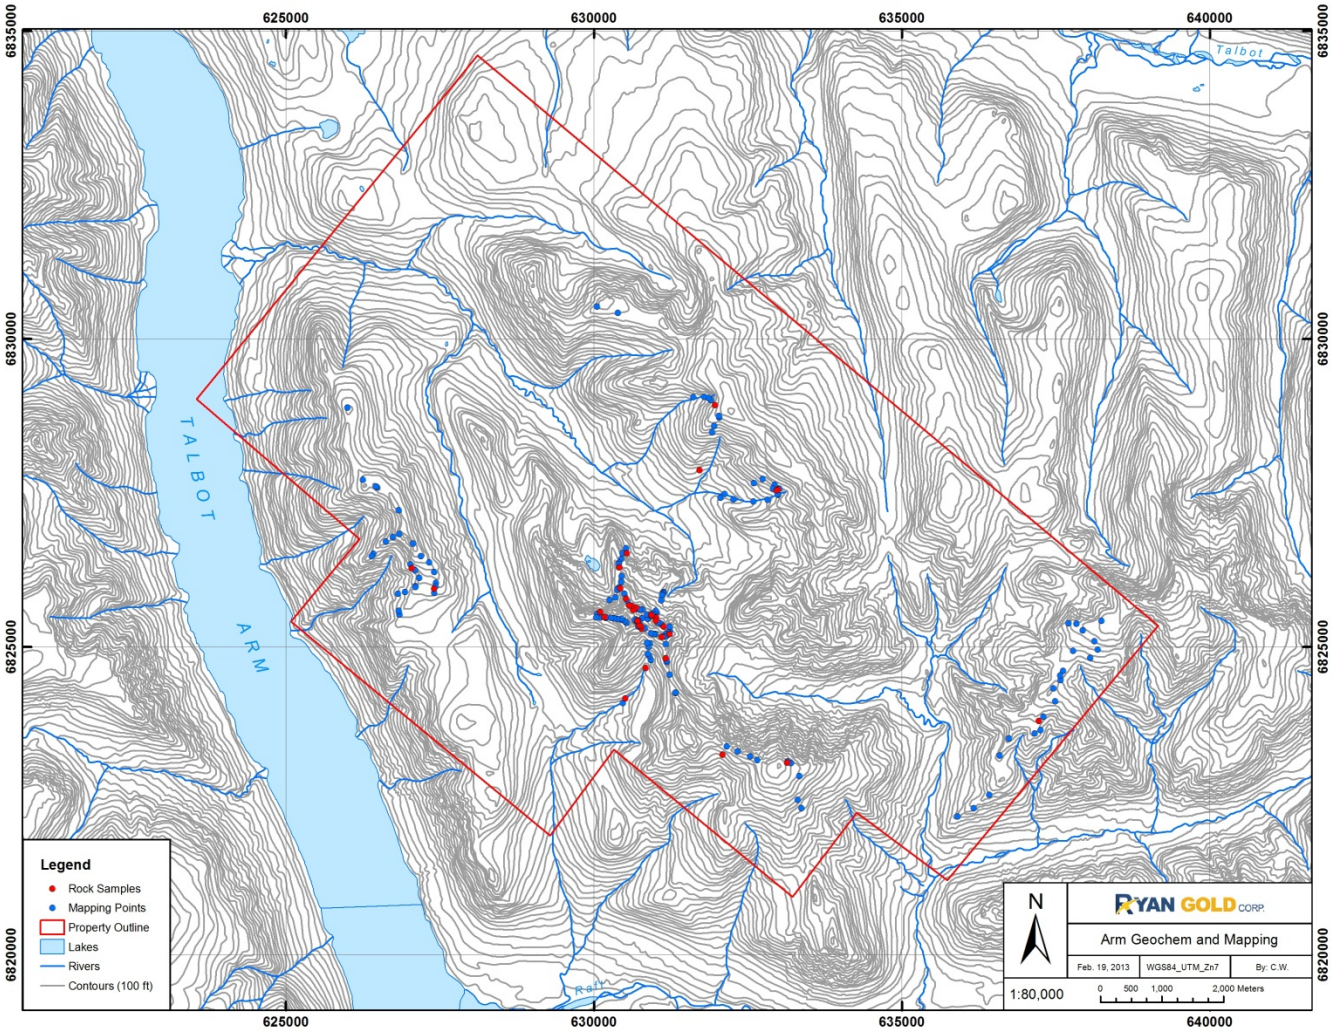

Figure 8: Arm Grab Sample & Observation Locations

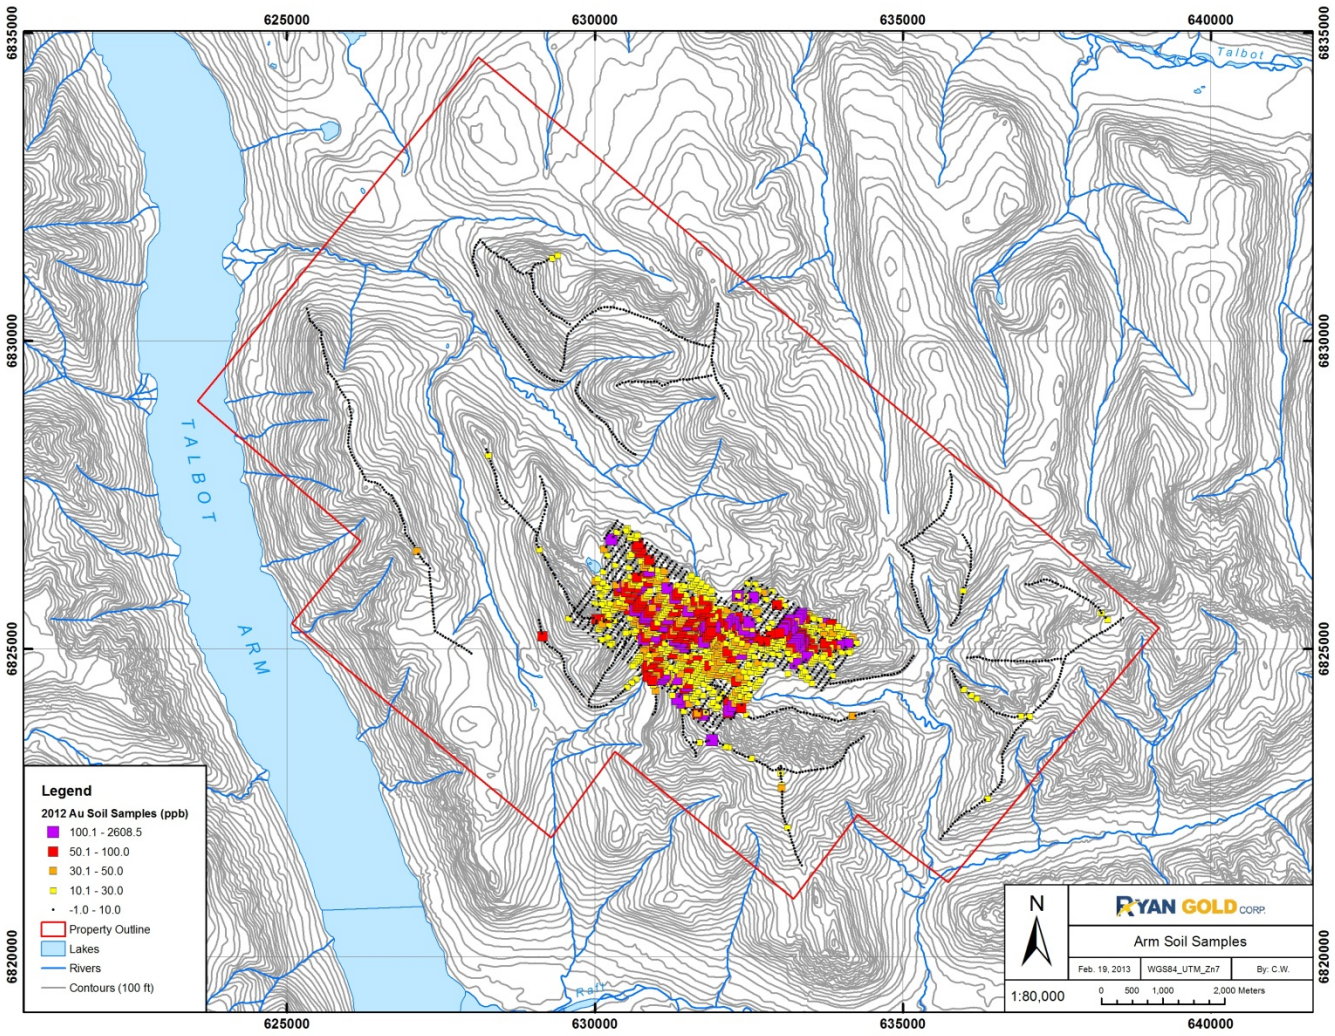

Figure 9: Arm 2012 Soil Sampling

Prospecting and reconnaissance mapping completed between the dates resulted in the construction of a 1:20,000 scale map, limited by completed traverses and outcrop exposures. Prior the 2012 field season, a targeted zone near the center of the property was selected to be mapped at a finer scale of 1:5,000 due to anomalous grades from historic workings. The produced map which illustrates the general location of samples and observations retrieved during the 2012 field season is displayed below in Figure 10.

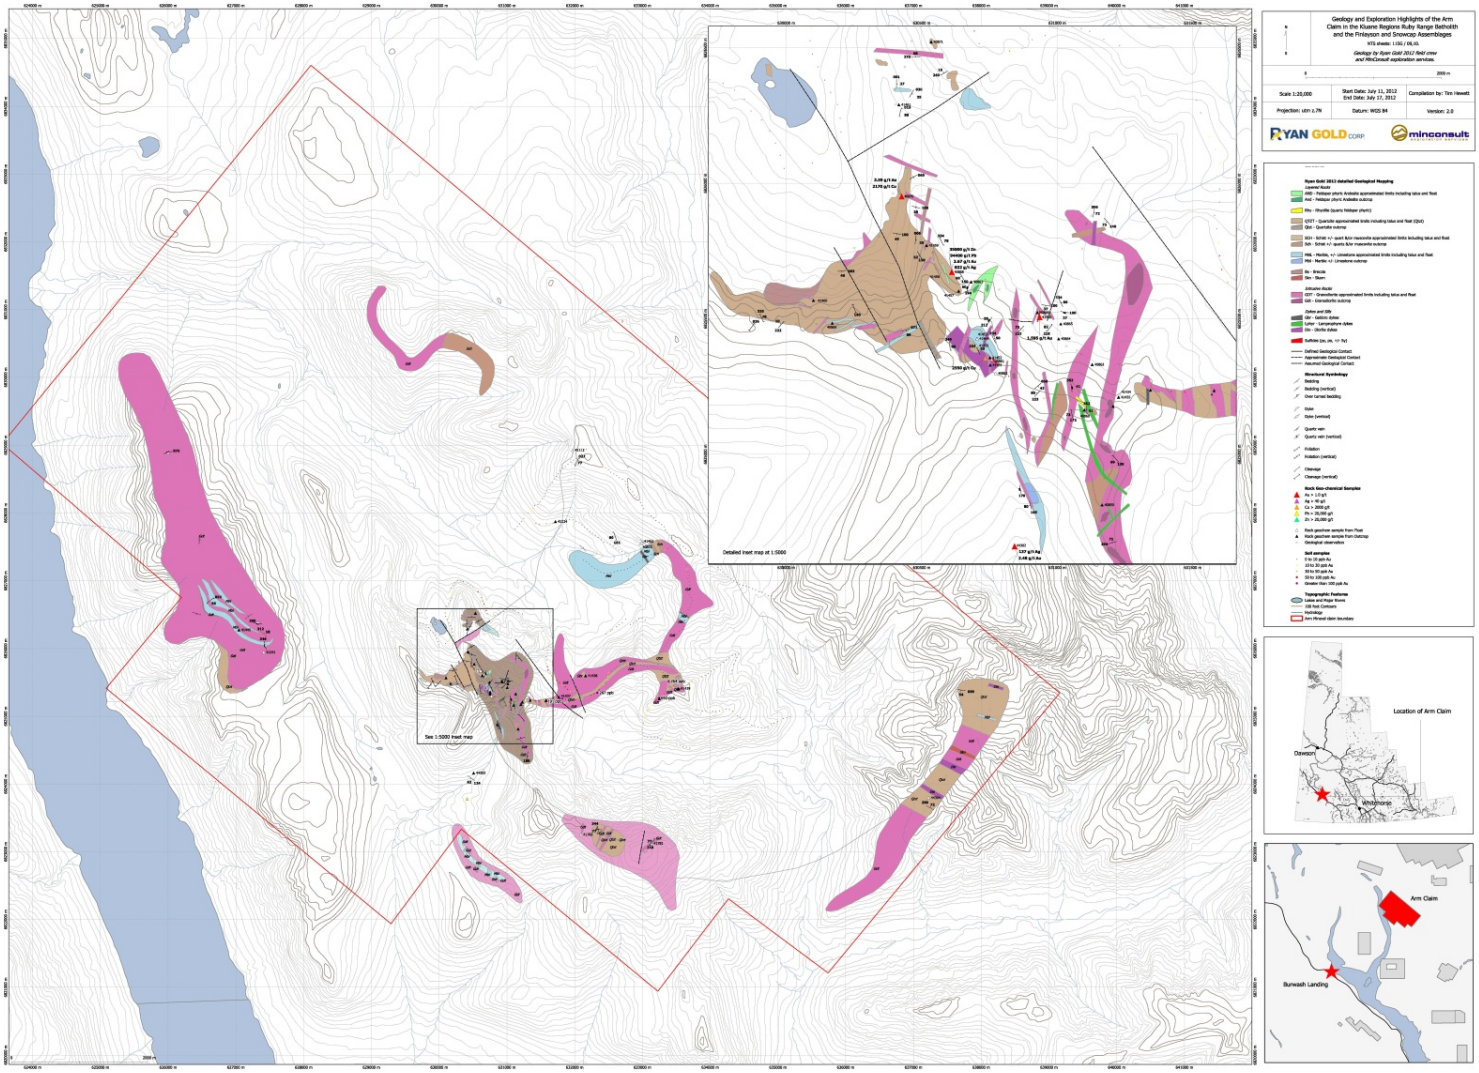

Figure 10: Geologic and exploration summary map of observations and notable assays of the Arm prospect from the 2012 field season.

The Arm property is situated in an area of the Coastal Belt where the lithologies are dominated by the Ruby Range batholith granodiorite and metasedimentary units of the Snowcap assemblage (Israel et al., 2010). Within the claim boundary, the metasedimentary units of the Snowcap assemblage are isolated by the Ruby Range batholith, following a roof pendant model. The interaction between the intruding Ruby Range batholith and older Yukon-Tanana terrane can be observed from cross-cutting granodiorite dykes and sills, recrystallization of calcareous units into a loosely-bound marble, the presence of orthogneiss along contacts and minor skarnification. Faults are generally orientated NW-SE, with several meter-wide displacements where the east block is commonly observed above the west block. Geochemical assays of soils reveal plunging folds with a fold axis trending in a NW-SE direction. From mineralization intensities along respective fold axis, it is assumed the antiform fold axis is orientated NW. Veining is rarely observed within the granodiorite and is more or less restricted to the mineralized quartzite of the Snowcap assemblage (Israel et al., 2010). Mineralization is most commonly observed within the quartzite units and is normally fracture-controlled and includes mineral types: arsenopyrite, chalcopyrite, galena, pyrite, and pyrrhotite. Minor igneous volcanic extrusives, porphyritic andesite and fine-grained rhyolite, cap the majority of units and generally display flow banding. Later stage mafic, lamprophyric and gabbroic, dykes cross cut all units, generally in an N-S to NW-SE orientation.

The granodiorite intrusion is actually a very complex, multiphase intrusive complex, consisting of many crosscutting phases of coarse to fine-grained, leucocratic to melanocratic phases, with various porphyritic textures. It appears that the intrusions crosscut each other, but maintaining the same general conduit. They seem to prefer bedding planes and partings, particularly the limestone contacts. More often than not, the marble beds are bounded between granodiorite sills. However, dykes of the same complex also crosscut the metasedimentary rocks at steeper angles. The overall intrusive-metasedimentary contact is highly irregular. The marble units, often isolated from the over and underlaying sedimentary rocks by granodioritic intrusions, display thin laminae with fine, honey sphalerite, up to 1%, and minor interstitial pyrrhotite. The pale banded skarns associated with the altered calcareous units display thin bands of diopside and pinkish garnet. The calcareous units also host massive sulphide pods which consist of massive pyrite, up to 90%, with minor pyrrhotite and chalcopyrite. The marble units are aligned discontinuously along a generally north-south trend, with massive (carbonate) lenses up to 30 meters thick and 400 meters long. The quartzites and siltites of the same pendant appear highly deformed along the length of the carbonate trend.

The target zone of the Arm prospect, mapped at 1:5,000 as illustrated in Figure 10, is further described as an area underlain by metasedimentary rocks including quartzite and marble. These rocks dip steep towards the east. Numerous, irregular biotite granodiorite dykes, up to several tens of metres wide, intrude into the metasedimentary rocks. This granodiorite is fine to medium equigranular, with approximately 10% biotite. Hornfelsed, bright red halos, with up to 10% pyrite-pyrrhotite are ubiquitous to these dykes. Each lithology unit is intruded by lamprophyre dykes pinching and swelling to up to 5 meters wide. These dykes trend roughly NNW, subvertical. Smaller dykes up to 1 meter width of both fine grained, massive, concoidal fractured basalt(?) and flow banded, pale grey, biotite-bearing rhyolite are the youngest observed dykes to date. An approximately 150 meter long limestone ‘reef’, up to 30 meters wide, is situated on the east face of the high point , centered in the main gossanous area visited. This limestone has been recrystallized into very coarse granular calcite. This reef dips steep towards the east (80°) and includes pods and lenses up to 50 cm wide of green, fine grained metasedimentary rock, with 40-50% pyrite and very abundant FeOx. Minor scorodite fracture zones appear associated with possible N-S trending inferred faults. It appears that the marble reef has been truncated at the top by a subhorizontal fault, which was then intruded by a fine grained, equigranular biotite diorite, over 25 meters in width. One dyke crosscuts across the marble. Medium grained biotite granodiorite dykes, up to two meters in width have then intruded into the diorite, as well as along the diorite-marble contact. More of the massive pyrite pods and lenses have been noted along the intrusive contact at the top of the marble reef. The contact between an observed marble bed and intrusion appears to have originated as a subhorizontal fault, along which a wide, 10 meter+ diorite dyke has intruded, which in turn has been intruded by a medium to coarse grained biotite granodiorite. Numerous skarned zones are associated with the main marble reef, with medium to very coarse tremolite-actinolite, minor red and pink garnets, quartz and minor diopside(?). Eastwards from the end of the marble reef, a very complex sequence of sedimentary and metasedimentary rocks, dipping steeply towards the east are intermittently exposed as small outcrops and along the major gully. Rock types include quartzite, psammite, quartzite, conglomerate and smaller marble and skarn layers. These rocks have been intruded by an equally complex intrusive complex of more diorite, granodiorite, very fine grained gabbro and basalt. The basalt displays pillow-like features with chilled margins and amygduloidal textures (quartz infill). Mapped upwards from the East spur, through a set of biotite+/-hornblende granodiorite, diorite and andesitic dykes and sills. The sedimentary rocks up the main gulley are fine grey arenites and quartzites, with a few very coarse quartzite beds, with sub-

vertical bedding. These sedimentary rocks are variably mineralized with up to 2% pyrite and 7% pyrrhotite. Towards the north, bedding starts shallowing out towards the east. Dykes as mentioned above start becoming more random in their orientation and the finer grained arenites are intensely folded and sheared. At least two breccia zones have been noted in outcrop, and several more are presumed to exist judging by the abundance of breccia material in talus. These breccias appear to be parallel to bedding, but also appear to be post genetic, as the fragments include the lithologies of both the sedimentary rocks and the younger, crosscutting granodiorite. The breccia here trends 228°/77° NW, parallel to a strong cleavage within the granodiorite which is observed as a felsic intrusive breccia, with a very fine grained, quartz rich matrix, which has intruded into a pre-existing fault. This intrusive breccia(?) has been truncated towards the southwest by another fault trending 010°. Angular to subangular fragments up to 15 cm of arenite, quartzite, limestone, granodiorite and quartz, form a framework packing with a fine grained, quartz and biotite-rich matrix. The breccia zones observed in outcrop are 3 to 5 meters wide. The fine grained, variably porphyritic diorite and andesite dykes appear to be closely related with the biotite +/- amphibole granodiorite dykes, as they often occur together along the same conduit, either parallel or oblique. The granodiorite usually crosscuts the diorite dykes. More of the coarse recrystallized marble beds have been mapped in, in this area. Along the ridge west of the cirque, the marble bed trends 060°/88° SE, but is offset along a set of parallel faults trending approximately 155° to 160°/steep, with dextral offsets in the order of several tens of meters. At the eastern limit, this marble bed is truncated by a major fault, with the same general trend.

The extensive geochemical sampling programs carried out by both GroundTruth and Ryan Gold Corp. during the 2012 field season on the various Kluane properties exposed the potential economic resource for Arm. Complimented with detailed bedrock mapping and airborne geophysics, the projects have advanced considerably due to the efforts of the 2012 exploration program. Table 6 highlights the notable grades retrieved from grab samples collected at the Arm prospect during the 2012 field season.

Table 6: 2012 grab sample Au, Ag & Cu highlights from the Arm prospect.

Sample #	Lithology	Grade (Au) [g/t]
40868	Quartzite	3.67
40870	Quartzite	3.59
44302	Marble	2.48
41456	Metasediment	1.595
Sample #	Lithology	Grade (Ag) [g/t]
40868	Quartzite	832
44302	Marble	137
Sample #	Lithology	Grade (Cu) [g/t]
41452	Massive Sulfide	2550
40870	Quartzite	2170
40868	Quartzite	1800

Table 6 displays the prominence of quartzite acting as host to mineralization at the Arm prospect. Although grades displayed in Table 6 are anomalous individual examples, the trend observed throughout the property is that the isolated Yukon-Tanana terrane metasedimentary blocks, mostly quartzite and marble, generally display high Au-values whereas the intrusive and extrusive rocks of the Ruby Range batholith, surrounding the metasediment blocks, do not. In addition to lithological controls, the highest Au-grades on the property were observed to be proximal to structural trends and controls such as plunging folds and apparent normal faults.

Groundtruth Exploration Ltd. conducted a soil sampling survey that consisted of 2,632 soil samples. The results of this soil sampling are displayed in Figure 9. Full details of soil sample locations and assay certificates can be found in Appendix 4 & 3 respectively.

The airborne radiometric and magnetic geophysical surveys conducted on the property yielded the following images for Total Magnetic Intensity at the Arm, displayed in Figure 11. Complete results of the geophysical survey are listed in Appendix 7.

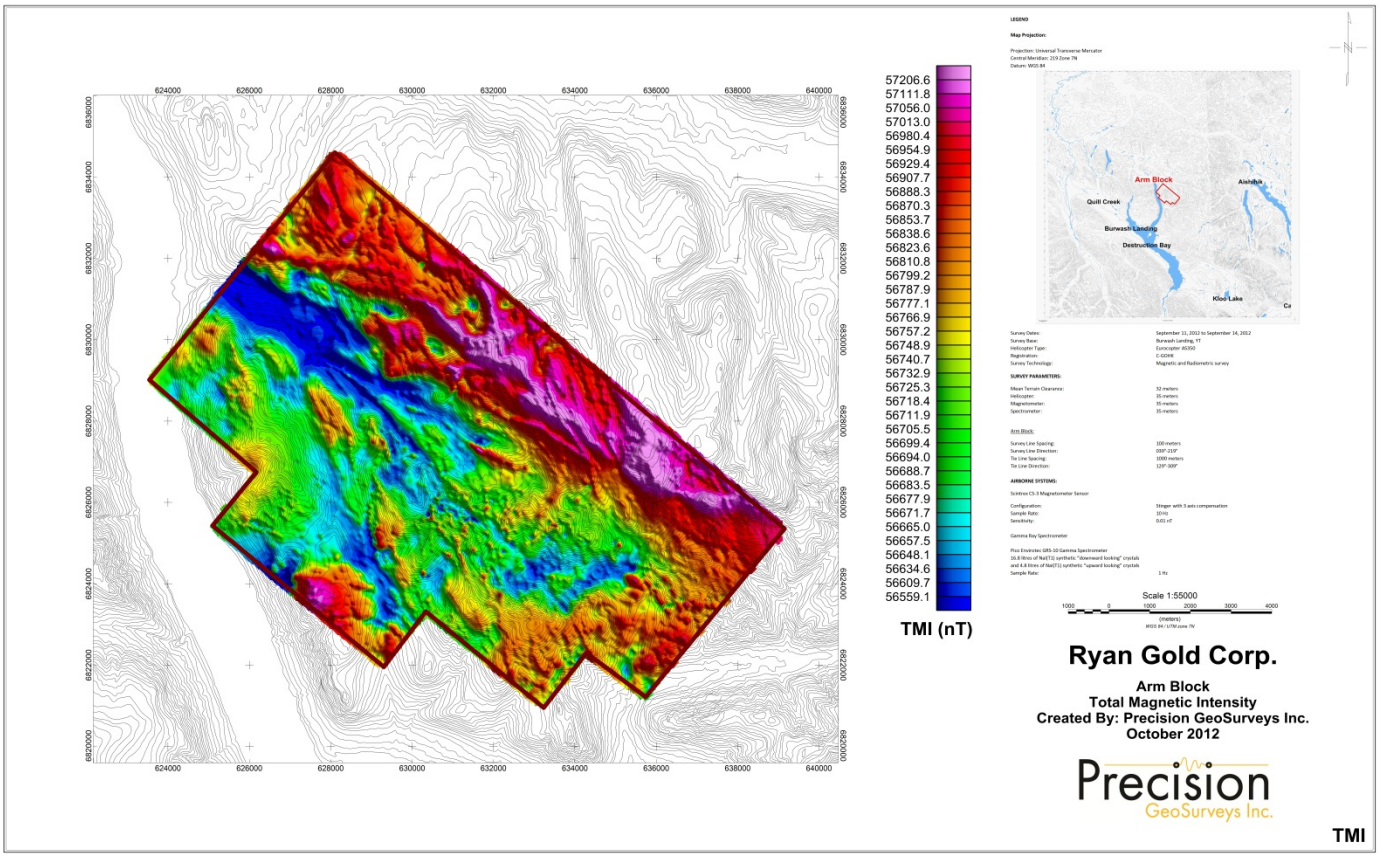

Figure 11: Total Magnetic Intensity (TMI) for the Arm prospect, completed in October, 2012, by Precision GeoSurvey Inc.

Appendix 3 displays the complete work certificate list for all sample assays received from the Arm property during the 2012 field program.

9.4 Beryl

The Beryl prospect was worked by members of the Ryan Gold team on August 23rd, 2012, and returned 21

geological observations and 3 geochemical samples. The terrain proved to be limited for suitable mapping outcrop. The samples retrieved were limited in mineralization and alteration. No significant results were found during the 2012 field season.

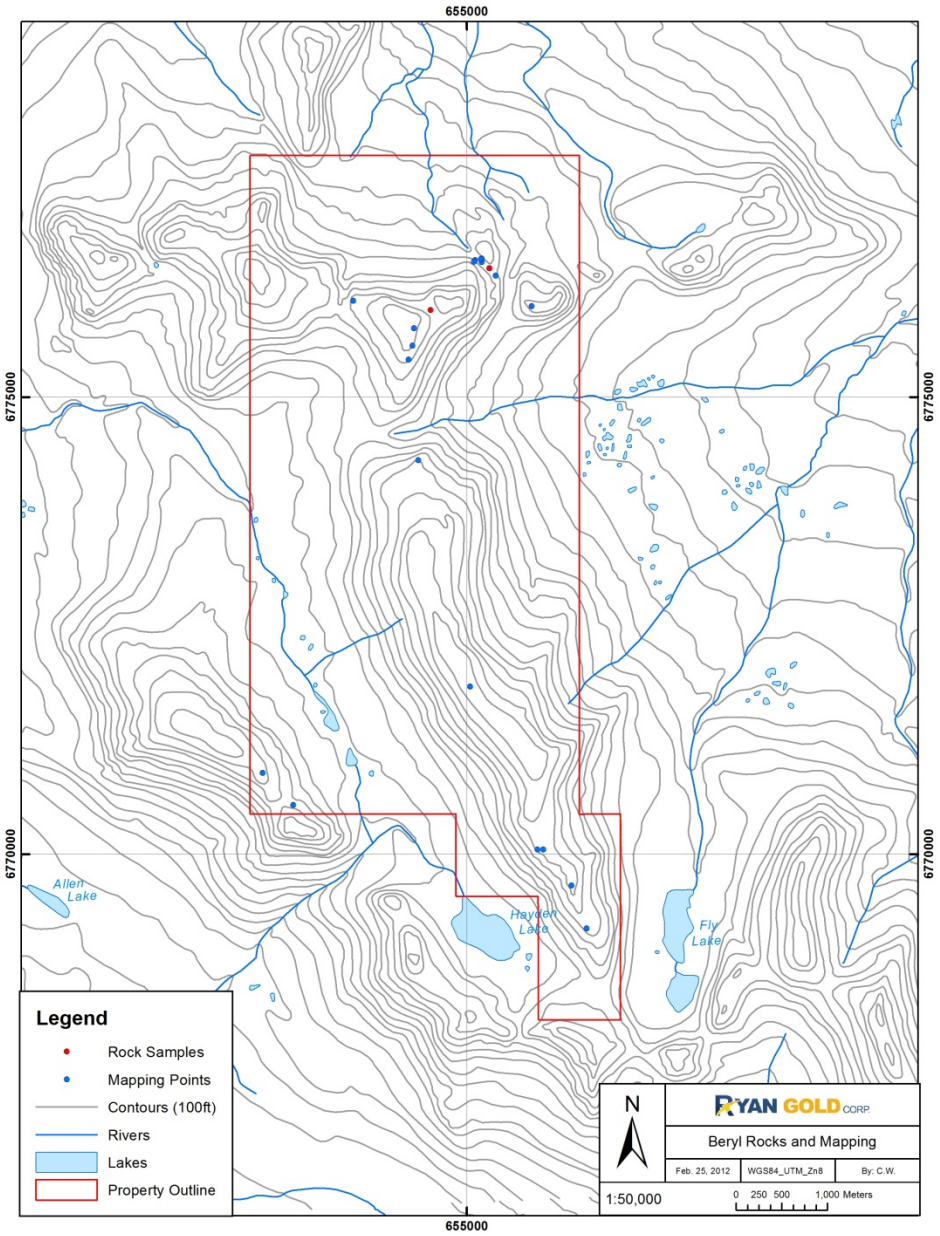

Figure 12: Beryl Grab Sample & Observation Locations

The Hayden Lake intrusion is observed to be an unaltered, fresh, massive, biotite-rich granodiorite where the Kluane Schist is divided by mineralogical modifiers into a lighter muscovite-rich schist unit and a darker biotite-rich schist unit.

Appendix 3 displays the complete work certificate list for all sample assays received from the Beryl prospect during the 2012 field program.

9.5 BWICK

The BWICK prospect was worked by members of the Ryan Gold team between August 20th and 23rd, 2012, and returned 70 geological observations and 13 geochemical samples. The terrain proved to be limited for suitable mapping outcrop for the majority of the property except along the eastern bank of Bekulmun Lake. The samples retrieved were limited in mineralization. No significant results were found during the 2012 field season.

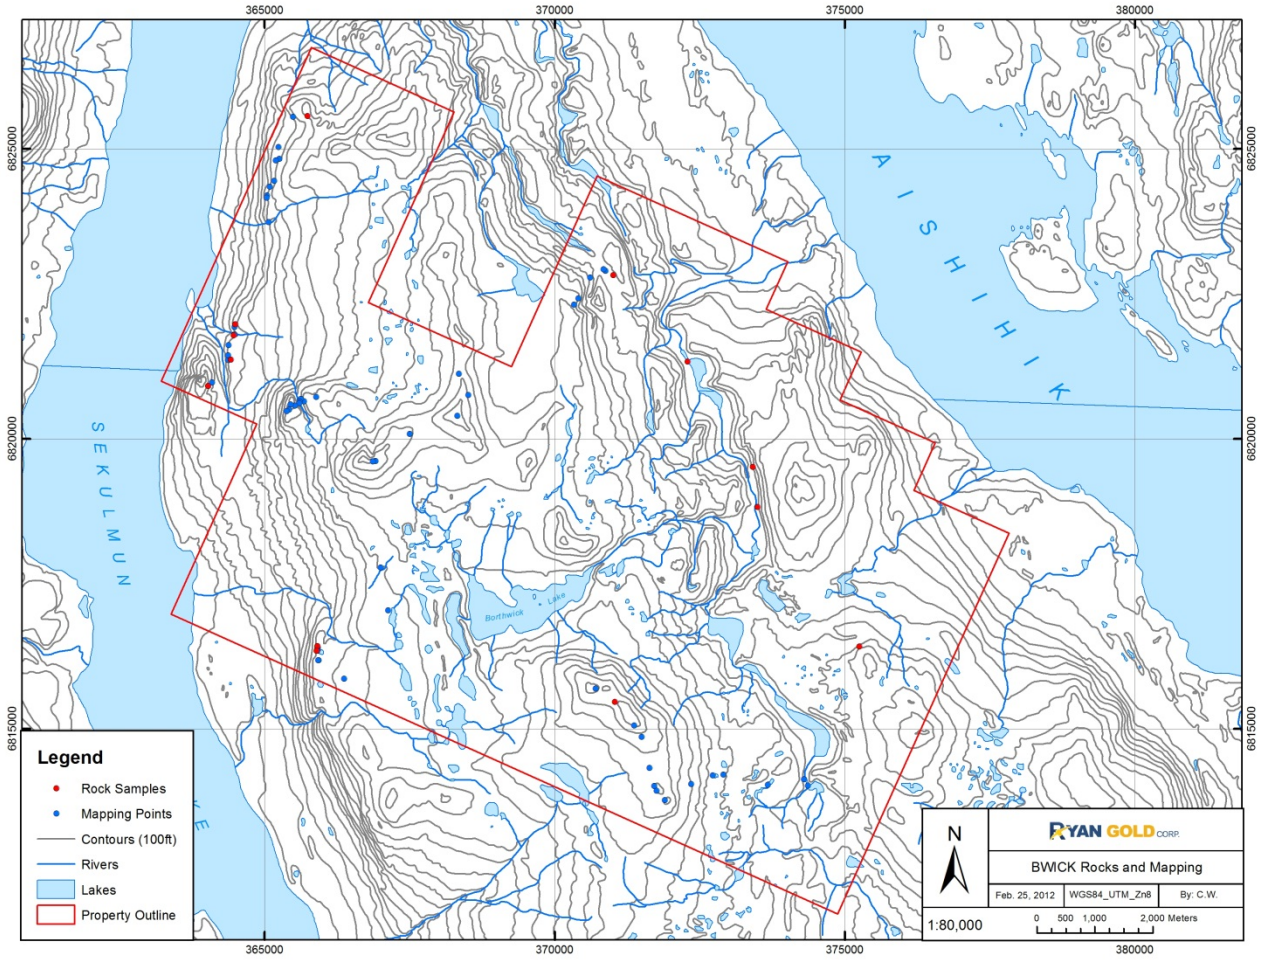

Figure 13: BWICK Grab Sample & Observation Locations

West of the outcrop visible at Bekulum Lake, the BWICK prospect is blanketed by glacial till. Till was typically transported intrusive and volcanic rocks. What was typically observed in outcrop along the eastern bank of Bekulum Lake was: dark grey garnet-bearing mica-rich schist, grey quartzite, and yellow-tan QF porphyry; fine grained, white, quartz-phyric rhyolite, with local phases of fine equigranular granite, with quartz phenocrysts <2mm. The QF porphyry generally weathers orange to pink. A strong cleavage trending 188°/75° develops in the observable outcrop near Bekulum Lake. This cleavage may suggest that the contacts observed in the area are

tectonic. East of the observed contacts, grey, fine to medium grained, generally massive to weakly bedded quartzite is exposed in creek canyons and some of the steeper slopes. Bedding measurements are erratic, and tight folding has been noted in some subcrop areas. These quartzites are believed to be generally deformed, with possibly two deformation phases. Minor marble beds are included within the quartzites. A quartz phyric dacite sill was noted in one of the larger quartzite outcrops. This dacite consists of quartz eyes up to 1mm and minor biotite and feldspar phenocrysts, supported in a very fine grained to aphanitic, white to pale grey, very siliceous groundmass. The quartz porphyry, in the area of the well-developed cleavage, includes local zones of abundant quartz veining and breccia zones, with very glassy, vuggy quartz, and no alteration of wallrock or breccia fragments. Only minor purple fluorite was noted within these veins. Spotty potassic alteration was noted in the bottom of the talus slopes below the main rhyolite cliffs. Fine disseminated pyrite and subhedral clots up to 2 mm, as well as minor pyrrhotite was noted localized throughout the quartzites. It appears that the observed QF porphyry occurs as a dyke swarm, which trends roughly north-south, subvertical, with dykes up to 10 metres or more. The fine grained quartzites dip shallow to moderate towards the west. Moving northward along the eastern bank of Bekelum Lake, intercalated quartzite, muscovite schist +/- garnet and minor marble trend roughly east-west, with a shallow to moderate northerly dip. Schistosity of the schists trend southwest, with a moderate to shallow northwesterly dip. A subvertical, north-south cleavage, as well as a distinct north-south cut in topography suggests the presence of a fault with that trend. A single example of a strong ankeritic alteration zone, approximately 30m by 100 metres occurs within fine grained quartz arenite. Ankerite was identified in the field by an orange colour anomaly, which includes subcrop of coarse, vuggy cockscomb quartz veins.

Groundtruth Exploration Ltd. conducted a soil sampling survey that consisted of 919 soil samples. The results of this soil sampling are displayed in Figure 14. Full details of soil sample locations and assay certificates can be found in Appendix 4 & 3 respectively.

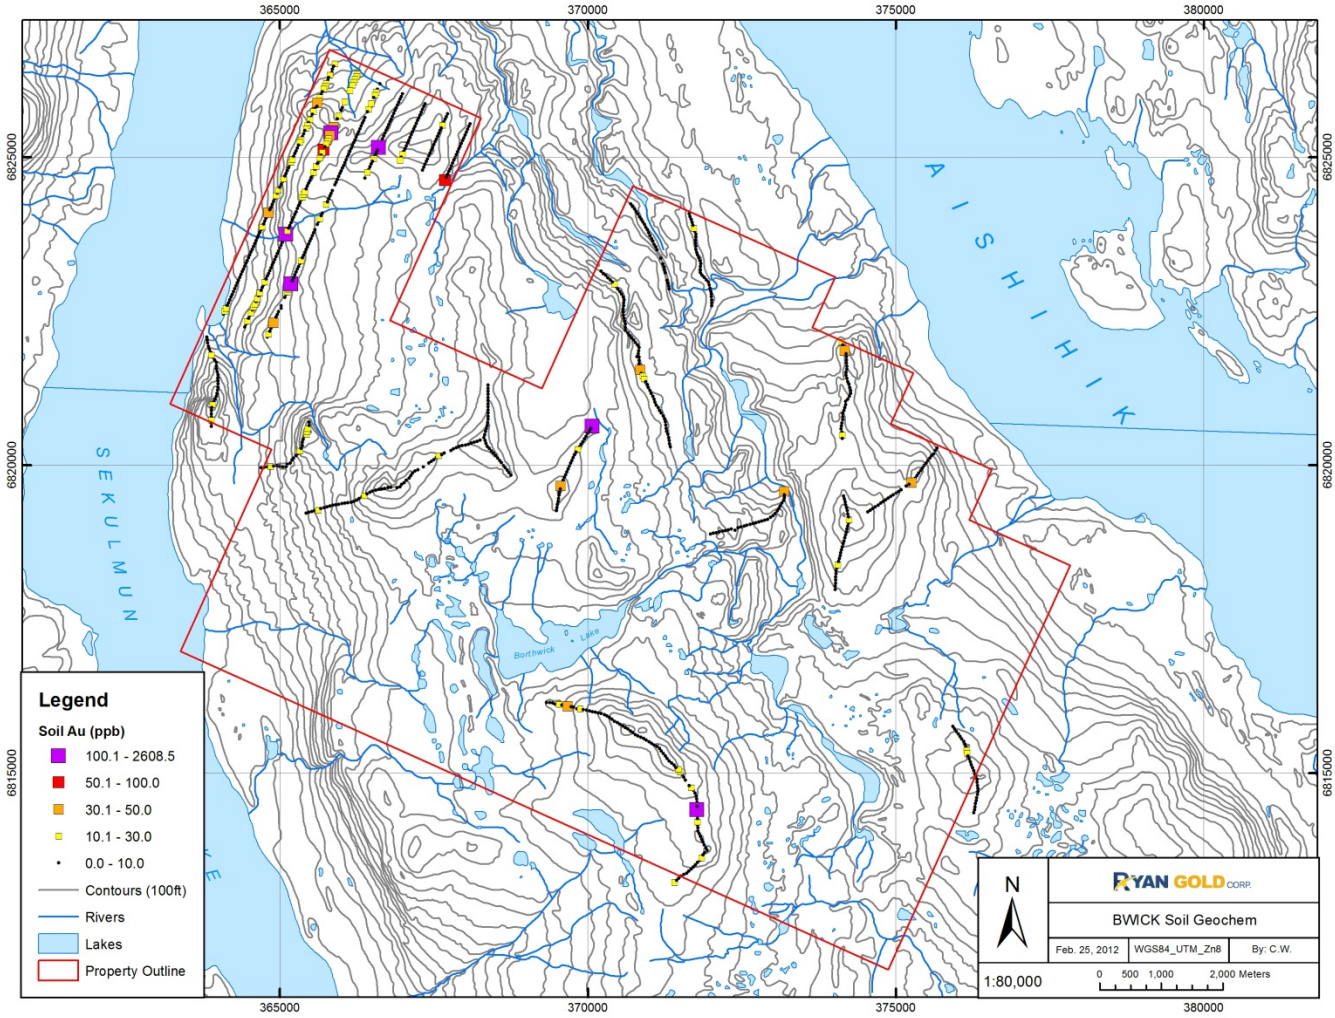

Figure 14: BWICK 2012 Soil Sampling

Appendix 3 displays the complete work certificate list for all sample assays received from the BWICK prospect during the 2012 field program.

9.6 Garnet-Topaz

The Garnet-Topaz prospect was worked by members of the Ryan Gold team between July 31st, August 1st and August 7th, 2012, and returned 99 geological observations and 18 geochemical samples.

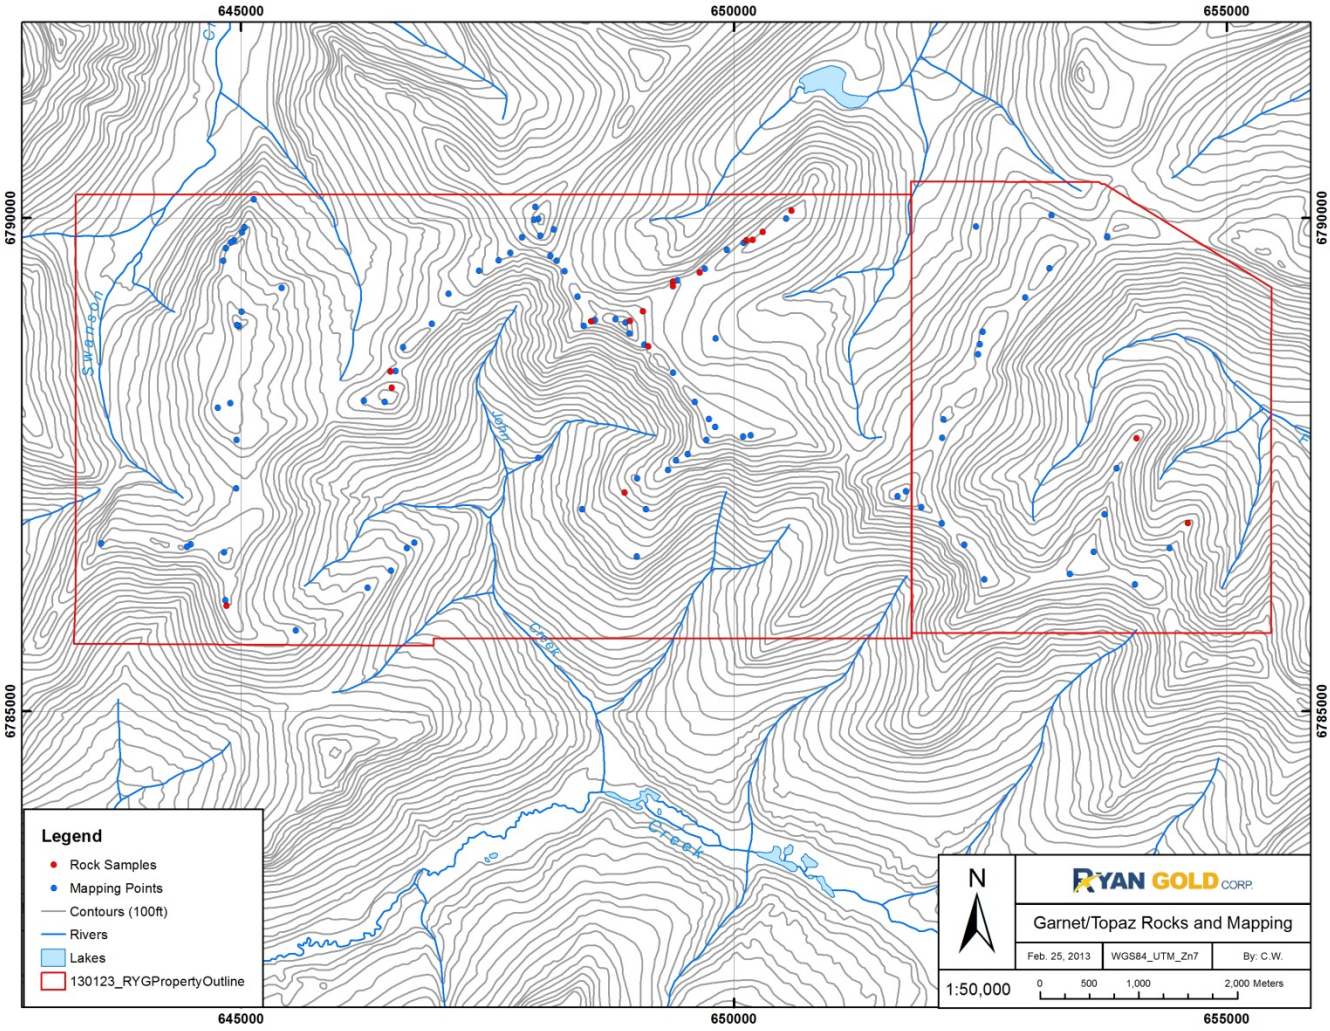

Figure 15: Garnet/Topaz Grab Sample & Observation Locations

Prospecting and reconnaissance mapping completed resulted in the construction of a 1:20,000 scale map, limited to traverses and outcrop exposures. The produced map which illustrates the general location of samples and observations retrieved, and is the working model moving forward with the Garnet-Topaz prospect, is displayed in Figure 16.

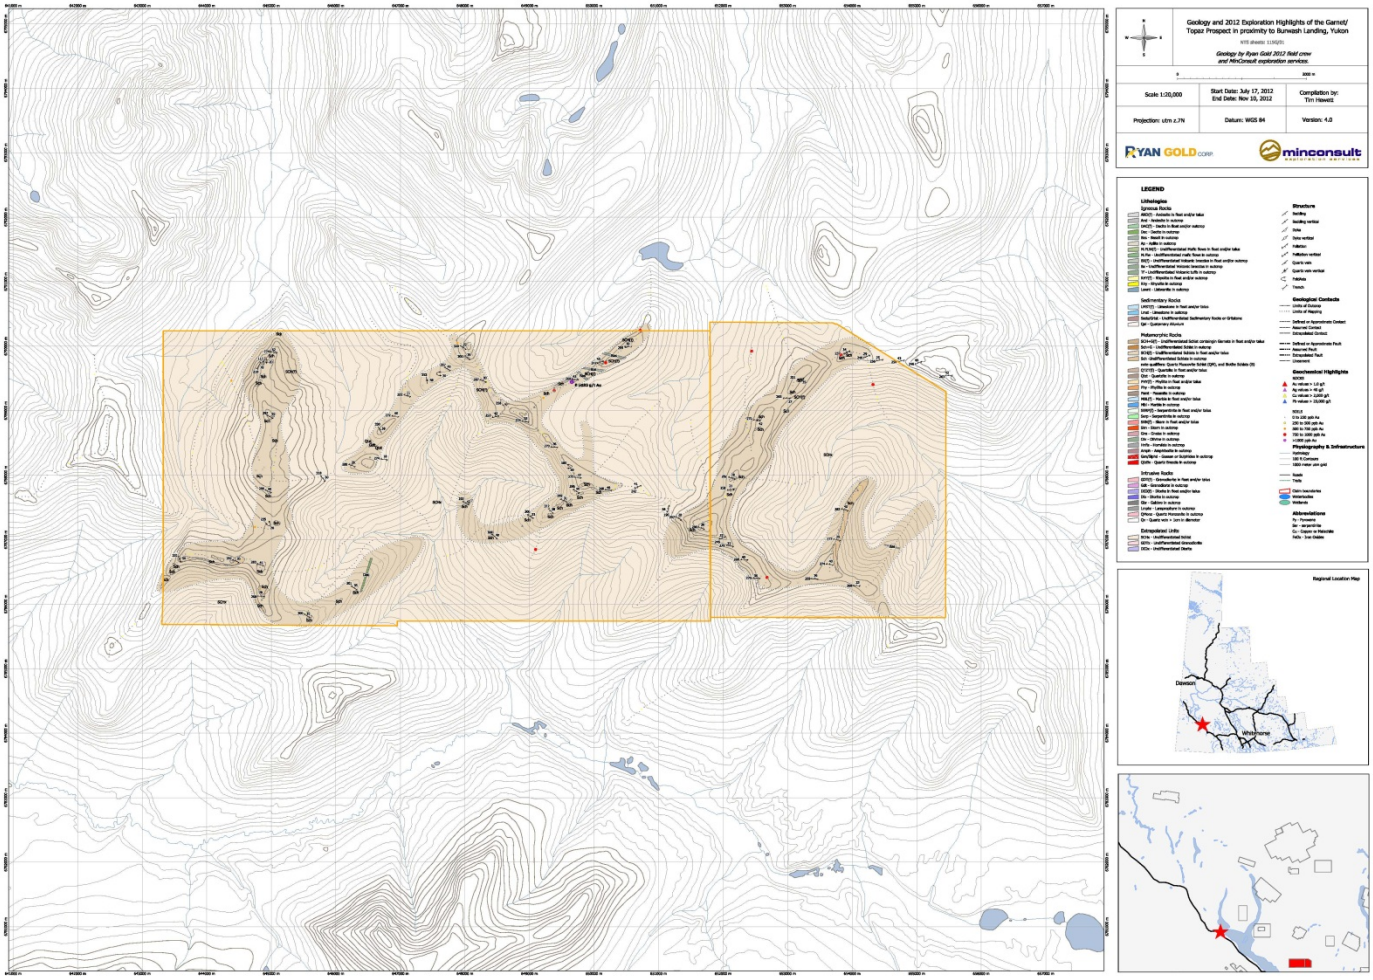

Figure 16: Geologic and exploration summary map of observations and notable assays of the Garnet-Topaz prospect from the 2012 field season. Note: Master legend for all Kluane prospects (Arm & Pluto-Venus excluded).

Figure 16 illustrates the nearly uniform lithology observed at the Garnet-Topaz prospect as described by Israel (2010). More detail mapping reveals a clear E-W to NW-SE trend of foliation and a dip ranging between 30° to 50° to the N/NE. The presence of a dacitic volcanic-dyke in the southeast and basaltic mafic-dykes in the northeast section of the Garnet prospect of the contiguous Garnet-Topaz property was also observed. The minor swarm dykes could be related to the mafic to ultramafic-hosted units described by Escayola et al. (2012) whom revealed the potential significance of Pt-Pd-rich chromitite and PGE mineralization in southwest Yukon mantle peridotite complexes. The highest Cr and Ni values from the Kluane region, southeast of Escayola's (2012) study area and east of the PGE-rich Wrangellia and Alexander assemblages which are divided from the Kluane region prospects by the Denali fault, were retrieved from the Garnet-Topaz prospect and are displayed in Table 7.

Table 7: 2012 grab sample Cr & Ni highlights from the Garnet-Topaz prospect.

Sample #	Lithology	Grade (Cr/Ni, ppm)
41272	Gneiss	1800 / 482
40977	Feldspar Porphyry	1560 / 921

The entire area is underlain by biotite-muscovite schists, with a shallow northerly foliation. These schists are cut by

a set of east-northeast trending steep lineaments, which may have offsets, but cannot be confirmed. It appears that folding increases along these lineaments. Minor amounts of serpentine, mariposite and talc(?) were noted in one of the lineaments. Tourmaline and black garnets are minor minerals noted within the schists. A strong AC joint plane clearly displays folding, which often includes folding of foliation also, indicating a possible second phase of ductile +/- brittle deformation. Large quartz and coarse pegmatite boulders are a possible result of partial melting due to metamorphism. Some areas contain euhedral, but poorly defined porphyroblasts up to 5mm, either twinned or zoned, as seen on weathered surfaces. Gneisses were observed in the eastern section of the property. Strong joints have been measured in various directions but are most often dipping moderately steep towards the south-southeast. These are believed to be the AC joints developed along folded zones. Large quartz veins and pegmatite dykes are common throughout the area, but have been noted in talus, felsenmeer and subcrop only. A single fault plane, on a large subcrop block with very minor slumping (no more than 3 degrees), measured a fault plane with slickensides straight down the plunge line of the fault plane (56° to 042° slicks on a 312°/56° fault plane), indicating a reverse or normal fault, at least on a local scale.

Groundtruth Exploration Ltd. conducted a soil sampling survey that consisted of 840 soil samples. The results of this soil sampling are displayed in Figure 17. Full details of soil sample locations and assay certificates can be found in Appendix 4 & 3 respectively.

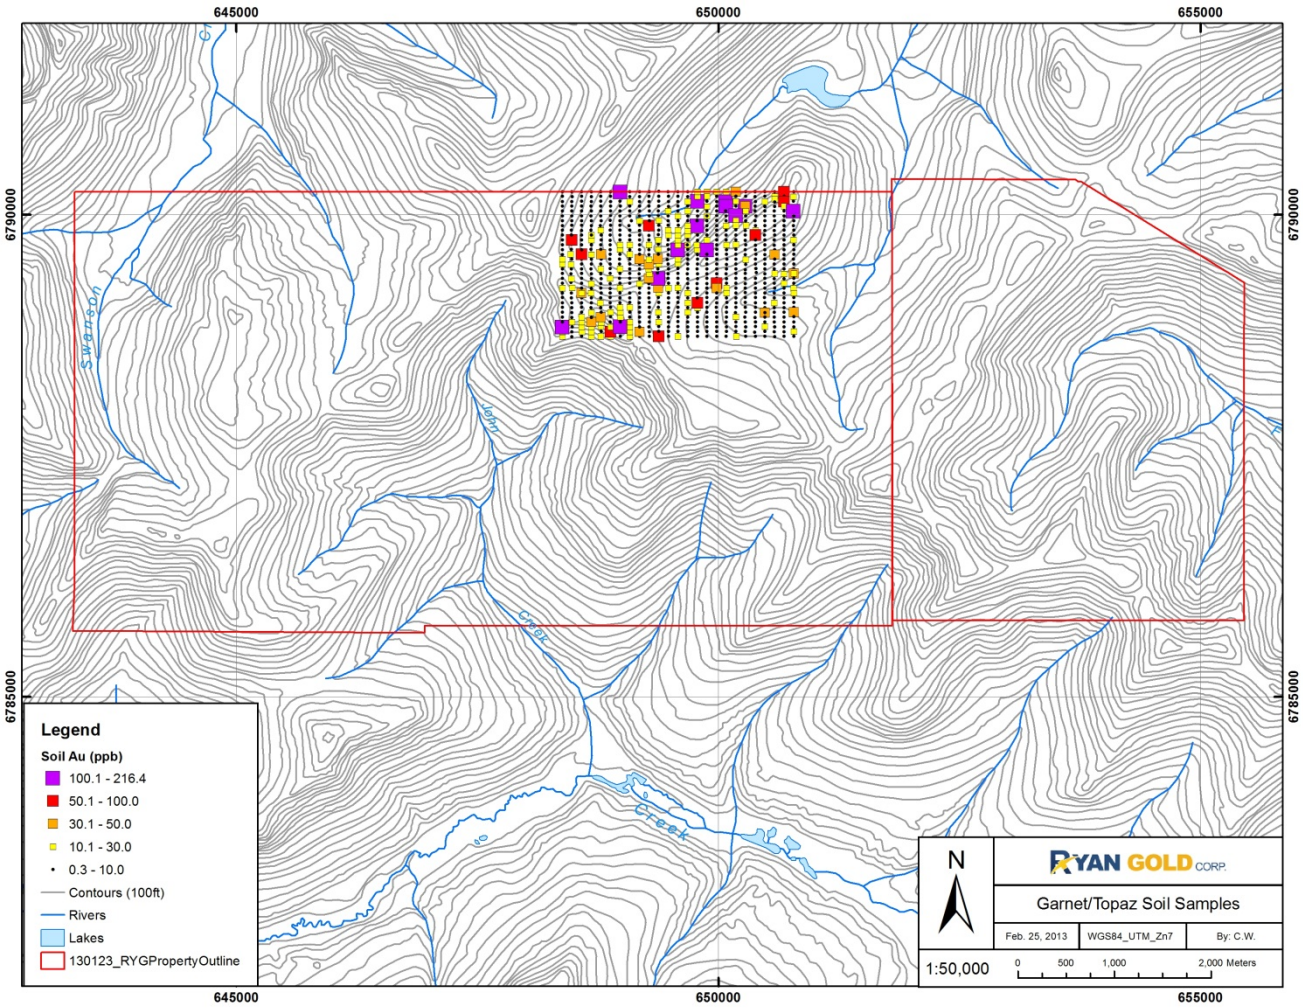

Figure 17: Garnet/Topaz 2012 Soil Sampling

Appendix 3 displays the complete work certificate list for all sample assays received from the Garnet-Topaz prospect during the 2012 field program.

9.7 Glad

The Glad prospect was worked by members of the Ryan Gold team between August 2nd and 3rd, 2012, and returned 73 geological observations and 8 geochemical samples. A breccia sample, sample # 41703, returned a grab of 1.13 g/t Au.

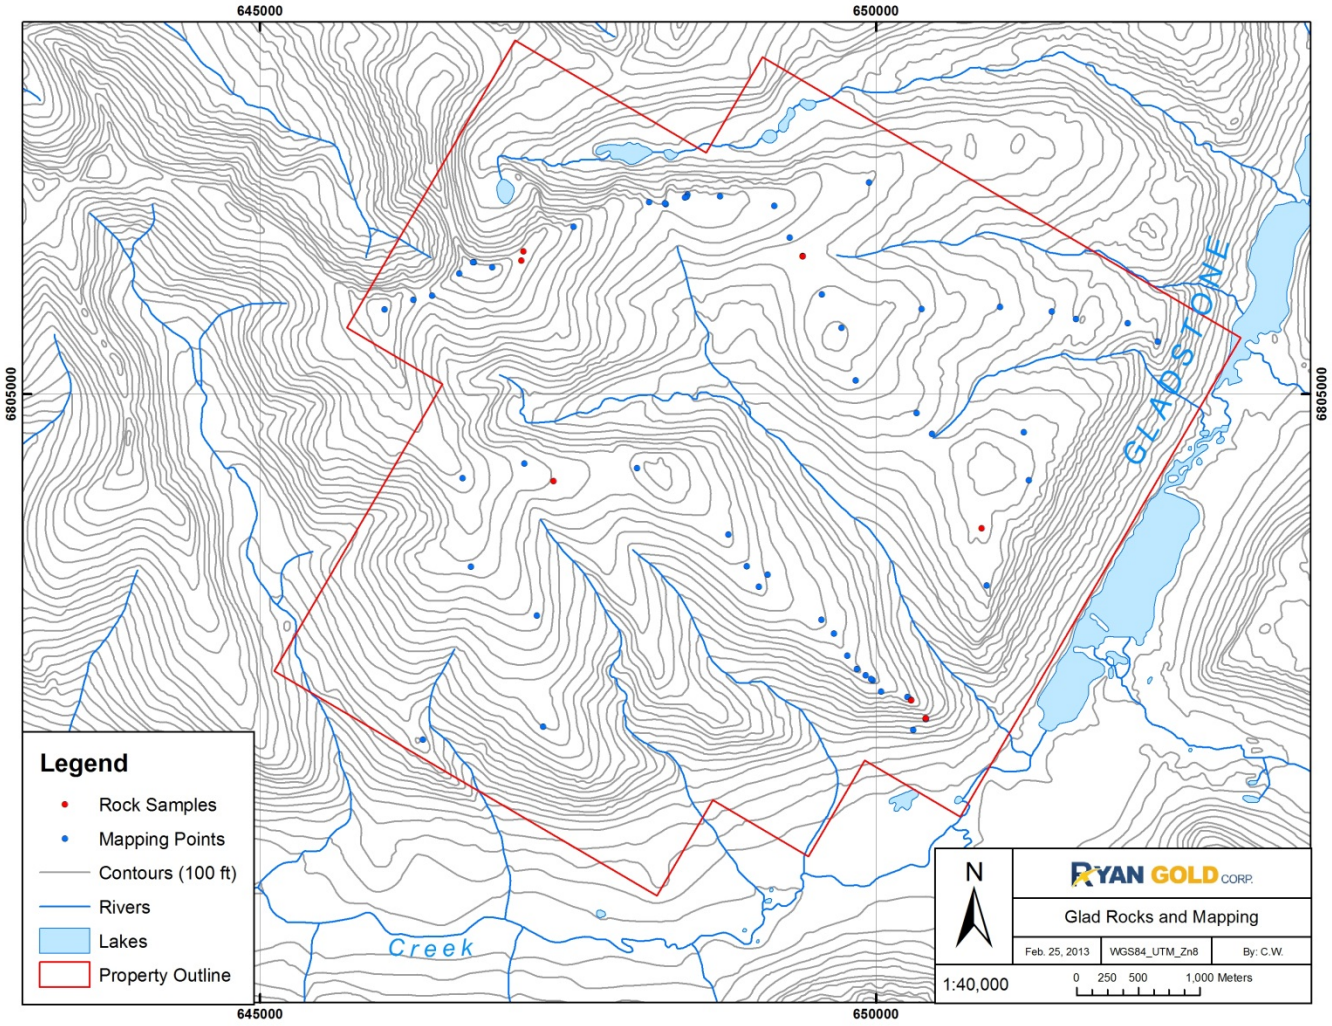

Figure 18: Glad Grab Sample & Observation Locations

Prospecting and reconnaissance mapping completed on the Glad prospect resulted in the construction of a 1:20,000 scale map, limited to traverses and outcrop exposures. The produced map which illustrates the general location of samples and observations retrieved, and is the working model moving forward with the Glad prospect, is displayed in Figure 19.

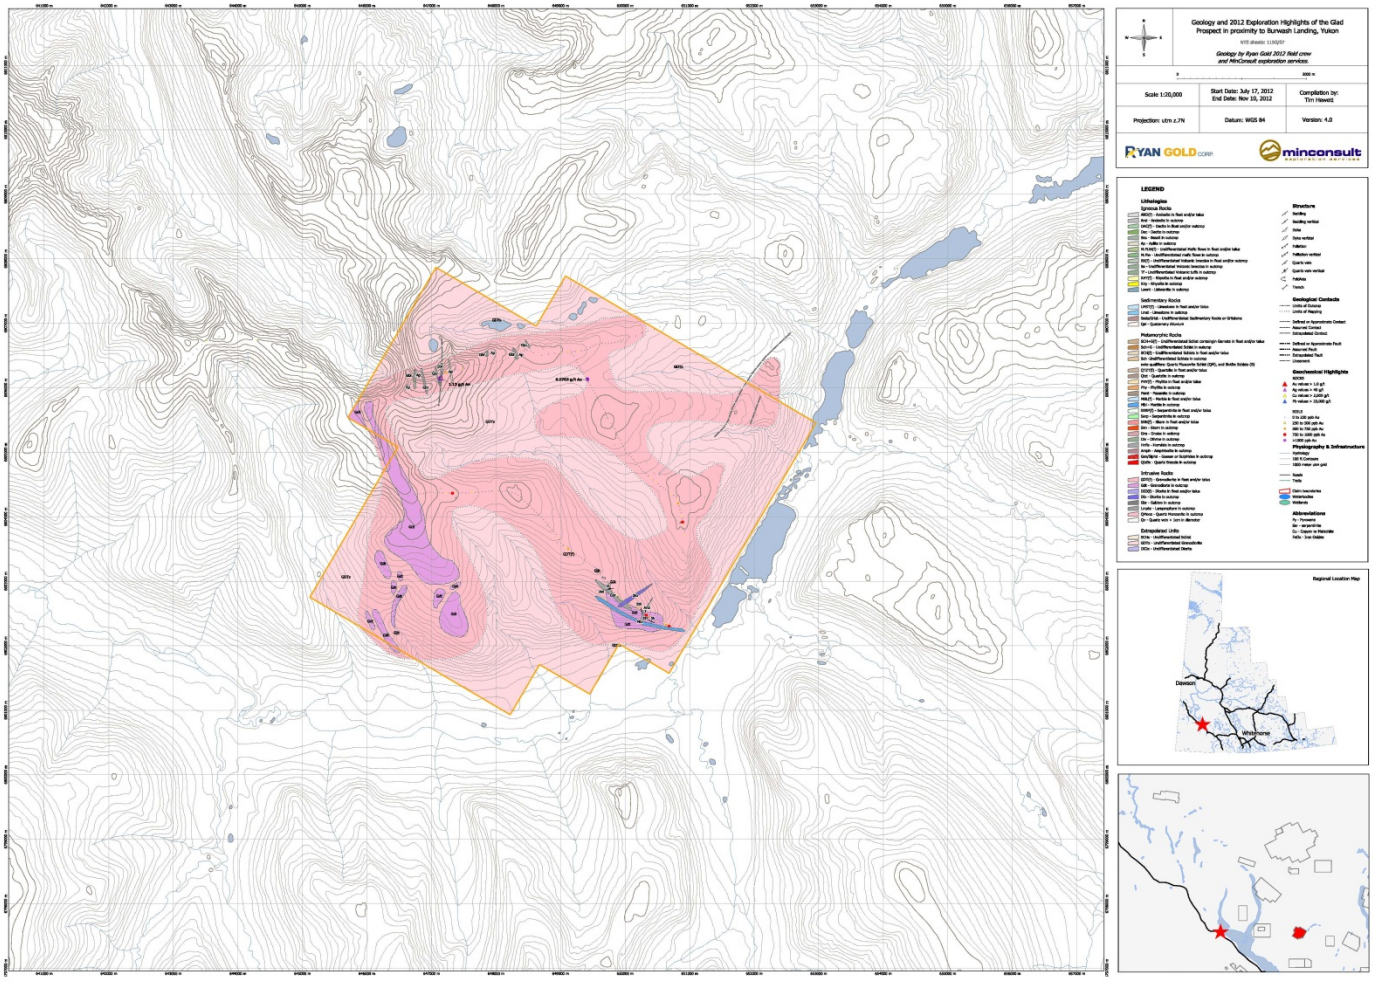

Figure 19: Geologic and exploration summary map of observations and notable assays of the Glad prospect from the 2012 field season. Note: Master legend for all Kluane prospects (Arm & Pluto-Venus excluded).

Figure 19 displays sample #41703, 1.13 g/t Au, sampled along an interpreted fault which reveals a potential model for structurally-controlled mineralization at Glad. Figure 19 illustrates the nearly uniform lithology observed at the Glad prospect as described by Israel (2010). More detail mapping reveals the presence of an isolated saddle-shaped marble bed in the southeastern section of the prospect where 2011 soils show the most frequent anomalous hits for the prospect. The anomalous zone from 2011 soils is also cross-cut by diorite dyke, north of the marble bed. Aplite was commonly observed in outcrop alongside granodiorite. Faults were interpreted at the Glad prospect from surface morphologies and expressions, and lineaments.

The most diverse geology was observed in the southeastern section of the claim boundary where multiple lithologies were observed. A large dyke-like intrusion of hornblendite or hornblende-phyric gabbro intrudes the granodiorite, however numerous granodiorite dykes up to 15 metres in width intrude the large gabbroic dyke, indicating that the granodiorite both predates and postdates the more mafic phase. This gabbro intrusion, up to 20 meters wide, trends approximately 142°/90°, with the crosscutting granodioritic intrusions trending approximately 052°/77°. The gabbro consists of large, euhedral hornblende phenocrysts up to 1 cm, and lesser biotite, in a dark grey, finer grained groundmass. A second steeply dipping, 1.5 meter, dyke was observed to be striking 020°

through the granodiorite. The second dyke is a fine grained, dark grey, weak siliceous andesite, with subhedral feldspar phenocrysts <0.5mm and is situated immediately upslope from the second gold anomaly of the ridge. Towards the bottom of the ridge, a steep dipping, east-west trending wedge of metasedimentary rocks is exposed in the cliffs, for a width of approximately 60 meters and dipping 56° towards the north. It consists of mostly marble, interbedded with clastic and schistose layers. The overall wedge area is moderately gossanous and is located in the area of the lower of the three gold anomalies of the central ridge. Below the sedimentary wedge, the remainders of the rocks towards the southeast are biotite-rich granodiorite.

The granodioritic rocks vary highly, in composition and texture. Biotite ranges from 2 to 50%, and texture ranges from very fine grained, to very coarse grained, minor pegmatite and banded units. The banded, or layered units consist of very coarse grained bands, with up to 80% coarse biotite, and pale, finer grained, biotite deficient bands. These rocks generally weather with an abundance of ferrous oxides. Outcrops along the ridge are generally deficient of outcrops, but felsenmeer mapping indicates that the intrusive rocks are generally an intermittent sequence of massive coarse grained biotite granodiorite, and the same with an abundance of fine grained, equigranular, biotite rich diorite. It is not clear whether the diorite occurs as dykes, or as rafts, as they are not exposed in outcrop. Lower down, where the first outcrops are observed, the granodiorite appears banded, or layered, presumed to be a flow 'banding' from thermal flows during the viscous stage of the melt. Autobreccias(?) also appear in outcrop.

Groundtruth Exploration Ltd. conducted a soil sampling survey that consisted of 975 soil samples. The results of this soil sampling are displayed in Figure 20. Full details of soil sample locations and assay certificates can be found in Appendix 4 & 3 respectively.

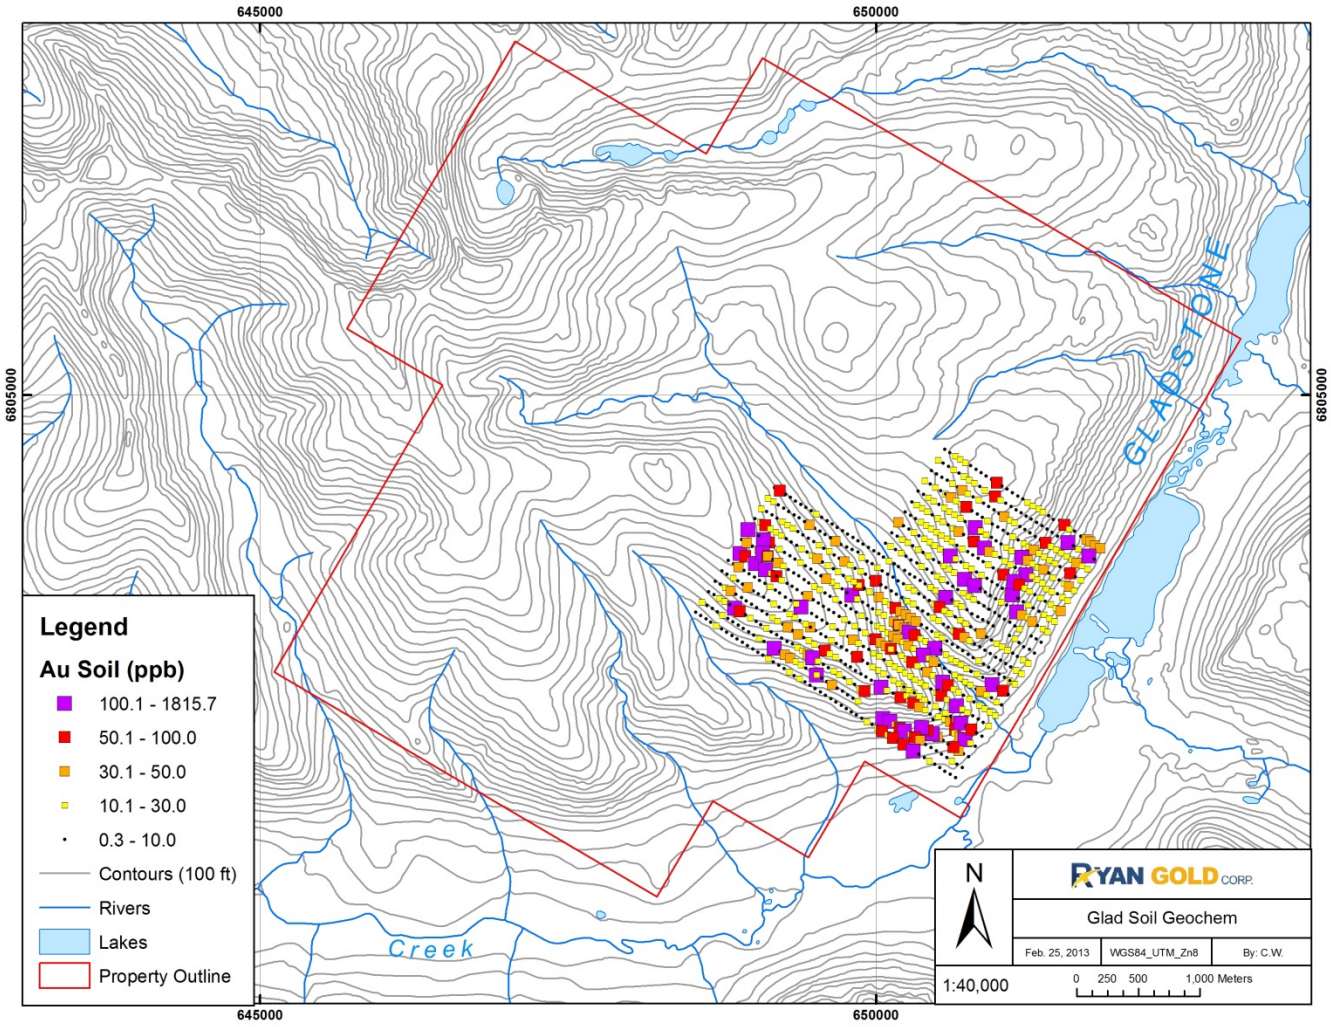

Figure 20: Glad 2012 Soil Sampling

Appendix 3 displays the complete work certificate list for all the sample assays received from the Glad prospect during the 2012 field program.

9.8 Kilo

The Kilo prospect was worked by members of the Ryan Gold team between August 17th and 19th, 2012, and returned 55 geological observations and 14 geochemical samples. The terrain proved to be limited for suitable mapping outcrop. The samples retrieved were limited in alteration, structure and mineralization.

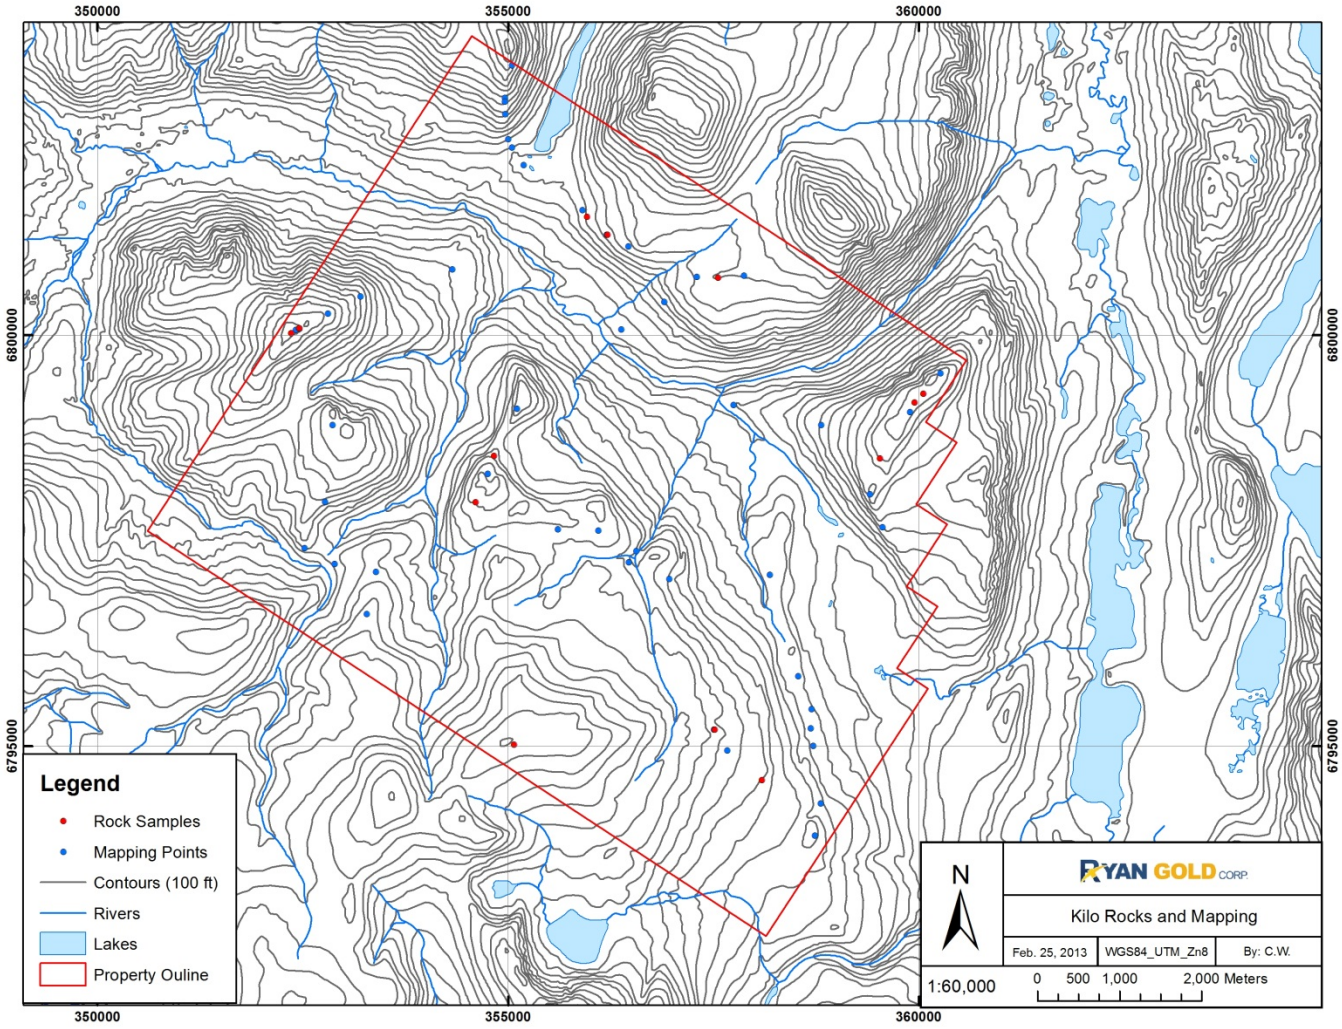

Figure 21: Kilo Grab Sample & Observation Locations

Prospecting and reconnaissance mapping completed resulted in the construction of a 1:20,000 scale map, limited to traverses and outcrop exposures. The produced map which illustrates the general location of samples and observations retrieved, and is the working model moving forward with the Kilo prospect, is displayed in Figure 22.

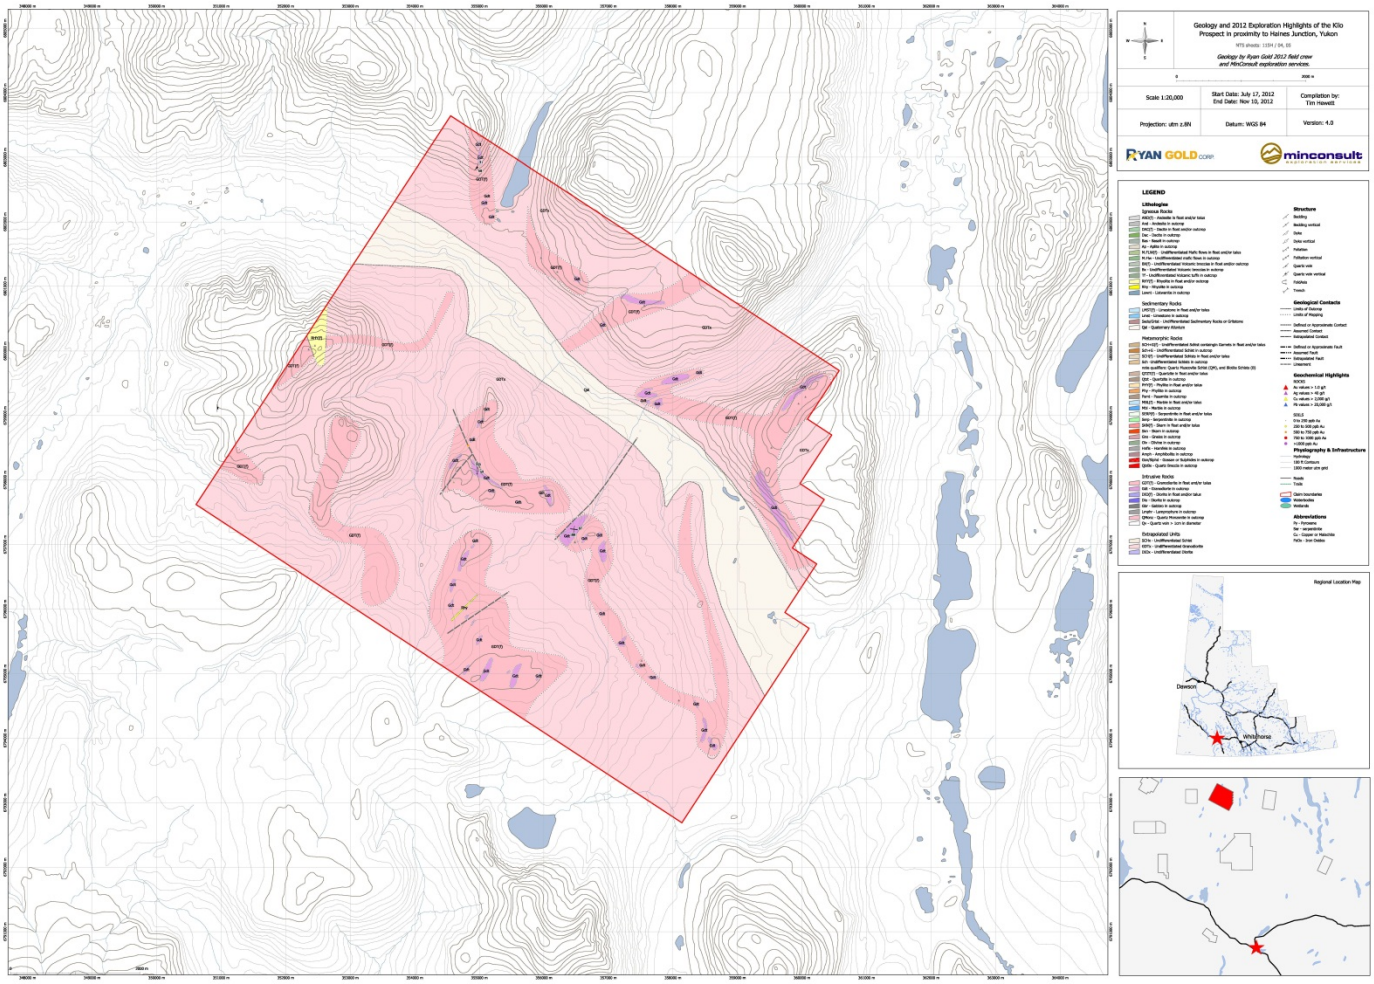

Figure 22: Geologic and exploration summary map of observations and notable assays of the Kilo prospect from the 2012 field season. Note: Master legend for all Kluane prospects (Arm & Pluto-Venus excluded).

Figure 22 illustrates the nearly uniform lithology observed at the Kilo prospect as described by Israel (2010). More detail mapping reveals the presence of a rhyolite cap along the property with the most prominent volcanic unit on the western edge of the prospect. The volcanic rocks observed at Kilo are most likely members of the Ruby Range porphyry (Israel et al., 201). Faults were interpreted at the Kilo prospect from surface morphologies and expressions, and lineaments.

The majority of the rocks are very coarse grained biotite granodiorite, with up to 15% biotite. These rocks are not altered in any way. Two distinct lineaments were noted, one narrow one trending approximately 160°, and one approximately 050°. The 160° trending lineament is narrow, in the order of one to two meters wide, and includes up to 30 cm of drusy, vuggy, locally banded quartz vein with minor reddish orange FeOx. The 050° trending lineament is approximately 30 meters wide, and manifests as a wide, recessive zone through the intrusive rocks, with an abundance of quartz vein and chalcedony material throughout the felsenmeer filling the lineament. No mineralization was noted within the mapped area. Towards the southeast of the mapped area, a large outcrop, approximately 20 by 30 meters in extent, consist of fine to medium grained, equigranular biotite granodiorite, but with only 2-3% biotite. This granodiorite seems more resistant to weathering, and is presumed to be a different phase of the same melt as the main granodiorite. In the southern area of the claim, an area of strong jointing was observed which trended vertically 020°. Jointing faded where a rhyolite dyke, approximately a meter wide and

trending 040°, cut through the intrusion. Quartz eyes and subhedral feldspar phenocrysts up to 1 mm are supported in a very fine grained, pale beige groundmass. Roughly 200 meters upslope (SE) from this dyke, a prominent lineament trends subparallel to the dyke at 050°. High up on the broad ridgetop, the rocks are represented mostly as felsenmeer, with at least three broad zones up to 200 meters of finer grained, equigranular biotite granodiorite, which is significantly darker and richer in biotite, as well as lesser quartz.

The two highest soil returns were both collected from small eskers, which are part of a broader lateral moraine and its outwash, which was observed on both sides of the main creek towards the north of the mapped area. The source of both of these soil samples are presumed to be erratics.

Groundtruth Exploration Ltd. conducted a soil sampling survey that consisted of 1,390 soil samples. The results of this soil sampling are displayed in Figure 23. Full details of soil sample locations and assay certificates can be found in Appendix 4 & 3 respectively.

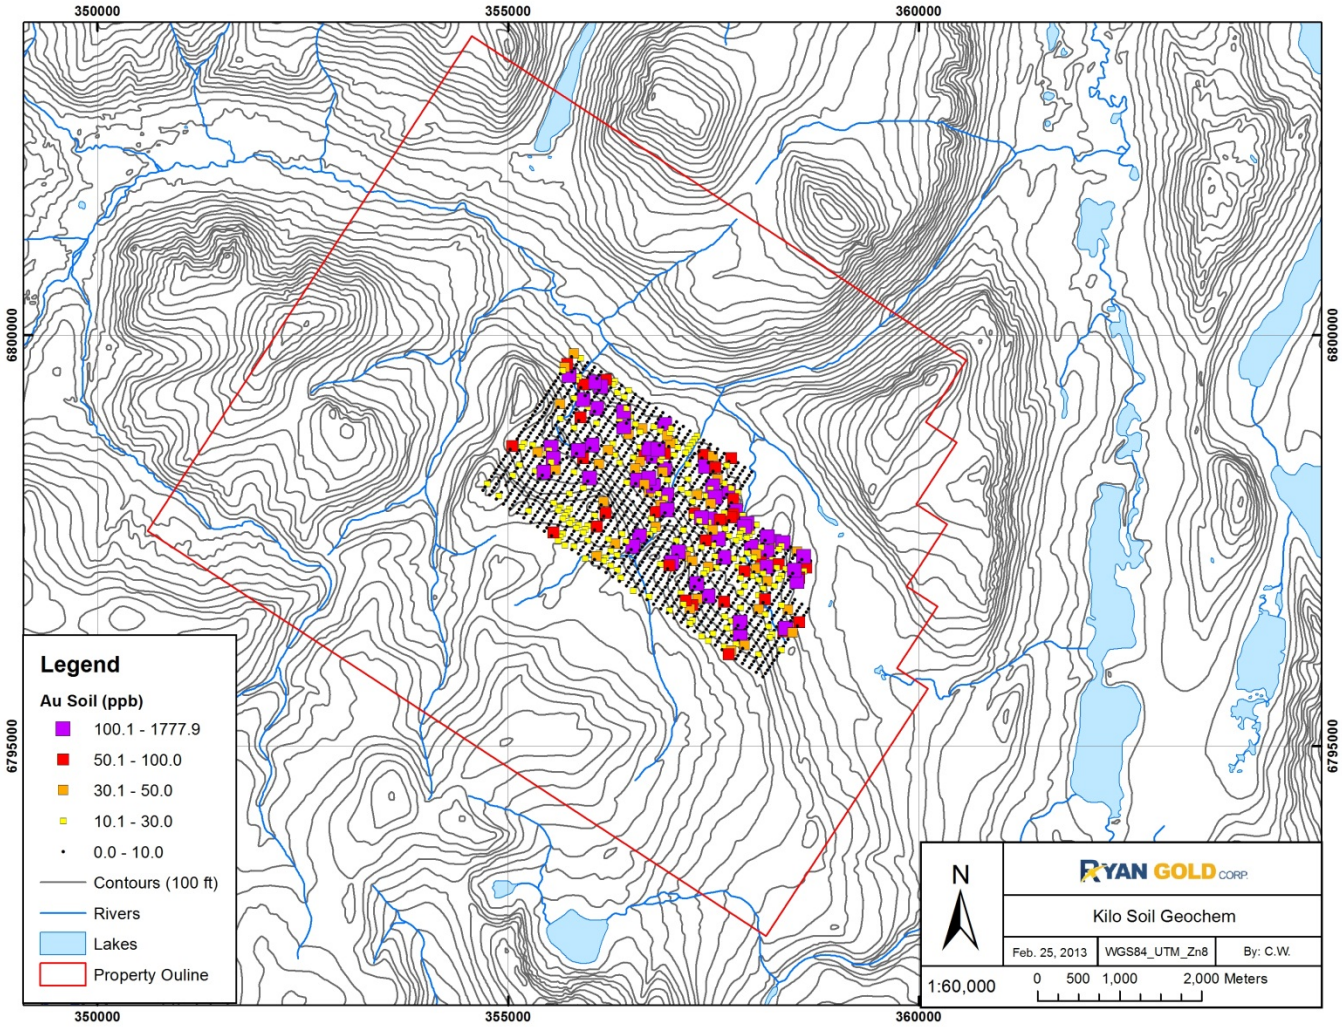

Figure 23: Kilo 2012 Soil Sampling

No significant results were found during the 2012 field season. Appendix 3 displays the complete work certificate list for all sample assays received from the Kilo prospect during the 2012 field program.

9.9 Pluto-Venus

The Pluto-Venus prospect was worked by members of the Ryan Gold team between July 18th and July 30th, 2012, and returned 722 geological observations and 77 geochemical samples. The terrain proved to be suitable for mapping outcrop.

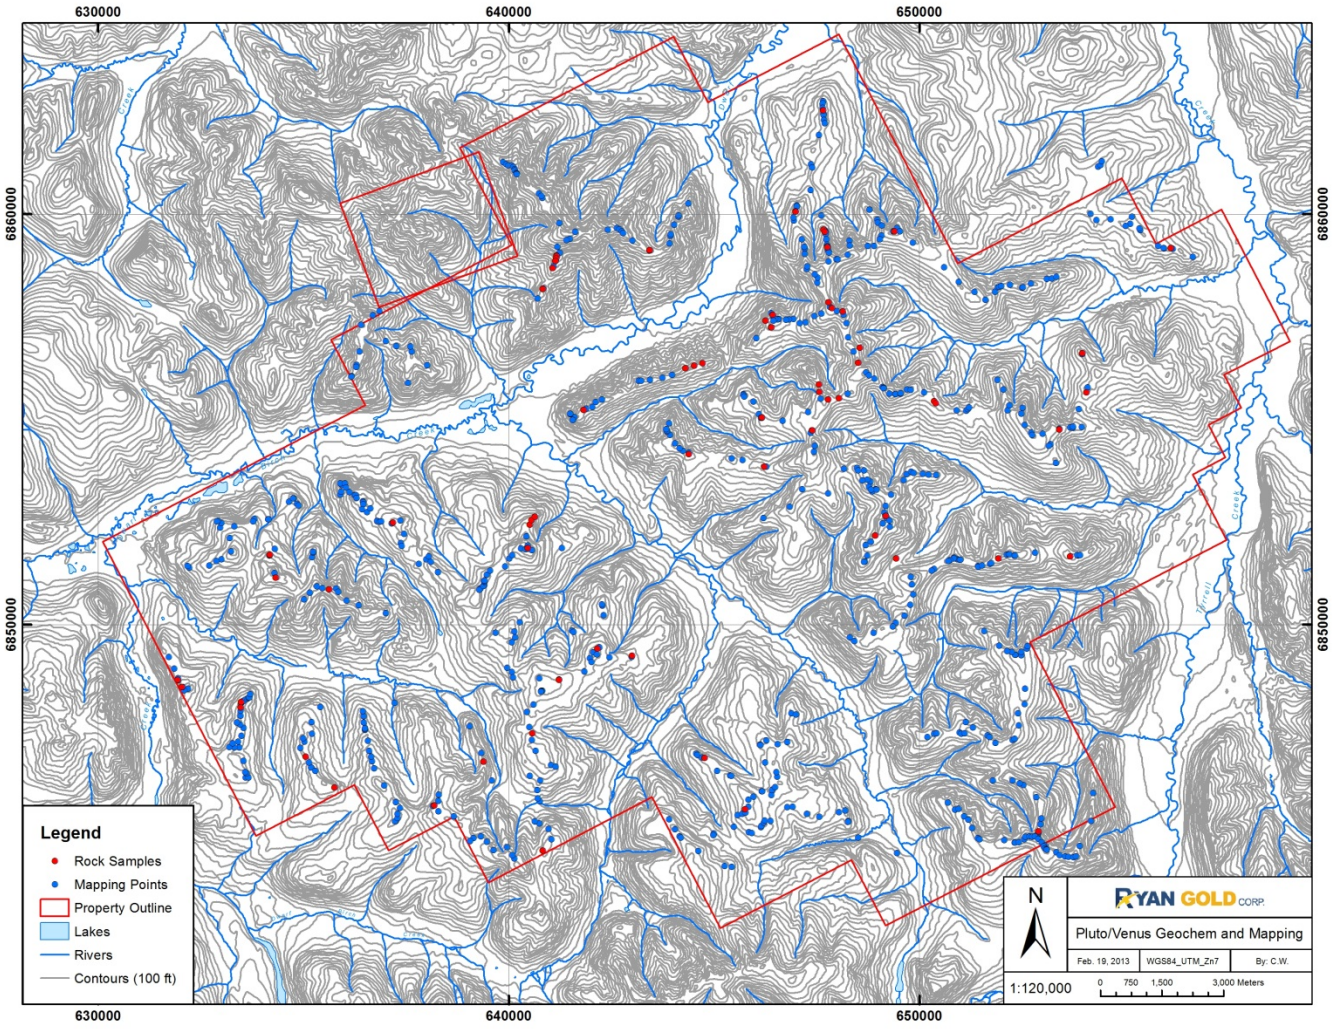

Figure 24: Pluto/Venus Grab Sample & Observation Locations

Prospecting and reconnaissance mapping completed resulted in the construction of a 1:20,000 scale map, limited to traverses and outcrop exposures. Prior the 2012 field season, a targeted zone near the center of the property was selected to be mapped at a finer scale of 1:5,000 due to historic Minfile showings, anomalous soils and 2011 trenching conducted by Ryan Gold Corp. The produced map which illustrates the general location of samples and observations retrieved and is the working model for 2012 of the Pluto-Venus prospect is displayed in Figure 25.

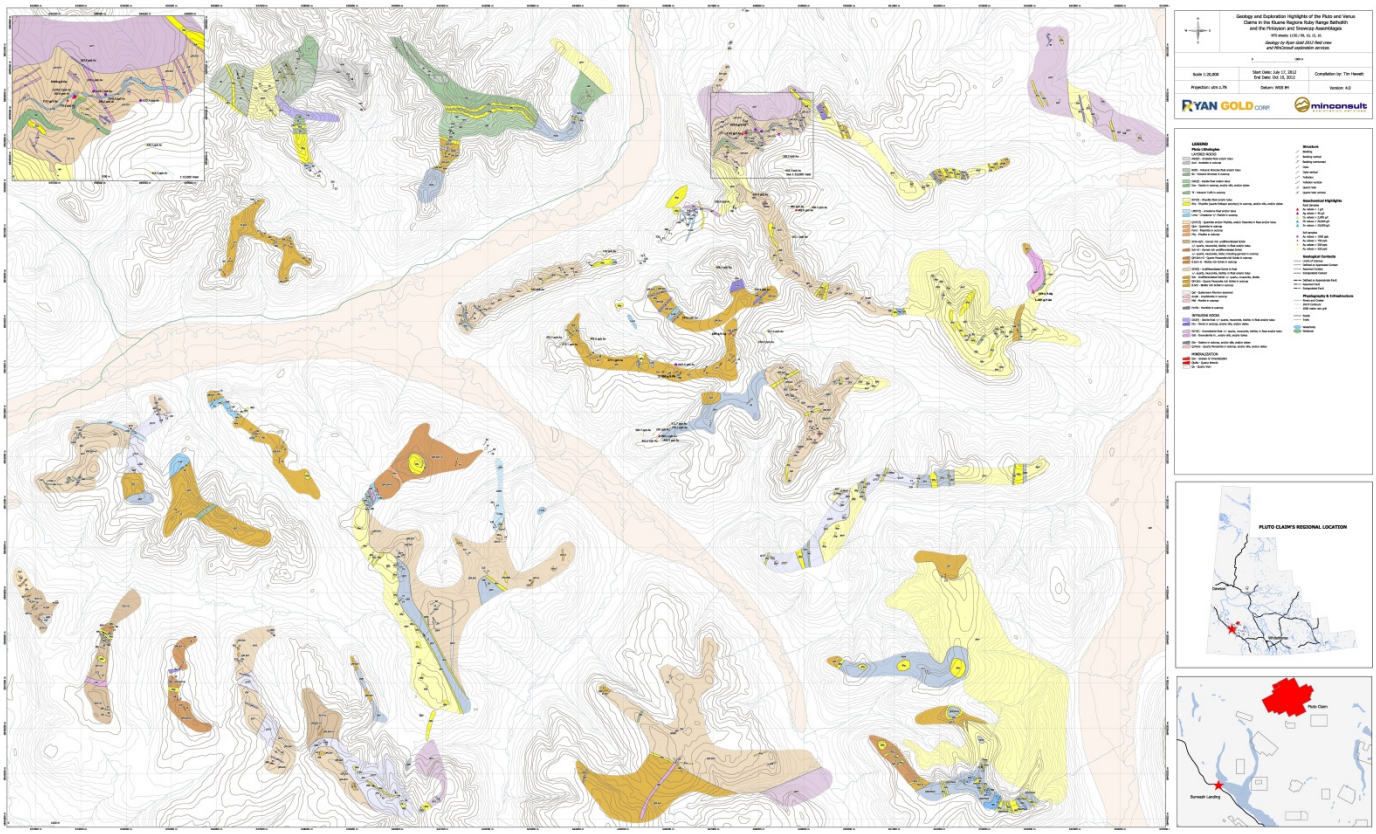

Figure 25: Geologic and exploration summary map of observations and notable assays of the Pluto prospect of the Pluto-Venus contiguous blocked property from the 2012 field season. Refer to Appendix F for full legend.

Figure 25 illustrates the variety of lithologies observed at the Pluto-Venus prospect. Generally, the northwest section is dominated by a greenish-grey, porphyritic dacite where the phenocrysts were both grey to white quartz and white plagioclase; the east section of the property dominated by a tan rhyolite or quartz-feldspar porphyry which typically displayed flow banding; and the southwestern section which was dominated by a black biotite-rich schist which increased in garnet abundance towards the southwest. Loosely bound, coarse grained blueish-white +/- banded marble beds usually occurred as local saddles and were numerous throughout the property, generally in the center portion of the property. Skarns were observed within the targeted zone, as expected from historic Minfile showings respectively below the marble beds. Bedding is generally sub-horizontal, characterized by shallow open-folding with fold planes generally trending NW-SE.

The target zone of the Pluto-Venus prospect, mapped at 1:5,000 as illustrated in Figure 25 is further described as an area underlain by metasedimentary, volcanic and intrusive rocks. The area which includes trenches from the 2011 exploration program carried out by Ryan Gold Corp. is underlain by a regional contact between biotite-muscovite schists and quartzites of Israel et al.'s (2010) described Finlayson assemblage and Ruby Range intrusive rocks. The intrusive rocks are situated immediately below the lower trench (001) and are described as a fresh, massive, biotite-rich, feldspar-phyric granodiorite. The Finlayson rocks include biotite schist, quartzite, muscovite-biotite schist and minor marble beds. They appear to trend moderately towards the south, but outcrop has not been observed. These rocks have been intruded by three types of intrusive rocks which generally trend E-W to WNW-ESE and are:

- Diorite, dark grey-green equigranular fine grained and feldspar-phyric, both variably foliated. Widths up to

5 meters. Mineralized with up to 3% fine interstitial pyrrhotite and up to 3% fine disseminated pyrite.

- Biotite-granodiorite dykes up to 2m width, varying from medium to very coarse grained, fresh, unaltered
- Quartz feldspar porphyry (rhyolite), usually iron stained, as the usual.

A fault hosted vein, approximately 10 cm wide (trending WNW), is variably mineralized with up to 10% pyrite, traces of chalcopyrite, and minor malachite staining. The area towards the east is underlain by a roughly east-west trending intrusive contact between the coarse grained, feldspar-phyric biotite granodiorite and the Finlayson Assemblage quartzites, schists and marble. The marble was observed in all of the ridges and spurs, so is believed to be very contiguous throughout the area, and is orientated roughly 062°/07° SE. Biotite-rich granodiorite occupies the area towards the north of the contact. Numerous dykes, presumed to strike steep SSE, intrude into the metasedimentary rocks. The dykes related with this intrusion vary highly in texture and composition. Texture ranges from very fine grained equigranular to very coarse grained, and porphyritic, and compositional variations show as a wide range of colours and darkness of the rocks, as well as the variation of biotite abundance. A shallow sill of feldspar-biotite porphyry, previously mapped as a porphyritic dacite, may be derived from a late phase melt of the same intrusion. A quartz-feldspar pegmatitic phase, with minor muscovite is also believed to be a residual phase. The intrusives are generally very coarse grained and feldspar-phyric, with feldspar phenocrysts <3mm. Numerous subvertical dykes of quartz and/or feldspar phyric rhyolite and very fine to aphanitic granodiorite crosscut these rocks with trends ranging from 145° to165°. Dyke width ranges to 10 meters or more, but across a single area approximately 400 meters wide, only rhyolitic subcrop was noted. Either this entire area is underlain by rhyolitic rocks, or the area is underlain by a rhyolite dyke swarm, where the rhyolites stood up better against erosion, and the granodiorites have completely eroded away below the surface. Three diorite dykes have been noted, all of which trend subparallel to the rhyolite dykes.

The extensive geochemical sampling programs carried out by both GroundTruth and Ryan Gold Corp. during the 2012 field season on the various Kluane properties exposed the potential economic resource for the Pluto-Venus prospect. Complimented with detailed bedrock mapping and airborne geophysics, the project has advanced considerably due to the efforts of the 2012 exploration program. Table 8 highlights the notable grades retrieved from grab samples collected at the Pluto-Venus prospect during the 2012 field season.

Table 8: 2012 grab sample Au, Ag & Cu highlights from the Pluto prospect.

Sample #	Lithology	Grade (Au)
41715	Skarn	7.11
40890	Breccia	1.205
Sample #	Lithology	Grade (Ag)
40890	Breccia	164
41124	Skarn	109
Sample #	Lithology	Grade (Cu)
40956	Quartz Vein	5210
41124	Skarn	1690

All samples highlighted in Table 8 are from the targeted area of the property, originally based off a historic Minfile and soil showings. Preliminary planning revealed an anomalous elevation amongst the soils within the Au-rich target at approximately 1400 meters above sea level. Reconnaissance mapping of the area revealed the anomalous elevation to be correlated nearly perfectly with a low-lying dipping marble +/- skarn unit.

Groundtruth Exploration Ltd. conducted a soil sampling survey that consisted of 12,071 soil samples. The results of this soil sampling are displayed in Figure 26. Full details of soil sample locations and assay certificates can be found in Appendix 4 & 3 respectively.

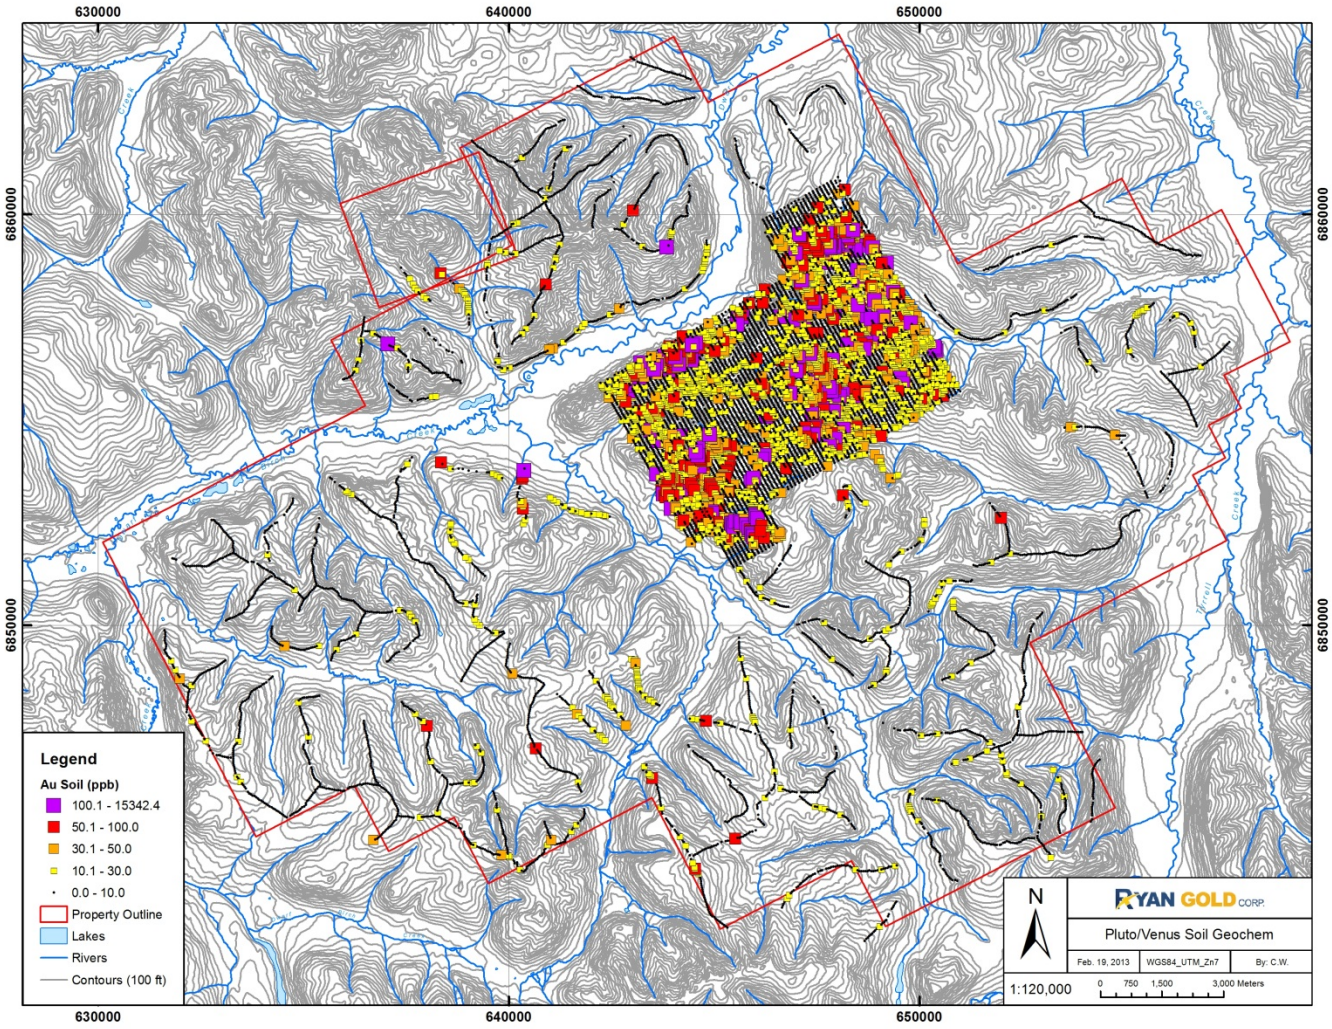

Figure 26: Pluto/Venus 2012 Soil Sampling

Appendix 3 displays the complete work certificate list for all sample assays received from the Pluto-Venus property during the 2012 field program.

9.10 Sapphire

The Sapphire prospect was worked by members of the Ryan Gold team between August 9th and 16th, 2012, and returned 126 geological observations and 25 geochemical samples. The terrain proved to be limited for suitable mapping outcrop. The samples retrieved were limited in alteration, structure and mineralization.

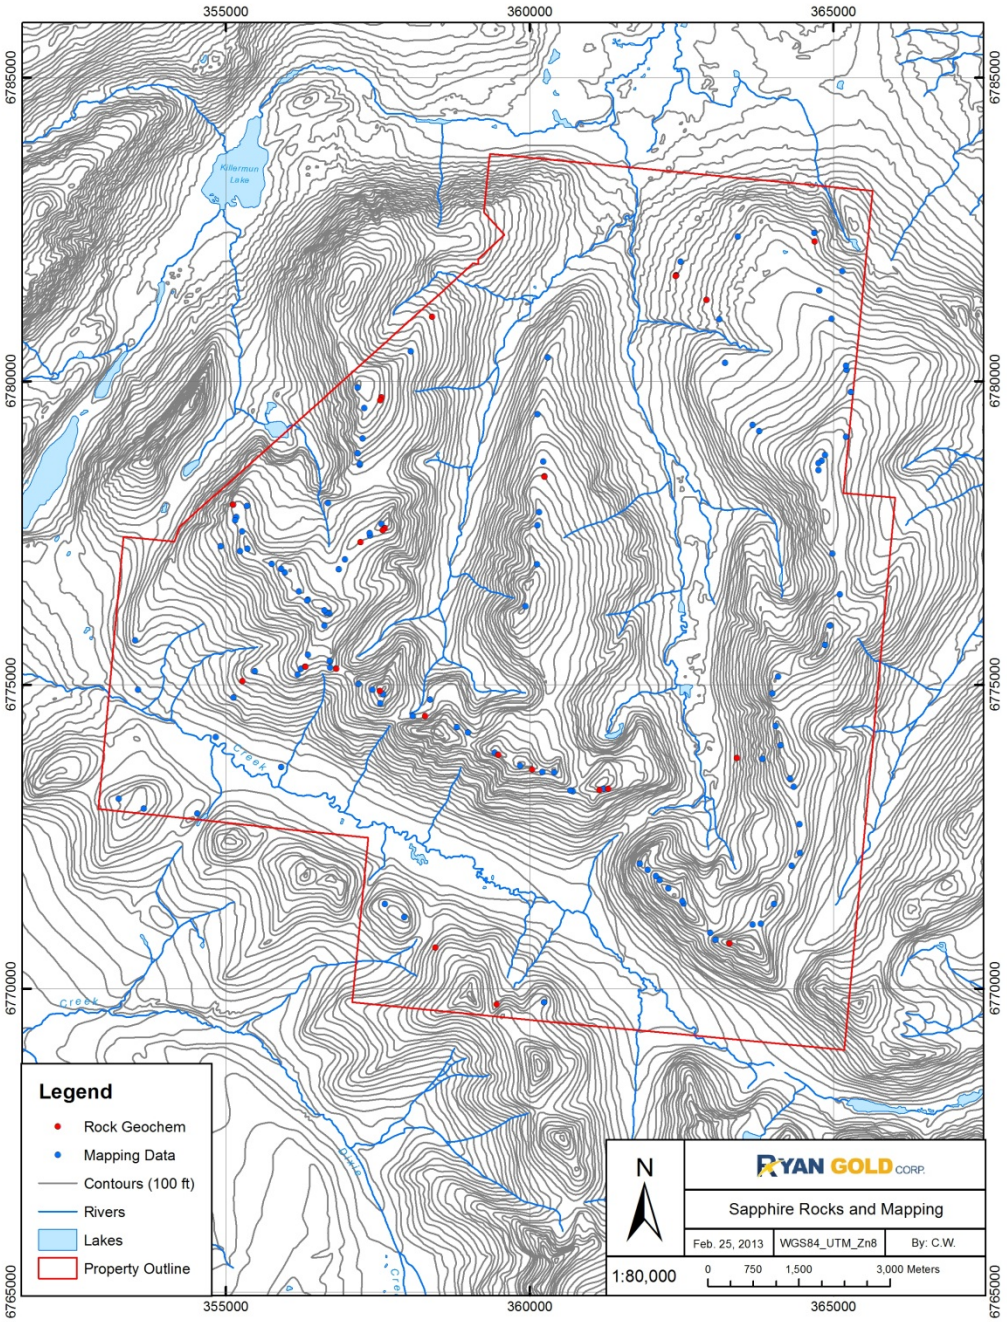

Figure 27: Sapphire Grab Sample & Observation Locations

Prospecting and reconnaissance mapping completed resulted in the construction of a 1:20,000 scale map, limited to traverses and outcrop exposures. The produced map which illustrates the general location of samples and observations retrieved, and is the working model moving forward with the Sapphire prospect, is displayed in Figure 28.

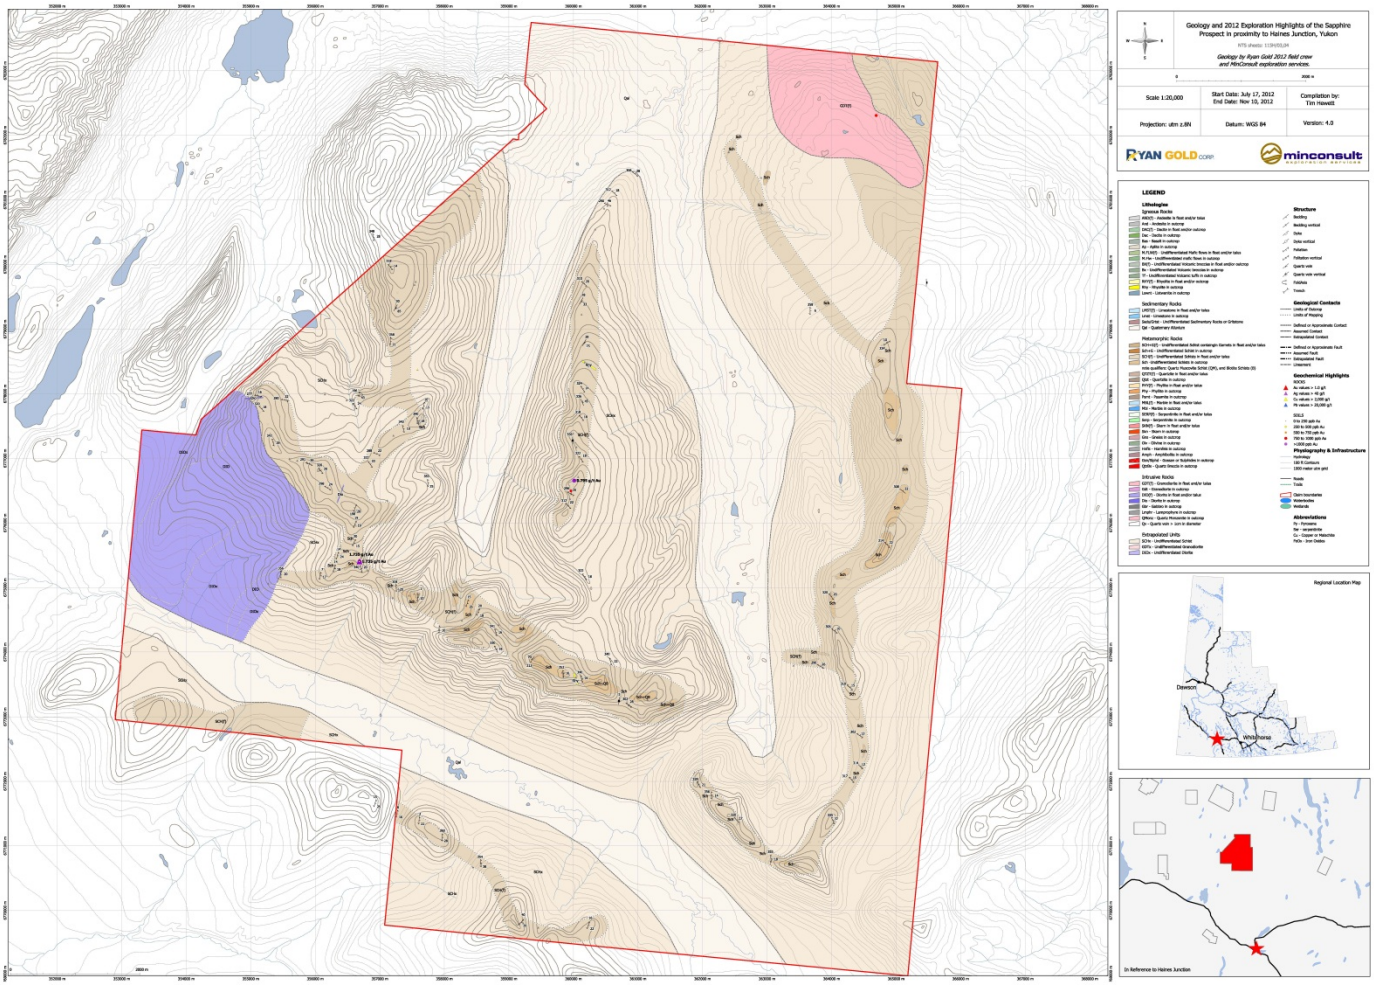

Figure 28: Geologic and exploration summary map of observations and notable assays of the Sapphire prospect from the 2012 field season. Refer to Appendix F for full legend.

The entire area is dominated by biotite-muscovite schists with a faulted diorite intrusion to the southwest and granodiorite +/- orthogneiss unit to the northeast. The schists display a regular foliation, striking NNW-SSE with a shallow dip of 10-20° ENE. Diorite dykes, averaging 1 meter-wide, were observed to intrude the schist parallel to foliation.

Groundtruth Exploration Ltd. conducted a soil sampling survey that consisted of 4,201 soil samples. The results of this soil sampling are displayed in Figure 29. Full details of soil sample locations and assay certificates can be found in Appendix 4 & 3 respectively.

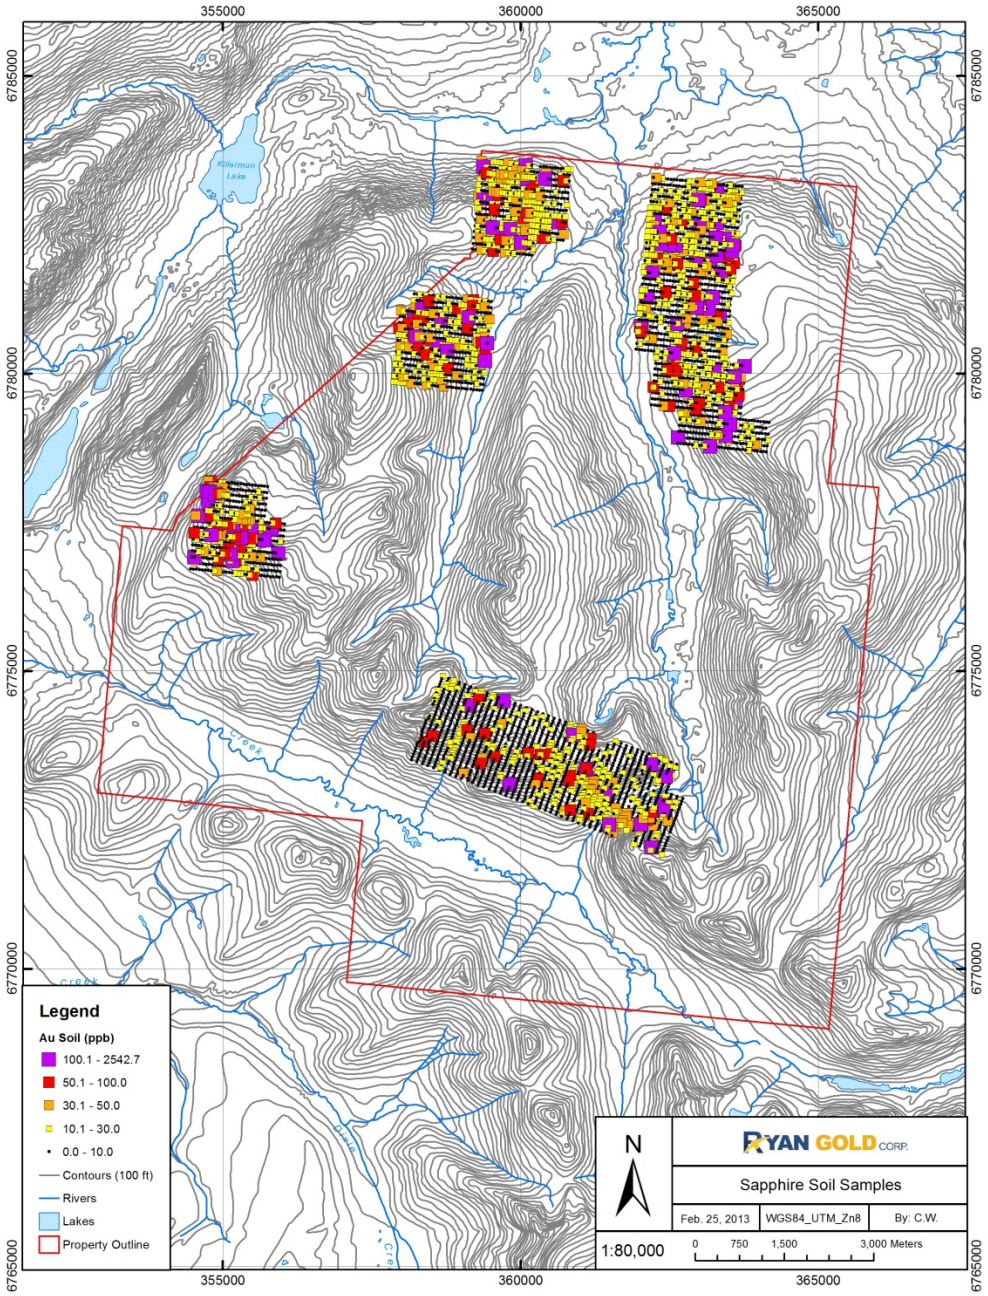

Figure 29: Sapphire 2012 Soil Sampling

Appendix 3 displays the complete work certificate list for all sample assays received from the Sapphire property during the 2012 field program.

9.11 Serp

The Serp prospect was worked by members of the Ryan Gold team on August 5, 2012, and returned 58 geological observations and 8 geochemical samples. The terrain proved to be limited for suitable mapping outcrop. The samples retrieved were limited in alteration, structure and mineralization.

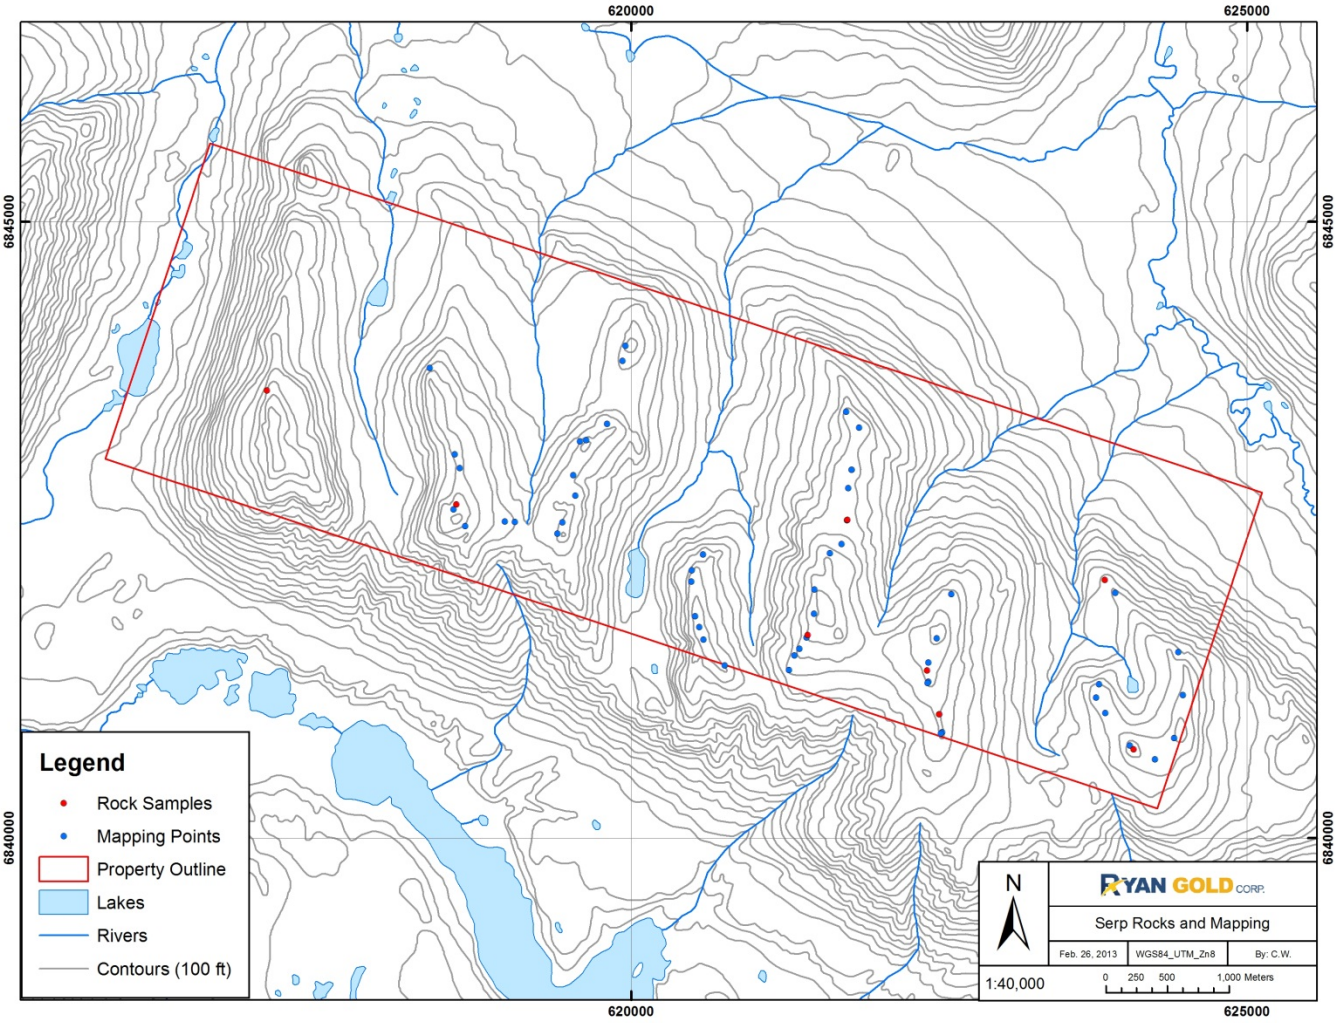

Figure 30: Serp Grab Sample & Observation Locations

Prospecting and reconnaissance mapping completed resulted in the construction of a 1:20,000 scale map, limited to traverses and outcrop exposures. The produced map which illustrates the general location of samples and observations retrieved, and is the working model moving forward with the Serp prospect, is displayed in Figure 31.

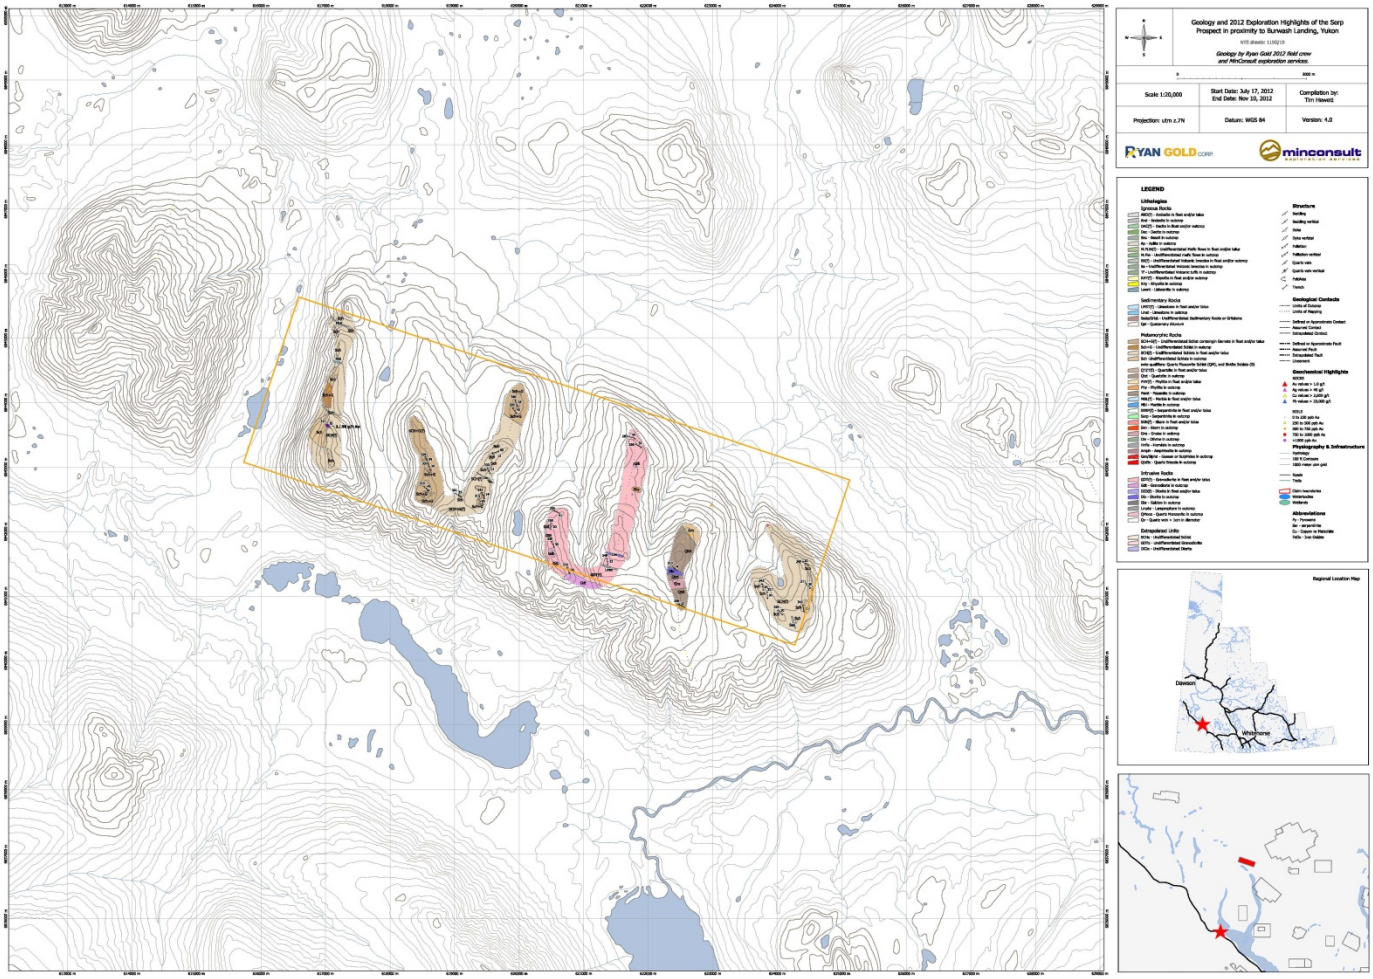

Figure 31: Geologic and exploration summary map of observations and notable assays of the Glad prospect from the 2012 field season. Note: Master legend for all Kluane prospects (Arm & Pluto-Venus excluded).

Foliation measurements taken on the Serp claim typically display an orientation striking NW-SE and a shallow dip of 20-40° NE.

The claim is underlain by moderate east-northeast dipping quartzites, siltstones, schist and minor gneiss. A few marble beds up to 2 meters in width are intercalated with these rocks, associated with garnet-rich schists. Bedding attitude is very consistent, except near prominent lineaments, where it shallows out to approximately 20°. These lineaments strike 50° to 70°; subparallel to highly oblique to bedding. Foliation and schistosity measurements are the same as bedding measurements. Up to 2% fine disseminated pyrite was noted at one location, which coincides with a highly anomalous soil sample collected. Chlorite alteration occurs over an approximately 200 meter long section across the stratigraphic sequence, and is closely tied in with very fine grained silty quartz arenite. Well-rounded erratics of coarse grained granodiorite are scattered throughout the mapped area.

Groundtruth Exploration Ltd. conducted a soil sampling survey that consisted of 465 soil samples. The results of this soil sampling are displayed in Figure 32. Full details of soil sample locations and assay certificates can be found in Appendix 4 & 3 respectively.

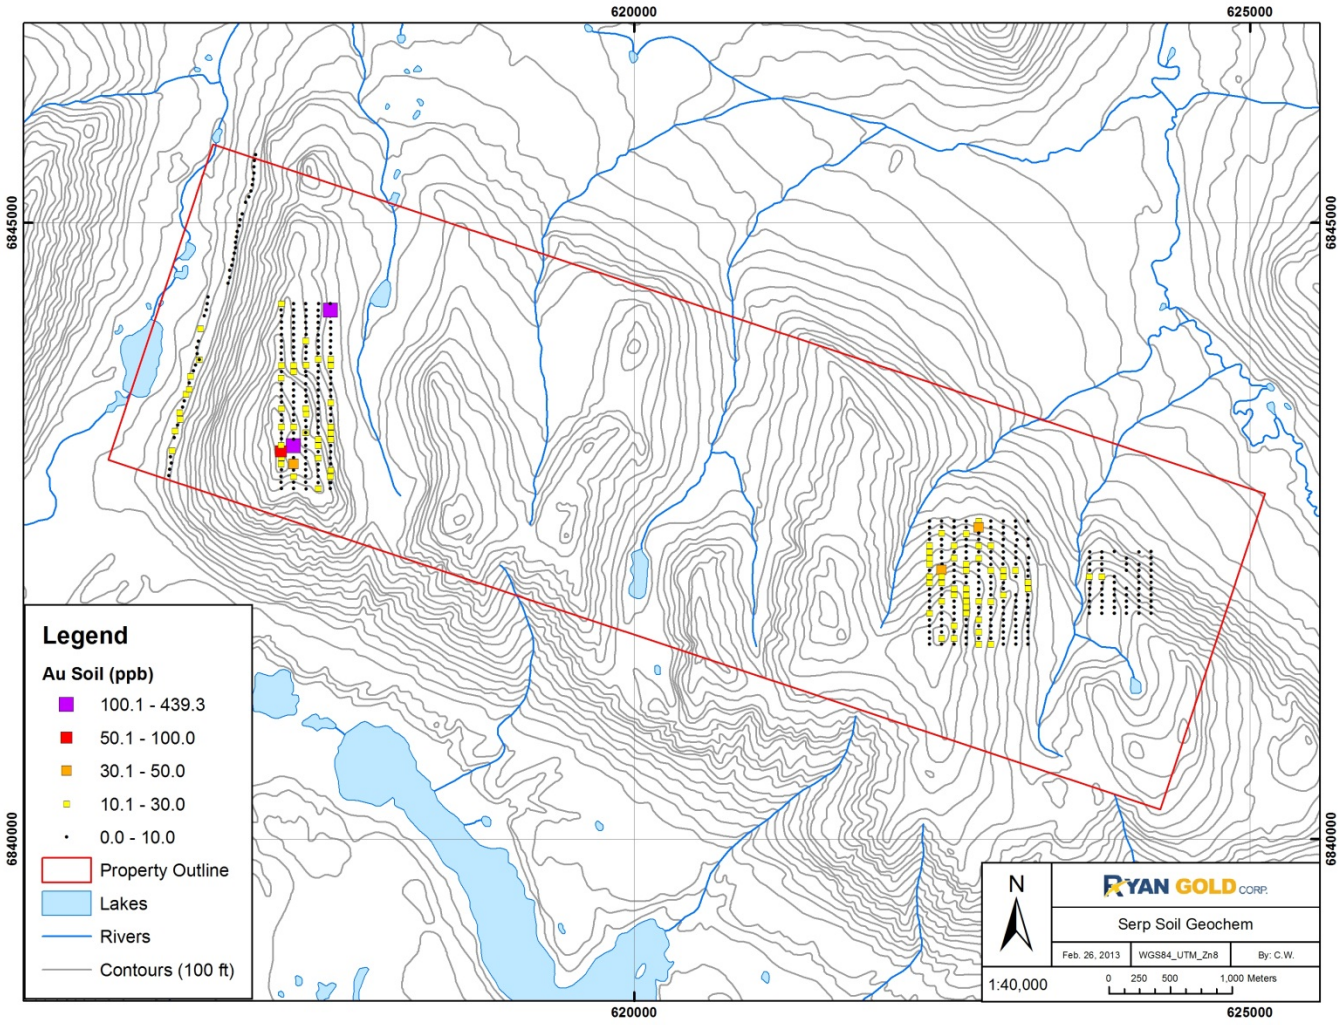

Figure 32: Serp 2012 Soil Sampling

Appendix 3 displays the complete work certificate list for all sample assays received from the Serp property during the 2012 field program.

10.0 Conclusions and Recommendations

The vast area which comprises the discontiguous landholdings of Ryan Gold Corp.'s Kluane properties shows a variety of deposit styles. The geology of the Kluane area is summarized as the Coastal Belt and defined by five main lithological units (Israel et al., 2010): the Yukon-Tanana terrane, Ruby Range Batholith, para-/ortho-gneiss unit, Kluane Schist and Rhyolite Creek Complex. The deposit styles from the 40 kilometer, northeast-trending structural stack that defines the Coastal Belt, in the Kluane area are: orogenic-Au, late stage fracture controlled-Au, Cu-Au-Mo porphyry, and epithermal Au-Ag. The prospects which are included within Israel et al.'s (2010) expected deposit styles for the Kluane region are as follows:

- Orogenic Au: Agate, Beryl, Garnet-Topaz, Sapphire

- Late-stage fracture controlled Au: Agate, Arm, Glad, Sapphire
- Cu-Mo(-Au) Porphyry: Arm, Glad, Kilo, Serp
- Epithermal Au-Ag: BWICK, Pluto-Venus, Serp

Reconnaissance mapping and general prospecting which defined the overall work program for Ryan Gold Corp.'s 2012 exploration season at the Kluane properties highlighted the potential economic resources the area may host. Additional work is required on all prospects to further determine the economic significance of each, however the prospects which yielded the highest probability for future exploration by Ryan Gold Corp. were: Arm and Pluto-Venus.

10.1 Arm

Field work on the Arm prospect was completed between the dates of July 12th and July 17th, 2012. The total number of geochemical grab and soil samples retrieved during 2012 field season was 37 and 161, respectively. Remote lodging at Burwash Landing proved to be advantageous in terms of logistics, helicopter access, and budget. The limited amount of days due to the season's aggressive schedule was the only shortcoming on the project, which resulted in only partial ground cover. All work planned for the 2012 field season was completed.

Geochemical assays from soils reveal mineralized trends that suggest a structurally controlled system which is complimented by geologic mapping and anomalous grab samples. The addition of airborne geophysics near the end of the field season highlighted the major NW-SE trending structures and related splays, spreading outwards to normal of the major trend. Results from the 2012 field season on the Arm prospect should promote further exploration on the property.

Historic Minfile showings and regional setting suggest a Cu-Au-Mo porphyry model for a potential deposit type at the Arm property. However, geochemical assays from soils reveal mineralized trends that suggest a structurally controlled system which is complimented by geologic mapping and anomalous grab samples. Data obtained during the 2012 field season correlates more appropriately with a late structurally controlled Au model. Both deposit type models compliment Israel's (2010) Coast Belt model for the Kluane area, where the mineral potential deposit styles categorizing the Arm fall in the realm of either a Cu-Au- Mo porphyry or a late structurally controlled Au model.

Future work recommendations on the Arm property for the 2013 season include:

- Further mapping required at a finer scale, 1:1,000 scale, to determine finer correlations between mineralization, alteration and structure.
- Detailed structural mapping.
- Detailed petrography study to further determine mineralization correlations to structure.
- Dense geochemical rock sampling grid within the isolated Yukon-Tanana terrane blocks.

10.2 Pluto-Venus

Field work on the Pluto-Venus prospect was completed between the dates of July 18th and July 30th, 2012. The total number of geochemical grab and soil samples retrieved during 2012 field season was 77 and 722, respectively.

Remote lodging at Burwash Landing proved to be advantageous in terms of logistics, helicopter access, and budget. The limited amount of days due to the season's aggressive schedule was the only shortcoming on the project, which resulted in only partial ground cover. All work planned for the 2012 field season was completed.

Results from the 2012 field season on the Pluto-Venus prospect should promote further exploration on the property.

Future work recommendations on the Pluto property for the 2013 season include:

- Further mapping required at a finer scale, 1:1,000 scale, to determine finer correlations between mineralization, alteration and structure.
- Detailed structural mapping.
- Detailed petrography study to further determine mineralization correlations to alteration and structure.
- Trenching along the northern aspect of the targeted zone, normal to the low-lying marble +/- skarn beds
- RC drilling on the summit of the targeted mineralized zone, from north to south and along strike of the low-lying marble +/- skarn beds, to determine continuity of the unit and grade.

10.3 All other Kluane Properties

The exploration worked performed on the Agate, April, Beryl, BWICK, Garnet-Topaz, Glad, Kilo, Sapphire and Serp properties returned no significant results. These properties hold significant potential and further exploration will be warranted.

Future work recommendations on the Arm property for the 2013 season include:

- Further mapping required at a finer scale, 1:1,000 scale, to determine finer correlations between mineralization, alteration and structure.
- Detailed structural mapping.
- Detailed petrography study to further determine mineralization correlations to structure.
- Dense geochemical rock sampling grid within mineralized areas to determine the hosts and mode of mineralization.

Schedule C - SOIL SAMPLING PROGRAM
PLUTO/VENUS Claims

VENUS PROPERTY

SOIL SAMPLING PROGRAM:

a total of 500 man days were required for Ground Truth crews to collect 12,071 soils samples on the project between June 24 to August 4, 2012

Description		Rate	Unit	Total
WAGES:				
Soil Samplers	per day	$ 350.00	333	$ 116,550.00
Project Forman	per day	$ 400.00	83	$ 33,200.00
Soil Samplers	per day	$ 250.00	25	$ 6,250.00
Travel Rate: Soil Sampler- Demob	per day	$ 250.00	48	$ 12,000.00
Packing & Prep	per day	$ 250.00	6	$ 1,500.00
Stat Holiday	per day	$ 250.00	15	$ 3,750.00
DATA MANAGEMENT & PROCESSING SERVICES:				
GIS/Job Layout/Mapping/Results Plotting	per hour	$ 75.00	14	$ 1,050.00
Data Processing: In the field	per hour	$ 60.00	83	$ 4,980.00
Database Management/Chain of Custody, Barcoded Samples	$0.50/sample	$ 0.50	12071	$ 6,035.50
Georeferenced In situ Sample & Sample Site Photos	per sample	$ 1.00	12071	$ 12,071.00
QA/QC Standard & Blank Material & Standardized Insertion	per sample	$ 0.20	12072	$ 2,414.40
CONSUMABLE SAMPLING SUPPLIES:				
Flagging, Metal ID Tags, Sample Bags, Ore Bags, Rice Bags, etc.	per sample	$ 1.00	12071	$ 12,071.00
EQUIPMENT RENTAL (per unit, per day):				
Truck Rental: Fuel Extra	per day	$ 150.00	54	$ 8,100.00
Fuel	per km	$ 0.40	5000	$ 2,000.00
Flat Deck Trailer: 10,000 lbs., 20 ft.	per day	$ 100.00	27	$ 2,700.00
Chainsaw drop kit: 1 per helicopter load, or as required	per day	$ 35.00	41	$ 1,435.00
Iridium Satellite Phone: 1 per crew, charge 10 min/day	per day&min	$ 35.00	83	$ 2,905.00
Radio: ICOM Handheld: 1 per person	per day	$ 5.00	416	$ 2,080.00
Computer/Software: 1 per camp nightly data download	per day	$ 50.00	83	$ 4,150.00
Handheld GPS/Barcode Scanner/Camera/Data Recorder	per day	$ 15.00	416	$ 6,240.00
Camp Satellite Internet	per day	$ 20.00	31	$ 620.00
ACCOMODATION and FOOD:				
Remote Camp Fee: full fly camp/kitchen/generator (10 men)	per man day	$ 35.00	416	$ 14,560.00
Dawson Accomodation Fee: Samplers based in Dawson	per man day	$ 35.00		$ -
Food - 91 field days and 15 travel days	per man day	$ 50.00	500	$ 25,000.00
Pilot Room @ Burwash Landing (June 14-July 18)				$ 2,454.71
Campsite rental @ Burwash Resort (June 23-July18 - 5 men&Equip)				$ 1,430.00
EXPEDITING:				$ 2,720.00
MOBILIZATION/OPERATIONAL COSTS:				$ 8,559.45
AIR SUPPORT:				
Trans North Helicopter, Whitehorse, YK- 69.0 hrs + FUEL	**per hour+FUEL**	$ 1,575.00	69	$ 156,207.45
Great River Air, Dawson-Pluto (fixed wing-Cessna172)	**per hour+FUEL**	$ 280.00	3	$ 1,268.54
ANALYTICAL ANALYSIS COSTS:				
Acme Laboratories, Vancouver, B.C./SOILS	per sample	$ 21.00	12071	$ 253,491.00
REPORT WRITING:				$ 1,500.00
			SOIL SAMPLING PROGRAM =	**$ 709,293.05**
$709,293.05	**DIVIDED BY 12,071 SAMPLES**		**=**	**$ 58.76**
				COST PER SAMPLE

ELIGIBLE EXPENSES

50 SAMPLES WERE TAKEN WITHIN THE BOUNDARIES OF THE VENUS CLAIMS = $ 2,938.00

Appendix 1 - Statement of Qualifications

Daniel Jonathan Lake, BSc, G.I.T.
#5 2466 West 4th Ave
Vancouver, B.C. V6K1P3

Certificate of Author

1. I, Daniel J. Lake,G.I.T., am a Geologist in Training, employed by Ryan Gold Corp. at Suite 600 – 666 Burrard St. Vancouver, BC. V6C 2X8
2. I am a member- in-training in good standing of the Association of Professional Engineers and Geoscientists of Alberta.
3. I am a graduate of the University of Alberta with a B.Sc. (2009) in geology.
4. I have practiced my profession continuously since graduation in 2009, and have been involved in mineral exploration in Canada, Australia and Mexico.
    a. The foregoing report is based on study of available data and company reports.

Dated at Vancouver this day the Monday, February 25th, 2012.

CERTIFICATE WH12207127

Project: ARM

P.O. No.:

This report is for 10 Rock samples submitted to our lab in Whitehorse, YT, Canada on 4- SEP- 2012.

The following have access to data associated with this certificate:

ANDY RANDELL	CARRIE WONG	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
ME- MS41	51 anal. aqua regia ICPMS	

To: RYAN GOLD CORP.
ATTN: ANDY RANDELL

CERTIFICATE OF ANALYSIS WH12207127

Method	CERTIFICATE COMMENTS
ME- MS41	Interference: Samples with Ca> 10% on ICP- MS As. ICP- AES As results reported (2 ppm DL)
ME- MS41	Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).

CERTIFICATE WH12174861

Project: Kluane Area: Arm, Venus, Pluto

P.O. No.: MH12- 008

This report is for 64 Rock samples submitted to our lab in Whitehorse, YT, Canada on 27- JUL- 2012.

The following have access to data associated with this certificate:

HUA JIN	ANDY RANDELL	CARRIE WONG

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% < 2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb- OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Zn- OG46	Ore Grade Zn - Aqua Regia	VARIABLE
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
ME- MS41	51 anal. aqua regia ICPMS	
Ag- OG46	Ore Grade Ag - Aqua Regia	VARIABLE
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES

To: RYAN GOLD CORP.
ATTN: ANDY RANDELL
713 - 4TH AVENUE, LOT 12, BLOCK HD
P.O. BOX 5070
DAWSON CITY YT Y0B 1G0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS WH12174861

Method	CERTIFICATE COMMENTS
ME- MS41	Interference: Ca> 10% on ICP- MS As,ICP- AES results shown.
ME- MS41	Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).

CERTIFICATE WH12174862

Project: Kluane Area: Arm, Venus, Pluto

P.O. No.: MH12- 008

This report is for 64 Rock samples submitted to our lab in Whitehorse, YT, Canada on 27- JUL- 2012.

The following have access to data associated with this certificate:

HUA JIN	ANDY RANDELL	CARRIE WONG

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb- OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
ME- MS41	51 anal. aqua regia ICPMS	
Ag- OG46	Ore Grade Ag - Aqua Regia	VARIABLE
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES

To: RYAN GOLD CORP.
ATTN: ANDY RANDELL
713 - 4TH AVENUE, LOT 12, BLOCK HD
P.O. BOX 5070
DAWSON CITY YT Y0B 1G0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH12187309

Project: Kluane Area

P.O. No.: MH12- 009

This report is for 134 Rock samples submitted to our lab in Whitehorse, YT, Canada on 10- AUG- 2012.

The following have access to data associated with this certificate:

ANDY RANDELL	CARRIE WONG	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Cu- OG46	Ore Grade Cu - Aqua Regia	VARIABLE
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
ME- MS41	51 anal. aqua regia ICPMS	
Ag- OG46	Ore Grade Ag - Aqua Regia	VARIABLE
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES

To: RYAN GOLD CORP.
ATTN: ANDY RANDELL
713 - 4TH AVENUE, LOT 12, BLOCK HD
P.O. BOX 5070
DAWSON CITY YT Y0B 1G0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH12198904

Project: Kluane

P.O. No.: MH12- 010

This report is for 74 Rock samples submitted to our lab in Whitehorse, YT, Canada on 25- AUG- 2012.

The following have access to data associated with this certificate:

ANDY RANDELL	CARRIE WONG	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
ME- MS41	51 anal. aqua regia ICPMS	

To: RYAN GOLD CORP.
ATTN: ANDY RANDELL
713 - 4TH AVENUE, LOT 12, BLOCK HD
P.O. BOX 5070
DAWSON CITY YT Y0B 1G0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS WHI12000493.1

CLIENT JOB INFORMATION

Project: ARM
Shipment ID:
P.O. Number
Number of Samples: 320

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
RTRN-RJT Return

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
SS80	312	Dry at 60C sieve 100g to -80 mesh			WHI
Dry at 60C	320	Dry at 60C			WHI
RJSV	312	Saving all or part of Soil Reject			WHI
1DX2	320	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
