MAYO AND WATSON LAKE MINING DISTRICTS

Work Performed: July 20th to August 17th
Date of Report: 7 February 2013

AUTHOR OF REPORT: Jarod Lapp, BSc.

RYAN GOLD CORP.

666 Burrard Street,
Suite 600
Vancouver, British Columbia, V6C 2X8

Executive Summary

Ryan Gold Corp.'s Nug property block comprises five prospects situated in the Hess mountains area of the Yukon Territory, on the western flank of the Mackenzie Mountains approximately 570 km north east of the city of Whitehorse. The property block straddles the boundary between the Mayo and Watson Lake mining divisions, and comprises 5030 semi-contiguous claim units collectively covering an area of approximately 100,941 hectares.

Claim ownership is shared between Ryan Gold Corp. and 45127 Yukon Inc., where Ryan Gold holds a 70%/100% share of the claims, while 45127 Yukon Inc. holds a 0%/30% share in the remainder. The Nug property block was progressively staked from 2006-2010 by Shawn Ryan, the previous owner of the claims. Mr. Ryan performed soil geochemical and geophysical work on the properties between 2006 and 2008.

Prior to the staking of the property block by Mr. Ryan, the Nug area was subject to numerous exploration campaigns. Previously explored prospects within the Nug block include: Nordic (formally Alp), Nug (formally Nuke), Oly (formally Ivor, Rog and Beethoven) and PDM (Formally Mozart, Gato Negro and Fairweather). Previous work on these prospects comprised of grassroots exploration methods, including reconnaissance geological mapping, silt soil and rock sampling, airborne and ground based geophysics, hand trenching on the PDM and Nordic and finally drilling of three diamond drill holes at PDM as part of an option agreement between Mr. Ryan and Strategic Metals in 2008-09.

The 2012 Ryan Gold Corp. exploration program focused on further continuing and better developing prospect targets identified during previous exploration campaigns. To that end a total of 538 rock chip samples, 1177 geological observations, and 1121 soil samples were taken. Strong indicator geology, geochemistry and geophysics, from historic and recent workings vector toward the presence of local intrusion-related gold and/or copper mineralization. The Nug and Oly prospects were identified as having the greatest potential for hosting significant auriferous mineralization, related to intrusive granodiorite stocks surrounded by broad hornfels alteration halos. Further ground work is required to define the extent and intensity of mineralization at each of the prospect foci.

1.0 Introduction

The Nug Property block hosts intrusion related gold and copper occurrences and multi-element soil geochemical anomalies, which are associated with granodiorite stocks. The property comprises five prospects located in east-central Yukon, straddling the North Canol Road approximately 135 km northeast of the community of Faro. This report summarizes the geological observations and geochemical rock and soil samples collected on the Nug prospects during the summer of 2012. This report describes exploration work that was conducted between the 20th of July and the 17th of August by Ryan Gold Corp. staff. The work focused on five prospects: Golden, Nordic, Nug, Oly, and PDM. The work included the collection of 538 rock chip samples and 1177 geological observations, as well as the collection of 1121 soil samples from the Oly prospect, contracted to GroundTruth Exploration Ltd. All rock geochemical samples were submitted to ALS labs in Vancouver, while all soil geochemical samples were submitted to Acme Labs, also located in Vancouver. No construction work was undertaken on the project during the 2012 field season. Work was conducted from a temporary camp located along the North Canol rd., and no mechanized work was conducted on any of the properties.

2.0 Location & Access

The Nug property block is located in the Hess mountains area of the Yukon Territory, on the western flank of the Mackenzie Mountains, approximately 160 km northeast of the community of Ross River, and 570 km north east of the territorial capital of Whitehorse. The property block straddles the boundary between the Mayo and Watson mining divisions, and falls within both divisions. Approximate limits of the property block are latitude 63° 5'40"N to 62°44'4"N and longitude 131°40'25"W to 130°25'53"W. Portions of the property occur in 1:50,000 scale topographic map sheets 105 I/13; 105 J/10, 13-16; 105O/02-04 of the Canadian National Topographic system.

Access to the property block is via the seasonal North Canol Rd (Yukon Highway 6), from the community of Ross River, where a section of the Canol Rd parallels the south MacMillan River through the properties in the area where the mining divisions meet (Figure 1). Access to the majority of the property block is via helicopter though limited access can be achieved either on foot or by ATV. Access to some of the more remote lakes in the area is also possible by float plane.

3.0 Claim Information

Within the Nug property block, the total number of 'active' claims and leases held in accordance with the Quartz Mining Act is 5030. Table 1 summarizes the claim breakdown and ownership by prospect. The reader is referred to Appendix C for a complete listing of claims and claim maps.

Table 1: Summarized claim information and ownership, as of the date of this report.

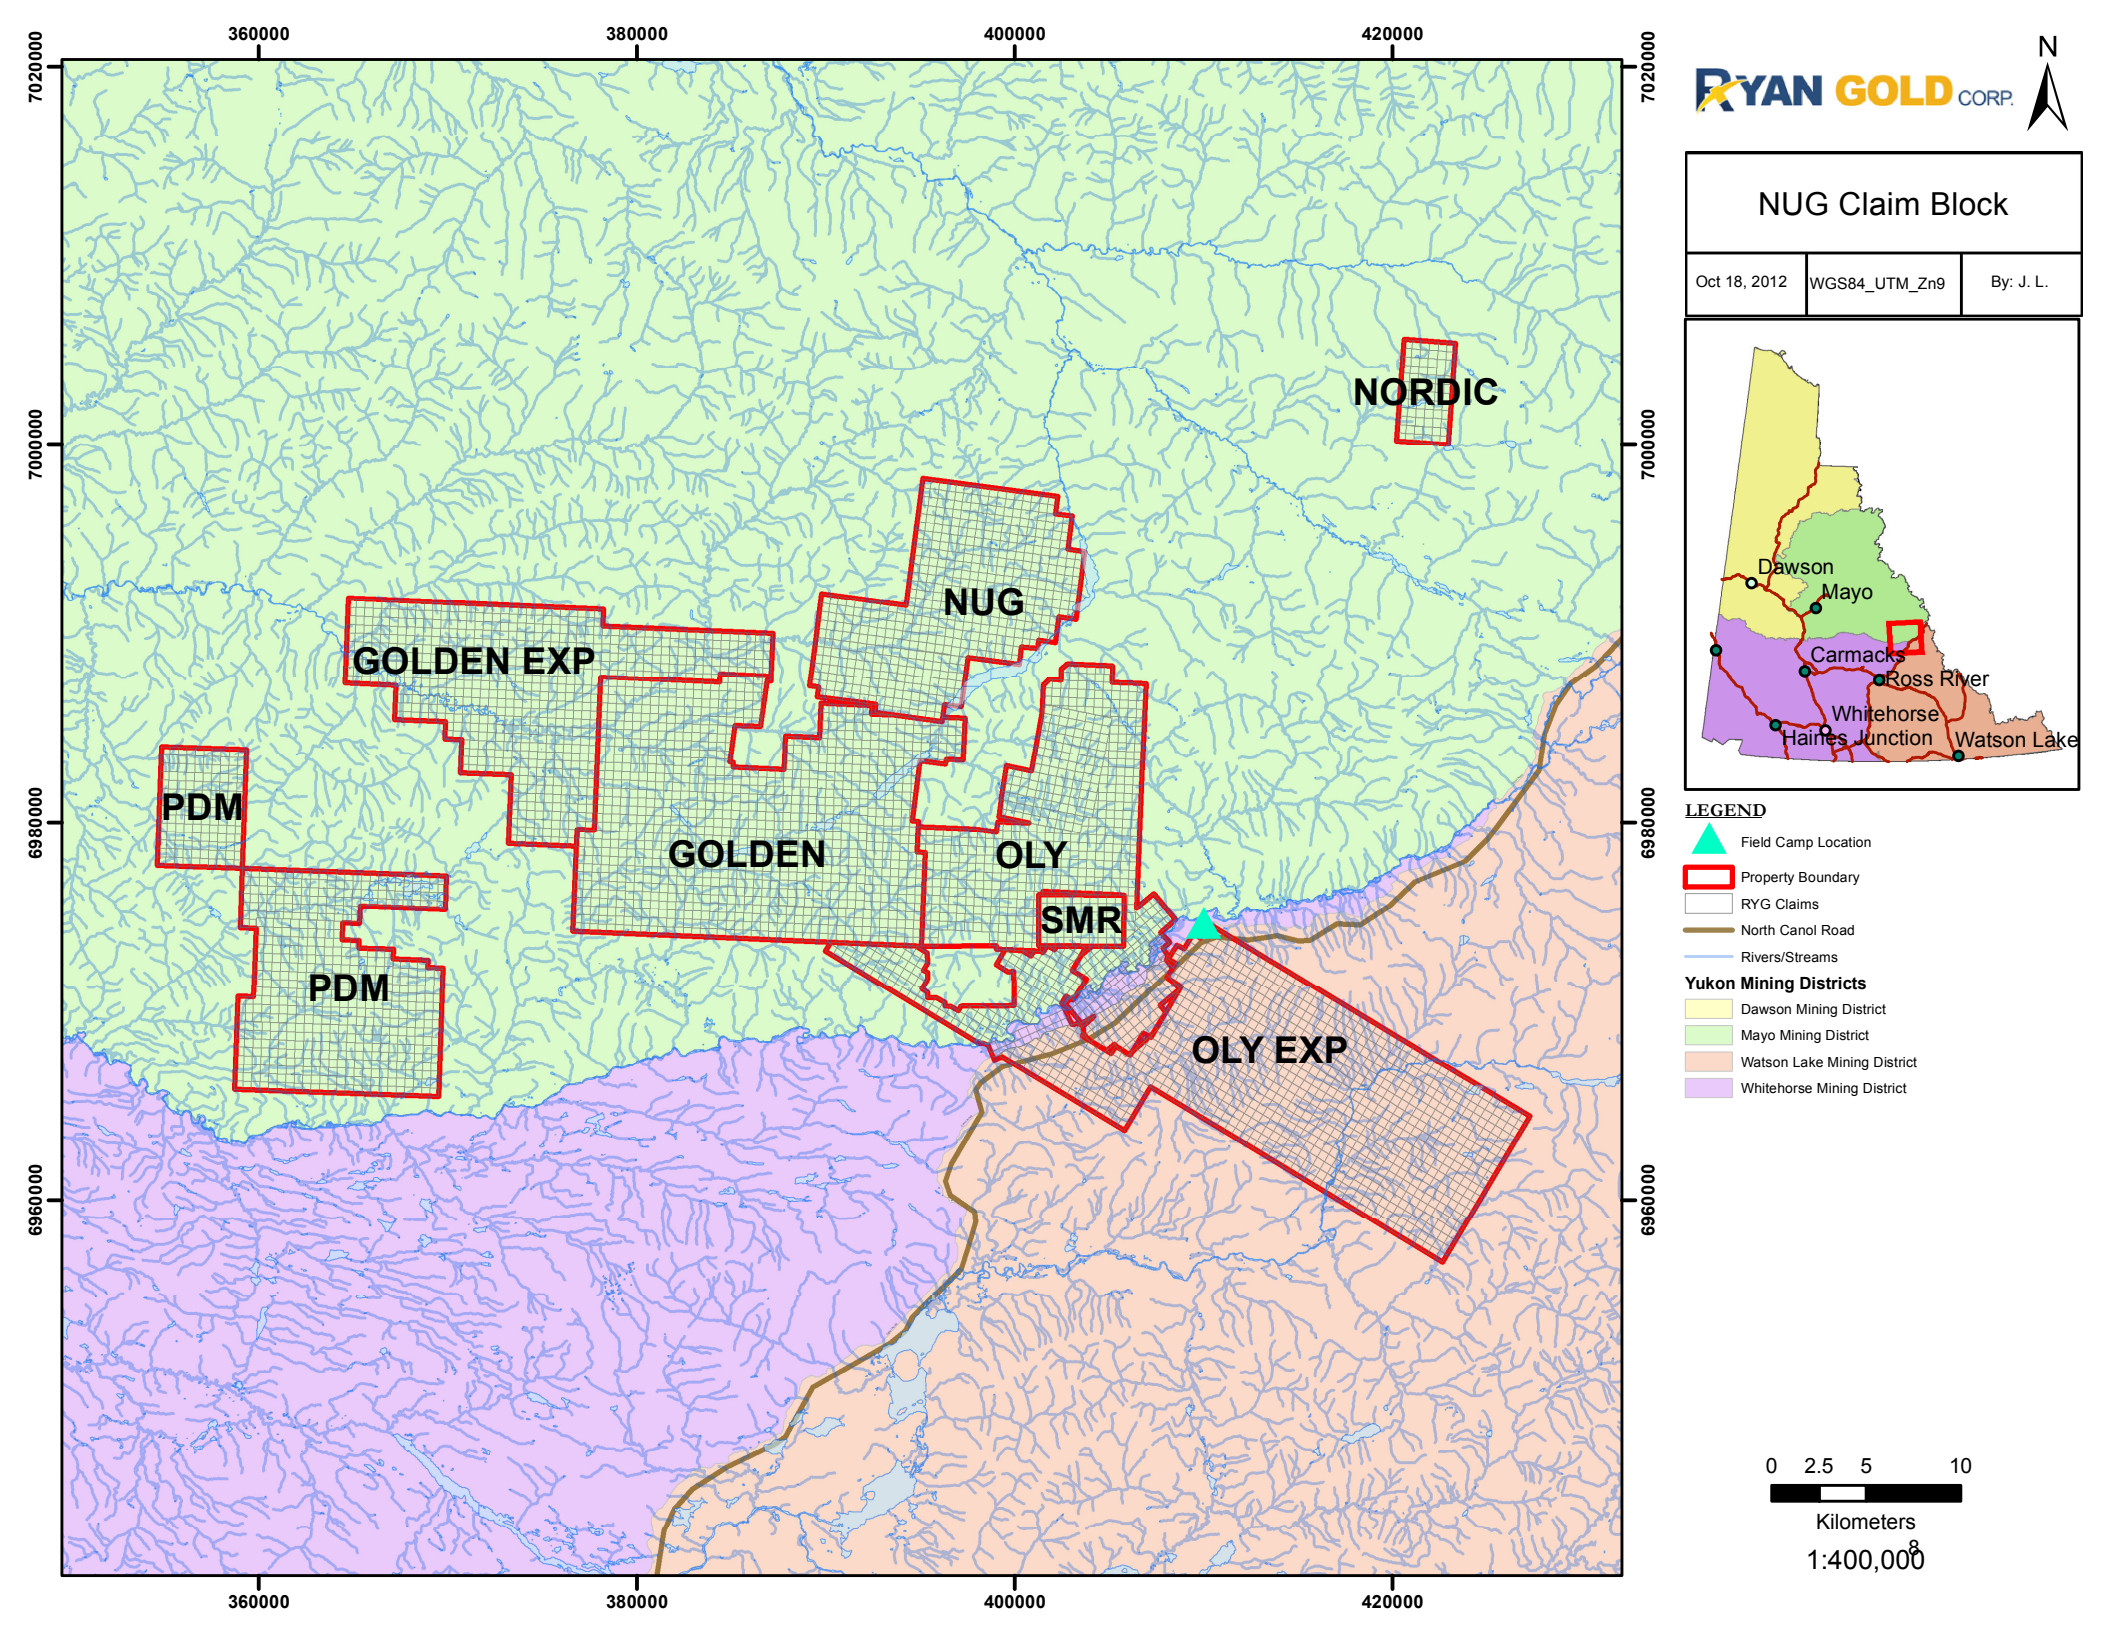

Property Name	Claim #	Claim Owner
Golden	1-232	45127 Yukon Inc. - 30%, Ryan Gold Corp. - 70%
Golden	233-1802	Ryan Gold Corp. - 100%
Nordic	72	45127 Yukon Inc. - 30%, Ryan Gold Corp. - 70%
Nug	1-228	45127 Yukon Inc. - 30%, Ryan Gold Corp. - 70%
Nug	229-543	Ryan Gold Corp. - 100%

Oly	129-1873	Ryan Gold Corp. - 100%
PDM	1-198	45127 Yukon Inc. - 30%, Ryan Gold Corp. - 70%
PDM	199-688	Ryan Gold Corp. - 100%
SMR	60	45127 Yukon Inc. - 30%, Ryan Gold Corp. - 70%

The properties discussed in this report are located within the traditional territory of either the Kaska Dena or Nacho Nyak Dun First Nations who have settled their land claims in the area. More specifically, the land in which the mineral claims are situated is Crown Land such that the mineral claims fall under the jurisdiction of the Yukon Government (Chakungal 2011).

4.0 Physiography & Climate

The project area is situated in a part of the territory that was last affected by the McConnell glaciation between 26-18 thousand years ago (Bond, 2004). The surrounding terrain is moderate to densely timbered below 1300 m (4265 feet), and is characterized by the presence of alpine vegetation at higher altitudes. Outcropping of the underlying bedrock is sparse at altitudes below 1300m, and is generally restricted to rounded ridge tops and angular felsenmeer. Where altitudes exceed 1300 m, outcropping bedrock is abundant, though in places virtually inaccessible (e.g. Nug, Oly).

Regional climate data has been recorded since the 1970's at stations in the nearby communities of Faro and Ross River. The summers are short and cool with an average frost-free period of less than 130 days and a mean daily summer temperature ranging from 12.3°C to 15.0°C, while average winter temperatures range from -16.0°C to -21.5°C. Extreme temperature ranges from 33.9°C in the summer to as low as -52°C in the winter. The prevailing wind direction for the area is from the southwest. The average annual precipitation for the area is 316 mm, with more than half of the annual precipitation occurring from May through to September. Snowfall usually occurs from October to May, with most winter precipitation occurring between October and February (source: Environment Canada).

5.0 Exploration History

The Nug property block encompasses a large area within the south central Hess Mountains which has been historically explored by many workers. Generally this work has focused on historical minfile showings within and immediately adjacent to the current property block. The following is a chronological summary of work performed at each of the historical exploration targets.

5.1 Nordic Prospect Exploration History

1969: The Nordic claims were originally staked around the Alp minfile occurrence as a joint venture between Canadian Industrial Oil and Gas Ltd, Canadian Southern Petroleum Ltd, Sabre Petroleum Company Ltd and Wainoco Oil & Chemicals Ltd which performed mapping, prospecting and channel sampling in 1970.

1982: Restaked as the Ross claim by a joint venture between Hudson Bay Exploration and Development Company Ltd. and Minorco Canada Ltd, who performed mapping, geochemical sampling and hand trenching.

1989: Noranda Exploration Company Ltd restaked the property as the Who claim and performed mapping, geochemical and magnetometer surveys, along with Kubota trenching in 1990. Soil sampling by Noranda outlined a 7km long As, Cu and Sb anomaly centred over the hornfels zone. A second, smaller Au, Sr and Bi anomaly was outlined 1 km north of the occurrence. The magnetometer survey outlined several anomalies, the best of which occurred to the northwest of the Noranda claims. Follow-up prospecting failed to reveal a possible source of the anomaly. Trenching, mapping and sampling of the felsic dykes returned values similar to earlier programs. The best chip sample, collected from dyke #1 returned 58.9g/t Au over 1m.

1996: Restaked as Alp by Eagle Plains Resources Ltd and Miner River Resources Ltd, who carried out geological mapping and minor hand trenching and grab sampling. The work performed on the property was designed to test the prospectivity by following up on anomalous results from previous work conducted by Noranda. This work verified previous results. A 1.5m chip sample collected from vein material returned 13g/t Au.

5.2 Nug Prospect Exploration History

1983: The Nug was first staked as the Nuke claims by a joint venture between Canada Tungsten Mining Corporation Ltd and Canamax Resources, who carried out a small soil sampling and mapping program.

1984: Additional claims were added to the joint venture group's holdings, on which geological mapping, rock and soil sampling were carried out.

1996: Eagle Plains Resources Ltd and Miner River Resources Ltd restaked the ground as Nug and carried out small prospecting and rock sampling programs in 1996 and 1997 demonstrating variable, though widespread gold mineralization associated with the Nug Stock (Kreft, 1998).

5.3 Oly Prospect Exploration History

1967: The northeastern region of the current Oly claims, around the Ivor minfile occurrence, was staked by Atlas Exploration Ltd for the Hess Syndicate, a joint venture with Quebec Cartier Mining Company Ltd and Phillips Brothers (Canada) Ltd.

1968: Exploration of the Ivor prospect included geological mapping and grid soil sampling in the vicinity of elevated zinc in stream-sediments.

1997: Hemlo Gold Mines Inc obtained encouraging gold results in rock and soil samples collected during their 1996 exploration program. The Beethoven claims were staked ~ 3 km to the southwest of the Ivor prospect by Viceroy Exploration (Canada) Inc. Viceroy Exploration continued geological mapping and geochemical (silt, soil and rock) sampling in 1998.

1999: NovaGold Resources Inc acquired 100% of Viceroy's interest and later in 1999, carried out geological mapping and geochemical (silt, soil and rock) sampling across the central and eastern portions of the property. Exploration carried out by NovaGold highlighted the occurrence of auriferous mineralization

within argillically altered portions of bedrock in contact with a quartz-bioite monzoite stock in addition to arsenopyrite veining up to 300 metres outbound in adjacent country rock (Shultze, 2000). Three zinc soil anomalies were found at the Ivor minfile occurrence, the largest of which had peak values of 4600ppm and covered an area 1100m long and 120m to 300m wide. Lead and copper values are erratic. Rusty weathering black chert with small quartz veinlets returned rock geochemical values in the 1200ppm zinc range and probably explain the soil response. Viceroy and NovaGold sampling during 1998 and 1999 yielded the following results: at the Beethoven minfile occurrence grab sampling returned peak values for altered intrusive up to 300ppb Au, 6.6g/t Ag, 0.14% Pb, 518ppm Zn, 0.24% As and 79ppm Sb; for mineralized country rock up to 570 ppb Au, 128.7g/t Ag, 557 ppm Cu, 1.71% Pb, 524 ppm Zn, 4.03% As, 0.26% Sb and 82 ppm Bi; and for veins and vein breccias up to 6.8g/t Au was returned.

5.4 PDM Prospect Exploration History

1967-1968: the occurrence was investigated by Atlas Explorations Ltd and was first staked in October 1971 as PDM by Phelps Dodge Corporation of Canada Ltd, which carried out geological mapping, soil sampling, magnetic surveying and hand trenching in 1972.

1976: Restaked as Fat by R.G. Hilker, who hand trenched in 1977 and 1978 and as Uno in June 1994 by Archer, Cathro & Associates (1981) Ltd.

1996: Hemlo Gold Mines Inc carried out geochemical (rock, silt and soil) sampling over the occurrence before merging with Battle Mountain Gold Company in July 1996. Battle Mountain subsequently released the data to Viceroy Exploration (Canada) Inc in 1997, prompting Viceroy to restake the occurrence as Mozart in April 1998 and carry out geological mapping and geochemical (rock, silt and soil) sampling later that year. Grab sampling of limonitic calcareous sediments, 450m north of the stock, returned values to 3.67g/t Au.

1998: Viceroy staked Gato Negro 13.5 km to the northwest based on favourable results of geochemical (rock, silt and soil) sampling carried out in the area. Late in Jul/98, Viceroy carried out additional geochemical sampling, geological mapping and prospecting of the Gato Negro claims.

1999: NovaGold Resources Inc acquired 100% of Viceroy's interest in 22 grassroots properties in the Yukon, including the Mozart and Gato Negro claims in exchange for 3.4 million common shares. In August 1999, NovaGold staked Gato Negro to surround the original 12 claims staked by Viceroy. The Gato Negro claims were staked to cover a widespread, weakly scoroditic baritic vein and vein breccia zone about 3 km upstream from a GSC silt sample that returned 35 ppb Au and greater than 95 percentile mercury values. Chert and chert breccia of the Road River Group are apparently underlain by a large buried intrusive. Stream sediment sampling on both flanks of an east-southeast trending ridge that hosts a circular breccia zone, 1 km northwest of the claims, returned anomalous values to 130 ppb Au, with up to 5.4 g/t Ag, 2340 ppb Hg and 6 ppm Sb; four samples returned greater than 100 ppb Au.

2006: Shawn Ryan restaked the Spearhead Mountain Stock as the PDM 1-20 claims and later added the PDM 21-40 claims, after receiving favourable copper and gold results from soil sampling and prospecting. Shawn Ryan optioned the property to Strategic Metals in early 2007 and performed soil sampling on its behalf in summer of the same year. In November 2007, Strategic Metals added the PDM 41-78 claims to the southwest corner of the property.

2008: Archer, Cathro & Associates (1981) Limited on behalf of Strategic Metals Ltd, conducted gridded and reconnaissance traverse soil sampling which identified six anomalous zones of various dimensions across the property, and also identified a new mineral showing; the 'Ming showing'. A helicopter-borne magnetometer and VTEM survey was flown over the property, and demonstrated high magnetic activity around the rims of the intrusions where intrusions themselves show up as pronounced magnetic lows.

2009: The previous year's work was followed up by limited soil sampling and an extension to the helicopter-borne magnetometer and VTEM survey over the Ming showing. Rock chip sampling yielded low values except for one sample that returned 6.9 g/t gold and 7.4 g/t silver. Geological mapping identified limited

skarnification at the Ming showing, this was followed up by hand trenching, that yielded channel sampling results of 1.50 g/t gold across 18 m, including 3.5 g/t across 4 m from a mapped 2.5m wide band of massive pyrite and pyrrhotite. A total of 883.92m of diamond drilling was completed in three holes beneath copper soil and rock geochemical anomalies, results were generally disappointing with the best result averaging 0.213 ppm gold and 345ppm copper over 50m.

Between 2006 and 2010: encouraging results from regional reconnaissance soil sampling lead to the progressive staking of the Nug properties by Shawn Ryan. Initially small claim blocks were staked surrounding pre-defined minfile showings or soil geochemical anomalies at; Nordic, Nug, Oly, and PDM. These small blocks were progressively expanded until 2010 when the entire, then contiguous, property block was acquired by Ryan Cold Corp.

2011 Ryan Gold Corp. Program: The 2011 Ryan Gold Corp. exploration program for the Nug project area consisted of bedrock mapping, prospecting and rock sampling, and regional soil and geophysical surveys. 134 rock grab samples were collected on the Nug block in 2011. The 2011 soil sampling program consisted of 19,559 samples collected by Groundtruth Exploration in both grid and reconnaissance style traverses, at 50m intervals. An airborne geophysical survey was also flown over the Nug project area by precision GeoSurveys Inc. between August 16th and September 25th. This resulted in the acquisition of 10,214 line km of high resolution magnetic and radiometric data over the Golden, Nug and Oly/SMR prospects. The survey lines were flown at 100m spacing, with tie lines flown at 1km spacing (Chakungal 2011).

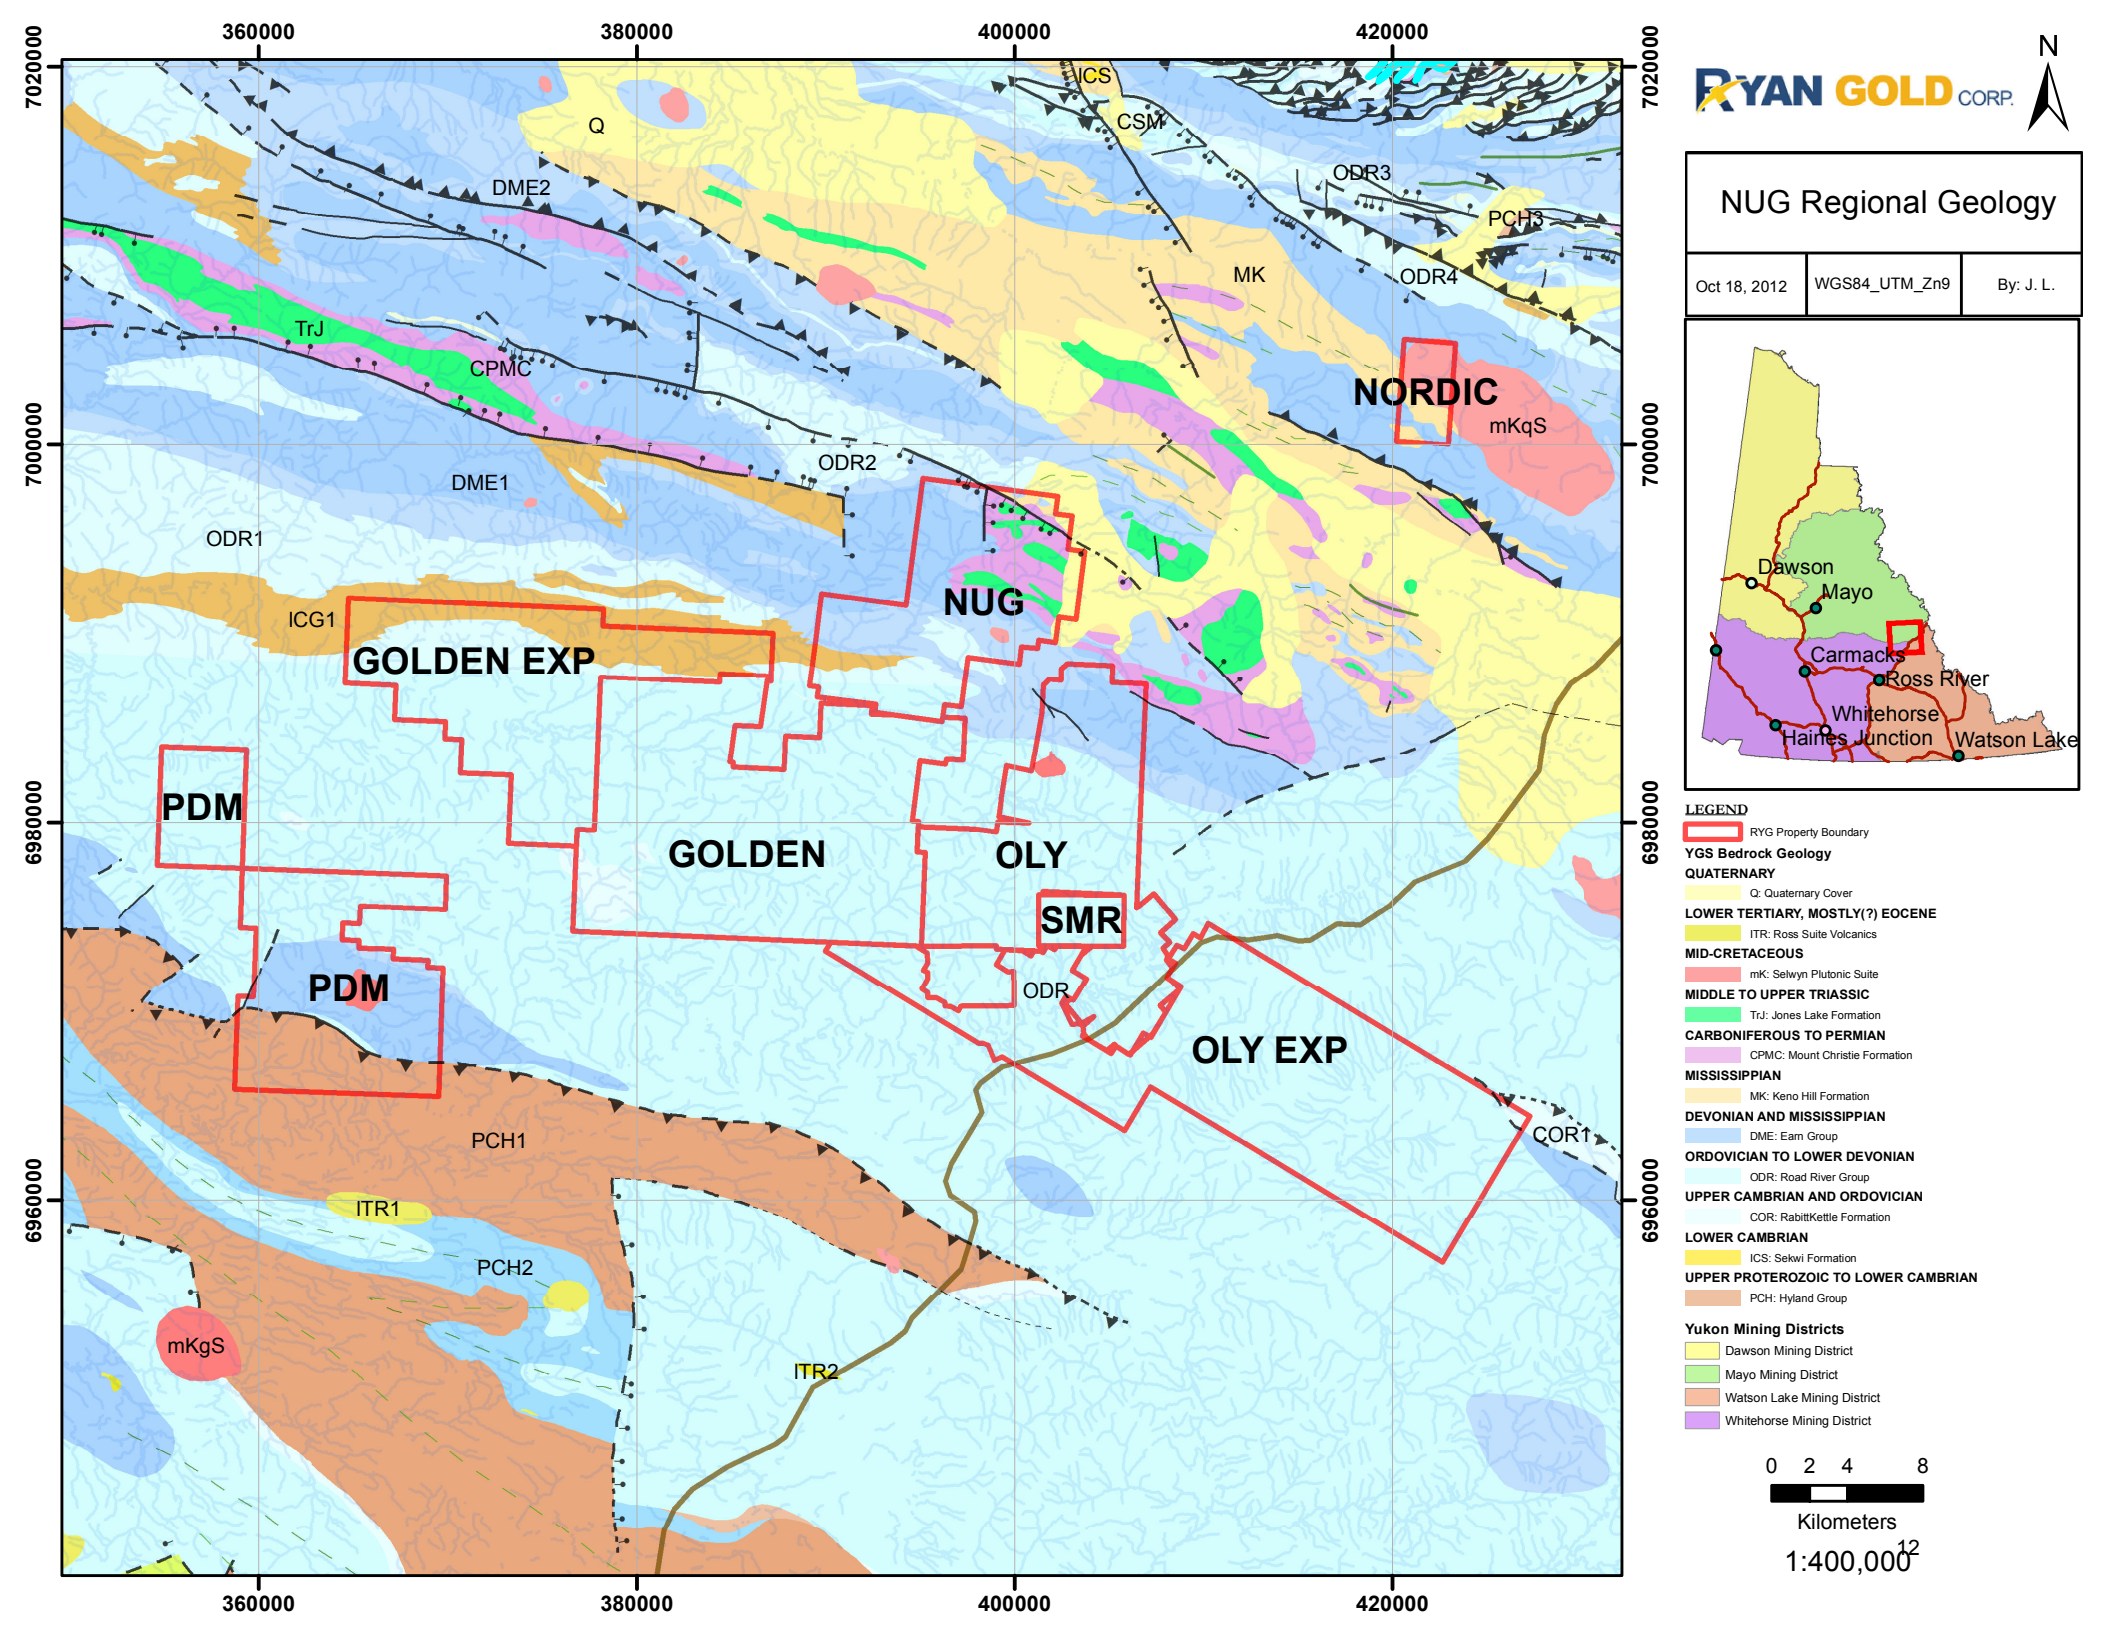

6.0 Geology

6.1 Regional Geology

The Nug property block lies within the Selwyn Basin, with the MacKenzie carbonate platform to the west, and the Cassiar platform to the east. According to Nelson and Colpron (2007) the Selwyn Basin is a rift controlled, deep-marine embayment of uppermost Proterozoic and lower Paleozoic basinal strata along the outer margin of ancestral North America. The Cambrian to Middle Devonian strata represent a west-facing miogeocline that developed along the subsiding margin of Laurentia following Late Proterozoic rifting. From west to east within the miogeocline there are typically thinning, argillite-dominated basinal facies, followed by westward thickening carbonate-dominated shelf slope sequence, overlain by a thin, mainly clastic platformal sequence.

The oldest exposed bedrock in the region includes Neoproterozoic to early Cambrian medium grained sandstone, calcareous sandstone and minor limestone of the Yusezyu Formation - the basal unit of the Hyland Group which defines the Selwyn Basin (Gordey and Anderson, 1993). In southeastern Yukon, proximal to the border with NWT, units of the Yusezyu Formation grade upward at the basin to platform edge, into the time equivalent Lower Cambrian Gull Lake Formation (lCG). The Gull Lake Formation consists of a dominantly fine grain clastic assemblage with local volcanic units. Transgression of the sea onto the passive margin in the Upper Cambrian to Ordovician resulted in deposition of thinly bedded, basinal limestone assemblage of the Rabbitkettle Formation (COR). Following this transgression, in late Ordovician through early Devonian, the Selwyn Basin was dominated by sedimentation of the Road River Group (ODR). The Road River Group consists of a thick package of black siliceous, fissile mudstone, chert and siltstone (Cecile and Norford, 1991).

As sedimentation ensued, percolation of metal-rich brines through seafloor springs onto the basin floor

likely led to the precipitation and preservation of stratiform lead-zinc deposits within the Selwyn Basin (e.g. Howard's Pass and Anvil Range). During the mid-Devonian (~390 Ma), a rise in sea level forced the west Laurentian coastline to migrate inland (eastward) resulting in the submergence of the Selwyn Basin and deposition of black shale and siltstone beds with lenses of sandstone in eastern and northern Yukon (Gordey, 1991). Uplift and erosion in central Yukon at that time resulted in the deposition of the Earn Group (DME). The Devonian to Mississippian Earn Group consists of a complex assemblage of submarine fan and channel deposits varying between a thinly bedded laminated argillite, medium grained chert-quartz arenite and a thick bedded chert-pebble conglomerate.

The convergence and accretion of continental and oceanic terranes at the western margin of North America beginning in the middle Jurassic and has resulted in fold and thrust style deformation (Selwyn Fold Belt) within the shale-siltstone dominated, relatively incompetent strata of the Selwyn Basin (Nelson and Colpron 2007). The Selwyn Basin contains north striking zones of extension, northwest striking dextral faults into the Tombstone strain zone and northwest verging Tombstone and Robert Service thrusts (Murphy, 1997; Gabrielse et al., 2006) and associated folding. The Early and mid-Cretaceous Tombstone, Mayo and Tungsten belt intrusions may be lithospheric melts emplaced during the final stages of extension (Mair et al., 2006).

6.2 Property Geology

Property-scale geology maps of all Nug block prospects are presented in Appendix F.

6.2.1 Golden Prospect Geology

The Golden claims are underlain by the Ordovician to Silurian Road River Group sediments consisting of shales, cherts and siltstones. The dominant host rock is a dark grey intercalated fine grain siliceous siltstone with chert layers containing trace disseminated pyrite. Mineralization is expressed through oxidized, druzy, commonly vuggy, quartz veins containing between 1-3% pyrite-arsenopyrite-pyrrhotite which cross cuts bedding. Oxidized quartz veins and veinlets are commonly observed as stockwork with an aplitic texture. Zones of brecciated mudstone clasts ranging up to 3cm wide are observed near veining and roughly (240 to 270) east-west trending structures.

6.2.2 Nordic Prospect Geology

The Nordic claim is located in the north-central region of the Selwyn Basin, adjacent to the boundary with the Mackenzie Platform. The Alp minfile occurrence overlies the intrusive contact between a medium-grained, mid-Cretaceous granodiorite pluton belonging to the Tombstone Suite and black argillites, phyllites and slates tentatively assigned by Gordey (1999) to the Mississippian Keno Hill Assemblage. Devonian to Mississippian siltstones, arenites with minor bedded chert and chert pebble conglomerate sedimentary package assigned to the Earn Assemblage occur to the north and south. A series of 1 to 6m thick quartz-porphyry dykes, thought to be associated with the pluton, intrude argillites and slates belonging to the Keno Hill Assemblage.
The contact zone between the pluton and sedimentary rocks is represented by a purple-grey, pyrite-pyrrhotite (± arsenopyrite) bearing hornfels zone, ranging between 200 and 1000 m thick. The hornfels zone contains minor amounts (1-2%) of very fine-grained, disseminated arsenopyrite and 1-2 mm wide arsenopyrite stringers. Similarly minor amounts of arsenopyrite and quartz-arsenopyrite stringers were also observed within slates lying at the margins of the hornfels zone. No mineralization was observed in the granodiorite itself other than minor disseminated pyrrhotite; however, massive to druzy quartz veins, < 4cm wide, crosscut the granodiorite, which contain 3 to 5% pyrite-arsenopyrite. To date, five dykes have been identified of which the longest dyke has been traced for 1.6 km. The felsic dykes which all appear to be of similar composition, contain arsenopyrite in the form of fine disseminations, large clots, blebs and large euhedral crystals within milky quartz. The dykes are commonly anomalous in arsenic and gold, all of which strike southeasterly and dip steeply to the south.

The Earn group of fissile, black argillite rock trend roughly northeast-southwest with small scale (1-2m) folds adjacent to margins of the quartz-porphyry dykes. Several of the dykes have been offset by as much as 25 m along a series of steeply dipping, subparallel faults which appear to cross-cut both the regional foliation and the dykes. The largest fault zone coincides with a large topographic "saddle" and was the target of past trenching and

sampling by Noranda Exploration Limited.

6.2.3 Nug Prospect Geology

The Nug region is located in the north-central area of the Selwyn Basin, near the boundary with the Mackenzie Platform. The area is underlain by Upper Paleozoic sedimentary rocks which have been intruded by mid-Cretaceous granitic intrusions. The occurrence lies along the intrusive contact between a medium-grained, mid-Cretaceous biotite monzonite stock belonging to the Tombstone Suite, and the siltstones, arenites with minor bedded chert and chert pebble conglomerate assigned by Gordey (1999) to the Devonian to Mississippian Earn Group. The Earn Group is observed as a very fine grain siltstone, which is strongly silicified and variably oxidized. A northwest elongate hornfels aureole ranging from 400 to 1000m in width surrounds the stock. A series of biotite to monzonite to felsic quartz-feldspar porphyry dykes ranging from several metres to 50 metres wide radiate from the western contact. Mineralization is contained in a northerly-striking set of quartz-arsenopyrite-galena-tetrahedrite veins exposed in pelitic hornfels adjacent to the southwest contact of the monzonite stock. Pyrite-arsenopyrite is disseminated between 3-5% within more felsic phases of the granodiorite. Alteration selvages are restricted to the vein margins where they appear pale green, likely due to the weathering of the arsenic. The oxidation and gossaneous appearance of the siltstone is due to the weathering of 1% disseminated pyrite. There are at least three observable fracture sets: north-south faults/fractures, a sub-horizontal fracture set and east-west vertical fractures. So far, north-south and east-west vertical trending structures have been found to contain polymetallic veins.

6.2.4 Oly Prospect Geology

The Oly claims contain two separate minfile occurrences: the IVOR and Beethoven. The Ivor claims were staked in an area of high zinc stream sediment values. Host rocks are cherty shale and slate of the Devonian to Mississippian Earn Group Prevost Formation about 3 km east of a small mid-Cretaceous quartz-biotite monzonite stock of the Tombstone Intrusive suite. The Oly claims are underlain by Ordovician to Silurian Road River Group sediments consisting of shales, cherts and siltstones that have been intruded by the mid-Cretaceous quartz-biotite monzonite stock of the Tombstone plutonic suite. Moderate to strong argillic alteration is present, particularly along the southern margins of the stock. Propyllitic alteration and hornfelsing, with resultant limonitic stain, have occurred in the sediments near the stock. Sampling during 1998 and 1999 indicated that most auriferous mineralization occurs within marginal portions of the stock displaying argillic alteration, along with adjacent country rock, which contains widespread, narrow gold bearing arsenopyrite veins and vein breccias occurring up to 300 m from the stock. Numerous pyrite-arsenopyrite bearing, brecciated polymetallic veins are present, trending 150^{o} and dipping 70^{o}, with the largest brecciated zone up to 50cm wide.

6.2.5 PDM Prospect Geology

A biotite-granite stock of the mid-Cretaceous Selwyn Suite has intruded Devonian to Mississippian Earn Group shale and Ordovician to Silurian Road River Group shale, chert and limestone that are in thrust fault contact with Proterozoic Hyland Group sediments. Traces of chalcopyrite and pyrrhotite occur on unidirectional dry fractures within the stock. Pyrite and pyrrhotite (<1%) is concentrated along very thin fractures which may line up with the 040 trending joints observed within the granodiorite. Pyrite and pyrrhotite can also be found disseminated within the granodiorite around 0.5%. The mudstone is very fine grained and differs greatly with variations in grain size, silicification and hornfelsing. Mineralization is concentrated on; (1) siliceous banding with strong oxidation varying from 5 to 10% py-asp-po parallel to bedding (300/80); (2) Lesser silicified dark black mudstone beds average between 3 to 5% py-asp-po parallel to bedding ; (3) Brecciated siliceous mudstone trending roughly east-west and dipping to the north parallel to jointing. Pyrite and arsenopyrite occur in xenoliths and schlieren and along fractures cutting hornfelsed sedimentary rocks at the contact. Abundant gossanous zones with lesser arsenopyrite skarn and vein mineralization also occur near the stock.

7.0 Exploration Program 2012

The focus of 2012 explorations on the Nug property block was follow up investigation of previously identified anomalous soil geochemistry results and geophysical anomalies obtained in 2011, via reconnaissance style geological mapping and sampling. Five prospects (Golden, Nug, Oly, Nordic, PDM) were targeted for more detailed sampling and mapping. Minfile showings and findings by previous workers identifying anomalous soil geochemistry, favorable ground or airborne geophysical targets, and encouraging rock geochemistry results from float, outcrop and trenching comprised the foci of the 2012 exploration program. The 2012 Nug block work program comprised of a 29 day field program between the dates July 20th and August 17th, where time on the property block was divided between the five prospects. All certificates of work are presented in Appendix B.

Soil sampling was also conducted on parts of the Oly prospect, contracted to Ground Truth Exploration Inc., concurrent with reconnaissance mapping. 1121 soil samples were collected at 50 m intervals. For Au in soil results on Oly, the reader is referred to maps presented in Appendix F, and the summary contained in the table below.

Due to the nature of the reconnaissance mapping and sampling program via helicopter, there was little to no disturbance of the project areas. A temporary fly camp was constructed along the North Canol Rd in accordance with the issued Class 1 permit, and all site operations were based out of the fly camp.

Table 2: Summary of Nug block data.

Prospect	# RYG man days	No of Geochem Samples	No of Geological Observations	No of Soil Samples
Golden	34	102	247	0
Nordic	17	69	117	0
Nug	49	197	477	0
Oly	17.5	84	169	1121
PDM	15	86	167	0
Total	**132.5**	**538**	**1177**	**1121**

8.0 Sampling Procedures

8.1 Rock chip sample collection and Geochemical Analytical Procedures

Sampling, chosen based on geological relevance, followed a methodical set of procedures from initial sample collection to final database recording. Samples were typically chipped away from outcrop showings, using a standard Estwing rock hammer, into polyurethane bags and recorded digitally using a Pidion/IPAQ handheld PDA device. Before sealing the bag with a cable tie, an ALS Chemex supplied sample tag was placed inside the bag and then another stapled to the open, outside edge, finally followed by marking the number on the bag using a permanent felt. The closed sample, along with a marked show sample, was stored amongst the others throughout the day by the sampler in a field pack. After returning each day, sample numbers and descriptions were uploaded to a database and the samples were securely stored until a batch shipment was prepared. The on-site project geologist was responsible for creating the chain of custody and shipment forms. Samples were placed in a sample string with a systematic pattern of standards and blanks to ensure QA/QC, grouped in rice bags and secured with security tags. The batch shipments would be transported via expeditor or Ryan Gold personnel to ALS Chemex in Whitehorse, where the samples were prepped and shipped to their Vancouver lab for assaying and QA/QC checks. Throughout the shipment process, a chain of custody paperwork trail was maintained to ensure sample security.

Once in at the ALS Lab in Whitehorse the samples are received, weighed and logged. Samples are then crushed until 80% or better passes through a 2 mm mesh screen. This resulting material is put through a riffle splitter, where a 1000 g sample is isolated and the rest is collected as reject. The sample is pulverized further until 85% or better passes through a 75 micron mesh screen. After this step the pulp material is shipped to the North Vancouver lab for analysis. The remaining reject material is stored in Whitehorse.

The material that is shipped to the North Vancouver lab is split using a riffle splitter where a 50 g sample is isolated. The reject material from this process is stored at the lab. This 50 g sample is now subjected to ICP22 and ME-MS41 assaying methods. The ICP22 is a fire assay and ICP-AES method to assay for gold, and can detect values between 0.01 ppm and 10 ppm. ME-MS41 is a 51 element analysis by aqua regia digestion and a combination of ICP-MS and ICP-AES assaying. Assays for Au, Ag, Cu, Pb, As, Zn and Sb that are above detection are then finished using a gravity method to obtain true value. Final results using the methods above are reported to Ryan Gold electronically, consisting of an excel spreadsheet and a PDF certificate of work.

8.2 Soil sample collection and Geochemical Analytical Procedures

All sampling traverses are pre-planned, with pre -specified sampling intervals, typically 50m. Field technicians navigate to sample site using handheld GPS units. The soil sampler arrives at each sample site, identifies the most appropriate location to collect the sample and lays out a sheet of plastic (12”x20” ore bag). The soil sample is taken using an Eijklcamp brand hand auger at a depth of between 20cm and 110cm. Samplers strive to consistently collect C-Horizon sample material. Where necessary (rocky or frozen ground) a prospector's pick ('mattock') is used to obtain the sample. The soil is laid out on the sheet of plastic in the order it was recovered from the sample hole. Standardized photos are taken of the sample site- across slope, 5m from sample hole with auger inserted. With the necessary amount of soil (400-500 grams) has been collected, the deepest soil is taken and placed in a bag labeled with the 3-letter project and tagged with a unique barcode ID tag containing a unique 7 digit sample identification number. An aluminum metal tag inscribed with the sample identification number is attached to a rock or branch in a visible area at the sample site along with a length of pink flagging tape.

A field duplicate sample is taken once for every 25 samples. Both samples are given unique Sample identification number. The data for both samples is recorded and a note is made indicating the duplicate and its corresponding sample identification number.

The GPS location of the sample site is recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD83 format, and the waypoint is labeled with the project name and the sample identification number.

A weather-proof handheld device equipped with a barcode scanner is used in the field to record the descriptive attributes of the sample collected. This includes: sample identification number (scanned into device at sample site), soil colour, soil horizon, slope, sample depth, ground and tree vegetation and sample quality and any other relevant information. As well, the GPS coordinates are entered into the handheld device as a secondary backup in case of GPS failure.

Each night in the field, the GPS and Palm PDA devices are downloaded to a laptop computer. The data is verified and mapped on a sampler-by-sampler basis in proprietary database auditing and mapping software. At the end of each day, the crew boss inspects all samples for size and consistency as a quality check. Each sampler then repackages all samples for shipping- barcode scanning them as they are placed into a rice bag which is sealed with a barcoded security zip tie. Samples are shipped from the field to the lab on a daily basis, tracked by the unique ID on each security seal.

A backup of the sample data is made, copied onto a USB memory stick and kept in a separate location from the laptop computer until job completion. Where possible, a backup is also sent via e-mail.

Samples were processed by Acme Labs in Vancouver with Aqua Regia digestion and analyzed with ICP-MS for 36 elements (Acme Labs 1DX-15 gram). Samples are dried at 60°C, sieved at -80 mesh.

9.0 Exploration Results 2012

The results of the 2012 Ryan Gold Corp. exploration program are summarized below, with brief geological notes included. The reader is referred to Appendix E for sample location data from rock chip sampling and soil sampling. Appendix F contains all map figures with corresponding rock sample locations.

9.1 Golden Results

Mapping at the Golden prospect focused on identifying geological indicators for a theorized buried intrusive body, previously identified by airborne geophysical survey. The area is characterized by tightly to isoclinally folded sediments of the Road River group, typically black shales to fine sandstones and quartz pebble conglomerates. Graptolite bearing shales were also found in the Golden area, indicating that the sediments belonged to the Ordovician to early Silurian Duo group of the Road River group. Mapping uncovered common granodiorite in float, indicating a proximal source of intrusive rock. No outcropping intrusive rocks were mapped. Numerous outcropping, late stage hydrothermal quartz+calcite+tourmaline veins were also mapped.

102 rock chip samples were collected from the Golden prospect, none of these samples returned significant grade for any of the major trace element geochemistry.

9.2 Nordic Results

2012 mapping and sampling at the Nordic prospect primarily focused on following up on previous work performed

on the property, in order to verify previously identified rock and soil geochemistry anomalies and other encouraging results. The area is characterized by strongly hornfelsed, tightly folded arenitic quartzites of the Mississippian Keno Hill formation and fine grained sediments of the Pervost formation, part of the Earn group. These fault imbricated sediments have been intruded by an extensive Cretaceous stock, belonging to the Tombstone suite, that cross-cuts the northern half of the prospect. Locally, within sedimentary rocks to the south of the intrusion there is widespread E-W, bedding parallel sills of more felsic intrusive phases, parallel to the larger intrusive stock. Mapping at the Nordic prospect has demonstrated similar geology as previous workers have documented.

69 rock chip samples were collected from the Nordic prospect in 2012 (see appendix F for details). Of those, two samples returned anomalous Copper values. The first (44093) was taken from unaltered granodiorite within the intrusive complex, while the second (44057) was taken from from sandstone on the margin of the intrusive stock. These results are summarized below in table 3.

Table 3: Summarized significant results from rock chip/grab sampling at Nordic (significant results in red).

Sample ID	Prospect	Z9 Easting	Z9 Northing	Au (Gold) g/t	Ag (Silver) ppm	As (Arsenic) ppm	Cu (Copper) ppm	Mo (Moly) ppm	Ni (Nickel) ppm	Pb (Lead) ppm	Zn (Zinc) ppm
44093	Nordic	421026	7003365	0.3	77.3	3360	29600	2.09	12.2	40.5	483
44057	Nordic	420954	7003353	0.013	10	1530	6710	4.62	63.6	15.8	203

9.3 Nug Results

Reconnaissance mapping and sampling at the Nug prospect focused on the previously identified Nuke showing, within a small 70 hectare granodiorite-monzonite stock. The roughly circular shaped stock intrudes into a tightly to isoclinally folded, and occasionally overturned, thrust faulted sedimentary package of the upper Road River group, and lower Earn group formations. The structural relationships between the various exposed sedimentary rocks are complex, however may prove critical to unraveling the structural controls on mineralization in the immediate area.

On the southwest margin of the intrusive stock there is a 50m wide structural corridor characterized by offset black shales and medium grained sandstones of the Pervost formation and Duo Lake formation, where extensive and complex and N-S oriented faulting is present. Widespread sampling was conducted from within this corridor as well as across the southern half of the stock. Both mineralized vein samples and host rock samples were collected, within both the granodiorite and the surrounding hornfelsed sedimentary sequence.

Of the 197 rock samples collected, 47 were from vein material and returned significant results for gold (Au>1g/t), silver (Ag>80ppm) or copper (Cu>4% or 4000ppm) with an additional 10 samples (not listed below) grading over 0.5g/t Au. Many of the samples also returned significant results for lead and zinc. The vein material is characterized by a quartz+arsenopyrite+pyrite±tetrahedrite±chalcopyrite±galena±sphalerite assemblage within rhythmically layered pinching and swelling veins up to 30cm wide.

Three distinct mineralized locales occur at the Nug prospect:

1. The most extensive veins occur within the southern portion of the granodiorite stock. Here polyphase quartz+pyrite veins and polymetallic veins are typically 0.5-30cm wide, NNW-NNE striking, steeply dipping and tend to pinch and swell along strike. Veins occur parallel to a pervasive joint set within the stock.

2. A large structural corridor occurs on the south western margin of the intrusive stock. Here polymetallic veining is also extensive, and is distributed within a complex NW-SE oriented fault system. Individual veins range in thickness from 1-30cm, commonly tend to pinch and swell along strike, and are intricately offset against cross cutting faults and truncated lithologies within the structural corridor.
3. The least abundant occurrence of polymetallic veins is within the hornfels alteration aureole surrounding the granodiorite stock. Here veins are typically <3cm wide and discontinuous. They occur as much as 300m from the intrusive body.

The most significant results of major trace elements are summarized in Table 4 below:

Table 4: Results from rock chip/grab sampling at Nug (significant results in red).

Sample ID	Prospect	Z9 Easting	Z9 Northing	Au (Gold) g/t	Ag (Silver) ppm	As (Arsenic) ppm	Cu (Copper) ppm	Mo (Moly) ppm	Ni (Nickel) ppm	Pb (Lead) ppm	Zn (Zinc) ppm

9.4 Oly Results

2012 mapping and prospecting on the Oly prospect focused on a small, 120 hectare granodiorite-monzonite stock and surrounding sedimentary host rocks. The area is typified by tightly to isoclinally folded, northwest striking, black shales, cherts and interbedded mudstones of the Road River group. The sedimentary rocks are intruded by a small, multiphase biotite granodiorite-monzonite stock. Highly brecciated phases occur at the margin of the stock and more porphyritic and felsic phases are present locally as dykes or sills that intrude host sediments, roughly parallel to bedding. Mineralization is restricted to polymetallic veining of a similar nature to Nug, and appears to radiate outward from the stock into the sediments and occur distally to the stock by as much as 300m.

A total of 84 rock chip samples were collected from both the intrusive and sedimentary rocks at Oly. Of those, five samples from vein material collected from a polymetallic vein swarm in a north draining creek on margin of the stock yielded anomalous results for gold, silver and copper. See table 5 below for results:

Table 5: Results from rock chip/grab sampling at Oly (significant results in red).

Sample ID	Prospect	Z9 Easting	Z9 Northing	Au (Gold) g/t	Ag (Silver) ppm	As (Arsenic) ppm	Cu (Copper) ppm	Mo (Moly) ppm	Ni (Nickel) ppm	Pb (Lead) ppm	Zn (Zinc) ppm
42004	Oly	401879	6983393	3.25	26.4	308000	146.5	2.98	265	1020	11
42007	Oly	401906	6983437	3.00	11.45	338000	221	1.98	248	409	3
42012	Oly	401888	6983382	1.565	19.75	148000	181	1.12	114.5	746	44
42005	Oly	401890	6983396	0.192	96.8	951	11550	7.81	29.8	57.8	177
42226	Oly	402465	6982712	0.175	54.6	288000	4930	0.89	0.9	1390	76

Soil sampling at the Oly prospect in 2012 comprised of 1121 samples (including QAQC samples) collected by Ground Truth Exploration. Soil sampling was two phase. Primarily, 979 grid samples were collected, roughly overlapping the mapped extent of the intrusive stock. The soil grid displayed a strong Bismuth and Arsenic anomaly, coincident with the the intrusive stock at Oly. Additionally, 208 samples were collected from reconnaissance traverses in the south corner of the prospect. These did not yield significant results. Please refer to appendix F for detailed map of soil sampling results.

9.5 PDM Results

Mapping and sampling at the PDM prospect primarily focused on following up on previous explorations conducted on the property in order to verify previously identified rock and soil geochemistry anomalies and other encouraging results from earlier trenching and drilling. The area is characterized by patchy, strongly hornfelsed, tightly folded sediments of the Road River group. These fault imbricated sediments are intruded by an extensive Cretaceous intrusion of the Tombstone suite that penetrates the center of the prospect. Mapping at the PDM prospect has verified the geology that previous workers have documented.

86 rock chip samples were collected from the PDM prospect (see appendix F for details). Of those, three samples returned anomalous values for gold. One sample from the northern margin of the intrusion returned 19.15g/t Au from a narrow quartz vein. These results are summarized below in table 7.

Table 6: Summarized significant results from rock chip/grab sampling at PDM (significant results in red).

Sample ID	Prospect	Z9 Easting	Z9 Northing	Au (Gold) g/t	Ag (Silver) ppm	As (Arsenic) ppm	Cu (Copper) ppm	Mo (Moly) ppm	Ni (Nickel) ppm	Pb (Lead) ppm	Zn (Zinc) ppm
45277	PDM	366703	6972198	19.15	1.79	2	2.5	0.52	3.5	8.1	1

44081	PDM	365587	6970509	1.295	6.98	979	1405	1.73	1.7	187.5	63

10.0 Conclusions and Recommendations

The Nug property block has been explored by numerous workers since the late 1960's. Numerous Au-in-soil anomalies have been defined over five prospects within the property block. Historically these have been followed up with limited rock chip sampling, comprehensive geophysical survey, occasional hand trenching and, on PDM, diamond drilling. Generally the properties have been held for short periods by the respective holding companies, and in the transition of ownership much of the valuable historical data has been lost.

Strong indicator geology, geochemistry and geophysics from historic workings vector toward the presence of intrusion-related gold and/or copper mineralization somewhere within the property block. Additionally, there are strong indicators for strata-bound SEDEX style base metals deposits.

The reconnaissance style mapping, prospecting and sampling of the five prospects during the 2012 exploration program has identified three areas of relatively underexplored, ongoing potential. With the application of diligent and comprehensive explorations into the future, these prospects have a high probability of yielding further

exploration success. Recommendations include:

- For all the prospects on the Nug property block a detailed systematic compilation, review and analysis of all available historical data is necessary and essential to the prospects continued exploration success.
- Following this, all occurrences on the property blocks should be systematically followed up, and historical showings and occurrences should be individually validated, via conventional field mapping and sampling methods.

10.1 Recommendations for the Golden prospect

- Detailed, ≤1:5000 scale mapping of the areas overlying high magnetic responses in the area that was investigated within the 2012 exploration program is recommended. This should include defining the spatial distribution of key stratigraphic components, including nodular pyrite bearing black shales, graptolite bearing shales and other marker horizons to better constrain any structural controls in the area.
- A comprehensive sampling program of rock chip, grab and float samples should be conducted. Focus should be on the collection of samples from intrusive boulders, and late stage hydrothermal veining, so as to determine the structural level of buried plutonism in the area, and determine the presence of mineralization within intrusive phases.
- Finally, systematic representative samples should be collected from host sedimentary sequence rocks.

10.2 Recommendations for the Nug and Oly prospects

- Detailed, ≤1:1000 scale mapping of the structural corridor on the southwest margin of the Nug intrusion is recommended.
- Detailed mapping should be accompanied by systematic cut-channel sampling cross-cutting mineralization at measured intervals along the structural corridor. The view to be to develop a sectional plan resource envelope and subsequently, an internal grade estimate.
- Detailed ≤1:5000 scale mapping of the area of outcropping intrusives and the surrounding hornfelsed aureole, at both the Nug and Oly intrusions. This should include:
  - Systematic sampling of steeply dipping, N-S sheeted quartz veins sets, including calculation of vein density.
  - Systematic sampling and categorization of polymetallic vening, including calculation of vein density.
  - Systematic sampling and categorization of host intrusive phases.

10.3 Recommendations for the Nordic and PDM prospects

- Comprehensive desktop review of all historical data from work previously conducted on the properties is recommended.
- Minor mapping and systematic follow up of previously identified anomalous veins and mineral showings, specifically including the 19.5g/t Au grab sample obtained this year.

APPLICATION FOR A CERTIFICATE OF WORK

Office Date Stamp

I, Robin Sudo ,

Land Manager/Ryan Gold Corp.

of #600 - 666 Burrard St., Vancouver, B.C. V6C 2X8

Phone 250-421-0939

Client I.D. Number: 4000351

make oath and say that:

1. I am the owner, or agent of the owner, of the mineral claim(s) to which reference is made herein.

2. I have done, or caused to be done, work, on the following mineral claim(s): (Here list claims on which work was actually done by number and name)

Oly 1331 to 1334/YE73411 to YE73414

OLY Exp GROUP #1

situated at S. MacMillan River area Claim sheet No. 105J15&16

in the Watson Lake Mining District, to the value of at least $11,600 dollars,

since the 20th day of July & the 17th day of August 20 12 ,

to represent the following mineral claims under the authority of Grouping Certificate No. _____.
(Here list claims to be renewed in numerical order, by grant number and claim name, showing renewal period requested).

See attached Schedule B

3. The following is a detailed statement of such work: (Set out full particulars of the work done indicating dates work commenced and ended in the twelve months in which such work is required to be done as shown by Section 56).

See attached Schedule C

***** REPORT TO FOLLOW *****

Sworn before me at Cranbrook BC this 24 day of October 20 12.

QUARTZ MINING ACT FORM 4 SECTION 56

APPLICATION FOR A CERTIFICATE OF WORK

Office Date Stamp

I, Robin Sudo,

Land Manager/Ryan Gold Corp.

of #600 - 666 Burrard St., Vancouver, B.C. V6C 2X8

Phone 250-421-0939

Client I.D. Number: 4000351

make oath and say that:

1. I am the owner, or agent of the owner, of the mineral claim(s) to which reference is made herein.

2. I have done, or caused to be done, work, on the following mineral claim(s): (Here list claims on which work was actually done by number and name)

See attached Schedule A

PDM Property

situated at the South MacMillan area Claim sheet No. 105J13

in the Mayo Mining District, to the value of at least $35,200 dollars,

since the 13th day of August to the 15th day of August 20 12,

to represent the following mineral claims under the authority of Grouping Certificate No. _____.
(Here list claims to be renewed in numerical order, by grant number and claim name, showing renewal period requested).

See attached Schedule B

3. The following is a detailed statement of such work: (Set out full particulars of the work done indicating dates work commenced and ended in the twelve months in which such work is required to be done as shown by Section 56).

See attached Schedule C

***** REPORT TO FOLLOW *****

Sworn before me at Cranbrook BC this 19 day of December 20 12.

Notary Public

Owner or Authorized Agent

Donald Paolo
Barrister & Solicitor
2nd Floor, 6 - 10th Ave. S.
Cranbrook, BC V1C 2M8

Account: RYGCOR

CERTIFICATE WH12184207

Project: Nug (Nug)
P.O. No.: NG12- 003
This report is for 85 Rock samples submitted to our lab in Whitehorse, YT, Canada on 9- AUG- 2012.
The following have access to data associated with this certificate:

ANDY RANDELL	CARRIE WONG	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
ME- MS41	51 anal. aqua regia ICPMS	

To: RYAN GOLD CORP.
ATTN: ANDY RANDELL

CERTIFICATE OF ANALYSIS WH12200371

Method	CERTIFICATE COMMENTS
ME- MS41	Interference: Samples with Ca> 10% on ICP- MS As. ICP- AES As results reported (2 ppm DL)
ME- MS41	Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).

CERTIFICATE WH12200370

Project: Nug (Nordic)

P.O. No.: ND12- 001

This report is for 82 Rock samples submitted to our lab in Whitehorse, YT, Canada on 27- AUG- 2012.

The following have access to data associated with this certificate:

ANDY RANDELL	CARRIE WONG	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Cu- OG46	Ore Grade Cu - Aqua Regia	VARIABLE
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
As- OG46	Ore Grade As - Aqua Regia	VARIABLE
ME- MS41	51 anal. aqua regia ICPMS	
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES

To: RYAN GOLD CORP.
ATTN: ANDY RANDELL
713 - 4TH AVENUE, LOT 12, BLOCK HD
P.O. BOX 5070
DAWSON CITY YT Y0B 1G0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS WH12200370

Method	CERTIFICATE COMMENTS
ME- MS41	Interference: Samples with Ca> 10% on ICP- MS As. ICP- AES As results reported (2 ppm DL)
ME- MS41	Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).

CERTIFICATE WH12177220

Project: Nug

P.O. No.: NG12- 001

This report is for 85 Rock samples submitted to our lab in Whitehorse, YT, Canada on 30- JUL- 2012.

The following have access to data associated with this certificate:

ANDY RANDELL	CARRIE WONG	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
EXTRA- 01	Extra Sample received in Shipment
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb- OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Zn- OG46	Ore Grade Zn - Aqua Regia	VARIABLE
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
As- OG46	Ore Grade As - Aqua Regia	VARIABLE
Sb- AA08	Sb - KClO3/HCl digestion AA	AAS
ME- MS41	51 anal. aqua regia ICPMS	
Ag- OG46	Ore Grade Ag - Aqua Regia	VARIABLE
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES

To: RYAN GOLD CORP.

Project: Nug (Nug)

P.O. No.: NG12- 002

This report is for 85 Rock samples submitted to our lab in Whitehorse, YT, Canada on 3- AUG- 2012.

The following have access to data associated with this certificate:

ANDY RANDELL	CARRIE WONG	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% < 2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb- OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
As- OG46	Ore Grade As - Aqua Regia	VARIABLE
Sb- AA08	Sb - KClO3/HCl digestion AA	AAS
ME- MS41	51 anal. aqua regia ICPMS	
Ag- OG46	Ore Grade Ag - Aqua Regia	VARIABLE
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES

Project: Nug (Nug)
P.O. No.: NG12- 004
This report is for 79 Rock samples submitted to our lab in Whitehorse, YT, Canada on 9- AUG- 2012.
The following have access to data associated with this certificate:

ANDY RANDELL	CARRIE WONG	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb- OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Zn- OG46	Ore Grade Zn - Aqua Regia	VARIABLE
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
As- OG46	Ore Grade As - Aqua Regia	VARIABLE
Sb- AA08	Sb - KClO3/HCl digestion AA	AAS
ME- MS41	51 anal. aqua regia ICPMS	
Ag- OG46	Ore Grade Ag - Aqua Regia	VARIABLE
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES

CERTIFICATE WH12195457

Project: Nug(Nug)

P.O. No.: NG12- 005

This report is for 85 Rock samples submitted to our lab in Whitehorse, YT, Canada on 21- AUG- 2012.

The following have access to data associated with this certificate:

ANDY RANDELL	CARRIE WONG	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb- OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Cu- OG46	Ore Grade Cu - Aqua Regia	VARIABLE
Zn- OG46	Ore Grade Zn - Aqua Regia	VARIABLE
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
As- OG46	Ore Grade As - Aqua Regia	VARIABLE
Sb- AA08	Sb - KClO3/HCl digestion AA	AAS
ME- MS41	51 anal. aqua regia ICPMS	
Ag- OG46	Ore Grade Ag - Aqua Regia	VARIABLE
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES

Project: Nug (Nug)

P.O. No.: OY12- 001

This report is for 83 Rock samples submitted to our lab in Whitehorse, YT, Canada on 3- AUG- 2012.

The following have access to data associated with this certificate:

ANDY RANDELL	CARRIE WONG	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 24	Pulp Login - Rcd w/o Barcode
LOG- 22	Sample login - Rcd w/o BarCode
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Cu- OG46	Ore Grade Cu - Aqua Regia	VARIABLE
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES
As- OG46	Ore Grade As - Aqua Regia	VARIABLE
ME- MS41	51 anal. aqua regia ICPMS	
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES
