Vancouver, British Columbia, V6C 2X8

Executive Summary

Exploration during the 2012 field season was completed on the Mayo properties between the dates of June 5th and September 19th, 2012. The Mayo properties are located 50 kilometers northwest of the village of Mayo, Yukon Territory, and are most easily accessible by helicopter. Operations were carried out north of Mayo, on Halfway Lake at the Silver Trail Inn, located 135° 50' 8.387" W and 63° 37' 8.194" N.

Staked in 2011 by Ryan Gold Corp., the Mayo properties are a contiguous claim block of separate prospects which include: Alp, Callum, Forty, Mahtin, May and Qu. The properties are further grouped into larger contiguous prospects, Alp-Forty-Callum, Mahtin and May-Qu, which define the Mahtin area. The Mahtin area is comprised of 1434 claims, covering an area of 28577 hectares. The Alp-Forty-Callum, May-Qu and first 120 claims that comprise the Mahtin prospect are 70% owned by Ryan Gold Corp. and 30% 45127 Yukon Inc., which is now owned by Ryan Gold Corp., while the remaining Mahtin prospect claims are 100% owned by Ryan Gold Corp. Previous work on the Mahtin area by Ryan Gold included geochemical soil and rock sampling in 2011.

Exploration activity on the Mahtin area commenced in 1948 and was carried through by independent parties intermittently until being acquired by Ryan Gold Corp. Historically, the target of exploration in the Mahtin area was focused around the Sprague Creek stock and associated Au-skarn at the Mahtin prospect, Sn-greisen +/- veins at the Alp-Forty-Callum prospect and polymetallic Ag-Pb-Zn +/- Au veins at the May-Qu prospect. The extent of work advanced to the stage of diamond drilling on the Mahtin prospect and reverse circulation drilling on May-Qu in 2007 by independent parties.

The aim of the 2012 field season was soil sampling, general prospecting and reconnaissance mapping of the Mahtin area.

1.0 Introduction

This assessment report documents the field work completed during the 2012 field season on six Ryan Gold Corp. prospects in the Mayo mining district: Alp, Callum, Forty, Mahtin, May, and Qu. The prospects are grouped based off historic names and geological relevance into the Alp-Forty-Callum, May-Qu and Mahtin prospects. All the prospects exist as one contiguous claim block which is deemed the 'Mahtin area'. The 2012 field work program consisted of soil sampling performed by Ground Truth Exploration Inc. on behalf of Ryan Gold Corp. and geological mapping and grab sampling performed by Ryan Gold Corp. staff.

Field work in the Mahtin area was completed between the dates of June 5th and September 19th, 2012. The total number of geological observations, geochemical grab and soil samples retrieved during 2012 field season was 186, 72, and 9379, respectively. The analytical lab used to the conduct the assaying of the samples selected was ALS Chemex for rock sampling and Acme Labs for the soil sampling.

2.0 Location & Access

Access to all the Mahtin area is currently limited to helicopter. The most accessible route is to stage from the Klondike or Silver Trail highway and reach the properties via helicopter. Ryan Gold Corp. field teams were based close to the nearby village of Mayo, between the dates of June 1st and July 15th, 2012, for the duration of the program. Ground Truth Exploration staffs were based in Dawson City, Mayo and various remote fly camps. The locations and related accessibility of each prospect is displayed in Figure 1. The Mayo area properties reside in both the Mayo and Dawson mining districts.

The locations of the Mahtin area prospects, all of which reside west-northwest to the village of Mayo are summarized below in Table 1:

Table 1: 2012 Mahtin property locations.

Property Name	Centre Point (Longitude/Latitude)	NTS map sheets	Distance from Whitehorse (km)
Alp-Forty-Callum	136°46'31.402"W 63°46'31.402"N	115P15	350
Mahtin	136°47'31.726"W 63°51'50.693"N	115P15	365
May-Qu	136°44'12.708"W 63°46'18.355"N	115P15	350

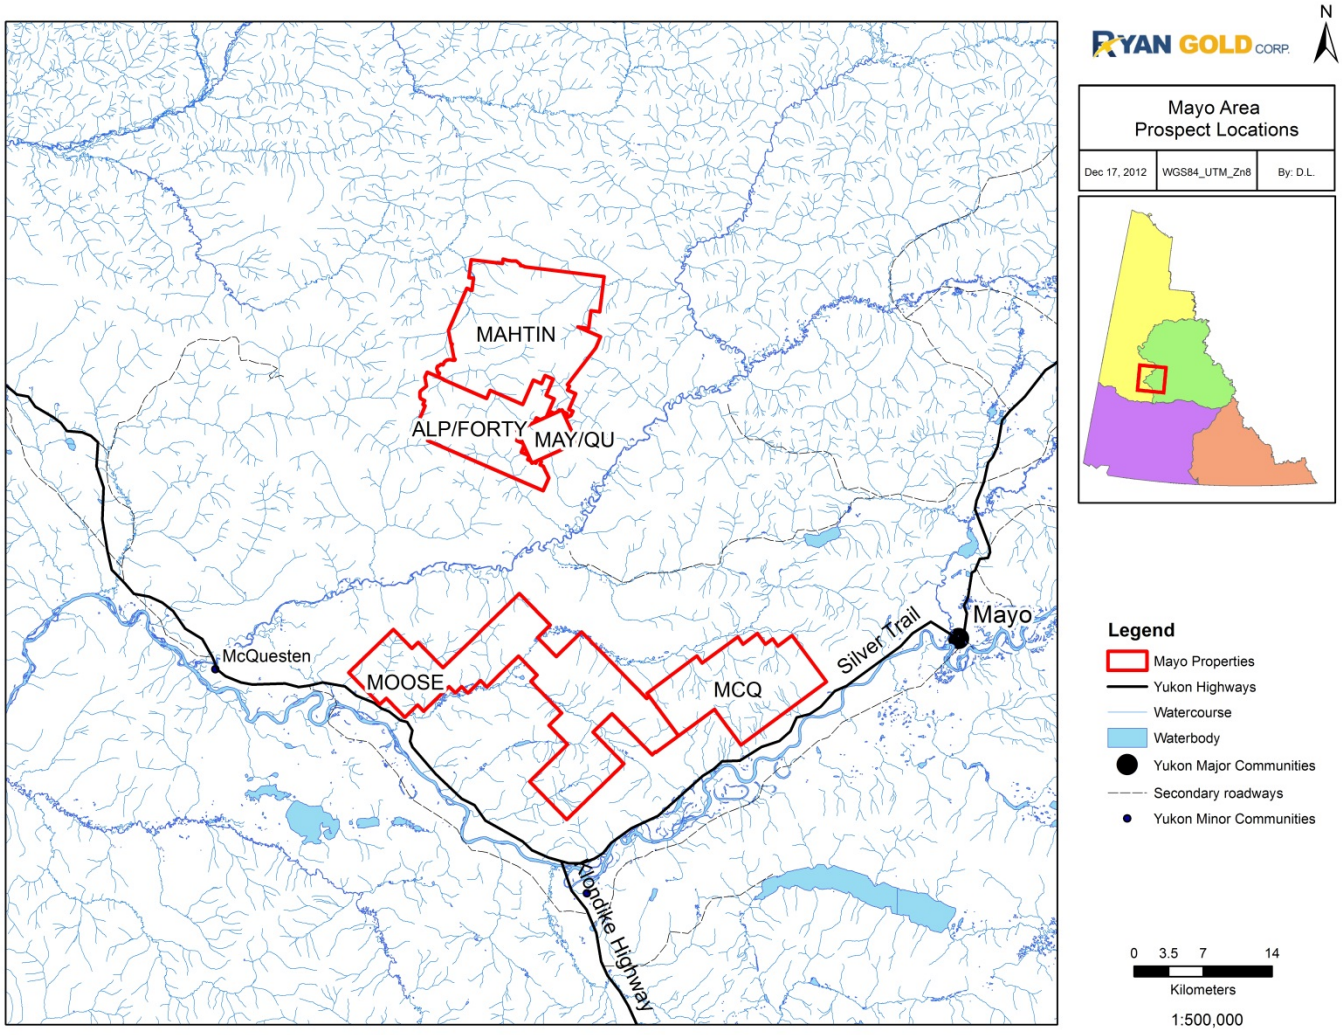

Figure 1: Location map of the Mayo Area Properties.

3.0 Claim Information

The total number of active claims and leases in accordance with the Quartz Mining Act as of 2012 for the Mayo area properties is 1434, as illustrated in Figure 2. A full claims listing can be found in Appendix 2.

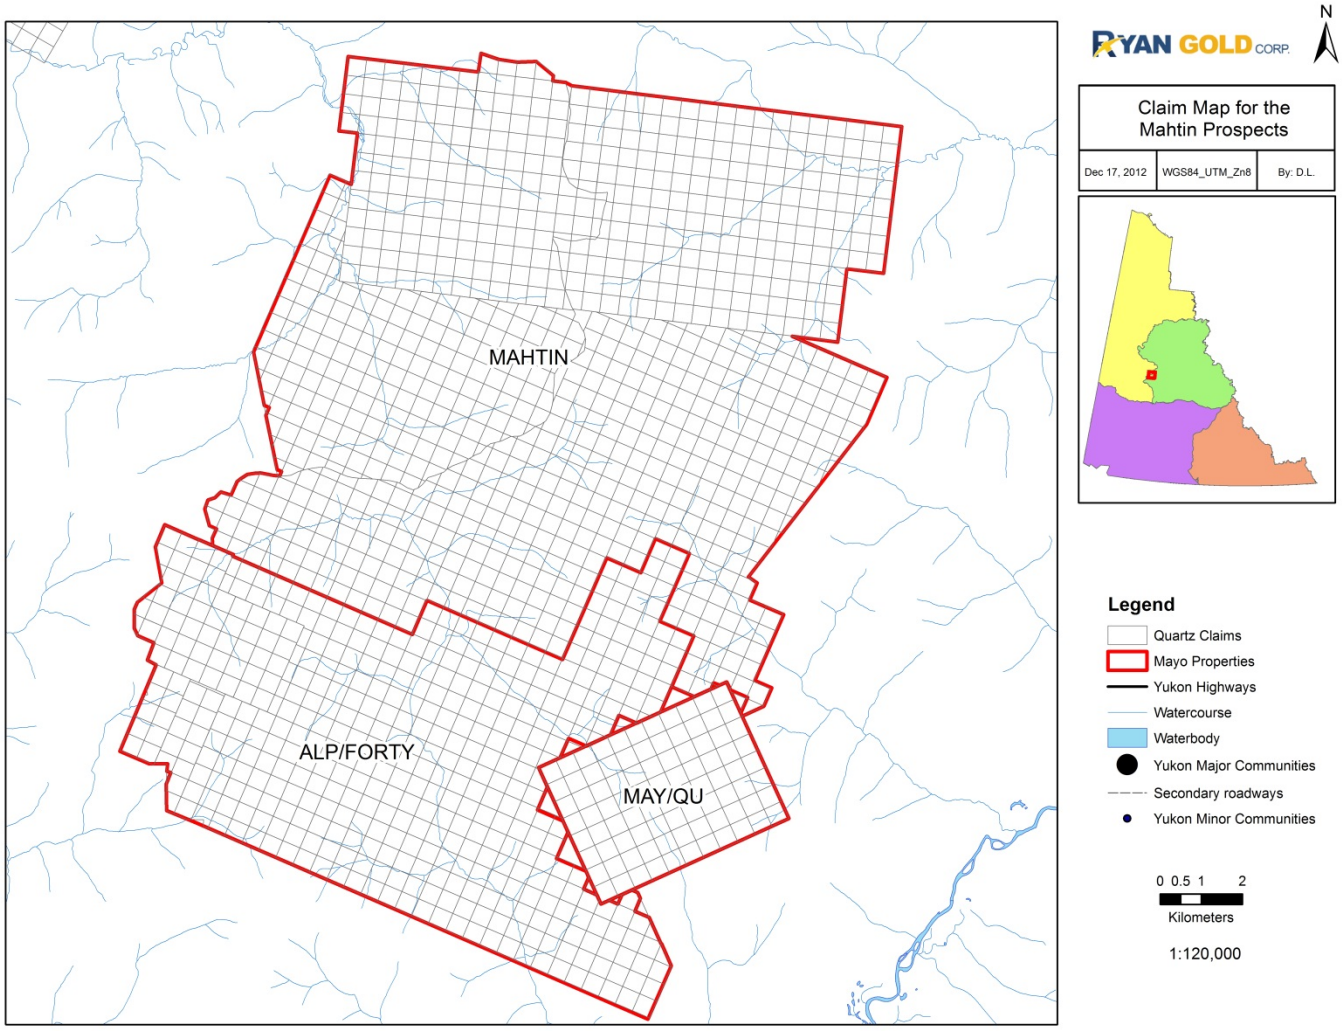

Figure 2: Mahtin prospects 'active' claim map.

Table 2 below displays total number of active claims and leases per prospect and claim ownership.

Table 2: 2012 Mahtin properties claim information; brackets highlighting claim breakdowns.

Property Name	# of Claims	Claim Owner	Mining District
Alp-Forty-Callum	344 (128-208-8)	45127 Yukon Inc – 30%, Ryan Gold Corp. – 70%	Mayo
Mahtin	916	45127 Yukon Inc – 30%, Ryan Gold Corp. – 70% (1-120) 100% Ryan Gold Corp. (121-916)	Dawson (1-157, 361-536) Mayo (158-360, 537-916)
May-Qu	88 (40-48)	45127 Yukon Inc – 30%, Ryan Gold Corp. – 70%	Mayo

Claims are individually referenced in Appendix 2 and displayed as separate property maps in Appendix 6.

4.0 Physiography & Climate

The Mahtin area is situated in the partially glaciated Stewart Plateau. Higher elevations were not affected by the last glaciation in the area during the Pleistocene. The area is largely defined as moderate to rugged, characterized by steep gradients and sheer ridges to rounded hills and modest gradient valleys with limited exposure. Elevation on the property ranges from 1200 meters at Horseshoe Creek to 1680 meters in the center of the Mahtin prospect and summit of the May-Qu prospect. Vegetation is concentrated along lower elevations, in drainages and north-facing aspects. Higher elevations are generally associated with scarce cover, limited to grassy knolls and minor buck brush.

The climate statistics for the Mahtin area are based on Canadian Climate Normals from the Mayo A station from the Nation Climate Data and Information Archive (Canada, 1971 - 2000). The station is located at Latitude: 63°37'00.000"N, Longitude: 135°52'00.000"W. The daily average temperatures for January and July are -25.7 °C and 16 °C respectively. The daily maximum temperature in July is 22.7 °C while the daily minimum temperature in January is -31 °C. The average annual rainfall for the area is 205.3 millimeters and the average snowfall for the year is 147 centimeters.

Discontinuous permafrost defines the region which has discernible permafrost issues regarding mass wasting and environmental concerns if any of the reported projects are to advance in stage.

5.0 Exploration History

Documented exploration history prior to work completed by Ryan Gold Corp. in 2011 is extensive given the nature of placer mining surrounding the Mahtin area. The Mahtin area prospects have been progressively expanded on since being acquired by Ryan Gold Corp. to the present day claim boundaries.

5.1 Alp-Forty-Callum

The Alp prospect, formerly the Sterling claim to the northeast, was staked by Silver Standard Mines Ltd in 1971. Silver Standard Mines Ltd. carried out; geological sampling, electromagnetic geophysical surveying and a five hole, 239 meter drill program. The data from Silver Standard Mines Ltd is unavailable online. In 1978, CCH Resources staked the Jabberwock claims to the south which eventually merged with the Cortin project in 1979. The joint venture by CCH Resources, Inco and Billiton conducted; geochemical sampling, geological mapping and prospecting of the area. The property was held by Placer Dome and other companies between 1988 and 1998 who carried out further geochemical and geological mapping. In 1999, Shawn Ryan acquired the property by staking the claims and conducted geochemical sampling and prospecting of the area.

The Forty prospect formed in 1979 with the joint venture between CCH Resources, Inco and Billiton, formerly named the Cortin project, staked the area as Bander & Snatch. Work was conducted on the property between 1979 and 1981 which included; geochemical sampling and geological mapping.

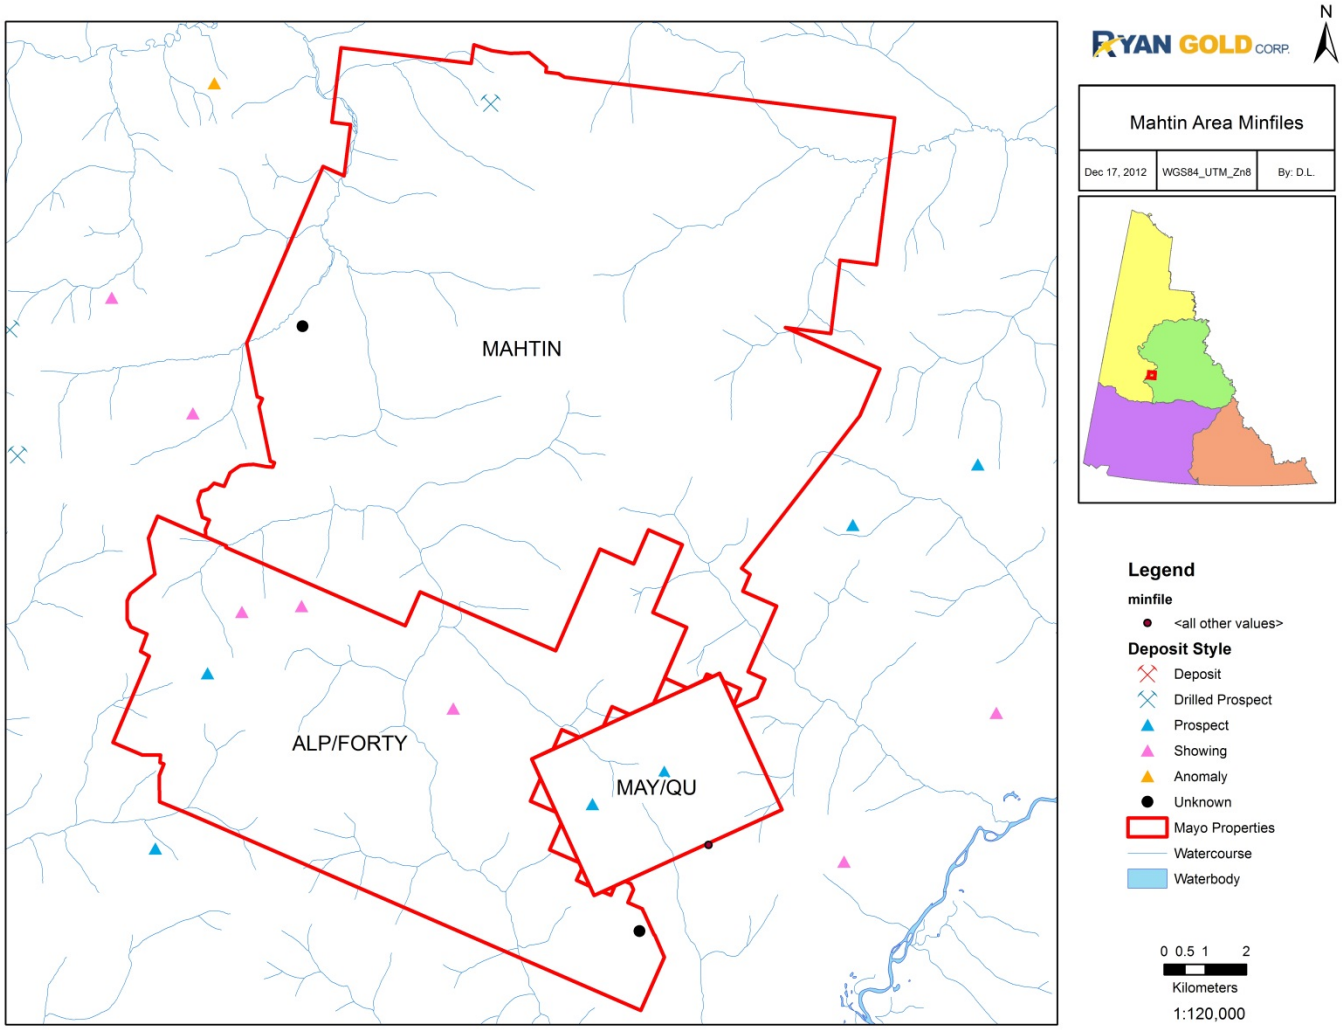

Figure 3: Mahtin Area Minfile Locations

5.2 Mahtin

The Red Mountain area residing almost adjacent to the northeast of the Mahtin prospect was first prospected in the mid 1920's when Treadwell Yukon Corporation discovered a quartz-gold-arsenopyrite-stibnite vein. Since the discovery, the area has been actively explored since 1948. The first corporation to officially stake claims was in 1979 by CCH Resources who conducted; stream sediment sampling, geological mapping and geochemical soil sampling. CCH Resources operated on the property until 1980. Between 1980 and 2003, the property was held by numerous prospectors and exploration companies, all carrying out; minor geochemical soil and rock sampling, geological mapping and trenching. In 2003, Shawn Ryan acquired the Mahtin claims by staking the area and carried out ground magnetometer and an IP geophysical survey. Shawn Ryan optioned off the claims to International Gold Resources in 2004 who conducted a 999 meter drill program in 2007 which consisted of 7 diamond drill holes on 2 separate pads. Further work by Shawn Ryan was carried out in 2005 and 2006. In 2005, additional magnetometer surveys, geochemical soil sampling, and trenching were carried out. In 2006, versatile time domain electromagnetic (VTEM) and cesium magnetometer geophysical surveys were conducted.

5.3 May-Qu

In 1962, Zulco Exploration first staked the May claims and conducted heavy-equipment trenching between 1963 and 1965. Between 1965 and 2004, several different companies and prospectors have carried out; geological mapping, geochemical soil and rock sampling, local geophysical surveys and trenching. In 2004, Shawn Ryan acquired the property by staking the claims and conducted geochemical soil and rock sampling. An assessment report regarding reverse circulation drilling in 2007 will be available soon, as it is temporarily still closed due to confidentiality and should be available within the year.

Originally staked as a part of the Snark claim block with CCH Resources in 1977, the Qu claim became part of the joint venture between CCH, Inco and Billiton, named the Cortin project, in 1979. Between 1978 and 1979, extensive mapping and geochemical sampling were carried out. Since, prospecting, sampling and trenching have been carried out by Archer, Cathro & Associates and Silverquest Resources.

6.0 Geology

6.1 Regional Geology

All the Ryan Gold prospects in the area with the exemption of Summit are located east of the Tintina fault, within the geologic unit, the Selwyn Basin. Systematic mapping of the area was started by H.S. Bostock of the Geological Survey of Canada between 1938 and 1941. Between 1938 and 1972, the Keno Hill area was studied intensively given the economic significance of the region. A hiatus of comprehensive studies in the region were absent until a framework mapping of the Mayo area began again in 1991. Murphy (1997) expanded the mineral exploration of the area by; identification of a previously unrecognized Cambrian sequence (potentially equivalent to the Anvil Mine sequence), the Tombstone intrusions (Dublin Gulch-type), and identification of potential gold deposits in structurally and stratigraphically controlled zones near plutons (Brewery Creek-type).

The Selwyn Basin formed in the Paleozoic era between the Cambrian and Devonian periods. The Selwyn Basin existed mainly as a passive margin, developed as a carbonate shelf. Depending on locality, the Selwyn Basin is usually characterized by deeper water facies, which include; shales, mudstones, siltstones and cherts. The Selwyn Basin phase of evolution of the continental margin is represented by ten rock units (Murphy, 1997):

- Yusezyu and Narchilla Formation (upper Proterozoic to lower Cambrian Hyland Group),
- Carbonate member of Narchilla Formation,
- Four members of the Gull Lake Formation (lower to middle (?) Cambrian),
- Rabbitkettle Formation (upper Cambrian to lower Ordovician),
- Duo Lake and Steel Formations (Ordovician to Devonian Road River Group),
- Earn Group (Devonian – Mississippian),
- Keno Hill Quartzite (Mississippian),

Structures surrounding the Selwyn Basin include; the Dawson Fault to the north, Mackenzie platform to the northeast, and the Tintina Fault to the southwest.

During the period where the Selwyn Basin existed as a passive margin, the inner miogeocline developed as a

carbonate shelf and the deep water facies listed above where deposited to the southwest. During the passive margin phase, respective periods of deformation and emplacement included; extension, volcanism, and horst & graben development. The extension phase formed a secondary rift basin which can be correlated to such units as the Misty Creek embayment – episodes of mafic and more minor felsic volcanism associated with the rifting. Horst & graben development occurred between the Silurian and Devonian which bound the basin to the southwest by the Cassiar Platform carbonates and volcanoclastics. The passive margin environment was terminated during the mid-Devonian due to a forming back arc setting. Marine transgression from rifting / wrench faulting resulted in a deep marine basin to exist during the mid-late Devonian. Regional uplift and erosion gave rise to an influx of sediments from the Hyland and Road River groups. The influx of eroded sediments from the west blanketed the south and east Earn group – a SEDEX-rich asset. Following regional uplift and the subsequent erosion was a northeast-orientated compression during the Mesozoic. The compression resulted in the formation of thrust and fold belts throughout the region. Between the Jurassic and early-mid Cretaceous, large scale thrust faulting, open to tight similar folds, imbricate fault zones and an axial planar slaty cleavage developed throughout the Selwyn Basin.

Three principal thrust faults developed in the western and central areas of the Selwyn Basin which from youngest to oldest, south to north, are; the Robert Service Thrust, the Tombstone Thrust and Dawson Thrust.

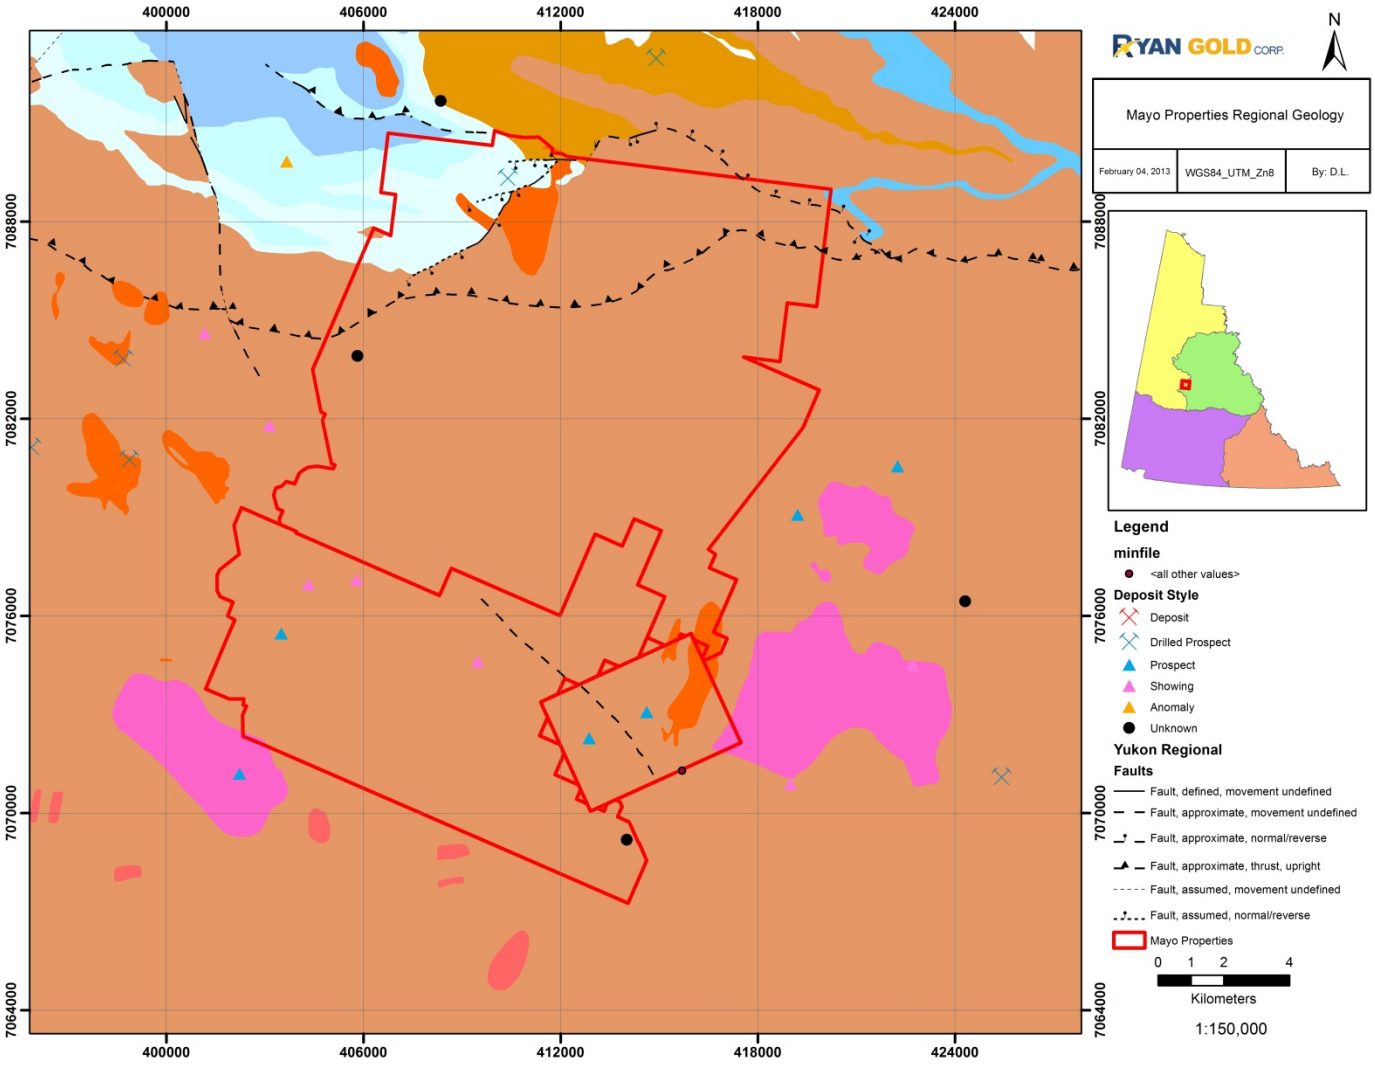

Figure 4: Mayo Area Regional Geology

Legend

Mayo Properties

20121129_SD_MAYO_REGIONAL_GEOLOGY

LATE CRETACEOUS

LKqM: MCQUESTON SUITE: medium- to coarse-grained, locally porphyritic and K-feldspar megacrystic biotite muscovite granite and quartz monzonite;

MID-CRETACEOUS

mKT: TOMBSTONE SUITE: plutonic suite dominated by felsic (q) to syenitic (y) compositions

mKyT: TOMBSTONE SUITE: medium- to coarse-grained biotite-hornblende-clinopyroxene syenite, quartz syenite; tourmaline orbicular granite; hornblende biotite alkali-feldspar syenite; hornblende-biotite monzogranite; clinopyroxenite, diorite, and pseudoleucite tinguaite (Tombstone Suite)

mKyT?: TOMBSTONE SUITE: medium- to coarse-grained biotite-hornblende-clinopyroxene syenite, quartz syenite; tourmaline orbicular granite; hornblende biotite alkali-feldspar syenite; hornblende-biotite monzogranite; clinopyroxenite, diorite, and pseudoleucite tinguaite (Tombstone Suite)

mKqT: TOMBSTONE SUITE: medium- to coarse-grained, locally porphyritic biotite hornblende, clinopyroxene granite, quartz monzonite and granodiorite (Tombstone Suite)

mKS: SELWYN SUITE: plutonic suite of intermediate (g) to more felsic composition (q) and rarely syenitic (y); equivalent felsic dykes (f); complete compositional gradation so that these designations are somewhat arbitrary

mKqS: SELWYN SUITE: equigranular to porphyritic (K-feldspar) biotite hornblende muscovite granite, quartz monzonite and granodiorite; porphyritic biotite hornblende granite with large smoky grey quartz phenocrysts and locally K-feldspar phenocrysts (Selwyn Suite)

DEVONIAN AND MISSISSIPPIAN

DME: EARN: complex assemblage of submarine fan and channel deposits (1), (5) within black siliceous shale and chert (2), (4) and including separated small occurrences of felsic volcanic rocks (3); barite common, and many occurrences of stratiform Pb-Zn

DME1: EARN: thin bedded, laminated slate with thin to thickly interbedded fine to medium grained chert-quartz arenite and wacke; thick members of chert pebble conglomerate; black siliceous siltstone; nodular and bedded barite; rare limestone (Earn Gp., Portrait Lake and Prevost)

ORDOVICIAN TO LOWER DEVONIAN

ODR: ROAD RIVER - SELWYN: black shale and chert (1) overlain by orange siltstone (2) or buff platy limestone (3); locally contains beds as old as Middle Cambrian (4); correlations with basinal strata in Richardson Mountains include: ODR1 with CDR2 (upper part) and ODR2 with CDR4 (Road River Gp.)

ODR1: ROAD RIVER - SELWYN: black, gun-blue, or silvery white weathering black graptolitic shale and black chert; resistant grey weathering, thin to medium bedded, light grey to black, greenish grey or turquoise chert; minor argillaceous limestone (Road River Gp., Duo Lake and Elmer Creek)

ODR2: ROAD RIVER - SELWYN: rusty dark green to orange buff weathering, pyritic, burrowed, thin to thick bedded, argillite and dolomitic siltstone with members or partings of black shale and chert; minor bright orange dolostone (Road River Gp., Steel)

UPPER CAMBRIAN AND ORDOVICIAN

COR: RABBITKETTLE: basinal limestone (1) that may locally include older and younger basinal pelitic strata undivided (2)

COR1: RABBITKETTLE: thin bedded, wavy banded, silty limestone and grey lustrous calcareous phyllite; limestone intraclast breccia and conglomerate; massive to laminated, grey quartzose siltstone and chert and rare black slate; local mafic flows, breccia, and tuff (Rabbitkettle)

COR1?: RABBITKETTLE: thin bedded, wavy banded, silty limestone and grey lustrous calcareous phyllite; limestone intraclast breccia and conglomerate; massive to laminated, grey quartzose siltstone and chert and rare black slate; local mafic flows, breccia, and tuff (Rabbitkettle)

LOWER CAMBRIAN

lCG: GULL LAKE: dominantly fine clastic assemblage (1) with local volcanic units (2)

lCG1: GULL LAKE: shale, siltstone and mudstone, locally bioturbated, with minor quartz sandstone; rare green-grey chert; local basal limestone and limestone conglomerate; phyllite to quartz-muscovite-biotite schist (garnet sillimanite staurolite andalusite) (Gull Lake)

lCG2: GULL LAKE: dark green massive to fragmental mafic metavolcanic and volcaniclastic rocks; siltstone and argillite

UPPER PROTEROZOIC TO LOWER CAMBRIAN

PCH: HYLAND: consists upwards of coarse turbiditic clastics (1), limestone (2) and fine clastics typified by maroon and green shale (3); may include younger (4) units; includes scattered mafic volcanic rocks (5) (Hyland Gp.)

PCH1: HYLAND: thin to thick bedded, brown to pale green shale, fine to coarse grained quartz-rich sandstone, grit, and quartz pebble conglomerate; minor argillaceous limestone; phyllite, quartzofeldspathic and micaceous psammite, gritty psammite and minor marble (Hyland Gp., Yusezyu)

PCH2: HYLAND: grey weathering, dark grey to grey white, thin to thick bedded, very fine crystalline limestone, locally sandy; calc-silicate and marble; may locally include carbonate members within (1) or (4) (Hyland Gp., Algae Lake , limestone member of Yusezyu)

PCH2?: HYLAND: grey weathering, dark grey to grey white, thin to thick bedded, very fine crystalline limestone, locally sandy; calc-silicate and marble; may locally include carbonate members within (1) or (4) (Hyland Gp., Algae Lake , limestone member of Yusezyu)

PCH3: HYLAND: distinctive, recessive, maroon weathering, interbedded maroon and apple-green slate; "Oldhamia" trace fossils; rare grey chert; locally basal member and interbeds of quartz siltstone, sandstone and quartz-pebble conglomerate (Hyland Gp., Narchilla , Senoah , Arrowhead Lake)

PCH4: HYLAND: quartzose clastic rocks as described in (1); mostly(?) equivalent to (1) but may include younger units (Hyland Gp., mostly(?) Yusezyu)

6.2 Property Geology

6.2.1 Alp-Forty-Callum

Alp-Forty is a prospect defined entirely by Hyland group sediments aside from a small sliver of the Vancouver Creek stock on the south-western corner of the prospect's boundary. The lithology is primarily quartzite and schist. The rocks on the property are locally brecciated along a north-south lineament.

6.2.2 Mahtin

The geology of the property is dominantly the Hyland Group, but also includes younger, Palaeozoic formations in the northwest corner (Road River group, Rabbitkettle formation and the Gull Lake group) and several Cretaceous intrusions (Tombstone Suite) located in the northwest and southeast corners. The Mahtin prospect is located on the southern side of the Lost Horse Syncline. The property contains skarns and zones of hornfelsing in limestones, cherts and shales of the Rabbitkettle formation.

6.2.3 May-Qu

The geology at May-Qu is similar to that of the Mahtin prospect such that the property is focused around a Tombstone Plutonic Suite intrusion, the Bos Stock. A larger, younger Cretaceous intrusion sneaks into the southeast edge of the claim block. Hyland group sediments shape the rest of the prospect, dominantly quartzite and schist with minor limestone units.

Property geology maps for all three prospects can be found in Appendix 6.

7.0 Exploration Program 2012

The intent of the 2012 Ryan Gold Corp. exploration program for the Mahtin area was to advance the understanding of the properties, supplemented by extensive geochemical sampling, and detailed geologic mapping, generally at a scale of 1:20,000.

Due to the nature of the reconnaissance mapping and sampling programs via helicopter, there was little to no disturbance of the areas. Remote lodging at the Silver Trail Inn, near the village of Mayo, allowed operations to be carried out with zero site work construction. All work completed on the various Mahtin properties was in accordance with the issued Class 1 permit.

7.1 Soils

The geochemical soil sampling was contracted to and completed by Ground Truth Exploration Inc. The soil grids were chosen based off targeted zones from the previous season results and the historic mineral showing. A total of 9379 soils were taken, within the Mayo mining district, and 24 soils were taken within the Dawson Mining District. The soil sampling on the Mayo Area properties was conducted from June 17th to September 19th 2012.

7.2 Geological Mapping

The reconnaissance bedrock mapping of the Mahtin area during the 2012 exploration program resulted in the collection of 72 grab samples within the Dawson Mining District. A total 186 geological observations were taken which aided in the geological interpretation of the properties. Grab sample coordinates for the Mahtin area are listed in Appendix D and illustrated by location maps in Appendix F. Dates worked and total field observations and grab samples taken for the 2012 field program, per property, is displayed in Table 4.

Table 3: Dates and sample/observation totals for geological work completed during the 2012 field season program, by property.

Property Name	Field Dates (2012)	Total Grab Samples	Total Observations
Mahtin	June 5th – July 13th	72	186

8.0 Geochemical Analytical Procedure

8.1 Grab Sampling

Sampling, chosen based on geological relevance, followed a methodical set of procedures from initial sample collection to final database recording. Samples were typically chipped away from outcrop showings, using a standard Estwing rock hammer, into polyurethane bags and recorded digitally using a Pidion/IPAQ handheld PDA device. Before sealing the bag with a cable tie, an ALS Chemex supplied sample tag was placed inside the bag and then another stapled to the open, outside edge, finally followed by marking the number on the bag using a permanent felt. The closed sample, along with a marked show sample, was stored amongst the others throughout the day by the sampler in a field pack. After returning each day, sample numbers and descriptions were uploaded to a database and the samples were securely stored until a batch shipment was prepared. The on-site project geologist was responsible for creating the chain of custody and shipment forms. Samples were placed in a sample string with a systematic pattern of standards and blanks to ensure QA/QC, grouped in rice bags and secured with security tags. The batch shipments would be transported via expeditor or Ryan Gold personnel to ALS Chemex in Whitehorse, where the samples were prepped and shipped to their Vancouver lab for assaying and QA/QC checks. Throughout the shipment process, a chain of custody paperwork trail was maintained to ensure sample security.

Once in at the ALS Lab in Whitehorse the samples are received, weighed and logged. Samples are then crushed until 80% or better passes through a 2 mm mesh screen. This resulting material is put through a riffle splitter, where a 1000 g sample is isolated and the rest is collected as reject. The sample is pulverized further until 85% or better passes through a 75 micron mesh screen. After this step the pulp material is shipped to the North Vancouver lab for analysis. The remaining reject material is stored in Whitehorse.

The material that is shipped to the North Vancouver lab is split using a riffle splitter where a 50 g sample is isolated. The reject material from this process is stored at the lab. This 50 g sample is now subjected to ICP22 and ME-MS41 assaying methods. The ICP22 is a fire assay and ICP-AES method to assay for gold, and can detect values between 0.01 ppm and 10 ppm. ME-MS41 is a 51 element analysis by aqua regia digestion and a combination of ICP-MS and ICP-AES assaying. Assays for Au, Ag, Cu, Pb, As, Zn and Sb that are above detection are then finished using a gravity method to obtain true value. Final results using the methods above are reported to Ryan Gold electronically, consisting of an excel spreadsheet and a PDF certificate of work.

8.2 Soil Sampling

All sampling traverses are pre-planned, with pre -specified sampling intervals, typically 50m. Field technicians navigate to sample site using handheld GPS units. The soil sampler arrives at each sample site, identifies the most appropriate location to collect the sample and lays out a sheet of plastic (12”x20” ore bag). The soil sample is taken using an Eijklcamp brand hand auger at a depth of between 20cm and 110cm. Samplers strive to consistently collect C-Horizon sample material. Where necessary (rocky or frozen ground) a prospector's pick ('mattock') is used to obtain the sample. The soil is laid out on the sheet of plastic in the order it was recovered from the sample hole. Standardized photos are taken of the sample site- across slope, 5m from sample hole with auger inserted. With the necessary amount of soil (400-500 grams) has been collected, the deepest soil is taken and placed in a bag labeled with the 3-letter project and tagged with a unique barcode ID tag containing a unique 7 digit sample identification number. An aluminum metal tag inscribed with the sample identification number is attached to a rock or branch in a visible area at the sample site along with a length of pink flagging tape.

A field duplicate sample is taken once for every 25 samples. Both samples are given unique Sample identification number. The data for both samples is recorded and a note is made indicating the duplicate and its corresponding sample identification number.

The GPS location of the sample site is recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD83 format, and the waypoint is labeled with the project name and the sample identification number.

A weather-proof handheld device equipped with a barcode scanner is used in the field to record the descriptive attributes of the sample collected. This includes: sample identification number (scanned into device at sample site), soil colour, soil horizon, slope, sample depth, ground and tree vegetation and sample quality and any other relevant information. As well, the GPS coordinates are entered into the handheld device as a secondary backup in case of GPS failure.

Each night in the field, the GPS and Palm PDA devices are downloaded to a laptop computer. The data is verified and mapped on a sampler-by-sampler basis in proprietary database auditing and mapping software. At the end of each day, the crew boss inspects all samples for size and consistency as a quality check. Each sampler then repackages all samples for shipping- barcode scanning them as they are placed into a rice bag which is sealed with a

barcoded security zip tie. Samples are shipped from the field to the lab on a daily basis, tracked by the unique ID on each security seal.

A backup of the sample data is made, copied onto a USB memory stick and kept in a separate location from the laptop computer until job completion. Where possible, a backup is also sent via e-mail.

Samples were processed by Acme Labs in Vancouver with Aqua Regia digestion and analyzed with ICP-MS for 36 elements (Acme Labs 1DX-15 gram). Samples are dried at 60°C, sieved at -80 mesh.

9.0 Exploration Results 2012

9.1 Soil Sampling

A total of 9,379 soil samples were taken on the Mayo prospects (Alp/Forty, Mahtin, May-Qu) contained in the Mayo mining district. A further 24 soil samples were taken on the Mahtin prospect that fell in the Dawson Mining district. A list of the sample locations of these soil samples can be found in Appendix 4. Figure 6 shows the soil sample locations for the 2012 exploration season. The soil sampling survey was conducted by Groundtruth Exploration Inc. Figure 7, 8 & 9 shows the Au-in-soil from the 2012 geochemical survey on the Alp/Forty, May-Qu and Mahtin properties, respectively.

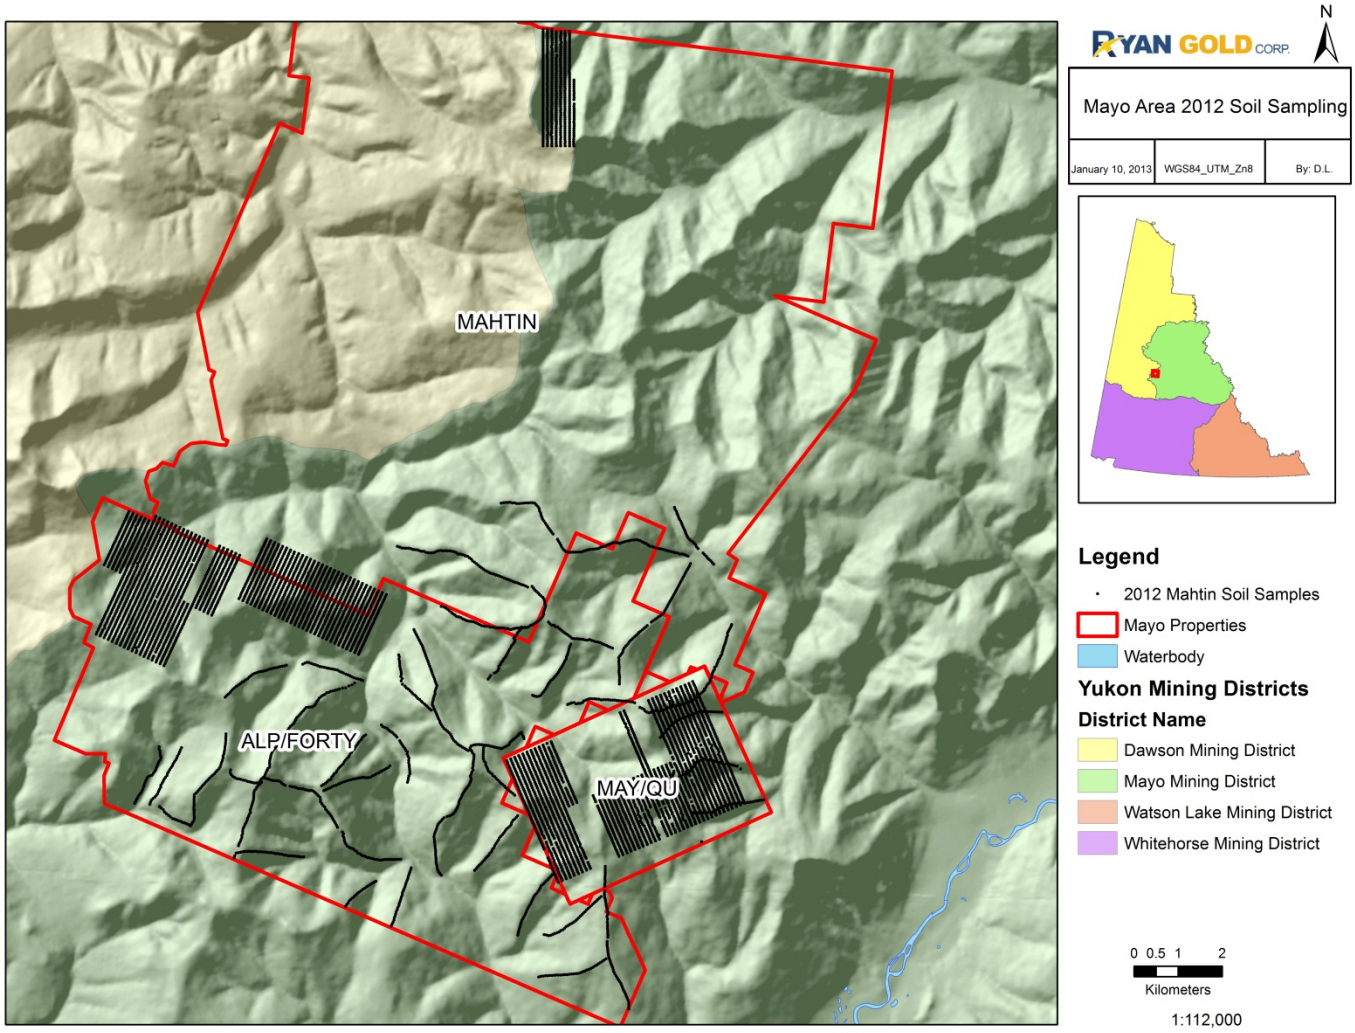

Figure 6: Mayo Properties 2012 Soil Sampling

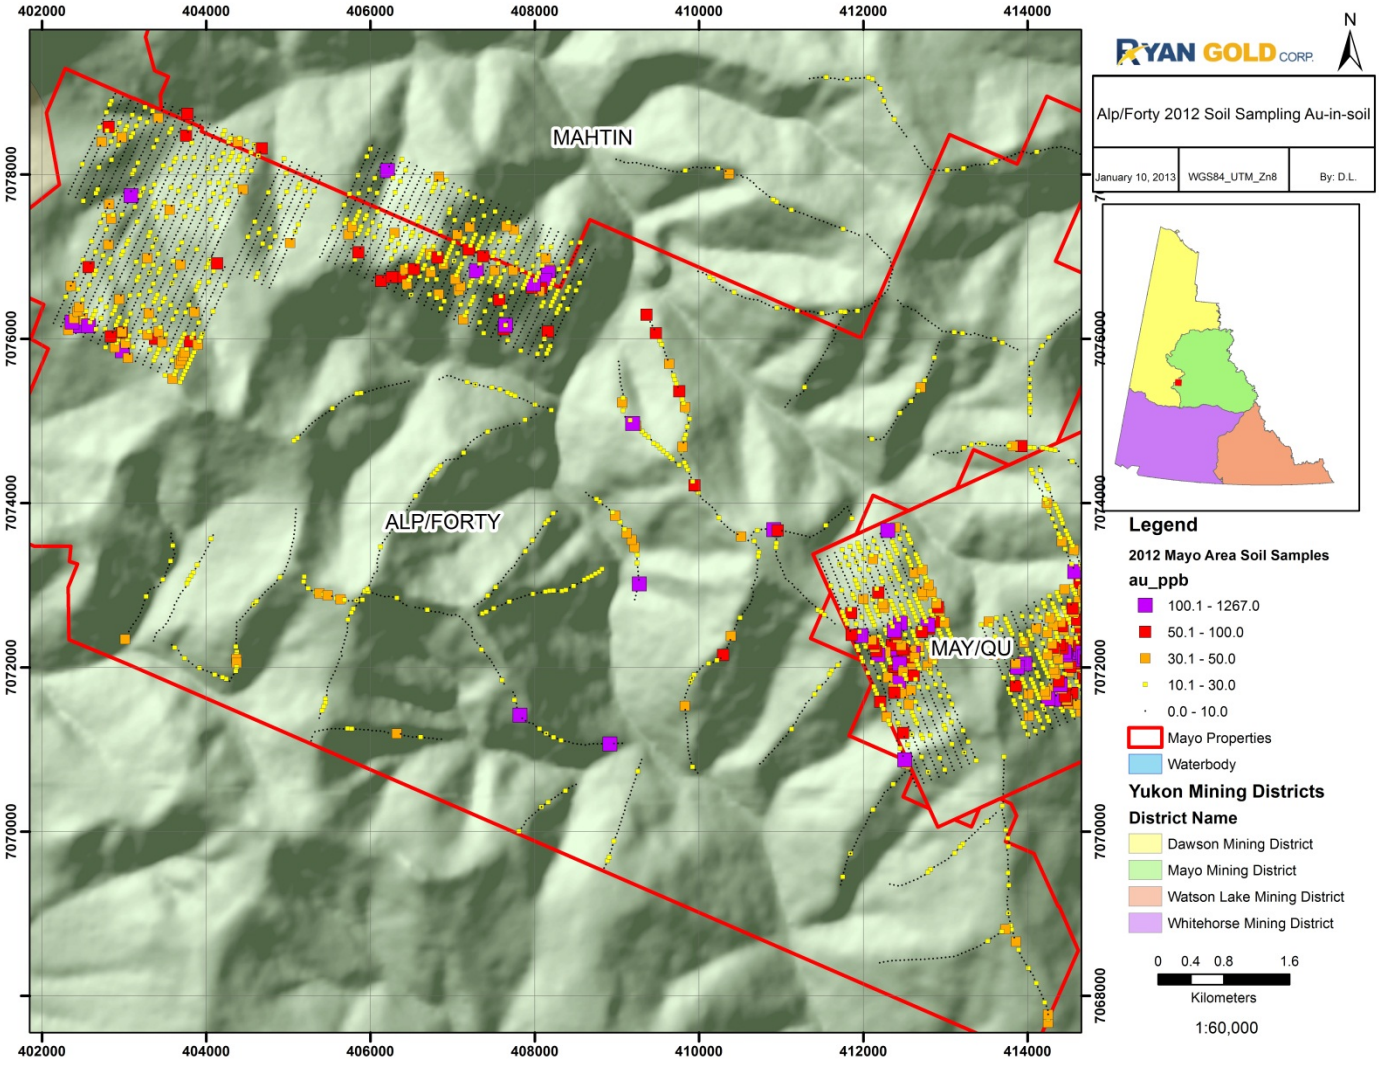

Figure 7: Alp/Forty 2012 Soil Sampling

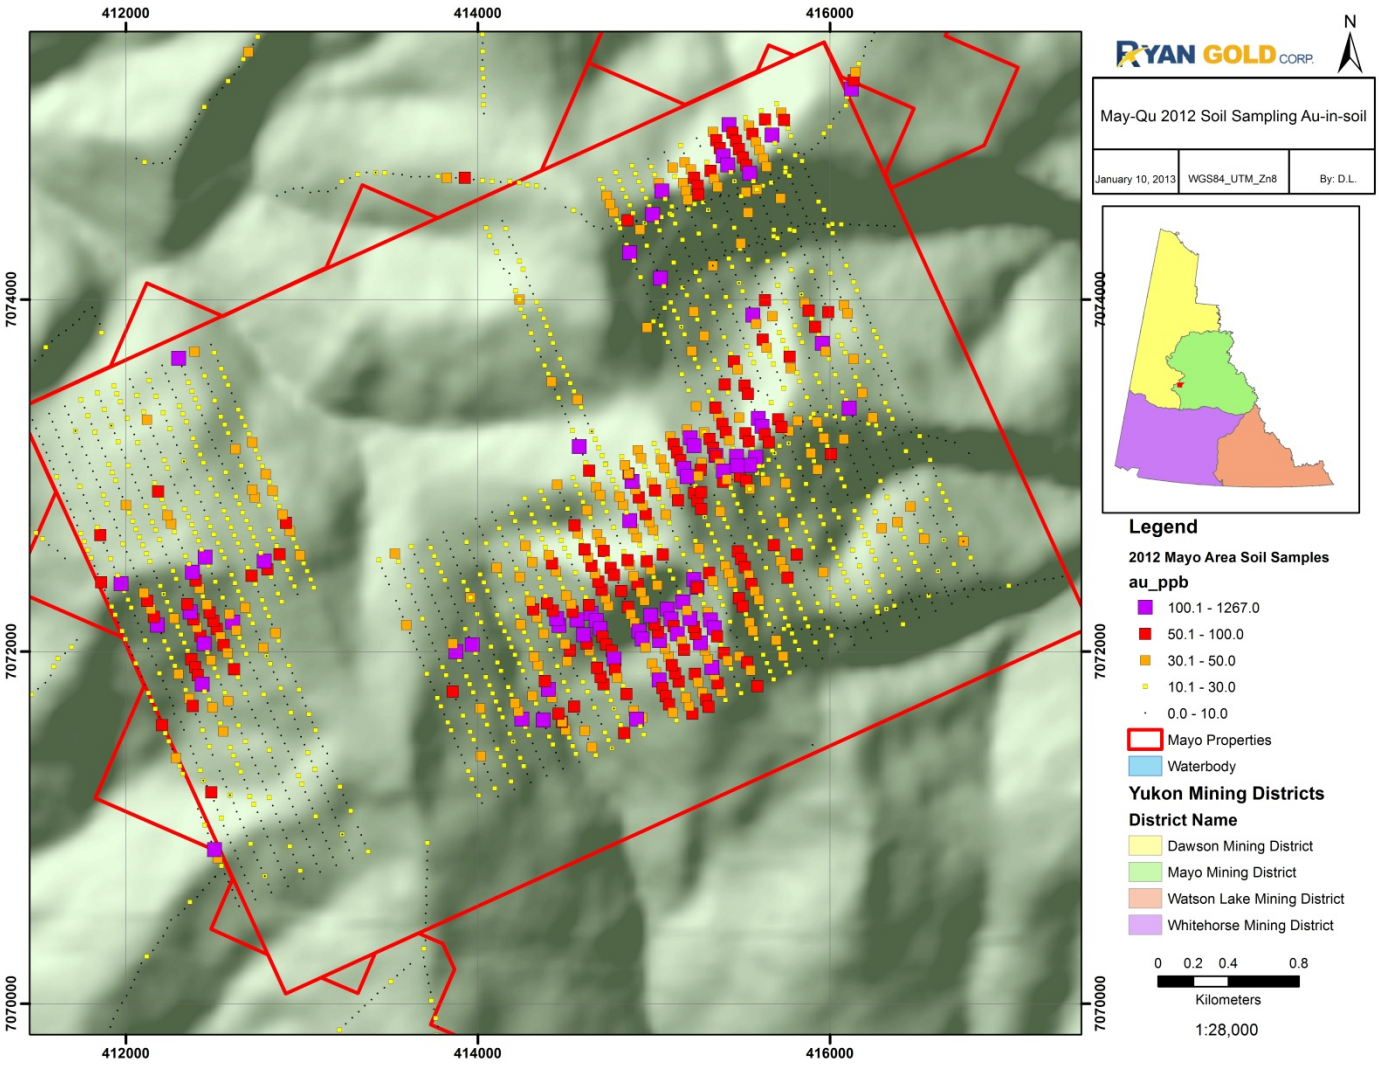

Figure 8: May-Qu 2012 Soil Sampling

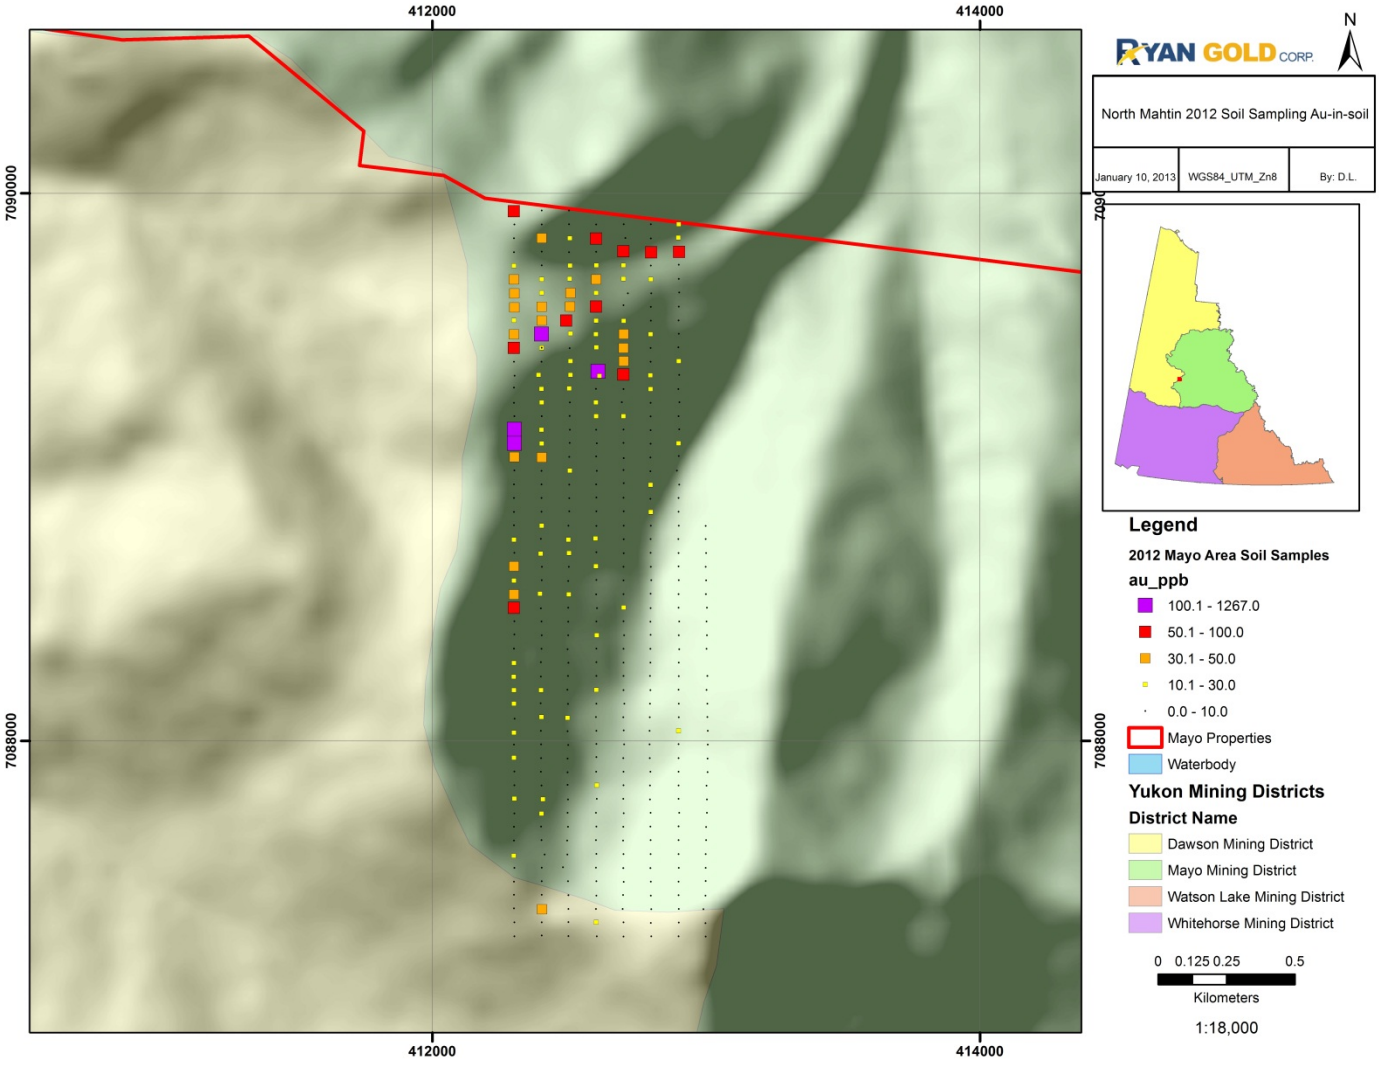

Figure 9: North Mahtin 2012 Soil Sampling

A total of 107 soil samples collected were found to have Au-in-soil values of more than 100 ppb. The highest values (>400 ppb) were all found on the Mahtin property with a maximum Au-in-soil value of 1267 ppb. Table 4 summarizes the most anomalous samples for Au, As, Cu, Pb, & Ag on Alp/Forty, Mahtin and May-Qu.

Element	Sample I.D.	Property	Easting	Northing	Element-in-soil value
Au	1316274	Mahtin	414447	7072187	1266.8 ppb
Au	1326310	Mahtin	415671	7074935	724.2 ppb
Au	1324048	Mahtin	402977	7075856	656.6 ppb
Au	1326409	Mahtin	415474	7073054	625 ppb
Au	1312820	Mahtin	414863	7074266	545.4 ppb

Table 4: 2012 Mayo properties soil sampling anomalous assay results

Full details of the soil sampling locations and results can be found in the appendices.

9.2 Mahtin Mapping & Rock Sampling

The Mahtin prospect was worked by members of the Ryan Gold team between the dates of June 5th and July 13th, 2012, and returned 186 geological observations and 72 geochemical samples. The terrain proved to be suitable mapping outcrop. The samples retrieved were limited in mineralization and no significant results were found during the 2012 field season.

Prospecting and reconnaissance mapping completed on Mahtin resulted in the construction of a 1:10,000 scale map, limited to traverses and outcrop exposures. The production map focuses on the northwestern section of the property where 2007 drilling by International Gold Resources was completed and highest anomalous soils from Ryan Gold Corp.'s 2011 geochemical sampling program were found. The produced map which illustrates the general location of samples and observations retrieved during the 2012 field season is displayed in Figure 10.

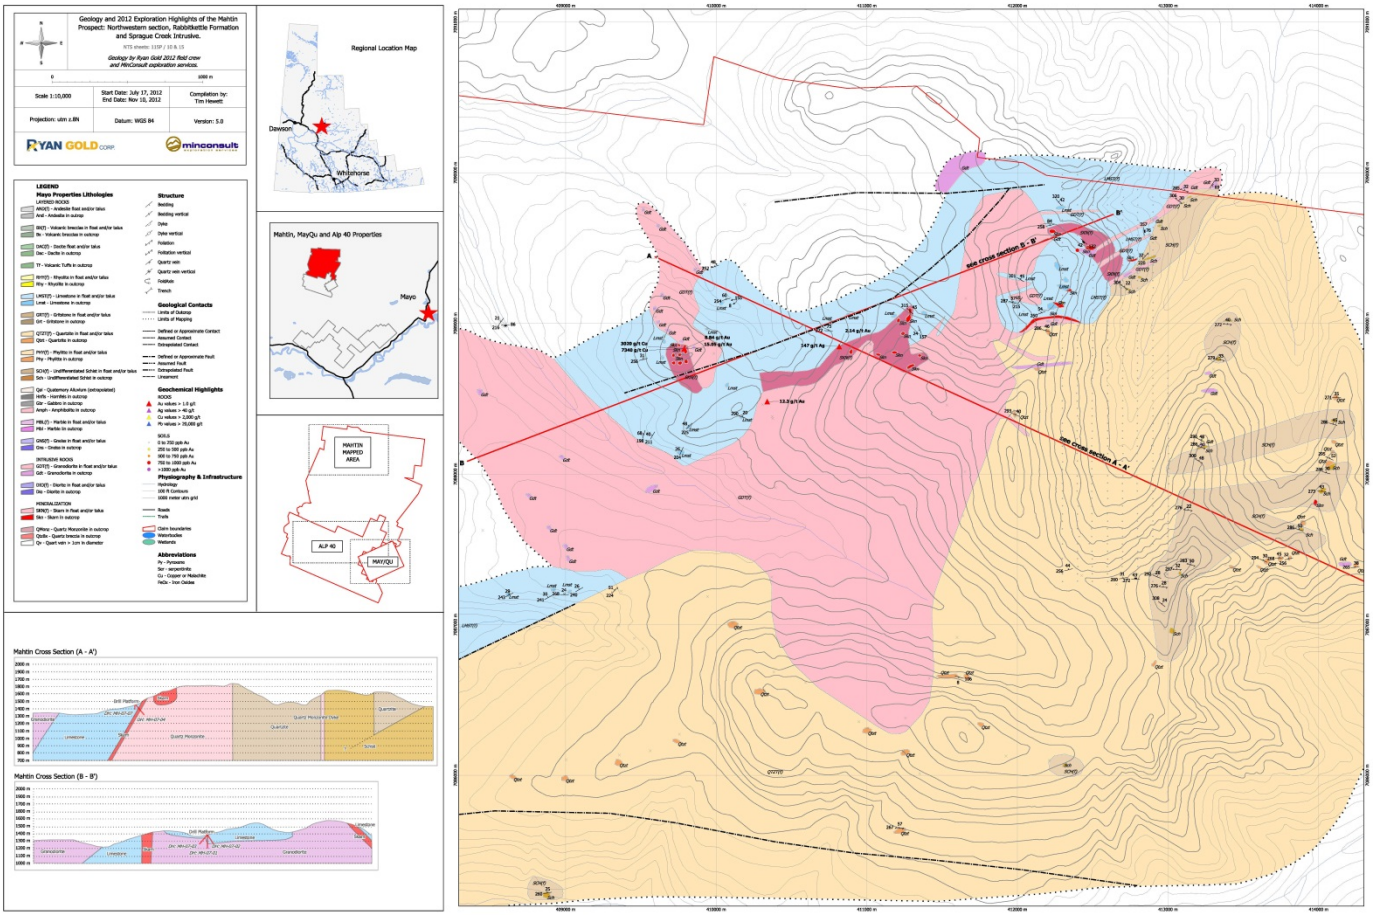

Figure 10: Geologic and exploration summary map of observations and notable assays of the Mahtin prospect from the 2012 field season.

Figure 8 highlights the Sprague Creek stock's relation to the Hyland Group, Rabbitkettle Formation and associated skarnification. The mapping done by the Ryan Gold Corp. team compliments the work compilations completed by Gordey & Makepeace (1999).

The lithologies which define the Mahtin prospect are; quartzite & schist of the Hyland group, limestone and chert units of the different Palaeozoic formations, and the Cretaceous granodiorite and quartz monzonite intrusions. Other lithologies include; skarn, mafic & felsic dykes, minor conglomerates & breccias. Skarnification of the calcareous unit adjacent to the intrusion is the most significant alteration in the Mahtin property, given the economic significance. The skarn is most likely a result of the Sprague Creek intruding and altering the adjacent Rabbitkettle Formation calcareous units. The skarn can be more accurately described as a massive, green diopside-garnet exoskarn. Other alterations include; pervasive silicification, chloritization and sericitization, leaching, weathering and Fe-O staining & mineralization. Faulting and parasitic folding within the Mahtin prospect is apparent throughout the property. No regionally defined vein sets were observed, however local vein structures included; stockwork, cross-cut and minor sheeted veining. Structures of interest include; the known thrust fault which cuts through the centre of the property which is further highlighted by anomalous soil samples, splays off the main thrust which are topographically observed with minor mineral showings and the faulted Sprague Creek stock. Observable mineralization includes: pyrrhotite, pyrite, arsenopyrite, chalcopyrite, and sphalerite. Mineralization averages less than 3% per sample and was hosted throughout the differing units of the Mahtin prospect, but mainly within the skarn. Styles of mineralization included; disseminated, massive, replacement and vein-hosted. The most significant mineralization were observed in historic drill core that displayed massive, >1cm wide pyrrhotite +/- sphalerite veins which were observed within the skarn, displayed in Figure 10.

Sample I.D.	Lithology	Easting	Northing	Grade (Au) [g/t]
41624	Skarn	409788.5	7088831	15.05
41064	Limestone	409787.4	7088832	8.84
41501	QuartzBreccia	410816.3	7088847	2.14
Sample I.D.	Lithology	Easting	Northing	Grade (Cu) [g/t]
41624	Skarn	409788.5	7088831	7340
41769	Gossan	411354.4	7088964	4230
41064	Limestone	409787.4	7088832	3020
41063	Limestone	409684.3	7088831	1920
Sample I.D.	Lithology	Easting	Northing	Grade (Ag) [g/t]
41501	QuartzBreccia	410816.3	7088847	147

Table 5: Best assays from Mahtin 2012 grab samples

Appendix 5 displays the complete work certificates for all work performed on the Mahtin prospect during the 2012 field program.

10.0 Conclusions and Recommendations

10.1 Mahtin

One of the potential deposit types in the Mahtin prospect would be the IRGS-style intrusions, the Sprague Creek and Bos stocks. Notable IRGS deposits which are within in the same Tombstone Plutonic Suite, include; Dublin Gulch, Brewery Creek, Scheelite Dome, Doblin Creek and Fort Knox (Hart, 2005). Mineralization and structure within the intrusion was difficult to observe and International Gold's 2007 drill results (Doherty, 2007) would suggest the mineralized zone, if it exists, has yet to be found within the Sprague Creek stock. However, the lack of structure and alteration in a known TPS district makes the Sprague Creek stock similar to that of the Shamrock zone at Dublin Gulch (located roughly 30 kilometres away) which is a recognized Au-resource. Another potential mineralization host in the Mahtin prospect is the Nevada-favourite "dirty" limestone, Carlin-style deposit (Large, Bull, & Maslennikov, 2011). However, the lack of regional volume regarding the Rabbitkettle Formation would suggest that the deposit style is unlikely in the area. Between the IRGS-style Sprague Creek stock and Carlin-friendly Rabbitkettle Formation resides a skarn unit which is a well-known Selwyn Basin style deposit type (Murphy, 1997). The skarn at Mahtin revealed to have the highest Au returns during the 2007 drill program with grades as high as 2.4 g/t (Doherty, 2007).

The skarn unit located within the north-western section of the Mahtin prospect has the highest potential for an economic resource. The skarn was mapped and further defined which is displayed in Figure 6, Figure 7 and Figure 8. Other potential resources in the area include unavailable Minfile showings and fault-hosted mineralization. Further exploration is recommended on the north-western section of the Mahtin property to better understand the mineralized skarn and 'tiger-rock' units. This would include further detailed mapping as well as channel sampling along the zones of mineralization. This would help determine the extent of mineralization outside of the skarnified zone and into the host rock. Once the size and extent of mineralization has been understood at surface, drilling can be used to test the depth of mineralization and 3-dimensional extent of the possible ore body.

10.2 May-Qu

Similar to the Mahtin property, the TPS intrusive Bos Stock is a key interest in the exploration of the region. The contact metamorphism, primarily at the south-western tail edge of the Bos Stock revealed the most intense mineralization. The soil sampling of the May-Qu property revealed some anomalous trends. The Au-in-soil trend is related to the contact between the Bos Stock intrusive and the metasediments (schists and quartzites). The Bos Stock intrusive bodies seem to follow the regional trend of the McQuesten antiform which also defines the Au-in-soil trend. This trend is offset by known faults in the area that define the drainages running NW-SE.

Further groundwork will need to be performed to progress this property. Detailed mapping will be essential to defining the controls and mineralization and the host of such mineralization. Establishing which lithology contains the Au mineralization and whether it is vein controlled or lithologically hosted will help progress the exploration. Channel sampling will also be beneficial.

10.3 Alp-40

The Alp/Forty property has been soil sampled sparsely in relation to the size of the property. Ridge & spur sampling has identified some areas that would be desirable for grid sampling (Figure 5). The area in the north central property contains several good Au-in-soil assay values that should be further explored with more soil sampling. In the west portion of the property the soil grid in the northwest corner of the property should be extended to the south to test the extent of the soil anomaly discovered. Property wide geological mapping would be useful in accompanying the soil survey data to identify possible drill targets for the future.

CERTIFICATE WH12132944

Project: Mahtin, McQuesten & Summit

P.O. No.: MH12-002

This report is for 60 Rock samples submitted to our lab in Whitehorse, YT, Canada on 13-JUN-2012.

The following have access to data associated with this certificate:

HUA JIN	ANDY RANDELL	CARRIE WONG

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-24	Pulp Login - Rcd w/o Barcode
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-32	Pulverize 1000g to 85% < 75 um
BAG-01	Bulk Master for Storage
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Au-ICP22	Au 50g FA ICP-AES finish	ICP-AES
As-OG46	Ore Grade As - Aqua Regia	VARIABLE
ME-MS41	51 anal. aqua regia ICPMS	
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES

To: RYAN GOLD CORP.
ATTN: ANDY RANDELL
713 - 4TH AVENUE, LOT 12, BLOCK HD
P.O. BOX 5070
DAWSON CITY YT Y0B 1G0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS DAW12000127.1

CLIENT JOB INFORMATION

Project: MAH
Shipment ID:
P.O. Number
Number of Samples: 320

SAMPLE DISPOSAL

PICKUP-PLP Client to Pickup Pulps
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	320	Dry at 60C			DAW
SS80	320	Dry at 60C sieve 100g to -80 mesh			DAW
RJSV	320	Saving all or part of Soil Reject			DAW
1DX2	320	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

ADDITIONAL COMMENTS

Invoice To: Ryan Gold Corp.
