Date of Report: November 16, 2012.

Summary

The metamorphic rock package mapped at the RP claim block is similar in composition to the rocks which host the nearby Golden Saddle deposit. The RP claims were staked in 2009 by Underworld Resources because of this lithologic similarity. Underworld is not known to have conducted any exploration activities at RP beyond a limited soil sampling program. Subsequent to acquiring Underworld, Kinross conducted an airborne magnetic and radiometric survey over the property in 2010, and a stream sediment sampling and prospecting program in 2011. This report summarizes the ridge-and-spur soil sampling performed by Selene Holdings L.P. in 2012.

In spite of the lithologic similarities between RP and Golden Saddle, no significant gold mineralization has thus far been demonstrated to occur at RP. Soil sampling along the ridgelines of the property has failed to identify any interesting or prospective zones. Although RP is present geological similarity to Golden Saddle, the RP claim block appears to lack the intersecting fault sets that are believed to be critical for gold mineralization at Golden Saddle.

1.0 Introduction

This report summarizes the ridge-and-spur soil geochemistry survey conducted in 2012 by Selene Holdings L.P. on the RP claim block in the Dawson Mining District, Yukon Territory. The 2012 program was intended as reconnaissance to evaluate the potential of this claim block to host Golden Saddle-style mineralization. Golden Saddle is a nearby structurally-controlled gold deposit hosted in a faulted package of metamorphic rocks. The RP claim block contains similar metamorphic rocks to those at Golden Saddle, and was thus considered a prospective area for gold mineralization. Field work in 2012 included a reconnaissance soil ridge-and-spur survey over the majority of the claim block.

1.1 Location, Access, and Physiography

The RP claim block is located at the headwaters of Eighteen Mile and Twenty Mile Creeks. The claims are located approximately 40 km northwest from the Green Gulch camp on Thistle Creek, and approximately 75 km southwest of Dawson City.

During the 2012 season the RP project was accessible by helicopter. The ridges on the property generally have suitable landing sites, while the lower spurs, slopes and valleys have fewer suitable landing sites. Helicopter landing zones were cleared at a few sites in stream valleys to facilitate access.

The RP claim block consists of a series of ridges that form a horseshoe shape, open to the south. Ridge tops generally have sparse but continuous outcropping rock, while lower hills and slopes are thickly covered by trees, with limited rock exposure. The highest ridges, located in the northern part of the property, have large exposures of felsenmeer and outcropping rock. Much of the property appears to have been burned by a forest fire in the last five to ten years. Throughout the property, there is a significant difference in soil development and vegetation between the north- and south-facing slopes. North-facing slopes typically have poorly developed soil horizons and more extensive zones of near-surface permafrost.

1.2 Property

The RP claim block consists of 336 mineral claims covering an area of ~64 km². The claim block forms a rectangular donut shape; 7.3 by 9.6 kilometres wide, with a 1.9 by 3.5 kilometre hole in the center. Details of individual claims are presented as a table in Appendix 2.

1.3 Historical Work

The geology of the RP area was mapped by the Geological Survey of Canada as part of the Stewart River map area (Ryan and Gordey, 2005). This mapping describes the RP claims as comprising Devonian to Mississippian quartz-mica schist, amphibolite, and orthogneiss overlain by Cretaceous volcanic and Tertiary intrusive rocks (Figure 3). Most of the lithologic contacts at RP were mapped as approximate or assumed by the Geologic Survey of Canada mapping.

No recent exploration is known to have occurred on the RP claims prior to 2008. In 2008, soil samplers working for Shawn Ryan collected ridge-and-spur soil samples on the

central ridge of the property. This initial sampling resulted in a few weakly anomalous gold-in-soil samples. The RP claims were staked by Underworld in 2009 because of their proximity to the White claims and the similarity of mapped rock units to those at White. No further work by Underworld is known to have occurred on the property.

Airborne magnetic and radiometric surveys were flown over the RP claim block as part of Kinross' 2010 airborne survey. The survey was flown by helicopter with 75 meter line spacing over the entire RP claim block. The most prominent feature from this survey is a series of magnetic lineations trending NNW across the property. These linear features are interpreted to be faults. The magnetic survey also highlights the fabric of different rock units on the property .

A stream geochemistry survey and prospecting was carried out in 2011 by Kinross Gold. In spite of the lithologic similarities between RP and Golden Saddle, no significant gold mineralization has thus far been demonstrated to occur at RP. Prospecting, rock chip sampling, and soil sampling along the ridgelines of the property has failed to identify any interesting or prospective zones.

Much of Twenty Mile Creek north of the RP claims is staked for placer mining. Eighteen Mile creek is not known to have any history of placer mining operations. No evidence of recent placer mining activity in the vicinity of RP was observed during 2012.

2.0 2012 Soil Geochemistry Survey.

The 2012 program at RP was intended as reconnaissance exploration survey to evaluate the potential of this claim block to host Golden Saddle-style mineralization. Field work in the 2012 program consisted of eleven days of soil geochemistry survey by a two-man crew. In total, 353 soil samples were collected (Figure 4).

Figure 4; Sample location map

The soil sampling program was conducted by two Selene Holdings L.P. trained technicians. Auger style soil sampling was conducted using a 1.25 m “Dutch Auger”. Sampling targeted the C Horizon, which consists of rock fragments ideally from the underlying bedrock. Due to terrain, vegetation, and/or soil consistency at some locations, it was not always possible to obtain a sample from the C Horizon. Sample depths ranged from 30 cm to 60cm and had an average of about 40 cm. Soil material was placed into labelled Kraft paper envelopes. At each soil sample location, the sampler ID, location, date, soil colour and sample depth were recorded.

Locations of all samples were determined by a GPS. Coordinates of the samples were input directly to a spreadsheet containing the details of the sample location. At the end of the

survey, a spreadsheet containing all soil sample information was imported into the soil master database.

The soil samples were delivered to Acme's preparatory lab in Dawson City, Yukon. The samples were checked in and then placed in an oven at 60°C until dry. After drying, the sample was sieved using a -80 mesh to procure a 100 g sample. A 15g split of this 100g sample was used for analysis. The Acme Lab 1DX2 package, used by Kinross, analyzes for 36 pathfinder elements. Samples were digested using a hot, 95°C, Aqua Regia digestion process before being analyzed by via ICPMS.

Turnover time, between submittal of the sample to final results, varied from 20 to 30 days. All final analyses were received through e-mail or via the Acme Labs website. Signed certificates were delivered in an Adobe PDF format.

3.0 Geochemistry

3.1 Soil Sample Geochemistry

Three hundred and fifty three soil samples were collected over eleven days from ridge and spur on property, with the exception of the central part of the claim block which was staked by Silverquest.

Gold assay results from these samples returned a range of values from 0 to 22.3 ppb Au, with only six samples greater than 10 ppb. One sample, CAG196584, returned a highly anomalous value of 22.3 ppb Au.

Figure 5; Thematic map, Au ppb results

Weak to moderate correlation with Au and pathfinder element, Ag, As, Cu, Mo, Pb, Sb and Zn, is present, and characterized the same pathfinder anomalies encountered at the White Gold Project – Golden Saddle Deposit.

4.0 Summary of Results and Conclusions

No significant occurrences of gold mineralization were identified at the RP claim block in 2012. Only six samples returned gold values over 10 ppb with the highest values of 20.3 ppb Au from sample CAG196584. No robust gold anomalies or pathfinder anomalies were outlined during the 2012 survey.

Nevertheless, the geologic map of the claim block could be improved with additional time spent mapping and prospecting. This additional mapping would help confirm the mapped distribution of rock types and constrain lithologic contacts. This exercise will improve the geological understanding of the metamorphic rock package in the area, and will guide our future exploration on the project. Based on the proposed mapping / prospecting finding, additional soil grid survey might be warrant to help to vector toward a discovery.
