Executive Summary

Ryan Gold Corp.'s Ida Oro property block is comprised of 3527 contiguous claims in the Dawson Mining District of the Yukon Territory, Canada. The property block is located 90km east of Dawson City. Individual properties covered in this report include: Ida, ID, Idaoro, Keiths, MLN, Oreo, Oreox, Oro, Pano, Pilsner, Toro, and Zoro.

Initially staked by Rio Tinto Canadian Exploration Ltd. in 1979, the Ida Oro property has seen intermittent work performed on it since. This staking followed anomalous arsenic, antimony and mercury values identified through regional silt sampling conducted by the Geological Survey of Canada. From 1979-1981 RioCanex performed geologic mapping, rock sampling, soil sampling and blast trenching. Trenching returned a maximum value of 10.6 g/t Au. The property was restaked by Noranda Exploration Ltd. in 1987, who performed mapping and geochemical sampling near the centre of the property until 1989. Orinoco Gold Inc. then performed rock grab and soil sampling work in the south of the property in 1995, returning three samples greater than 2.0 g/t Au. Noranda acquired the claims in 2000 and performed further rock sampling and mapping on the property. The property was restaked and optioned by Shawn Ryan and Henry Neugebauer in 2006. Soil grid and rock spur sampling was completed on the property between 2006 and 2009. The property was then acquired by Ryan Gold Corp. through a purchase agreement, in 2010.

The 2011 Ryan Gold Corp. exploration program at Ida Oro took place between May 12 and October 2, 2011. Work consisted of soil sampling, bedrock geologic mapping, rock sampling and diamond drilling. The soil sampling program was conducted by Ground Truth Exploration and consisted of both ridge and spur and contour sampling at 50m spacing. 16512 soil samples were collected on the Ida Oro block. 2011 drilling on the property took place from July 27 to September 4, 2011. The work was conducted by Kluane Drilling Ltd., and consisted of 11 diamond drill holes totalling 2854.50m. 3410 core samples were collected during from drill program. The property had seen no previous drilling prior to the 2011 Ryan Gold program.

The 2012 Ryan Gold Corp. exploration program consisted of 28 diamond drill holes. As per the requirement of the Yukon Mining Recorder, 14 holes are covered in this assessment report, totaling 3970m. Drilling was again contracted to Kluane Drilling Ltd., based in Whitehorse.

1.0 Introduction

The Ida Oro Property is located 90km East of Dawson City, Yukon within the Dawson Mining District (Figure 1). The project area is made up of 3527 contiguous claims covering an area of approximately 71107 hectares. The Ida Oro Property is located within NTS map sheets 116A, 116B, and 115P. This report summarizes the findings of the 2012 Ryan Gold Corp. exploration program on the Ida Oro property block. The 2012 program consisted of reconnaissance soil geochemical sampling, geologic mapping, grab sampling, and diamond drilling. 28 diamond drill holes were drilled in total during the 2012 exploration campaign. As per the requirement of the Yukon Mining Recorder, 14 holes are covered in this assessment report. All samples were assayed by ALS Chemex Labs in Whitehorse.

2.0 Location & Access

The Ida Oro Property block is located within the Ogilvie Mountain Range 90 km East of Dawson City, Yukon, in the Dawson Mining District. Access to the project is by helicopter from Dawson City or from the staging area set up by Ryan Gold Corp. near the Tintina Lookout on the Klondike Highway. The 2012 exploration program was helicopter-supported by TransNorth Helicopters (A-Star, 206 Bell Jet Ranger). The location of the property block is displayed in Figure 1.

3.0 Claim Information

The Ida Oro property block consists of 3527 registered claims. Breakdown of claim blocks are as follows: IDA (21 claims), ID (3 claims), IDAORO (1182 claims), Zorro (696 claims), Toro (580 claims), MLN (274 claims), KEITHS (322 claims), Oreo (42 claims), Oreox (222 claims), Oro (25 claims), PILSNER (118 claims), and PANO (42 claims). All claims are held in accordance with the Quartz Mining Act. For the Keiths, Pilsner, Toro 1-512, Zoro 1-676 claims, ownership is divided between Ryan Gold Corp. (70%) and 45127 Yukon Inc. (30%). The Ida Oro claims map is displayed in Figure 2. Individual property claim maps are displayed in Appendix VI. The complete claims listing for the Ida Oro block is displayed in Appendix II.

4.0 Physiography & Climate

The region encompassing the Ida Oro Project has a sub-arctic continental climate with a summer mean of 10 degrees Celsius and a winter mean of minus 23 degrees Celsius. Summer and winter temperatures can reach up to 35°C and minus 55°C, respectively. Dawson City, the nearest access point, has a daily average above freezing temperature over 180 days per year.

The land is unglaciated and consists of rugged ridgelines and valleys ranging from below 1000m to just over 1800m. The majority of the property is below treeline; however, most 2011 work was completed at or above the treeline on ridges and spurs. Land cover is mostly short evergreen and deciduous trees, shrubs in the valleys, and a moss and lichen coating of rocks above treeline. Major rivers and creeks within the project area include the Klondike River, Hamilton Creek, and Aussie Creek. Bedrock is abundant (>50%) above treeline and decreases rapidly to less than 1% in valleys and depressions (Lisson, 2012).

5.0 Exploration History

5.1 Pre-2011 Work

The Ida Oro Project area was original staked by Rio Tinto Canadian Exploration Ltd. (Rio Canex), in 1979. Regional silt sampling conducted by the Geological Survey of Canada found anomalous arsenic, antimony and mercury, and RioCanex began working the property from 1979 to 1981 based on those results. The program included geologic mapping, rock and chip sampling, soil sampling, and blast trenching. In total, 1034 rock, and 3268 soil samples were taken over three years with 51 blast trenches sampled. Soils were analyzed for indicator elements As, Sb, and Hg; however, Au was not analyzed. The results of rock and chip sampling and trenching revealed a 300m by 800m zone of >500 ppb Au in the central portion of the property. Rock chip samples returned a high value of 3820ppb Au in 1980 and trenching in 1981 returned a maximum value of 10.6g/t Au (McClintock, 1981). In total, RioCanex expenditures totaled $79,500 over three years and in spite of each assessment report recommending that additional exploration work was warranted, no further exploration was performed in the following years and claims were allowed to lapse in 1986 (McClintock, 1981).

In 1987, The Ida Oro property was re-staked as IDA 1-23 and ORO 1-28 by Noranda Exploration Company Ltd. Exploration focussed on mapping and sampling of the central portion of the property (Copland, 1988). Between 1987 and 1989, 1597 soil, 323 rock, 218 chip and 21 grab samples were collected. Results confirmed previous anomalies. The Ida claims were then picked up by Orinoco Gold Inc. in 1995 and work included 218 chip and 53 soil samples targeting the previously unexplored southernmost intrusive stock. Results returned three anomalous samples of 2.05, 5.49 and 9.27 g/t Au. In 2000, NovaGold Resources acquired the Ida claims and performed rock sampling and mapping over the property. Results from 58 rock samples taken included 1.4, 2.9 and 4.5 g/t Au with an average of 0.43 g/t. Conclusions from the report noted the excellent potential of the property to host significant intrusive and sediment hosted gold deposits and recommended drilling in late 2000; however, no further exploration work was completed and claims were allowed to lapse (Johnson, Brownlee, & Schulze, 2001).

From 2006 to 2009, Ida and surrounding were re-staked and optioned by Shawn Ryan and Henry Neugebauer and a joint venture agreement resulted. Rock and grid soil sampling confirmed the presence of gold mineralization over the property with several samples within a single soil line returning multi gram per ton gold proximal to historical anomalous zones. The property was acquired by Ryan Gold Corp. through a purchase agreement in 2010 with Mr. Ryan and Mr. Neugebauer.

5.2 2011 Ryan Gold Corp. Exploration Program

The 2011 exploration program at Ida Oro took place between May 12 and October 2, 2011. Surficial work consisted of soil sampling and bedrock geologic mapping. The soil sampling program was conducted by Ground Truth Exploration and consisted of both ridge and spur and contour sampling at 50m spacing. 16512 soil samples were collected on the Ida Oro block. Mapping on the Ida Oro block was conducted by Ryan Gold staff and was focused on the ridgelines of the central claim area. 2011 drilling

on the property took place from July 27 to September 4, 2011. The work was conducted by Kluane Drilling Ltd., and consisted of 11 diamond drill holes totalling 2854.50m. 3410 core samples were collected during the drill program. All samples were analyzed by Acme Labs, based in Vancouver, BC.

6.0 Geology

6.1 Regional Geology

The Ida Oro property lies within Selwyn Basin, part of the North American Cordilleran Miogeocline (Gordey & Anderson, 1993). The regional geology of the area was initially mapped in 1972 by Green at 1:250,000 scale. Although surrounding areas have been mapped at smaller scales (1:50,000), mapping of the property is confined to RioCanex and NovaGold Corp.

The Cordilleran Miogeocline records three major periods of geologic and tectonic evolution on the western edge of Ancestral North America. From the mid-Proterozoic to late-Precambrian, rifting of the cratonic margin led to deposition of a thick wedge (>10km) of clastic sediments known as the Windermere Supergroup. Sedimentation during this time was punctuated and separated by major regional deformation and rifting.

In the late Precambrian, tectonic quiescence led to the development of passive margin sedimentation. Two contrasting but contemporaneous facies belts parallel to the cratonic margin resulted. To the northeast, shallow water, carbonate and clastic shelf facies rocks known as the Mackenzie Platform were deposited in a variably subsiding near shore environment. To the southwest, offshelf slope and basin deep water facies developed forming the outer edge of the Miogeocline known as the Selwyn Basin (Gordey & Anderson, 1993).

The Selwyn Basin is comprised predominately of thick off-shelf siliclastic sedimentary sequences spanning from the Proterozoic through to the Triassic. Geographically, the Selwyn Basin is defined as a westward tapering package that accumulated on the sloping Precambrian Ancestral North America (Gabrielse & Yorath, 1991).

6.2 Property Geology (from (Lisson, 2012))

The geology of the Ida Oro Property is characterized by a close-tightly folded hornfelsed sedimentary package belonging to the Road River Group and Rabbitkettle Formation of the Selwyn Basin. Ordivician to Early Devonian in age, they are intruded by a complex calc-alkaline multi-phase intrusive body of the Tombstone Plutonic Suite, emplaced during the mid-Cretaceous period. Both rock packages have been intruded by a late stage mafic intrusive of lamprophyre, also of the TPS intrusives. Intrusive composition is gradational over the property and all sedimentary structures except remnant bedding within the mapping area have been destroyed by contact metamorphism.

Road River Group Sediments: Sediments on the Ida Oro property consist of thin to thick bedded cherts, silstones, shales, mudstones and minor sandstones. The sedimentary package is loosely placed within the Road River Group based on composition, sedimentary structures, and mapped sedimentary units by Ryan Gold and previous companies. Age contraints for the sediments on the Ida Oro property come

from graptolites monograptus vomeriums and monograptus spiralis found in 1981 by A. Winkler working for RioCanex and points to a lower Silurian age for the sedimentary package.

Felsic TPS Intrusives: Several stocks and dykes intrude sediments and make up the main N-S ridge in the central portion of the Ida Oro property. Both composition and texture of intrusives is gradational from north to south and within intrusive bodies from diorite and granodiorite, to quartz monzonite. Texture varies from coarse grained equigranular to porphyritic with plagioclase and potassium feldspar being the primary phynocrysts up to several centimeters . Groundmass composition is commonly feldspar +/- chlorite. Mafic mineralogy is primarily biotite and amphibole of which both are commonly altered by cholrite +/- calcite. Several highly altered dykes, which occur as discrete recessive notches within ridgelines with intense clay alteration, are also believed to be part of the same suite of intrusives.

Mafics: Several small, fine to coarse grained gabbroic/lamprophyre dykes outcrop in the north end of the Ida Oro property and were intersected by several drill holes in the 2011 season**.** This mafic unit commonly contains fresh sulphide mineralization of pyrrhotite +/- chalcopyrite. The unit has been extensively altered by amphibolization and biotitization of clinopyroxene, and saussuritization of feldspars.

7.0 2012 Exploration Program

The 2012 Ida Oro exploration program consisted of further exploratory diamond drilling focused on the central target, along with extensive mapping and geochemical rock and soil sampling throughout the property block. 28 diamond drill holes were drilled in total during the 2012 exploration campaign. As per the requirement of the Yukon Mining Recorder, 14 drillholes are covered in this assessment report. Drilling was again contracted to Kluane Drilling Ltd., based in Whitehorse, Yukon. Drilling from 2011 confirmed the existence of mineralization at depth, as mineralization was found in nine of eleven holes; however 2011 drilling was restricted to the main N-S ridgeline at Ida Oro. Drilling in 2012 focused on lateral (E-W) step out holes intended to complement existing data and test three dimensional continuity of the mineralization identified in the previous season. The 2012 drillhole statistics are displayed below in Table 1. The average hole depth was 279.01m, with a total depth of 3907m. The following 14 drillholes were filed for assessment: IO-12-012, IO-12-013, IO-12-014, IO-12-015, IO-12-017, IO-12-021, IO-12-022, IO-12-025, IO-12-032, IO-12-035, IO-12-06, IO-12-037, IO-12-038, IO-12-039. The reported 2012 drill collar locations are displayed in figure 5. All core samples were assayed by ALS Chemex Labs in Whitehorse.

Table 1: 2012 Ida Oro Drillhole Statistics

8.0 Sampling and Analytical Procedure

8.1 Drill Collar Locations and Methods

Drilhole locations were planned and marked by Ryan Gold geologists using hand held IPAQ GPS equipment, and azimuth/inclination measurements were confirmed by a Brunton Transit compass once a platform was constructed and drill rig moved on site. All holes were completed at a -44 to -55 degree angles from horizontal and downhole deviations were monitored using a Reflex Maxibor electronic multi shot survey tool. Core was also oriented using Reflex EZ-Mark core orientation tool. The tool was fixed to the top end of core barrel and sent down hole while drilling commenced. After each run the tool was activated and an orientation read taken before taking out the core. Once the barrel was retrieved from the hole, an instrument was attached to the end of the tool which allowed for the reorientation of core to its original bottom-of-hole-down position. A mark was then placed on the bottom face of the core so that a bottom of hole line could be drawn down the length of hole at a later time.

8.2 Core sample collection and Geochemical Analytical Procedures

Ryan Gold Corp. established a sampling and assay control program with insertion of assay blanks, standards, and preparation duplicates, in addition to the internal QA/QC program of ALS Labs. Blank samples consisted of crushed granite (sourced from a garden centre in Whitehorse) that were known to have no significant precious metals of interest. Nine standard reference materials (SRM's), OxC88, OXi81, were used in 2011 program and were sourced from RockLabs, a commercial supplier. Preparation duplicates were prepared by the laboratory by splitting off a crushed portion of the sample (using a riffle splitter) which was then pulverized. All core samples collected were split using a Vancon core saw. The core was marked with an "orientation line" and "cut line." This was to ensure once the core was cut the orientated half of the core was returned to the core box while the other half was put in a poly sample bag. A sample tag was placed in the sample bag and also stapled to the outside of the bag. The bag was secured using a cable tie. These samples were placed in a sample string with a systematic pattern of standards, blanks and duplicates to ensure QA/QC. Samples were grouped in rice bags and

secured with security tags. The samples were shipped out of camp with the helicopter to Dawson City where they were transferred to the expeditor to be hauled to Whitehorse and processed at the ALS prep lab. Throughout the shipment process, a chain of custody paperwork trail was maintained to ensure sample security. Once received in at the ALS Lab in Whitehorse the samples were weighed and logged. Samples were then crushed until 80% or better passes through a 2 mm mesh screen. This resulting material was put through a riffle splitter, where a 1000 g sample was isolated and the rest was collected as reject. The sample was pulverized further until 85% or better passes through a 75 micron mesh screen. After this step the pulp material was shipped to the North Vancouver lab for analysis. The remaining reject material was stored in Whitehorse.

The material that was shipped to the North Vancouver lab was split using a riffle splitter where a 50 g sample was isolated for gold analysis and the pulp reject material from this process was stored at the lab. This 50 g sample was subjected to the ICP22 analysis method. The ICP22 package is a fire assay and ICP-AES method to assay for gold, and can detect gold values between 0.01 ppm and 10 ppm. Gold and 40 other elements were also analysed as part of the, ME-MS41 geochemical package. This includes 41 multi-element analysis by aqua regia digestion and a combination of ICP-MS and ICP-AES analysis. Assays for Au that are above 10ppm detection are then re-analysed using a gravimetric method. Other elements such as Ag, Cu, Pb, As, Zn and Sb that are above detection of the method requested for analysis are also re-analysed using a similar method with higher detection to obtain true value. Final results using the methods above are reported to Ryan Gold electronically, consisting of an excel spreadsheet and a PDF certificate of work.

9.0 2012 Exploration Results

14 drillholes were filed for assessment from the 2012 Ida Oro exploration program. A total of 3907m was drilled. The reported 2012 drill collar locations are displayed in Figure 5. 2012 drilling on the Ida Oro property returned some significant Au intervals. Assay results are displayed in Appendix III, while complete core logs are found in Appendix IV. Significant gold intervals are displayed in Table 2.

10.0 Conclusions and Recommendations

From the 2012 Ryan Gold Corp. exploration program on the Ida Oro property, 14 diamond drillholes were filed for assessment. Significant mineralization, defined by gold grades exceeding 0.7 g/t, was encountered in nine of the 14 drillholes. Successful drilling in 2012 focused on lateral (E-W) step out holes intended to complement existing data and test three dimensional continuity of mineralization identified in the previous season.

Further drilling is recommended to test the depth and continuity of the mineralized system at Ida Oro, and confirm the presence of higher grade gold mineralization. Host rock characteristics and the presence of major structural features are important considerations for controls on gold mineralization on the Ida Oro property.

Signature: Colin Ramshaw, Vancouver Laboratory Manager

Comments: Gold assay result for sample 19472 is reported by fire assay gravimetric method offline due to high Ag content in the sample that might have caused incomplete Au dissolution in aqua regia solution.

Comments: Gold assay result for sample 19472 is reported by fire assay gravimetric method offline due to high Ag content in the sample that might have caused incomplete Au dissolution in aqua regia solution.

Comments: Gold assay result for sample 19472 is reported by fire assay gravimetric method offline due to high Ag content in the sample that might have caused incomplete Au dissolution in aqua regia solution.

Method	CERTIFICATE COMMENTS
ALL METHODS	NSS is non- sufficient sample.
ME- MS41	Interference: Samples with Ca> 10% on ICP- MS As. ICP- AES As results reported (2 ppm DL)
ME- MS41	Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).

Appendix IV – 2012 Ida Oro Core Logs

IV.1 Drill Log Legend

Core was logged and sampled in systematic steps where the core was divided into alteration, lithology, mineralization, structure and veining.

IV.1.a Alteration

The alteration legend is categorized and illustrated in Table 1:

Alteration				
Alteration Type			**Alteration Style**	
Biotitization (secondary biotite)	**BIO**		Fractures	**FR**
Carbonate alteration	**CRB**		Replacement	**RP**
			Vein	
Hornfels	**HNF**		Selvage	**VS**
Silicification	**SIL**		Pervasive	**PV**
Chloritization	**CHL**		Patchy	**PA**
Clay	**CL**		Overprinting	**OP**
Sericitization	**SER**		Phenocrysts	**PH**
Saussuritization	**SSR**		Matrix	**MT**
			Leaching	**LC**
Alteration Intensity			Banded	**BND**
Non pervasive: Fractures and/or Veins. Weak when present		**1**		
Non pervasive: Fractures and/or veins. Moderate when present		**2**		
Pervasive: Relatively continuous through interval. 10-30%		**3**		
Pervasive: Moderately continuous through interval. 30-60%.		**4**		
Pervasive: Intensely continuous through interval 60-100%		**5**		

Table 1: 2012 core log alteration legend.

IV.1.b Lithology

The lithology legend is categorized and illustrated in Table 2:

Note: Overlapping lithology intervals are NOT allowed; interbedded lithlogies can be recorded in the Lith Major and Lith Minor PLEASE do not use special character - comma (,); use underscore (_) instead in all the Comments Column (Lith Alt Veins Mineralization Comments) (comma is usually used for seperating columns such as comma delimited in database)				
Rock type			Texture	
Sedimentary	Chert	CHT	Banded	BND

IV.1.c Mineralization

The mineralization legend is categorized and illustrated in Table 3:

Mineralization Type	
ArsenoPyrite	**Aspy**
Pyrrhotite	**Po**
Pyrite	**Py**
ChalcoPyrite	**CPy**
Scorodite	**Scr**
Sphalerite	**Sp**
Galena	**Gl**
Molybdenite	**Mo**
Mineralization Style	
Fracture Coatings	**FRC**
Pervasive	**PS**

IV.1.d Sample

Refer to section 8.0 for sampling methods. The grades for each standard type are illustrated in Table 4:

STDType	grade (ppm)
OXC88	0.203
OXi81	1.807
SG40	0.976
OXC102	0.207
SF57	0.848
OXG99	0.932
OXH97	1.278
SI64	1.78
OXJ95	2.337

Table 4: Standard grades for 2012 sampling procedures.

IV.1.e Structure

The structure legend is categorized and illustrated in Table 5:

Cleavage	**CLE**
Contact	**CON**
Fault	**FLT**
Fold Axis	**FLD**
Foliation	**FOL**
Joint	**JNT**
Lineation	**LIN**
Breccia	**BX**

IV.1.f Veining

The veining legend is categorized and illustrated in Table 6:

Vein Fill	
Quartz	Qtz
Carbonate	Crb
Tourmaline	Tml
Sulphide	Sul
Chlorite	Chl
Biotite	Bio
Pyrite	Py
Pyrrhotite	Po
Arsenopyrite	Asp
Chalcopyrite	Cpy
