## SUMMARY

The Mariposa Property (the “Property”) was acquired in September 2009, by way of an option agreement with the Tintina Syndicate that granted Pacific Ridge Exploration Ltd. (“Pacific Ridge”), the right to earn a 100% interest in the Property subject to a 2% NSR through making cash and share payments. With the success of the 2010 YMIP supported exploration program, Pacific Ridge expanded the property to comprise 1,477 claims covering a 30 x 10 km area, or approximately 265 km<sup>2</sup>.

The property is located 120 km southeast of Dawson City, Yukon. It is also 15 km southeast of the Underworld/Kinross White Gold discovery and 12 km east-northeast of Kaminak’s Coffee property. The Property lies within a regional major northwest trending structural corridor which hosts numerous gold and copper deposits.

The local geological setting of the Mariposa Property is similar to that of the White Gold and Coffee properties in terms of the host lithologies, the structural controls and brittle style of deformation and the style of gold mineralization. Prior exploration identified an open-ended 7 km long horizon of altered sulphide bearing quartz mica schist in the Skookum Zone area of the Property. This unit is locally flanked by intrusive and mafic rock units, a setting favorable for hosting a gold-mineralizing system.

The history of gold exploration within the Property dates to 1898, when gold was first discovered in Scroggie and Mariposa Creeks (Richards, 2005). The first mechanized placer-mining began in the mid 1950’s, while large scale mechanized placer-mining began in 1980 and has continued uninterrupted up until the present. It has been estimated that approximately 100,000 ounces of gold with a fineness of 905 has been produced from Mariposa and Scroggie Creeks.

The first lode gold exploration in the area was reported in 1917, when claims were staked over a reported quartz vein occurrence in the area of the Mariposa Creek placer workings in the general vicinity of the currently defined Skookum Zone anomaly. Interest in lode gold exploration picked up in the early 1970’s, with the porphyry copper exploration boom in the Dawson Range, but, it is only during the past 12 years that a sustained exploration effort has been carried out on the Property, including ridge and spur prospecting and geochemical sampling (rock, soil and silt) and, more recently with several localized soil grids throughout the claims. Pacific Ridge initiated the first mechanized trenching in 2010 with the first diamond drilling then initiated in 2011.

The Property is located within the central Dawson Range, southwest-central Yukon, where it forms part of a regionally extensive, northwest-southeast trending polymetallic mineral belt associated with Early Jurassic to latest Cretaceous magmatism. It lies entirely within the Yukon-Tanana Terrane (YTT), an accreted terrane separated from the Selwyn Basin and associated carbonate platform strata of the ancestral North American margin by the NW-SE trending Tintina Fault. The YTT consists of a belt of Late Devonian to Late Permian metamorphic rocks, including various metasedimentary and metavolcanic assemblages, and up to four distinct suites of calc-alkaline metaplutonic rocks (Mortensen, 1996; Colpron et al., 2006). In the Dawson Range, the YTT typically includes intercalated packages of metasedimentary and metavolcanic rock sequences predominantly composed of quartz-mica schist and diorite gneiss. The magmatic episodes are associated with penetrative deformation and metamorphic events ranging in age from late Paleozoic to Tertiary.

The Property is underlain by a polydeformed sequence of Permian through to Jurassic age metasedimentary and metaplutonic rocks that have been intruded by (i) discontinuous bodies of mafic – ultramafic intrusions, (ii) Cretaceous quartz monzonite and granite intrusions, and (iii) feldspar porphyry dykes and small intrusive plugs. The Permian – Jurassic rocks are considered to be ‘basement’ and host gold mineralization on the Mariposa property where they form a NW-striking, variably NE-dipping homoclinal sequence.

The 2011 work program consisted of a soil geochemical survey over two key areas of the Mariposa property; the Skookum Zone and the Alberta Creek Zone. Two types of sample were collected. C horizon samples were collected using a hand auger in non-permafrost areas. Where permafrost prevented access to the C horizon, an organic A horizon sample was collected. The budget for this Phase I program that is being applied as assessment work is \$199,555.

Two strong gold anomalies were defined at the Skookum Zone, Skookum Main and Skookum West. These two anomalies have an east-northeast trend and appear to be related to a structurally controlled bedrock source. Two other base metal signature anomalies have a northwesterly trend and appear to have an association with stratigraphy and possibly also VMS style mineralization. The more easterly of these intersects the Skookum Main anomaly where it contains some of the better gold values, so the intersection of the two styles of anomaly may have an important influence on the control of gold mineralization on the Property.

Three anomalous targets have been defined at Alberta Creek: Gold South, Gold North and Copper-Moly. The Gold South and Gold North targets are similar in nature and could be a part of one continuous anomaly. The second anomaly, the Copper-Moly Zone, has only a weak gold association but is interesting as a possible porphyry-style target.

## INTRODUCTION

The Mariposa Property (the “Property”) was acquired in September 2009, by way of an option agreement with the Tintina Syndicate that granted Pacific Ridge Exploration Ltd. (“Pacific Ridge”), the right to earn a 100% interest in the Property subject to a 2% NSR through making cash and share payments. With the success of the 2010 YMIP supported exploration program, Pacific Ridge expanded the property to comprise 1,477 claims covering a 30 x 10 km area, or approximately 265 km<sup>2</sup>.

The property is located 120 km southeast of Dawson City, Yukon. It is also 15 km southeast of the Underworld/Kinross White Gold discovery and 12 km east-northeast of Kaminak’s Coffee property. The Property lies within a regional major northwest trending structural corridor which hosts numerous gold and copper deposits.

The local geological setting of the Mariposa Property is similar to that of the White Gold and Coffee properties in terms of the host lithologies, the structural controls and brittle style of deformation and the style of gold mineralization. Prior exploration identified an open-ended 7 km long horizon of altered sulphide bearing quartz mica schist in the Skookum Zone area of the Property. This unit is locally flanked by intrusive and mafic rock units, a setting favorable for hosting a gold-mineralizing system.

In this area, prior geochemical soil sampling at the western exposed end of the quartz-mica schist has defined an open ended, two kilometre long gold-in-soil anomaly containing values above 20 ppb gold

and ranging up to 1300 ppb gold. Additional soil sampling by Tintina Syndicate also outlined a second open-ended gold target, measuring a kilometer square and overlying nearby intrusive rocks. Samples collected from bedrock exposed by placer mining along Scroggie Creek have returned gold values up to 3 gpt from sulphide-bearing rocks.

All streams draining the Property are known to contain placer gold, of which Scroggie Creek has had over 100 years of placer gold production which continues today. The placer miners recovered rough, pristine gold nuggets ("hackly gold") near the headwaters of Mariposa Creek. This suggests the presence of nearby lode gold sources.

The Property has undergone sporadic prospecting efforts over the years in search of the bedrock source of the placer gold. However, it is only during the past 12 years that a sustained exploration effort has been carried out, including ridge and spur prospecting and geochemical sampling (rock, soil and silt) and, more recently with several localized soil grids throughout the claims. These endeavors led to the first trenching and diamond drilling programs that commenced in 2011.

In 2010, in an effort to define future drilling and trenching targets, auger soil sampling was conducted to the south of the Skookum Zone, over a 9 x 3 km grid centered on a south facing slope to the immediate north of Mariposa Creek. In 2011, this grid was expanded to improve coverage over the Skookum Main and Skookum West zones and to the north. Because of the difficulty in collecting C horizon samples in the permafrost that occurs within much of this area, a program of A horizon sampling was also carried out. Two non-contiguous soil grids were also completed in the Alberta Creek area towards the eastern end of the property. Samples were collected by personnel of the Company and contractor All-In Exploration Solutions Inc. of Whitehorse. Within the two grid areas, Skookum and Alberta Creek, a total of 5,882 soil samples were collected during the program, of which 2,459 are applied for credit in this report. The budget for this Phase I program that is being applied as assessment work is \$199,555. The program was designed and supervised by Janice Fingler, P.Geo., Vice President of Exploration for Pacific Ridge at the time of the field work.

The sampling program successfully defined two strong gold anomalies in the Skookum Zone, Skookum Main and Skookum West, and this work has guided subsequent trenching and drilling programs. Two strong gold anomalies have also been defined at Alberta Creek.

Figure 1. Yukon Location Sketch.

## LOCATION, ACCESS AND PHYSIOGRAPHY

The Mariposa Property is situated 120 km south of the Dawson City, Yukon, and is located within four 1:50,000 NTS topographic map sheets: 115O/1 & 2, 110J/15 & 16 (Figure 1). The property is accessible by helicopter or fixed-wing aircraft from Dawson City or Whitehorse, to a 750 m airstrip located within the Scroggie Creek valley, in the west-central portion of the Property. The Property is also accessible in summer by ATV from Pelly Farm on the north side of Pelly River, 40 km west of Pelly Crossing, a total distance of approximately 70 km. Winter road access may also be gained from Pelly Farm to Scroggie Creek. Within the Property, access by ATV is possible along existing placer mining roads which flank Scroggie and Mariposa Creeks. More distant parts of the Property are accessed by helicopter.

The property lies within an unglaciated portion of the Yukon Plateau. The topography is moderate, with low sinuous plateaus cut by narrow valleys and creeks that drain into the broader flat-bottomed valleys of Scroggie and Mariposa Creeks. These drainages are lined with gravels of past and present placer mining workings. Elevations in the area range from 900 m to 1150 m above sea level. Spruce and poplar trees are found on south-facing slopes while the north-facing slopes are sparsely treed with dwarf spruce. Permafrost is intermittent and is limited to north-facing slopes and valley bottoms. Much of the property was burned during a 2009 forest fire.

There is less than 5% outcrop exposed on the property. In the areas of drilling, overburden in the Mariposa Grid area has been shown to range from 2 to 6 m in depth. Much of the central Yukon is covered by a thin blanket of volcanic ash and tephra that resulted from recent eruptions in Alaska.

**Figure 2. White Gold District Location Sketch.**

## **CLAIM STATUS**

The Mariposa Property consists of 1,477 quartz claims within the Dawson Mining District, as listed in Appendix I (the "Property"). Of this number, 200 core claims are under option from Gordon G. Richards (Tintina Syndicate) under an agreement dated September 17, 2009 and the 39 PTL claims are under option from Glen MacDonald under an option agreement dated July 27, 2011 (see Figure 3).

## **PROPERTY HISTORY**

The history of gold exploration within the Property dates to 1898, when gold was first discovered in Scroggie and Mariposa Creeks. The first mechanized mining began in the mid 1950's, while large scale mechanized mining began in 1980 and has continued uninterrupted up until the present. It has been estimated that approximately 100,000 ounces of gold with a fineness of 905 has been produced from Mariposa and Scroggie Creeks (Richards, 2005).

The first lode gold exploration in the area was reported in 1917, (Richards, 2005) when claims were staked over a reported quartz vein occurrence in the area of the Mariposa Creek placer workings in the general vicinity of the current Skookum Jim anomaly.

In 1971 and 1972, Silver Standard Mines Limited and American Smelting & Refining Company prospected a copper-molybdenum porphyry occurrence (McMichael, 1973), located south of Scroggie Creek and just outside the Property boundary. Sparse mineralization observed related to a siliceous, medium-grained quartz-feldspar porphyry included finely disseminated chalcopyrite and pyrite. Finely disseminated molybdenite occurs as quartz vein fracture coatings in a quartz-rich breccia, approximately 130 m wide and unknown strike length. Soil sampling outlined a 1,000 m by 300 m plus 100 ppm Cu anomaly and a coincident 1,000 m by 250 plus 60 ppm Mo anomaly. McMichael concluded that Mo appeared to be the primary metal of interest in the system.

In 1980, Amax of Canada Limited (Booth et. al., 1980) completed additional soil sampling and confirmed the Cu-Mo soil anomaly and completed an IP geophysical survey which outlined a weak (1% sulphide content) chargeability anomaly beneath the soil anomaly. In addition to the Cu and Mo mineralization, one speck of native gold was observed in a schist specimen. Gold in soils was typically low, 10 ppb (detection limit), with a few samples in the 30 to 40 ppb range.

In 1986, Kerr Addison Mines Ltd. staked the Sizzler showing, now within a third party claim inside the eastern portion of the Mariposa property. The area of interest includes quartz stringers, stringer stockworks and silicified breccias over a 1.7 km diameter area (Pautler, 1986). Soil geochemistry failed to locate a significant gold anomaly, but two rock samples from the southwest margin of the silicified area assayed 1,050 and 400 ppb Au.

In 1986, Doron Exploration Inc. staked the Pyroxene Mountain claims, located just to the north of the Mariposa property (Wallis, 1987). The property was acquired in order to examine the potential for platinum group mineralization associated with the ultramafic rock units that underlie Pyroxene Mountain. Previous workers had noticed that placer gold in creeks with their headwaters on Pyroxene Mountain contained appreciable amounts of platinum group minerals. Work in 1987 (Waugh, 1988) included the collection of 1596 soil samples and 22 rock samples along 101 km of survey line. The survey

Figure 3. Mariposa Property Claim Map.

outlined two Pt-Pd soil anomalies as well as several other single point anomalies and one rock sample that assayed 0.444 opt Au.

In 1987, Ron McPhee staked the Wine and Fish claims, located within the current Property boundary, along the north side of Scroggie and Mariposa Creeks and in the area of Pacific Ridge's Skookum Jim anomaly (Minfile 1150-075). Initial exploration work defined a weak gold in soils anomaly north of upper Mariposa Creek.

**Figure 4. Mariposa Property showing historical placer workings and main target areas.**

In 1988, D. Waugh (1989) completed a program of prospecting and the collection of 174 rock samples on the Fish and Wine claims. Most of the work was completed on the Fish 94 claim in an area at the intersection of two structural lineaments. Assay results were disappointing, mostly below 30 ppb, with the exception of three samples that ran 3.1 gpt, 2.6 gpt and 2.0 gpt Au.

During the 1988 placer mining season, Richards (2005) reports that mining cuts along Scroggie Creek downstream from Stevens Creek yielded abundant arsenopyrite crystals in the sluice concentrates over about 300 meters of workings. No source for the arsenopyrite was ever found during the course of excavation for placer mining.

Richards (2005) also reports that in 1990 a black sand sluice concentrate, containing coarse gold, was anomalous for several elements including Au, Ag, Bi, Pb, W and Sn. He concluded that this suite of elements could be indicative of an intrusion-related gold deposit. Pt and Pd values were also anomalous.

In 1990, Ron McPhee carried out an additional work program on the Irish and Kip claims on Pyroxene Mountain (Richards, 1991). The work included a VLF-EM survey and soil sampling. The soils were moderately anomalous in Cr, Ni and Cu. A VLF was defined conductor that correlates with a significant linear magnetic anomaly, interpreted to be caused by massive magnetite, conductive sulphides or serpentinization.

In 1996, Newmont Exploration Limited completed a one day property examination of the Bos and Stock claims on Pyroxene Mountain (Stammers, 1996). The examination was carried out in the area of the previous best results. However, these results could not be duplicated.

In 1999, Shawn Ryan staked the Scroggie 1-16 claims, along the east side of Scroggie Creek adjacent to the Rum Run claim group, and completed a program of prospecting and sampling. Ryan reported two anomalous silt samples of 77 ppb and 378 ppb, the latter near an occurrence of pegmatite. In 2000, Ryan added the Scroggie 17-24 claims.

Gordon Richards began prospecting the area in 1999 and staked the RUM RUN 1-20 quartz claims. In June 2000, Richards added the RUM RUN 21-50 and 53-59 claims. Initial work involved prospecting and limited soil sampling (Richards, 2001). The Pegmatite Zone, along Scroggie Creek on the Rum Run 1-20 claims, is defined by a gold-in-soil anomaly approximately 1 km in diameter, with associated moderate anomalies of Mo, Pb and Sb. Rock outcrops with anomalous gold values, up to 3,020 ppb, are associated with quartz stockwork in pegmatitic units. In July and August 2001 he completed a program of geochemical sampling, including 95 soils, 15 rock chips and 4 silt samples, mapping and a VLF-EM geophysical survey in an effort to locate the Scroggie fault.

During 2000, Morgan (2001) completed prospecting and geochemical sampling (11 soils, 5 rocks and 4 stream sediments) on the Wolf 1-42 and Pyrex 1-4 claims, adjoining the Rum Run claims along Scroggie Creek to the east. The highest gold value, from a soil sample, was 111 ppb Au.

Richards (2001A, B, C, D) reported that in 2001, gold-quartz pebbles with angular gold were obtained from a localized area of placer workings along Scroggie Creek, with a gold-in soil anomaly identified on the slope above this occurrence. He believed that this occurrence could indicate the possible importance of the Scroggie Fault or related splays in controlling bedrock gold mineralization. However, no bedrock gold source has yet been found in this area.

In July and August of 2003 Richards (2004) completed magnetometer surveys and limited geochemical sampling over the Pegmatite, QMS and East Zones. The magnetic surveys over the Pegmatite and QMS zones were generally featureless. Over the East Zone, linear highs trending southwesterly probably reflect mafic layers, parallel to the metamorphic foliation.

In 2005, Richards completed a magnetometer survey near the south end of the Scroggie airstrip and another magnetic survey on the east side of the property (Richards, 2005; Richards 2005 YMIP). The purpose of the surveys was to fill in areas between previous surveys in an effort to tie down the location of the Scroggie Fault. Richards suggests that a weak magnetic low along Scroggie Creek could be related to the fault. A strong mag high is associated with the contact between metamorphic rocks and the younger granodiorite. In addition, 8.5 km of VLF-EM surveying was carried out along 200 m spaced lines. No significant anomalies were detected.

In 2005, Richards (2006A) completed a program of mapping, sampling and a magnetometer survey on his East Zone. Of 42 soil samples collected, only a weak gold anomaly was defined with associated Bi-Pb-Te-As-Ag values. The magnetic survey detected linear trends reflecting compositional layering in metamorphic rocks.

During the 2006 field season, Richards completed an orientation mobile metal ion ("MMI") soil survey along selected lines throughout the property and dug a tractor trench along Scroggie Creek. Initial results from the MMI work were encouraging, with anomalous values in Au and Ag supported by

anomalous Zn, Mo and Pb, providing more discrete targets than conventional soil sampling. The trenching failed to locate mineralization related to the Scroggie Fault. Much of this exploration work was completed with the assistance of YMIP grubstake and target evaluation grants (Richards, 2006B).

In 2008, Richards (2009) completed a program of bedrock sampling from recent mining cuts along Scroggie Creek and MMI sampling along the base of slope west of the mining cuts on the Cigar claims, contiguous with the north end of the Rum Run claim block. Pyrite and pyrrhotite were noted in many of the rock samples, along with minor disseminated chalcopyrite. The samples contained weakly anomalous values of Cu and Mo, but not Au. The MMI samples showed only a weak Cu anomaly. The zone of potential copper mineralization is open to the north.

In 2008 and 2009, Richards added the Toluamide claims to the claim group.

In 2009, Richards completed a program of geochemical soil sampling and rock sampling over selected areas within the Toluamide claim group. In September, 2009, Richards optioned the Mariposa claim group, then including 203 mineral claims, to Pacific Ridge.

Pacific Ridge's 2010 exploration program included prospecting, rock sampling and grid soil sampling in the area of the newly discovered Skookum Jim anomaly and staked an additional 40 AP claims to the north. A total of 2,952 auger soil samples were collected. The survey defined a strong gold anomaly approximately 600 m by 1,100 with peak gold values to 1,570 ppb that was open to the north and west. To the east of Skookum Jim, locally elevated gold results were detected in areas of sporadic permafrost. Soil samples in the Hackly Gold, Maisy May and Big Alex areas also returned elevated gold results.

Also in 2010, with the assistance of a YMIP grant, Richards (2010) staked the 128 claim AC claim group in the Alberta Creek area and then carried out a geochemical survey, including 202 soil samples, two silt samples and 11 rock chip samples. Several of the soil samples reported moderately anomalous Au values (20 to 134 ppb) with supporting anomalous Mo, Pb, As and Sb. The AC claims were subsequently optioned to Pacific Ridge.

## **REGIONAL GEOLOGY**

The Property is located within the central Dawson Range, southwest-central Yukon, where it forms part of a regionally extensive, northwest-southeast trending polymetallic mineral belt associated with Early Jurassic to latest Cretaceous magmatism.

The Property lies entirely within the Yukon-Tanana Terrane (YTT), an accreted terrane separated from the Selwyn Basin and associated carbonate platforms strata of the ancestral North American margin by the NW-SE trending Tintina Fault. The NW-SE trending Denali or Shakhwak Fault, located approximately 190 km to the southwest forms the southwestern boundary of the YTT (Gordey and Makepeace, 1999).

The YTT consists of a belt of Late Devonian to Late Permian metamorphic rocks, including various metasedimentary and metavolcanic assemblages, and up to four distinct suites of calc-alkaline metaplutonic rocks (Mortensen, 1996; Colpron et al., 2006). In the Dawson Range, the YTT typically includes intercalated packages of metasedimentary and metavolcanic rock sequences predominantly composed of quartz-mica schist and diorite gneiss. The magmatic episodes are associated with penetrative deformation and metamorphic events ranging in age from late Paleozoic to Tertiary.

According to Colpron (2006), the Yukon Tanana Terrane consists of four unconformity-bounded tectonic assemblages: the basal siliciclastic Snowcap Assemblage, and three volcanic and volcanoclastic sequences including the Upper Devonian to Upper Mississippian Finlayson Assemblage, the Mid Mississippian to Lower Permian Klinit Assemblage and the Mid to Upper Permian Klondike Assemblage. A coeval oceanic sequence of chert, argillite and mafic volcanic rocks of the Slide Mountain Terrane is preserved discontinuously along the eastern margin of the YTT. A sequence of immature fine grained clastic rocks and polymictic conglomerate of Permian to late Triassic age overlie the strata of the YTT and adjacent Slide Mountain Terrane, as well as the Selwyn basin to the east.

Plutonic rocks of the mid-Cretaceous Dawson Range batholith intrude the Yukon-Tanana terrane over vast areas and consist of large bodies of granodiorite and quartz monzonite, and smaller high-level felsic porphyry plugs and sills. The Property is underlain by one of the larger bodies of this unit.

Locally, narrow ultramafic units of unknown age have been emplaced along major structures within the Yukon-Tanana terrane. Pyroxene Mountain, located immediately to the northeast of the Property, is cored by this ultramafic unit.

Figure 5. Mariposa property regional geology.

## PROPERTY GEOLOGY

The Mariposa property is located 120 km south of Dawson City and 315 km northwest of Whitehorse (Fig. 6). The property lies within the central Dawson Range, SW central Yukon, where it forms part of the regionally extensive, NW-SE trending polymetallic mineral belt associated with Early Jurassic to latest Cretaceous magmatism.

The Property occurs entirely within the Yukon-Tanana terrane and is underlain by a polydeformed sequence of Permian through to Jurassic age metasedimentary and metaplutonic rocks that have been intruded by (i) discontinuous bodies of mafic – ultramafic intrusions, (ii) Cretaceous quartz monzonite and granite intrusions, and (iii) feldspar porphyry dykes and small intrusive plugs. The Permian – Jurassic rocks are considered to be ‘basement’ and host gold mineralization on the Mariposa property where they form a NW-striking, variably NE-dipping homoclinal sequence. Polyphase ductile deformation is responsible for the intercalation of Permian gneiss and schist packages of diverse compositions, in addition to foliation development within Jurassic intrusions that occur within the basement terrain. Metamorphism associated with ductile deformation attained at least mid- Amphibolite facies as evidenced by the kyanite-muscovite  $\pm$  garnet,  $\pm$  magnetite  $\pm$  staurolite assemblage that has been reported on both sides of Scroggie Creek at the south end of the airstrip (Richards, 2005). At least two episodes of brittle faulting have been observed to post-date the ductile deformation on the Mariposa property, the older of the two brittle events is associated with gold mineralization. A geological map indicating the main gold exploration targets in the Property is shown in Figure 6. The map represents integration of field traverses by Pacific Ridge Exploration Ltd. staff in the Skookum West and Skookum Main zones, historical mapping by Gordon Richards (property vendor), fault and lineament interpretations derived from high resolution aeromagnetic data flown for the property and available regional government geological mapping.

### Devono – Mississippian Basement

Several schist and gneiss units have been mapped on the Mariposa property where they form part of the Devono – Mississippian Yukon-Tanana terrane basement. Mappable units of surface and recognized in drill core include:

- ✧ Mafic-intermediate hornblende gneiss – Compositionally banded gneiss package varying from locally ultramafic (hornblendite) to pegmatitic granitic-granodioritic horizons. The mafic-intermediate gneiss package is transitional into a banded quartz diorite gneiss.
- ✧ Banded quartz diorite gneiss is comprised centimetrically layered felsic, intermediate and mafic (biotite-rich) intervals but is often dominated by the presence of a moderately foliated quartz-diorite (McIntosh, 2012). Locally, narrow bands of fine ( $\leq 2$  mm) pink garnets have been noted in unit and mafic bands may show (sometimes intense) epidote alteration  $\pm$  secondary biotite and minor chalcopyrite (McIntosh, 2012).
- ✧ Granodioritic biotite gneiss is characterized by textures that vary from gneissose to weak to moderately foliated and is a medium grained, leucocratic rock. The granodioritic gneiss is intimately interleaved with biotite rich mafic-intermediate

hornblende gneiss unit. The granodiorite often exhibits distinctive sericite alteration clots when in the sericite alteration zone (McIntosh, 2012).

- ✧ Biotite Gneiss - Strongly foliated, melanocratic, fine-grained biotite-rich unit with variable biotite content but 40% - 50% is common. Biotite gneiss is often banded, with leucocratic units of foliated granodiorite.
- ✧ Granitic gneiss
- ✧ Felsic gneiss – quartz-sericite+/- talc gneiss unit exhibiting granoblastic textures and locally hosting early stage chalcopyrite-pyrite mineralization. The bleached colour of the gneiss package distinguishes it from other gneisses on the property.
- ✧ Quartz-muscovite-garnet schist – Strongly foliated, silvery- grey quartz muscovite schist with garnet porphyroblasts up to 2cm in diameter. This schist unit occurs immediate south of the Skookum West target and is associated with multi-element soil anomalies
- ✧ Marble – occurs as discontinuous lenses within felsic gneiss in the Alberta Creek target area

Of these map units, the granodioritic biotite gneiss to foliated biotite granodiorite represents the most important host lithology for gold mineralization.

## **Jurassic Intrusives**

Jurassic intrusive rocks occur north of the Skookum main and east of the Big Alex targets and vary from monzonitic to granitic in composition. Pegmatite is common and perthite is often observed. Jurassic intrusions are locally observed to cut Devonian-Mississippian basement rocks; however they have also undergone penetrative deformation and have variably developed mineral fabrics. These intrusions are not an important host to gold mineralization. A minor amount of gabbro variable to pyroxenite occurs at the eastern boundary of the property. The unit is continuous with exposures of ultramafic rocks that constitute Pyroxene Mountain. The age of this map unit is currently not known, however, weak to moderately developed mineral fabrics in the unit imply they pre-date at least some phase of ductile deformation.

## **Cretaceous and Younger Intrusives**

Several small plugs of Cretaceous quartz monzonite to granodiorite are illustrated on the geological map of the Mariposa property, however their occurrence needs to be verified. Quartz feldspar porphyry dykes and small intrusive bodies are located towards the eastern end of the property, in close proximity to the Sizzler target. In the vicinity of the Sizzler target, a NNW-trending dyke swarm is locally associated with anomalous gold. Dykes occurring in the swarm range from fine-grained, equigranular dacite with 1-2% disseminated pyrite to localized rhyolitic breccia.

Figure 6. Mariposa property geology.

## Structure

Ductile deformation of basement lithologies is expressed as planar and linear metamorphic mineral fabric alignment (both schist and gneissose lithological units), leucosome formation and alkali feldspar augen development in more porphyroclastic units. The general geometry of the metamorphic basement rocks consists of a NW-striking, variable NE dipping homoclinal sequence, which is readily identified in the high resolution aeromagnetic data. At least two episodes of brittle faulting are recognized to post-date ductile deformation on the Mariposa property, including an ENE-trending sinistral fault system associated with gold mineralization, and a NE to NNE striking fault set that may offset the mineralized structures. A more detailed examination of gold mineralizing structures in the Skookum West and Skookum Main zones indicates that two primary orientations of structures are present and include N- to NNW and E- to ENE trending fault structures. This geometry is replicated on the Coffee property and also within the Golden Saddle deposit. Brittle faults are expressed as fault breccia, gouge and cataclasite development associated with sericite-alkali feldspar-pyrite and quartz alteration.

## 2011 WORK PROGRAM

The portion of the 2011 work program presented in this report consisted of a soil geochemical survey over two key areas of the Mariposa property; the Skookum Main Zone and the Alberta Creek Zone. Two types of sample were collected. C horizon samples were collected using a hand auger in non-permafrost areas. Where permafrost prevented access to the C horizon, an organic A horizon sample was collected. The budget for this Phase I program that is being applied as assessment work is \$199,555. Sample locations are shown in Figures 7 (by soil sample type) and 8 (by analytical certificate). Analytical certificates are included in Appendix II and complete sample results are tabled in Appendix III.

Samples were collected by personnel of the Company and contractor All-In Exploration Solutions Inc. of Whitehorse. Crews were transported by ATVs and helicopter to the sample grids. For safety and for support carrying samples during longer traverses, crews worked in teams. Figure 7 shows the survey areas within the Property while Figures 8a and 8b show greater detail of the sample grids. In most cases, samples were collected at 50 m intervals along 100 m spaced lines, except where no sample could be collected due mainly to permafrost. In areas of greater interest, sample spacing was reduced to 25 m. In the central Skookum grid, samples were collected at 25 m intervals on 50 m spaced lines.

Within the two grid areas, Skookum and Alberta Creek, a total of 5,882 soil samples were collected during the program, of which 2,459 are applied for credit in this report. The budget for this Phase I program that is being applied as assessment work is \$199,555. The program was designed and supervised by Janice Fingler, P.Geo., Vice President of Exploration for Pacific Ridge at the time of the field work.

The coordinates of planned grid stations (UTM NAD 83, Zone7) were uploaded to handheld Garmin 60C GPS units prior to traverses and were then used by crews to navigate in the field. All sample sites were marked in the field with flagging and tyvek tags.

All C horizon samples were collected using a one metre long Edelman Dutch hand auger and were gathered from depths ranging from 20 to 60 cm. A horizon samples were collected from within a few cm of surface.

Figure 7. 2011 soil grids over Skookum and Alberta Creek grids showing 1DX2 and 1F2 sample locations.

Figure 8. 2011 soil sample location coded by analytical certificate.

The sample numbers used are shortened versions of the actual GPS coordinates, assigning only the last 5 digits of both the east and the north UTM coordinate. Sample numbers therefore had 10 digits, with a space separator. A total of 400 to 500 grams of soil was collected and placed in well- marked kraft soil bags. These were packaged into sealed rice bags, flown to Dawson City by charter, and were delivered to the Acme Analytical freight service by Small's Expediting. Soil samples were received and processed by the Acme Lab facility in Whitehorse and pulps were forward to Vancouver for analysis. Samples were analyzed for 36 elements using an Aqua Regia digestion and an ICP-MS finish (1DX). Acme Analytical Labs is an ISO9001 accredited facility which conducted full internal QA-QC with the insertion and monitoring of standards, blanks and duplicates.

## 2011 SOIL SURVEY RESULTS

Anomalous results have been discriminated by calculating percentiles from the 3,894 C horizon samples collected (Table 1) and the 1,988 A horizon samples collected (Table 2). These values were used to construct bubble plots for nine key elements for each of the two survey areas, Skookum and Alberta Creek. Circles were used for the 1DX2 analyses and squares for the 1F2 analyses. Results from the Skookum Zone are shown in Figures 9 to 17 and results from Alberta Creek are shown in Figures 17 to 26.

In general, gold values from C horizon soils above 300 ppb are taken to be anomalous and above 50 ppb as significantly anomalous. In this study, the 90<sup>th</sup> percentile value of 1DX2 gold is 22.4 ppb and the 95<sup>th</sup> percentile is 45.9 ppb. Any values above this number are taken to be strongly anomalous. The 97.5<sup>th</sup> and 99<sup>th</sup> percentile values are added to provide anomaly definition. Where several "strongly anomalous" samples occur in a cluster, the resulting soil anomaly definitely requires follow-up exploration.

The same percentile levels, symbols and colours have been used for all other elements compared in this presentation. Correlations among the various metals can be observed when comparing the various maps. Such correlations can sometimes provide further support for a defined anomaly and may also provide clues as to the possible style of mineralization being reflected by the anomaly.

**Table 1. Percentile Thresholds for C Horizon (1DX2) Samples**

| Percentile | Mo(ppm) | Cu(ppm) | Pb(ppm) | Zn(ppm) | Ag(ppm) | As(ppm) | Au(ppb) | Sb(ppm) | Bi(ppm) |
|------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 99         | 9.4     | 143.4   | 167.5   | 215.0   | 0.9     | 46.0    | 152.1   | 1.1     | 4.4     |
| 97.5       | 5.8     | 87.4    | 66.0    | 160.0   | 0.6     | 26.0    | 79.4    | 0.8     | 1.5     |
| 95         | 4.0     | 62.4    | 32.2    | 129.0   | 0.4     | 15.1    | 45.9    | 0.6     | 0.6     |
| 90         | 2.8     | 44.7    | 18.4    | 107.0   | 0.3     | 9.9     | 22.4    | 0.5     | 0.3     |
| 75         | 1.7     | 30.2    | 11.5    | 85.0    | 0.2     | 7.6     | 8.0     | 0.4     | 0.2     |

**Table 2. Percentile Thresholds for A Horizon (1F2) Samples**

| Percentile | Mo(ppm) | Cu(ppm) | Pb(ppm) | Zn(ppm) | Ag(ppb) | Au(ppb) | As(ppm) | Sb(ppm) | Bi(ppm) |
|------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 99         | 7.7     | 77.4    | 33.5    | 230.7   | 2762.4  | 19.5    | 6.7     | 0.7     | 0.4     |
| 97.5       | 5.8     | 60.6    | 17.3    | 150.4   | 1639.3  | 10.9    | 5.5     | 0.6     | 0.3     |
| 95         | 3.5     | 46.1    | 13.0    | 113.7   | 1224.3  | 8.1     | 4.7     | 0.5     | 0.3     |

## Skookum Zone Results

Two strong gold anomalies were defined at the Skookum Zone, Skookum Main and Skookum West. A third, linear anomaly, the Maisy Mae trend, appears to be stratigraphically controlled and has a base metal signature without gold. Other anomalous areas will be discussed in the text, below. The results from the Skookum Zone are shown as bubble plots in Figures 9 to 17.

### Skookum Main

The Skookum Main is defined by a strong cluster of anomalous gold in soil results (Figure 9), 1,500 m long by 1,000 m wide, where almost 50% of the samples are greater than 50 ppb Au and range up to 1946 ppb. Most of the soils that define the anomaly are C horizon, but the northern edge of the anomaly is defined by A horizon soils, with values up to 52.4 ppb Au. The fact that the A horizon anomaly complements and fills out the adjacent C horizon anomaly suggests that A horizon sampling can be an effective way to define soil anomalies in permafrost areas.

The Skookum Main anomaly is also defined by silver (Figure 10), but the values are weak (<3 ppm) and the anomalous values cover only about half the area of the gold anomaly. There is virtually no arsenic response (Figure 11). There is a good correlation with molybdenum (Figure 12), which appears to extend the anomaly farther to the northeast than the gold values, in an area of A horizon sampling. Copper in soils supports the gold anomaly in part and shows a trend that is similar to silver. Bismuth and antimony (Figures 14 and 15) are weakly anomalous in Skookum Main. Both lead and zinc (Figures 16 and 17) are anomalous in the western portion of Skookum Main, somewhat similar to silver and copper.

Assuming that the soils are reflecting metal values in bedrock that are in reasonable proximity to their bedrock source in this area of residual soils, the anomaly pattern suggests at least two metal sources in the area of the Skookum Main Zone. The first is an east-northeast trending structurally controlled zone with an Au-Mo+/-Ag+/-Sb signature. This is intersected by a likely stratigraphically controlled, northwest trending Ag-Cu+/-Bi+/-Pb+/-Zn base metal signature. This latter zone is parallel to but less well defined than the Maisy Mae trend to the southwest, described below, with the same signature.

The strongest portion of the gold anomaly correlates with the intersection of the structural gold trend and the stratigraphically controlled base metal trend, suggesting that the point of intersection of these two styles of anomaly may have been an important influence on the control of gold mineralization on the Property.

### **Skookum West**

This is a less intense gold anomaly, up to 606 ppb Au, it is smaller than Skookum Main, and it appears to have two structural trends; a main east-northeast trend and a secondary north-northeast trend at its eastern end. It has a weaker correlation with silver and antimony and virtually no anomalous arsenic, bismuth, lead or zinc. There are strong molybdenum values associated with this anomaly, but they are very localized, in the core of the anomaly and in the extreme northeast corner.

There does not appear to be the northwest trending base metal association with this anomaly, but this may be due in part to the lack of sampling, particularly to the southeast of the zone.

The Skookum West anomaly is secondary in terms of strength, size and supporting metals when compared with Skookum Main.

### **Maisy Mae Trend**

This is a strong, linear, west-northwest trending Pb-Zn-As-Bi-Ag that is also weakly anomalous in Mo. It appears to parallel stratigraphy and is similar in nature to the previously described base metal anomaly that intersects the Skookum Main zone. However, it is stronger and more tightly defined and it lacks a copper signature. It is 3,000 m in length and is open to the southeast and possibly also to the northwest. Further to the northwest, it aligns with the Maisy Mae target (see Figures 4 & 6), which Venessa Bennett has suggested might be caused by VMS style mineralization (pers.com.).

### **Other Targets**

Two other zones are worth noting. There is a significant antimony anomaly in the southeast corner of the area sampled. This is adjacent to the Hackly Zone (see Figures 4 & 6) and could be indicative of gold mineralization in that area.

The other is the area of A horizon sampling north and mainly northeast of Skookum Main. Silver, lead and zinc all define fairly strong anomalies, while there are anomalous but more dispersed values in copper and arsenic. Since there is no bedrock or evidence of what kind of bedrock source might cause these anomalies, an interpretation of this zone is difficult. It may be a continuation of the northwest-trending base metal zone or down slope dispersion from the Skookum Main Zone or related mineralization, or a combination of the two.

## **Alberta Creek Zone Results**

Three anomalous targets have been defined at Alberta Creek: Gold South, Gold North and Copper-Moly (Figures 18 to 26). The Gold South and Gold North targets are similar in nature and could be a part of one continuous anomaly and will therefore be described together. The second anomaly, the Copper-Moly Zone, has a weak gold association and is prospective as a possible porphyry-related target.

### **Gold North and South Zones**

There is a gap in sampling between these two anomalies, but it appears that they may be part of one continuous gold zone. Yet to be confirmed, this anomaly could have an overall strike length in excess of 2 km. As presently defined, the North Zone is 700 m long and the South Zone is 800 m long. The North Zone is fully defined by C horizon samples, while the South Zone is defined by more than 50% A horizon samples, on the lower or eastern and north side of the anomaly.

C horizon gold values range up to 450 ppb within the anomaly. Compared with the Skookum Zone, there is relatively little support from other elements here. The North Zone is an Au-Sb anomaly with locally anomalous Mo while the South Zone is also moderately anomalous in Sb and weakly anomalous in As and Cu. Neither portion shows any anomalous values in Bi, Pb or Zn.

There is no known bedrock source for this soil anomaly. Except for minor prospecting along the ridge within the North Zone, there has been very little exploration work carried out in the area.

### **Copper-Moly Zone**

This is a Mo-Cu-Au+/-Ag+/-Sb+/-As anomaly with weakly anomalous Zn. As defined by Mo, it is 600 m by 800 m in size and defined by both C horizon and A horizon samples, but it is predominantly A horizon, as it occurs on a north-facing slope.

There is no reported indication of mineralization associated with this anomaly. It could represent porphyry-style or some other type of hydrothermal base and precious metal mineralizing system. There is a known porphyry system called the Bridget (or Brigitte – Yukon Minfile – see Figure 4) just south of the Property and approximately 10 km southwest of the Alberta Creek Zone.

## **SUMMARY AND CONCLUSIONS**

The 2011 work program consisted of a soil geochemical survey over two key areas of the Mariposa property; the Skookum Zone and the Alberta Creek Zone. Two types of sample were collected. C horizon samples were collected using a hand auger in non-permafrost areas. Where permafrost prevented access to the C horizon, an organic A horizon sample was collected. The budget for this Phase I program that is being applied as assessment work is \$199,555.

Two strong gold anomalies were defined at the Skookum Zone - Skookum Main and Skookum West. These two anomalies have an east-northeast trend and appear to be related to a structurally controlled bedrock source. Two other anomalies with a base metal signature have a northwesterly trend and may have an association with stratigraphy and possibly also VMS style mineralization. The more easterly of these intersects the Skookum Main anomaly where it contains some of the better gold values, so the

intersection of the two styles of anomaly may have an important influence on the control of gold mineralization on the Property.

Three anomalous targets have been defined at Alberta Creek: Gold South, Gold North and Copper-Moly. The Gold South and Gold North targets are similar in nature could be a part of one continuous anomaly. The second anomaly at Alberta Creek, the Copper-Moly Zone, has a weak gold association and is prospective as a possible porphyry-style target.

The Skookum Main geochemical anomaly is classic for the White Gold district with a gold-moly signature and with associated anomalous arsenic, bismuth and, to a lesser extent base metals. It is somewhat unique in that it appears to occur at the intersection of two separate anomalies; gold dominant (NNE) vs. base metal (NW) signatures. More work is required to determine the nature of the bedrock sources of these soil anomalies and the relationship between the different geochemical signatures.

The third anomaly at the Skookum Zone, the Maisy Mae Trend, is a strong, northwest trending linear anomaly defined by base metals, bismuth, arsenic and silver, with lesser anomalous molybdenum and antimony. The source of this anomaly is unclear, but it appears to be stratigraphically controlled and it could be related to VMS style mineralization and the main Maisy Mae target area on strike to the northwest of this trend.

## **RECOMMENDATIONS**

It is difficult to make recommendations based on this work, as a full season of yet-to-be reported exploration has been completed in 2012. This work has included additional soil sampling in the Skookum area and at Alberta Creek as well as additional trenching and drilling within the Skookum Zone. No trenching or drilling has been carried out at Alberta Creek.

For 2013, additional sampling and trenching, accompanied by detailed IP and resistivity surveying, has been recommended for Skookum Main, Skookum West and Alberta Creek.

## STATEMENT OF EXPENDITURES

| Dates of Work     | CATEGORY                        | Unit          | Number             | Rate         | Subtotal          |
|-------------------|---------------------------------|---------------|--------------------|--------------|-------------------|
| August 2-20, 2011 | PERSONNEL (14 crew days)        | Crew days     | 22                 | \$ 2,000     | \$ 44,000         |

## CERTIFICATE OF QUALIFICATIONS

I, Gerald G. Carlson, hereby certify that:

1. I am a consulting mineral exploration geologist and Vice President, Exploration of Pacific Ridge Exploration Ltd., 100 – 1199 West Hastings Street, Vancouver, B.C., V6E 3T5.
2. I am a graduate of the University of Toronto, with a degree in Geological Engineering (B.A.Sc., 1969). I attended graduate school at Michigan Technological University (M.Sc., 1974) and Dartmouth College (Ph.D., 1978). I have been involved in geological mapping, mineral exploration and the management of mineral exploration companies continuously since 1969, with the exception of time between 1972 and 1978 for graduate studies in economic geology.
3. I am a member in good standing of the Association of Professional Engineers and Geoscientists of the Province of British Columbia, Registration No. 12513 and of the Association of Professional Engineers of Yukon, Registration No. 0198.
4. I am the author of this report on the Mariposa Project, Report on the 2011 Soil Geochemical Program. The report is based on a literature review, on private company reports and on the 2011 work program.
5. I am an officer of Pacific Ridge Exploration Ltd. and I own shares in the company.
6. I was not personally involved in the planning and execution of the exploration program discussed in this report. However, I do take responsibility for the interpretations presented herein.

**Dated at Vancouver, B.C. this 18th day of April, 2013,**

**Gerald G. Carlson, Ph.D., P. Eng.**

## **APPENDIX II**

### **ANALYTICAL CERTIFICATES**

1020 Cordova St. East Vancouver BC V6A 4A3 Canada

Acme Analytical Laboratories (Vancouver) Ltd.

[www.acmelab.com](http://www.acmelab.com)

**Client:** Pacific Ridge Exploration Ltd.

1100 - 1199 West Hastings Street  
Vancouver BC V6E 3T5 Canada

Submitted By: Janice Fingler

Receiving Lab: Canada-Whitehorse

Received: June 20, 2011

Report Date: July 04, 2011

Page: 1 of 11

## CERTIFICATE OF ANALYSIS

WHI11000260.1

### CLIENT JOB INFORMATION

Project: None Given  
Shipment ID: IIMPS02  
P.O. Number  
Number of Samples: 285

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Pacific Ridge Exploration Ltd.  
1100 - 1199 West Hastings Street  
Vancouver BC V6E 3T5  
Canada

### SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

| Method Code | Number of Samples | Code Description                           | Test Wgt (g) | Report Status | Lab |
|-------------|-------------------|--------------------------------------------|--------------|---------------|-----|
| SS80        | 285               | Dry at 60C sieve 100g to -80 mesh          |              |               | WHI |
| Dry at 60C  | 285               | Dry at 60C                                 |              |               | WHI |
| RJSV        | 285               | Saving all or part of Soil Reject          |              |               | WHI |
| 1DX2        | 285               | 1:1:1 Aqua Regia digestion ICP-MS analysis | 15           | Completed     | VAN |

### ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.  
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only.  
\*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

## CERTIFICATE OF ANALYSIS

WHI11000313.1

### CLIENT JOB INFORMATION

Project: Mariposa  
Shipment ID: 11MPS-04  
P.O. Number  
Number of Samples: 320

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

### CLIENT JOB INFORMATION

Project: Mariposa  
Shipment ID: 11MPS-04  
P.O. Number  
Number of Samples: 36

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

### CLIENT JOB INFORMATION

Project: Mariposa  
Shipment ID: 11MPS-07  
P.O. Number  
Number of Samples: 280

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

### CLIENT JOB INFORMATION

Project: None Given  
Shipment ID: 11MPS-05  
P.O. Number  
Number of Samples: 292

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

## CERTIFICATE OF ANALYSIS

WHI11000588.1

### CLIENT JOB INFORMATION

Project: Mariposa  
Shipment ID: 11MPS-08  
P.O. Number  
Number of Samples: 295

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Pacific Ridge Exploration Ltd.

### CLIENT JOB INFORMATION

Project: Mariposa  
Shipment ID: 11MPS-13  
P.O. Number  
Number of Samples: 180

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

| RJSV        | 178               | Saving all or part of Soil Reject          |              |               | WHI |
| 1DX2        | 178               | 1:1:1 Aqua Regia digestion ICP-MS analysis | 15           | Completed     | VAN |

### ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted. \*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

### CLIENT JOB INFORMATION

Project: Mariposa  
Shipment ID: 11MPS-14  
P.O. Number  
Number of Samples: 189

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

### CLIENT JOB INFORMATION

Project: Mariposa  
Shipment ID: 11MPS-16  
P.O. Number  
Number of Samples: 200

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

## CERTIFICATE OF ANALYSIS

WHI11001024.1

### CLIENT JOB INFORMATION

Project: Mariposa  
Shipment ID:  
P.O. Number: 11MPS-17  
Number of Samples: 224

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

| SS80        | 224               | Dry at 60C sieve 100g to -80 mesh          |              |               | WHI |
| Dry at 60C  | 224               | Dry at 60C                                 |              |               | WHI |
| RJSV        | 224               | Saving all or part of Soil Reject          |              |               | WHI |
| 1DX2        | 224               | 1:1:1 Aqua Regia digestion ICP-MS analysis | 15           | Completed     | VAN |

### ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted. \*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

### CLIENT JOB INFORMATION

Project: Mariposa  
Shipment ID: 11MPS-15  
P.O. Number  
Number of Samples: 168

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

### CLIENT JOB INFORMATION

Project: Mariposa  
Shipment ID: 11MPS-19  
P.O. Number  
Number of Samples: 202

### SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage  
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Pacific Ridge Exploration Ltd.  
1100 - 1199 West Hastings Street  
Vancouver BC V6E 3T5  
Canada

CC: Katie Dodd  
John Brock

### SAMPLE PREPARATION AND ANALYTICAL PROCEDURES
