1. EXECUTIVE SUMMARY

The *Victoria Category-B Lands West* (VBW) and *Victoria Category-B Lands South* (VBS) projects are located in the Mayo Mining District, Yukon Territory, approximately 85 kilometers north of Mayo and 370 kilometers due north of Whitehorse. The VBW and VBS (VB) claims are owned and operated by Strata Gold Corporation, a wholly-owned, directly-held subsidiary of Victoria Gold Corp.

The 2012 exploration program at the VB projects comprised surface geochemical sampling and geological mapping. Access was by helicopter and approximately 10 days were spent in the field. Work was done by Victoria Gold Corp. and Ground Truth Exploration. Geochemical analysis of samples was done by Acme Labs and ALS Chemex Labs.

Results of the surface geochemical sampling and mapping program identified several zones of interest across the property, most notably a 5 Km long east-west striking gold in soil (>20 ppb Au) anomaly that is coincident with a mapped structural zone consisting of oxidized, brecciated quartzite and associated en echelon quartz veins. Geological mapping also discovered intrusive rocks which may host gold mineralization similar to the adjacent Eagle gold deposit.

2. INTRODUCTION

The VB claims are located in the Mayo Mining District, Yukon Territory, approximately 85 kilometers north of Mayo and 370 kilometers due north of Whitehorse (fig. 1 – VB Claims shown in green). The properties outlined for assessment comprises 1,485 quartz mining claims, covering approximately 30,000 hectares of land. StrataGold Corporation, a wholly-owned, directly-held subsidiary of Victoria Gold Corp. is the registered owner and operator for all claims. Surface rights on the Category B Lands belong to the First Nation of NaCho Nyak Dun (FNNND) and are part of the FNNND's final Umbrella Agreement with the federal and territorial governments. The FNNND signed an agreement giving consent to Victoria for staking claims and conducting exploration on the Category B Lands described in this report. This assessment report details work carried out on the VB Property between January 1st, 2012 and January 31st, 2013. For the purposes of claim renewal, only work completed between June 1st, 2012 and December 1st, 2012, and the costs associated with that work was applied to the claim groupings.

2.1. Surface Sampling and Mapping - Objective

The 2012 surface geochemical sampling program was conducted on the VB claims and 1982 soil samples and 14 rock chip samples were taken. The sampling programs were conducted in conjunction with field mapping and the objective of the work was to evaluate the project geology, obtain a better understanding of the geology and mineralogy of the project area and to define regional exploration targets for future testing.

Figure 1 - VBW and VBS Claim Outlines

3. HISTORY

Limited exploration work has been done on the VB claims in the past. Historical records show that one mineral occurrence was staked in 1911 by George Ortell. Various companies staked ground and explored the area in the late 1970s through the early 1990s but no drilling was done. Regional geological mapping and sampling by the Yukon Geological Survey was completed in the mid-1990s. Placer gold is found in several of the creeks in the area and work on those has been intermittent through the years. There has been no recent exploration using modern methods.

4. CLAIMS

The VBW and VBS claims comprise 1,485 quartz mining claims, covering approximately 30,000 hectares of land. StrataGold Corporation, a wholly-owned, directly-held subsidiary of Victoria Gold Corp. is the registered owner and operator for all claims (appendix III).

Maps depicting the VBW and VBS claim groupings related to this report and a full claim list for the VB lands are provided in appendix III.

5. GEOLOGICAL SETTING

The VB Project is interpreted to be an intrusive-related gold system (IRGS) or porphyry system associated with the western extension of the Dublin Gulch Stock, a member of the 90 Ma Tombstone Plutonic Suite (TPS), which forms a narrow belt of intrusions extending 550 kilometers across the north-central Yukon. Host rocks for the gold at the VB Project also include oxidized, brecciated quartzite and en echelon quartz veins. The following discussion on regional and local geology is mostly taken from Mair et al (2006a, 2006b) and Doherty (2007).

5.1. Regional Geology

The VB project resides within upper Proterozoic Hyland Group (fig. 2) rocks, which are part of the western Selwyn Basin, an epicratonic basin developed in a divergent margin setting established as the result of neo-Proterozoic rifting along the North American margin (Ross, 1991; Colpron et al., 2002). Jurassic convergence between the North American and Farallon plates led to the collision of outboard terranes with the continental margin, which resulted in northward thrusting and low-grade metamorphism of Selwyn Basin strata (Monger, 1993). In the Mayo region, the Jurassic-Cretaceous Dawson, Tombstone and Robert Service thrusts (Murphy and Héon, 1995), juxtapose Hyland Group rocks against Mississippian shelf units and Devonian to Jurassic clastic units. With waning deformation across the orogen by the mid-Cretaceous, emplacement of a series of northwardly-younging, orogen-parallel, felsic to intermediate plutonic suites occurred between 112 and 90 Ma (Mortensen, 2000). The Tombstone Plutonic Suite (TPS) is the most cratonward and youngest of the mid-Cretaceous plutonic belts emplaced into deformed Selwyn Basin strata. It extends in excess of 500 kilometers in an east-west direction, from the Yukon-Northwest Territory border to Dawson City, where it is truncated by the Tintina Fault Zone, a Cretaceous-Tertiary strike-slip fault with an estimated 450 kilometers of displacement. The TPS intrusions are typically <5 km in diameter and occur as composite plutons or as isolated pluton and dyke clusters. Compositionally they are predominantly monzogranite to quartz monzonite, with smaller volumes of later monzonite to quartz monzodiorite (Mortensen et al., 2000; Hart et al., 2004). They are weakly reduced to weakly oxidized and metaluminous to weakly peraluminous. Minor porphyritic, aplitic and calc-alkaline lamprophyre dykes (Mair et al., 2003) cross-cut and intrude the main stocks.

Figure 2 - Simplified geology of the western Selwyn Basin (after Mair, 2004).

5.1.1. Deposit Types

Regionally, the TPS is spatially and possibly also genetically associated with a range of precious and base-metal occurrences. These include: intrusion-hosted sheeted vein systems (Fort Knox, Dublin Gulch, Sheeted Zone at Scheelite Dome), metasediment-hosted sheeted veins (Harvey-Rudolph Zone at Scheelite Dome), intrusion-hosted disseminations and stringers (Brewery Creek), skarns (Marn, Wolf tungsten), hornfels-hosted sulfide veins, sediment-hosted stratabound sulfide replacement and disseminated, stringer and breccia-hosted mineralization external to the hornfels. The characteristic metal association of TPS related deposits comprises Au-W-Bi-As-Sb-Te-Mo±Cu±Pb±Sn.

5.2. VB Project Geology

The claims in the VB Project area are underlain by Proterozoic to Middle Cambrian Hyland Group siliciclastic units of the Yusezyu Formation (primarily phyllite) and (Cretaceous?) intrusive rocks. The intrusive rocks are interpreted to be of similar character and age to the Dublin Gulch stock, which hosts Victoria's Eagle gold deposit, located approximately 15 km to the east. The metasedimentary units are

deformed, brecciated, locally oxidized and host up to 244 ppb gold. The VBW claim block is on strike with the Potato Hills mineral trend identified to the east, and is also part of the Tombstone High Strain Zone that extends into the Dublin Gulch area.

6. 2012 EXPLORATION PROGRAM

6.1. Soil Geochemical Surveys

Exploration in the VBW and VBS claim blocks commenced in September of 2012 and comprised a 1982 sample ridge-and-spur soil sampling program conducted by Ground Truth Exploration; and a 4 day helicopter-supported mapping and rock chip sampling program conducted by Victoria Gold Corp. The mapping program focused predominately on VBW claims, targeting interpreted fault systems and intrusive bodies. In total, 14 rock chip samples were collected and sent for analysis.

Results of the programs defined a 5 km long, east-west striking gold-in-soil and coincident As, Ag, Sb and Bi trend on the VBW claims, returning up to 244 ppb gold (fig. 3). The trend is proximal to and coincident with an area of quartz veined quartzite with local areas of heavily oxidized brecciated quartzite and associated en echelon quartz veins as well as several mapped faults and a zone of hornfelsed metasedimentary rocks.

The mapping program also delineated two outcropping intrusive bodies. One of these outcrops is located 1.5 km north of the gold in soil trend and the other is located in the northwest quadrant of the VBW claim block. The intrusions are interpreted to be of similar character to the Dublin Gulch stock, which hosts the company's Eagle gold deposit, located 15 km to the east.

Figure 3 - Sample Location Map

6.1.1 Analytical Method

The soil samples collected on the VB claims were assayed at Acme Labs and the rock chip samples were assayed at ALS Chemex Labs. The following is a description of the methods used by the two labs taken from their websites;

Acme Labs:

Preparation

Soils, tills and sediments typically undergo two stages of preparation consisting of drying and screening. At AcmeLabs we dry these materials at 60°C to minimize loss of volatile elements (eg. Mercury). Soils, tills and sediments are screened to -180 microns (-80 mesh ASTM).

Analysis

Analysis consists typically of two stages comprising extraction of the desired elements into a solution and element determination by instrumental analysis of the solution.

ICP-MS measures the element concentrations by counting the atoms for each element present in the solution.

ALS Chemex Labs:

Analysis Description – VB Claim Rock Chip samples	
Analysis Code	
Au-AA24	Gold (0.005-10ppm) by Fire Assay (50g nominal sample weight). Aqua Regia Digest and analysis by AAS. NOTE: All samples with Au >10ppm as determined by Au-AA24 is re-assayed by method Au-GRA22
Au-GRA22	Gold (0.05-1000ppm) by Fire Assay (50g nominal sample weight) and gravimetric finish
ME-ICP61	33 elements by Aqua Regia Acid Digestion and ICP-AES Ag (0.2-100ppm), Al (0.01-25%), As (2-10000ppm), Ba (10-10000ppm), Be (0.5-1000ppm), Bi (2-10000ppm), Ca (0.01-25%), Cd (0.5-1000ppm), Co (1-10000ppm), Cr (1-10000ppm), Cu (1-10000ppm), Fe (0.01-50%), Ga (10-10000ppm), K (0.01-10%), La (10-10000ppm), Mg (0.01-25%), Mn (5-50000ppm), Mo (1-10000ppm), Na (0.01-10%) Ni (1-10000ppm), P (10-10000ppm), Pb (2-10000ppm), S (0.01-10%), Sb (2-10000ppm), Sc (1-10000ppm), Sr (1-10000ppm) Th (2-10000ppm), Ti (0.01-10%), Tl (10-10000ppm), U (10-10000ppm), V (1-10000ppm), W (10-10000ppm), Zn (2-10000ppm)

7. INTERPRETATION AND CONCLUSIONS

7.1. *Geological Mapping and Surface Sampling Programs*

The VB claim blocks consist of dominantly Hyland group sediments of the Yusezyu Formation; primarily phyllite, and meta-sandstone. The VBS block is also host to the Mississippian aged Keno Hill Quartzite unit on its southern boundary (Hunt & Murphy, 1996). The area is bordered to the South by the Tombstone strain Zone, a large scale structural feature that extends into the Dublin Gulch claims, and the Robert Service Thrust. Mapping in the VBS block was limited by the lack of exposure. The Ag vein occurrences in the southern part of the block were inaccessible and overgrown. YGS mapping places the Argent occurrence within the Keno Hill Quartzite, in relation to the Keno Silver District style massive sulphide veins.

In the VBW claim block a resistant quartzite unit dominates the western ridge. It is frequently silicified with numerous bull quartz veins ranging from 1 mm up to 30 cm thick. Intruding into the country rock are two plutonic bodies. The smaller northern body (1.5km x 0.5km) consists of a medium grained quartz-diorite to granodiorite with locally moderate to heavy chlorite alteration of mafic minerals. The larger southern body (1.5km x 0.7km) may possibly be related to the northern body. It consists of a sericite altered, light green to grey, quartz-monzonite to granodiorite. This larger intrusion appears similar to the Rex-Peso mapped igneous rocks to the east. Both outcrops in VBW lack visible veining and prominent structures.

To the south of the largest intrusion, hornfelsing occurs in an area named Black Hill, consisting of tourmaline-altered hornfelsed quartzite and phyllite with a 3km East-West extent, of an unknown Northern extent. Samples taken here by the YGS consist of gossanous quartz and tourmaline veins with anomalous levels of arsenic up to 8399 ppm, antimony up to 1096 ppm, and gold up to 0.17 ppm (Murphy and Héon, 1995). The presence of contact metamorphosed sediments and gossanous mineralized veins with scorodite suggests a buried intrusive body. Of the 1982 soil samples taken during September 2012, 18 returned values between 0.04 and 0.244 ppm Au with highs of 0.214 and 0.244 ppm Au, the majority of which came from the lower west quadrant of the VBW claims. The two highest soil samples coincide with the Black Hills hornfelsed zone and major faulted areas. Lower level gold anomalies correspond with the two intrusive bodies in VBW as well as several unmapped areas. In general, gold shows the best correlation with arsenic and bismuth, similar to mineralization in the Dublin Gulch stock.

Previous air photo interpretation by Aho (1962) identified numerous fault, vein or dyke lineaments and formation trends. Of these, three major faults in VBW were identified from mapping and regional magnetic geophysics. The large east-west striking fault in VBW expresses at surface as heavily oxidized quartzite fault breccia. Structural measurements in the field support a general 90-100 degree fault plane strike and 45 degree dip to the south in this area. This fault zone is interpreted to have up-thrown a large block of quartzite creating a distinguishable discontinuity in the landscape. The high strain in this area is also exhibited by quartz filled tension gashes up to 6 cm thick and dextrally offset veins within the quartzite. Minor normal faulting in this area also occurs with a north-south strike.

The second major fault direction strikes roughly 330 degrees on the eastern side of VBW. This shows as a strong positive magnetic anomaly on the Canada wide residual geophysics grid. This is also the site of a

sulphide vein occurrence, likely similar to Rex-Peso style silver vein-faults. The large positive anomaly showing on the Residual Total Field grid in VBW indicates a possible extension of the Tombstone Strain Zone to the south west. Samples taken by Murphy and Héon (Murphy & Heon, 1995) on the southern end of the anomaly consist of vuggy limonitic breccia with up to 1141 ppm Zn (Table 1), as well as moderate amounts of lead and antimony. Rock chip sampling from the 2012 season show the presence of a gossanous pyrite vein within the quartzite with anomalous values of silver, manganese, lead, and zinc. Limited exposure and outcrop in this area precluded identifying the extent and intensity of veining. Anomalously high silver values from the 2012 soil program consist of 9 samples between 0.9 and 2.1 ppm and one sample at 4.1ppm. These all occur around the identified faults likely similar to the Rex-Peso silver vein system. Bedding in this area reverses close to the center of the anomaly suggesting an antiform may be present, structurally consistent with the area to the east.

8. Statement of Qualifications

Certificate of Qualified Person

Richard Eliason – CPG 11261 (AIPG)
Victoria Gold Corp and StrataGold Corporation – 1055 Dunsmuir Street
Suite 584 – Bentall 4 – PO Box 49215
Vancouver, BC V7X 1K8
Telephone: 604-696-6601
Email: reliason@vitgoldcorp.com

I, Richard Eliason, CPG, do here-by certify that:

1. I am a geologist employed by Victoria gold Corp., 1055 Dunsmuir St., Suite 584 – Bentall 4 – PO Box 49215, Vancouver, BC V7X 1K8
2. I graduated with a Bachelor of Science degree, majoring in Geology, from the University of Montana, USA.
3. I am a practicing member of the American Institute of Professional Geologists and am a Certified Professional Geologist (CPG – 11261)
4. I have worked as a geologist for over 25 years since my graduation; this has included work in the United States, Canada and Europe.
5. I have read the definition of “qualified person” set out in National Instrument 43-101 (NI 43-101) and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-1-1) and past relevant work experience, I fulfill the requirements to be a “qualified person” for the purposes of NI 43-101.
6. I was present on site from time to time during the reporting period in 2012 and was involved in all aspects of the exploration program.
7. I had involvement with the properties that are subject to this Assessment Report prior to 2012.
8. As at the date of this certificate, to the best of my knowledge, information and belief, the Assessment Report contains all scientific and technical information that is required to be disclosed to make the Assessment Report not misleading.
9. I am not independent of StrataGold Corporation or Victoria Gold Corp (owner of StrataGold Corporation) as Vice President – Exploration.
10. I have read National Instrument 43-101 and form 43-101F1, and the Assessment Report has been prepared under my supervision in compliance with that instrument and form.
11. I consent to the filing of the Assessment Report with any stock exchange and other regulatory authority and any publication by them for regulatory purposes, including electronic publication in the public company files on their websites accessible by the public, of the Assessment Report.

Dated: May 22, 2013

Richard Eliason, Certified Professional Geologist (CPG – 11261)

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"***" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

Appendix II - Rock and Soil Sample Descriptions

Rock Sample Descriptions:

Sample	Certificate	UTM_E	UTM_N	Elevation	Coord_System	Geo_Zone	Geo_Grid	Exposure_Type	Lithology	Notes
N819022	WH12223893	441151	7098129	1436	NAD83	8N	VBW	Boulder field/talus	Breccia	Below outcrop of quartzite, boulder of silicified quartzite breccia. Light-grey very fine grained matrix. Oxides in matrix as well. Quartzite has dark-grey laminations (primary?). Very silicified.
N819023	WH12223893	441501	7098114	1540	NAD83	8N	VBW	Frost Heave (in situ)	Breccia	On top of ridge. Obvious fault with 65-70 degree slope on North side and very gradual slope on south side of ridge. Fault breccia consists of highly oxidised matrix and brecciated white to light grey quartzite. Globular hematite in many places.
N819024	WH12223893	442282	7105218	1158	NAD83	8N	VBW	Outcrop	Quartz Vein	Huge cliff outcrop of foliated pebbly quartzite, feldspathic in areas. Quartz veins are common, some are oxidised with small amounts of black sulphosalts. Around the base of the outcrop and to the south, rock turns to a micaceous phyllite. Some veins contain very small amounts of possible corodite. Sample taken of quartz vein.
N819025	WH12223893	442287	7105152	1159	NAD83	8N	VBW	Outcrop	Quartz Vein	Still in same large ridge-crop. Vein of oxidised quartz within the phyllite.
N819026	WH12223893	441905	7104038	1349	NAD83	8N	VBW	Frost Heave (in situ)	Diorite	Chlorite alteration of mafic minerals (amphiboles). In this subcrop clasts of phyllite/quartzite country rock as well as a fine-grained (basaltic?) enclaves present.
N819027	WH12223893	441222	7099704	1358	NAD83	8N	VBW	Frost Heave (in situ)	Felsic Intrusive	
N819028	WH12223893	447078	7099245	1396	NAD83	8N	VBW	Boulder field/talus	Quartzite	Whole ridge and talus of light grey medium to fine grained quartzite. Weathered to dark grey or orange. Many bull quartz veins up to 40cm thick. Sample taken of pervasively oxidised quartzite.
N819034	WH12228198	447415	7098298	1334	NAD83	8N	VBW	Outcrop	Quartzite	Quartzite outcrop with some quartz veining. sample from quartz vein with no visible mineralization and oxidized fractures.
N819035	WH12228198	447506	7097515	1090	NAD83	8N	VBW	Float	Quartz Vein	Quartz vein float, from subangular boulder; possible weathered/oxidized sulphides.
N819036	WH12228198	447530	7097368	1029	NAD83	8N	VBW	Boulder field/talus	Quartzite	Exposed talus slope with mostly phyllite and some quartzite, coordinate from top of talus slope which continues to the bottom of the valley; sample is float found in talus field which is highly gossanous, dark orange purple, pyrite seen, possibly quartzite or phyllite hard to discern due to oxidation.
N819037	WH12228198	443588	7098337	1207	NAD83	8N	VBW	Outcrop	Quartzite	Highly oxidized quartzite, very hard to break.
N819038	WH12228198	443503	7098368	1187	NAD83	8N	VBW	Outcrop	Quartzite	Oxidized quartzite, fault breccia.
N819039	WH12228198	455338	7091221	1232	NAD83	8N	VBS	Outcrop	Phyllite	Sample is phyllite with thin moderately oxidized quartz veins crosscutting the foliation.
N819040	WH12228198	462387	7093197	1163	NAD83	8N	VBS	Outcrop	Phyllite	Large outcrop; sample from a quartz vein that runs parallel to the foliation, containing relict pyrite, moderate oxidation.
