			181.50	190.25	8.75		GRD	MG	Lt	Gn	Po			PHC	3i			Ak	2.00		Phyllic alteration envelope with patchy argillic alteration. Interval is intensely crosscut by carbonate veinlets, and often offset preexisting quartz veins. Quartz veins show netted textures. Disseminated pyrite throughout. Sulphide stringers are common. A mixing zone exists where unit is partially intruded by porphyry quartz feldspar dyke. Dyke is heavily silicified and has a varied contact with the GRD. Contact is sharp to gradational to mixed, indicating the GRD was warm when the dyke intruded, allowing for mixing and blurring of the contact to occur.

						SP	<1	Strongly silicifed vein zone. Large grey to smokey quartz veins have been brecciated by carbonate vein/veinlets and stringers. White calcite rhombs are clearly visible in smokey quartz. Two 7cm mineralized bands of blebby pyrite in in high abundance hosted in smokey quartz are located at 175.28m and 176.31m. Disseminated to blebby pyrite is abundant throughout the interval. Trace amounts of of sphalerite and galena are present and primarily located in the center of the interval. Arsenopyrite is slightly less frequent but is present in small quantities throughout the interval. Chalcopyrite is present in trace amounts and found in conjunction with pyrite.

0.00	54.12	54.12					GRD	MG	Lt	Gn	Fr	4I				1.00		To	1.00		7' Casing at 0.00m. Granodiorite with propyllitic, phyllic, and argillic alteration. Pervasive oxidation to approximately 34.75m, then oxidation is limited to fracture envelopes until 44.60m. Clay gouge is pervasive with oxidation. Disseminated to blebby pyrite is common.
									Md	Gy											
			0.00	18.88	18.88		GRD	MG	Lt	Gn	Fr	4I		PRO	2I	1.00		To	1.00		Poor recovery to 5.8m. Rock is mainly rubble-clay and heavily oxidized, with very little competent core. Rock regains competence after 5.80m, but is still heavily oxidized. Orange stains are pervasive, and oxidized clays are common. Fracture faces are completely obscured by black-brown stains. Overall granodiorite is weakly propyllitic, but mostly unaltered.
									Md	Gy											
			18.88	22.81	3.93		GRD	MG	Lt	Gn	Fr	3I		ARG	3I			Se	2.00		Moderate argillic alteration of granodiorite, with a sharp transition from propyllitic to argillic at 18.88m, and from argillic to propyllitic at 22.81m.

			22.81	24.33	1.52		GRD	MG	Lt	Gn				PRO	3I			Cl	10.00		Weak-moderate propyllitic alteration with patches of weak phyllic overprint. Moderate oxide staining on fracture faces and approximately 5mm fracture envelopes.
									Md	Gy				PHC	2I						
			24.33	39.40	15.07		GRD	MG	Lt	Gn				OXI	2I	1.00					Dominantly phyllic alteration with argillic patches (24.33-26.80m; 33.00-33.60m; 36.10-36.80m). Oxide staining is common and pervades beyond fractures. Minor silica flooding in short intervals. Crosscut by mineralized smoky quartz veins and hosts disseminated pyrite.

			39.40	53.08	13.68		GRD	MG	Lt	Gn				OXI	2I						Unaltered granodiorite, cut by quartz veins (with bordering phyllic alteration). Overall weak-moderate oxide staining. Patches of weak phyllic, propyllitic, and argillic alteration. Cut by quartz veins that are bordered by thin phyllic envelopes.
									Md	Gy

			204.20	222.80	18.60	mKgW	GRD	MG	LT	GN				PRO	3I						Dominantly propyllitic with phyllic envelopes near veins, and very weak oxide staining on fractures/rubble/slickensides (207.90-209.30m). Intensely sheared at 205.95-211.48m and 213.36-218..47m. Rock in these intervals are finely ground to coarse sand size. Mineralized quartz veins are seen in some patches of rubble, so this fault zone hosted quartz veins prior to movement. Slickensides are found on many fragments of rock, and most of the faulted granodiorite is propyllitic altered. Rock after the fault zone is propyllitic-phyllic with many quartz veins from 218.47-220.62m. Closely spaced carbonate veinlets are crosscutting pre-existing quartz veins and coating fracture faces. Large epidote blebs occur after 221.59m.

			222.80	235.61	12.81	mKgW	GRD	MG	LT	GN				PRO	4I	1.00		Cl	2.00		Moderate-intense propyllitic alteration in granodiorite. Later stage pervasive silica flooding resulting in quartz eyes. Crosscut by quartz and carbonate veins/veinlets. Hematite staining is fairly common from 222.80-229.20m. Several clay altered-gouged quartz veins. Rubbly 225.90-228.50m. Crosscut by pyrite stringers. Chlorite-rich veinlets most disseminated-blebby pyrite from 2311.60-235.61m. Grades into weak propyllitic by EOH (235.61m).

			60.89	67.19	6.30	LKqP	FEL	FG	LT	GN		1I									Extremely fine grained, with fewer and smaller phenocrysts than usually seen at this property. Phenocrysts are quartz and clay altered feldspars approximately 0.5mm-1mm in diameter. Weak oxidation on carbonate veinlets.
									MD	GY											
			67.19	68.82	1.63	LKqP	FEL	FG	LT	OR		2I									Similar overall composition and textures in 60.89-67.19m, but with more pervasive iron staining, resulting in an overall orange colour. Orange highlights the flow regions within the porphyry dyke. Crosscut by smoky quartz veinlets that follow the banded structure of the dyke. Looks like the planet Jupiter.
									MD	GY											
68.82	83.08	14.26				mKgW	GRD	MG	LT	GN				PRO	3I						Moderate propyllitic granodiorite with patchy phyllic and argillic, with phyllic vein envelopes and crosscutting quartz and carbonated veins and veinlets.

Heavy oxidation grading to argillic grading to phyllic grading to vein. Quartz carbonate veinlets cut through, 2 per meter. In general, fractures are oxidized. Phyllic alteration around vein hosts crystalline sericite.

Veinlets/veins show now effervescence, and grow in density to the point of strong preferential weathering, and on to intense brecciation of host rock. Trace disseminated pyrite through breccia gone; dark vein remnants show disseminated to blebby pyrite. Carbonate stringers detectable in more competent rock downhole of breccia; alont with chalcedony vein with carbonate flooding. Dyke intrusion, siliceous, after sulfide-rich quartz vein. Sulfide stringers immediately after dyke with disseminated pyrite grading out to trace into heavily silicified phyllic.

Sulphide-rich quartz vein at 98.90m. Clay veins generally white to off-white with disseminated pyrite; clay is black around quartz vein (sulfide rich). Quartz vein hostsblebby to massive pyrite, chalcopyrite; blebby arsenopyrite, sphalerite. Pyrite is disseminated through clay in higher concentrations around black clay/near quartz vein.
