CERTIFICATE WH12209402

Project: KEG (Main - Group 1)

P.O. No.: Batch 68

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 6-SEP-2012.

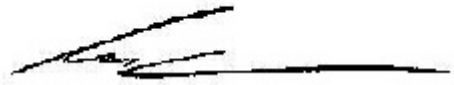
The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	HEATHER SMITH

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis

ANALYTICAL PROCEDURES



ALS CODE	DESCRIPTION
ME-MS61	48 element four acid ICP-MS

To: **SILVER RANGE RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE WH12209403

Project: KEG (Main - Group 1)

P.O. No.: Batch 74

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 6-SEP-2012.

The following have access to data associated with this certificate:

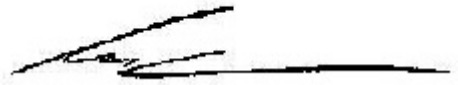
MATT DUMALA	JOAN MARIACHER	HEATHER SMITH

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES



To: **SILVER RANGE RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE WH12209420

Project: SNAP-GROUP 5

P.O. No.: Batch 46

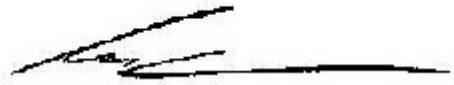
This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 4-SEP-2012.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	HEATHER SMITH

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70%<2mm
CRU-QC	Crushing QC Test
SPL-21	Split sample - riffle splitter
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85%<75 um
LOG-22d	Sample login - Rcd w/o BarCode dup
SPL-21d	Split sample - duplicate
PUL-31d	Pulverize Split - duplicate
LOG-23	Pulp Login - Rcvd with Barcode



ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Sn-XRF05	Sn-Trace Level XRF Analysis	XRF
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Ag-GRA21	Ag 30g FA-GRAV finish	WST-SIM

CERTIFICATE WH12209421

Project: SNAP-Group 5

P.O. No.: Batch 47

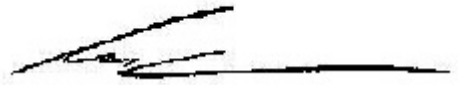
This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 4-SEP-2012.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	HEATHER SMITH

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70%<2mm
CRU-QC	Crushing QC Test
SPL-21	Split sample - riffle splitter
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85%<75 um
LOG-22d	Sample login - Rcd w/o BarCode dup
SPL-21d	Split sample - duplicate
PUL-31d	Pulverize Split - duplicate
LOG-23	Pulp Login - Rcvd with Barcode



ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
Au-GRA22	Au 50 g FA-GRAV finish	WST-SIM
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Sn-XRF05	Sn-Trace Level XRF Analysis	XRF
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Ag-GRA21	Ag 30g FA-GRAV finish	WST-SIM

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

Signature: 

Colin Ramshaw, Vancouver Laboratory Manager

Comments: Gold assay on sample M389940 is reported by fire assay gravimetric method due to high silver content in the sample that may cause incomplete gold dissolution in aqua-regia solution.

Comments: Gold assay on sample M389940 is reported by fire assay gravimetric method due to high silver content in the sample that may cause incomplete gold dissolution in aqua-regia solution.

CERTIFICATE WH12210692

Project: WELD - Group 5

P.O. No.: Batch 51

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 7-SEP-2012.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	HEATHER SMITH

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70%<2mm
CRU-QC	Crushing QC Test
SPL-21	Split sample - riffle splitter
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85%<75 um
LOG-22d	Sample login - Rcd w/o BarCode dup
SPL-21d	Split sample - duplicate
PUL-31d	Pulverize Split - duplicate
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Sn-XRF05	Sn-Trace Level XRF Analysis	XRF
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Ag-GRA21	Ag 30g FA-GRAV finish	WST-SIM

CERTIFICATE WH12210693

Project: SNAP-GROUP 5

P.O. No.: Batch 49

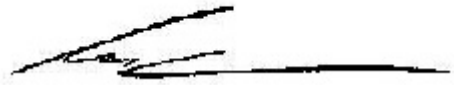
This report is for 35 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 7-SEP-2012.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	HEATHER SMITH

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70%<2mm
CRU-QC	Crushing QC Test
SPL-21	Split sample - riffle splitter
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85%<75 um
LOG-22d	Sample login - Rcd w/o BarCode dup
SPL-21d	Split sample - duplicate
PUL-31d	Pulverize Split - duplicate
LOG-23	Pulp Login - Rcvd with Barcode



ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Sn-XRF05	Sn-Trace Level XRF Analysis	XRF
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Ag-GRA21	Ag 30g FA-GRAV finish	WST-SIM

CERTIFICATE WH12210694

Project: RISBY-GROUP 5

P.O. No.: Batch 48

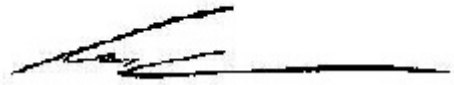
This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 7-SEP-2012.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	HEATHER SMITH

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70%<2mm
CRU-QC	Crushing QC Test
SPL-21	Split sample - riffle splitter
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85%<75 um
LOG-22d	Sample login - Rcd w/o BarCode dup
SPL-21d	Split sample - duplicate
PUL-31d	Pulverize Split - duplicate
LOG-23	Pulp Login - Rcvd with Barcode



ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Sn-XRF05	Sn-Trace Level XRF Analysis	XRF
ME-MS61	48 element four acid ICP-MS	
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE

CERTIFICATE WH12210695

Project: RISBY-GROUP 5

P.O. No.: Batch 50

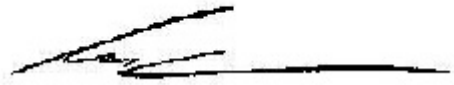
This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 7-SEP-2012.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	HEATHER SMITH

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70%<2mm
CRU-QC	Crushing QC Test
SPL-21	Split sample - riffle splitter
PUL-QC	Pulverizing QC Test
PUL-31	Pulverize split to 85%<75 um
LOG-22d	Sample login - Rcd w/o BarCode dup
SPL-21d	Split sample - duplicate
PUL-31d	Pulverize Split - duplicate
LOG-23	Pulp Login - Rcvd with Barcode



ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Sn-XRF05	Sn-Trace Level XRF Analysis	XRF
ME-MS61	48 element four acid ICP-MS	
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE WH12215610

Project: KEG (MAIN-GROUP1)

P.O. No.: Batch 85

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 13-SEP-2012.

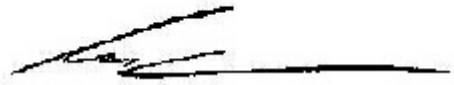
The following have access to data associated with this certificate:

JOAN MARIACHER		

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-25	Wt. of Crushed Reject
FND-03	Find Reject for Addn Analysis
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85%<75 um
LOG-22	Sample login - Rcd w/o BarCode

ANALYTICAL PROCEDURES



ALS CODE	DESCRIPTION	INSTRUMENT
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
ME-MS61	48 element four acid ICP-MS

CERTIFICATE WH12221692

Project: KEG (MAIN-GROUP 1)

P.O. No.: Batch 88

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 18-SEP-2012.

The following have access to data associated with this certificate:

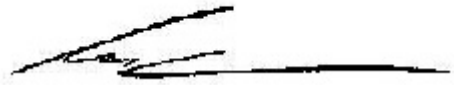
MATT DUMALA	JOAN MARIACHER	HEATHER SMITH

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
FND-02	Find Sample for Addn Analysis

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Cu-OG62	Ore Grade Cu - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES



To: **SILVER RANGE RESOURCES LTD.**

APPENDIX V

SAMPLING METHODS

Sampling Methods

In 2010, 2011 and 2012, grid soil samples were collected at 50 m intervals along north-south oriented lines spaced 100 m apart. All soil sample locations were recorded using hand-held GPS units. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. Soil samples were collected from 10 to 80 cm deep holes using hand-held augers. They were placed into individually pre-numbered Kraft paper bags. Sampling was often hindered by permafrost on moss-covered, north-facing slopes. Samples were not collected from many of these locations due to poor sample quality.

Rock sample sites were marked with orange flagging tape labeled with the sample number. The location of each sample was determined using a handheld GPS unit.

Geotechnical and geological logging was performed on all drill core from the 2010 to 2012 programs. A geotechnical log was filled out prior to geological logging of drill core and included the conversion, where needed, of drill marker blocks from imperial to metric and determinations of recovery, rock quality designations (RQD), hardness and weathering. Wetted core photographs were taken and catalogued prior to logging.

A sample was collected every six boxes for density measurements using both wet and dry evaluation methods to provide base level density data for resource evaluation. Magnetic susceptibility measurements were taken at one metre intervals along each hole.

All logging data were recorded as a hardcopy during the day and transcribed to digital format during the evenings.

Drill core samples were collected using the following procedures:

1) Core was reassembled, lightly washed and measured.
2) Core was photographed.
3) Core was geotechnically logged.
4) Core was geologically logged and sample intervals were designated. Sample intervals were set at geological boundaries, drill blocks or sharp changes in sulphide content.
5) Core recovery was calculated for each sample interval.
6) In 2010, visually promising core intervals were sawn in half using a rock saw and the remainder was split with an impact core splitter. In 2011 and 2012, all core was sawn in half. One-half was sent for analysis and one-half returned to the core box.
7) Samples were double bagged in 6 mm plastic bags, a sample tag was placed in each sample bag, then two or three samples were placed in a fiberglass bag sealed with a metal clasp and sample numbers were written on the outside of that bag with permanent felt pen. The fibreglass bag was sealed with a numbered security tag.
8) Two blank and two standard samples were randomly included in every batch of 31 core samples (in 2012, batches comprised 30 core samples).
9) One quarter-split duplicate sample was included in every batch of 31 core samples (in 2012, batches comprised 30 core samples).

10) In 2012, one coarse reject duplicate sample was included in every batch of 30 core samples.

Core recovery was good, averaging 96% for the 2010 to 2012 drill programs. The holes were mostly sampled top to bottom (about 90% of core was sampled). Care was taken to ensure that the sample split was not biased to sulphide content and, therefore, the sampling should be reliable and representative of the mineralization.

Reverse circulation chip samples encompassed five foot (1.52 m) intervals. All holes were continuously sampled from top to bottom. Samples were transported by ATV from the drill sites to a logging tent located on site. Approximately 200 g of chip material from each sample was washed, sieved to 8-mesh and transferred into a labelled chip tray for logging and future reference. Each interval was logged using a binocular microscope.

Sample Handling and Security

In 2010, the drill core was flown by helicopter from the drill sites to the company's staging area at the Faro airport, where it was transferred to a truck and transported to Whitehorse for logging and sampling. In 2011 and 2012, the core was flown by helicopter from the drill sites to a logging and sampling area on the Property. The samples were later flown by helicopter to the Faro airport and transported to Whitehorse by truck. All samples were controlled by employees of Archer Cathro until they were delivered directly to ALS Minerals' laboratory in Whitehorse for preparation. ALS Minerals was responsible for shipping the prepared sample splits to its North Vancouver laboratory, where they were analyzed.

Archer Cathro ensured that a Chain of Custody form accompanied all batches of drill core during transportation from the Property to the laboratory. A unique security tag was attached to each individual fibreglass bag when the bag was sealed. The bags and security tags had to be intact in order to be delivered to ALS Minerals.

Sample Analysis

All samples were sent to ALS Minerals' laboratory in Whitehorse for preparation and then on to its laboratory in North Vancouver for analysis. ALS Minerals, a wholly owned subsidiary of ALS Limited, is an independent commercial laboratory specializing in analytical geochemistry services. Both ALS Minerals' Whitehorse and North Vancouver laboratories are individually certified to standards within ISO 9001:2008. The North Vancouver laboratory has also received accreditation to ISO/IEC 17025:2005 from the Standards Council of Canada for several analytical methods.

All 2010 to 2012 soil samples were dried and screened to -180 microns. The 2010 soil samples were analyzed for 35 elements by aqua regia digestion followed by inductively coupled plasma with atomic emission spectroscopy (ME-ICP41). An additional 30 g charge was further analyzed for gold by fire assay with inductively coupled plasma-atomic emissions spectroscopy finish (Au-ICP21). The samples were reanalyzed for 51 elements by aqua regia digestion

followed by inductively coupled plasma combined with mass spectroscopy or atomic emission spectroscopy (ME-MS41).

The 2011 soil samples were analyzed for 51 elements using aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy or atomic emission spectroscopy (ME-MS41). Soil samples were further analyzed for gold by aqua regia digestion followed by inductively coupled mass spectrometry (Au-TL43).

The 2012 soil samples were analyzed for 51 elements using aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy or atomic emission spectroscopy (ME-MS41). An additional 30 g charge was further analyzed for gold by fire assay with inductively coupled plasma-atomic emissions spectroscopy finish (Au-ICP21).

All 2010 to 2012 rock and core samples were dried, fine crushed to better than 70% passing -2 mm and then a 250 g split was pulverized to better than 85% passing 75 microns.

The 2010 rock and core samples were initially analyzed for gold by fire assay followed by atomic absorption (Au-AA24) and 35 other elements using aqua regia digestion followed by inductively coupled plasma-atomic emission spectroscopy (ME-ICP41). Samples in mineralized intervals were later assayed for silver, zinc, lead and copper (Ag/Zn/Pb/Cu-OG62); geochemically analyzed for 51 elements (which include common refractory elements) by aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy or atomic emission spectroscopy (ME-MS41); and analyzed for tin and tungsten by pressed pellet XRF (Sn/W-XRF05).

The 2011 rock and core samples were analyzed for 51 elements by aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy or atomic emission spectroscopy (ME-MS41) and tin using pressed pellet XRF (Sn-XRF05). Samples that exceeded upper detection limits were assayed for silver, zinc, lead and/or copper by Ag/Zn/Pb/Cu-OG46. From the beginning of the program until late July, the core samples were analyzed for gold by aqua regia and mass spectroscopy (Au-TL44). During the QA/QC review, there were difficulties reproducing gold values from standard samples analyzed by this technique. These difficulties, combined with more severe problems encountered using the Au-TL44 technique on other projects with higher gold contents (conducted by another company managed by Archer Cathro) lead Silver Range to change techniques. The difficulties involved understatement of gold contents. For the remainder of the program, the core samples were analyzed for gold by fire assay followed by atomic absorption (Au-AA24).

The 2012 rock and core samples were routinely analyzed for gold by fire assay followed by atomic absorption (Au-AA24), tin using pressed pellet XRF (Sn-XRF05) and for 48 other elements using four acid digestion followed by inductively coupled plasma-mass spectroscopy (ME-MS61). Samples in mineralized intervals that exceeded the upper detection limits were assayed for silver, zinc, lead and copper by inductively coupled plasma-atomic emission spectroscopy (Ag/Pb/Zn/Cu-OG62).

All 2010 to 2012 standard, blank and duplicate samples passed QA/QC reviews.

DATA VERIFICATION

Database

Geological and geotechnical logging prior to 2012 was initially recorded as a hardcopy and then transcribed into MS Excel®. In 2012, logging was recorded as a hardcopy and then entered into a MS SQL Server® database. All of the pre-2012 data has been transferred to the database.

Visual comparison of hardcopy data and digital data was conducted on select holes to ensure accuracy. Any discrepancies identified by this process were investigated, by examining the core stored on the Property, and corrected.

Collar Locations

All drill hole collars at the Keg Main and East Zones were re-surveyed in 2012 using a Trimble RTK GPS system and, where necessary, survey data collected in previous years was corrected. The differences between this most recent survey and the earlier surveys can be explained by the poorer accuracy of the hand held equipment used in previous years. Drill hole collars at the Rebel and Hammer Zones has also been surveyed using the RTK GPS system.

The collar data stored in the MS SQL Server® database have been visually cross-checked with the digital survey reports generated by the Trimble system. No errors were found.

Down-hole Orientations

Prior to 2011, no down-hole azimuth measurements were made and dip deviations were measured using an acid test at the bottom of each hole. This practice does not follow industry standards, but due to the limited number of holes (four) and shallow depths (all but one less than 255 m), the Author does not consider this to be a significant issue.

Original 2011 and 2012 survey data obtained from the survey tools in CSV format has been imported directly into the MS SQL Server® database. All of the down-hole data was visually inspected and erroneous data has been omitted.

Assays

Assay certificates, for all of the drilling done to date, were obtained from ALS Minerals in CSV format and imported directly into the MS SQL Server® database. Spot checking of data within the database to hard copy certificates issued by ALS Minerals has not revealed any issues.

Samples from the diamond drilling programs were subjected to a QA/QC program designed by Archer Cathro for Silver Range. The QA/QC program consisted of:

1) Sequentially numbered sample tickets: to identify each sample with a unique number to minimize the possibility of sample numbering errors and to ensure uniform collection of sample data.
2) Sealed sample bags: to secure individual sample bags in order to reduce the possibility of sample contamination, spilling or tampering.
3) Chain of custody: samples were stored in a secure preparation area and delivered to the laboratory directly by Archer Cathro personnel.
4) Sample duplicates: select samples were quartered and re-submitted for assay. In addition, duplicates of coarse reject material of select 2012 samples were re-submitted for assay.
5) Sample blanks: commercial samples were purchased and inserted in the sample sequence. All blank samples yielded background values, including samples inserted directly following a "standard" value to test for "smear effect" during the sample preparation process, indicating no observable contamination. These blanks were assigned unique sample numbers within the sample sequence so as to be "blind" to the laboratory.
6) Reference standard samples: commercially available standard samples for silver, copper, lead and zinc were purchased for the 2010 and 2011 drill program. Four standards were prepared from coarse reject material from the 2011 core samples for use during the 2012 drill program. Standards were assigned a unique sample number within the sample sequence.

Samples from the reverse circulation drill program were group into batches encompassing an entire hole. Sample batches ranged from 25 to 42 samples depending on the length of hole. One standard and one blank was inserted randomly into batches exceeding 30 samples.

All of the samples have passed this QA/QC program.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
0.00	5.94	5.94	CAS	--	Casing							
						--	--	---	---	--	--	0
5.94	19.21	13.27	GRN	MG	Medium grey phaneritic granite. Weak oxidation seen on fracture surfaces. 2 pegmetite veins seen at 6.21 - 6.59 and 7.57 - 7.52m - Both have rough contacts into granite.							
						MD	GY	PH	OXI	1I	--	0
19.21	32.08	12.87	GRN	MG	Light to medium grey to tan phaneritic granite with localized phyllic and argillic alteration. Oxidation seen enveloping select fracture surfaces. Small dark brown/grey stringers throughout surrounded by oxidation envelopes - too small to see if they are sulphide-rich.							
						MD	TN		ARG	1I		
						LT	GY	PH	PHC	2I	--	0
									OXI	2I		
32.08	48.29	16.21	GRN	MG	Medium grey phaneritic granite. Weak oxidation seen on select fracture surfaces. Very weak phyllic alteration around small 2mm quartz veinlets. Phyllic envelopes 1-2cm thick.							
						MD	GY	PH	OXI	1I	--	0
									PHC	1I		
48.29	59.95	11.66	MNZ	FG	Medium grey-green porphyritic monzonite with a very fine grained matrix - little to no quartz in matrix. Plagioclase and chlorite phenocrysts throughout. Weak oxidation seen on select fracture surfaces. Small fine grained bright pyrite blebs seen throughout the matrix. Disseminated pyrrhotite seen throughout. Strongly magnetic. Calcite replacement (?) of matrix.							
						MD	GY	PO	OXI	1I	Py	0.01
						MD	GN				Po	1

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
59.95	93.53	33.58	GRN	MG	Medium to light grey to green phaneritic granite. Localized moderate phyllic and weak argillic alteration throughout. Oxidation seen enveloping select fracture surfaces. Small dark brown/grey stringers throughout surrounded by oxidation envelopes - too small to see if they are sulphide rich.							
						MD	GY	PH	PHC	2I	--	0
						LT	GN		ARG	1I		
									OXI	2I		
93.53	114.76	21.23	GRN	MG	light to medium grey to green phaneritic granite with localized segments of porphyritic texture - feldspars as phenocrysts - 5mm-1cm in size. Moderate phyllic alteration throughout with localized weak argillic. Weak oxidation seen on select fracture surfaces and weak to moderate manganese oxide seen enveloping select fracture surfaces - envelope typically 1cm. Small 2-5mm thick quartz-carbonate veinlets with disseminated pyrite and sphalerite throughout. Upper contact at 55 degrees TCA.							
						MD	GN	PO	ARG	2I	Sp	0.01
						LT	GY	PH	PHC	3I	Py	0.01
									OXI	1I		
114.76	115.36	0.60	VEN	CG	Medium to dark grey semi-massive sulphide quartz vein. Entire interval rubble. Quartz is locally brecciated. Sulphides seen are galena, sphalerite, pyrite (both very fine grained dull and fine grained bright pyrite) and very small amounts of arsenopyrite. Weak oxidation on fracture surfaces.							
						MD	GY	MA	OXI	1I	Gn	2
						DK	GY				Sp	30
											Py	10
											As	0.1
115.36	118.00	2.64	GRN	MG	Light to medium grey granite with two large quartz-breccia veins at 115.76-116.46m and 117.20-118.00m. Breccia has disseminated pyrite, sphalerite and arsenopyrite throughout. Veins vuggy oxidation seen on fracture surface and vug surfaces. Quartz-carbonate veins seen in the surrounding granite. Carbonate pinkish - with euhedral pyrite in these veins. A 12cm heavily oxidized gouge zone on the lower contact.							

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
						MD	GY	PH	OXI	1I	Sp	2
						LT	GY	BX	SIL	5I	Py	2
											As	0.1
118.00	123.01	5.01	GRN	MG	Light to mid grey to green granite with local moderate phyllic and weak argillic alteration throughout. Weak oxidation seen on select fracture surfaces. Small 2mm - 5mm thick quartz and quartz-carbonate veinlets that host pyrite, sphalerite and arsenopyrite mineralization.							
						MD	GY		ARG	1I	Sp	0.01
						LT	GN	PH	PHC	2I	Py	0.01
									OXI	1I	As	0.01
123.01	146.91	23.90	MNZ	MG	Medium to dark grey-green phaneritic to porphyritic monzonite. Weak oxidation seen on fracture surfaces. Chlorite phenocrysts seen throughout. Small 1mm quartz and carbonate stringers throughout. Carbonate infill of matrix. Not magnetic like previous monzonite. Gradually getting lighter in colour down hole.							
						MD	GY	PH	OXI	1I	--	0

COMMENTS

Redrill of hole 1. Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

COMMENTS

Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

COMMENTS

Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

COMMENTS

Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

COMMENTS

Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

COMMENTS

Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

COMMENTS

Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

COMMENTS

Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

179.10	180.10	1.00	GRN	MG	Fairly bleached granite without oxidation or black mineralisation.							
						MD	GY	PH	BLE	2I	--	0
						LT	GY					
180.10	183.50	3.40	GRN	MG	Moderately silicified, argillic and bleached, strongly oxidized granite with <60cm long replacement sections and quartz and pink carbonate (rhodocrosite) veining. Black mineralisation present as mineralised powder on fracture surfaces and semi-massive aggregates up to 5cm thick.

COMMENTS

Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

COMMENTS

Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

COMMENTS

Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

COMMENTS

Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

COMMENTS

Steeper redrill of 14. Mineralisation, if not otherwise specified, occurs as a black powder which is probably a mix of very fine grained sulphides, sulphosalts and oxides.

						LT	RD		BLE	1I		
141.44	198.50	57.06	GRN	MG	Granite with occasional hairline-2mm thick dark grey veinlets and bleached sections up to 2.5m long with weakly mineralised vienlets present in the lower quarter of the interval.							
						MD	GY	PH	BLE	1I	Un	0.1

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
198.50	199.24	0.74	GRN	MG	Strongly bleached granite with eight up to 2mm thick quartz-carbonate veinlets with sulphide infill.							
						LT	GY	PH	BLE	4I	Un	5
						LT	BR		OXI	1I		
						LT	PK		SIL	1I		
199.24	199.80	0.56	QVN	MG	Laminated 45° TCA quartz (40%) vein intercalated with wallrock (50%) and with sulphides (5%) and white and pink carbonate (5%).							
						MD	GY	LA	---	--	Un	5
						LT	WH					
						LT	PK					
199.80	204.30	4.50	GRN	MG	Strongly bleached granite with 25 up to 1cm thick quartz-carbonate veinlets with fair sulphide infill at 45-55° TCA.							
						LT	GY	PH	BLE	4I	Un	2
						LT	PK					
						LT	BR					
204.30	210.30	6.00	GRN	MG	Granite with up to 40cm large weakly bleached sections and scattered sulphide carrying veinlets.							
						MD	GY	PH	BLE	1I	Un	0.5
						LT	GY					
210.30	218.54	8.24	GRN	MG	Light to medium grey, strongly bleached granite with trace oxidation on fractures and with sulphide carrying calcite veinlets as well as argillic, gougy fractures and 5-10cm intervals.							
						MD	GY		ARG	1I		
						LT	GY	PH	BLE	4I	Un	1
218.54	219.01	0.47	MX	FG	Massive 10cm thick sulphide vein. Sulphides (in order of highest to lowest concentration) are sphalerite, pyrite, galena, arsenopyrite? And possibly others that are to powdery to identify. The gangue is a smoked quartz that makes up around 10% of the total vein. The pyrite occurs as an up to 2cm large fine grained conchoidallly fracturing aggregate; the sphalerite is a fine grained irregular aggregate up to 2cm large engulphing medium grained galena aggregates up to 5mm large; the unknown mineralisation is powdery and medium grey to dark brown.

262.43	262.71	0.28	MX	FG	28cm thick massive sulphide vein at 50° TCA with 5% quartz gangue. Pyrite occurs as up to 2cm large compact fine-grained aggregates with conchoidal fracturing. Sphalerite and galena occur as up to 1.5cm large medium-grained aggregates bordering each other and often surrounded by pyrite. Chalcopyrite and others (including tetrahedrite) form up to 1cm large fine-grained aggregates.

						LT	RD					
81.26	82.86	1.60	GRN	MG	Strongly bleached and silicified granite occuring as smoked quartz and buff to white chalcedony in up to 5cm large veinlets and brecciating the granite. This breccia is matrix supported, featuring sub-rounded to sub-angular clasts of quartz within chalcedony or sub-angular to angular wallrock clasts within quartz and chalcedony. These clasts are generally under 1.5cm large, but some larger ones are also visible. Weak sulphides occur almost entirely within the quartz and chalcedony, but some disseminated blebs in granite matrix are also visible.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
82.86	83.20	0.34	GRN	MG	Strongly bleached and silicified granite with weak sulphides occuring within the silicified sections. These sections feature laminated quartz and white to buff chalcedony in up to 5cm veinlets and as brecciated granite with up to 1.5cm large sub-rounded to sub-angular clasts of granite within the quartz, or alternatively as more rounded quartz clasts within the chalcedony. The sulphides occur almost entirely within the quartz and chalcedony, but trace disseminated blebs of pyrite are visible elsewhere.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
56.12	56.21	0.09	QVN	MG	17cm vuggy quartz-carbonate (15%) and chalcedony (5%) vein at 60° TCA with disseminated sulphides and sulphide aggregates up to 2mm large. These sulphides are mostly pyrite and sphalerite. The vugs within are up to 2cm large and demonstrate 1mm scale euhedral quartz crystals as well as some black mineralisation. This same black mineralisation is visible on fracture faces and on both contacts with the hydrothermally altered granite that surrounds this vein.

Hole Name

Hole Name	From (m)	Length (m)	Core Size	Rock Type	Weight in Air (g)	Weight in Water (g)	Density (g/cm3)	Specific Gravity	Comments
KEG-12-042									
	22.53	10.6	NQ2	ICL	557.7	347.2	2.6	2.7	Most of section undergone bleaching alterations with spots of sericitic alteration throughout, 2cm calcite infill cutting though.
	51.61	11.4	NQ2	ICL	607.3	380.6	2.6	2.7	Weak to moderate Silica bleaching, extensive hairline Calcite infill fractures. Trace Pyrite minteral infills.
	84.43	11	NQ2	ICL	559.3	341.3	2.5	2.6	Few hairline Calcite infill fractures with trace Pyrite minerals.
	109.33	11	NQ2	ICL	559.3	341.3	2.5	2.6	3.4cm Calcite infill fracture. Minor section of Chlorite alteration.
	141.44	10.9	NQ2	ICL	588.1	369.9	2.7	2.7	Rare blebby Pyrite in Calcitic patches and weak Chlorite envelopes.
	174.69	11.6	NQ2	ICL	684.2	453.1	2.9	3.0	Slightly more coursely grained siltstone.
	213.54	12.5	NQ2	ICL	686.3	437.6	2.7	2.8	Bleached Siltstone iwht narrow Calcite veinlets and trace minteralization.
	240.49	13.1	NQ2	ICL	745.7	350.6	2.8	1.9	Light-medium green calcareous siltstone with moderate calc-silicate alteration. Fine grained disseminated mineralization of sphalerite, pyrrhotite and galena.
	254.9	12.2	NQ2	ICL	725.5	322.5	3.0	1.8	Light-medium grey siliceous siltstone with calcareous fractures with trace pyrrhotite and sphalerite.

Hole Name	From (m)	Length (m)	Core Size	Rock Type	Weight in Air (g)	Weight in Water (g)	Density (g/cm3)	Specific Gravity	Comments
	259.07	13.4	NQ2	ICL	689.7	372.1	2.6	2.2	Light grey/green siltstone. Weakly effervesces. Fractures controlled mineralization of pyrrhotite, sphalerite and chalcopyrite.
	300.9	11.4	NQ2	SLT	614	419.9	2.7	3.2	Bleached light grey siliceous siltstone with moderate density calcite fractures (no mineralization).
	317.18	10.5	NQ2	SLT	577.8	384	2.7	3.0	Moderately bleached and chlorite altered siliceous siltstone with moderate density calcite fractures.
	333.67	10.3	NQ2	SLT	515.2	330.4	2.5	2.8	Light green siltstone with abundant calcite fractures at a low angle to core axis.
	342.72	12.7	NQ2	SLT	713.8	382.3	2.8	2.2	Highly bleached siltstone with highly mineralized veinlets oriented at 43° to core axis.
	363.9	11.5	NQ2	SLT	601	311.6	2.6	2.1	Fine grained siliceous siltstone.
	378.95	13.5	NQ2	SLT	750	479.8	2.8	2.8	Light to medium grey siliceous siltstone with mineralized veinlets.
	398.9	13.7	NQ2	SLT	751.9	478.5	2.7	2.8	Light grey to green siltstone with non-calcareous fracture infill and trace fracture controlled mineralization.
	414.83	12.8	NQ2	SLT	697.9	439.4	2.7	2.7	Light to dark grey, variably bleached siliceous siltstone.

3.25	8.87	5.62	CHT	VF	multicolored banded chert consisting of dark grey/light grey/maroon/light green bands. Most fracture surfaces oxidized with preferred orientation 0f 60-75 degrees to core axis with a less predominant set oriented at 25-40 degrees to core axis. Weak fracture controlled sulphide mineralization mostly along hairline- 2mm fractures, some along larger discontinuous fractures. Some fine grained granular mineralization within small fine grained siltstone inter-beds/lenses. Small intervals of silica flooding and weak to moderate oxidation. Black hard unknown fracture infill mineral predominant in fractures (quartz?) Most un-mineralized veins are quartz with lesser amounts of calcite in fills.

378.72	460.70	81.98	ICL	FG	Intercalated, variably bleached siltstone/ limestone with diffuse contacts. Interval consists primarily of siliceous siltstone. Intervals (5-25 cm) of intense mineralization present primarily as disseminated grains and blebs within calc-silicate altered sections and also as replacement style mineralization, oriented parallel to foliation (55° TCA). Galena is trace throughout the interval, but is generally localized within calc-silicate altered sections. Intervals of bleached siliceous siltstone host fine grained disseminations of pyrrhotite, chalcopyrite and sphalerite. Veinlets and joints (1-4 mm wide) host calcite and quartz with minor pyrrhotite, chalcopyrite and sphalerite. Euhedral, honey-brown, semi-hard mineral also locally present within veinlets. Localized fine to medium grained arsenopyrite present as disseminated grains near calcareous veins, occurring independently of other sulphides. Fracture controlled mineralization of pyrrhotite, occurring with chalcopyrite and minor sphalerite dominates downhole, from 433.94 m to 460.70 m depth.

460.70	477.00	16.30	ICL	FG	Moderately fractured, strongly calcareous, intercalated unit. Medium to coarse grained galena is prominent from 468 m to 472.21 m depth, appearing as 2-5 mm blebs and as fracture infill. Galena is present near intervals of bladed calcite. Slickensides are also locally present.

425.20	426.55	1.35	SSS	VF	strongly bleached interval with weak mineralization predominantly replacement in weak chlorite altered sections							
						LT	GY	---	BLE	4I	Sp	1.5
						LT	GN		CHL	2I	Po	1
											Cp	0.05
426.55	433.92	7.37	SSS	VF	interval of oxidized segments mainly surrounding calcite veins. Some sections oxidized throughout where heavy calcite veining apparent causing brecciated texture. Others sections unoxidized but strongly chlorite altered with brecciated texture. Trace to no mineralization in oxidized sections while weak-moderate in strongly chlorite altered brecciated sections

						DK	GN		CHL	3I	Py	1
											Cp	0.05
433.92	444.61	10.69	SSS	VF	interval of localized sections of intense mineralization both fracture controlled and replacement. Mineralization predominantly in strongly altered sections. Po and Sp being the dominant sulphides with fair amounts of Py, Gn, Cp and trace As, some sections up to 90% mineralized with sulphides. Intensely mineralized sections show fracture controlled and replacement mineralization.

Box Number	From (m)	To (m)

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
0.00	6.64	6.64	CAS	FG	Casing, no recovery.							
						--	--	---	---	--	--	0
6.64	13.40	6.76	SLT	FG	Light orange to light grey, rubbly siliceous siltstone that has been moderately bleached, chlorite altered and oxidized, little mineralization is seen within the rubble, but some blebby pyrrhotite, and sphalerite are seen in larger pieces.							
						LT	GY	RB	CHL	3I	Sp	2
						LT	OR	FR	BLE	4I	Po	2
									OXI	3I		
13.40	33.95	20.55	SLT	FG	Siliceous siltstone with strong fracture controlled mineralization. Siltstone is light grey to green, strongly bleached and chlorite altered. Mineralization consists of medium to coarse grained galena, sphalerite, chalcopyrite, and pyrrhotite within calcite veins and veinlets with orientations ranging between 20 and 80 deg. TCA. Unit is laminated with laminations ranging from 9 - 15 degrees TCA. Oxidation occurs primarily close to the top of the hole, but also occurs along fractures lower down.							
						LT	GY	LA	CHL	4I	Gn	3
						LT	GN	FR	BLE	4I	Sp	4
											Po	2
									OXI	2I	Cp	1.5
33.95	44.18	10.23	FLR	FG	Large fault zone witj abrupt contacts oriented at approx. 50 deg. TCA. Fault zone consists of small (0.2 cm) to large (10's of cm) angular blocks of siliceous siltstone within a network of fine grained calcite veins and veinlets. Some mineralization occurs in the veins and veinlets and consists of fine-medium grained sphalerite, galena, pyrrhotite, and pyrite. One very coarse, vuggy calcite vein occurs at 43.23 m. Fault is highly chlorite altered and weakly clay altered. Fault contact appears to be at approx. 38.70 m, where intense shlorite and clay alterations occur over a 7 cm interval.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
											Py	1
44.18	46.10	1.92	SLT	FG	Fairly oxidized interval of siliceous siltstone with moderate calcite veining at a low angle TCA (<15% TCA). Trace fracture controlled pyrrhotite is seen along fractures.							
						--	--	---	OXI	3I	Po	1
46.10	48.20	2.10	SLT	FG	Interval with moderately strong fracture controlled mineralization consisting of medium to coarse grained sphalerite, pyrrhotite, galena, and chalcopyrite with calcite veinlets. Mineralization widens and pinches out at random and no distinct attitude to core axis is definable. The siltstone is much more bleached likely due to silicification as the interval is very hard (approx. 7, on Moh's hardness scale). Weakly laminated, but not visible due to alteration.							
						LT	GY	FR	CHL	1I	Sp	6
						--	WH	LA	SIL	3I	Gn	3
						--	--		BLE	4I	Po	6
											Cp	1
48.20	66.25	18.05	SLT	FG	Light to medium grey, fractures and laminates siliceous siltstone.							
						MD	GY	LA			Po	0.75
						LT	GY	FR	CHL	1I	Sp	1
						LT	GN				Gn	0.5
											Cp	0.05
											As	0.05
66.25	75.39	9.14	SLT	FG	Mainly dark grey, with short intervals of light grey, weakly bleached and chlorite altered in small sections and contains moderate mineralization in calcite veinlets. Mineralization consists of fine to medium grained sphalerite, arsenopyrite, pyrrhotite, chalcopyrite, and galena.							
						LT	GY	FR	CHL	1I	Po	2.5

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
75.39	113.00	37.61	ARG	FG	Laminations (foliations) are readily visible (see primary structure log). Lower contact is sharp at 60 deg. TCA (parallel with laminations), while upper contact is diffuse (parallel with laminations), and intercalated for a bit. Black calcareous laminated argillite with pervasive stockwork style calcite fractures with a dominant orientation of 30 to 45 deg. TCA. Some sections have a brecciated texture due to pervasive fractures. Unit is generally unaltered though trace oxidation and some chlorite alteration occurs along some fractures. Unit is unmineralized, except for trace pyrrhotite which occurs along fractures.							
						--	BK	---	OXI	1I	Po	0.5
									CHL	1I		
113.00	144.00	31.00	SLT	FG	Light and medium grey siliceous siltstone with fiar oxidation mainly along fractures. Interval is generally unmineralized though trace galena, sphalerite and pyrrhotite are found in some (1 - 3 mm) veinlets with a general orientation of approx. 30 deg. TCA. Two small (15cm) faults occur at 142.25 m to 142.40 m and 143.05 m to 143.10 m with contacts oriented at 39 deg. TCA (see secoundary structure log for more detail).

61.70	172.73	111.03	ICL	FG	Intercalated, intermittently foliated, variably bleached siltstone/ limestone with diffuse contacts. Intermittent 5-25 cm intervals of weakly calc-silicate altered limestone hosts weak mineralization of disseminated pyrrhotite and chalcopyrite. Fractures and veinlets have predominantly calcareous infill and host pyrrhotite, sphalerite and chalcopyrite with localized medium grained galena. Siliceous fractures are less abundant and host mineralization of fine grained pyrrhotite occurring with chalcopyrite. Arsenopyrite is locally present as 1-3 mm blebs near a calcareous vein at 71.54 m depth. Interval contains minor faulting, with 3-10 cm sections of gouge. Chlorite alteration occurs along fractures and veinlets.

0.00	5.45	5.45	-?-	--	no recovery							
						--	--	---	---	--	--	0
5.45	12.08	6.63	SSS	VF	Siliceous siltstone unit with smaller interbeds of calcareous siltstone. Zones of oxidation weak to intense frequent in shallower sections and decreasing in occurrence downhole and almost exclusively within calcareous intervals. Siliceous sections show occasional weak to strong bleaching and banded texture.							
						LT	GY		OXI	3I		
						LT	OR					
						DK	GY	---	BLE	3I	Py	0.5
12.08	16.49	4.41	FLR	MG	interval of periodic strong oxidation and clay alteration marking several localized faults. Oxidized sections weak-strong calcareous, stronger in the more altered zones. Faults separated by siliceous rock partially bleached hosting weak fracture controlled mx of Sp and Po.							
						LT	BF	---	OXI	4I	Po	0.5
						LT	GY		CLY	3I	Sp	0.5
									BLE	2I		
									CHL	2I		
16.49	34.65	18.16	SSS	FG	interval of siliceous siltstone and small interbeds of calcareous siltstone. Small sections of weak to strong oxidation and clay alteration marking possible micro faulting. Small sections of moderate to strong mineralization of Sp and trace to weak Po. Areas of moderate to strong mineralization in calcareous sections predominantly, both fracture controlled and by replacement. Chlorite alteration throughout, strongest in calcareous sections and areas of moderate to strong mineralization.							
						LT	GN	---	CLY	2I	Sp	2
						LT	GY		BLE	3I		
						DK	GY		OXI	3I		
						DK	GN		CHL	3I	Po	0.5
34.65	35.08	0.43	CSL	FG	strongly mineralized section by replacement. Section strongly chlorite altered and calcareous.							
						LT	GN				Po	10
						DK	GN	---	CHL	4I	Sp	15
											Py	2

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
35.08	73.96	38.88	SSS	FG	interval almost exclusively siliceous siltstone with trace calcareous content. Almost all fracture faces oxidized with few small strongly oxidized sections predominantly large calcite veins. Mineralization predominantly fracture controlled consisting of trace Sp, Po, Py. Fracture infills both calcite and quartz in composition							
						LT	GY		CHL	2I	Po	1
						DK	GY	---	BLE	3I	Sp	1
									OXI	2I	Py	0.5
73.96	81.30	7.34	CSL	FG	interval of weak to strong oxidation predominantly calcareous. Small sections of sericitic and clay alteration. Trace Sp mineralization. Fracture infills mostly calcite. Green stained calcareous rock apparent throughout interval possible calc-silicate alteration.							
						LT	BF	---	SER	2I	Sp	0.5
						LT	GN		OXI	3I		
									CLY	2I		
									CLS	3I		
81.30	112.34	31.04	SSS	FG	interval of predominantly siliceous siltstone with small sections of calcareous rock either being calc-silicate altered or calcareous siltstone. Mineralization predominantly replacement style with smaller amounts of fracture controlled. Areas of strongest mineralization in chlorite altered areas and mostly consisting of Sp and Po. Few strongly bleached sections with fine-medium grained disseminated Sp throughout.							
						LT	GY	---	CHL	3I	Sp	2
						LT	GY					
						DK	GY		OXI	2I	Cp	0.01
						DK	GN		BLE	3I	Po	1
112.34	146.92	34.58	SSS	FG	interval of purely siliceous rock with intervals of strong replacement mineralization with lesser amounts of fracture controlled. Most of interval has been altered either by bleaching, chlorite alteration or other unknown alteration. Mineralization almost fully occurring in alterations, predominantly chloritic alterations. 25% of interval showing intense mineralization. Fracture infill predominantly quartz.							
						LT	GN	---	CHL	3I	Cp	2
						LT	GY				Po	10

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.

									FEC	2I		
34.78	41.22	6.44	ICL	FG	Intercalated unit with moderately iron carbonate altered, brecciated silty limestone. Crackle breccia prevalent throughout, with calcareous fracture infill. Localized vuggy calcite veins and gouge also present. Trace sulphide mineralization includes fine grained pyrrhotite, sphalerite and pyrite within veinlets and fractures.							
						MD	GY	BX	FEC	3I	Py	0.1
						--	BF		CLY	2I	Sp	0.1
									OXI	1I	Po	0.1
41.22	78.44	37.22	ICL	FG	Variably bleached, foliated, intercalated siliceous siltstone/ silty limestone with diffuse contacts. Localized vuggy calcite veins present within oxidized sections. Intermittent 15-60 cm sections of calc-silicate altered silty limestone hosts fine grained disseminations of pyrrhotite and sphalerite, as well as pyrrhotite, sphalerite and chalcopyrite within fractures and veinlets. Intervals of bleached siliceous siltstone hosts fine grained, disseminated pyrrhotite and sphalerite. Fractures and veinlets are predominantly calcareous with minor siliceous infill and minor mineralization of fine to medium grained pyrrhotite, sphalerite, pyrite and chalcopyrite.

						--	--	---	---	--	--	0
5.62	32.00	26.38	SSS	FG	fractured rubbly altered siliceous siltstone with several small calcareous siltstone sections. Interval is tracely chlorite altered and bleached and weak-moderately oxidized and clay altered. Intermittent zones are highly fractured with calcite infills. Fractures seldomly host trace to weak Sp and Po. Blebby Sp also occurs in soft light green altered (possible weak chlorite alteration) and bleached zones.

						--	BF	RB	OXI	3I	Sp	1
32.00	105.89	73.89	SSS	FG	siliceous siltstone with small weak-strongly calcareous sections, predominantly in altered areas. Fracturing almost only containing calcite infill. Gouge found along several of the larger fracture faces containing strong calcareous content. Weak-strong chlorite and clay alteration throughout interval , strongly altered areas predominantly calcareous. Mineralization mostly found within fractures but some found to be disseminated or in blebs. Unaltered siliceous has light/dark banded texture. Several chlorite alterations showing mottled texture. Sections of weak-moderate oxidation throughout interval, predominantly within calcareous zones.

						DK	GY		BLE	2I	Cp	1
											Gn	0.1
469.73	491.35	21.62	SSS	FG	interval predominantly unaltered siliceous siltstone with localized small sections of strong bleaching in bands with bedding or surrounding discontinuous siliceous fracture infills. Moderate - strong fracture controlled Po mineralization throughout unaltered sections with trace-weak Cp mineralization paired with the Po. Most mineralized fractures randomly oriented and discontinuous. Fractures with bleached envelopes hosting blebby sulphide mineralization some having strong chlorite alteration within.

						--	BF	FR				
23.00	41.54	18.54	ICL	FG	Intercalated altered and unaltered silty limestone and siltstone with pervasive calcareous fractures. Local bleaching and calc silicate alteration occur frequently with oxidized joints and fractures. Mineralized fractures have calcareous and/or siliceous infills with seldom chlorite alteration. Overall, mineralization is trace; however, seldom fractures host fair pyrrhotite, sphalerite and weak chalcopyrite and galena.

Box Number	From (m)	To (m)

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
0.00	7.60	7.60	CAS	--	casing, no recovery							
						--	--	---	---	--	--	0
7.60	20.25	12.65	ICL	FG	Oxidized, buff, light to dark grey and dark orange, rubbly, intercalated silty limestone and siltstone with small, localized areas of competent, foliated rock and pervasive calcite infill. Mineralization is fracture controlled and trace overall; weak arsenopyrite, sphalerite, pyrrhotite, pyrite and seldom trace galena. Few fractures are lined with a black (potentially sulfide?) powder that lacks any identifiable properties. Weak clay alteration is prevalent on heavily oxidized surfaces, joints and fractures.							
						LT	GY				Py	0.05

						DK	GY	FO	CLY	1I	Sp	0.05
						--	BF	BX	OXI	3I	Gn	0.05
											Po	0.05
20.25	24.78	4.53	ICL	FG	Region of buff, light to dark grey and light green, altered, intercalated silty limestone and siltstone with roughly 8 0.8 cm to 5.0 cm bands of replacement style arsenopyrite. Bands run almost parallel to general rock fabric, ~55° to 60° to core axis. Zone is weakly oxidized and calc silicate altered, fractured and rubbly with small subsections of competent rock. Fractures towards end of interval contain moderate chlorite and trace to weak sphalerite.							
						LT	GY	RB	CLY	1I	As	2
						LT	GN	FO	CHL	2I	Sp	1
						DK	GY		CLS	2I		
						--	BF		OXI	2I		
24.78	55.40	30.62	ICL	FG	Buff, light to dark grey and light green, intercalated rubbly, brecciated and competent silty limestone and siltstone with an abundance of calcite. Region is moderately calc silicate altered with oxidized and rarely chloritized joints and fractures. Calcareous fractures seldom host weak to fair sphalerite, arsenopyrite, sphalerite and trace galena; overall, mineralization is trace.							
						LT	GN	FO	OXI	2I	Sp	0.05
						LT	GY	BX	CLY	1I	Gn	0.01

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
						DK	GY		CLS	3I	Po	0.05
						--	BF	RB	CLS	1I	As	0.01
55.40	63.52	8.12	ICL	FG	Foliated and fractured, light to dark grey, light green and buff intercalated rubbly and competent silty limestone and siltstone with pervasive, weakly chlorite altered fractures that rarely host trace pyrite. Fractured and broken surfaces are weakly oxidized while calc silicate alteration occurs locally. Foliations and calcareous fractures are planar, undulating or discontinuous with no consistency. **One weakly oxidized, brecciated fracture exists from 62.95m to 63.08 with upper and lower contacts oriented 45° to core axis; 0.1 cm to 1.0 cm, angular, rotated clasts of wall rock in an oxidized, calcite matrix.**

						LT	GN	FO	CHL	2I		
						DK	GY	RB	OXI	1I		
						--	BF					
63.52	65.30	1.78	FLR	FG	Intensely graphitic and calcareous, sheared and locally brecciated, clay altered fault rock. Calcareous infill contains trace fine grained pyrite.							
						MD	GY	SH				
						--	BK	BX	CLY	3I	Py	0.05
								RB				
65.30	74.60	9.30	FLR	FG	Strongly sheared and brecciated, moderately chlorite altered fault rock with an abundance of calcite infill hosting trace pyrite, sphalerite, chalcopyrite and galena. Rock competency increases downhole of interval, starting gradational contact into foliated rock.							
						LT	GY	BX	CHL	3I	Py	0.05
						DK	GY	RB			Gn	0.01
						--	GN	SH	CLY	3I	Sp	0.05
								FO			Cp	0.01

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
74.60	87.70	13.10	ARG	FG	Light to dark grey and light green foliated bleached argillite with pervasive calcareous fracturing throughout. Foliations are thin (0.5 to 5.0 cm), weakly undulating and show a general orientation perpendicular to core axis while calcite fractures are discontinuous and tend to be oriented almost parallel to core axis. Calcareous fractures host the majority of mineralization; trace to weak arsenopyrite, pyrite, sphalerite and seldom galena. The darker of the bands have a light greenish hue exemplifying a weak chlorite or sericite alteration.

33.94	39.20	5.26	ICL	FG	Rubbly, oxidized, intercalated silty limestone and siltstone with weak fracture controlled sphalerite. Potential fault zone?							
						LT	GY	FO	OXI	2I		
						DK	GY	RB	SER	1I	Sp	0.5
						--	BF					
						--	OR					
39.20	60.63	21.43	ICL	FG	Foliated, competent, weakly sericitized and chloritized, intercalated silty limestone and siltstone with pervasive calcareous fractures and localized bleaching. Oxidation is pervasive as fracture envelopes and on jointed surfaces. Foliations are planar or convoluted with no consistent orientation. Zone also exhibits localized weakly brecciated areas with an abundance of calcite infill. Mineralization is mainly fracture controlled and trace to weak overall; sphalerite, pyrite, galena and pyrrhotite. Bleached regions host trace blebby sphalerite. Bleaching hosts trace blebby sphalerite and oxidized fractures are commonly lined with a black (potential sulfide?) powder that lacks any identifiable properties.

								FR				
122.00	141.80	19.80	ICL	FG	Extremely limey, light to dark grey and light green, weakly bleached, chloritized and sericitized, intercalated silty limestone and siltstone with pervasive calcite infill. Chloritization is diffuse throughout interval and concentrated in occasional fractures. Very seldom trace pyrrhotite is fracture controlled. Occasional, distinct calcite fractures have a vuggy texture. **Gradational change to calcareous argillite, which hosts weak disseminated, euhedral pyrite, begins at 134.95m.**

141.80	152.00	10.20	ARG	FG	Light to dark grey, foliated, calcareous argillite with pervasive, irregular calcite fractures seldom hosting trace fine grained pyrite. Unit also hosts trace to weak, disseminated, euhedral pyrite. Occasional fractures are brecciated but lack any additional sulfides.

Box Number	From (m)	To (m)

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
0.00	5.00	5.00	CAS	--	Casing, no recovery							
						--	--	---	---	--	--	0
5.00	34.60	29.60	-?-	--	Overburden; weathered rubble and gravel. Few localized calcareous gougy subsections exist in interval up to 60 cm in length. Interval contains an fair amount of calcite and no visible mineralization.							
						LT	GY					
						DK	GY	RB	---	--	--	0
34.60	41.00	6.40	ARG	FG	Light to dark grey, foliated, fractured and rubbly calcareous argillite hosting trace to weak disseminated, euhedral pyrite. Fractured surfaces are tracely oxidized and chloritized. Foliations are planar or undulating with no consistent orientation angles. Calcite infill is pervasive throughout.							
						LT	GY	FR	OXI	1I		
						DK	GY	FO	CHL	1I	Po	1
								RB				
41.00	48.00	7.00	ICL	FG	Region of gradational contact between argillite and siltstone. Unit is foliated and fractured with pervasive calcite infill. Pyrrhotite is tracely disseminated within argillite and fracture controlled with sparse trace galena in siltstone. Trace chlorite alteration is present throughout while bleaching is limited to siltstone.							
						LT	GY	FO	BLE	1I	Po	0.5
						DK	GY	FR	CHL	2I	Gn	0.05
									SER	1I	Po	0.5
48.00	55.00	7.00	SLT	FG	Light to dark grey and green, foliated siltstone with sparse interbeds of silty limestone. Region is weakly bleached, sericitized and chloritized. Fractures within unit host trace to fair pyrrhotite, sphalerite, galena, chalcopyrite and pyrite; overall, mineralization is weak. Mineralized fractures are discontinuous or planar with no consistency.							
						LT	GY	FO	BLE	2I	Po	2

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
55.00	65.04	10.04	SLT	FG	Light to dark grey and greenish, foliated siltstone with few interbeds of silty limestone. Pyrrhotite, sphalerite and chalcopyrite are fracture controlled and sparse compared to surroundings. Weak bleaching, chloritization and sericitization are prevalent throughout interval.							
						LT	GY	FO	BLE	2I	Cp	0.05
						DK	GY		SER	1I	Po	0.5
						--	GN		CHL	2I	Sp	0.1
65.04	76.68	11.64	ARG	FG	Weakly bleached, light grey to black, fine to medium grained, calcareous argillite with few, sparse non calcareous regions and an abundance of calcite infill. Trace, euhedral pyrite is disseminated throughout and trace pyrrhotite and pyrite are fracture controlled. Fractures and foliations are planar, undulating or crackled with no consistency.							
						LT	GY	FO	BLE	1I	Py	0.05
						DK	GY	FR			Py	0.5
											Po	0.05
76.68	84.70	8.02	ARG	FG	Interbedded calcareous argillite and siltstone with a pervasive semi-soft, light green alteration throughout. Trace pyrite and pyrrhotite are fracture controlled and trace pyrite is also disseminated throughout. Weak chlorite and sericite alterations are prevalent throughout and a more intense chlorite alteration is focused in fractures.							
						LT	GN	FR	CHL	2I	Po	0.5
						LT	GY	FO	SER	3I	Py	0.05
						DK	GY				Py	0.05
84.70	112.00	27.30	ARG	FG	Light grey to black, calcareous argillite with interbedded siltstone. Unit is highly fractured and locally sheared or brecciated with few localized graphitic sections. The localized deformation is likely due to proceeding fault zone (?). Fracture controlled galena, arsenopyrite, pyrrhotite, sphalerite and pyrite are sparse and trace overall. Few fractures host large grains of crystalline calcite.

						--	--	---	---	--	--	0
6.00	29.10	23.10	SSS	FG	Variably bleached, intermittently foliated siliceous siltstone with a moderate-strong amount of fractures and veinlets infilled with silica. Calcite infill is less abundant and is locally vuggy. Mineralization occurs primarily within fractures and veinlets and consists of fine grained pyrrhotite, sphalerite and trace chalcopyrite and pyrite. Disseminated grains of pyrrhotite and sphalerite are present in strong-intensely mineralized, 30-40 cm intervals. Chlorite alteration occurs along fractures and rims localized clasts and grains.

29.10	62.91	33.81	SSS	FG	Siliceous siltstone interbedded with chert. Mineralization is primarily within siliceous fractures and veinlets which host fine grained pyrrhotite, sphalerite, chalcopyrite and pyrite. Calcite infill is rare and is locally vuggy. Weak-moderate chlorite alteration occurs along fractures. Interval is variably bleached and intermittently foliated with a moderate amount of fractures.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
62.91	113.41	50.50	SSS	FG	Weakly fractured, variably bleached, foliated, siliceous siltstone, intermittently interbedded with weak amounts of maroon chert. Fractures and veinlets have siliceous infill and trace chlorite alteration along fracture margins. Mineralization occurs primarily within veinlets and fractures, consisting of fine grained pyrrhotite, chalcopyrite, sphalerite and pyrite. Pyrrhotite and sphalerite are locally disseminated in a 20 cm, strongly mineralized interval at 65.52 m depth. Intermittent, 7-33 cm intervals are brecciated, containing 2-6 mm clasts of angular wallrock. Localized 1-2 mm blebs of arsenopyrite present at 79.47 m.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
139.14	196.44	57.30	SSS	FG	Foliated siliceous siltstone intermittently interbedded with chert. Fine grained pyrite, pyrrhotite and chalcopyrite is present within fractures and veinlets with silica and localized quartz-carbonate infill. Chlorite alteration occurs along fractures. Trace arsenopyrite is locally present in veinlets. Subsection from 145.63 m - 150.70 m is moderately oxidized with rubbly sections. Interval from 160.58 m - 161.00 m is brecciated and moderately oxidized with calcareous infill.

196.44	211.45	15.01	SLT	FG	Siliceous siltstone interbedded with calcareous siltstone. Replacement style mineralization of fine grained pyrrhotite, sphalerite and chalcopyrite occurs parallel to foliation (60° TCA). Interval is skarnified and strongly chlorite altered, with localized sections of calc-silicate alteration present downsection (from ~ 209.00 m). Calcareous fracture infill is prominent from 207.50 m depth. Mineralization also occurs within fractures, consisting of fine grained pyrite, sphalerite, pyrrhotite and chalcopyrite. Sulphides are also locally disseminated.

211.45	230.97	19.52	SLT	FG	Interbedded siliceous siltstone and calcareous siltstone with prominent faults and 5-93 cm sections of gouge. Pervasive fractures have dominantly calcareous infill. Intermittent, moderate-strong chlorite alteration present. Intermittent intervals are rubbly and moderate-strongly oxidized. Localized calc-silicate altered calcareous siltstone hosts moderate sphalerite and trace arsenopyrite in veinlets and fractures. Fault contacts are rubbly.

									CHL	3I		
230.97	316.12	85.15	SSS	FG	Variably bleached, intermittently foliated siliceous siltstone with rare calcareous siltstone and trace mineralization throughout. Veinlets and fractures have both siliceous and calcareous infill, hosting trace, fine grained arsenopyrite, pyrrhotite, chalcopyrite and sphalerite. Localized sections also contain disseminated grains of arsenopyrite, pyrrhotite, chalcopyrite and sphalerite. Intermittent 5-10 cm intervals are sericite altered and contain moderate-strong sphalerite, occurring as blebs and fracture infill. Subsection from 254.33 m - 255.12m is skarnified, with medium-green hue, calcareous fracture infill and 1-2 mm blebs of sphalerite, galena and arsenopyrite. Fractures within subsection also host fine grained sphalerite, pyrrhotite and chalcopyrite.

0.00	4.59	4.59	CAS	--	casing no recovery							
						--	--	---	---	--	--	0
4.59	8.80	4.21	SLT	FG	rubbly strongly oxidized interval of siltstone.							
						LT	GY		OXI	4I		
						DK	GY					
						--	OR	RB	CLY	3I	--	0
8.80	19.70	10.90	SLT	FG	highly deformed (probable shear) siltstone section with light/dark grey foliations. Fractures predominantly strongly oxidized consisting of calcite and soft white mineral (barite?). Deformed foliations causing brecciated texture in places. Fine grained disseminated Py throughout interval.							
						LT	GY	SH	OXI	3I	Py	0.1
						DK	GY					
19.70	21.67	1.97	FLR	MG	probable fault center, dark grey strong clay alteration throughout interval. Entire interval strongly calcareous.							
						DK	GY	---	CLY	4I	--	0
21.67	29.40	7.73	SLT	FG	predominantly altered interval with several small localized sections of gouge. Light brown/green soft alteration dominant in first half on interval (possible sericitic alteration). Gouge sections moderate-strongly calcareous. Weak fracture controlled and disseminated Py mineralization.							
						LT	BN		SER	3I	Py	0.1
						LT	GY					
						DK	GY	---	CLY	3I	Py	1
29.40	35.00	5.60	SLT	FG	strongly deformed (probable shear) interval with strong carbon content. Foliations strongly deformed consisting of light/dark foliations. Light foliations harder quartz rich siltstone, dark foliations soft dark grey strongly clay altered argillaceous carbon rich. Moderate calcite fracturing throughout. Deformation causing brecciation in sections. Weak Gn mineralization found within small rubbly sections. Weak-moderate Py mineralization found throughout.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
35.00	46.00	11.00	SLT	FG	interval of predominantly unaltered siltstone. Interval made up of beds of ranging grain sizes from fine grained siltstone to medium grained sandstones. Pervasive undulating 1-2mm strongly oxidized calcite veinlets throughout (could also be infilled primary fabric). Foliation in sections moderately clay altered (possible sericitized).							
						LT	GY		OXI	3I	Py	0.5
						DK	GY	---	CLY	3I	Sp	0.5
46.00	53.00	7.00	SLT	FG	interval with oxidation present throughout, weak in spots (just along fractures) to intense in others (throughout core). Few localized rubbly sections with weak clay alteration. Both calcite and quartz veining apparent. Weak-moderate sulphide mineralization throughout. Intensely brecciated sections (possible vein) intensely oxidized with clasts 1-20mm wide at 50-50.50m. Very soft transparent crystals found in vugs (possible gypsum or barite). Small sections of large grained sandstones.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
66.27	74.80	8.53	SLT	FG	fine grained dark grey foliated siltstone with deformed (sheared) sections. Pervasive fracturing throughout interval mainly calcite and soft white mineral (barite?). Many fractures moderate-strongly oxidized.							
						DK	GY	FO	OXI	2I	Gn	0.1
											Py	1
											As	0.1
74.80	87.40	12.60	SLT	FG	Predominantly highly fractured, altered siltstone. 5m section of strongly oxidized fractures at start of interval, mainly calcite composed. Small, localized sections of chlorite alteration. Rubbly and clay altered/gougy sections towards end of interval. Brecciated sections where sheared or from intense fracturing. Moderate to strong mineralization in sections forming blebs, fracture infill or found interstitially. Most mineralization is contained to rubbly, clay altered sections (last 3m to 4m of interval).

									CHL	2I	Po	1
87.40	92.40	5.00	SLT	FG	Highly fractured, moderately oxidized siltstone section. Fracturing predominantly calcareous. Small, localized sections of rubble and clay alteration. Weak, fracture controlled and blebby sphalerite mineralization can be found sporadically throughout.							
						LT	OR					
						LT	GY		OXI	3I	Sp	1
						DK	GY	---	CLY	2I	Sp	1
92.40	93.35	0.95	SLT	FG	Strongly mineralized interval with sphalerite occurring exclusively within strongly calcareous section; possibly a semi-massive, undulating calcite vein?							
						LT	GY	---	---	--	Sp	30

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
93.35	109.07	15.72	SLT	FG	Dark grey siltstone/argillite with a predominant shear fabric. Fractures mostly filled with calcite. Brecciated texture in places caused by intense shearing or fracturing. Weak sulphide mineralization is found mostly within calcite fractures. Rubbly/clay altered sections found locally. Shear fabric consisting of harder, light grey and softer, dark grey, carbon rich foliations. Localized calcareous sections throughout.							
						LT	GY				Py	0.5
						DK	GY	SH	CLY	3I	Sp	2
											Py	0.5
109.07	109.50	0.43	SLT	FG	Extensive calcite veining with strong to semi-massive, blebby sphalerite mineralization and weak galena mineralization.							
						LT	GY				Sp	60
						DK	GY	---	---	--	Gn	1
109.50	143.00	33.50	SLT	FG	same as interval 93.35m to 109.07m.							
						LT	GY				Py	0.5
						DK	GY	SH	CLY	3I	Py	0.5
											Sp	2
143.00	159.80	16.80	SLT	FG	Predominantly rubbly, clay altered, carbon rich, fine grained, dark grey siltstone/argillite. Weak to moderately calcareous sections throughout. Fractures are mostly calcite with few occurrences of quartz carbonate infill.							
						DK	GY	---	CLY	3I	Py	0.5
											Po	1
											Py	0.5
159.80	169.88	10.08	FLR	FG	Predominantly rubbly, moderately clay altered section. Strong chlorite alteration occurring in last 2m of interval. Clay altered sections are weak to strongly calcareous. Extensive fracturing, weathering and brecciating host rock. Weak, blebby sulphides found throughout.							
						LT	GY	---	CLY	3I	Py	1
						DK	GY		CHL	2I	Sp	0.5
											Po	1

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
169.88	233.00	63.12	SLT	FG	Interval of dark grey, foliated siltstone with small argillaceous sections. Rubbly/clay altered sections throughout interval. Many clay altered sections are weak to strongly calcareous. Carbon rich sections seen occurring moving downhole. 1.5cm polymetallic vein seen at 172.68m. Veining predominantly quartz carbonate and calcite occurring intensely in places causing brecciated texture in spots. Most mineralization is fracture controlled with weak disseminated, fine grained pyrite throughout.

						--	GY	RB	SER	1I	--	0
								FR				
46.44	89.27	42.83	ICL	FG	Light to dark grey, foliated and fractured, intercalated siltstone and silty limestone with very pervasive calcite infill occasionally hosting trace weak pyrrhotite, pyrite, sphalerite and rarely arsenopyrite. Foliations are often undulating and fractures are almost exclusively discontinuous. Localized regions are moderately siliceous.							
						--	GY	FO	---	--	As	0.01
								FR			Po	0.5
											Py	0.5
											Sp	0.1
89.27	93.85	4.58	ICL	FG	Weakly deformed (sheared?), green and grey, intercalated siltstone and silty limestone with several calcareous, hairline fractures hosting weak to fair pyrrhotite and pyrite. Sphalerite occurs as small blebs around calcite fractures; overall mineralization is trace. Chloritization is mainly focused in fractures but is weakly diffuse with sericitization throughout. Region is also locally siliceous with few veins of quartz carbonate infill.							
						--	GN	---	CHL	2I	Py	1
						--	GY		SER	2I	Po	1
											Sp	0.5
93.85	100.21	6.36	ICL	FG	Grey to black, foliated and fractured, intercalated siltstone and silty limestone with pervasive calcite infill hosting moderate pyrrhotite and pyrite; overall mineralization is weak. Region also hosts weak, disseminated, euhedral pyrite. Few fractures host trace amounts of galena and sphalerite. Weak chlorite alteration is evident on fractures surfaces. Fractures and foliations show no consistent orientation or pattern.

						DK	GY				Py	1
											Po	0.5

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
64.04	64.50	0.46	FLR	MG	probable small fault. Sections of strongly oxidized gouge with sections of moderately clay/sericite altered brecciated rock. Interval moderate-strongly calcareous. Weak-moderate blebby sulphides present throughout. Possible beginning of skarnified zone.							
						LT	GN		CLY	4I	Gn	0.5
						DK	GN	BX	OXI	3I	Py	3
						DK	OR		SER	4I	Sp	1
64.50	69.86	5.36	ICL	FG	interval of intercalated calcareous and siliceous siltstone. Pervasive calcite veining throughout. Soft pale green alteration (sericite?) in localized sections and mineralizing several fractures. Chlorite also seen mineralizing in several fractures. Trace sulphides seen mineralizing within fractures and intestinally within brecciated zones cause by extensive calcite fracturing.							
						LT	GN		CHL	2I	Sp	0.1
						LT	GY				Py	2
						DK	GY	---	SER	3I	Po	0.1
											Gn	0.1
69.86	70.41	0.55	FLR	MG	strongly clay altered/gouge and brecciated section. Most of interval strongly calcareous. Small localized oxidation in one part.							
						LT	GY		CLY	4I		
						DK	GY	---	OXI	2I	Py	1
70.41	83.81	13.40	ICL	FG	predominantly altered interval. Probable skarn zone. Intercalated siliceous and calcareous siltstone with weak-strong chlorite alteration throughout. Soft pale green alteration (sericite?) seen also throughout interval. Calcite veining seen throughout entire interval occurring heavily between 73.50-77.50 where most of sulphides are mineralized. Several localized sections having brecciated textures. Small gouge sections at 82.62 (4cm thick). Weak-fair sulphides found in blebs or within fractures.							
						LT	GN		SER	3I	Py	0.5
						LT	GY				Sp	0.5
						DK	GN	---	CHL	3I	Py	2
						DK	GY		CLY	1I	Gn	0.5
83.81	84.25	0.44	ICL	FG	rubbly sections with small sections of gouge. Moderate chlorite alteration found in some of rubble.							
						LT	GY		CLY	3I		

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
						DK	GN	RB	CHL	2I	Py	1
						DK	GY					
84.25	110.10	25.85	ICL	FG	interval of intercalated calcareous and siliceous siltstone with localized rubbly sections throughout. Weak occurrences of clay alteration and gouge within rubbly sections. Pale dark and light green soft alteration seen in sections (chlorite and sericite respectively?). Small localized sections with brecciated texture predominantly caused from calcite veining. Veining mostly calcite composed with rare occurrences of siliceous veining. Weak mineralization of sulphides in blebs or within fractures.							
						LT	GN	---	CLY	2I	Po	1
						LT	GY		SER	2I	Sp	0.1
						DK	GY		CHL	3I	Gn	0.1
											Py	1
110.10	115.00	4.90	SSS	FG	interval of moderate sulphide mineralization. Mineralization predominantly in sections of pale dark green alteration (weak chlorite alteration) and mostly within fractures with few sections of replacement style. Fractures hosting mineralization mostly siliceous or quartz-composed. Small localized calcareous bands throughout. Chlorite mineralization forming within most mineralized fractures.							
						LT	GY		CHL	2I	Sp	2

3.10	20.00	16.90	SSS	FG	siliceous siltstone unit with localized calcareous sections mostly near top of hole. Bladed calcite seen in calcareous sections. Sections of rubble throughout interval. Chlorite alteration seen mineralizing several fractures. Oxidation seen on most fracture faces and in small localized sections. Clay alteration also seen in small localized sections. Trace Po mineralization found within few fractures.

KEG-12-065									
	11.68	11.8	NQ2	ICL	642.2	406.5	2.7	2.7	Medium grey, intercalated siliceous siltstone and limey siltstone. Mineralization present in quartz veinlets (blebby, medium grained).
	42.92	12	NQ2	ARG	639.7	400	2.6	2.7	Black-dark grey argillite with no mineralization and pervasive calcite veinlets.
	127.82	11.3	NQ2	ICL	600.9	378	2.6	2.7	Foliated, intercalated siltstone/ limestone with no mineralization.
	154	10.6	NQ2	ICL	590.4	380.9	2.8	2.8	Weakly fractured, bleached siliceous siltstone, with fine grained pyrrhotite, chalcopyrite and sphalerite present in fractures.
	188.18	13.8	NQ2	ICL	750.5	473	2.7	2.7	Medium grey, partially brecciated, foliated siliceous siltstone. Quartz veinlets host weak, medium grained sulphides.
	192.12	11.4	NQ2	ICL	606.8	319.3	2.6	2.1	Weakly bleached, foliated siliceous siltstone with trace fine grained pyrrhotite, chalcopyrite and sphalerite in fractures.
	225.44	12.4	NQ2	FLR	638.1	384.5	2.6	2.5	Medium green, brecciated siltstone and limey siltstone with no mineralization present.

Hole Name	From (m)	Length (m)	Core Size	Rock Type	Weight in Air (g)	Weight in Water (g)	Density (g/cm3)	Specific Gravity	Comments
	237.2	14.8	NQ2	FLR	788.5	491	2.6	2.7	Medium-dark grey siliceous siltstone with hairline quartz veinlets that contain blebby, medium grained mineralization.
	265	11.5	NQ2	ICL	626.9	396.8	2.7	2.7	Medium grey to light green siltstone with quartz-carbonate fractures. Some disseminated mineralization present.
	302	13.9	NQ2	ICL	739	462.8	2.6	2.7	Light grey/ green siltstone (partially limey) with calcareous veinlets. Medium grained, blebby mineralization in disseminations.
	321.59	11.2	NQ2	SLT	580.8	363.4	2.6	2.7	Moderately fractured, dark grey siliceous siltstone. Fractures have quartz infill and host trace, fine grained pyrrhotite and chalcopyrite.
	361.54	11.1	NQ2	ICL	581.9	359.3	2.6	2.6	Calc-silicate altered limestone with minor siltstone, prominent 5 cm wide calcite veinlet and disseminated, fine grained sphalerite.
	369.19	12.7	NQ2	ICL	677.9	425.9	2.6	2.7	Weakly bleached siliceous siltstone with siliceous veinlets hosting trace, fine grained pyrrhotite.

						LT	BN					
						DK	GY	RB	CLY	1I	Cp	0.1
						DK	BN					
14.00	25.25	11.25	SSS	FG	Interval of Siliceous siltstone with moderate-strong sulphide mineralization, predominantly fracture controlled. Beginning of interval is heavily fractured with moderate-strong Oxidation. Last section of interval (23.50-25.25m) shows evidence of probable shearing with extensive undulating calcite/siliceous veinlets and is leading up to probable fault. Moderate-strong chlorite alteration seen in sheared section along with moderate Oxidation and weak clay alteration. Sulphide mineralization is seen throughout interval in blebs or within fractures.

						DK	BN		OXI	4I		

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
26.55	54.17	27.62	ICL	FG	predominantly altered intercalated siliceous siltstone and calcareous siltstone interval with localized sections of moderate-strong sulphide mineralization exclusively within altered sections. Mineralization mostly forming blebs or within fractures, occasionally occurring in replacement bands along foliation or in disseminations. Veining mostly calcite composed. Oxidation seen throughout interval but strongest at beginning of interval within rubbly sections. Chlorite and sericite alteration found throughout interval, in places having mottled texture.

											Sp	1
54.17	98.65	44.48	SSS	FG	sparsely mineralized interval of siliceous siltstone with small calcareous sections. Mineralization predominantly in small blebs or in fractures within altered sections. Calcareous sections are all altered. Sections of banded unaltered and bleached siliceous siltstone seen throughout. Moderate-strongly oxidized sections seen throughout entire interval. Chloritic alteration seen within many fractures and around areas of mineralization. Strongly mineralized section seen from 81.62-81.80m, mostly being As. Predominantly calcite fracturing with minor occurrences of siliceous fracturing.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
98.65	111.69	13.04	FLR	MG	strongly altered probable fault zone. Extensive brecciation throughout most of interval as well as moderate to strong oxidation. Few small localized sections of rubble/strong clay alteration. Several strongly calcareous sections including few sections hosting bladed calcite. Strong chlorite alteration seen within fractures and in small blebs throughout. Areas of heaviest brecciation have semi-soft white non-effervescent matrix. Few localized section (10-50cm wide) of moderate-strong sulphide mineralization predominantly fracture controlled or in small blebs. Most noted mineralized sections from approximately 110-111m.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
118.30	142.14	23.84	SSS	FG	predominantly strongly altered siliceous siltstone interval with small localized calcareous sections. Extensive veining through some sections, both calcite and siliceous composed. Oxidation occurring in small-large sections throughout interval, more so in the first half of interval. Several large (2-4cm wide) low angle undulating siliceous and calcite veins with strong oxidation surrounding them. Sulphide mineralization sporadic throughout interval with exception to one concentrated strongly altered/mineralized section from 128.40-128.75m. Predominant mineralization being Gn and Sp. Mineralization mostly fracture controlled or in blebs with small amounts of disseminations within bleached sections. Few large brecciated sections mostly at start of interval where probable shearing has taken place. Chlorite alteration seen throughout interval. Pale green weak-moderately reactive alteration seen in several places (possible calc-silicate alteration). Sulphides mineralizing exclusively in altered regions.

25.55	47.80	22.25	ICL	FG	10 cm section of gouge, followed by faulted, strongly fractured, locally brecciated, intercalated siliceous siltstone/ silty limestone with localized sections of moderate-strong oxidation. Fracture and veinlet infill is calcareous, hosting trace, fine grained pyrrhotite.							
						MD	GY	BX				
						LT	GY					
						DK	GY	FR	OXI	2I	Po	0.5
47.80	52.64	4.84	ARG	FG	Pervasively fractured, locally brecciated, variably bleached argillite with calcareous fracture infill. Trace, fine grained pyrite present in fractures. Top and bottom contacts are gradational over 20 cm.							
						MD	GY	FR	---	--	Py	0.5
						DK	GY	BX				
52.64	60.80	8.16	FLR	FG	Brecciated, strongly fractured fault rock with clasts of intercalated siliceous siltstone and silty limestone. Fractures and veinlets are dominantly calcareous, hosting localized, blebby galena and trace pyrrhotite. Localized sections of gouge and moderate oxidation present. Lower contact to intercalated unit is composed of gouge and rubble, with no measurable contact.							
						LT	GY	BX			Gn	0.1
						--	BF	FR	OXI	2I	Po	0.2
60.80	89.38	28.58	ICL	FG	Intercalated siliceous siltstone/ silty limestone with fair-moderate amount of fractures and variable bleaching. Contacts between units are diffuse. Trace mineralization consists of fine grained pyrrhotite and chalcopyrite within dominantly calcareous fractures and veinlets.

						MD	GY	FR	OXI	2I	Cp	0.1
						LT	GY		BLE	2I	Po	0.3
89.38	120.18	30.80	ICL	FG	Intercalated siliceous siltstone/ silty limestone with minor faulting, localized 4-8 cm sections of gouge and intermittent sections of breccia. Mineralization consists of pyrrhotite, sphalerite, chalcopyrite and localized galena within veinlets and fractures, with dominantly calcareous infill. Interval 97.27 m - 99.24 m is brecciated and strongly oxidized.

						--	--	---	---	--	--	0
7.15	46.33	39.18	SLT	FG	Siliceous siltstone interbedded with less abundant calcareous siltstone. The interval is moderate-strongly mineralized, with intermittent 10-60 cm sections of intense blebby to semi-massive replacement-style mineralization occurring parallel to foliation (30°-70° TCA). Localized, coarse grained blebs of arsenopyrite, as well as blebs of sphalerite, chalcopyrite, galena and pyrrhotite are also present. The interval is fair-moderately oxidized and chlorite altered, with sections of calc-silicate alteration. Moderate to strong bleaching and sections of rubble are also present.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
67.15	87.81	20.66	SLT	FG	Intermittently foliated, moderate to strongly bleached siliceous siltstone with weak chlorite alteration occurring along fractures and surrounding disseminated sulphide grains. Mineralization decreases downsection and consists of pyrrhotite, chalcopyrite and sphalerite occurring as disseminated grains and infilling fractures and veinlets. Arsenopyrite is locally present as coarse grained blebs within a strongly mineralized and chlorite altered section at 70.83 m - 71.05 m depth and within a 2.5 cm thick, quartz-carbonate vein at 73.13 m depth.

87.81	100.42	12.61	SLT	FG	Siliceous siltstone interbedded with minor calcareous siltstone. Interval is moderately chlorite altered along fractures. Pyrrhotite, sphalerite and localized galena are present within veinlets. Blebs (1-3 mm) of sphalerite and galena are also intermittently present. White, 5-50 cm, strongly bleached(?) sections contain blebs of galena and are foliated. The top of the interval contains a 20 cm section of fault gouge.

100.42	121.67	21.25	SLT	FG	Variably (weak-strong) bleached, foliated siliceous siltstone interbedded with minor calcareous siltstone. Moderate-strong mineralization of sulphides consists of galena, sphalerite, chalcopyrite, pyrrhotite and pyrite occurring as disseminated grains, within veinlets and as medium-coarse grained, blebby replacements. Replacement-style mineralization generally occurs within calc-silicate altered sections, parallel to foliation (30°-70° TCA). Chlorite alteration is also present along fractures and veinlets.

											Sp	1
121.67	156.50	34.83	SLT	FG	Siliceous siltstone, intercalated with minor calcareous siltstone from approximately 151.20 m depth. The interval is intermittently foliated with variable (weak-strong) bleaching and weak chlorite alteration along fractures. Weak mineralization of fine grained pyrrhotite, sphalerite and chalcopyrite occurs primarily within fractures, with locally disseminated grains of pyrrhotite and sphalerite. Oxidized, clay and chlorite altered sections are present adjacent to calcite veins/ veinlets from 151 m depth to the end of the interval. Localized 2-5 mm blebs of galena are present within a oxidized, clay altered interval at 155.85 m - 156.50 m depth (fault?).

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
26.54	56.10	29.56	QTE	FG	heavily fractured interval of intercalated fine grained light gray and dark gray quartzite. Fractures purley siliceous and predominantly weathered. Interval predominantly rubbly with sections of heavily fractured compotent rock. Tracely mineralized hairline fractures throughout interval with predominantly Po and Py. Possible showing of graded beds pointing towards fining uphole bouma sequences.							
						LT	GY				Po	0.1
						DK	GY	FR	OXI	3I	Py	0.1
56.10	67.67	11.57	SSS	FG	siliceous siltstone unit with small strongly calcarious sections. Fractures predominantly siliceous with calcite dominating the calcarious sections. Weak Py mineralization throughout both fracture controled and deceminated euhedral grains ranging from 0.5-5mm wide. Convoluted foliation seen throughout interval. Few rubbly sections throughout. Trace to weak clay alteration in some rubbly sections.							
						DK	GY	FO	OXI	1I	Po	0.5
									CLY	1I	Py	2
67.67	70.72	3.05	CHT	VF	maroon chert interval with bands of light biege alteration (possible sericite) mostly occuring around contacts of section. Weak chlorite alteration within bands. Mineralization predominantly Po and Py within small silliceous fractures.							
						LT	GY		CHL	1I	Py	1
						DK	BN	FO	SER	3I	Po	0.5
70.72	88.41	17.69	SSS	FG	siliceous siltstone section with most of interval being intensely fractured by mostly hairline-1mm wide siliceous fractures that have been altered by dark grey/black material. Sulphides seen in most fractures predominantly Po and Py. Banded sericite alteration seen throughout interval possibly oriented with bedding. Blebby Py seen forming in bands with less fractured section at beginning of interval. Fractures forming dendridic texture in places. Weak occurances of deceminated euhedral Py grains seen in secitons.							
						LT	GY	FR	SER	2I	Po	0.5
						DK	GY				Py	3
											Py	0.5
											Cp	0.1

											Cp	0.1
117.08	124.00	6.92	CHT	FG	interval of banded maroon chert with rubbly sections. Sericitic alteration forming bands following bedding orientation. Weak Py mineralization found within fractures. Strong chlorite alteration also found within some fractures.							
						LT	GY		CHL	2I		
						DK	BN	BN	SER	3I	Py	1
124.00	135.20	11.20	FLR	MG	interval predominantly rubbly and weak-moderatly clay altered. Weak to moderate chlorite alteration throughout interval, strong in several fractures. Most of compotent rock heavily brecciated. Trace to weak occurances of deceminated and within fracture Py and Po. Host rock unidentifiable.							
						LT	GY	FR	CHL	2I	Sp	0.1
						DK	GN		CLY	2I	Py	1
135.20	161.09	25.89	SSS	FG	siliceous siltstone with sections of rubble throughout. Localized sections (5-20cm) of moderate bleaching and chlorite alteration hosting moderate mineralization of Po and Py with trace Sp. Weak clay alteration in small sections with light blue color. Light blue soft alteration on several fracture faces within rubbly sections and with clay alterations. Predominantly calcarious fracture infills.							
						LT	BL	---	CLY	2I	Po	0.5
						LT	GY		CHL	2I	Sp	0.1
						DK	GY				Py	2
161.09	161.26	0.17	SSS	FG	small altered interval with moderate sulphide mineralization. Sections looks skarnified. Sections strongly calcarious and has defined contacts at 60 degrees to core axis.							
						LT	GY		BLE	3I	Sp	2
						DK	GN	---	CHL	4I	Py	2
											As	1

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
161.26	176.71	15.45	CHT	FG	interval of predominantly rubbly partially altered maroon chert. Localized sections of moderate bleaching and chlorite alteration. Fracture controled Py mineralization throughout. Soft pale blue alteration seen on several fracture faces. Weak-moderate clay alteraiton with secveral rubbly sections including contact to next interval of siliceous siltstone. Most hairline fractures hosting black mineralization probable sulphides.							
						LT	GY		CHL	3I		
						DK	BN	RB	BLE	3I	Py	2
176.71	215.92	39.21	SSS	FG	predominantly unaltered siliceous siltstone unit with pervasive calcite fracturing. Rare localized bands of strongly calcarious siltstone. Occurances of trace to weak clay alteration mostly along fracture faces. Possible bouma sequences showing fining uphole pattern s with occassional brecciation of clay cap layer. Localized sections of rubble with weak clay alteration. Predominantly fracture controled Pu, Po and Cp with trace sections of replacement Py in blebs and cubic medium grained deceminated mienralization.							
						DK	GY	FO	CLY	2I	Po	0.5
											Py	3
											Cp	0.1
215.92	216.29	0.37	SSS	FG	interval with strongly calcarious section strongly mineralized with Py and Po. Bedding convoluted up to contact of different unit. Moderate chlorite alteration within calcarious section.							
						LT	GY				Py	7
						DK	GY	FO	CHL	2I	Po	1
											Py	2
216.29	218.87	2.58	SSS	FG	weakly bleached, predominantly strongly seriticized interval with blebby replacement sulphide mineralization throughout. Sericitic alteration mostly having foliated texture, in places causing a brecciated texture. Calcarious section (50cm long) with fibrous calcite crystals throughout and blebby Sp replacement (blebs 2-3mm wide). Fracture controled Py and Po apparent through interval stronger near end of interval.							
						LT	GY		BLE	2I	Cp	0.1

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
104.52	121.15	16.63	SLT	FG	Siliceous siltstone interbedded with bands of chert. Siliceous siltstone is generally dark grey, while chert is generally light grey. Interval is intermittently foliated. Fractures and joints are dominantly siliceous, with some calcite infill. Mineralization primarily occurs within fractures and veinlets, consisting of fine grained pyrrhotite and pyrite, with trace, localized galena in veinlets near 108 m depth. Fine grained, disseminated pyrrhotite is also intermittently present. Trace, localized medium grained arsenopyrite occurs independently of other sulphides, near 119 m depth. Interval from 115.72 m - 121.15 m is weak-moderately sericite altered.

											Py	0.3
121.15	126.47	5.32	SSS	FG	Moderate to strongly fractured siliceous siltstone. Fracture controlled mineralization consists of fine grained pyrrhotite, pyrite and sphalerite. Fracture infill is primarily siliceous with minor calcite infill. Interval from 125.00 m - 126.47 m is intensely fractured (crackle breccia).							
						LT	GY	BX			Sp	0.1
						DK	GY	FR	---	--	Py	0.2
											Po	0.8
126.47	128.39	1.92	CHT	FG	Maroon chert interbedded with siliceous siltstone. Interval is strongly to intensely fractured with crackle brecciation. Fractures have siliceous infill and host fine grained pyrrhotite. Some hairline fractures infilled with calcite. Chlorite alteration present along fracture surfaces.							
						LT	GY	FR	CHL	1I	Po	0.5
						DK	BN	BX			Py	0.5

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
128.39	155.22	26.83	SLT	FG	Medium to dark grey siltstone with fine grained mineralization of pyrrhotite, pyrite and sphalerite occurring as fracture infill. Fractures and veinlets are primarily siliceous with less abundant calcite infill. Weak chlorite alteration occurs along fractures. Interval from 128.39 m - 145.42 m has intermittent, 20-120 cm rubbly sections. Interval from 147.71 m - 155.22 m is moderate-strongly sericitized.							
						MD	GN		CHL	2I	Py	0.4
						MD	GY				Sp	0.1
						DK	GY	RB	SER	3I	Po	0.4
155.22	173.00	17.78	SLT	FG	Strongly to intensely fractured, interbedded siltstone and maroon chert with moderate bleaching. Interval is skarnified and moderately to strongly sericitized, with moderate chlorite alteration. Mineralization consists of fine grained pyrite and less abundant pyrrhotite within fractures and veinlets. Fractures and veinlets are primarily calcareous. Rubbly sections with weak clay alteration present at 167.00 m - 167.15 m and 171.00 m - 173.00 m depth.							
						MD	GN	RB	SER	3I	Po	0.1
						LT	GY		CHL	3I		
						DK	BN	FR	BLE	3I	Py	0.2
									CLY	1I		
173.00	213.23	40.23	CHT	FG	Strongly fractured maroon chert interbedded with siliceous siltstone. Chert is intermittently banded in 23-30 cm sections. Interval is rubbly and is weakly-moderately chlorite altered along fractures. Fractures and veinlets have siliceous infill with less abundant calcite. Localized vuggy calcite vein at 193.84 m depth. Fine grained pyrite, pyrrhotite and sphalerite present in fractures and veinlets. Localized, disseminated fine-medium grained arsenopyrite occurs independently of other sulphides at 199.60 m - 199.80 m depth. Localized fine grained galena present within calcareous, polymetallic veins in an intensely fractured, skarnified section at 199.70 m - 200.00 m depth.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
0.00	2.75	2.75	CAS	--	Casing							
						--	--	---	---	--	--	0
2.75	8.63	5.88	GRN	MG	Medium to light grey to brown phaneritic granite. Manganese oxide staining seen enveloping (and on) most fracture surfaces. Envelope typically 5mm on either side of the fractures. Oxidation seen locally throughout altering whole core in places.							
						MD	GY	PH	MNO	2I	--	0
						LT	BN		OXI	2I		
8.63	10.82	2.19	GRN	MG	Light tan to green moderately phyllic altered granite. Local argillic alteration throughout. Oxidation seen on select fracture surfaces and locally altering bands throughout core. Small quartz stringers/veinlets throughout.							
						LT	TN	PH	OXI	2I	--	0
						LT	GN		PHC	3I		
									ARG	2I		
10.82	13.72	2.90	VEN	MG	Light grey massive to brecciated quartz vein / silicified granite - phase in and out of intensely silicified granite and pure quartz. Disseminated pyrite, sphalerite and galena seen throughout. Interval moderately oxidized - seen on fracture surfaces and seen as brown/tan stringers throughout some of the vein, and oxidation altering whole core locally. Upper contact at 30 degrees TCA, lower contact rubble.							
						LT	GY	MA	OXI	2I	Py	0.01
								BX	SIL	5I	Sp	0.05
											Gn	0.01
13.72	25.23	11.51	GRN	MG	Light to medium tan to grey moderately oxidized and phyllic altered granite with weak argillic alteration locally throughout. Oxidation seen on all fracture surfaces and locally altering whole core. Quartz veinlets and veins throughout - occasionally hosting arsenopyrite mineralization.							
						MD	GY		ARG	2I		
						LT	TN	PH	OXI	3I	As	0.01
									PHC	3I		

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
25.23	50.75	25.52	GRN	MG	Medium to light grey to tan granite with localized moderate phyllic and argillic alteration. Oxidation seen throughout mainly on fracture surfaces, with occasional 1cm envelopes. Localiazed moderate silicification seen around quartz veinlets and veins. Quartz veinlets/veins hosting pyrite mineralization. Trace smithsonite seen on fracture surfaces and associtaed with quartz veins.							
						MD	GY					
						LT	TN					
50.75	51.05	0.30	VEN	FG	White to light grey quartz vein with disseminated fine grained pyrite and arsenopyrite. Trace smithsonite throughout vein. Oxidized stringers throughout and oxidation seen on fracture surfaces.							
						LT	GY	MA	SIL	5I	Py	0.01
						--	WH		OXI	2I	As	0.01
51.05	57.49	6.44	GRN	MG	Light tan phaneritic granite with moderate argillic and phyllic alteration throughout. Moderate oxidation throughout but more pervasive on fracture surfaces. Quartz stringers and veinlets throughout hosting disseminated pyrite mineralization. Segments of 10cm of grit to rubble throughout.							
						LT	TN	PH	ARG	2I	Py	0.01
									PHC	2I		
									OXI	2I		
57.49	79.95	22.46	GRN	MG	Medium to light grey phaneritic granite with weak argillic and phyllic alteration locally throughout. Oxidationb seen on fracture surfaces and around veinlets/veins throughout. Quartz veinlets and stringers throughout hosting pyrite mineralization and trace sphalerite and galena mineralization.							
						MD	GY	PH	OXI	1I	Py	0.01
						LT	TN		ARG	1I	Sp	0.01
									PHC	1I	Gn	0.01

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
79.95	82.15	2.20	GRN	MG	Light tan to grey moderately argillic altered granite with localized weak phyllic alteration. Rubble patches throughout interval (20cm long). Infrequent quartz veinlets hosting pyrite and trace galena mineralization.							
						LT	TN	PH	ARG	3I	Py	0.01
						--	GY		PHC	2I	Gn	0.01
82.15	83.04	0.89	FLR	FG	Light to medium grey to tan milled breccia (?) and sheared fault rock. Milled breccia has rounded grey porphyritic clasts and mid grey quartz clasts in a light grey gritty gouge matrix. Sheared segment is light to medium grey with sheared bands and trace disseminated pyrite throughout. Shear fabric seen surrounding quartz grains and clasts. Sheared segment at 82.60 - 82.71m. Rest of interval milled breccia to gouge. Weak oxidation seen throughout the gouge.							
						MD	TN	BX				
						LT	GY	SH	OXI	1I	Py	0.01
83.04	95.83	12.79	GRN	MG	Medium to light grey to tan phaneritic to weakly porphyritic granite with localized moderate argillic and phyllic alteration. Moderate oxidation throughout - mainly on fracture surfaces and locally altering whole core. Small quartz stringers and veinlets throughout with fine grained disseminated pyrite.							
						MD	GY	PH	ARG	2I	Py	0.01
						LT	TN	PO	PHC	2I	Sp	0.01
									OXI	2I		
95.83	97.46	1.63	BXA	MG	Light to medium grey to tan milled breccia. Clasts throughout are sub rounded argillic and weakly oxidized phaneritic granite. Matrix is a grey medium grained intrusive with pyrite disseminated throughout and blebs of galena. Quartz-pyrite stringers seen throughout.							
						MD	TN	PH	OXI	1I	Py	0.01
						LT	GY	BX	ARG	2I	Gn	0.01

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
97.46	99.56	2.10	GRN	MG	Light tan to grey phaneritic granite with moderate argillic and phyllic alteration throughout. Moderate oxidation also seen on, and enveloping select fracture surfaces. Quartz veinlets throughout with no visible mineralization. Contact into dyke at 40 degrees TCA and very undulatory.							
						LT	GY	PH	ARG	2I	--	0
						--	TN		PHC	2I		
									OXI	2I		
99.56	112.65	13.09	QFP	FG	Medium green quartz feldspar porphyry dyke. Phenocrysts are very soft white clay altered feldspars and dark grey quartz grains - often cubic and glassy. Locally mildly calcareous around these phenocrysts. Disseminated very fine grained pyrite seen throughout matrix. Matrix medium green - very fine grained - and moderately silicified. Small quartz-pyrite stringers and veinlets also seen throughout - larger veinlets often vuggy. Feldspar phenocrysts moderately oxidized locally and oxidation seen on all fracture surfaces.							
						MD	GN	PO	OXI	2I	Py	0.1
									SIL	2I		
112.65	134.79	22.14	GRN	MG	Light to medium grey to tan granite with localized moderate argillic and phyllic alteration throughout. Pervasive oxidation seen locally throughout, but mainly on select fracture surfaces. Quartz veinlets and veins seen throughout hosting galena, sphalerite and pyrite mineralization, and typically surrounded by a mild silicification halo. Small 30cm segments of rubble.							
						MD	TN		PHC	3I	Sp	0.01
						LT	GY	PH	OXI	2I	Gn	0.01
									ARG	2I	Py	0.01
									SIL	1I		
134.79	135.91	1.12	GRN	MG	Light tan to grey moderately argillic altered granite. Entire interval rubble to grit.							
						LT	TN	PH	ARG	3I	--	0
						--	GY	RB				

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
135.91	142.34	6.43	GRN	MG	Light tan to grey granite with localized moderate argillic and phyllic alteration throughout. Granite phaneritic to porphyritic - with feldspar phenocrysts locally (5mm - 1cm). Quartz veinlets and veins throughout hosting pyrite mineralization. Small 10cm segments of rubble throughout.							
						LT	TN	PH	ARG	2I	Py	0.01
						--	GY	PO	PHC	3I		
142.34	147.92	5.58	GRN	MG	Light to medium grey phaneritic granite with localized weak phyllic alteration - primarily around quartz veinlets. Mainly fresh granite.							
						MD	--					
						LT	GY	PH	PHC	1I	--	0
147.92	172.41	24.49	GRN	MG	Light tan to grey phaneritic to porphyritic granite. Porphyritic texture generated from 5mm - 1cm feldspar clasts throughout - often rectangular to square. Granite locally moderately argillic and phyllic altered. Silicification seen around veins and veinlets. Quartz veins and veinlets hosting pyrite mineralization and often vuggy with well developed quartz crystals in the vugs.							
						LT	TN	PH	ARG	2I	Py	0.1
						--	GY	PO	PHC	2I		
									SIL	2I		
172.41	173.46	1.05	VEN	VF	Milky white very fine grained cryptocrystalline quartz vein. Light grey bands seen throughout - multiple infill stages (?). Upper contact at 85 degrees TCA and has a 15cm zone of prismatic quartz crystals. Lower contact is at 85 degrees TCA and has a 3cm band of grey multi-generational infill stages with mild breccia. Trace pyrite seen at both contacts.							
						--	WH	XL	---	--	Py	0.01
								BN				

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
173.46	200.25	26.79	GRN	MG	Light to medium grey to tan phaneritic to porphyritic granite. Porphyritic texture generated from 5mm - 1cm feldspar clasts that are occasionally rectangular. Zones of minor breccia with chlorite (?) alteration throughout. Moderate local argillic and phyllic alteration throughout. Silicification seen around veins and veinlets throughout. Quartz veins and veinlets hosting pyrite mineralization and occasionally have a peach-pink colour. Veins occasionally vuggy. Local stockwork veinlets also seen hosting pyrite mineralization.							
						MD	GY	PO	PHC	2I		
						LT	TN	PH	ARG	2I	Py	0.1
								BX	SIL	2I		
									CHL	1I		
200.25	200.93	0.68	VEN	MG	Quartz vein / intensely silicified granite. Stockwork pyrite and sphalerite veinlets seen. Segments of vein have remnant granite texture visible - argillic altered but very intensely silicified. Quartz vein segments banded with multiple generations of infill - including peach-pink quartz. Locally vuggy. An unknown sulphide - sulfosalt (?) silverish in colour throughout.							
						LT	TN	BN	CHL	1I	Py	0.01
						--	GN	MA	ARG	2I	Sp	0.01
									SIL	4I	Un	0.01
200.93	208.25	7.32	GRN	MG	Light to medium grey to tan granite with localize moderate phyllic and argillic alteration. Argillic altered zones rubble to grit. Phyllic alteration mainly seen around veinlets throughout. Quartz veinlets and veins seen with trace pyrite mineralization.							
						MD	TN		ARG	1I		
						LT	GY	PH	PHC	2I	Py	0.01

87.55	92.18	4.63	GRN	MG	Light grey to mid brown phaneritic granite with localized moderate phyllic alteration, weak argillic alteration and moderate oxidation. Quartz-sulphide veins throughout 3mm - 4cm thick hosting galena, sphalerite and pyrite mineralization. Silicification halos seen around these, and no oxidation and very weak phyllic alteration. Majority of all alteration in segments with no veins throughout. Pink carbonate veins throughout - up to 30cm thick, often with angular granite clasts throughout.

92.18	109.74	17.56	GRN	MG	Light grey-tan to brown phaneritic granite with localized phyllic and argillic alteration. Pervasive oxidation seen throughout interval. 1-2cm quartz veins with sphalerite and pyrite seen throughout surrounded by non-oxidized silicified halos. Quartz veins locally vuggy. 10-20cm peach carbonate veins also seen, often with granite clasts throughout.

									PHC	2I		
117.45	117.81	0.36	BXA	CG	Medium grey to tan breccia with quartz and peach carbonate infill. Galena, sphalerite, pyrite, arsenopyrite and chalcopyrite seen semi-massive throughout the matrix. Clasts in breccia are silicified phyllic granite, and edges of clasts are not well defined into matrix.

											Py	10
120.08	165.20	45.12	GRN	MG	light tan to green-grey phaneritic to porphyritic granite with localized moderate to strong phyllic and argillic alteration. Porphyritic texture local throughout and generated from 5mm - 1.5cm feldspar phenocrysts - often rectangular. Phyllic alteration more pervasive surrounding veins. Silicification halos also seen around larger veins/veinlet series. Quartz-carbonate-sulphide veins and veinlets seen throughout hosting pyrite, sphalerite, arsenopyrite and galena. Oxidation seen locally - often more pervasive in argillic altered zones. No unaltered granite in this interval.

Box Number	From (m)	To (m)

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
0.00	11.28	11.28	-?-	--	Casing, no recovery.							
						--	--	---	---	--	--	0
11.28	21.00	9.72	GRN	MG	Highly oxidized, rubbly granite with yellowish, clay texture coating on rubble faces (potential scoridite?, but no arsenopyrite seen). Recovery is poor.							
						--	YW	RB	OXI	4I	--	0
						--	GY	PH				
21.00	50.50	29.50	GRN	MG	Oxidized, rubbly and fractured granite with localized competent rock. Fractures are siliceous with no consistent orientation and host blebby sulphides, mainly pyrite with sphalerite and galena. Competent regions are weakly siliceous. Regions surrounding fractures show argillic and phyllic alterations. Intermittent (~10 cm in width) regions are soft and pale yellow, almost gougy with small (1-2mm) mica and sulphide "clasts". Clay alteration occurs locally with no excess mineralization.							
						DK	OR	FR	PHC	3I	Gn	1
						--	GY	PH	ARG	3I	Sp	2
						--	TN		OXI	3I	Py	3
									SIL	2I		
50.50	56.50	6.00	GRN	MG	Light to dark grey and mostly dark orange, competent, altered granite with localized weakly clay altered rubble. Less oxidized areas are weakly fractured, seldom hosting blebby sphalerite. Fractures are siliceous in composition as is surrounding host rock. Argillic and phyllic alterations are pervasive surrounding infill. Few fractures are lined thin, black powder (manganese oxide? Or potential sulphide powder?).

Box Number	From (m)	To (m)

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
0.00	7.62	7.62	CAS	--	Casing							
						--	--	---	---	--	--	0
7.62	11.02	3.40	GRN	MG	Light grey to tan moderately argillicly altered and weakly oxidized granite. Oxidation more pervasive on fracture surfaces. Segments of grit and rubble throughout interval.							
						LT	GY	PH	OXI	2I	--	0
						LT	TN		ARG	3I		
11.02	18.92	7.90	GRN	MG	Medium grey to tan phaneritic to mildly foliated granite. Foliation ranging from 10-25 degrees TCA, and defined by grey/tan colour banding and weak alignment of micas (?). Weak oxidation seen on and occasionally enveloping fracture surfaces and veinlets. Manganese oxide seen on select fracture surfaces.							
						MD	GY	PH	OXI	2I	--	0
						MD	TN	FO	MNO	1I		
18.92	27.25	8.33	GRN	MG	Light to medium tan to brown granite with patchy argillic and silic alteration throughout - 80 percent of interval is argillic, 30 percent silic overprinting argillic. Oxidation seen throughout on all fracture surfaces - and enveloping veinletts/stringers to upto 2cm on either side. Manganese oxide seen on majority of fracture surfaces. Trace sphalerite also seen on fractures. Dark brown stringers seen throughout (MNO?)							
						MD	BN		SIL	1I		
						LT	TN	PH	ARG	2I	Sp	0.01
									OXI	3I		
									MNO	1I		
27.25	36.23	8.98	GRN	MG	Medium grey phaneritic granite with weak oxidation and manganese oxide seen on fracture surfaces. Localized moderate argillic alteration throughout - typically 20-30cm segments with weak oxidation. Argillic zones typically rubble to grit.							
						MD	GY	PH	OXI	2I	--	0

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
									MNO	1I		
									ARG	2I		
36.23	41.23	5.00	GRN	MG	Medium grey phaneritic granite with weak oxidation seen on fracture surfaces and weak argillic alteration throughout - very localized and typically only 20cm. Manganese oxide seen on select fracture surfaces.							
						MD	GY	PH	OXI	1I	--	0
									MNO	1I		
									ARG	1I		
41.23	41.76	0.53	GRN	MG	Light grey to tan strongly argillicly altered granite. Interval grit to rubble. Weak oxidation and manganese oxide on fracture surfaces.							
						LT	TN	RB	OXI	1I		
						LT	GY	PH	ARG	4I	--	0
									MNO	1I		
41.76	45.19	3.43	GRN	MG	Medium to light grey phaneritic granite with moderate oxidation throughout - mainly on and enveloping fracture surfaces. Weak manganese oxide also seen on fracture surfaces. Localized weak to moderate argillic alteration throughout. Trace pyrite seen in quartz veinlets and stringers throughout.							
						MD	GY	PH	OXI	2I	Py	0.01
						LT	GY		ARG	1I		
									MNO	1I		
45.19	48.81	3.62	GRN	MG	Medium brown-grey phaneritic granite with moderate oxidation throughout. Moderate manganese oxide also seen - mainly on fracture surfaces. Localized argillic alteration throughout. Interval highly fractured to rubble. Galena seen in small quartz vein at 47.85m.							
						MD	GN	PH	OXI	3I	Gn	0.01
						MD	GY		MNO	2I		
									ARG	2I		

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
48.81	53.31	4.50	GRN	MG	Light to medium grey to tan strongly argillicly altered granite. Weak to moderate oxidation throughout. Weak manganese oxide seen on select fracture surfaces. Rubble segments throughout interval .							
						MD	TN	RB	OXI	2I		
						LT	GY	PH	ARG	4I	--	0
									MNO	1I		
53.31	57.79	4.48	GRN	MG	Medium grey phaneritic granite with weak to moderate oxidation on and surrounding fracture surfaces. Weak manganese oxide on select fractures and localized weak argillic alteration throughout - typically enveloping stringers.							
						MD	GY	PH	ARG	1I	--	0
									OXI	2I		
									MNO	1I		
57.79	61.24	3.45	GRN	MG	Light to medium grey to tan strongly argillicly altered phaneritic granite. Weak to moderate oxidation throughout. Small grit to rubble segments of intense argillicly altered granite.							
						MD	TN		OXI	2I		
						LT	GY	PH	ARG	4I	--	0
61.24	69.49	8.25	GRN	MG	Medium to light grey phaneritic granite with localized weak argilic alteration throughout. Weak oxidation seen on select fracture surfaces. Argillic alteration more pervasive 30cm before next interval. Trace sphalerite and pyrite seen in blebs around lower contact into next interval.							
						MD	GY	PH	ARG	2I	Py	0.01
						LT	GY		OXI	1I	Sp	0.01
69.49	70.67	1.18	GRN	MG	Medium brown strongly argillicly altered granite. Moderate oxidation throughout. Interval competent to grit. Sharp contacts.							
						MD	BN	PH	ARG	4I	--	0
									OXI	3I		

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
70.67	103.40	32.73	GRN	MG	Medium grey phaneritic granite. Small 5mm veinlets throughout hosting very fine grained pyrite. Argillic alteration halos seen around veinlets - 10cm envelope on either side. Trace arseno pyrite (?) blebs seen in the alteration halos -- too fine grained to tell. Small 20cm segments of moderate oxidation and rubble throughout interval. Segments with more biotite-rich bands throughout - bands typically 0.5 - 1cm thick.							
						MD	GY	PH	OXI	1I	As	0.01
									ARG	1I	Py	0.01
									SIL	1I		
103.40	105.04	1.64	GRN	MG	Medium to light grey intensely argillic granite. Entire interval grit to rubble. Weak oxidation seen locally throughout. Competent pieces throughout. Competent pieces throughout approx. 10cm and moderately silicified (?).							
						MD	GY	RB	OXI	1I	--	0
						LT	GY		ARG	5I		
									SIL	1I		
105.04	114.58	9.54	GRN	MG	Medium to light grey phaneritic granite with localized argillic alteration throughout. Argillic segments up to 70cm and grit. Silicified argillic alteration also seen around small 5mm veinlets with a 20cm envelope. Trace fine grained pyrite seen as blebs and euhedral crystals throughout veinlets. Small bands 5mm to 1cm of more biotite-rich granite. Weak oxidation through competent granite and moderate oxidation through heavy argillic altered segments. Small ankerite (?) seamlets seen throughout.							
						MD	GY	PH	OXI	2I	Py	0.01
						LT	GY		SIL	1I		
									ARG	2I		

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
114.58	119.47	4.89	GRN	MG	Light grey to tan weakly argilic altered granite. Localized silicification seen around veinlets. Small 5mm sulphide (sphalerite and pyrite) veinlets throughout, often discontinuous. 2 larger quartz-sulphide veins seen at 115.11m and 119.48m. Both very rubbly and 10-20cm thick. Pyrite, galena and sphalerite seen in these. Up to 30cm zones of intense argillic alteration - grit to rubble, throughout. Weak to moderate oxidation throughout, mainly in the moderate to intense argillic zones.							
						LT	GY	PH	SIL	4I	Py	0.01
						LT	TN		ARG	2I	Gn	0.01
									OXI	2I	Sp	0.01
119.47	123.44	3.97	GRN	MG	Medium to light grey to tan granite with localized moderate argillic alteration seen throughout - often enveloping small veinlets and stringers. Veinlets and stringers are quartz-pyrite and clay (?) - very soft, light tan coloured stringers. Argillic alteration surrounding these, often with a 2-5cm halo of silicification.

0.00	1.52	1.52	CAS	--	Casing							
						--	--	---	---	--	--	0
1.52	14.70	13.18	GRN	MG	Medium orange-brown strongly oxidized granite. Patchy argillic alteration throughout interval. Entire interval highly fractured to rubble. Small veinlets/fracture coatings of gypsum? Smithsonite? - slight turquoise/green colouring. Fracture surfaces have grit/powder trace very fine grained dull pyrite seen throughout. Tetrahedrite seen on select fracture surfaces with smithsonite. Trace galena.							
						MD	OR	PH	OXI	4I	Py	0.01
						MD	BN		ARG	4I	Gn	0.01
									MNO	1I		
14.70	17.60	2.90	GRN	MG	Light grey-blue phaneritic granite. Weak oxidation seen on select fracture surfaces/surrounding select veins/veinlets throughout. Trace smithsonite seen on select fracture surfaces - typically a 1-2mm coating. Trace pyrite seen throughout. Chalcedonic/quartz veins/veinlets throughout - seen in silicified zones. Granite texture still occasionally visible.							
						LT	GY	PH	OXI	1I	Py	0.01
						LT	BL		SIL	2I		
17.60	18.84	1.24	GRN	MG	Light to medium brown-tan phaneritic granite. Strongly oxidized throughout to a dark brown often on fracture surfaces. Large 30cm zone of coarse grained quartz and ankerite (?) from 18.08 - 18.38m with moderate oxidation throughout. Tourmaline (?) - dark black, slightly bladey crystals throughout matrix. Muscovite seen on fracture surfaces. Manganese oxide seen on select fracture surfaces.							
						MD	BN		MNO	1I		
						LT	BN	PH	OXI	4I	--	0

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
18.84	21.05	2.21	GRN	MG	Dark grey to brown phaneritic granite. More mafics seen than in unaltered granite - biotite and potentially tourmaline (?). Lighter grey-brown oxidation seen enveloping fractures and veinlets. Weak manganese oxide seen on select fracture surfaces. Trace sulphosalts (?) seen as dark black seamletts throughout.							
						DK	GY	PH	OXI	2I	Un	0.01
						DK	BN		MNO	1I		
21.05	24.12	3.07	GRN	MG	Light tan to grey argillic and mildly oxidized granite. Oxidation patchy throughout with zones of darker brown oxidation. Occasional fractures with manganese oxide.							
						LT	TN	PH	ARG	3I	--	0
						LT	GY		OXI	2I		
									MNO	1I		
24.12	26.32	2.20	GRN	MG	Light grey phaneritic argillic altered granite. Weak oxidation seen on select fracture surfaces. Interval highly fractured with some rubble throughout. Grit to gouge seen on fracture surfaces. Hematite staining seen locally, more common around sulphides. Medium grained bright coarse pyrite seen throughout - most commonly on fracture surfaces. Sphalerite also seen with pyrite, oxidizing to a purple-blue colour.							
						LT	GY	PH	ARG	3I	Sp	0.01
									OXI	1I	Py	0.01
											He	0.01
26.32	31.48	5.16	GRN	MG	Medium brown to tan phaneritic granite with moderate argillic and oxidation throughout. Fine grained dull to bright pyrite seen throughout, typically in stringers or large blebs. Hematite staining seen in segments of moderate pyrite mineralization, and occasional silicification(?) Quartz veins often seen with the pyrite.							
						MD	BN	PH	ARG	3I	Py	0.01
						MD	TN		OXI	2I		
									SIL	1I		

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
31.48	36.59	5.11	GRN	MG	Light to medium grey to tan granite with weak argillic alteration and oxidation throughout. Oxidation primarily on and enveloping fracture surfaces and veinlets. Trace galena and sphalerite seen in veinlets throughout - often visible on fracture surfaces. Pyrite seen throughout - both very fine grained dull pyrite and medium grained pyrite grains in veinlets/veins and often in blebs. Hematite staining often seen around the pyrite.							
						MD	TN				Gn	0.01
						MD	GY				Sp	0.01
						LT	GY	PH	ARG	2I	Py	0
36.59	37.47	0.88	GRN	MG	Dark grey sulphide-rich granite. Weak oxidation seen on fracture surfaces. Chalcedonic veining throughout with pyrite, galena and sphalerite throughout. Sulphides seen rimming and within the chalcedonic veins. Bright medium grained pyrite often seen rimmed by very fine grained dull pyrite and sphalerite. Chalcedonic veins often have slight breccia segments with oxidized veinlets.							
						DK	GY	PH	OXI	1I	Py	10
											Sp	5
											Gn	2
37.47	45.11	7.64	VEN	MG	Semi-massive to massive sulphide breccia vein. Chalcedony veins/veinlets seen throughout as well as blebs/clasts of quartz. Veins/veinlets rimmed with sulphides, and sulphides occasionally seen throughout. Pyrite is seen as very fine grained dull and medium grained bright pyrite blebs, occasionally as fibrous pyrite. Oxidized remnant granite clasts seen. Sulphides vuggy to sand/grit from 42.06 - 43.54m, and mainly massive dull very fine grained pyrite.							
						DK	GY	MA	OXI	1I	Py	20
								BX			Gn	1
											Sp	10

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
45.11	51.29	6.18	GRN	MG	Light to medium brown to grey granite with moderate to strong oxidation throughout. Veins/veinlets throughout with sphalerite, galena and pyrite as blebs of these sulphides throughout. A mild foliation seen locally throughout, and defined by oxidized stringers - ranges from 0 - 20 degrees TCA. Quartz blebs also seen throughout interval.							
						MD	GY				Gn	0.1
						LT	BN	PH	OXI	3I	Sp	0.5
											Py	1
51.29	56.72	5.43	BXA	MG	Light grey-tan to dark grey-green breccia vein. Matrix semi-massive sulphides - typically pyrite with quartz/silicified clasts throughout, occasionally oxidized. Clasts in breccia typically sub rounded to sub angular. Pyrite in matrix typically very fine grained, dull with medium grained bright pyrite overprinting. Sphalerite, galena and chalcopyrite seen in the matrix as larger grains with the pyrite. Pyrite occasionally pitted in the more massive segments. White quartz veins/veinlets throughout - typically with rough contacts into breccia.							
						LT	TN	BX	OXI	2I	Gn	5
						DK	GY	MA			Sp	10
											Py	30
											Cp	1
56.72	59.26	2.54	VEN	FG	Medium grey-tan intensely silicified vein - unable to tell protolith - no remaining textures. Stockwork sphalerite and pyrite stringers and seamletts locally throughout. Pyrite seen as very fine grained and dull and as medium grained bright pyrite. Galena occasionally seen in these seamletts, but more commonly as grains throughout. Small blebs of a light tan-yellow mineral (ankerite?) that is often vuggy.							
						MD	GY	MA	SIL	5I	Sp	1
						MD	TN				Py	2
											Gn	0.01

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
59.26	67.13	7.87	GRN	MG	Medium to dark grey phaneritic granite with zones of mild silicification and stringers and veinlets throughout with pyrite and sphalerite - typically a sphalerite matrix with bladey/elongate pyrite crystals throughout. Pyrite and sphalerite also seen disseminated throughout. Pyrite and sphalerite overprinting biotite(?) in granite. Galena seen in the more silicified zones - often on vugs in the core. Small stringers of gypsum/smithsonite throughout - fibrous with a greenish colouration (typically dark green).							
						MD	GY	PH	SIL	2I	Py	5
						DK	GY				Sp	5
											Gn	0.01
67.13	69.45	2.32	GRN	MG	Light to medium grey phaneritic granite with patchy silicification and argillic alteration throughout. Interval has segments 30cm of rubble to grit. Pyrite seen in the stringers and veinlets throughout - typically very undulatory and uneven thickness. Py is fine grained to very fine grained and typically dull.							
						MD	GY		---	--		
						LT	GY	PH	ARG	3I	Py	0.01
69.45	76.38	6.93	GRN	MG	Light to medium grey phaneritic granite with patchy silicification and argillic alteration throughout. Py seen throughout replacing biotite (?) as well as in stockwork veins/veinlets/stringers locally throughout. Pyrite is very fine grained and dull. Sphalerite rarely replacing biotite and in stringers/veinlets throughout. Occasional veins/veinlets with coarse grained pyrite. Quartz veinlets/veins throughout with trace galena and chalcopyrite on fracture/vugg surfaces.							
						MD	GY		ARG	2I	Py	0.1
						LT	GY	PH	SIL	2I	Sp	0.01
											Gn	0.01
											Cp	0.01
76.38	77.52	1.14	VEN	MG	Medium to dark grey-tan intensely silicified vein with moderate breccia throughout. Matrix fine grained to very fine grained pyrite. Clasts sub rounded quartz blebs.							
						MD	GY	BX	SIL	4I	Py	5

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
						DK	TN					
77.52	78.64	1.12	GRN	MG	Medium to light grey to tan moderately argillic altered granite. Stockwork pyrite veinlets/stringers locally throughout. Sulphosalts (?) seen on select fracture surfaces - dark grey to black powdery soot. Pyrite also seen locally overprinting biotite in granite.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
0.00	0.90	0.90	CAS	--	Casing							
						--	--	---	---	--	--	0
0.90	3.22	2.32	PHY	FG	Medium to dark grey to brown meta-sed phyllite. Pervasive foliation - typically 40 - 50 degrees TCA - alignment of the micas throughout. Elongate augens of quartz and remnant sedimentary rock (?). 1-2cm thick quartz veins throughout with the same orientation as the foliation (synformational?). Interval moderately oxidized on fracture surfaces and augens throughout. Weak manganese oxide seen on select fracture surfaces. Interval highly fractured to rubble.							
						MD	GY		MNO	1I		
						DK	BN	FO	OXI	3I	--	0
3.22	4.20	0.98	PEG	VC	Light tan to grey massive pegmatite body. Rough contacts into pyllite. Primary quartz grains throughout with a few plag (?) crystals that have been weathered and oxidized. Very coarse grained - crystals 5mm - 8mm typically.							
						LT	TN	MA	OXI	3I	--	0
						LT	GY					
4.20	16.50	12.30	PHY	FG	Medium to dark grey to brown meta-sed phyllite. Pervasive foliation at 40 - 50 degrees TCA typically. Micas (biotite and muscovite) aligned throughout. Elongate bands and augens of quartz and calcite (potentially remnant sediments?) throughout. 1-2cm thick quartz veins throughout with the same orientation as the foliation - synformational? Interval moderately oxidized - fracture surfaces and calcite/SED augens and bands throughout. Cross-cutting veinlets seen throughout with a 2cm thick alteration halo - mid greenish grey and very soft. Chlorite?							
						MD	GY	FO	OXI	3I	--	0
						DK	BN					

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
16.50	17.09	0.59	PEG	VC	Light to medium tan to white massive pegmatite body. Rough contacts into pyllite. Quartz and feldspar (?) grains throughout. A few medium grey-blue silicified clasts throughout - Limestone? Very coarse grained. Crystals 5mm - 1.5cm typically.							
						MD	WH					
						LT	TN	MA	OXI	2I	--	0
						LT	GY					
17.09	20.67	3.58	PHY	FG	Medium to dark brown to grey meta-sed phyllite. Pervasive foliation at 50 - 60 degrees TCA. Micas aligned throughout with more muscovite than previous phyllite intervals - up to 1cm thick bands of muscovite. Elongate bands and augens of quartz and calcite. 1-2cm thick quartz veins throughout as the same orientation as the foliation - synformational? Interval moderately oxidized - fracture surfaces and calcite augens and bands throughout.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
0.00	7.00	7.00	-?-	--	Casing, no recovery							
						--	--	---	---	--	--	0
7.00	15.00	8.00	SLT	FG	Weakly oxidized, rubbly, siliceous siltstone with localized clay altered regions. Semi-pervasive quartz infill hosts no visible sulphides.							
						--	GY	RB	OXI	2I	--	0
									CLY	2I		
									SIL	3I		
15.00	20.40	5.40	SLT	FG	Relatively competent, foliated, siliceous siltstone with localized limey regions and weak oxidation evident on fractured surfaces. Few calcareous or siliceous fractures host no visible sulphides.							
						--	GY	FO	OXI	2I	--	0
									CLY	2I		
20.40	32.00	11.60	SLT	FG	Rubbly and locally clay altered siliceous siltstone with pervasive oxidation evident on joints and fractures and intermittent, coarser grained limey regions. Siliceous infilled fractures are semi pervasive and host no visible sulphides.							
						DK	OR	FO	CLY	2I		
						--	GY	RB	OXI	3I	--	0
32.00	37.00	5.00	SLT	FG	Semi-competent, foliated, light to dark grey siliceous siltstone with localized limey regions and pervasive oxidation on joints and fractures. Calcareous fractures occur regularly and generally cross-cut foliations hosting minor pyrrhotite.							
						--	GY	FO	OXI	2I	Po	0.5
								FR				
37.00	38.20	1.20	SLT	FG	Subsection of oxidized, rubbly siliceous siltstone with localized limey regions. Siliceous and calcareous infill is pervasive hosting trace pyrrhotite.							
						DK	OR					
						--	GY	RB	OXI	3I	Po	0.2

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
38.20	45.00	6.80	SLT	FG	Light to dark grey, foliated, competent, siliceous siltstone with localized limey regions. Foliations are convoluted or undulating with a general fabric oriented 30° to 40° to core axis. Siliceous and calcareous infill is pervasive seldom hosting fine grained sulphides - pyrrhotite, sphalerite and galena. Weak oxidation is evident from orange staining on joints and fractures.							
						--	GY	FO	OXI	1I	Po	0.5
											Sp	0.1
											Gn	0.1
45.00	52.80	7.80	SLT	FG	Rubbly, light to dark grey siliceous siltstone with weakly calcareous regions and no visible sulphides.							
						--	GY	RB	OXI	2I	--	0
52.80	53.80	1.00	SLT	FG	Dark grey, weakly clay altered, rubbly siltstone with pervasive calcite infill. Region hosts fracture controlled and blebby replacement sulphides - pyrrhotite, pyrite, sphalerite, galena and minor chalcopyrite. Fractures are weakly chlorite altered.							
						DK	GY	RB	CLY	2I	Po	5
											Gn	3
											Cp	0.5
											Py	3
									CHL	2I	Sp	4
53.80	58.00	4.20	SLT	FG	Mostly competent, light to dark grey and light green, foliated siliceous siltstone with localized clay altered, rubbly subsections. Region contains several, weakly chlorite altered calcite fracture fills hosting weak pyrrhotite and pyrite with seldom sphalerite. Fractures tend to cross-cut foliations with a dominant set oriented roughly 50° to core axis.							
						LT	GN		CLY	2I	Py	1
						--	GY	FO	CHL	1I	Po	1
											Sp	0.1
58.00	65.00	7.00	SLT	FG	Potential fault zone? Region is extremely rubbly with few localized clay altered, gougy areas. Weak oxidation is evident on seldom fracture faces. Fracture controlled, blebby sulphides are prevalent in oxidized, clay altered regions (most evident between 61.00m and 63.20m), also possible fault center. Fractures are generally carbonate in composition.							

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
						--	GY	RB	OXI	1I	Sp	2
								FR	CLY	2I	Py	4
											As	0.5
											Gn	1
											Po	2
65.00	84.42	19.42	SLT	FG	Mostly competent, foliated, light to dark grey siliceous siltstone with several calcareous or siliceous fractures and loaclized limey regions. Foliations are generally planar while fractures are undulating and often discontinuous. Fractures host weak sulphides - commonly pyrite and pyrrhotite and seldom galena and sphalerite. A soft, dark olive green alteration is inconsistently on and around fractured surfaces. A weak correlation can be seen between the alteration and the presence of sphalerite and galena (potentially chlorite and argillic alterations?). Weak bladed arsenopyrite is disseminated in dark, siliceous areas. Limey bands and altered regions range in width from 10cm to 40cm.

						--	--	---	---	--	--	0
2.57	17.10	14.53	SLT	FG	Highly siliceous, light to dark grey and light green sheared siltstone with dark orange oxidation staining on joints and fractures. Localized clay alteration is also found on joints and as infill in sheared zones. Pervasive hairline calcite or quartz infill hosts weak pyrite. **0.6cm veinlet at 17.00m hosts blebby sphalerite, galena and pyrite with a softer, dark green alteration (possibly argillic and chlorite combination?).**

17.10	48.20	31.10	SLT	FG	Highly siliceous, foliated and fractured siltstone with pervasive calcite infill. Foliations are convoluted or undulating with no consistent orientations. Calcareous fractures host minor pyrrhotite and few are weakly argillic altered.							
						--	GY	FO	SIL	4I		
								SH				
								FR	ARG	1I		
48.20	54.00	5.80	SLT	FG	Dark grey, sheared siltstone with pervasive hairline fractures and intermittent limey regions. Few fractures have a calcareous infill and host minor pyrrhotite. **48.31m to 48.41m hosts a semi-massive, pyrrhotite replacement bleb lined with calcite.** Overall, mineralization is almost non-existent.							
						DK	GY	SH	SIL	4I	Po	1
								FO				

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
54.00	75.28	21.28	SLT	FG	Sheared and foliated, light to dark grey siliceous siltstone with few intermittent limey or bleached regions. Limey regions are usually sheared and have an abundance of calcite infill hosting trace sulphides - pyrrhotite, pyrite, chalcopyrite, sphalerite and seldom galena. Fractures have no consistent orientation and are planar or undulating and often discontinuous. Bleached and limey regions range from 10cm to 40 cm in width. Few dark grey, extremely siliceous, almost cherty regions host trace disseminated pyrrhotite.

METALLURGICAL TESTS – MELIS ENGINEERING LTD.

MELIS ENGINEERING LTD.

May 28, 2012 **Melis Project No. 547**

Silver Range Resources Ltd.
1016 510 West Hastings Street
VANCOUVER BC V6B 1L8

Attention: Bruce A. Youngman, Chairman

Dear Bruce:

Re: Silver Range Resources Ltd. - Keg Main Zone Ag/Zn/Pb/Cu Project
Metallurgical Testwork - Melis Status Report No. 1 for the Period to May 28, 2012

SUMMARY

Melis Engineering Ltd. (Melis) was asked by Silver Range Resources Ltd. (Silver Range) to overview and direct a flotation testwork program on their Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon. The testwork, being completed at SGS Canada Inc. Lakefield Research (SGS-Lakefield) in Lakefield Ontario, encompasses preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No.1, collates the preparation and analyses of test composites and the results of the initial flotation tests completed to date.

Six variability composites were prepared for testing at SGS Canada Inc.'s Vancouver laboratory under the direction of Archer, Cathro & Associates (1981) Limited (composite details are attached in Appendix A). In turn, a portion of each of the six variability composites, Composites A to F, were used to prepare an overall master composite for use in initial testwork.

E	23.1	0.185	0.141	1.344	24.07	287.7
F	31.3	0.174	0.296	1.024	9.41	356.0
Master	43.5	0.27	0.32	1.33	0.00127	0.0472

Comparison of head grades showed good agreement between the average test metallurgical calculated head grade to date, the drill core calculated head grade and the assay head grade except for indium, repeat indium analysis of the test composites with a lower detection limit has been requested.

Available grinding tests on two of the six test composites indicate that the Keg Main Zone mineralization is of medium hardness.

The master composite was submitted to a gravity recoverable test under the standard conditions used for a GRG (Gravity Recoverable Gold) test. A GRG value of 25% for silver was obtained which implies that approximately 15% of the silver may be recoverable by gravity under plant operating conditions. The GRG value for tin was lower at 5.1% which implies that only about 3% of the tin can be recovered by gravity under plant operating conditions.

Based on four preliminary rougher flotation tests completed to date, target rougher recoveries to a bulk copper/lead rougher concentrate would be approaching 90% for copper, lead and silver with a mass pull of about 3%. Actual recoveries, and achievable concentrate grades, under conditions approaching steady state, which will be less than the bulk rougher recoveries, will be determined in batch cleaner tests and lock cycle tests.

The target zinc rougher recovery to a bulk zinc rougher concentrate would be 75% with a mass pull of about 7%, potentially increasing to over 80% with increased addition of copper sulphate. Again, actual recoveries, and achievable concentrate grades, under conditions approaching steady state will need to be determined in batch cleaner tests and lock cycle tests.

Separate tin recovery by flotation may prove difficult and would require more extensive flotation testing.

Approximately 70% of the indium reports to the final rougher float tails with less than 10% reporting to the copper/lead rougher concentrate and the remainder, approximately 20%, reporting to the zinc rougher concentrate. Payable values will depend on the indium grade in the final copper, lead and zinc concentrates which will need to be determined in batch cleaner tests and lock cycle tests.

The following testwork is currently being, or will be, carried out:

- Repeat indium analysis of the test composites.

- QEMSCAN mineralogical examination of master composite.
- Completion of Ball Mill Bond Work Indices.
- Tin gravity recovery test using a centrifugal concentrator and/or a Wilfley table with upgrading of the gravity concentrate using a Mozley table.
- Cleaner flotation tests on the master composite to quantify achievable concentrate grades and distribution of metal values in recycle products.
- Lock cycle test on the master composite to determine recoveries and concentrate grades under conditions approaching steady state.
- Cleaner flotation tests and lock cycle tests on the six variability composites, Composites A to F.
- Detailed elemental analysis of final concentrate products.
- Tailings physical and chemical characterization.

INTRODUCTION

Melis Engineering Ltd. (Melis) was requested by Silver Range Resources Ltd. (Silver Range) to overview and direct a flotation testwork program on their Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon.

The testwork, being completed at SGS Canada Inc. Lakefield Research (SGS-Lakefield) in Lakefield Ontario, encompasses preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No.1, collates the preparation and analyses of test composites using drill core samples provided by Silver Range and the results of initial comminution and rougher flotation tests completed to date.

COMPOSITE PREPARATION AND ANALYSIS

A set of diamond drill hole (DDH) coarse assay reject samples, collected from 11 drill holes over a strike length of 600 m, were collected and sent to SGS Canada Inc.'s Vancouver laboratory to prepare test composites for metallurgical testwork. Sample collection and composite preparation instructions were prepared by Archer, Cathro & Associates (1981) Limited. The composite preparation procedure and drill hole information are attached in Appendix A.

A total of six variability composites of approximately 100 kg each were prepared to represent distinct zones of the known mineralization, designated as Composites A, B, C, D, E, and F. The drill core calculated grades for these six composites are summarized in Table 1 below.

Table 1

	KEG-11-39							

For the initial testwork a portion of each variability composite was taken and mixed, on a weighted basis, to prepare an overall master composite.

Samples of each prepared composite were submitted to detailed head analyses. Key elemental analyses are summarized in Table 2 and detailed analyses are listed in Table 3.

A comparison of the expected drill core calculated head grades in Table 1 against the assay head grades of the test composites listed in Table 2 shows good agreement for copper, lead and zinc, reasonable agreement for tin and, except for Composite A, good agreement for silver.

The metallics silver assay on Composite A carried out at 150 mesh (81.7 g Ag/t versus the assay head grade of 89.1 g Ag/t and the drill core calculated grade of 73.7 g Ag/t) suggests the presence of “coarse silver” but only 0.1% of the silver was in the plus 150 mesh fraction.

Indium assays with a lower detection limit will be requested for the test composites as the assay grade was only reported as <0.02% In.

A further comparison of the master composite analyses is possible using the metallurgical calculated head grades for the tests completed to date as listed in Table 4 below.

Table 4
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Comparison of Head Grades for the Master Composite

Measurement	Ag, g/t	Cu, %	Pb, %	Zn, %	In, %	Sn, %
Drill Core Calculated Head Grade	43.5	0.27	0.32	1.33	0.00127	0.0472
Assay Head Grade	41.6	0.27	0.31	1.36	<0.002	0.040
Flotation Test Calculated Head Grade						
Test F1	48.8	0.30	0.37	1.35	0.0026	0.042
Test F2	44.2	0.26	0.33	1.36	0.0026	0.041
Test F3	43.9	0.27	0.21	1.37	0.0036	0.042
Test F4	44.3	0.25	0.32	1.34	0.0028	0.041
Test Average to Date	45.3	0.27	0.33	1.36	0.0029	0.042

As can be seen from the above comparison there is good agreement between the average test metallurgical calculated head grade to date, the drill core calculated head grade and the assay head grade except for indium, repeat indium analysis of the test composites with a lower detection limit will be requested.

COMMINUTION TEST DATA

Each composite is to be submitted to a Bond Ball Mill Work Index test to identify the grinding characteristics of the Keg Main Zone mineralization. The two results available to date, listed in Table 5 below, suggest that the Keg Main Zone mineralization is of medium hardness.

Table 5
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Test Composites-Ball Mill Bond Work Index (BWI) Measurements (kWh/t - Metric)

Measurement	Master Comp	Comp A	Comp B	Comp C	Comp D	Comp E	Comp F
BWI (kWh/tonne)	n/a	16.1	n/a	16.1	n/a	n/a	n/a

GRAVITY RECOVERABLE TEST ON MASTER COMPOSITE

The master composite was submitted to a gravity recoverable test under the standard conditions used for a GRG (Gravity Recoverable Gold) test. This test is a standard test used to determine the amount of gold (or silver and tin for the Keg Main Zone case) that can be recovered by gravity.

A GRG value of 25% for silver was obtained which implies that approximately 15% of the silver may be recoverable by gravity under plant operating conditions.

The GRG value for tin was lower at 5.1% which implies that only about 3% of the tin can be recovered by gravity under plant operating conditions.

ROUGHER FLOTATION TESTS ON MASTER COMPOSITE

A series of four rougher kinetics tests, Test Nos. F1 to F4, were initially completed on the master composite to provide some indication of the floatability of the Keg Main Zone mineralization. Three tests were completed to evaluate the primary mesh-of-grind and one test completed to check on the elimination of zinc sulphate as a zinc depressant. Test conditions are summarized in Table 6 below. The copper/lead float was completed at pH 9.5 and the zinc float carried out at pH 11.5. Three rougher stages were used for both.

Table 6
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Summary of Rougher Kinetic Test Conditions

Test No.	Grind P_{80} µm	3418A, g/t	$CuSO_4$, g/t	$ZnSO_4$, g/t	A5100, g/t	$Ca(OH)_2$, g/t

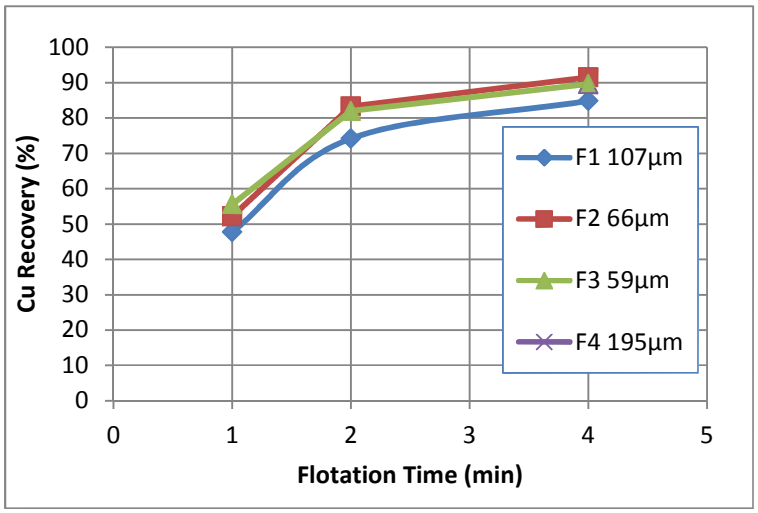

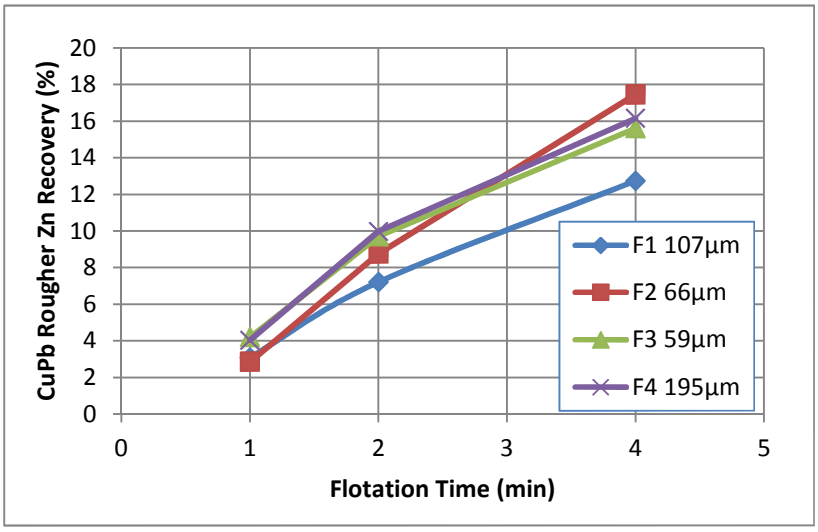

Figure 4
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork -Rougher Kinetic Tests
Zinc Distribution to Copper/Lead Rougher Concentrate versus Flotation Time
(from SGS Lakefield)

An evaluation of the rougher kinetic test results yielded the following observations:

- Eliminating the zinc sulphate in the copper/lead float led to a higher zinc recovery in the zinc rougher concentrate (73.2% in Test F3 vs. 66.7% in Test F2).
- The use of zinc sulphate in the copper/lead float yielded the lowest zinc recovery in the zinc rougher concentrate (59.1% in Test F1).
- Higher dosages of copper sulphate will need to be tested to see if this can lead to increased zinc rougher recovery.
- Coarsening the primary grind from a P_{80} of 59 microns (Test F3) to a P_{80} of 195 microns (Test F4) caused a 6% drop in zinc recovery to the zinc rougher concentrate.
- Increasing the zinc rougher float time to eight minutes could possibly provide a slight increase in zinc rougher recovery.
- Rougher lead recovery with a four minute float time yielded good rougher recoveries (the lower rougher recovery for Test F3, 88.8% was due to the lower calculated head grade for this test).
- Lead liberation was good in all tests, even at the coarser grind P_{80} of 195 microns (Test F4) which yielded an acceptable rougher recovery of 91.5%, albeit with a slight increase in the copper/lead rougher flotation tail (zinc rougher feed) to 0.030% Pb.
- Increasing the dosage of Aerophine 3418A did not increase lead rougher recovery (Test F2 vs. Test F1).
- Rougher copper recovery would increase with a longer copper/lead rougher float time (see Figure 3).
- Coarsening the primary grind from a P_{80} of 59 microns (Test F3) to a P_{80} of 195 microns (Test F4) caused a 4% drop in copper rougher recovery..
- Increasing the dosage of Aerophine 3418A increased copper rougher recovery by about 7% (Test F2 vs. Test F1).
- The majority of the silver reports to the copper/lead rougher concentrate with good silver rougher recoveries achieved in all tests.
- Increasing the dosage of Aerophine 3418A increased silver rougher recovery by only 3% (Test F2 vs. Test F1).
- Coarsening the primary grind from a P_{80} of 59 microns (Test F3) to a P_{80} of 195 microns (Test F4) caused a 3% drop in silver rougher recovery.

- Less than 10% of the indium reports to the copper/lead rougher concentrate. Of the 90% of the indium reporting to zinc flotation only about 20% reports to the zinc rougher concentrate.
- Any recoverable tin, approximately 45% to 50%, floats with the copper and lead with the remainder reporting to the zinc float tails. Very little (< 4%) reports to the zinc rougher concentrate. More extensive flotation tests would be required to investigate tin flotation in more detail.

Based on these four preliminary rougher flotation tests target rougher recoveries to a bulk copper/lead rougher concentrate would be approaching 90% for copper, lead and silver with a mass pull of about 3%. Actual recoveries under conditions approaching steady state, which will be less than the bulk rougher recoveries, will need to be determined in batch cleaner tests and lock cycle tests.

The target zinc rougher recovery to a bulk zinc rougher concentrate would be 75% with a mass pull of about 7%, potentially increasing to over 80% with increased addition of copper sulphate. Again, actual recoveries under conditions approaching steady state will need to be determined in batch cleaner tests and lock cycle tests.

Separate tin recovery by flotation may prove difficult and would require more extensive flotation testing.

Approximately 70% of the indium reports to the final float tails with less than 10% reporting to the copper/lead rougher concentrate and the remainder, approximately 20%, reporting to the zinc rougher concentrate. Payable values will depend on the indium grade in the final copper, lead and zinc concentrates which will need to be determined in batch cleaner tests and lock cycle tests.

ON-GOING TESTWORK

The following testwork is currently being, or will be, carried out:

- Repeat indium analysis of the test composites.
- QEMSCAN mineralogical examination of master composite.
- Completion of Ball Mill Bond Work Indices.
- Tin gravity recovery test using a centrifugal concentrator and/or a Wilfley table with upgrading of the gravity concentrate using a Mozley table.

- Cleaner flotation tests on the master composite to quantify achievable concentrate grades and distribution of metal values in recycle products.
- Lock cycle test on the master composite to determine recoveries and concentrate grades under conditions approaching steady state.
- Cleaner flotation tests and lock cycle tests on the six variability composites, Composites A to F.
- Detailed elemental analysis of final concentrate products.
- Tailings physical and chemical characterization including:
    - Specific gravity and particle size distribution.
    - Acid Base Accounting (ABA) and Net Acid Generation Potential (NAG).
    - Detailed ICP-OES/MS analysis of tailings solids and liquid.
    - Tailings aging tests with analysis of tailings supernatant at 3, 7, 14, 28 and 56 days.
    - Toxicity LC50 testing (rainbow trout and daphnia magna).
    - Tailings settling tests and rheology measurements.

Yours truly;
MELIS ENGINEERING LTD.

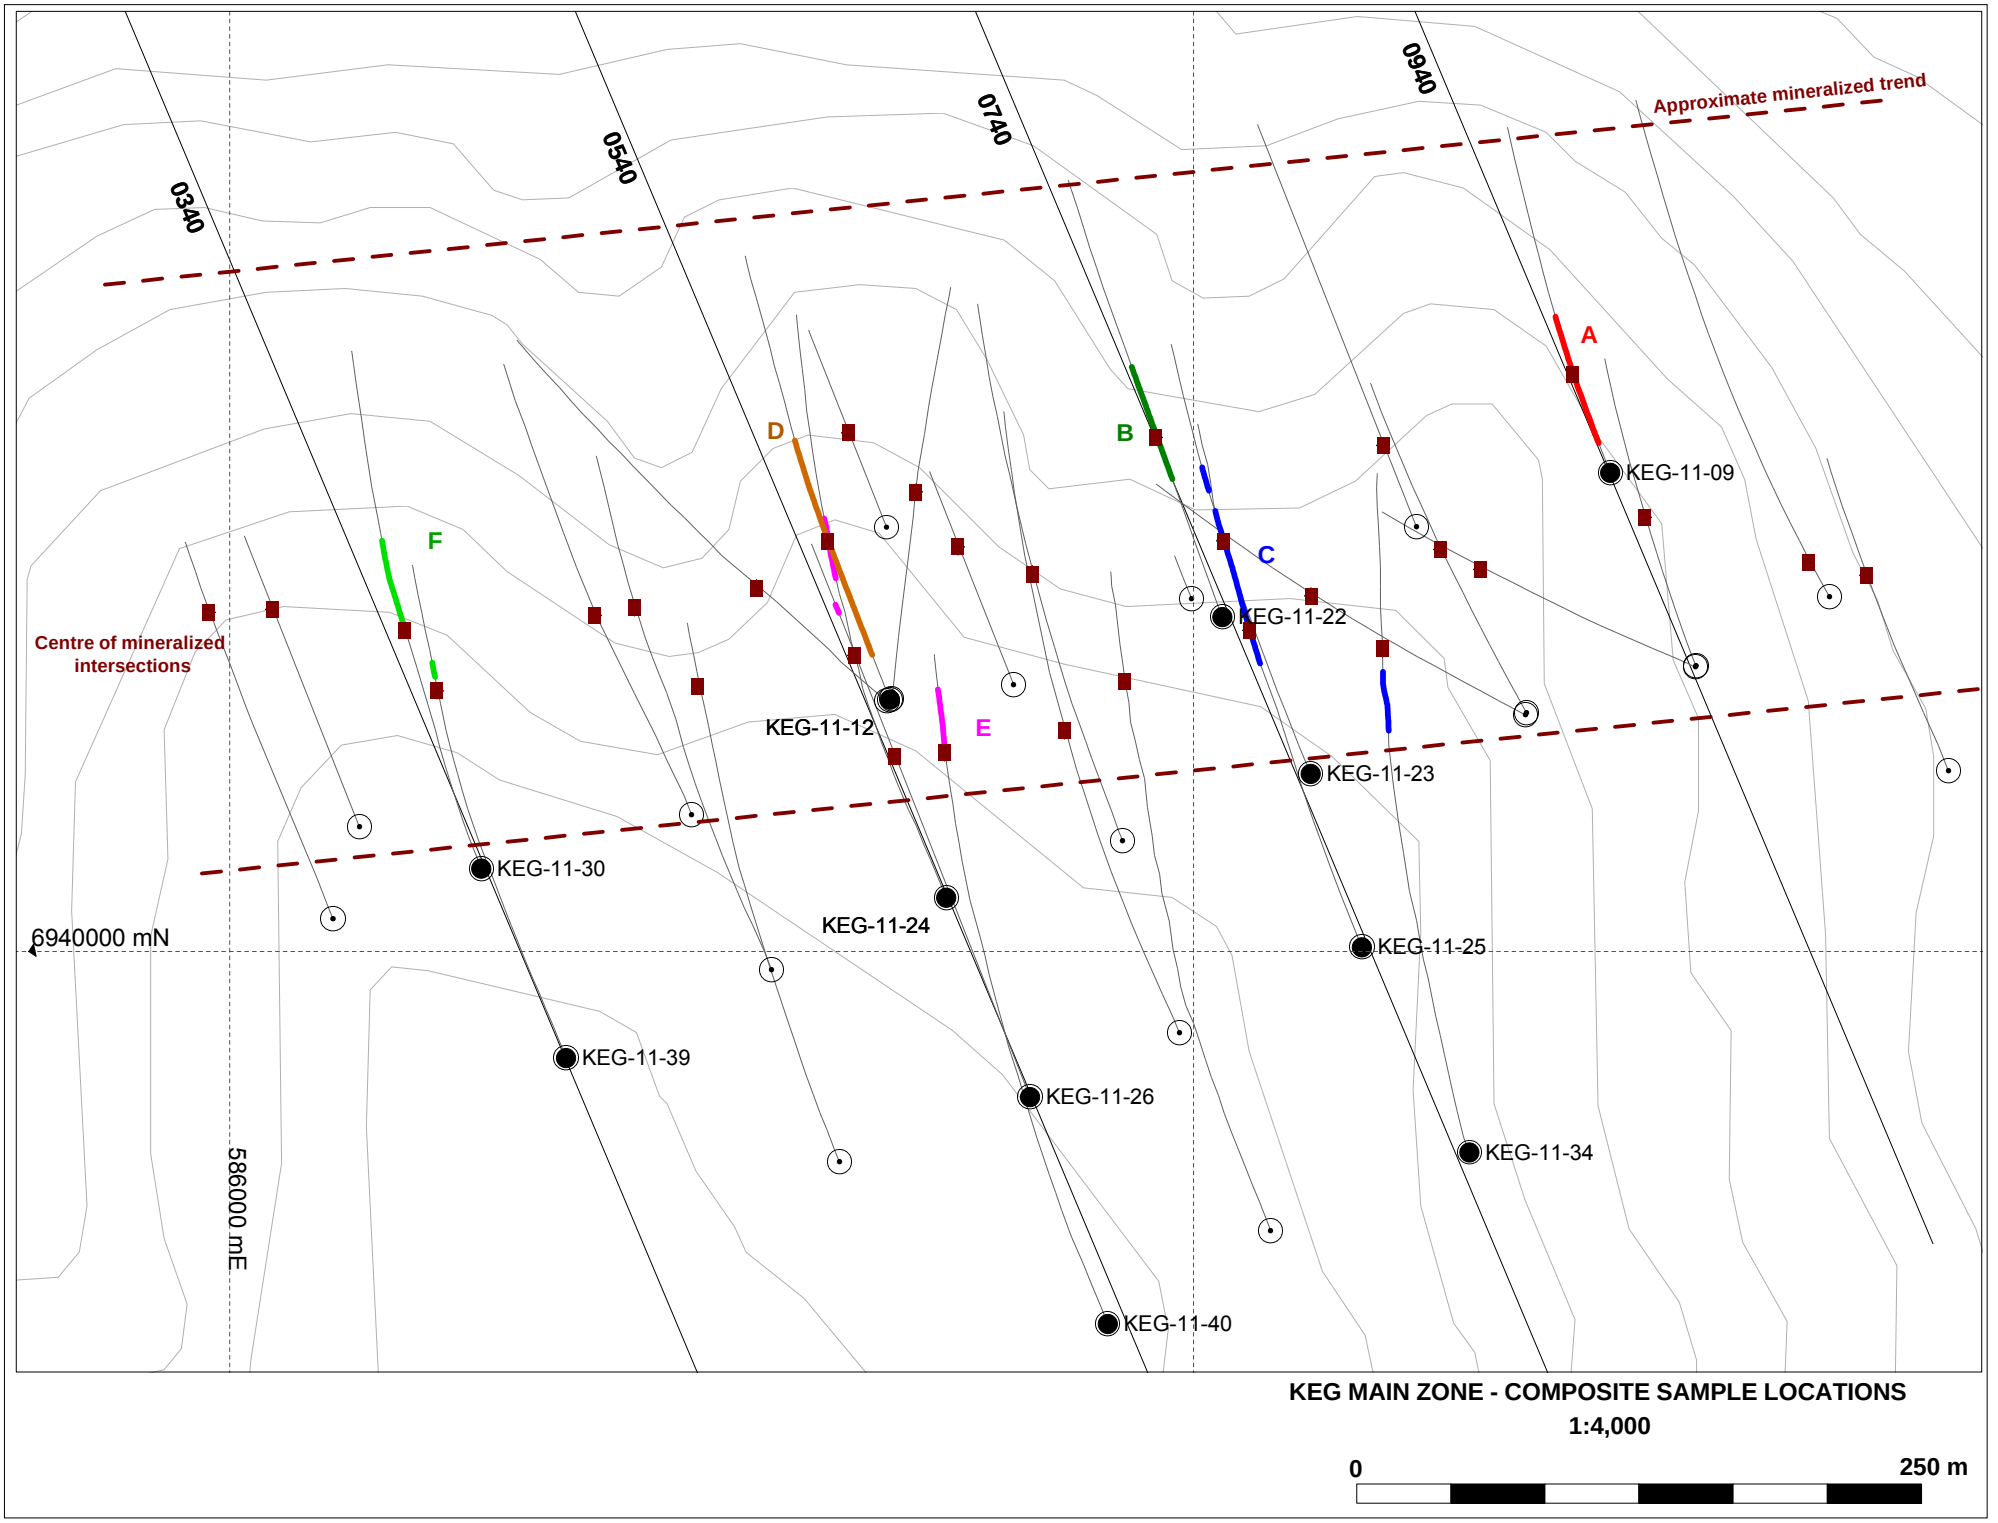
Re: Silver Range Resources Ltd. – Keg Main Zone Metallurgical Test Program Composite Preparation (Proposal #13589-PR1) - REVISED

A total of six composites have been selected from Silver Range Resources' Keg project for metallurgical testing. This metallurgical test program will follow the procedures outlined in the proposal submitted by SGS (#13589-PR1) and will be overseen by Melis Engineering Ltd. The sample composites chosen for this program each represent distinct portions of the known mineralization and were collected from eleven drill holes over a strike length of 600 m. The following table summarizes the six composites and their estimated grades. A plan map illustrating the locations of each drill hole is attached.

Composite	Hole	Section	Ag (g/t)	Cu (%)	Pb (%)	Zn (%)	In (ppm)	Sn (ppm)
A	KEG-11-09	940E	73.68	0.181	0.558	0.631	1.856	808.4
B	KEG-11-22	740E	56.03	0.622	0.325	2.436	17.539	896.5
C	KEG-11-23 KEG-11-25 KEG-11-34	740E	42.28	0.326	0.326	1.661	14.368	316.4
D	KEG-11-12	540E	34.36	0.107	0.260	0.884	9.046	169.9
E	KEG-11-24 KEG-11-26 KEG-11-40	540E	23.14	0.185	0.141	1.344	24.067	287.7
F	KEG-11-30 KEG-11-39	340E	31.29	0.174	0.296	1.024	9.409	356.0



The composite samples shall be prepared by SGS at their Vancouver facilities. Each composite sample will weigh 105 kg, with the exception of composite F which totals 100 kg, and be prepared from coarse reject material on a weighted basis according to intersection width. The weight of each coarse reject sample to be used in the composites is listed in the attached appendix. The appropriate amount of coarse reject material shall be weighed out prior to being combined into its respective composite sample and blended. The unused portion of each coarse reject will be left in the original packaging and either forwarded to CDN Resource Laboratories Ltd. or discarded.

All coarse rejects from composites B, D, E and F shall be forward to CDN (#2, 20148 – 102 Avenue, Langley, BC, V1M 4B4). If any of the original packaging is damaged and will not survive further handling, it shall be placed in a suitable container that will allow for safe transport. Coarse rejects from composites A and C should be discarded when no longer needed.

Once blended, each composite shall be crushed to minus 6 mesh and a 10 kg split of each composite shall then be taken to complete a ball mill Bond Work Index test. The remaining composites will then be crushed to minus 10 mesh and forwarded to SGS Lakefield to complete the metallurgical test program as outlined by Melis. All composites shall be stored in a freezer to minimize oxidation.

Please contact me if you have any questions or require further clarification.

Yours truly,
Matthew Dumala, P.Eng.

APPENDIX B

SILVER RANGE KEG MAIN ZONE METALLURGICAL TESTWORK

SGS-LAKEFIELD TEST DATA SHEETS

Test No.:	F1		**Project No.**: 13589-001		**Operator**: CC		**Date**: April 30th 2012
Purpose:	Rougher kinetics test - effect of primary grind						
Procedure:	As outlined below.						
			50244-001				
Feed:	2 kg of minus 10 mesh		Overall Comp	(location in a drum on a skid in the freezer)			
Primary Grind:	30	minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1).				P80 =	107 µm

Conditions:

	Reagents added, grams per tonne							Time, minutes				
Stage	$Ca(OH)_2$	NaCN	$ZnSO_4$	3418A	$CuSO_4$	5100	MIBC	Grind	Cond.	Froth	pH	Ep (mV)
Grind (BM#1)	200	-	60	5	-	-	-	30			8.0	+60
CuPb Rougher												
CuPb Rougher 1	230	-	-	-	-	-	10		1	1	9.5	+80

Zn Rougher 2	-	-	-	-	-	5	5		1	2	11.3	+20
Zn Rougher 3	-	-	-	-	-	5	5		1	2	11.2	+50
Total	2045	0	60	10	150	15	40					

* as required

Stage	Rougher
Flotation Cell # 8	1000g-D1
Speed: rpm	1800

Observation: Pb seems very slow maybe the grind is too coarse.

Test No.: F3 **Project No.**: 13589-001 **Operator**: CC **Date**: May 3rd 2012

Purpose: Rougher kinetics test - as F2 no ZnSO4, increase collector in Zn circuit

Procedure: As outlined below.

Feed: 2 kg of minus 10 mesh 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 45 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 59 µm

Conditions:

Attention: Bruce A. Youngman, Chairman

Dear Bruce:

Re: Silver Range Resources Ltd. - Keg Main Zone Ag/Zn/Pb/Cu Project Metallurgy
Melis Status Report No. 2 for the Period May 29, 2012 to July 9, 2012

SUMMARY

Melis Engineering Ltd. (Melis) is overseeing a flotation testwork program on Silver Range Resources Ltd. (Silver Range)'s Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon. The testwork, being completed at SGS Canada Inc. Lakefield Research (SGS Lakefield) in Lakefield Ontario, encompasses preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No.2, a follow-up to the May 28, 2012 Melis Status Report No. 1, provides results of the remaining comminution tests and additional flotation tests completed to date.

Additional flotation tests were completed to test varying flotation conditions, incorporating cleaner flotation of the copper/lead rougher concentrate, copper/lead separation testing and zinc cleaner flotation and to attempt tin flotation from zinc tails.

Requested indium re-assays with lower detection limits showed good agreement between the drill core calculated indium grade and the assay head grade.

Additional grinding test results confirmed that the Keg Zone mineralization is of medium hardness.

Results of the previously reported Test F3 have been corrected for lead assays and distribution, putting lead rougher recovery in line with the other three initial rougher flotation tests.

Based on the flotation tests completed to date target rougher recoveries to a bulk copper/lead rougher concentrate remain at close to 90% for copper, lead and silver. Subsequent copper/lead separation should yield high lead recovery to a separate lead concentrate but further testing will be required in an attempt to direct more copper to the copper concentrate. Actual net recoveries to copper and lead cleaner concentrates under conditions approaching steady state, which by nature will be less than the bulk rougher recoveries, will need to be determined in lock cycle tests.

The target zinc rougher recovery to a bulk zinc rougher concentrate is in the range of 80% to 90%. Again, actual net recoveries to a zinc cleaner concentrate under conditions approaching steady state will need to be determined in lock cycle tests.

Separate tin recovery by flotation of zinc rougher tails was unsuccessful.

Further testing on larger quantities of material will be required to provide a better mass balance for indium and silver as some of the test product quantities were insufficient to complete all the required analyses. Preliminary numbers suggest that about 40% to 75% of the indium could report to a zinc concentrate assaying close to 50% Zn and about 400 g In/t. A small amount of the indium, less than 10%, would report to the copper and lead concentrates. About 80% to 85% of the silver would be expected to report to the copper and lead concentrates, with possibly 5% to 10% expected to report to the zinc concentrate. Payable values will depend on the indium and silver grades in the final copper, lead and zinc concentrates which will need to be better quantified in lock cycle tests.

The following testwork is currently being, or will be, carried out:

- Repeat indium analysis of the test composites.
- QEMSCAN mineralogical examination of master composite.
- Lock cycle test on the master composite to determine recoveries and concentrate grades under conditions approaching steady state. One or two additional optimization tests need to be completed first to establish optimum flotation conditions for copper, lead and zinc recovery.
- Cleaner flotation tests and lock cycle tests on the six variability composites, Composites A to F.
- Detailed elemental analysis of final concentrate products.
- Tailings physical and chemical characterization.

Appendix A: SGS Lakefield Test Data Sheets

INTRODUCTION

Melis Engineering Ltd. (Melis) is overseeing a flotation testwork program on Silver Range Resources Ltd. (Silver Range)'s Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon.

The testwork, being completed at SGS Canada Inc. Lakefield Research (SGS Lakefield) in Lakefield Ontario, encompasses preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No.2, a follow-up to the May 28, 2012 Melis Status Report No. 1, provides results of additional flotation tests completed to date.

COMPOSITE INDIUM RE-ASSAYS

As noted in Melis Status Report No. 1, indium re-assays with lower detection limits were requested for the test composites. The re-assays are compared to the drill core calculated grades in Table 1 below. There is good agreement between the drill core calculated indium grade and the assay head grade.

Table 1
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Test Composites – Indium Re-Assays

Composite	In, g/t	
	Drill Core Calculated	Assay Head Grade

A	1.9	1.7
B	17.5	15.6
C	14.4	13.1
D	9.1	8.8
E	24.1	19.5
F	9.4	9.1

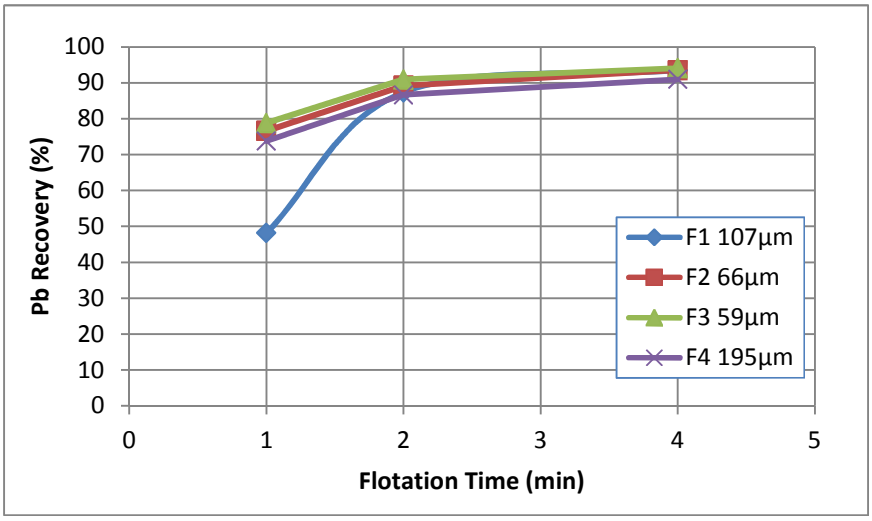
COMMINUTION TEST DATA

Each composite was submitted to a Bond Ball Mill Work Index test to identify the grinding characteristics of the Keg Main Zone mineralization. Results are summarized in Table 2 below. Except for Composite D which was slightly harder, all composites suggest that the Keg Main Zone mineralization is of medium hardness.

Table 2
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Test Composites-Ball Mill Bond Work Index (BWI) Measurements (kWh/t - Metric)

Measurement	Master Comp	Comp A	Comp B	Comp C	Comp D	Comp E	Comp F
BWI (kWh/tonne)	n/a	16.1	16.5	16.1	17.5	16.0	15.9

CORRECTION TO TEST F3 RESULTS



In the previously reported results for Test F3 (Melis Status Report No. 1), the lead calculated head was noted as being much lower than the lead assay head. This was attributed to incomplete dissolution of the lead in the AA method of analysis, hence all lead assays have been switched to the XRF method of analysis. Test results for Test F3 are updated in Table 3 below.

Table 3

The previously reported graph (Melis Status Report No. 1) depicting lead recovery against rougher flotation time also requires updating as follows:

Figure 1
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork -Rougher Kinetic Tests
Lead Recovery versus Flotation Time – Revised Graph with Updated Test F3 Results
(from SGS Lakefield)

As can be seen from the above graph the results of Test F3 are in line with the other three rougher flotation tests, with high lead rougher recovery being achieved with a four minute float time.

CLEANER FLOTATION TESTS ON MASTER COMPOSITE

Tests F5 to F7

Three flotation tests, Tests F5 to F7, were completed to test varying flotation conditions and incorporating cleaner flotation of the copper/lead rougher concentrate.

Results are summarized in Table 4 below and SGS Lakefield test data sheets are enclosed in Appendix A. Indium results are not listed as they were based on a per cent analysis (note: tests subsequent to Test F8 were analyzed on a g In/t basis with a lower detection limit).

Test F5 was carried out under the previous Test F3 (see Melis Status Report No. 1) but with increased copper sulphate addition in zinc rougher flotation (250 g/t instead of 150 g/t). Zinc rougher recovery increased from 73.2% to 84.1%, although the higher zinc recovery in Test F5 was partially due to the higher calculated head grade for this test (1.49% Zn versus 1.37% Zn). Lead/copper/silver recoveries to the CuPb rougher concentrate were high, 93.4% for lead, 87.1% for copper and 86.3% for silver, similar to those if Test F3, and just under half (42.8%) of the tin floated to the rougher concentrate. Three stages of cleaning increased the grade of the CuPb concentrate to 20.0% Pb, 20.9% Cu and 2,885 g Ag/t.

Test F6 was similar to Test F5 but with a coarser primary grind (~100 µm versus 62 µm), 10 g/t Aerophine 3418A collector addition to the CuPb rougher float instead of 15 g/t, and 50 g/t $ZnSO_4$ addition to the CuPb cleaner float. The (slightly) coarser primary grind and slightly lower collector addition did not affect lead/copper/silver recoveries to the CuPb rougher concentrate, or zinc recovery to the zinc rougher concentrate as they were similar to those of Test F5. Three stages of cleaning yielded a grade in the CuPb concentrate grade of 23.0% Pb, 18.9% Cu and 2,787 g Ag/t.

Test F7 evaluated the use of SIPX (sodium isopropyl xanthate) and Aero 208 collectors in place of Aerophine 3418A and Aero 5100. Again bulk recoveries to the CuPb rougher concentrate were similar for copper and lead but slightly lower for silver (80% versus 86%). Zinc rougher recovery was also similar. Grades in the CuPb cleaner concentrate were similar for lead and silver and slightly lower for copper.

Test F8

Test F8 was completed to test a longer float time in CuPb rougher flotation and to test pyrite removal and desliming ahead of tin flotation on zinc rougher tails using Aero 845 collector at low pH. Test results are summarized in Table 5, the test data sheet is enclosed in Appendix A.

The longer float time in CuPb rougher flotation did not significantly increase lead, copper or silver recovery. Attempts at floating tin from zinc rougher tails were unsuccessful as seen by the results in Table 5 above.

Test F9A

Test F9A was similar to Test F8 with the addition of copper/lead separation of the CuPb cleaner concentrate and the addition of Flotinor 1682 in tin flotation without removal of pyrite or desliming ahead of tin flotation. Results are summarized in Table 6 below and the test data sheet is enclosed in Appendix A. Indium assays are included as they were completed on a g/t basis (note four of the assays had to be estimated because of insufficient amounts of some test products, hence the indium mass balance may be suspect). Silver is not included in these results as six of the high grade products had insufficient material for assay.

Sn Rougher Tails	79.9	0.039	0.025	0.014	0.024	0.50	2.2	6.4	4.2	44.5	40.0

The use of Flotinor 1682 for tin flotation did not improve tin recovery from zinc rougher tails. Copper/lead separation was successful in separating the lead from the copper but a disproportionate amount (42.6%) of copper ended up in the lead rougher concentrate. In this test a total of 43.3 % of the indium reported to the zinc rougher concentrate.

Test F9B

Test F9B was similar to Test F9A but without tin flotation and the addition of zinc cleaner flotation.

As per Test F9A, an indium balance is included (with estimated assays of some test products, so the mass balance may not be exact) but a silver balance is not included. Results are summarized in Table 7 below and the test data sheet is enclosed in Appendix A.

Table 7

Zn Rougher Tails	91.1	0.051	0.020	0.020	0.024	0.80	3.5	5.7	6.9	53.1	6.1

Test F9B results were similar to Test F9A with good lead recovery to the lead rougher concentrate but accompanied with a disproportionate amount of copper (42.5%). In this test a high indium recovery was obtained in the zinc rougher concentrate, which was retained in the zinc cleaners with 73.2% of the indium reporting to the third zinc cleaner concentrate which assayed 47.6% Zn and 399 g In/t.

Test F10

Test F10 was a repeat of Test F9B but adding a small amount (25 g/t) of sodium cyanide in the CuPb concentrate regrind ahead of copper/lead separation and less collector in the zinc cleaner float. Results are summarized in Table 8 below and the test data sheet is enclosed in Appendix A. Silver and indium assays are pending.

Zn Rougher Tails	89.6	0.036	0.018	0.018	0.024		2.4	5.0	6.1	55.7	

Test F10, with cyanide added in the regrind, resulted in better rejection of zinc and pyrite from the CuPb concentrate, improving lead recovery to the lead concentrate and increasing copper recovery to the copper concentrate. A lead cleaner on the lead rougher concentrate would transfer some of the copper in the lead rougher concentrate to the copper concentrate. Zinc recovery to the zinc third cleaner concentrate was high but the grade of zinc (30.7% Zn) was low, possibly due to low collector addition and a slightly coarse regrind (23 µm instead of 16 µm in Test F9B) of the feed to zinc cleaning.

An additional open cycle batch test will be done to test a finer regrind of the copper/lead separation feed (to possibly improve deportment of copper), to try a finer regrind of the zinc cleaner feed and a fourth cleaning stage (to improve the zinc grade in the final cleaner), to try a lower cyanide addition in copper/lead separation (to possibly improve the amount of copper reporting to the copper concentrate), to add slightly more collector in the zinc cleaners, and to add a cleaner stage on lead rougher concentrate.

CONCLUSIONS

Based on the completed additional flotation tests, target rougher recoveries to a bulk copper/lead rougher concentrate remain at close to 90% for copper, lead and silver. High lead recovery to a separate lead concentrate should be achievable but further testing will be required to direct more copper to the copper concentrate. Actual net recoveries under

conditions approaching steady state, which will be less than the bulk rougher recoveries, will need to be determined in lock cycle tests.

The target zinc rougher recovery to a bulk zinc rougher concentrate is in the range of 80% to 90%. Again, actual net recoveries under conditions approaching steady state will need to be determined in lock cycle tests.

Separate tin recovery by flotation of zinc rougher tails was unsuccessful.

Further testing on larger quantities of material will be required to provide a better mass balance for indium and silver as some of the test product quantities were insufficient to complete all the required analyses. Preliminary numbers suggest that about 40% to 75% of the indium could report to a zinc concentrate assaying close to 50% Zn and about 400 g In/t. A small amount of the indium, less than 10%, would report to the copper and lead concentrates. About 80% to 85% of the silver would be expected to report to the copper and lead concentrates, with possibly 5% to 10% expected to report to the zinc concentrate. Payable values will depend on the indium and silver grades in the final copper, lead and zinc concentrates which will need to be better quantified in lock cycle tests.

ON-GOING TESTWORK

The following on-going testwork is planned:

- QEMSCAN mineralogical examination of master composite.
- Lock cycle test on the master composite to determine recoveries and concentrate grades under conditions approaching steady state. One or two more batch tests will need to be done first to optimize flotation conditions for copper, lead and zinc recovery as discussed above. The lock cycle test will include:
    - Copper/lead rougher and cleaner flotation
    - Lead rougher flotation from the copper/lead concentrate with one cleaning stage to produce a separate lead concentrate and a separate copper concentrate
    - Zinc rougher and cleaner flotation to produce a separate zinc concentrate.
- Cleaner flotation tests and lock cycle tests on the six variability composites, Composites A to F.
- Detailed elemental analysis of final concentrate products.
- Tailings physical and chemical characterization including:

- Specific gravity and particle size distribution.
- Acid Base Accounting (ABA) and Net Acid Generation Potential (NAG).
- Detailed ICP-OES/MS analysis of tailings solids and liquid.
- Tailings aging tests with analysis of tailings supernatant at 3, 7, 14, 28 and 56 days.
- Toxicity LC50 testing (rainbow trout and daphnia magna).
- Tailings settling tests and rheology measurements.

Yours truly;
MELIS ENGINEERING LTD.

SGS-LAKEFIELD TEST DATA SHEETS

Test No.: F3 **Project No.**: 13589-001 **Operator**: CC **Date**: May 3rd 2012

Purpose: Rougher kinetics test - as F2 no $ZnSO_4$, increase collector in Zn circuit

Procedure: As outlined below.

Feed: 2 kg of minus 10 mesh 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 45 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 59 µm

Conditions:

Test No.:	F5	**Project No.**:	13589-001	**Operator**:	CC	**Date**:	May 15th 2012

Purpose: CuPb Cleaner with Zn Rougher Kinetics - Roughers as F3, except increase CuSO4

Procedure: As outlined below.

Feed: 2 kg of minus 10 mesh — 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 45 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 62 µm

CuPb Regrind 10 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 13 µm

Conditions:

Test No.:	F9B			**Project No.**:	13589-001			**Operator**:	CC/TM			**Date**:	June 5th, 2012						
Purpose:	As F8 + CuPb separation with NaCN, Sn flotation with 1682 and A845, no deslime, no pyrite float																		
	Zn cleaner, no Sn flotation																		
Procedure:	As outlined below.																		
				50244-001															
Feed:	2 x 2 kg of minus 10 mesl			Overall Comp		(location in a drum on a skid in the freezer)													
Primary Grind:	30	minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1).										P80 =	100	µm					
CuPb Regrind	10	minutes / 2 x CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.										P80 =	23	µm					
Zn Regrind	10	minutes / 1 x Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.										P80 =	16	µm

MELIS ENGINEERING LTD.

September 14, 2012 **Melis Project No. 547**

Silver Range Resources Ltd.
1016 510 West Hastings Street
VANCOUVER BC V6B 1L8

Attention: Bruce A. Youngman, Chairman

Dear Bruce:

Re: Silver Range Resources Ltd. - Keg Main Zone Ag/Zn/Pb/Cu Project Metallurgy
Melis Status Report No. 3 for the Period July 10, 2012 to September 14, 2012

SUMMARY

Melis Engineering Ltd. (Melis) is overseeing a flotation testwork program on Silver Range Resources Ltd. (Silver Range)'s Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon. The testwork, being completed at SGS Canada Inc. Lakefield Research (SGS Lakefield) in Lakefield Ontario, encompasses preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No.3, a follow-up to the July 9, 2012 Melis Status Report No. 2, provides results of additional flotation tests completed to date. It includes two batch tests on the Overall Composite, partial results of variability batch tests and partial results of the lock cycle test on the Overall Composite.

An additional open cycle batch test of the Overall Composite was completed to optimize flotation conditions ahead of lock cycle testing. Increasing the fineness of the copper/lead rougher concentrate regrind increased copper recovery to the copper/lead third cleaner concentrate and to the final copper concentrate with no impact on copper grade in the concentrate. Adding a single lead cleaning stage to the lead rougher increased the lead concentrate grade from to 67.9% Pb. Adding cyanide to control redox potential likely enhanced copper/lead separation. A slightly finer regrind of the zinc cleaner feed and adding a fourth cleaning stage improved the zinc grade in the final zinc cleaner to 41.0% Zn. Increasing the collector dosage in the zinc cleaning stage did not increase zinc recovery.

As expected most of the recoverable silver reported to the lead rougher concentrate and a smaller amount reported to the copper concentrate. The zinc third cleaner concentrate contained a minor amount of silver but at a low (likely non-payable) grade.

About 50% of the indium reported to the zinc concentrate and very little reported to the lead/copper concentrate.

A lock cycle test was completed on the Overall Composite. Separate copper, lead and zinc concentrates were produced to quantify recoveries and concentrate grades under conditions approaching steady state. Only zinc, lead and copper results are available at this time.

Lead recovery was 84.8% to a lead concentrate assaying 65.5% Pb. If the lead cleaner grade is lowered to, say, 55% Pb by just producing a lead rougher concentrate the lead recovery would go up but the copper grade in the lead concentrate would increase and which in turn would decrease the amount of copper reporting to the copper concentrate.

Copper recovery was 71.4% to a copper concentrate assaying 28.8% Cu.

Zinc recovery to a 47.5% Zn concentrate was 85.2%. A fifth cleaning stage will be tested in an open cycle test on a 10 kg charge to try and achieve a target zinc concentrate grade of 50% Zn, which in turn would drop the recovery somewhat.

The six variability composites, Composites A to F, were submitted to a single batch flotation test using the flotation conditions used in the lock cycle test. A graphical review of the available test data showed that there is no direct correlation between head grade and recovery and grade in concentrate for zinc and lead which implies that there are other (mineralogical) factors affecting recovery and deportment of zinc and lead to concentrate. Copper on the other hand generally shows increasing recovery and copper grade to copper concentrate with increasing head grade.

The following on-going testwork is being worked on:

- Reporting of QEMSCAN mineralogical examination of the Overall Composite (interpretation of the Qemscan data by SGS Lakefield remains to be done).
- Open cycle batch test on a 10 kg sample of the Overall Composite to test a fifth zinc cleaner and to generate sufficient material for assay of all test products (to be done).
- Lock cycle tests on the six variability composites, Composites A to F (the first three tests have been completed and there are three remaining. Results are not yet available).

- Detailed elemental analysis of final concentrate products (to be done once lock cycle tests are completed).
- Tailings physical and chemical characterization (the tailings from the lock cycle test on the Overall Composite have been submitted to the SGS Lakefield environmental department.

ON-GOING TESTWORK 19

APPENDICES

Appendix A: SGS Lakefield Test Data Sheets

INTRODUCTION

Melis Engineering Ltd. (Melis) is overseeing a flotation testwork program on Silver Range Resources Ltd. (Silver Range)'s Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon.

The testwork, being completed at SGS Canada Inc. Lakefield Research (SGS Lakefield) in Lakefield Ontario, encompasses preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No.2, a follow-up to the May 28, 2012 Melis Status Report No. 1, provides results of additional flotation tests completed to date. It includes two batch tests on the Overall Composite, partial results of variability batch tests and partial results of the lock cycle test on the Overall Composite.

CLEANER FLOTATION TESTS ON MASTER COMPOSITE

Test F10

Zinc, lead, copper and tin results of Test F10, a repeat of Test F9B but with a small amount (25 g/t) of sodium cyanide in the copper/lead concentrate regrind ahead of copper/lead separation and less collector in the zinc cleaner float, were previously reported in Melis Status Report No. 2 dated July 9, 2012. Additional silver and indium results have been received for this test and have been added to Table 1 below. The test data sheet is enclosed in Appendix A. Note that three of the test products (Pb Rougher No. 2, Pb Rougher No. 3 and Cu 3rd Cleaner Tail) had insufficient amounts for complete analysis, hence Ag, In, and Sn grades were estimated for these products to enable completion of the mass balance for this test, and for this reason the balances for these three elements are only approximate.

Zn Rougher Tails	89.6	0.036	0.018	0.018	0.024	3.3	10.0	2.4	5.0	6.1	55.7	7.4	43.1

Test F10, with cyanide added in the regrind, resulted in better rejection of zinc and pyrite from the CuPb concentrate, improving lead recovery to the lead concentrate and increasing copper recovery to the copper concentrate. A lead cleaner on the lead rougher concentrate would transfer some of the copper in the lead rougher concentrate to the copper concentrate.

Zinc recovery to the zinc third cleaner concentrate was high but the grade of zinc (30.7% Zn) was low, possibly due to low collector addition and a slightly coarse regrind (23 µm instead of 16 µm in Test F9B) of the feed to zinc cleaning.

As expected most of the recoverable silver (62%) reported to the lead rougher concentrate (containing 4,530 g Ag/t) and some (12%) reported to the copper concentrate (containing 1,201 g Ag/t). The zinc third cleaner concentrate contained 12% of the silver but at a low (likely non-payable) grade of 110 g Ag/t.

Indium distributions can only be considered approximate, however, as expected from previous tests, about 50% of the indium reported to the zinc concentrate and very little reported to the lead/copper concentrate.

Test F11

Test F11, an open cycle batch test, was done to test a finer regrind of the copper/lead separation feed (to possibly improve deportment of copper), to try a finer regrind of the zinc cleaner feed and a fourth cleaning stage (to improve the zinc grade in the final cleaner), to try a lower cyanide addition in the copper/lead cleaner float, to add slightly more collector in the zinc cleaners, and to add a cleaner stage on the lead rougher concentrate with the addition of cyanide to control the redox potential, and to add cyanide in the copper/lead separation float to control redox potential.

Available test results are summarized in Table 2 below. The test data sheet is enclosed in Appendix A. Note that some of the test products (Pb Cleaner Con, Pb Cleaner Tail, Pb Rougher Tail, Cu 3rd Cleaner Tail and Cu 2nd Cleaner Tail) had insufficient amounts for complete analysis, hence Ag and In assays were unavailable and some of the tin assays had to be estimated to provide an approximate tin material balance for the test.

Zn Rougher Tails	90.9	0.053	0.029	0.018	0.024	3.3	n/a	3.6	7.9	6.6	54.8	n/a	n/a

Increasing the fineness of the copper/lead rougher concentrate regrind from a K_{80} of 33 µm to a K_{80} of 14 µm increased copper recovery to the copper/lead third cleaner concentrate (from 68.8% to 78.0%) and to the final copper concentrate with no impact on copper grade in the concentrate. Adding a single lead cleaning stage to the lead rougher increased the lead concentrate grade from 52.5% Pb to 67.9% Pb. Adding cyanide to control redox potential likely enhanced copper/lead separation. A slightly finer regrind of the zinc cleaner feed (from a K_{80} of 23 µm to a K_{80} of 20 µm) and adding a fourth cleaning stage improved the zinc grade in the final zinc cleaner from 30.7% Zn to 41.0% Zn). Increasing the collector dosage in the zinc cleaning stage did not increase zinc recovery.

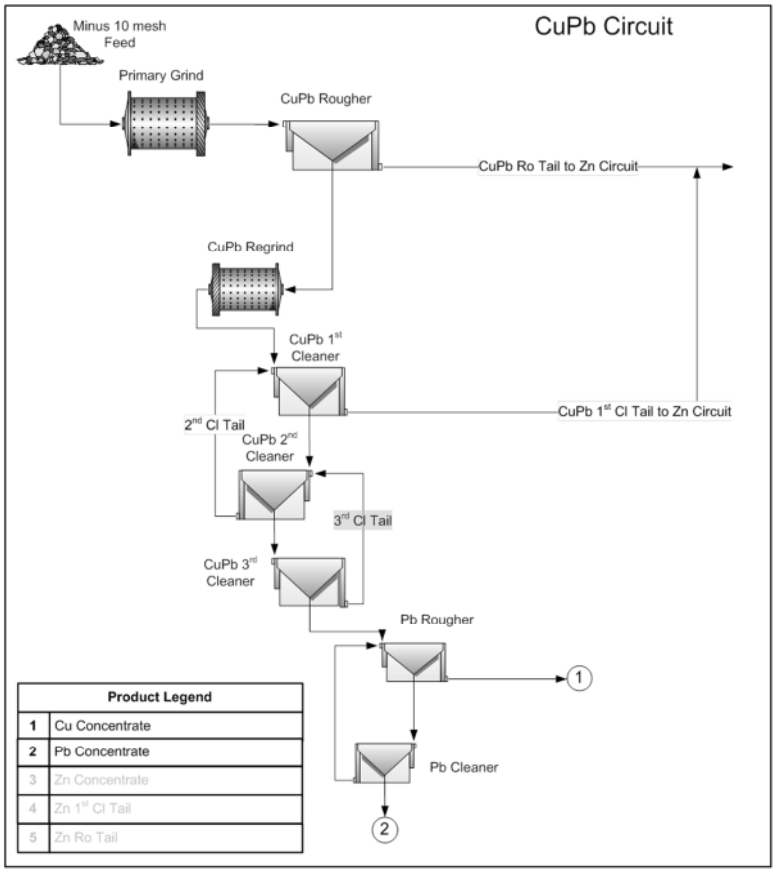
Based on the above results Test F11 conditions were used in the lock cycle test on the Overall Composite except the zinc collector (Aero 5100) dosage in the zinc cleaner was reduced back to 7.5 g/t from 12.5 g/t, the zinc rougher concentrate regrind time was increased to 25 minutes (from 20 minutes) to increase the fineness of grind to less than 20 µm and CMC (carboxy methyl cellulose) was added in the zinc first cleaner in the fourth cycle of the lock cycle test.

An additional open cycle batch test on a 10 kg test charge has been requested to provide sufficient material for tin, silver and indium assay of all test products and to test the effect of adding a fifth cleaning stage in the zinc cleaner.

LOCK CYCLE TEST ON OVERALL COMPOSITE

A lock cycle test, Test LCT1, was completed on the Overall Composite under the conditions of Test F11 with minor changes as noted above. Separate copper, lead and zinc concentrates were produced to quantify recoveries and concentrate grades under conditions approaching steady state. The copper/lead circuit and zinc circuit test flowsheets are depicted in Figures 1 and 2 below.

Figure 1
Silver Range Project – Overall Composite Lock Cycle Test (Test LCT1)
Copper/Lead Circuit
(from SGS Lakefield)



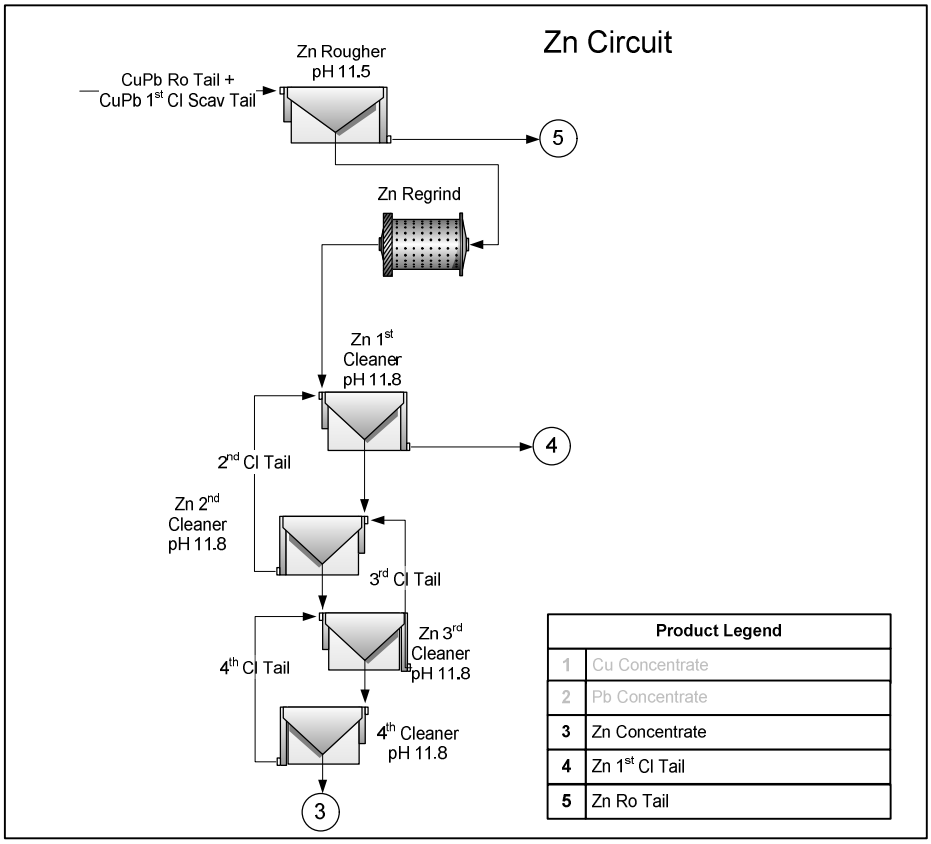


Figure 2
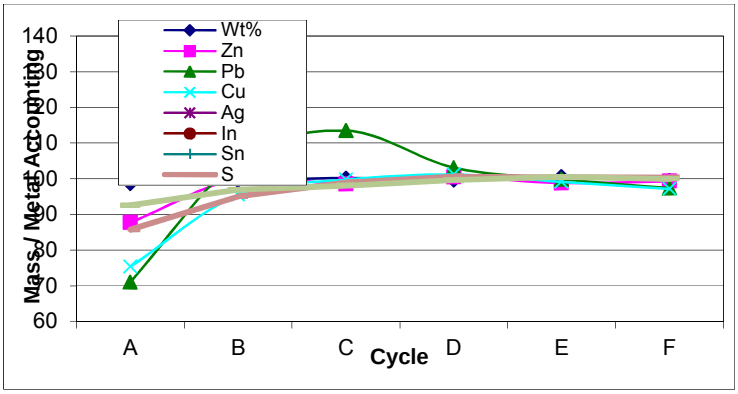
Silver Range Project – Overall Composite Lock Cycle Test (Test LCT1)
Zinc Circuit
(from SGS Lakefield)



The test data sheet and detailed zinc, lead and copper results are enclosed in Appendix A. Silver, indium and tin results are pending and will be reported on in the next status report. The metallurgical projections based on the last three cycles (Cycles D to F) are summarized in Table 3 below. As noted in Figure 3, the lock cycle test was very stable in the last three cycles.

Table 3
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Metallurgical Projections from Cycles D through F of Lock Cycle Test LCT1 Conducted on Overall Composite

Product	Weight %	Assays, % or g Ag /t or g In/t						Distribution, %

Figure 3
Silver Range Project – Overall Composite Lock Cycle Test (Test LCT1)
Test Stability Check
(from SGS Lakefield)

Lead recovery was 84.8% to a lead concentrate assaying 65.5% Pb. If the lead cleaner grade is lowered to, say, 55% Pb by just producing a lead rougher concentrate the lead recovery would go up but the copper grade in the lead concentrate would increase and which in turn would decrease the amount of copper reporting to the copper concentrate.

Copper recovery was 71.4% to a copper concentrate assaying 28.8% Cu.

Zinc recovery to a 47.5% Zn concentrate was 85.2%. As noted above a fifth cleaning stage will be tested in an open cycle test to try and achieve a target zinc concentrate grade of 50% Zn, which in turn would drop the recovery somewhat.

VARIABILITY BATCH FLOTATION TESTS

The six variability composites were submitted to a single batch flotation test using the conditions of Test F11. Results available to date are presented below. Test data sheets are enclosed in Appendix A.

Composite A

The available results of the test completed on Composite A are summarized in Table 4 below. Because of insufficient sample weight, silver assays for Pb Cleaner Tail and CuPb 3rd Cl Tail had to be estimated to complete the silver balance for the test.

Composite B

The available results of the test completed on Composite B are summarized in Table 5 below. Because of insufficient sample weight, zinc, lead and copper assays for CuPb 2nd Cl Tail and CuPb 3rd Cl Tail had to be estimated to complete the balance for these three elements.

Table 5

Comparison of Batch Test Results

A comparison of the batch test results on the six composites was completed by plotting head grade against open cycle batch test recovery (these recovery values do not include any of the recycle products, net overall recoveries will be established by running lock cycle tests which are underway) and against grade in concentrate. The data used for this comparison is summarized in Table 10 below.

Table 10
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Comparison of Batch Test Results on Variability Composites

	Head Grade, %			Zn 4th Cl Con		Pb Cl Con		Cu Con	
Comp.	Zn	Pb	Cu	% Zn	% Zn Rec.	% Pb	% Pb Rec.	% Cu	% Cu Rec.
A	0.66	0.60	0.18	37.3	76.6	72.2	74.9	24.6	55.8
B	2.40	0.35	0.62	46.3	76.4	73.1	58.3	30.3	64.9
C	1.56	0.30	0.30	35.9	91.4	69.4	76.3	28.2	70.5
D	0.91	0.25	0.11	21.8	92.1	69.6	67.5	23.8	52.2
E	1.33	0.12	0.19	43.3	87.9	66.0	60.7	26.2	56.9
F	1.12	0.28	0.20	42.0	89.0	68.7	77.0	27.7	63.9

As seen in the graphs depicted in Figures 4 to 9 below, there is no direct correlation between head grade and recovery and grade in concentrate for zinc and lead which implies that there are other (mineralogical) factors affecting recovery and deportment of zinc and lead to concentrate. Copper on the other hand generally shows increasing recovery and copper grade to copper concentrate with increasing head grade.

VARIABILITY LOCK CYCLE FLOTATION TESTS

The six variability composites are being submitted to a lock cycle test flotation test using the conditions of Test LCT1, the lock cycle test on the Overall Composite. Results will be reported when available.

ON-GOING TESTWORK

The following on-going testwork is planned:

- Reporting of QEMSCAN mineralogical examination of the Overall Composite.
- Batch test on a 10 kg sample of the Overall Composite to test a fifth zinc cleaner and to generate sufficient material for assay of all test products.
- Lock cycle tests on the six variability composites, Composites A to F.
- Detailed elemental analysis of final concentrate products.
- Tailings physical and chemical characterization including:
    - Specific gravity and particle size distribution.
    - Acid Base Accounting (ABA) and Net Acid Generation Potential (NAG).
    - Detailed ICP-OES/MS analysis of tailings solids and liquid.
    - Tailings aging tests with analysis of tailings supernatant at 3, 7, 14, 28 and 56 days.
    - Toxicity LC50 testing (rainbow trout and daphnia magna).
    - Tailings settling tests and rheology measurements.

Yours truly;
MELIS ENGINEERING LTD.

Bruce C. Fielder, P.Eng.
Principal Process Engineer

Lawrence A. Melis, P.Eng.

Test No.:	F11		**Project No.**:	13589-001		**Operator**:	CC		**Date**:	July 11th 2012											
Purpose:	As F10, less NaCN with finer regrinds																				
Procedure:	As outlined below.																				
			50244-001																		
Feed:	2 x 2 kg of minus 10 mesh Overall Comp				(location in a drum on a skid in the freezer)																
Primary Grind:	30	minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1).								P80 =		µm									
CuPb Regrind	20	minutes / 2 x CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.								P80 =	14	µm									
Zn Regrind	20	minutes / 1 x Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.								P80 =	20	µm									

Conditions:

Test No.:	F13	**Project No.**:	13589-001	**Operator**:	CC/TM	**Date**:	Aug 7th 2012

Purpose: As F11 on variability composites - higher Zn, increased NaCN in CuPb regrind and CuSO4 in Zn circuit

Procedure: As outlined below.

Feed: 2 kg of minus 10 mesh — 50244-001 Comp B (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 106 µm

CuPb Regrind 15 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 24 µm

Zn Regrind 20 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 15 µm

Conditions:

Test No.:	F15			**Project No.**:	13589-001			**Operator**:	CC/TM			**Date**:	Aug 15th 2012						
Purpose:	As F11 on variability composites																		
Procedure:	As outlined below.																		
				50244-001															
Feed:	2 x 2 kg of minus 10 mesh Comp D							(location in a drum on a skid in the freezer)											
Primary Grind:	30	minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1).										P80 =	105	µm					
CuPb Regrind	15	minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.										P80 =		µm					
Zn Regrind	15	minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.										P80 =		µm

Test No.:	F17	**Project No.**:	13589-001	**Operator**:	CC/TM	**Date**:	Aug. 29th 2012

Purpose: As F11 on variability composites

Procedure: As outlined below.

Feed: 50244-001 — 2 x 2 kg of minus 10 mesh Comp F (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 80 µm

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 19 µm

Zn Regrind 25 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 14 µm

November 16, 2012 **Melis Project No. 547**

Silver Range Resources Ltd.
1016 510 West Hastings Street
VANCOUVER BC V6B 1L8

Attention: Bruce A. Youngman, Chairman

Dear Bruce:

Re: Silver Range Resources Ltd. - Keg Main Zone Ag/Zn/Pb/Cu Project Metallurgy
Melis Status Report No. 4 for the Period September 15 to November 15, 2012 Rev 1

SUMMARY

Melis Engineering Ltd. (Melis) is overseeing a flotation testwork program on Silver Range Resources Ltd. (Silver Range)'s Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon. The testwork, being completed at SGS Canada Inc. Lakefield Research (SGS Lakefield) in Lakefield Ontario, encompasses preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No.4, a follow-up to the September 14, 2012 Melis Status Report No. 3, provides results of additional flotation tests completed to date. It includes update of results for the batch variability tests, results of zinc concentrate upgrading batch tests, results of lock cycle tests on the variability composites, and preliminary information on the mineralogy of the Keg Zone deposit.

As summarized in the tables below, the results of the lock cycle tests on all test composites show that the Keg Zone mineralization responds very well to typical copper/lead/zinc flotation circuits with excellent recoveries of payable metals and acceptable concentrate grades in copper, lead and zinc concentrates, in line with metallurgical efficiencies of much higher grade copper/lead/zinc deposits.

E	1.28	0.15	0.14	21.1	19.5	92.3	77.5	72.2	72.0	93.3
F	1.14	0.28	0.19	32.7	9.1	87.5	83.9	67.6	80.6	77.9
Average	1.33	0.33	0.25	45.9	11.3	88.6	82.4	69.4	80.0	82.9
Overall	1.36	0.31	0.27	41.6	11.4	85.2	84.8	71.4	82.5	80.1

Notes: 1. Combined silver recovery to lead and copper concentrate
2. Combined indium recovery to zinc and copper concentrate

General comments and observations on the lock cycle results are noted below:

- There was generally good agreement between the results of the Overall Composite and the average results of the six variability composites, both with respect to grades and recoveries.
- Zinc concentrate grades of greater than 45% Zn were achievable on composites with head grades greater than 1.0 % Zn. As noted above the lock cycle tests were completed using sodium cyanide as a depressant in the float. The use of sodium metabisulphite offers the potential to increase the zinc grade in the zinc concentrate. This is currently being evaluated further on the Overall Composite.
- The lead grade in the lead concentrate, which averaged 65% Pb, was independent of the head grade of the composites. Excellent lead concentrate grades were achieved even down to a low head grade of 0.15% Pb in Composite E.
- Excellent copper grades were obtained in the copper concentrate, averaging 27.2% Cu, even for the composites with relatively low copper head grade. For example Composite D with a copper head grade of only 0.10% Cu achieved a 25.2% Cu concentrate grade.
- Zinc recoveries to zinc concentrate averaged 88.6% and were generally over 90% for composites with zinc head grades greater than 1.0% Zn. Net zinc recoveries may adjust slightly downward when attempting to increase the concentrate zinc grade to a target of 50% Zn.

- Lead recoveries to lead concentrate averaged 82.4% and were all greater than 80% except for the one composite with a low lead head grade which had a 77.5% lead recovery for a 0.15% Pb head grade, still quite acceptable for a low head grade.
- Copper recoveries averaged 69.4% and generally followed copper head grade, ranging from 80.2% recovery for a 0.60% Cu head grade (Composite B) down to 59.0% for a 0.10% Cu head grade (Composite D).
- Excellent silver recoveries were achieved, averaging 57.2% recovery to lead concentrate assaying an average of 5,816 g Ag/t, and 22.7% recovery to copper concentrate assaying an average of 1,458 g Ag/t. A minor amount, an average of 8.2%, reported to the zinc concentrate which assayed an average of 136 g Ag/t. Silver head grade did not have much impact on overall silver recovery.
- The majority of the recoverable indium reported to the zinc concentrate, averaging 74.3% recovery and assaying an average of 320 g In/t. A lesser amount, 8.6%, was recovered to the copper concentrate assaying an average of 150 g In/t. No indium reported to the lead concentrate. Indium head grade did not seem to have an impact on overall indium recovery.
- The average tin grades were 1.99% Sn in the copper concentrate, 0.44% Sn in the lead concentrate and 0.04% in the zinc concentrate. The majority of the tin, an average of 60%, was not recovered and reported to the final float tails which had an average tails tin assay of 0.025% Sn.

Mineralogical examination of the Overall Composite, a blend of the six variability composites, was completed to quantify the mode of occurrence of minerals of interest. Quartz is the dominant mineral in all size fractions accounting for 30.6 % of the Overall Composite sample, followed by pyroxene, K-feldspar and plagioclase which account for 22.1 %, 12.2 % and 8.1 % of the sample respectively. Calcite accounts for 5.7 %, epidote for 5.2 %, chlorite for 3.0 % and titanite for 2.0 %.

The sulphides consist mainly of sphalerite (2.6 %), pyrite (2.2 %), chalcopyrite (1.1 %), pyrrhotite (0.7 %), arsenopyrite (0.4 %) and galena (0.5 %). Other minerals are present in trace amounts (<1 %). Traces of silver minerals (native silver and silver sulphides) were found, but more detailed examination specific to silver would be required to properly define the mode of occurrence of silver. The main tin minerals, which are typically fine grained, include stannite (0.2 %) and rare cassiterite (0.01 %).

Remaining testwork as planned, and outstanding test results which remain to be received, include two batch flotation tests and an additional lock cycle test on the Overall Composite to evaluate an alternative depressant, particularly as it applies to the zinc concentrate grade, receipt of the QEMSCAN mineralogical report, receipt of detailed elemental analysis of final concentrate products and tailings physical and chemical characterization.

Appendix A: SGS Lakefield Test Data Sheets

INTRODUCTION

Melis Engineering Ltd. (Melis) is overseeing a flotation testwork program on Silver Range Resources Ltd. (Silver Range)'s Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon.

The testwork, being completed at SGS Canada Inc. Lakefield Research (SGS Lakefield) in Lakefield Ontario, encompasses preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No.4, a follow-up to the September 14, 2012 Melis Status Report No. 3, provides results of additional flotation tests completed to date. It includes update of results for the batch variability tests, results of zinc concentrate upgrading batch tests, results of lock cycle tests on the variability composites, and preliminary information on the mineralogy of the Keg Zone deposit.

MINERALOGICAL DATA

The Overall Composite was submitted to a QEMSCAN mineralogical study to quantify mineral associations and liberation requirements. A final report of this study will be issued by SGS Lakefield. The following provides key conclusions of the mineralogy of the Keg Zone mineralization.

Quartz is the dominant mineral in all size fractions accounting for 30.6 % of the Overall Composite sample, followed by pyroxene, K-feldspar and plagioclase which account for 22.1 %, 12.2 % and 8.1 % of the sample respectively. Calcite accounts for 5.7 %, epidote for 5.2 %, chlorite for 3.0 % and titanite for 2.0 %.

The sulphides consist mainly of sphalerite (2.6 %), pyrite (2.2 %), chalcopyrite (1.1 %), pyrrhotite (0.7 %), arsenopyrite (0.4 %) and galena (0.5 %). Other minerals are present in trace amounts (<1 %).

All sulphides reach their best liberation in the -20 μm fraction, copper sulphides (93.6%), sphalerite (97.4%), pyrite (85.3%), pyrrhotite (70.2%) and galena (96.0%). Arsenopyrite is liberated through all size fractions and reaches 97.2% in the -20 μm fraction.

Traces of silver minerals (native silver and silver sulphides) were found, but more detailed examination specific to silver would be required to properly define the mode of occurrence of silver.

The main tin minerals include stannite (0.2 %) and rare cassiterite (0.01 %). The mineralogical observation suggests that the tin minerals occur as fine-grained liberated particles and as complex middling particles (13.1%), and binary particles with copper sulphides (7.2%), sphalerite (5.9%) and silicates (4.8%). The fine grain nature of the tin is in agreement with the low gravity recovery of tin (GRG value of 5.1) reported earlier (see Melis Status Report No. 1 dated May 28, 2012).

VARIABILITY BATCH FLOTATION TESTS

The six variability composites were previously submitted to a single batch flotation test using the conditions of Test F11 on the Overall Composite. Zinc, lead and copper results were previously reported in Melis Status Report No. 3 dated September 14, 2012. Additional results obtained to date, where applicable, have been included in the updated tables below, Tables 1 to 6. It should be noted that, due to limited amount of test products, some indium and tin assays were not available. It is also notes that poor detection limits for indium (low assays are simply reported as <50 ppm, and very few cases as < 5ppm) were attributed by SGS Lakefield to lead interference.

Updated test data sheets for these variability batch tests are enclosed in Appendix A.

Composite A Batch Variability Test

The available results of the test completed on Composite A are summarized in Table 1 below. Because of insufficient sample weight, silver assays for Pb Cleaner Tail and CuPb 3rd Cl Tail had to be estimated to complete the silver balance for the test. Indium and tin assays were not available for this test due to limited sample of test products.

Table 1
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Cleaner Flotation Test F12 on Composite A

Product	Wt	%				g/t		% Distribution					
	%	Zn	Pb	Cu	Sn	Ag	In	Zn	Pb	Cu	Sn	Ag	In

Pb Cleaner Con	0.6	1.51	72.2	3.6	n/a	8084	n/a	1.4	74.9	12.7	n/a	69.7	n/a
Cu Con	0.4	7.28	6.5	24.6	n/a	1626	n/a	4.5	4.4	55.8	n/a	9.1	n/a
Zn Rougher Con	4.9	10.9	0.66	0.40	n/a	136	n/a	81.4	5.4	11.1	n/a	9.2	n/a
Zn 4th Cln Con	1.4	37.3	2.09	1.01	n/a	372	n/a	76.6	4.7	7.6	n/a	7.0	n/a
Zn Rougher Tails	93.7	0.063	0.076	0.025	n/a	5.8	n/a	8.9	11.8	13.0	n/a	7.5	n/a

For Composite A most of the silver (69.7% of the silver in the feed) reported to the lead concentrate which assayed 8,084 g Ag/t. A small amount reported to the copper concentrate (9.1% of the silver in the feed) which had a payable assay of 1,626 g Ag/t. The zinc concentrate contained the least amount of silver (7.5% of the silver in the feed).

Composite B Batch Variability Test

The available results of the test completed on Composite B are summarized in Table 2 below. Because of insufficient sample weight, zinc, lead, copper and silver assays for CuPb 2nd Cl Tail and CuPb 3rd Cl Tail, as well as silver assays for Pb Cleaner Con and Pb Cleaner Tail, had to be estimated to complete the balance for these four elements. Indium and tin assays for this test were not available due to limited sample of test products.

Table 2
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Cleaner Flotation Test F13 on Composite B

Product	Wt %	%				g/t		% Distribution					
		Zn	Pb	Cu	Sn	Ag	In	Zn	Pb	Cu	Sn	Ag	In
Test No. F13- Composite B (Calc. Head:2.40% Zn, 0.35% Pb, 0.62% Cu, 55.7 g Ag/t)													
CuPb 3rd Cln Con	1.6	1.47	16.3	25.3	n/a	2293	n/a	1.0	74.5	65.8	n/a	66.0	n/a
Pb Rougher Con	0.4	1.09	52.1	10.0	n/a	4489	n/a	0.2	66.8	7.3	n/a	36.2	n/a
Pb Cleaner Con	0.3	0.61	73.1	2.0	n/a	6000	n/a	0.1	58.3	0.9	n/a	30.1	n/a
Cu Con	1.3	1.65	4.3	30.3	n/a	1509	n/a	0.9	16.2	64.9	n/a	35.9	n/a
Zn Rougher Con	10.4	22.0	0.24	1.59	n/a	114	n/a	95.7	7.0	26.9	n/a	21.3	n/a
Zn 4th Cln Con	4.0	46.3	0.44	3.23	n/a	201	n/a	76.4	5.0	20.7	n/a	14.3	n/a
Zn Rougher Tails	87.6	0.056	0.043	0.030	n/a	6.4	n/a	2.0	10.7	4.3	n/a	10.1	n/a

For Composite B the amount of silver reporting to concentrate were similar in both the lead concentrate (30.1% of the silver in the feed) and the copper concentrate (35.9% of the silver in the feed), due in part to the high weight of the copper concentrate (1.3%) which in turn was due to the high copper head grade for this composite. The zinc concentrate contained the least amount of silver (14.3% of the silver in the feed).

Composite C Batch Variability Test

The available results of the test completed on Composite C are summarized in Table 3 below. Because of insufficient sample weight, silver assays for Pb Cleaner Con, Pb Cleaner Tail and CuPb 3rd Cl Tail, and tin assays for Pb Cleaner Tail and CuPb 3rd Cl Tail had to be estimated to complete the silver and tin balance. Due to poor detection limits for indium (low assays are simply reported as <50 ppm) and low sample weights only the Cu Con and Zn 4th Cln Con indium assays are available, an indium balance for the test was not possible.

Table 3
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Cleaner Flotation Test F14 on Composite C

Product	Wt	%				g/t		% Distribution					
	%	Zn	Pb	Cu	Sn	Ag	In	Zn	Pb	Cu	Sn	Ag	In

Zn Rougher Con	8.4	17.6	0.15	0.45	0.034	50.5	n/a	94.2	4.3	12.6	12.5	9.5	n/a
Zn 4th Cln Con	4.0	35.9	0.31	0.57	0.050	73.3	254	91.4	4.1	7.6	8.6	6.6	n/a
Zn Rougher Tails	90.3	0.052	0.018	0.026	0.015	3.1	n/a	3.0	5.4	7.9	58.8	6.3	n/a

For Composite C most of the silver reported to the lead concentrate (58.2% of the silver in the feed) but there was still a substantial amount reporting to the copper concentrate (24.2% of the silver in the feed). The zinc concentrate contained the least amount of silver (6.6% of the silver in the feed).

Composite D Batch Variability Test

The available results of the test completed on Composite D are summarized in Table 4 below. Because of insufficient sample weight, silver, tin and indium assays for Pb Cleaner Tail, Pb Ro Tail, CuPb 2nd Cl Tail and CuPb 3rd Cl Tail, silver and tin assays for Pb Cleaner Con, and tin assay for the Zn 4th Cleaner Tail had to be estimated to complete the balance for these three elements. It is noted that a lower indium detection limit (5 ppm) was possible for this test.

Table 4
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Cleaner Flotation Test F15 on Composite D

Product	Wt	%				g/t		% Distribution					
	%	Zn	Pb	Cu	Sn	Ag	In	Zn	Pb	Cu	Sn	Ag	In
Test No. F15- Composite D (Calc. Head:0.91% Zn, 0.25% Pb, 0.11% Cu, 32.2 g Ag/t, 12.6 g In/t)													
CuPb 3rd Cln Con	0.5	1.48	43.0	13.1	0.66	4845	60	0.8	82.6	58.2	30.8	72.7	2.3

Pb Cleaner Con	0.2	0.59	69.6	2.7	0.25	8000	20	0.2	67.5	6.0	5.9	60.6	0.4
Cu Con	0.2	2.39	15.8	23.8	1.07	1625	100	0.6	15.0	52.2	24.9	12.1	1.9
Zn Rougher Con	7.9	11.0	0.32	0.39	0.005	73	97	95.0	10.1	28.1	3.6	17.9	60.9
Zn 4th Cln Con	3.9	21.8	0.57	0.65	0.002	114	191	92.1	8.7	23.0	0.8	13.7	58.4
Zn Rougher Tails	91.5	0.030	0.011	0.010	0.007	2.8	<5	3.0	4.0	8.4	62.4	8.0	36.3

For Composite D most of the silver reported to the lead concentrate (60.6% of the silver in the feed) but there was still a substantial amount reporting to the copper concentrate (17.9% of the silver in the feed). The zinc concentrate contained the least amount of silver (13.7% of the silver in the feed).

An approximate metallurgical balance for indium was possible for this test due to the lower detection limit (5 ppm).As expected very little indium reports to the lead concentrate or the copper concentrate. The recoverable indium reports to the zinc concentrate with 58.4% (excluding recycle products) of the indium reporting to the zinc 4th cleaner concentrate which assayed 191 g In/t.

Composite E Batch Variability Test

The available results of the test completed on Composite E are summarized in Table 5 below. Because of insufficient sample weight, zinc, lead, copper and silver assays for CuPb 3rd Cl Tail, and the silver assay for CuPb 2nd Cln Tail, had to be estimated to complete the balance for these four elements. Indium and tin assays were not available for this test due to limited sample of test products.

Table 5

Similar to Composite B, for Composite E the amount of silver reporting to concentrate were similar in both the lead concentrate (30.4% of the silver in the feed) and the copper concentrate (33.1% of the silver in the feed. The zinc concentrate contained the least amount of silver (14.2% of the silver in the feed).

Composite F Batch Variability Test

The available results of the test completed on Composite F, for zinc, lead and copper, are summarized in Table 6 below. Because of insufficient sample weight silver assays for Pb Ro Tail, CuPb 3rd Cl Tail and CuPb 2nd Cl Tail had to be estimated to complete the balance for silver. Indium and tin assays were not available for this test due to limited sample of test products.

Table 6

Zn Rougher Con	7.4	14.0	0.27	0.44	n/a	56	n/a	92.9	7.1	16.5	n/a	13.1	n/a
Zn 4th Cln Con	2.4	42.0	0.77	0.95	n/a	126	n/a	89.0	6.4	11.4	n/a	9.5	n/a
Zn Rougher Tails	91.6	0.042	0.010	0.015	n/a	2.5	n/a	3.4	3.2	7.0	n/a	7.3	n/a

For Composite F most of the silver reported to the lead concentrate (59.0% of the silver in the feed) but there was still a substantial amount reporting to the copper concentrate (16.5% of the silver in the feed). The zinc concentrate contained the least amount of silver (9.5% of the silver in the feed).

Observations from Batch Variability Tests

As reported in Melis Status Report No. 3, there was no direct correlation between head grade and recovery and grade in concentrate for zinc and lead which implied that there are other (mineralogical) factors affecting recovery and deportment of zinc and lead to concentrate. Copper on the other hand generally showed increasing recovery and copper grade to copper concentrate with increasing head grade.

Although recoverable silver tends to go with the lead concentrate, for two composites, Composites B and D, recovered silver was split between the lead concentrate and the copper concentrate. The zinc concentrate contained a small amount of silver but a relatively low silver grade in the concentrate.

The one test with an approximate indium balance showed that almost all of the recoverable indium reported to the zinc concentrate.

ZINC CONCENTRATE UPGRADING TESTS

Test F18 – Higher pH and Fifth Cleaning Stage

One batch test, Test F18, was completed using a greater weight (8 kg in total) of material to provide sufficient material for assay of all products, and to see if an improvement in zinc concentrate grade could be made using a higher pH in the zinc cleaners and adding a fifth cleaning stage. This test was essentially a repeat of Test F11 with the exception of the changes to the zinc cleaners.

Test F11 results, previously reported in Melis Status Report No. 3, are reproduced in Table 7 below.

Table 7

Using a larger quantity of sample in the test allowed for a complete metallurgical balance for the test, except that the indium balance remains as approximate since a couple of test products were at the detection limits of the indium assay. More than 50% of the recoverable indium reported to the zinc concentrate which assayed 321 g In/t.

Again in this test most of the recoverable silver reported to the lead concentrate which assayed 5,887 g Ag/t but some also reported to the copper concentrate which assayed 1,312 g Ag/t.

The use of a higher pH in the zinc cleaners increased the zinc grade in the fourth zinc cleaner concentrate from 41.0% Zn to 43.4% Zn. The use of a fifth cleaner increased the grade further to 46.9% Zn but with a slight drop in recovery.

Tests F19 and F20 –Re-Cleaner Comparison Using Cyanide and MBS

Tests F19 and F20 were completed as zinc re-cleaner tests using the Cycles A to F zinc fourth cleaner concentrate from the lock cycle test, Test LCT5, on Composite D (see below).

In Test 19 additional sodium cyanide was added to depress iron sulphides. In Test 20 sodium metabisulphite (MBS) was used as a depressant. In both tests the zinc concentrate was reground before the re-cleaner flotation. Results of these two tests are compared in Table 9 below.

Table 9
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork
Zinc Upgrading Tests on LCT5 Zn 4th Cleaner Concentrate

Product	Test F19 (NaCN)		Test F20 (MBS)	
	% Zn	% Zn Recovery	% Zn	% Zn Recovery
LCT5 Zn 4th Cleaner Con	29.7	-	29.7	-
Zn Re-Cleaner Con 1	40.1	18.7	46.2	52.8
Zn Re-Cleaner Con 1-2	40.7	35.1	46.2	81.6
Zn Re-Cleaner Con 1-3	41.0	41.0	45.1	94.1
Zn Re-Cleaner Con 1-4	41.3	49.0	43.9	97.5
Zn Re-Cleaner Con 1-5	42.1	79.5	42.9	98.5
Zn Re-Cleaner Tail	13.7	20.5	1.5	1.5

The low zinc grade of Test LCT5 Zinc 4th Cleaner Concentrate used as re-cleaner feed in this test, 29.7% Zn, was partially due to the low zinc grade of this composite (0.84% Zn). From the above results it is clear that the use of MBS in place of sodium cyanide in the zinc re-cleaner leads to a higher zinc concentrate grade and better zinc cleaner recovery. Combining the first three re-cleaner concentrate, Zinc Re-Cleaner Concentrate 1 to 3, the zinc grade improves to 45.1% Zn with a high unit zinc recovery of 94.1% in Test F20, compared to a zinc grade of 41.0% Zn and a unit zinc recovery of only 41.0% in Test F19.

The lock cycle tests on the variability composites, which had already been completed by the time these two comparison tests were done, did not use MBS in the float. To investigate this further two batch flotation tests are being done on the Overall Composite, one using a combination of cyanide and MBS as depressants in the float and one only using MBS as a depressant. Once these additional results are available, a repeat lock cycle test on the Overall Composite using the better of the two depressants will be done

to quantify concentrate grade and recovery under conditions approaching steady state, particularly as it applies to the zinc concentrate. Results will be reported when available.

LOCK CYCLE TESTS

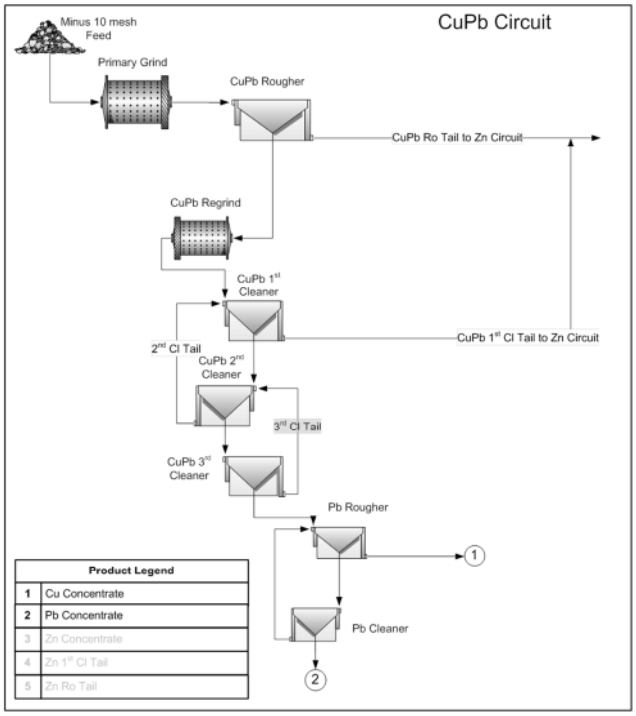
Test Flowsheet

Lock cycle tests were completed on the Overall Composite and on the six variability composites, Composites A to F. Separate copper, lead and zinc concentrates were produced to quantify recoveries and concentrate grades under conditions approaching steady state.

The test data sheets for these tests are enclosed in Appendix A.

The copper/lead circuit and zinc circuit test flowsheets used in these lock cycle tests are depicted in Figures 1 and 2 below.

Figure 1
Silver Range Project –Lock Cycle Test Flowsheet
Copper/Lead Circuit
(from SGS Lakefield)



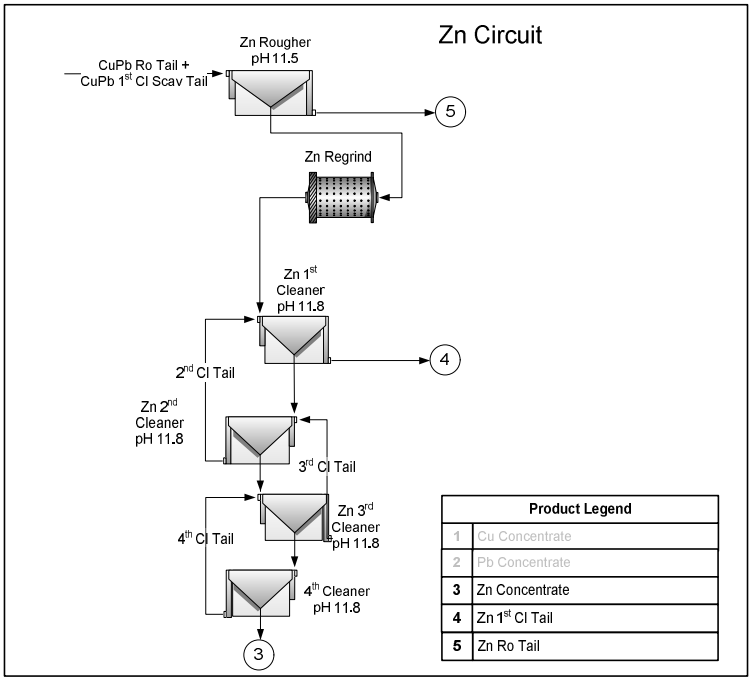


Figure 2
Silver Range Project – Lock Cycle Test Flowsheet
Zinc Circuit
(from SGS Lakefield)

The feed slurry, with a target primary grind P_{80} of 100 µm, was first aerated in the cell followed by copper/lead rougher flotation at pH 9 to 9.5, adjusted with lime, using Aerophine 3418A (a dithiophosphinate) as collector and MIBC (methyl isobutyl carbinol) as frother.

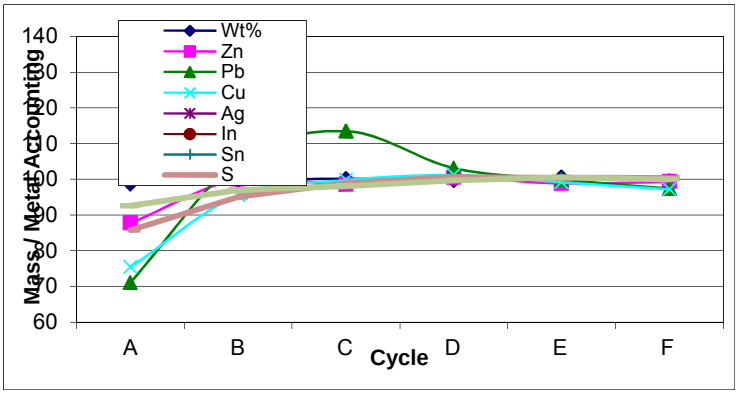
This was followed by regrinding the copper/lead rougher concentrate to a target regrind P_{80} of 25 µm in the presence of zinc sulphate and sodium cyanide (both used as zinc depressants) ahead of a three stage copper/lead cleaner float at pH 10 using Aerophine 3418A as collector and MIBC as frother.

Copper/lead separation on the third copper/lead cleaner concentrate is accomplished at pH 11 using sodium cyanide as a chalcopyrite depressant. A single stage lead cleaner on the lead rougher concentrate produces a separate upgraded lead concentrate.

The tails from the copper/lead separation float combined with the copper/lead concentrate first cleaner tails, feed to zinc flotation, are activated with copper sulphate and the pH is

raised to pH 11.8 with lime. Three stages of zinc rougher flotation using Aero 5100 (modified thionocarbamate) as promoter produce a zinc rougher concentrate. The rougher concentrate, reground to a target regrind P_{80} of 15 to 20 µm in the presence of an incremental amount of copper sulphate, is submitted to four cleaning stages with incremental addition of Aero 5100 and further addition of lime to increase the zinc cleaner float pH to 12 to produce a zinc fourth cleaner concentrate.

Overall Composite Lock Cycle Test



A lock cycle test, Test LCT1, was completed on the Overall Composite generally under the conditions of Test F11 except with a lower collector dosage in the zinc cleaner circuit and a longer regrind of the zinc rougher concentrate. The metallurgical projections based on the last three cycles (Cycles D to F) are summarized in Table 10 below. As noted in Figure 3, the lock cycle test appeared to be stable in the last three cycles.

Primary Grind	102
Cu/Pb Rougher Regrind	24
Zinc Rougher Regrind	16

Figure 3
Silver Range Project – Overall Composite Lock Cycle Test (Test LCT1)
Test Stability Check
(from SGS Lakefield)

Lead recovery was 84.8% to a lead concentrate assaying 65.5% Pb.

Copper recovery was 71.4% to a copper concentrate assaying 28.8% Cu.

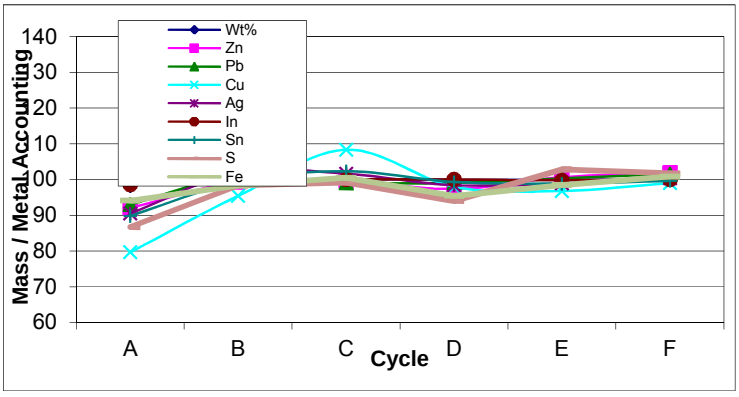
Zinc recovery was 85.2% to a zinc concentrate assaying 47.5% Zn.

Silver recoveries were 60.5% to the lead concentrate assaying 5,924 g Ag/t, 22.0% to the copper concentrate assaying 1,442 g Ag/t and 6.6% to the zinc concentrate assaying 117 g Ag/t.

Because of poor detection limits for indium assays (50 ppm or 0.005% In), a metallurgical balance for indium was not possible. However, indium recoveries to the copper and zinc concentrates were estimated by using the indium assay head grade for the composite as the total indium in the feed for the test, and calculating the amount of indium reporting to the copper and zinc concentrates based on weight and indium assay (very little indium, less than 1.8% in this test, reports to the lead concentrate based on the low assay, <50 g In/t, for the lead product). Using this approach 7.9% of the indium reported to the copper concentrate assaying 150 g In/t and 72.2% to the zinc concentrate assaying 358 g In/t.

Composite A Lock Cycle Test

A lock cycle test, Test LCT2, was completed on Composite A generally under the conditions of Test F12 but with a higher pH (pH 12) in the zinc float. The metallurgical



projections based on the last three cycles (Cycles D to F) are summarized in Table 11 below. As noted in Figure 4, the lock cycle test appeared to be stable in the last three cycles.

Table 11
Silver Range Resources Ltd. - Keg Main Zone Metallurgical Testwork

Figure 4
Silver Range Project –Composite A Lock Cycle Test (Test LCT2)
Test Stability Check
(from SGS Lakefield)

Lead recovery was 82.9% to a lead concentrate assaying 67.3% Pb.

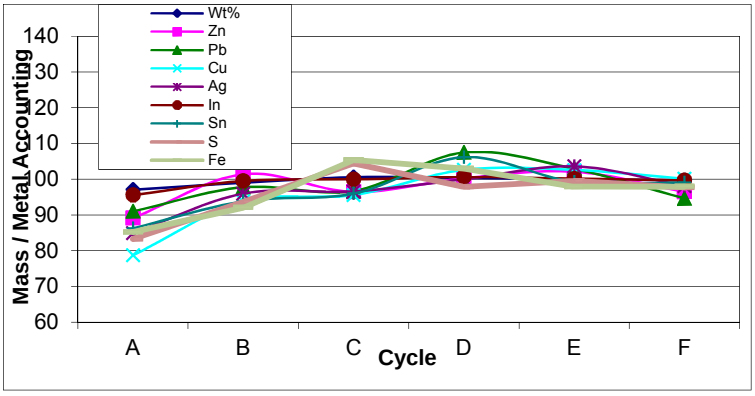
Copper recovery was 62.3 % to a copper concentrate assaying 23.5% Cu.

Zinc recovery was 81.5% to a zinc concentrate assaying 39.8% Zn.

Silver recoveries were 75.9% to the lead concentrate assaying 7,761 g Ag/t, 8.8% to the copper concentrate assaying 1,454 g Ag/t and 5.9% to the zinc concentrate assaying 314 g Ag/t.

Using the same approach as Test LCT1 to estimate indium recovery, in this test, which had a very low indium grade (1.7 g In/t), 14.4% of the indium reported to the copper concentrate assaying 61 g In/t and 68.8 % to the zinc concentrate assaying 90 g In/t.

Composite B Lock Cycle Test



A lock cycle test, Test LCT3, was completed on Composite B generally under the conditions of Test F13 except with a higher pH in the zinc float and more collector added to the copper/lead rougher float. The metallurgical projections based on the last three cycles (Cycles D to F) are summarized in Table 12 below. As noted in Figure 5, the lock cycle test appeared to be stable in the last three cycles.

Primary Grind	134
Cu/Pb Rougher Regrind	27
Zinc Rougher Regrind	20

Figure 5
Silver Range Project –Composite B Lock Cycle Test (Test LCT3)
Test Stability Check
(from SGS Lakefield)

Lead recovery was 82.9% to a lead concentrate assaying 59.7% Pb.

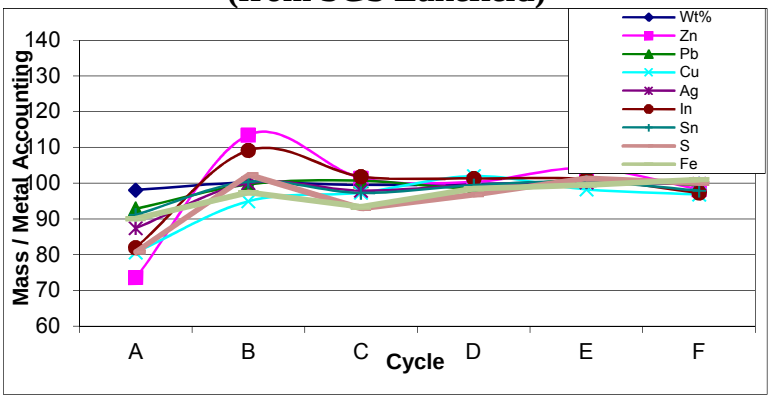
Copper recovery was 80.2% to a copper concentrate assaying 29.8% Cu.

Zinc recovery was 92.4% to a zinc concentrate assaying 49.6% Zn.

Silver recoveries were 38.4% to the lead concentrate assaying 4,521 g Ag/t, 42.3% to the copper concentrate assaying 1,351g Ag/t and 7.7 % to the zinc concentrate assaying 94.6 g Ag/t.

Using the same approach as Test LCT1 to estimate indium recovery, 14.0 % of the indium reported to the copper concentrate assaying 129 g In/t and 82.1% to the zinc concentrate assaying 291 g In/t.

Composite C Lock Cycle Test



A lock cycle test, Test LCT4, was completed on Composite C generally under the conditions of Test F14 except with a higher pH in the zinc float and more collector added to the copper/lead rougher float. The metallurgical projections based on the last three cycles (Cycles D to F) are summarized in Table 13 below. As noted in Figure 6, the lock cycle test appeared to be stable in the last three cycles.

Table 13

Mesh-of-Grind P_{80}	**µm**
Primary Grind	95
Cu/Pb Rougher Regrind	26
Zinc Rougher Regrind	20

Figure 6
Silver Range Project –Composite C Lock Cycle Test (Test LCT4)
Test Stability Check
(from SGS Lakefield)

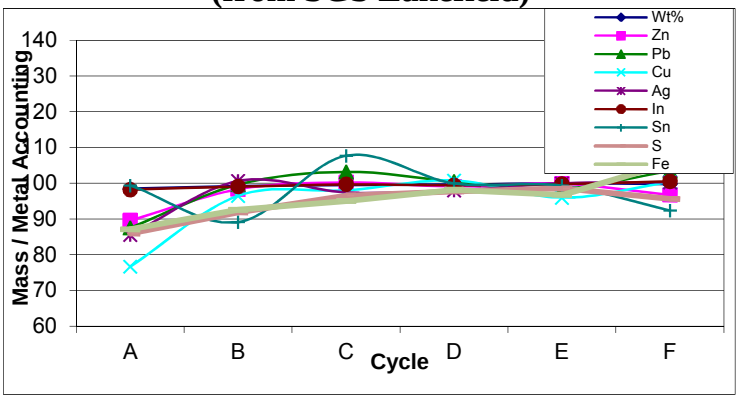
Lead recovery was 84.9% to a lead concentrate assaying 68.2% Pb.

Copper recovery was 75.3% to a copper concentrate assaying 29.0% Cu.

Zinc recovery was 92.0% to a zinc concentrate assaying 46.1% Zn.

Silver recoveries were 55.3% to the lead concentrate assaying 5,507 g Ag/t, 26.2% to the copper concentrate assaying 1,326 g Ag/t and 6.8% to the zinc concentrate assaying 81 g Ag/t.

In this test, the only test in the series, a lower detection limit, 5 ppm, was possible for indium hence a calculated metallurgical balance for indium, assuming a 5 g In/t assay for the final tail (which was actually <5 g In/t), was available for this test. As noted in Table 13 above, very little indium (0.5%) reports to the lead concentrate which assayed 21 g In/t. Only 6.1% of the indium reported to the copper concentrate assaying 132 g In/t and 63.3% reported to the zinc concentrate assaying 325 g In/t.



Composite D Lock Cycle Test

A lock cycle test, Test LCT5, was completed on Composite D generally under the conditions of Test F15 except with a higher pH in the zinc float. The metallurgical projections based on the last three cycles (Cycles D to F) are summarized in Table 14 below. As noted in Figure 7, the lock cycle test appeared to be relatively stable in the last three cycles.

(from SGS Lakefield)

Lead recovery was 82.4% to a lead concentrate assaying 65.8% Pb.

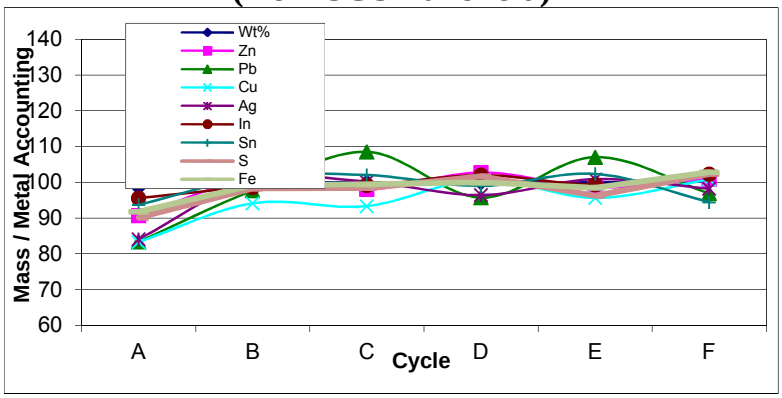
Copper recovery was 59.0% to a copper concentrate assaying 25.2% Cu.

Zinc recovery was 85.7% to a zinc concentrate assaying 28.4% Zn.

Silver recoveries were 65.7% to the lead concentrate assaying 6,647 g Ag/t, 14.6% to the copper concentrate assaying 2,062 g Ag/t and 8.6% to the zinc concentrate assaying 105 g Ag/t.

Using the same approach as Test LCT1 to estimate indium recovery, 3.8% of the indium reported to the copper concentrate assaying 169 g In/t and 73.6% to the zinc concentrate assaying 249 g In/t.

Composite E Lock Cycle Test



A lock cycle test, Test LCT6, was completed on Composite E generally under the conditions of Test F16 except with a shorter zinc cleaner retention time. The metallurgical projections based on the last three cycles (Cycles D to F) are summarized in Table 15 below. As noted in Figure 8, the lock cycle test was relatively stable in the last three cycles.

Lead recovery was 77.5% to a lead concentrate assaying 64.4% Pb.

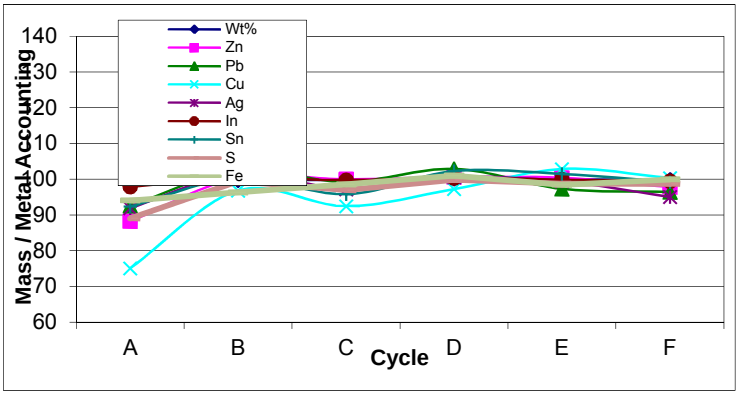
Copper recovery was 72.2% to a copper concentrate assaying 28.2% Cu.

Zinc recovery was 92.3% to a zinc concentrate assaying 48.3% Zn.

Silver recoveries were 43.1% to the lead concentrate assaying 4,895 g Ag/t, 28.9% to the copper concentrate assaying 1,468 g Ag/t and 11.6% to the zinc concentrate assaying 91.5 g Ag/t.

Using the same approach as Test LCT1 to estimate indium recovery, 5.6% of the indium reported to the copper concentrate assaying 274 g In/t and 87.7% to the zinc concentrate assaying 658 g In/t.

Composite F Lock Cycle Test



A lock cycle test, Test LCT7, was completed on Composite F generally under the conditions of Test F17 but with a shorter zinc cleaner retention time. The metallurgical projections based on the last three cycles (Cycles D to F) are summarized in Table 16 below. As noted in Figure 9, the lock cycle test appeared to be stable in the last three cycles.

Test Stability Check
(from SGS Lakefield)

Lead recovery was 83.9% to a lead concentrate assaying 65.1% Pb.

Copper recovery was 67.6% to a copper concentrate assaying 27.6% Cu.

Zinc recovery was 87.5% to a zinc concentrate assaying 45.9%.

Silver recoveries were 65.0% to the lead concentrate assaying 5,567 g Ag/t, 15.6% to the copper concentrate assaying 1,089 g Ag/t and 8.6% to the zinc concentrate assaying 129 g Ag/t.

Using the same approach as Test LCT1 to estimate indium recovery, 7.5% of the indium reported to the copper concentrate assaying 137 g In/t and 70.4% to the zinc concentrate assaying 305 g In/t.

Summary of Lock Cycle Test Results

Table 17 below summarizes the results of the lock cycle tests and compares the average results of the six variability tests against the results of the Overall Composite which was a blend of the six variability composites. Table 18 compares assay head grades against recoveries.

Notes: 1. Combined silver recovery to lead and copper concentrate
2. Combined indium recovery to zinc and copper concentrate

General comments and observations on the lock cycle results are noted below:

- There was generally good agreement between the results of the Overall Composite and the average results of the six variability composites, both with respect to grades and recoveries.
- Zinc concentrate grades of greater than 45% Zn were achievable on composites with head grades greater than 1.0 % Zn. As noted above the lock cycle tests were completed using sodium cyanide as a depressant in the float. The use of sodium metabisulphite offers the potential to increase the zinc grade in the zinc concentrate. This is currently being evaluated further on the Overall Composite.
- The lead grade in the lead concentrate, which averaged 65% Pb, was independent of the head grade of the composites. Excellent lead concentrate grades were achieved even down to a low head grade of 0.15% Pb in Composite E.
- Excellent copper grades were obtained in the copper concentrate, averaging 27.2% Cu, even for the composites with relatively low copper head grade. For example Composite D with a copper head grade of only 0.10% Cu achieved a 25.2% Cu concentrate grade.
- Zinc recoveries to zinc concentrate averaged 88.6% and were generally over 90% for composites with zinc head grades greater than 1.0% Zn. Net zinc recoveries may adjust slightly downward when attempting to increase the concentrate zinc grade to a target of 50% Zn.

- Lead recoveries to lead concentrate averaged 82.4% and were all greater than 80% except for the one composite with a low lead head grade which had a 77.5% lead recovery for a 0.15% Pb head grade, still quite acceptable for a low head grade.
- Copper recoveries averaged 69.4% and generally followed copper head grade, ranging from 80.2% recovery for a 0.60% Cu head grade (Composite B) down to 59.0% for a 0.10% Cu head grade (Composite D).
- Excellent silver recoveries were achieved, averaging 57.2% recovery to lead concentrate assaying an average of 5,816 g Ag/t, and 22.7% recovery to copper concentrate assaying an average of 1,458 g Ag/t. A minor amount, an average of 8.2%, reported to the zinc concentrate which assayed an average of 136 g Ag/t. Silver head grade did not have much impact on overall silver recovery.
- The majority of the recoverable indium reported to the zinc concentrate, averaging 74.3% recovery and assaying an average of 320 g In/t. A lesser amount, 8.6%, was recovered to the copper concentrate assaying an average of 150 g In/t. No indium reported to the lead concentrate. Indium head grade did not seem to have an impact on overall indium recovery.
- The average tin grades were 1.99% Sn in the copper concentrate, 0.44% Sn in the lead concentrate and 0.04% in the zinc concentrate. The majority of the tin, an average of 60%, was not recovered and reported to the final float tails which had an average tails tin assay of 0.025% Sn.

In summary the Keg Zone mineralization responds very well to typical copper/lead/zinc flotation circuits with excellent recoveries of payable metals and acceptable concentrate grades in copper, lead and zinc concentrates, in line with metallurgical efficiencies of much higher grade copper/lead/zinc deposits.

ON-GOING TESTWORK

The following summarizes remaining testwork as previously planned and outstanding test results which remain to be received:

- Two batch flotation tests are being done on the Overall Composite, one using a combination of cyanide and sodium metabisulphite (MBS) as depressants in the float and one only using MBS as a depressant. Once these additional results are available, a repeat lock cycle test on the Overall Composite using the better of the two depressants will be done to quantify concentrate grade and recovery under

conditions approaching steady state, particularly as it applies to the zinc concentrate.

- Final QEMSCAN mineralogical report for the Overall Composite.
- Detailed elemental analysis of final concentrate products.
- Tailings physical and chemical characterization including:
  - Specific gravity and particle size distribution.
  - Acid Base Accounting (ABA) and Net Acid Generation Potential (NAG).
  - Detailed ICP-OES/MS analysis of tailings solids and liquid.
  - Tailings aging tests with analysis of tailings supernatant at 3, 7, 14, 28 and 56 days.
  - Toxicity LC50 testing (rainbow trout and daphnia magna).
  - Tailings settling tests and rheology measurements.

Yours truly;
MELIS ENGINEERING LTD.

Lawrence A. Melis, P.Eng.
President

APPENDIX A

SILVER RANGE KEG MAIN ZONE METALLURGICAL TESTWORK

SGS-LAKEFIELD TEST DATA SHEETS

Test No.: F11 **Project No.:** 13589-001 **Operator:** CC **Date:** July 11th 2012

Purpose: As F10, less NaCN with finer regrinds

Procedure: As outlined below.

Feed: 2 x 2 kg of minus 10 mesh 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = µm

CuPb Regrind 20 minutes / 2 x CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 14 µm

Zn Regrind 20 minutes / 1 x Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 20 µm

Conditions:

Test No.:	F13	**Project No.**:	13589-001	**Operator**:	CC/TM	**Date**:	Aug 7th 2012

Purpose: As F11 on variability composites - Comp B - higher Zn, increased NaCN in CuPb regrind and CuSO4 in Zn circuit

Procedure: As outlined below.

Feed: 2 kg of minus 10 mesh — 50244-001 Comp B (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 106 µm

CuPb Regrind 15 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 24 µm

Zn Regrind 20 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 15 µm

Test No.:	F15			**Project No.**:	13589-001			**Operator**:	CC/TM			**Date**:	Aug 15th 2012						
Purpose:	As F11 on variability composites - Comp D																		
Procedure:	As outlined below.																		
				50244-001															
Feed:	2 x 2 kg of minus 10 mesh Comp D							(location in a drum on a skid in the freezer)											
Primary Grind:	30	minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1).										P80 =	105	µm					
CuPb Regrind	15	minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.										P80 =		µm					
Zn Regrind	15	minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.										P80 =		µm

Test No.:	F17	**Project No.**:	13589-001	**Operator**:	CC/TM	**Date**:	Aug. 29th 2012

Purpose: As F11 on variability composites - Comp F

Procedure: As outlined below.

Feed: 50244-001 — 2 x 2 kg of minus 10 mesh Comp F (location in a drum on a skid in the freezer)

Primary Grind:	30	minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1).	P80 =	80	µm
CuPb Regrind	20	minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.	P80 =	19	µm
Zn Regrind	25	minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.	P80 =	14	µm

Conditions:

Test No.:	F18	**Project No.**:	13589-001	**Operator**:	CC	**Date**:	Sept.19th, 2012

Purpose: As F11, double feed mass to have more sample for assay, increase pH in Zn circuit and add 5th cleaning stage

Procedure: As outlined below.

Feed: 4 x 2 kg of minus 10 mesh; 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1+BM#2). P80 = µm

CuPb Regrind 20 minutes / 2 x CuPb Ro Conc 1-3 @ 65% solids in laboratory ball mill. P80 = µm

Zn Regrind 20 minutes / 2 x Zn Ro Conc 1-3 @ 65% solids in laboratory ball mill. P80 = µm

Test No.: F19 **Project No.**: 13589-001 **Operator**: CC **Date**: Oct. 2nd 2012

Purpose: Upgrade Zn 4th Cleaner concentrate

Procedure: As outlined below.

Feed: 230g of minus 10 mesh LCT 5 Zn 4th Cl Conc A-F
(Assume 8kg of whole ore feed)

Regrind: 15 minutes / Zn 4th Cl Conc A-F @ 65% solids in laboratory pebble mill. P80 = µm

Conditions:

Test No.: LCT1 **Project No.:** 13589-001 **Operator:** CC/TM **Date:** Aug 13th 2012

Purpose: As F11, lower collector in the Zn cleaner circuit, longer regrind

Procedure: As outlined below.

50244-001

Feed: 12 x 2 kg of minus 10 mesh Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). Zn Ro Tail A-F P80 = 102 µm
Cu Conc A-F P80 = 24 µm
CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. Pb Conc A-F P80 = 23 µm
Zn Regrind 25 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. Zn Conc A-F P80 = 16 µm

Test No.: LCT3 **Project No.**: 13589-001 **Operator**: CC/TM **Date**: Sept 6,2012

Purpose: As F13, 4kg per cycle, higher pH in Zn circuit, more collector in Cu/Pb rougher

Procedure: As outlined below.

50244-001

Feed: 12 x 2 kg of minus 10 mesh Comp B (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 134 µm

Pb Conc P80 = 25.7 µm

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. Cu Conc P80 = 27.3 µm

Zn Regrind 22 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. Zn Conc P80 = 20 µm

Conditions:

Test No.: LCT4 **Project No.:** 13589-001 **Operator:** CC/TM **Date:** Sept. 11th 2012

Purpose: As F14, 4kg per cycle, higher pH in Zn circuit, more collector in Cu/Pb rougher

Procedure: As outlined below.

50244-001

Feed: 12 x 2 kg of minus 10 mesh Comp C (location in a drum on a skid in the freezer)

Primary Grind:	29.5	minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1 & #2).		P80 =	95 µm
			Pb Conc	P80 =	27.3 µm
CuPb Regrind	20	minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.	Cu Conc	P80 =	23.4 µm
Zn Regrind	15	minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.	Zn Conc	P80 =	20 µm

Conditions:

Purpose: As F15, higher pH in Zn circuit

Procedure: As outlined below.

50244-001

Feed: 12 x 2 kg of minus 10 mesh Comp D (location in a drum on a skid in the freezer)

Primary Grind:	30	minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1&#2).		P80 =	111 µm
			Pb Conc	P80 =	29.8 µm
CuPb Regrind	20	minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.	Cu Conc	P80 =	22.4 µm
Zn Regrind	20	minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.	Zn Conc	P80 =	19 µm

Test No.: LCT7 **Project No.**: 13589-001 **Operator**: CC/TM **Date**: Sept. 20th 2012

Purpose: As F17, shorter Zn cleaner retention time

Procedure: As outlined below.

50244-001

Feed: 12 x 2 kg of minus 10 mesh Comp F (location in a drum on a skid in the freezer)

Primary Grind: 28 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 89 µm

Pb Conc P80 = 25.5 µm

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. Cu Conc P80 = 23.6 µm

Zn Regrind 25 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. Zn Conc P80 = 15 µm

Conditions:

December 14, 2012 **Melis Project No. 547**

Silver Range Resources Ltd.
1016 510 West Hastings Street
VANCOUVER BC V6B 1L8

Attention: Bruce A. Youngman, Chairman

Dear Bruce:

Re: Silver Range Resources Ltd. - Keg Main Zone Ag/Zn/Pb/Cu Project Metallurgy
Melis Status Report No. 5 for the Period November 16 to December 14, 2012 Rev 1

SUMMARY

Melis Engineering Ltd. (Melis) is overseeing a flotation testwork program on Silver Range Resources Ltd. (Silver Range)'s Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon. The testwork, being completed at SGS Canada Inc. Lakefield Research (SGS Lakefield) in Lakefield Ontario, encompasses preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No.5, a follow-up to the November 16, 2012 Melis Status Report No. 4, provides additional results available to date. It includes results of two additional batch tests to test zinc concentrate upgrading, results of one additional lock cycle test completed on the Overall Composite, available detailed analyses of the concentrates from the lock cycle tests on the Overall Composite and on the variability composites, tailings solids and supernatant analysis, results of a tailings settling test and results of tailings supernatant aging tests available to date.

Batch testing showed that complete replacement of sodium cyanide with MBS resulted in poor copper/lead separation and a drop in zinc recovery to the fourth cleaner concentrate with only a slight improvement in zinc concentrate grade. The replacement of sodium cyanide with MBS only in the zinc cleaner circuit improved the zinc concentrate grade to 48.5% Zn with four cleaners, compared to the 46.9% Zn achieved with five cleaners (43.4% Zn with four cleaners) in a previous test, Test F18.

An additional lock cycle test, Test LCT8, was completed on the Overall Composite with replacement of sodium cyanide with MBS only in the zinc cleaner circuit, adding slightly less collector in the zinc cleaner circuit and a longer regrind of the zinc rougher concentrate. This test achieved better zinc concentrate grade and recovery than the

previous lock cycle test, zinc recovery was 87.7% to a zinc concentrate assaying 49.8% Zn. Lead recovery was 86.0% to a lead concentrate assaying 59.4% Pb. Copper recovery was 69.2% to a copper concentrate assaying 28.1% Cu. Silver recoveries were 62.9% to the lead concentrate assaying 5,559 g Ag/t, 20.5% to the copper concentrate assaying 1,328 g Ag/t and 5.9% to the zinc concentrate assaying 105 g Ag/t. An indium recovery of 8.0% reported to the copper concentrate assaying 152 g In/t and 77.5% to the zinc concentrate assaying 384 g In/t.

Detailed analyses of the copper, lead and zinc concentrates, composites of the concentrates from the six cycles (A-F) of the lock cycle tests on the Overall Composite and on the variability composites, are summarized in Tables 5, 6 and 7 of this report. These analyses can be used as preliminary data in marketing studies and for developing smelter terms for each concentrate.

Tailings data provided in Tables 8 and 9 of this report can be used in preliminary environmental studies for the project.
