INTRODUCTION

Melis Engineering Ltd. (Melis) is overseeing a flotation testwork program on Silver Range Resources Ltd. (Silver Range)'s Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon.

The testwork, being completed at SGS Canada Inc. Lakefield Research (SGS Lakefield) in Lakefield Ontario, encompasses preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No.5, a follow-up to the November 16, 2012 Melis Status Report No. 4, provides additional results available to date. It includes results of two additional batch tests to test zinc concentrate upgrading, results of one additional lock cycle test completed on the Overall Composite, available detailed analyses of the concentrates from the lock cycle tests on the Overall Composite and on the variability composites, tailings solids and supernatant analysis, results of a tailings settling test and results of tailings supernatant aging tests available to date.

BATCH FLOTATION TESTS TO COMPARE ALTERNATIVE DEPRESSANTS

Two batch flotation tests, Tests F21 and F22, were completed to further evaluate the use of alternative depressant combinations to see if an increase in zinc concentrate could be attained without impacting on copper/lead flotation. Previous tests (Tests F19 and F20, see Melis Status Report No. 4 dated November 16, 2012) showed that the use of sodium metabisulphite (MBS) in place of sodium cyanide in the zinc re-cleaner yielded a higher zinc concentrate grade and better zinc cleaner recovery.

In Test F21 MBS replaced sodium cyanide only in the zinc cleaner circuit and in Test F22 MBS replaced sodium cyanide in the complete float. Results of these two tests are summarized in Tables 1 and 2 below.

Complete replacement of sodium cyanide with MBS in Test F22 resulted in poor copper/lead separation and a drop in zinc recovery to the fourth cleaner concentrate with only a slight improvement in zinc concentrate grade. The replacement of sodium cyanide with MBS in the zinc cleaner circuit improved the zinc concentrate grade to 48.5% Zn with four cleaners, compared to the 46.9% Zn achieved with five cleaners (43.4% Zn with four cleaners) in Test F18 (see Melis Status Report No. 4).

ADDITIONAL LOCK CYCLE TEST ON OVERALL COMPOSITE

An additional lock cycle test, Test LCT8, was completed on the Overall Composite under the conditions of Test F21 except with slightly less collector dosage in the zinc cleaner circuit and a longer regrind of the zinc rougher concentrate. The results of the previous lock cycle test on the Overall Composite, Test LCT1, are reproduced in Table 3 for comparison purposes. The metallurgical projections based on the last three cycles (Cycles D to F) for Test LCT8 are summarized in Table 4 below. As noted in Figure 1 below, the additional lock cycle test appeared to be stable in the last three cycles.

Figure 1
Silver Range Project – Overall Composite Lock Cycle Test (Test LCT8)
Test Stability Check
(from SGS Lakefield)

Test LCT8 achieved better zinc concentrate grade and recovery than Test LCT1, confirming the batch test results that showed MBS replacement of sodium cyanide in the zinc cleaner circuit yielded better zinc results.

In Test LCT8 lead recovery was 86.0% to a lead concentrate assaying 59.4% Pb. Copper recovery was 69.2% to a copper concentrate assaying 28.1% Cu. Zinc recovery was 87.7% to a zinc concentrate assaying 49.8% Zn.

Silver recoveries were 62.9% to the lead concentrate assaying 5,559 g Ag/t, 20.5% to the copper concentrate assaying 1,328 g Ag/t and 5.9% to the zinc concentrate assaying 105 g Ag/t.

Because of poor detection limits for indium assays (50 ppm or 0.005% In), a metallurgical balance for indium was not possible. However, as done for previous lock cycle tests, indium recoveries to the copper and zinc concentrates were estimated by using the indium assay head grade for the composite as the total indium in the feed for the test, and calculating the amount of indium reporting to the copper and zinc concentrates based on weight and indium assay. Using this approach 8.0% of the indium reported to the copper concentrate assaying 152 g In/t and 77.5% to the zinc concentrate assaying 384 g In/t.

DETAILED CONCENTRATE ANALYSES

Available detailed analyses of the copper, lead and zinc concentrates, composites of the concentrates from the six cycles (A-F), are summarized in Tables 5, 6 and 7 below for the first lock cycle test completed on the Overall Composite, Test LCT1, and for the lock cycle tests completed on the six variability composites, Tests LCT 2 to LCT7. These analyses can be used as preliminary data in marketing studies and for developing smelter terms for each concentrate.

TAILINGS DATA

Tailings Analyses

The combined zinc flotation tailings solids and tailings supernatant from the first lock cycle test were submitted to a detailed analysis. The tailings were also submitted to tailings aging tests with analysis of the supernatant at regular intervals. The tailings solids analyses are summarized in Table 8 and the tailings aging test results available to date are summarized in Table 9. These data can be used in preliminary environmental studies for the project.

Tailings Settling Test

A static settling test was completed on the zinc flotation tailings from Test LCT1. This test showed that a thickened tailings density of 69% solids (w/w) could be achieved using a feed pulp density of 10% solids (w/w) and a Magnafloc 10 flocculant dosage of 8 g/t. The thickener unit area was measured at 0.08 m^2/t/day.

Allowing for a 25% design factor the net thickener area would be 0.10 m^2/t/day, which implies that the Silver Range flotation tailings settle relatively well.

REMAINING TESTWORK

With submission of this status report this phase of the Silver Range Keg Main Zone test program is essentially complete with the only outstanding item being the tailings supernatant aging assays which are extended to 56 days of aging, the standard protocol for this type of test.

Yours truly;
MELIS ENGINEERING LTD.

Lawrence A. Melis, P.Eng.
President

Test No.:	F22	**Project No.:**	13589-001	**Operator:**	TM/CC	**Date:**	Nov.14th 2012

Purpose: As F21, replace NaCN with NaMBS

Procedure: As outlined below.

Feed: 2 x 2 kg of minus 10 mesh; 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1+BM#2). P80 = µm

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = µm

Zn Regrind 25 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = µm

Conditions:

Test No.: LCT8 **Project No.:** 13589-001 **Operator:** CC/TM **Date:** Nov. 26th 2012

Purpose: As F21/F22, lower collector in the Zn cleaner circuit, longer regrind

Procedure: As outlined below.

50244-001

Feed: 12 x 2 kg of minus 10 mesh Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). Zn Ro Tail A-F P80 = 106 µm; Cu Conc A-F P80 = 29 µm

CuPb Regrind: 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. Pb Conc A-F P80 = 30 µm

Zn Regrind: 25 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. Zn Conc A-F P80 = 17 µm

Conditions:

MELIS ENGINEERING LTD.

January 8, 2013 **Melis Project No. 547**

Silver Range Resources Ltd.
1016 510 West Hastings Street
VANCOUVER BC V6B 1L8

Attention: Bruce A. Youngman, Chairman

Dear Bruce:

Re: Silver Range Resources Ltd. - Keg Main Zone Ag/Zn/Pb/Cu Project Metallurgy
Melis Status Report No. 6 for the Period December 15, 2012 to January 8, 2013

SUMMARY

Melis Engineering Ltd. (Melis) has overseen a flotation testwork program on Silver Range Resources Ltd. (Silver Range)'s Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon. The testwork, completed at SGS Canada Inc. Lakefield Research (SGS Lakefield) in Lakefield Ontario in 2012, encompassed preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No. 6, a follow-up to the December 14, 2012 Melis Status Report No. 5, and the final status report to be issued by Melis, provides the final results of tailings supernatant aging tests and toxicity tests completed on tailings supernatant water.

Tailings supernatant aging test data, provided in Table 1 of this report, and the toxicity results summarized in Table 2 and attached as Appendix A, which showed a pass for both the *Daphnia magna* test and the rainbow trout test, can be used in preliminary environmental studies for the project.

With submission of this status report the Silver Range Keg Main Zone test program is complete. SGS Lakefield will issue its own report of the testwork and this will be forwarded to Silver Range when received.

INTRODUCTION

Melis Engineering Ltd. (Melis) has overseen a flotation testwork program on Silver Range Resources Ltd. (Silver Range)'s Keg Main Zone silver/zinc/lead/copper project located near Faro, Yukon.

The testwork, completed at SGS Canada Inc. Lakefield Research (SGS Lakefield) in Lakefield Ontario in 2012, encompassed preparation and analyses of test composites, comminution testing, open cycle and lock cycle flotation tests, gravity recovery tests, concentrate analyses and tailings physical and chemical characterization.

This status report, Melis Status Report No. 6, a follow-up to the December 14, 2012 Melis Status Report No. 5, and the final status report to be issued by Melis, provides the final results of tailings supernatant aging tests and toxicity tests completed on tailings water.

TAILINGS DATA

Tailings supernatant aging test analyses and tailings supernatant toxicity tests, which can be used in preliminary environmental studies for the project, are provided below.

Tailings Supernatant Aging Test Analyses

The combined zinc flotation tailings solids and tailings supernatant (from blending rougher tails and first cleaner scavenger tails from the first lock cycle test) were submitted to tailings aging tests with analysis of the supernatant at regular intervals. Day 0 to Day 28 results were reported in the previous Melis status report. Day 56 results have been added to Table 1 below.

Tailings Toxicity Tests

Toxicity tests were completed on the Day 56 tailings supernatant using *Daphnia magna* and rainbow trout. Results are summarized in Table 2 below and detailed in Appendix A. The Silver Range Day 56 tailings supernatant passed both the *Daphnia magna* test and the rainbow trout test.

TOXICITY TEST REPORT

Daphnia magna

Work Order : 222785
Sample Number : 36185

SAMPLE IDENTIFICATION

Company :	SGS Lakefield Research Limited	Time Collected :	10:30
Location :	Lakefield ON	Date Collected :	2012-12-13
Substance :	DE 13/12 LCT1 Comb Tls Day 56	Date Received :	2012-12-14
Sampling Method :	Grab	Date Tested :	2012-12-14
Sampled By :	B. Bowman	Temp. on Arrival :	14.0 °C
Sample Description :	Clear, colourless, odourless		

Test Method : Reference Method for Determining Acute Lethality of Effluents to *Daphnia magna* . Environment Canada EPS 1/RM/14 (Second Edition, December 2000).

TEST RESULTS

Effect	Value	95% Confidence Limits	Slope	Calculation Method
48-h LC50	100%*	50 - *	–	Nonlinear Interpolation
48-h EC50	100%*	50 - *	–	Nonlinear Interpolation

The results reported relate only to the sample tested.

*The usefulness of any LC50/EC50 calculated from this set of data is quiestonable because a concentration-effect relationship has not been demonstrated over a reasonable range (e.g. <37 to >63) of percent dead. A statistically valid upper 95% confidence limit could not be generated. At a confidence level of 95%, the binomial test shows that the LC50/EC50 is above 50%.

SODIUM CHLORIDE REFERENCE TOXICANT DATA

Organism Batch :	Dm12-24	Historical Mean LC50 :	6.6 g/L
Date Tested (yyyy/mm/dd) :	2012-12-11	Warning Limits (± 2SD) :	6.0 - 7.3 g/L
LC50 (95% Confidence Limits) :	7.5 g/L[1] (6.9 - 7.8)	Analyst(s) :	MS, NK
Statistical Method :	Linear Regression (MLE)		

Daphnia magna CULTURE HEALTH DATA

Time to First Brood :	9.8 days	Mean Young Per Brood :	28.3
Culture Mortality :	0.4% (previous 7 days)		

TEST CONDITIONS

Sample Treatment :	None	Number of Replicates :	1
pH Adjustment :	None	Test Organisms / Replicate :	10
Test Aeration :	None	Total Organisms / Test Level :	10
Organism Batch :	Dm12-24	Organism Loading Rate :	15.0 mL/organism

[1]Note: The reference toxicant test result fell outside the 95% warning limits for historical data. No other unusual circumstances were observed and therefore the test result is considered acceptable. Reference toxicant test was conducted under conditions identical to the test.

Figure 2: Cu & Zn Stage Recovery for Comp B 5

Executive Summary

The scope of this metallurgical test program included the investigation of metals - Ag, Sn, Cu, Zn, Pb & In recovery from the Rebel project samples supplied by Archer, Cathro & Associates Limited.

Two composites (A & B) were prepared by splitting 1kg of material from each crushed samples and blended together to form a composite. The head grade of the composite A & B are presented in table below.

Composite	Head Grade					
	Ag (g/t)	Cu (%)	Pb (%)	Zn (%)	In (ppm)	Sn (ppm)
Comp A	22.0	0.13	0.35	1.05	24.3	250
Comp B	15.5	0.09	0.26	1.55	15.7	220

Two test grinds were performed for each composite in a 2 kg laboratory mill (rod) to calibrate grind time for subsequent bench testing.

Two stage gravity separation tests (Wilfley shaking table & Knelson concentrator) recovered 25.8% and 36.8% of the silver from Comp A & B respectively with 55.4 g/t and 227.0 g/t of Ag in Wilfley concentrates. Tin was recovered up to 10.1% & 3.2% from comp A & B to a concentrate (Wilfley) of Sn at 330 ppm & 290 ppm respectively.

The silver recovery by gravity separation of the A & B composites is considered acceptable with very low tin recovery in both Composites. It is likely that a processing plant for material from the Rebel zone will benefit from the inclusion of a gravity concentration circuit for Ag.

Four atmospheric acid leach tests were conducted on comp A & B at pHs of 1.0 & 2.5 (controlled) to investigate the response of Cu, Zn, Pb, In & Ag recovery. Leach residence time was 6.0 hours for each test, reaching a plateau after 4 hours of leach residence time.

Pb, In and Ag recovery were negligible for both composites A & B under these test (atmospheric acid leach) conditions. The highest copper and zinc extractions, 51.3% & 88.3% respectively, from comp B were obtained at pH 1.0 . Comp A yielded recoveries of 24.7% & 57.5% of Cu & Zn respectively at pH 1.0. Reducing the acid addition resulted in lower recoveries of both copper for both comp A & B. Both composites showed lower ORP at pH 2.5 (controlled) than pH 1.0 condition, due to the lack of oxidant which impacted Cu recovery directly.

Introduction

A scoping level metallurgical test program was conducted for Archer, Cathro & Associates (1981) Ltd. on two different ore types from the Rebel project, located in the Yukon territory. The samples were collected and submitted by Archer, Cathro & Associates (1981) Ltd. All testwork was conducted by SGS. Unless otherwise stated, all the work referenced in this report was completed under the internal SGS project number CAVM-50303-001.

The intention of this test program was to conduct scoping level metallurgical testwork to investigate the extraction of Ag, Sn, Cu, Zn, Pb and In efficiently. All test results and work conditions are presented in the attached appendices. The testing program was completed over the months of December, 2012 to February, 2013. Mr. Andrew Carne of Archer, Cathro & Associates (1981) Ltd. was regularly updated with the results as testwork progressed.

Testwork Summary

1. Sample Receipt, Preparation and Characterisation

1.1. Sample Receipt and preparation

Two composites (Comp A & Comp B) representing two differing ore types from the Rebel zone arrived on one skid (14 rice bags) and were received at the SGS sample preparation facility in Burnaby, BC on November, 2012. The shipment was assigned the receipt no VAN-460. The samples were inspected as received, inventoried and weighed. Table 1 represents the sample inventory received by SGS. Composites were prepared by splitting 1kg of material from each crushed sample and blended to form a composite. Composite A & B weights were 21kg and 22kg respectively. Unused portions were stored for possible future testwork. The composite samples were stage crushed separately to 100% passing 10 mesh, blended thoroughly and split into 2 kg test charges with a rotary splitter.

2. Metallurgical Testwork

2.1. Grind Curve Determination

Two test grinds were performed for each composite in a 2 kg laboratory mill (rod) to calibrate grind time for subsequent bench testing. Results are presented in Table 3.

Table 3: Grind Calibration Data

Sample ID	Grind Time, min	K_{80}, µm	Predicted time, min	Target K_{80}, µm
Comp A	30	69	30.3	74
	15	126		
Comp B	30	48	25.4	74
	15	198		

2.2. Gravity Separation

A two-stage gravity separation test was completed on each composite; A & B were ground to 80% passing 77 and 98 µm respectively and processed through a Wilfley shaking table, with collection of the concentrates and tailings. The Wilfley concentrate was assayed for Ag & Sn. The Wilfley tailings were further processed through a Knelson MD-3 concentrator. The Knelson concentrate and tailings were both assayed for Ag and Sn . The combined gravity tailings were stored for possible downstream testing. The details of the gravity test procedures are presented in Appendix C and summary of results reported in Table 4.

Table 4: Summary of Gravity Separation

Composite	Stream	Wt, g	Wt, %	Assay - g/t, ppm*		Distribution - %	
				Sn*	Ag	Sn*	Ag
Comp A	Wilfley Conc.	789.3	7.9	330	55.4	9.48	23.7
	Knelson Conc.	68.0	0.7	280	56.1	0.69	2.1
	Combined Tailing	9142.7	91.4	270	15.0	89.8	74.3
	Calc. Feed	10000	100	275	18.5	100	100
	Direct Head Grade			250	22.0		
Comp B	Wilfley Conc.	208.1	2.1	290	227.0	2.5	33.8
	Knelson Conc.	71.1	0.7	250	60.0	0.7	3.0
	Combined Tailing	9720.8	97.2	240	9.10	96.8	63.2
	Calc. Feed	10000	100	241	14.0	100	100
	Direct Head Grade			220	15.5		

The results indicate that 25.8% and 36.8% of the silver were recoverable from Comp A & B respectively by two stage gravity separation to a concentrate (Wilfley) containing 55.4 g/t and 227 g/t of Ag respectively. The calculated silver head assay agreed well for Comp A with the direct head assays, but Comp A is around 15% off. Also, 10.1% & 3.2% of Sn were recovered from comp A & B respectively to a concentrate (Wilfley) containing 330 ppm & 290 ppm of Sn from Comp A & B respectively.

The silver recovery by gravity separation for the two composite is considered acceptable with overall very low tin recovery in both composite. It is likely that a processing plant for material from the Rebel zone will benefit from the inclusion of a gravity concentration circuit. It is recommended to conduct detailed gravity separation tests at different grind sizes in the next stage of testing to further substantiate the above results along with variability testing.

2.3. Atmospheric Acid Leach

A series of sulphuric acid leaches were performed on the two composites A & B at two different pH ranges. In these tests, samples were leached for 6 hours at ambient temperature (no control) at 30% initial pulp density with controlled concentrated sulphuric acid. The pH of the pulp was maintained at pH 1 & 2.5 using sulphuric acid. Each leach test used 500 g of sample. Kinetic samples of the pulp were collected after 0.5, 1, 2, 3, 4.5 and 6 hours using a syringe. The samples were filtered and the weights of

pulp and PLS were recorded. Solids were returned to the reactor. Kinetic solution samples were analysed for Cu, Pb, Zn, In and Ag. After the residence time was over (6 hours), the reactor contents were filtered and the final filtrate (PLS) was obtained. The pH, ORP, density and free acid concentration of the final filtrate were measured.

For all tests, the residue was washed three times with de-ionized water, filtered and dried. Subsamples were cut from the dry residues and analysed for metal content. The remainder of the dry solids were stored for further testwork.

Table 5 represents the detailed conditions of each leach test. Table 7 shows summarized metal recoveries for the two composites at the two different test pH.

Table 7: Atmospheric Acid Leach Metal Recovery

Test Series	**Metal Recvory , %**			
Sample	**Comp A**	**Comp A**	**Comp B**	**Comp B**
Test ID	**AL-Comp A pH 1.0**	**AL-Comp A pH 2.5**	**AL-Comp B pH 1.0**	**AL-Comp B pH 2.5**
Cu	24.7	18.6	51.3	22.6
Zn	57.0	57.2	88.3	78.0
Pb	1.00	0.00	0.00	0.00
In	0.00	0.00	0.00	0.00
Ag	0.00	0.00	0.00	0.00

Copper extraction ranged from 18.6% to 51.3% with the best result originating from comp B at lower pH (1.0). Zn extractions were higher - ranging from 57.0% to 88.3%. Pb, In and Ag extraction were negligible.

Both composites showed lower ORP at pH 2.5 (controlled) than pH 1.0, due to the lack of oxidant which impacts Cu & Zn recovery directly.

Acid consumptions were considered to be medium to high. The highest amounts of Cu and Zn leached were in Comp B @ pH 1.0, which explains why this test had higher acid consumption (147.0 kg/t). Figure 1 & Figure 2 represent the staged Cu & Zn recovery of Comp A & B at pH 1.0 & 2.5. The leaching kinetics of Cu & Zn recovery are average, reaching maximum recovery plateau within 1.0 hrs for pH 1.0.

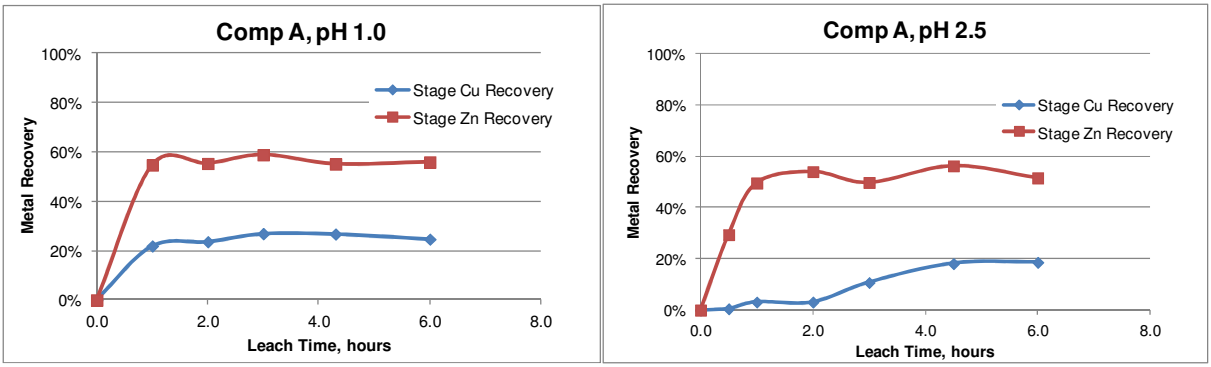

Figure 1: Cu & Zn Staged Recovery for Comp A

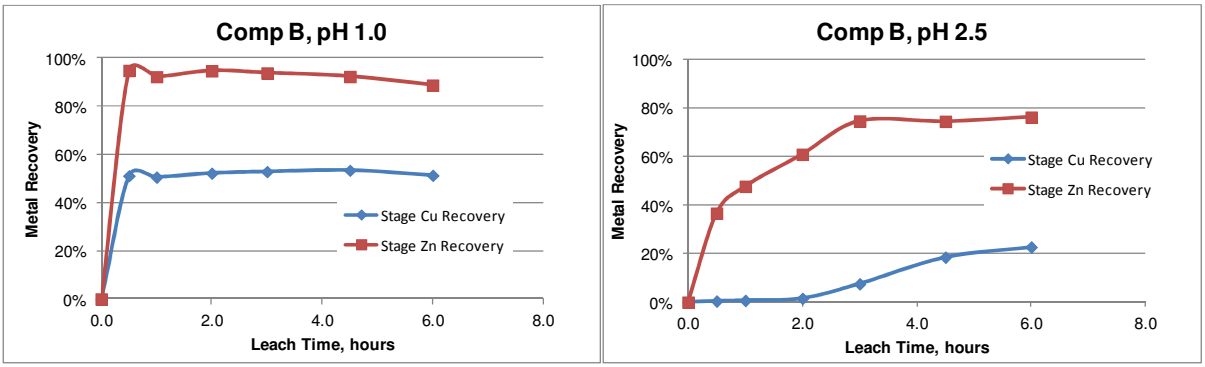

Figure 2: Cu & Zn Staged Recovery for Comp B

Conclusions and Recommendations

The testwork program was completed using material originating from samples representing the Rebel zone, supplied by Archer, Cathro and Associates (1981) Limited. Two composites were formed with the following characteristics:

- The head assay of composites A & B are presented in Table 8.

Table 8: Head Assays of Composites A & B

Composite	Head Grade					
	Ag (g/t)	Cu (%)	Pb (%)	Zn (%)	In (ppm)	Sn (ppm)
Comp A	22.0	0.13	0.35	1.05	24.3	250
Comp B	15.5	0.09	0.26	1.55	15.7	220

- Gravity separation tests (combined Wilfley & Knelson) recovered 25.8% and 36.8% of silver from Comp A & B respectively with concentrate grades (Wilfley) of 55.4 g/t and 227.0 g/t Ag. Also, 10.1% & 3.2% of Sn was recovered from comps A & B to a concentrate (Wilfley) grading 330 ppm & 290 ppm Sn respectively.

- Silver recovery by gravity separation of the A & B composites is considered acceptable. It is recommended to conduct gravity separation tests at different grind sizes with variability samples to further substantiate the above results.

- The whole ore atmospheric acid leach tests produced Zn recoveries ranging from 57.5% to 88.3% and copper recoveries ranging from 18.6% to 51.3%. The amenability of Pb, In and Ag to atmospheric acid leaching was negligible. Reducing the acid addition resulted in lower copper recoveries for both comp A & B.

- Acid consumptions were considered to be medium to high. The highest amounts of Cu and Zn leached were in Comp B @ pH 1.0, which explains why this had higher acid consumption (147.0 kg/t). The leaching kinetics of Cu & Zn recovery is average, reaching maximum recovery plateau within 1.0 hrs for pH 1.0.

- Further acid leach tests are recommended at higher temperature and high pressure and at different grind sizes to investigate the effects on recovery of metals.

- Flotation test work is also recommended to investigate the Cu, Zn & Pb recovery.

- Testing additional ore lithologies and special samples is recommended.

Appendix A – Sample Preparation and Head Assays

Certificate of Analysis

Work Order: VC123515

To: **Met - Subrata Roy**

SGS

SAMPLE PREPARATION AND COMPOSITING INSTRUCTIONS

Receipt Number: _____ Date: 12 Dec, 2012
Project Number: CAVM-50303-001 Metallurgist: Subrata Dept.: MET
Name of Company: Archer Cathro.
Name of Samples: Composite A & B

Crushing Information: (Indicate Size Required)

Jaw Crush to: -2" ☐ -1" ☐ -3/4" ☐ -1/2" ☐ -3/8" ☐
-3 Mesh (1/4") ☐ -6 Mesh (3.3 mm) ☐ **Riffle and Store** ☐
Roll Crush to: -10 Mesh (2 mm) ☒ -20 Mesh (0.84 mm) ☐ **Riffle and Store** ☒

Analyses Required:

Head Sample: Yes Number: 1 × Weight of Each
Chemical Analyses: Ag, Au, Pb, Cu, Zn, In & ICP scan
Bucking Room:
Mineralogy: N/A
Other:

Storage Information:

Freezer Storage: ☐ Sample Plant Storage: ☐ Other: As delivered

Compositing Instructions:

1. Composites will be prepared by splitting 1kg of material from each crushed sample interval and blending to form a composite, as shown in the attached spreadsheet. Composite A will weigh 21kg, and composite B will weigh 22 kg. Unused portions of sample shall be stored for possible future testwork.
2. Once blended, composites will be stage crushed to minus 10 mesh.
3. Then blend it homogenously.
4. Rotary split to 2kg test charges.
5. Split head assay from one 2kg charges per composite
6. Submit head assay for Au, Ag, Pb, Cu, Zn, In & ICP scan

Charges Required: **(Please list all charges by number, weight and mesh size,** eg. 10 × 2 kg, -10M)

Sample ID	Test Charge Location	Charge #	Unit Wt. (kg)
1		2	1
2		2	1
3		2	1
4		**2**	1
5		2	1
6		2	1
7		2	1
8		2	1

COMPLETED BY: _____ **DATE COMPLETED:** _____

Appendix B – Metallurgical Test Data

Project No.: 50303-001 **Project Technologist:** SR
Client: Archer & Cathro **Date of Test:** 20-Dec-12

Test No.: AL-Comp A pH 1.0

Objective: 6-hr leach test, **Comp A**, 30% solids, 74 micron, ambient temp, pH 1.0 controlled

Procedure:

1. Review MSDS for concentrated sulphuric acid (H_2SO_4).
2. Set up 2 L glass leach vessel with vapour condenser, mixer, pH and ORP probes.
   Note: No metal exposed surfaces.
3. Grind the sample to (based on grind cal) to get 80% passing 74µm.
4. Accurately measure DI water per calculated values (see below).
5. Obtain 500 g sample (as DRY weight) of ground sample.
6. Add slurry sample to DI water in vessel - make sure that all of the sample is below liquid level.
7. Start mixer.
8. Record pH, temperature and ORP per checklist below.
9. If the measured pH is higher than 1, add conc. H2SO4 in dropwise fashion to target pH 1 +/- 0.1.
10. Record weight of conc. H_2SO_4 added in table below.
11. Collect ~15 mL aliquot samples as per table below. Filter and submit for chemical analysis. Return solids to vessel.
12. DO NOT COLLECT ALIQUOTS soon after H_2SO_4 addition. Sample first, and then make pH modification.
13. When total time has elapsed stop mixer.
14. Weigh and record tare weight of pan and paper.
15. Vacuum final leach slurry. Measure density and weight of PLS. Collect sample of PLS to submit to lab.
16. Repulp 2X with 1 L DI water. Followed by final displacement with 1 L DI water. Combine wash solution filtrate.
17. Measure density and weight of wash solution. Collect sample and submit to lab.
18. Weigh wet filtercake in pan and record weight.
19. Dry in oven to constant weight. Record final weight of dried product.
20. Submit dried solids for lab analysis.

Data:

Project No.: 50303-001 **Project Technologist:** SR
Client: Archer & Cathro (Rebel Project) **Date of Test:** 2-Jan-13

Test No.: AL-Comp B, pH 1.0

Objective: 6-hr leach test, **Comp B**, 30% solids, 74 micron, ambient temp, pH 1.0 controlled

Procedure:

1. Review MSDS for concentrated sulphuric acid (H_2SO_4).
2. Set up 3 L glass leach vessel with vapour condenser, mixer, pH and ORP probes.
   Note: No metal exposed surfaces.
3. Grind the sample to (based on grind cal) to get 80% passing 74µm.
4. Accurately measure DI water per calculated values (see below).
5. Obtain 500 g sample (as DRY weight) of ground sample.
6. Add slurry sample to DI water in vessel - make sure that all of the sample is below liquid level.
7. Start mixer.
8. Record pH, temperature and ORP per checklist below.
9. If the measured pH is higher than 1, add conc. H2SO4 in dropwise fashion to target pH 1 +/- 0.1.
10. Record weight of conc. H_2SO_4 added in table below.
11. Collect ~15 mL aliquot samples as per table below. Filter and submit for chemical analysis. Return solids to vessel.
12. DO NOT COLLECT ALIQUOTS soon after H_2SO_4 addition. Sample first, and then make pH modification.
13. When total time has elapsed stop mixer.
14. Weigh and record tare weight of pan and paper.
15. Vacuum final leach slurry. Measure density and weight of PLS. Collect sample of PLS to submit to lab.
16. Repulp 2X with 1 L DI water. Followed by final displacement with 1 L DI water. Combine wash solution filtrate.
17. Measure density and weight of wash solution. Collect sample and submit to lab.
18. Weigh wet filtercake in pan and record weight.
19. Dry in oven to constant weight. Record final weight of dried product.
20. Submit dried solids for lab analysis.

Data:

Test No.: **Comp -A** Technologist: Courtney J
Project No: **CAVM-50303-001** Date: Jan 08,2013

Purpose: Concentrate Sn & Ag by gravity seperation

Feed: 5x 2 kg of minus 10 mesh of Comp - A Target K_{80} 74 µm
Grind: 5 x 2 kg charge for 43 minutes (65% solid) in 10kg rod mill Tested K_{80} 77 µm
Regrind:
Procedure: Repulp the ground sample and feed to Wilfley shaking table, collecting a shaking table concentrate and tailings.
Concentrate will be assayed for Sn & Ag.
The tailings from Wilfley shaking table will be reprocess through a Knelson MD-3 concentrator for Ag recovery.
The Knelson concentrate will be will be assayed for Ag to extinction (duplicate).

The combined tailing pulp will be stored for future test.

Results: **CAVM-50303-001** **Comp -A**

An Investigation into

THE RECOVERY OF COPPER, LEAD, ZINC AND SILVER FROM THE KEG PROPERTY

prepared for

SILVER RANGE RESOURCES LTD.

Project CALR-13589-001 – Final Report
July 12, 2013

NOTE:
The practice of this Company in issuing reports of this nature is to require the recipient not to publish the report or any part thereof without the written consent of SGS Minerals Services. This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. WARNING: The sample(s) to which the findings recorded herein (the 'Findings') relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law. Test method information available upon request.

Executive Summary

Testwork was completed on 6 variability samples as well as an Overall composite from the Keg deposit. The variability composites ranged in head grades from 0.69 to 2.30% Zn, from 0.15 to 0.62% Pb, and from 0.10 to 0.60% Cu for an Overall composite grading 1.36% Zn, 0.31% Pb, and 0.27% Cu. The samples also contained Ag (21.1 to 89.1 g/t), Sn (0.010 to 0.077%), and In (1.7 to 19.5 g/t).

Mineralogical characterization of the Overall composite showed the minerals to be well liberated at a P_{80} of 100µm. The Overall composite was composed mainly of quartz (30.6%), pyroxene (22.1%), K-feldspar (12.1%), and plagioclase (8.1%). Sulphide minerals accounted for 7.8% of the total minerals and included sphalerite (2.6%), pyrite (2.2%), chalcopyrite (1.1%), pyrrhotite (0.7%), galena (0.5%), and arsenopyrite (0.4%). Tin was present mostly as stannite with trace amounts of cassiterite. Trace amounts of Ag were also observed as native silver and sulphide minerals.

Bond ball mill grindability tests conducted on the variability composites obtained BWI ranging from 15.9 to 17.5 kWh/t, which falls in the hard category of the SGS database.

Evaluation of the amount of gravity recoverable silver and tin showed good Ag recovery at 25.6% while gravity recoverable tin was lower at 5.1%. The gravity concentrate appeared to contain high amount of Pb.

A total of 4 rougher kinetic tests and 11 batch cleaner tests were conducted on the Overall composite to optimize flowsheet and reagent conditions including primary grind, the addition of $ZnSO_4$ as a sphalerite depressant, regrind size, and CuPb separation. The optimized conditions were evaluated in a single batch cleaner test on each of the variability composites. The optimum conditions were as follows:

- A primary grind P_{80} of 100 µm.
- A CuPb rougher pH of 9.5, adjusted with lime ($Ca(OH)_2$) with 3418A (20 g/t) as collector and MIBC (15 g/t) as frother.
- CuPb cleaning included regrinding to a P_{80} of ~25 µm with 75 g/t $ZnSO_4$ and 12.5 g/t NaCN as sphalerite and pyrite depressants as well as 5 g/t 3418A collector prior to three cleaning stages with some collector added to the 2nd and 3rd cleaning stages.
- CuPb separation using NaCN targeting an oxidation-reduction potential of -400 mV (Ag/AgCl) to depress the chalcopyrite.
- The CuPb rougher and CuPb 1st cleaner scavenger tails were combined to feed the Zn circuit.
- Zn was activated with $CuSO_4$ prior to flotation at pH 11.8 using Aero 5100 as collector.
- The Zn rougher concentrate was reground to a P_{80} of ~15 µm prior to four cleaning stages.

Locked cycle tests, using the above conditions and the flowsheet depicted in Figure 1, were completed on the Overall composite as well as each of the variability composites. The test results correlated well with

head grades. The average variability LCT results are compared to the average results for the Overall composite in Table 1.

* Values <50 g/t were estimated to target head grade

Attempts to recover tin from the Zn rougher tailings were unsuccessful.

In tests to upgrade the poor Zn concentrate produced in LCT5, sodium metabisulphite performed better than sodium cyanide and was able to upgrade the Zn concentrate from 29.9% Zn to 42.9% Zn with 98.5% stage recovery.

Analysis of the Overall composite (LCT1) tailings solids found the Zn 1st cleaner scavenger tailings to contain significant concentrations of As (1.7%) and Zn (2.0%), which may be of environmental concern.

Modified acid base accounting (ABA) and net acid generation (NAG) tests found the Zn 1st cleaner scavenger tailings to have a strong potential for acid generation while it was uncertain whether the Zn rougher tails would potentially generate acid.

Analysis of the fresh and aged LCT1 Combined tailings decant solutions reported decreasing pH, increasing acidity and concentrations of arsenic (1.79 to 0.975 mg/L) well in excess of the MMER and World Bank limits (0.5 and 0.1 mg/L, respectively) throughout the 56 day ageing test period. Acute lethality bioassay testing resulted in the non-lethal designations for both trout and *Daphnia magna*.

PSD analyses determined that both samples (LCT1 Zn rougher tailings and LCT1 Zn 1st cleaner scavenger tailings) were comprised predominantly of fine grained material (-200 mesh or <0.075 mm) with the Zn 1st cleaner scavenger tailings having a much finer size distribution and containing a significant proportion of clay sized grains (<0.002 mm).

Introduction

Core samples from the Keg deposit were submitted to SGS Minerals Services (SGS) for metallurgical beneficiation testing at the request of Mr. Lawrence Melis of Melis Engineering Ltd. (Melis) on behalf of Silver Range Resources Ltd. The objective of the testwork was to quantify the metallurgical response of the mineralization in terms of payable metal recoveries. The targeted metals include lead (Pb), zinc (Zn), silver (Ag), copper (Cu), and possibly tin (Sn) and indium (In).

The metallurgical test program included mineralogy, beneficiation by gravity, flotation optimization testwork, as well as grindability testing. An environmental testing program completed the project.

Testwork Summary

1. Sample Receipt and Description

Approximately 630 kg of drill core contained in three drums were received at the SGS Lakefield site on April 23th, 2012. The shipment was given the SGS receipt number 0336-APR12, and was inventoried shortly after receipt. The shipment contained 301 intervals classified under six composites and the complete inventory is detailed in Appendix A.

2. Sample Preparation and Characterization

2.1. Sample Preparation and Head Analysis

The composite samples were labeled Comp A to Comp F. The intervals from each composite were blended and crushed for BWI testwork. The remaining material was then crushed to 10 mesh and 25 kg was riffled out to make up the overall composite. The rest of the composite samples were blended and rotary split into 2-kg test charges for the subsequent testwork. One 2-kg test charge from each composite was used for Au/Ag pulp metallic and head assay. Figure 2 presents the samples preparation flowsheet for the composites.

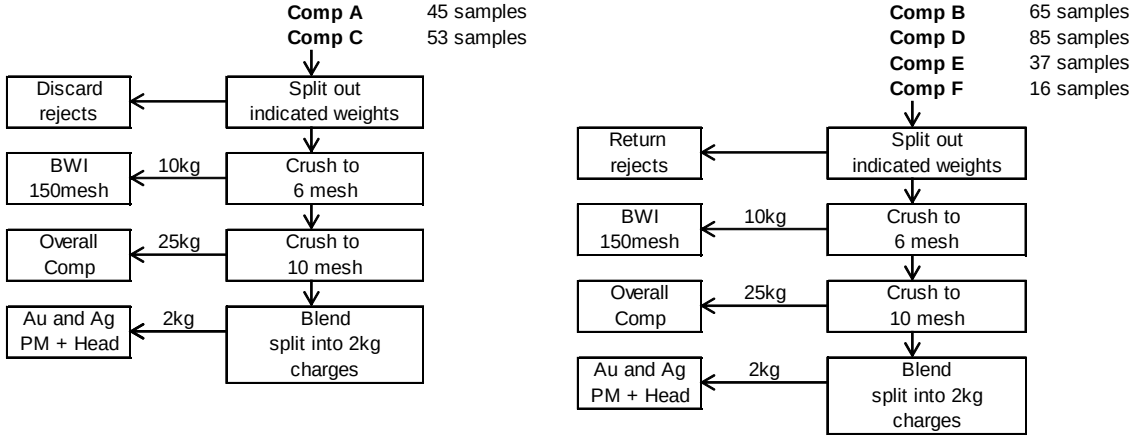

Figure 2: Composite Sample Preparation Flowsheet

A total of 150 kg was blended from the 6 composite samples. A 31-kg sub-sample was riffled out and crushed to 20 mesh and then split into 10-kg charges. The remaining material was split into 2kg charges, with one of them being used for Au/Ag pulp metallics and head analysis.

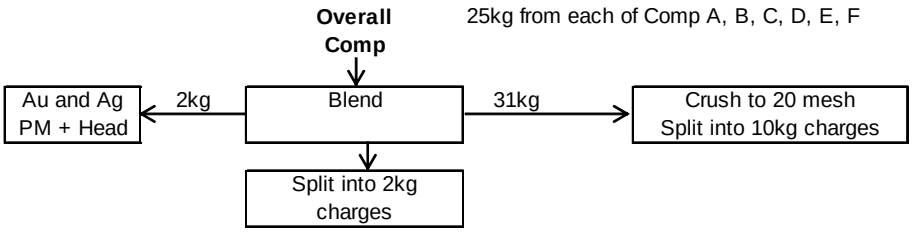

Figure 3: Overall Composite Preparation Flowsheet

A sample of 1-kg of each composite was submitted to the screened metallics analysis for Au and Ag. The pulp and metallics Au and Ag analyses presented in Table 2, indicated that there is no significant potential to recover the precious metals via gravity. A 250g head assay sample from each composite (7 in total) was submitted for Pb, Cu, Zn, Fe, S, Sn, In, Hg, ICP-OES (Al, As, Ba, Be, Bi, Ca, Cd, Co, Cr, K, Li, Mg, Mn, Mo, Na, Ni, P, Sb, Se, Sn, Sr, Ti, Tl, U, V, and Y), WRA, ABA, NAG, and specific gravity analyses as well as Au, Ag, Pt, and Pd by fire assay. The head assays are presented in Table 3

2.2. Mineralogical Analysis

A sample of the overall composite was ground to an approximate P_{80} of 100 µm. A sample of approximately 250g of sample was riffled to complete a full screen analysis, using four sizes (+106 µm,

-106 µm/+53 µm, -53 µm/+20 µm and -20 µm). The Overall composite was submitted for mineralogical analysis by QEMSCAN (Quantitative Evaluation of Minerals analysis, by SCANning Electron Microscopy) in order to identify the minerals and their liberation. The sulphide minerals observed in the overall sample were sphalerite (2.6%), pyrite (2.2%), chalcopyrite (1.1%) pyrrhotite (0.7%), arsenopyrite (0.4%) and galena (0.5%). The mineral abundance by size fraction is presented in Table 4. The results are presented in a histogram in Figure 4.

The gangue minerals were principally quartz at 30.6%, pyroxene 22.1%, K-feldspar 12.1% and plagioclase at 8.1%. The other minerals observed were calcite (5.7%), epidote (5.2%), chlorite (3.0%) and titanite/sphene (2.0%).

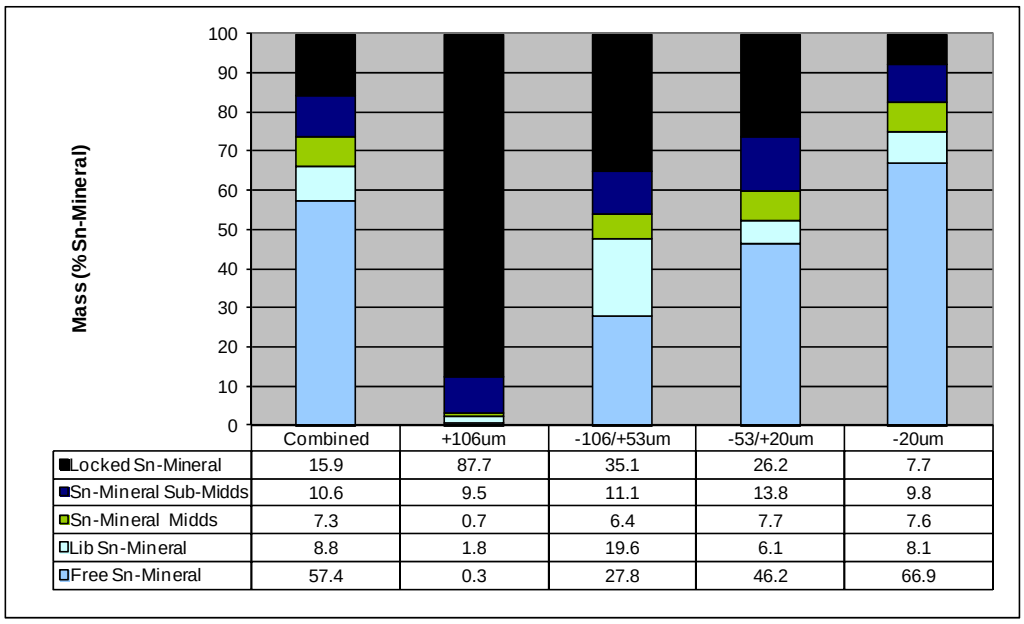
Figure 7: Sphalerite Liberation – Overall Comp



The tin minerals observed included the stannite (0.2%) and cassiterite (0.01%). The tin was not well liberated and associated primarily with complex middlings particles (13.1%) such as Cu-sulphides (7.2%), sphalerite (5.9%) and silicates (4.8%). The Sn deportment is presented in Figure 8. The trace amount of silver was found in the form of native silver and silver sulphide

3. Bond Ball Mill Grindability Tests

The Bond ball mill grindability tests were performed on each composite sample (A-F) at 150 mesh of grind (106 microns). The test results are summarized in Table 5 and compared to the SGS database in Figure 10. The Bond Ball mill Work Indices (BWI) ranged from 15.9 to 17.5 kWh/t, and the average was 16.4 kWh/t, corresponding to the hard range of hardness of the SGS database. The test details are appended in Appendix B.

Table 5: Bond Ball Mill Grindability Summary

Sample Name	Mesh of Grind	F_{80} (µm)	P_{80} (µm)	Gram per Revolution	Work Index (kWh/t)	Hardness Percentile
Comp A	150	1,943	76	1.16	16.1	70

Rel. S.D. (%)					4	7

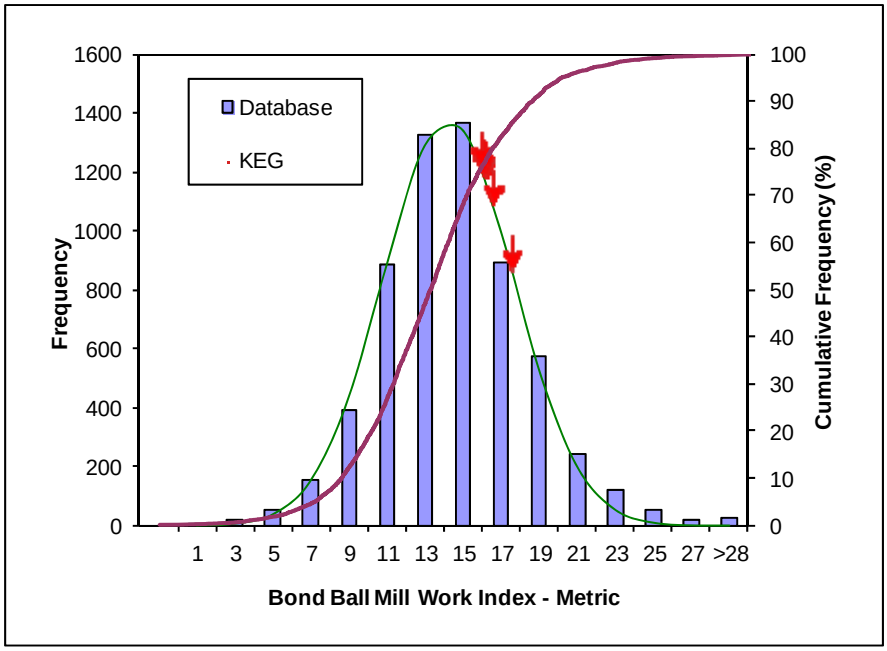

Figure 10: Bond Ball Mill Work Index Comparison to the SGS Database

4. Gravity Recoverable Silver and Tin

The Overall composite was submitted for a gravity recoverable silver and tin test. The test protocol consisted of processing a 20-kg charge, previously stage-crushed to 20 mesh, through a Knelson (MD4) concentrator in three stages.

The metallurgical balances presented in Table 6 and Table 7 show good gravity recovery of silver with an overall recovery of 25.6%, while tin recovery was much lower at 5.1%. Gravity recovery could be used to recover a portion of the Ag to a high grade concentrate (750 g/t Ag) but it would require a fine primary grind and it is also likely that this Ag concentrate would contain a significant proportion of the lead. The test details are appended Appendix C.

5. Flotation Testwork

5.1. Flotation Optimization (Overall Composite)

Rougher and cleaner reagent conditions as well as flowsheet options were optimized on the Overall composite.

5.1.1. Rougher Kinetics

Rougher kinetics tests are typically used to determine the relative rate of flotation and ultimate floatability of the minerals based on several variables. Four rougher kinetics tests were done on the Overall composite varying the primary grind size, reagent scheme, and pulp density. Each test produced timed rougher concentrates and tailings which were submitted for assay. The rougher reagent scheme and grind size are summarized in Table 8. The rougher overall results are presented in Table 9.

Table 8: Rougher Kinetics Reagent Scheme and Grind Size Summary

Test #	K80 (µm)	Reagents added (g/t whole ore)

The main rougher conditions evaluated included three primary grind sizes with and without $ZnSO_4$, addition. The combination of the coarser grind with addition of $ZnSO_4$ on test F1 reduced the kinetics of the lead in the CuPb flotation with a rougher concentrate recovery of 48% compared to a range of 74% to 79% for the other tests. Nonetheless, the overall lead recovery in the CuPb rougher flotation concentrate (1-3) averaged 94% Pb, which was comparable to the other tests: 91% (coarser without Zn depressant reagent added) to 94% (finer grind). Figure 11 presents the lead recovery in the rougher tests.

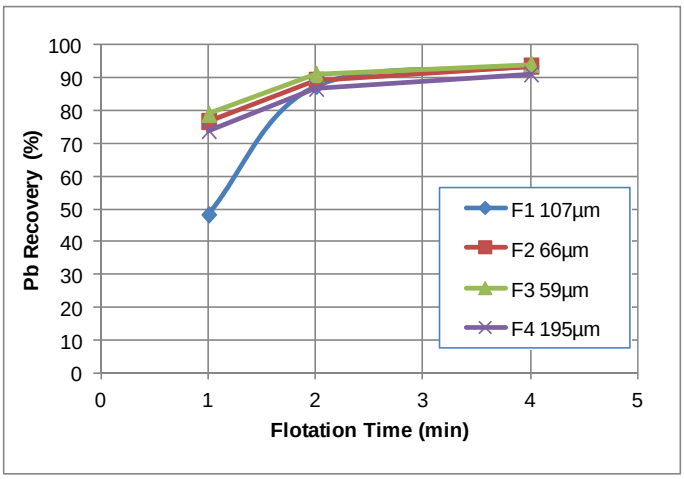

Figure 11: Pb Recovery vs. Flotation Time

The grind size seems to have the most significant impact on copper recovery. The tests with the coarsest grind obtained an overall copper recovery of ~85% with ~50% of the Cu recovered in the first rougher increment while the finest grind resulted in a CuPb flotation recovery of ~90% with the first increment recovering ~55% of the Cu. Figure 9 illustrates the Cu recovery kinetics with grind size.

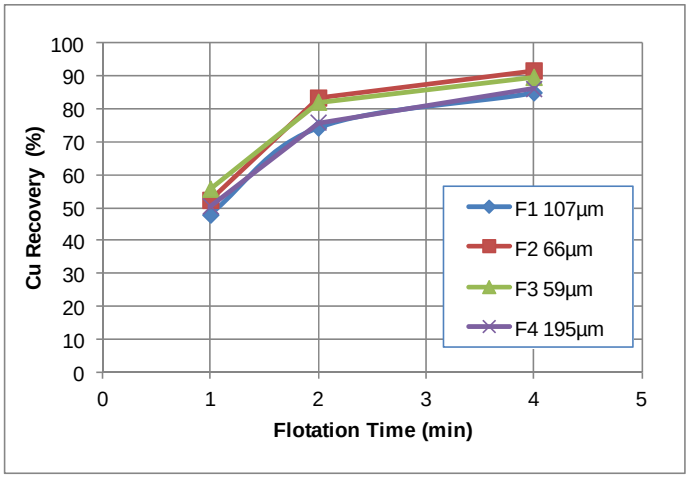

Figure 12: Cu Recovery vs. Flotation Time

The use of $ZnSO_4$ at 50 g/t as depressant did not appear to have any impact on the amount of Zn reporting to the CuPb concentrate varying from 13% to 18% of the global zinc. The Zn stage recoveries by size are presented in Figure 13 for the zinc circuit. The test performed on the finest grind resulted in the best overall results. The detailed rougher kinetics results are included in Appendix D.

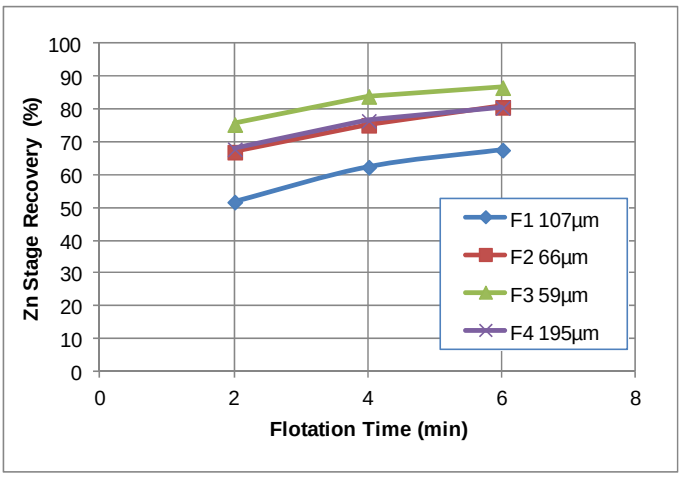

Figure 13: Zn Recovery vs. Flotation Time

5.1.2. Overall Composite Batch Cleaner Tests

Eleven batch cleaner tests (F5-F11, F18, and F21-F22) were performed on the master composite. These tests were designed to investigate the effect of flowsheet configuration, reagent scheme, and regrind size on rougher concentrate upgrading. Two of these tests also evaluated the flotation of tin from the zinc rougher tails. Table 10 summarizes the batch cleaner test conditions and Table 11 presents the flotation results.

Table 10 : Batch Cleaner Flotation Conditions Summary

Several variables were investigated in the batch cleaner tests. The tests varied grind, collector type, reagent dosage and addition point, as well as pyrite and tin flotation. The best results were obtained with an initial grind of 100 µm. The addition of a regrind stage to 20µm before the zinc cleaners improved the concentrate grades for tests F9B, F10 and F11.

In CuPb separation, the addition of sodium cyanide in the regrind stages as well as in lead rougher flotation produced the highest grades and recoveries of copper and lead. Different dosages were tested (300, 325, and 530g/t), producing a Pb concentrate grading 68% at 73% recovery, while the copper concentrate achieved graded 27% Cu at 72% recovery.

Collector 3418A gave the best results compared to xanthates (SIPX and PAX). The combination of Aero 208 with SIPX in test F7 did not improve on the 3418A CuPb cleaner concentrate grade and recovery. The majority of the silver reports to the lead concentrate (> 60% recovery).

The tin flotation tests (F8-F9) were not promising. The initial grade was 0.02 g/t and the concentrate graded 0.03 g/t, even with the addition of pyrite flotation and desliming stages.

Zinc upgrading was difficult even when four cleaners were done in test F11. Depression of pyrite appeared to be challenging. The grades obtained were 41% Zn and 20% Fe at a recovery of 90%. Appendix D details the batch cleaner flotation test results.

5.1.3. Overall Composite Locked Cycle Tests (LCT)

Two LCT were conducted on the Overall composite. The LCT is a batch scale test designed to simulate continuous conditions. It is used to project the overall performance of the conceptual flowsheet in terms of expected recovery/grade of the final concentrate and estimated reagent consumption. The test included six cycles where intermediate products were re-circulated in each subsequent cycle. The LCT flowsheet is presented in Figure 14 and the reagent additions are summarized in Table 12.

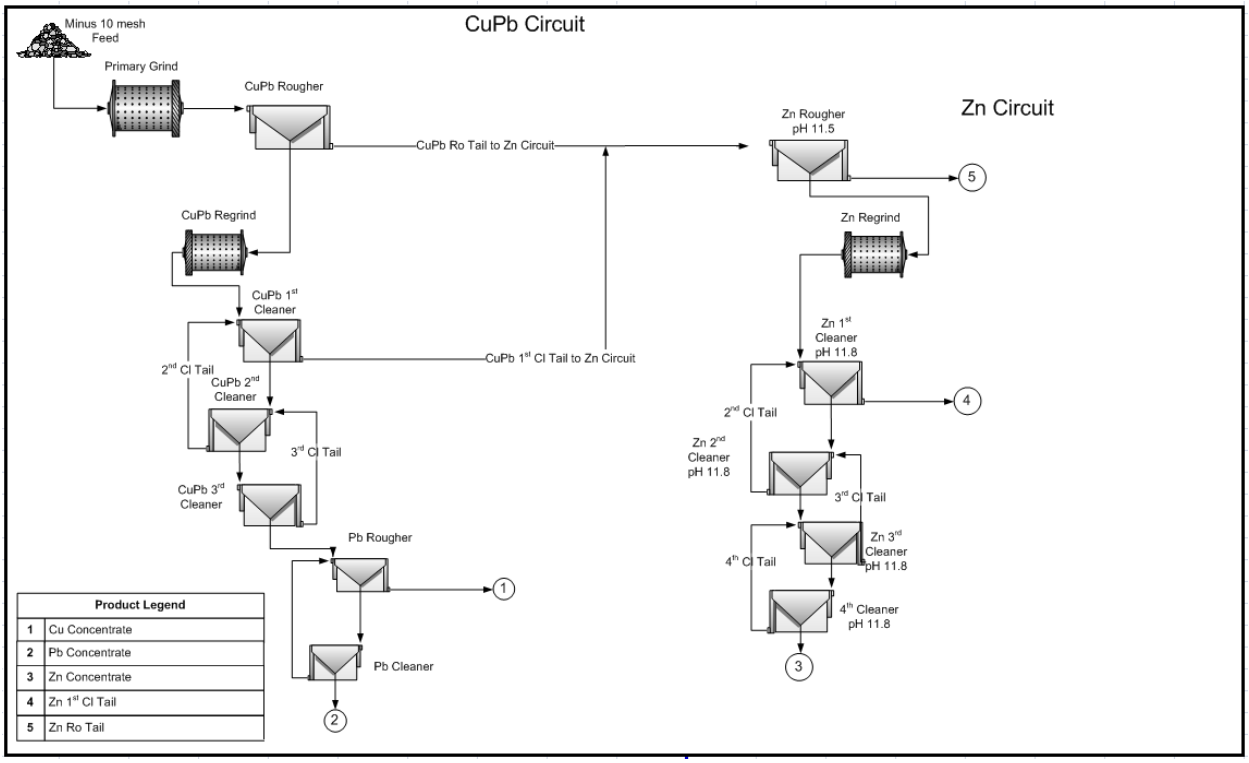

Figure 14: LCT Flotation Flowsheet

Table 12: Locked Cycle Test Reagent Additions – Overall Composite

Test #	K_{80} (µm)				Reagents added (g/t) - CuPbZn flotation													
					CuPb Rougher-Cleaner					CuPb Separation			Zn Rougher-Cleaner					
	Primary Grind	Pb Conc	Cu Conc	Zn Conc	$Ca(OH)_2$	$ZnSO_4$	3418-A	NaCN	MIBC	NaCN	3418-A	MIBC	$Ca(OH)_2$	$CuSO_4$	5100	CMC	NaMBS	MIBC
LCT1	102	24	23	16	646	75	20	12.5	37.5	613	5	10	2638	300	32.5	20	-	40
LCT8	106	29	30	17	532	75	20	12.5	37.5	518	5	5	2260	300	32.5	-	375	25

The LCT results are summarised in Table 13. Both locked cycle tests were very stable, achieving ~100% metal accountability from cycle C onwards. The first locked cycle test produced a Pb concentrate grading 66.5% Pb, 4.90% Cu, and 5,924 g/t Ag at 84.8% Pb recovery and 60.5% Ag recovery, a Cu concentrate grading 28.8% Cu, 2.65% Pb, 3.85% Zn, and 1,442 g/t Ag at 71.4% Cu recovery and 22.0% Ag recovery, and a Zn concentrate grading 47.5% Zn, 0.53% Pb, 0.91% Cu, and 358 g/t In at 85.2% Zn recovery and a calculated In recovery of ~72%. The second locked cycle test on the Overall composite (LCT8), with a coarse CuPb regrind and NaMBS as pyrite depressant in the Zn circuit produced a Pb concentrate grading 59.4% Pb, 7.02% Cu, and 5,924 g/t Ag at 86.0% Pb recovery and 62.9% Ag recovery, a Cu concentrate grading 28.1% Cu, 2.43% Pb, 5.04% Zn, and 1,328 g/t Ag at 69.2% Cu recovery and 20.5% Ag recovery, and a slightly improved Zn concentrate grading 49.8% Zn, 0.45% Pb, 0.79% Cu, and 384 g/t In at 87.7% Zn recovery and a calculated In recovery of ~73.5%. The batch cleaner and LCT results are compared in Figure 15, Figure 16, and Figure 17 for Zn, Pb, and Cu, respectively.

5.2. Variability Testwork

5.2.1. Batch Cleaner Tests

A batch cleaner test was performed on each of the 6 composites (A-F) to confirm the response to the established flowsheet configuration, reagent scheme, and regrind size. The variability test results are presented in Table 14.

Table 14: Variability Test Results

* Values <50 g/t were estimated to target head grade

The reagent scheme was the same for all composites tested, except for the composite B, where the initial Zn grade was the highest and for which copper sulphate was increased. All six composites showed very good performance for both Cu and Pb while difficulties in achieving acceptable Zn grades were once again observed.

For the most part, recovery trended well with head grade. Composite E, having the lowest Pb head grade at 0.15% Pb, performed relatively well, producing a Pb concentrate grading 66.0% Pb at 60.7% recovery. Composite A, having the highest Pb head grade at 0.60%, produced a Pb concentrate grading 72.2% Pb at 74.9% recovery. Copper reporting to the Pb concentrate was high with 12.7% for Composite A. Composites B, C, D, and F, with head grades averaging 0.30% Pb produced concentrates averaging ~70% Pb with recoveries ranging from 58.3% for Composite B, to 67.5% for composite D, to 76.3% and 77.0% for composites C and F, respectively. The copper concentrate grade varied between 24% and 30%. The higher recoveries were achieved with composites B and C at 65% and 71%Cu, respectively.

Recovery to the Cu concentrate was in line with head grades, with recoveries ranging from 52.2% for composite D with a 0.11% Cu head grade to 64.9% for composite B with a 0.62% Cu head grade.

The zinc concentrate grades were quite low, ranging from 21.8% to a high 46.3% Zn, at Zn recoveries from 76.4% up to 92.1%. Zinc concentrate grades appeared to be influenced by head grades. Test F12 on composite A included only a single cleaning stage, while the tests on the other composites included four cleaning stages. The detailed results are shown in Appendix E.

5.2.2. Locked Cycle Tests (LCT)

A locked cycle test was performed on each of the 6 composites (A-F) to better evaluate the grade and recovery to the final concentrates.

The general reagent scheme reflects the conditions of the variability batch cleaner tests; however some modifications were made to improve the flotation conditions in the LCT. The main changes were modifications to collector and increased lime addition to the zinc circuit. The locked cycle reagent additions are summarized in Table 15.

Table 15: Locked Cycle Test Reagent Additions – Variability Composites

Test #	Feed	K_{80} (µm)				Reagents added (g/t) - CuPbZn flotation											
		Primary	Pb	Cu	Zn	CuPb Rougher-Cleaner					CuPb Separation			Zn Rougher-Cleaner			
		Grind	Conc	Conc	Conc	$Ca(OH)_2$	$ZnSO_4$	3418-A	NaCN	MIBC	NaCN	3418-A	MIBC	$Ca(OH)_2$	$CuSO_4$	5100	MIBC
LCT2	Comp A	93	23	28	16	700	75	20	25.0	40.0	580	5.0	10.0	4166	180	20.0	40
LCT3	Comp B	134	26	27	20	738	75	30	25.0	26.0	1100	5.0	10.0	4798	425	32.5	20
LCT4	Comp C	95	27	23	20	626	75	20	12.5	45.0	750	5.0	7.5	3794	300	37.5	40
LCT5	Comp D	111	30	22	19	631	75	15	12.5	37.5	613	3.8	10.0	2612	125	22.5	40
LCT6	Comp E	91	41	23	16	511	75	15	12.5	37.5	800	3.8	10.0	3135	185	27.5	40
LCT7	Comp F	89	26	24	15	551	75	15	12.5	37.5	750	3.8	10.0	2299	185	27.5	40

The detailed LCT results are appended. The Pb concentrates ranged from 59.7% (Comp B) to 68.2% Pb at recoveries ranging from 77.5% (Comp E) to 84.9%. Silver grades in the Pb concentrates ranged from 4,521 g/t to 7,761 g/t. Despite the important variability in silver grade for the composites (21 g/t to 71 g/t) overall recovery to the Pb and Cu concentrates combined ranged from 72.0% (for the 21 g/t composite) to 84.7% (for the 71 g/t composite). Silver appears to follow both Pb and Cu, with the Ag split between the two concentrates correlating well with Cu misreporting to the Pb concentrate (Figure 18).

The copper grades obtained with the composites ranged from 23.5% to 29.8% Cu. Recovery ranged from 59% to 80% Cu. Composites B (29.8% Cu) and C (29.0% Cu) gave the highest grades and recoveries. Tin appears to report to the Cu concentrate, with a small portion reporting to the Pb concentrate and is likely associated with chalcopyrite.

Zinc recovery ranged from 81.5% to 92.4% Zn, but the grades were low ranging from (49.6% Zn for composite B and 28.4% Zn for composite D. The iron grade in the zinc concentrate was high, for composite D at 30.6% Fe, while the lowest Fe grade obtained was 12.7% (Comp B), indicating that pyrite is the main diluents.

Indium reports to the zinc concentrates; composite A had the lowest grade at 90 g/t while composite E had the highest grade at 658 g/t. The LCT results are compared to the batch cleaner results in Figure 19.

The variability results presented in Figure 20 show good correlation between head grade and recovery to the individual final concentrates for Zn, Pb, and Cu.

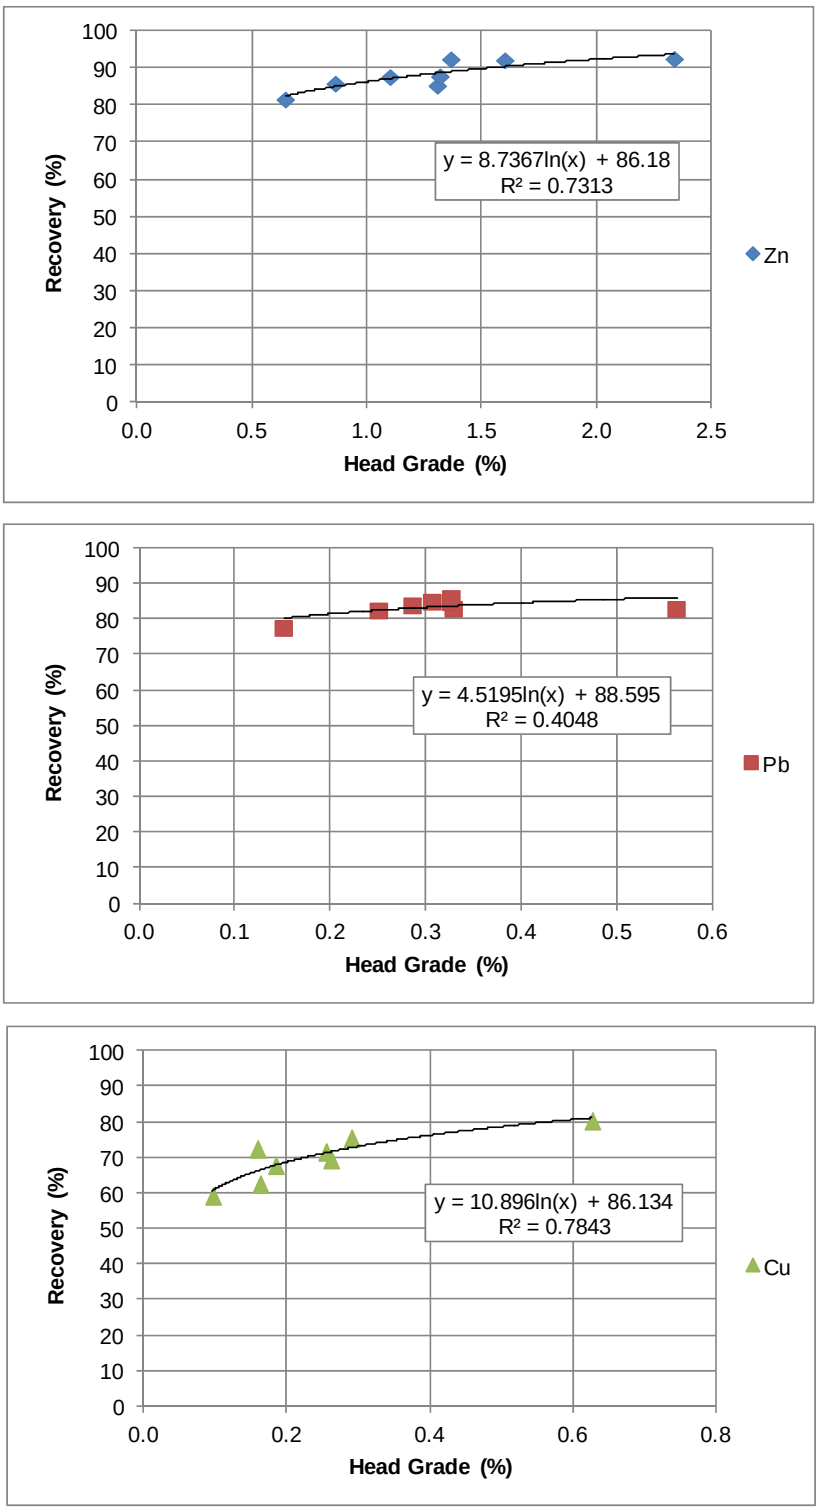

Figure 20: Relationship between Head Grade and Recovery to Final Concentrate

5.2.3. Zinc Concentrate Upgrading

The projected final concentrate for LCT5, conducted on composite D, was very low at 28.4% Zn. The final Zn concentrates from each of the six cycles completed in LCT5 were combined and split into test charges to evaluate different reagent schemes to improve the final concentrate grade. Test F19 included the addition of sodium cyanide (NaCN) while test F20 evaluated sodium metabisulphite (NaMBS). Both reagents are depressants for pyrite, which was believed to be the main diluent in this concentrate. The tests were able to improve the Zn concentrate grade from 29.9% to 42.1% and 42.9%, respectively, with NaMBS being the best at depressing pyrite while maintaining Zn recoveries as evidenced in Figure 21.

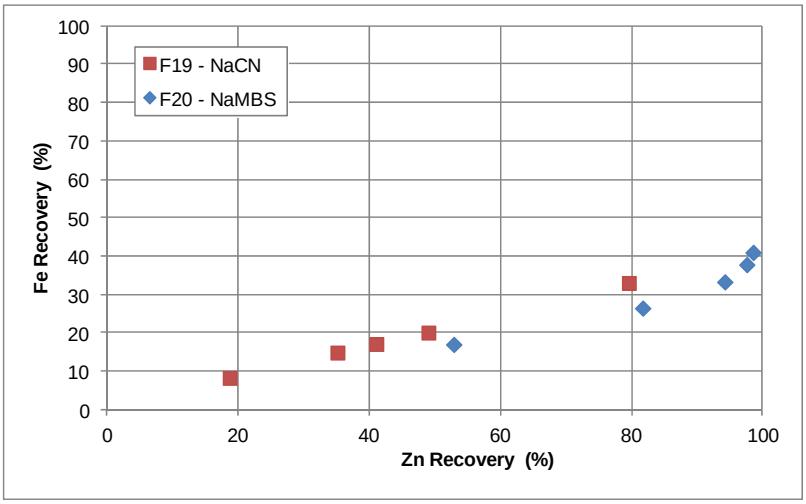

Figure 21: Zinc Upgrading – Zn/Fe Selectivity

6. Concentrate Characterization

The final concentrates from each of the locked cycle tests were submitted for detailed analytical characterization. The available analyses (depending on sample availability) are summarized in Table 17 for the Zn concentrate, Table 18 for the Pb concentrate, and Table 19 for the Cu concentrate.

7. Environmental Testwork Summary

A basic environmental test program, including inductively coupled plasma-optical emission spectroscopy/mass spectroscopy (ICP-OES/MS) strong acid digest elemental analyses, modified acid base accounting (ABA), net acid generation (NAG) testing and particle size distribution (PSD) analyses, were completed to characterize the LCT1 (locked cycle test) tailings components (LCT1 Zn Ro Tails and LCT1 Zn 1st Cl Scav Tails). Ageing tests, including analysis of the fresh and aged tailings decant solutions and LC_{50} rainbow trout and daphnia magna bioassays, were also conducted on a sample of the combined tailings (LCT1 Comb Tails). Results of the environmental testwork completed are presented and discussed in the following sections. Environmental Certificates of Analysis are appended to this report (Appendix G).

7.1. ICP-OES/MS Strong Acid Digest Elemental Analyses

The tailings solids components (LCT1 Zn Ro Tails and LCT1 Zn 1st Cl Scav Tails) were digested using an acid mixture of HNO_3, HF, $HClO_4$, and HCl to obtain a near total digest of the parameters being analyzed. ICP-OES/MS trace metal scans were performed to provide quantitative analyses of the elemental components of the sample material. Mercury analyses were completed by cold vapour atomic absorption spectroscopy (CVAAS).

ICP-OES/MS strong acid digest elemental analysis indicated that the rougher tailings solids were composed primarily of Si (28%) with moderate amounts of Al (4%), Ca (8%), Fe (3%) and minor amounts K (2%) and Mg (2%). In comparison to the rougher tailings, the 1st cleaner scavenger tailings were predominantly comprised of Fe (30%) with moderate levels of Si (11%). Lesser amounts of Al (2%), Ca (5.1%) and Mg (1.2%) were also observed. Significant concentrations of As (1.7%) and Zn (2.0%), which are expected to be of environmental concern, were also reported in the 1st cleaner scavenger tailings sample. Results ICP elemental analyses conducted on the tailings samples are presented in Table 20. Comparative results of the ICP elemental analyses are provided in Figure 22. The significant components of the tailings samples are illustrated in Figure 23.

7.2. Modified Acid Base Accounting and Net Acid Generation Testing

The modified ABA test provided quantification of the total sulphur, sulphide sulphur, and sulphate concentrations present and the potential acid generation (AP) related to the oxidation of the sulphide sulphur concentration. The test method determined the neutralization potential (NP) of the sample, by initiating a reaction with excess acid, then titrating to pH 8.3 with NaOH to determine how much acid was consumed during the reaction. The balance between the AP and NP assisted in defining the potential of the sample to generate acid drainage. In addition, quantification of the extent of carbonate mineral content permitted calculation of the theoretical carbonate NP of the tailings.

The net acid generation (NAG) test initiated a reaction between the tailings sample and concentrated hydrogen peroxide in order to force complete oxidation and reaction of the acidity produced with the neutralizing minerals present within the sample.

Modified ABA test results for the LCT1 Zn 1st Cl Scav Tails sample reported a very high sulphide content (11.8%), negative total net NP value (-299 t $CaCO_3$/1000 t) and total NP/AP ratio less than 1 (0.19) indicating that, even based on the total NP, this sample has strong potential for acid generation. ABA testing also indicated that 38% of the total sulphur contained within the 1st Cl Scav Tails sample is comprised of sulphate (7.43% as S).

The acid generating nature of the LCT1 Zn 1st Cl Scav Tails sample was confirmed by the highly acidic final pH value (3.06) and the considerable residual acidity concentration reported after titration to pH 4.5 (13 kg H_2SO_4/t) during net acid generation (NAG) testing. Further titration of the NAG test solution to pH 7.0 suggested that metal acidity may also be a factor which will contribute to difficulty in neutralizing this

sample. It should be noted that, due to the high sulphide concentration of the 1st Cl Scav Tails sample, a single aliquot of H_2O_2 could not be expected to completely oxidize the S^{2-} present; therefore, the actual amount of acid generated would be in excess of the 13 and 56 kg reported. Sequential NAG tests using multiple additions of H_2O_2 would be required to determine terminal NAG test results for this sample.

Modified ABA testing of the LCT1 Zn Ro Tails sample reported a significant sulphide concentration (0.69%) which, coupled with the total Net NP value and total NP/AP ratio (41.2 $CaCO_3$/1000 and 2.90, respectively), classify this sample as uncertain with regards to acid generation potential. Carbonate (CO_3) analysis also indicated that much of this total NP (~35%) is from less reactive (non-carbonate) sources. Since carbonate minerals are typically the only minerals that can react at fast enough rates to counteract acidities released by sulphide mineral oxidation; the elevated sulphide content, coupled with the low resultant CO_3 Net NP and CO_3 NP/AP values (19.1 t $CaCO_3$/1000 t and 1.88), suggests increased uncertainty with regards to the availability and reactivity of this total NP.

NAG test results for the LCT1 Zn Ro Tails sample, however, reported no net acidity generated and a highly alkaline final pH value (10.34) after aggressive oxidation of the sample. ABA test results are provided in Table 21. Results of the NAG test are presented in Table 22.

7.3. Decant Solution Ageing and LC_{50} Bioassay Tests

Upon receipt the individual LCT1 Zn Ro Tails and LCT1 Zn 1st Cl Scav Tails pulp samples were mixed at 200 rpm for 60 minutes to ensure all solids were thoroughly recombined prior to the extraction of minimal aliquots of sample required for characterisation of the individual components. The remaining pulps (rougher and cleaner) were subsequently combined and remixed (200 rpm for 60 minutes) prior to the extraction of individual Day 0 (done in duplicate), 4, 7, 14, 28 and 56 ageing test charges that maintained the original ratio of liquids to solids. The fresh Day 0 tailings samples were allowed to settle undisturbed for 2 hours prior to the supernatant being decanted and submitted for analyses. Aged supernatants were subsequently decanted from the settled tailings slurry test charges and analyzed after the prescribed periods of ageing. The objective of this testing was to identify changes in the sample supernatant over time, and quantify elemental concentrations that may report to surface or ground water systems in a tailings pond setting.

Acute lethality testing was completed to determine the concentration of the combined tailings solution in which 50% of *Daphnia magna* exposed would die after 48 hours (the LC_{50}). Rainbow trout LC_{50} testing similarly determined the concentration of effluent at which 50% of the trout exposed would die after 96 hours. The test organisms (*Daphnia magna* or rainbow trout) were exposed to the full-strength solution and at least four geometrically more dilute (for example, 50%, 25%, 12.5%, and 6.3%) concentrations of the effluent. The LC_{50} values were then statistically estimated. Control tests of the dilution water were run parallel to the tests. Testwork was conducted according to the *Daphnia magna* Acute Lethality Toxicity Test Protocol EPS 1/RM/14 and the Acute Lethality of Liquid Effluents to Fish EPS 1/RM/13 protocols from Environment Canada. All toxicity tests were subcontracted to Aquatox Testing and Consulting Inc.

The fresh and aged LCT1 Comb Tails decant solutions reported concentrations of As (1.79 to 0.975 mg/L) well in excess of the MMER and World Bank limits (0.5 and 0.1 mg/L, respectively) throughout the 56 day ageing test period. Over this time period, decreasing pH values and increasing dissolved solids, conductivity and acidity concentrations were evident. Elevated levels of Al, Fe, Pb, Th, Ti and Y observed in the Day 0 decant solutions decreased over time as the suspended solids settled out of solution.

Overall, the solutions reported high levels (>100 mg/L) of TDS, SO_4 and Ca and significant levels (>1 mg/L) of Cl, K, Na and Si.

Acute lethality bioassay testing of the Day 56 decant solution resulted in the non-lethal designations for both trout and *Daphnia magna*. The trout tests reported 100% survival rates resulting in an LC_{50} value of greater than 100%. The daphnia tests reported 50% mortality in the 100% concentration test resulting in an LC_{50} value of 100%. It should be noted that the usefulness of any LC_{50}/EC_{50} value from the daphnia testing completed is questionable because a concentration-effect relationship was not demonstrated over a reasonable range of percent dead (e.g. <37 to >63). Therefore the statistically valid upper 95% confidence limits could not be generated for this test.

Results of the fresh and aged decant solution analyses are presented in Table 23. Comparative results of the solution analyses are illustrated in Figure 24. Summary results of the acute lethality toxicity tests are presented in Table 24. Complete toxicity test reports are provided in Appendix H.

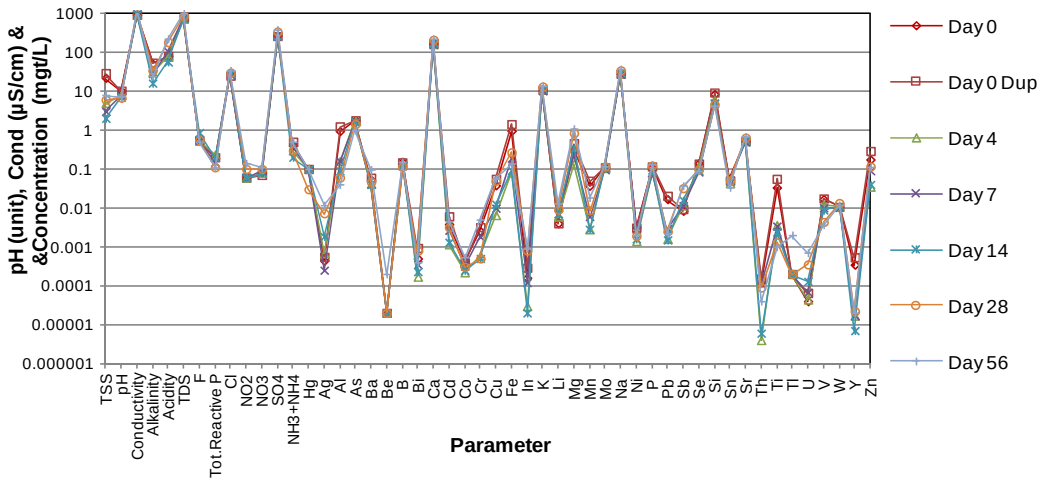

Figure 24: ICP-OES/MS Fresh and Aged Decant Solution Results – LCT1 Comb Tails

Table 24: LC_{50} Acute Lethality Toxicity Test Results

Sample Identifier	Unit	Acute Lethality of Effluents to Daphnia Magna 48-h LC_{50} Survival	Acute Lethality of Effluents to Rainbow Trout 96-h LC_{50} Survival
LC-1 Comb Tls Day 56	%	100 *	> 100

*The usefulness of and LC_{50} calculated from this set of data is questionable because a statistically valid upper 95% confidence limit could not be generated.

Standard screen sieve sizes (Tyler) were used to determine the particle sizes of the solid tailings particles. The weights of the percent retained and passing on each respective screen size were determined. The test determined the particle size distribution of the plus 200 mesh fraction of the products being investigated.

The particle size distribution for the minus 200 mesh fraction of the products was established using the hydrometer (sedimentation) method. A 50 g (dry equivalent) sample was placed into solution (dispersing agent) with 1 L of distilled water in a standardized glass cylinder. The solution was agitated, and the particles were permitted to settle out of suspension. As settling occurred over time, the average specific gravity of the mixture decreased, causing the height of the suspended hydrometer to drop. Reading the hydrometer at specific time intervals provided (through established relationships) the weight of the soil remaining in suspension, and the size of the particles that had settled out of solution. The percent finer weight was calculated based on the hydrometer readings, using Stokes Law for spheres falling freely in a fluid of known properties.

Although both the LCT1 Zn Ro Tails and LCT1 Zn 1st Cl Scav Tails were comprised predominantly of fines, the LCT1 Zn 1st Cl Scav Tails reported much finer particle size distribution characteristics with 99.8% of the sample passing the 200 mesh sieve (0.075 mm). While this fine grained material was

composed predominantly of silt size grains (82.8%), a significant fraction of the sample (17%) reported as clay size grains (<0.002 mm).

Although PSD analysis of the LCT1 Zn Ro Tails similarly indicated that this sample was also primarily comprised of fines, 29.2% of the sample was classified as fine sand sized material. Of the 70.8% of the sample that passed the 200 mesh sieve, 61.8% was composed of silt size grains and 9% was comprised of clay size grains. Results of the particle size analyses are shown in Table 25 and presented graphically in Figure 25. Complete test reports are included in Appendix I (Particle Size Distribution Analyses -Sieve and Hydrometer).

Conclusions and Recommendations

Drill cores samples from the Keg deposit were prepared into six variability composites and an Overall composite for mineralogical and metallurgical testwork.

Mineralogical analysis of the overall composite at a P_{80} of 100 µm determined that:

- Silicates were the main gangue component with carbonates also present.
- The sulphide minerals are sphalerite, pyrite, chalcopyrite, pyrrhotite, arsenopyrite galena and stannite.
- The liberation of Sn minerals is moderate at 66.2%. Sn minerals occur mainly as middling particles with Cu sulphide (7%) and silicates (5%) and as complex particles (13%).
- Sulphides are well liberated; Cu sulphides at 89%, sphalerite at 95%, galena at 90%, iron sulphide at 90%, and arsenopyrite at 97%.
- Tin is mostly (91%) carried by stannite but also by cassiterite (9%).

The following conclusions resulted from characterization testwork performed on the composites:

- The Bond Ball Mill Work Index performed on the composites averaged 16.4 KWh/t, the Overall composite can be categorized as hard.
- The six variability composites covered a wide range in terms of head composition:
  - Cu from 0.10% to 0.60%, averaging 0.25%
  - Pb from 0.15% to 0.62%, averaging 0.33%
  - Zn from 0.69% to 2.30%, averaging 1.33%
  - Sn from 0.010% to 0.077%, averaging 0.041%
  - Ag from 21.1 g/t to 89.1 g/t, averaging 45.9 g/t
  - In from 1.7 g/t to 19.5 g/t, averaging 11.3g/t

The following conclusions can be made from the test performed on the Overall composite:

- Gravity recovery of Ag or Sn was not found to be practical
- The Overall composite graded 0.27% Cu, 0.3% Pb, 1.36% Zn, 4.70% Fe, 0.04% Sn, 11.4 g/t In, 2.81% S, and 41.6 g/t Ag.
- The following optimum conditions were determined:
  - A primary grind P_{80} of 100 µm.
  - A CuPb rougher pH of 9.5, adjusted with lime ($Ca(OH)_2$) with 3418A (20 g/t) as collector and MIBC (15 g/t) as frother.
  - CuPb cleaning included regrinding to a P_{80} of ~25 µm with 75 g/t $ZnSO_4$ and 12.5 g/t NaCN as sphalerite and pyrite depressants as well as 5 g/t 3418A collector prior to three cleaning stages with some collector added to the 2nd and 3rd cleaning stages.
  - CuPb separation using NaCN targeting an oxidation-reduction potential of -400 mV (Ag/AgCl) to depress the chalcopyrite.
  - The CuPb rougher and CuPb 1st cleaner scavenger tails were combined to feed the Zn circuit.

  - Zn was activated with $CuSO_4$ prior to flotation at pH 11.8 using Aero 5100 as collector.
  - The Zn rougher concentrate was reground to a P80 of ~15 µm prior to four cleaning stages.
- Attempts to recover tin from the Zn rougher tailings were unsuccessful with approximately 30% of the tin reporting to the Cu concentrate.

Locked cycle tests completed on the seven samples outlined the following:

- There was some degree of correlation between feed grade and final concentrate recovery for Zn, Pb, and Cu.
- The Zn concentrates had generally poor grades, ranging from 28.4 to 49.8% Zn and from 89.8 to 658 g/t Ag, at recoveries ranging from 81.5 to 92.4% but also recovered ~70% of the In. The addition of sodium metabisulphite in the cleaning stages upgraded the 28.4% Zn concentrate to 42.9% in a single cleaning stage. Sodium metabisulphite was beneficial in the Zn cleaning circuit.
- The Pb concentrates had generally acceptable grades, ranging from 59.4 to 68.2% Pb and from 4521 to 7761 g/t Ag, at Pb recoveries ranging from 77.5 to 86.0% and Ag recoveries ranging from 38.4 to 75.9%.
- The Cu concentrates had generally good grades, ranging from 23.5 to 29.8% Cu and from 1089 to 2062 g/t Ag, with Pb contents below 6.79% Pb. Copper recoveries ranged from 59.0 to 80.2%.
- Silver is recovered to both Pb and Cu concentrates and recovery to the Pb concentrate increases with Cu deportment to that concentrate.

The environmental characterisation of the LCT1 tailings samples (rougher, 1st cleaner scavenger and combined) indicated the following:

- The rougher tailings sample was comprised primarily of Si while the 1st cleaner scavenger tailings sample was predominantly composed of Fe.
- The 1st cleaner scavenger tailings also contain elevated levels of As and Zn, which are expected to be of environmental concern.
- ABA testing indicated, and NAG testing confirmed, that the 1st cleaner scavenger tailings have strong potential for acid generation.
- Although ABA testing classified the rougher tailings as having uncertain acid generation potential; NAG test results reported no net acidity generated.
- The combined tailings decant solutions reported decreasing pH, increasing acidity and concentrations of As well in excess of the MMER and World Bank limits throughout the 56 day ageing test period.
- Acute lethality bioassay testing of the day 56 decant solution from the combined tailings resulted in the non-lethal designations for both trout and Daphnia magna (Days 56).

The following testwork is recommended to further advance the project:

- Evaluation of coarser primary grinds.
- Confirmation of the CuPb regrind size requirement.
- Further optimization of the Zn circuit including $CuSO_4$ dosage, pH, and regrind size.
- Mineralogical examination of specific products to support optimization testwork.
- Further evaluation of impact of variability on flotation response.
- Solid-liquid and rheological testwork on final concentrate and tails.

SGS Minerals Services

Standard Bond Ball Mill Grindability Test

Project No.: 50244-001 Date: 23-May-12
Sample: COMP A

Purpose: To determine the ball mill grindability of the sample in terms of a Bond work index number.

Procedure: The equipment and procedure duplicate the Bond method for determining ball mill work indices.

Test Conditions:

Feed 100% Passing	6	mesh
Mesh of grind:	150	mesh
Test feed weight (700 mL):	1,441	grams
Equivalent to :	2,058	kg/m³ at Minus 6 mesh
Weight % of the undersize material in the ball mill feed:		22.6%
Weight of undersize product for 250% circulating load:		412 grams

Results: Gram per Rev Average for the Last Three Stages = **1.16 g**
Circulation load = **251%**

CALCULATION OF A BOND WORK INDEX

$$BWI = \frac{44.5}{P1^{0.23} \times Grp^{0.82} \times \left\{ \frac{10}{\sqrt{P}} - \frac{10}{\sqrt{F}} \right\}}$$

P1 = 100% passing size of the product	106	microns
Grp = Grams per revolution	1.16	grams
P_{80} = 80% passing size of product	76	microns
F_{80} = 80% passing size of the feed	1,943	microns

BWI = **14.6** kWh/t (imperial)

BWI = **16.1** kWh/t (metric)

Comments:

Stage No.	# of Revs	New Feed (grams)	Product in Feed (grams)	Material to Be Ground (grams)	Material Passing 150 mesh in Product (grams)	(grams)	Material Ground Per Mill Rev (grams)
1	150	1,441	325	86	504	179	1.19
2	249	504	114	298	396	282	1.13
3	285	396	89	322	410	320	1.12

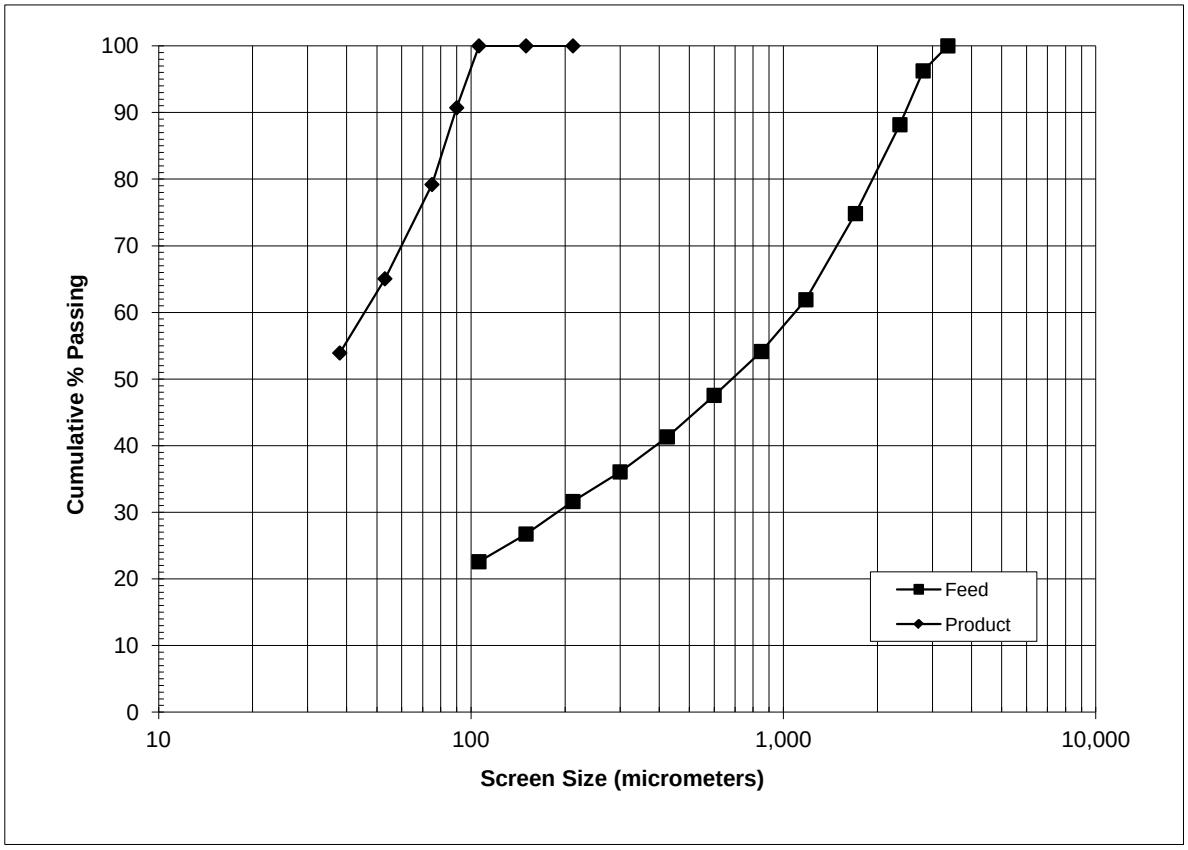
Standard Bond Ball Mill Grindability Test



Project No.: 50244-001 Date: 23-May-12
Sample: COMP B

Purpose: To determine the ball mill grindability of the sample in terms of a Bond work index number.

Procedure: The equipment and procedure duplicate the Bond method for determining ball mill work indices.

Test Conditions:

Feed 100% Passing	6	mesh
Mesh of grind:	150	mesh
Test feed weight (700 mL):	1,584	grams
Equivalent to :	2,263	kg/m³ at Minus 6 mesh
Weight % of the undersize material in the ball mill feed:		22.8%
Weight of undersize product for 250% circulating load:		453 grams

Results: Gram per Rev Average for the Last Three Stages = **1.15 g**
Circulation load = **249%**

CALCULATION OF A BOND WORK INDEX

$$BWI = \frac{44.5}{P1^{0.23} \times Grp^{0.82} \times \left\{ \frac{10}{\sqrt{P}} - \frac{10}{\sqrt{F}} \right\}}$$

P1 = 100% passing size of the product	106	microns
Grp = Grams per revolution	1.15	grams
P_{80} = 80% passing size of product	78	microns
F_{80} = 80% passing size of the feed	1,926	microns

BWI = **15.0** kWh/t (imperial)

BWI = **16.5** kWh/t (metric)

Comments:

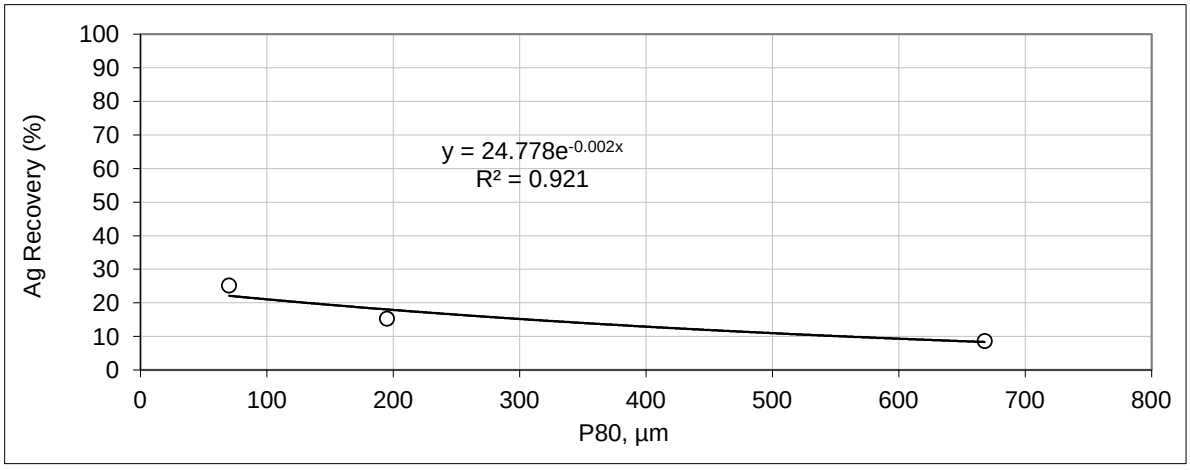
Appendix C – GRS

Test: GRG-1Ag **Project No.: 13589-001** Technician: Olena G May 1, 2012

Purpose: To determine the gravity-recoverable silver number (GRG) (for Ag) applying the standard E-GRG procedure to the Overall Master Comp sample.

Procedure: For stage 1, 20-kg of -20 mesh Overall Comp was passed through the Knelson concentrator, collecting a concentrate and tailing sample. The Knelson concentrate and tailing samples were filtered and submitted for size-fraction analysis for Ag. The remainder of the tail was decanted to ~65% solids, split into two equal parts and each half ground in a 10-kg rod mill for 17 minutes. For stage 2, the gravity separation, sampling, and size-fractional assaying procedure was repeated. Stage 2 Knelson tail was split into two equal parts and each part ground at ~65% solids in the 10-kg rod mill for 36 minutes. Stage 3 gravity separation was performed as per the above stages repeating the gravity separation, sampling, and size-fractional assaying procedure.

Feed: 20-kg -20 mesh of Oveall Master Comp



Grind:

Stage 1:	no grind. (100% passing 20 mesh)	P_{80}	=	668 µm
Stage 2:	17 min @ 65% solids in a 10-kg Rod mill #2	P_{80}	=	195 µm
Stage 3:	36 min @ 65% solids in a 10-kg Rod mill #2	P_{80}	=	70 µm
	total = 53 minutes			

Metallurgical Balance:

Appendix D – Rougher and Batch Cleaner Test

Test No.: F1 **Project No.**: 13589-001 **Operator**: CC **Date**: April 30th 2012

Purpose: Rougher kinetics test - effect of primary grind

Procedure: As outlined below.

Feed: 2 kg of minus 10 mesh 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 107 µm

Conditions:

	Reagents added, grams per tonne							Time, minutes				
Stage	$Ca(OH)_2$	NaCN	$ZnSO_4$	3418A	$CuSO_4$	5100	MIBC	Grind	Cond.	Froth	pH	Ep (mV)
Grind (BM#1)	200	-	60	5	-	-	-	30			8.0	+60

Total	2045	0	60	10	150	15	40					

* as required

Stage	Rougher
Flotation Cell # 8	1000g-D1
Speed: rpm	1800

Observation: Pb seems very slow maybe the grind is too coarse.

Test No.: F4 **Project No.**: 13589-001 **Operator**: CC **Date**: May 3rd 2012

Purpose: Rougher kinetics test - as F3, coarser grind

Procedure: As outlined below.

Feed: 2 kg of minus 10 mesh 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 19 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 195 µm

Conditions:

Test No.: F7 **Project No.**: 13589-001 **Operator**: CC **Date**: May 28th 2012

Purpose: CuPb Cleaner with Zn Rougher Kinetics - As F6, SIPX (and 208) instead of 3418A and 5100

Procedure: As outlined below.

Feed: 2 kg of minus 10 mesh 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 98 µm

CuPb Regrind 10 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory Small pebble mill. P80 = 19 µm

Conditions:

Test No.: F9A **Project No.**: 13589-001 **Operator**: CC/TM **Date**: June 5th, 2012

Purpose: As F8 + CuPb separation with NaCN, Sn flotation with 1682 and A845, no deslime, no pyrite float
Zn rougher kinetics, Sn float

Procedure: As outlined below.

50244-001

Feed: 2 x 2 kg of minus 10 mesh Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 96 µm

CuPb Regrind 10 minutes / 2 x CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 23 µm

Conditions:

Test No.: F10 **Project No.**: 13589-001 **Operator**: CC **Date**: June 27th 2012

Purpose: As F9B, add NaCN to regrind
Zn cleaner, no Sn flotation

Procedure: As outlined below.

Feed: 2 x 2 kg of minus 10 mesh 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 100 µm

CuPb Regrind 10 minutes / 2 x CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 33 µm
Zn Regrind 10 minutes / 1 x Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 23 µm

Test No.: F18 **Project No.**: 13589-001 **Operator**: CC **Date**: Sept.19th, 2012

Purpose: As F11, double feed mass to have more sample for assay, increase pH in Zn circuit and add 5th cleaning stage

Procedure: As outlined below.

Feed: 4 x 2 kg of minus 10 mesh 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1+BM#2). P80 = 100 µm

CuPb Regrind 20 minutes / 2 x CuPb Ro Conc 1-3 @ 65% solids in laboratory ball mill. P80 = 25 µm
Zn Regrind 20 minutes / 2 x Zn Ro Conc 1-3 @ 65% solids in laboratory ball mill. P80 = 21 µm

Test No.: F22 **Project No.**: 13589-001 **Operator**: TM/CC **Date**: Nov.14th 2012

Purpose: As F21, replace NaCN with NaMBS

Procedure: As outlined below.

Feed: 2 x 2 kg of minus 10 mesh 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1+BM#2). P80 = 103 µm

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 19 µm
Zn Regrind 25 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 14 µm

Result Analysis Report

Sample Name:
13589-001 F22 Cu Comb Prod - Average

SOP Name:
Defaultar

Measured:
November 15, 2012 8:48:49 AM

Sample Source & type:

Measured by:
LR_Malvern1

Analysed:
November 15, 2012 8:48:51 AM

Sample bulk lot ref:
ar

Result Source:
Averaged

Particle Name:
Default

Accessory Name:
Hydro 2000G (A)

Analysis model:
General purpose

Sensitivity:
Enhanced

Particle RI:
1.520

Absorption:
0.1

Size range:
0.020 to 2000.000 um

Obscuration:
18.02 %

Dispersant Name:
Water

Dispersant RI:
1.330

Weighted Residual:
0.728 %

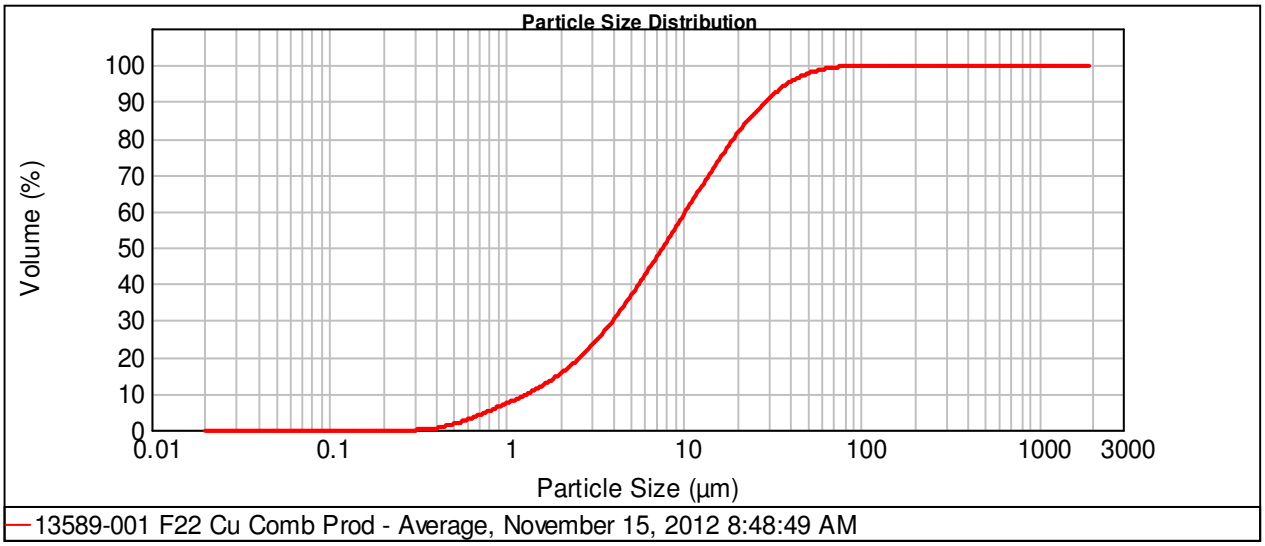
Result Emulation:
Off

Concentration:
0.0108 %Vol

Span :
3.592

Uniformity:
1.13

Result units:
Volume



Specific Surface Area:
1.77 m²/g

Surface Weighted Mean D[3,2]:
3.395 um

Vol. Weighted Mean D[4,3]:
12.105 um

Appendix E – Variability Testing

Test No.: F12 **Project No.**: 13589-001 **Operator**: CC/TM **Date**:

Purpose: As F11 on variability composites - Comp A

Procedure: As outlined below.

Feed: 2 x 2 kg of minus 10 mesh 50244-001 Comp A (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 91 µm

CuPb Regrind 20 minutes / 2 x CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 22 µm
Zn Regrind 15 minutes / 2 x Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 17 µm

Conditions:

Test No.: F14 **Project No.**: 13589-001 **Operator**: CC/TM **Date**: Aug 14th 2012

Purpose: As F11 on variability composites - Comp C

Procedure: As outlined below.

Feed: 2 x 2 kg of minus 10 mes 50244-001 Comp C (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 92 µm

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 16 µm
Zn Regrind 15 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 25 µm

Conditions:

Test No.: F16 **Project No.**: 13589-001 **Operator**: CC/TM **Date**: Aug. 28th 2012

Purpose: As F11 on variability composites - Comp E

Procedure: As outlined below.

Feed: 2 x 2 kg of minus 10 mesh 50244-001 Comp E (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1). P80 = 97 µm

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 21 µm
Zn Regrind 25 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill. P80 = 16 µm

Test No.: F19 **Project No.**: 13589-001 **Operator**: CC **Date**: Oct. 2nd 2012

Purpose: Upgrade Zn 4th Cleaner concentrate

Procedure: As outlined below.

Feed: 230g of minus 10 mesh LCT 5 Zn 4th Cl Conc A-F
(Assume 8kg of whole ore feed)

Regrind: 15 minutes / Zn 4th Cl Conc A-F @ 65% solids in laboratory pebble mill. P80 = µm

Conditions:

Operator notes:

Appendix F – LCT Tests Results

Test No.: LCT1 **Project No.**: 13589-001 **Operator**: CC/TM **Date**: Aug 13th 2012

Purpose: As F11, lower collector in the Zn cleaner circuit, longer regrind

Procedure: As outlined below.

Feed: 12 x 2 kg of minus 10 mesh 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1).

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Regrind 25 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Ro Tail A-F	P80 =	102	µm
Cu Conc A-F	P80 =	24	µm
Pb Conc A-F	P80 =	23	µm
Zn Conc A-F	P80 =	16	µm

Conditions:

Test No.: LCT8 **Project No.**: 13589-001 **Operator**: CC/TM **Date**: Nov. 26th 2012

Purpose: As F21/F22, lower collector in the Zn cleaner circuit, longer regrind

Procedure: As outlined below.

Feed: 12 x 2 kg of minus 10 mesh 50244-001 Overall Comp (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1).

CuPb Regrind: 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Regrind: 25 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Ro Tail A-F	P80 =	106	µm
Cu Conc A-F	P80 =	29	µm

Test No.: LCT4 **Project No.**: 13589-001 **Operator**: CC/TM **Date**: Sept. 11th 2012

Purpose: As F14, 4kg per cycle, higher pH in Zn circuit, more collector in Cu/Pb rougher

Procedure: As outlined below.

Feed: 12 x 2 kg of minus 10 mesh 50244-001 Comp C (location in a drum on a skid in the freezer)

Primary Grind: 29.5 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1 & #2).

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Regrind 15 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Ro Tail	P80 =	95	µm

Test No.: LCT5 **Project No.**: 13589-001 **Operator**: CC/TM **Date**: 13-Sep-12

Purpose: As F15, higher pH in Zn circuit

Procedure: As outlined below.

Feed: 12 x 2 kg of minus 10 mesh 50244-001 Comp D (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1&#2).

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Regrind 20 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Ro Tail	P80 =	111	µm
Pb Conc	P80 =	30	µm
Cu Conc	P80 =	22	µm
Zn Conc	P80 =	19	µm

Test No.: LCT6 **Project No.**: 13589-001 **Operator**: CC/TM **Date**: Sept.18th 2012

Purpose: As F16, shorter Zn cleaner retention time

Procedure: As outlined below.

Feed: 12 x 2 kg of minus 10 mesh 50244-001 Comp E (location in a drum on a skid in the freezer)

Primary Grind: 30 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1 &#2).

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Regrind 25 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Ro Tail	P80 =	91	µm
Pb Conc	P80 =	41	µm
Cu Conc	P80 =	23	µm
Zn Conc	P80 =	16	µm

Test No.: LCT7 **Project No.**: 13589-001 **Operator**: CC/TM **Date**: Sept. 20th 2012

Purpose: As F17, shorter Zn cleaner retention time

Procedure: As outlined below.

Feed: 12 x 2 kg of minus 10 mesh 50244-001 Comp F (location in a drum on a skid in the freezer)

Primary Grind: 28 minutes / 2 kg @ 65% solids in laboratory ball mill (BM#1).

CuPb Regrind 20 minutes / CuPb Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Regrind 25 minutes / Zn Ro Conc 1-3 @ 65% solids in laboratory pebble mill.

Zn Ro Tail	P80 =	89	µm
Pb Conc	P80 =	26	µm
Cu Conc	P80 =	24	µm
Zn Conc	P80 =	15	µm

TOXICITY TEST REPORT

Daphnia magna

Work Order : 222785
Sample Number : 36185

SAMPLE IDENTIFICATION

Company :	SGS Lakefield Research Limited	Time Collected :	10:30
Location :	Lakefield ON	Date Collected :	2012-12-13
Substance :	DE 13/12 LCT1 Comb Tls Day 56	Date Received :	2012-12-14
Sampling Method :	Grab	Date Tested :	2012-12-14
Sampled By :	B. Bowman	Temp. on Arrival :	14.0 °C
Sample Description :	Clear, colourless, odourless		

Test Method : Reference Method for Determining Acute Lethality of Effluents to *Daphnia magna* . Environment Canada EPS 1/RM/14 (Second Edition, December 2000).

TEST RESULTS

Effect	Value	95% Confidence Limits	Slope	Calculation Method
48-h LC50	100%*	50 - *	–	Nonlinear Interpolation
48-h EC50	100%*	50 - *	–	Nonlinear Interpolation

The results reported relate only to the sample tested.

*The usefulness of any LC50/EC50 calculated from this set of data is quiestonable because a concentration-effect relationship has not been demonstrated over a reasonable range (e.g. <37 to >63) of percent dead. A statistically valid upper 95% confidence limit could not be generated. At a confidence level of 95%, the binomial test shows that the LC50/EC50 is above 50%.

SODIUM CHLORIDE REFERENCE TOXICANT DATA

Organism Batch :	Dm12-24	Historical Mean LC50 :	6.6 g/L
Date Tested (yyyy/mm/dd) :	2012-12-11	Warning Limits (± 2SD) :	6.0 - 7.3 g/L
LC50 (95% Confidence Limits) :	7.5 g/L[1] (6.9 - 7.8)	Analyst(s) :	MS, NK
Statistical Method :	Linear Regression (MLE)		

Daphnia magna CULTURE HEALTH DATA

Time to First Brood :	9.8 days	Mean Young Per Brood :	28.3
Culture Mortality :	0.4% (previous 7 days)		

TEST CONDITIONS

Sample Treatment :	None	Number of Replicates :	1
pH Adjustment :	None	Test Organisms / Replicate :	10
Test Aeration :	None	Total Organisms / Test Level :	10
Organism Batch :	Dm12-24	Organism Loading Rate :	15.0 mL/organism

[1]Note: The reference toxicant test result fell outside the 95% warning limits for historical data. No other unusual circumstances were observed and therefore the test result is considered acceptable. Reference toxicant test was conducted under conditions identical to the test.

Hammer Zone Project
Report of Metallurgical Test Work

1.0 Summary of Metallurgical Test Work

On 22 January 2013, the laboratory facility of Kappes, Cassiday and Associates (KCA) in Reno, Nevada received a single green rice bag of sample material from the Hammer Zone Project. The rice bag contained fifteen (15) individual bags of material, each representing a single sample. Each sample was received with an identification number and assay information provided by the client, along with data from previously conducted metallurgical tests. The samples were individually prepared and utilized for metallurgical test work.

All preparation, assaying and metallurgical studies completed by KCA were performed utilizing accepted industry standard procedures.

1.1 Sample Receipt and Preparation

Upon receipt, each received sample was weighed and assigned a unique sample number (KCA Sample No. 66156 A through O). Each sample was then photographed and described briefly.

From each sample, a portion of material was split out and pulverized to a target size of 80% passing 0.075 millimeters. A 250 gram portion of the pulverized material was utilized for a bottle roll leach test. An additional portion of the pulverized material was utilized for head analyses.

1.2 Head Analyses

A portion of head material from each sample was ring and puck pulverized and analyzed for silver content by wet chemistry methods. Additionally, the head material was also assayed by quantitative methods for sulfur with speciation for sulfide and sulfate sulfur.

A summary of the head analyses is presented in Table 1-1.

Table 1-1.
Hammer Zone Project
Summary of Head Analyses

KCA Sample No.	Description	Assay, gms Ag/MT	Total Sulfur, %	Sulfide Sulfur, %	Sulfate Sulfur, %
66156 A	WH12138330R007, L845507	1040.61	0.16	0.04	0.13
66156 B	WH12138330R008, L845508	536.26	0.11	0.06	0.05

1.3 Bottle Roll Leach Test Work

Bottle roll leach testing was conducted on a portion of material split from each sample. For each test, a 250 gram portion of head material was ring and puck pulverized to a target size of 80% passing 0.075 millimeters and leached with a sodium cyanide solution (5.0 grams per liter).

KCA Sample Nos. 66156 B, F, J and G were utilized for 96 hour bottle roll leach tests. The remaining samples were utilized for 120 hour leach tests.

Summaries of the gold and silver extraction results of the bottle roll tests are presented in Tables 1-2 and 1-3, respectively.

1.4 Discussion

A comparison of the silver head assays conducted by KCA with the bottle roll calculated heads compared well. Exceptions to this were KCA Sample Nos. 66156 C, E, J and K, which showed relative standard deviations of 16%, 24%, 17% and 13%, respectively.

A comparison of the silver extraction percentages to the sulfur species did not show any obvious overall trends, and seemed to suggest that sulfur content does not affect leachability.

A comparison of the silver head assays with statistical analysis is presented in Table 1-4.

A comparison of the leach test data with sulfur and sulfur speciation is presented in Table 1-5.

Several relationships to the bottle roll silver extraction percentages are presented graphically in Figures 1-1 through 1-5.

2.0 Sample Receipt and Preparation

On 22 January 2013, the laboratory facility of KCA in Reno, Nevada received a single green rice bag of sample material from the Hammer Zone Project. The rice bag contained fifteen (15) individual bags of material, each representing a single sample. Each sample was received with an identification number and assay information provided by the client, along with data from previously conducted metallurgical tests. Each sample was prepared and utilized for head analyses and bottle roll leach testing.

Upon receipt, each received sample was weighed and assigned a unique sample number (KCA Sample No. 66156 A through O). Each sample was then photographed and described briefly.

From each sample, a portion of material was split out and pulverized to a target size of 80% passing 0.075 millimeters. A 250 gram portion of the pulverized material was utilized for a bottle roll leach test. An additional portion of the pulverized material was utilized for head analyses.

The received sample information is presented in Table 2-1.

The assays provided by the client are presented in Tables 2-2 through 2-4.

The test data provided by the client is presented in Table 2-5.

A photograph of each sample is presented in Figures 2-1 through 2-15, with a description of the sample below each figure.

Overall the sample was greyish brown in color and was composed of approximately 95% fines. The sample contained small, opaque, shiny flakes of possibly gypsum.

3.0 Head Analyses

A portion of head material from each sample was ring and puck pulverized and analyzed for silver content by wet chemistry methods. Additionally, the head material was also assayed by quantitative methods for sulfur with speciation for sulfide and sulfate sulfur.

3.1 Head Analyses for Silver

Head analysis for silver was conducted on the sample material. A portion of the head material was split out and ring and puck pulverized to a target size of 80% passing 0.075 millimeters. Silver content was determined using wet chemistry methods (4-acid digestion) with FAAS finish.

The results of the head analysis for silver are presented in Table 3-1.

Table 3-1.

4.0 Bottle Roll Leach Test Work

Bottle roll leach testing was conducted on a portion of material split from each sample. For each test, a 250 gram portion of head material was ring and puck pulverized to a target size of 80% passing 0.075 millimeters and utilized for leach testing.

KCA Sample Nos. 66156 B, F, J and G were utilized for 96 hour bottle roll leach tests. The remaining samples were utilized for 120 hour leach tests.

The bottle roll test procedure is outlined in the following:

1. One 250 gram split of pulverized material was placed into a 1.0 liter bottle and slurried with 375 milliliters of tap water.

2. The slurry was mixed thoroughly and the pH of the slurry checked. The pH of the slurry was adjusted, as required, to 10.5 to 11.0 with hydrated lime.

3. Sodium cyanide was added to the slurry to a target amount of 5.0 grams per liter sodium cyanide. The bottle was then placed onto a set of laboratory rolls. Rolling throughout the duration of the test mixed the slurry.

4. The slurry was checked at 2, 4, 6, 24, 48, 72 and 96 hours for pH, dissolved oxygen (DO), NaCN, Au, Ag and Cu. Select tests were also checked at 120 hours.

5. Additional hydrated lime and sodium cyanide were added after each sample period, if required, to adjust the slurry to the target levels.

6. After completion of the leach period, the slurry was filtered, washed and dried.

From the dry tailings, duplicate portions were split out and assayed for residual gold and silver content. The reject material was stored.

These laboratory tests were conducted with hydrated lime for pH control. A discussion regarding the available lime index for the hydrated lime ($Ca(OH)_2$) and lime (CaO) utilized by KCA is presented in Section 5 of this report.

The gold and silver extraction results of the bottle roll test are summarized in Tables 4-1 and 4-2, respectively. The detailed individual results are presented in Tables 4-3 through 4-17.

5.0 Assaying Procedures

5.1 Heads and Tails

Head assays for silver were run through a four (4) acid digestion of a 0.2 gram sample with FAAS finish.

Tail assays for gold were run as one assay ton (1AT) fire assays by standard fire assay methods with flame atomic absorption spectrophotometric (FAAS) finish. Tail assays for silver were run through a four (4) acid digestion of a 0.2 gram sample with FAAS finish.

5.2 Solution Assays

Solution assays were made by FAAS methods using certified gold and silver standards.

5.3 Cyanide Assays

Sodium cyanide concentrations in leach solutions were determined using a colorimetric titration using a silver nitrate titrant and 5-[p-(Dimethylamino)- benzylidene]-rhodanine as the indicator. Free cyanide was determined by titrating 25 mL of the leach solution to the colorimetric end point. A few drops of 1N sodium hydroxide solution were then added to break up any base metal cyanide complexes and the titration continued until the end point was reached again to determine the "total" cyanide in solution.

5.4 Sulfur Assays

Sulfur analysis was conducted utilizing a LECO® CS 230 carbon/sulfur with an induction furnace (approximately 1,350^{o}C) and infrared (IR) detectors. The LECO® method consists of burning the sulfur to SO_2 and analyzing the off-gas in a sequential IR detector system.

The method employed by Kappes, Cassiday & Associates (KCA) to determine sulfate sulfur is to roast a sample of the material at 650^{o}C followed by an analysis of the roasted residue in the LECO® to determine sulfur present as sulfate sulfur (sulfides have been burned off). The difference between the total sulfur and the sulfur present as sulfate sulfur is then calculated as the sulfide sulfur.

5.5 Available Lime Index

The available lime index for the reagent grade hydrated lime ($Ca(OH)_2$) or lime (CaO) utilized by Kappes, Cassiday & Associates (KCA) for this test program was determined using a modified procedure developed from ASTM C25-99, Standard Test Methods for Chemical Analysis of Limestone, Quicklime and Hydrated Lime. This test is otherwise known as the "rapid sugar test method".

For the Available Lime Index test method, a sample of the reagent grade lime material is slaked and dispersed with water. The lime is solubilized by reaction with sugar to form calcium sucrate which is then determined by titration against a standard acid (hydrochloric acid) using phenolphthalein as the indicator.

Analysis of the reagent grade hydrated lime ($Ca(OH)_2$) or lime (CaO) utilized by KCA is conducted periodically and the average results are reported below:

Reagent Grade Product	Available Lime Index, % CaO
Lime, CaO	95.4%
Hydrated Lime, $Ca(OH)_2$	73.1%

APPENDIX XI

WATER QUALITY REPORTS – J. GIBSON ENVIRONMENTAL CONSULTING

Silver Range Resources

KEG AND REBEL CLAIMS

Baseline Water Quality / Hydrology Survey

March, 2012

J.Gibson Env. Consulting *Whitehorse, Yukon*

KEG / REBEL Claims March 2012

Silver Range Resources baseline water quality / hydrology surveys of the KEG and REBEL Claims surface waters continued on March 22 and 23, 2012.

The March 2012 surveys are at winter low flow volumes.

The sites are located in the Anvil Range approximately 30 kilometers north of Faro, Yukon and 15 kilometers north of the former Faro Mine.

The KEG Claims are located on tributaries to the Tay River.

The REBEL Claims are located south of the KEG Claims on tributaries to Anvil Creek.

All surface waters are tributaries to the Pelly River.

The initial water quality / hydrology survey was done in August 2010 followed by surveys in October 2010, March 2011 and June 2011 and September 2011.

Exploration activity had been halted in September 2011 for the winter.

The exploration camp and all survey sites were accessed by helicopter.

The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals, total organic carbon, total cyanide and total mercury with field measurements for pH, water temperature and flow volumes.

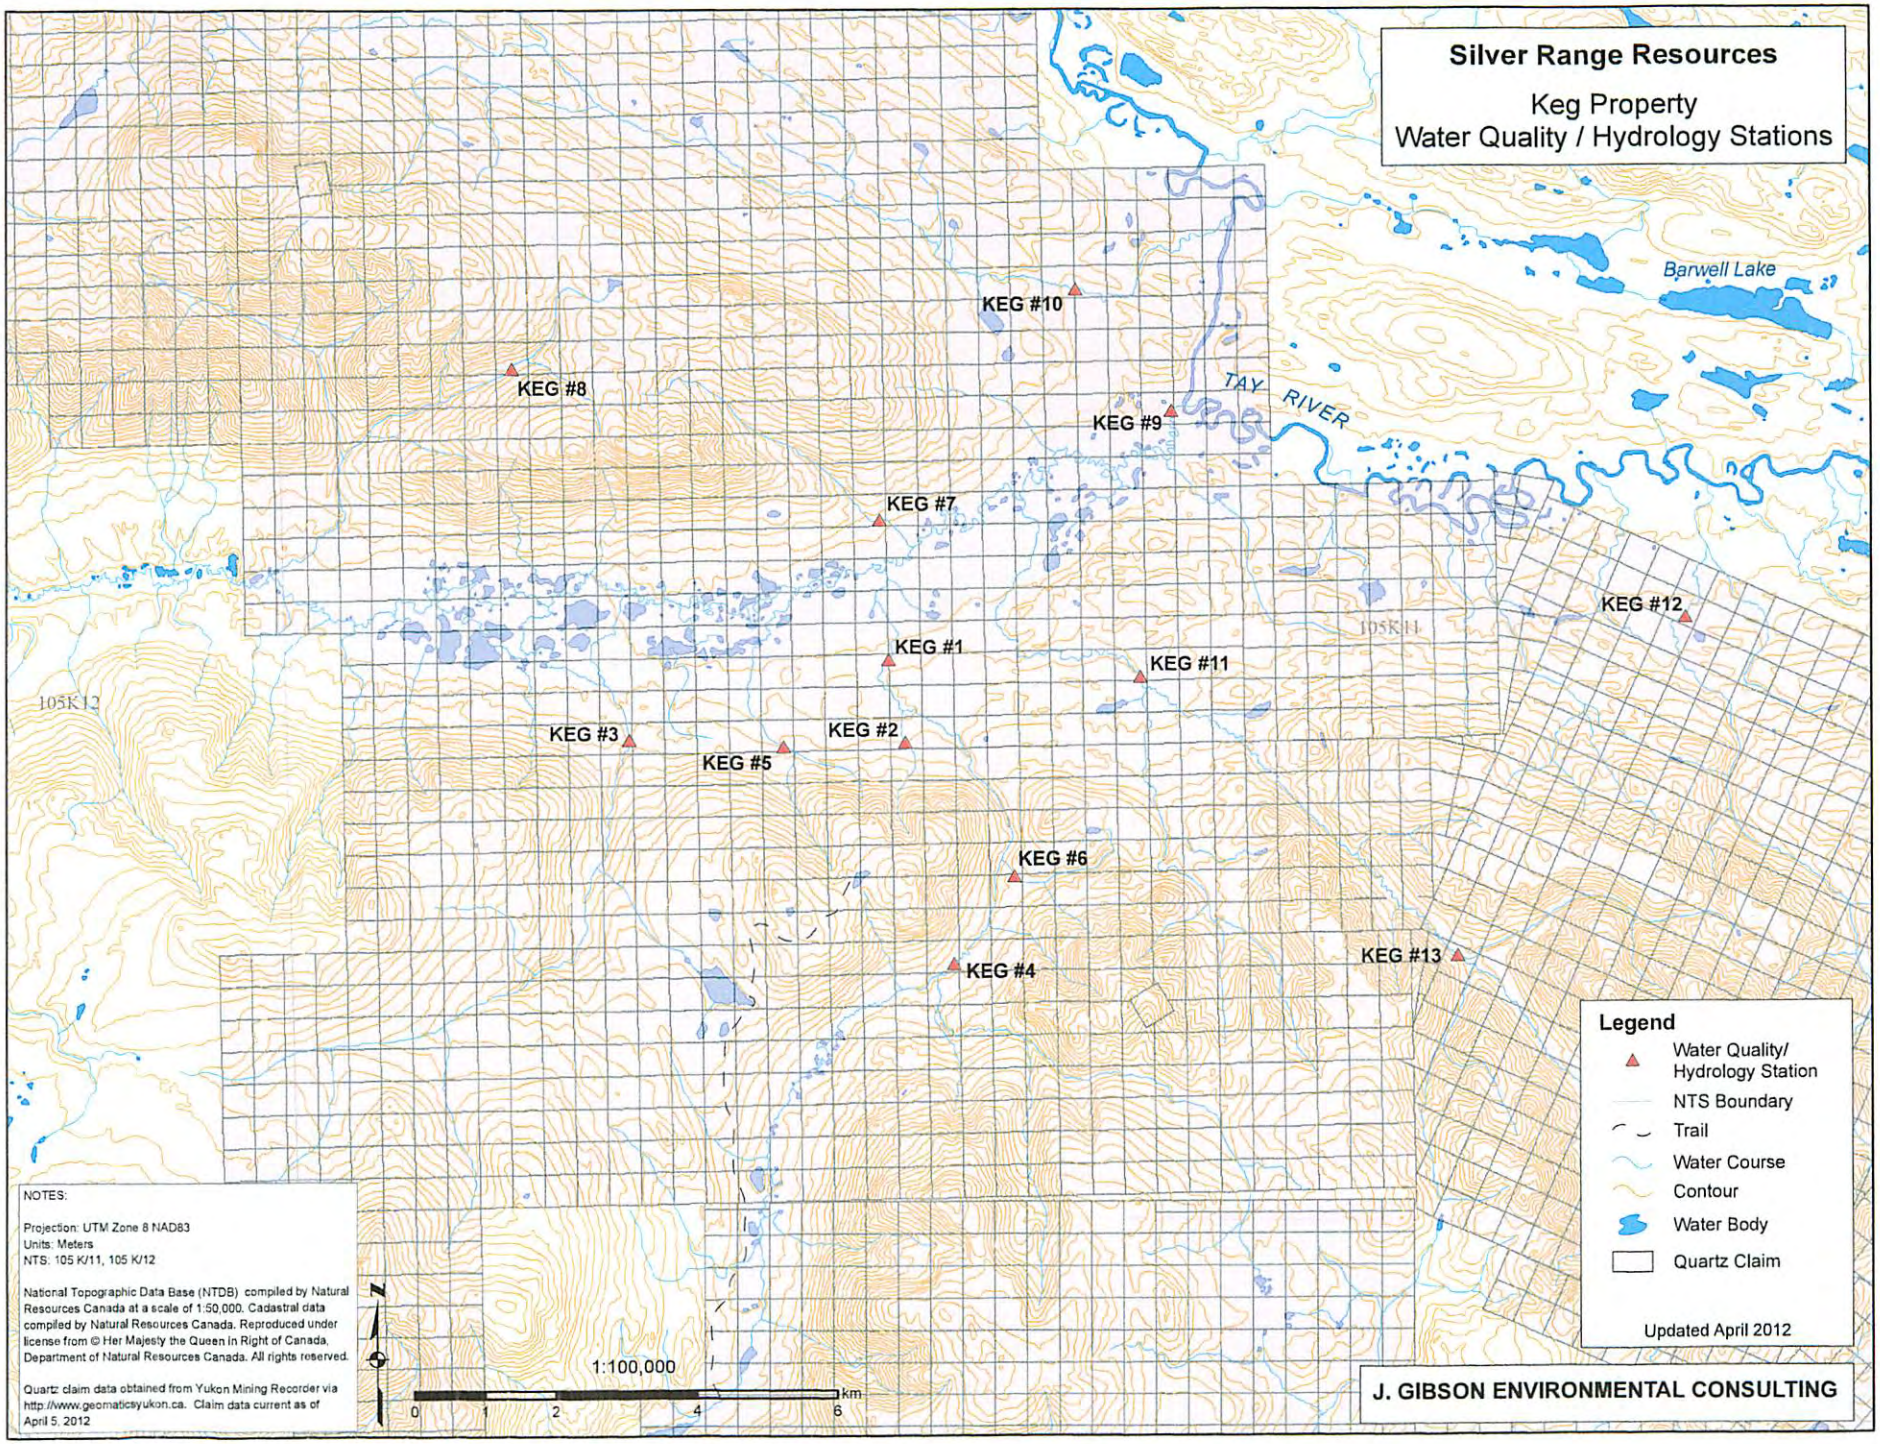
Snow survey measurements were taken at Snow Site #1 (established in March 2011).

Sample Locations

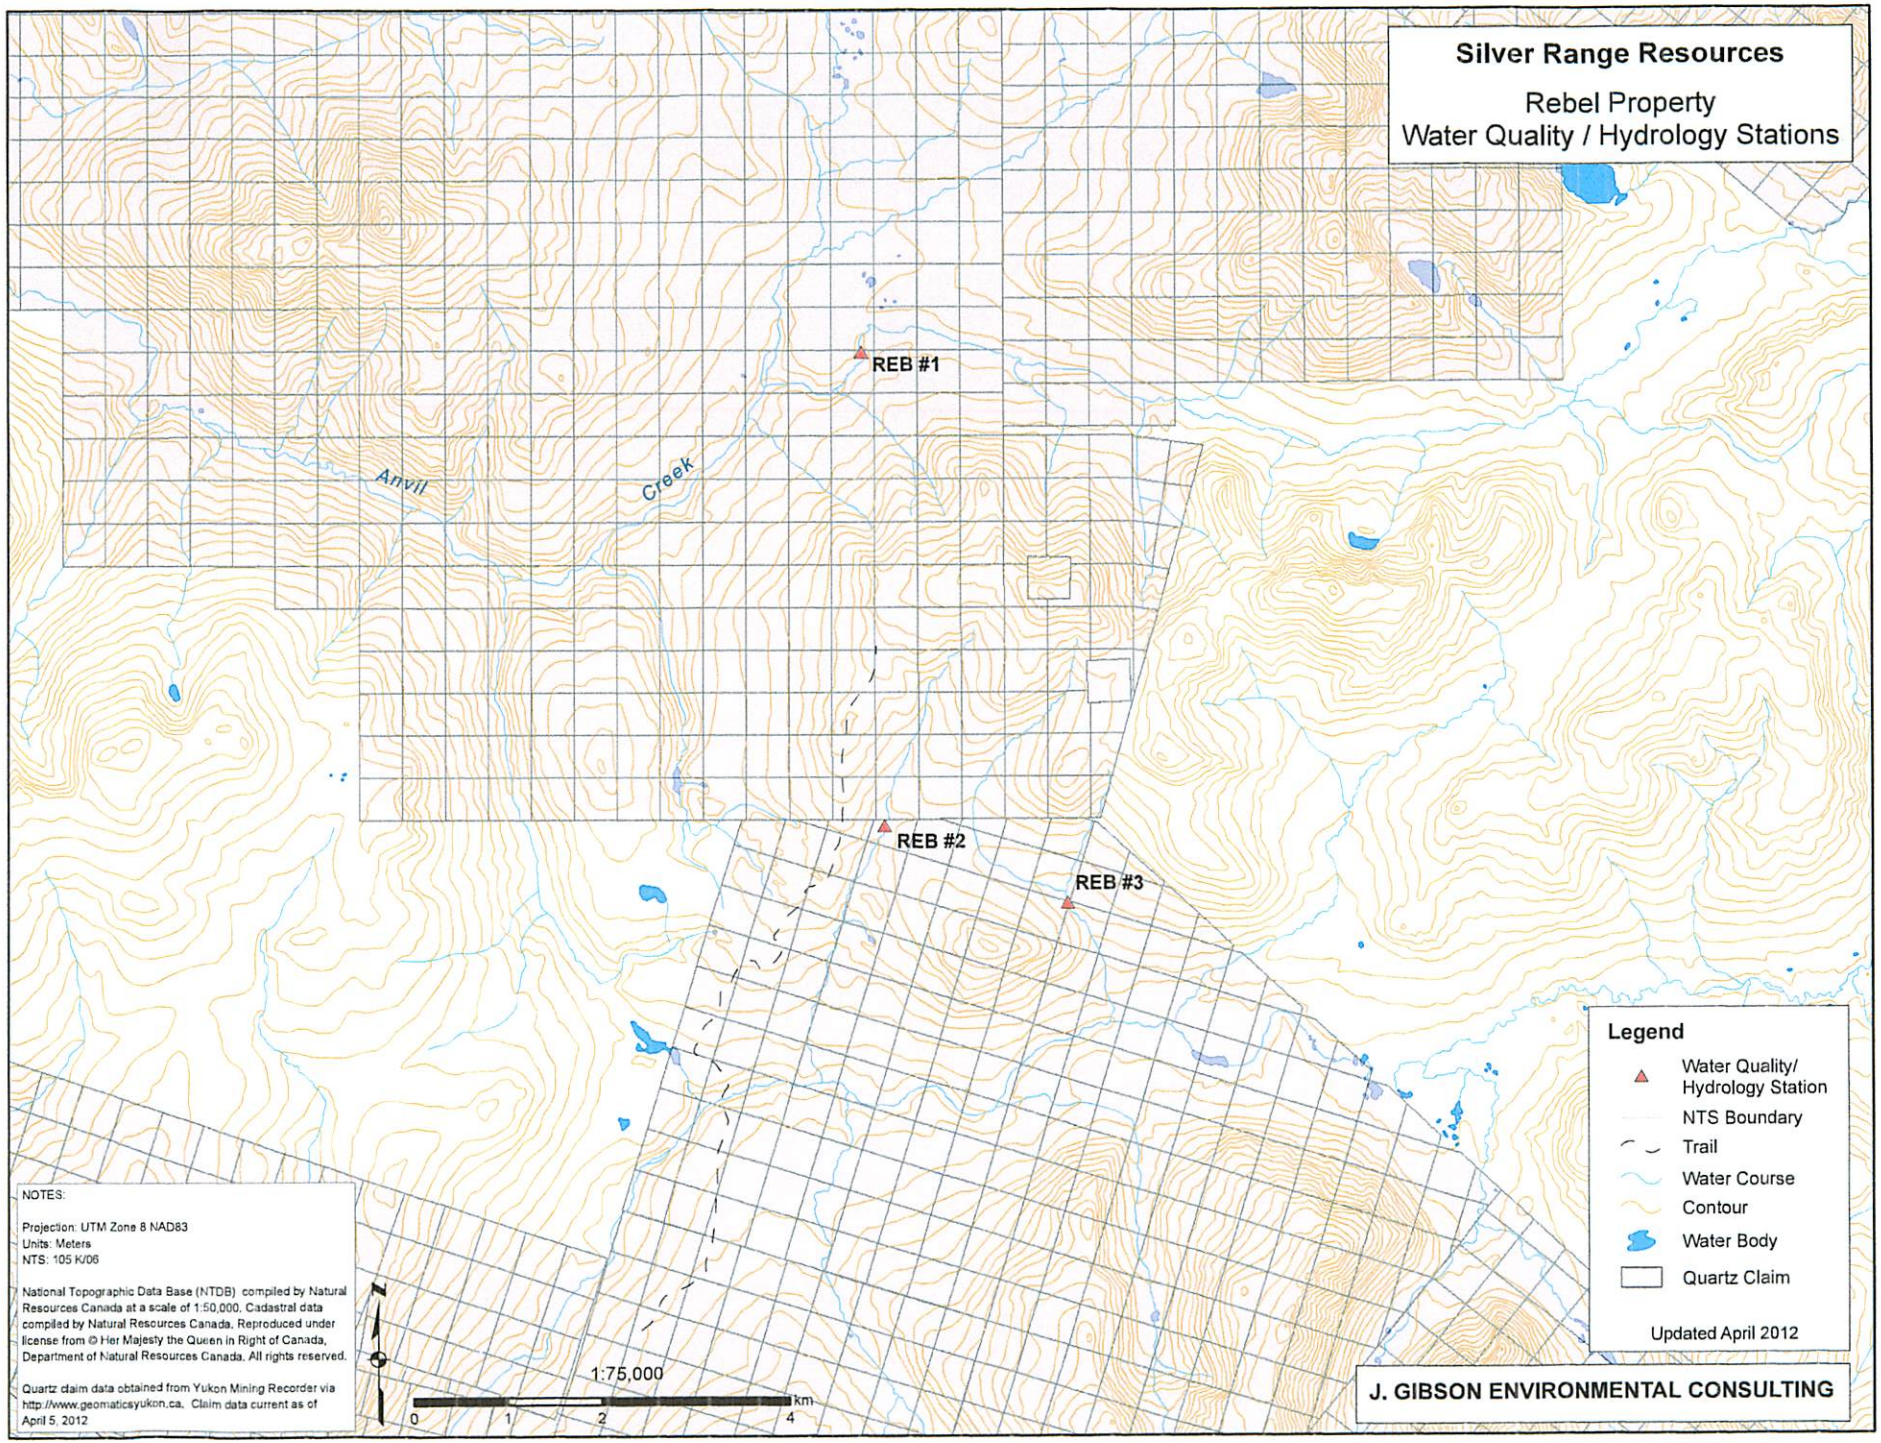
Nine water quality sample sites were established on the KEG Claims during the initial survey in August 2010.
Four sites were added in October 2010 on the eastern limits of the expanded claim block.

Three sites were established on the REBEL Claims in August, 2010 with no additions.
All sites are on the attached location maps.

Site Change / Relocation



Station location coordinates were checked during the March 2012 survey.



There is a discrepancy between the map location and coordinates for KEG#2, KEG#3 and KEG#5. A change was made to the map location of all three stations resulting in a new station KEG#3.
KEG#3 will be established in May 2012 when ground access is possible to establish a landing site.
Data collected at Stations KEG#2 and KEG#5 remains valid for the new locations.

New site coordinates are listed below and on the updated site map.

KEG Claim sample station designations and coordinates (updated March 2012) are:

Station #	Lat/Long Coordinates	Elevation(m)
KEG #1	62 36 8.26 / 133 19 58.3	787
KEG #2	62 35 29.8 / 133 19 44.2	818
KEG #3	62 35 34.4 / 133 24 18.1	865
KEG #4	62 33 46.9 / 133 19 48	970
KEG #5	62 35 29.3 / 133 21 45.3	833
KEG #6	62 34 26.4 / 133 17 59.1	940
KEG #7	62 37 12.9 / 133 20 43	833
KEG #8	62 38 26.8 / 133 26 5.3	1152
KEG #9	62 37 59.2 / 133 15 9.9	750
KEG #10	62 38 56.3 / 133 16 41.9	850
KEG #11	62 35 57.1 / 133 15 48.3	880
KEG #12	62 36 16.9 / 133 06 45.8	820
KEG #13	62 33 43.7 / 133 10 41.6	1020

REBEL Claim sample station designations and coordinates are:

Station #	Lat/Long Coordinates	Elevation(m)
REB #1	62 27 49.8 / 133 12 47.9	1305
REB #2	62 24 59.5 / 133 13 21.1	1425
REB #3	62 23 48.3 / 133 10 36.9	1365

Station coordinates and elevations are for helicopter landing sites. Due to the topography and thick vegetation it was often necessary to located landing sites up to100 meters distance from sample sites.

Sample Analysis Parameters

Stations KEG #1, #4, #9 and #11 to #13 and REB #1 and #3 were sampled for total metals, dissolved metals and routine chemistry, total organic carbon, total cyanide and total mercury.
Station KEG #9 is the KEG Claims downstream station prior to flows entering the Tay River and was sampled for routine chemistry, total and dissolved metals.

Stations Keg #2, #5, #6, #10 were not sampled as there was no surface flow in these tributary channels.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total and dissolved metal samples were preserved with nitric acid immediately after sampling.

Total Cyanide samples were preserved with NaOH, Total Organic Carbon samples with HCL immediately after sampling.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Exova Canada Inc. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH, conductivity, total dissolved solids were taken with an Oakton PCS TestR 35, water temperatures with a digital thermometer.

Flow Volume Measurements

Station KEG#7 had heavy overflow ice greater than the auger depth and was not sampled.

Station KEG#8 was not visited.

Station KEG#3 will be installed in May 2012.

Stream flow volumes were measured at Stations KEG#1 and KEG#11 with a Price AA velocity meter and cross sectional area calculations. Measurement required ice removal from the channel cross section.

Stream flow volumes at KEG#4, #12 and #13 were estimated.

Stream flow volumes at REB#1 and #3 were estimated. Station REB#2 was dry with no water or ice in the stream channel.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Tables 1a and 1b. KEG Stations Routine Chemistry – laboratory analysis and field measurements

Tables 2a and 2b. KEG Stations Total Metals ICP–MS laboratory analysis results

Tables 3a and 3b. KEG Stations Dissolved Metals ICP–MS laboratory analysis results

Table 4. KEG Stations Flow Volume Summary 2010, 2011, 2012.

Table 5. REBEL Stations Routine Chemistry – laboratory analysis and field measurements

Table 6. REBEL Stations Total Metals ICP–MS laboratory analysis results

Table 7. REBEL Claims Dissolved Metals ICP-MS laboratory analysis results

Table 8. REBEL Stations Flow Volume Summary 2010, 2011, 2012.

Table 9.. Camp Drinking Water Supply at KEG #4. Laboratory analysis results to. March 2012.

Table 10. Snow Survey Data March 2011 and 2012.

Listed with the analysis data are the laboratory detection limits for each parameter.

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic Guidelines for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to ***CCME – Canadian Water Quality Guidelines.***
All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by Exova Canada Inc of Surrey B.C.

Laboratory Analytical Reports are attached in Appendix 1.

Snow survey field notes are in Appendix 2.

Data Summaries for each station are on the attached Excel disc.

Quality Control

No samples for quality control were taken in March 2012.

Discussion

Snow Survey

Snow survey results for March 22, 2012 show a decreased snow depth from March 2011. Snow density is increased from March 2011 along with snow water equivalent.

The survey course, located across the stream channel near camp was not utilized by caribou compared to 2011.

Hydrology

All water quality / hydrology stations on the KEG and REBEL claims were in winter low / minimum stage flow conditions. There was no input from snow melt at the time of the survey.

Flow measurements were done on Stations KEG#1 and #11. All other KEG stations and REB stations with flow had volumes estimated.

Stations KEG#2, #5 and #6 were frozen to channel base with no flow. KEG #10 was dry with a 0.25 meter airspace between ice and channel base.

Station KEG#7 had heavy overflow ice.

Station REB #2 was dry with no ice – flow dried up prior to freeze up.

Ice conditions ranged from 0.3 meters depth at KEG# 9 and #11, to 2 cm depth at KEG#1.

A summary of flow volumes for the surveys to date are listed in Table 4 (KEG) and Table 8 (REBEL).

Laboratory Analytical Results

Parameters that equal or exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

KEG Stations

Station KEG#1 results exceed ***Aquatic Guidelines*** for total selenium.

Station KEG#4 results exceed ***Aquatic Guidelines*** for total selenium.

Station KEG #9 results exceed ***Drinking Water MAC's*** for total iron and manganese. KEG#9 exceeds the ***Aquatic Guideline*** for total iron.

Station KEG #11 results exceed ***Aquatic Guideline*** for total selenium.

Station KEG #12 results exceed ***Aquatic Guideline*** for total selenium.

Station KEG #13 results exceed ***Aquatic Guideline*** for total selenium..

Total Mercury concentrations were at or below the detection limit of 0.00001 mg/L at all KEG stations.

Total cyanide concentrations were below the detection limit of 0.001 mg/L at all stations

Stations KEG #2, #5, #6, #10 had no surface flow and were not sampled.

Stations KEG #3 and #8 were not surveyed.

REBEL Stations

Parameters that exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

All REBEL stations meet ***Drinking Water Guideline*** and ***Aquatic Guidelines*** limits for all parameters tested with the continued exception of ***total selenium at Station REB#1***.

Total Mercury concentrations were below detection limits at all REB stations.

Total cyanide concentrations were at or below the detection limits of 0.001 mg/L at all REB stations.

Camp Drinking Water Supply

Station KEG #4 is the source of camp drinking water supply. Analysis results for samples taken of the ***"Raw"*** supply (total metals and routine chemistry) are listed in Table 9.

KEG#4 supply waters ***"Raw"*** met ***Drinking Water Guideline*** limits for all parameters tested.

Gibson & Associates	, Box 20913 Whitehorse, Yukon Territory Y1A 6P2 Phone: (867) 633-4522 Fax: (867) 668-6895 Email: luditegibson@yahoo.ca	On [Lot Verification] send (COA) by Email - Multiple Reports On [Report Approval] send (COC, Test Report) by Email - Merge Reports On [Lot Approval and Final Test Report Approval] send (Invoice) by Email - Single Report

Notes To Clients:

- Analysis was performed on samples 861983-1 to 6 that exceeded the recommended holding time for Water Nitrate analysis.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Notes To Clients:

- Analysis was performed on samples 861990-1 and 2 that exceeded the recommended holding time for Water Nitrate analysis.
- Some total metal results were less than dissolved metal results for sample 861990. The results were verified and are within expected measurement uncertainty.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Comments:

- Analysis was performed on samples 861990-1 and 2 that exceeded the recommended holding time for Water Nitrate analysis.
- Some total metal results were less than dissolved metal results for sample 861990. The results were verified and are within expected measurement uncertainty.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Please direct any inquiries regarding this report to our Client Services group.
Results relate only to samples as submitted.

Silver Range Resources

KEG CLAIMS

Baseline Water Quality / Hydrology Survey

Environmental Data Update

October, 2012

J.Gibson Env. Consulting *Whitehorse, Yukon*

KEG Claims October 2012

Silver Range Resources baseline water quality / hydrology surveys of the KEG Claims surface waters continued October 17, 2012.

REBEL Claims surveys are now reported with SNAP and HAMMER surveys.

The sites are located in the Anvil Range approximately 30 kilometers north of Faro, Yukon and 15 kilometers north of the former Faro Mine.

The KEG Claims are located on tributaries to the Tay River.

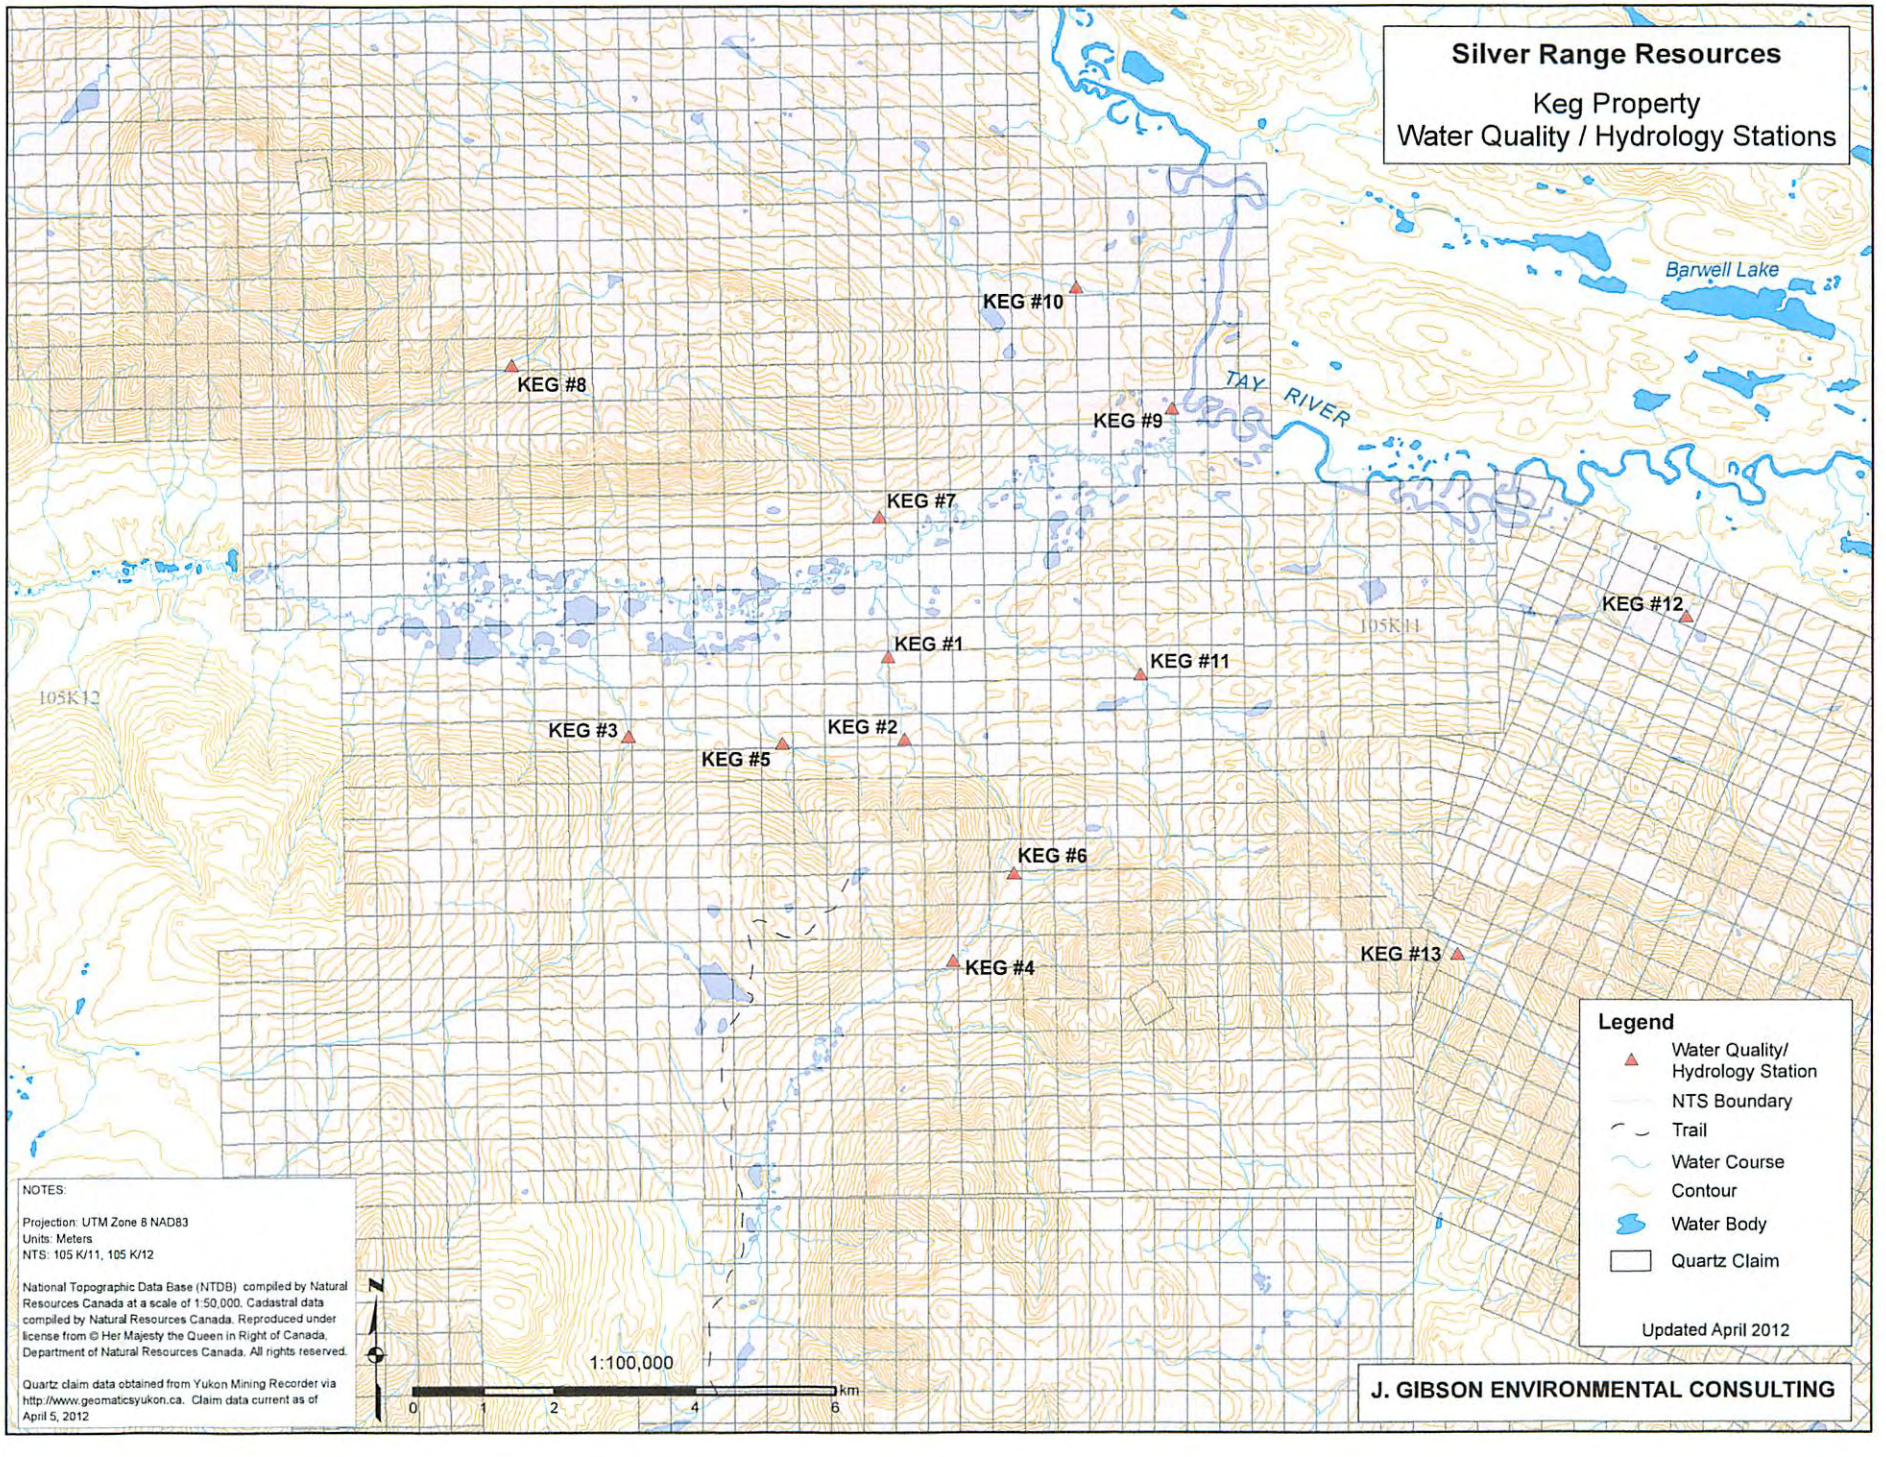
All surface waters are tributaries to the Pelly River.

The KEG exploration project was shut down for the season in September.

The exploration camp and all survey sites were accessed by helicopter.

The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals, total organic carbon, total cyanide and total mercury with field measurements for pH, water temperature and flow volume measurements.

Water level data loggers installed May 2012 at Stations KEG#1 and KEG#11 were downloaded, level surveyed and removed at close of open water season..



Sample Locations

Nine water quality sample sites were established on the KEG Claims during the initial survey in August 2010.
Four sites were added in October 2010 on the eastern limits of the expanded claim block.

All sites are on the attached location map.

Sample Frequency

All Keg stations to October 2012 remain on a quarterly sampling frequency.

KEG #7	62 37 12.9 / 133 20 43	833
KEG #8	62 38 26.8 / 133 26 5.3	1152
KEG #9	62 37 59.2 / 133 15 9.9	750
KEG #10	62 38 56.3 / 133 16 41.9	850
KEG #11	62 35 57.1 / 133 15 48.3	880
KEG #12	62 36 16.9 / 133 06 45.8	820
KEG #13	62 33 43.7 / 133 10 41.6	1020
*Updated March 2012		

Station coordinates and elevations are for helicopter landing sites. Due to the topography and vegetation it was often necessary to located landing sites up to100 meter distance from sample sites.

Sample Analysis Parameters

All KEG Stations were sampled for total metals, dissolved metals and routine chemistry, total organic carbon, total cyanide and total mercury.

Station KEG #9 is the KEG Claims downstream station prior to flows entering the Tay River.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total and dissolved metal samples were preserved with nitric acid immediately after sampling.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Exova Canada Inc. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH, conductivity, total dissolved solids were taken with an Oakton PCS TestR 35, water temperatures with a digital thermometer.

Flow Volume Measurements

Stream flow volumes were measured at all KEG Stations with a Price AA velocity meter and cross sectional area calculations. All channels had minor shore ice to 30% of channel coverage.

A summary of KEG stream flow volumes from 2010 to 2012 are in Table 4.

Stream flow volume data/calculations are attached in Appendix 2.

Water level data logger data for Stations KEG#1 and KEG#11 will be reported after open water season.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Table 1. KEG Stations Routine Chemistry – laboratory analysis and field measurements

Table 2. KEG Stations Total Metals ICP–MS laboratory analysis results

Table 3. KEG Stations Dissolved Metals ICP–MS laboratory analysis results

Table 4. KEG Stations Flow Volume Summary 2010, 2011, 2012.

Table 5. Quality Control Sample Results- KEG#13 Total and Dissolved Metals

Table 6.. Camp Drinking Water Supply at KEG #4. Laboratory analysis results to October 2012.

Listed with the analysis data are the laboratory detection limits for each parameter.

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic Guidelines for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to ***CCME – Canadian Water Quality Guidelines.***
All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by Exova Canada Inc of Surrey B.C.

Laboratory Analytical Reports are attached in Appendix 1.

Data Summaries for each station are on the attached Excel disc.

Quality Control

Duplicate total and dissolved metals samples for quality control were taken in October 2012 at Station KEG# 13. Analysis results are listed in Table 5.

DWQ* = Canadian Drinking Water Quality Guideline ***exceeds DWQ MAC***

Discussion

Hydrology

All hydrology stations on the KEG claims were in decreasing stage flow conditions under partial ice condition.
Larger stream channel show a 25-38% decrease in volume from July 2012. Smaller stream channel show less of a decrease in volume from July.

Flow measurements were estimated at KEG #2 and #5.

Water level data loggers at Stations KEG#1 and #11 were downloaded and removed for the completion of open water season.
Data will be reported at a later date.

Laboratory Analytical Results

Parameters that equal or exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

KEG Stations

Station KEG#1 results exceed the ***Aquatic Guidelines*** for selenium.

Station KEG#2 results exceed the ***Aquatic Guidelines*** for aluminum and copper.

Station KEG#4 results equal or exceed ***Aquatic Guidelines*** for selenium.

Station KEG#5 results exceed ***Aquatic Guidelines*** for copper and selenium.

Station KEG#6 results exceed ***Aquatic Guidelines*** for aluminum, iron and zinc; and exceed the ***Drinking Water MAC*** for iron and manganese.

Station KEG#7 results exceed ***Aquatic Guidelines*** for iron and selenium; and the ***Drinking Water MAC*** for iron.

Station KEG#8 results exceed ***Aquatic Guidelines*** for selenium.

Station KEG #9 results exceed ***Aquatic Guideline*** for iron; and the ***Drinking Water MAC's*** for iron.

Station KEG #10 results exceed ***Aquatic Guideline*** for selenium and zinc.

Station KEG#11 results exceed ***Aquatic Guidelines*** for selenium.

Station KEG #12 results exceed ***Aquatic Guideline*** for selenium.

Stations KEG#13 results exceeds ***Aquatic Guideline*** for selenium and zinc.

Total Mercury concentrations were below the detection limit of 0.0001 mg/L at all KEG stations.
Total Cyanide concentrations were below the detection limit of 0.002 mg/L at all KEG stations.

Camp Drinking Water Supply

Station KEG #4 is the source of camp drinking water supply. Analysis results for samples taken of the ***"Raw"*** supply (total metals and routine chemistry) and the ***"treated/ filtered"*** supply are listed in Table 6.

In October 2012 only the "raw" supply was analyzed as camp was closed for the season.

KEG#4 camp supply waters in October "raw" met ***Drinking Water Guideline*** limits for all parameters tested.

Notes To Clients:

- Analysis was performed on samples 901092-1 to 13 that exceeded the recommended holding time for Total Phosphorus analysis.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.
- HARD is included in the TW23EW.

Comments:

- Analysis was performed on samples 901092-1 to 13 that exceeded the recommended holding time for Total Phosphorus analysis.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Silver Range Resources

REBEL/SNAP/HAMMER CLAIMS

Baseline Water Quality / Hydrology Survey

Environmental Data Update

October, 2012

REBEL/ SNAP/HAMMER Claims October 2012

Silver Range Resources baseline water quality / hydrology surveys of the REBEL Claims surface waters continued October 18, 2012.

Water quality / hydrology surveys of the SNAP and HAMMER Claims were started October 18, 2012.

The sites are located in the Anvil Range approximately 30 kilometers north of Faro, Yukon and 15 kilometers north of the former Faro Mine.

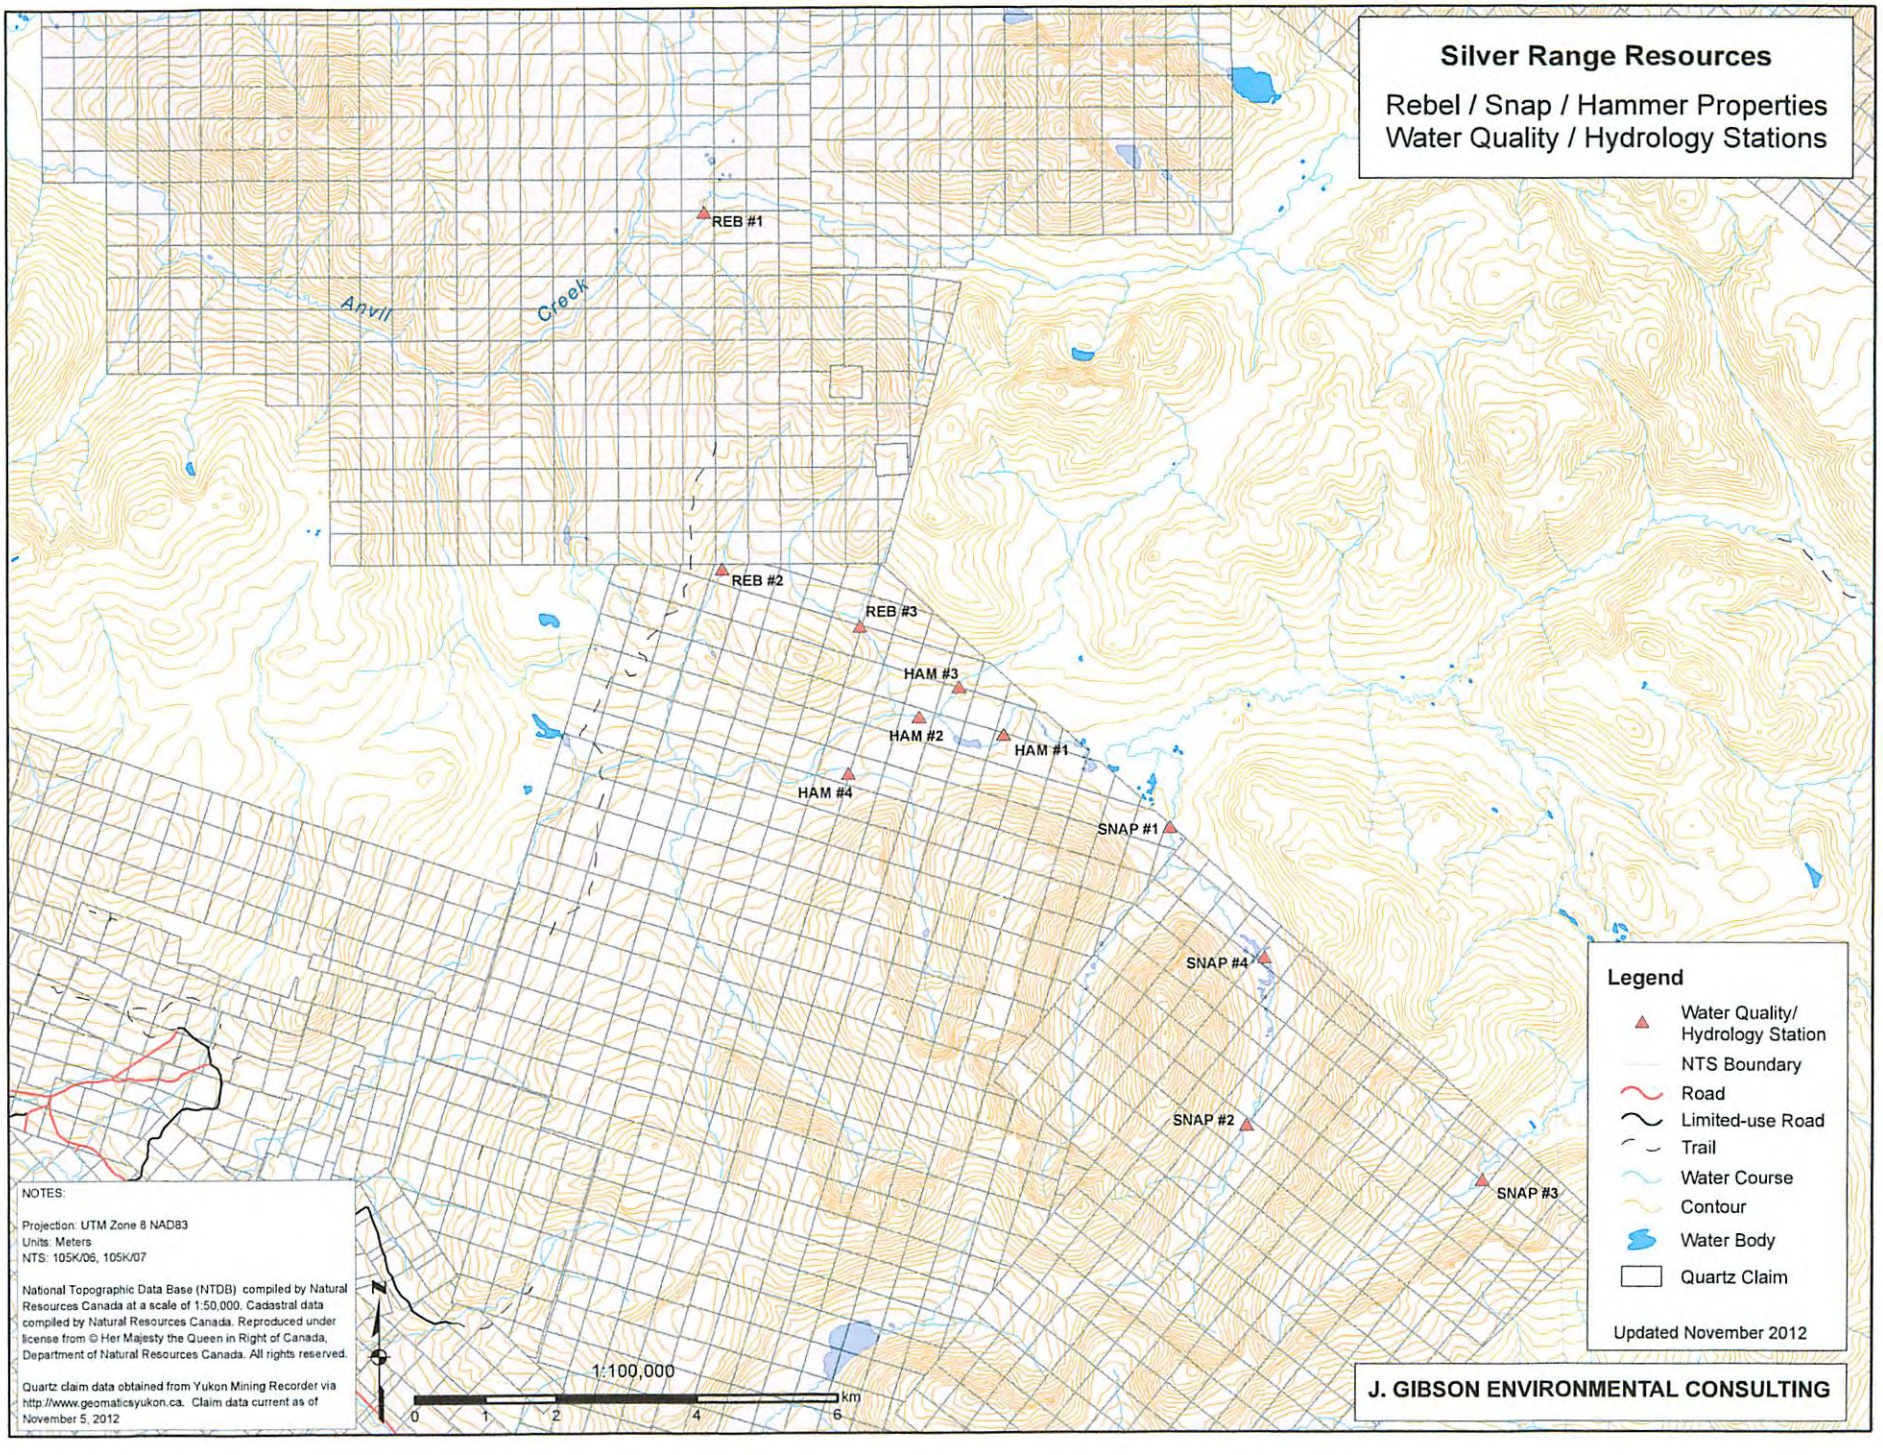
The REBEL Claims are located on tributaries to Anvil Creek and Rose Creeks.

The SNAP Claims are located on tributaries to Blind Creek.

The HAMMER Claims are located on tributaries to Rose Creek.

All surface waters are tributaries to the Pelly River.

All survey sites were accessed by helicopter.



The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals, total organic carbon, total cyanide and total mercury with field measurements for pH, water temperature and flow volume.

Sample Locations

Three sample sites were established on the REBEL Claims during the initial survey in August 2010.

Four sites were established on each of the SNAP and HAMMER Claims in October 2012.

All sites are on the attached location map.

0 1 2 4 6 km
J. GIBSON ENVIRONMENTAL CONSULTING

REBEL Claim sample station designations and coordinates are:

Station #	Lat/Long Coordinates	Elevation(m)
REB #1	62 27 42.8N / 133 13 32.8W	1305
REB #2	62 24 58.7N / 133 13 26.1W	1425
REB #3	62 24 30.3N / 133 11 12.1W	1365

SNAP Claims station designations and coordinates are:

Station #	Lat/Long Coordinates	Elevation(m)
SNAP #1	62 22 52.6N / 133 6 13W	
SNAP #2	62 20 34.9N / 133 5 5.4 W	
SNAP #3	62 20 7 N / 133 1 17.1 W	
SNAP #4	62 21 51.3N / 133 4 43.4W	

HAMMER Claims station designations and coordinates are:

Station #	Lat/Long Coordinates	Elevation(m)
HAM#1	62 23 37.9N / 133 8 53.9W	
HAM #2	62 23 47.3N / 133 10 16.9W	
HAM #3	62 24 0.7N / 133 9 36.6W	
HAM #4	62 23 22.1N / 133 11 28.1W	

Station coordinates and elevations are for helicopter landing sites. Due to the topography and thick vegetation it was often necessary to located landing sites up to100 meters from sample sites.

Sample Analysis Parameters

All REBEL, SNAP and HAMMER Stations were sampled for total metals, dissolved metals and routine chemistry, total organic carbon, total cyanide and total mercury.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total and dissolved metal samples were preserved with nitric acid immediately after sampling.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Exova Canada Inc. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH, conductivity, total dissolved solids were taken with an Oakton PCS TestR 35, water temperatures with a digital thermometer.

Sample Frequency

All REBEL, SNAP and HAMMER stations are on a quarterly sample frequency.

Flow Volume Measurements

Stream flow volumes were measured with a Price AA velocity meter and cross sectional area calculations. All channels had partial ice cover.

Measured stream flow volumes are listed with Routine Chemistry and in a flow summary table for each project.

Stream flow volume data/calculations are attached in Appendix 2.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Table 1. REBEL Stations Routine Chemistry – laboratory analysis and field measurements

Table 2. REBEL Stations Total Metals ICP–MS laboratory analysis results

Table 3. REBEL Stations Dissolved Metals ICP–MS laboratory analysis results

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic Guidelines for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to ***CCME – Canadian Water Quality Guidelines.***
All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by Exova Canada Inc of Surrey B.C.

Laboratory Analytical Reports are attached in Appendix 1.

Data Summaries for REBEL stations are on the attached Excel disc. Summary tables for SNAP and HAMMER stations will be developed when three data points are available.

Quality Control

Duplicate total metals samples were taken in October 2012 at Station SNAP #3. Analysis results are listed in Table 8.

Discussion

Hydrology

All water quality / hydrology stations were in low stage flow conditions at the start of ice conditions. All stations had partial ice cover with minor anchor ice at Station REBEL #1 only.

Flow volumes had recent input due to overnight snowfall.

Laboratory Analytical Results

Parameters that equal or exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

REBEL Stations

Station REBEL #1 results exceed the ***Aquatic Guidelines*** for selenium.

Station REBEL#3 results exceed the ***Aquatic Guidelines*** for aluminum.

Station REBEL #2 meets all ***Guideline*** limits

SNAP Stations

Station SNAP#2 results exceed the ***Aquatic Guidelines*** for cadmium and zinc

Station SNAP#3 results exceed ***Aquatic Guidelines*** for aluminum, cadmium and zinc; and exceeds the ***Drinking Water MAC*** for manganese.

Station SNAP#4 results exceed ***Aquatic Guidelines*** for iron, cadmium and zinc; and exceeds the ***Drinking Water MAC*** for iron.

Station SNAP #1 meets all ***Guideline*** limits

HAMMER Stations

Station HAM#1 results exceed ***Aquatic Guidelines*** for iron, and exceeds the ***Drinking Water MAC*** for iron and manganese.

Stations HAM #2, #3 and #4 meets all ***Guideline*** limits

Total Mercury concentrations were below the detection limit of 0.0001 mg/L at all project stations.

Total cyanide concentrations were at or below the lab detection limit of 0.002 mg/L at all project stations.

Camp Drinking Water Supply

Station KEG #4 is the source of camp drinking water supply for area projects. Analysis results for samples taken of the "***Raw***" supply (total metals and routine chemistry) are listed the October KEG update.

KEG#4 supply waters, both raw and treated met ***Drinking Water Guideline*** limits for all parameters tested.

Notes To Clients:

- Analysis was performed on samples 901088-1 to 7 and 9 to 12 that exceeded the recommended holding time for Total Phosphorus analysis.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.
- HARD is included in the TW23EW.

Comments:

- Analysis was performed on samples 901088-1 to 7 and 9 to 12 that exceeded the recommended holding time for Total Phosphorus analysis.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Silver Range Resources

KEG CLAIMS

Baseline Water Quality / Hydrology Survey

Environmental Data Update

November and December, 2012

J.Gibson Env. Consulting *Whitehorse, Yukon*

KEG Claims November and December 2012

Silver Range Resources baseline water quality / hydrology surveys of the KEG Claims surface waters continued in November and December 2012 at stations identified for monthly surveillance. Monthly stations are located on surface waters adjacent to the mineralized zone.

Monthly stations are: KEG#1, #2, #3, #4, #5 and #6.

The sites are located in the Anvil Range approximately 30 kilometers north of Faro, Yukon and 15 kilometers north of the former Faro Mine.

The KEG Claims are located on tributaries to the Tay River.

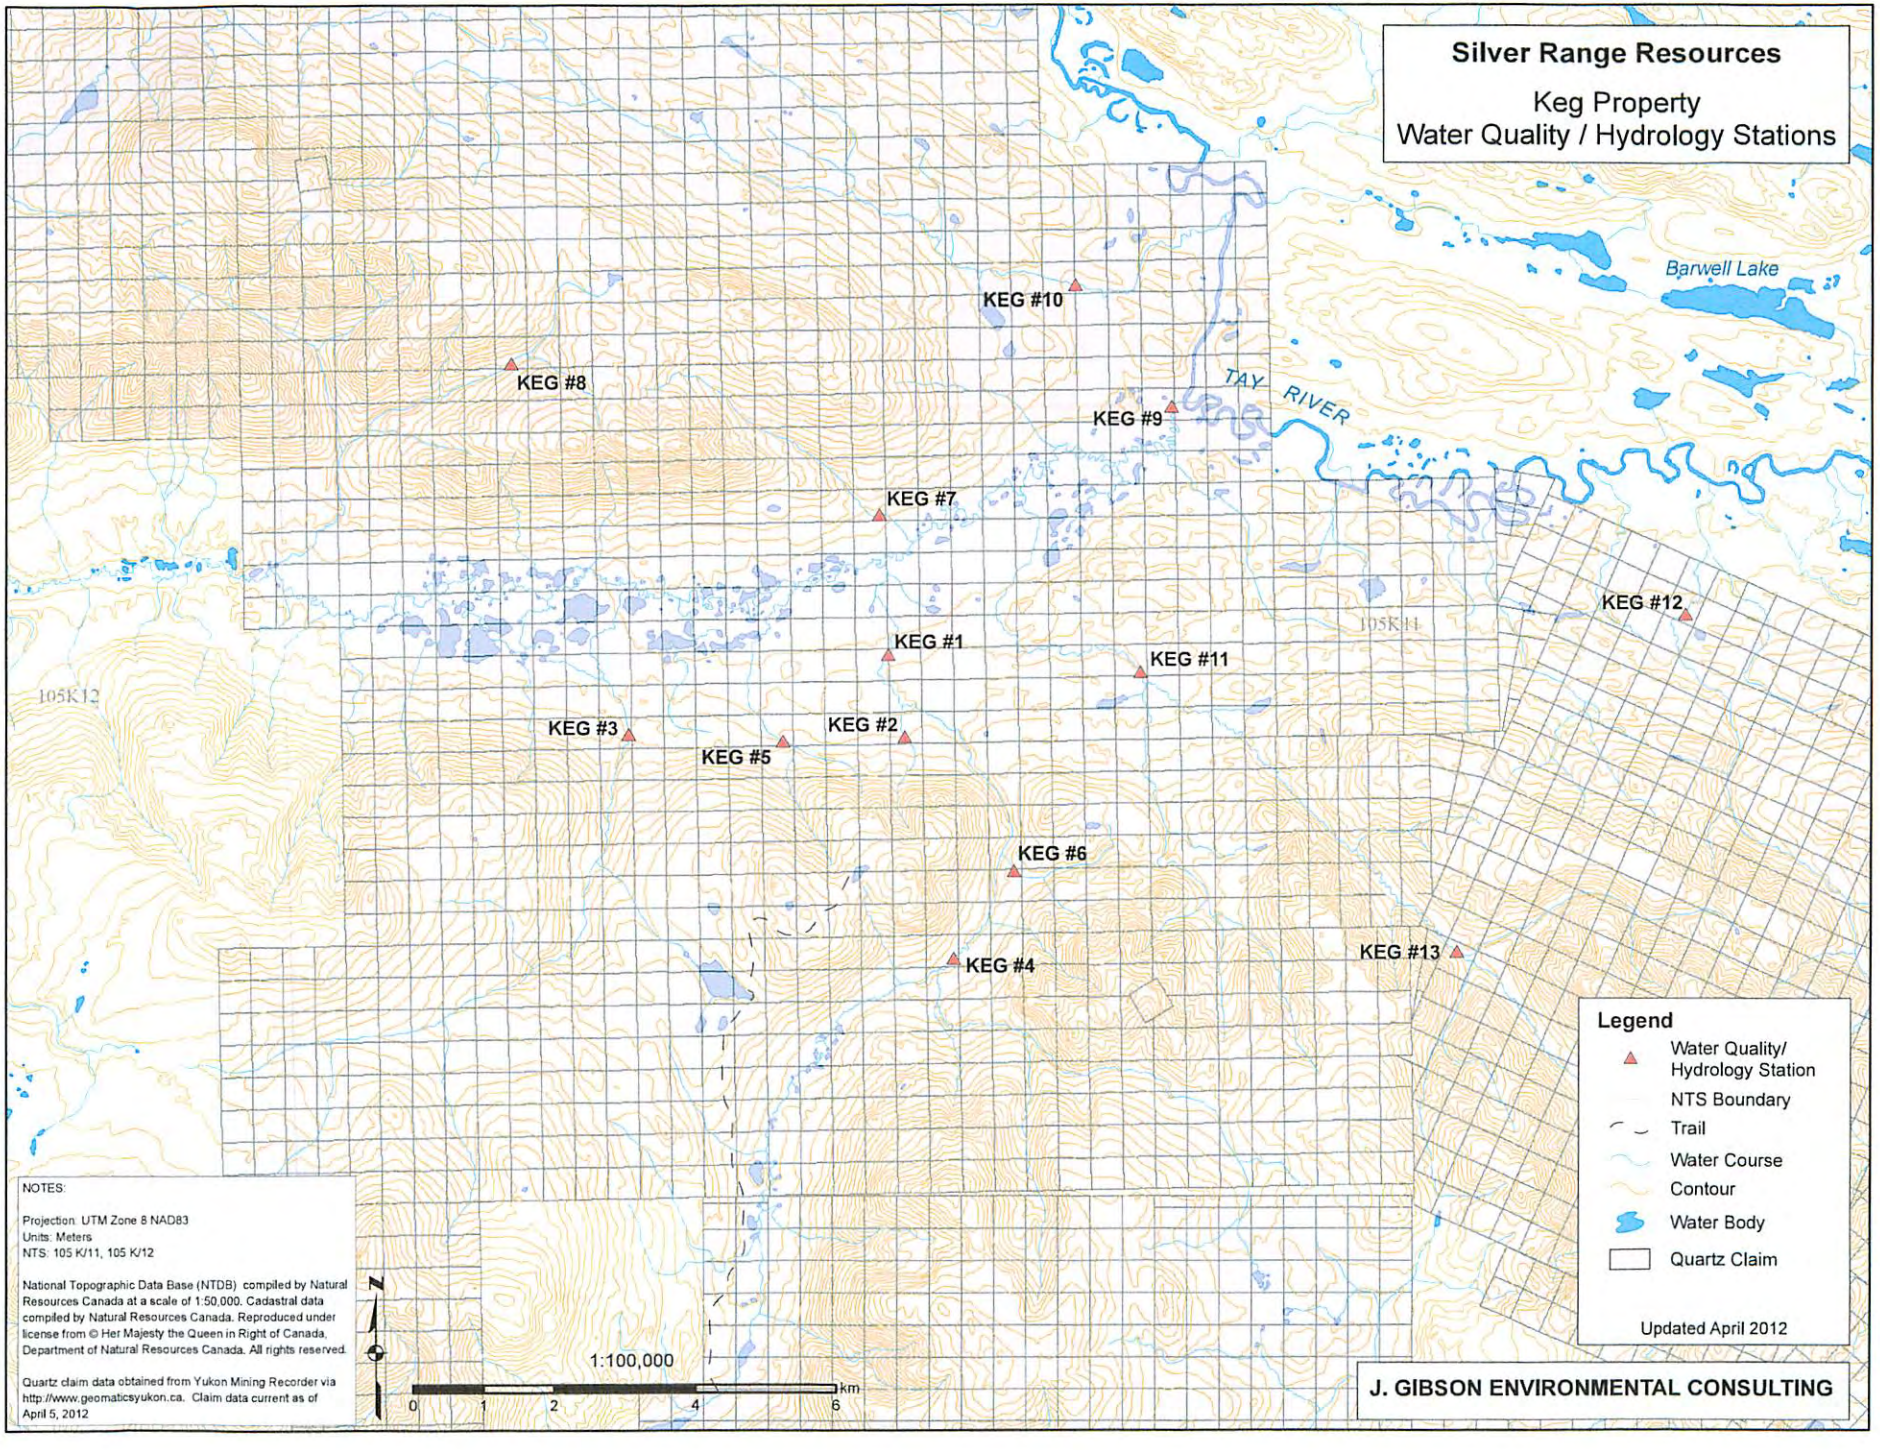
All surface waters are tributaries to the Pelly River.

The KEG exploration project was shut down for the season in September.

The exploration camp and all survey sites were accessed by helicopter.

The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals, total organic carbon, total cyanide and total mercury with field measurements for pH, water temperature and flow volume measurements.

Water level data loggers installed May 2012 at Stations KEG#1 and KEG#11 were removed in October at close of open water season.



Sample Locations

Nine water quality sample sites were established on the KEG Claims during the initial survey in August 2010.
Four sites were added in October 2010 on the eastern limits of the expanded claim block.

All sites are on the attached location map.

Sample Frequency

KEG stations #1, #2, #3, #4, #5, #6 are on a monthly frequency as of November 2012.
All other stations remain on a quarterly sampling frequency.

KEG #9	62 37 59.2 / 133 15 9.9	750
KEG #10	62 38 56.3 / 133 16 41.9	850
KEG #11	62 35 57.1 / 133 15 48.3	880
KEG #12	62 36 16.9 / 133 06 45.8	820
KEG #13	62 33 43.7 / 133 10 41.6	1020
*Updated March 2012		

Station coordinates and elevations are for helicopter landing sites. Due to the topography and vegetation it was often necessary to located landing sites up to100 meter distance from sample sites.

Sample Analysis Parameters

All KEG monthly stations were sampled for total metals, dissolved metals and routine chemistry, total organic carbon, total cyanide and total mercury.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total and dissolved metal samples were preserved with nitric acid immediately after sampling.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Exova Canada Inc. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH and conductivity were taken with an Oakton PCS TestR 35, water temperatures with a digital thermometer.

Flow Volume Measurements

Stream flow volumes were measured in November at KEG #1 and #4, in December at KEG#1 with a Price AA velocity meter and cross sectional area calculations. Both channels had complete ice cover with elevated shelf ice.
On both survey dates, Stations KEG#2 and #5 were dry with ice to the channel base.

KEG #6 flows were estimated at less than 1 liter per second on both survey dates.

A summary of KEG stream flow volumes from 2010 to 2012 are in Table 4.

Stream flow volume data/calculations are attached in Appendix 2.

Keg Weather Station

An Onset/Hobo weather station was installed in November.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Table 1. November 2012 KEG Monthly Stations Routine Chemistry – laboratory analysis and field measurements

Table 2. November 2012 KEG Monthly Stations Total Metals ICP–MS laboratory analysis results

Table 3. November 2012 KEG Monthly Stations Dissolved Metals ICP–MS laboratory analysis results

Table 4. KEG Stations Flow Volume Summary to December 2012.

Table 5. December 2012 KEG Monthly Stations Routine Chemistry – laboratory analysis and field measurements

Table 6. December 2012 KEG Monthly Stations Total Metals ICP–MS laboratory analysis results

Table 7. December 2012 KEG Monthly Stations Dissolved Metals ICP–MS laboratory analysis results

Listed with the analysis data are the laboratory detection limits for each parameter.

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic Guidelines for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to ***CCME – Canadian Water Quality Guidelines.***
All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by Exova Canada Inc of Surrey B.C.

Laboratory Analytical Reports are attached in Appendix 1.

Data Summaries for each station are on the attached Excel disc.

Quality Control

There were no quality control samples taken in November or December.

Discussion

Hydrology

All hydrology stations on the KEG claims were in decreasing stage flow conditions under full ice cover.

Stations KEG #2 and #5 had no surface flow with channel ice to stream invert.

Laboratory Analytical Results

Parameters that equal or exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

November

Station KEG#1 results exceed the ***Aquatic Guidelines*** for selenium.

Station KEG#4 results equal or exceed ***Aquatic Guidelines*** for iron, aluminum and selenium and exceed the ***Drinking Water MAC*** for iron and manganese.

Station KEG#6 results exceed ***Aquatic Guidelines*** for aluminum, iron, copper and zinc; and exceed the ***Drinking Water MAC*** for iron and manganese.

December

Station KEG#1 results exceed the ***Aquatic Guidelines*** for selenium.

Station KEG#4 results equal or exceed ***Aquatic Guidelines*** for selenium.

Station KEG#6 results exceed ***Aquatic Guidelines*** for aluminum, iron, copper and zinc; and exceed the ***Drinking Water MAC*** for iron and manganese.

Station KEG #9 results exceed ***Aquatic Guideline*** for iron; and the ***Drinking Water MAC's*** for iron and manganese.

Total Mercury concentrations were below the detection limit of 0.0001 mg/L at all KEG stations.
Total Cyanide concentrations were below the detection limit of 0.002 mg/L at all KEG stations.

SILVER RANGE RESOURCES LTD - KEG PROPERTY

2012 WATER LEVEL/ STREAM DISCHARGE DATA

J. Gibson Env. Consulting *Whitehorse, Yukon*

KEG Property 2012 Water Levels/Stream Discharge

Water level / discharge flow monitoring on streams adjoining the KEG Property began in May 2012.

Station KEG#1 drains a north flowing watershed that runs adjacent to the main drill targets and discharges into the receiving water creek (a tributary to Tay River)..

Station KEG#11 drains a west flowing watershed that discharges into the receiving water creek

(tributary to Tay River).

Stations are located on the attached map.

Flow volume measurements at Station KEG#1 from August 2010 to October 2012 established a flow volume range of 0.025 to 1.374 cubic meters per second.

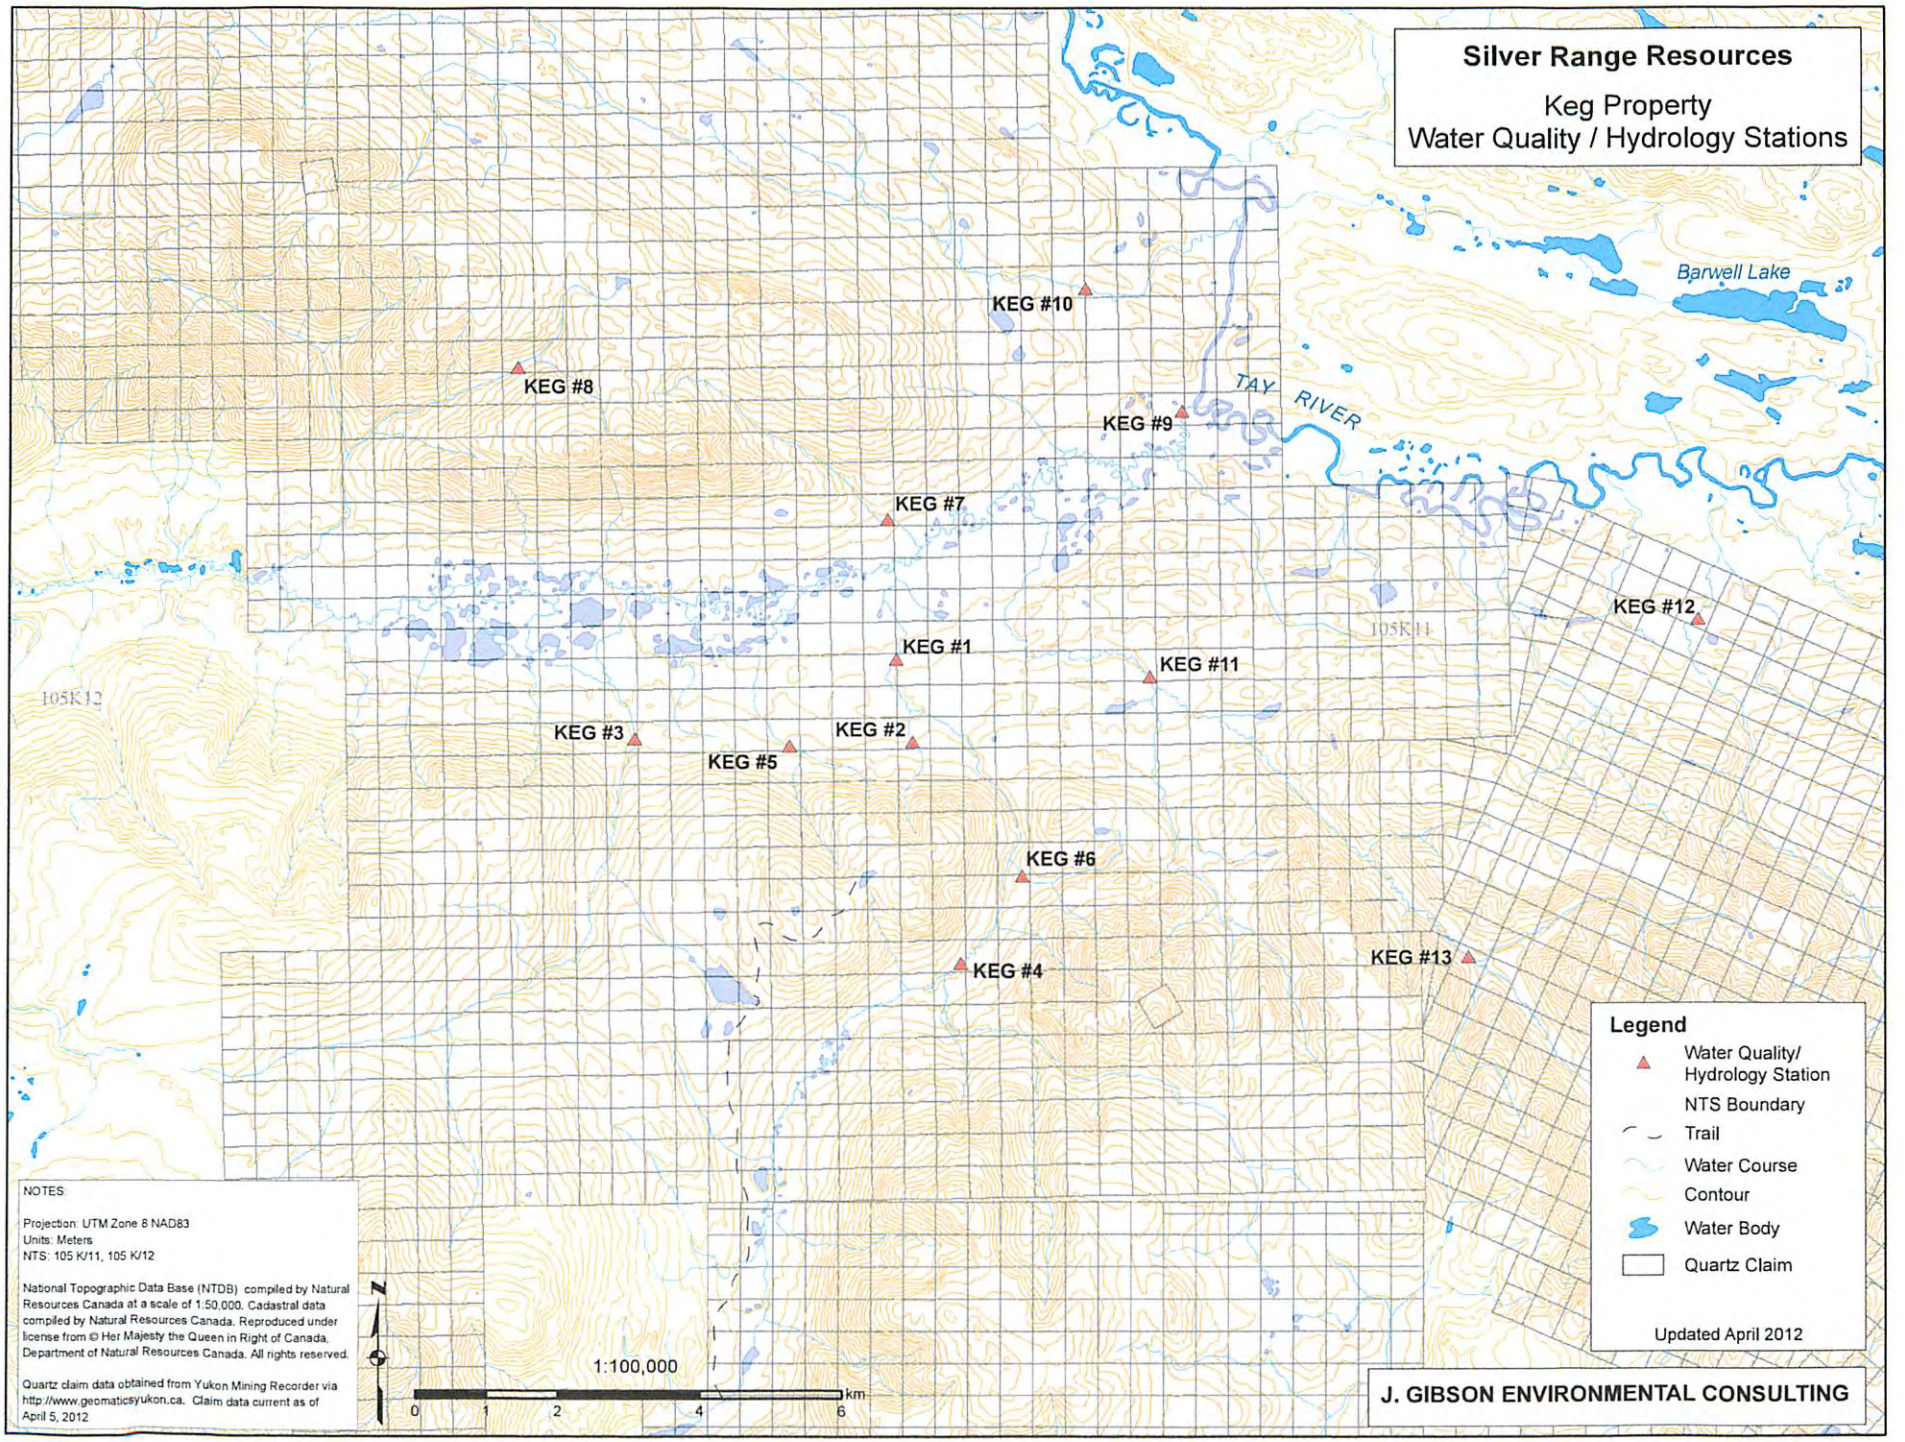
Flow Volume measurements at Station KEG#11 from August 2010 to October 2012 established a flow volume range of 0.035 to 0.797 cubic meters per second.

Both minimum volume flows are "under ice condition" measurements.

Water level monitoring began May 20, 2012 with the installation of ONSET HOBO U20 water level / temperature data loggers.

Two survey benchmarks were established at each site. Water level and "Top of Pipe" elevations were obtained with each site visit.

Data loggers were programmed to take water level readings at 15 minute intervals. Data was corrected for barometric pressure and surveyed elevations.



Water level data for each station is presented as a graph and table for daily mean discharge based on the developed stage / discharge relationship.

Daily mean water temperatures are included as a graph.

Silver Range Resources

KEG AND REBEL CLAIMS

Baseline Water Quality / Hydrology Survey

Environmental Data Update

May, 2012

J.Gibson Env. Consulting *Whitehorse, Yukon*

KEG / REBEL Claims May 2012

Silver Range Resources baseline water quality / hydrology surveys of the KEG and REBEL Claims surface waters continued on May 21 and 22, 2012.

The May 2012 surveys are at early spring freshet flow volumes.

The sites are located in the Anvil Range approximately 30 kilometers north of Faro, Yukon and 15 kilometers north of the former Faro Mine.

The KEG Claims are located on tributaries to the Tay River.

The REBEL Claims are located south of the KEG Claims on tributaries to Anvil Creek.

All surface waters are tributaries to the Pelly River.

The KEG exploration was operating and preparing for the start of drilling..

The exploration camp and all survey sites were accessed by helicopter.

The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals, total organic carbon, total cyanide and total mercury with field measurements for pH, water temperature and flow volume measurements.

Water level data loggers were installed at Stations KEG#1 and KEG#11. Level survey data is attached in Appendix 2.

Sample Locations

Nine water quality sample sites were established on the KEG Claims during the initial survey in August 2010.
Four sites were added in October 2010 on the eastern limits of the expanded claim block.

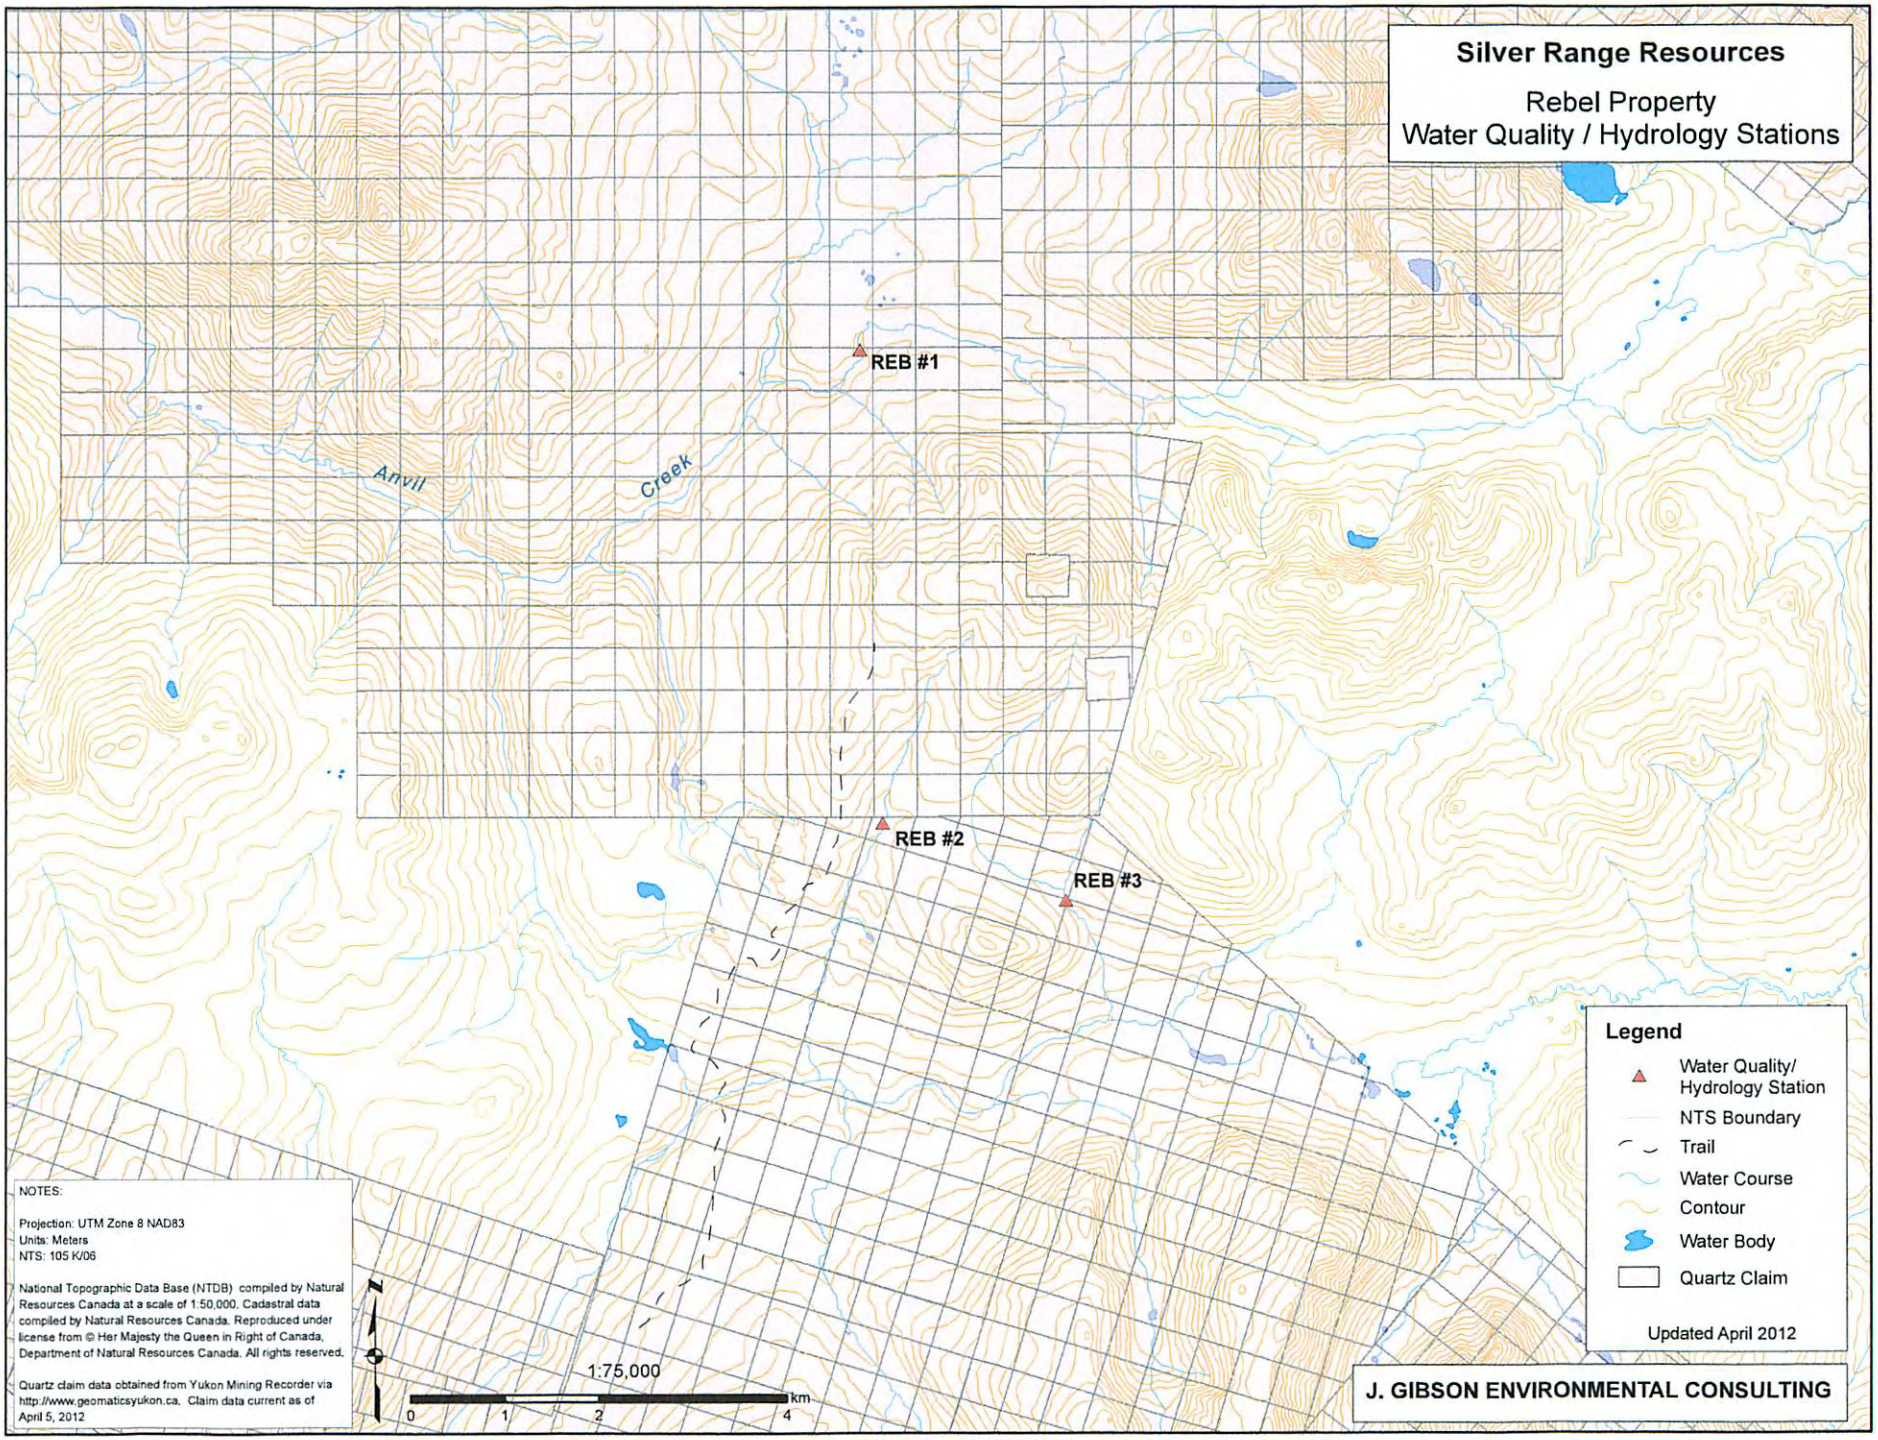
Three sites were established on the REBEL Claims in August, 2010 with no additions.

All sites are on the attached location maps.

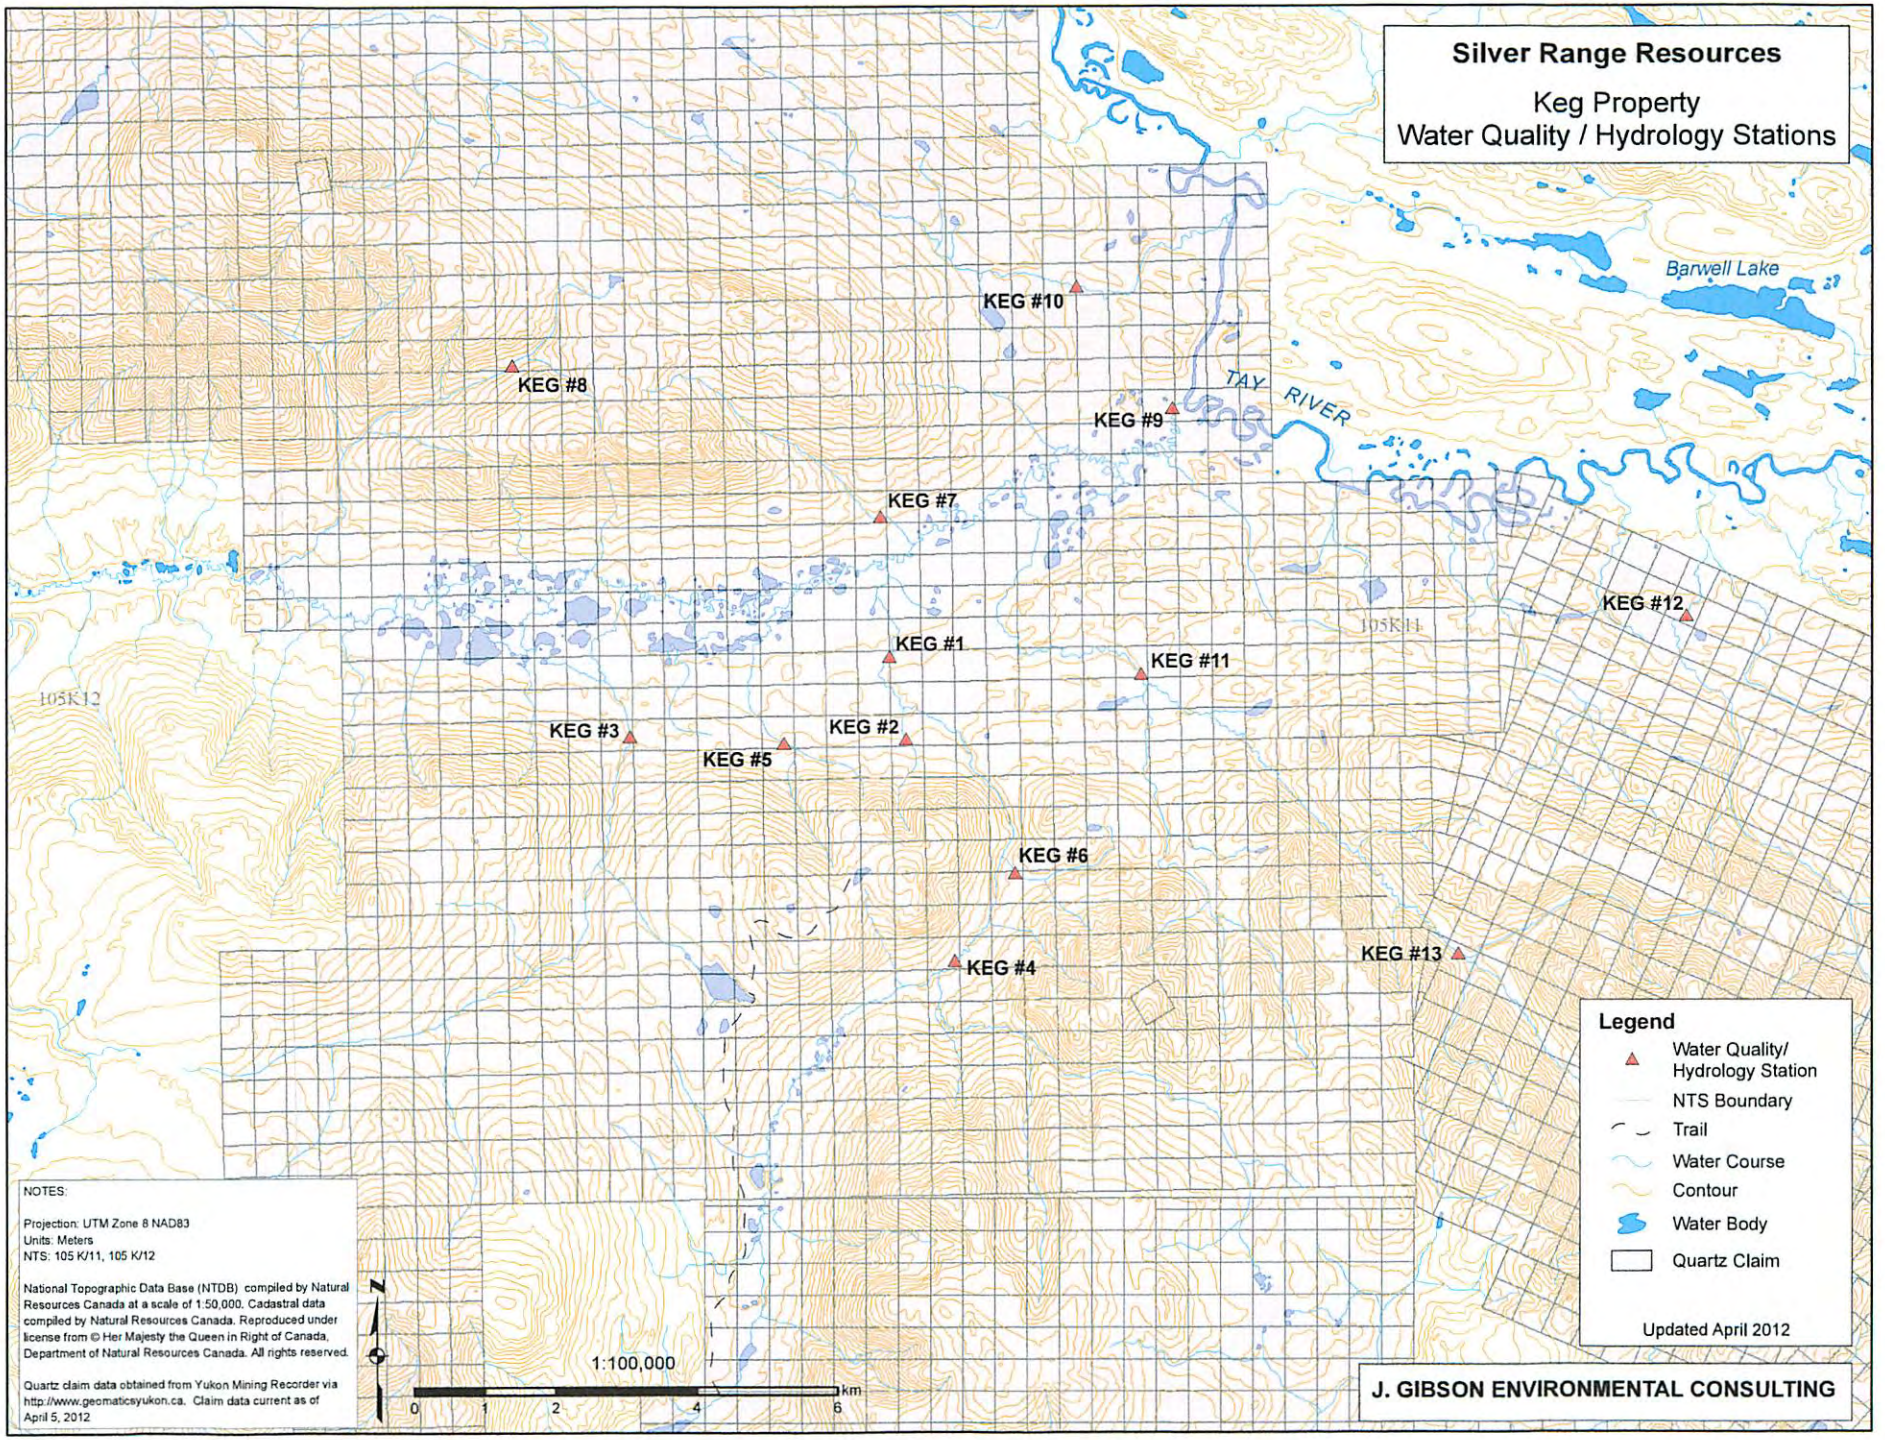
Site Change / Relocation

Station location coordinates were checked during the March 2012 survey.

There is a discrepancy between the map location and coordinates for KEG#2, KEG#3 and KEG#5. A change was made to the map location of all three stations resulting in a new station KEG#3.
KEG#3 was established on May 21, 2012. Previous notes of "dry channel" do not refer to the new site.



.
Stations KEG#2 and KEG#5 locations remain the same.



New site coordinates are listed below and on the updated site map.

KEG Claim sample station designations and coordinates (updated March 2012) are:

Station #	Lat/Long Coordinates	Elevation(m)
KEG #1	62 36 8.26 / 133 19 58.3	787
KEG #2	62 35 29.8 / 133 19 44.2	818
KEG #3	62 35 34.4 / 133 24 18.1	865
KEG #4	62 33 46.9 / 133 19 48	970
KEG #5	62 35 29.3 / 133 21 45.3	833
KEG #6	62 34 26.4 / 133 17 59.1	940
KEG #7	62 37 12.9 / 133 20 43	833
KEG #8	62 38 26.8 / 133 26 5.3	1152
KEG #9	62 37 59.2 / 133 15 9.9	750
KEG #10	62 38 56.3 / 133 16 41.9	850
KEG #11	62 35 57.1 / 133 15 48.3	880
KEG #12	62 36 16.9 / 133 06 45.8	820
KEG #13	62 33 43.7 / 133 10 41.6	1020
*Updated March 2012

REBEL Claim sample station designations and coordinates are:

Station #	Lat/Long Coordinates	Elevation(m)
REB #1	62 27 49.8 / 133 12 47.9	1305
REB #2	62 24 59.5 / 133 13 21.1	1425
REB #3	62 23 48.3 / 133 10 36.9	1365

Station coordinates and elevations are for helicopter landing sites. Due to the topography and thick vegetation it was often necessary to located landing sites up to100 meters distance from sample sites.

Sample Analysis Parameters

All KEG and REBEL Stations were sampled for total metals, dissolved metals and routine chemistry, total organic carbon, total cyanide and total mercury.

Station KEG #9 is the KEG Claims downstream station prior to flows entering the Tay River.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total and dissolved metal samples were preserved with nitric acid immediately after sampling.

Total Cyanide samples were preserved with NaOH, Total Organic Carbon samples with HCL immediately after sampling.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Exova Canada Inc. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH, conductivity, total dissolved solids were taken with an Oakton PCS TestR 35, water temperatures with a digital thermometer.

Flow Volume Measurements

Stream flow volumes were measured at all KEG and REBEL Stations with a Price AA velocity meter and cross sectional area calculations. All channels were ice free.

Stream flow volume data/calculations are attached in Appendix 2.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Tables 1a and 1b. KEG Stations Routine Chemistry – laboratory analysis and field measurements

indicates >10% variation between samples

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic Guidelines for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to ***CCME – Canadian Water Quality Guidelines.***
All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by Exova Canada Inc of Surrey B.C.

Laboratory Analytical Reports are attached in Appendix 1.

Data Summaries for each station are on the attached Excel disc.

Quality Control

Duplicate total and dissolved metals samples for quality control were taken in May 2012 at Station KEG#4.

Discussion

Hydrology

All water quality / hydrology stations on the KEG claims were in early freshet stage flow conditions.
REBEL stations remained in late winter low flow conditions.

Flow measurements were done on all KRG Stations. REBEL #1 and #3 stations were also measured for flow volume.

Station KEG#7 had a flow channel cut through heavy overflow ice that remained to one meter depth.

A summary of flow volumes for the surveys to date are listed in Table 4 (KEG) and Table 8 (REBEL).

Laboratory Analytical Results

Parameters that equal or exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

KEG Stations

Station KEG#1 results exceed or equals the ***Aquatic Guidelines*** for aluminum, copper and iron; and the ***Drinking Water MAC*** for iron.

Station KEG#2 results exceed the ***Aquatic Guidelines*** for aluminum and copper.

Station KEG#4 results exceed ***Aquatic Guidelines*** for aluminum, chromium, copper and iron; and the ***Drinking Water MAC*** for iron.

Station KEG#5 results exceed ***Aquatic Guidelines*** for aluminum, copper and iron; and the ***Drinking Water MAC*** for iron.

Station KEG#6 results exceed ***Aquatic Guidelines*** for aluminum and copper.

Station KEG#7 results exceed ***Aquatic Guidelines*** for aluminum, copper and iron; and the ***Drinking Water MAC*** for iron.

Station KEG#8 results exceed ***Aquatic Guidelines*** and the ***Drinking Water MAC*** for iron.

Station KEG #9 results exceed ***Aquatic Guideline*** for aluminum, copper and iron; and the ***Drinking Water MAC's*** for total iron and manganese.

Station KEG #10 results exceed ***Aquatic Guideline*** for aluminum, copper and iron; and the ***Drinking Water MAC's*** for total iron and manganese.

Station KEG #12 results exceed ***Aquatic Guideline*** for aluminum, copper and iron; and the ***Drinking Water MAC's*** for iron.

Stations KEG#3, #11 and #13 results meet all ***Aquatic Guideline and Drinking Water Guideline*** levels.

Total Mercury concentrations were at or below the detection limit of 0.00001 mg/L at all KEG stations.

Total cyanide concentrations were at or below the detection limit of 0.002 mg/L at all stations

REBEL Stations

Parameters that exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

Station REB#1 results exceed the ***Aquatic Guidelines*** for aluminum and iron; and the ***Drinking Water MAC's*** for iron.

Station REB#3 results exceed the ***Aquatic Guidelines*** for aluminum, chromiun and iron; and the ***Drinking Water MAC's*** for iron.

Total Mercury concentrations were below detection limits of 0.00001 mg/L at all REB stations.

Total cyanide concentrations were at or below the detection limits of 0.002 mg/L at all REB stations.

Camp Drinking Water Supply

Station KEG #4 is the source of camp drinking water supply. Analysis results for samples taken of the ***"Raw"*** supply (total metals and routine chemistry) and the ***"treated/ filtered"*** supply are listed in Table 9.

KEG#4 supply waters, both raw and treated met ***Drinking Water Guideline*** limits for all parameters tested with the exception of total iron.

Notes To Clients:

- Analysis was performed on samples 871989-1 to 14 that exceeded the recommended holding time for Water Nitrate analysis.
- Some total metal results were less than dissolved metal results for lot 871989. The results were verified and are within expected measurement uncertainty.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Comments:

- Analysis was performed on samples 871989-1 to 14 that exceeded the recommended holding time for Water Nitrate analysis.
- Some total metal results were less than dissolved metal results for lot 871989. The results were verified and are within expected measurement uncertainty.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Please direct any inquiries regarding this report to our Client Services group.
Results relate only to samples as submitted.

Comments:

- Analysis was performed on samples 872004-1 and 2 that exceeded the recommended holding time for Water Nitrate analysis.
- Some total metal results were less than dissolved metal results for lot 872004. The results were verified and are within expected measurement uncertainty.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Please direct any inquiries regarding this report to our Client Services group.
Results relate only to samples as submitted.
The test report shall not be reproduced except in full, without the written approval of the laboratory.

Silver Range Resources

KEG AND REBEL CLAIMS

Baseline Water Quality / Hydrology Survey

Environmental Data Update

July, 2012

J.Gibson Env. Consulting *Whitehorse, Yukon*

KEG / REBEL Claims July 2012

Silver Range Resources baseline water quality / hydrology surveys of the KEG and REBEL Claims surface waters continued July 9,10 and 11, 2012.

The sites are located in the Anvil Range approximately 30 kilometers north of Faro, Yukon and 15 kilometers north of the former Faro Mine.

The KEG Claims are located on tributaries to the Tay River.

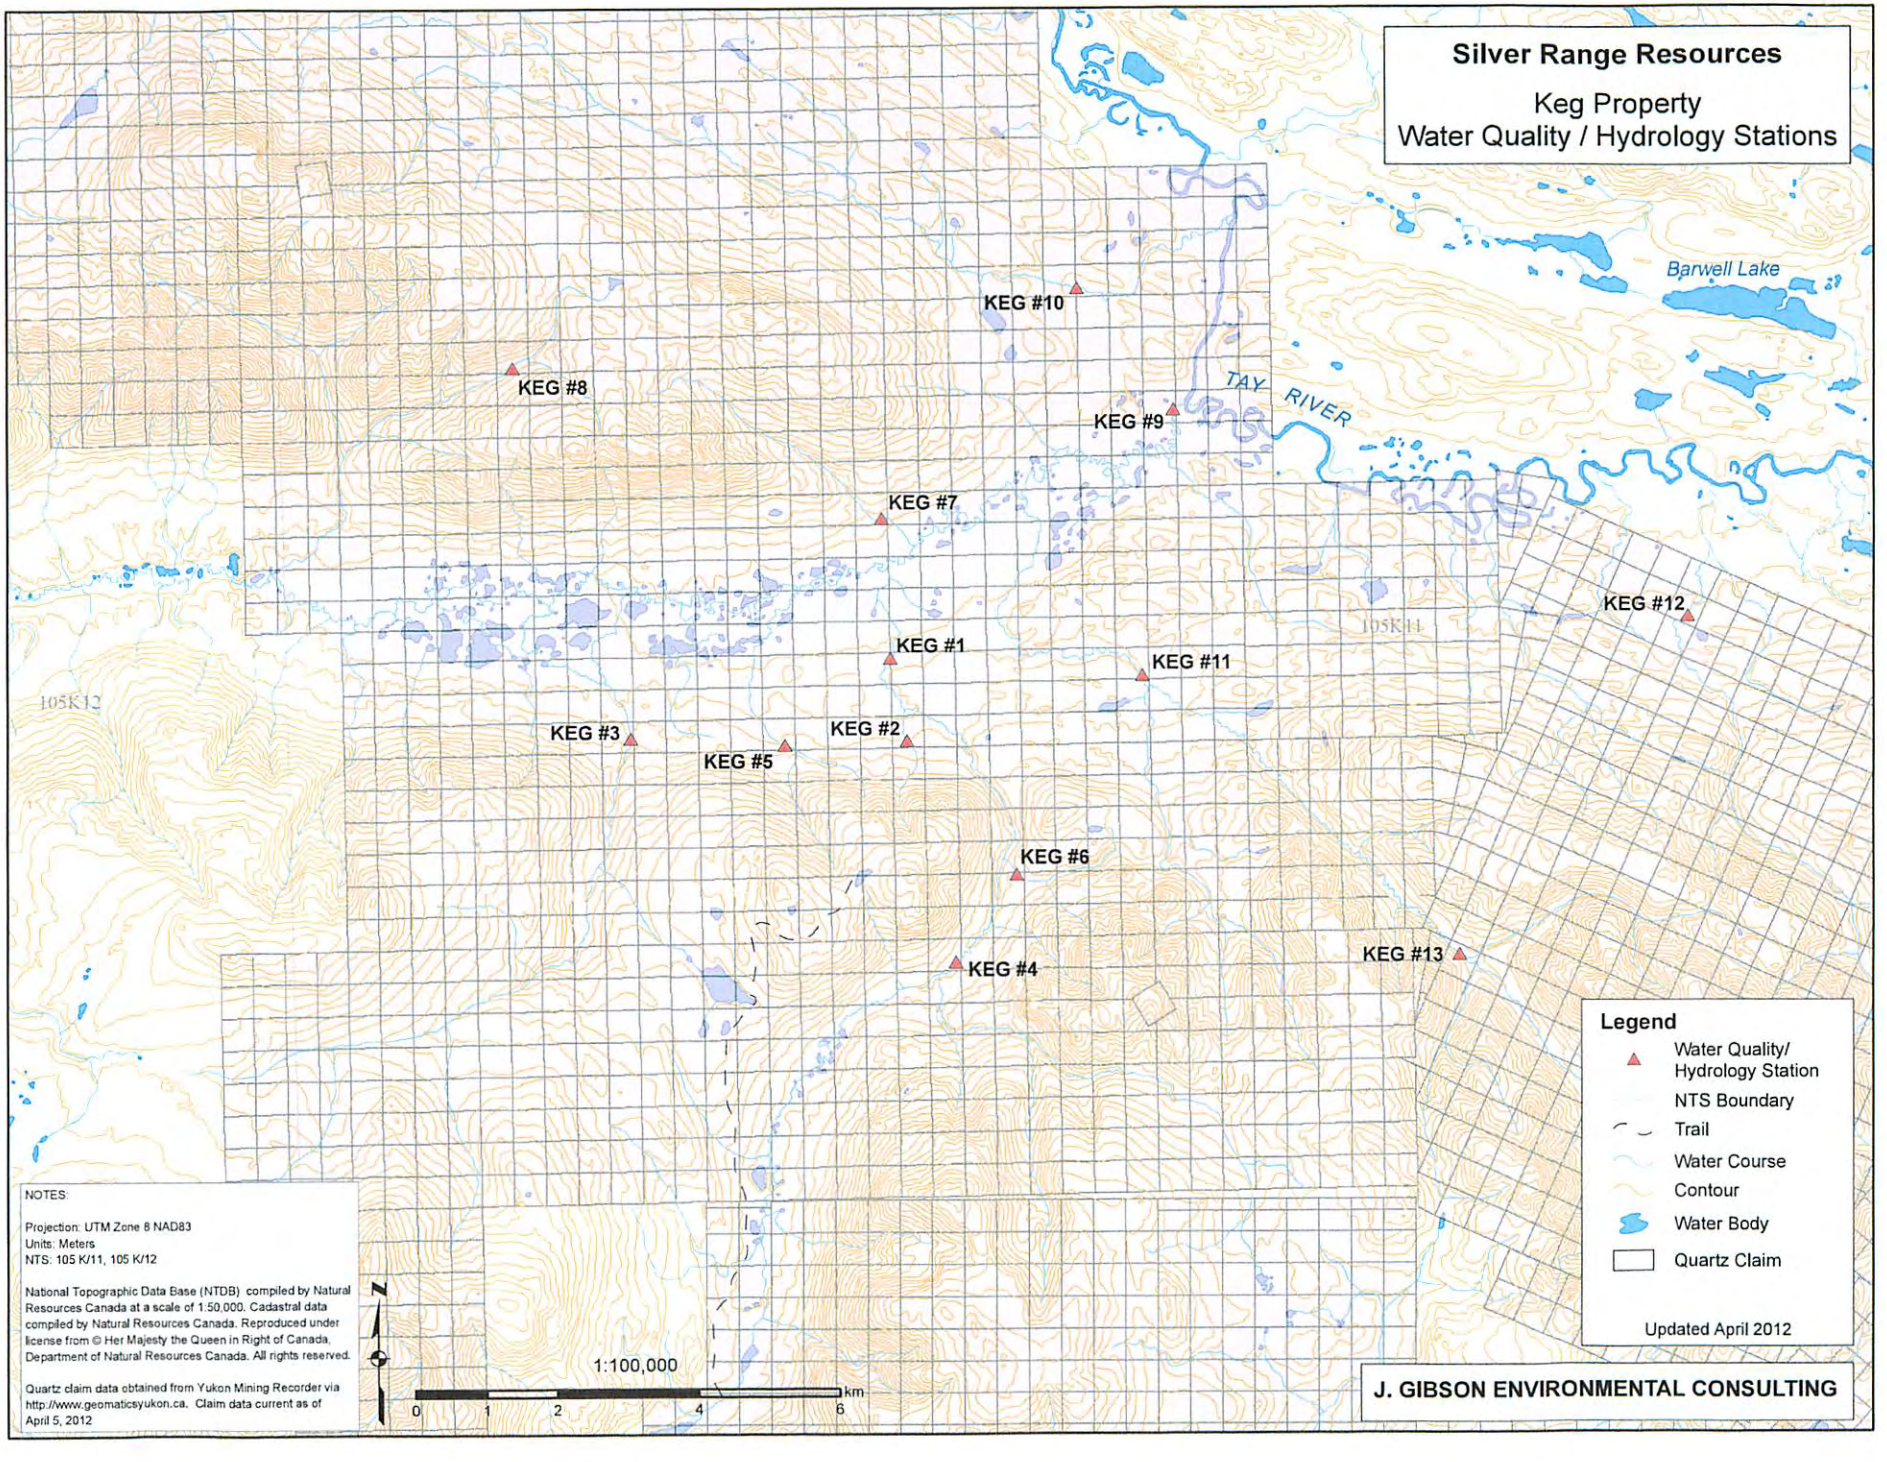
The REBEL Claims are located south of the KEG Claims on tributaries to Anvil Creek.

All surface waters are tributaries to the Pelly River.

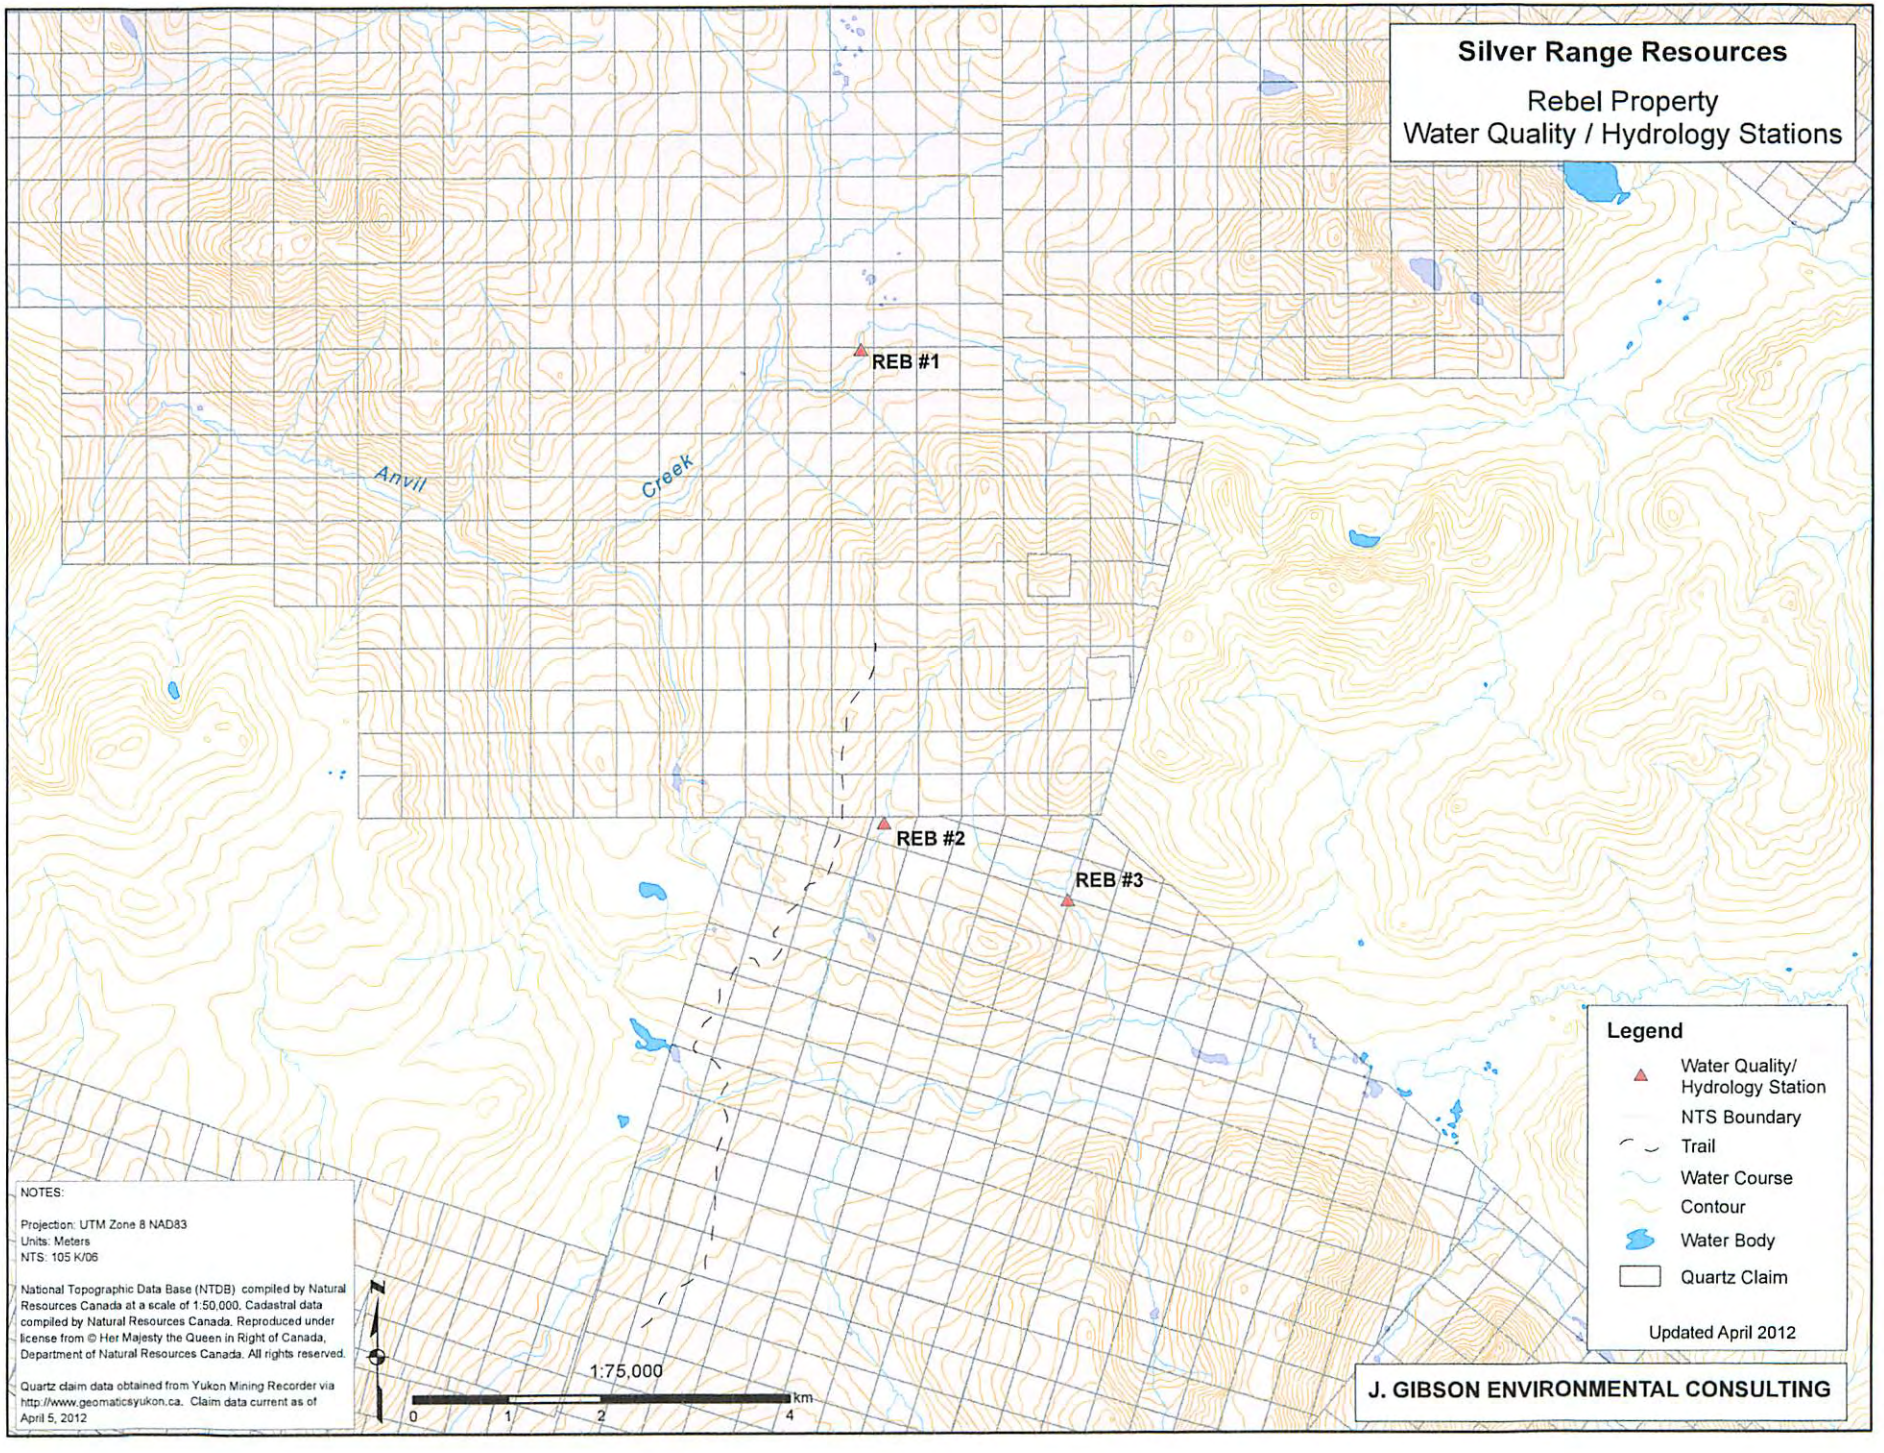
The KEG exploration was operating..

The exploration camp and all survey sites were accessed by helicopter.

The baseline survey consisted of water quality samples for routine chemistry, total metals, dissolved metals, total organic carbon, total cyanide and total mercury with field measurements for pH, water temperature and flow volume measurements.



Water level data loggers installed May 2012 at Stations KEG#1 and KEG#11 were downloaded and level surveyed.



Sample Locations

Nine water quality sample sites were established on the KEG Claims during the initial survey in August 2010.
Four sites were added in October 2010 on the eastern limits of the expanded claim block.

Three sites were established on the REBEL Claims in August, 2010 with no additions.

All sites are on the attached location maps.

KEG Claim sample station designations and coordinates (updated March 2012) are:

Station #	Lat/Long Coordinates	Elevation(m)
KEG #1	62 36 8.26 / 133 19 58.3	787
KEG #2	62 35 29.8 / 133 19 44.2	818
KEG #3	62 35 34.4 / 133 24 18.1	865
KEG #4	62 33 46.9 / 133 19 48	970
KEG #5	62 35 29.3 / 133 21 45.3	833
KEG #6	62 34 26.4 / 133 17 59.1	940
KEG #7	62 37 12.9 / 133 20 43	833
KEG #8	62 38 26.8 / 133 26 5.3	1152
KEG #9	62 37 59.2 / 133 15 9.9	750
KEG #10	62 38 56.3 / 133 16 41.9	850
KEG #11	62 35 57.1 / 133 15 48.3	880
KEG #12	62 36 16.9 / 133 06 45.8	820
KEG #13	62 33 43.7 / 133 10 41.6	1020
*Updated March 2012		

REBEL Stations remain unchanged.

REBEL Claim sample station designations and coordinates are:

Station #	Lat/Long Coordinates	Elevation(m)
REB #1	62 27 49.8 / 133 12 47.9	1305
REB #2	62 24 59.5 / 133 13 21.1	1425
REB #3	62 23 48.3 / 133 10 36.9	1365

Station coordinates and elevations are for helicopter landing sites. Due to the topography and thick vegetation it was often necessary to located landing sites up to100 meters distance from sample sites.

Sample Analysis Parameters

All KEG and REBEL Stations were sampled for total metals, dissolved metals and routine chemistry, total organic carbon and total mercury. Total cyanide analysis was not done this survey.

Station KEG #9 is the KEG Claims downstream station prior to flows entering the Tay River.

Dissolved metals samples were filtered onsite using disposable 60 ml syringes and 0.45 micron filters. New syringes and filters were used for each station.

Total and dissolved metal samples were preserved with nitric acid immediately after sampling.

Stream sediment (three replicates) samples were collected at each KEG#1 and KEG#11 stations.

All samples were stored in coolers, kept at 4 Celsius and shipped by air cargo to the Exova Canada Inc. laboratory in Surrey B.C. for analysis within recommended holding times.

Field measurements for pH, conductivity, total dissolved solids were taken with an Oakton PCS TestR 35, water temperatures with a digital thermometer.

Flow Volume Measurements

Stream flow volumes were measured at all KEG Stations with a Price AA velocity meter and cross sectional area calculations. All channels were ice free.

A summary of KEG and REBEL stream flow volumes from 2010 to 2012 are in Table 4 and Table 9.

Stream flow volume data/calculations are attached in Appendix 2.

Water level data logger data for Stations KEG#1 and KEG#11 will be reported after open water season.

Analysis Results

Laboratory analysis and field measurement results are listed in the following tables:

Tables 1. KEG Stations Routine Chemistry – laboratory analysis and field measurements

Tables 2. KEG Stations Total Metals ICP–MS laboratory analysis results

Tables 3. KEG Stations Dissolved Metals ICP–MS laboratory analysis results

DWQ* = Canadian Drinking Water Quality Guideline ***exceeds DWQ MAC***

As a guide for reviewing site water quality, the Maximum Acceptable Concentration (MAC) according to ***Canadian Drinking Water Quality*** are listed along with the Aquatic Guidelines for the protection of aquatic life in water with a pH of > 6.5 and a total hardness as CaC03 > 180 mg/L according to ***CCME – Canadian Water Quality Guidelines.***
All water quality ***Guideline*** concentrations are based on total metal values.

All laboratory analysis was done by Exova Canada Inc of Surrey B.C.

Laboratory Analytical Reports are attached in Appendix 1.

Data Summaries for each station are on the attached Excel disc.

Quality Control

Duplicate total and dissolved metals samples for quality control were taken in July 2012 at Station KEG#3. Analysis results are listed in Table 10.

Discussion

Hydrology

All water quality / hydrology stations on the KEG claims were in mid stage flow conditions as a result of late snowmelt at higher elevations and precipitation input. Larger stream channel had twice the volume as measured in May 2012 and most stations exceeded volumes measured in June 2011.

Flow measurements were done on all KEG Stations. Stations KEG#1 and #11 had flows measured July 9 and 10th against increasing stage / staff gauge readings.

REBEL stations had high volume flow conditions due to overnight snowfall precipitations but were not measured due to poor weather/ flight conditions.

Water level data loggers at Stations KEG#1 and #11 were downloaded. Data will be reported at finish of open water season.

Laboratory Analytical Results

Parameters that equal or exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

KEG Stations

Station KEG#1 results exceed or equals the ***Aquatic Guidelines*** for aluminum.

Station KEG#2 results equals or exceed the ***Aquatic Guidelines*** for aluminum and copper.

Station KEG#3 results exceed or equals the ***Aquatic Guidelines*** for aluminum.

Station KEG#4 results equal or exceed ***Aquatic Guidelines*** for aluminum and copper.

Station KEG#5 results exceed ***Aquatic Guidelines*** for aluminum, copper and selenium.

Station KEG#6 results exceed ***Aquatic Guidelines*** for aluminum, copper, iron, selenium and zinc; and exceeds the ***Drinking Water MAC*** for iron and manganese.

Station KEG#7 results exceed ***Aquatic Guidelines*** for copper, iron and selenium; and the ***Drinking Water MAC*** for iron.

Station KEG#8 results exceed ***Aquatic Guidelines*** for selenium.

Station KEG #9 results exceed ***Aquatic Guideline*** for aluminum, iron and selenium;and the ***Drinking Water MAC's*** for iron.

Station KEG #10 results exceed ***Aquatic Guideline*** for aluminum, copper, iron and selenium; and the ***Drinking Water MAC's*** for iron.

Station KEG#11 results exceed ***Aquatic Guidelines*** for selenium.

Station KEG #12 results exceed ***Aquatic Guideline*** for aluminum, iron, selenium and zinc; and the ***Drinking Water MAC's*** for iron.

Stations KEG#13 results exceedsl ***Aquatic Guideline*** for selenium and zinc.

Total Mercury concentrations were at or below the detection limit of 0.0001 mg/L at all KEG stations.

REBEL Stations

Parameters that exceed either ***Drinking Water or Aquatic Guidelines*** are highlighted in yellow.

Station REB#1 results exceed the ***Aquatic Guidelines*** for selenium

Total Mercury concentrations were below detection limits of 0.0001 mg/L at all REB stations.

Camp Drinking Water Supply

Station KEG #4 is the source of camp drinking water supply. Analysis results for samples taken of the ***"Raw"*** supply (total metals and routine chemistry) and the ***"treated/ filtered"*** supply are listed in Table 11.

KEG#4 supply waters, both raw and treated met ***Drinking Water Guideline*** limits for all parameters tested.

Notes To Clients:

- Analysis was performed on sample 881573-1 to13 that exceeded the recommended holding time for NO2/NO3 analysis.
- Some ICP-MS total metal results were less than dissolved metal results for samples 881573-1 to 15. The results were verified and are within expected measurement uncertainty.
- Some trace total metal results were less than dissolved metal results for samples 881573 - 2 to 14, excluding sample 1 and 3 . The results were verified and are within expected measurement uncertainty.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.

Comments:

- Analysis was performed on sample 881573-1 to13 that exceeded the recommended holding time for NO2/NO3 analysis.
- Some ICP-MS total metal results were less than dissolved metal results for samples 881573-1 to 15. The results were verified and are within expected measurement uncertainty.
- Some trace total metal results were less than dissolved metal results for samples 881573 - 2 to 14, excluding sample 1 and 3 . The results were verified and are within expected measurement uncertainty.
- pH analysis was performed past the recommended holding time of 15 minutes from sample collection.
