1.0 INTRODUCTION

The GNR property previously consisted of 708 contiguous mineral claims covering an area of approximately 14,305 hectares. The Groundhog property consists of 120 contiguous mineral claims covering an area of approximately 2494 hectares. In 2012, Silver Predator Canada Corp. reduced the holdings size of the GNR property. Currently, the GNR property consists of 74 contiguous mineral claims covering an area of approximately 1,547 hectares, and the Groundhog property consists of 120 contiguous mineral claim , covering an area of approximately 14,305 hectares. The properties are contiguous to each other and to CYR claims and are located in Pelly-Cassiar Platform in central Yukon. Silver Predator Canada Corp. has a 100% undivided interest in the property and is targeting high-grade silver bearing galena veins.

2.0 PROPERTY LOCATION AND DESCRIPTION

This report describes the work completed in the 2012 field season from September 4th to 11th which consisted of grid soil sampling.

Both properties are located in the Pelly Mountains. They lie 50 km south-southwest of Ross River, YT (Figure 2-1). They can be accessed by 15 minute helicopter trip from Ross River. The properties are also accessible by road from Whitehorse or Ross River from the South Canol road to Groundhog Creek at km 162. The road then continues along the Groundhog Creek for 16 km where a very rough 2 km long cat-track accesses the property by 4x4.

Figure 2-1. GNR and GROUNDHOG Property Location, Yukon

During the 2012 field season, the soil sampling crew used helicopter to establish a temporary camp on the Groundhog property and used the camp as a base for 2012 sampling program.

The properties are located in the Watson Lake Mining District, and the current assessment work will apply to 76 non-contiguous mineral claims covering an aggregate area of 1,520 hectares (Table 2-1, Figure 2-2).

3.0 INFRASTRUCTURE, CLIMATE AND PHYSIOGRAPHY

The centre of the current GNR property is located at approximately 605000 E, 6829000 N (NAD83, Zone 8N). The nearest settlement accessible by road is Ross River, which is located at ~ km 215 along the South Canol gravel road (the Groundhog road is at km 162, to the south). The property lies approximately 10 miles up Groundhog Creek. The South Canol road is maintained by the Yukon government in the summer months.

Both properties are located in the north central Pelly Mountains. The hills are steep, but rounded, rising to just over 6,000 feet, or 1,500 feet above the creek valleys in the immediate area. Vegetation is low forbs and minor shrubs and other alpine plants. Treeline is generally below 4,500 feet. Outcropping rock is not abundant except on cliff face. Winters are cold with a deep snow belt just south of the claim area. The no snow field season can stretch from mid May to mid September or longer depending on the year (Berdahl 1995).

The Pelly Mountains, south of the Tintina Trench, feature long rugged northwesterly trending ridges separated by deep U shaped valleys. Pass Peak at 2162 m (7094') is the highest point in the district while Seagull Creek at 1180 m (3900') is the lowest elevation. From Pass Peak a system of north and west trending ridges averaging 1800 m (6000') in elevation extend through the area of the GNR (previously HV) property (Berdahl 1995). The ridge tops are generally rounded but valley walls are often steep with abundant outcrop. Glacial overburden and typical solifluction features cover lower slopes and valley floors. Bedrock exposure is limited

Figure 3-1. GNR and GROUNDHOG Claim Map with 2012 Soil Sampling Lines

(~2%) to ridge crests and resistant dolomite outcrops. Alpine areas feature sturdy grasses and moss while lower areas contain thick buck brush and sparse isolated stands of spruce trees. Permafrost underlies most of the property (Berdahl 1995).

The Groundhog Creek area has a subarctic climate with maximum summer temperatures of 15°C and average winter temperatures of -25°C. Precipitation is moderate and the snow pack averages 1 – 2 meters. On the ridge tops high winds and sleet often hinder exploration work. The field season lasts from early June to September (Davidson 1987).

The properties lie within the Pelly Mountains eco-region, extending from the Pelly and northern Cassiar Mountains in British Columbia and the Yukon. The mean annual temperature in this eco-region is approximately -3°C with a summer mean of 10.5°C and a winter mean of -17.5°C. Mean annual precipitation is 500-1000 mm, varying with elevation (<http://ecozones.ca/english/region/178.html>).

4.0 EXPLORATION HISTORY

The Lapie, Nisutlin and Ketza River drainages were first explored for placer gold deposits in the early 1900s. In 1907 several Ag-Pb-Zn veins were discovered near the Ketza River on the Iona Silver property. In the Groundhog Creek-Seagull Lake area documented exploration started in the mid 1950s when the British-Yukon Exploration Co. conducted several seasons of prospecting (Davidson 1987).

Parts of the 2011 GNR and Groundhog properties were first staked by Harry and Pete Verslucé. First they located the Tet claim group in 1956 over galena veins on behalf of British-Yukon Exploration Ltd. The claims were restaked several times by Verslucé with the BEN and AG claims being vended to Canol Mines Limited. Canol Mines acquired 56 claims on the divide between Groundhog and Seagull Creeks in 1966. By 1969 the Canol Mines property consisted of 521 claims. Numerous Ag-Pb-Zn veins and lenses were located and tested in trenching and diamond drill programs. However, most of the sulphide occurrences proved to be of limited size and grade (Davidson 1987).

In 1966 the Caribou 1-3 claims were staked by Peter and Harry Verslucé and optioned to Canol Mines. Canol Mines added the Ben 1-24 claims (Davidson 1987).

Jeff 1-4 and Hi Grade claims were staked in 1979 by H. and P. Holdings to cover several galena float trains. These claims were located within the 2011 Groundhog property. In August of 1979 by the Verslucé brothers, Pete and Harry, after the discovery of massive galena float boulders. Yukon Minerals Corp. optioned the ground and in a joint venture with Perrex Resources, bulldozer trenched this and adjacent properties. The property showing, on a cliff edge, was backhoe trenched and hand cobbled. A 20 ton bulk sample was reportedly shipped to Trail in 1988. It graded 75% Pb, 0.5% Zn, 1.2% Cu and 4354.2g Ag (140 opt Ag). This sample has been attributed to the pinnacle showing (min. File 105F74). The claims were restaked as five Pete claims in February of 1995. 1995 Higrade project consisted of sampling the vein for representative grades in order to determine the potential of high-grading the ore zone. Soil lines exploring for possible extensions of the silver zone were slightly anomalous (>10 ppb) near the main showing. The Higrade project has a significant grade mineralization present on surface in main vein (100+ opt Ag, 1-2% Cu, 66% Pb, etc) (Berdahl 1995). Pete 2-5 claims (including Higrade project) are not owned by Silver Predator and are surrounded by 2011 Groundhog claims.

In 1981, Great Western Petroleum Corporation surrounded the Jeff 1-4 and Hi Grade claims with the Lorne 1-55 claims. Great Western conducted reconnaissance level rock, soil and stream sediment sampling over an area presently covered by the HV claim block. They reported silver values of 18.65 oz /t from a galena vein in a strongly faulted zone in dolomite. This showing is currently known as the Jill vein. Elsewhere Great Western found isolated occurrences of narrow

fracture fillings and blebs of galena in dolomite with relatively low silver values. Stream sediment and soil samples returned background to weakly anomalous values in Au-Ag-Cu-Pb-Zn. The Lorne 1-55 claims lapsed in 1983 (Davidson 1987).

2011 Groundhog (SEA) claims were staked over Lorne, Jeff and Jim claims. HiGrade claims (Pete claims) are not owned by Silver Predator. Location of 1981 Lorne exploration seems not to be coincident with 2011 soil grids.

In 1986 the HV 1-66 and VER 1-9 claims were added onto the original block of H. and P. Holdings. A short blasting program on several galena float trains on the Jeff claims uncovered a 3 m wide zone of broken galena and frozen gouge which assayed 108.6 oz t Ag. This vein called the PN vein was stripped and exposed over a 33 m length during the 1987 work program (Davidson 1987).

1987 exploration program was undertaken on the HV property (403 claims) by Yukon Minerals Corporation. The work program consisted of prospecting, geological sampling and mapping, extensive surface trenching and blasting, and upgrading and development of access roads. The fieldwork focused on five main Ag-Pb showings and numerous galena-tetrahedrite bearing quartz veins and float trains were investigated. (Davidson 1987). Location of HV claims coincides with 2011 GNR claims.

The MPR 1-86 claims were recorded with the district mining recorder in Watson Lake on 30 March, 1987. The MPR 87-152 claims were added to the original claim block in the same year. The property was owned by T. McCrory, B. Preston and T. Rich (Davidson 1988). These claims are Pass Creek property and northern part of this property coincides with 2011 GNR claims. On the PASS PEAK property, nine mineral occurrences and float trains have been discovered.

The 1988 Ketzka Project (included in 2011 GNR property) consisted of 2,286 metres of diamond drilling in 45 holes, surface trenching, mapping and sampling, a regional mapping/ prospecting program, 300 metres of underground drifting and drill station slashing, enlarging camp and considerable road construction and upgrading. A total of 53 galena showings and 22 quartz-freibergite showings were documented and examined during the 1988 Ketzka Project (Fowler 1988).

In 1990 the Ketzka project included trenching during which four thousand seven hundred and thirty (4,730) cubic metres of material was removed from eleven trenches (Davidson 1991).

In 1995 trenching was performed on Rob claims that were together with Fuss 1-2 claims, Pete 1-5 claims (Hi Grade property) in place of 1986 HV and 1987 MPR claims. The work in 1995 involved the digging of trenches by hand to expose vein material, which was then sampled.

Mineralization consisted quartz-tetrahedrite veins, one massive galena vein and disseminated galena (Kreft 1996).

As previously noted 2011 GNR, Groundhog (SEA) and CYR and CYRX claims were staked over the area containing all above mentioned past claims, excluding Pete 2-5 claims.

From July 18th to July 29th 2011, Silver Predator Canada Corp. contracted Aurora Geosciences of Whitehorse, YT to complete a soils sampling program of the GNR/Groundhog property. A total of 1,659 soils samples were collected. The details of the 2011 program are contained in a report titled “Assessment Report, 2011 Geochemical Sampling Program GNR and Groundhog Property” dated June 25th, 2012 and authored by Karin Fecova, M.Sc.

5.0 GEOLOGY

5.1 Regional Geology

The property is located in the St. Cyr range of the Pelly Mountains, in south central Yukon. The area is underlain by a shallow marine miogeoclinal sequence that constitutes the Pelly-Cassiar carbonate platform (and the Cassiar terrane, part of the Intermontane Belt). The Cassiar terrane is bound in the southwest by the Omineca tectonic terrane and bound to the northeast by a faulted lobe of the Yukon Tanana terrane, across the Tintina Fault.

The Pelly-Cassiar platform is a displaced fragment of the continental margin of ancient North America (Israel, et al. 2011). Rocks of the Pelly-Cassiar platform consist of continental margin sedimentary sequences of the Rocky Mountain Assemblage composed of interbedded carbonate and clastic units of Paleozoic age. By late Jurassic, the rocks of the Intermontane Belt of the Cordillera collided with the passive margin of the North America Shelf, causing compressive tectonics, doming and uplift during the intrusion of mid-Cretaceous stocks, and a Palaeogene displacement of about 430 km along the Tintina dextral strike-slip fault.

The deformation events resulted in crustal shortening, tight folding, and failure along hinges. On the property, four significant Late Jurassic and Early Cretaceous thrust faults are the McConnell, Porcupine-Seagull, Cloutier, and St. Cyr thrusts which are all parallel the northwest-trending Tintina Fault and dip generally southwest (Abbott, 1986). The GNR claim block is primarily underlain by fault bounded blocks of recessive weathering shale and phyllite, and resistant dolomite. Numerous northerly and northwesterly trending normal faults traverse the area (Davidson, 1987).

The Ketz - Seagull district is underlain by late Proterozoic to Triassic, miogeoclinal clastic, volcanic, and carbonate rocks that were deformed during Mesozoic arc-continent collision, and by mid-Cretaceous intrusions that are thought to underlie the region (Abbott, 1986). The structural framework is dominated by a few large thrust faults, mainly the McConnell, Porcupine

- Seagull - Ross Peak, Cloutier, and St. Cyr, and by the Ketz - Seagull Arch. The Ketz - Seagull Arch is a broad window in which strata in the Cloutier Thrust sheet are exposed beneath the Porcupine - Seagull Thrust. The Ketz Uplift and Seagull Uplift are two parts of the Ketz Seagull Arch. Shortening on the Porcupine - Seagull - Ross Peak Thrust alone must be at least 30 km. Displacement on the others is probably less, but in the same order of magnitude (Abbott, 1986).

The major lithological units in the GNR and Groundhog area are described in Table 5-1 and their distribution is shown on Figure 5-1 (after Gordey and Makepeace, 2001).

Table 5-1. Regional Lithological units (after Gordey and Makepeace, 2001)

Name	Age	Unit	Description
Cassiar Suite	Mid-Cretaceous	mKqC	Light grey weathering, homogenous, porphyritic medium-grained biotite quartz monzonite
Earn Group	Upper Devonian to Lower Mississippian	DMEC1	Dark grey, recessive weathering, thin bedded, black siliceous slate with chert pebble conglomerate and rare lenses of intermediate to felsic volcanoclastic rocks.
		DMEC3	Heterogeneous, rusty, black, white, and orange- weathering rhyolite-trachyte to andesite flows, breccias and tuffs.
Askin Group	Middle Silurian to Middle Devonian	SDA2	Medium grey to buff weathering, medium to thick bedded dolomite, silty and sandy dolomite, limestone, and medium to thick bedded orthoquartzite.
Road River - Cassiar	Ordovician to Devonian	ODRC1	Recessive, black, calcareous, fissile, graptolitic shale; local thick interbeds of grey quartz arenite; includes thin sills or flows of dark green basalt undifferentiated.
Kechika Group	Upper Cambrian to Lower Ordovician	COK1	Basinal, fine grained, calcareous pelitic strata containing thin bedded, lustrous, calcareous grey slate, phyllite, limestone, minor grey dolomite and dolomitic limestone; quartz-carbonate veins; minor sills and flows of basalt.
		COK2	Massive, dark green and maroon amygdaloidal basalt flows and volcanoclastics; medium to fine grained diabase or diorite sills with chilled margins, medium grey, chlorite muscovite quartz phyllite with abundant undifferentiated lenses of "greenstone".
Rosella Group	Lower Cambrian	ICR	Resistant, thick bedded to massive, limestone and argillaceous limestone with local archaeocyathid buildups, trilobite fragments, and oolites; pisolitic massive dolomite and limestone; marble, calc-silicate, calcareous phyllite and minor schist.
Ingenica Group	Upper Proterozoic to Lower Cambrian	PCI4	Buff weathering, resistant muscovite-biotite granodiorite gneiss and augen gneiss.

5.2 Property Geology, Structure and Mineralization

The Groundhog Creek area is underlain by Lower Cambrian to Mississippian carbonate and clastic rocks of the Cassiar Platform that was deformed during Mesozoic arc-continent collision and uplifted during intrusion of the Nisutlin Batholith. This area known as the Seagull Uplift has been recently mapped and interpreted by G. Abbott of D.I.A.N.D. (published in Yukon Geology, Vol.1). The oldest rocks in the area are Early Cambrian calcareous mica schist and marble which are overlain by late Cambrian and Early Ordovician phyllite containing some mafic tuffs and flows. The phyllites are in turn overlain by black graptolitic shale of Ordovician and Silurian age. These older rock units are recessive weathering and occur in valley bottoms and well-rounded ridges (Davidson, 1987).

Resistant weathering Silurian-Devonian dolomite, dolomitic siltstone and quartz arenite overlie the shales and phyllites. Buff, red and grey weathering dolomite form prominent cliffs and host most of the known Ag-Pb-Zn mineralization in the district. The dolomite unit is from 300 - 1500 m thick and contains three members: a basal sandy, silty dolomite with lenses of massive grey dolomite; a middle member of dolomitic sandstone and quartzite; and an upper member composed mainly of dark grey dolomite. Overlying the dolomites are Late Devonian and Mississippian black shales, chert and grit. This sedimentary sequence is cut by numerous normal and thrust faults, formed during uplift of the Cretaceous Nisutlin batholiths (Seagull Uplift). The faulting has left a complex assemblage of fault bounded blocks of dolomite, shale and phyllite. Ag-Pb-Zn mineralization generally occurs in quartz-siderite veins or limonitic gangue occur in normal faults cutting dolomite and fault contacts between dolomite and black shale (Davidson, 1987).

The property is underlain by Cambrian to Mississippian carbonates, clastics and volcanoclastics chopped into fault bounded blocks by strong normal and thrust faults. A few mafic and porphyritic dykes cut the sediments (Davidson, 1987).

The following rock types occur on the property (Davidson, 1987):

1/ Calcareous and tuffaceous phyllite (uEOs1): The oldest rocks on the property, of Upper Cambrian to Ordovician age, are recessive weathering phyllite which generally occupies low lying ground except where up-thrusted. Typically, they are grey to buff weathering, thinly laminated and very lustrous. Quartz veins and boudins are common. The phyllite contains minor pyrite and occasionally lenses or veins of massive pyrite-pyrrhotite. Phyllite outcrops along stream banks in the center of the property and as klippen along ridge crests in the north central part of the claims.

2/ Black graptolitic shale, minor chert (OSsl): Fairly limited in extent, the recessive weathering graptolitic shale of Ordovician to Silurian age occupies valley bottoms and was only found along

Groundhog Creek and in deep cat trenches excavated by Canol Mines, south and west of the Silver Arrow vein. The black calcareous shale unconformably overlies phyllite. Mineralization in the shales is very patchy and consists of lenses of pyrite and galena in close proximity to large quartz veins.

3/ Dolomite, dolomitic siltstone and quartz arenite (SOd, Ss, Sq): Up to 1500 m thick, this resistant sequence of Silurian and Devonian carbonate and clastic rock underlies much of the property and outcrops extensively on steep valley walls. The carbonate sequence has been divided into three members; a lowermost grey weathering, thinly laminated dolomitic siltstone; a buff to grey weathering, thick bedded dolomite with massive quartz arenite lenses; and an uppermost red weathering, moderate to thick bedded, locally fossiliferous dolomite (G. Abbott, 1986). Fossils in the red weathering dolomite include Devonian age solitary corals and brachiopods. Large cliffs of thickly bedded, shallowly dipping dolomite are common on the property. Vein fault structures can be traced down the outcrop in narrow linear gullies to the base of the cliff. The carbonates host quartz veins and lenses up to 10 m wide. Some of the larger quartz veins occur in normal faults while many others lie parallel to the regional structural trend N10-30°W. On the HV (2011 GNR) property, dolomite hosts all the known Ag-Pb-Zn veins and lenses.

4/ Black shale, chert grit and chert conglomerate (uDt,1s): The youngest sedimentary rocks on the property are Upper Devonian to Mississippian graphitic black shales, grits and conglomerates which are generally recessive weathering. Black shales lie in fault contact with dolomite. Chert grits and conglomerates contain small stretched chert pebbles in a graphitic matrix. The shales and conglomerates occasionally contain quartz veins with minor galena and tetrahedrite.

5/ Mafic and porphyritic dykes: dark green mafic dykes up to 2 m wide occur in dolomite and phyllite in the southwestern part of the HV (2011 GNR) claims. The dykes are fine grained and locally silicify the host rocks. Also, a felsic porphyry dyke is present.

Structure (Davidson, 1987): The Pass Peak and Seagull Thrusts form the southern and northern flanks of a complexly faulted arch, the Seagull Uplift, which underlies the HV (2011 GNR) property. G. Abbott has interpreted three possible structural levels for fault bounded strata in this area. The pattern of faulting and uplift documented for the Seagull Uplift resembles that seen in the Ketza Uplift where fault orientations and overall sense of movement indicates local doming centered a short distance west of the Ketza River deposit (Yukon Geology, Vol. 1). A quartz monzonite plug located 5 km east of the HV (2011 GNR) property may be responsible for local uplift and the complex system of normal faults.

Mineralization (Davidson, 1987): Mineral occurrences on the HV (2011 GNR) property consist of silver bearing galena veins with pyrite, tetrahedrite and lesser sphalerite in quartz-siderite

gangue. Mineralization occurs over widths of up to 15 m, however massive sulphide lenses generally average 0.5 m wide. The massive sulphide lenses pinch and swell along fault zones containing frozen clay gouge, dolomite fragments and limonite. Numerous narrow veins of galena occur in footwall and hanging wall rocks up to 15 m from the vein fault. Silver to lead ratios in the galena veins range from 1:2 to 2:1. Accessory minerals include chalcopryite, anglesite, cerrusite, scorodite, azurite, malachite and mimetite.

Figure 5-1. Regional Bedrock Geology Map of the GNR and GROUNDHOG Area.

6.0 2012 EXPLORATION

6.1 Exploration Program

The 2012 exploration program on the GNR/Groundhog property was carried out from September 4th to 11th. The program consisted of grid soil sampling. Silver Predator contracted Ground Truth Exploration Inc. of Dawson City, YT to complete the program. A total of 24 man days were spent to collect 623 samples from the GNR/Groundhog property. Soil crews were based on the Groundhog property and completed the sampling by foot traverses.

Soil samples on the GNR/Groundhog property were collected on 50 m intervals on east-west soil lines set at 100 m apart. The grids are located on three different parts of the property. All soil lines start from the top of the mountains and continue along the ridge tops and downstream directions. The total length of soil lines is approximately 31 kilometres (Appendix 4).

6.2 Sampling Methodology and Protocols

Most 2012 samples were collected at a depth > 0.3 m using hand-held Dutch augers except where soils were very shallow or sparse, such as in boulder fields. At each sample station, sample descriptions, UTM co-ordinates and photographs were recorded. Location and observational data were recorded when no sample was collected due to ground conditions (i.e., permafrost or boulder field with insufficient fines).

Soil sample descriptions were entered into a hand held device with the following information: geographic location, relief, vegetation, depth of sample, soil horizon, sample color, sample quality, soil texture and moisture.

Samples were freighted to AGAT Laboratories ISO 9001 certified preparation facility in Whitehorse, YT and the pulps were analyzed at AGAT Laboratories ISO 9001 certified laboratory in Ontario. Samples were dissolved in an aqua regia acid solution and then analyzed by ICP/ICP-MS methods (package 201074). AGAT completes quality assurance/ quality control data verification of their assays through internally inserted duplicates, standards and blanks. Assay certificates and the detailed methodology and detection limits are in Appendix 3.

Soil samples were ranked by percentile to determine statistical anomalies for the property. Dark blue circles plot samples ranking in the lower 50th percentile, light blue circles are samples ranking in the 50th – 75th percentile, green circles represent samples in the 75th - 90th percentile, yellow circles indicate 90 – 95th percentile, orange 95-97th (labelled) and red circles are the upper 98th -99th percentile (labelled).

7.0 CONCLUSIONS AND RECOMMENDATIONS

The GNR and Groundhog properties presently consist of 76 non-contiguous mineral claims covering an area of approximately 1,520 hectares, located in Pelly-Cassiar Platform in central Yukon. Silver Predator is targeting high-grade silver bearing galena veins.

The 2012 field program consisted of the collection of 623 gridded soil samples in three locations on the GNR/Groundhog property. The program identified new multi and single element geochemical anomalies.

Follow-up work consisting of prospecting and mapping is recommended to investigate the sources of the geochemical anomalies.

8.0 2012 EXPENDITURES

Expenditures for the 2012 GNR/Groundhog exploration program was \$ 33,757.46 as summarized in Table 8-1.

Table 8-1. 2012 GNR Expenditures

Contract Soil Sampling	Ground Truth Exploration	\$19,595.21
Transportation	Trans North Helicopter Bell 206	\$3,960.00
Fuel	Jet Fuel	\$921.00
Analytical	Soil Samples	\$8,281.25
Report Preparation	Report	\$1,000.00
Total Expenditures		\$33,757.46
Total number of Samples		623
Cost Per Sample		\$54.19

9.0 STATEMENT OF AUTHORSHIP

This Report titled "Assessment Report, 2012 Geochemical Soil Sampling Program, GNR and Groundhog Project, Watson Lake Mining Division, Yukon Territory, Canada", and dated October 3rd, 2013 was prepared and signed by the following author:

Mike Burke, B.Sc.

Dated:

Whitehorse, Yukon, Canada

Appendix 1

Statement of Qualifications

CERTIFICATE OF AUTHOR

I, Mike Burke of 60 Boswell Crescent, Whitehorse, Yukon, certify that:

I, Mike Burke, chief geologist for Silver Predator Canada Corp., with residential addresses in Whitehorse, Yukon Territory certify that:

I graduated from the University of British Columbia with a B.Sc in Geology in 1987.

From 1987 to present, I have been actively engaged as a geologist in mineral exploration, mining and with the Federal and Yukon Governments in the Yukon Territory.

I am author of this Report “Assessment Report, 2012 Geochemical Soil Sampling Program GNR and Groundhog Property”, Watson Lake Mining Division, Yukon Territory, Canada; dated October 3rd, 2013; and

I have reviewed the geological data and am not aware of any material facts or change in facts at the time this certification is dated.

Mike Burke, B.Sc.

Whitehorse, Yukon

Dated this ____ Day of October, 2013
