1 Introduction

The 2012 Betty property exploration program tested the large gold-in-soil anomaly outlined in 2011 for bulk-tonnage epithermal gold mineralization similar to the gold mineralization discovered by Kaminak Gold Corp ("Kaminak") on the adjacent "Coffee" gold property. The Betty property was identified and staked as an area of exploration interest by prospector Shawn Ryan following the discovery of gold near Coffee Creek by Kaminak. Mr. Ryan proposed that the east-west trending gold-bearing Coffee fault identified by Kaminak continued through the middle of the Betty Property. He also suggested this structure was transected by the north-east trending Dip Creek fault and that the confluence of these features would be a prime location for near surface gold mineralization. Exploration by Ethos Gold Corp ("Ethos") during 2011 outlined a 17 square kilometer gold-in-soil anomaly within the Betty property near the junction of the Coffee fault and the Dip Creek fault (see Tallman, 2012 for full results of 2011 program). Prospecting and follow up trench pits on these gold-soil anomalies yielded gold in rock grab samples supporting the potential for a bulk tonnage gold deposit.

1.1 Scope of Work

This report describes the exploration history, geology and mineral potential of the Betty property, including work performed by Ethos Gold Corp during the period May 1, 2012 to September 30, 2012. A review of historical industry work and other information within the immediate and surrounding region is included. Regional geology, associated data and current exploration information have been reviewed to determine the geological setting and potential for mineralization.

1.2 Work Program

The objective of 2012 exploration on the Betty property was to follow up on 2011 geochemical results suggesting the possibility of bulk-tonnage epithermal gold mineralization at the Mascot gold target. The 2012 exploration on the Betty property included additional soil sampling, back-filling 2011 trench pits, limited prospecting and rock sampling, ground "walking" magnetic surveying, and reverse circulation drilling. A total of 1800+ man-days work was completed during the 2012 field season plus work by contractors up to September 30, 2012. Ethos moved into the Caribou Rose 'base camp' rented from Castilian Resources Corp as a base for 2012 exploration. The Caribou Rose camp is located 10 km west of Western Copper's Casino airstrip and 20 km west of the Mascot gold target area. The Caribou Rose camp housed up to 22 Ethos and contractor personnel during 2012. Ethos contracted Heli-Dynamics of Whitehorse YT which provided a Bell 407 based at the Caribou Rose camp. Property access was provided via daily helicopter flight from the camp to the targeted areas within the Betty property. The ground magnetics survey was conducted by Ground Truth Exploration personnel and based out of the Caribou Rose camp. Additional soil sampling was conducted by Ground Truth Exploration personnel based in a series of locally mobile field camps on the Betty property and supported primarily by Ethos' Bell 407 helicopter from Caribou Rose camp. Fuel, equipment, supplies, and samples were shipped in/out by various fixed wing aircraft using primarily the Rude Creek airstrip or the Casino airstrip.

1.3 Terms, Definitions & Units

The following terms and abbreviations are used within this report:

- Distances are reported in meters (m), kilometres (km) and feet (ft).
- Costs are reported in Canadian dollars (CAN$).
- Locational information is reported in both Latitude-Longitude and UTM grid (Easting, Northing) NAD83, Zone 7N.
- Geochemical data is reported in parts per million (ppm) the equivalent to grams per tonne (g/t) and ounces per tonne (oz/t), as well as parts per billion (ppb).
- QAQC refers to quality assurance and quality control.
- Geological ages include: Ka (thousand) and Ma (million) years ago.
- Elemental abbreviations include: antimony (Sb), arsenic (As), bismuth (Bi), copper (Cu), gold (Au), iron (Fe), lead (Pb), silver (Ag) and zinc (Zn).
- Mineralogical abbreviations include: pyrite (Pyr) and pyrrhotite (Po) [iron sulphides], limonite (Lim) [hydrated iron oxide], magnetite (Mag) [iron oxide], chalcopyrite (Cpy) [copper sulphide] and molybdenite (Mo) [molybdenum sulphide].
- MINFILE showing refers to documented mineral occurrences compiled by the Yukon Geological Survey.

- Directional units include: north (N), east (E), south (S), west (W) and may be used in combination (*i.e.*, NNE for north-northeast).

1.4 Source Documents

The following sources of information were used in writing this technical report and include private company data and information available on the public domain:

- Review of published and scientific papers on geology on the region and on mineral deposit types
- Review of geological maps and reports completed by the Yukon Geological Survey and the Geological Survey of Canada
- Research on the Yukon Geological Survey's MINFILE database (http://servlet.gov.yk.ca/ygsmin/index.do) and Map Viewer (http://maps.gov.yk.ca/imf.jsp?site=YGS)
- Review of previously written assessment and YMIP reports at the Energy, Mines & Resources Library (http://www.emr.gov.yk.ca/library/)
- Review of publically available data, including news releases, on Ethos Gold Corp. (www.ethosgold.com/s/home.asp)
- Work directed and performed by the author on the Betty property during June through September, 2011.

1.5 Geotechnical Information

Ethos uses UTM NAD83 Zone 7 coordinates for geographic positioning system ("GPS"). Coordinates are expressed in UTM NAD83 Zone 7 unless specified otherwise. Ethos employees and consultants were provided with Garmin "GPSMap 62s" model GPS devices, which can automatically record continuous route tracks as well as set waypoint information. The Garmin GPS devices are assumed accurate to within 5 meters horizontally and within 10 meters on elevation. Cameras were synchronized with clocks on individuals GPS units so that photographs could be geo-tagged using Garmin Basemap software. Tracks were continuously recorded daily for mapping and prospecting surveys, waypoints entered with notes where features of interest were encountered, and photographs tagged to individual waypoint and sample locations.

1.6 Limitations, Restrictions and Assumptions

The author has assumed that the previous and documented work on the property is valid and has not encountered any information to discredit such work.

1.7 Reliance on Other Experts

The author has relied in part upon work and reports completed by others in previous years and in the preparation of this technical report. The authors' opinion contained herein is based on information obtained to date, which in turn reflect various technical and economic conditions; given the nature of the mining industry, these conditions can change rapidly over relatively short periods of time. Furthermore, thorough checks to confirm results of such reports and work has not been completed and unless otherwise stated the author has not independently confirmed the accuracy of the data. To the authors knowledge there are no known litigations potentially affecting the Betty project. Title documents and option agreements were reviewed for this study, this report does not constitute, nor is it intended to represent a legal opinion as to the validity of the title. The project is an early stage exploration property and therefore, limited surface disturbances have been created by the company.

1.8 Qualified Person and Participating Personnel

Mr. Peter Tallman, P.Geo Chief Operating Officer (COO) of Ethos Gold Corporation (Vancouver, British Columbia) directed exploration and worked on the Betty property during the period from May 20 to September 15, 2012. This report describes the property and the work performed in 2012.

2 Property Location & Description

2.1 Location & Land Tenure

The Betty property is located in west-central Yukon in the White Gold district within the Whitehorse Mining District, Canada, (Figure 1) and is at an early exploration phase. For the purposes of this report, the Betty property is comprised of the Betty East and Betty West Claims grouping totaling 1,425 contiguous claims (Table 1; Figure 2). The contiguous Betty property claims (NTS map sheets 115J/09, 10, 15 & 16) are centered at a latitude of 62°47'N and a longitude of 138°34'W (Figure 2) and lie 130 km southeast of Dawson City, located 540 km north of Whitehorse via a paved highway (*Table 1*). The boundaries of the property have not been legally surveyed. Refer to *Appendix I. Mineral Tenure of the Betty* for a detailed statement of claims.

Figure 1: Property location map (Ethos, 2012)

Table 1. Betty Property Claim Summary (see appendix I for full list of claims described in this report)

Claim Group Name	Claim No. (from)	Claim No. (to)	Grant No. (from)	Grant No. (to)	NTS	Expiry Date*	Total No.
Betty	1	564	YD96501	YD97064	115J/09,10, 15 & 16	09/29/20	564
Betty	565	730	YD133355	YD133520	115J/10 & 15	12/29/20	166
Betty	731	860	YD97071	YD97190	115J/09,10, 15 & 16	08/11/21	130
Hayes	1	100	YE24001	YE24100	115J/09 & 16	06/29/21	100
Hayes	101	1077	YE22701	YE23677	115J/09, 16, 115I/12 & 13	06/29/21	466
*Based upon acceptance of this report						Total Claims-	1,425
						Approximate Total Area (ha)-	25,700 ha

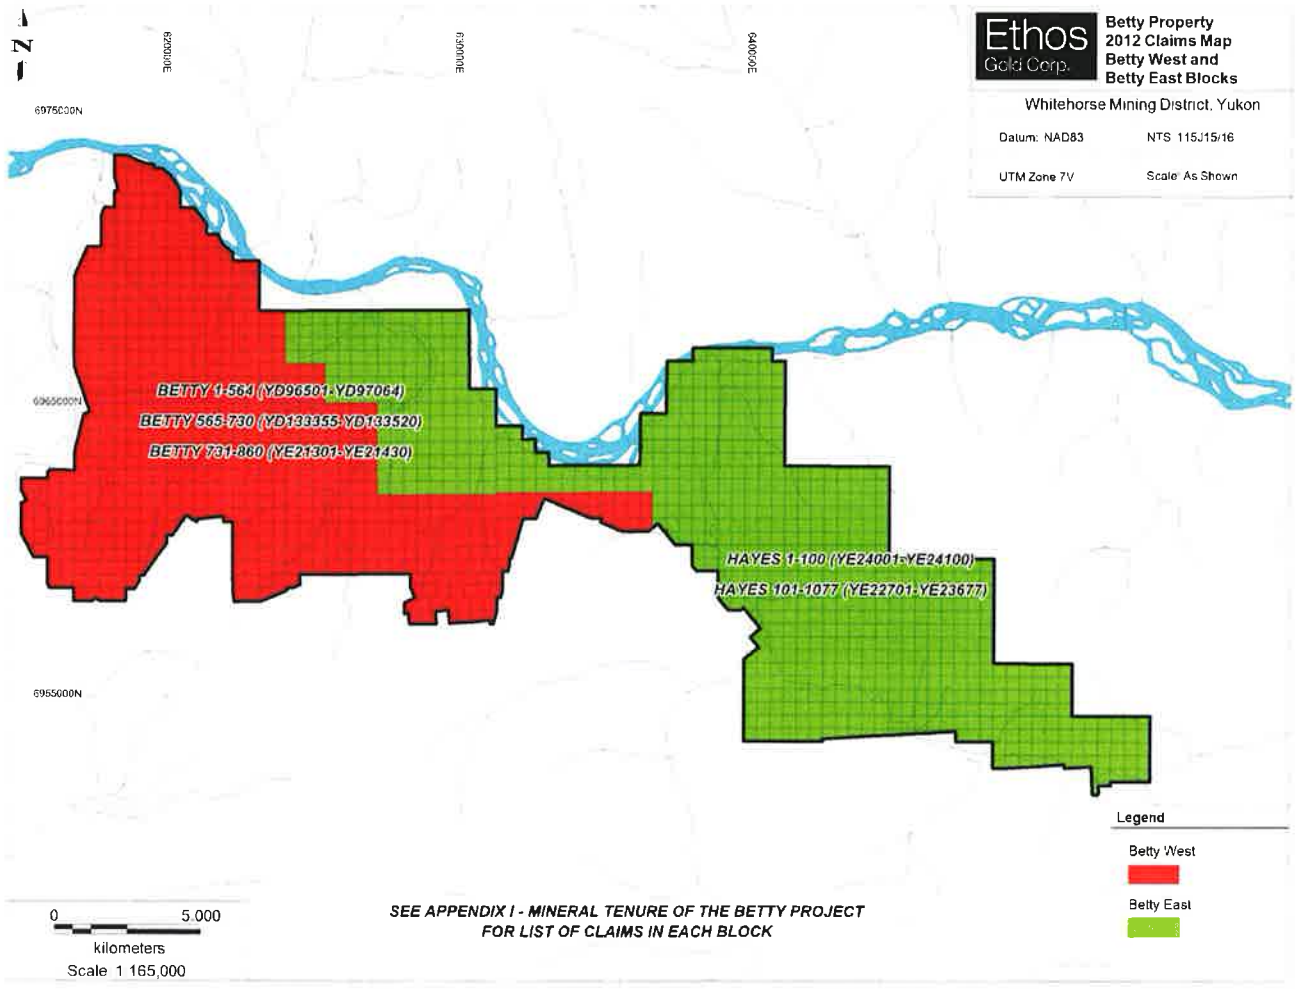

Figure 2: Claims Location Map (Ethos, 2012)

2.2 Underlying Agreements

The Betty Property, shown in Figure 2, were optioned from Shawn Ryan (70%) and Wildwood Explorations Inc. (30%) (the "vendors") by the Betty Agreement dated November 30, 2010. Under the terms of the Betty Agreement, Ethos may earn a 100% interest through a series of staged payments of cash and shares over four years, as well as staged exploration expenditures by October 15th 2015. Additional common shares are payable upon Ethos having incurred $4,000,000 in

cumulative expenditures and also having incurred a cumulative total of $7,500,000 in expenditures. The vendors retain a 2% underlying net smelter return royalty (NSR).

The claims are located within the Traditional Territory of the Selkirk First Nation with minor overlap with the Tr'ondëk Hwëch'in (TH) First Nation. Both First Nations have settled their land claims in the area. The closest Selkirk First Nation surveyed land (SFN R-12A) lies approximately 5 km south of the property. The claims are situated on Crown Land and therefore the mineral claims fall under the jurisdiction of the Yukon Government. Surface rights would have to be obtained from the government should the property go into development.

As required by the Yukon Quartz Mining Act, a mineral claim holder must perform $100 assessment work per claim, per year and document this work to maintain the title, or otherwise pay $100 in lieu per claim per year to maintain title to the claims.

2.3 Permits

Early exploration activities do not require permitting, however significant drilling, trenching, blasting, line cutting and excavating may require a Mining Lands Use Permit (MLUP) that must be approved under the Yukon Environmental Socioeconomic Assessment Act (YESAA). Ethos obtained a Class 3 MLUP #LQ00316 for the 2011 exploration year. This permit was renewed for the 2012 exploration year. Ethos also obtained a waste management permit #4201-81-022 for the 2011 exploration year which was also renewed for 2012. The property has been fully remediated and inspected/passed by YT government inspectors in 2013.

3 Accessibility, Local Resources, Infrastructure, Physiography & Climate

3.1 Access, Local Resources & Infrastructure

The project is centered at a latitude of 62°47'N and a longitude of 138°34'W (E623575, N6964825 NAD 83, Zone 7N). There is no road access to the Betty property during the summer months however during the winter the Casino Trail winter road is serviced by "snowcats" which pass along the southern claim boundary of the Betty property. The claims are accessible via helicopter from Dawson City (150 km), 536 km north of Whitehorse via a paved highway, or from the communities of Carmacks (170 km southeast) or Minto (100 km east). The property is also accessible by fixed wing to the Thistle Airstrip (E6995390, N586256 NAD 83, Zone 7N) from airstrips at Dawson, Carmacks, Minto or Whitehorse, followed by a 45 km helicopter flight to the claims. Several charter aircraft companies provide services with a variety of aircraft types. Other airstrips close to the Betty property include the Casino airstrip located 10 km to the southwest built and maintained by Western Copper to service the Casino Au-Cu mine development project, and a smaller 300 meter long airstrip on Hayes Creek located 25 kilometers to the east was built and is maintained by Carmacks-based placer miner George Wilson. Other local airstrips of significance include those at Rude Creek, Black Hills, Kirkman, Barker, Scroggie, Ballarat, and Coffee Creek associated with placer mining operations.

Commercial charter barges are available during summer for bulk transport of materials from Minto or Dawson City along the Yukon River. Barge landing areas have been constructed at Britannia Creek on the Yukon River (maintained by Western Copper for the Casino project) in the northeast corner of the Betty property, and at Isaac Creek used c.1900 to 1930's when there was a telegraph station there. Nearby barge landings along the Yukon River have also been built at the mouths of Ballarat and Thistle Creeks which support placer gold mining operations. A cat-trail from the mouth of Isaac Creek extends along the creek into the surrounding highlands and connects to a cross-country trail constructed in the 1970's from Burwash Landing to Casino. Water is available from the northerly flowing tributaries of the Yukon River including tributaries of Isaac and Britannia Creeks (Pautler, 2011) (Figure 3).

Dawson City, home of the historic 1896-1899 Klondike Gold Rush, has approximately 1300 residents and draws nearly 60,000 visitors each year. Main industries in Dawson City are tourism and placer mining. Heavy equipment repair and rental, a lumber mill, freighting and trucking companies and a mining oriented labour force is available for contract exploration and mining work. An airport with air service to Whitehorse and Fairbanks, Alaska and two permanent and several seasonal helicopter company bases are present providing transportation. Facilities include a health center, grocery stores, a police station, service stations (tire repair and propane sales), welding and machine shops, accommodation and restaurants.

The nearest hydroelectric power source to the Betty claims is the Minto Mine owned by Capstone Mining Corporation which lies approximately 75 km to the south-southeast (Figure 3). The Minto Mine is a 3,600 tonne per day open pit copper mining operation with conventional crushing, grinding, and flotation to produce copper concentrates with significant gold and silver credits. Concentrates are exported via truck through the Port of Skagway, Alaska. The Minto Mine was commissioned in 2007 and has an expected mine life (as of January 2012) sufficient to 2020 (Giroux, G.H., 2010; Hester, M., 2011).

The Casino Deposit owned by Western Copper and Gold Corporation is located on claims adjoining Ethos' Betty Property along the Betty southern claim boundary. The Casino Deposit contains reserves totaling 976M tonnes milling and 82M tonnes heap leachable containing 8M oz gold, 4.5B lbs copper, and 0.5B lbs molybdenum (G. Giroux, 2010; M. Hester, 2011) and a positive final feasibility study was completed (C. Huss, 25 January 2013). A 50 man camp, fuel tanks, equipment shed, plus a large airstrip, a local road network, and other infrastructure is located on the property.

A private 75 km long road from Carmacks, YT is proposed to connect to the Casino Deposit to the Yukon Highway. The completion of this road to Casino has the near-future potential to favourably affect project thresholds and economic costs at the Betty Property.

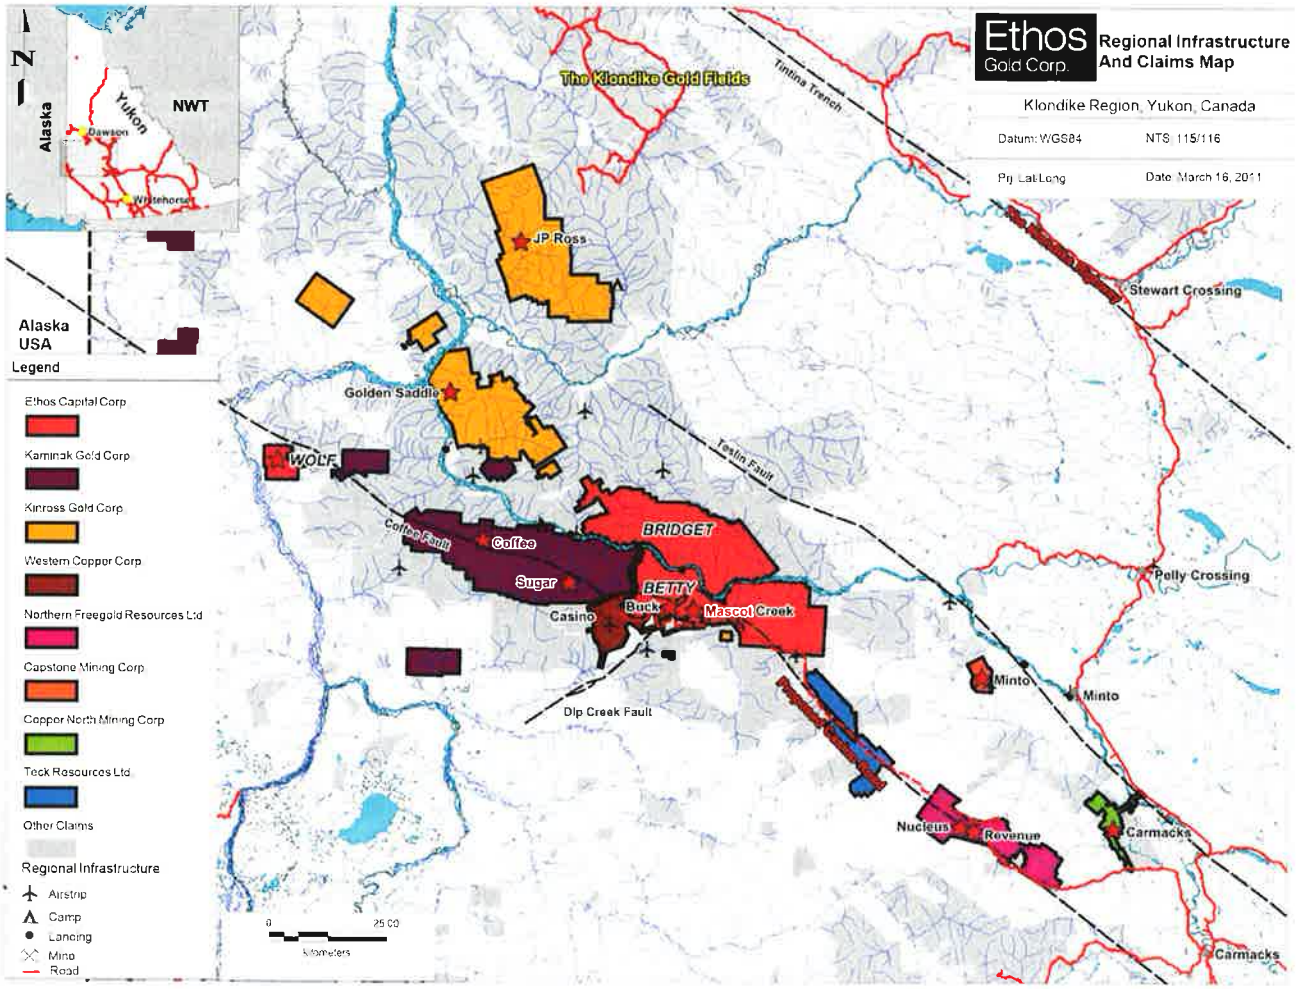

Figure 3: Property infrastructure (Ethos, 2012)

3.2 Physiography & Climate

The area of interest covers low rolling hills within the Dawson Range on the unglaciated Yukon Plateau. The topography is characterized by rolling terrain with rounded hill tops and local flat plateau areas. Elevations range from just under 1300' (396 m) along the Yukon River to 4400' (1341 m) in the southwestern corner with central ridges reaching 3700' (1128 m). Vegetation is typical boreal forest with sparse vegetation above elevations of 3500' (1067 m). Exploration in the region

typically begins in late May and ends in October as the climate is characterized by continental subarctic conditions with average temperatures ranging from 15.6°C (60°F) in July to -26.7°C (-16°F) in January (Environment Canada, 2012).

The property is drained by the northerly-flowing tributaries of the Yukon River. Vegetation is typical boreal forest (white spruce, birch, poplar and black spruce) with sparse vegetation above elevations of 3500' (1067 m) dominated by buckbrush and sparse tree cover.

4 Property History

The Dawson Range has been placer mined and explored for copper porphyry mineralization since the 1960s. The property covers the Empire, Marguerite, Brewster and Mascot MINFILE occurrences (115J 069, 070, 071 & and 074, respectively). Empire (115J 069) and Mascot are unknown mineral occurrences, Marguerite is a polymetallic Ag-Pb-Zn± Au, Cu and mineralization at Brewster is reported to be plutonic-related gold. Modern gold exploration in the area began in the late 1990's and the area has become a regional focus since the discovery of the Golden Saddle gold deposit 60 km to the northwest in 2007 by Underworld Resources (now owned and operated by Kinross Gold Corporation) and the Coffee gold mineralization 40 km to the west in 2009 by Kaminak Gold Corporation. The area of the Betty property has been staked intermittently although little exploration results are recorded. In 2008 Shawn Ryan collected 33 reconnaissance soils.

The Betty property was staked by Shawn Ryan in August 2010 following the discovery of gold on the adjacent property at Coffee. Exploration by Ethos began in June 2011 with soil surveys, airbourne geophysics, orthophotography and surficial mapping, prospecting, and trenching.

The property history is summarized in *Table 2* and is based upon information from the YGS's MINFILE capsules 115J 069, 070, 071 & and 074 (Empire, Marguerite, Brewster and Mascot; Deklerk (*compiler*), 2011), 'Mineral Industry Reports', and various 'Yukon Exploration and Geology' publications.

Table 2. Betty Property – Work History

April 1924	Mascot occurrence (115J 074) originally staked as Premier (*15032*; Deklerk, 2011).
1966	Marguerite occurrence stakes as the Sun claims (*Y5404*) by Kluane Exploration Ltd. Later that season explored by soil geochemical surveys concentrating on silver-lead veins (Deklerk, 2011).
1969	Marguerite occurrence restaked Arm, Carlo, Folly, Fred etc. claims (*Y43296*) by Marguerite Lake Mines Ltd.
1969-1970	Brewster occurrence staked as Folly (*Y43021, Y43043, Y43065 & Y43089*) in 1969 and Rain (*Y53507*) in 1970 by Brewster Lake Mines Ltd. Later that season explored via geochemical grid soil sampling (593 samples) and prospecting (on Folly and Rain claims to east). Sampling delineated a 240 m X 460 m copper soil anomaly (Brewster anomaly) with copper-in-soil values ≤105 ppm (Radvak, 1971).
1970	Empire occurrence staked as Hop (*Y48919*) in January 1970 by Empire Mercury Corporation Ltd. Later that season, 423 grid soil samples were collected in conjunction with mapping (probably staked as a copper-porphyry target). Reportedly returned no significant anomalies (Scott, 1970). Exploration of the Marguerite via geochemical grid soil sampling, geological mapping and bulldozer trenching by Nippon Mining of Canada Ltd., under option from Marguerite Lake Mines Ltd., resulting in delineating four copper soil anomalies, one up to 550 m-long where trenching exposed a small section of rusty skarn with weakly mineralized chalcopyrite (Marguerite showing) hosted by the metamorphic rocks (Craig & Laporte, 1972).
1999	Brewster occurrence staked as Hiho (*YC09898 & YC13901)* 2 km to the east and subsequently optioned the claims to Prospector International Resources Inc. which carried out geochemical soil sampling later that year. The survey identified an area of weakly anomalous arsenic (≤143.4 ppm), antimony (≤10.36 ppm) and molybdenum (≤4.42 ppm), approximately 1.1 km northeast of the Brewster occurrence in a location underlain by schist and gneiss (Jaworski and Meyer, 2000a).

2007-2008 Brewster staked as Flush claims (*YC60340*) 1.5 km to the northeast and later in 2008, Ryan collected 33 soil samples along a line to follow-up the 1999 arsenic anomaly. Samples returned a broadly arsenic anomalous zone (≤78.5 ppm) and antimony (≤10.1 ppm) at the ends of the line (Ryan, 2008).

5 Geological Setting

5.1 Regional Geology

The Betty property is located on the 1:250,000-scale 115J (Stevenson Ridge) map-sheet, which was completed in 1974 by Templeman-Kluit (Geology, Snag, Yukon (NTS 115J/K), GSC Preliminary Map 16-1973). In 2005, Gordey and Ryan re-compiled map sheets 115N, 115O and part of 115J (GSC Open File 4970).

The property is located in the Yukon-Tanana terrane (*herein* YTT), which underlies much of central and western Yukon. Its history and tectonic evolution, particularly prior to mid-Mesozoic time, has been largely obscured by younger magmatism and tectonism. The YTT is primarily a product of episodic continental arc magmatism forming a sequence of accreted pericratonic terranes that form a large portion of the Omineca Belt. The terrane underlies part of the Tintina gold belt and hosts gold deposits related to Mesozoic intrusions, including the Sonora Gulch gold deposit and the Casino copper-gold-molybdenum porphyry located southeast of the Coffee project (Bennett *et al.*, 2010). The widespread YTT is defined by metamorphosed and deformed sedimentary and volcanic rocks (schists and gneisses) that were accreted along foliation-parallel thrust faults and later deformed in the late Paleozoic, creating multiple penetrative rock fabrics. The TTY was intruded by a number of Mesozoic suites including the Late Cretaceous Dawson Range intrusions (felsic stocks and related rhyolite dykes). The rocks were later tectonically staked along foliation-parallel trust faults during the Early Jurassic (Mortensen, 1996) and subsequent regional extension occurred between the middle Cretaceous and Eocene, accompanied by fault-controlled mafic and felsic magmatism (Gabrielse and Yorath, 1991).

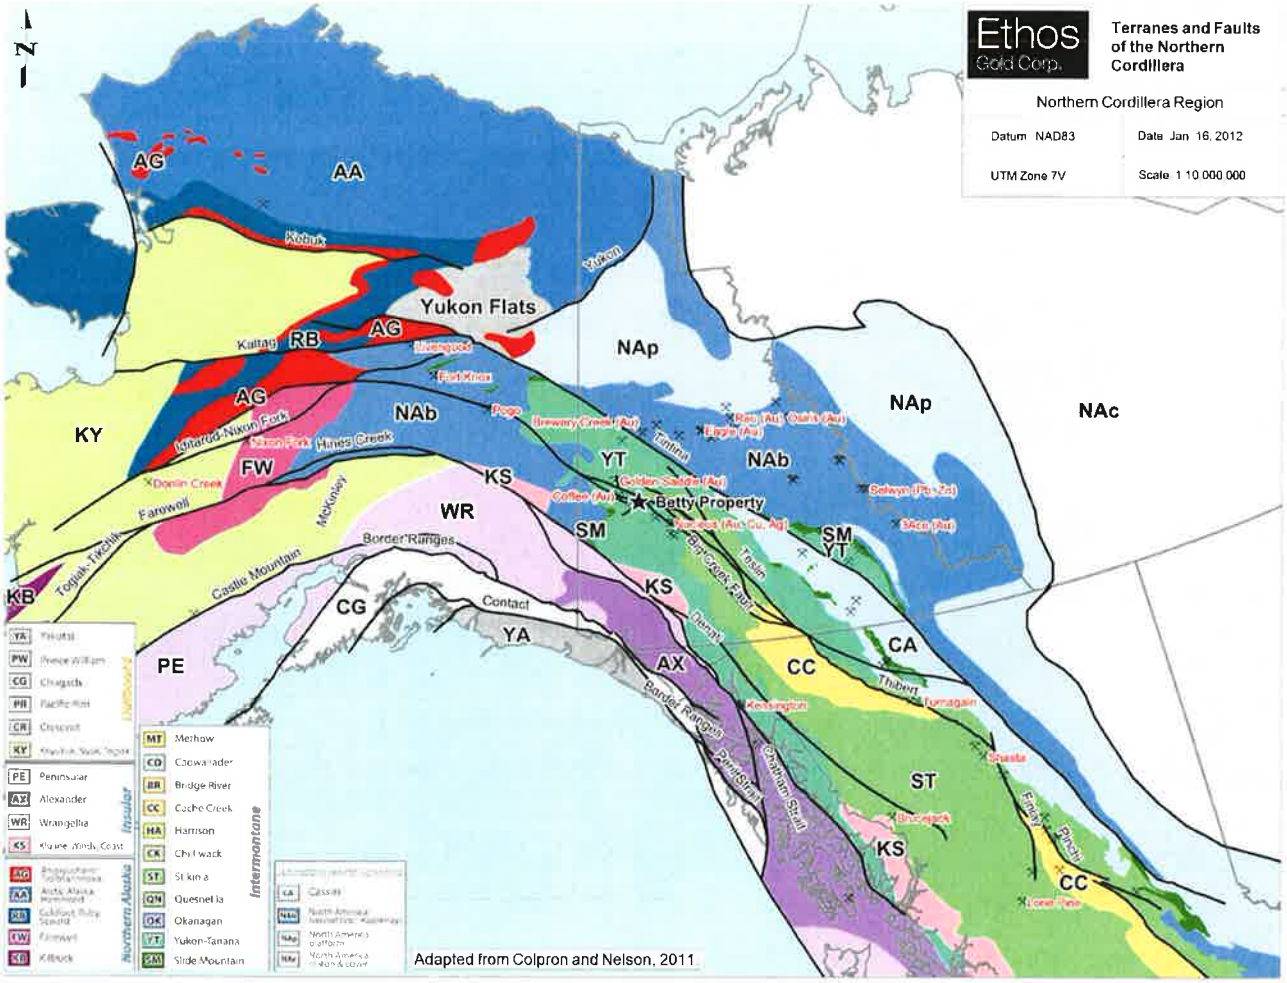

Figure 4: Regional terrane geology (Ethos, 2011)

5.2 Property Geology

The property occurs in the unglaciated Dawson Range, wedged between the northwest-striking Tintina fault to the northeast and the Denali fault to the southwest. The Dawson Range is characterized by metamorphosed basement rocks of the YTT and is intruded by voluminous Jurassic to Cretaceous intrusions, largely the mid-Cretaceous Dawson Range Batholith. The YTT basement rocks in the northern claim area are represented by Devonian to Mississippian-aged Snowcap Assemblage (420 Ma) orthogneiss. The YTT basement rocks in the center of the property are represented by the Permian-aged Sulphur Creek suite (262 Ma). Both YTT basement rocks were intruded upon during the Mid-Cretaceous by smaller felsic stocks and related rhyolite dykes of the Whitehorse Suite (112-105 Ma) (located to the south on the property). The Whitehorse Suite includes the Coffee Creek phase and the Dawson Range Batholith. The Dawson Range Batholith primarily consists of Casino granodiorite phase. However, in the southeastern and southwestern corners, a dioritic phase is exposed (*Table 3) (Ryan et al., 2012)*.

Table 3. Regional Geological Units (Ryan et al., 2012).

Unit	*Age*	*Rock Type*
Dawson Range	Lower Cretaceous 112-102 Ma	Medium to coarse-grained, unfoliated to weakly foliated, hornblende +/- biotite granodiorite with lesser quartz diorite, tonalite, granite and diorite (may contain orthoclase megacrysts and fine-grained diorite enclaves). Leucocratic and aplitic margins.

Sulphur Creek suite	Permian 262 Ma	Quartz and K-fledspar porphyritic to augen monzogranite; strain varies from moderately foliated to gneissic; biotite bearing; is locally the protolith of felsic Klondike Schist.
Simpson Range Suite	Mississippian 345 Ma	Compositionally layered, weakly to intensely foliated, granodiorite to diorite to monzogranite.
Finlayson Assemblage	Devionian-Mississippian 416-318 Ma	Carbonaceous metasilicclastic: interlayered with carbonaceous quartzite and mica-quartz schist; black to white quartzite, garnet schist and rare black phyllite. Also amphibolite schist to garnet-amphibolite; metabasite; usually hornblende+/-garnet, with local chlorite-biotite. These rocks were probably derived from mafic to intermidate volcanic to volcaniclastic units of the Finlayson arc assemblage (some mafic sills).
Snowcap Assemblage	Pre-Devonian 420 Ma	Metasilicilastic rocks – include layered quartzite, psammite and lesser semipelite. The latter commonly contain garnet with local kyanite or andallusite porphyroblasts.

The property covers a major structural intersection with the northeasterly-trending Dip Creek fault intersecting the northwesterly-trending Coffee Creek structure (probable extension of the Big Creek fault; Pautler, 2011). Kaminak Gold Corporations' Coffee project situated 40 km to the southeast, reported significant gold mineralization along the Coffee Creek structure.

The creeks in the claim region have seen some placer mining, Britannia Creek has been a significant gold producer and Isaac Creek has also seen some placer activity. During 2012 field work, two water-filled placer prospecting shafts were located along the upper part of Sunshine Creek. These were constructed with headless hand-forged nails so probably date from before the 1950's.

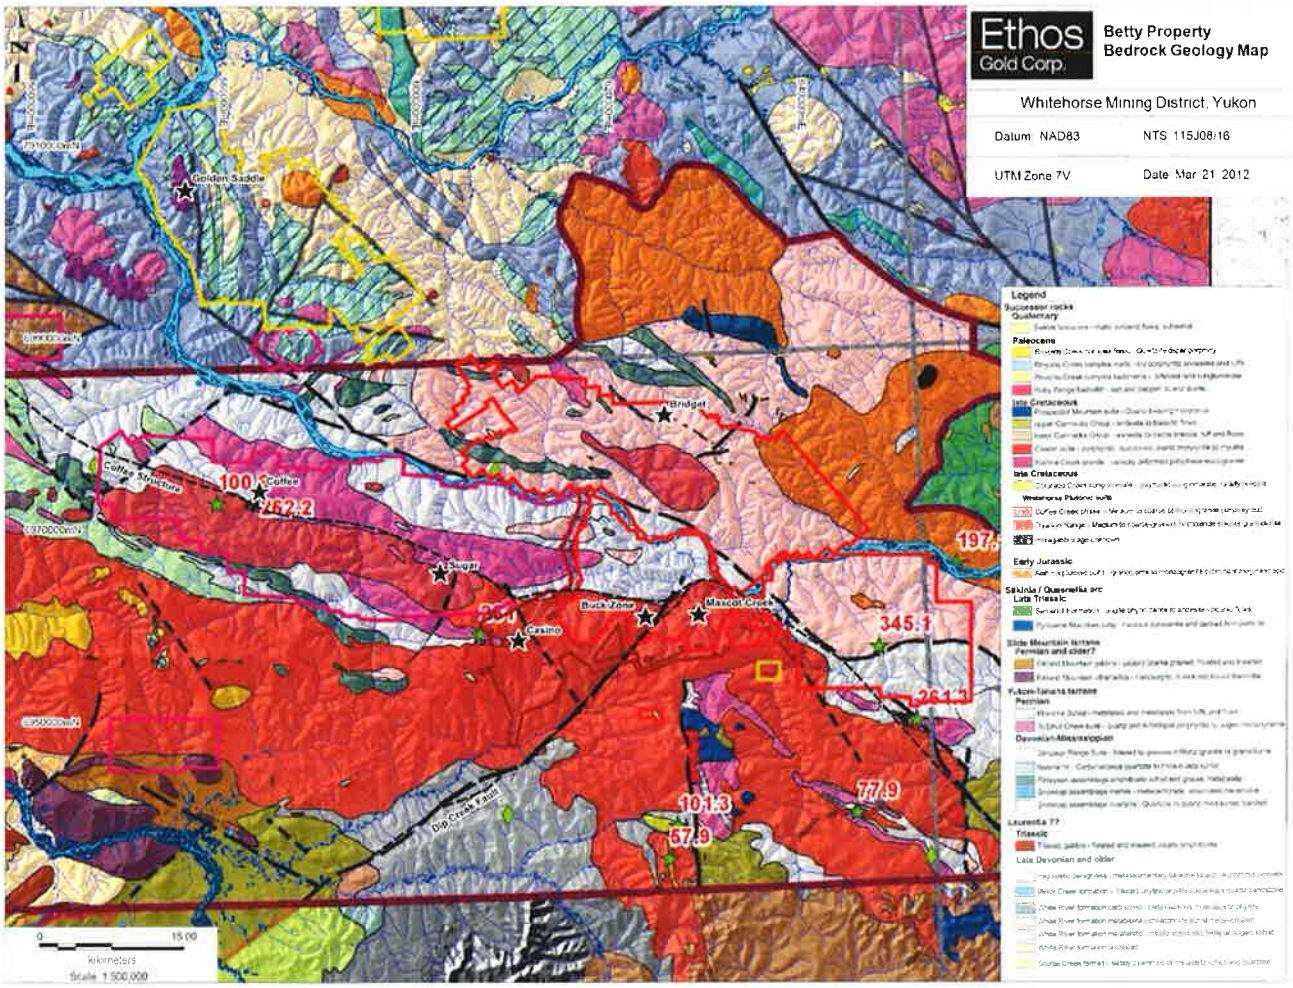

Figure 5: Betty property geology (after Ryan, 2012)

6 Deposit Types & Mineralization

6.1 Deposit Type

The Betty claims cover a portion of the Tintina Gold Belt, a 200 km-wide by 1,200 km-long arcuate, metallogenic province that extends from British Columbia, through Yukon to Alaska. The province is underlain by rocks of the YTT and is characterized numerous gold deposits including: Pogo and Fort Knox, True North, Donlin Creek, Shotgun (Alaska), and the White Gold (Yukon). The Pogo property has proven and probable reserves of 3.6 million ounces gold and measured and indicated resources of 1.7 million ounces gold. Donlin Creek has proven and probable reserves of 29.3 million ounces of gold and measured and indicated resources of 6 million ounces gold. Kinross Gold Corporations' White Gold deposit (AKA-Golden Saddle) is located thirty-five kilometers to the northeast. The White Gold deposit contains an indicated resource of 9,797.000 tonnes grading 3.2 g/t gold (1,005,000 ounces), primarily mineable by open pit methods using a cutoff of 0.5 g/t Au for the open pit and 2.0 g/t Au for underground (Weiershauser *et al.*, 2010). The deposit has additional inferred resources of 9,391,000 tonnes grading 1.91 g/t gold (578,000 ounces) (Weiershauser *et al.*, 2010).

At Kaminak's Coffee project, gold mineralization is hosted in quartz veins, stockworks and breccia zones. A strong association with gold and pyrite has been established and mineralization is largely structurally controlled and proximal to the Coffee Creek structure. Gold structures on the Coffee project are generally steeply-dipping and cross-cut all rock units; moreover, there is a lack of direct evidence of gold mineralization associated with specific vein or breccia events (Couture, 2011). Host rocks include felsic orthogneiss, an ultramafic horizon and the Cretaceous Coffee Creek granite (Paulter, 2011). Selected intersections from Kaminak's news releases at Coffee include gold grades of 17.1 g/t over 15.5m (Supremo Zone), 1.08 g/t over 83.93m (Latte Zone), 6.3 g/t over 35m (Double Double Zone), 2.21 g/t over 56.75m and 1.92 g/t over 23m

(Kona Zone), 2.36 g/t over 18m (Americano Zone) and 5.5g/t over 11m (Connector Zone). Soil sampling, detailed ground magnetic data, aerial photograph interpretation, trenching and drilling data suggest that the gold mineralization is hydrothermal, structurally controlled and that the auriferous structures crosscut all lithologies on the property (Couture, 2011).

The Betty property is considered prospective for near-surface, bulk tonnage intrusion-related to epithermal, structurally-controlled gold mineralization similar to that recently discovered at Coffee and other gold zones within the Tintina Gold Belt (Table 4). Furthermore, the Coffee fault structure which localizes gold mineralization is interpreted to strike across the Betty property.

Table 4: Gold deposits in the Tintina Gold Belt (Kinross 2012, Kaminak 2012, Donlin Gold 2012, Sumitomo Metal Mining 2012)

Deposit	Owner	Proven & Probable reserves	Measured & indicated	Host & Deposit Type
Pogo	Sumitomo Metal Mining Pogo LLC	3.6 M oz Au	1.7 M oz Au	Quartz-vein hosted in mid-Paleozoic gneiss
Donlin Creek	Donlin Gold	29.3 M oz Au	6 M oz Au	Quartz-vein and breccias hosted in felsic sill and dikes
Fort Knox	Kinross Gold Corp	4.3 M oz Au	1.4 M oz Au	Quartz, quartz-sercite, quartz pegmatite veins, stockwork, and shear zones hosted in intrusive granitic complexes.
White Gold (Golden Saddle)	Kinross Gold Corp.		1.6 M oz Au	Quartz-vein, stockwork and breccias hosted in Devonian-Mississippian felsic orthogneiss and felsic and mafic metavolcanics. Structurally controlled, epithermal and intrusion related
Coffee Project	Kaminak Gold Corp.		Drilling on going* (3.2M oz Au inferred)	Quartz-vein, stockwork and breccias hosted in felsic orthogneiss, ultramafics and granites

*gold grades of 17.1 g/t over 15.5m, 1.08 g/t over 83.93 m, 6.3 g/t over 35 m, 2.21 g/t over 56.75 m and 1.92 g/t over 23 m, 2.36 g/t over 18 m, and 5.5 g/t over 11 m.

6.2 Mineralization

The Betty property has less than 3% outcrop. C-horizon colluvium begins between 0.5 to 1.5 meters depth making prospect pitting a method that yields widespread outcrop information slowly. However, samples collected by Ethos in 2011 and 2012 from outcrops, trenches and pit trenches were used in conjunction with Ryan (2012) mapping plus detailed descriptions of mineralization on adjacent properties describe and constrain the mineralization to the extent possible.

6.2.1 Mineralization on the Betty Property Mascot Area

Based on outcrop and trench results mineralization is associated with quartz veining hosted in unaltered or altered granodiorite or diorite. The quartz veining contains locally massive seams of arsenopyrite, plus pyrite, galena (and silver), sphalerite, stibnite, and rare chalcopyrite and molybdenum. Limonite (+hematite), carbonate, and silica alteration were associated with mineralization. Soil and rock samples from the mineralized areas indicate the strongest correlation to gold was with arsenic, followed by bismuth and silver respectively. The mineralization is associated with magnetic breaks interpreted as faults within the granodiorite. The magnetic breaks / faults where gold-bearing quartz-arsenopyrite veins are present are clearly synchronous with and generated from the northeast trending Big Creek fault. The visual and

geochemical character of mineralization intersected in Ethos' RC drilling are comparable to the silver-lead-zinc veins (such as the Bomber and Helicopter veins) adjacent to the Casino porphyry. The mineralization does not appear to have an epithermal character comparable to Coffee-style gold mineralization.

6.2.2 Mineralization in surrounding properties

Kaminak Gold Corporations' Coffee project is an exploration discovery stage project. The Betty property adjoins Kaminak's Coffee claims however the main zone of mineralization is located 20 km to the west. Gold mineralization is hosted in quartz veins, stockwork and breccia zones associated with the Coffee Creek fault, the probable extension of the government mapped Big Creek fault. A strong association with gold and pyrite has been established and mineralization is largely structurally controlled and proximal to the Coffee Creek structure. Gold structures in the project area are generally steeply-dipping and cross-cut all rock units; moreover, there is a lack of direct evidence of gold mineralization associated with specific vein or breccia events (Couture, 2011). Host rocks include felsic orthogneiss, an ultramafic horizon and the Cretaceous Coffee Creek granite (Pautler, 2011). The age of the gold mineralizing event is reportedly c.100 Ma.

The Casino project is a development stage project owned by Western Copper and Gold Corp ("WCGC"). The Betty property adjoins WCGC's Casino claims however the main zone of mineralization is located 10 km to the southwest. The Casino deposit is comprised of gold-copper-molybdenum mineralization hosted by granodiorite-diorite porphyry. The deposit includes oxide and supergene sulphide zones (M3 PFS, August 2008). Northeasterly-trending Dip Creek fault or parallel sympathetic structures are associated with the mineralization. The age of mineralization is reportedly c.70 Ma.

The Betty property has a prominent intersection of the northeasterly-trending Dip Creek fault and the northwesterly-trending magnetic feature inferred to be the Coffee Creek fault (probable extension of the Big Creek fault). The Betty property has potential to host either or both Coffee or Casino styles of mineralization. The Betty property gold-in-soil anomaly detected in 2011 work is considered to potentially represent the surface expression of Coffee-style mineralization, and the 2012 exploration program was designed with this bulk-tonnage target in view.

7 2012 Ethos Exploration Work

The objective of 2012 Betty property exploration was to locate bedrock sources of gold-in-soil anomalies outlined in Ethos' 2011 exploration program (Tallman, 2012). The exploration program was directed towards the discovery of bulk-tonnage gold mineralization similar to that discovered at the adjoining Coffee project. The minimum economic threshold target of Ethos' exploration program has characteristics of >10-50+ meter wide zones of gold-bearing material with average grade-over-widths of a minimum 1 g/t Au and with substantial mineralized volume with grade-over-widths of minimum 3 g/t Au. These zones would require lateral persistence to have potential to reach a minimum 1 million ounce threshold. The target characteristics determined the drill density and exploration strategy from the outset.

Work by Ethos in 2012 included collection of additional grid soils contracted to Ground Truth Exploration to cover the trace of the Coffee Creek fault and infill areas of anomalous multi-element soil geochemistry identified in recce soils in 2011. Other work included a detailed ground magnetometer surveying (25 meter line spacing) contracted to Ground Truth Exploration over the center of the Mascot Creek soil anomaly intended to image smaller structures than those evident from airborne magnetics surveying (100 meter line spacing) in 2011. Talus Exploration provided Candig backhoe and operators for reclamation work and drill pad construction. Northspan Explorations Limited provided reverse circulation ("RC") drilling services. Ground Truth Exploration tested a bench-scale XRF machine with operators for a limited time at the beginning of the RC program. Kluane Drilling were contracted to provide diamond drilling services however the program was curtailed prior to mobilization of a diamond drill rig. Heli Dynamics provided helicopter support including pilots plus on-site mechanic throughout the summer. Tintina Air and Nomad Air provided fixed-wing air support. Acme Analytical provided soil and rock analyses. Keats Global Exploration Services provided prospecting services. Reliance Remote Logistics provided project management, field logistics, technical, and government regulatory services for all phases of the 2012 program.

A total of ~1800 man-days of explorative work were completed on the Betty property during the 2012 program.

7.1 Soil Sampling

Prior to 2011, Shawn Ryan (2008) collected 33 soil samples along a test line on the Betty Property. During Ethos' 2011 exploration program, 14,677 soil samples were collected by Ground Truth Exploration Ltd ("Ground Truth") and submitted

for analysis. In 2012, Ethos' again contracted Ground Truth who collected 8,107 soil samples during the season to complete the soil-sampling component of the exploration program.

The Ground Truth crews fly-camped in 4 to 5 man crews within the areas being worked on. A Heli-Dynamics Bell 407 was used daily to move them to/from their work areas, and to bring samples to the Rude Creek airstrip for transshipment to Acme Labs in Whitehorse. Tintina Air and Nomad Air fixed wing aircraft provided logistical support to the Rude Creek and Casino airstrips for this program.

Ground Truth planned each job and sample sites using ESRI ArcMap to sample over areas of exploration interest. Grid sampling (typically 100 x 50 m) and reconnaissance ridge and spur (also known as elevation contour) sampling was planned in advance with ESRI. The guide points were transferred to each soil sampler's GPS for use in the field and samplers were supplied with an accompanying small-scale topographic map to assist traversing.

During the 2012 field season 8,107 soil samples, including duplicates, blanks, and standards were collected and submitted for assaying. Infill soil samples were collected on the Mascot Grid (Figure 7: the isolated lines south of the "Coffee Fault") plus grid soil samples collected along and north of the Coffee Fault which were designed to follow up on gold-soil anomalies obtained from the reconnaissance ridge-and-spur soil campaign on the Betty Property in this area (assay certificates are in Appendix IV).

A map of the location of areas soil sampled in 2012 is shown in Figure 6. A map of all soils collected from the Betty property from 2008 through 2012 is shown in Figure 7 and highlights the areas of gold-anomalous soils.

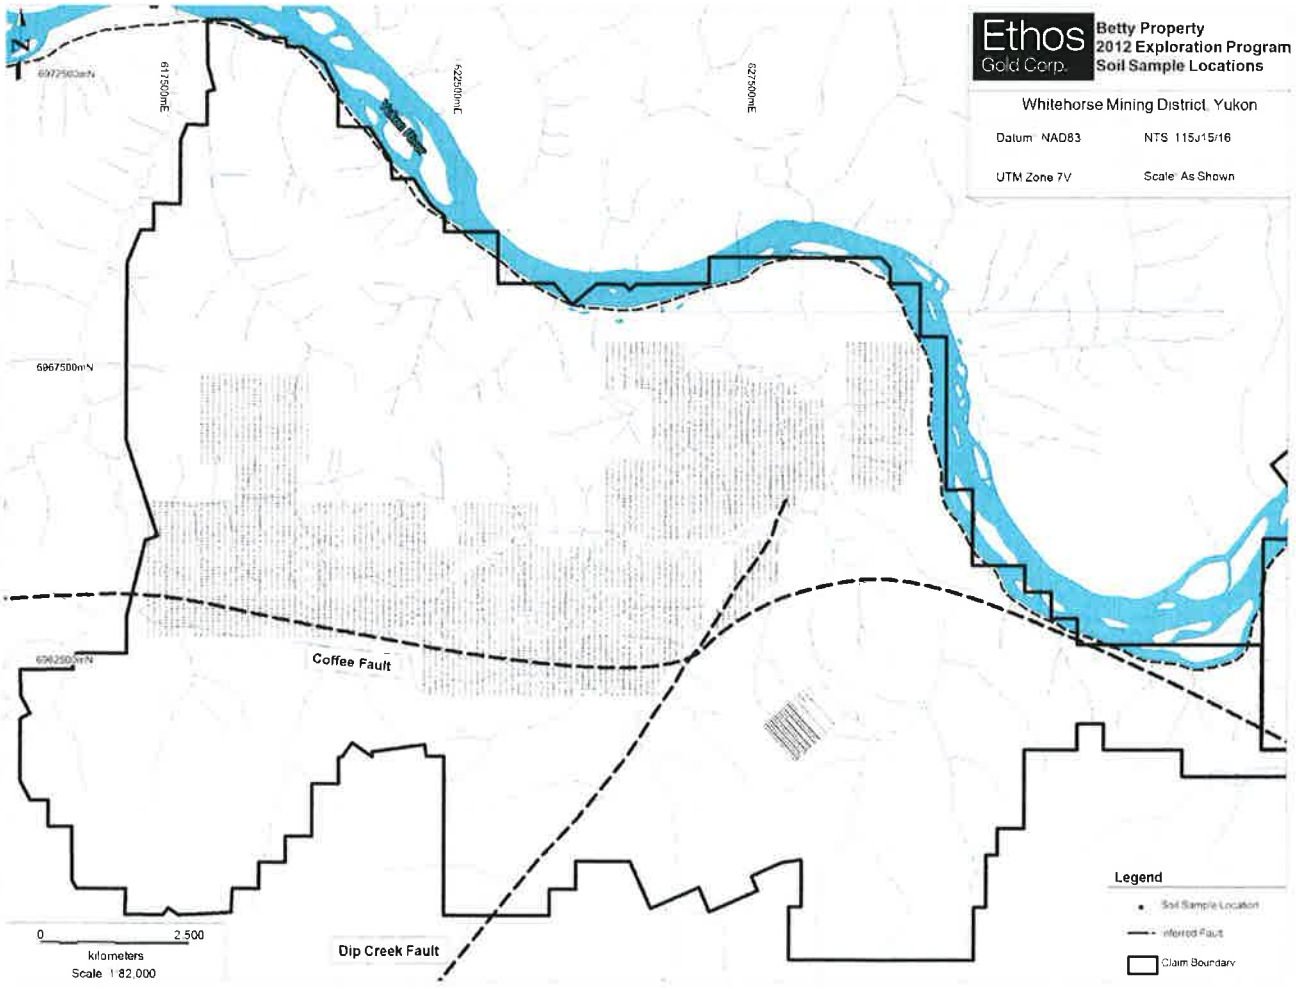

Figure 6: 2012 Soil Sample Locations for the Betty Property (Ethos, 2012)

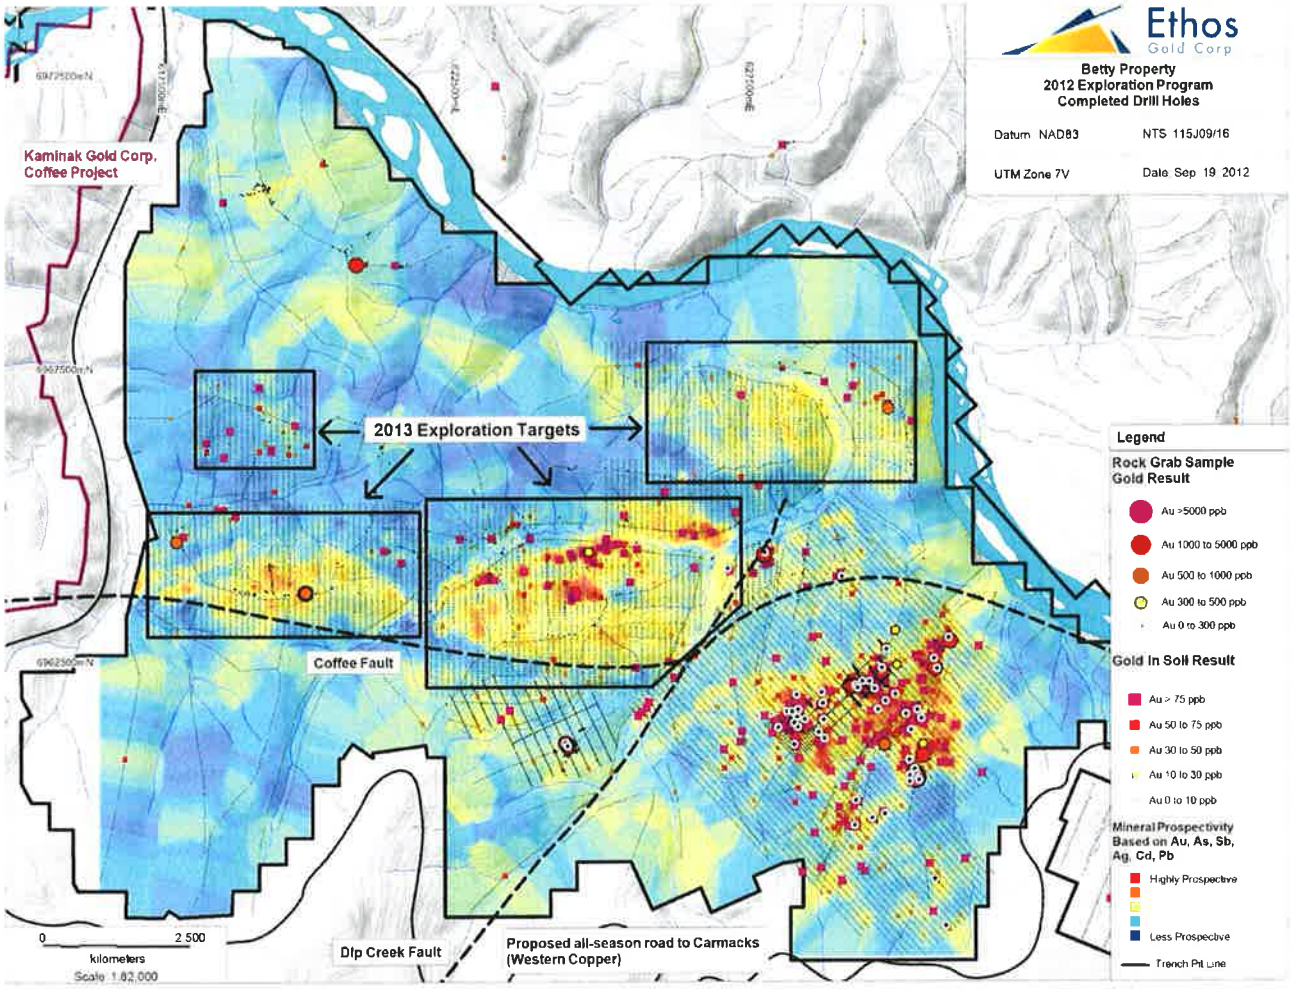

Figure 7: Gold-in-Soil Results for the Betty Property, combining 2008, 2011, and 2012 survey years.

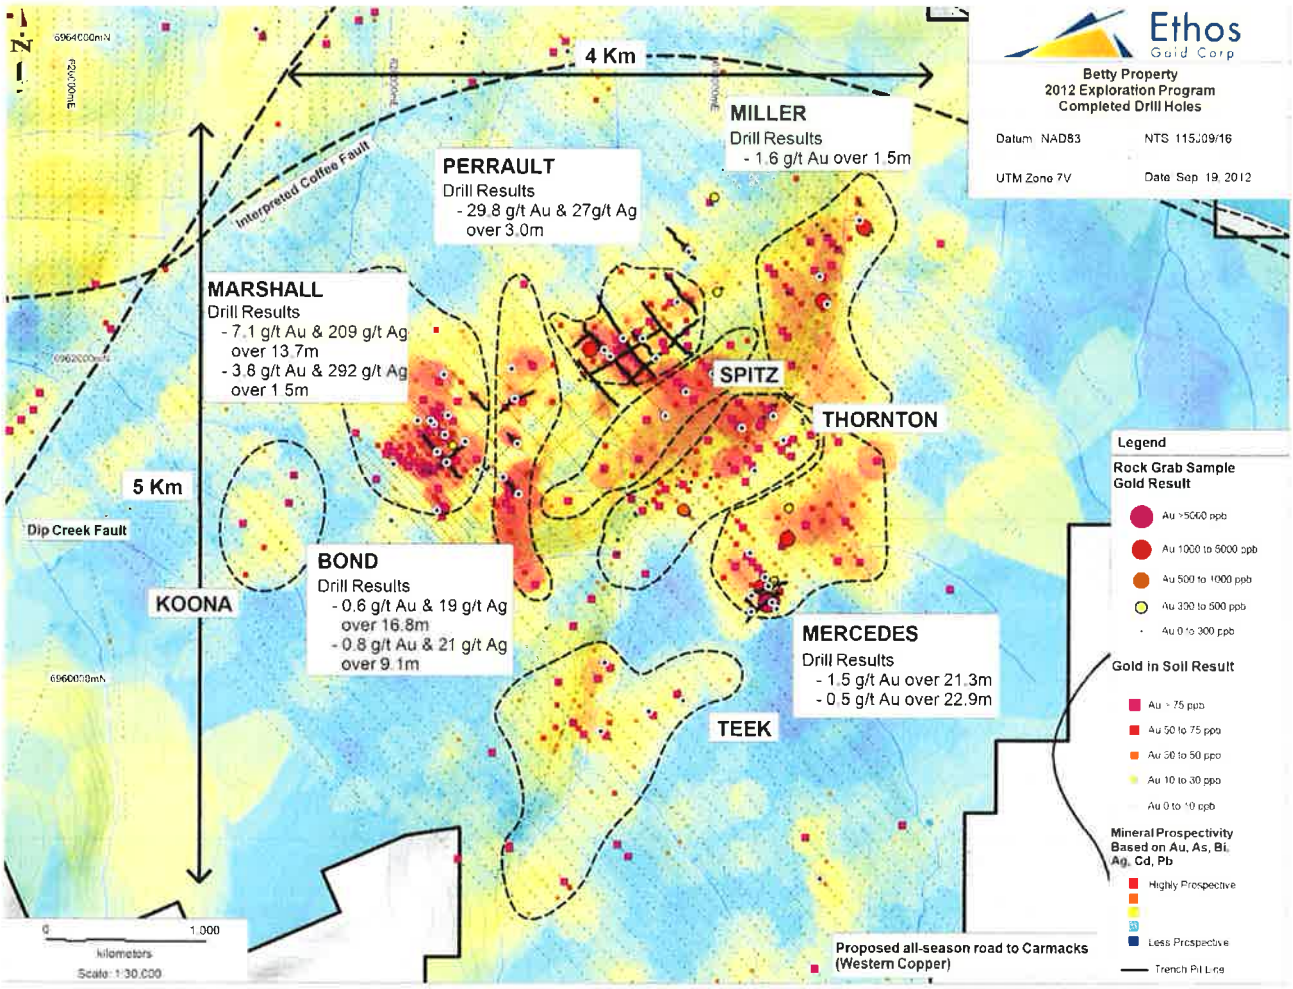

Figure 8: Mascot zone gold-in-soil results (Ethos, 2012) divided into named sub-areas referred to in some News Releases.

7.2 Prospecting

Ethos contracted Keats Global Exploration Services ("Keats Global") of Gander, Newfoundland to perform prospecting on the Betty property during 2012. A total of 166 rock grab samples were collected in 2012. Prospecting targets were assigned based on areas of anomalous grid soils; prospectors pre-planned traverses and usually stayed in sub-areas for several days, with drop-off and pick up by helicopter.

Locations and descriptions for individual rock grab samples were recorded before being sent for assaying (assay certificates are in Appendix IV). Prospecting traverses focused along and adjacent to the Coffee Fault, as well as in areas of specific gold-in-soil anomalies. Prospecting on gold-in-soil anomalies typically required the prospectors to excavate as deep a pit as possible, to obtain samples of colluvium as near to bedrock as practicable (see photo below).

Photo-plate 1: Deep prospecting pits testing soil geochemical anomalies.

A map of the distribution of prospecting samples and the corresponding gold analyses is shown in Figure 9 and 10.

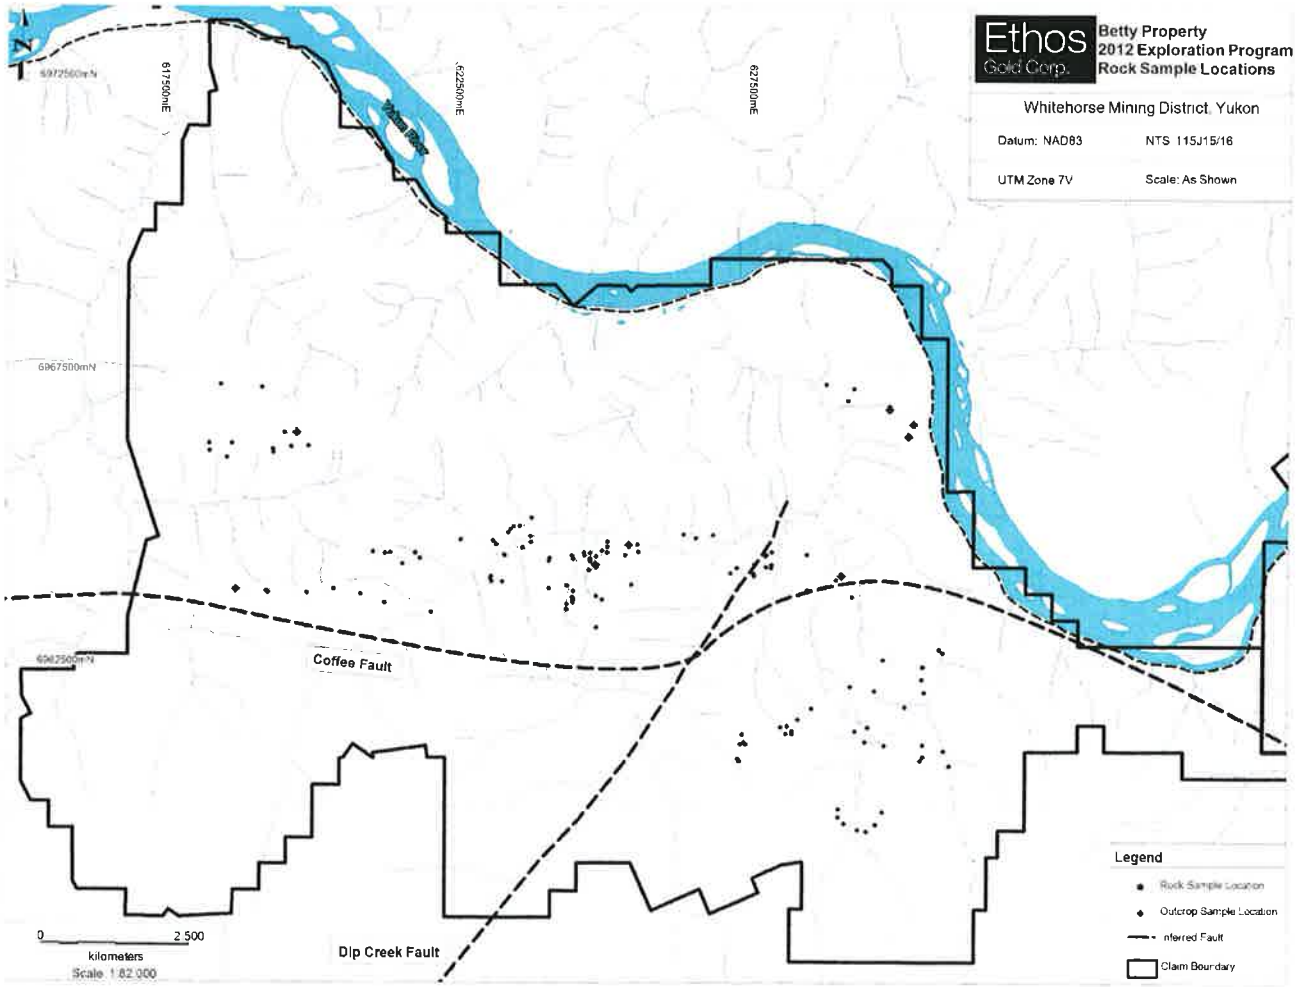

Figure 9: 2012 Betty prospecting rock sample location (Ethos, 2012)

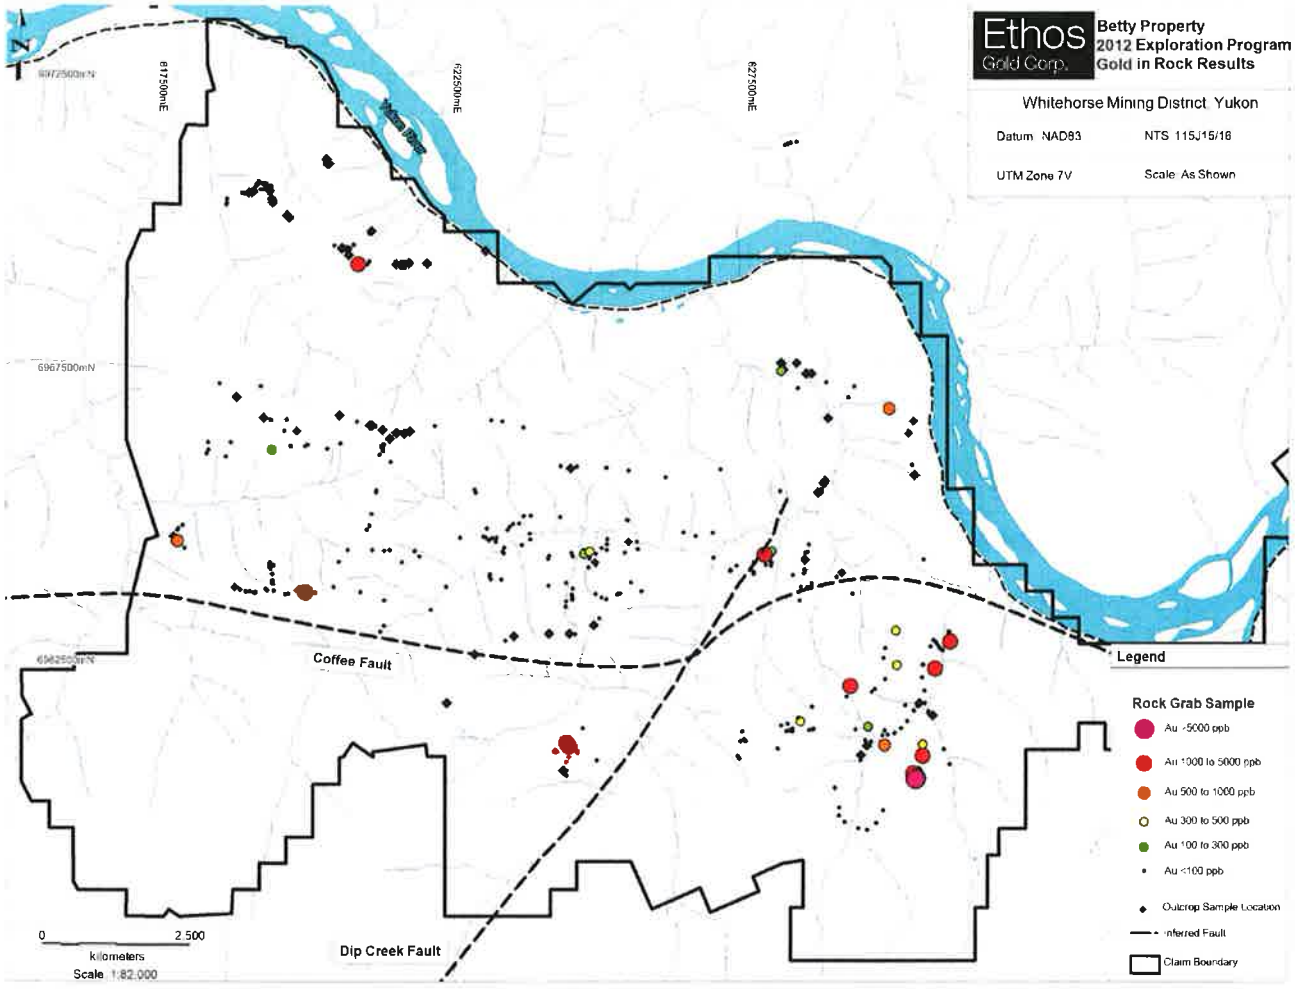

Figure 10: Betty prospecting rock sample location and assay results (2011 & 2012) (Ethos, 2012)

7.3 Trenching Rehabilitation

During the 2012 field season, Ethos systematically back-filled and remediated all pits and trenches excavated during the 2011 field season. Ethos engaged Talus Exploration Inc. ("Talus") of Dawson City to complete the backfilling component of the 2012 exploration program. A total of 7 km of trenching was systematically backfilled. This work began in June and was completed in August, 2012.

Talus provided a modified 'Can-dig' heli-portable backhoe plus an operator, plus one cutter as needed whose primary job was to clear brush and debris ahead of the progress of the backhoe. Ethos used a Heli-Dynamics Bell 407 helicopter to mobilize/demobilize the backhoe and Talus camp gear between areas once on site. The mobilization point for the backhoe originated from the Black Hills airstrip in June; the demobilization point was also to the Black Hills airstrip in August.

7.4 Ground Magnetic Geophysics Survey

The airborne total field magnetics survey in the main area of exploration interest shows a number of significant "magnetic breaks" interpreted as faults. The technical objective of the ground 'walking mag' survey was to provide a high-resolution total field magnetic map suitable for detailed structural evaluation and to provide local control of magnetic trends to assist with target identification. The survey was commissioned following the result of drilling hole BETR12-022 which intersected 41.1 meters of 2.6 g/t Au and 107 g/t Ag (4.7 g/t AuEq) from 16.8 meters. The intersection is in an area of interpreted faults of different orientations. The detailed survey was intended to help resolve the orientation of faulting and which structure was intersected.

Ethos contracted Ground Truth of Dawson City in 2012 to complete a detailed ground magnetic survey to help refine the structural complexity of the area. A total of 220 line kilometers of walking magnetics surveying covering a 5.7 square kilometer area was completed between July 2 and July 16, 2012. Two portable Gem Systems Overhauser proton magnetometers plus one base station were required to conduct the survey. Survey data was collected by walking in a northeast direction at nominal 25 meter spaced lines with no line gaps to exceed 40 meters. The GPS location of the walking line was also recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD 83 format as back-up. The data was collected in the field, then sent to Dawson where it was de-spiked, corrected for diurnal variation, and then leveled for plotting as the final total field magnetic product. The final product was delivered to Ethos in .grd format which can be plotted and viewed by most standard mapping programs.

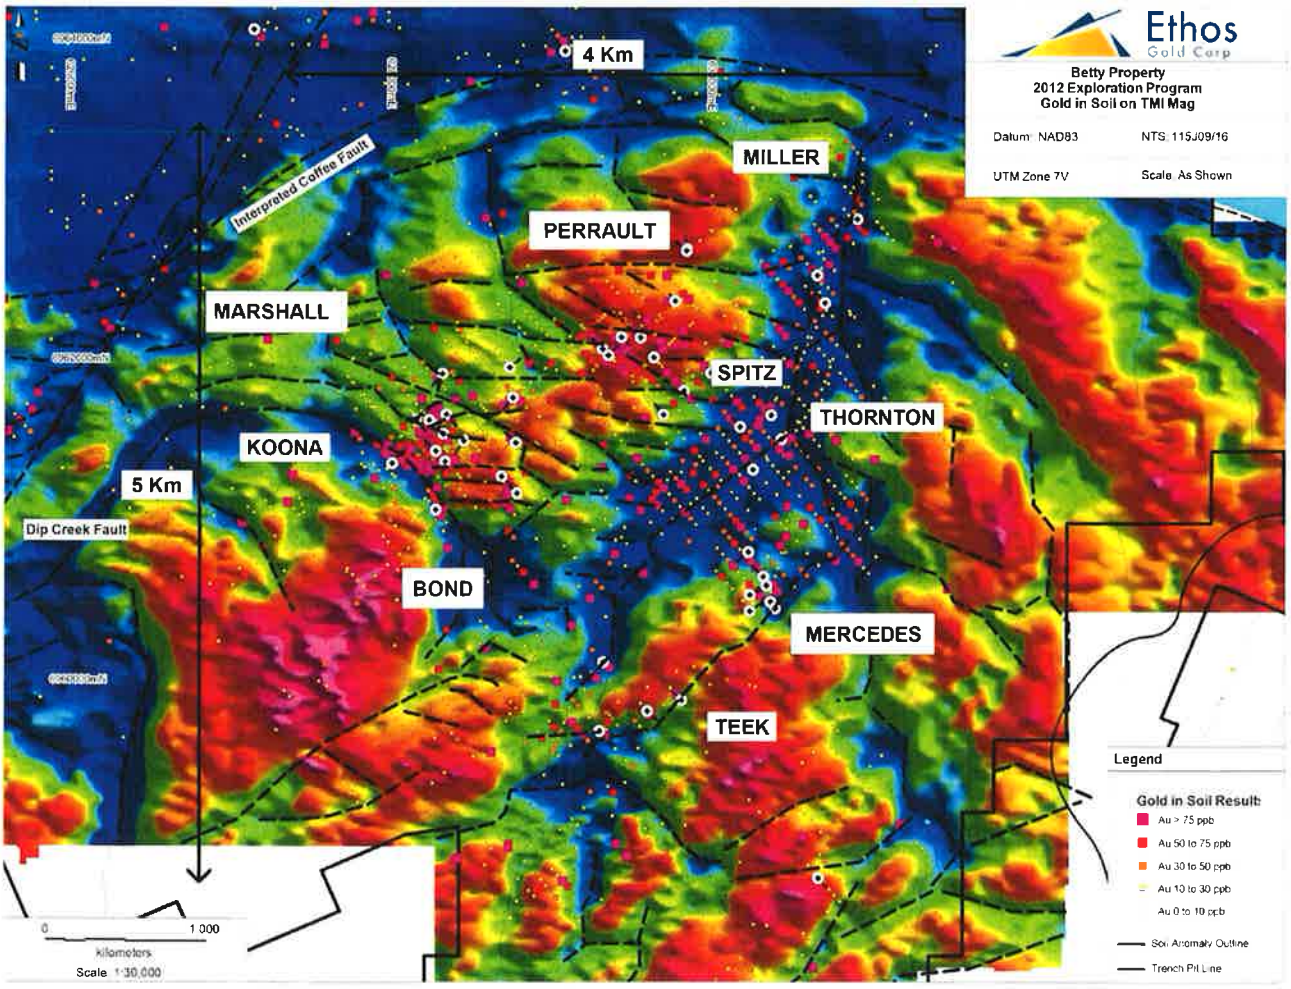

Figure 11: Window of total field magnetic data from 2011 airborne survey with interpreted faults, for the Mascot anomaly area.

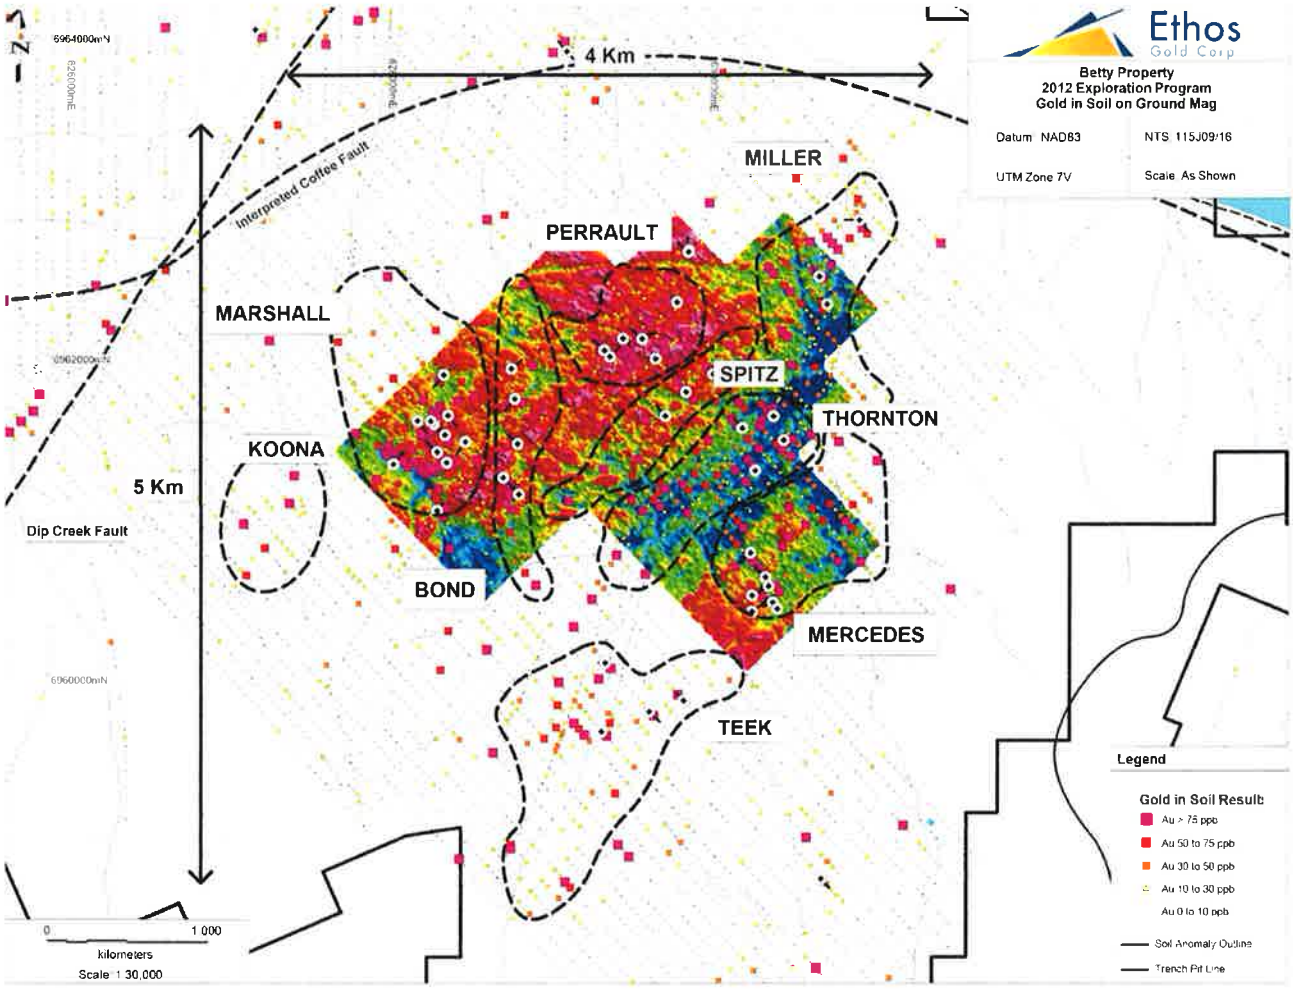

Figure 12: Total field magnetic data from 2012 detailed ground 'walking mag' survey, for the Mascot anomaly area.

One recommendation for further work, if warranted, is to have the ground magnetics data and the airborne magnetics data leveled and merged resulting in one composite total field magnetics image for this area of interest.

8 Reverse Circulation Drilling

Northspan Explorations Limited ("Northspan") provided reverse circulation ("RC") drilling services. One 'super hornet' helicopter-mobile fly rig was utilized for the drill program. The RC rig drills a 92 mm (3 5/8") diameter hole to a depth on the Betty project of approximately 150 meters (~500 feet) depth, using individual 5-foot rods. A two man drill crew per 12-hour shift was also provided to operate the drill, except during the latter part of the program when a 3-man drill crew (including a trainee) was utilized. Ethos supplied an additional 1 to 3 man crew to assist with sample collection at the drill, plus to do processing of samples in the field including preliminary logging, splitting; also photography, sample description, and magnetic susceptibility of each sample; and tagging of individual assay samples plus reject samples. A continuous chip log was also created by collecting 250 g of chip material, washing and sieving to remove fines, and placing a large handful per sample (representing every 5 foot of material) in an NQ-size corebox marked with the footage. These continuous chip log trays were transported back to camp where the tray was used for logging, and the tray was photographed as a photolog of each RC hole. For 3 weeks, there was also a bench XRF unit supplied by Ground Truth which analyzed the assay sample (as it was recovered from the drill) and provided on-the-spot analyses (rather than waiting 30 days for chemical analyses).

The magnetic susceptibility logging was valuable in providing magnetic logs which correlate with lithology and alteration types. The field-XRF was not nearly so useful; it identified arsenic (As) anomalous zones but As-elevated rocks are common and thus As-enrichment (as detected by XRF) was not a useful predictor for gold mineralization because there were too many false positives (an abundance of arsenic).

The chip trays provided a visual record of lithology and alteration change which was very useful as long as features intersected were 5 to 10 feet thick at a minimum. Features such as mineralized quartz veins that are 10 to 50 cm thick produce a minority of RC chips which can easily be 'lost' in the majority of uninteresting chips. The exploration target at Betty was bulk tonnage gold in widespread epithermal alteration environment – ideal for testing with RC. The intersected mineralization was narrow gold-bearing 10-50cm quartz-sulphide veins interpreted to be peripheral to the porphyry environment centered at Casino; thus RC is not a useful tool for examining this type of vein system.

A total of 61 reverse circulation ("RC") drill holes were completed on the Betty property which targeted soil geochemical anomalies generated in 2011-2012 programs or were follow-up holes targeting areas of interest. Drill holes were generally spaced 200 meters to 500 meters apart on interpreted soil/fault structures, to maximize the area tested. For example, holes BETR12-023 and -024 tested the same fault target at 500 meter spacing, and holes -004, -003, -002, -001, -018, and -048 tested the Bond target over a 2 km strike length also at ~500 meter spacing.

Highlights of the 2012 RC drilling include:

BETR12-012: 3.0 meters of 29.8 g/t Au and 27 g/t Ag (30.3 g/t AuEq) from 27.2 meters;
BETR12-014: 12.2 meters of 2.0 g/t Au and 19 g/t Ag (2.4 g/t AuEq) from 108.2 meters;
BETR12-022: 41.1 meters of 2.6 g/t Au and 107 g/t Ag (4.7 g/t AuEq) from 16.8 meters;
BETR12-023: 1.5 meters of 3.8 g/t Au and 292 g/t Ag (9.6 g/t AuEq) from 78.7 meters;
BETR12-024: 1.5 meters of 0.9 g/t Au and 280 g/t Ag (6.5 g/t AuEq) from 14.9 meters;
BETR12-027: 1.5 meters of 1.1 g/t Au and 98 g/t Ag (3.1 g/t AuEq) from 15.3 meters
and also 22.9 meters of 0.5 g/t Au from 103.6 meters;
BETR12-052: 3.0 meters of 0.9 g/t Au and 91 g/t Ag (2.7 g/t AuEq) from 83.8 meters;
BETR12-061: 3.0 meters of 0.9 g/t Au and 85 g/t Ag (2.6 g/t AuEq) from 106.7 meters.

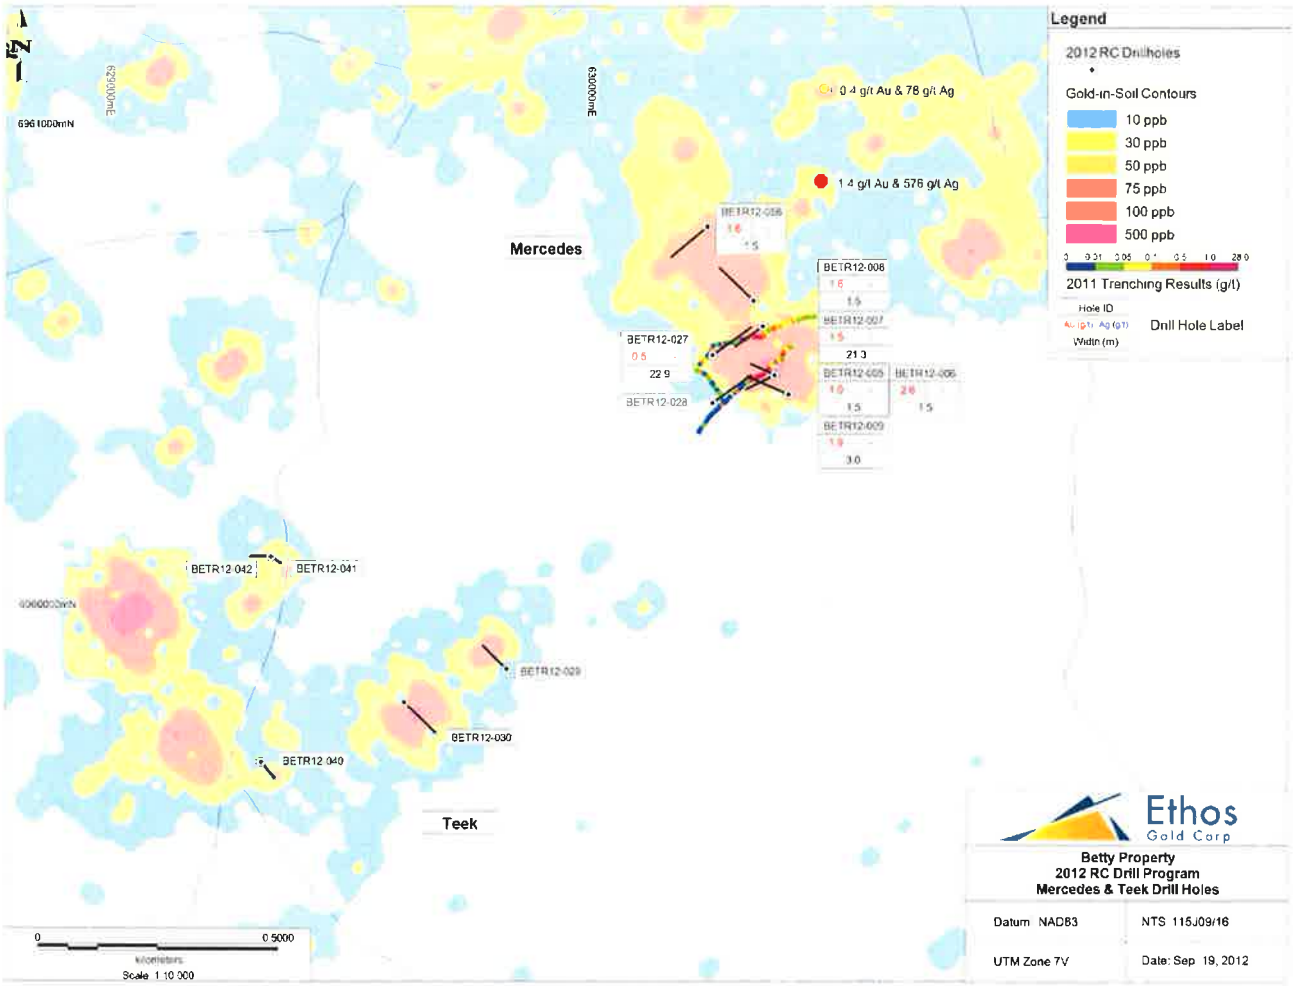

Figure 13: Mercedes and Teek area gold-in-soil anomaly, pit trench location, and RC drill hole traces (Ethos, 2012)

The Mercedes area has an interpreted fracture fault set trending north-northwest; there may be two parallel faults with 10-20 meter between them. No arsenopyrite veins were observed in the RC chips however there is some alteration and low gold values consistent perhaps with thin gold-bearing breccia or network veins.

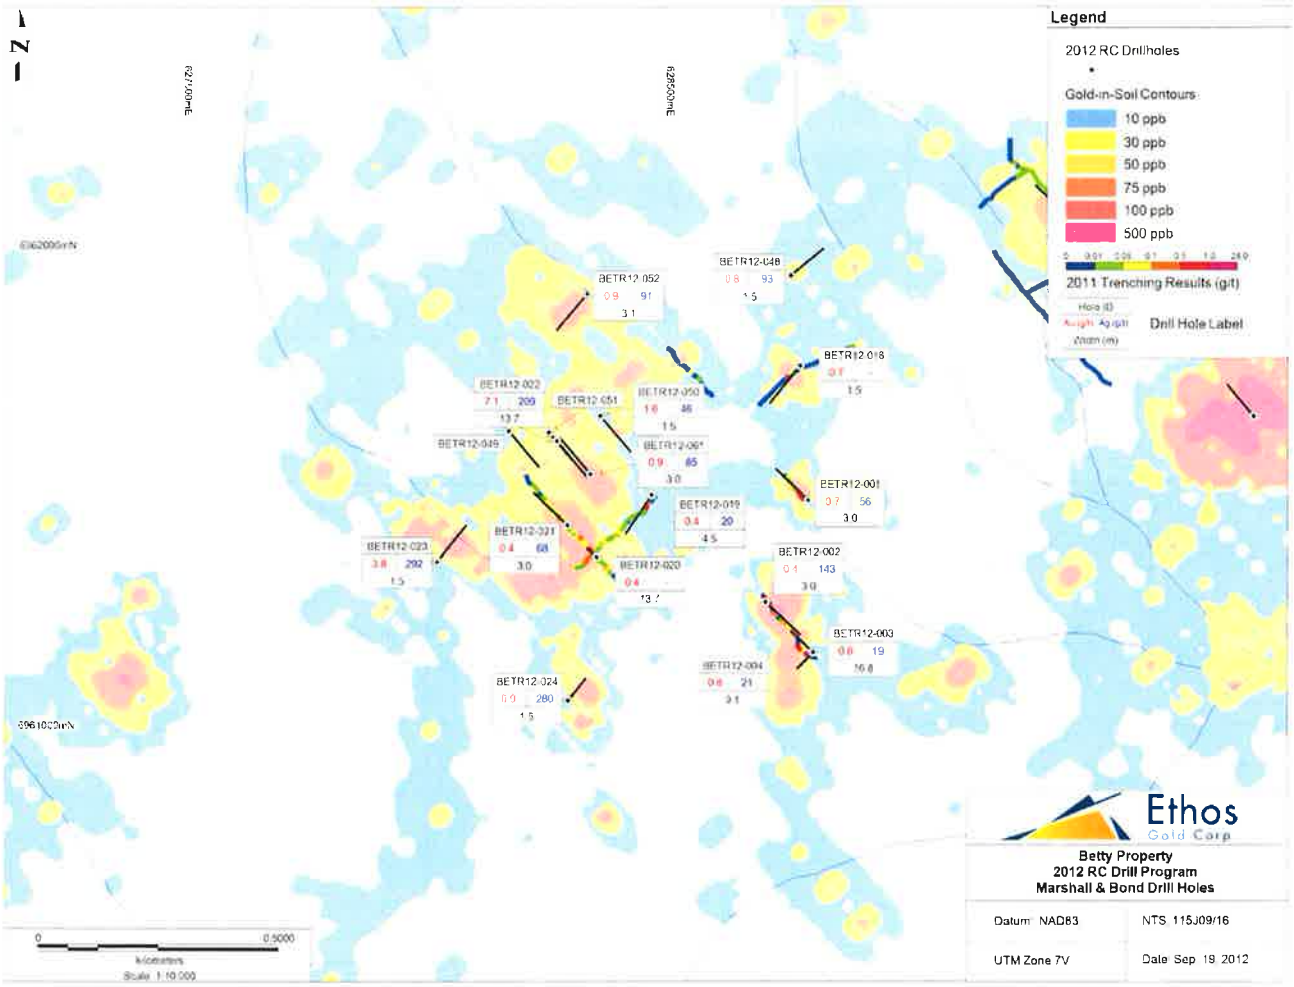

Figure 14: Marshall and Bond area gold-in-soil anomaly, pit trench location, and RC drill hole traces (Ethos, 2012)

The Bond area has interesting soil geochemistry which suggests a north-south oriented feature. This is supported by RC drilling which intersected mineralization or alteration (from north to south) in hole BETR12-048, -018, -001, -003, and -004 suggestive of a continuous gold-silver enriched fracture-fault feature over a 700 meter distance.

The Marshall area yielded the best individual drill hole of the RC program. Hole BETR12-022 intersected four arsenopyrite-enriched veins(?) which assayed 7.1 g/t Au with 209 g/t Ag across a 13.7 meter extended interval. Follow-up holes were drilled to test gold-in-soil geochemistry combined with structural interpretations. Holes -049, -050, and -051 did not yield a recognizable correlative to hole -022. Ultimately hole -061 showed the interval in -022 had been drilled down the dip of a narrow fault structure. The orientation and strike extent of the structure is constrained but still open to interpretation.

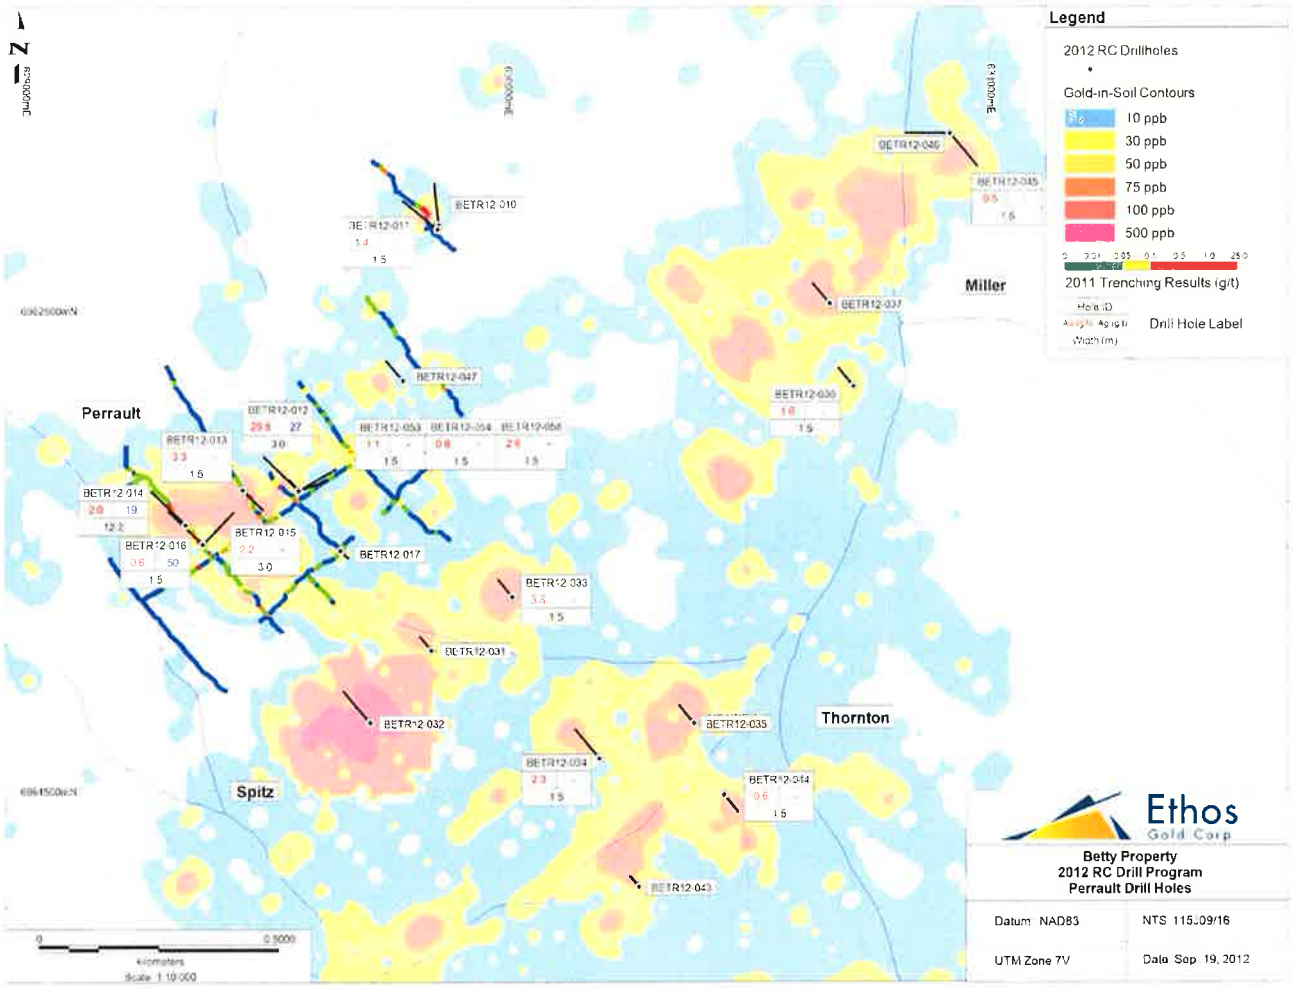

Figure 15: Perrault, Spitz, Thornton, Miller areas gold-in-soil anomaly, pit trench location, and RC drill hole traces (Ethos, 2012)

The Miller and Thornton areas are associated with a significant magnetic low interpreted fault that essentially corresponds with Isaac Creek. Gold-in-soil anomalies were targeted to test areas where lower order structures intersected the main Isaac Creek structure, or where lower order structures were in proximity to it. Drilling conditions were difficult in the steep terrain, and the top of the water table is near surface in the valley bottom (as is expected). No significant results were achieved from these tests.

In general, the best results were obtained by drilling gold-in-soil targets on the top of topographic ridges. Mid-slope and slope-bottom targets did not generate significant results.

In general, the broader intersections of low-grade Au-Ag mineralization included a narrow (vein) interval of high-grade mineralization that pulled the Au-Ag average up across adjacent anomalous visually altered samples. RC drilling is useful for testing wide zones and bulk targets; the interesting gold-(silver) mineralization encountered at the Betty property appears to be hosted by narrow veins and to be locally high-grade. RC drilling is not suitable in determining the geological characteristics, orientation, or assay grade of the (narrow) veins nor the host geology adjacent along the vein margins. If further drilling is warranted, a diamond drill program (which was planned in 2012, and cancelled) is recommended to determine the character and extent of these veins.

9 Sampling Method & Analyses

Collection of rock and soil samples on the property during the 2012 field season was completed under the supervision of qualified geologists by experienced geological technicians. Ethos adhered to industry best practices for sample collection and handling of rock and soil samples on location. ACME Analytical Laboratories Ltd. was employed for geochemical sample analysis. ACME is an ISO 9001:2008 credited facility (certificate number FM 63007) and ISO/IEC 17025:2005 credited by the Standards Council of Canada.

9.1 Sampling Methodology

9.1.1 Soil Samples

At each soil sample site, the Soil Technician identified the most appropriate location to collect the sample and laid out a 12" x 20" thick plastic (poly) rock sample bag. The soil sample was taken using an Eijklcamp© hand-auger at a depth of between 20 and 110 cm. Samplers strived to consistently collect C-horizon sample material. Where necessary (rocky or frozen ground) a prospector's pick ('mattock') was used to obtain the sample. The soil was laid out on the sheet of plastic in the order it was recovered removed from the sample hole. Once the necessary amount of soil (400 - 500 g) was obtained the deepest soil was taken and placed in a kraft soil sample bag labeled with the 3-letter project code and a unique 5-6 digit sample identification number. A representative rock chip sample was then taken from the recovered soil and placed in a small (1" x 1.5") bag labeled with the same project code and sample identification number. An aluminum metal tag inscribed with the sample identification number was attached to a rock or branch at the sample site along with a length of pink flagging tape. A duplicate sample was taken once for every 25 samples: at the sample site twice as much of the desired soil was acquired and then placed on the plastic sheet and homogenized before being placed into two sample bags. Both samples were given their own sample identification number. The data for both samples was recorded and a note was made indicating the duplicate and its corresponding sample identification number.

The soil samples were packaged daily into fiber bags, sealed, and delivered via fixed wing to Whitehorse where Ethos or Reliance Remote personnel deliver them to the ACME sample preparation laboratory. ACME issued a receipt upon each delivery. Samples were dried and prepped for analysis in Whitehorse then shipped to ACME's laboratory in Vancouver for analysis.

The GPS location of the sample site was recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD 83 format, and the waypoint were labeled with the project name and the sample identification number. A Palm PDA device was used in the field to record the characteristics and description of the sample taken which included: sample identification number, soil colour, soil horizon, slope, sample depth, ground and tree vegetation, sample quality, and any other relevant information. Furthermore, the GPS coordinates were entered into the Palm device as a secondary backup in case of GPS failure.

Every night in the field, the GPS and Palm PDA devices were downloaded to a laptop computer and the data verified on a sampler-by-sampler basis in proprietary database auditing software ("Dirtbagger 3000") to ensure accurate data was recorded. The data was also mapped out daily using ESRI ArcMap to assure proper sample spacing and location. A backup of the sample data was made, copied onto a USB memory stick and kept in a separate location from the laptop computer until job completion. When possible, a backup was also sent via e-mail.

9.1.2 Rock and RC Drill Samples

Outcrop, float, and RC rock chip samples were collected during the summer by prospectors and geologists. At each sample location sample descriptions were collected and locations were marked with flagging tape and recorded with a GPS. All samples were photographed with sample ID's before being placed in thick plastic (poly) rock sample bags along with the assay sample tag. The assay tag number was recorded on the flagging tape marking the sample location. The descriptions for each sample were entered into the 'rock sample report form' at the end of each day. Rock samples bags were placed into a rice bag and security sealed and shipped by air to ACME's facility in Whitehorse whereby Ethos personnel were issued a submittal receipt. Rocks were crushed and split in Whitehorse and sample pulps shipped via Air North air-freight to Acme's Vancouver laboratory for analysis. The originating preparation lab is indicated on the final signed assay certificate.

9.2 Sample Preparation, Analyses and Security

Soil samples were analyzed by ACME Analytical Laboratories Ltd. in Vancouver, British Columbia using a 36-element ICP-MS nitric-aqua regia digestion with a mass spectrometer finish, code "1DX2" (Table 5). A 15 g sub-sample material was analyzed for Al, Sb, As, Ba, Bi, B, Cd, Ca, Cr, Co, Cu, Ga, Au, Fe, La, Pb, Mg, Mn, Hg, MO, Na, Ni, P, Ag, K, Sc, Sr, S, Tl, Th, Ti, Sn, W, U, V and Zn. A 0.5 g sub-sample undergoes aqua regia digestion with ICP-MS analysis for Au. Quality control procedures were implemented at the laboratory, involving regular insertion of blanks, standards (approximately every 25th sample) and repeat analyses (approximately every 15th sample). Furthermore, soil sample field duplicates were routinely collected and inserted into the analytical stream (every 25th sample). ACME Labs prepared all samples collected in 2012 for Ethos in Whitehorse. Soil samples are dried at 60°C and sieved to collect up to 500 grams passing the -80 mesh fraction. This prepared sample is shipped to Vancouver for analysis.

Rock samples were crushed in Whitehorse to 80% passing plus-10 mesh, split 250 g and pulverized to 85% passing minus -200 mesh. Rock samples are analyzed in Vancouver using specific ACME rock and drill core packages coded "Geo2" which consists of the code 1DX1 and 3B01procedures as follows (Table 5). Rock samples are analyzed for gold coded "3B01" using a 30 gram sub-sample by fire assay with an atomic absorption finish for concentrations under 10 g/t Au and a gravimetric finish if greater than 10 g/t Au. All rocks are also analyzed coded "1DX1" using a 0.5 g sub-sample which undergoes aqua regia digestion with ICP-MS analysis for 36 reporting elements using the same methodology as per soils.

Ethos uses protocols standard to the industry and professional QA/QC procedures for assaying including the use of duplicates and certified laboratory standards. Furthermore, Ethos ensures the maintenance of chain-of-custody and that ACME Labs retains the pulps.

Table 7: Summary of description and code for Acme Analytical soil and rock analytical packages used by Ethos during the 2012 exploration program

1. Sample Preparation

Package	Description	Code	Unit Cost CDN$
Soils	Dry at 60°C, sieve (up to) 100g to -80mesh, up to ½ kg		
	Soils processed in Dawson City	SS80-DAW	2.85
	Soils processed in Whitehorse	SS80-WHI	1.85
	Sieve large samples 80 mesh per ½ kg		0.80
Rock and Drill Cores	Crush 1kg to 80% passing 10mesh, split 250g and pulverize to 85% -200mesh	R200-250	6.20
	Extra crushing and saving rejects over 1kg. per kg		0.60

2. Sample Analysis

Package	Description	Code	Unit Cost CDN$
Soils	15g sample, aqua regia digestion, ICPMS finish for low detection limits	1DX2	15.20
Rocks and Drill Cores	A Consists of:		
	1 1DX1 – 0.5g sample, aqua regia digestion, ICPMS analysis	Geo2	23.40
	2 3B01 – 30g sample, fire assay, AA or ICP finish (2 – 10,000 ppb	(package)	
	B (Over limit Au > 10,000 ppb)	G601+G612	15.85
	30g sample, fire assay, gravimetric finish		

10 Data Verification

The author directly supervised field exploration during the 2011 and 2012 seasons. The geochemical data was verified by using original analytical certificates and data. Data QA/QC was conducted on an ongoing basis when new data became available. Assay protocols were was met by the favourable reproducibility of the standards, blanks and duplicate samples. No re-assaying was requested at this early stage of exploration. Individual samples which exceeded tolerances for gold analytical 3-sigma errors were noted. No material systemic analytical error was noted.

11 Adjacent Properties

Adjoining the Betty claim block immediately to the west are the Western Copper "Brit" claims; part of the property underlying the Casino porphyry copper-gold-molybdenum deposit. The Casino deposit has 4.4 billion pounds copper, 7.5 million ounces gold, 494 million ounces molybdenum, and 54.3 million ounces silver in proven + probably mill ore contained metal plus an additional 0.1 billion pounds of copper, 0.8 million ounces of gold, and 6.3 million ounces of silver in proven + probable heap leach contained metal (Hester, 2011). The Casino deposit has completed a positive feasibility (January 2013).

Adjoining the Betty claims to the west is Kaminak's Coffee project. Kaminak's 2011 exploration drilling season on the project has defined gold mineralization along the Coffee Creek structure reporting 17.1 g/t Au over 15.5m with wider intervals running 1.08 g/t Au over 83.93 m from drill core (Couture, 2011).

The Kinross' White Gold deposit (or Golden Saddle) is located 55 kilometers to the northeast, reporting 9,797, 000 tonnes measured and indicated of 3.19 g/t gold (1,005,000 ounces), with an additional 9,391,000 tonnes inferred of 1.91 g/t gold (578,000 ounces) (Kinross, 2012).

12 Mineral Processing & Metallurgical Testing

The project is at an early exploration phase and therefore no metallurgical testing has been carried out to date.

13 Mineral Resource & Reserve Estimate

There has not been sufficient work on the property to undertake a resource calculation.

14 Other Relevant Data and Information

To the author's knowledge, there is no additional information relevant to this report.

15 Interpretation and Conclusions

The ~17.5 square kilometre Mascot gold-in-soil anomaly is developed on Cretaceous granitoids. Prospecting, and RC drilling in 2011 and 2012 identified several sources of veins and alteration containing gold. One source of gold mineralization is contained within narrow veins of massive arsenopyrite mineralization that typically assay 20 to 30 g/t Au (eg the Mercedes target). Other quartz-dominated veins were identified that assayed locally up to 4 g/t Au. Samples of altered granodiorite contained disseminated galena-sphalerite-sulphide mineralization associated with carbonate and, with or without veining, assayed up to 1.0 g/t Au (eg the Bond target). Geochemically the Mascot soil anomaly can be subdivided into several geochemical domains. Speculatively the varying styles of vein mineralization and alteration may be an expression of slightly different genetic pressure-temperature-time environments of deposition related to the overall mineralizing event that created the broad Mascot anomaly.

Analysis of airborne magnetic data indicates two large through-going north-east trending fractures in the Cretaceous granitoid, the main fault is the Dip Creek fault and the secondary parallel structure is termed the Mascot Creek fault. Fractures rotate between the two, seem to pass out of the plane of extension, and newer fractures develop which overprint the older rotated structures.

Analysis of detailed ground magnetic surveying shows the same large features as the airborne data, but includes much finer detail and many more smaller structures/fractures that are not evident from the airborne data.

It is interpreted that the Dip Creek fault, and ancilliary structures, progressively fractured the Cretaceous granitoid in the area of the Mascot soil anomaly which allowed the introduction of various types of gold-bearing veins dominated by arsenopyrite and carbonate (in addition to various felsic and andesitic dykes along these faults).

The RC drilling did not find a bedrock source for many of the individual soil anomalies tested, despite the RC program which deliberately tested as many anomalies in all parts of the Mascot soil anomaly as practical. The RC results show there is no widespread ("bulk tonnage" type) gold-bearing alteration system underlying the Mascot anomaly. The RC results do show isolated veins associated with faults. Locally there is massive arsenopyrite veining in the faults; these intersections returned the best gold (and silver) analyses of the drill program and the intervals were elevated in base metals. The veins are similar and comparable to descriptions of the Bomber vein (which is associated with 70 Ma Casino mineralization) and the Rude Creek original discovery vein above the Rude Creek gold placer.

The RC drilling within the Mascot gold soil anomaly did not find evidence of a widespread area of gold bearing alteration, which was the conceptual economic target justification. Instead, there is abundant evidence that the soil anomaly is underlain by a well-fractured granitoid where the fractures contain gold-silver-sulphide mineralization. These narrow veins are not an economic target at this time, and are interpreted to be an outer halo of vein mineralization that is derived from the adjacent Casino gold-copper porphyry deposit.

Soil surveying north of the east-west magnetic break interpreted to be the Coffee fault returned sporadic smaller areas of interesting anomalous soil geochemistry. Prospecting discovered gold in quartz veins containing minor chalcopyrite at the intersection of the Dip Creek fault and the Coffee fault, but hosted by schist or at the contact between granitoid and schist. RC drilling this target did not return positive results. However, the area where the Dip Creek fault passes into the older schists at the intersection with the Coffee fault remains an area of exploration interest not adequately tested by the 2012 program.

16 Recommendations

The 2012 Ethos exploration program failed to detect bulk-tonnage gold mineralization beneath any part of the widespread Mascot gold-in-soil anomaly; the primary exploration target area. The program did detect sporadic intervals of higher grade gold mineralization associated with quartz-sulphide veins that produced interesting values over sample intervals of 5 or 10 feet. In hole BETR12-022 (the best result of the RC drill program) the 2.6 g/t Au with 107 g/t Ag result over 41.1 meter interval was shown with further testing (and interpretation of ground magnetics) to be drilled down-dip on a localized (narrow) structure. In hole BETR-014 (the most interesting result of the RC drill program because of the length of the host structure) the 2.0 g/t Au with 19 g/t Ag over 12.2 meters has potential but is not economic and adjacent drilling shows extension of the structure but not the gold-silver grade. The massive arsenopyrite veins encountered in surface pit trenches in this area were not identified in the RC drilling, but this is a likely effect of narrow veins being "overwhelmed" as they are aggregated into 5mm chips from a 5-foot interval of granodiorite.

Narrow high grade gold veins interpreted to be derived from and peripheral to the Casino gold-copper porphyry system are not an economic exploration target considering current gold/silver prices and contemporary underground narrow-vein mining costs at this time. Future local infrastructure developments including a mill, road, or powerline particularly to serve a mine at Casino may make this type of narrow-vein target attractive at some point in the future. In the meantime, the cost to hold the property under option does not warrant the potential future return on investment.

It is therefore recommended the property be returned to the vendors.

17 2012 Statement of Exploration Expenditures

Betty West Property (676 claims)
Work completed: May 1, 2012 to September 30, 2012
Grouping Certificate: HW07221

	Description (Contractor)	Total Cost
Soils	5,785 (GroundTruth, Acme)	$ 257,000.00
Trench Rehab	(Talus Expl)	$ 72,730.00
Prospecting	124 (50 man days, Supplies, Acme assay)	$ 27,220.00
RC Drilling, Fuel, Transport, Personnel, Assay, Heli		$ 2,303,000.00
Ground Geophysics	(Ground Truth)	$ 12,880.00
		$ 2,672,830.00

Betty East Property (750 claims)
Work completed: May 1, 2012 to September 30, 2012
Grouping Certificate: HW07220

	Description (Contractor)	Total Cost
Soils	2,322 (GroundTruth, Acme,,HeliDynamics)	$ 103,000.00
Trench Rehab	(Talus Expl)	$ 31,170.00
Prospecting	42 (17 man days, Supplies, Acme assay)	$ 9,220.00
RC Drilling, Fuel, Transport, Personnel, Assay, Heli		$ 1,161,000.00
Ground Geophysics	(Ground Truth)	$ 8,180.00
		$ 1,312,570.00

Expenditures certified correct,

Peter Tallman, P.Geo.

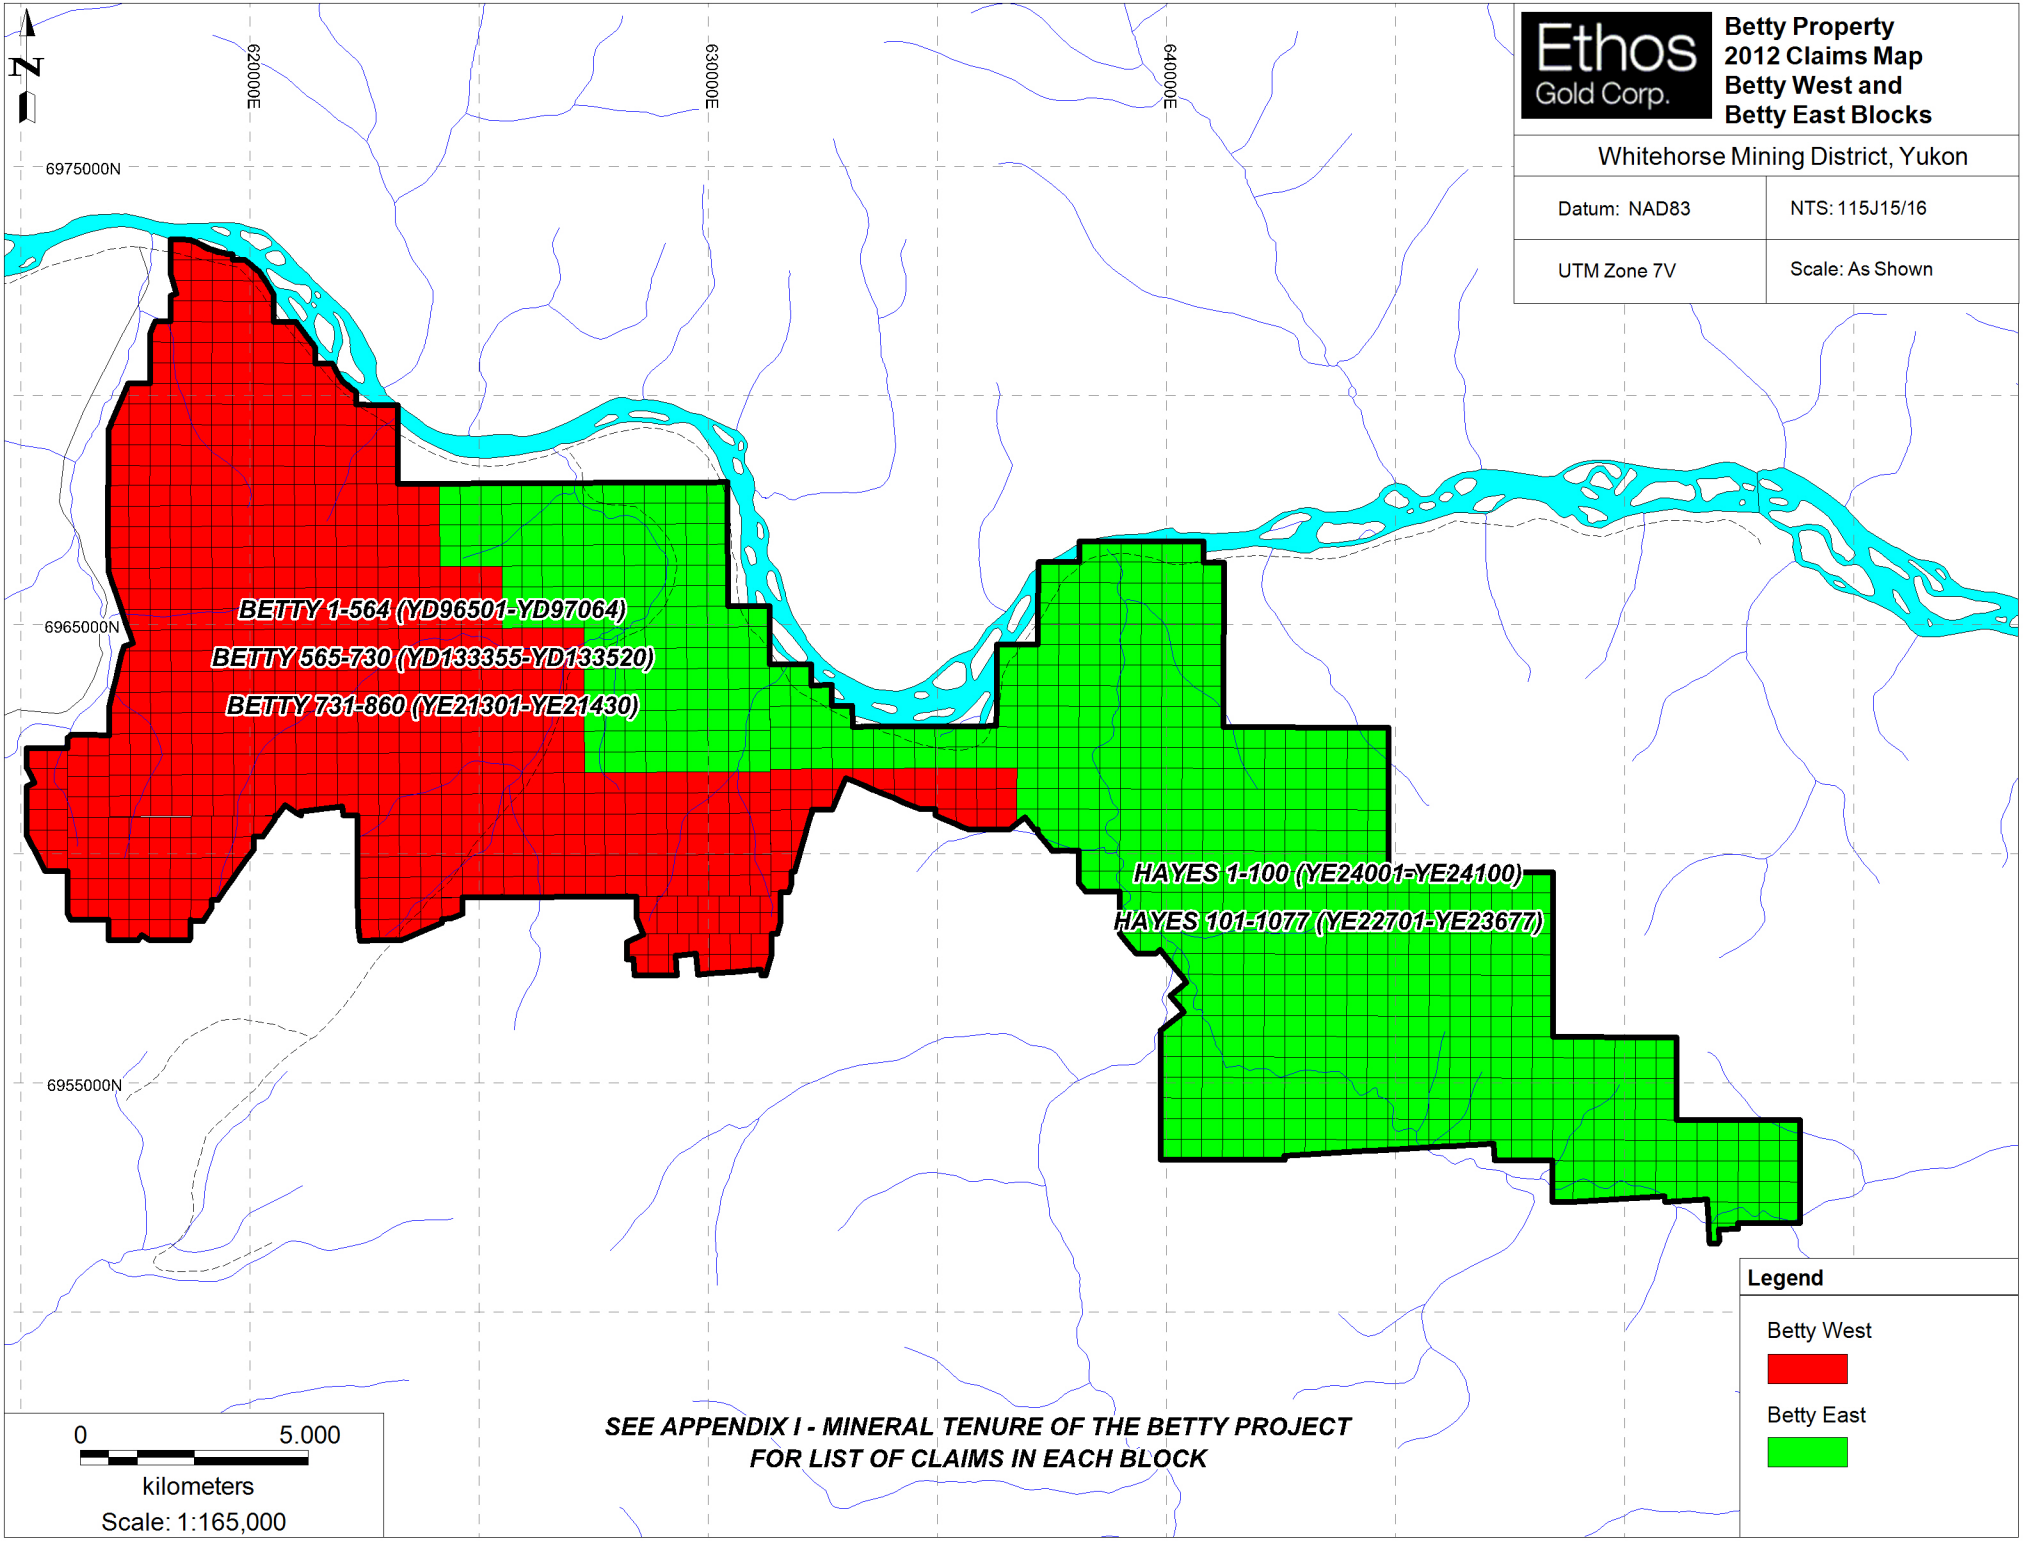
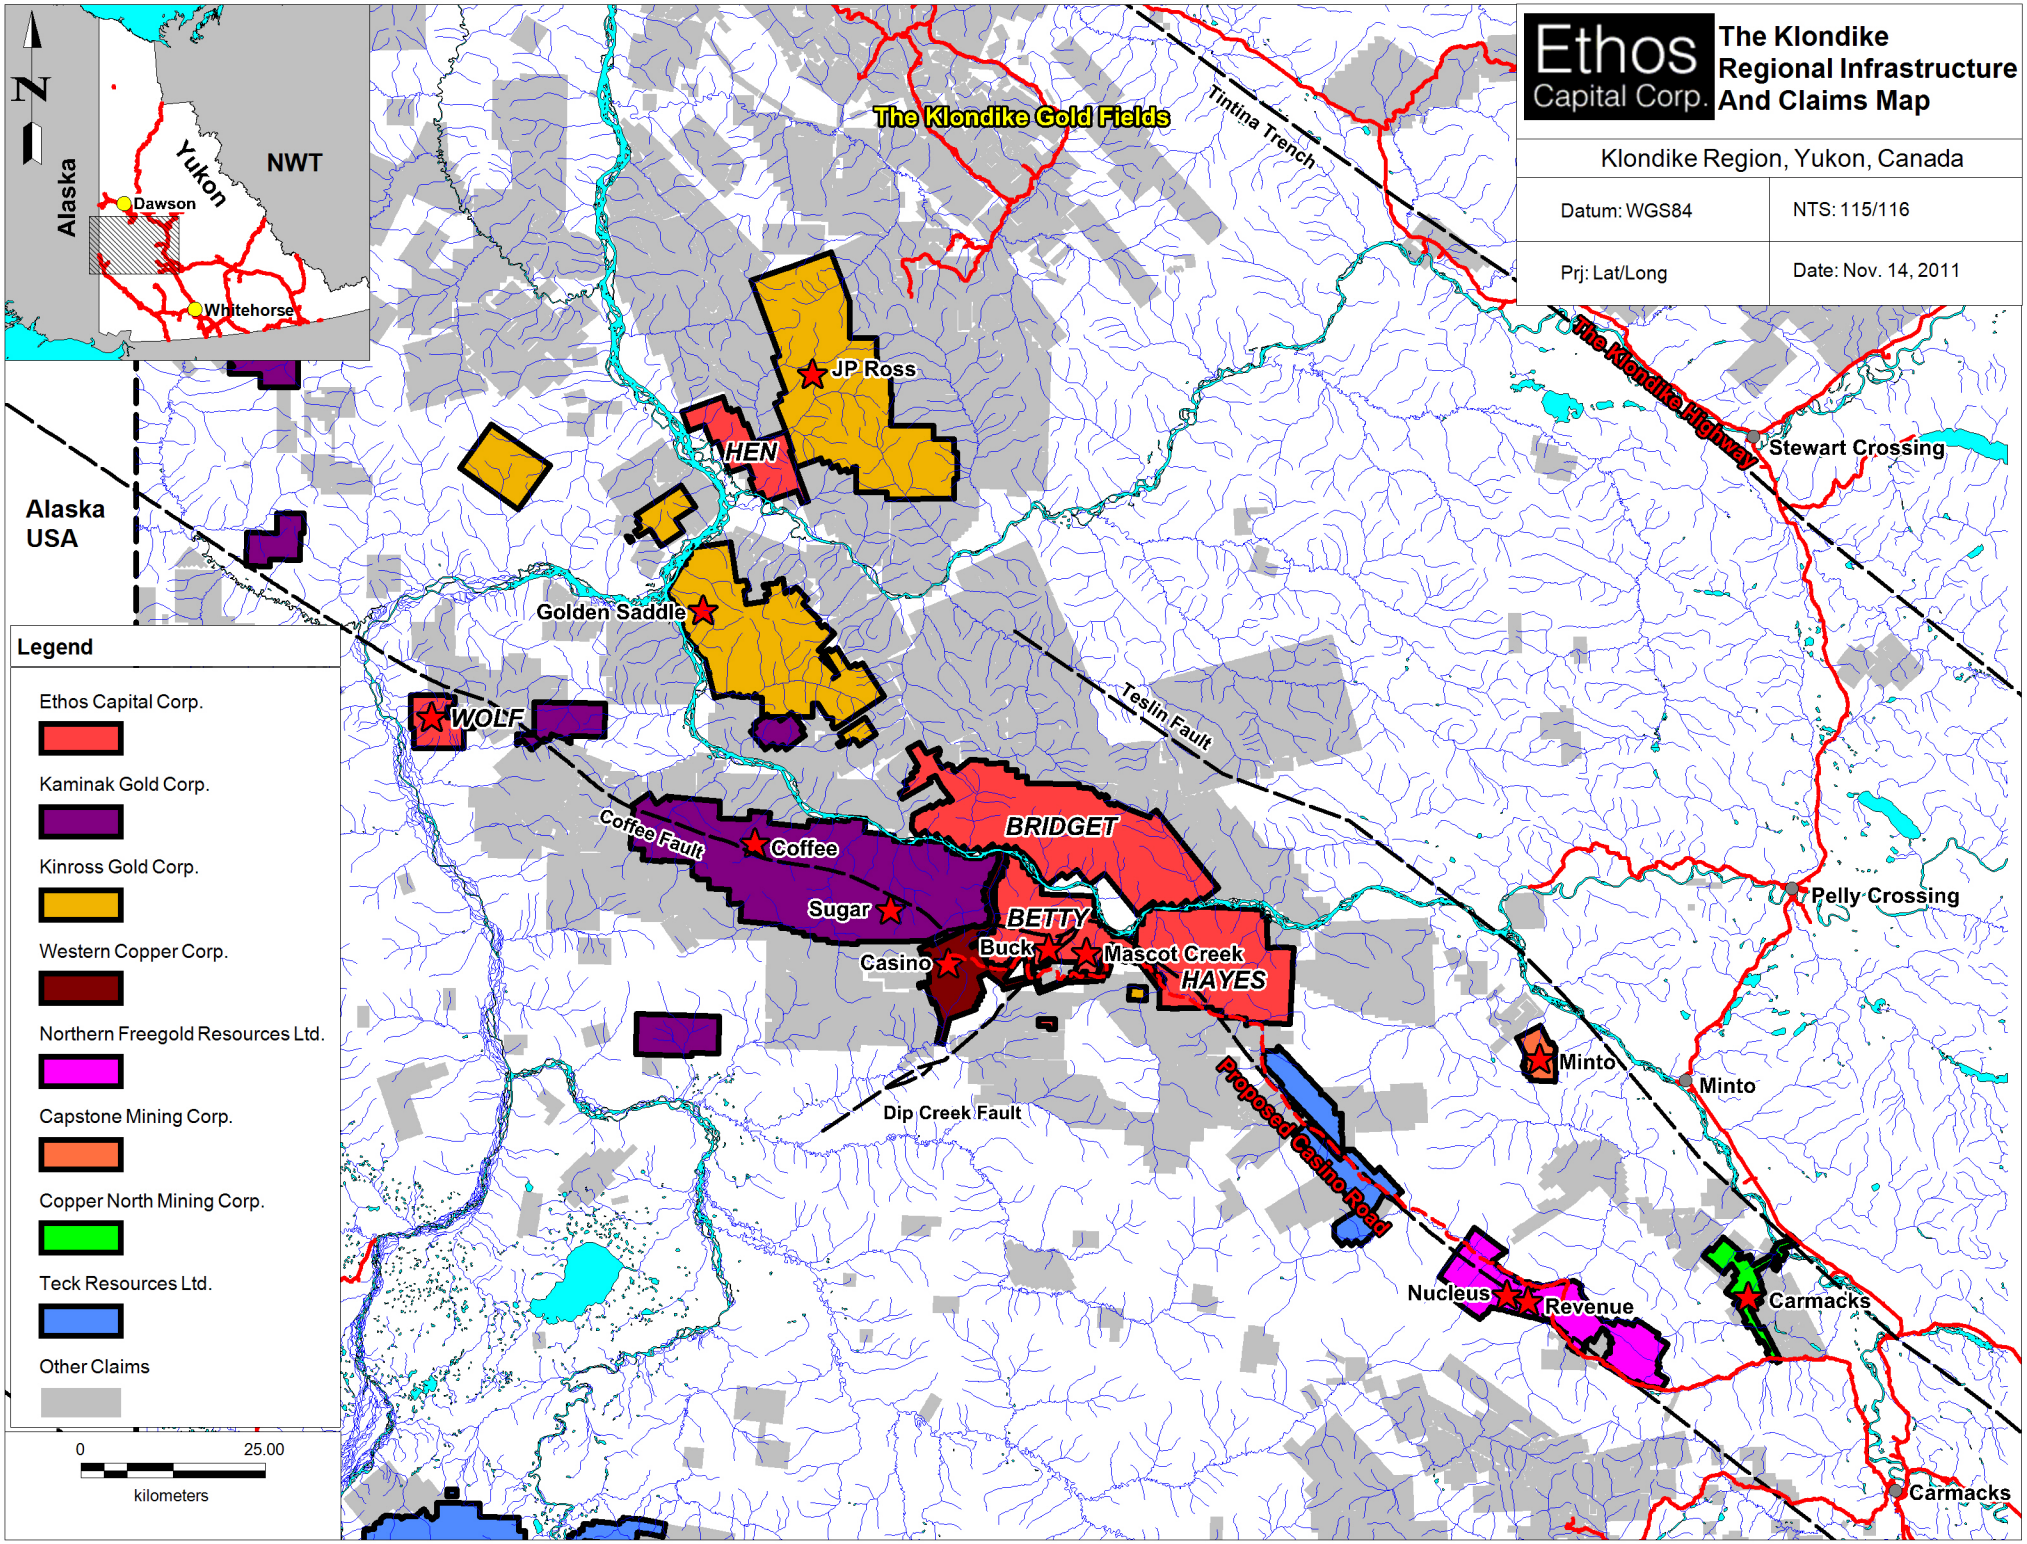
19 Certification, Date and Signature

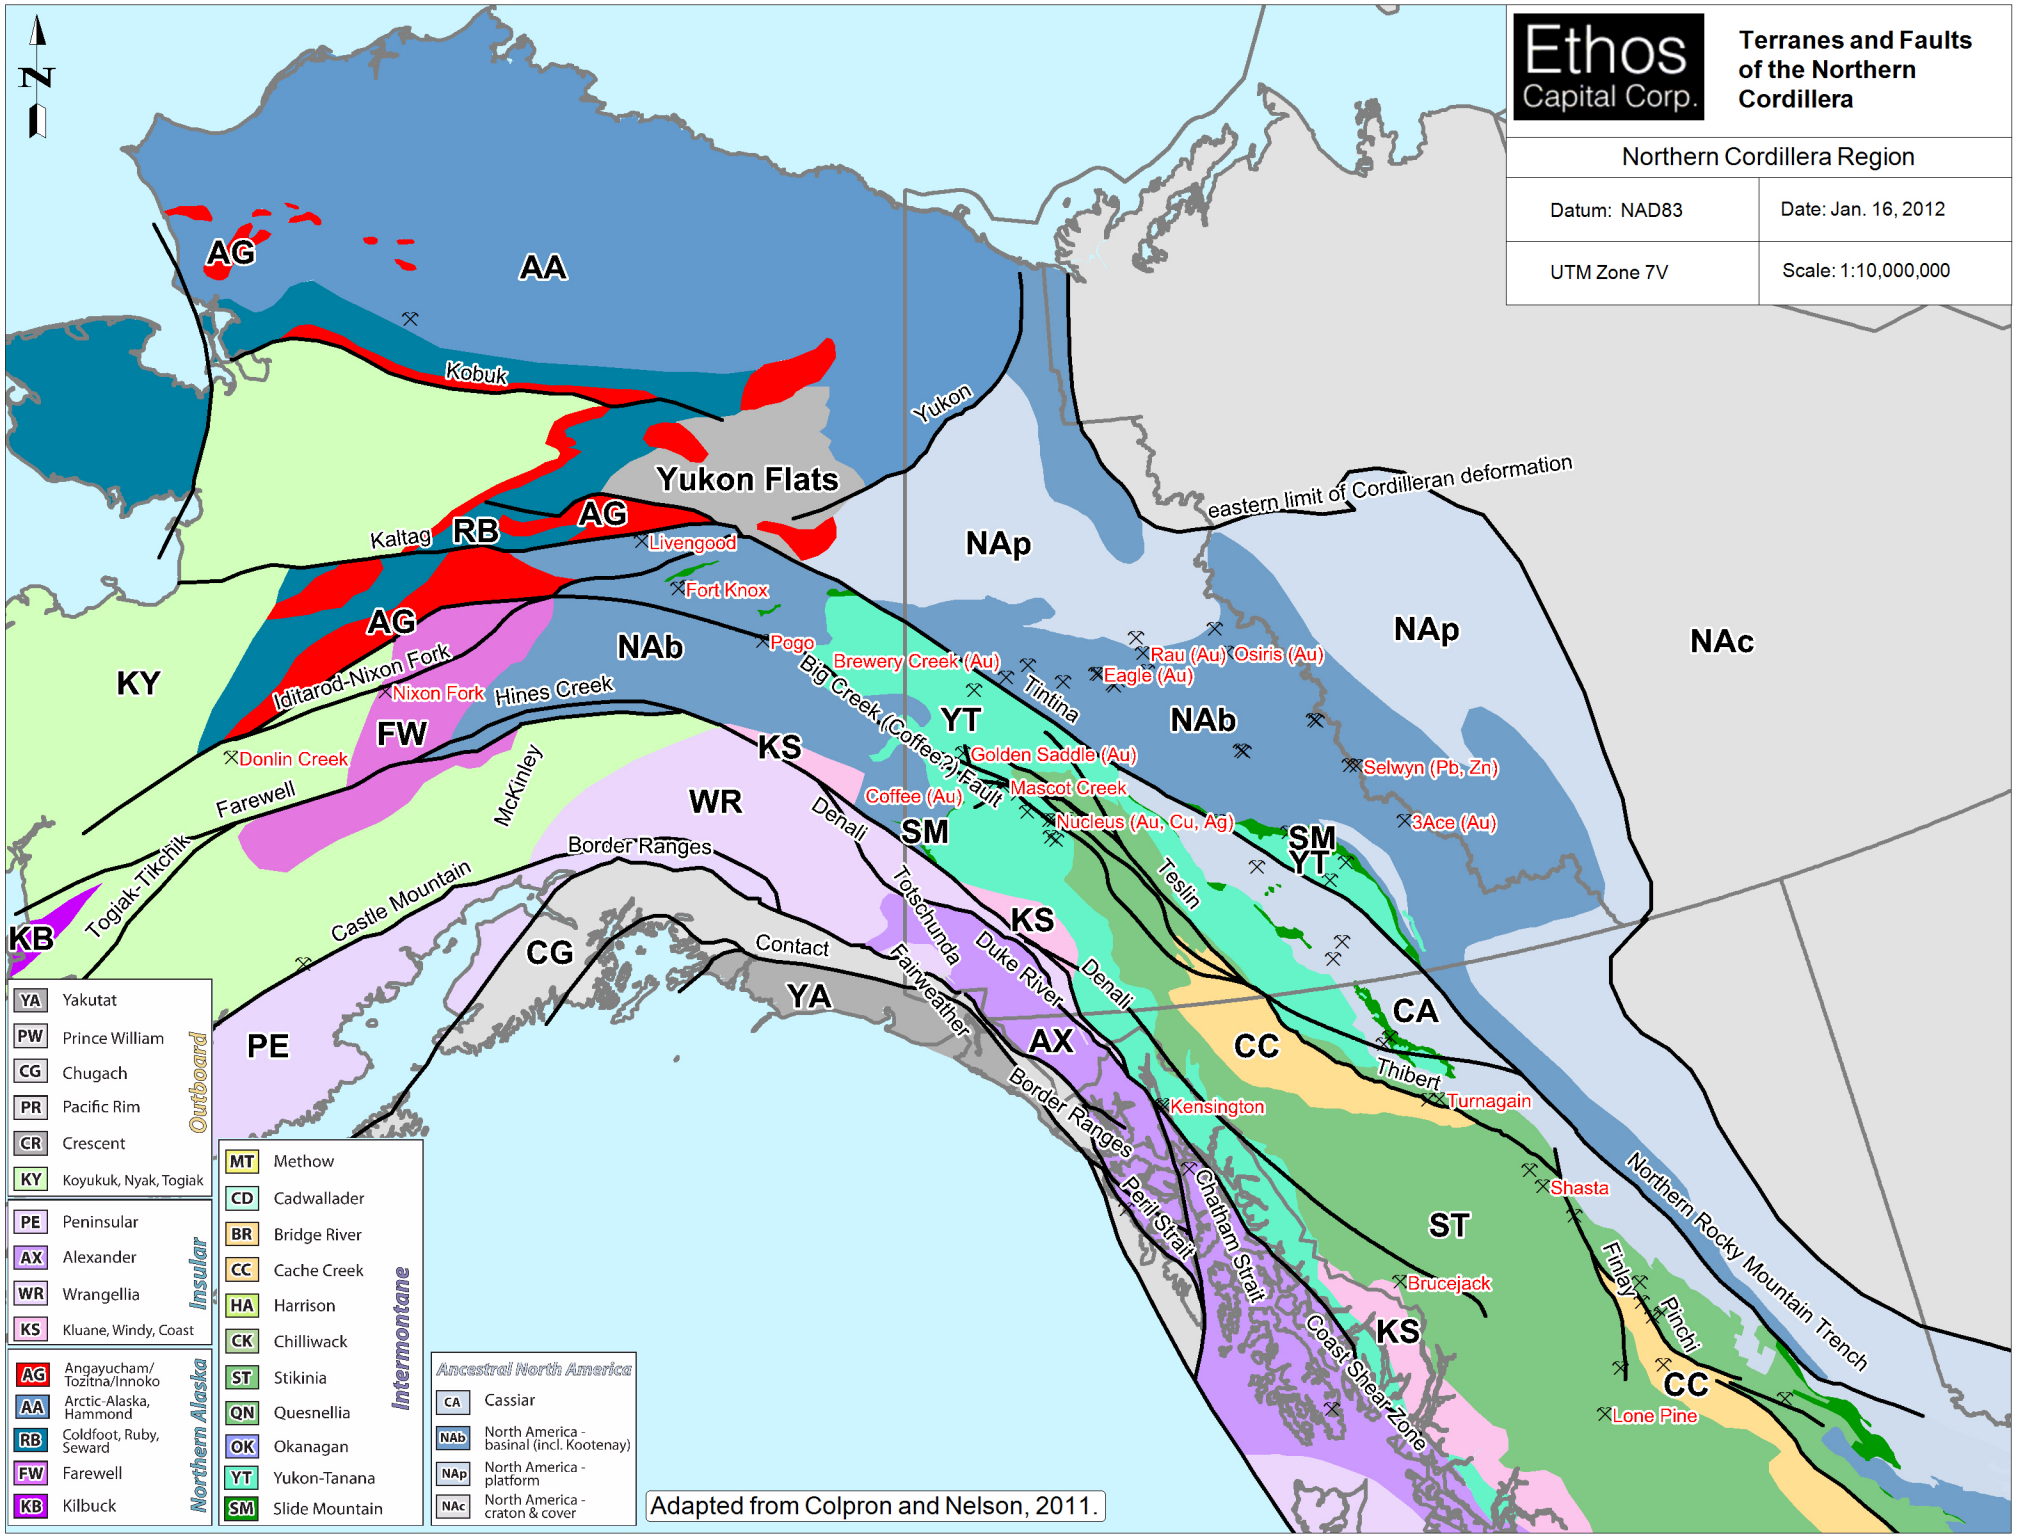
I, Peter Tallman, of Vancouver, British Columbia hereby certify that:

- I am a graduate of the University of Western Ontario with a Bachelor of Science (Geology) degree (1984).
- I am a practicing Professional Geoscientist (#02366) with the Professional Engineers and Geoscientists of Newfoundland and Labrador (PEGNL) since May 1991.
- I have practiced my profession as a geologist in Canada, throughout the America's as well as Australia and Africa continuously since graduation.
- I have held the position of executive officer and/or director of various publically listed Canadian corporations since 1995.
- I currently hold the position of consultant to Ethos Gold, a company listed publically on the TSXV Exchange.
- I do not own shares, warrants, or options to purchase shares in Ethos Gold Corp.
- I directed work on the Betty Property during the period beginning in 2011 to March 2013 and am the designated Qualified Person as defined by National Instrument 43-101 policy.



Dated in Vancouver, British Columbia this 22th day of August, 2013.





Peter Tallman, P.Geo.

Successor rocks
Quaternary
Selkirk Volcanics - mafic volcanic flows, subaerial
Paleocene
Rhyolite Creek complex felsic - Quartz-feldspar porphyry
Rhyolite Creek complex mafic - hbl porphyritic andesites and tuffs
Rhyolite Creek complex sediments - siltstone and conglomerate
Ruby Range batholith - salt and pepper, quartz diorite;
late Cretaceous
Prospector Mountain suite - Quartz-bearing monzonite
upper Carmacks Group - andesite to basaltic flows
lower Carmacks Group - andesite to dacite breccia, tuff and flows
Casino suite - porphyritic, leucocratic quartz monzonite to rhyolite
Katrina Creek granite - variably deformed polyphase leucogranite
late Cretaceous
Colorado Creek conglomerate - polymictic conglomerate, locally breccia
Whitehorse Plutonic suite
Coffee Creek phase - Medium to coarse bt monzogranite (smokey qtz)
Dawson Range - Medium to coarse-grained, hornblende ±biotite granodiorite
metagabbro age unknown
Early Jurassic
Aishihik plutonic suite - granodiorite to monzogranite prominent magmatic epd
Stikinia / Quesnellia arc
Late Triassic
Semenof Formation - augite phyric dacite to andesite volcanic flows
Pyroxene Mountain suite - massive pyroxenite and derived hornblendite
Slide Mountain terrane
Permian and older?
Eikland Mountain gabbro - gabbro coarse grained, foliated and lineated
Eikland Mountain ultramafics - Harzburgite, dunite and lesser lherzolite
Yukon-Tanana terrane
Permian
Klondike Schist - metafelsic and metabasite from tuffs and flows
Sulphur Creek suite - quartz and K-feldspar porphyritic to augen monzogranite
Devonian-Mississippian
Simpson Range Suite - foliated to gneissic mMonzogranite to granodiorite;
Nasina fm - Carbonaceous quartzite to mica-quartz schist
Finlayson assemblage amphibolite schist and gneiss; metabasite;
Snowcap assemblage marble - metacarbonate; associated calcsilicate
Snowcap assemblage quartzite - Quartzite to quartz-mica schist; banded
Laurentia ??
Triassic
Triassic gabbro - foliated and lineated, locally amphibolite
Late Devonian and older
migmatitic paragneiss - metasedimentary paragneiss with leucozome veinlets
Mirror Creek formation - foliated phyllitic argillite calcareous quartz sandstone
White River formation carb schist - carbonaceous musc-quartz phyllite
White River formation metabasite - chl-actinolite schist meta-volcanic
White River formation metafelsite - ms-qtz schist and feldspar augen schist
White River formation undivided
Scottie Creek formati - slabby psammitic bt-ms quartz schist and quartzite

Appendix IV.I – Soil Sample Assay Certificates

Acme Analytical Laboratories (Vancouver) Ltd.
1020 Cordova St. East Vancouver BC V6A 4A3 Canada

www.acmelab.com

Client: **Ethos Gold Corp.**
Suite 680-789 West Pender St
Vancouver BC V6C 1H2 Canada

Submitted By: Peter Tallman
Receiving Lab: Canada-Whitehorse
Received: July 03, 2012
Report Date: July 14, 2012
Page: 1 of 12

CERTIFICATE OF ANALYSIS WHI12000204.1

CLIENT JOB INFORMATION

Project: BET
Shipment ID:
P.O. Number
Number of Samples: 320

SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	320	Dry at 60C			WHI
SS80	313	Dry at 60C sieve 100g to -80 mesh			WHI
1DX2	320	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

ADDITIONAL COMMENTS

Invoice To: Ethos Gold Corp.
Suite 680-789 West Pender St
Vancouver BC V6C 1H2
Canada

CC:

BRITISH COLUMBIA CERTIFIED ASSAYER

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
