Introduction

This report describes the 2013 exploration program completed on the WS property, one of a number of properties held by BCGold Corp. in their Minto/Carmacks Copper-Gold project area. Work completed in 2013 consisted of a biogeochemical (black spruce twig) and VLF-EM geophysical survey. The survey was completed on a number of variably spaced lines over the property, with samples collected on 20 m spacings. A total of 562 sites were visited, with VLF-EM data collected at each site, and a total of 550 geochemical samples were collected (including QAQC). A roll along high resolution resistivity and IP survey was also completed (1.2 line km) by Ground Truth Exploration.

Location and Description

The WS property is located 31 kilometres NW of Carmacks (Figure 1, see Appendix I for detailed claim map) and 3 kilometres ESE of the Carmacks Copper Mine owned by Copper North Mining Corp. The WS claims (table 1) adjoin the W and WCC claims owned by Copper North Mining Corp. The property falls within the Whitehorse Mining District on NTS map sheet 115I/07 and is centered at 62° 19' N Latitude / 136° 38' W Longitude (UTM NAD 83 Zone 8: 416,500 m East / 6,912,000 m North).

The claims are located within the Traditional Territory of the Little Salmon Carmacks First Nation and Selkirk First Nation, which has a land claim settlement Agreement under the Yukon Umbrella Final Agreement.

Table 1: WS Property Tenure Information

Grant Number	Claim Name	Claim Owner
YC60184 - YC60209	BC 1 – BC 26	BCGold Corp. – 100%
YC60218 - YC60327	BC 35 – BC 144	BCGold Corp. – 100%
YC54407 - YC54443	ICE 5 – ICE 41	BCGold Corp. – 100%
YC60134 - YC60139	SLEEP 13 – SLEEP 18	BCGold Corp. – 100%
YC53521 - YC53602	WS 1 – WS 82	BCGold Corp. – 100%
YC53748 - YC53821	WS 83 – WS156	BCGold Corp. – 100%
YC53993 - YC54032	WS 157 – WS 196	BCGold Corp. – 100%

Access, Topography, Vegetation and Climate

Access

The property is currently accessible via the Freegold Road, which leads out of Carmacks to the NW. After approximately 34 km on the Freegold Road, a 12 km drive up the Carmacks Copper access road heading north leads to the property. The property access road is narrow and rough with steep sections which require 4x4 capabilities in any inclement weather. The Freegold Road is maintained by the territorial government and is currently open seasonally, generally from April through September. Carmacks, on the Yukon River, is 175 km by paved road north of Whitehorse.

Topography, Vegetation and Climate

Vegetation in wet areas, especially along the Williams Creek valley, consists of willows and alders. Drier areas are covered by spruce and pine trees. The property as a whole is below the tree line, and dominated by spruce.

The climate in the project area is marked by warm summers and cold winters. Average daily temperatures at the Williams Creek Station range from -30 °C for the month of January to 12 °C for the month of July. The location close to the Arctic Circle provides 22 hours of daylight in late June with similarly long nights in late December. Precipitation is light with moderate snowfall, the heaviest precipitation being in the summer months. The average annual precipitation is approximately 346.5 mm (water equivalent) with about 30% falling as snow. July is the wettest month.

The property topography is generally that of rolling hills, with a number of peaklets on the property all around the 3,000 ft elevation mark. The lowest drainage on the property is approximately 2,000 ft in elevation. The property is divided by the steep NE-SW gully formed by Merrice Creek, which runs from Merrice Lake (approx. center-west of the property) to the Yukon River to the northeast.

Exploration History

The area covered by the WS claims has seen some prior reconnaissance exploration work as part of the property work around the Williams Creek deposit primarily by Hudson Bay Exploration. There are two Minfile occurrences within the WS claim bounds; Bishi (115I 006) and Taslar (115I 007). Both were staked in the early 1970's on aeromagnetic anomalies.

In 2007 BCGold completed an airborne magnetic and radiometric survey that was flown over the WS as well as other properties in the area. Also during 2007,

BCGold Corp collected a total of 1,618 MMI soil samples and 5 rock samples from the WS property.

In 2008, BCGold Corp conducted two geophysical surveys on the WS property. A 14 km winter IP survey was conducted on the western side of the property along with a 22.1 km IP survey in the summer. A total of 465 MMI soil samples were collected by Ryanwood crews and a 1,300 metre diamond drill program was completed consisting of 6 holes.

In 2009, BCGold Corp completed a pole-dipole IP survey on two grids within the WS property, with dipole spacing at 100m and a 26.3 total line km of IP work completed.

In 2012, BCGold Corp completed a biogeochemical orientation survey over the drill trace of hole WS08_09B, which intersected Cu mineralization. The orientation survey consisted of 116 vegetation samples collected at 10 m spacing on two lines.

Geological Setting

Regional Setting

The WS claims are located approximately 3-7 kilometres south of the Carmacks (Copper North Mining Corp.) copper-gold deposits. This area of the Yukon (figure 2) is bounded by Stikinia Terrane rocks to the east, Yukon Tanana Terrane rocks to the north and the Coast Plutonic Complex rocks to the west. The WS property, along with the Minto/Carmacks copper-gold deposits, are hosted within foliated biotite rich granodiorite and granitic rocks of the Early Jurassic Aishihik Suite.

Property Geology

The following is taken verbatim from Devine, 2009: “Interoffice Memo: WS Property Area Geology”.

The western side of the WS Property is underlain by various phases of the Granite Mountain batholith. The area is immediately south, along strike from the Carmacks Copper Deposit. The rocks types, structural fabric, geophysical trends, and MMI geochemical anomalies all indicate that the mineralized zones at Carmacks Copper likely continue onto the WS Property.

Rocks types range from fine –grained, sugary textured, biotite-amphibole rocks, to well foliated biotite-amphibole gneissic rocks, up through various granodiorite to quartz-monzonite intrusions and granitic pegmatite dykes.

Early, well foliated, gneissic and schistose rocks may be incorporated supracrustal rocks and/or earliest phases of the Granite Mountain batholith. Well-foliated granodioritic rocks cut the fine-grained rocks and are themselves incorporated into the strongly foliated zones. The relationships suggest progressive ductile deformation contemporaneous with igneous intrusion. Other phases and compositions of intrusion, commonly quartz-diorite also intrude the fine-grained rocks and are moderately foliated to well-foliated. These early intrusions also commonly display fine to medium-grained, equigranular texture, with higher concentrations of mafic minerals – biotite and amphibole. The may have experienced a higher degree of metamorphism than later intrusions, or perhaps been altered during the following mineralization event.

2013 Exploration Program

The 2013 exploration program on the WS property consisted of biogeochemical sampling and geophysical surveying at 20 m spacings on a number of NE-SW oriented lines (perpendicular to the dominant structural orientation which controls Cu-mineralization on the adjacent Carmacks Copper property). Building on the biogeochemical orientation survey completed in 2012, the goal of the 2013 program was to delineate drill targets through the use of biogeochemistry and VLF-EM surveying. Drilling and trenching in previous years has shown that there is the potential for Carmacks style copper mineralization on the property, but targets based on original IP surveys and MMI soil sampling have proven to be false positive anomalies.

Biogeochemical sampling was proposed by the author in 2012 as a means to see through the buried ash layer which covers much of the property, and which has been cited as a possible reason that MMI sampling has not been a terribly effective means of detecting buried mineralization. In the biogeochemical orientation survey completed in 2012 on the WS property (Dumas, 2013), black spruce twig sampling returned positive results, and appears to be delineating the known mineralization of DDH WS08-09B.

Sampling and surveying was completed on 12 separate lines with sample spacing at 20 m. The majority of the work was completed to the NW of Merrice Lake,

in the areas previously drilled and trenched, with 2 reconnaissance lines being completed to the E of Merrice Lake. A total of 562 sites were surveyed using the VLF-EM, and a total of 550 Black Spruce twig samples were collected (which includes 28 duplicate samples). At 40 sites, it was not possible to collect a biogeochemical sample as a result of there being no black spruce trees in the vicinity.

A 1.2 line km high resolution resistivity and induced polarization survey was also completed over a portion of the 2008 drilling. See Appendix VII for the report and figures from Ground Truth Exploration.

Method

Biogeochemistry

Black Spruce twig samples were collected by clipping approximately 15cm off the ends of small branches showing new growth and placing them in 5x7 Hubco bags. A sample size of approximately 250 g was the target, which is approximately a full 5x7 bag worth of twigs. Healthy trees of approximately the same size were selected, with a target tree height 5 m, although smaller or larger trees were sampled when necessary. Particular attention was paid in areas which also contained White Spruce trees, as it is very easy to mistake a White Spruce for a Black Spruce.

At each sampling site, the following notes were recorded by hand: sample number, UTM coordinates (UTM NAD83 Zone 8); vegetation density (sparse, moderate, dense); ground moisture (dry, moist, wet); slope (flat, gentle, medium, steep) and slope direction; date; sampler; general comments.

Geophysics

A Geonics Inc. Ronka EM-16 “Very Low Frequency” Electromagnetic (VLF-EM) unit, rented from SJ Geophysics in North Delta, BC, was utilized for the VLF-EM survey. Seattle, Washington (NLK - 24.6 kHz) was chosen as the preferred source transmitter for the survey, as it lies at an orientation of 144 degrees from the TOE Project area and is therefore almost exactly perpendicular to the TOE 2013 grid lines oriented at ~050 degrees. An 050 degree grid line orientation was chosen for the 2013 work, in contrast to the North-South grid for IP cut lines used in previous years, as this orientation is perpendicular to mineralization at the Minto Mine and Williams Creek, as well as the Carmacks Copper Belt as a whole.

At each station the operator always commenced taking readings by facing toward the southwest. While holding the unit horizontally, it was slowly swung back and forth to find the “null” direction to Seattle. The unit was then rotated up to vertical, while maintaining the same “null” direction to Seattle, and rocked forward and backward to find the second “null” while adjusting the quadrature dial. At this

point the in-phase (%), quadrature (%), slope (degrees), and slope direction (degrees) were all noted in a book along with the UTM coordinates of the station. At the end of the day the GPS coordinates were downloaded with the station labels and checked against the coordinates noted in the field. VLF data was then entered into the spreadsheet for each station by hand.

Sample Preparation and Analysis

Biogeochemistry

All biogeochemical samples were prepped and analyzed in the same manner. Samples were analyzed at Activation Laboratories' Kamloops lab. Twig samples were dried, after which the needles were separated and discarded (only twig material is analyzed). The remaining twig material was then macerated and digested in an acid mixture composed of HCl with trace HF acid. Following digestion, a 250 mg sample was analyzed using a high resolution ICP-MS, and assay results were returned for 63 elements. (Activation Lab codes: Prep – B2; Analysis – 2F)

Results

Analytical results were received directly from Activation Laboratories and merged with field location and sample descriptions recorded in the field and stored in MS Excel files. This information was subsequently added to a MS Access database. VLF-EM readings were recorded directly in the field and interpreted in-house. For a complete set of field notes for both the geochemical and the geophysical data collected, see Appendix III. See Table 2 for statistics on selected elements, and Figures 3 through 10 for mapped results of selected elements.

Table 2: Statistics for selected elements (all values in ppb)

Element	Mean	Max	Min	Std. Dev.	Det. Limit

QA/QC

It was not possible to obtain relevant standards before departing for the field this fall, and as a result QA/QC for the biogeochemical sampling is entirely duplicate based. Due to the high resolution (ppb to sub-ppb levels) and the inherent variability due to medium and sample size, it must be expected that there will be some variability between duplicate samples. With this in mind, the vast majority of duplicate samples tested were within 1 to 2 standard deviations of the original sample, which is quite acceptable (for detailed QA/QC results, see Appendix IV). This question of variability is certainly worth paying attention to, and I would strongly suggest that in subsequent years some re-sampling of trees take place, to determine if values are fluctuating greatly from year to year, and to prove that the underlying anomalous patterns are reproducible.

Upon receipt of assay certificate A13-11986 from Activation Labs, a number of outlying samples were noted. This concern was raised with the lab, and these samples were re-assayed (both the original assay certificate, as well as the re-assaying are included in Appendix VII). Activation Labs suggested that these outlying values could have been produced by tiny precipitated mineral grains, however this was never confirmed.

Conclusions

Biogeochemical sampling once again effectively highlighted known mineralization which was intersected in hole WS08_09B. Interestingly, VLF-EM interpretation suggests that there is a NW-SE conductor approximately 100 m west of the known mineralization, which is in fact coincident with a stronger geochemical signature than that shown over the known mineralization. This new target, defined by a strong Cu-Ag-Ni-W anomaly, was not tested by previous drilling (see Figs. 3-10).

Further south, in the vicinity of the 2007 drilling, VLF-EM interpretation shows a NW-SE conductor which can be traced for 700 m and remains open to the north. This conductor, which lies uphill and just west of all 2007 holes, is coincident with a strong W-Sb-Ce-Cr and weak Cu-Mo-Ni-Ag anomaly.

Directly west of the 2007 drilling, on the southwest slope of the adjacent hill, there is a very strong Cu anomaly which bookends the gap in geochemical sample collection. This gap in sampling is a result of a pine dominated forest zone which was entirely devoid of black spruce trees. It is the author's opinion that due to the fact that this anomaly occurs on the border of such a pronounced vegetation change, it is likely a result of soil conditions and vegetation, not an indicator of buried mineralization. This is merely an observational opinion, however, and warrants further study.

Recomendations

Based on the positive results in the vicinity of the 2008 drilling to the north, more biogeochemical sampling is suggested to extend the survey south to further delineate the target which is defined by the VLF-EM conductor and the biogeochemical anomaly.

Following this extended sampling, a small drilling program is suggested to test the newly defined target in the north, as well as the VLF-EM conductor with conincident geochemical anomaly which is upslope and just out of range of the 2007 drilling in the south.

Statement of Expenditures

Statement of Qualifications

I, Darren L. O'Brien of 3649 – 153 Street, Surrey in the Province of British Columbia, certify that:

1. I am registered as a Professional Geologist with the Association of Professional Engineers, Geologists and Geophysicists of Alberta (APEGGA), and the Association of Professional Engineers and Geoscientists of the Province of British Columbia (APEGBC).
2. I am a graduate of the University of Alberta (1993) and hold a B.Sc. Degree (Specialization) in Geology.
3. I have worked in my profession as a Geologist since 1993, both as an employee of a major mining company and as a consultant. Places that I have worked include Canada, USA, Central Asia and the Caribbean.
4. I am currently consulting to BCGold Corp. and hold the position of Vice President of Exploration. My responsibilities include generating exploration projects for the company and quality control for advanced stage projects.
5. This report is based upon data collected during field work completed in Sept 2013 on the WS property.
6. I was not directly involved in the sampling program described in this report but have reviewed and approved of the program and conclusions.
7. I hold no interest in the WS property. I am a shareholder of BCGold Corp. I am a member of the Stock Option Plan and my options have been registered with SEDI.

Dated this 24th day of January, 2014 at Vancouver, BC, Canada.

Darren L. O'Brien, P.Geo

I, Kory Dumas hereby certify that:

1. I reside at 22-1204 Main St., Squamish, BC, V8B 0S3
2. I have a Bachelor of Science Degree in Earth and Ocean Sciences from the University of British Columbia (2005), Vancouver, BC, Canada.
3. I have practiced my profession continuously since 2006 and have worked on exploration projects in British Columbia, Ontario, Nunavut and the Yukon Territory in Canada as well as Liberia, Africa.
4. I am a consultant employed by BCGold Corp. with offices at 520 – 800 West Pender Street, Vancouver, BC, Canada, V6C 2V6
5. I am the author of the assessment report titled 2013 Geochemical and Geophysical Report on the WS Property. I was responsible for carrying out sampling, compiling the data, and aided in the interpretation of results.
6. I hold no interest in the WS property, nor am I a shareholder in BCGold Corp.

Dated this 24th of January, 2014, Vancouver, BC

Geophysical Report and Figures

Geophysical Survey Report:

High Resolution Resistivity and Induced Polarization

Williams South Project

for

B.C. Gold Corp.

Date of Survey: October 5-9, 2013
Date of Report: November 26, 2013

Introduction

This report describes the high resolution resistivity (RES) and induced polarization (IP) ground geophysical survey conducted on BC Gold Corp's Williams South (WS) copper porphyry project. (Figure 1)

The survey was a joint project between BC Gold Corp and the YGS-GroundTruth Exploration partnered Yukon HRRIP Test Case Survey. Survey data will be presented in an Open File Report in March 2014. The goal of the survey was to identify key structures through resistivity and chargeability associated with mineralization encountered in BC Gold Corp diamond drilling.

Personnel

The survey was conducted by the following GroundTruth Exploration personnel:

1. Chad Cote, Lead Geophysical Operator and Crew Chief
2. Mark Dauphinee, Secondary Lead and GPS Technician
3. John McGrath, Geo Technician
4. Matthew Emmett, Geo Technician
5. Robin Miller, Geo Technician

Survey Dates:

Crew Mobilized to site on October 4, 2013.
Crew Surveyed 1260m profile October 5-9, 2013
Crew Demobilized on October 10, 2013

Instruments and Equipment

The survey was completed with the following instruments and equipment: Advanced Geosciences Supersting R8 IP 84 electrode passive cables Stainless steel electrodes 2 – 12V DC regulated power supply Honda 1000 watt generator 2 – Promark3 GPS receivers

Survey Location

The geophysical surveys took place on the “WS Property” approximately 33 kms NW of Carmacks. The survey was run over existing Drillhole locations, and a previous standard IP survey at wider electrode spacing.

Survey Summary and Arrays

The survey consisted of one long traverse 1260m in length. Survey was started on the NE limit of the profile where crew tested multiple arrays on the first 415m. Arrays tested: 1) Dipole Dipole (DD), 2) Strong Gradient (SG), 3) Inverse Schlumberger (Si2), 4) Inverse Schlumberger (Si3), 5) Extended Dipole-Dipole (xDD). It was determined that Extended Dipole-Dipole was the optimal array to process with for duration of survey. It required longest read time but also produces greatest data density. For the duration of the survey, crew ran survey in ‘Roll Along’ configuration which produces one long continuous profile and integrated dataset by cycling one cable from the rear to the front.

The survey line was placed to gain structural information related to the known drill intercepts and interpreted structures. Electrode spacing is set at 5m. The survey produced an optimal horizontal resolution of 2.5m, a maximum reading depth of 90m, and a traverse length of 1260m.

All traverses are surveyed with ProMark3 differential GPS units and post processed using GNSS Solutions to obtain accurate horizontal and vertical position.

Data Processing

The data that is collected is downloaded in the field after every array and checked for integrity. This allows us to identify any field errors and correct them before moving the equipment.

The RES/IP data is processed every evening by the lead operator in the field using EarthImager2D software provided by Advanced Geosciences Inc. Resistivity data-misfits are removed and the cleaned data-set is inverted. The same process is done with the IP data. Terrain corrections collected using a differential GPS are applied to the inversions.

The GPS data is processed using GNSS Solutions software. All unedited data is archived along with the command files for further investigation if required. A .csv is created containing the GPS traverse points collected.

-An ESRI shape file is created containing the traverse points collected. A table of surveyed electrode XYZ locations is provided.

-Files containing inverted IP & RES data is provided

Survey Result: Test arrays, length and Preliminary Interpretation:

- 1) Dipole-Dipole (DD): 84 Electrode, 415m Hz length
 - 2) Strong Gradient (SG): 84 Electrode, 415m Hz length
 - 3) Inverse Schlumberger (Si2): 84 Electrode, 415m Hz length
 - 4) Inverse Schlumberger (Si3): 121 Electrode, 600m Hz length
 - 5) Extended Dipole-Dipole (xDD): 252 Electrode, 1260m Hz length
- *105 Electrodes, 520m Hz length presented in this report.

Days 1 and 2 of survey were spent running numerous test arrays over the Northeastern limit of the profile. This zone includes the know drill intercept of 63m of 0.17% Cu.

Preliminary field plots indicated that the xDD and Si3 arrays were working best to

outline structure related to mineralization. The Si3 array was continued to 600m Hz length on traversed. The xDD array was run for the full length of planned survey on days 3, 4 and 5.

Resistivity (see drillhole overlay plots): Both Si3 and xDD show a resistivity high feature just above intersected mineralization that is shallowly dipping to NE. Mineralization sits in a relative resistivity low. The xDD shows the resistivity low feature coincident with mineralization to be continuous from near surface and dipping at ~45 degrees to Northeast. This feature correlated with BC Gold's interpretation of projected mineralization outlined on website figure showing IP conductivity over drillholes. For these reasons it was decided to run the xDD for duration of survey. It should be noted that the historic IP survey outlined the mineralization to sit in a conductivity low (resistivity high) at a coarse resolution. The high resolution survey shows mineralization to be related to a resistivity low feature.

Chargeability (see drillhole overlay plots): xDD and Si3 arrays show mineralization to sit just NE of a highly conductive feature. The Si3 array shows the conductive body to be linear in trend, starting at surface and dipping ~45 degrees NE. The xDD array shows a break in this same feature and is less linear in appearance. It is recommended to examine these inversions with logged lithology overlaid.

9. Inverted xDD Resistivity w Drillhole overlay
10. Inverted xDD Chargeability w Drillhole overlay

HRRIP Survey Supplementary

The High Resolution Resistivity IP (HRRIP) Survey was conducted in October, 2013 by Ground Truth Exploration out of Dawson, YT for BC Gold Corp out of Vancouver, BC. The results presented here-in, of a said roll-along method used is the basis of this summary.

Survey

This Figure describes plot points post designed using Advanced Geoscience instruments (AGI) administrator software. Initially designed to investigate an area bound by cable lengths (415M). Which is a made up of six times 70M cables with 5M dipole spacing's.

The Roll-along method presented here-in will contribute additional coverage leap-frogging a single cable in one direction.

Data (please refer to work report for physical locations)

The results of the ongoing resistivity imaging procedure is presented as such; post an initial 415M traverse (using 5M dipole separations) then performing 12 roll-along 's (leap frogging one 70M section at a time), Data is broken into four sub-sets allowing the software (earth imager) to do inversions on both Resistivity and Chargeability. The elevation changes for this survey also introduces asymmetry, thus making it more difficult to understand the overlapping data sub-sets, seen above.

There are three known obstacles to overcome when merging data when doing inversion; (1) RMS, (2) extrapolation, (3) Mesh (survey matrix) vs. filtering blocks

Post extracting Data File 1, earth imager was used by Dr. M. Best who presents us with optimum inversion results for that one area, then repeated three additional times. These inversions for said Resistivity and Chargeability on all Data files were gridded using Krigrd (Geosoft). The four krigrd files are then displayed into a single field. To smooth overlapping areas Boolean operations were used (averaging overlap results). Each element is presented here-in using seven separate grids.

CERTIFICATE OF ANALYSIS

458 Vegetation samples were submitted for analysis.

The following analytical package was requested: Code 2G Unwashed Vegetation ICP/MS

REPORT A13-11986-0.25g-R

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.

Notes:

CERTIFIED BY :

A handwritten signature in black ink, appearing to read "Emmanuel Esemé", written over a dashed line.

Emmanuel Esemé, Ph.D.

CERTIFICATE OF ANALYSIS

556 Vegetation samples were submitted for analysis.

The following analytical package was requested: Code 2G Unwashed Vegetation ICP/MS

REPORT A13-12722

This report may be reproduced without our consent. If only selected portions of the report are reproduced, permission must be obtained. If no instructions were given at time of sample submittal regarding excess material, it will be discarded within 90 days of this report. Our liability is limited solely to the analytical cost of these analyses. Test results are representative only of material submitted for analysis.
