Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5239323	355061.0	7100370.0			1586.0	Outcrop	13Y753483	Rusty/Laminated/Clay alteration(Drk Red)Galena 2-3%,Orpiment,small exposed area of approx.2/2m's.
E5239324	355060.0	7100371.0			1586.0	Outcrop	13Y753483	Orpiment,possible arsenopyrite,black sooty look,Galena 0.1% approx.Small trace of realgar.
E5239325	355064.0	7100378.0			1593.0	Outcrop	13Y753483	Limonitic silicified sandstone slightly carbonated.Galena 0.1%.possible sphalerite and stibnite.
E5239326	355136.0	7100378.0			1626.0	Outcrop	13Y753483	Brecciated silicified sandstone,no visible sulphides,slightly carbonated,yellow stain weathering along the fractures.
E5239327	355136.9	7100380.2			1635.1	Outcrop	13Y753450	silicified sandstone/dolostone,no visible sulphides.
E5239328	355133.4	7100383.0			1632.2	Outcrop	13Y753450	3 meter chip sample,small narrow calcite veining,no visible sulphides.
E5239341	355068.5	7100438.1			1623.1	Outcrop	13Y753450	SS,Dolostone,no visible sulphides.
E5239342	355061.7	7100437.5			1619.7	Outcrop	13Y753450	Same as # E5239341.
E5239343	355060.1	7100435.8			1615.4	Outcrop	13Y753450	SS,No visible sulphides.
E5239344	355060.4	7100438.4			1614.6	Outcrop	13Y753450	Same as sample # E5239343.
E5239345	355056.6	7100441.3			1614.9	Outcrop	13Y753450	SS/Dolostone,Orpiment,no visible sulphides.
E5239346	355055.7	7100439.3			1615.8	Outcrop	13Y753450	Same as sample # E5239345.
E5239979	377513.3	7093637.7			1492.2	Outcrop	13Y729534	Calcareous silty sandstone with quartz carbonate vein cut through. Locally limonite staining.
E5239980	379490.3	7079855.6			1756.9	Talus	13Y729534	Decalcified calcareous siltstone with boxes filled with liminte. Quartz vein cut locally. Gossanous.
E5239981	379529.8	7079842.7			1759.5	Talus	13Y729534	Quartz vein float at talus pile, limited cubic pyrite and spot of galena observed. Weakly limonite staining
E5239982	379633.8	7080042.6			1732.2	Float	13Y729534	pale grey colored silicified siltstone with sericite alteration, limonite staining, quartz veining cut through.
E5239983	380038.1	7080327.3			1660.4	Float	13Y729534	Algea calcareous greywacke with disseminated fine grained pyrite up to 1 % set in matrix to coarse grained quartz and interclasts.
E5239984	380054.0	7080351.3			1659.5	Float	13Y729534	Fault breccia with calcareous siltstone clast, milled, fine grained pyrite observed.
E5535863	399097.5	7123923.7	690084.7	7128132.7	1612.1	Float	13Y743991	Bleb, patches of 1% pyrite in breccia.
E5535864	399057.9	7123976.5	690040.3	7128181.6	1626.2	Float	13Y743991	
E5535865	399475.5	7123737.5	690478.7	7127982.9	1560.9	Outcrop	13Y743991	secondary gossan with strong iron staining, iron oxide sand sement the gravels.
E5535866	399113.2	7121530.3	690325.7	7125750.7	1809.1	Float	13Y743991	Quartz vein float. Limonite hematite staining.
E5535867	399104.8	7121543.3	690316.2	7125762.8	1808.4	Outcrop	13Y743991	Brecciation dolostone with carbonate veining cut through. Trace sulfide. 60 structure orientation.
E5535868	399058.4	7121859.0	690240.2	7126072.9	1667.8	Float	13Y743991	Black shale breccia.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5536031	358055.5	7079958.8			1867.1	Subcrop	13Y739112	Orange oxidized, porous and permeable, altered limestone subcrop.
E5536032	357879.5	7080006.5			1882.1	Outcrop	13Y739112	169/64 predominant fracturing/jointing in dark-grey limestone with orange oxidized calc veins on same orientation and stockwork, some dolomite crystals.
E5536033	357829.7	7080028.8			1891.7	Outcrop	13Y739112	342/54 bedding in grey limestone, 190/65, ~ 30 cm calcite vein, orange stained, 1 cm + euhedral crystals.
E5536034	357767.8	7080018.5			1918.5	Talus	13Y739112	Talus/Float, amongst zebra limestone. Brecciated shale with ferrirete welding.
E5536035	357613.2	7080055.6			1943.3	Outcrop	13Y739112	Drusy calcite on irregular fracture; iron oxide stained in grey limestone.
E5536036	357653.7	7080037.9			1951.0	Outcrop	13Y739112	Alternating bands of dark dolomite crystals and white calcite with orange oxide stain and ~< 1% galena agglomerations.
E5536037	357813.3	7079938.3			1943.1	Subcrop	13Y739112	Dark-grey dolostone with some decalcification, zebra banding with calcite and orange iron oxide. Subcrop.
E5536038	357910.3	7080223.9			1771.9	Outcrop	13Y739112	@ bottom of 255 ppb gold in soil, grab sample of white qtz veining in calcareous, qtz sandstone.
E5536039	357895.8	7080226.6			1780.1	Outcrop	13Y739112	Calcareous qtz sandstone to arenaceous limestone with antitaxial and simple white qtz-calcite veins, bedrock yes, but some talus moved over top.
E5536040	357920.1	7080327.0			1759.2	Float	13Y739112	Few subcrop pieces in dispersal from uphill. Grab-float. Outcrop is calcareous, qtz sandstones.
E5536041	357934.8	7080277.0			1761.3		13Y739112	no description
E5536042	357957.6	7080320.4			######		13Y739112	no description
E5536043	357880.2	7080311.2			1776.1	Outcrop	13Y739112	PIT #1, dark-grey sandstone, vfg qtz and dolomite + calcite with qtz, orange calcite stock work. 2 inches depth.
E5536044	357885.7	7080295.9			1778.8	Outcrop	13Y739112	Outcrop - debrite, 50% qtz grains, 10% limestone clasts matrix of sparry calcite, <= 1% diss py.

E5535674	358418.0	7080408.7			1751.0	Subcrop	13Y741276	Fault zone rock. Boxwork silicificatino, calcareous (5) on broken surfaces, C-0 on some weathered, silicified surfaces.
E5535675	358416.8	7080409.3			1757.7	outcrop	13Y741276	This is a TALUS GRAB across 1m of the fault zone.
E5535946	362591.8	7112727.7			1114.0		13Y733608	Float in creek, rounded ankorite/qtz-carbonate dolostone breccia with .5 % galena.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5535947	360775.1	7114199.4			1866.3		13Y734503	Subcrop, dolostone with qtz veining and hematite staining/oxidation.
E5535948	360695.1	7114243.5			1871.5		13Y734503	Subcrop, sooty, dark-grey-black limestone.
E5535949	360606.6	7114319.8			1874.5		13Y734503	Subcrop, brecciated, calcite vein limestone matrix, rusty.
E5535950	360536.4	7114420.1			1841.2		13Y734503	Talus from directly below ridge with oxide samples from previous sampler - breccited calcite with up to 5 cm clasts with orange, calcareous oxide matrix.
E5535951	360615.1	7114525.7			1751.6		13Y734503	Subcrop in talus, angular, massive - rusty (orange and red) qtz in talus with brecciated black seds?, in sandstone.
E5535952	360577.3	7114560.8			1754.2		13Y734503	Float, sub-angular in talus - breccia of sandstone/dolomite/ankorite, highly oxidized with hemtite and limonite, very porous, with one sample taken having galena in matrix
E5535953	360529.3	7114512.8			1786.3		13Y734503	Talus, angular, brecciated dolostone/ankorite matrix plus veined and calcareous.
E5535954	360478.6	7114491.6			1821.7		13Y734503	Talus, angular, dolostone with oxidized, porous layers with 30 % galena.
E5535955	360489.8	7114455.8			1845.9		13Y734503	Subcrop, rusty, brecciated dolostone.
E5535956	370075.0	7115023.4			1683.5		13Y734503	Float, sub-angular in talus of maroon shale - brecciated sandstone in qtz vein with ornge rust pockets in qtz with manganese.
E5535957	370328.1	7115398.5			1673.3		13Y734504	Talus-float, local - layered, metamorphosed, f.g. sediment with fine sulphides (1%) in light-green layers with scattered sulphides throughout.
E5535958	370353.0	7115931.5			1634.3		13Y734504	Float in talus, sub-angular, ferrouscrete with shale fragments.
E5535959	370184.2	7116240.7			1567.4		13Y734504	Talus, sub-angular, qtz veined sandstone, minimal oxidation.
E5539948	354374.5	7093551.4			1557.2	outcrop	13Y746411	Silicified zone, fault zone
E5539967	367403.2	7118184.6			1569.9		13Y734658	Outcrop - massive qtz vein, meters thick at minimum, with trace galena and silicious dolomite wallrock. 50 degree dip to 203 degrees (speculative), 112 degree strike, about E-
E5539968	366673.8	7117915.0			1322.1		13Y734658	Subcrop - veined black shale in black slope - veins are yellow-white (ankorite?)/carbonate.
E5539969	366666.1	7117771.0			1342.8		13Y734658	Outcrop - extremely oxidized (orange) black-grey shale, carbonate.
E5539970	366683.1	7117758.4			1349.4		13Y734658	Talus, subcrop - black shale breccia/weld with orange rust/carbonate matrix.
E5539971	359413.6	7098993.8			1596.0		13Y736545	Outcrop - light-grey chert unit in softer seds., close to volcanics - rusty surface, pyrite pods.
E5539972	359645.5	7099199.6			1550.2		13Y736545	Float, angular in maroon shales, calcareous, f.g. volcanic, small clasts, trace fine sulphides (orange-brown surface oxid./grey matrix.
E5539973	359733.4	7099206.9			1527.5		13Y736545	Float, angular, cherty seds with qtz veins paralleling bedding, oxidized.
E5239366			635925.2	7096597.9	1529.8	Outcrop	13Y727309	Silicified siltstone with sooty fine grain minerals staning in matrix of the siltstone. Quartz vein occuras matrix and sheeted pattern.
E5239367			636162.0	7096106.6	1554.1	Outcrop	13Y727309	Silicified alteration lens parallel or cross cut the calcareous siltstone unit that the 110 degree structure trending near vertical, iron staining. greyish brown colored sooty (dark
E5239368			636164.9	7096107.4	1550.0	Outcrop	13Y727309	Intense silicified siltstone or dolostone with white quartz wire cut through, stylolite sooty strings observed locally. Limenite staining.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5239369			636166.1	7096111.7	1541.6	Outcrop	13Y727309	Intense silicified siltstone, with 90% quartz composition lens 80 cm wide and 1.5 meters long, host in grey shale. Strings and patches of sooty sulfide? Observed. Quartz
E5239370			636170.0	7096115.6	1529.6	Outcrop	13Y727309	Intense silicified unit vertically concord with the wall rock that is silty shale in greyish colore. Quartz occur as stock work veining. Disseminated dark minerals fill in matrix to
E5239371			636169.5	7096117.6	1528.1	Outcrop	13Y727309	out standing large out crops of silicified dolostone with surface weather texture indicate to be dolostone, does not fuse, sugary quartz and stock work quartz occur as white
E5239372			636159.2	7096134.1	1516.1	Outcrop	13Y727309	Silicified with white colored stockwork quartz veining unit intercalated with in grey shale occur as 35 cm wide. Scorodite and limenite staining. Sooty metallic material fill in matrix
E5239373			636163.0	7096122.4	1525.2	Outcrop	13Y727309	Intense silicified unit with sooty matallic material 1-2 cm wide occur surround the 2-3 cm cross clast. Silicified brecciation unit oppear 10-20 meter wide lensoid likely 65 degree
E5239374			636161.7	7096122.8	1526.4	Outcrop	13Y727309	Intense silicified unit with sooty strings cut through sugary replacement textured clast.
E5239375			636143.8	7096131.9	1514.9	Outcrop	13Y727309	Caterclastic intense silicified dolostone unit with sooty dylolite strings in sugary texture quartz matrix, limonite staining.
E5239376			636202.3	7096118.5	1512.7	Outcrop	13Y727309	Intense silicified unit in between (intercalated) with in silty shale (orange to brown color). Silica unit 50 to 100 cm wide. More than 5 silicified units in 40 estimated meters
E5239377			636203.5	7096121.4	1512.7	Outcrop	13Y727309	Silty shale brown color with sheeted quartz vein cut through. Does not fuse to acid.
E5239378			636214.1	7096125.6	1510.3	Outcrop	13Y727309	Intense silicified unit in silty shale, limonite staining, sooty strings and patches occur. 130 degree trending, near vertical occurrence.
E5239379			636270.1	7096179.4	1490.6	Outcrop	13Y727309	Dark grey carbonaceous silty shale with quartz carbonate veining cut through, the county rock ia Nachillar shale formation.
E5239380			636231.5	7096242.7	1453.4	Outcrop	13Y727309	Intense silicified dolostone with vuggy quartz stock work veining cut through. Sooty strings observed locally. Limonite staining.
E5239381			636145.5	7096227.6	1464.0	Outcrop	13Y727309	20 cm wide structure zone with intense limonite-scorodite alteration (staining). Vein strike to 90 degree S 75 degree dipping overprinting. Sooty strings and matrix to sugary
E5239382			636138.1	7096235.6	1462.0	Outcrop	13Y727309	Pinky intense silicified dolostone (or siltstone?) with sooty sulfide strings cut through, white quartz veininga coup;le mm wide cross cut the sooty strings.
E5239383			636112.7	7096152.0	1517.1	Outcrop	13Y727309	Brecciation zone 1 meter wide in 90% silicified zone, intense sooty strings, limonite staining on fracture surface, no evidence for other minerals. Sample at a 5 meter high
E5239384			636085.0	7095742.0	1504.6	Outcrop	13Y727309	Intense silicifide siltstone (quartzite?) with dark patches and strings penatrate in, the dark mettallic may refer to sulfide that contain higher asenic and pyrite.
E5239385			636149.1	7095729.3	1509.4	Outcrop	13Y727309	Intense silicifide siltstone (quartzite?) with dark patches and strings penatrate in, silicified belt observed to be 10 - 15 meter wide 300 meter along east to west trending.
E5239386			636208.7	7096088.9	1546.2	Outcrop	13Y727309	Silicified silty shale with shooty sulfide patches and matrix to sugary quartz clasts.
E5239410	342830.0	7097091.0			1551.0	Outcrop	13Y727309	
E5239411	342383.0	7097091.0			1531.0	Outcrop	13Y727309

E5535910	355269.3	7100625.9			1684.4		13Y731280	Outcrop,dolostone,rusty with 0.5-1% realgar.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5535911			637238.8	7097422.0	1708.4		13Y731280	Outcrop,bull qtz., 25 meters west of contact with maroon shale.
E5535912			637147.5	7097568.2	1622.3		13Y731280	Float in shale talus,brecciated qtz. In rusty matrix.
E5535913			636676.0	7097992.5	1612.6		13Y731280	Talus, E-W zone of minor quartz veining, bull qtz crossing shale.
E5535914			642886.7	7100196.8	1587.2		13Y731280	Float, local, rusty, weathered, qtz-carbonate sandstone.
E5535915			642887.9	7100358.4	1486.2		13Y731280	Float,local, talus field, grey-green qtz sandstone with parallel qtz veins and trace, fine sulphides, maroon oxide.
E5535916			643326.6	7100670.3	1334.7		13Y731280	Outcrop, creek, light-brown shale with parallel qtz veins, .25-.3-1 cm width with orange oxide.
E5535917			643393.7	7100773.4	1263.4		13Y731280	Outcrop, 1/2 foot of silicious, grey mudstone with calcite veinlets with 1 % fine, disseminated sulphides. Calcite veins have trace black sulphide/mineral.
E5535918			637444.2	7098938.2	1302.6		13Y731280	Float, angular, from uphill source, massive qtz, remnants of green shale, orange oxide rust pockets throughout, plus manganese.
E5535919			637425.7	7098995.2	1271.6		13Y731280	Subcrop in talus, maroon shale unit, orange oxide, thin 2 mm veinlets of black, liquid-looking mineral.
E5535920			637331.0	7099015.4	1229.5		13Y731280	Float, local, angular slab of qtz pebble conglomerate, 1-3 mm clasts, orange oxide throughout.
E5535921			637138.1	7099171.6	1188.5		13Y731280	Outcrop, silicious,qtz veined sandstone, minor oxide. Dolostone trace, no hcl reaction.
E5535922			637254.6	7099204.8	1186.1		13Y731280	Outcrop, rusty, silicious shale with cherty interbeds (possibly silica replacement/alteration).
E5535923			641575.6	7100698.5	1346.3		13Y731280	Float, local (angular-sub-angular), calcareous conglomerate with calcite veins.
E5535924			641494.3	7100709.9	1340.6		13Y731280	Outcrop, calcareous, dark-grey, fine-grained, hard(dense), mudstone?
E5535925			641462.9	7100723.3	1340.0		13Y731280	Float, very large, 1 m x 1.5 m, boulder, f.g., very hard, mildly calcareous, dark-grey with maroon patches.
E5535926			641406.5	7100839.7	1235.8		13Y731280	Outcrop, calcareous, quartz/calcite veining, slightly oxidized shale.
E5535927			641394.1	7100889.0	1201.1		13Y731280	Talus, calcareous, grey siltstone with band of rusty calcite with pyrite.
E5535928			641336.6	7100905.3	1192.6		13Y731280	Talus, pitted/cavities, highly orange oxidized breccia.
E5535929	356881.3	7102217.2			1755.4		13Y733608	Subcrop, mafic volcanic with calcareous red chert clasts and calcareous sections.
E5535930	356826.6	7102290.5			1710.1		13Y733608	Outcrop, highly oxidized .5 foot wide, vertical, fractured section with iron staining in volcanics.
E5535931	356677.0	7102476.5			1616.6		13Y733608	Float, angular, talus field, highly brecciated, silicified rock with very- fine dark sulphides, jasperoid.
E5535932	356373.4	7102587.8			1525.0		13Y733608	Float, large, angular, brecciated, jasperoid, with v.f. dark sulphides.
E5535933	364820.0	7104617.7			1757.6		13Y733608	Subcrop, volcanics, calcite-rich, .25 % sulphides.
E5535934	364885.2	7104525.6			1760.0		13Y733608	Talus, volcanics with calcite veins with pyrite along veins.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5535935	364836.3	7104339.0			1799.4		13Y733608	Talus, brecciated chert with 1 % fine, brassy pyrite.
E5535936	364677.0	7104353.6			1785.2		13Y733608	Talus/boulder field, locally sourced, hard, dense, heavy, grey sulphide? Matrix with 40 % epidote and rare 2 mm qtz veins.
E5535937	364046.1	7104598.4			1603.7		13Y733608	Talus/boulder field, locally sourced, light-grey, porous, very calcareous matrix with 2-1 mm calcite clasts with orange and hematite plus black oxide/porous gouge.
E5535938	363861.4	7104492.9			1594.3		13Y733608	Talus, local?, light, grey-brown shale with calcite veins and pyrite along fractures.
E5535939	363828.2	7104475.9			1588.5		13Y733608	Float, subangular, local source?, orange oxide throughout, calcareous with silicious sections with fine, black patches (sulphides?).
E5535940	363367.2	7104454.6			1522.7		13Y733608	Float, subangular, talus/boulder field, silicious, orange and 80 % jarosite, iron staining, porous/vugs.
E5535941	363162.8	7104320.6			1546.3		13Y733608	Float, angular in talus/boulder field, highly oxidized shale, rust stain on mountain, above.
E5535942	362953.6	7104244.6			1539.5		13Y733608	Float, angular, talus/boulder field, black shale with rusty qtz veins.
E5535943	362683.8	7104274.1			1498.0		13Y733608	Talus, sub-angular, below oxidized zone on mountain, grey carbonate (volcaniclastic limestone?) with 3 % pyrite.
E5535944	363388.6	7113963.8			1690.1		13Y733608	Float, subangular sandstone with bulk qtz.
E5535945	363147.2	7113641.6			1503.9		13Y733608	Outcrop with foot thick qtz layer in sandstone, below contact with maroon shale.
E5535960	355249.0	7100651.8			1704.3		13Y731280	Outcrop, realgar in recrystallized dolostone, minor silicification, light yellow-green scorodite (?) staining~moderate to weak, ~E-W apparent strike-fault zone over
E5535961	355280.3	7100661.1			1670.6		13Y731280	Outcrop, dolostone with brown goethite staining, pseudo-breccia (?) texture due to recrystallization of white dolomite.
E5535962			638159.7	7097513.4	1644.2		13Y731280	Outcrop, siliceous unit in maroon mudstone.
E5535963			638165.3	7097521.3	1643.0		13Y731280	Outcrop, white qtz flooding with earthy hematite (limonite) vugs. Narchilla.
E5535964			638144.0	7097750.7	1621.6		13Y731280	Outcrop, limy qtz arenite with breccia @ contact btw. Mudstone to South and quartz arenite to North.
E5535965			638121.9	7098029.8	1587.3		13Y731280	Outcrop, black, siliceous, fine- grained sediment, carbonaceous, some qtz veining locally.
E5535966			638084.5	7098225.1	1603.6		13Y731280	Outcrop, minor white qtz veining in cherty black rock.
E5535967			637737.0	7098531.2	1512.3		13Y731280	Talus, silicified, limy, vuggy breccia.
E5535968			637470.8	7098805.5	1369.8		13Y731280	Outcrop, white qtz veining, anti taxial in black shale.
E5535969			636792.3	7099237.4	1098.2		13Y731280	Outcrop, fine-grained to cherty qtz bed in grey shale, ~20 cm thick, recrystallized.
E5535970			642869.2	7100177.0	1601.9		13Y731280	Outcrop,calcite veining in qtz arenite with black glossy mineral ~ 1% in veins.
E5535971			642610.5	7100393.9	1462.0		13Y731280	Talus, silicified (white, massive qtz) ~ 60%, 40% dark green chlorite, within green and maroon shale talus.
E5535972			642394.7	7100570.5	1344.8		13Y731280	Float, qtz arenite, v.f.g., black, brecciated with limonitic carbonate veining ~ vein breccia.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5535973			642152.0	7100549.0	1413.7		13Y731280	Outcrop, ~ 10m wide exposure of qtz arenite, with local networks of f.g. black sulphide veinlets.
E5535974			641776.8	7100609.7	1405.1		13Y731280	Outcrop, vuggy, sheeted, white and limonitic qtz veins, ~ 190/90, 2 mm - 1 cm wide in bedded, 10 cm thick sandstone and 30 cm thick shale. Bedding, 45/30.
E5535975			640841.5	7100654.3	1324.6		13Y731280	Outcrop, white qtz arenite beds, roughly greater than, equal to 30 cm thick, interbedded with grey shale. Some recrystallization with black, sooty "wisps" (sulphide?,
E5535976			637537.3	7098843.7	1399.6		13Y731280	Talus - Narchilla Formation - highly silicified beds?, vuggy, patchy limonite with some euhedral qtz. Antitaxial veining of qtz.
E5535977			637598.6	7098961.9	1319.0		13Y731280	Talus - silicified green shale and sandstone, milky-white, massive qtz, trace py grains.
E5535978			637409.0	7099223.3	1218.1		13Y731280	Outcrop - dark grey, dense dolostone, locally calcite recrystallization.
E5535979			637383.7	7099233.4	1213.5		13Y731280	Outcrop - grey dolostone/limestone with local "veinlets" of fine qtz grains and limonite stained carbonate matrix, trace py, depositional?, alteration (?) ~ weak.
E5535980			637371.3	7099232.1	1201.0		13Y731280	Outcrop - dolostone ~ grey - dense with siliceous zones, highly calcareous but with round qtz grains and hairline veins of black, sooty sulphide?
E5535981			637259.3	7099190.1	1200.1		13Y731280	Outcrop - siliceous limestone, qtz grains with carbonate matrix, some antitaxial qtz veins.
E5535982			641411.6	7100736.5	1329.4		13Y731280	Outcrop - calcareous black shale, 50 by 100 foot escarpment exposure, silicification and carbonate/calcite veining.
E5535983			641350.6	7100840.9	1246.5		13Y731280	Outcrop - quartz-calcite veining in anticline of folded calcareous, black shales and limestone beds, 100 m x 50 m exposed tight folds and brittle faulting.
E5535984			641313.6	7100880.7	1228.7		13Y731280	
E5535985			641308.6	7100872.3	1234.2		13Y731280	Outcrop - brecciated sandstone, highly siliceous with black sulphide (?) stringers and limonite staining, shearing along bedding planes (008/18).
E5535986			641336.8	7100914.9	1188.5		13Y731280	Talus - qtz arenite?, bleached ~ partly sanded, green-yellow stain locally ~ arsenopyrite?
E5535987			641328.6	7100915.2	1189.0		13Y731280	Talus, grab - limonitic green shale with grey-white qtz vein, ~ 2 cm wide.
E5535988			641281.8	7100871.8	1234.7		13Y731280	Outcrop - qtz arenite adjacent to limestone bed with dark grey patches ~ sulphides?
E5535989	356709.5	7102388.4			1664.2		13Y733608	Subcrop - Gull Lake volcanics - calcareous, with limestone lapilli inclusions, qtz-chlorite vein, ~ 10 cm thick, sampled.
E5535990	356546.0	7102538.8			1589.4		13Y733608	Outcrop - silic. Dolostone?, very f.g. granular qtz, dense with v.f.g. black sulphide? (some grains visible) network around qtz grains. Non-calc., 1 mm to gretaer than 1 cm white qtz
E5535991	356547.7	7102543.8			1587.3		13Y733608	Outcrop - moderately calcareous, silicified and vuggy white qtz veining in calc. qtz sandstone plus fine-grained, black, sooty sulphides ~ 1-2%.
E5535992	356530.9	7102530.2			1588.0		13Y733608	Outcrop - weakly calcareous qtz arenite (fine gr gran qtz), white-grey-green with network of sooty black sulphide.
E5535993	364979.7	7104422.0			1772.1		13Y733608	Outcrop - black, siliceous shale with up to 20-30% pyrite, ~ 1/2 m wide in grey-green silica, v.f.g. sedimentary rocks ~ cherty mudstones.
E5535994	364958.7	7104421.6			1814.8		13Y733608	Outcrop - siliceous, cherty mudstone with qtz, trace chalcopyrite veins @ ~ 310/60.
E5535995	364971.7	7104404.1			1830.7		13Y733608	Outcrop - roughly less than, equal to 10% fine diss. Py in cherty layers, likely syngenetic, ~ 1 m wide exposure, strike extent is limited.
E5535996	362970.8	7104484.4			1468.8		13Y733608	Talus - volcanic breccia with siliceous and pyritic matrix.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5535997	362628.8	7104361.8			1445.0		13Y733608	Talus - calcareous (locally 100% calcite), volcaniclastic with ~ 4% fine gr diss py with calcite and some qtz veining from a similar orange stained outcrop ~ 100 m upslope on
E5535998	361346.8	7113566.6			1724.7		13Y733608	Outcrop - dark grey dolostone, locally bleached with white qtz veins, ~ 5 m wide zone of qtz veins in dolomite to zebra textured dolomite.
E5535999	361245.2	7113621.5			1752.8		13Y734503	Outcrop - brecciated, pale limonite stained, qtz veined (~2%) dolomite ~ 3 m wide zone of grey dolomite. Bedding controlled @ ~ 130/82.
E5536000	361605.6	7113539.9			1715.3		13Y734503	Outcrop - qtz-carbonate veining @ dolomite to shale package, contact ~ 1 m wide zone of veining and limonite stain ~ weak.
E5536001	362259.4	7112874.9			1327.7		13Y734503	Float - brecciated limestone, dark grey with white calcite veins.
E5536002	362396.7	7112162.6			1035.0		13Y734503	Outcrop - white qtz- carbonate vein in qtz arenite, 140/74.
E5536003	360817.9	7114087.1			1842.5		13Y734503	Outcrop - fault zone, ~ 110 azimuth in saddle, brecciated limestone with ankerite/limestone zebra bands, trace qtz veining and ~ 15m wide zone.
E5536004	360460.6	7114202.9			1779.5		13Y734503	Outcrop - hand samples of limonitic-calcite-galena (up to ~ 5%) in blasted trench, ~ 1-2 m (?) wide gossan in zebra dolostone.
E5536005	360459.2	7114207.2			1777.8		13Y734503	Outcrop - zebra textured dolostone adjacent to gossanous zone, some silicification, limonite staining.
E5536006	360872.3	7114371.7			1704.5		13Y734503	Talus - qtz arenite with limonitic stained white qtz veins. Some veins have antitaxial growth textures.
E5536007	361074.3	7114429.7			1635.8		13Y734503	Outcrop - 173/90 qtz-chlorite veining in qtz arenite.
E5536008	361096.1	7114530.1			1610.8		13Y734503	Float - calcareous qtz sandstone, weak limonite stain and criss-crossing qtz vein network and massivewhite qtz.
E5536009	361104.4	7114641.4			1576.7		13Y734503	Outcrop - qtz-chlorite vein in qtz arenite, ~ 30 cm wide @ 312/86.
E5536010	361470.9	7115154.3			1579.6		13Y734503	Outcrop - calcareous sandstone, qtz grains and calcite grains and matrix, strongly calcareous, oxidizes red, fine grey sulphide diss on fresh breaks, fracturing and bedding
E5536011	361398.1	7115369.4			1616.3		13Y734503	Talus - boulder - porous ~ partly decalsified gossanous limestone ~ 30% porosity, red and orange colouration, v.f.g. trace visible sulphides.
E5536012	361539.3	7115770.6			1829.0		13Y734503	Outcrop - qtz veining in white recrystallized limestone with zebra texture, general area is talus field of light-pale red dicolouration of limestone.
E5536013	371185.9	7115307.4			1722.8		13Y734503	Outcrop - orange iron oxide stained, light grey shale with ~ 1% diss. F.g. pyrite.
E5536014	371398.7	7115444.6			1659.1		13Y734503	Outcrop - white bull qtz veining in qtz arenite, trace iron oxide (goethite).
E5536015	371512.6	7115637.8			1676.9		13Y734503	Outcrop - rotated outcrop block with broken, tight strain fold, iron oxide stained up to ~ 20 cm from fault, granular qtz vein (?) in fracture.
E5536016	371345.4	7115998.5			1630.8		13Y734503	Outcrop - massive white and iron oxide stained qtz vein boulders, minor calcite, minor chlorite, strong folding in siliciclastics up slope.
E5536017	371425.8	7116144.7			1639.2		13Y734503	Talus - limestone with ~ 10% qtz, medium sand sized grains, some trace pyrite grains, diss.
E5536018	371355.9	7116633.0			1626.2		13Y734503	Talus - zebra dolostone, some minor qtz veining, some bleached and weakly siliceous dolostone as well, weak iron oxide staining.
E5536019	371219.9	7116871.7			1592.3		13Y734504	Outcrop - grey, fine grained dolostone with ~ 1% white qtz veining ~ antitaxial with earthy hematite staining.
E5536020	369128.9	7117192.1			1292.4		13Y734504	Outcrop - vein breccia, ~ 40% black dolostone with angular clasts "floating" in massive white qtz, no limonitic staining.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5536021	369164.2	7117189.0			1296.2		13Y734504	Outcrop - plunging 16 to 310 azimuth of fold hinges, 310/60 axial planar, calcite veining, limestone shale beds reactive and accepting alteration and fluid flow from axial planar
E5536022	369455.9	7117207.3			1356.5		13Y734504	Outcrop - limonite stained black shale with granular qtz veining along cleavage planes, interbedded limestone present, bedding @ 287/59.
E5536023	369219.0	7118626.3			1459.9		13Y734504	Outcrop - 296/61 bedding foliation, limonitic, ~ trace pyritic grey shale.
E5536024	369075.1	7118739.7			1445.7		13Y734504	Subcrop - white qtz vein, very abundant in local area, hillside ~ 4% covered in qtz subcrop in qtz arenite.
E5536025	368919.7	7119332.1			1420.0		13Y734504	Float - white qtz-kaolinite boulder.
E5536026	368903.9	7118910.6			1419.0		13Y734504	Subcrop - vuggy white qtz veining in grey-green shale, trace goethite.
E5536028	367523.1	7118025.6			1530.8		13Y734504	Outcrop - dolostone, limonite weathering with qtz veining.
E5536029	381508.5	7104209.7			1869.0	Subcrop	13Y739112	~ 1 m wide subcrop of calcareous sandstone in saddle, trending ~ 345 azimuth with white qtz veining and vuggy replacement of sandstone. 1 meter channel grab.
E5536030	358088.7	7079955.6			1871.9	Outcrop	13Y739112	Qtz sandy limestone with calcite veins, fairly unaltered, grey.
E5536045	357913.7	7080230.5			1778.5	Talus	13Y739112	1st block out of 2 m deep pit, ~ 1-2% vfg py and sooty pyrite, some calcite veins, very dense, massive. Talus.
E5536046	357847.6	7080179.4			1816.5	Float	13Y739112	Spotted to zebra textures of dark dolomite crystals and orange-white calcite, some yellowish staining, scorodite and jarosite? Float/Talus.
E5536047	357855.4	7080308.8			1788.3	Outcrop	13Y739112	Outcrop - qtz sandstone, calcareous, ~ 1-2% diss py, orange weathering.
E5536048	358116.4	7080462.6			1735.3	Outcrop	13Y739112	Outcrop - qtz sandstone, ~ 80-90% qtz grains, well-rounded, with < 1% diss py.
E5536049	357998.9	7080937.4			1699.7	Outcrop	13Y739130	Calcareous sandstone with abundant qtz, orange weathering, stockwork and boxwork of white qtz veins. Outcrop.
E5536050	357503.4	7081538.0			1691.6	Outcrop	13Y739130	Grey mudstone, soft, noncalc,strongly limonitic with open, porous, honeycomb structure.
E5536052	357809.0	7081659.3			1793.0	Float	13Y739130	Calcareous, qtz sandstone, dark-grey, ~ 8% orange weathered grains, diss after pyrite? Float, subcrop nearby.
E5536053	357609.4	7081687.9			1690.3	Outcrop	13Y739130	General area of blocky talus, weathering orange iron oxide. Fg calc sandstone to coarse-grained qtz sandy limestone, upto 1% diss py.
E5536054	357474.8	7081655.4			1663.2	Float	13Y739130	Intense, white qtz vein stockworked boulder of decalsified, medium-grained qtz sandstone. Float boulder?
E5536055	357468.0	7081642.5			1658.2	Float	13Y740184	Coarse-grained, qtz sandstone with ~ 20% matrix is orange oxidized. Removed from pit.
E5536056	357466.2	7081647.9			1660.4	Subcrop	13Y740184	Orange and yellow, rusty, grey shale with calcite veins, some minor silicification from pit.
E5536057	357474.8	7081845.5			1629.9	Float	13Y740184	Clay-altered, clayish limestone, micro-network of calcite veins, grey-yellow oxide ~ 10%, soft and altered. Large block at bottom of 1.5 foot pit.
E5536058	357500.2	7081921.4			1619.8	Float	13Y740184	Partly decalcified limestone float boulder. Honeycomb network of white calcite with porous (~50% open space), bright-orange limestone clasts between brecciation.
E5536059	357531.2	7082040.2			1604.7	Outcrop	13Y740184	Black micrite limestone bedrock with white calite veining in pit below ~250 ppb gold in soil.

E5539974	359793.8	7099251.4			1564.4		13Y736545	Float, angular - green shale, brecciated with 60 % qtz.
E5539976	360837.8	7099253.2			1746.6		13Y736545	Subcrop - fine volcanic with sooty pyrite, no HCL reaction, 5 % minimum sulphides plus globular pyrite with orange oxidation.
E5539977	360857.4	7099311.9			1753.3		13Y736545	Subcrop between two volcanic outcrops with qtz vein (1 foot wide) to west, hard, silicious with cm wide qtz veins and fine, black sooty sulphides in volcanics? Non-
E5539978	359006.2	7079579.8			1812.8	Talus	13Y739112	Talus - subangular, silicified, brecciated and veined, sandstone.
E5539979	359011.0	7079607.9			1808.5	Talus	13Y739112	Talus - subangular, brecciated, red and grey Narchilla shale with qtz veining (2cm wide or greater), noncalc.
E5539980	359158.1	7079757.3			1730.4	Float	13Y739112	Float - subangular, grey, siliceous limestone?, with calcareous veinlets.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5539981	359165.4	7079754.6			1727.9	Float	13Y739112	Float - Talus Field - subang., zebra dolostone with brecciation where qtz and calcite has intruded.
E5539982	359142.3	7079772.0			1736.9	Float	13Y739112	Float - talus field - subang,brecciated, angular orange oxide matrix clasts (also breccia of seds) by qtz vein.
E5539983	358820.5	7079636.2			1825.4	Float	13Y739112	Float - talus - qtz/calcite slab, remnants of grey seds in matrix, mod oxidation.
E5539984	358774.8	7079653.1			1838.6	Float	13Y739112	Float - talus - subang., mildly siliceous dolostone with leopard texture.
E5539985	357885.7	7080117.2			1826.1	Float	13Y739112	Float - talus, qtz sandstone, sheared, fractured, hematite in matrix and stained on surface, orange oxidation, noncalc, hematite veinlets.
E5539986	358122.9	7080413.5			1732.3	Subcrop	13Y739112	Subcrop - fine grained to medium grained sandstone, grey, with orange oxide staining and qtz veining, manganese and iron staining, no HCL reaction.
E5539987	358093.8	7080428.6			1725.6	Talus	13Y739112	Talus - angular, local source, fine-grained, grey-black sandstone with manganese and qtz veining (90%, 10% calcite) with orange oxide pockets throughout, matric
E5539988	358103.4	7080418.1			1728.0	Outcrop	13Y739112	Outcrop - dark-brown-black soil and clasts from rusty, carbonaceous seds. Degraded bedrock.
E5539989	357986.6	7080820.4			1682.3	Subcrop	13Y739112	Subcrop at base of trench - qtz veining (oxide patches) along bedding, minor silicification of calcareous, black mudstone, foliation evident, highly friable, orange and red oxide.
E5539990	357990.8	7080826.1			1687.9	Float	13Y739112	Float - angular to subangular - calcareous sandstone with crisscrossing cm wide qtz veins (some grey), orange surface oxidation.
E5539991	358361.1	7081050.8			1662.8	Subcrop	13Y738893	Subcrop @ outcrop - calcareous dolostone with black jack occuring with qtz/calcite and red sphalerite occuring in calcareous sections.
E5539992	358402.1	7081131.2			1667.3	Float	13Y738893	Float - angular, in talus, sooty-looking, grey to dark-grey, noncalc qtz grained sandstone?, with surficial yellow (jarosite?) coating (fine sulphides?), bright red pinpoint crystals
E5539993	358389.8	7081124.5			1669.3	Float	13Y738893	Float - angular, in talus - foliated, slighty faded, dark-grey shale with qtz in beds (up to 2cm), noncalc, very oxidized.
E5539994	358351.4	7081171.2			1687.9	Float	13Y734658	Float in talus, angular - dark and white qtz, granular, grey coloured matrix with sulphide pits, yellow (jarosite), orange and rusty red oxide, visible sulphides trace, noncalc.
E5539995	357780.6	7080946.6			1654.1	Float	13Y734658	Float, subangular - white and grey matrix, mildly calcareous with very fine sulphides, qtz veined (1-2 cm), 20 meters NW of 34 ppb gold in soil. Silicified limestone?
E5539996	357817.1	7080930.1			1667.6	Subcrop	13Y734658	Subcrop, subangular - calcareous sandstone, orange oxide matrix, qtz veined (pervasive, massive, 1/2 cm veinlets), 23 meters E of 34 ppb gold in soil.
E5539997	357449.3	7082636.4			1603.2	Talus	13Y734658	Talus under ground cover - calcite-rich limestone, also orange oxidized limestone; from trench. 107 ppb gold in soil.
E5539998	357449.2	7082644.4			1603.6	Outcrop	13Y738893	Bedrock - ~ 50 cm depth, variably calcareous, rusty, fragile, grey to dark-grey mudstone. 107 ppb gold in soil.
E5539999	357672.4	7082844.6			1528.7	Subcrop	13Y738893	Subcrop - subangular boulders in till, sper oxidized, porous sandstone. 80 ppb gold in soil.
E5540000	357879.7	7082774.0			1561.3	Float	13Y743402	Float - large, subangular boulder, silicified sandstone with qtz veining and mas qtz, sericite alteration, vein is fractured and healed, trace fine sulphides. 230 meters east of
E5540001	357775.9	7082670.1			1573.1	Float	13Y743402	Float - weathered limestone, bleached looking with qtz eyes, calcareous, some areas very fg, minor oxid.
E5540002	357663.3	7082924.0			1521.2	Talus	13Y743402	Talus under ground cover, thin, up to 3 cm platy shale-seds, dark-grey with minor oxid, noncalc. @ 35 ppb gold in soil.
E5540003	357662.4	7082930.6			1520.1	Float	13Y743402	Float in trench, angular to subang, major orange to orange-red oxid, porous sections calcareous, sandstone. @ 35 ppb gold in soil.
E5540004	357599.8	7083043.2			1510.3	Float	13Y743402	Float - orange and red oxidized, small pieces of noncalc, porous, irregular shaped, limestone, oxidized limestone (orange in matrix), red on surface, found below surface in

E5540558	355230.9	7100681.0			1689.9	Outcrop	13Y753458	Outcrop - 3 meter chip channel, 112 azimuth, transitioning out of dolostone with orange brown weathering to realgar weathering, dolostone.
E5540559	355226.4	7100681.6			1691.0	Outcrop	13Y758292	Outcrop - 3 meter chip channel, 112 azimuth, dolostone
E5540770	353695.0	7091950.0			1414.0	Float	13Y747890	Quartz/Limestone alteration,No visible sulphides.Boulder approx 5-10cm's.
E5540771	353652.0	7091857.0			1394.0	Float	13Y747890	Laminated siltstone with fine grained disseminated pyrite.Small boulder approx 10-20 cm's.Outer surface limonitic.Cherty.
E5540772	356758.7	7082115.0			1910.3	Outcrop	13Y747890	################
E5540773	356176.6	7081626.3			1794.9	Float	13Y747890	Small angular boulder approx 10-10cm's,large calcite crystals,carbonated.
E5540774	356161.8	7081596.2			1793.9	Outcrop	13Y747890	Black Limestone.Strong sulphur smell.Fine traces of pyrite.
E5540775	356241.9	7081628.4			1840.6	Outcrop	13Y747890	Fine grained sandstone(layering) with fine traces of pyrite.Sample taken along contact with the black limestone.
E5540776			636654.0	7096932.0	1501.0	Outcrop	13Y747890	Grey siltstone with narrow dark veining.pods of pyrite.Oxidation around the pyrite also small narrow qtz veining.
E5540777			636859.0	7096926.0	1556.0	Float	13Y747890	Small sub-angular boulder silicified sandstone with narrow quartz veining also fine traces of pyrite.Has strong sulphur smell.
E5540778	355732.0	70801053.0			1701.0	Outcrop	13Y747890	Small narrow fold, limonitic, silicified sandstone approx 0.5 meters.
E5540779	356721.0	7081788.0			1909.0	Float	13Y747890	Small narrow quartz veining,silicified sandstone with traces of pyrite.Rusty,narrow qtz veining,sample taken in skree slope.
E5540780	357285.0	7081826.0			1705.0	Subcrop	13Y747890	Black limestone with narrow calcite veins with fine traces of sulphides(pyrite).
E5540781	359069.0	7079676.0			1799.0	Float	13Y747890	Small angular boulder, silicified sandstone with qtz veining, limonitic. Boulder in skree slope.
E5540782	359128.0	7079815.0			1772.0	RubbleCrop	13Y747890	Limonitic siltstone with clusters of pyrite.
E5540783	359717.0	7080028.0			1560.0	Float	13Y747890	Large sub-angular qtz boulder(Qtz stockwork), heavily limonitic, no visible sulphides. Qtz/SS alteration.
E5540784	359790.0	7080396.0			1536.0	Subcrop	13Y747890	Grey/green shaley /siltstone with clusters of pyrite.Possible sub-crop?Exposed area approx 40-80 cm's.
E5540785	359854.0	7080607.0			1502.0	Float	13Y747890	Rusty qtz veining/Qtz stockwork/altered with disseminated and clusters of pyrite.
E5540786	358069.0	7079733.0			1727.0	RubbleCrop	13Y747890	Boulder approx 20cm. Brown silicified sandstone,limonitic and qtz veining (5-10mm) wide.
E5540787	358147.0	7079954.0			1882.0	Outcrop	13Y747890	Brown, silicified sandstone, limonitic. Qtz/Calcite alteration, no visible sulphides.
E5540788	358307.0	7079958.0			1912.0	Outcrop	13Y747890	Qtz vein dip 30 degrees/strike 170 degrees, limonitic, no visible sulphides. Qtz/SS alteration.
E5540789	358303.0	7080019.0			1866.0	Float	13Y747890	Sampled on high arsenic soil #21495. Located in skree slope; narrow calcite veining, black limestone with fine-grained, disseminated pyrite.
E5540790	358247.0	7080019.0			1867.0	Float	13Y747890	Small, angular boulder of black limestone dug up on soil anomaly # 21496; narrow calcite veining. Fine-grained disseminated sulphides.
E5540791	380126.0	7080314.0			1633.0	Float	13Y747890	Large, angular silicified boulder with 10% disseminated pyrite. Coarse- grained, rusty iron staining on outer surface approx size 30-50 cm.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5540792	380113.0	7080306.0			1636.0	Float	13Y747890	Angular boulder approx 15 cm, brown, silicified sandstone with quartz veining, pods of weathered pyrite (5-10mm).
E5540793	380246.0	7080248.0			1606.0	Float	13Y747890	Small pods of pyrite (2-4mm); small narrow quartz veining, coarse- grained. Highly weathered.
E5540794	378143.0	7099382.0			1764.0	RubbleCrop	13Y753483	Grey-green shale with pods of pyrite. Some iron staining around the edges. Also fine-grained, disseminated pyrite.
E5540795	377750.0	7099629.0			1724.0	RubbleCrop	13Y753483	Medium-dark-grey shale, laminated with pods of pyrite 5-10mm.
E5540796	377692.0	7099726.0			1708.0	Float	13Y753483	Grey siltstone/chert, with narrow bands of pyrite. Very angular.
E5540797	375221.0	7117812.0			2058.0	RubbleCrop	13Y753483	Quartz rubble with small traces of Chalcopyrite, 0.5% approx. Small trace of Bornite alteration with green shale.
E5540798	375171.0	7117812.0			2025.0	RubbleCrop	13Y753483	Silicified sandstone with narrow quartz veining, disseminated pyrite along the edges of the quartz veins. Narrow quartz veins also throughout the green shale.
E5540799	375004.0	7117407.0			2024.0	Outcrop	13Y753483	Quartz vein in green shale,strike 162/dip 44 degrees. Heavily disseminated suphides ~ 40%. Sample taken where Qtz Vein appears to be 20 cm wide.Qtz vein seems to pinch off
E5540800	374056.0	7117012.0			1786.0	Outcrop	13Y753483	Quartz stockwork altered with green shale, no visible sulphides, limonitic.
E5540801			645872.0	7092785.0	1472.0	RubbleCrop	13Y753483	Silicified sandstone,limonitic veins, no visible sulphides, sample taken directly above soil anomoly in a talus slope drainage.
E5540802			643320.0	7090658.0	1685.0	Outcrop	13Y753483	Siltstone (light-drk grey), small pods of pyrite, iron staining, slightly carbonated in areas, sulphides bleeding out of the outcrop which appears to bubble.
E5540803			643249.0	7090619.0	1665.0	Float	13Y753483	Subangular, silicified dolostone with narrow qtz veining, spotty leopard texture and disseminated pyrite.
E5540804			642199.0	7090503.0	1672.0	Outcrop	13Y753483	Silicified sandstone with minor traces of pyrite,slightly limonitic.
E5540805	355017.0	7100391.0			1575.0	Outcrop	13Y753483	3 meter sample - quartz-rich, slightly carbonated sandstone.
E5540806	355017.0	7100394.0			1573.0	Outcrop	13Y753483	3 meter sample - quartz-rich, slightly carbonated sandstone.
E5540807	355015.0	7100388.0			1571.0	Outcrop	13Y753483	Quartz/Calcite rich with yellow tarnish.
E5540808	355022.0	7100383.0			1579.0	Outcrop	13Y753483	Silicified dolostone with some zebra texture, slightly carbonated.
E5540809	355030.0	7100378.0			1571.0	Outcrop	13Y753483	Silicified sandstone/calcite veining.

E5661060	358733.0	7081106.0			1585.6		13Y736545	Outcrop - 1 cm galena (10 %) in carbonate matrix with orange oxide.
E5661079	359626.1	7080122.2			1618.9	RubbleCrop	13Y747885	some limestone clasts mixed in. quartz calcite vein present(possible ankerite).
E5661080	359787.3	7080416.6			1539.7	Outcrop	13Y747885	patches of unidentified deep green inside. Contact between two siltstone beds(above is purple, below is green-grey)
E5661081	377900.1	7081056.6			1700.5	Float	13Y747885	possible sulphides. Calcarious in the lighter bands. Sample pulled from where the soil was a richer brown colour. Limonite pervasive in the calcarious layers.
E5661082	377887.6	7081137.6			1741.3	Float	13Y747885	staining present that adds colour to the sample(red, green, purple). Possible sulphides.
E5661083	377555.4	7080982.5			1587.1	Float	13Y747885	staining present. Possible sulphides. Limonite also in blobs along fractures(moderate to strong).
E5661084	377452.8	7081002.0			1570.8	Float	13Y747885	vugs are square where pyrite used to be. Some staining present. Blotches of sulphides near surface of sample(unidentified). Sulphides are silvery colour, not cubic and found
E5661110	359002.2	7079604.0			1818.9	RubbleCrop	13Y739112	Milky white qtz w/vuggy orange limonitic veins. ~5cm thickness. Likely hosted in maroon green Narchilla shales.
E5661111	359000.1	7079603.8			1820.1	RubbleCrop	13Y739112	Similar to E5661110; brecciated green Narchilla shale w/rusty, vuggy white quartz.
E5661112	359044.7	7079722.8			1829.5	Float	13Y739112	Rusty weathering, dark blue-grey dolostone debris flow with minor quartz and light silicification.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5661113	359045.3	7079720.4			1831.4	Subcrop	13Y739112	Bright orange, limonitic quartz breccia through dark blue grey shale fragments.
E5661114	359037.9	7079730.8			1835.7	Subcrop	13Y739112	Rusty qtz vein ~7cm thick infilled with calcite.
E5661115	359196.6	7079942.1			1751.9	Subcrop	13Y739112	Orange limonitc qtz breccia through dull maroon-green siltstone.
E5661116	359192.0	7079969.1			1773.5	Subcrop	13Y739112	Rusty, silicified qtz arenite beneath fault contact w. mm scale qtz stringers.
E5661117	359192.3	7079965.4			1779.8	Subcrop	13Y739112	Lightly silicified tan-orange weatheirng limestone at basal contact of major E-dipping thrust. Yellow alteration (possibl trace scor?) on fractures.
E5661118	359181.2	7079967.5			1778.3	Outcrop	13Y739112	Rusty, orange-weathering qtz arenite; similar to but more silicified than E5661116. Taken ~2m below E dipping thrust contact.
E5661119	359208.2	7079964.7			1757.4	Outcrop	13Y739112	Brecciated, bright orange limonitic shear zone through pale maroon green shales. ~5-15 cm thick, oriented 195/25. Diss. Pyrite in surrounding wall rocks.
E5661120	359167.7	7079897.0			1751.2	Float	13Y739112	Rusty calcite breccia through dark blue marble/altered ls. Pervasive yellow/green staining, possibly As oxide. Float weathers orange-tan.
E5661121	359097.2	7079698.2			1777.1	Float	13Y739112	Silicified qtz sandstone, grey & orange weathering with limonite rimmed qtz stockwork. Euherdral & disseminated clusters of pyrite, >1%.
E5661140	358375.7	7081025.4			1661.0	Float	13Y740184	Lightly silicified qtz-cal brecciation through dolomitized host. Dull, light brown weathering, yellowish tinge to fracture faces.
E5661141	358043.4	7079969.6			1864.6	Float	13Y740184	Calcitic breccia through light carbonate with pink & yellow to deep red (hem) Fe alteration. Vuggy zones. Float near mountain pass ridge top.
E5661142	357930.1	7080048.1			1809.8	Float	13Y740184	Fault brecciated carbonate w/ distinct pitted (minor bxwk) weathering texture. Massive stibnite (?) in matrix, also pitted. Large float block with others (+/- stibnite) nearby.
E5661143	357921.5	7080152.9			1794.9	Trench	13Y740184	Hematite stained, polymictic, calcareous matrix supported breccia (sedimentary?) w/ various clastic & carbonate clasts from 1 mm to 2 cm.
E5661144	357930.0	7080048.0			1187.8	Talus	13Y740184	Similar to E5661142; heavily brxted calcareous carbonate with pitted, boxworked weathering texture. Minor dark, fine-grained matrix (carbonaceous?) and bright rusty
E5661145	358479.0	7081063.0			1636.0	Trench	13Y740184	Dense sphalerite specimen from 75-TR-21 w/mineralization through lightly silicified dolostone.
E5661146	358477.0	7081065.0			1636.0	Trench	13Y740184	Lightly silicified dolomitized carbonate from McIntyre Mines 1975 trench: 75-TR-21. Abundant massive sphalerite. Similar to E5661138 & E5661145.
E5661147	357266.0	7083053.0			1190.5	Trench	13Y743402	Representative grab from 2012 high As soil follow-up pit of limonitic, qtz veined qtz arenites with minor quartz veins and siltstone samples. Visibly altered material selected
E5661148	357421.0	7083347.0			1190.5	Trench	13Y743402	Selective rep. sample of dark blue to black, fissile siltstones from follow-up pit to high 2012 Au, As in soils.
E5661149	357421.0	7083347.0			1190.5	Trench	13Y743402	Subangular, intensely limonitic qtz arenite w/light qtz veining & sericite alteration.
E5661150	357388.0	7082951.0			1189.7	Float	13Y743402	Limonitic qtz breccia through dark blue siltstone with disseminated sulphides in clasts and minor calcite along fractures.
E5661151	357390.0	7082946.0			1189.5	Float	13Y743402	Likely useless… Float/outcrop pseudo-representative chip sample across N-S fold/fault structures exposed on F2 target. ~15m sample distance. Various lithologies.
E5661152	357376.2	7082948.6			1591.6	Float	13Y743402	Likely useless… Float/outcrop pseudo-representative chip sample across N-S fold/fault structures exposed on F2 target. ~15m sample distance. Various lithologies.
E5661153	357361.6	7082957.0			1594.7	Float	13Y743402	Likely useless… Float/outcrop pseudo-representative chip sample across N-S fold/fault structures exposed on F2 target. ~15m sample distance. Various lithologies.
E5661154	357347.3	7082959.0			1594.9	Float	13Y743402	Likely useless… Float/outcrop pseudo-representative chip sample across N-S fold/fault structures exposed on F2 target. ~15m sample distance. Various lithologies.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5661155	357331.5	7082962.3			1600.0	Float	13Y743402	Likely useless… Float/outcrop pseudo-representative chip sample across N-S fold/fault structures exposed on F2 target. ~15m sample distance. Various lithologies.
E5661156	357311.1	7082961.5			1595.4	Float	13Y743402	Likely useless… Float/outcrop pseudo-representative chip sample across N-S fold/fault structures exposed on F2 target. ~15m sample distance. Various lithologies.
E5661157	357289.7	7082959.4			1596.6	Float	13Y743402	Likely useless… Float/outcrop pseudo-representative chip sample across N-S fold/fault structures exposed on F2 target. ~15m sample distance. Various lithologies.
E5661158	357272.0	7082959.5			1593.3	Float	13Y743402	Likely useless… Float/outcrop pseudo-representative chip sample across N-S fold/fault structures exposed on F2 target. ~15m sample distance. Various lithologies.
E5661159	357256.8	7082965.1			1600.5	Float	13Y743402	Likely useless… Float/outcrop pseudo-representative chip sample across N-S fold/fault structures exposed on F2 target. ~15m sample distance. Various lithologies.
E5661160	357582.7	7082235.6			1581.5	Trench	13Y740184	Dark blue/grey silt/mudstone with bright orange limonitic fracture faces. Possible gouging or minor clay alteration. Weak. Zones of Fe-Mg alteration/staining. Trace
E5661161	357544.8	7082547.7			1576.9	Trench	13Y740184	Calcite matrix breccia through earlier silicified blue-grey carbonate with trace disseminated pyrite. Rusty, cemented breccia weathering appearance, found as buried
E5661162	357548.2	7082540.0			1569.0	Trench	13Y740184	Limonitic qtz ss, lightly silicified & cut by mm scale qtz stringers. From 2012 high soils follow-up pit; 13JSB005. Float ~ 1m below surface.
E5661163	357548.2	7082540.2			1569.2	Trench	13Y740184	Sample of blue-grey shale bedrock at bottom of 2012 soils follow-up pit. Incompetent material; fragments rarely >5cm. Depth 160 cm. Should be compared to soil sample
E5661164	357548.3	7082540.5			1569.5	Trench	13Y740184	Sample of gauged red layer 50-70 cm deep in 2012 soil anomaly follow-up pit. 13JSB005. Likely altered silstone or sandstone; intense hematite red colour & slicken textures.
E5661165	359512.2	7079518.6			1726.9	Float	13Y741281	Lightly silicified, dolomitic brecciation with vuggy pitted section rimmed by massive galena. Light to tan-orange weathering rind. Float.
E5661166	359502.2	7079495.7			1741.1	Float	13Y741281	Very strong (diff. to break) dolomitized carbonate w/ carbonaceous stylolites. Float.
E5661167	357241.0	7082942.8			1582.0	Float	13Y741281	Likely useless… Float/outcrop pseudo-representative chip sample across N-S fold/fault structures exposed on F2 target. ~15m sample distance. Various lithologies.
E5661168	388670.9	7110172.1			1740.6	Subcrop	13Y741278	Limonitic qtz vein, milky white, subcropping on cental ridgeline.
E5661169	388692.1	7110409.3			1576.0	Talus	13Y741278	Strongly limonitic calcite veins intruding through earlier qtz, hosted in pyritic blue-grey siltstone.
E5661170	401622.5	7090770.7			1649.3	Float	13Y741278	Medium grained limonitic qtz arenite w/ dark blue grey matrix, possible minor fine sulphides.
E5661171	401601.9	7090786.9			1623.1	Subcrop	13Y741278	Light quart breccia through fine-med grained grey sandstone with sericitic & limonitic alteration. Slicks.
E5661172	401103.6	7091026.6			1487.8	Float	13Y741278	Silicified, qtz-brecciated siltstone w/trace pyrite in clasts. Interesting patch of bright red fe-ox alteration; check As numbers for possible As4S4…
E5661173	401101.4	7091009.9			1494.7	Float	13Y741278	fault brecciated, lightly silicified blue-grey siltstone with abundant, mm-scale pyrite clusters occuring as clasts + disseminated pyrite in matrix. Distinct Fe-Mg oxide red-
E5661174	356521.7	7082977.6			1695.2	Subcrop	13Y741278	Dolomitized dk blue ls w/ vuggy section & pod of massive red sphalerite. Rep sample in camp.
E5661175	356476.6	7082839.6			1714.1	Trench	13Y741278	Outcrop sample of massive galena replacement of dolostone, distinct greenish hue, exposed 1.5 by 2m or more in old McIntyre Mines pit, likely TR-75-4. Rep sample in
E5661176	355812.1	7082871.5			1824.9	RubbleCrop	13Y744014	Strongly-limonitic-matrix-supported tectonic breccia through bleached maroon/green shales; occurs as rubblecrop along recessive feature trending 10 deg (or 190) through
E5661177	355574.1	7082440.2			1977.5	Subcrop	13Y744014	Fratured qtz vein through silicified, lightly limonitic gouge in Arrowhead fm. siltstone breccia.
E5661178	355685.5	7082391.8			1932.6	Outcrop	13Y744014	Possible goethite in tensile fracture qtz veins oriented ~270/90 (vertical), to 5 cm wide.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5661179	355488.4	7082122.4			1799.9	Float	13Y744014	Possible scorodite alteration in lightly silicified qtz arenite.
E5661180	357446.4	7082665.0			9999.0	Trench	13Y746414	F2-TRENCH-2013-002 Medium-grained blue-grey limestone with minor dark carbonaceous zones & layers (stylolites?) and light calcite stockword.
E5661181	357444.0	7082665.0			9999.0	Trench	13Y746414	F2-TRENCH-2013-002 Gouged blue-grey siltstone with rusty fractures and gouge.
E5661182	357442.6	7082665.0			9999.0	Trench	13Y746414	F2-TRENCH-2013-002 Zone of more competent orange weathering blocky siltstone.
E5661183	357440.9	7082665.0			9999.0	Trench	13Y746414	F2-TRENCH-2013-002 Recessive zone of blue-grey siltstone with minor qt veining & bright orange rust, possible gouge.
E5661184	357439.7	7082665.0			9999.0	Trench	13Y746414	F2-TRENCH-2013-002 Very strong unit. Bright orange limonitic brecciation through blue siltstone.
E5661185	357438.1	7082665.0			9999.0	Trench	13Y746414	F2-TRENCH-2013-002 Recessive zone of blue-grey siltstone with minor qt veining & bright orange rust, possible gouge.
E5661186	357438.7	7082664.0			9999.0	Trench	13Y746414	F2-TRENCH-2013-002 Foliated/bedded blue grey siltstone with trae quartz & concoidal fracture.
E5661187	357436.1	7082664.0			9999.0	Trench	13Y746414	F2-TRENCH-2013-002 Foliated/bedded blue grey siltstone with rusty fractures.
E5661188	357434.1	7082664.0			9999.0	Trench	13Y746414	F2-TRENCH-2013-002 Foliated/bedded blue grey siltstone with rusty fractures & one small silicified rusty breccia zone.
E5661189	357432.2	7082664.0			9999.0	Trench	13Y746414	F2-TRENCH-2013-002 Subcrop sample - foliated/bedded blue grey siltstone with rusty fractures.
E5661190	359676.7	7083360.7			1310.9	Float	13Y746411	Fine grained dark blue (to black) limetsone, difficult to break, sandy limestone with fine disseminated pyrite cubes. Immediately above 2012 Au spot soils anomaly.
E5661191	387628.1	7109140.0			2085.5	RubbleCrop	13Y746411	Calcareous breccia through limonitic carbonates, calcite stkwk cut by later qt veins (to ~2cm width). Minor euhedral pyrite.
E5661192	387712.7	7109082.6			2020.3	Float	13Y746411	Calcite vein through plae grey micrite, euhedral pyrite cubes to 1mm in both units (<0.5%) and minor sericite alteration in micrite.
E5661193	387826.9	7108999.5			1920.3	Subcrop	13Y746411	Brecciated, zebra-textured light coloured (grey) medium grained dolostone with yellow weathering on fractures and trace sericitization. Subcrop/outcrop.
E5661194	388234.2	7108966.6			1895.4	Subcrop	13Y746411	Fine grained grey limestone, brecciated by calcite with slickenlines and regions of strong hematite & limonite alteration. Subcrop, from east limb of 10s of m scale, ~SW vergent
E5661195	388374.1	7109051.1			1899.7	RubbleCrop	13Y746411	Fault brecciated carbonate unit with calcite stkwk and minor dogtooth dolomite recrystallization in cavity. Intense hematite & limonite alteration in separate regions,
E5661196	388569.4	7108845.9			1690.8	Float	13Y746411	Fine to medium grained calcareous qtz arenite with 5mm thick yellow-weathering alteration rind.
E5661197	388942.3	7109036.0			1749.2	Float	13Y746411	Bright orange limonitic calcite breccia through fine grained ls.
E5661198	387856.6	7109026.6			1945.3	Subcrop	13Y746411	Finely laminated, silicified vfg. Siliciclastics w/ pyrite-bearing hematite laminae. Some minor yellow coating on fractures.
E5661199	356737.8	7082051.2			1930.2	Float	13Y747935	Decalcified, medium grained qtz areite, vuggy with light silicification.
E5661200	402382.3	7088446.5			1601.2	Float	13Y747935	Limonitic quartz through green-grey siltstone/argillite.
E5661201	400573.2	7086612.5			1308.7	Float	13Y747935	Brecciated, bleached, limonitic silstone with large (to 1 cm), weathered out euhedral pyrite cubes.
E5661202	377249.0	7081307.8			1717.7	Float	13Y747935	Limonitic quartz float with possible light scorodite staining on fractures.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5661203	377143.0	7081607.3			1683.6	Trench	13Y747935	Rock sample of clay-rich gouge or weathering material with abundant foggy yellow-white limonitic quartz & bleached fine grained siliciclastic clasts. Corresponds to soil
E5661204	377147.0	7081594.4			1660.1	Trench	13Y747935	Cloudy, manganese & limonite stained quartz with several large (~3mm) pyrite cubes. Subcrop sample from large, resistant boulder in 13JSB053 follow-up pit.
E5661205	377144.8	7081596.5			1660.6	Trench	13Y747935	Limonitic quartz material from 13JSB053 with light sericitization & weathered out, fine to medium-grained sulphides. Possible scorodite staining near weathered sulphides.
E5661206	377146.4	7081600.5			1657.9	Trench	13Y747935	Fine-grained, sheared blue-green siltstone w/manganese staining & green coating to fractures that turns white on exposure to sunlight. Subcrop/shale from follow-up pit at
E5661207	377147.5	7081601.8			1659.8	Trench	13Y747935	Bleached/clay altered white fine-grained siliciclastic found as subcrop/shale in follow up pit at station 13JSB054. Similar to clasts in soil sample E5532504.
E5661208	377145.9	7081602.5			1661.8	Float	13Y747935	Manganese and limonite stained siltstone with quartz veining & light silicification, taken on surface adjacent to 2.56 g/t Au soil site.
E5661209	377098.9	7081719.7			1639.6	Subcrop	13Y747935	Light clay alteration in sheared fine grained siliciclastic subcrop, orange weathering, minor hematite or manganese staining. Weathered out sub mm scale sulphides.
E5661210	408320.7	7079670.0			9999.0		13Y747935	Light greent o tan, fine-grained siliciclastic unit with abundant weathered-out euhedral pyrite voids to 5 mm across. Limonitic. Some residual pyrite.
E5661211	407446.9	7080241.0			9999.0		13Y747935	Rusty qtz vein with dark parallel fracture set.
E5661212	407380.7	7080305.0			9999.0		13Y747935	Blue-grey siliciclastic (qtz arenite supported) debris flow unit with greenish (scor?) weathering hue. Vuggy matrix with abundant (~5%) fine grained sulphides + euhedral
E5661213	377095.4	7081630.4			1661.2	Outcrop	13Y747935	Outcropping vein of limonitic quartz with clay-altered fine-grained siliciclastic vein selvages.
E5661214	377143.5	7081600.6			9999.0	Trench	13Y747935	Light tan, lightly clay-altered siltstone with weathered out pyritohedra. From follow up pit to 2.5 g/t Au soil at 13JSB053.
E5661215	377145.5	7081601.7			9999.0	Trench	13Y747935	Strongly limonitic quart vein, taken at follow-up pit to high soil at station 13JSB053.
E5661216	377145.0	7081601.0			9999.0	Trench	13Y747935	Limonitic, fractured qtz with possible scorodite staining. Subcrop from follow-up pit at 13JSB053.
E5661217	377158.3	7081464.3			1690.4	Trench	13Y747935	Lightly calcareous, bright orange limonitic breccia through quartz and quartz arenite. Float.
E5661218	377146.0	7081601.7			9999.0	Trench	13Y747935	Limonitic, fractured quartz vein with possible light scorodite staining, minor vuggy areas.
E5661219	354599.4	7119774.4			1798.3	Float	13Y762297	Orange weathering, lightly calcareous sandy matrix of debris flow unit.
E5661220	354449.9	7119723.1			1791.5	R.Glacier	13Y762297	Quartz breccia through dark grey siltstone, cut by later carbonate veins w/minor rust.
E5661221	354607.7	7119865.8			1776.1	Float	13Y762297	Green-grey siltstone with dark weathering sections, light silicification/chert and abundant pyrite (euhedral cubes to 3mm)
E5661222	354789.0	7120286.0			1707.4	Float	13Y762297	Qtz carbonate vein float, rusty-weathering carbonate.
E5661223	354732.6	7120407.4			1783.6	RubbleCrop	13Y762297	Limonitic qtz breccia through green-grey siltstone wall rock w/ moderate silicification. Minor hematite. Sample from ridge top.
E5661224	354742.3	7120402.8			1779.8	Outcrop	13Y762297	Outcropping qtz intruding through Mn & Fe-stained green-grey siltstone.
E5661225	356168.7	7121117.4			1442.1	Outcrop	13Y762297	Orange-tan weathering light green grey fine-grained dolomitized carbonate with minor silicification & limonite in matrix. Outcrop orientations variable; brecciation occurs near
E5661226	372114.2	7117992.5			1361.6	Float	13Y762297	Subangular qtz vein float with soft, weathered limonitic patches throughout interior.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5661227	372034.1	7117315.2			1207.3	Float	13Y762297	Dark grey to black, fine-grained, sheared siliciclastic with mn/fe oxide stained areas and vugs. Alluvial float in canyon bottom.
E5661228	371978.7	7117406.8			1227.5	Float	13Y762297	Rusty clacite breccia through dark grey limestone.
E5661229	371922.4	7117428.9			1222.7	Float	13Y762297	Hematitic calcite breccia with fine grained qtz arenite clasts. Rounded float.
E5661230	372107.2	7117334.8			1233.5	Outcrop	13Y762297	Lightly silicified limestone with large calcite veins infilled by fluorite.
E5661231	372101.0	7117336.5			1227.7	Float	13Y762297	Float near outcrop - grey, fine-grained limestone clast-supported breccia with vuggy Mn, Fe stained and grey areas. Calcitic matrix.
E5661232	372110.2	7117333.6			1222.9	Outcrop	13Y762297	Heavily silicified, fine-grained grey limestone in outcrop.
E5661233	372085.0	7116972.4			1280.6	Subcrop	13Y762297	Rusty, vuggy sections in brecciated blue-grey limestone with small (~3mm wide) "beef" calcite veinlets.
E5661234	388028.3	7110808.7			1943.7	Talus	13Y762297	Quartz stockwork through limonitic alteration of fine siliciclastics. Talus float.
E5661235	387935.6	7110819.7			1944.1	Float	13Y762297	Selective replacement of calcareous-matrix rounded qtz arenite debris flow unit with massive euhedral pyrite and possible patch of chalco.
E5661236	387942.3	7110950.2			1927.3	Float	13Y762297	Lightly decalcified or leached tectonic breccia w/angular qtz vein and qtz arenite clasts. Lightly limonitic, green-grey colour.
E5661237	387904.1	7110946.6			1894.4	Float	13Y762297	Qtz veins through limonitic, lightly silicified qtz-arenite-matrix debris flow with fine grained grey siliciclastic clasts. Open spaces with drusy qtz, crystals to 1 cm.
E5661238	387812.2	7110870.6			1876.1	Float	13Y762297	Fractured/gouged limonitic qtz vein. Float.
E5661239	387809.0	7110869.7			1871.6	Float	13Y762297	Intensely limonitic qtz arenite with moderate silicification and Mn weathering rhine.
E5661240	387740.0	7110802.1			1880.9	Float	13Y762297	Heavily silicified qtz arenite with moderate limonite and greenish hue.
E5661241	387811.1	7110975.1			1836.2	Float	13Y762297	Heavily silicified qtz-arenite-matrix debris flow with fine grained dark grey siliciclastic clasts & yellow to greenish oxidized material. Euhedral, weathered-out pyrite voids.
E5661242	387785.9	7111003.7			1807.6	Float	13Y762297	Green-brown calcareous breccia with fine to medium grained qtz arenite clasts. Distinct conglomeratic/brecciated weathering appearance.
E5661243	387597.4	7111086.6			1681.0	Float	13Y762297	Silicified qtz arenite clasts held together by fe-oxide calcite cement with greenish hue.
E5661244	387539.0	7110902.0			1623.3	Outcrop	13Y762297	Heavily leached, dark grey, non-calcareous concretion outcropping on cave ceiling with remnant qtz grains. Distinct lime yellow colour, pod ~15 cm across by 5 cm thick.
E5661245	387537.0	7110900.0			1625.2	Outcrop	13Y762297	Limonitic calcite +/- ankerite vein through dark grey siltstone, oriented along axial planar cleavage at ~120/80. Vein ~5 cm thick.
E5661246	387476.6	7111007.9			1658.4	Outcrop	13Y762297	Silicified qtz arenite, limonitic, w/ large disseminated euhedral pyrite and small patches of fine-grained pyrite. Dark maroon Mn weathering colour. Small fold hinge.
E5661247	387483.2	7111105.2			1630.3	Float	13Y762297	Crumbly qtz arenite with intense limonitic and hematitic solution fronts.
E5661248	387493.4	7111187.6			1623.3	Float	13Y762297	Grungy limestone with small limonitic pods and possible fine disseminated sulphides.
E5661249	387480.8	7111308.3			1597.8	Float	13Y762297	Fine gr. Qtz arenite with dark alteration bands and finely porous limonitic sections.
E5661250	387479.9	7111309.2			1598.5	Float	13Y762297	Rusty weathering, heavily sheared and moderately silicified dk grey silstone with large vuggy sections.

E5661283	355489.5	7100510.7			1617.7	Outcrop	13Y753486	~3m chip, ~293 Azimuth, light-grey and coarse-grained (~ 1mm) zebra dolostone, minor amount of grey mudstone
E5661284	355492.1	7100513.0			1618.2	Outcrop	13Y753486	~3m chip, ~293 Azimuth, ~ 95% decalsified dolostone beds are pure sand with 2 areas of ~ 40 cm thick, massive limonite cement and massive disseminated, local pyrite pods.
E5661285	355493.8	7100515.9			1615.4	Outcrop	13Y753486	~3m chip, ~293 Azimuth, sandy, sanded, tan dolostone; decalcification; some mudstone beds and clay alteration.
E5661286	355494.4	7100519.2			1610.2	Outcrop	13Y753486	~3m chip, ~293 Azimuth, sandy dolostone, ~ 80% sand grains, 20% dolomite; some realgar in dolostone, ~ 200 Azimuth fracture fabric.
E5661287	355496.1	7100522.2			1611.7	Outcrop	13Y753486	~3m chip, ~293 Azimuth, dolostone, ~ 196/90 limonitic fracture fabric with ~ 1% realgar in a narrow, 20 cm wide zone; fracturing is everywhere, yet selectively mineralized.
E5661288	355493.5	7100527.6			1607.8	Outcrop	13Y753486	Line 6 ~ 3m chip, ~ 017 Azimuth, zebra dolostone with realgar and limonite along 185/86 to 240/89, narrow fracture zones.
E5661289	355493.6	7100530.8			1609.9	Outcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, zebra dolostone, 010/90 fractures.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5661290	355494.5	7100533.5			1606.1	Outcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, zebra dolostone and ~ 40cm wide fault gouge (very little clay); 205/80 fractures parallel to sampling; everything sampled equally.
E5661291	355494.7	7100536.6			1609.5	Outcrop	13Y753486	~ 3m chip, ~ 015 Azimuth, ~ 205/80 fractures in zebra dolostone; some fractures limonitic.
E5661292	355495.8	7100540.7			1604.7	Outcrop	13Y753486	~ 3m chip, ~ 015 Azimuth, zebra dolostone with some limonite select along fractures.
E5661293	355497.1	7100543.4			1599.3	Outcrop	13Y753486	~ 3m chip, ~ 015 Azimuth, zebra dolostone; subparallel 210/90 fractures with trace realgar and abundant limonite and black stylolites.
E5661294	355500.5	7100547.4			1598.2	Outcrop	13Y753486	~ 3m chip, ~ 015 Azimuth, 074/38 bedding, siliceous dolostone, extremely fractured clay gouge ~ orientation?
E5661295	355501.2	7100549.0			1592.9	Outcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, zebra dolostone, siliceous sandstone, black clay alteration ~ illite?, strongly fractured, some trace realgar.
E5661296	355501.7	7100554.0			1592.5	Outcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, sandstone and grey-black mudstone, last meter has strong fractures @ 005/84.
E5661297	355502.9	7100557.6			1592.0	Outcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, intense, ~ 310/90 fabric fractures and/or mudstone plus minor sandstone bedding; ~ dark-grey to blue with pods of realgar, minor orpiment, clay
E5661298	355504.7	7100561.9			1591.4	Outcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, deep weathering of quartz sandstone @ start and end, middle ~ 80% is interbedded, minor sandstone and abundant grey-black, mudstone and
E5661299	355509.1	7100563.2			1587.2	Outcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, qtz sandstone.
E5661300	355508.7	7100567.4			1587.0	Outcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, subcrop to outcrop, deeply weathered, quartz sandstone, then ~ 1% realgar and interbedded mudstone/sandstone, recessively weathered.
E5661301	355509.8	7100572.7			1589.2	Subcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, dug down to grey mudstone and brown sandstone; threw in orpiment and realgar and scorodite talus, from close source.
E5661302	355507.7	7100578.0			1592.7	Outcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, grey mudstone and 2 meter bed of limestone debrite, rubbly subcrop, ~ 90% sandstone.
E5661303	355510.3	7100580.9			1591.3	Outcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, quartz sandstone and minor, black, mudstone bedding @ 119/48.
E5661304	355511.0	7100583.5			1591.7	Outcrop	13Y753486	~ 3m chip, ~ 017 Azimuth, interbedded siltstone/sandstone/mudstone, finely bedded, ~ some kaolinite, gouge?
E5661305	355510.6	7100587.3			1590.6	Outcrop	13Y753486	~ 3m composite grab, ~ 017 Azimuth, grey-black mudstone, dug 40cm deep holes at 3 locations.
E5661306	355512.1	7100589.1			1587.9	Outcrop	13Y758292	~ 3m chip, ~ 017 Azimuth, sandstone to grey mudstone; kaolinite alteration to sandstone - goethite.
E5661307	355514.1	7100591.8			1585.7	Outcrop	13Y758292	~ 3m chip, ~ 017 Azimuth, grey mudstone, qtz sandstone (~ 50cm bed), then, deeply weathered subcrop.
E5661308	355515.2	7100594.8			1582.5	Outcrop	13Y758292	~ 3m chip, ~ 017 Azimuth, brown-weathered mudstone dug 80cm depth for grab sample, then, sandy, dolostone bed.
E5661309	355515.3	7100599.0			1579.4	Outcrop	13Y758292	~ 3m chip, ~ 017 Azimuth, dolostone to sandy dolostone; strong fracturing @ 212/76, no conjugate here.

E5661884	388609.6	7110116.5			1736.5	Outcrop	13Y762288	Similar to E5661883, but with outcropping, possibly shifted bedrock & w/o massive calcite. S0 ~ 270/20, S1 ~ 305/75, dominant fracture along S1. Minor calcite veinlets and
E5661885	388611.4	7110118.4			1736.4	RubbleCrop	13Y762288	Similar to E5661883 & 84, with more abundant orange weathering qtz arenites (~60%) and possible debris flow unit with fine-grained grey siliciclastic clasts, calcareous qtz
E5661886	388612.9	7110121.0			1724.7	RubbleCrop	13Y762288	Similar to E5661885. Dominant S1 foliation & fracture. Bedding likely shifted, but dips slightly SW, suggesting NE limb of parasitic syncline. Small (1-2 cm) qtz carbonate vein
E5661887	388615.0	7110124.5			1725.4	Outcrop	13Y762288	Laminated, limonitic, calcareous qtz arenites interbedded with minor, fine-grained, blue-grey calcareous siltstones, possible grading to dk grey-black, dirty carbonates.
E5661888	388617.1	7110126.7			1741.1	RubbleCrop	13Y762288	Similar to E5661887, but with smaller rock fragments. Rusty carbonate veins to 3 cm thick cut by white quartz vein ~2% of float. Recessive rubble zone.
E5661889	388620.1	7110127.9			1741.1	Outcrop	13Y762288	Same as E5661888 w/ minor limonitic carbonate breccia unit through fine grained, dark-grey siliciclastics; fragments to >20 cm across with minor qtz ~3% of float.
E5661890	388622.6	7110130.2			1742.7	RubbleCrop	13Y762288	Similar to previous samples - interbedded calcareous siltstones and fine to medium-grained qtz arenites grading towards dirty carbonates. Several brecciated qtz-carb
E5661891	388624.2	7110133.2			1741.0	Outcrop	13Y762288	First half of interval very similar to previous samples, especially E5661890, but w/o quartz carbonate vein/breccia. Second half of interval predominantly laminated, orange-
E5661892	388626.0	7110136.0			1735.2	Outcrop	13Y762288	Resistant outcrop of blocky, calcareous, orange-weathering qtz arenite beds to 50 cm thick, interbedded with minor layers of dark blue-grey, non-calcareous
E5661893	388628.0	7110139.0			1743.5	Outcrop	13Y762288	Similar to E5661892. Beds within interval appear to form nose of tight parasitic anticline or Z fold (looking NW). Axial planar S1 cleavage through fine-grained siliciclastics is
E5661894	388629.0	7110141.0			1739.2	Outcrop	13Y762288	Same as E5661892 & 93, with later carbonate infilling of quartz veins in arenite units.
E5661895	388631.0	7110142.0			1745.1	Outcrop	13Y762288	Blocky - unit of calcareous, coarse-rounded-qtz arenite/debris conglomerate/limestone debrite with carbonate pods to >1cm in size and fine-grained siliciclastic rip-up clasts.
E5661896	388634.0	7110143.9			1747.4	Outcrop	13Y762288	Outcrop, primarily along a single bedding plane (S0 ~ 140/60) of medium to coarse-grained qtz arenite with calcareous matrix and minor (~1%) euhedral pyrite. Some fine-
E5661897	388636.0	7110146.0			1749.8	Outcrop	13Y762288	Same as E5661896, along bedding plane (S0 ~ 140/60) and then crosscutting beds ~30 to 50 cm thick.
E5661898	388639.0	7110149.0			1754.6	Outcrop	13Y762288	Outcropping clast-supported carbonate debris flow unit. Subangular, 2mm to 2 cm, blue-grey limestone clasts with broader orange-tan dolomitic clasts to 10 cm across near base

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5661899	388640.0	7110151.0			1754.9	RubbleCrop	13Y762288	Very similar to E5661898, but rubblecrop instead of outcrop, and having f.g. siliciclastic clasts. Towards NE of interval, small subcrop of laminated, calcareous, dark grey-blue
E5661900	388642.0	7110151.0			1745.3	Outcrop	13Y762288	Shifted outcrop/subcrop of laminated (mm to cm scale) grey-tan weathering, calcareous qtz arenites, S0 ~ 155/38. Also rubble of debris flow unit similar to E5661898 & 99.
E5661901	388642.9	7110152.4			1745.2	Talus	13Y762288	Recessive, non-calcareous dk blue-grey siltstones. Fissile along S1. Mostly skree. One float piece of leached limonitic qtz arenite.
E5661902	388643.6	7110155.2			1744.0	Talus	13Y762288	Same as E5661901, w/ minor limonitic, laminated qtz arenite layers.
E5661903	388645.0	7110156.4			1744.1	Talus	13Y762288	Same as E5661901 & 1902.
E5661904	388645.8	7110157.6			1744.5	Talus	13Y762288	Same as E5661901, 02 & 03, with cm wide rusty quartz vein along bedding in float.
E5661905	388647.9	7110159.2			1745.0	Talus	13Y762288	Same as E5661901, 02, 03 & 04 with minor outcrop at northeast limit. S1 ~ 310/60, likely shifted slightly.
E5661906	388649.6	7110160.7			1744.6	Talus	13Y762288	Same as E5661901, 02, 03, 04 & 05.
E5661907	388650.8	7110163.0			1745.6	Outcrop	13Y762288	Slightly more resistant, with subdued outcrop heavily sheared along S1, otherwise same as E5661901-1906.
E5661908	388653.4	7110164.4			1746.4	Outcrop	13Y762288	Similar to previous samples, but more competent and with more calcareous, laminated, limonitic qtz arenite layers (~ 50 % of interval).
E5661909	388656.7	7110168.3			1744.6	Outcrop	13Y762288	Similar to E5661908. Predominantly limonitic, laminated qtz arenite (fine grained - almost a siltstone - to medium grained), though in present interval these layers are not
E5661910	388034.2	7110927.8			1986.5	Outcrop	13Y762294	Misty chip sample, 126/86 grey shale beds
E5661911	388032.2	7110924.6			1986.5	Outcrop	13Y762294	300/84 bedding, dark grey limestone, 2.5m wide bed, with qtz-calcite veining stockwork, some @ 204/60, ~15% calcite veining, ~1% qtz veining
E5661912	388030.3	7110919.8			1982.6	Subcrop	13Y762294	finely laminated grey shale, very fissile and interbedded silty limestone, subcrop. Minor clay altered blk shale
E5661913	388028.7	7110917.2			1981.0	Outcrop	13Y762294	finely laminated grey shale, very fissile and interbedded silty limestone, subcrop. Minor clay altered blk shale
E5661914	388026.5	7110914.0			1981.4	Outcrop	13Y762294	very fissil grey shale, clay weathering, with minor interbeds of calcareous sandstone---~50% wh-qtz grains (fine to medium grained), one 5cm wide wh-qtz vein, cleavage
E5661915	388025.1	7110910.9			1979.6	Outcrop	13Y762294	soft brn-gry slate?, cleavage @ 290/88, bedding is folded, but overall flat, 20cm wide qtz vein in shale, parallel to cleavage
E5661916	388023.3	7110909.0			1981.2	Outcrop	13Y762294	grey-brn shale, clay weathering
E5661917	388020.8	7110906.4			1982.3	Outcrop	13Y762294	1.5m of grey, clay weathering shale, strong cleavage, then 1m wide orange-brn stained lst/dolostone with 20% qtz-calcite stockwork. Beds at 292/90
E5661918	388018.3	7110902.4			1982.5	Outcrop	13Y762294	gry-brn, clay weathering, soft, phyllite to shale boundary. Strong cleavage @ 302/90, very finely laminated
E5661919	388016.2	7110899.4			1982.1	Outcrop	13Y762294	grey shale
E5661920	388013.2	7110896.4			1981.5	Outcrop	13Y762294	gy and brown shale (mudstones, siltstones) with minor 10cm wide lst interbed with qtz-ankerite veining
E5661921	388011.2	7110893.3			1981.5	Outcrop	13Y762294	(mudstone/phyllite) or clay weathering shale, with 1/2m of sst (fine-grained) at end of interval
E5661922	388009.7	7110890.1			1981.9	Outcrop	13Y762294	strongly silicified sst (qtz sand and some silty component visible. Massive wh qtz and minor calcite, predominantly bedding parallel @ 305/54

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5661923	388008.2	7110887.9			1979.6	Rubblecrop	13Y762294	qtz sandstone, brn with silicification, very rubbly
E5661924	388005.9	7110884.9			1977.7	Rubblecrop	13Y762294	very rubbly qtz sandstone, brn, fmg, minor silicification, subcrop, washed by rain
E5661925	388005.0	7110882.5			1977.7	Outcrop	13Y762294	very rubbly qtz sandstone, brn, fmg, minor silicification, subcrop, washed by rain. Some silicified,sheared, limonitic sst, only 1/2 interval was representative, 1st half was washed
E5661926	388003.3	7110881.3			1977.4	Outcrop	13Y762294	clay alteration and silicification and wh qtz veining and sheared/silic, limonitic sst (with slickensides) within m-fold in anticline hinge area
E5661927	388000.5	7110878.0			1977.0	Talus	13Y762294	talus, to subcrop, washed brn sandstone and grey phyllite
E5661928	387997.9	7110874.2			1977.6	Outcrop	13Y762294	gy shale, then brn quartz sandstone, bedding @ 145/42, then 317/65, then flattening over anticline hinge (133----10)
E5661943	387969.4	7110826.5			1974.6	Outcrop	13Y762294	gy fissile shale
E5661944	387968.1	7110822.9			1975.4	Outcrop	13Y762294	gy fissile shale
E5661945	387965.5	7110819.2			1975.6	Outcrop	13Y762294	gy fissile shale
E5661946	387962.9	7110819.2			1979.5	Outcrop	13Y762294	dark grey, clay weathering shale, 10cm wh qtz-calcite vein and 1/2m wide brn sst bed
E5661947	387960.9	7110815.7			1980.5	Outcrop	13Y762294	grey qtz sst, fmg with minor wh qtz veining, strong fractures @ 015/75
E5661948	387957.2	7110812.2			1982.4	Outcrop	13Y762294	interbedded grey shale and brn sst and massive sandstone bed, bedding @ 132/64, no qtz veining
E5661949	387955.3	7110809.9			1981.6	Outcrop	13Y762294	grey shale, end of ridge chip sampling line
E5661960	388659.7	7110170.4			1742.5	Outcrop	13Y762288	125/36 cleavage (strong), 006/78 evenly spaced, smooth fracture pattern, grey shale ~ slate, approaching anticline.
E5661961	388662.0	7110172.8			1739.3	Subcrop	13Y762288	Rubbly subcrop, grey shale.
E5661962	388664.0	7110176.8			1739.3	Outcrop	13Y762285	Grey shale, strong cleavage passing through hinge; some of anticline with 30 cm wide qtz and minor limonite vein.
E5661963	388666.0	7110177.8			1739.3	Outcrop	13Y762285	Brown-grey weathering, hackly cleavage ~ vertical.
E5661964	388668.0	7110178.6			1739.5	Outcrop	13Y762285	Interbedded brown siltstone (calcareous?) and very fissile, dark-grey shale, very soft.
E5661965	388671.6	7110180.4			1739.7	Outcrop	13Y762285	Grey-brown, fissile shale, cleavage @ 294/24 and very strong; limb of anticline hinge zone has some qtz-limonite veining.
E5661966	388675.9	7110181.1			1742.7	Outcrop	13Y762285	Grey-brown, fissile shale, cleavage @ 294/24 and very strong; limb of anticline hinge zone has some qtz-limonite veining.`fvj
E5661967	388676.1	7110182.1			1744.0	Subcrop	13Y762285	Grey shale.
E5661968	388678.6	7110185.4			1743.3	Outcrop	13Y762285	~ 5 mm pebbles in fine to medium-grained sandstone, also massive white qtz; bedding @ 330/76.
E5661969	388680.1	7110188.1			1744.0	Outcrop	13Y762285	~ 20% veining, massive white qtz vein stockwork in fine to medium-grained qtz-sandstone; grey, massive, sandstone bed.
E5661970	388681.1	7110191.8			1741.6	Outcrop	13Y762285	~ 20% veining, massive white qtz vein stockwork in fine to medium-grained qtz-sandstone; grey, massive, sandstone bed.

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E5661971	388682.0	7110193.8			1741.5	Outcrop	13Y762285	~ 20% veining, massive white qtz vein stockwork in fine to medium-grained qtz-sandstone; grey, massive, sandstone bed.
E5661972	388686.1	7110198.2			1735.1	Outcrop	13Y762285	~ 20% veining, massive white qtz vein stockwork in fine to medium-grained qtz-sandstone; grey, massive, sandstone bed.
E5661973	388687.3	7110198.6			1733.5	Outcrop	13Y762285	~ 20% veining, massive white qtz vein stockwork in fine to medium-grained qtz-sandstone; grey, massive, sandstone bed. Abundant qtz veining @ 198/45.
E5661974	388688.8	7110200.5			1736.4	Outcrop	13Y762285	~ 20% veining, massive white qtz vein stockwork in fine to medium-grained qtz-sandstone; grey, massive, sandstone bed.
E5661975	388689.3	7110202.8			1733.5	Outcrop	13Y762285	Still abundant qtz stockwork; end of qtz sandstone bedding; bedding @ ~ 316/61.
E5661976	388683.0	7110213.0			1727.2	Outcrop	13Y762285	Line offset to northwest; qtz sandstone and white qtz veining.
E5661977	388685.1	7110213.8			1718.1	Outcrop	13Y762285	Grey shale with qtz veins and iron oxide (after pyrite?) along cleavage @ 326/83.
E5662014	355846.6	7120690.0			1547.2	Outcrop	13Y762246	Rusty, carbonaceous, vuggy siltstone, sulphides (?)
E5662015	355886.3	7120243.7			1475.5	Float	13Y762246	Black-grey, siliceous siltstone with quartz veining, brecciation, moderate disseminated oxidation-oxidation on some vein margins, visible sulphides rare.
E5662016	355883.3	7120225.9			1491.3	Float	13Y762246	From soil pit sample E6577672. Angular slab of siltstone, grey, very fine grained sulphides, oxidation on surface.
E5662017	355871.8	7119828.0			1548.0	Float	13Y762246	Subangular, brecciated (quartz clasts, sandstone matrix) quartz veined (quartz clasts in vein) sandstone, moderate orange oxidation.
E5662018	355865.5	7119790.6			1553.0	Float	13Y762246	Subangular, dark, black, some orange oxidation, grey, vfg sulphides, siltstone.
E5662019	371025.6	7106305.5			1696.8	Outcrop	13Y762297	Outcrop - silicified wallrock (siltstone-mudstone) of quartz vein, trace oxidation, crisscrossing qtz veins, minimal brecciation of matrix into qtz vein. Dark-grey, fine-
E5662020	371029.9	7106312.8			1703.1	Outcrop	13Y762297	White quartz vein - 25cm width. Multiple veins over ~ 10cm section along siltstone bedding. Some 2.5cm quartz veins cutting across bedding. Trace galena. ~ 335/72 vein
E5662021	371023.6	7106305.0			1688.7	Outcrop	13Y762297	Rusty quartz vein, fracture controlled in siltstone, high angle.
E5662022	382615.9	7106446.0			1900.5	Subcrop	13Y762297	Strongly oxidized siltstone slab @ contact with maroon-purple shale. Cubic pyrite and finer-grained pryrite concentrated in quartz scarn/vein. Greenish siltstone outside vein.
E5662023	382532.8	7106470.8			1860.6	Float	13Y762297	Float - subangular - siltstone, light-banded with dark, large, up to 1cm pyrite cubes and finer-grained pyrite.
E5662024	382211.3	7107208.0			1890.2	Rubblecrop	13Y762297	Silicified sandstone, quartz veined, bleached exterior, weathered. Dark, fine- grained.
E5662025	370390.7	7105159.1			1289.6	Rubblecrop	13Y762297	Highly siliceous rock (?) with dark brown patches of oxidation and 0.25% fine sulphides. Hard!!! Colour is light grey-white.
E5662026	382802.0	7109428.3			1258.8	Outcrop	13Y762297	Siltstone with fine-grained sulphides in creek side.
E5662027	388790.1	7110106.4			1636.3	Subcrop	13Y762355	312/52N cleavag and fold changes to 308/62N over 3m. 308/62N cleavage. Interbedded qtz sandstone vfg, calcareous, orange weaterhing 75%, and dark grey shale 25%, 2 vcg
E5662028	388792.9	7110108.0			1637.1	Outcrop	13Y762355	interbedded gy shale and calcareous qtz sandstone, some s-folds of cleavage
E5662029	378334.5	7079037.0			1405.1	Outcrop	13Y762355	Outcrop - 126 Azimuth @ Mars zone in creek below trench.
E5662030	378342.6	7079033.1			1406.3	Outcrop	13Y762355	Outcrop - 126 Azimuth @ Mars zone in creek below trench.

E6577891	400733.8	7090499.8			1587.8	Outcrop	13Y762302	Breccia with vuggy quartz in matrix; clasts composed of black shale. Locally clast supported.
E6577892	377301.2	7081120.9			1632.2	Float	13Y762302	Quartz vein float, rusty (gossaneous @ high au in soil zone). 20 cm wide boulder. Near sample E6577442.
E6577893	377054.9	7081138.6			1632.2	Float	13Y762302	Float - milled, rock-flour clasts, cemented in quartz-carbonate matrix, weak iron staining.
E6577894	377056.9	7081134.6			1632.2	Outcrop	13Y762302	Fault breccia with angular limestone clast set in quartz-carbonate matrix. Near soil sample location of E6577447
E6577895	381472.6	7089764.9			1209.0	Float	13Y762302	Quartz vein float in broad valley, blebs of grey, fine-grained pyrite, clay altered in patches in quartz, scorodite staining.
E6577896	381519.1	7089865.0			1198.7	Float	13Y762302	Quartz vein float in broad valley, blebs of grey colored, fined-grained pyrite, scorodite staining.
E6577897	377060.1	7086540.7			1848.1	Outcrop	13Y762302	Dolostone vein breccia with dolostone clast in carbonate-quartz matrix. Sampled at furthest north au anomaly at Mars trend.
E6577898	376781.2	7086546.2			1864.7	Outcrop	13Y762302	Decolored grey shale with rusty staining, quartz veining cut through, with iron oxide filling boxes in quartz veining.
E6577899	376785.6	7086548.2			1865.6	Outcrop	13Y762302	Calcareous quartz arenite, silty texture cut by carbonate veining, rusty on surface.
E6577900	376780.8	7086550.3			1866.3	Outcrop	13Y762302	Breccia, quartz arenite and limestone set in carbonate and quartz matrix.
E6577901	388770.8	7110117.3			1560.0	Outcrop	13Y762305	Banded quartz-calcite vein hosted by calcareous shale. Mineralization : pyrite, chalcopyrite(?).
E6577902	385921.0	7112941.0			1940.0	Outcrop	13Y762305	Limestone with calcite veins, limonite on suface.
E6577903	385917.0	7113111.9			2030.0	Float	13Y762305	Quartzite stockwork. Silica and calcite veinlets. Mineralisation: well- developed pyrite (oxidation) associated with quartz veinlets.
E6577904	385880.0	7113185.0			2086.0	Outcrop	13Y762305	Calcarous gossanous veins (limonite?). Well-develpoed pyrite.
E6577905	378401.2	7078930.9			1402.0	Float	13Y762305	Oxidized fractured siltstone. Rusty aspect. Pyrite-limonite.
E6577906	376614.0	7080966.0			1761.0	Outcrop	13Y762305	silicified limestone with quartz and calcite veinlets. Mineralisation : disseminated pyrite.
E6577907			632160.5	7079190.8	1390.0	Float	13Y762305	breccia, siltstone clasts. Quart and calcite (probably dolomitisation), weak limonite alteration.
E6577908	377351.0	7080722.0			1504.0	Float	13Y762305	Silicified sanstone. Quartz veinlets and oxidation associted.
E6577909	376671.0	7082542.0			1397.0	Float	13Y762305	Limestone with calcite veins. Strong limonite alteration.
E6577910	377366.0	7080918.0			1580.0	Float	13Y762305	Very altered, probably siltstone clasts breccia-Rusty, intensive loss mineral. Close to soil sample location 191.
E6578601	361863.1	7099078.8			1595.8	Float	13Y762355	East Venus float grab, non-calcareous, sandstone, siliceous, stockwork quartz veins, manganese and fine-grained sulphide. Moderate oxidation, hematitic, limonitic.
E6578602	397566.4	7099419.8			1558.7	Outcrop	13Y762355	Mildly calc, moderately limonitic oxidation. Quartz veining, 1mm-2cm. Silicified, grey sericite alt in siltstone. Outcrop above stream, 1m wide quartz vein.
E6578603	401683.5	7088292.5			1721.3	Float	13Y762355	Grey siltstone enveloped by massive quartz, white quartz is moderately oxidized, anti-taxial, noncalc.
E6578604	401701.3	7088271.5			1718.6	Float	13Y762355	Moderately calc, 0.5-1cm quartz/calcite veining. Moderately disseminated, limonitic oxidation, 3-4% dark sulphides?

Rocks Sample	NAD83_Z9 Easting	NAD83_Z9 Northing	NAD83_Z8 Easting	NAD83_Z8 Northing	Elevation	Sample Type	Certificate	Description
E6578605	401982.5	7088362.2			1665.6	Float	13Y762355	Light-brown/tan siltstone(weakly calcareous) anti-taxial quartz veining 1cm - limonitic oxidation. Cavities, euhedral quartz crystals, float.
E6578606	402363.0	7088276.2			1605.0	Float	13Y762355	Float - fine-grained sandstone, 2cm quartz vein w/ moderate oxidation, disseminated brown oxidation. Quartz is coarse-grained.
E6578607	402063.7	7088243.4			1666.0	Float	13Y762355	Slight anti-taxial texture, quartz vein with moderate oxidation.
E6578608	382105.9	7089971.0			1256.0	Float	13Y762355	Mica schist, moderate dark-brown, orange oxidation, noncalcareous. 1cm quartz vein, siltstone?
E6578609	377325.1	7081197.1			1685.5	Outcrop	13Y762355	Siltstone- strong limonitic oxidation with quartz - outcrop.
E6578610	377325.2	7081197.8			1681.7	Outcrop	13Y762355	Noncalc siltstone, 1cm quartz vein. Outcrop.
E6578611	377330.3	7081189.6			1685.2	Outcrop	13Y762355	Same As Last Sample, siltstone is greenish. Outcrop, same trend.
E6578612	377010.6	7081374.6			1627.1	Outcrop	13Y762355	Outcrop - non-calc, white quartz, finer-grained quartz, weakly spotty oxidation small white/yellow siltstone clasts.
E6578613	376966.1	7081369.2			1603.5	Outcrop	13Y762355	Outcrop - quartz-calcite vein 85% quartz, 15% calcite. Interbedded 1mm, grey siltstone.
E6578614	377506.3	7080530.2			1591.4	Float	13Y762355	Float - quartz with strong orange oxidation. Noncalcareous siltstone interbedded with quartz, fine-grained.
E6578615	377302.0	7080513.9			1606.3	Float	13Y762355	Float - sandstone is fine-grained, dark matrix sandstone with light-orange disseminated oxidation. Moderate to highly calcareous. 2mm quartz vein running through.
E6578616	377203.4	7080510.8			1551.4	RubbleCrop	13Y762355	Sugary quartz veins, quartz has grey colour to clustered quartz. Surface of veins has euhedral, clustered appearance.
E6578617	377148.3	7080509.4			1536.2	RubbleCrop	13Y762355	Noncalc, very fine-grained quartz with dark-grey silicified bands, geod quartz appearance in the cavities. Limestone originally. 1% large calcite crystals.
E6578618	377148.3	7080509.4			1536.2	RubbleCrop	13Y762355	Highly hematitic, limonitic oxidized, pitted, non-calc, quartz veined (brecciated?) quartz vein is blocky.
E6578701	376772.8	7086389.4			99999.0		13Y762302	Breccia in matrix. Muddy limestone with rusty carbonate-quartz matrix, fine-grained pyrite.
E6578702	376810.6	7086361.3			1745.7	Float	13Y762302	Float of limestone breccia with carbonate-quartz matrix. Limonitic staining.
E6578703	376840.8	7086355.2			1728.4		13Y762302	Siltstone with disseminated, fine-grained pyrite. Orange and reddish iron oxide staining in fractures.
E6578704	376885.1	7086358.0			1729.1		13Y762302	Dolostone fault breccia, weak iron staining.
E6578705	376874.8	7086352.2			1712.0		13Y762302	Calcareous siltstone brecciated with angular clasts set in carbonate and quartz matrix. Weak iron oxide staining.

GeoSpark: Drill Hole Report

Project: AHR-Einarson

Hole: D2-13-10

UTM Datum:	NAD83_Z9	**Hole Type:**	DD	**Casing Pulled?:**	☐	**Survey Type:**	
UTM East:	355143	**Hole Diameter:**		**Casing Depth (m)**		**Survey By:**	
UTM North:	7100324	**Hole Status:**	Completed	**Azimuth:**	295	**Logged By:**	JAW
UTM Elevation:	1602.493	**Pad Status:**	Built	**Core Size:**	HQ	**Date Started:**	2012-12-31
Local Grid Name:		**Tenement Number:**	YD114397	**Dip:**	-70	**Date Completed:**	2013-07-02
Local East:		**Target:**	AHR-SA-12028	**Length (m):**	246.89	**Drill Company:**	Peak
Local North:		**Rank:**	prospect			**Drill Rig:**	Rig1
Latitude:	63.999564	**Priority:**				**Drill Started:**	2013-06-28
Longitude:	-131.962466	**Trend Name:**	Venus Trend			**Drill Completed**	2013-07-01

Objective: A steeper hole on the same pad as D2-13-PB. Dependent upon results.

165.57	**193.93**	**S-Dol Dolostone Grey fmgr**	165.57	167.00	1.43	E6565554	0.003	4660	5.73	1.43	0.223
		165.57 - 193.93: Silisified sandy dolostone with 5-10 % of quartz rounded grains set in carbonate matrix that mostly composed of dolomite. Zebra textured intervals can be found throughout the unit containing a few instensly deformed (ductile-like) gouge structures in which are graphitic. Upper contact is brecciated with an overlying sheared shale/mudstone. Lower Contact is……. Mineralization is consentrated at upper contact and brecciated zones with an increase in realgar and arsenopyrite leading up to these contacts/structures. Mineralization of realgar and arseno pyrite is most evident close to the upper brecciated contact. **This upper contact is very similar to that @ ~115m each with adjacent mineralization. Its likely that this structure is the control on mineralization.

Objective: A 50m step-back to the southeast of D2-13-PB/PC to test stratigraphic down-dip and strike extent of mineralisation intersected in D2-12-04/05. Dependent upon results of D2-13-PB/PC.

		185.05 - 211.45: brecciation nature, with locally strongly sheared zone over printing. Elevated Carbonate, silica and argillic alteration.									
		<<Min: 185.05 - 195.34: 2% pyrite / 1% arsenic oxide / 0.2% arsenopyrite>> elevated silica altered interval with wispy an dwebby fine grained arsenia pyrite stylolite and blebby strings, fracture controlled As oxide staining elevated. Realgar spots observed.	189.05	191.05	2.00	E6565792	0.002	206	0.71	17.9	0.098
		<<Min: 195.34 - 208.56: 2% pyrite / 2% arsenic oxide / 0.5% realgar>> carbonate disolvative replacment brecciation textured dolostone interval with wisppy and webby fine arsenia pyriet dissemination. Greenish grey As oxide coating pervasively observed along fractures. Realgar patches overprinting observed locally.	191.05	193.05	2.00	E6565793	0.001	327	1.24	22.8	0.147
		<<Min: 208.56 - 211.45: 3% pyrite / 0.5% realgar>> brass and dark fine grained pyrite occur as dissemination in silicified dolostobne clasts and graphitic matrix, spots and foliated strings.	193.05	195.07	2.02	E6565794	0.01	310	1.2	22.7	0.144
		<<Alt: 185.05 - 195.34: weak to moderate alteration - Silicification / weak to moderate alteration - carbonate / weak alteration - Argillic alteration assemblage / weak Hydrothermal - Scoridite>> weak to moderate carbonate and silica alterated brecciation dolostone interval, greenish grey colored scorodite fracture filling.	195.07	197.07	2.00	E6565795	0.006	463	2.43	12.1	0.283
		<<Alt: 195.34 - 208.56: weak to moderate alteration - Silicification / weak to moderate alteration - carbonate / weak to moderate Hydrothermal - Scoridite>> weak to moderate carbonate, silica altered brecciation dolostone interval with scorodite fracture filling locally pale -orange colored realgar filled in fractures.	197.07	199.07	2.00	E6565796	0.004	516	2.59	6.02	0.252

Hole: D2-13-11

From (m)	To (m)	Rock Type & Description
		<<Alt: 208.56 - 211.45: weak to moderate alteration - graphite alteration / weak to moderate alteration - Argillic alteration assemblage / weak to moderate alteration - Silicification / weak alteration - carbonate>> sheared zone with argillic, graphite alteration in sheared foliation and fractures.
		<<Struc: 188.9: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Shear - Point structure shear>> sheared point structure.
		<<Struc: 190.02: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> disolution carbonate replacement bands with stylolite-webby dark arsenia pyrite strings association.
		<<Struc: 190.31: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> diolated fracture with weakly arsenic oxide minerals stained on fractre surface.
		<<Struc: 195.23: non-penetrative cleavage\foliation development or brittle faults\brecciation Joints - General>> diolated veinlet filled with ankerite. Locally realgar crystal spots observed in.
		<<Struc: 206.32: non-penetrative cleavage\foliation development or brittle faults\brecciation Bedding - Unknown>> argillic layer fill in fractures, likely bedding structure.
		<<Struc: 210.09: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Shear - Point structure shear>> strong sheared zone. Augon eye texture shows strongly sheared- mylonitic component.
211.45	**218.03**	**S-SS Sandstone Grey fgr**
		211.45 - 218.03: weakly calcareous fine grained sandstone with diolated sheeted fracture filled with white caolinite veinlets.
		<<Min: 211.45 - 218.03: 1% pyrite>> silicified fine sandstone with weakly crackle brecciation wisppy and webby fractures filled with graphitite and arsenia pyrite. Caolinite alteration elevated.
		<<Alt: 211.45 - 218.03: weak to moderate alteration - Silicification / weak to moderate alteration - Argillic alteration assemblage / weak alteration - carbonate>> silicified fne grained sandstonwith caolinite sheeted fracture filling, stylolite strings filled with graphite and trace fine grained arsenia pyrite. Calcite alteration observed weakly filling marging of quartz veinlets.
		<<Struc: 212.12: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> diolated sheeted veinlet set filled with white caolinite cut through strongly silicified calcareous sandstone. Cut through stylolite dark aresenia pyrite and graphite webby strings.
		<<Struc: 214.68: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> diolated kaolinite veinlets show diolation nature.
		<<Struc: 215.06: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Shear - Point structure shear>> sheared narrow zone, with graphite and pyrite sheared lamination with augon of silicified dolosotne clast in it.

Latitude:	64.001207	**Priority:**				**Drill Started:**	
Longitude:	-131.959588	**Trend Name:**	Venus Trend			**Drill Completed**	

Objective: Test potential open warp antiformal trap at Clastic_DST contact immediately south of SILICA Fault and several rock grab samples

Comments: This hole was steepened to accommodate the limits of the drill.

Hole: D2-13-12

From (m)	To (m)	Rock Type & Description
183.26	**190.97**	**S-Dol Dolostone Grey fmgr**
183.26 - 190.97: sheared zone interval with augon and budding texture set along sheared rock flour.		
<<Min: 183.26 - 190.86: 2% pyrite / 2% arsenic oxide>> elevated mineralization interval overprinting the sheared zone.		
<<Min: 190.86 - 201.47: 0.5% pyrite>> fine grained likely arsenia pyrite disseminated locally in strongly altered mafic lippili breccia.		
<<Alt: 183.26 - 190.56: moderate alteration - carbonate / weak alteration - Silicification / weak to moderate alteration - graphite alteration>> sheared fault zone with elevated alteration and arsenic oxide ovprinting.		
<<Alt: 190.56 - 201.47: moderate alteration - Iron Oxide Alteration / moderate alteration - carbonate / alteration - chloritization>> serpentine, magnetite, carbonate alyeration overprint mafic volcanic breccia.		
<<Struc: 184.26: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> stylolite veinlets set in larger crackle brecciation dolostone clast set within brittle cataclast sheared fault interval,		
<<Struc: 186.63: non-penetrative cleavage\foliation development or brittle faults\brecciation Lithological Contact>> brittle calaclast contact to sheared textured interval.		
<<Struc: 189.3: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Shear - Point structure shear>> shear lamination orientation.		
190.97	**201.47**	**V-Bx Volcanic Breccia Green-Grey mcgr**
190.97 - 201.47: mafic lapplli breccia. with serpentanite carbonate alteration, (pyroxen and olivine altered to serpentanite and carbonate). Volcanic clastic rock unit. Composition: rounded clasts composed of ultramafic clasts up to 40 %, minor sandstone and dolostone clast, magnetic crystal clast, set in carbonate (mainly calcite matrix). The origional rock type are hard to say, consider ultramafic dyke?		
<<Struc: 191.42: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> late stage ankerite laminated veinlets up to 0.8 cm cross cut shearing foliation.		
<<Struc: 191.68: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Shear - Point structure shear>> ankerite veinlets filling along shearing foliation at shear zone in between dolostone and mafic tuffaceous volcanic breccia.		
<<Struc: 196.87: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> carbinate veinlets clust show this orientation in volcanic breccia.

		<<Min: 54.45 - 60.23: 1% pyrite / 0.1% goethite / 0.1% realgar>> elevated mineralization interval associated with brecciation elevation, realgar selectively filling fractures.	56.45	58.45	2.00	E6566109	0.195	2650	4.94	4.84	2.34
		<<Min: 60.23 - 80.23: 0.5% pyrite / 0.5% arsenic oxide>> yellowish green colored arsenic oxide foam filling in fractures,	58.45	60.23	1.78	E6566110	0.082	1500	4.48	8.49	0.989
		<<Min: 80.23 - 88.15: 0.5% pyrite / 0.5% arsenic oxide / 0.2% realgar / 0.8% kaolinite>> Pyrite is brassy coloured and sparsely disseminated throughout the dolostone. Arsenic oxide (scorodite?) is present along most fracture faces and is crusted in appearance. The realgar occurs as vug filling or along fractures. The kaolinite is present towards the centers of some of the calcite/ankerite veins and is mainly vug filling.	60.23	62.23	2.00	E6566112	0.007	472	0.71	1.07	0.329
		<<Min: 88.15 - 96.06: 0.8% pyrite / 0.5% arsenic oxide / 0.1% limonite>> Pyrite is most concentrated in wispy bands of oxidized pyrite adjacent to calcite veining. The highest concentration of sulfides is in the finer grained bands of dolostone. The arsenic oxide (scorodite?) is present along most fractures and coexists with some minor limonite/geothite crust.	62.23	64.23	2.00	E6566113	0.009	343	0.88	0.884	0.13
		<<Min: 96.06 - 97.6: 0.2% pyrite / 0.5% limonite / 0.5% hematite>> Pyrite mineralization is concentrated in the dolostone clasts within the breccia. The limonite is present along the fractures/vugs that surround the clasts. The hematite mineralization is present as a crust along some clast edges on fracture planes.	64.23	66.23	2.00	E6566114	0.036	586	0.47	1.05	0.207
		<<Min: 97.6 - 103.63: 0.1% pyrite / 0.5% realgar / 0.3% pyrite / 0.1% Mn-oxides / 0.4% limonite>> The brassy pyrite occurs as blobs along stylolites. It is disseminated through the stylolite but blobby along the margins of the stylolite in the dolostone. The stylolite is composed of graphite and other microscopic clay minerals. The silvery pyrite (ASPy?) is very fine grained and disseminated through the dolostone. The realgar mineralization is vug filling within calcite veins and typically forms large crystals. The manganese oxide and the limonite alteration is fracture controlled.	66.23	68.23	2.00	E6566115	0.067	732	1.21	2.61	0.123

		<<Min: 103.63 - 115.63: 0.5% pyrite / 0.4% limonite / 0.1% realgar / 1% arsenic oxide>> The pyrite in this section is silvery in colour and potentially aspy. It is disseminated through the dolostone though is does appear in slightly higher concentration closer towards limonite-coated microfractures. The realgar is sparsely crystallized and occurs only along fracture faces and within veins. The scorodite occurs along vein margins and fracture faces.	68.23	70.23	2.00	E6566116	0.011	555	0.7	3.65	0.178
		<<Min: 115.63 - 119.63: 0.4% pyrite / 0.2% graphite / 0.1% goethite>> pyrite is very fine grained and disseminated throughout the dolostone. It is brassy coloured and evenly distributed. There is graphite coating along the fractures. Very minor trace goethite is present along some fractures.	70.23	72.23	2.00	E6566117	0.009	214	0.45	2.7	0.055
		<<Min: 119.63 - 121.63: 0.3% pyrite / 0.4% limonite / 0.5% arsenic oxide>> Pyrite is silvery/brassy coloured and very fine grained when it is disseminated througout. When it is localized around/in stylolites, it is more brass coloured and more likely to occur in clumps rather than fine grained dissemination. Limonite occurs along fractures and vein coatings. Arsenic oxide (scorodite?) occurs along nearly all fracture surfaces.	72.23	74.23	2.00	E6566118	0.01	183	0.46	4.97	0.048
		<<Min: 121.63 - 132.86: 0.1% pyrite / 0.2% limonite>> Pyrite in this section is less than previous. The pyrite crystallization is centered around brecciated finer grained blue-grey dolostone. Limonite is present along some fractures	74.23	76.23	2.00	E6566119	0.008	224	0.57	47.8	0.091
		<<Alt: 54.45 - 60.23: weak to moderate alteration - carbonate / weak alteration - Silicification>> elevated carbonate alteration as blebs in sandy dolostone clasts and veinlets. Weak silicification fill in carbonate vuggys as drussy crystals.	76.23	78.23	2.00	E6566120	0.004	213	0.76	56	0.194
		<<Alt: 60.23 - 80.23: weak alteration - carbonate / weak alteration - Silicification>> weakly brecciation sandy dolostone interval with weak carbonate bleb alteration, weakly silica alteration pervasively overpint sandy dolostone unit.	78.23	80.23	2.00	E6566122	0.004	181	1.34	1.47	0.253
		<<Alt: 80.23 - 103.63: moderate alteration - Scorodite alteration / trace alteration - Argillic alteration assemblage / moderate alteration - carbonate / weak to moderate alteration - ankerite>> Scorodite alteration present along most fracture planes as a yellow-green colour. There is some trace argillic alteration present in the form of white clay minerals present within vuggy calcite veins (interesting side note, most realgar mineralization in this interval has associated argillic alteration present). The carbonate alteration creates halos around the veins that react with acid. Ankerite alteration is present in most carbonate veins as a coating. Towards the centers of the veins, the carbonate is more calcite rich and the ankerite is typically more towards the margins.	80.23	82.23	2.00	E6566123	0.014	349	1.77	4.37	0.575
		<<Alt: 103.63 - 106.47: weak to moderate alteration - Scorodite alteration / moderate to strong alteration - carbonate / moderate alteration - carbonate / trace alteration - Argillic alteration assemblage / weak alteration - ankerite>> The carbonate alteration shows halos around veins, and then small blebs disseminated through the dolostone that almost look like clasts. In the dolostone breccia, the dolostone "Clasts" have frayed margins indicating carbonate alteration. The scorodite alteration has decreased in intensity by this margin although it is still present on the majority of fractured surfaces. The argillic alteration is still present though is at an even lower level than before. It is only present in very few vuggy calcite veins	82.23	84.23	2.00	E6566124	0.02	1050	11.3	5.68	1.07

		<<Alt: 106.47 - 116.41: weak alteration - Scorodite alteration / trace alteration - Limonite alteration / moderate alteration - carbonate / trace alteration - ankerite / weak alteration - graphite alteration>> The carbonate alteration in this section is dominated more by vein controlled alteration and less by blebs like in previous intervals. Blebs of carbonate do occur but only in close proximity to veins and fractures already filled by carbonate. Ankerite alteration of the calcite veins is not as intense as before. There is an absence of argillic alteration as well. Scorodite alteration is present though in small amounts irregularly on occasional fracture faces. The limonite alteration is present on occasional fractures.	84.23	86.23	2.00	E6566125	0.012	435	1.98	6.69	0.452
		<<Alt: 116.41 - 120.35: moderate to strong alteration - carbonate / moderate alteration - graphite alteration / weak alteration - ankerite>> Carbonate alteration in this interval is entirely the result of veining. There are no more blebs disseminated throughout the rock. The graphitic alteration in this interval is characterized by brittle fractures and is banded on either side of the broken core indicating that the weaker graphite was the source of jointing in this core. Minor ankerite alteration is present though only in some calcite vein sets	86.23	88.23	2.00	E6566126	0.011	283	1.19	6.11	0.313
		<<Alt: 120.35 - 126.26: weak to moderate alteration - Scorodite alteration / moderate alteration - ankerite / weak to moderate alteration - carbonate / moderate alteration - carbonate>> The scorodite alteration is yellow-green and present along most fracture surfaces and appears as a very thin crust. Ankerite alteration is prevalent in this interval and is found coating almost all carbonate veins. Carbonate alteration appears either as blebs disseminated through the dolostone or as "halos/envelopes" around the carbonate veins. The carbonate cement in the dolostone host rock makes a mosaic-like texture.	88.23	90.06	1.83	E6566127	0.01	762	3.09	7.05	0.675
		<<Alt: 126.26 - 132.86: weak to moderate alteration - Limonite alteration / weak to moderate alteration - ankerite / moderate to strong alteration - carbonate / weak to moderate alteration - carbonate>> limonite alteration is prevalent on nearly all fracture faces and takes on a green colour due to the blue-grey dolomite host (once it is scraped off it is a yellow colour). Ankerite alteration is present on many of the carbonate veins. Carbonate blebs are present throughout the interval and carbonate halos surrounding the veins are typical.	90.06	92.06	2.00	E6566128	0.013	1570	5.28	9.32	1.32

		132.84 - 139.2: The Upper contact of this unit is characterized by a small fault zone around 10 cm long. This unit has realgar mineralization along stylolites and fine grained disseminated pyrite and arsenopyrite (<1%). The veins and breccia matrix are composed mostly of carbonate which is mostly ankerite. There are abundant brittle fractures with 1-5mm offset. Numerous stylolites and veins follow the original bedding planes. The lower contact is a stylolite									
		<<Min: 132.86 - 139.2: 1% pyrite / 0.3% pyrite / 0.2% realgar / 0.1% kaolinite>> The pyrite in this section appears in 2 forms. The disseminated pyrite occurs in small sub millimeter patches throughout the fine grained dolostone whereas the other type occurs concentrated in small fractures. There is elevated pyrite along stylolites as well. The realgar mineralization occurs as small veinlets within calcite-ankerite veins. The kaolinite appears as globby vug-fillings inside of calcite/ankerite veins.	135.63	137.63	2.00	E6566153	0.025	1310	2.19	7.25	3.83
		<<Alt: 132.86 - 139.2: moderate alteration - graphite alteration / weak to moderate alteration - ankerite / weak alteration - Limonite alteration>> The graphite alteration is pervasive in this section. Numerous stylolites and fracture hosted graphite layers and laminations present. The alteration is most distinct along fracture planes. Ankerite coats most of the calcite veins but some later stage veins are pure calcite. Limonite alteration is along fracture planes but isnt as distinct as in previous sections.	137.63	139.63	2.00	E6566154	0.016	324	1.54	5.89	1.54

		<<Struc: 132.84: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Faults - General>> small fault zone is an unconformity below which is a lithological change. There is a small amount of fault gouge inside of the fault zone and numerous fragments									
		<<Struc: 136.48: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Styolite>> stylolite cross cuts veining (which makes it 3rd deformation event). They are composed mostly of graphite									
		<<Struc: 138.76: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> graphite stylolite showing volume loss. Cross cuts veining.									
139.20	**179.88**	**S-Dol Dolostone Grey fmgr**	139.63	141.03	1.40	E6566155	0.013	1780	4.12	5.75	5.61
		139.2 - 179.88: Upper contact is the stylolite unconformity. This unit is characterized by numerous sets of brecciated dolostone with ankerite-calcite matrix. The brecciated sections are matrix supported and are the locations for realgar and orpiment mineralization when present. This lithology has disseminated pyrite through most of the section though it is in low abundance. There is arsenic oxide present along some fracture planes though this is not uniform throughout the lithological section. The lower contact is a gradual shift into cataclasite and sheared rock									
		<<Min: 139.2 - 142.16: 0.1% pyrite / 0.1% realgar / 0.2% limonite>> Pyrite is very fine grained and is disseminated through the dolostone. The realgar is sporadically crusted on fracture surfaces as fine grained crystals. The limonite occurs as a crust on fracture surfaces.	141.03	143.03	2.00	E6566156	0.028	776	3.22	4.72	2.72
		<<Min: 142.16 - 145.99: 0.2% pyrite / 0.1% realgar / 0.1% arsenic oxide>> Pyrite is very fine grained disseminated through the dolostone though it tends to cluster around fractures (or at least adjacent to the fractures). Realgar appears as vug filling inside of carbonate veins. The scorodite is present along few fracture planes.	143.03	144.95	1.92	E6566157	0.018	1310	3.96	6.81	2.1
		<<Min: 145.99 - 151.29: 0.01% pyrite / 0.4% goethite / 0.5% limonite>> pyrite in this section is very fine grained and in very low abundance. It is only found in stylolites and along their margins. Limonite and goethite are present along the numerous fracture planes in this section along with a distinct iron oxide coating.	144.95	146.37	1.42	E6566158	0.011	1510	4.49	5.88	2.92
		<<Min: 151.29 - 179.88: 0.1% pyrite / 0.2% arsenic oxide / 0.2% goethite / 0.2% limonite>> The pyrite in this section is silvery in colour and very fine grained. It is sparsely mineralized. There is no realgar mineralization through this section. Arsenic oxide/scorodite is present in many fractures though this is not universal throughout the interval. Goethite and limonite are crusted along fracture planes throughout the section albeit in varying amounts.	146.37	148.37	2.00	E6566159	0.006	937	3.16	2.44	2.13
		<<Alt: 139.2 - 142.16: moderate to strong alteration - carbonate / weak to moderate alteration - carbonate / moderate to strong alteration - ankerite>> The carbonate alteration is characterized by blebs disseminated through the dolostone and by halos of carbonat surrounding the carbonate veins. Ankerite alteration is also present as patches coating all of the carbonate vein systems	148.37	148.99	0.62	E6566160	0.018	4580	9.78	36.8	7.17
		<<Alt: 142.16 - 145.99: moderate alteration - ankerite / weak alteration - Scorodite alteration / weak to moderate alteration - Limonite alteration / moderate to strong alteration - carbonate>> Ankerite appears as a coating on most carbonate veins and appears as a tan colour. Scorodite is present along a few fracture planes as a green-yellow colour. Limonite is present along large and small fractures in this interval. Carbonate alteration is characterized by blebs disseminated through the dolostone and in brecciated zones as the frayed margins of the dolostone clasts	148.99	151.29	2.30	E6566161	0.046	9350	30.5	54.4	19.7

179.88	**190.35**	**S-Dol Dolostone Grey fgr** 179.88 - 190.35: This lithological interval is a silicified dolostone that has an upper limit that is a sharp contact into a cataclasite. The cataclasite is composed of sandy dolostone clasts within a matrix of mudstone. Towards the bottom of the section, the amount of silicification increases so that the only carbonate part of the rock is in the late stage veining. The pyrite mineralization of this section is variable and the higher concentrations are found in the darker, finer grained graphite-rich sections and adjacent to stylolites. Realgar and orpiment mineralization is focussed around the cataclasite (likely due to the more permeable nature of the rock). Towards the bottom of the section the cataclasite eventually grades into a more ductile-like shearing and the mudstone content of the rock sharply increases.	179.88	181.88	2.00	E6566179	0.009	914	7.23	10.2	6.34
		<<Min: 179.88 - 181.88: 0.8% pyrite / 0.1% realgar / 0.1% orpiment>> The pyrite in this section has a sooty appearance and is found in slightly variable abundance throughout. It is found in its highest concentration through the darker, finer grained rock. Realgar and orpiment occur together here in small spots inside of vugs and small cavities.	181.88	182.88	1.00	E6566180	0.008	2480	14.7	14.7	11.2
		<<Min: 181.88 - 184.88: 0.1% Arsenian Pyrite / 0.2% pyrite / 0.6% realgar / 0.2% orpiment>> ASPy found only on cataclasite fragments adjacent to fracture planes. It takes on a silvery-brassy appearance. Pyrite is disseminated throughout. Realgar and orpiment are concentrated around fracture faces and withing micro fractures throughout the section	182.88	184.88	2.00	E6566181	0.012	12400	35.5	42.6	33.8
		<<Min: 184.88 - 192.02: 0.2% realgar / 0.2% kaolinite / 0.7% pyrite>> The pyrite is found primarily in the sandy dolostone "clasts" adjacent to the mudstone stringers in the sheared rock. The kaolinite is located withing vugs of qtz-carbonate veinlets. The realgar mineralization crusts along the micro fractures making miniature veins	184.88	186.88	2.00	E6566182	0.001	5940	26.8	30.3	21.8
		<<Alt: 179.88 - 181.88: trace alteration - Iron Oxide Alteration / weak alteration - graphite alteration / weak alteration - Limonite alteration>> Alteration here is limited. Some yellow limonite, graphitic and iron oxide are present though not on most fracture faces	186.88	188.81	1.93	E6566183	0.001	272	2.03	1.55	0.361
		<<Alt: 181.88 - 184.88: weak alteration - graphite alteration>> Low levels of alteration present. Graphitic alteration located along fracture planes and along banding through the rock.	188.81	190.81	2.00	E6566184	0.009	342	1.35	0.934	0.214
		<<Alt: 184.88 - 192.02: weak to moderate alteration - graphite alteration / weak alteration - Argillic alteration assemblage / weak to moderate alteration - carbonate>> Graphitic alteration due to shearing is pervasive through the section though it is concentrated at fracture openings. The argillic alteration is responsible for the kaolinite visible infilling some of the vugs in the qtz-cbt veining. Carbonate veining is prevalent through much of the section overprinting shearing fabrics and previous generations of veining									
		<<Struc: 179.88: non-penetrative cleavage\foliation development or brittle faults\brecciation Lithological Contact>> This is the lithological contact between the dolostone unit above and the sandy silicified dolostone unit below. No angle can be measured as it is an open contact with fractured rock in between									
		<<Struc: 185.25: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> Preserved foliation in the sandstone unit on either side of shearing. Foliation is likely bedding (?)

190.35	**193.54**	**S-Mst mudstone Black vfgr** 190.35 - 193.54: The upper contact for this unit separates the sandy silicified dolostone above from the sheared mudstone below. The contact is a distinction between the brittle forces above and the brittle-ductile forces below. This mudstone has abundant shear banding, at least 2 generations of qtz-cbt veining and substantial graphite alteration. Clasts/boulders from this unit can be found in the lithological section below which makes the contact between the two gradational in a sense. There is no realgar or orpiment mineralization in this interval, and pyrite mineralization is limited to close-by qtz-cbt veins	190.81	192.81	2.00	E6566185	0.002	98.5	0.3	0.896	0.302
		<<Min: 192.02 - 203.47: 0.6% pyrite>> Pyrite appears as a brassy yellow wispy mineral disseminated through the main host rock. The sheared calcareous sandstone/mudstone rock both contain the disseminated pyrite. Interesting side note, the more sheared the area, the greater the amount of pyrite.	192.81	194.85	2.04	E6566186	0.001	55	0.55	0.983	0.338
		<<Alt: 192.02 - 203.47: weak to moderate alteration - graphite alteration>> The only alteration visible is graphite alteration along fracture planes and along flow banding. The shearing likely destroyed previous generations of alteration									
		<<Struc: 190.35: non-penetrative cleavage\foliation development or brittle faults\brecciation Lithological Contact>> This is the lithological contact between the dolostone above and the mudstone below									
193.54	**203.47**	**S-Slt Siltstone Green-Grey vfgr** 193.54 - 203.47: The upper contact between the black mudstone above and the green sitlstone below is somewhat gradational because clasts/boulders from the mudstone are found below the contact. There is visible intense shearing fabrics showing flow banding and almost mylonite-like vein stretching. The occasional clast of silicified dolostone is visible and when visible, are not as sheared as the rest of the unit (though this is likely due to the more competent nature of dolostone relative to the siltstone). The primarily qtz-cbt veining preceded the shearing forces as there are no cross-cutting relationships observed. There is no realgar or orpiment mineralization. The alteration in this unit is primarily graphitic along fractures and stringers though there is some very slight ankerite alteration of some of the veins and a trace amount of oxidation along some fractures. The Pyrite mineralization occurs sporadically through the green siltstone and occurs as blebs and wisps spread through the host rock. The lower contact for this unit is a gradational contact in through a more highly sheared zone which mixes in darker brittle cataclasite which has been introduced to more ductile forces.	194.85	196.85	2.00	E6566187	0.001	19.7	0.2	0.831	0.213
		<<Struc: 193.54: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Lithological Contact>> This is the lithological contact between the black mudstone above and the green siltstone below.	196.85	197.95	1.10	E6566188	0.001	15.5	0.12	0.683	0.151
		<<Struc: 194.97: non-penetrative cleavage\foliation development or brittle faults\brecciation Joints - General>> Joint at the end of the brittle ductile shear zone interval separating it and the less-strained sandstone unit.	197.95	199.95	2.00	E6566189	0.001	16.9	0.31	0.596	0.206
		<<Struc: 197.95: macro evidence for deformation, but no foliation development or brecciation Joints - General>> A joint separating the shear zone and a less deformed sandstone section	199.95	201.87	1.92	E6566190	0.002	2.7	0.025	0.987	0.097
		<<Struc: 200.48: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Banding>> Banding created by shearing. This foliation is characterized by the quartz veins and the graphite stringers	201.87	203.77	1.90	E6566192	0.0005	7	0.12	0.784	0.132

Hole: D2-13-13

203.47	**226.64**	**S-Slt Siltstone Grey-Green vfgr** 203.47 - 226.64: This section is composed of interbedded grey-green siltstone similar to the previous interval, however it is interbedded with another unit of highly sheared banded brown-grey mudstone. The grey-green siltstone has multiple generations of fractures and veining which cross cut one-another. These veins cross cut both units and are composed entirely of calcite. The grey-green siltstone contains numerous graphite stringers and stylolites with elevated levels of mineralization. Low level metamorphism is present with some low levels of fuchsite mineralization. Pyrite occurs in the grey green siltstone as disseminated clumps and wisps throughout, usually clumping around small nodules of graphite/clay. In the mudstone, the pyrite mineralization occurs around calcite veins and as a vuggy infill in the eroded mudstone. The lower contact in this unit is a gradational one, fading into the green coloured brecciated volcanics.	203.77	205.77	2.00	E6566193	0.0005	11	0.14	0.396	0.128
		<<Min: 203.47 - 226.64: 0.7% pyrite / 1% fuchsite>> The fuchsite in this interval only appears as a "clast" inside of the lighter coloured grey-green siltstone part of the lithology. It is a vitreous green flaky mineral and it occurs both as a "crust" on some fracture faces and as a "clast" in the lithology. The pyrite in the lighter grey-green rock type appears as small wispy blobs scattered throughout the rock whereas in the darker mudstone part it appears along side calcite veins and as fracture infill.	205.77	207.71	1.94	E6566194	0.002	29.1	0.25	0.652	0.201
		<<Alt: 203.47 - 226.64: weak to moderate alteration - graphite alteration / moderate alteration - carbonate>> The carbonate alteration in this rock is visible as a carbonate halo surrounding the calcite veins. This halo extends for up to a cm away and is strongly reactive to acid. The graphit alteration is present along fracture planes and mudstone stringers.	207.71	209.62	1.91	E6566195	0.008	45.2	0.52	0.793	0.225

From (m)	To (m)		Rock Type & Description			From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
						225.55	226.64	1.09	E6566205	0.002	150	0.16	3.96	0.232
226.64	**242.70**	**V-Bx**	**Volcanic Breccia**	**Green**	**fgr**	226.64	228.60	1.96	E6566206	0.002	59.6	0.07	0.224	0.269
226.64 - 242.7: This volcanic breccia is clast supported with a matrix and cement composed of calcite. There is some pyrite and arsenopyrite mineralization in low abundance along the calcite veins. There are also hematite rims surrounding some of the darker mudstone clasts. By volume, the darker green diabase/basalt composes 70 percent of the clasts, the dark brown mudstone makes up 20% and the 10% is of a red shale (though this could be a clast of mudstone that has been oxidized to the red colour. The diabase/gabbro clasts are made up of pyroxene and plagioclase laths though there are multiple generations of carbonate alteration blebs and veinlets permeating through the various clasts. Some shearing is also visible in sections richer in the darker mudstone though the vast majority of this lithology is dominated by brittle forces.														
<<Min: 226.64 - 242.7: 0.3% pyrite / 0.2% arsenopyrite / 0.7% hematite>> The hematite mineralization materializes as rims around some of the darker coloured mudstone clasts as they are suspended in the calcite matrix/cement. The arsenopyrite and pyrite are both situated inside of the calcite veins and matrix in between clasts. The pyrite is a deep brassy yellow while the arsenopyrite is a shimmery-silver colour.						228.60	230.60	2.00	E6566207	0.017	14.2	0.025	0.117	0.12
<<Alt: 226.64 - 242.7: weak alteration - Limonite alteration / weak alteration - hematite / strong alteration - carbonate / trace alteration - serpentine / strong alteration - carbonate>> Limonite alteration occurs along some fracture faces though it does not permeate through the breccia. The Hematite alteration occurs as rims surrounding selected dark mudstone clasts. Carbonatization occurs as blebs and spots appearing on the various clasts throughout the breccia, and as halos surrounding the intense calcite veining through the whole interval. Serpentine alteration occurs around certain diabase/gabbro clasts although this is very limited and only in a small number of clasts.						230.60	232.06	1.46	E6566208	0.002	14	0.06	0.102	0.118
<<Struc: 226.64: non-penetrative cleavage\foliation development or brittle faults\brecciation Lithological Contact>> This is the lithological contact between the sheared siltstone/mudstone above and the volcanic unit below. The contact is gradational so no angle was measured						232.06	234.06	2.00	E6566209	0.002	18.9	0.07	0.037	0.117
<<Struc: 226.98: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Veins - General>> Calcite veins coexisting with the brecciation						234.06	236.09	2.03	E6566210	0.002	67	0.1	0.01	0.133
<<Struc: 227.2: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Veins - General>> This set of calcite veins cross cuts the foliation and previous generations of veining. It is much larger than the other vein set at ~2cm thick						236.09	237.85	1.76	E6566212	0.002	54	0.28	0.038	0.254
<<Struc: 235.3: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Low angle fracture with limonite coating. It cross cuts brecciation						237.85	241.31	3.46	E6566213	0.001	25.3	0.08	0.014	0.12
						241.31	242.70	1.39	E6566214	0.003	38.5	0.1	0.023	0.13

Hole: D2-13-13

From (m)	To (m)		Rock Type & Description		
242.70	**243.84**	**II-DB**	**Diabase**	**Green**	**fgr**

242.7 - 243.84: The upper contact in this unit is a sudden contact where a brecciation interval terminates. This unit is dark green with white plagioclase lathes speckled through the lithology. The green likely comes from the pyroxene groundmass (?). The very small grain size indicates a fast cooling pluton. Potentially this is a mafic dyke (possibly micro-gabbro/diabase) with ophitic texture. This interval continues to the end of hole. Minor fe-ox alteration and minor serpentine alteration is also present.

<<Min: 242.7 - 243.84: 0.2% kaolinite / 0.1% arsenopyrite>> Kaolinite replacement of some of the feldspar lathes. There is also very sporadic arsenopyrite mineralization in very low amounts disseminated through the main lithogy

<<Alt: 242.7 - 243.84: trace alteration - Argillic alteration assemblage / trace alteration - Iron Oxide Alteration>> Kaolinite replacement of some of the feldspar grains. Some minor fe-ox coating is present as well.

<<Struc: 242.7: non-penetrative cleavage\foliation development or brittle faults\brecciation Lithological Contact>> This is the lithological contact between the volcanic breccia above and the diabase below. The contact is defined by the end of a brecciated zone but because the contact is irregular, no angle was taken

<<Struc: 243: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Veins - General>> There is no beta angle as this core has no bottom mark (ie not oriented). It was measured and noted because the vein is quite large (2.5cm in diameter) and cross cuts 2 lithological units as well as the breccia and previous generations of veining. It is also pure calcite

From (m)	To (m)	Rock Type & Description
0.00	**6.10**	**Casing** **Casing**
6.10	**10.52**	**S-SS** **Sandstone** **Grey-Maroon** **mgr**
		6.1 - 10.52: This lithology has 3 units that grade into one another. The main unit is the granule-pebble conglomerate (clasts are rounded and similar in size and range from 2-5cm in diameter).. It is composed of rounded quartz pebbles in a sandy oxidized matrix with calcite cement. There are some small lithic fragments (likely small pieces of the black mudstone) present as well. The second unit is a calcareous medium grained sandstone. It is mostly grey in colour, though oxidized sections display a maroon tinge. The third lithological unit is the laminated mudstone. It is non-calcareous and shows iron oxide alteration along some laminations. The mudstone mostly appears as angular rip up clasts inside of the conglomerate unit. The sandstone grades into the conglomerate gradually which then unconformably changes to a mudstone. This is then followed by a conglomerate with rip up mudstone clasts and then gradually grades back into a sandstone over roughly 10 cm. The lower contact in this lithological unit is at a heavily fractured zone after which a mudstone unit follows. The sandstone and conglomerate both show oxidation along fractures and as bands/halos that surround the fractures. This unit does not have significant mineralization
		<<Alt: 6.1 - 10.25: weak to moderate alteration - Iron Oxide Alteration / weak to moderate alteration - Iron Oxide Alteration / weak alteration - Limonite alteration / weak to moderate alteration - carbonate>> The alteration in this unit varies depending on which lithology you are in. The iron oxide alteration types (fracture controlled/pervasive) tends to occur more heavily in the conglomerate. It is also present in the sandstone. The mudstone shows fe-ox alteration along specific laminations though it does not appear throughout. The Limonite alteration tends to appear on the mudstone fractures only (perhaps fe-ox alteration has overwritten it in the other rock types). Carbonate alteration is present as cement more strongly in the conglomerate than the sandstone. The mudstone is non-calcareous
10.52	**12.63**	**S-Mst** **mudstone** **Black** **vfgr**
		10.52 - 12.63: This unit is the black laminated mudstone. It displays oxidation along some of its laminations along with a prominent cleavage parallel to bedding. The mudstone is calcareous along some laminations. The upper contact in this unit is a highly fractured zone separating this mudstone from the sandstone above it. Some limonite alteration is present along some of the fractured bedding planes.
		<<Alt: 10.52 - 12.63: weak alteration - Limonite alteration / weak to moderate alteration - Iron Oxide Alteration / weak alteration - carbonate>> In this interval, the dominant alteration type is fe-ox. It appears as bands along certain laminations through the mudstone. The limonite appears on fracture surfaces whilte carbonate alteration appears along the same laminae as the oxidation surfaces
		<<Struc: 10.52: macro evidence for deformation, but no foliation development or brecciation Lithological Contact>> This is the lithological contact between the sandstone/conglomerate above and the laminated mudstone below. The contact is characterized by a series of fractures. No angle was taken due to the highly fractured nature of the rock and lack of orientable core

Hole: D2-13-14

From (m)	To (m)	Rock Type & Description
12.63	**22.06**	**S-SS Sandstone Grey-Maroon mcgr**
12.63 - 22.06: This unit is characterized by a sharp contact above between a layer of laminated fine grained sandstone and the unlaminated coarser sandstone below. The weakly calcareous sandstone is mostly quartz though there are some darker pebbles interspersed. This section varies in grain size as it gradually grades up to a fine grained weakly calcareous conglomerate. The lower contact in this unit is a weakly lithified conglomerate with intensive fe-ox alteration which then becomes finely laminated mudstone. There is very minimal mineralization in this unit.		
<<Alt: 12.63 - 22.06: trace alteration - Limonite alteration / moderate alteration - Iron Oxide Alteration / moderate alteration - Iron Oxide Alteration / weak to moderate alteration - carbonate>> The carbonate alteration in this unit is much stronger while in close proximity to fractures and veins though there is carbonate alteration throughout the unit. Limonite appears along the numerous fractures and is more evident in the conglomerate sections. Fe-ox alteration is very strong in this section, particularly in the conglomerate and fractured sandstone. It appears as a coating on fractures/halo around fractures as well as a pervasive grain coating throughout the sections.		
<<Struc: 12.63: macro evidence for deformation, but no foliation development or brecciation Lithological Contact>> Grain size contact between mudstone unit above and the sandstone below. No beta angle was obtained (no bottom line/oriented core)		
22.06	**27.28**	**S-SS Sandstone Blue-Grey mcgr**
22.06 - 27.28: The non-calcareous grey-blue sandstone is the dominant unit in this lithology. It has significant oxidized fracture planes and oxidation halos around them as well. The sandstone has small interbeds of the mudstone throughout. The conglomerate is only at the beginning of the section at the contact. The mudstone is non calcareous as is the sandstone. The Lower limit for this unit is a fault zone with fault gouge present.		
<<Min: 22.06 - 27.28: 0.2% pyrite / 0.1% pyrite / 0.4% goethite>> The pyrite in this section appears as single small cubes disseminated through the host lithology (oxidized sandstone section in this case). These disseminated cubes appear only in sections of oxidized sandstone immediately adjacent to oxidized clasts of mudstone. The wispy blebs of pyrite appear in the main sandstone unit as blobs surrounding some of the quartz grains. The goethite occurs as an oxidizing surface and as a halo surrounding many of the fractures in this interval.		
<<Alt: 22.06 - 27.28: weak to moderate alteration - Limonite alteration / moderate alteration - Iron Oxide Alteration / weak to moderate alteration - Iron Oxide Alteration / weak alteration - carbonate>> The limonite alteration appears along side the fe-ox alteration as coatings on fractures. The fe-ox alteration also appears as 1-2 cm thick halos surrounding the fracture faces. Carbonate alteration is present throughout the host rock as calcite cement and appears to act as a host for some minor pyrite mineralization. Certain mudstone laminations show a tendency to become oxidized as well as the conglomerate layers.		
<<Struc: 22.06: no macro evidence of deformation Lithological Contact>> Lithological contact between conglomerate and sandstone. No angle measureable due to the crumbly nature of the rock

		<<Struc: 23.66: no macro evidence of deformation Bedding - Unknown>> Bedding orientation in the laminated sandstone									
		<<Struc: 24.29: macro evidence for deformation, but no foliation development or brecciation Fractures - sheeted fractures>> Fracture plane appears to be parallel to bedding, minor fe-ox along fracture face									
27.28	**49.54**	**S-IBSTS Interbedded siltstone and sandstone Grey fmgr**	27.28	29.28	2.00	E6566230	0.001	150	1.38	0.69	0.153
		27.28 - 49.54: Interbedded calcareous sandstone and non calcareous laminated green-grey siltstone/mudstone. The sandstone has abundant brittle fractures. The upper contact in this unit is a fault zone characterized by fault gouge.									
		<<Min: 27.28 - 46.57: 0.1% pyrite / 0.1% Arsenian Pyrite / 0.2% goethite>> The pyrite in the siltstone part of the section is found selectively surrounding specific thin black muddy laminations through the rock. Primarily, it surrounds these black stringers and is hosted by the sandier, light coloured laminations. In the sandstone, mineralization seems to be focussed around the dark coloured thin stringers/laminations. Occasionally, small wisps of arsenian pyrite can be found in the sandstone surrounding quartz veins in the carbonate cement. Goethite can be found as a coating on some of the fracture surfaces, primarily in the sandstone.	29.28	31.28	2.00	E6566231	0.012	26	0.22	0.837	0.116
		<<Min: 46.57 - 57.27: 0.4% pyrite / 0.2% pyrite>> 2 types of pyrite mineralization are apparent in this unit. The disseminated matrix controlled cubic pyrite is present in the calcareous sandstone unit while the patchy/crusty pyrite globs are present as clast coating in the conglomerate unit.	31.28	33.26	1.98	E6566232	0.0005	16.8	0.21	0.72	0.083
		<<Alt: 27.28 - 46.57: trace alteration - Iron Oxide Alteration / weak alteration - Iron Oxide Alteration / trace alteration - Limonite alteration / weak to moderate alteration - carbonate>> The alteration in this unit isnt as extensive in other previous units. The fe-ox alteration is almost exclusively present along fracture planes. The halos previously seen are restricted to only a few areas with prominent fracturing. The carbonate alteration is also irregular as some intervals of sandstone are only weakly calcareous while others have strong reaction. Limonite occurs with fe-ox though in fewer fracture planes	33.26	35.28	2.02	E6566234	0.001	9.3	0.14	0.717	0.056
		<<Alt: 46.57 - 57.27: weak to moderate alteration - carbonate / trace alteration - Iron Oxide Alteration>> The fe-ox alteration is patchy and preferentially coating the occasional siltstone clast in the breccia/conglomerate. Carbonate alteration occurs primarily through the late stage veining visible.	35.28	36.50	1.22	E6566235	0.001	18.4	0.26	1.04	0.09

		49.54 - 57.27: This unit is characterized by a brecciated contact near the top and inclusion of angular clasts of the grey-green siltstone. The breccia near the top contains calcareous sandstone clasts though the mudstone matrix is non-calcareous. Certain layers in the siltstone sections are also calcareous. The sandstone is weakly calcareous though it has blebs of pure calcite and veining throughout. The Lower contact is sharp and appears erosional. Pyrite mineralization in this interval is minor though is more concentrated in the calcite veined calcareous sandstone.									
		<<Struc: 50.81: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> Bedding laminations in the sandstone defined by the dark mudstone laminations	53.25	55.25	2.00	E6566246	0.0005	15	0.31	1.09	0.088

		<<Struc: 53.26: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> Bedding laminations in the sandstone/siltstone. Planes of weakness follow this same orientation									
57.27	**62.60**	**S-IBSTS Interbedded siltstone and sandstone Grey fgr**	57.27	59.09	1.82	E6566248	0.002	9.9	0.18	0.463	0.086
		57.27 - 62.6: This unit is comprised of fine grained grey sandstone, a grey siltstone with calcareous laminations, and a non-calcareous black mudstone. The unit is heavily veined with carbonate (calcite). The units upper contact is s sharp erosional contact with the brecciated sandstone unit above. The lower contact is sharp and the last appearance of the siltstone. The mineralization in this section is highly concentrated in the fine black muddy laminations pervasive throughout the section, however, the main form of mineralization is sparsely disseminated through the sandstone and to a lesser extent, the siltstone. The alteration in this interval is primarily iron oxide which is fracture controlled and only occurs in fracture-rich areas. Some carbonate alteration is also present as veining though it is not extensive									

Hole: D2-13-14

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
		<<Min: 57.27 - 62.6: 0.1% pyrite / 0.2% pyrite>> The pyrite mineralization in this unit is complex. The primary mineralization occurs as small disseminated cubes pervasive throughout the lighter sandstone sections. The less common type is selective mineralization coating small mineral grains inside and adjacent to the thin black laminations in the very fine grained muddy rock. The pyrite is globby in appearance and in high concentrations in these areas though there arent enough of these laminations to create high mineralization levels. The grey-green siltstone also shows minor disseminated pyrite mineralization.	59.09	60.96	1.87	E6566249	0.0005	9.9	0.14	0.448	0.061
		<<Alt: 57.27 - 62.6: weak alteration - Iron Oxide Alteration / weak to moderate alteration - carbonate>> The feox alteration in this section is fracture controlled with small halos surrounding the fractures. The alteration also "leaks" through some of the siltstone bedding planes of weakness present.The carbonate alteration present is primarily in the veining.	60.96	62.55	1.59	E6566250	0.013	16.7	0.16	0.587	0.083
		<<Struc: 57.27: macro evidence for deformation, but no foliation development or brecciation Lithological Contact>> Lithologic contact between the breccia/conglomerate unit and the sandstone/siltstone below. No angles taken due to the irregular contact plane	62.55	64.44	1.89	E6566251	0.005	9.3	0.08	0.385	0.053
		<<Struc: 59.23: macro evidence for deformation, but no foliation development or brecciation Veins - General>> Low angle calcite vein through the sandstone cross cutting bedding. No beta angle was obtained (no bottom line/oriented core)									
		<<Struc: 59.49: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> Bedding planes defined by dark laminations in the sandstone/siltstone									
		<<Struc: 59.72: macro evidence for deformation, but no foliation development or brecciation Styolite>> Stylolites in the calcareous sandstone unit. Potentially indicating bedding and lithostatic pressure directions									
		<<Struc: 60.33: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> Bedding plane defined by dark laminations in the calcareous sandstone/siltstone interbeds									
		<<Struc: 60.61: macro evidence for deformation, but no foliation development or brecciation Styolite>> Stylolite in the calcareous sandstone potentially indicating bedding and lithostatic pressure directions									
		<<Struc: 62.55: macro evidence for deformation, but no foliation development or brecciation Lithological Contact>> Lithological contact between the brecciated/conglomerate unit above from the sandy unit below. No angle measured due to the irregular contact									
62.60	**66.44**	**S-SS Sandstone Grey fgr**	64.44	66.44	2.00	E6566252	0.002	15.7	0.11	0.356	0.057
		62.6 - 66.44: This sandstone unit is highly calcareous and has thin black laminations present. The upper contact is sudden and separates the breccia/conglomeratic unit above from the calcareous sandstone below. The mineralization in this unit is low and disseminated pyrite can be found through the cement around the quartz grains. Thr alteration in this unit is mainly fe-ox along fracture planes.									
		<<Min: 62.6 - 65.44: 0.01% pyrite / 0.3% goethite>> Besides an occasional small speck of pyrite in the matrix/cement of the sandstone, there is very low levels of mineralization in this interval. Goethite is slightly more prevalent as a fracture coating, however.

Hole: D2-13-14

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
		<<Min: 65.44 - 66.44: 0.2% pyrite / 0.3% limonite / 0.4% goethite>> The pyrite in this interval is in low abundance in the main rock type. However, localized on either side of an iron oxide-altered fracture, the pyrite appears in large clumps and has a sooty appearance. In the main lithology, it is concentrated around the black laminations									
		<<Alt: 62.6 - 65.44: moderate to strong alteration - carbonate / weak alteration - Iron Oxide Alteration>> The carbonate alteration in this section is very strong as both main rock units are pervasively calcareous. Some minor calcite veining is also present. The iron oxide alteration is only present along fracture planes and even then is still patchy									
		<<Alt: 65.44 - 67.75: moderate to strong alteration - carbonate / weak alteration - Iron Oxide Alteration>> The carbonbate alteration in this interval is as pervasive as the previous zone, however the carbonate alteration along veins is much more pervasive and the veins are much thicker (10mm on average). The iron oxide alteration is seen along fracture planes in this section as well, however there is significant fe-ox alteration halos surrounding certain low angle fractures in the area									
		<<Struc: 65.73: macro evidence for deformation, but no foliation development or brecciation Fractures - sheeted fractures>> Low angle fracture coated with feox alteration									
		<<Struc: 65.89: macro evidence for deformation, but no foliation development or brecciation Veins - General>> Large (3cm) calcite vein similar in orientation to closeby fracture set									
66.44	**71.50**	**S-Mst mudstone Black vfgr**	66.44	68.41	1.97	E6566253	0.006	15.4	0.12	0.37	0.059
		66.44 - 71.5: This highly calcareous mudstone unit contains numerous darker and lighter laminations (compositional differences and grain size differences. The unit contains small interbedded layers of calcareous sandstone though these are not extensive. The upper contact in this unit is an interval of breccia/conglomerate that separates it from the calcareous sandstone above. The brecciated section then grades into the laminated mudstone. The alteration in this interval is characterized by iron oxide coating along fractures and calcite veining in the sandstone pieces. The pyrite mineralization through this section is interesting as it follows certain laminations and in some cases completely replaces them. Certain laminations up to 5mm in thickness are nearly pure pyrite (potentially arsenian pytrite). The lower contact is a gradual one as the grain size increases to a grey calcareous sandstone									
		<<Min: 66.44 - 71.5: 0.1% pyrite / 2% pyrite>> The pyrite mineralization in this unit is very high compared to other intervals. The disseminated pyrite is low and only in the coarser grained lighter coloured laminations. Along certain layers in the mudstone, pyrite has overprinted entire bands up to 5 mm in thickness at irregular intervals along the interval. The pyrite is brassy and sooty in appearance (potentially due to the very small grain size).	68.41	70.41	2.00	E6566254	0.002	15.9	0.11	0.864	0.171
		<<Alt: 67.75 - 71.5: moderate to strong alteration - carbonate / weak alteration - Iron Oxide Alteration>> The alteration in this zone is primarily carbonate cement replacement of both the sandy and muddy units. The feox alteration is entirely fracture controlled with small 5 mm halos around them	70.41	72.25	1.84	E6566256	0.024	15.9	0.15	0.759	0.129
		<<Struc: 66.6: macro evidence for deformation, but no foliation development or brecciation Veins - General>> Small calcite vein set similar in orientation to nearby low angle fracture									
		<<Struc: 66.69: macro evidence for deformation, but no foliation development or brecciation Veins - General>> Small calcite veinlet set in similar orientation to nearby fracture									

Hole: D2-13-14

		<<Struc: 67.78: macro evidence for deformation, but no foliation development or brecciation Fractures - sheeted fractures>> Low angle fracture potentially defined by a stylolite									
		<<Struc: 70.23: macro evidence for deformation, but no foliation development or brecciation Fractures - sheeted fractures>> Repeated fracture set appears to follow bedding weakness planesin the siltstone									
		<<Struc: 70.89: macro evidence for deformation, but no foliation development or brecciation Fractures - sheeted fractures>> Low angle fracture potentially defined by a stylolite. Feox alteration is present along the fracture face									
		<<Struc: 70.95: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> Bedding plane defined by dark laminations in the rock. Fractures are present nearby that follow bedding planes									
85.38	**88.37**	**S-Dol Dolostone Grey fmgr**	85.38	86.41	1.03	E6566264	0.0005	1060	2.38	2.79	0.582
		85.38 - 88.37: This small interval is a silicified dolostone unit. The Veins have been replaced by dolostone and numerous quartz-infilled vugs are present. Significant oxidation is present along fractures and through 1cm thick oxidation halos around the fractures There is a small section of non-calcareous black mudstone with lighter grey laminations towards the bottom of this section. Some fracture faces display scorodite alteration along with feox alteration. The mineralization in this section is minimal									
		<<Min: 85.38 - 88.37: 0.1% pyrite / 0.1% pyrite / 0.4% arsenic oxide>> The pyrite mineralization occurs differently in the 2 units. In the silicified dolostone the pyrite occurs as disseminated wisps throughout the host lithology while in the small intervals of interbedded finely laminated black mudstone, the pyrite is preferentially mineralized along certain laminae. The pyrite along these laminations occurs as sooty, very finely grained blobs	86.41	88.37	1.96	E6566265	0.0005	525	1.67	1.51	0.242
		<<Alt: 85.38 - 88.37: weak to moderate alteration - Iron Oxide Alteration / strong alteration - Silicification / weak to moderate alteration - Scorodite alteration>> This section has been completely silicified. The feox alteration is located along fracture planes. The veining through the rock is also qtz. The silicified rock is heavily fractured indicating a pathway for the alteration fluids to pass through. Some scorodite alteration is present along the same fractures that hosts the feox alteration									
		<<Struc: 85.38: non-penetrative cleavage\foliation development or brittle faults\brecciation Lithological Contact>> This is a contact between the interbedded siltstone/sandstone above and the silicified dolostone below. No angle was taken due to the lack of oriented core									
88.37	**93.57**	**S-IBSTS Interbedded siltstone and sandstone Grey fgr**	88.37	91.37	3.00	E6566267	0.004	557	4.5	1.34	0.254
		88.37 - 93.57: The upper contact in this unit is a sharp contact with the silicified unit above. This unit is characterized by a strongly calcareous sandstone unit with black non-calcareous mudstone laminations. This is interbedded with non calcareous grey-green laminated siltstone. The lower contact is a sharp contact with non calcareous oxidized sandstone. There is moderate pyrite mineralization in this unit primarily located in dark laminations in the fine grained mudstone. There is scorodite alteration present.									

Hole: D2-13-14

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
		<<Min: 88.37 - 93.57: 0.6% pyrite / 0.1% arsenic oxide>> The pyrite in the siltstone is clustered around dark coloured laminations and is wispy and brassy. The pyrite in the sandstone is sparse and disseminated. In the light coloured very fine grained siltstone, however, the pyrite is cubic in form and disseminated throughout. There is scorodite alteration present along few of the fractures.	91.37	93.38	2.01	E6566268	0.257	834	4.94	1.03	0.303
		<<Alt: 88.37 - 93.57: weak alteration - Iron Oxide Alteration / trace alteration - Scorodite alteration / weak to moderate alteration - carbonate>> The carbonate alteration in this zone is moderate but patchy. Some small sections of the sandstone are weakly reactive while others have a very strong reaction. The mudstone by and large is non-calcareous but some of the sandy laminations are reactive. Scorodite is present along few fracture planes. Most of the fracture related alteration is feox.	93.38	95.69	2.31	E6566269	0.062	759	2.51	0.763	0.324
		<<Struc: 88.37: non-penetrative cleavage\foliation development or brittle faults\brecciation Lithological Contact>> This is the lower contact of the silicified dolostone and the siltstone/sandstone below.No angle was taken due to the highly fractured nature of the contact									
		<<Struc: 91.31: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> The bedding laminations in this sandstone are defined by darker bands of finer grained material									
		<<Struc: 91.35: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> This stylolite cross cut several veins indicating late stage (d3) formation									
		<<Struc: 91.69: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> This veinlet set is cross cut by numerous stylolites									
93.57	**95.71**	**S-SS Sandstone Grey mgr**	95.69	97.65	1.96	E6566270	0.061	1250	7.46	1.9	0.725
		93.57 - 95.71: This grey sandstone has an oxidized upper contact with the laminated calcareous sandstone above. The contact is sharp. This sandstone is non-calcareous and silicified. There is some scorodite alteration present along with some fe-ox alteration. Realgar mineralization is present along one fracture face in the interval. The lower contact is a gradual grain size decrease followed by a sharp contact with laminated heavily fractured siltstone.									
		<<Min: 93.57 - 95.71: 0.1% pyrite / 0.1% realgar>> The pyrite in this interval is disseminated through the silicified sandstone matrix, coating specific quartz grains. There is realgar mineralization present along one of the fracture planes. This is the first visible mineralization of realgar in this drill hole.									
		<<Alt: 93.57 - 95.71: moderate alteration - Silicification / weak alteration - Iron Oxide Alteration / trace alteration - Limonite alteration / weak alteration - Scorodite alteration>> This unit is characterized by silicification. There is no carbonate reaction present in this lithology. There is some scorodite alteration present along many of the fracture planes. Feox alteration and limonite alteration appear along side the scorodite in most of the fractures.									
		<<Struc: 93.57: non-penetrative cleavage\foliation development or brittle faults\brecciation Lithological Contact>> This contact separates the calcareous sandstone above from the silicified sandstone below. The contact is an unconformity with numerous faults and fractures in the area. No beta angle was obtained (no bottom line/oriented core)									
		<<Struc: 93.59: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> This low angle stylolite shows enough volume loss to create a displacement of about 4 cm

			<<Struc: 94.75: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> This low angle fracture has substabntial scorodite alteration crusting the plane											
95.71	**97.21**	**S-CO**	**Conglomerate**	**Blue-Grey**	**mcgr**									
95.71 - 97.21: This conglomerate unit is composed of multiple clast types. It is clast supported with the majority being calcareous sandstone ranging from 1-4cm in diameter. There are numerous non calcareous siltstone clasts ranging up to 7 cm in length. The matrix is mudstone and non calcareous. The clasts are sub rounded-sub angular so it is on the boundary between breccia and conglomerate (potentially a debris flow). Late stage calcite veining cross cuts all of the clasts. The lower contact is sharp (likely erosional) and laminated calcareous finely grained sandstone follows.														
			<<Min: 95.71 - 97.21: 1% pyrite / 0.1% goethite>> The pyrite in this breccia/conglomerate/debris flow section selectively crusts clasts and matrix alike. The coated clasts show bright, shiny coarser grained pyrite while the matrix shows fine grained, sooty looking pyrite. Goethite mineralization is limited and reserved only to fracture planes											
			<<Alt: 95.71 - 97.21: weak alteration - Iron Oxide Alteration / trace alteration - Scorodite alteration / trace alteration - carbonate>> The alteration is minor in this zone. Low levels of scorodite and feox alteration are present in this unit, though at lower levels than past units. Carbonatization is present only in patches surrounding previously calcareous clasts in this debris flow/breccia/conglomerate											
97.21	**99.12**	**S-IBSTS**	**Interbedded siltstone and sandstone**	**Grey**	**fgr**	97.65	99.19	1.54	E6566271	0.028	769	3.45	1.1	0.338
97.21 - 99.12: This unit is a laminated non-calcareous fine grained sandstone and non-calcareous siltstone. The rock is highly fractured and oxidized along most fracture planes. The upper contact is a sharp contact with the breccia/conglomerate unit above. The lower contact is a set of closely spaced oxidized fractures indicating fluid movement and potentially a sharp contact/fracture set.														
			<<Min: 97.21 - 99.12: 0.1% pyrite / 0.2% arsenic oxide>> The only pyrite in this section is located in the small intervals of finely laminated mudstone. Selectively replacing/encrusting specific laminations. Scorodite is present along the silicified lithology fractures											
			<<Alt: 97.21 - 99.12: weak alteration - Scorodite alteration / moderate to strong alteration - Silicification>> Scorodite alteration is present along most of the fracture planes along with some feox alteration. The unit is also highly silicified											
			<<Struc: 97.27: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> This carbonate vein cross cuts multiple clasts in the conglomerate unit											
			<<Struc: 97.93: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> This bedding plane is characterized by think dark laminations											
			<<Struc: 97.98: macro evidence for deformation, but no foliation development or brecciation Veins - General>> This small package of similarly oriented veinlets is composed of carbonate in a non calcareous sandstone											

Hole: D2-13-14

		<<Struc: 98.44: macro evidence for deformation, but no foliation development or brecciation Fractures - sheeted fractures>> This is one of several low angle fractures appearing in a small package in this lithology									
		<<Struc: 98.7: macro evidence for deformation, but no foliation development or brecciation Fractures - sheeted fractures>> This is one of several low angle fractures appearing in a set in this lithology									
99.12	**103.17**	**S-lBSTS Interbedded siltstone and sandstone Blue-Grey fgr**	99.19	101.19	2.00	E6566272	0.004	362	2.06	1.26	0.518
		99.12 - 103.17: This unit has a fractured oxidized contact above and a sharp contact below. The rock is made of finely laminated non-calcareous siltstone interbedded with strongly calcareous fine grained grey sandstone. Bedding planes are visible throughout and are defined by dark laminations. The sandstone is well sorted with calcite cement and the quartz grains This unit has very high pyrite mineralization. The pyrite appears as layers replacing/overprinting laminations throughout the unit. Also visible is blobs of fine grained pyrite distributed along bedding laminae									
		<<Min: 99.12 - 103.17: 2% pyrite / 1% pyrite>> The pyrite mineralization in this unit occurs in two ways. The first type of pyrite occurs as blobs and bands lined up along bedding planes. The second type is disseminated fine grained throughout the matrix of the laminated mudstone.	101.19	103.17	1.98	E6566273	0.004	136	1.05	1.8	0.754
		<<Alt: 99.12 - 103.17: weak alteration - carbonate / trace alteration - Iron Oxide Alteration>> the carbonate alteration is only present in the small amount of calcareous sandstone in this unit. The mudstone only shows calcareous alteration along some of the coarser grained grey laminations. There is very limited iron oxide alteration present solely along few fracture planes in trace amounts									
		<<Struc: 99.62: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> This bedding lamination is pervasive and repeated over a small section in the siltstone									
		<<Struc: 100.52: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> This is one of the last bedding measurements for awhile due to the lower less oriented and more fragmented core. This lamination is defined by small thin dark layers inside the siltstone									
103.17	**112.47**	**S-SS Sandstone Grey fgr**	103.17	104.67	1.50	E6566274	0.008	359	2.6	0.473	0.166
		103.17 - 112.47: The upper limit for this unit is a sharply grading contact with the silty unit above. This unit is very slightly calcareous though this seems to be focussed around small fractures. The sandstone is very fractured with limonite alteration through fracture planes. Some small sections of fault gouge are present. Towards the bottom of the section, the grain size of some of the clasts in the sandstone increases. Darker lithic fragments go from sub millimeter in size to gradually become 4 mm. This grain size increase is truncated by what appears to be a scouring surface followed by the fine grained sandstone again. The lower contact with the sandy dolostone is a brecciated section approx 20cm in size. The only pyrite mineralization is localized in small wisps and bands in some laminations of the finer grained siltier rock.									
		<<Min: 103.17 - 112.47: 0.1% pyrite / 0.2% arsenic oxide / 0.1% limonite>> The pyrite mineralization in this section is very limited in the main lithology (the weakly calcareous sandstone) as tiny wisps disseminated sparingly in the matrix. The majority of the pyrite mineralization is localized in small bands/laminations in the siltier layers of this rock.	104.67	106.68	2.01	E6566275	0.003	542	6.04	1.52	0.603

Hole: D2-13-14

		<<Alt: 103.17 - 112.47: weak alteration - Scorodite alteration / moderate to strong alteration - Silicification / weak alteration - Limonite alteration>> The alteration is characterized by scorodite and limonite along fractures. The sandstone has been nearly completely silicified with small sporadic sections of carbonate remaining as cement	106.68	108.68	2.00	E6566276	0.003	1010	3.21	0.541	0.22
			108.68	110.65	1.97	E6566278	0.01	624	3	1.21	0.562
			110.65	112.30	1.65	E6566279	0.014	921	2.62	1.5	0.845
			112.30	114.40	2.10	E6566280	0.042	1470	4.49	1.92	1.02
112.47	**165.36**	**S-Dol Dolostone Blue-Grey fmgr**	114.40	116.16	1.76	E6566281	0.011	866	2.64	1.26	0.779
		112.47 - 165.36: This dolostone unit has a brecciated upper contact with the weakly calcic sandstone. The dolostone has a sandy/granular texture with weakly calcic cement and intensive qtz-cbt veining. Some of the veins have ankerite/fe-cbt coating though this is not universal throughout the section; only near heavily fractured sections. There is sporadic realgar mineralization occuring as vug filling. Scorodite/arsenic oxide alteration is pervasive through the interval along with patchy limonite and fe-ox alteration. Some kaolinite is present as vug filling inside of veins. The siltstone sections of this rock are spread evenly and are no more than 20 cm in length. Realgar/orpiment mineralization occurs in high concentrations near heavily fractured zones and appears as fracture coating/vein fill.									
		<<Min: 112.47 - 117: 0.1% pyrite / 0.1% goethite / 0.3% arsenic oxide>> The pyrite mineralization is centered around the stylolites in this section. The stylolites are very fine grained clay-like minerals (some graphite as well) The goethite appears as small blobs and as a thin crust in some fractures. Scorodite alteration appears on fracture faces and along some vein walls	116.16	118.05	1.89	E6566282	0.019	1430	4.5	2.28	1.28
		<<Min: 117 - 119.12: 0.1% pyrite / 0.1% realgar / 0.4% arsenic oxide>> Pyrite appears as small globs interspersed in the dolostone. There is a slightly elevated mineralization in proximity to the stylolites. Scorodite also appears on fracture coatings though more pervasively than the realgar.	118.05	120.04	1.99	E6566283	0.031	360	2.58	1.69	0.396
		<<Min: 119.12 - 130.15: 0.2% kaolinite / 0.6% arsenic oxide / 0.2% realgar>> This section has minimal mineralization. Kaolinite appears as vuggy infill in the qtz-carbonate veins. Scorodite and realgar appear as fracture coatings	120.04	122.04	2.00	E6566284	0.012	375	2.91	1.29	0.633
		<<Min: 130.15 - 137.58: 0.2% realgar / 0.6% arsenic oxide / 0.3% kaolinite / 0.1% pyrite / 0.01% Arsenian Pyrite>> The pyrite mineralization in the small siltstone section is very fine grained and seems to crust/overprint some of the darker stringers and clasts adjacent to the dark siltstone banding. The very small amount of arsenopyrite observed was sparsely disseminated in the dolostone matrix of a heavily qtz-cbt veined section. Scorodite alteration is located along most fracture planes and occasionally as a vein envelope (qtz-cbt). Reaglar occurs as vuggy infill of some of the qtz-cbt veins (usually with kaolinite).	122.04	124.01	1.97	E6566285	0.017	367	2.72	1.18	0.594
		<<Min: 137.58 - 151.68: 0.1% kaolinite / 0.1% realgar / 0.6% arsenic oxide / 0.1% pyrite>> Pyrite in this section is silvery and very fine grained in the matrix of the dolostone (higher concentrations around stylolites). Kaolinite appears as a vugg infill in few of the qtz-cbt veins. Realgar is in low concentration along fracture planes and scorodite is pervasive along nearly every fracture	124.01	126.10	2.09	E6566286	0.008	224	1.66	0.861	0.338

		<<Min: 151.68 - 161.04: 0.3% arsenic oxide / 0.3% limonite / 0.1% realgar / 0.1% pyrite>> Scorodite and limonite appear as fracture coating as well as realgar to a limited extent. Realgar is in low abundance though it is found in a few small vugs in the qtz-cbt veins. Pyrite is found as small disseminated cubes primarily in dolostone clasts within the brecciated units. It appears to be in higher concentrations in the smaller clasts with frayed margins	126.10	128.02	1.92	E6566287	0.02	556	4.07	201	1.61
		<<Min: 161.04 - 165.36: 0.4% goethite / 0.5% limonite / 0.1% pyrite>> The pyrite mineralization is very fine grained disseminated through the brecciated dolostone clasts. Goethite and limonite can be found on numerous fracture planes (large amount of fracturing in the area).	128.02	130.15	2.13	E6566289	0.013	712	4.12	9.96	1.68
		<<Alt: 112.47 - 117: weak to moderate alteration - Scorodite alteration / moderate alteration - ankerite / weak to moderate alteration - Iron Oxide Alteration / weak to moderate alteration - Silicification>> The alteration in this section is dominated by scorodite and ankerite alteration. The ankerite is a patchy covering of carbonate veins while scorodite and feox alteration is fracture controlled	130.15	131.84	1.69	E6566290	0.003	293	1.98	1.48	0.572
		<<Alt: 117 - 119.12: moderate alteration - Scorodite alteration / weak alteration - ankerite / weak to moderate alteration - Silicification>> Scorodite alteration appears along fracture planes while ankerite appears as a coating on some of the carbonate-qtz veins. The rock is weakly-moderately silicified with cement replacement	131.84	133.84	2.00	E6566291	0.004	442	3.01	6.76	0.916
		<<Alt: 119.12 - 130.15: trace alteration - Argillic alteration assemblage / weak to moderate alteration - Scorodite alteration / weak alteration - Silicification / weak alteration - ankerite>> The argillic alteration is characterized by trace amounts of kaolinite vuggy infill in the qtz-cbt veins. The scorodite appears along fracture surfaces and this dolostone has been weakly-moderately silicified. Some of the veins have been coated with ankerite though this is not universal throughout this section	133.84	135.92	2.08	E6566292	0.019	633	2.82	11.2	0.894
		<<Alt: 130.15 - 137.58: weak alteration - Limonite alteration / weak to moderate alteration - Scorodite alteration / weak alteration - Argillic alteration assemblage / trace alteration - graphite alteration / weak alteration - Silicification>> Scorodite and limonite alteration is found along fracture planes in the dolostone unit while graphite alteration is along the fracture planes in the non calcareous siltstone unit. Argillic alteration is defined by small clots of kaolinite within vugs in the qtz-cbt veining. The dolostone is weakly silicified with very little reaction to HCL even when powdered	135.92	137.58	1.66	E6566293	0.005	636	4.05	11.9	1.41
		<<Alt: 137.58 - 151.68: trace alteration - Argillic alteration assemblage / weak to moderate alteration - Scorodite alteration / weak alteration - ankerite / weak alteration - Silicification / trace alteration - graphite alteration>> The argillic alteration is sporadic and in trace amounts. It occurs as small clots inside some vugs in the qtz-cbt veins. Scorodite alteration occurs along fracture planes. Ankerite appears as a coating on some of the qtz-cbt veins adjacent to fractured zones. Silicification appears throughout the rock as cement replacement though it is stronger in the veining. Graphite alteration appears only in high carbon sections of the dolostone where the grain size decreases slightly and the colour gets a little darker.	137.58	139.55	1.97	E6566294	0.008	420	2.12	3.77	0.61
		<<Alt: 151.68 - 161.04: weak alteration - Scorodite alteration / weak alteration - ankerite / weak alteration - Silicification / weak alteration - Limonite alteration>> In this section, scorodite and limonite appear on a few fracture surfaces. Ankerite appears as a coating on a few sets of veins and in the breccia matrix. Silicification is through the matrix of the dolostone as a cement and is more common in heavily fractured areas	139.55	141.55	2.00	E6566295	0.017	1080	5.02	21.4	1.05

165.36	**168.69**	**S-IBSTDO interbedded siltstone and dolostone Blue-Grey fgr**	165.36	167.03	1.67	E6566310	0.587	1120	8.58	562.5	14.2
		165.36 - 168.69: This interbedded siltstone and dolostone unit is characterized by heavy fracturing separating this unit from the contacts above and below. Strong evidence for fluid movement is seen in the strong fe-oxidation, graphite alteration, ankerite alteration, scorodite and limonite alteration. There is significant mineralization present in this section though it manifests itself differently in the dolostone unit and the siltstone unit. The darker dolostone shows some disseminated arsenopyrite, particularly in brecciated clasts with frayed margins. The siltstone shows pyrite mineralization. The upper contact is likely a small fault zone characterized by fault gouge. The lower contact is a fracture and the beginning of realgar and orpiment mineralization.									
		<<Min: 165.36 - 168.69: 0.3% limonite / 0.3% goethite / 0.2% arsenic oxide / 0.9% graphite / 0.6% pyrite / 0.4% arsenopyrite>> Goethite and limonite appear on fracture surfaces throughout the unit regardless of rock type. Scorodite only appears along fracture planes in the dolostone unit though this could be due to overprinting of the feox and limonite. Pyrite mineralization in this section is heightened. It is inside of the darker siltstone layers. There is disseminated arsenopyrite in the darker dolostone clasts adjacent to veining and fractures.	167.03	168.96	1.93	E6566312	0.058	4240	16.5	153.8	59.5
		<<Alt: 165.36 - 168.69: weak alteration - Scorodite alteration / weak to moderate alteration - Limonite alteration / weak to moderate alteration - Iron Oxide Alteration / weak alteration - graphite alteration / weak to moderate alteration - Silicification>> Scorodite is present along fracture planes in the dolostone sections of this interbedded siltstone unit. The siltstone shows extensive feox and limonite alteration along fractures while graphite alteration occurs along bands in the finer grained siltstone sections. There is some silicification along heavily fractured areas. In these areas, the only carbonate is in fracture coating

168.69	**234.16**	**S-Dol Dolostone Blue-Grey fgr** 168.69 - 234.16: This fine grained blue-grey dolostone has a heavily fractured/silicified upper contact with the interbedded siltstone/dolostone. Its lower contact is a fault zone characterized by a layer of fault gouge leading into the volcanic layer below . This sectio has intense realgar and orpiment mineralization that is very strong towards its upper contact and then localized around strongly fractured zones. Its lower limit has an increased level of realgar mineralization before leading into the fault zone. The main texture of the rock is highly brecciated with a quartz-carbonate crystalline matrix. The alteration in this zone is characterized by graphite alteration along planes. Scorodite alteration along fracture planes may be present but can be overwritten by intense realgar and orpiment mineralization when present. Pyrite in this unit is prevalent in the sections with less realgar and orpiment. It occurs as disseminated wisps through the dolostone matrix. Typically, the darker, carbon rich dolostone has higher levels of pyrite mineralization than the lighter pieces. This lithology has several large fault zones characterized by strongly fractured dolostone with arsenic oxide alteration along most fracture planes.	168.96	170.96	2.00	E6566313	0.035	78600	7.69	72.9	39.7
		<<Min: 168.69 - 170.38: 10% realgar / 5% orpiment>> This section is very heavily mineralizaed with realgar and orpiment. They take on a characteristic red-yellow-orange colour due to the very strong mineralization. They are hosted mostly by fractures and veins though it is so pervasive that it has taken on a patchy appearance. There is no pyrite mineralization present	170.96	172.50	1.54	E6566314	0.101	17100	5.26	179	31.6
		<<Min: 170.38 - 179.83: 0.8% pyrite / 2% realgar / 1% orpiment>> Pyrite in this section appears as very fine grained silvery coloured wisps strongly disseminated in the fine grained dark coloured dolostone. Realgar and orpiment appear on fracture faces and as patches through the dolostone.	172.50	174.43	1.93	E6566315	0.094	6240	4.05	51.1	27.9
		<<Min: 179.83 - 192.02: 1% realgar / 0.8% orpiment / 0.3% pyrite / 0.1% arsenic oxide>> The mineralization in this interval is dominated by realgar and orpiment along fracture planes, stylolites and numerous microfractures. There are "halos" of these arsenic sulfides around the fractures throughout this interval. The pyrite in this section is located primarily in or immediately adjacent to stylolites. Some disseminated very fine grained pyrite cubes are located throughout the darker dolostone especially in brecciated clasts though this mineralization isnt in high abundance. Scorodite is present along some fracture faces outside of the realgar/orpiment dominated zone	174.43	176.43	2.00	E6566316	0.106	15200	3.61	78.9	12.4
		<<Min: 192.02 - 200.48: 0.9% arsenic oxide / 0.1% pyrite>> in this section, pyrite mineralization is limited to the dolostone matrix as small disseminated cubes in low abundance. The scorodite alteration is present along nearly every fracture face	176.43	178.20	1.77	E6566317	2.56	5150	6.33	25.6	14.8
		<<Min: 200.48 - 228.3: 0.6% arsenic oxide / 0.1% realgar / 0.5% pyrite / 0.4% goethite / 0.2% limonite>> The pyrite in this section is brighter coloured than its typical brassy colour. It is disseminated through the matrix of the dolostone and in slightly higher concentration adjacent to stylolites and fractures. There are small patches of realgar occupying some fractures and vugs though it is not as pervasive as previously seen. The scorodite/arsenic oxide is present along many fracture faces throughout the section. Goethite and limonite exist as oxidation products along certain fracture faces near faulted zones.	178.20	179.83	1.63	E6566318	0.209	25700	3.78	21.7	15

Hole: D2-13-14

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
		<<Min: 228.3 - 230.05: 0.9% realgar / 0.1% orpiment / 0.4% pyrite>> pyrite mineralization is brassy coloured and disseminated through the dolostone clasts in the breccia. It is most concentrated inside of the darker dolostone clasts. Mineralization may be at a higher level than reported due to the potential overprinting of the realgar and orpiment mineralization. Orpiment and realgar occur along fracture planes in this interval though it is mostly realgar. They occur together and are orange in colour	179.83	181.74	1.91	E6566319	0.073	42500	3.33	31.1	21.8
		<<Min: 230.05 - 234.16: 0.1% pyrite / 0.1% realgar / 0.6% limonite>> The pyrite in this section appears very weak. The pyrite is located only in the dark coloured dolostone fragments in the breccia and because of the intense fluid movement and fractured nature of this rock, pyrite mineralization is only visible in few places. It may have been overwritten by the strong alteration. Realgar mineralization occurs in only small sections and even then is not very strong. Limonite appears as an alteration product along fracture planes	181.74	183.76	2.02	E6566320	0.035	65700	1.95	22.5	14.4
		<<Alt: 168.69 - 170.38: moderate alteration - graphite alteration / strong alteration - Scorodite alteration>> This section is characterized by carbon rich dolostone. It shows moderate graphite alteration in bands that also characterize fractures. The realgar/orpiment rich sections show scorodite alteration when fractured	183.76	185.74	1.98	E6566321	0.059	22700	2.68	24.6	13.5
		<<Alt: 170.38 - 179.83: weak alteration - graphite alteration / intense hydrothermal - realgar>> Graphite alteration is present along many fracture faces. Scorodite alteration may be present, however, it is likely overprinted by realgar and orpiment mineralizations. Realgar mineralization/alteration is intense along fracture planes and is concentrated towards the topmost part of the section adjacent to the intense fracturing	185.74	187.73	1.99	E6566323	0.01	62000	12.5	40.7	5.82
		<<Alt: 179.83 - 192.02: weak to moderate alteration - Scorodite alteration / weak alteration - graphite alteration>> Scorodite (arsenic oxide) is visible on fractures after the intense realgar mineralization. The lack of realgar and orpiment make spotting the arsenic oxide easier. Graphite alteration is present along some fracture planes, though the fracture planes are likely a result of the graphite layers rather than graphite coating along them	187.73	189.61	1.88	E6566324	0.043	32000	12.2	12.8	3.99
		<<Alt: 192.02 - 200.48: moderate to strong alteration - Scorodite alteration / weak alteration - Silicification / weak alteration - ankerite>> This zone is characterized largely by scorodite alteration along fracture faces. Some ankerite alteration is present along some veins and breccia matrix zones but it is not pervasive everywhere. Silicification is present in some of the veins as qtz-cbt but it is minor as the vast majority of the cement in this lithology is carbonate	189.61	190.74	1.13	E6566325	0.079	2040	4.5	7.28	2.75
		<<Alt: 200.48 - 228.3: weak to moderate alteration - Scorodite alteration / weak to moderate alteration - ankerite / weak alteration - graphite alteration / weak to moderate alteration - Iron Oxide Alteration / weak alteration - Limonite alteration>> The ankerite alteratoin in this section is localized around veins and brecciated sections (qtz-cbt) that are nearby major fault zones. This indicates late stage fluid movement. Scorodite is present along most fracture planes (interesting to note is that oxidized black pyrite cubes can be found along some of these fracture planes. Graphite alteration is present along fracture planes though it is likely that they define the fracture planes rather than are defined by them (fracture planes form along planes of weakness through the less competant graphite rather than the graphite is fracture controlled alteration.	190.74	191.90	1.16	E6566326	0.032	1030	2.4	12.4	0.402
		<<Alt: 228.3 - 230.05: weak alteration - graphite alteration / moderate to strong hydrothermal - realgar>> The alteration in this section is strong along fracture planes. Realgar hydrothermal mineralization/alteration. Graphite alteration is prominent along stylolites and fracture planes	191.90	193.87	1.97	E6566327	0.008	297	1.24	1.8	0.242

234.16	**252.98**	**V-MV Mafic volcanic Green fgr** 234.16 - 252.98: This section of mafic volcanics is dark green in colour and streaked with calcite veining. There are blebs of calcite throughout the rock as well indicating carbonatization. The dark green host rock, however, is non-calcareous. There are multiple generations of calcite veining along with numerous fractures. The brecciated texture is fairly weak but it can be seen in sections throughout. There is some alteration to epidote along with ankerite alteration with intense feox alteration (visible as hematite rims). The rock is magnetic along certain red veins. The upper contact is a fault zone characterized by fault gouge. The end of this lithological section is the end of hole	234.16	236.05	1.89	E6566351	0.003	2010	1.92	9.76	5.53
		<<Min: 234.16 - 252.98: 3% hematite / 6% epidote / 0.4% pyrite>> Pyrite mineralization occurs as small cubic disseminated sections throughout the matrix of the brecciated sections but in very small amounts in the clasts themselves. Epidote occurs as an alteration product surrounding hornblende crystals while hematite forms as rims and veins throughout the rock	236.05	237.96	1.91	E6566352	0.005	365	0.64	3.21	0.531
		<<Alt: 234.16 - 252.98: moderate alteration - ankerite / moderate alteration - hematite / moderate metamorphic - epidote / weak to moderate alteration - carbonate / weak alteration - Limonite alteration>> Ankerite alteration appears as large halos surrounding the darker green clasts in brecciated sections of the rock. Hematite forms as rims and veins alongside the darker green clasts. Epidote alteration surrounds dark green/black clasts (probably hornblende) in breccias. Carbonate alteration appears as blebs through the lithology and as halos surrounding veining. Limonite appears on fracture faces	237.96	239.92	1.96	E6566353	0.002	30.4	0.08	0.015	0.17

From (m)	To (m)	Rock Type & Description
0.00	**3.05**	**Casing** **Casing**
3.05	**25.57**	**S-Dol** **Dolostone** **Blue-Grey** **vfgr**

3.05 - 25.57: This interval is characterized by a highly brecciated dolostone. The grain size ranges from fine dark coloured dolostone to a medium grained lighter dolostone. Stockwork veining is present in more strained sections of the rock and can sometimes cross cut brecciatioin indicating the stockwork veining is later stage. The breccia is characterized by numerous microfaulting through both clasts and matrix. The matrix is entirely quartz-carbonate though in some of the more fractured and faulted sections pervasive ankerite/fe-carbonate coating is characteristic. When ankerite alteration is present in large amounts, it forms "halos" around some of the dolostone clasts which also have frayed margins indicating ion leeching from the host dolostone. Due to the highly fractured nature of the rock, oriented core in many places is difficult so many point structures are impossible to measure. The lower contact in this unit is a gradual change into what appears to be fault breccia. Prior to this contact, the rock begins to become more ankerite rich. Moderate-strong arsenic oxide alteration is visible along most fracture planes while limonite and feox alteration can be found in more heavily fractured sections. Pyrite mineralization is minor and can be seen as low abundance disseminated cubes through the dolostone matrix.

<<Min: 3.05 - 25.57: 0.1% pyrite / 0.01% realgar / 0.7% arsenic oxide / 0.5% limonite / 0.3% goethite>> Realgar occurs as small patches along few fracture planes in the rock. It is oxidized giving it a buff/orange colour rather than the typical vivid red. Arsenic oxide/scorodite appears as fracture coating throughout most of the rock. Limonite and goethite exist as an iron oxide alteration product along sections of heavily fractured rock. Pyrite mineralization is limited and appears as brassy colored fine grained cubes disseminated in the matrix of the dolostone.

<<Alt: 3.05 - 25.57: moderate alteration - Scorodite alteration / trace hydrothermal - realgar / weak to moderate alteration - Limonite alteration / weak to moderate alteration - Iron Oxide Alteration / weak to moderate alteration - ankerite>> Scorodite alteration is present in this interval along most fracture planes. Limonite and feox alteration are also present though to a slilghtly lesser extent. The limonite and feox only occur on fracture planes adjacent to heavily fractured zones. There a few fracture planes with patches of realgar on them though this is trace. Due to the shallow nature of the rock, the realgar is strongly oxidized and it gives it a buff/orange colour rather than the typical vivid red. Ankerite occurs as patches/halos surrounding either dolostone clasts in the breccia or as patches around fractures in the rock. Likely just iron alteration of preexisting carbonate in the matrix and possibly leeching of fe ions out of the dolostone clasts

25.57	**37.44**	**S-Dol Dolostone Blue-Grey fmgr**	25.57	27.43	1.86	E6566376	0.078	2430	29.1	12.2	0.708
25.57 - 37.44: This section is characterized by very strong brecciation of the dolostone unit. This is likely a fault breccia. The clasts appear sub angular rather than the typical angular clasts in the previous breccias. The clasts are also highly variable in size. They range from several millimeters to 5 cm (though some clasts may exceed this as they are larger than the diameter of the core. There is strong fracturing in the area along with strong evidence for fluid movement due to the iron oxide alteration in many sections. In most of the rock, the fracturing allowed fluid movement which selectively dissolved much of the matrix, leaving a "skeleton" of clasts held together by cement which has been strongly limonitized. There is limited mineralization in this section other than the alteration minerals. Acicular arsenopyrite crystals can be seen in occasional sections that are not overprinted by alteration though even still are in low abundance. Pyrite can also be found in slightly higher abundance than arsenopyrite disseminated in the darker dolostone sections.										
<<Min: 25.57 - 37.44: 0.8% limonite / 0.4% goethite / 0.01% arsenopyrite / 0.05% pyrite>> The arsenopyrite mineralization appears as acicular needles disseminated through the matrix of the dolostone in the clasts albeit in very low abundance. Pyrite occurs in slightly greater abundance than arsenopyrite, however it appears that both are absent/overprinted by the heavily altered fault brecciated zones		27.43	29.40	1.97	E6566377	0.036	1640	10.4	4.69	0.312
<<Alt: 25.57 - 37.44: moderate to strong alteration - Limonite alteration / moderate to strong alteration - Iron Oxide Alteration / moderate alteration - ankerite>> This section is highly altered. Limonite and feox occur together in this section mostly as fracture coating though in the heavily fractured areas it appears pervasive as there are usually halos/patches of the alteration adjacent to the fracture planes. Ankerite occurs in nearly all of the qtz-cbt matrix though is stronger when adjacent to the fractured areas and the other types of alteration. Scorodite alteration may or may not be present. It would likely be overprinted by the other alteration types if present		29.40	31.30	1.90	E6566378	0.068	1950	13.9	2.91	0.492
<<Struc: 27.55: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> This stylolite is in a interval of dolostone that may be a large clast in the fault breccia so the orientation may be altered due to the later stage forces		31.30	33.00	1.70	E6566379	0.055	1700	26.1	2.71	0.436
<<Struc: 36.02: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Fracture plane through some of the fault brecciated section with minor feox coating		33.00	34.82	1.82	E6566380	0.032	1450	21	2.35	0.4

37.44	**112.88**	**S-Dol Dolostone Blue-Grey fmgr** 37.44 - 112.88: This lithology is characterized by the same dolostone in the previous lithologies, however the breccia in this unit predates the intesne faulting. The upper contact is a gradual one with the faulted breccia above. The dolostone is largely fine grained and darker coloured though there are some small sections of coarser grained lighter coloured dolostone. The intense brecciation seen is typically matrix supported with angular clasts suspended in a qtz-carbonate matrix. Ankerite/fe-carbonate coating is seen on most sections of breccia and veining though it is concentrated more highly in the sections of breccia adjacent to clasts. In the more matrix-dominated sections of breccia there is no ankerite coating, just qtz-carbonate. Ankerite alteration is also seen in higher concentrations as one gets closer to the faulted sections (like the upper contact). The lower contact in this unit is a sudden shift from this brecciated dolostone to the sandy laminated unit below	37.44	39.36	1.92	E6566384	0.174	3050	21.4	4.26	0.727
		<<Min: 37.44 - 45.02: 0.8% limonite / 0.3% goethite / 0.3% arsenopyrite / 0.4% pyrite>> Arsenopyrite occurs as acicular wisps distributed throughout the matrix of the dolostone clasts in the breccia. It appears in slightly higher concentrations in the lighter coloured dolostone while the brassy cubic pyrite occurs in higher abundance in the darker coloured dolostone. Both are still in relatively low abundance. Limonite and goethite appear as alteration minerals along fracture planes.	39.36	41.00	1.64	E6566385	0.119	1460	11	2.49	0.413
		<<Min: 45.02 - 55.28: 0.5% arsenopyrite / 0.4% pyrite / 0.2% arsenic oxide / 0.6% limonite / 0.2% goethite>> Arsenopyrite occurs throughout this section in both the finer grained dark dolostone and the coarser grained lighter coloured dolostone. It has a wispy acicular form disseminated through the matrix. Pyrite occurs as very fine grained cubes disseminated through both types of dolostone though in higher concentrations in the darker dolostone. Scorodite is visible along some fracture faces though it is commonly overprinted by limonite and iron oxide alteration. In the stylolites, pyrite mineralization is very high but due to the low volume represented by the stylolites the overall mineralization percentage is low	41.00	43.01	2.01	E6566386	0.157	2060	18	2.3	0.549
		<<Min: 55.28 - 76.77: 0.9% limonite / 0.8% goethite / 0.3% arsenic oxide / 0.1% arsenopyrite / 0.05% pyrite>> Arsenopyrite occurs as wispy acicular crystals disseminated in the dolostone matrix. It is in low abundance (potentially due to overprinting alteration). Pyrite occurs as fine grained disseminated cubes in the dolostone matrix. It can be seen in clumps adjacent to limonitized fractures but this is rare. Limonite and goethite occur as fracture coating in heavily oxidized fractures while the scorodite can be seen on fracture faces whenever the feox alteration is weakers	43.01	45.02	2.01	E6566387	0.236	1580	10.1	3.2	0.364
		<<Min: 76.77 - 87.6: 0.01% pyrite / 0.9% arsenic oxide / 0.05% realgar>> Pyrite mineralization is very limited as very fine grained sporadic disseminated crystals in the dolostone matrix. Scorodite/arsenic oxide is spread along most fracture faces and some eroded vein faces. Realgar mineralization can be found few fractures though in low levels	45.02	46.28	1.26	E6566388	0.222	781	11.4	1.77	0.333
		<<Min: 87.6 - 112.88: 0.05% goethite / 0.1% limonite / 0.9% arsenic oxide / 0.1% pyrite>> In this section, pyrite occurs as fine grained disseminated cubes sporadically through the dolostone matrix (particularly through the darker coloured matrix). Limonite and goethite exist as iron alteration products along fracture planes in highly fractured areas. Scorodite is an arsenic oxide product along fracture planes and eroded veins.	46.28	47.41	1.13	E6566389	0.15	570	5.91	0.874	0.179

		<<Alt: 37.44 - 45.02: moderate alteration - ankerite / moderate alteration - Limonite alteration / weak to moderate alteration - Iron Oxide Alteration>> Ankerite alteration is intensive and is pervasive through much of the breccia matrix. It forms as a coating on the qtz-cbt matrix. The alteration appears more intense as it gets closer to the dolostone clasts indicating some form of ion leeching is occuring. In the more matrix supported sections, the ankerite alteration is not as intense. Limonite and feox alteration occur along nearly every fracture face though limonite appears more frequently	47.41	49.33	1.92	E6566390	0.248	5590	22.6	4.74	0.959
		<<Alt: 45.02 - 55.28: weak alteration - ankerite / trace alteration - Scorodite alteration / moderate alteration - Limonite alteration / weak alteration - Iron Oxide Alteration>> Ankerite alteration occurs partially along some of the veins and in some of the brecciated sections matrix. Scorodite is visible along some of the fracture planes but is likely overprinted by the limonitic and feox alteration.	49.33	51.31	1.98	E6566392	0.092	1110	9.93	1.47	0.351
		<<Alt: 55.28 - 76.77: weak alteration - Scorodite alteration / moderate to strong alteration - Limonite alteration / moderate alteration - Iron Oxide Alteration / weak to moderate alteration - ankerite>> This zone is heavily faulted and fractured. The fractures are heavily altered by both limonite and iron oxide. Ankerite appears as a coating on most breccia matrix and all of the stockwork veining cross cutting the breccia. Scorodite is limited though this is likely due to overprinting by the feox and limonitic alterations.	51.31	53.28	1.97	E6566393	0.063	513	5.93	0.774	0.142
		<<Alt: 76.77 - 87.6: moderate to strong alteration - Scorodite alteration / weak alteration - ankerite / moderate alteration - carbonate>> Scorodite alteration in this section is strong. It occurs along nearly all fracture faces and as a coating in some veins. Carbonate alteration appears strongest in some of the veins that have been selectively eroded while ankerite coating is minor and only seen in some of the matrix supported brecciated sections	53.28	55.28	2.00	E6566394	0.064	413	4.02	0.683	0.116
		<<Alt: 87.6 - 112.88: moderate to strong alteration - Scorodite alteration / weak alteration - ankerite / trace alteration - Limonite alteration / trace alteration - Iron Oxide Alteration>> Scorodite/arsenic oxide alteration is present along nearly all of the fracture faces. Limonite and feox alteration are in trace amounts long few fracture faces in places where the level of fracturing is high. Ankerite coating of breccia matrix and veins is sporadic and mostly in the same heavily fractured places that contain iron oxidation products (lim/ge)	55.28	57.26	1.98	E6566395	0.225	1370	12.3	1.5	0.316

112.88	**115.52**	**S-IBSST Interbedded sandstone and siltstone Black vfgr**	112.88	113.83	0.95	E6566431	0.009	817	5.28	8.44	0.706
112.88 - 115.52: This fine grained interbedded sandstone and siltstone has a sharp upper contact with the weakly calcareous dolostone above. The contact grades into a heavily fractured coarser grained section with some stockwork calcite veining and visible bedding. The bedding is 60degrees to core axis with truncated cross beds indicating that way up is also up direction in the hole. The unit then grades into an interbedded very fine grained black siltstone with calcareous sandstone laminations. The black siltstone is non-calcareous. The unit contains calcite veining, one of which contains trace realgar. The lower contact is a gradual change into a brecciated unit with calcareous sandstone clasts in a silty matrix that grades into the dolostone unit again. Pyrite can be found disseminated through the dark siltstone or as clumps along sandston clasts in the breccia towards the bottom of the unit										
<<Min: 112.88 - 115.52: 0.3% pyrite / 0.01% realgar / 0.1% pyrite>> The pyrite mineralization occurs in 2 forms. It is disseminated throughout the black siltstone in low abundance and it is found in higher abundance in the sandstone clasts of the breccia in high abundance but large grain size. Realgar can be found as patchy coating within calcite veins			113.83	115.52	1.69	E6566432	0.02	2540	15.7	10.7	2.19
<<Alt: 112.88 - 115.52: weak to moderate alteration - carbonate / moderate alteration - carbonate>> carbonate alteration occurs as either veins through both sets of lithology layers, or as pervasive alteration of the cement of the sandstone unit											
<<Struc: 112.9: macro evidence for deformation, but no foliation development or brecciation Bedding - Upright>> Bedding in the lamnated sandstone. Cross beds indicate upright bedding (way up=up hole)											
115.52	**117.56**	**S-Dol Dolostone Blue-Grey fgr**	115.52	117.51	1.99	E6566434	0.018	581	3.57	7.34	0.421
115.52 - 117.56: The upper contact is a zone of brecciation that grades into the typical dolostone seen aboe the interbedded siltstone/sandstone unit. The lower contact is a sharp contact defined by a stylolite/pressure dissolution band that is 40 degrees to core axis separating the dolostone above from the brecciated calcareous sandstone/siltstone below. The dolostone is brecciated dark coloured fine grained material with an ankerite/qtz-cbt matrix. There is some zebra texture occuring in some of the dolostone clasts as well. The alteration is typical of scorodite/arsenic oxide as a coating along fracture planes and there is some feox/limonite alteration in some places as well. The mineralization is low with small very dispersed graines of cubic pyrite throughout the section. When present, stylolites/pressure dissolution surfaces hold slightly higher amounts of pyrite.										
<<Min: 115.52 - 117.56: 0.05% pyrite / 0.05% limonite / 0.7% arsenic oxide>> Pyrite occurs as small disseminated cubes throughout the dolostone matrix in low abundance. It can be found in slightly higher abundance inside of stylolites/pressure dissolution surfaces. Scorodite/arsenic oxide occurs as fracture coating while limonite is found in trace amounts as patches on certain fracture surfaces			117.51	119.42	1.91	E6566435	0.033	1970	15.6	12.6	1.12
<<Alt: 115.52 - 117.56: moderate alteration - Scorodite alteration / trace alteration - Limonite alteration / trace alteration - Iron Oxide Alteration>> limonite and feox alteration occur together as fracture coating along few fracture planes while scorodite alteration occurs along most fracture planes and has a green-yellow colour

117.56	**119.42**	**S-IBSST Interbedded sandstone and siltstone Black fgr**									
117.56 - 119.42: the upper contact in this unit is a sharp contact defined by a stylolite/pressure dissolution surface. The section is brecciated at both the top and bottom contact though the middle of the section is a non-calcerous siltstone with some weakly calcareous sandstone laminations. The calcite veining in this section has been altered to ankerite. The lower contact is a fault gouge section followed by dolostone. Mineralization is minimal as pyrite only occurs as very fine grained disseminated cubes in the siltstone matrix in low abundance. There is a moderate amount of iron oxide alteration along fracture faces as well as trace scorodite fracture coating										
<<Min: 117.56 - 119.42: 0.1% pyrite / 0.4% limonite / 0.2% goethite / 0.1% arsenic oxide>> Pyrite occurs as disseminated cubes through the siltstone matrix. Limonite and goethite occur as iron oxidation products along fracture faces while arsenic oxide occurs in small places as patches on fracture faces.										
<<Alt: 117.56 - 119.42: weak to moderate alteration - Limonite alteration / weak to moderate alteration - Iron Oxide Alteration / trace alteration - Scorodite alteration / weak alteration - ankerite>> this unit has most alteration occuring along fracture planes though ankerite alteration of calcite veins is visible towards the contacts on either side of the section. Scorodite is visible on some fracture surfaces though this could be overprinted by the iron oxidation products.										
119.42	**126.78**	**S-Dol Dolostone Blue-Grey fmgr**	119.42	121.05	1.63	E6566436	0.036	1140	5.48	3.64	0.734
119.42 - 126.78: This section is a heavily fractured and faulted unit with a number of gouge sections. The dolostone has abundant scorodite alteration slong both fracture planes and through fractured rock. The lower contact is another section of gouge followed by heavily fractured/faulted rock leading into the brecciated sandy unit below. Mineralization in this rock is low. Large degree of fluid movement seen through fractures as degree of alteration is high. Large amounts of calcification and scorodite alteration.										
<<Min: 119.42 - 126.78: 0.01% pyrite / 0.9% arsenic oxide>> The pyrite mineralization in this section is very low. There is the occasional very fine grain disseminated in the matrix of less-altered dolostone, however the rock is very heavily altered.			121.05	123.15	2.10	E6566437	0.02	699	3.14	2.46	0.474
<<Alt: 119.42 - 126.78: moderate to strong alteration - Scorodite alteration / moderate to strong alteration - carbonate>> This section has a high degree of scorodite alteration along fracture planes and in heavily fractured rock as "halos" around the fractures. Carbonate alteration is strong and pervasive through this heavily fractured rock. Could be evidence for "calcite flooding".			123.15	124.03	0.88	E6566438	0.018	780	3.54	3.87	0.473
			124.03	126.78	2.75	E6566439	0.009	1650	8.67	5.35	0.931

From (m)	To (m)	Rock Type & Description		
126.78	**129.10**	**S-IBSD**	**Interbedded sandstone and dolostone**	**Buff**	**fmgr**

126.78 - 129.1: This section is an interbedded weakly silicified dolostone with non-calcareous siltstone with calcite veining. The upper and lower contacts are sections of faulting characterized by iron oxide alteration. The dolostone in this section has been altered by fluid movement, some of it being completely silicified. The siltstone is interesting as it is the only unit with calcite veining. Limonite alteration is also present along fracture planes.

<<Min: 126.78 - 129.1: 0.6% limonite / 0.5% goethite>> Limonite and goethite are both alteration products in this section. There is no visible pyrite mineralization, possibly overprinted by the alteration

<<Alt: 126.78 - 129.1: moderate alteration - Limonite alteration / weak to moderate alteration - Iron Oxide Alteration / trace alteration - Silicification>> Along fractures and faulted zones, limonitic and feox alteration are common. Some small sections of dolostone are weakly silicified and have numerous fractures.

129.10	**134.73**	**S-Slt**	**Siltstone**	**Black**	**fgr**

129.1 - 134.73: This unit has a faulted contact above with the silicified dolostone. It is a silty layer with conglomeratic/debrite texture.There is abundant soft-sediment deformation with the siltstone as the matrix and the non-calcareous sandstone as the clasts. Some of the sandstone clasts are streaked with small calcite veinlets. The lower contact is a stylolite in the lower sandstone. The texture of the rock can appear sheared, however the banding and laminations are likely just soft sediment deformation. The pyrite mineralization in this section is quite high. Particularly along foliation/laminae in the deformed siltstone. The fluids likely percolated through planes of weakness like bedding. The sandstone clasts show minimal mineralization. The alteration in this zone is primarily graphitic

<<Min: 129.1 - 134.73: 1% pyrite>> The pyrite mineralization is very high in the siltstone unit. It seems to selectively crystallize along laminae. The pyrite appears sooty in places and globby throughout. The mineralization is limited in the sandy clasts and mostly focused through the siltstone

<<Alt: 129.1 - 134.73: moderate alteration - graphite alteration / weak to moderate alteration - carbonate>> The carbon rich siltstone has numerous sections of banded graphite alteration. Though it is likely that the graphite alteration is not fracture controlled and that the fractures preferentially go through graphite rich layers. Carbonate alteration is present as veining through the sandy layers and intrudes along some of the fracture planes in the siltstone

<<Struc: 134.15: non-penetrative cleavage\foliation development or brittle faults\brecciation Banding>> Banding-like foliation in the silty rock "matrix"

<<Struc: 134.5: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Fracture likely following foliation orientation

134.73	**138.18**	**S-SS Sandstone Grey mgr**	134.73	136.67	1.94	E6566446	0.001	36.5	0.28	0.234	0.058
		134.73 - 138.18: This sandstone unit is non-calcareous and grey in colour. The upper contact is sudden with the soft-sediment deformed siltstone above. This unit is approximately equigranular and contains sparse calcite veinlets. There is very slight carbonate alteration present as tiny blebs of cement though this is not pervasive. The lower contact is a sharp one with the silty deformed rock below									
		<<Min: 134.73 - 138.18: 0.2% pyrite>> The pyrite mineralization in this unit is mostly disseminated pyrite cubes throughout the sandstone in the matrix in between quartz grains	136.67	138.18	1.51	E6566447	0.001	32.4	0.25	0.224	0.04
		<<Alt: 134.73 - 138.18: trace alteration - carbonate>> The carbonate alteration in this rock is trace and appears as blebs of cement in the matrix.									
		<<Struc: 135.7: non-penetrative cleavage\foliation development or brittle faults\brecciation Joints - General>> Joint in the sandstone									
		<<Struc: 137.33: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Low angle fracture in the sandstone									
		<<Struc: 137.89: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Lower angle fracture in the sandstone									
138.18	**142.48**	**S-Slt Siltstone Black fgr**	138.18	139.42	1.24	E6566448	0.001	102	2.16	0.89	0.288
		138.18 - 142.48: This unit is similar to the previous siltsotne conglomeratic/debritic textured rock before the sandstone unit. It is a non calcareous siltstone with non calcareous sandstone clasts. It has extensive graphitic alteration and some calcite veining. The texture of this rock is beginning to appear more sheared and less like soft sediment deformation.									
		<<Min: 138.18 - 142.48: 0.8% pyrite>> pyrite in this section is concentrated in the black muddy/silty rock. It is located sparingly in the weakly calcareous sandstone clasts.	139.42	140.59	1.17	E6566450	0.0005	9.3	0.15	0.155	0.029
		<<Alt: 138.18 - 142.48: moderate alteration - graphite alteration / weak alteration - carbonate>> The graphite in this unit is pervasive and appears banded. The carbonate alteration appears as veinlets cross cutting both sets of lithology.	140.59	142.58	1.99	E6566451	0.003	58.8	0.44	0.51	0.216

Hole: D2-13-15

142.48	**149.95**	**S-IBSST Interbedded sandstone and siltstone Grey fmgr**	142.58	144.48	1.90	E6566452	0.002	28.1	0.12	0.417	0.137
142.48 - 149.95: This lithological unit is characterized by grey non-calcareous sandstone with thin black laminations interbedded with non-calcareous siltstone. The shearing fabric is much stronger in the siltstone unit than the sandstone. The sandstone is fine-medium grained while the siltstone is fine grained. There are sporadic brecciated sections but only make up a small percentage of the rock. There is graphitic layers/alteration throughout the section concentrated in the siltstone. These layers are more likely to define fractures rather than be fracture controlled alteration. Pyrite mineralization occurs sporadically as disseminated cubes in the matrix of the sandstone and in select laminations in the siltstone. The lower contact is a brecciated section above 5 cm long at the bottom of a section of the siltstone above that contains the clasts of the coarse grained sandstone below.										
<<Min: 142.48 - 149.95: 0.1% pyrite>> Pyrite is found as small disseminate silvery cubes in the matrix of the darker laminations in the sandstone and in select banding in the siltier rock	144.48	146.39	1.91	E6566453	0.002	49.9	0.14	0.569	0.138
<<Alt: 142.48 - 149.95: weak to moderate alteration - graphite alteration>> The main type of alteration in this section is graphite. This is likely in situ carbon that has been 'cooked"	146.39	148.25	1.86	E6566454	0.002	20.3	0.14	0.719	0.122
<<Struc: 142.88: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Banding>> Banding-like foliation in the dark laminations in the sandstone unit	148.25	149.95	1.70	E6566455	0.002	30.5	0.17	0.814	0.171
<<Struc: 149.13: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Banding>> Shear banding of darker laminations in the interbedded sandstone/siltstone									
149.95	**164.89**	**S-IBSST Interbedded sandstone and siltstone Grey cgr**	149.95	151.86	1.91	E6566456	0.002	20.9	0.11	0.321	0.116
149.95 - 164.89: This lithology is made up mostly of coarse grained sandstone-fine grained conglomerate. The majority of "clasts" are quartz crystals that are between 1-3mm in diameter. There are some other lithic fragments such as large (up to 3cm) angular fragments of the siltstone unit. This sandstone unit can be differentiated from the sandstone above by the larger grain size and lack of laminations. This unit also shows much more shearing fabric present as folding layers and flow-banding-like fabric. The alteration in this section is mostly graphitic though there is some weak calcite veining through some of the more strained sections. The coarse sandstone unit shows minimal mineralization. Pyrite can be found in globules in the matrix between quartz grains but are not uniform.										
<<Min: 149.95 - 164.89: 0.2% pyrite>> In this section, Pyrite mineralization is found as brassy coloured globules dispersed through the dark coloured matrix of the sandstone and the siltstone.	151.86	153.80	1.94	E6566457	0.002	25.6	0.11	0.278	0.11
<<Alt: 149.95 - 164.89: moderate alteration - graphite alteration>> The alteration in this section is primarily graphitic which appears as foliated bands along fracture planes. The graphite is likely a cause of the fracturing (due to low competency) rather than the result of fracture controlled fluids	153.80	155.66	1.86	E6566459	0.002	23.4	0.26	0.329	0.134
<<Struc: 152.2: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Fracture in the coarse grained sandstone that potentially follows foliation	155.66	157.60	1.94	E6566460	0.002	21.1	0.17	0.407	0.147

			162.99	164.98	1.99	E6566464	0.002	37	0.23	0.395	0.214
164.89	**201.92**	**S-Slt Siltstone Green-Grey vfgr**	164.98	166.90	1.92	E6566465	0.003	14.1	0.25	0.273	0.109
		164.89 - 201.92: This lithological section is dominated by 3 rock types interbedded. The siltstone units are an interebedded section with green-grey and maroon sections. They have undergone intense shearing with numerous sets of shearing foliation planes. The foliation planes are uniform through both sections and are defined by laminations of either the green siltstone in the maroon or vice versa. These units are non-calcareous but have multiple stages of calcite veining both following and cross cutting foliation. They are largely unaltered other than the calcite veining. The interbedded siltstone and sandstone lithology is the most heavily sheared section of this interval. It is characterized by sections of darkly laminated grey non-calcareous sandstone with mudstone/siltstone. In the sandstone-siltstone interbedded layer there are small (10-15cm) sections of heavily fractured laminated calcareous fine grained sandstone though these are likely "clasts/boulders" ripped up in the regional deformation events and picked up by the host rock. There is abundant calcite veining in this interbedded sandstone-siltstone unit though by and large these are preexisting veins as they are often sheared. In the interbedded sandstone-siltstone section in between the sections of maroon and green siltstone, the sandstone can take on a greenish hue. Mineralization in this section is in much higher concentration in the interbedded sandstone and siltstone layers than in the green and maroon siltstone layers. The pyrite is typically brassy coloured and disseminated in the darker laminations. The lower contact in this section is a fault gouge zone going from the sheared siltstone into the volcaniclastic unit below.									
		<<Min: 164.89 - 175.4: 0.1% pyrite>> The pyrite in this section is focused in the dark laminations in the sandstone	166.90	168.74	1.84	E6566467	0.002	11	0.13	0.074	0.116
		<<Min: 175.4 - 179.65: 0.05% pyrite>> The pyrite mineralization in this section is concentrated around foliations with trace iron oxide alteration in both the green and maroon siltstones. The mineralization is minor and likely uses some sets of foliation as nucleation sites.	168.74	170.42	1.68	E6566468	0.002	21.6	0.36	0.257	0.199
		<<Min: 179.65 - 186.94: 0.1% pyrite>> Pyrite mineralization is brassy coloured and disseminated through both the sandstone and siltstone lithologies in this interbedded section.	170.42	172.26	1.84	E6566469	0.003	16.3	0.19	0.242	0.192
		<<Min: 186.94 - 195.72: 0.05% pyrite>> In this interbedded green and maroon siltstone, the pyrite is focused around certain foliation fabrics that also have iron oxide halos though they are quite rare. The mineralization level in these green and maroon siltstone intervals is low	172.26	173.45	1.19	E6566470	0.002	8.7	0.11	0.078	0.18
		<<Min: 195.72 - 199.11: 0.3% pyrite>> In this interval, mineralization is focused around the interbedded sandstone and siltstone along the dark coloured laminations	173.45	175.40	1.95	E6566471	0.004	9.6	0.16	0.058	0.178

201.92	**207.58**	**V-Bx Volcanic Breccia Grey-Green fmgr**	201.92	203.84	1.92	E6566490	0.001	3	0.13	0.125	0.072
		201.92 - 207.58: This volcanic lithological section is intensely sheared and has a number of different conflicting textures. The rock is strongly calcareous though that seems to be focused in the clasts it contains. The clasts are by and large heterolithic though all show a calcareous nature or calcareous alteration. There are clasts of mudstone, limestone (potentially just calcareous sandstone), green and maroon siltstone and some unidentifiable smaller lithic fragments. The matrix shows the shearing texture more than the more competent clasts. The rock seems quite brecciated in places, though the larger clasts towards the middle of the section show rounded-sub rounded edges indicating that it could be a conglomerate as well. Wispy/patchy chlorite can be found throughout the section along with plagioclase lathes in some of the clasts. This rock appears to be of intermediate composition. There is intense calcite veining throughout the section as well as some small sections of breccia with calcite matrix. This unit grades into a deformed black and green mudrock below.									
		<<Min: 201.92 - 207.58: 1.5% pyrite>> Extensive pyrite mineralization is present in this unit. It occurs as medium grained cubes grouped in blobs throughout the rock. It occurs as clast overprinting, present in and along veins and through the general matrix of the unit.	203.84	205.68	1.84	E6566492	0.002	10.6	1.28	0.832	0.783
		<<Alt: 201.92 - 207.58: strong alteration - carbonate / weak alteration - chlorite>> There is some propylitic alteration taking place in this unit though it is not in the pick list of this program. Chloritization is present as a replacement alteration along some clasts in the conglomerate-like sections. Carbonate alteration is pervasive throughout the section present as veining and as cement and matrix replacement. Some of the clasts even show carbonate alteration.	205.68	207.53	1.85	E6566493	0.006	14.2	3.65	0.892	0.364
		<<Struc: 203.96: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Fractures - sheeted fractures>> High angle fracture in the volcanic unit	207.53	209.46	1.93	E6566494	0.003	6	0.68	0.144	0.133
		<<Struc: 205.73: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Veins - General>> Calcite vein following the foliation of the host rock. It looks to be a preexisting vein that has been sheared rather than a vein intruding along a plane of weakness									
207.58	**219.46**	**S-Mst mudstone Black vfgr**	209.46	211.24	1.78	E6566495	0.003	6.1	0.43	0.123	0.114
		207.58 - 219.46: This unit begins as a gradual contact with the volcanic unit above. As the contact is crossed, the number of larger clasts in the muddy rock decreases until it is just the black and grey-green mudstone "swirled" together. This lithology is non-calcareous though there are multiple stages of veining. This lithology is composed of 2 different mudstones (probably interbedded); a green-grey mudstone and a black mudstone thaty are sheared together to make a "swirly" appearance. There is a small 1 meter section of black carbon rich mudstone in the center of this unit. The rock is largely unaltered besides few trace amounts of iron oxide along some laminae. Tpwards the bottom of the section, the unit begins to grade back into the volcaniclastic unit. The mudstone begins to incorporate more and more angular clasts in its matrix which becomes lighter in colour. In some of the clasts, tension veining is present indicating strong shear forces.									
		<<Min: 207.58 - 219.67: 0.1% pyrite>> In this section, pyrite can onl be found as wisps along very small fracture planes. The pyrite is fine grained and wispy.	211.24	213.36	2.12	E6566496	0.002	1.7	0.08	0.047	0.125

Hole: D2-13-15

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
		<<Alt: 207.58 - 219.67: weak to moderate alteration - graphite alteration>> The only type of alteration present is graphitic alteration. It is very strong towards the end of the section.	213.36	216.29	2.93	E6566497	0.003	6.8	0.15	0.035	0.138
		<<Struc: 218.72: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Fracture with graphitic coating	216.29	218.13	1.84	E6566498	0.002	6.7	0.25	0.039	0.131
			218.13	219.67	1.54	E6566500	0.026	53.4	6.59	0.818	0.096
219.46	**234.76**	**V-Bx Volcanic Breccia Grey-Green fmgr**	219.67	221.53	1.86	E6566501	0.021	24.5	1.69	0.398	0.248
		219.46 - 234.76: This is a return to the intermediate volcanics from previous intervals. This unit has an upper contact that is gradual with the sheared mudstone above. The gradual contact is characterized by intervals/interbeds of mudstone with some of the volcanic clasts in it. The colour of the matrix of the volcanic section is a darker green near the contact with the mudstone above and slowly becomes a tan colour nearer to the bottom. The upper contact is marked at the last appearance of mudstone without clasts. This unit has undergone intense carbonate alteration as many of the clasts and most of the cement is calcite. There is pervasive calcite veining both pre/syn and post deformational. In situ propylitic alteration has taken place in the form of trace epidote, chlorite and carbonate alteration. The lower contact in this unit is a suddein/sharp contact with a small section of foliated calcite veins and heavily foliated dark siltstone/mudstone. Pyrite can be found as clumps selectively replacing specific carbonate rich clasts. The original idenitity of the clasts cannot be determined due to the strong pyrite replacement.									
		<<Min: 219.67 - 234.76: 1.2% pyrite>> In this section, pyrite mineralization is quite high. In the volcanic unit, it seems to selectively replace carbonate clasts within the conglomerate/breccia. It has a globby appearance and looks speckled. It is a brassy colour. There are small wisps of silvery pyrite in some of the black stringers through the volcanics but they are very sparse	221.53	223.53	2.00	E6566502	0.005	24.1	0.89	0.282	0.207
		<<Alt: 219.67 - 234.76: weak alteration - chlorite / moderate alteration - carbonate>> Carbonate alteration appears as pervasive replacement of cement in the host lithology. It also appears as veining. Chlorite alteration occurs as patchy trails following foliation. The majority of the chlorite is fine grained. Some propylitic alteration is occurring though this is likely in situ rather than hydrothermal	223.53	225.22	1.69	E6566503	0.005	25.4	1.27	0.336	0.221

234.76	**247.08**	**S-IBSST Interbedded sandstone and siltstone Black vfgr**	234.76	236.70	1.94	E6566510	0.015	32.9	8.27	1.64	0.145
		234.76 - 247.08: The upper contact in this unit is a sudden large calcite vein followed by a change in foliation orientation leading into the siltstone layer below. This lithology doesn't show the shearing forces as much as previous sections. The shearing in this section looks brittle-ductile as opposed to pure ductile shear. The unit is comprised of a fine grained black non-calcareous siltstone with interbedded fine grained non-calcareous sandstone. There is pervasive multi generation calcite veining through both lithologies. Tension veining is present in the sandstone sections (pre-shearing). The few very heavily veined sandstone sections have unergone carbonate alteration as their cement was replaced by calcite. In the more extensive siltstone sections there is abundant pyrite mineralization as disseminated medium-coarse grained cubes. Clusters of pyrite are often finer grained than the larger singular cubes found. The unit has unergone graphitic alteration (likely metamorphic-like pressure cooking of the carbon rich siltstone). The sharp lower contact, again, is a thick (2cm) calcite vein followed by the volcanic unit below.									
		<<Min: 234.76 - 247.08: 4.5% pyrite>> There is very extensive pyrite mineralization in this section. It occurs as very coarse grained cubes up to 1mm in diameter all the way down to very fine grained cubes. Regardles of diameter, the pyrite occurs disseminated throughout the dark black matrix of this siltstone. The cube faces are undulose indicating an odd fracture pattern due tp drilling or possibly recrystallization. The pyrite is brassy coloured.	236.70	238.40	1.70	E6566511	0.011	13.9	2.1	1.31	0.115
		<<Alt: 234.76 - 247.08: strong alteration - graphite alteration>> The graphite alteration in this lithology is likely in situ metamorphism of pre-existing carbon in the carbon rich siltstone. This pervasive alteration is throughout the rock though it typically defined fracture zones. This is most likely due to the low competency of the graphite unit.	238.40	240.31	1.91	E6566512	0.015	10.1	2.15	1.61	0.074

<<Struc: 243.76: non-penetrative cleavage\foliation development or brittle faults\brecciation Banding>> Foliation defined by shear banding		
247.08	**256.03**	**V-Bx Volcanic Breccia Grey-Green fgr**
247.08 - 256.03: This intermediate volcanic breccia unit is very similar to the previous sections. It has the same unusual sub rounded clast texture with heterolithic composition. The majority of the clasts are calcareous sandstone. Numerous sets of veins cross cut many of the clasts but not the matrix (previous generation of veining?). The matrix of this unit is held together with calcite cement. This is likely a carbonate alteration. The colour of this unit is grey-green-tan. There is minor chlorite alteration present replacing some veins as a patchy green mineral. Numerous black stringers through the host rock indicate foliation and shearing although not as strongly as the previous units. The alteration in this section is primarily propylitic with chlorite, carbonate and minor trace epidote alteration.		
<<Min: 247.08 - 256.03: 0.01% hematite / 0.9% pyrite>> The pyrite mineralization in this section is highly concentrated in specific blue-grey clasts of calcareous sandstone. It occurs in the matrix as well though in lower abundance. It is brassy coloured. Hematite occurs as rims on select clasts.		
<<Alt: 247.08 - 256.03: trace alteration - hematite / trace alteration - chlorite / moderate to strong alteration - carbonate>> Hematitic rims around some of the clasts in the volcanic unit. Chorite alteration is present as patchy replacement. Carbonate alteration is pervasive as intense veining and cement.

From (m)	To (m)		Rock Type & Description		
256.03	**261.13**	**S-IBSST**	**Interbedded sandstone and siltstone**	**Grey**	**fgr**

256.03 - 261.13: This interbedded sandstone and siltstone is strongly sheared. The grey fine grained sandstone has undergone boudinage in some places. Tension veining has occurred in many of the layers and is infilled with calcite. In strongly veined sandstone beds, the cement has been altered to calcite. The upper contact in this section is a sharp contact between the upper volcanics and the intensely sheared interbedded sandstone-siltstone. The calcite veining is likely syn deformational forming during the stresses that formed the shearing texture.The lower contact is sharp again leading into the volcanics below. The pyrite mineralization is focused around the sandstone sections though it is possible that calcite veining has overwritten the mineralization. The lower contact is sharp and defined by a calcite vein/foliation.

<<Min: 256.03 - 261.13: 0.2% pyrite>> The pyrite mineralization in this section is focused around the sandstone sections of the sheared interbeds. It is possible that more pyrite mineralization is overprinted by the intense calcite veining

<<Alt: 256.03 - 261.13: moderate to strong alteration - carbonate / moderate alteration - graphite alteration>> The carbonate alteration in this section is controlled by the intense veining through the sandstone interbeds. The graphite alteration is likely metamorphic and sources the carbon from the carbon rich siltstone.

From (m)	To (m)		Rock Type & Description		
261.13	**266.99**	**V-Bx**	**Volcanic Breccia**	**Grey-Green**	**fmgr**

261.13 - 266.99: This volcanic breccia is slightly different from previous sections. It contains a greater proportion of rounded clasts. There is also a clast size difference from the beginning to the end of the section. The beginning of the section shows smaller grain size (2-8mm) and more angular clasts. The end of the section has clasts ranging from 2-60mm and they are typically more rounded. The rock is strongly calcareous with most clasts and all of the cement altered to calcite. Some clasts show blobs of pure calcite replacement. Feldspar lathes are also prevalent through the section. The alteration is strongly carbonate with trace iron oxide alteration. Propylitic alteration also occurs though the telltale epidote alteration is trace. The lower contact is sharp into the sheared interbedded sandstone and siltstone.

<<Min: 261.13 - 266.99: 0.8% pyrite>> Pyrite Is found disseminated through the matrix as well as disseminated through select calcareous clasts.

<<Alt: 261.13 - 266.99: strong alteration - carbonate / trace alteration - Iron Oxide Alteration / trace alteration - chlorite>> Propylitic alteration is present though it is not available in the pick lists. Carbonate alteration is pervasive and found mostly as cement through the matrix of the conglomerate/breccia and as replacement of some of the clasts. Chlorite is present though in trace quantities.

<<Struc: 262.16: penetrative cleavage\foliation developed or abundant brittle faults\brecciation Veins - General>> Small calcite vein

Hole: D2-13-15

From (m)	To (m)	Rock Type & Description
266.99	**283.46**	**S-IBSST Interbedded sandstone and siltstone Grey fgr**

266.99 - 283.46: This lithology is a strongly sheared interbedded sandstone and siltstone. Towards the top of the section, the interbeds are thinner and show the shear more strongly. Towards the bottom of the section the beds become thicker. Because the more competent sandstone beds are thicker, the shearing isnt as evident in those beds as it is in the more siltstone rich layers. Some of the sandstone sections still have their original bedding laminations. There is no pervasive alteration through this section other than minor pre-deformational calcite veining. The sandstone is non-calcareous other than the weak veining. The siltstone is grey-black to grey-green in colour and non calcareous.

<<Min: 266.99 - 283.46: 0.1% pyrite>> In the sandstone, pyrite occurs mainly as a silvery fine grained disseminated mineralization. It occurs in very low abundance in the siltstone as a disseminated cubed silvery mineral

<<Alt: 266.99 - 283.46: weak to moderate alteration - carbonate>> The only alteration in this interval is pre-deformational calcite veins that have since been sheared.

<<Struc: 276.26: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Open fracture following a calcite vein

0.00	**8.23**	**Casing Casing**									
8.23	**36.29**	**S-Dol Dolostone Blue-Grey fmgr**	8.23	10.34	2.11	E6566543	0.02	232	2.89	2.41	0.793
8.23 - 36.29: This lithological unit begins at the casing at 8.23 meters and ends at a sharp contact with the brecciated siltstone below defined by a stylolite. The dolostone is blue-grey in colour and fine to medium grained (the finer grained dolostone tends to be darker than the coarser grained dolostone). The difference in colour is likely due to the calcite cement content. The coarser grained dolostone has more calcite cement visible and is lighter in colour. This unit is moderately fractured, veined and brecciated with several cross cutting stylolites. There are small sections of faulting. The alteration is characterized by abundant scorodite/arsenic oxide fracture coating throughout the section, limonite/goethite fracture coating in faulted zones, and pervasive carbonate alteration as cement replacement. Ankerite/fe-carbonate alteration is present in most vein systems and matrix breccia though it is more strongly visible in faulted/fractured zones. In some vugs there is kaolinite visible as an infill alteration. Arsenian pyrite is visible as disseminated blobs, some of which have iron oxide halos. Pyrite occurs as disseminated cubes through the matrix of the darker, finer grained dolostone unit									
<<Min: 8.23 - 36.29: 0.1% arsenopyrite / 0.2% pyrite>> Arsenopyrite is found as very fine grained silvery patches/wisps in the matrix of the dolostone, somewhat coating some of the dolostone grains. It can also occur as globs of silvery pyrite with oxidation rings surrounding it. Pyrite occurs as brassy coloured very fine grained disseminated cubes throughout the matrix. Brassy pyrite was only found in the darker finer grained dolostone sections			10.34	12.26	1.92	E6566544	0.007	234	1.76	2.12	0.443
<<Alt: 8.23 - 36.29: moderate alteration - Scorodite alteration / weak alteration - Limonite alteration / weak alteration - Iron Oxide Alteration / moderate alteration - carbonate / moderate alteration - ankerite>> Scorodite/arsenic oxide occurs as a fracture coating along most fracture faces. In places with no scorodite visible it is likely that is was overprinted by limonite and goethite coating. It is a green-yellow colour. Limonite/feox alteration occurs as fracture coating in heavily fractured/faulted zones. Limonite is a buff-yellow colour while feox/goethite is a red-brown colour. Carbonate alteration is a pervasive cement replacement throughout the matrix of the dolostone. The dark blue dolostone clasts are surrounded by calcite cement. Ankerite alteration occurs as a atchy "coating" of veins and matrix in the dolostone. It is a tan-flesh coloured alteration. It appears stronger when adjacent to fractures and faults. Very minor kaolinite alteration is also present as a vug filling. It is very soft and white in colour			12.26	14.25	1.99	E6566545	0.009	311	1.86	1.64	0.495

Hole: D2-13-16

From (m)	To (m)	Rock Type & Description
<<Struc: 14.71: Veins - General>> Uncoated calcite vein		
36.29	**40.56**	**S-Dol Dolostone Brown-Grey fgr**
36.29 - 40.56: This unit begins with a strongly brecciated section with dolostone matrix. The clasts are composed mostly of the lower silstone though clasts of small qtz-cbt are also common (brecciated veins (?)). The brecciated dolostone unit persists for the first 1.5 meters and then the laminated non-calcareous interbedded siltstone and dolostone remains for the rest of the section. Iron oxidation is present along some laminae and along fracture planes. The bottom section of this unit is faulted and highly fractured with heavy iron oxidation. The lower contact is a fault zone leading back into the fine-medium grained dolostone unit. The upper brecciated dolostone has moderate carbonate alteration occuring as cement replacement. No later stage veining is visible. Arsenian pyrite was found in the upper brecciated dolostone section while brassy pyrite was found in the siltstone/dolostone interbeds.		
<<Min: 36.29 - 40.56: 0.2% arsenopyrite / 0.4% pyrite>> In the dolostone breccia, arsenopyrite can be found as fine grained wisps disseminated through the dolostone matrix. No pyrite mineralization was found in the dolostone breccia.		
In the interbedded siltstone and dolostone, brassy fine grained pyrite cubes were found disseminated through the matrix of either lithology. The dolostone had slightly higher mineralization levels.		
<<Alt: 36.29 - 40.56: moderate alteration - Iron Oxide Alteration / weak alteration - Limonite alteration / moderate alteration - carbonate>> Iron oxide alteraton is strong in this unit along select laminae and the heavily fractured section towards the bottom.		
Limonite alteration is present though most of it is likely overprinted by feox alteration.		
Carbonate alteration is pervasive through the upper section of brecciated dolostone though very minimal in the lower laminated siltstone unit.

40.56	**140.11**	**S-Dol Dolostone Blue-Grey fmgr** 40.56 - 140.11: This fine-medium grained dolostone is heavily brecciated and veined with several sections of faulting and stylolites. The upper contact is a fault separating this dolostone from the interbedded siltstone/dolostone above. The alteration in this section is characterized by fracture coating by either limonite/goethite (feox) in faulted/fractured areas and then scorodite/arsenic oxide alteration fracture coating in the rest of the section. Carbonate alteration is present as calcite cement between the darker "grains/crystals" of dolomite. The coarser (lighter coloured) dolostone has a higher proportion of calcite cement relative to the finer grained (darker) dolostone. Ankerite/fe-carbonate alteration is present as a patchy "coating" along veins and breccia matrix. The veins are mostly qtz-cbt with ankerite/fe-carbonate coating in areas close to fractures and faults. The dominant texture in this rock is brecciation and zebra texture. Most brecciated sections show a qtz-carbonate matrix with doloston "clasts/fragments". These clasts often appear with frayed margins. The veins and matrix are more altered to fe-carbonate/ankerite closer to the surface. The deeper you go into this lithology, the more carbonate alteration is visible (often totally replacing the matrix and even forming blebs/blobs). The overall lithology is a mosaic of larger dolomite clasts with very fine grained calcite cementing them together. Numerous stylolites are present, often cross cutting and displacing veins/breccias. There are many micro-faults throughout the section showing 1-10mm displacement. This section has variable amounts of arsenopyrite and pyrite mineralization. Typically, arsenopyrite occurs in the darker coloured dolostone adjacent to fractures and in zones with intense scorodite/arsenic oxide alteration. The lower contact in this zone is a fault zone.	40.56	42.05	1.49	E6566563	0.028	1820	6.83	11.4	6.98
		<<Min: 40.56 - 45.07: 0.01% pyrite>> Pyrite is found in very low abundance. Sparse very fine grained brassy cubes. The mineralization I potentially overprinted by the strong alteration	42.05	44.00	1.95	E6566564	0.021	1120	4.83	7.82	3.13
		<<Min: 45.07 - 65.24: 0.05% arsenopyrite / 0.05% pyrite / 0.05% realgar / 0.7% arsenic oxide / 0.4% goethite / 0.5% limonite>> In the darker dolostone sections, silvery wispy arsenopyrite can be found disseminated in the matrix albeit in low abundance. Pyrite can also be found though it occurs as very fine grained disseminated cubes. Orange patchy realgar can be found in trace amounts along fracture planes and coating vug walls. Arsenic oxide/scorodite can be found coating fracture planes and is a yellow-green colour Limonite and goethite are found as fracture coating in heavily fractured areas	44.00	45.07	1.07	E6566565	0.048	1430	5.5	7.85	3.57
		<<Min: 65.24 - 66.69: 0.05% pyrite>> Pyrite occurs as very fine grained disseminated cubes within the dolostone. It occurs in slightly higher concentration when adjacent to stylolites.	45.07	47.01	1.94	E6566567	0.012	1580	3.83	12.5	2.67
		<<Min: 66.69 - 78.83: 0.6% arsenic oxide / 0.3% limonite / 0.1% goethite / 0.06% arsenopyrite>> Limonite and goethite occur along fracture planes as a yellow-buff-red colour. Scorodite/arsenic oxide occurs as a fracture coating as a yellow-green colour. Arsenopyrite occurs as silvery wisps disseminated through the matrix of the darker dolostone sections. The lighter coloured coarser/more calcite rich sections have likely overprinted the discrete arsenopyrite mineralization in these sections. Arsenopyrite occurs in higher abundance adjacent to scorodite/arsenic oxide altered fracture planes and near dissolution surfaces/stylolites	47.01	48.90	1.89	E6566568	0.012	668	2.09	10.1	0.917

Hole: D2-13-16

		<<Min: 78.83 - 87.7: 0.1% arsenic oxide / 0.1% kaolinite / 0.2% pyrite / 0.2% arsenopyrite>> Brassy pyrite occurs as very fine grained disseminated cubes, particularly in the darker dolostone "clasts" in the matrix supported breccia. Scorodite/arsenic oxide occurs as fracture coating Kaolinite occurs as vug filling though in very low amounts Arsenopyrite is present alongside pyrite as fine grained wisps as opposed to the strongly disseminated very fine grained pyrite. It occurs more commonly in the darker dolostone. Carbonate/calcite alteration could potentially be overprinting some of the mineralization	48.90	50.90	2.00	E6566569	0.015	1310	4.19	26	1.89
		<<Min: 87.7 - 90.71: 0.1% kaolinite / 0.8% arsenic oxide / 0.05% arsenopyrite>> Arsenopyrite occurs as strongly disseminated fine grained wispsy of acicular/needle like silvery crystals. Kaolinite occurs as a late stage vug coating Scorodite/arsenic oxide occurs as afracture coating (yellow-green)	50.90	52.26	1.36	E6566570	0.016	2060	4.86	5.53	2.77
		<<Min: 90.71 - 96.05: 0.9% arsenic oxide / 0.05% arsenopyrite / 0.1% pyrite>> Arsenic oxide/scorodite occurs as fracture coating and is yellow/green Arsenopyrite and pyrite both occur in low concentration. Arsenopyrite is silvery and forms elongate wisps in the darker dolostone matrix. Pyrite occurs as very fine grained disseminated cubes. In some cases, larger pyrite crystals will have iron oxide halos surrounding them	52.26	54.24	1.98	E6566571	0.023	3070	6.26	8.52	4.88
		<<Min: 96.05 - 101.82: 0.01% arsenopyrite / 0.2% arsenic oxide>> There is no visible pyrite mineralization in this interval Arsenopyrite is in very low abundance as small very fine grained wisps in the dolostone, particularly in the clasts within matrix sections. Arsenic oxide/scorodite occurs along few fracture planes, significantly less than previous intervals	54.24	56.23	1.99	E6566572	0.009	483	1.53	24.4	0.606
		<<Min: 101.82 - 109.92: 0.01% pyrite / 0.9% arsenic oxide>> In the hevily altered zones, pyrite is visible as a very low concentrated set of disseminated cubes. No arsenopyrite is visible.	56.23	58.15	1.92	E6566573	0.054	1480	6.13	32.8	2.44

		<<Min: 109.92 - 114.75: 0.1% pyrite / 0.05% arsenopyrite / 0.1% arsenic oxide>> Pyrite and arsenopyrite occur together as disseminated very fine grained crystals in the dolostone matrix. Arsenopyrite mineralization occurs at slightly higher concentrations closer to veining and brecciation. Arsenic oxide/scorodite occurs along very few fracture planes in this section	58.15	60.05	1.90	E6566575	0.029	1110	6.4	28.7	1.88
		<<Min: 114.75 - 130.25: 0.1% arsenopyrite / 0.9% arsenic oxide>> Arsenopyrite occurs as disseminated wisps in fractured zones of rock in the dolostone. It often has oxidation halos around it.	60.05	61.75	1.70	E6566576	0.004	683	2.66	7.04	1.24
		<<Min: 130.25 - 154.53: 0.05% arsenopyrite / 0.6% limonite>> Arsenopyrite mineralization appears as wisps disseminated in the matrix, particularly around the dark coloured fractures/stringers. Limonite appears as fracture coating though in the heavily fractured sections it is a pervasive alteration	61.75	63.73	1.98	E6566577	0.063	3370	7.09	15.2	5.22
		<<Alt: 40.56 - 45.07: moderate to strong alteration - Iron Oxide Alteration / moderate alteration - Limonite alteration / moderate alteration - carbonate / weak to moderate alteration - ankerite>> This small section is heavily altered, mostly by iron oxide. The iron oxide and limonite form as a fracture coating on nearly all fracture planes. Scorodite/arsenic oxide alteration may exist but is overprinted by the iron oxidation. Carbonate alteration is present as cement replacement in the dolostone, particularly in the coarser grained lighter dolostone. Ankerite/fe-carbonate alteration forms as a patchy "coating" on the qtz-cbt veining and matrix.	63.73	65.24	1.51	E6566578	0.011	901	2.44	8.3	0.994
		<<Alt: 45.07 - 65.24: moderate to strong alteration - Scorodite alteration / weak to moderate alteration - Limonite alteration / weak alteration - Iron Oxide Alteration / weak to moderate alteration - ankerite / moderate alteration - carbonate>> Scorodite/arsenic oxide alteration occurs as a fracture coating along most of the fractures in this section. It has a yellow/green colour. Feox/Limonite alteration occur together in heavily fractured and faulted zones as a fracture coating. Limonite is a yellow-buff colour while iron oxide is a red-brown colour. Carbonate alteration is present throughout the section as cement replacement around the dolostone grains. Ankerite occurs as a patchy coating on qtz-cbt veins/matrix.	65.24	66.69	1.45	E6566579	0.029	1270	5.5	4.31	0.965
		<<Alt: 65.24 - 66.69: weak to moderate alteration - Iron Oxide Alteration / weak to moderate alteration - Limonite alteration / moderate alteration - carbonate>> Iron oxide alteration occurs along side limonite on fracture faces, however, it also occurs as selective lamination overprinting in some of the small laminated siltier bands. Carbonate alteration occurs as cement replacement in between the dolomite crystals.	66.69	68.64	1.95	E6566580	0.01	512	1.94	4.09	0.299

Hole: D2-13-16

		<<Alt: 66.69 - 78.83: weak to moderate alteration - Scorodite alteration / weak alteration - Limonite alteration / trace alteration - Iron Oxide Alteration / moderate to strong alteration - carbonate / weak alteration - ankerite>> Scorodite/arsenic oxide occurs as fracture coating along a little more than half of all fracture planes but no veins. Limonite and feox alteration occur along few fracture planes and potentially overprint arsenic oxide alteration. Carbonate alteration is pervasive as cement replacement, forming a mosaic texture with the dolomite crystals. About 30% of the dolomite is calcite. Ankerite/fe-carbonate occurs only in the qtz-calcite veins and matrix though in only about half of them. This alteration is more pervasive in fractured zones	68.64	70.62	1.98	E6566581	0.003	218	0.87	2	0.196
		<<Alt: 78.83 - 87.7: weak alteration - Scorodite alteration / moderate to strong alteration - carbonate / weak alteration - ankerite / trace alteration - kaolinite>> Kaolinite alteration occurs as a white soft coating inside of vugs hosted in large veins and the matrix of breccias. Scorodite/arsenic oxide occurs as a fracture coating on about 15% of fractures as a yellow-green coating. Carbonate alteration is pervasive in the dolostone as cement as a mosaic with the dolomite. Ankerite/fe-carbonate alteration occurs as trace patchy coating on about 40% of veins and matrix.	70.62	72.56	1.94	E6566582	0.0005	205	0.99	1.28	0.201
		<<Alt: 87.7 - 90.71: moderate alteration - Scorodite alteration / moderate to strong alteration - carbonate / weak alteration - carbonate / trace alteration - ankerite / trace alteration - kaolinite>> Scorodite/arsenic oxide alteration occurs as fracture coating on the majority of fracture planes. Carbonate alteration appears as 2 phases. It occurs as either pervasive alteration in the dolostone as a cement type mosaic with dolomite crystals, or as a weak alteration in small sections as small blebs/blobs in the dolostone matrix (possibly as replacement). Ankerite is in trace amounts in some matrix edges. Kaolinite again appears as a late stage vug coating	72.56	74.42	1.86	E6566584	0.006	279	1.31	0.993	0.307
		<<Alt: 90.71 - 96.05: moderate to strong alteration - Scorodite alteration / moderate to strong alteration - carbonate / weak to moderate alteration - carbonate / trace alteration - ankerite>> Scorodite/arsenic oxide occurs along fracture planes and intrudes into a few veins as a light coating. It is yellow-green Carbonate alteration occurs as blebs and as a pervasive cement. It is strong as a cement with the dolomite and forms weak-moderately as blebs and small spherules in the matrix as a dolomite replacement. Ankerite is in trace quantities in some of the matrix and veining	74.42	75.52	1.10	E6566585	0.008	401	2.05	1.27	0.466

From (m)	To (m)		Rock Type & Description		
140.11	**154.53**	**S-Dol**	**Dolostone**	**Grey**	**fmgr**

140.11 - 154.53: This heavily altered dolostone section is also heavily faulted. The upper contact is a section of gouge. The unit is separated on either side by pervasive faulting and permeable fluid altered rock. The carbonate in this section is mostly removed leaving pits/miniature vugs where the calcite used to be. There are substantial micro faults and fractures through the section along with small intervals of fault gouge. Arsenopyrite mineralization can be seen in low abundance disseminated in the matrix though it appears in slightly higher concentration closer to fracture planes. There is strong evidence for decalcification and the resulting calcite flooding in the section below. Much of the relict texture of this rock has been destroyed/overprinted by the limonite alteration.

<<Alt: 140.11 - 154.53: weak alteration - carbonate / moderate alteration - Limonite alteration / weak alteration - Iron Oxide Alteration>> This section is heavily faulted and altered.

Sections of sandstone have carbonate alteration in the form of decalcification of the cement/matrix. Open vugs are left and very little calcite remains.

Feox and limonite appear along most fracture planes and in faulted zones. Limonite is a buff yellow colour while feox alteration is red.

154.53	**190.07**	**S-IBSST Interbedded sandstone and siltstone Grey fmgr**	154.53	155.60	1.07	E6566637	0.002	76.5	0.8	0.24	0.087
154.53 - 190.07: This section is a strongly calcareous sandstone interbedded with a non-calcareous siltstone. In some sections the sandstone in the dark silty matrix appears like a monomictic debrite. The non-calcareous siltstone sections display strong brittle/ductile shearing textures with abundant "flow banding" and tension veining. There are numerous stages of calcite veining present in this interval alongside the faulting. In faulted zones there are small intervals of decalcification capped on either end by calcite flooding through veins. The veins take on stockwork-like appearance. Graphitic texture is visible in some of the siltier sections along with some limonitic alteration. In the sandstone, disseminated pyrite can be found in large amounts up to 2 percent but the average for the entire lithology is around 0.3-0.5. The thinner bedded sandstone and siltstone show shearing fabrics in the competency differences between the units. The sandstone often make up the "clasts" of boudinaged pieces in a siltstone matrix. The sandstone beds show deformation in the tension veining visible (perpendicular to sigma 1?). The lower contact is with a non-calcareous medium-coarse sandstone with siltstone interbeds . It is a gradual contact (grain size increase). At the bottom of this unit, there is a section of non-calcareous (decalcification?) sandstone and sheared sandstone/siltstone debrite from 175.75-190.07.									
<<Min: 154.53 - 156.92: 1% pyrite>> There is extensive pyrite mineralization in this interval. It appears both as wispy larger groups and as very fine grained disseminated cubes in the matrix of this calcareous sandstone.	155.60	156.92	1.32	E6566638	0.001	65.3	1.1	0.301	0.136
<<Min: 156.92 - 165.99: 0.9% pyrite>> Pyrite mineralization appears globby around select quartz grains and disseminated in the slitstone matrix.	156.92	158.88	1.96	E6566639	0.006	78.9	2.21	0.773	0.353
<<Min: 165.99 - 167.85: 0.1% pyrite>> Pyrite mineralization is low as very fine grained disseminated crystals. It is possible that it was overprinted by either carbonate alteration or limonitic alteration	158.88	160.80	1.92	E6566640	0.002	96.2	2.26	0.817	0.287
<<Min: 167.85 - 172.82: 2% pyrite>> The pyrite mineralization in this section is high. In the siltier sections it appears as wispy replacement of laminations following the shearing foliation. In the sandier sections it appears as disseminated wisps through the matrix of the host rock	160.80	162.80	2.00	E6566642	0.002	83.5	2.68	1.2	0.331
<<Min: 172.82 - 175.75: 0.8% pyrite>> Pyrite mineralization is heavily disseminated through the matrix of the sandy section. It is fine grained and sooty appearing in places	162.80	164.66	1.86	E6566643	0.002	95.6	1.97	1.73	0.371
<<Min: 175.75 - 178.37: 0.01% pyrite>> Pyrite mineralization in this interval is very low. Very fine grained cubes are occasionally visible	164.66	165.99	1.33	E6566644	0.002	149	2.11	1.65	0.473
<<Min: 178.37 - 183.49: 0.8% pyrite>> Pyrite occurs as brassy fine grained wisps throughout th section though particularly concentrated in the sheared silty matrix stringers. It occurs in the veined sandstone as disseminated cubes	165.99	167.85	1.86	E6566645	0.002	348	1.67	1.18	0.33
<<Min: 183.49 - 184: 0.4% pyrite / 0.01% arsenopyrite>> Pyrite mineralization occurs along the dark sections of matrix (likely clay) and around the larger quartz veins. Arsenopyrite can be found as the occasional acicular crystal but the mineralization level is very low	167.85	169.77	1.92	E6566646	0.003	425	3.18	2.06	0.617

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
		<<Min: 184 - 190.07: 0.7% pyrite>> This rock has very fine grained disseminated pyrite in the matrix. The pyrite is small enough to appear drab in colour without the typical brassy shine. Some may be arsenopyrite but due to the very small grain size it is impossible to tell	169.77	171.67	1.90	E6566647	0.005	159	4.22	2.09	0.746
		<<Alt: 154.53 - 175.75: moderate alteration - carbonate / weak to moderate alteration - Limonite alteration / weak to moderate alteration - graphite alteration / moderate alteration - carbonate>> There are two types of carbonate alteration in this section. Calcite appears either as a pervasive cement replacement in the host rock surrounding the quartz grains or as intense veining seen in the calcite flooding adjacent to faults. Graphitic alteration is present as banding in the sheared siltstone unit and appears on fracture faces. Limonitic alteration occurs as fracture coating throughout the section in the sandstone or in the siltstone.	171.67	172.82	1.15	E6566648	0.006	251	2.8	2.02	0.603
		<<Alt: 175.75 - 178.37: trace alteration - carbonate / moderate alteration - Limonite alteration>> This unit is strongly decalcified with very little calcite remaining. The mosaic calcite cement/matrix has been replaced by very small limonite coated vugs. Limonite alteration is fairly strong with almost all fractures and some of the host rock cement replaced with little flecks of limonite. It is a buff-yellow colour	172.82	174.56	1.74	E6566650	0.011	266	2.13	1.38	0.423
		<<Alt: 178.37 - 183.49: moderate alteration - graphite alteration / weak to moderate alteration - carbonate>> The alteration in this section is mainly graphitic though there is some carbonate alteration in the form of tension veins forming	174.56	175.75	1.19	E6566651	0.005	245	4.81	2.21	0.86
		<<Alt: 183.49 - 184: trace alteration - graphite alteration / trace alteration - carbonate / weak alteration - Limonite alteration>> Graphitic alteration occurs as small patches on fracture faces. Carbonate alteration is minor cement in this unit though most of it has been decalcified leaving some minor limonite coated vugs	175.75	177.32	1.57	E6566652	0.004	118	0.44	0.314	0.072
		<<Alt: 184 - 190.07: moderate alteration - Silicification>> The intense carbonate alteration in this section is actually decalcification. Previous sites of calcite removal are now pitted and previous calcite veins have been silicified. Graphitic alteration is still present in this section along fracture planes and silty rich sections	177.32	178.37	1.05	E6566653	0.003	65.2	0.32	0.227	0.033

			186.99	188.90	1.91	E6566661	0.003	208	2.43	1.63	0.527
			188.90	190.07	1.17	E6566662	0.002	601	2.71	2.34	0.544
190.07	**196.92**	**S-SS Sandstone Grey fmgr**	190.07	192.04	1.97	E6566663	0.0005	546	0.79	2.18	0.197
190.07 - 196.92: This unit is a incompletely silicified calcareous sandstone. Its upper limit is a section of faulting with the interbedded sandstone and siltstone above. The grains in this sandstone are nearly 100% quartz, with some calcite cement still present. The quartz grains have grown together in a mosaic-like pattern with relict calcite cement in some of the spaces. The previous calcite veins have been replaced by quartz. The rock is fairly altered with limonite alteration along about half of the fractures and trace scorodite/arsenic oxide along 2 of the fractures. Some of the veining shows limonitic alteration as well. This unit is also fairly faulted with small sections of fault gouge. Its lower contact is another fault characterized by gouge leading into the calcareous sandstone below.										
<<Min: 190.07 - 196.92: 0.05% arsenic oxide / 0.3% pyrite / 0.1% goethite / 0.6% limonite>> Pyrite occurs as small fine grained disseminated wisps in the sandstone though they seem to be clustered around some of the dark coated fractures (clay?) Scorodite appears as a fracture coating in 2 places Limonite and goethite occur together along fracture planes			192.04	194.04	2.00	E6566664	0.0005	514	4.35	2.02	0.693
<<Alt: 190.07 - 196.92: weak to moderate alteration - Limonite alteration / moderate alteration - Silicification / trace alteration - Scorodite alteration / weak alteration - Iron Oxide Alteration>> Limonite and feox alteration occur along fracture planes in this section. In some of the more veined sections, limonite alteration can intrude along fracture planes Scorodite/arsenic oxide alteration is visible as a small patch coating on 2 of the fractures in this unit. This unit is fairly silicified with the quartz grains growing into one another while previous calcite cement is replaced incompletely by limonite coated vugs			194.04	195.63	1.59	E6566665	0.0005	2160	5.32	3.15	1.4
			195.63	196.92	1.29	E6566667	0.0005	370	0.59	0.392	0.185
196.92	**198.54**	**S-SS Sandstone Grey fmgr**	196.92	198.54	1.62	E6566668	0.0005	87.4	0.33	0.202	0.051
196.92 - 198.54: This sandstone unit is heavily calcified. It has numerous small blebs, cement replacement and overprinting on the quartz crystals. The section is highly oxidized and could be an example of calcite flooding on either end of the silicified/decalcified section immediately above. This section has a faulted upper contact as well as a faulted lower contact. Each set of faults is characterized by fault gouge. Calcite veining is common and halos of intensive calcification halos surround nearly all of the veins. Trace realgar was found in some of the closed fractures as a coating. Limonitic and feox alteration is common along most fracture planes and even in some veins. There is pyrite and arsenopyrite in this section though they are in low abundance.										

Hole: D2-13-16

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
		<<Min: 196.92 - 198.54: 0.1% pyrite / 0.05% arsenopyrite / 0.1% realgar / 0.1% arsenic oxide / 0.4% limonite / 0.1% goethite>> Pyrite and arsenopyrite occur together in this calcareous unit though in low abundance. Realgar occurs along small closed fractures as a coating and is oxidized to a orange colour Scorodite occurs along some fracture planes though in very low amounts Limonite and goethite occur as fe alteration products along fracture planes									
		<<Alt: 196.92 - 198.54: strong alteration - carbonate / weak to moderate alteration - Limonite alteration / trace alteration - Scorodite alteration / weak alteration - Iron Oxide Alteration / trace hydrothermal - realgar>> Carbonate alteration in this section is intense and overprints much of the original sandstone (this is nearly a limestone). Carbonate veining and patchy overprints dominate much of the lithology. Limonite and feox alteration occur along most fracture planes and some veins. Oxidized realgar is visible along some of the micro fractures in the rock Scorodite is also visible in the same fractures as the realgar but not always

		<<Struc: 202.8: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> Low angle stylolite in the sandstone									
204.00	**220.97**	**S-IBSST Interbedded sandstone and siltstone Grey fgr**	204.00	205.50	1.50	E6566672	0.0005	17.6	0.13	0.189	0.088
		204 - 220.97: This unit is characterized by medium grained dark grey sandstones with interbedded black siltstone. Both the siltstone and sandstone are non-calcareous. There are strong shearing textures visible in both the sandstone and the siltstone though the siltstone, due to its lower competency, shows these textures more strongly. There is banding foliation in both the siltstone and sandstone, boudinage of the small sandstone interbeds and folding of some of the sandstone beds. Tension veins of qtz-cbt are visible in some of the sandstone sections as well as numerous fractures. These fractures have become mineralized/coated with graphite and resemble stockwork veining in some places. This section has several faults. The sandstone is silicified to the point where the quartz grains have grown together into a mosaic like texture. The pyrite mineralization in this section is about 0.6% over the whole section. It is disseminated through the sandstone and the siltstone though it is in higher concentrations in the silty interbeds within the sandstone. The lower contact In this unit is the last appearance of sandstone interbeds within a sheared unit.									
		<<Min: 204 - 211.91: 0.7% pyrite>> This section of dark grey silicified sandstone has a fair amount of brassy pyrite mineralization. The pyrite is found as small wisps, cubes and blobs in the matrix of the sandstone.	205.50	207.43	1.93	E6566673	0.001	42.5	0.11	0.159	0.086
		<<Min: 211.91 - 220.97: 0.6% pyrite>> Pyrite in this section is brassy coloured and wispy. It is slightly more concentrated in the darker laminations in the sandstone	207.43	209.40	1.97	E6566675	0.0005	16.7	0.07	0.118	0.042
		<<Alt: 204 - 211.91: moderate to strong alteration - Silicification / moderate alteration - graphite alteration / trace alteration - carbonate>> The graphite alteration forms as a fracture coating. In some of the sections its likely that the graphitic sections defined the fracture planes rather than the fractures causing the alteration. In the siltier layers, the graphitic alteration is much more intense. Silicification is quite strong here. The quartz grains have grown together as a mosaic throughout the section. Preexisting calcite cement is almost entirely gone and only exists as a light crust on occasional quartz grains	209.40	210.92	1.52	E6566676	0.0005	6.5	0.025	0.072	0.022
		<<Alt: 211.91 - 220.97: moderate to strong alteration - graphite alteration / moderate alteration - Silicification / trace alteration - carbonate>> This section has more intense graphitic alteration than the previous one. There is a larger amount of siltstones in this unit along with more pervasive dark laminations in the sandstone that have been "cooked" into graphite. The silicification in this section is characterized by qurtz crystals growing into one another in the sandstone and the silicification of calcite veins in both units.	210.92	211.91	0.99	E6566677	0.0005	5.5	0.025	0.091	0.019

Hole: D2-13-16

From (m)	To (m)	Rock Type & Description
220.97	**233.17**	**S-Slt Siltstone Black vfgr**
220.97 - 233.17: This siltstone section is very fine grained, laminated, sheared and faulted. It is non-calcareous though it shows some very minor calcite veining. The rock shows some minor graphitic alteration as well though it is not as pervasive as previous units. The lower part of this unit is highly faulted and is composed mostly of fault gouge from 227.75-233.17.		
<<Min: 220.97 - 233.17: 0.4% pyrite>> Pyrite occurs as very fine grained wisps along foliation (potentially reoriented bedding).		
<<Alt: 220.97 - 233.17: weak to moderate alteration - graphite alteration / trace alteration - carbonate>> The siltstone unit shows minor alteration despite the intense faulting.		
Graphitic alteration appears in thin bands along fracture planes while carbonate alteration is characterized by thin sporadic veinlets.

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
0.00	**10.67**	**Casing Casing**									
10.67	**11.82**	**S-SS Sandstone Buff fmgr**	10.67	11.82	1.15	E6566692	0.019	16.5	0.36	0.155	0.037
10.668 - 11.82: This short lithological unit is a grey-buff sandstone with 90% quartz grains. The rock is moderately oxidized as most fracture planes show iron oxide alteration. Many of the fracture planes also show oxidation halos surrounding the fractures that permeates through the rock up to 2cm. The rock is calcareous with a moderate amount of calcite cement. Limonite alteration is present throughout the rock though it is in higher concentration adjacent to more highly fractured areas. The lower contact in this unit is a small fault zone characterized by buff coloured fault gouge before the lower interbedded siltstone and sandstone begin.											
<<Min: 10.67 - 11.82: 0.1% goethite / 0.8% limonite>> The limonite occurs mainly as a fracture coating but it can be found within the sandstone, particularly in heavily fractured units.											
Goethite also occurs as a fracture coating though its more sporadic than the limonite											
<<Alt: 10.67 - 11.82: weak to moderate alteration - Iron Oxide Alteration / moderate alteration - carbonate / weak to moderate alteration - Limonite alteration>>											
11.82	**33.27**	**S-Slt Siltstone Brown-Grey vfgr**	11.82	13.82	2.00	E6566693	0.001	13.1	0.36	0.458	0.096
11.82 - 33.27: The sandstone and siltstone units interbed in this section. The drab brown coloured siltstone once had thin (2-5 cm beds) of calcareous sandstone interbedded with it but have since been strongly deformed by shearing. They are now boudinaged, folded and faulted calcareous sections with little relict rock preserved. This calcareous sandstone is grey in colour. The other sandstone which forms thicker 10-30cm interbeds is a dark blue-grey with oxidized fractures. It is not pervasively calcareous though there are little blebs in the matrix of the rock, possible carbonate intraclasts. Overall, the unit is quite oxidized. The siltstone has intense iron oxide alteration along most of its laminae, enough so that the relict rock colour is obscured. The dark sandstone is oxidized only along fracture planes though there are oxidized "halos" surrounding the fractures.											
<<Min: 11.82 - 17.7: 3% limonite>> There is no visible pyrite mineralization in this section, however it is possible that the mineralization was overprinted by the intense oxidation.			13.82	15.72	1.90	E6566694	0.024	7.5	0.1	0.413	0.083
Limonite is present as disseminated patches throughout the rock and particularly intense along specific laminae											
<<Min: 17.7 - 21.8: 0.1% pyrite>> Pyrite mineralization is minor though pervasive. It occurs through the matrix of the sandstone as globs around preexisting quartz grains.			15.72	17.70	1.98	E6566695	0.013	11.8	0.58	0.488	0.112
It is mostly visible in the less-oxidized section of the rock though this is likely that the overprinted feox alteration has masked the pyrite mineralization											

Hole: D2-13-17

		<<Min: 21.8 - 27.38: 0.08% arsenopyrite / 0.05% pyrite>> Arsenopyrite occurs in this interval in some of the darker less oxidized sections of the siltstone. The crystals are very fine. Pyrite also occurs as fine grained disseminated cubes though in low concentration. Both don't seem to be controlled by fractures or by lithology though this could be due to the oxidized layers	17.70	19.66	1.96	E6566696	0.001	12.2	0.58	0.525	0.098
		<<Min: 27.38 - 28.39: 0.4% pyrite / 0.1% arsenopyrite>> Arsenopyrite occurs as very fine grained acicular/elongate crystals in the matrix of the sandstone. P Pyrite occurs as small fine grained globs in the matrix of the sandstone.	19.66	20.62	0.96	E6566697	0.004	14.9	0.69	0.883	0.116
		<<Min: 28.39 - 33.27: 0.1% pyrite / 0.05% arsenopyrite>> Pyrite occurs with arsenopyrite in this interval. The mineralization levels in the sandstone are higher than in the siltstone. The brassy fine grained pyrite occurs as clumps in the matrix of the sandstone while silvery fine grained wisps of elongate arsenopyrite crystals. Both arsenopyrite and pyrite are very fine grained	20.62	21.80	1.18	E6566698	0.004	13.5	0.59	0.681	0.099
		<<Alt: 11.82 - 17.7: strong alteration - Iron Oxide Alteration / moderate alteration - Limonite alteration>> The alteration in this section is dominated by iron oxide and limonitic alteration selectively overprinting laminations/layers in the siltstone	21.80	23.80	2.00	E6566700	0.002	13.2	0.48	0.525	0.099
		<<Alt: 17.7 - 21.8: weak to moderate alteration - Limonite alteration / moderate alteration - Iron Oxide Alteration / weak to moderate alteration - carbonate>> In this more sandstone rich section, the blue-grey sandstone has iron oxide alteration as halos around fracture planes and in the silty sections. Carbonate alteration exists as blebs/clots disseminated through the matrix of the dark grey sandstone. The small siltstone sections also have some boudinaged pieces of calcareous sandstone with calcite cement	23.80	25.68	1.88	E6566701	0.003	17	0.58	0.692	0.112
		<<Alt: 21.8 - 27.38: moderate to strong alteration - Iron Oxide Alteration / moderate alteration - Limonite alteration / weak alteration - carbonate>> In this section there is highly altered siltstone with feox and limonitic alteration along selected laminae/layers. The sandstone pieces show carbonate alteration in the form of blebs and clots as well as feox alteration halos around fracture planes	25.68	27.38	1.70	E6566702	0.012	14.4	0.4	0.635	0.105
		<<Alt: 27.38 - 28.39: moderate alteration - Iron Oxide Alteration / weak to moderate alteration - Limonite alteration / trace alteration - carbonate>> This section is slightly less altered than previous sections. This section is made up entirely of the blue-grey sandstone and shows feox halos around fracture planes and minor limonitic alteration along fractures only. Carbonate alteration is slightly less than in previous sections as disseminated blobs of calcite in the sandstone	27.38	28.39	1.01	E6566703	0.002	6.3	0.11	0.467	0.06

		<<Struc: 31.84: non-penetrative cleavage\foliation development or brittle faults\brecciation Bedding - Unknown>> Bedding planes that show later generation shearing. Potentially reoriented	31.49	33.27	1.78	E6566706	0.003	24.8	0.41	1.18	0.186
		<<Struc: 33.17: macro evidence for deformation, but no foliation development or brecciation Lithological Contact>> This is the contact between the siltstone above and the sandstone below. The contact couldve been reoriented during the shearing forces. No beta angle obtained due to lack of oriented									
33.27	**65.67**	**S-SS Sandstone Blue-Grey fmgr** 33.27 - 65.67: This lithological section is separated from the above interbedded siltstone and sandstone by a contact at 55 degrees to core axis. The contact begins a long section of sandstone with small interbeds (10-15cm) of siltstone. The sandstone begins strongly calcareous until 36.09 where the carbonate alteration peters off into the typical non-calcareous blue-grey sandstone below. The small beds of siltstone have some visible shearing textures such as bended/folded laminae and some faulting offsets of up to 5mm. The sandstone doesn't show the same shearing textures due to the more competent nature of the rock. Towards the bottom of the section, the sandstone begins to grade into coarser quartz pebbles which becomes the lower quartz pebble conglomerate unit below. The mineralization in this section is concentrated in the sandstone intervals. The siltstone sectiona have small amounts of pyrite mineralization. The pyrite appears either as wisps of fine grained pyrite or as very fine disseminated cubes. The average over this unit is around .5%. The alteration of this unit is mainly feox alteration with some limonite coating along fractures. The carbonate alteration seems to occur with the feox and limonite alteration along fracture planes and as halos surrounding those fracture planes.	33.27	33.95	0.68	E6566707	0.002	14.6	0.62	0.24	0.054
		<<Min: 33.27 - 36.09: 1% pyrite / 0.4% arsenopyrite>> Brassy coloured pyrite cubes are found throughout the matrix of this interval. They are very fine-fine grained Arsenopyrite can be found in significantly lower abundance as silvery wisps interspersed with the pyrite	33.95	35.07	1.12	E6566709	0.008	17	0.86	0.2	0.043
		<<Min: 36.09 - 42.93: 0.8% pyrite / 0.1% arsenopyrite>> Pyrite occurs as wisps and cubes throught the matrix of this non-calcareous sandstone unit. Arsenopyrite only appears in small amounts as wisps in between pyrite patches. The number may in fact be higher but at the fine grain size it is difficult to distinguish between the two when they are clustered together.	35.07	36.09	1.02	E6566710	0.002	28.1	1.07	0.357	0.075

65.67	**66.55**	**S-CO Conglomerate Grey mgr**	65.67	66.55	0.88	E6566731	0.001	33.1	0.84	0.51	0.095
65.67 - 66.55: This unit is a quartz pebble conglomerate likely part of a turbidite sequence. It is non calcareous. Its upper limit is a gradual grain size increase from the medium sands above to the quartz pebble conglomerate below. The lower contact is a gradual grain size decrease in the pebbles which includes some siltstone rip up clasts. There is one final scour surface with siltstone and then it becomes the medium sandstone below. There are thin iron oxide halos around fracture planes within the conglomerate and sometimes as a vein coating. The pyrite mineralization in this unit is very low. Pyrite appears as fine grained disseminated cubes in between quartz crystals									
<<Min: 65.67 - 67.2: 0.05% pyrite>> Ths mineralization in this section of sandstone is quite low. The coarser sandstone may have been more permeable to oxidation. There are few visible cubes of fine grained pyrite in between quartz grains in this sandstone									
<<Alt: 65.67 - 66.55: trace alteration - Iron Oxide Alteration>> This section shows trace iron oxide alteration along fracture planes and as a vein coating in places.									
66.55	**67.09**	**S-SS Sandstone Grey mgr**	66.55	67.20	0.65	E6566732	0.0005	15.3	0.25	0.217	0.058
66.55 - 67.09: This sandstone section is likely part of a larger turbidite sequence. Its upper contact is a scour surface with a quartz pebble conglomerate. It os laminated non-calcareous grey sandstone with some minor quartz veining. Its lower contact is another scour surface characterized by siltstone and some rip up clasts inside of another conglomerate unit. Pyrite mineralization occurs in very minor amounts. Iron oxide alteration can be found along fracture planes as well as in thin halos surrounding those fractures.									
<<Alt: 66.55 - 67.2: trace alteration - Iron Oxide Alteration>> The iron oxide alteration in this section is trace and only found along fractures. Minor halos around fractures can be visible as well									
67.09	**67.20**	**S-CO Conglomerate Grey fmgr**									
67.09 - 67.2: This small section is a clast suported quartz pebble conglomerate with fine-medium grain size (2-3mm) and is likely part of a larger turbidite sequence. It is characterized b siltstone rip up clasts towards the top section and a scour surface with the interbedded siltstone and sandstone below. It is non calcareous. The pyrite mineralization in this conglomerate is low and is found as small brassy patches on the margins of some of the quartz pebbles, particularly in the finer grained sections. Iron oxide alteration can be found along fracture planes as well as in thin halos surrounding those fractures.									
67.20	**69.60**	**S-SS Sandstone Grey fmgr**	67.20	68.58	1.38	E6566734	0.0005	377	2.1	1.48	0.321
67.2 - 69.6: This fine-medium grained sandstone is likely part of the larger turbidite sequence. It has darker fine grained stringers within it of silt-sized grains. The upper contact is a scour surface with the conglomerate above. This sandstone is non-calcareous. The lower contact is a gradual grain size increase marked at the beginning of the grain size increase. Pyrite occurs as a high concentration of wispy patches in the matrix of the sandstone.

72.06	**73.53**	**S-CO Conglomerate Grey mgr**	72.06	73.53	1.47	E6566738	0.001	85.6	1.84	1.22	0.253
72.06 - 73.53: This lithology is an interbedded short-sequence turbidite unit. It is composed of small repeated sections of siltstone scour surface-conglomerate-sandstone-rip up clasts in the conglomerate-siltstone scour surface as you get deeper. The upper contact is a gradual contact with grain size increasing to the conglomerate that begins this unit. The lower contact is sharp with a fine grained sandstone leading into an interbedded sandstone siltstone unit. Pyrite mineralization in this interval is very high particularly in the siltstone beds/rip ups. The adjacent conglomerate also shows pyrite mineralization as patches on the margins of the larger quartz pebbles. Iron oxide alteration occurs as fracture coating mostly in the sandstone and as a grain coating in this conglomerate. <<Min: 72.06 - 73.53: 2% pyrite>> In this interbedded turbidite section, the level of mineralization is high. It occurs disseminated throught the siltstone sections and seems to follow bedding planes. In the conglomerate, it forms as patches alongside quart grains though it is in slightly higher abundance in the darker clasts. <<Alt: 72.06 - 73.53: trace alteration - Iron Oxide Alteration>> In this small turbidite section, feox alteration occurs mainly along fracture planes in the sandstone and as a light coating around grains in the conglomerate. This is likely due to the high permeability of the coarser grained sections									
73.53	**77.07**	**S-IBSST Interbedded sandstone and siltstone Grey fgr**	73.53	75.19	1.66	E6566739	0.018	73.2	1.03	0.264	0.098
73.53 - 77.07: This unit begins with a sharp contact with the short sequence turbidite above. It is a fine grained sandstone-coarse siltstone interbedded non-calcareous sequence. The lower contact in this unit is a large section of faulting characterized by crumbled rock and a small section of fault gouge. Immediately following this fault is a medium grained conglomerate unit. In this interval, pyrite occurs as fine grained disseminated cubes in the matrix, particularly in the finer grained laminations. Iron oxide alteration can be found along fracture planes as well as in thin halos surrounding those fractures in the sandier sections. In the siltstone, feox alteration can be found along certain laminae (even with no nearby fractures) <<Min: 73.53 - 77.07: 0.1% goethite / 0.1% limonite / 0.3% pyrite>> Pyrite mineralization occurs as fine grained disseminated cubes in the fine grained sandstone, particularly in the slightly darker laminations. In the siltstone, pyrite mineralization is minor and occurs as disseminated wisps following laminae. Goethite and limonite occur along 2 fractre planes in the siltstone as a fracture coating <<Alt: 73.53 - 77.07: weak alteration - Iron Oxide Alteration / trace alteration - Limonite alteration>> The alteration in this section of fine grained sands and silts is feox and linonite. The feox occurs along some fracture planes and along laminations in the siltstone. Limonite appears as a trace alteration coating along 2 fractures in the sandstone	75.19	77.07	1.88	E6566740	0.004	91.1	1.88	0.428	0.114

77.07	**78.18**	**S-CO Conglomerate Brown-Grey fmgr**	77.07	78.17	1.10	E6566742	0.001	480	3.62	0.567	0.134
77.07 - 78.18: This small section of conglomerate is likely part of the turbidite sequence above. It is partially oxidized. It is non calcareous. Its lower contact is a section of faulting with some fault gouge which is immediately followed by the interbedded siltstone and sandstone unit. Pyrite mineralization only occurs as patches on the margins of the siltier clasts in this conglomerate. This conglomerate unit has a large degree of alteration as there is a high concentration of limonite crust forming between the conglomerate pebbles.											
<<Min: 77.07 - 78.17: 0.3% pyrite / 0.3% limonite / 0.1% goethite>> Pyrite occurs as patches on the margins of darker silty clasts.			78.17	79.92	1.75	E6566743	0.001	108	5.46	0.509	0.102
Limonite appears as a pervasive matrix mienralization as rims around most clasts.											
Goethite appears along a fracture plane adjacent to a fault											
<<Min: 78.17 - 81.89: 0.1% arsenopyrite / 0.8% pyrite>> The arsenopyrite occurs primarily in the fine grained light coloured sandstone intervals though in low abundance.											
In the darker coloured siltstones, pyrite mineralization is primarily found as disseminated cubes though wispy and globby pyrite mineralization can also be seen adjacent to darker silty stringers.											
<<Alt: 77.07 - 78.17: weak to moderate alteration - Limonite alteration / trace alteration - Iron Oxide Alteration>> This interval of conglomerate has a high level of alteration, likely propagated through the nearby faulting. There is limonite in between the conglomerate pebbles and along fracture planes. The iron oxide occurs in small amounts along fracture planes though it may be overprinted by limonite											
<<Alt: 78.17 - 81.89: weak to moderate alteration - Iron Oxide Alteration>> Iron oxide alteration occurs in this section along select laminae and some fractures. Some quartz veins have been weathered out and replaced by iron oxide coating.											
78.18	**81.89**	**S-IBSST Interbedded sandstone and siltstone Grey fgr**	79.92	81.89	1.97	E6566744	0.002	295	5.47	0.914	0.18
78.18 - 81.89: This unit is likely part of the turbidite sequence above. It is composed of interbedded fine grained sandstone and coarse grained siltstone. The unit is non-calcareous. There is some quartz sheet veining present in this section. Iron oxide alteration is present along some fracture faces. The lower contact is a sharp contact leading into the medium grained sandstone below. Arsenopyrite mineralization is found in the lighter coloured sandstone unit (though in low abundance). Pyrite can be found in higher abundance in the darker siltstone unit as disseminated cubes following bedding or as globby laminae.											

Hole: D2-13-17

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
81.89	**85.20**	**S-SS Sandstone Grey mgr**	81.89	83.70	1.81	E6566745	0.001	181	2.3	0.86	0.08
		81.89 - 85.2: This sandstone section is likely part of the turbidite sequence above. The laminations are visible in some of the finer grained sections of this lithology. Quartz veins are present throughout the unit. The lower contact is sharp with the calcareous debrite below. Towards the contact, fracture coatings become more carbonate rich. The disseminated pyrite cubes are found in higher abundance in the less oxidized section of the rock (they are likely more visible due to the potentially overprinting iron oxidation halos). Limonite and feox form as halos surrounding fracture planes									
		<<Min: 81.89 - 85.2: 0.2% pyrite / 0.6% limonite>> The pyrite mineralization is more concentrated in the less oxidized sections of the rock. This may be due to the overprinting of the limonite.	83.70	85.20	1.50	E6566746	0.001	96.2	2.25	0.561	0.061
		Limonite appears as an overprinting alteration mineralization that extends from the fracture margins approx 1-2cm.									
		<<Alt: 81.89 - 85.2: trace alteration - carbonate / weak alteration - Iron Oxide Alteration / weak to moderate alteration - Limonite alteration>> This interval of medium grained sandstone shows feox alteration similar to previous units as fracture coating with oxidation halos. The trace carbonate alteration is only visible towards the bottom of the section adjacent to the contact with the calcareous debrite.									
		<<Struc: 83.94: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Open fracture set in the sandstone									
85.20	**93.68**	**S-CO Conglomerate Black fgr**	85.20	87.10	1.90	E6566747	0.004	99.4	2.08	0.713	0.143
		85.2 - 93.68: This interval begins at a sharp contact with the non-calcareous sandstone above. This unit is a strongly calcareous matrix supported debrite with large polymictic clasts set in a dark fine grained sandstone matrix. The clasts are mostly limestone while the sandstone matrix has calcite cement. The clasts range from 2mm to 20cm (extrapolated size from length of clast as the clast is larger than the core). The alteration in this section is primarily feox and limonitic though these kinda of fracture coatings only occur in fractures through some of the larger clasts. The sandstone matrix only shows minor feox alteration along clasts. Carbonate alteration is visible as pervasive cement through the sandstone. The bottom of this lithology is a small section of limestone before an abrupt contact with the conglomerate below. In this debrite, pyrite mineralization is variable and selectively overprints/replaces some of the limestone clasts. Typically the pyrite is globby and fine grained.									
		<<Min: 85.2 - 93.68: 0.6% pyrite / 0.2% limonite / 0.1% goethite>> The pyrite mineralization in this debrite is varied. In the darker silty clasts and sandstone laminations the pyrite mineralization is disseminated in the matrix while selective replacement of small limestone clasts is visible. The pyrite is globby and fine grained.	87.10	88.88	1.78	E6566748	0.001	18	0.22	0.988	0.108
		In the larger siltstone clasts, pyrite mineralization is wispy and follows bedding laminations (primary pyrite?)									
		<<Alt: 85.2 - 93.68: weak alteration - Iron Oxide Alteration / weak alteration - Limonite alteration / moderate to strong alteration - carbonate>> The primary alteration type in this section is carbonate. The sandstone cement is nearly entirely calcite. There is some calcite veining as well.	88.88	90.87	1.99	E6566750	0.005	97.3	0.33	3.23	0.108

		<<Struc: 92.05: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> Bedding plane in the debrite interval. Potentially reoriented during regional shearing									
		<<Struc: 93.13: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Uncoated fracture in the calcareous sandstone									
93.68	**94.00**	**S-CO Conglomerate Grey mgr**	93.68	95.21	1.53	E6566753	0.005	77.6	0.025	1.82	0.112
		93.68 - 94: This small section of conglomerate is clast supported versus matrix supported like the prevous interval. It is strongly calcareous and has limestone clasts as well as siltstone clasts in it. Most clasts are rounded and there is a size disparity. The majority of clasts range from 2-10mm while the siltstone clasts are typically1-2cm in length. The bottom contact is an abrupt change to an interbedded sandstone and siltstone unit. Pyrite is found in the finer grained sections of this rock. Limonite and feox alteration are found in some of the fracture planes as halos or as patches on the planes										
		<<Min: 93.68 - 94: 0.3% pyrite / 0.1% limonite>> Pyrite mineralization occurs in the sandy matrix of this unit, particularly in the finer grained siltier stringers. It can also occur as a partial replacement of the siltstone clasts in the unit.									
		Limonit occurs as a halo around fracture planes and is found in the matrix within that halo									
		<<Alt: 93.68 - 94: weak alteration - Iron Oxide Alteration / trace alteration - Limonite alteration / moderate to strong alteration - carbonate>> Carbonate alteration is found as a cement replacement in the sandy matrix of this unit.									
		The iron oxide alteration occurs alongside the limonite alteration as an oxidation halo surrounding the fracture planes									
94.00	**94.79**	**S-IBSST Interbedded sandstone and siltstone Black fgr**									
		94 - 94.79: This small section of interbedded fine grained sandstone and siltstone is strongly calcareous in sand-rich sections and weakly calcareous in the siltstone sections. Its lower contact is with another small section of debrite. The green-grey sections of siltstone show little to no mineralization whereas the dark grey/black silststone show pyrite mineralization along bedding laminae (primary pyrite?)									

Hole: D2-13-17

From (m)	To (m)		Rock Type & Description			From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
			<<Min: 94 - 94.79: 0.3% pyrite>> Pyrite can be found selectively along bedding laminae in the coarser black siltstone rather than the finer grained green-grey siltstones											
			<<Alt: 94 - 94.79: trace alteration - Iron Oxide Alteration / weak alteration - carbonate>> This unit is not heavily altered. The unit is only strongly calcareous in the sandy sections where it is found as a cement.											
			The iron oxide alteration occurs on fracture planes											
94.79	**95.21**	**S-CO**	**Conglomerate**	**Grey**	**fmgr**									
			94.79 - 95.21: This small section of debrite is strongly calcareous with limestone clasts (possibly very calcareous sandstone). It is matrix supported with interbedded sections of coarser grained pebbles/clasts and siltier weakly calcareous sections. Its lower contact is sharp with the interbedded sandstone and siltstone below. There is extensive pyrite mineralization found as rims around the limestone clasts.											
			<<Min: 94.79 - 95.21: 0.9% pyrite>> The elevated pyrite mineralization found in this section is found as a rim around limestone clasts											
			<<Alt: 94.79 - 95.21: moderate alteration - carbonate>> The carbonate alteration is found as a cement replacement in the sandstone layers and as little blebs in the siltstone clasts											
95.21	**99.20**	**S-IBSST**	**Interbedded sandstone and siltstone**	**Grey**	**fgr**	95.21	97.11	1.90	E6566754	0.019	42.5	0.025	1.9	0.083
			95.21 - 99.2: This lithological section is an interbedded unit of strongly calcareous fine grained light grey sandstone intercalated with weakly calcareous black fine grained siltstone. There are dark siltstone laminae in the sandstone as well. There is some shearing towards the bottom of this section shown by folded bedding laminae. The lower contact is a sharp contact with the sandy limestone below. Pyrite can be found followin bedding laminae in this section (primary?). Limonite and feox alteration can be found as 1cm thick halos surrounding the fracture planes in the sandstone.											
			<<Min: 95.21 - 99.2: 0.7% pyrite / 0.1% goethite / 0.1% limonite>> Pyrite mineralization is focussed in the darker sandy/siltstone and follows bedding laminae.			97.11	98.42	1.31	E6566755	0.001	111	0.025	1.45	0.088
			The goethite and limonite appear on fracture faces as patchy mineralization											
			<<Alt: 95.21 - 99.2: weak alteration - Iron Oxide Alteration / trace alteration - Limonite alteration / moderate alteration - carbonate>> Iron oxide forms as fracture coatings and their oxidation halos.			98.42	99.20	0.78	E6566756	0.001	166	0.025	1.51	0.109
			Carbonate alteration occurs as selective cement replacement in the sandstone intervals											
			<<Struc: 96.19: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> Bedding plane in the siltstone/sandstone. Potentially reoriented during regional shearing

99.20	**101.90**	**S-Lmt limestone Grey fgr** 99.2 - 101.9: This lithology is a section of light grey limestone with numerous calcite tension veins, some of which have a sigmoidal appearance. The upper contact is a small section of clast supported brecciation with the clasts sutured together due to pressure solution. The lower contact is sharp leading into the siltstone sandstone interbeds once again. Both pyrite and arsenopyrite can be found as disseminated wispy crystals through the matrix of this unit (does not seem to be a control on the mineralization)	99.20	100.72	1.52	E6566757	0.004	31.2	0.025	0.756	0.039
		<<Min: 99.2 - 101.9: 0.2% arsenopyrite / 0.3% pyrite>> The limestone unit has disseminated pyrite and arsenopyrite in its matrix. Both are very fine grained <<Alt: 99.2 - 101.9: strong alteration - carbonate>> This sandy limestone is strongly calcareous with abundant calcite veining	100.72	101.90	1.18	E6566759	0.003	26.1	0.06	0.588	0.076
101.90	**117.39**	**S-Lmt limestone Grey fgr** 101.9 - 117.39: This section is an interbedded siltstone and limestone. The light grey limestone is characterized by intense calcite tension veining and small black silty laminations. This unit has a sharp lower contact with the silicified sandstone-like unit below. There are thin (up to 1cm) iron oxide halos around the oxidized fracture planes. The mineralization in this zone is highly variable. Pyrite mineralization can range from .2% in the green-grey siltstone to 3% in the black siltstone. The sandy limestone contains variable amounts of silvery arsenopyrite (sometime with oxidation halos). This interval contains some of the highest levels of sulfide mineralization in this drill hole. Iron oxide alteration can be found in both the limestone and the siltstone as fracture plane alteration (and occasionally in the siltstone as laminae overprinting).	101.90	103.90	2.00	E6566760	0.007	62	0.05	1.98	0.198
		<<Min: 101.9 - 107.4: 0.9% pyrite>> Pyrite mineralization in this interval is highly concentrated in the small limestone beds within silty intervals.	103.90	105.86	1.96	E6566761	0.002	102	0.07	2.39	0.155
		<<Min: 107.4 - 108.5: 0.5% arsenopyrite / 0.2% pyrite>> There is significant arsenopyrite mineralization in this section appearing as disseminated silvery wisps through the matrix. Pyrite occurs as very fine grained disseminated cubes throughout	105.86	107.40	1.54	E6566762	0.002	68.7	0.07	2.43	0.113
		<<Min: 108.5 - 112.02: 0.5% pyrite / 0.2% arsenopyrite>> In this interval, the arsenopyrite is only found as wispy disseminated fine grained crystals in the sandy limestone while the pyrite is found throughout (though in higher concentration in the siltstone laminations and layers)	107.40	108.50	1.10	E6566763	0.001	35.9	0.025	0.376	0.025
		<<Min: 112.02 - 113.12: 0.8% pyrite / 0.2% arsenopyrite>> The pyrite in this section is disseminated and wispy though fine grained disseminated cubes are also present. Arsenopyrite is present as a wispy coating on some grains and can also be found with oxidation halos. Calcite veining cross cuts mineralized zones indicating a later stage non-mineralizing event	108.50	110.38	1.88	E6566764	0.002	115	0.025	2.94	0.144

117.39	**117.90**	**S-SS Sandstone Grey fmgr**	117.39	117.90	0.51	E6566772	0.001	1370	2.67	8.9	0.821
		117.39 - 117.9: This small unit is a silicified sandstone unit. It may have originally been a sandy limestone/calcareous sandstone. The medium sized quartz grains have been "sutured" together. There is minor amounts of arsenopyrite and pyrite present in the rock. The unit has a vuggy texture and contains many fractures and small quartz veins. The fracture planes are oxidized and limonite is found as interstitial crust in between quartz grains (limonite crust may be overprinting mineralization). The lower contact is a return to the calcareous sandstone and siltstone interbeds (the carbonate level is variable in the lower unit).									
		<<Min: 117.39 - 117.9: 0.3% pyrite / 0.6% arsenopyrite / 0.05% arsenic oxide / 0.3% limonite / 0.1% goethite>> Pyrite is found as disseminated brassy coloured fine grained cubes withing the darker matrix of this unit.									
		Arsenopyrite is found in clusters of wispy silvery mineralization that is typically in the matrix surrounding quartz grains									
		<<Alt: 117.39 - 117.9: moderate alteration - Silicification / weak to moderate alteration - Limonite alteration / trace alteration - Scorodite alteration / weak alteration - Iron Oxide Alteration>> This interval is marked by a change from strongly calcareous sandstone/ sandy limestone to a non-calcareous sandstone. This is also the first appearance of arsenic oxide/scorodite alteration along fracture planes									
117.90	**128.30**	**S-Lmt limestone Grey fmgr**	117.90	120.00	2.10	E6566773	0.002	2770	3.09	7.25	0.919
		117.9 - 128.3: This lithological section is composed of interbedded siltstone and sandy limestone. The siltstone is typically black though there are small interbeds of grey-green siltstone as well. The limestone is strongly veined by calcite. There is some minor faulting occuring in this lithology. Around some of these faults, there has been some decalcification. The lower contact in this unit is sharp with the siltstone and interbedded non-calcareous sandstone below. The alteration in this unit is characterized by iron oxide and limonite coating along fracture planes with some trace scorodite/arsenic oxide. This unit shows pyrite mineralization through both interbeds. In the limestone, the pyite is wispy and disseminated while in the siltstone the pyrite follows bedding and is likely formed prior to deformation/veining.									
		<<Min: 117.9 - 120: 0.4% pyrite / 0.05% arsenic oxide>> Arsenic oxide/scorodite is present along fracture planes in trace amounts	120.00	121.46	1.46	E6566775	0.001	499	0.46	1.62	0.247
		Pyrite can be found as disseminated cubes in the matrix of the decalcified sandy limestone									
		<<Min: 120 - 128.3: 0.6% pyrite / 0.05% arsenic oxide / 0.1% limonite / 0.1% goethite>> In the sandy limestone, the pyrite is found as disseminated wisps in the matrix. In the siltstone unit, it can be found as laminations in the darker sections as well as globby overprinting of select laminations	121.46	123.10	1.64	E6566776	0.002	220	0.22	0.905	0.133
		Goethite and limonite are found as oxidation products along some fracture planes.

		<<Alt: 117.9 - 120: moderate alteration - carbonate / trace alteration - Scorodite alteration>> This lithology shows decalcification as the sandy limestone is not as reactive as in previous sections. Arsenic oxide/scorodite is present in trace amounts as a patch on fracture faces	123.10	125.35	2.25	E6566777	0.0005	94.6	0.68	0.501	0.081
		<<Alt: 120 - 128.3: strong alteration - carbonate / weak alteration - Iron Oxide Alteration / trace alteration - Scorodite alteration / trace alteration - Limonite alteration>> Carbonate alteration is present throughout the sandy limestone unit as well as along some sandy laminations in the siltstone. It is also present as pervasive veining. Scorodite/arsenic oxide are present along few fracture planes Limonite and feox alteration occur along most fracture planes	125.35	127.15	1.80	E6566778	0.003	226	3.48	0.815	0.164
		<<Struc: 123: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> Bedding plane in the interbedded sandstone and siltstone. Potentially reoriented during shearing	127.15	128.30	1.15	E6566779	0.002	260	2.54	0.622	0.109
128.30	**133.70**	**S-IBSST Interbedded sandstone and siltstone Grey fgr**	128.30	130.07	1.77	E6566780	0.001	365	3.56	1.71	0.305
		128.3 - 133.7: This interval begins with a sharp contact with the limestone interbeds above. This section is composed of a light grey non calcareous sandstone interbedded with a dark grey-black siltstone. There is a small amount of calcite veining through the sandstone (interestingly enough the calcite veining is cross cut by laminations in the siltstone [potentially due to the siltstone being less permeable/more ductile and less prone to the fracturing required for veining to intrude]). The lower contact is the beginning of a debris flow section. The mineralization in this section is primarily pyrite (though there is a small speck of orpiment on a fracture face). Pyrite in the sandstone is composed of disseminated cubes in the matrix while in the black-grey siltstone it is found as wispy laminations. In the sandstone it takes on a silvery-brassy colour whereas in the siltstone it is much yellower. The grey-green siltstone has minimal pyrite mineralization.									
		<<Min: 128.3 - 133.7: 1% pyrite / 0.8% pyrite / 0.005% orpiment>> Pyrite in the sandy layers of this section is silver-brassy coloured and found thoroughly disseminated through the matrix. In the dark grey siltstone, it appears as wispy bands following laminations and is more brassy in colour. There is a small grain of orpiment on a fracture face alongside the siltstone unit.	130.07	131.94	1.87	E6566781	0.003	1030	5.74	2.34	0.404
		<<Alt: 128.3 - 133.7: weak alteration - carbonate>> This section shows very minor alteration, primarily carbonate alteration within veins and in small (1-3mm) thick halos around them.	131.94	133.70	1.76	E6566782	0.001	153	2.25	1.4	0.345

Hole: D2-13-17

133.70	**135.12**	**S-CO Conglomerate Grey fgr**	133.70	135.12	1.42	E6566784	0.003	548	1.91	1.63	0.395
133.7 - 135.12: This matrix supported conglomerate is most likely a debrite. There is large silstone clasts within a medium grained sandstone matrix inside of the siltstone unit. The sandstone matrix is calcareous and has a salt and pepper appearance. The only alteration visible is carbonate as there is minor veining and cement replacement in the sandstone. The lower contact in this interval is sharp with the silicified sandstone below. The only alteration visible in this debris flow section is the carbonate alteration in the sandstone matrix. This sandstone matrix has patchy pyrite mineralization around the grains in the matrix. Some orpiment is visible along the micro fracture planes in the sandstone										
<<Min: 133.7 - 135.12: 0.4% pyrite / 0.05% orpiment>> Pyrite is found primarily in the calcareous sandstone as a matrix disseminated mineralization. Orpiment can be found along small fractures in the sandstone matrix as well.										
<<Alt: 133.7 - 135.12: weak to moderate alteration - carbonate>> The only visible alteration in this zone is the carbonate alteration in the white-grey speckled sandstone matrix of the debris flow.										
135.12	**149.57**	**S-IBSST Interbedded sandstone and siltstone Grey fgr**	135.12	136.68	1.56	E6566785	0.004	551	2.02	2.21	0.48
135.12 - 149.57: This sandstone and siltstone interbedded unit is composed of fine-medium grained grey sandstone with thin black silty laminations and small (10-30cm) interbeds of black-grey siltstone. There is some minor faulting present in this lithology. The lower contact in this unit is the beginning of a grain size increase starting the coarse sandstone/green siltstone interbedded section. The alteration in this zone varies spatially with respect to faulting/fracture zones. Heavily fractured areas show feox and limonitic alteration. This unit is also variably calcareous. The thin sandstone interbeds in silty rich areas are weakly calcareous while in the thicker sandstone sections they are non-calcareous. Some brittle-ductile shearing textures are visible in the siltstone sections such as faulting and lamination folding. In this interval, pyrite mineralization is found primarily in the fine grained sands/coarse black silts in the small interbeds. Arsenopyrite can be found in sections with lots of arsenic oxide on fracture faces though the level of arsenopyrite is usually low.										
<<Min: 135.12 - 139.48: 0.4% pyrite / 0.8% pyrite>> In this interval, the sandstone hosts pyrite that is a darker brassy-yellow than in previous sections. It forms as small patches in the matrix of the sandstone.			136.68	137.76	1.08	E6566786	0.028	307	1.68	1.81	0.359
Within the siltier layers (short interbeds of silts and sands) the pyrite forms disseminated wisps throughout the darker finer grained sandy layers while in the siltstone it forms as wispy laminations.											
<<Min: 139.48 - 144.13: 0.6% pyrite / 0.05% orpiment / 0.2% arsenic oxide / 0.2% limonite>> In the very fine grained sand-dark siltstone layers there are lamination controlled wisps of pyrite.			137.76	139.48	1.72	E6566787	0.002	792	1.88	2.33	0.615
In one of the small faults there is a sliver of orpiment.											
In the coarser grey sandstone, pyrite is sparse and silvery in colour.

		<<Struc: 141.7: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> Bedding lamination in the interbedded siltstone and sandstone									
149.57	**153.74**	**S-IBSST Interbedded sandstone and siltstone Grey fmgr**	149.57	150.37	0.80	E6566796	0.105	1460	7.04	4.59	1.77
		149.57 - 153.74: This interval marks a grain size increase in the sandstone and a change in colour of the siltstone. The sandstone section is non calcareous, light grey-beige and is not medium grained. The siltstone is a blue-grey non-calcareous laminated section showing some shearing texture. The unit has a lower contact that is heavily faulted leading into the dolostone unit below. The sandstone show feox alteration and some scorodite/arsenic oxide alteration. The pyrite mineralization is low in this unit. Some realgar is present alongside kaolinite on a few fracture faces and some vugs. Scorodite alteration is present though not pervasively (only on fracture faces). The feox alteration forms small halos around fracture planes The main locus for pyrite mineralization is in the siltstone unit. The pyrite forms medium grained cubic crystals that are grouped in laminae and sometimes on unit boundaries (between sandstone and siltstone interbeds)									
		<<Min: 149.57 - 150.37: 0.1% realgar / 0.1% kaolinite / 0.2% arsenic oxide / 0.1% pyrite>> Pyrite is mainly wispy and in low abundance. It is brassy coloured Kaolinite and realgar occur together in some vugs and on few fracture faces. Scorodite/arsenic oxide occurs as fracture coating	150.37	151.73	1.36	E6566797	0.074	1640	4.59	6.9	1.1

Hole: D2-13-17

		<<Min: 150.37 - 151.73: 0.2% pyrite / 0.1% pyrite>> In this interval, the longer sandstone section shows no mineralization though this couldve been destroyed by the intesne feox alteration halos. In the siltstone, the pyrite has 2 forms. It follows bedding/foliation laminae as medium grained cubes in the siltstone and in the very small sandstone interbeds it appears wispy and disseminated (perhaps the siltstone on either side capped it off from destructive feox alteration?) <<Min: 151.73 - 153.74: 0.3% arsenic oxide / 0.6% pyrite>> Pyrite mineralization is medium-coarse grained in the siltstone and it follows bedding laminae (these beds have been sheared/deformed). It also forms on the boundary between units (siltstone/sandstone) <<Alt: 149.57 - 150.37: trace alteration - kaolinite / trace hydrothermal - realgar / trace alteration - Scorodite alteration / weak alteration - Iron Oxide Alteration>> The iron oxide alteration occurs along fracture planes and in heavily fractured zones shows oxidation halos surrounding the fracturing. Realgar and kaolinite seem to occur together in vugs and sometimes on fracture faces. Scorodite/arsenic oxide is solely occuring as a fracture coating <<Alt: 150.37 - 151.73: weak alteration - Iron Oxide Alteration>> The only alteration type visible in this interval is the feox in halos surrounding fracture faces. The feox is mostly in the sandstone unit <<Alt: 151.73 - 153.74: weak alteration - Scorodite alteration>> This interval of green-blue-grey siltstone only has scorodite/arsenic oxide alteration. This appears solely on fracture faces.	151.73	153.74	2.01	E6566798	0.142	2780	8.67	5.88	2.34
153.74	**182.50**	**S-Dol Dolostone Blue-Grey fmgr** 153.74 - 182.5: This section of dolostone (likely algae lake) is weakly calcareous (calcite cement between dolomite crystals), strongly brecciated and extensively faulted. There is realgar mineralization present along some fracture planes along with extensive scorodite/arsenic oxide, iron oxide and limonitic alteration. There are numerous stylolites present cross cutting breciated sections and seeminly "weling" dolostone clasts together. The upper contact is a fault zone characterized by limonitic and scorodite coating with some realgar mineralization as well. This dolostone shows no laminations or bedding indicating texturally destructive dolomitization. There is some zebra textured dolostone with calcite/ankerite veins with some quartz. The breccia matrix is mostly calcite with some ankerite/fecarbonate coating. The vast majority of these veins and the breccia matrix has quartz as well. The dolostone ranges from a light grey-blue medium grained rock to a dark grey-blue finer grained rock. The lighter coloured dolosone typically has more calcite cement (potentially more interstitial space allowing for greater amounts of cement?). Towards the bottom of this section, the amount of calcite in the rock increases, potentially making this a dolomitic limestone. The lower contact in this unit is a section of faulting with trace cinnabar mineralization. Below this contact is the dolomitic limestone	153.74	155.55	1.81	E6566800	0.016	2330	10.6	29.1	1.33

		<<Struc: 187.84: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> Stylolite cross cutting brecciation section									
		<<Struc: 189.92: Fractures - sheeted fractures>> Open fracture with scorodite coating									
203.61	**208.95**	**S-Dol Dolostone Blue-Grey fmgr** 203.61 - 208.95: This lithological section is straddling the line between calcareous dolostone and dolomitic limestone. This section is around 60% dolomite and 40% calcite. There is extensive realgar and orpiment mineralization in this section and strong brecciation textures. The realgar and orpiment appear to be fracture controlled. These minerals form patches throughout the rock but in higher concentration adjacent to fracturing. Pyrite mineralization can be found in the stylolites. Arsenopyrite wisps can be found in the matrix of the darker dolostone unit. The lower contact in this unit is a section of brecciation followed by the coarser grained calcareous dolostone below.	203.61	204.99	1.38	E6566831	0.007	721	4.62	50	1.31

		<<Min: 203.61 - 208.95: 5% realgar / 2% orpiment / 0.05% arsenopyrite / 0.05% pyrite>> Pyrite can be found as disseminated cubes in the stylolites in this section that havent been mineralized by realgar Arsenopyrite can be found in disseminated wisps within the darker dolostone with fe-oxidation halos around them. Realgar and orpiment mineralization is patchy and pervasive. It coats every fracture face and seems to form patches around fractures and stylolites within the rock	204.99	206.20	1.21	E6566832	0.022	29800	25.7	104	4.43
		<<Alt: 203.61 - 208.95: weak to moderate alteration - Scorodite alteration / moderate alteration - carbonate>> Scorodite alteration is present as an occasional fracture coating. However this is likely hidden by the intense realgar/orpiment mineralization	206.20	207.36	1.16	E6566834	0.761	242	5.85	6.31	0.831
		<<Struc: 204.87: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Open fractre with trace realgar coating <<Struc: 205.55: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Open fracture with trace realgar coating	207.36	208.95	1.59	E6566835	0.022	17400	7.12	86.6	12.8
208.95	**210.00**	**S-Lmt limestone Grey mgr** 208.95 - 210: This strongly calcareous grey dolomitic limestone section has some intense brecciation. There is also strong realgar and orpiment mineralization. The realgar and orpiment appear along fracture planes. The only alteration visible in this small section is the strong carbonate alteration. Arsenopyrite is visible as wispy fine grained disseminated crystals in the matrix of the limestone. The lower contact is a section of closely spaced stylolites. Below this unit is the calcareous fine grained blue-grey dolostone <<Min: 208.95 - 210: 1% realgar / 1% orpiment / 0.05% arsenopyrite>> Arsenopyrite appears as a fine grained wispy mineral disseminated in the matrix of this limestone. It often appears with iron oxide halos around it Realgar and orpiment only appear as fracture coating in this section. <<Alt: 208.95 - 210: strong alteration - carbonate>> The only visible alteration in this section is the carbonate alteration. More than 50% of this lithology is calcite	208.95	210.00	1.05	E6566836	0.023	14400	8.67	36.4	5.27
210.00	**214.79**	**S-Dol Dolostone Blue-Grey fmgr** 210 - 214.79: This section is characterized by a dark blue-grey dolostone with abundant fracturing and small sections of brecciation. There are also numerous stylolites cross cutting across the core, some of which are mineralized by realgar/orpiment. The arsenic sulfide mineralization in this section is intense, some sections showing up to 50% realgar/orpiment. In the matrix of this dolostone unit, arsenopyrite and pyrite can be found in the matrix in low abundance (though some of the highest in this larger dolostone section). The lower contact in this unit is a gradual contact with crystal size increase.	210.00	211.22	1.22	E6566837	0.011	90400	83.5	3090	16.2

229.99	**268.04**	**S-Dol Dolostone Grey mgr**	231.15	232.68	1.53	E6566855	0.024	1790	6.78	10.7	3.41
		229.99 - 268.04: This calcareous dolostone unit contains nearly 50% calcite. This lithology sits right on th boundary between a dolomitic limestone and a calcareous dolostone. There is intense brecciation in this section with calcareous dark dolostone clasts set in a qtz-cbt matrix (most of the matrix is calcite becoming more quartz rich towards the middle of the matrix). Most of the brecciated sections are matrix supported hydraulic breccias. There are abundant stylolites through this unit suturing large "clasts" of dolostone together (likely these stylolites cross cut sections and mark sections of volume loss). Carbonate bleb alteration is present as rounded spherules of carbonate within the dolostone matrix. Some of the brecciated sections show ankerite/fe-carbonate coating in the matrix of the breccia and it appears as a tan colour. The ankerite/fe-carbonate alteration of the matrix appears in an interval on either side of faulting in the area. The lower contact in this unit is a fault zone characterized by gouge leading into the volcanic unit below. Pyrite mineralization is throughout the section however it is typically in low abundance. It appears in slightly higher abundance in the darker finer grained dolostone sections. It appears as very fine grained dark-brassy globs of cubes. Arsenopyrite can also be found in sections with intense scorodite alteration though in typically low abundance.									
		<<Min: 233.65 - 240.15: 0.4% realgar / 0.1% orpiment / 0.1% arsenopyrite / 0.3% pyrite>> Pyrite and arsenopyrite are found disseminated in the matrix of the dolostone. Pyrite is often found in small globs with oxidation halos while arsenopyrite is found as very fine grained disseminated elongate crystals. Realgar and orpiment are found as fracture coating	232.68	234.12	1.44	E6566856	0.029	655	5.23	8.21	3.2
		<<Min: 240.15 - 249.46: 0.1% realgar / 0.1% orpiment / 0.8% limonite / 0.3% goethite>> Realgar and orpiment occur in trace amounts as a fracture coating Limonite occurs throughout the section as a fracture coating, and often appears mineralization within the matrix of the rock inside of the large oxidation halos surrounding fractures Goethite appears as fracture coating in fault zones	234.12	235.46	1.34	E6566857	0.041	642	4.28	6.66	4.17
		<<Min: 249.46 - 268.04: 0.3% limonite / 0.5% arsenic oxide / 0.1% realgar / 0.3% pyrite>> Pyrite appears as globby mineralization through the matrix of the dolostone. It appears in slightly higher concentration in the darker fine grained dolostone section. Limonite appears as a fracture coating in some of the faulted zones. Realgar mineralization is trace and appears on some fracture coating and in some vugs Scorodite appears as a fracture coating throughout the interval	235.46	237.23	1.77	E6566859	0.044	5290	7.92	6.48	4.68
		<<Alt: 233.65 - 240.15: moderate alteration - carbonate>> Carbonate alteration appears as blebs and as a "cement" like alteration through the matrix of the dolostone	237.23	239.00	1.77	E6566860	0.061	2500	8.36	8.87	5.78

From (m)	To (m)	Rock Type & Description
		<<Struc: 259.52: non-penetrative cleavage\foliation development or brittle faults\brecciation Fractures - sheeted fractures>> Open uncoated fracture in the dolostone
268.04	**269.44**	**V-IV Intermediate volcanic Buff-Green fgr**
		268.04 - 269.44: This section of intermediate volcanics is a buff-green colour and has moderate calcite veins (approx 1cm thick) in a small section of the rock. There are abundant fractures and apparent shear banding. There is trace iron oxide alteration along fractures that form halos reaching up to 1cm away from the fractures into the rock. Near the bottom of this section there is a small band of hematite alteration (adjacent to the fault). There are bands and blobs of pyrite throughout the section (appears as clast replacement). Pyrite mineralization in this section is high and forms globby sections of fine grained cubes thoroughly disseminated through this unit.
		<<Min: 268.04 - 269.44: 0.6% hematite / 2% pyrite>> Pyrite mineralization occurs in large concentration throughout this section as large globs and wisps
		Hematite appears right below the fault gouge section at the bottom of this interval
		<<Alt: 268.04 - 269.44: weak alteration - Iron Oxide Alteration / trace alteration - hematite / weak to moderate alteration - chlorite>> Iron oxide appears as a fracture coating with minor 1cm halos
		Hematitic alteration appears underneath the fault zone near the bottom of the section
		Chlorite alteration takes place throughout the volcanic unit and apears as a green colour

From (m)	To (m)		Rock Type & Description		
100.95	**116.29**	**S-SS**	**Sandstone**	**Grey**	**mcgr**

100.95 - 116.29: grey sandstone with medium to coarse grained sands; small interbeds/layers of dark grey shale/siltstone; silicified rock, definite infilling of silica between grains, minor calcite in matrix; other than thin silt/shale layers a faint bedding/foliation can be observed but appears massive; cut by quartz carbonate veins; minor oxidation of fractures; when muriatic acid is applied to the rock the next day carbonate is stained orange and appears (is?) oxidized; one area shows a vein that has calcite adjacent to wall rock and then coarse quartz crystals growing out from calcite and then an infilling of calcite between quartz crystals

<<Min: 100.95 - 116.29: 0.2% pyrite>> trace pyrite seen in blebs and some singular cubic crystals, appears to be related to veining but are not imedietly adjacent

<<Alt: 100.95 - 116.29: weak to moderate alteration - Silicification / trace alteration - Iron Oxide Alteration>> siliifiation of sandstone units minor amounts seen infilling matrix; patchy no obvious controls; iron oxide seen on fractures, addition of acid will quickly stain rock and also provide an orange stain, quickly oxidizing iron associated with carbonate?

<<Vein: 100.95 - 116.29: 1% Quartz-Carbonate>> quatz carbonate veining, possibly iron carbonate?; buff white veins; multiple generations of fluid flow evidence for carbonate followed by silica followed by carbonate

<<Struc: 102: macro evidence for deformation, but no foliation development or brecciation Bedding - Upright>> bedding plane

From (m)	To (m)		Rock Type & Description		
116.29	**129.61**	**S-IBSTS**	**Interbedded siltstone and sandstone**	**Grey**	**fgr**

116.29 - 129.61: light and dark grey interbanded/laminated siltstones, sandstone and clay stone; siltsone is dark grey, sandstone is light grey and the claystone is a buffgrey; claystone seen near beginning of interval below a brecciated zone (117.06-118.24) that is crosscut by stringer veins, which are qtz rich at beginning of brecciated zone and calcite rich at the end of brecciated zone, brittle deformation; at 126.28-126.52m there is a ductile shearing occuring with observed pyrite mineralization and carbon on a fracture face running through zone; clast size in sands gets up to fine to medium size; pyrite mineralization seen as layers in laminaed siltstones, possibly exploiting more porous thin sandy units adjacent to black/dark grey siltsone or primary?; contact with unit below is gradational and was seperated on basis of clast size; in thin sandy units sometimes crossbedding/ripple marks is observed as welll as some soft sediment deformation, which could have possibly been subsequently deformed post lithification; bottom of interval show convuluted bedding;

<<Min: 116.29 - 117.48: 0.1% pyrite>> trace pyrite seen,

Hole: F2-13-02

From (m)	To (m)	Rock Type & Description
12.54	**29.81**	**S-IBSTS Interbedded siltstone and sandstone Grey fmgr**
		12.54 - 29.81: orange grey laminated siltstones and sandstones, sandstones up to very coarse, 24.26-25.20 is a grit bed with up to 4mm granules; soft sediment load structures indicate bedding is upright, beds fine upwards; quartz veining at beginning of interval is all deformed, no qtz veining in second half of interval; moderate oxidation which is fracture controlled, some possible hematite or iron carbonate in qtz veins (suspect siderite); calcite on fracture surfaces; what I thought was hydrothermal breccia in the previous hole is at 17.90-18.20m approximately, is broken up/fractured in this hole; bedding has an alpha angle on around 65 degrees; fractures tend to be parallel with bedding
		<<Min: 12.54 - 24.26: 0.1% pyrite>> only trace amounts of pyrite seen but iron oxide in matrix leads me to believe there was more but has been oxidized, as further down holepyrite exists in matrix of snady units
		<<Min: 24.26 - 29.81: 0.1% pyrite>> fine grained aggregrate blebs of pyrite seen near zones of silicification
		<<Alt: 12.54 - 18.4: weak alteration - Silicification / moderate to strong alteration - Iron Oxide Alteration>> silicification from quartz veining; iron stained mineral associated with quartz veins, possibly siderite or limonite, seems to soft to be hematite; iron oxide staining on fractures
		<<Alt: 18.4 - 24.26: weak alteration - Silicification / trace alteration - carbonate / weak to moderate alteration - Iron Oxide Alteration>> some silicification in matrix of coarser units, along with iron oxide in matrix and on fractures; calcite on fracture surfaces
		<<Alt: 24.26 - 29.81: moderate to strong alteration - Silicification / weak to moderate alteration - Iron Oxide Alteration>> patchy silicification intense around 28m;
		<<Vein: 12.54 - 18.4: 1% Quartz-Iron oxide>> quartz veins that are deformed and contain variable amounts of an iron oxide or iron carbonate
		<<Vein: 24.26 - 29.81: 0.2% Quartz>> minor quartz veining
		<<Struc: 27.15: macro evidence for deformation, but no foliation development or brecciation Bedding - Upright>> bedding in laminated siltstone, somewhat convuluted
29.81	**38.57**	**S-SS Sandstone Grey cgr**
		29.81 - 38.57: sandstone to conglomerate (grit unit); quartz clasts that can be subangular to rounded up to 5mm in size; some clay alteration with some orange brown staining (oxidation), white/buff clay seems to be replacing clasts in the grit unit; clasts fine upwards, no obvious bedding observed massive appearance, except where coarse sequences begin again above finer grained material; no sulphide mineralization seen; oxidation seems to be pervasive and not fracture controlled maybe due to high porosity/permabilty of rock; minor quartz carbonate veins with cabonate appearing to have some iron oxide (ankerite?);

From (m)	To (m)		Rock Type & Description		From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
0.00	**8.30**	**S-CO**	**Conglomerate**	**Blue-Grey**	0.00	6.10	6.10	E6567211	0.003	13	2.97	0.066	0.079
0 - 8.3: not actually a conglomerate; debris flow, large angular to sub angular clasts in dark blue grey matrix, light grey to dark grey clasts , large variation in size sand/silt size up to cobble size, contains: siltsone clasts that were still soft at time of deposition, wispy bent appearance; calcareous sandstone clasts (fine grained quartz sands with a carbonate rich matrix, primary or secondary?); light grey limestone clasts which are the largest observed clasts, looks sparry on broken surface, contains some rounded allochems (ooids?); dark grey limestone clasts which are lime mud stones, micrite; matrix is very fine grained and highly calcareous; some pyrite blebs seen, appears to be replacing clasts?, sometimes pyrite is seen rimming calcareous sandstone clasts; minor non penetrative oxidation on fracture surfaces; rock is cut by calcite veins and veinlets; bottom contact possibly fault bounded loss of recovery between units											
<<Min: 0 - 8.3: 1% pyrite>> pyrite seems to replace clasts in debris flow, suspect the calcareous sandstone clasts; blebs up to .5cm seen, sometimes pyrite is seen on margins of sandstone clasts					6.10	8.30	2.20	E6567212	0.004	12	3.61	0.045	0.069
<<Alt: 0 - 8.3: alteration - carbonate>> there are carbonate veins present cutting the rock indicating an influx of carbonate, rock is highly calcareous and a large part is primary													
<<Vein: 0 - 8.3: 0.5% Calcium carbonate/Carbonate>> carbonate veins and veinlets, suspect minor iron component													
<<Struc: 6.72: macro evidence for deformation, but no foliation development or brecciation Veins - General>> multiple carbonate veins in 25 cm radius seen with same orientation, beta angle was unobtainable													
8.30	**20.11**	**S-IBSST**	**Interbedded sandstone and siltstone**	**Grey**	8.30	9.97	1.67	E6567213	0.003	18	4.35	0.056	0.096
8.3 - 20.11: heterolithic interbedded sandstone and siltstone, some siltsone beds are unsorted and contain up very coarse quartz sands and lobes of a calcareous sandstone matrix supported, coarse grains average about a cm seperation from each other, near end of interval (18.90-19.30m) there is a calcareous sandstone with a dark grey dendritic banding pattern on light grey, bands are about 1cm in width, unknown cause for colouration; more porous units have significant calcite in matrix, nil in silt rock; pyrite observed with carbonate in porous units, near silt units there is an increase in pyrite but still in porous rock; minor oxidation on fractures with a small amount of penetration into rock												
<<Min: 8.3 - 20.11: 1.5% pyrite>> pyrite mineralization seen in porous rock (larger grain size) fine grained, in bands of sandstone enclosed by siltstone and in lobes of sandstone enclosed in siltstone					9.97	11.97	2.00	E6567214	0.067	42.2	6.34	0.072	0.115
<<Alt: 8.3 - 20.11: moderate to strong alteration - carbonate / weak to moderate alteration - Silicification>> minor silicified zone around 11.50m and quartz carbonate veining; carbonate in matrix of more porous units, seems to be associated with pyrite mineralization but both may be exploiting porous units					11.97	13.60	1.63	E6567215	0.03	53.7	6.7	0.059	0.145
<<Vein: 8.3 - 20.11: 0.6% Quartz-Carbonate>> quartz carbonate veins and veinlets appear more often inn sandstone units, possibly due to being more brittle?					13.60	15.35	1.75	E6567217	0.014	36.7	5.39	0.058	0.121

210.31	**219.75**	**S-IBSST Interbedded sandstone and siltstone Orange-Brown mcgr**	210.31	213.36	3.05	E6567344	0.001	36.6	1.89	0.038	0.068
210.31 - 219.75: interbedded sandstone and siltstone; highly oxidized and leached, falling apart, removal of carbonate, though rock still fizzes readily with acid; siltstones less effected by leaching remaining fairly intact; quartz carbonate veins show dissolultion of carbonate leaving quartz behind, a deep red oxidation colour is present on some of the fracture faces; no pyrite mineralization seen most likely oxidized away; suspect supergene fluids leeched and oxidized rock; rock is weak and friable											
<<Min: 210.31 - 219.75: limonite>> no sulphide observed but most likely due to high oxidation			213.36	216.41	3.05	E6567345	0.002	54.7	2.25	0.022	0.022
<<Alt: 210.31 - 219.75: strong alteration - Iron Oxide Alteration>> highly oxidized and decalcified rock, some deep red staining on fracture faces (type of oxide?)			216.41	219.75	3.34	E6567346	0.002	42.9	1.82	0.055	0.057
<<Vein: 210.31 - 219.75: 0.5% Quartz-Carbonate>> most carbonate has been leeched from veins											
219.75	**222.75**	**S-CO Conglomerate Grey**	219.75	222.75	3.00	E6567347	0.002	19	1.3	0.064	0.02
219.75 - 222.75: conglomerate/debrite; up to pebble sized clasts in a medium to coarse grained qtz sand matrix; qtz sand matrix is highly calcareous; majority of clasts are micritic limestone; minor black siltstone clasts that are non calcareous and a sandy micritic limestone matrix supported; a thin sandstone layer in the middle of unit, as well it looks like there were multiple depositional events of debrite, with slight changes in sand size in matrix; highly oxidized fractures with penetration of matrix and clasts; minor pyrite seen in matrix as well thin wisps of a fine grained grey sulphide seen inbetween clasts that has been partially oxidized;											
<<Min: 219.75 - 222.75: 0.5% pyrite>> trace pyrite mineralization in matrix; some thin grey sulphide that is partially oxidized between clasts											
<<Alt: 219.75 - 222.75: weak alteration - carbonate / weak to moderate alteration - Iron Oxide Alteration>> possible carbonate alteration of matrix but suspect primary; some influx of carbonate due to veining; iron oxide on fractures with some carbonate leeching but minor especially compared to units above and below											
<<Vein: 219.75 - 222.75: 1% Calcite>> minor calcite veining, some hybrid veins; cuts clasts in debrite											
222.75	**230.12**	**S-IBSST Interbedded sandstone and siltstone Orange-Brown mgr**	222.75	225.55	2.80	E6567348	0.002	20.6	1.41	0.076	0.068
222.75 - 230.12: very bad recovery with rocks being rounded by the drill; interbedded sandstone and siltstone, same as interval ending at 219.75m; some highly leeched zones byt not as intense as interval ending at 219.75 (may not have been recovered); silty units less effected by oxidation and leeching, low amount of carbonate;											
<<Alt: 222.75 - 230.12: weak to moderate alteration - carbonate / moderate to strong alteration - Iron Oxide Alteration>> carbonate in sandstone units, mostly leeched away, still some residual carbonate; iron oxide on fractures along with a red oxide on some fractures			225.55	228.60	3.05	E6567350	0.008	17.4	1.46	0.1	0.067

GeoSpark
geosparkconsulting.com

Hole: F2-13-04

From (m)	To (m)		Rock Type & Description		
0.00	**7.40**	**OVBD**	**Over Burden**		
0 - 7.4: green shales, conglomerate, siltstone; at end of overburden there is a moderately pervasive silicified sandstone					
7.40	**23.66**	**S-Slt**	**Siltstone**	**Grey**	**fgr**
7.4 - 23.66: laminated siltstone; light and dark grey layers; light grey layer has more of a muddy component and a blockier fracture, dark grey layer is more shale like and fractures are more planar there; pyrite seen in the black layer; there is trace/minimal quartz sandstone layers with a carbonate rich matrix; oxidation on fractures minimal penetration of wall rock; way up is up hole; asymmetric folds offset by fractures at seen around 20m					
<<Min: 7.4 - 23.66: 1% pyrite>> pyrite in bands or blebs in blcak silt layers, suspect primary					
<<Alt: 7.4 - 23.66: weak to moderate alteration - Iron Oxide Alteration>> oxidation on fractures, penetration of wallrock increases where fractures intersect sandy units					
23.66	**26.68**	**S-IBSST**	**Interbedded sandstone and siltstone**	**Grey**	**fmgr**
23.66 - 26.68: first 20cm of interval is a coarse to very coarse grained sand unit, with a calcareous matrix and pyrite disseminated in matrix, followed by laminated silts and sands with fine grained sands and some interbeds of limestone with a fine grained sandy component; oxidation on fractures with very minor penetration of wall rock; some orange brown calcareous oxidized clay on fractures as well; cut by calcite veins, in some veins pyrite is seen along with a fine grained black mineral (possibly sulphide)					
<<Min: 23.66 - 26.68: 1% pyrite>> pyrite seen in black siltstone as bands and blebs; minor pyrite seen in calcite vein with a fine grained black material which may also be a sulphide					
<<Alt: 23.66 - 26.68: weak alteration - carbonate / weak to moderate alteration - Iron Oxide Alteration>> carbonate veins; iron oxide on fractures					
<<Vein: 23.66 - 26.68: 1% Calcite>> minor calcite veining; some veins contain a fine grained black material (sulphide), seen once with pyrite

From (m)	To (m)	Rock Type & Description	From (m)	To (m)	Length	Sample #	Au Best ppm	As Best ppm	Sb Best ppm	Hg Best ppm	Tl Best ppm
		<<Struc: 52.38: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> carbonate pyrite vein with major amount of pyrite									
53.32	**62.49**	**S-Lmt limestone Blue-Grey vfgr**	53.32	55.20	1.88	E6567403	0.003	1.3	0.49	0.047	0.012
		53.32 - 62.49: blue grey micritic limestone; some minor silicification which at first looked like oolites as they were small circular sometimes donut shaped crystals (not a solid crystal, more like a microcrystaline aggregrate), in places it seems to be related to styolites with silicification pentrating rock 1 to 2 cm on either side, though original texture of styolite is barely recognizable; fine grained sulphide seen in styolites but less is seen if there is silicification; this interval has much less veining than the previous interval, most veining looks to be due to tension cracks; trace oxidation seen on fracture surfaces at beginning of interval, less than previous interval and not much seen at bottom of this interval, probably due to competent stick rock so less natural fractures; interval end chosen due to no silicification observed and the beginning of quartz sands in limestone									
		<<Min: 53.32 - 62.49: 0.5% pyrite>> most pyrite seen in styolites with a dark grey fine grained material that looks metallic (suspect sulphide; aspy?); trace disseminated pyrite in limestone as well	55.20	57.24	2.04	E6567404	0.002	3.6	0.58	0.032	0.009
		<<Alt: 53.32 - 62.49: weak alteration - carbonate / weak alteration - Silicification / weak alteration - Iron Oxide Alteration>> carbonate veining less than previous interval; silicification is styolite controlled (I think) patchy, but not all styolites; tace iron oxide on fractures	57.24	59.23	1.99	E6567405	0.002	1.2	0.33	0.043	0.009
		<<Vein: 53.32 - 62.49: 1% Calcite>> mostly tension veins; one carbonate vein at beginning of interval looks to contain some iron and is displaced by later calcite veins	59.23	61.17	1.94	E6567406	0.002	1.2	0.22	0.028	0.008
		<<Struc: 53.6: non-penetrative cleavage\foliation development or brittle faults\brecciation Bedding - Unknown>> thin siltstone bed in limestone	61.17	62.49	1.32	E6567407	0.002	0.4	0.27	0.031	0.009
		<<Struc: 53.64: macro evidence for deformation, but no foliation development or brecciation Styolite>> styolite in limestone									
62.49	**83.14**	**S-Lmt limestone Blue-Grey vfgr**	62.49	64.35	1.86	E6567409	0.003	0.5	0.32	0.04	0.014
		62.49 - 83.14: very fine grained micritic limestone with a variable very fine grained sand component, and so thin interbedded siltstone, qtz sand content seems to increase near siltstone beds; slightly more better developed styolites in this interval; zone of minor silicification at 78.70-79m; trace oxidation on fractures especially where fractures crosscut silty beds, probably due to increased pyrite in silty layers (suspect primary pyrite); sulphides in styolites and trace disseminations, pyrite in silty layers some large cubes produced near thin sand layers, zones of permeability producing causing fluids to grow new pyrite on primary?; minor veining in this interval most tension veins, no qtz seen in veins;									
		<<Min: 62.49 - 83.14: 1% pyrite>> trace disseminated pyrite throughout; increased amount of pyrite in siltstones, primary plus overgrowths?; sulphides in styolites may be an aspy component but very fine grained dark grey material	64.35	66.36	2.01	E6567410	0.002	0.9	0.43	0.054	0.022
		<<Alt: 62.49 - 83.14: weak alteration - carbonate / weak alteration - Iron Oxide Alteration / trace alteration - Silicification>> minor amount of carbonate veins; iron oxide on fractures increasing where fractures cut siltstone; zone of minor silicification from 78.70-79m;	66.36	68.35	1.99	E6567411	0.001	4.3	0.85	0.085	0.04

<<Vein: 86.05 - 89.81: 0.1% Calcite>> minor amount of calcite veinlets						89.22	89.81	0.59	E6567427	0.002	0.3	0.73	0.075	0.014

Hole: F2-13-05

From (m)	To (m)		Rock Type & Description		
89.81	**94.89**	**S-Dol**	**Dolostone**	**Grey**	**mgr**

89.81 - 94.89: light grey dolomite rock with a few sections that contain minor amount of fine grained qtz sand; one small section of rock around 91.44m has the appearance of a conglomerate from afar but under close inspection appears to be all dolomite; minor amount of thin siltstone layers; trace oxide with higher amounts of iron carbonate seen on some fractures; patchy distribution of some disseminated pyrite in dolostone seems related to thin siltstone wisps/layers;

<<Min: 89.81 - 94.89: 0.5% pyrite>> patchy zones of disseminated pyrite

<<Alt: 89.81 - 94.89: weak alteration - carbonate / trace alteration - Iron Oxide Alteration>> some carbonate veining; trace iron oxide on fractures

<<Vein: 89.81 - 94.89: 1% Calcium carbonate/Carbonate>> some thinner carbonate veins at beginning of interval, planar, and some larger veins in a broken zone near end of interval

94.89	**109.64**	**S-Dol**	**Dolostone**	**Grey**	**mcgr**

94.89 - 109.64: interbedded dolomite and limestone/dolomitic limestone; some zebra dolomite formation; throughout there is what looks like some possible brecciation not tectonic probably more related to dolomite formation; some quartz is present in lighter part of zebra sections along with some calcite, in some spots quartz is not seen directly but a steel nail will not fully scratch a dolomite crystal; trace amount of iron oxide on fractures, less than previous intervals; there is carbon present with some sulphide on some fracture surfaces, most intense around 97.54 where on a fracture down the core axis a silver grey clay was seen feels talc like when it dries on fingers, looks like silver paint; at about 96m there is what looks like a flower structure (kind of a circular pattern) made of dolomite and quartz, some minor pyrite mineralization seen nearby; trace amount of pyrite seen through interval, few styolites and don't appear to be sulphide rich;

<<Min: 94.89 - 109.64: 0.5% pyrite>> trace/minor amounts of pyrite seen in rock seems to be related to quartz when seen in zebra dolomites

<<Alt: 94.89 - 109.64: weak to moderate alteration - carbonate / weak to moderate alteration - Silicification / trace alteration - Iron Oxide Alteration>> minor quartz and carbonate alteration brought in by veining (in light bands of zebra dolomite); trace iron oxide on fractures; also some carbon on fractures; near end of interval the light stripes become more of a buff colour indicating more iron content, after 108m;

<<Vein: 94.89 - 109.64: 3% Calcium carbonate/Carbonate>> some carbonate tension veins which seem more prevlent in limestone but some seen in zebra dolomite; also quartz in white layers of zebra dolomite;

<<Struc: 108.83: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> calcite vein in dolomite; nearby zebra pattern appears to be roughly parallel

From (m)	To (m)		Rock Type & Description		
109.64	**149.50**	**S-IBSTL**	**Interbedded siltstone and limestone (packestone)**	**Blue-Grey**	**fgr**

109.64 - 149.5: dark blue-grey micritic limestone with some minor interbeds of dark grey siltstone; limestone is sandy in sections usually near siltsone layers; some siltsone beds are calcareous, (unusual so far); minor amount of styolites, less than previous limestone intervals, styolites don't seem to contain sulphides like previous intervals before dolostone; sulphides only seen with clastic seds, suspect primary; trace oxidation on some fractures with clay at beginning of interval; zero iron oxide seen on fractures in second half of interval; iron in veins (buff coloured ankerite) at beginning of interval ending after a small brecciated section (111.31-111.43); last 7m of interval seems to be a fault zone, breccias and minor gouge and some extensive stockwork calcite veining, no sulphide seen in this area;

<<Min: 109.64 - 149.5: 0.5% pyrite>> trace pyrite seen in zones with clastic seds suspect primary

<<Alt: 109.64 - 149.5: weak alteration - carbonate / trace alteration - Iron Oxide Alteration>> carbonate in veins, most seem to be tension related; trace iron oxide; carbon in styolites

<<Vein: 109.64 - 149.5: 10% Calcite>> calcite veins most look like tension veins, stockworks forming near fault zones

<<Struc: 110.9: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> planar calcite vein in limestone

<<Struc: 111.19: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> planar calcite vein in limestone

<<Struc: 111.75: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> styolite

<<Struc: 112.46: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> styolite

			188.34	189.75	1.41	E6567488	0.006	55	6.72	0.122	0.067
189.75	**209.60**	**S-SS Sandstone Grey cgr**	189.75	191.62	1.87	E6567489	0.021	1740	5.77	0.092	0.056
		189.75 - 209.6: quartz granule/pbble conglomerate, called sandstone to distinguish from debrite unit; clasts up to 6mm in size; mostly quartz clasts (some qtz? clasts are blue) but there are a minor amount of siltstone clasts, at times it has a silty matrix, some silicification has infilled the matrix; where the clasts are down to a coarse sand the rock looks a darker grey; no oxidation; crosscut by quartz carbonate veins, with minor carbonate; white clay and sericite alteration; pyrite in matrix has blebs increased amount near end of interval/contact with larger clasts, primary?;									
		<<Min: 189.75 - 209.6: 1.5% pyrite>> unsure if pyrite is primary or secondary, larger amount near bottom contact with larger clasts and minor distribution through matrix for the rest of the interval; in spots with larger quartz veins it is noticed that there are what look like styolites running through the quartz containing pyrite and a fine grained dark grey material which may have some aspy, similar look to styolites seen in lime stone further up hole, no carbon observed;	191.62	193.56	1.94	E6567490	0.002	32.8	0.98	0.03	0.021
		<<Alt: 189.75 - 209.6: moderate alteration - Silicification / weak alteration - carbonate / weak alteration - Generic clay alteration / weak to moderate alteration - sericite>> rock cut by quartz carbonate veins with minor carbonate, silica seems to infill the matrix near veins, some carbonate in matrix of rock, residual primary?, also some carbonate on fractures; non calcareous white clay seems to be replacing some clasts; sericite seen in/adjacent to some veins fine grained aggregrates of a silvery white mica;	193.56	195.58	2.02	E6567492	0.002	16.8	2.53	0.035	0.023
		<<Vein: 189.75 - 209.6: 7% Quartz-Carbonate>> veins mostly have a planar look but occasionaly are bent, unsure if due to shearing; very minor amount of carbonate in veins, has some iron content;	195.58	197.98	2.40	E6567493	0.003	32.6	2.4	0.037	0.032

From (m)	To (m)		Rock Type & Description		
0.00	**9.14**	**OVBD**	**Over Burden**	**Orange-Brown**	**fgr**
0 - 9.14: overburden and highly weatered/oxidized bedrock; looks like laminated silstone, many original textures destroyed; some calcite veins; no sulphide mineralziation seen but probably oxidized away					
<<Alt: 0 - 9.14: intense alteration - Iron Oxide Alteration / weak alteration - carbonate>> highly oxidized rock; some carbonate veins present, even on some highly oxidized pieces there is stil a slight fizz with acid					
9.14	**16.00**	**S-IBSTS**	**Interbedded siltstone and sandstone**	**Orange-Brown**	**fmgr**
9.14 - 16: interbedded siltstone and sandstone with a higher siltstone component than sandstone; laminated siltstone; very highly oxidized, other holes the fine grained silts beds don't show such penetrative oxidation, orange rusty cooured oxide; highly fractured/broken rock, rock fractures along bedding planes/laminations; some oxidized pieces still fizz readily with acid; no sulphide mineralization seen, usually always pyrite seen in black silts, must have been oxidized away;					
<<Alt: 9.14 - 16: strong alteration - Iron Oxide Alteration / weak alteration - carbonate>> strong iron oxidation; minor amount of carbonate in rocks, normally fine grained black silt layers have no fizz and do not show penetrative oxidation, but in this interval they do and fizz with acid					
16.00	**28.24**	**S-IBSST**	**Interbedded sandstone and siltstone**	**Grey**	**fmgr**
16 - 28.24: orange and grey rock; beginning of interval is a sandy limestone/limey sandstone followed by some laminated silt units interbedded with some leeched and highly oxidized sandstone, red and orange staining and very porous, followed by more interbedded sandstone and silt units with increasing micritic limestone content down hole, near end of interval sandy limestone which has some minor styolite development; highly oxidized sections seem to be fracture related and more porous permeable rocks; rocks carbonate rich except for the thin zones where it is most highly leeched; carbonate veins except a few quartz veins in oxidized zone;					
<<Min: 16 - 28.24: 0.5% pyrite>> fine grained pyrite and possibly other sulphide seen in styolites near end of interval; sulphide mineralization not observed in other sections of rock probably due to being estroyed by alteration					
<<Alt: 16 - 28.24: moderate to strong alteration - Iron Oxide Alteration / weak alteration - carbonate>> carbonate veins; orange brown iron oxide as well as a maroon (burgundy) coloured alteration seen with orange brown iron oxide in second half of interval; oxide is fracture controlled with deeper penetration of more porous units					
<<Vein: 16 - 28.24: 3% Calcium carbonate/Carbonate / 0.2% Quartz>> veins appear to be more tension related, tace amount are more planar; trace amount of quartz veins in broken sandy unit;

From (m)	To (m)	Rock Type & Description
28.24	**39.00**	**S-Lmt limestone Grey-Maroon cgr**
28.24 - 39: interbedded limestone debris flow? and sandy limestone/sandstone; limestone clasts in a matrix of lime mud and quartz sands, occasionally has a jigsaw puzzle look to it with styolitic shaped boundaries where clasts increase and the matrix lessens, where matrix is a larger component of rock there is increased oxidation probably due to increased permeability and porosity ; sandy limestone/sandstone contains fine to medium grained qtz sands and shows increased oxidation in matrix where sand content increases; from ~33.25-33.53m there is a section of maroon coloured clay that is non calcareous, possibly a weathered/altered mudstone; pyrite seen in matrix of limestone debris flow and sandy limestone where oxidation is low;		
<<Min: 28.24 - 39: 1% pyrite>> minor pyrite mineralization, blebs in matrix of rock, seen where rock is untouched by oxidation		
<<Alt: 28.24 - 39: moderate alteration - Iron Oxide Alteration / weak alteration - carbonate>> oxidation decreases down interval, oxidation effects the more quartz rich units more than the more limey units; there is a maroon (burgundy) coloured clay alteration possibly altering a mudstone?, manganese oxide dendrites (pyrolucite) seen on nearby fracture surfaces; carbonate veins;		
<<Vein: 28.24 - 39: 1% Calcium carbonate/Carbonate>> veins mostly calcite some might have a small iron oxide component; large calcite crystals, most look like tension veins, some have a more planar look and a more translucent calcite		
39.00	**49.79**	**S-Lmt limestone Blue-Grey vfgr**
39 - 49.79: interval starts off with a sandy micritic limestone with decreasing sand content down interval, some small interbedded siltsone layers; near end of interval limestone has trace/minor silicification; minor amount of styolites in rock, contain trace pyrite and mostly carbonaceous material; rock is cut by carbonate veins tension veins, no quartz; oxidation low in this interval only minor amount on fractures with little to no rock penetration;		
<<Min: 39 - 49.79: 0.5% pyrite>> trace amount of pyrite seen; tace amounts seen in styolites and in silt layers, some styolites have no observable mineralization		
<<Alt: 39 - 47.32: weak alteration - carbonate / weak alteration - Iron Oxide Alteration>> some carbonate veins; minor iron oxide on fractures, large decrease from previous interval

		<<Alt: 47.32 - 49.79: weak alteration - Silicification / weak alteration - carbonate / trace alteration - Iron Oxide Alteration>> weak silicification patchy seen in another hole and it appeared to be related to styolites but evidence for such is low in this area (silica could be hiding the former styolite), small silicified circles forming a foliation; some carbonate veining; very minor amount of iron oxide, could be due to lack of natural fractures	45.00	47.32	2.32	E6567564	0.003	21.8	1.58	0.118	0.034
		<<Vein: 39 - 49.79: 1% Calcite>> calcite tension veins seems to be no iron content	47.32	49.78	2.46	E6567565	0.005	21.5	1.79	0.161	0.019
		<<Struc: 45.48: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> styolite in limestone	49.78	51.63	1.85	E6567567	0.006	29.2	6.91	0.192	0.023
		<<Struc: 45.84: macro evidence for deformation, but no foliation development or brecciation Styolite>> styolite with more with parallel orientations nearby									
		<<Struc: 49.36: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> styolite in limestone									
49.79	**55.75**	**S-Lmt limestone Blue-Grey vfgr**	51.63	53.75	2.12	E6567568	0.003	26.6	1.13	0.375	0.019
		49.79 - 55.75: dark blue grey micritic limestone with a couple of small bands of dolomite/dolimitic limestone; some small circular quartz microcrystals seen (about 1mm width) that occasionally have a calcareous core, assume silica replacement, seems to be more prevelent near veins; seen in other holes and were concentrated near styolites that were barely visible due to infillling silica, near end of interval it was noticed that the silica is starting to connect between circle shaped crystals and must be silica alteration; red coating seen on a fracture surfaces, diffcult to identify, may an iron oxide (hematite?), (possibly cinnabar but low confidence); crosscut by carbonate veins that have a buff/orange colouration suspect ankeritic; trace pyrite seen disseminated in rock; in areas with red colouration there is shiny fine grained bronze coloured crystals (seen with microscope); oxidation on fractures with some of the same maroon coloured coating seen uphole;									
		<<Min: 49.79 - 55.75: 0.5% pyrite>> trace disseminated pyrite seen in matrix of rock in small microcrystalline blebs; in areas with red mineral coating some brassy shiny mineral was seen on max power of microscope but may or may not be sulphide, very small and masked by red coating	53.75	55.75	2.00	E6567569	0.002	6.4	2.18	0.424	0.011
		<<Alt: 49.79 - 55.75: moderate alteration - iron carbonate / weak to moderate alteration - Silicification / weak alteration - Iron Oxide Alteration>> iron carbonate veining as well as small ~2mm vugs filled with an iron carbonate; patchy silicification that increases towards end of interval, silica infils and forms circular aggregrates of micro crystals that have a calcareous centre; minor iron oxide on fractures along with a red mineral coating possibly hematite, (feel like it could be cinnabar)									
		<<Vein: 49.79 - 55.75: 5% Calcium carbonate/Carbonate>> moderate amount of carbonate veining with more of an ankerite (iron carbonate) in the beginning of the interval and less amounts of iron near the end of interval; in sections with iron carbonate veins are larger and almost give the rock a brecciated look									

Hole: F2-13-06

55.75	**58.89**	**S-Lmt limestone Grey cgr**	55.75	57.20	1.45	E6567570	0.045	265	4.19	0.249	0.042
55.75 - 58.89: limestone that is heavily veined and atered, possibly breccia (hydrothermal?); last 30cm of interval is a less altered micritic limestone; at around 57.50m there is about 5cm of clay gouge in the box; abundant styolites cut interval usually filled with sulphide mineralization; some fine grained aspy seen in this interval along with pyrite; around 56.80m there is intense red colouration coming in along fractures, styolites and between crystals, suspect hematite or cinnabar?;											
<<Min: 55.75 - 58.89: 0.5% pyrite / 0.5% arsenopyrite>> fine grained pyrite and arsenopyrite seen, could be more fine grained sulphides in styolites and between crystal boundaries, very fine grained			57.20	58.89	1.69	E6567571	0.031	103	2.33	0.263	0.057
<<Alt: 55.75 - 58.89: moderate to strong alteration - carbonate / moderate alteration - Silicification / weak alteration - Iron Oxide Alteration>> many carbonate veins or replacement calcite, slightly brecciated texture but not a typical breccia look of angular clasts in a matrix, styolites cross cut through rock and are not interupted by veins/calcite/silica; silica is present but is unrelated to veining; there is a pentrative red colouration around 56.90m; minor iron oxide on some natural fracture surfaces;											
<<Vein: 55.75 - 58.89: 40% Calcium carbonate/Carbonate>> large amount of carbonate in rock somewhat like veins but could be a replacement texture											
58.89	**63.79**	**S-Dol Dolostone Brown-Grey mcgr**	58.89	60.96	2.07	E6567572	0.038	45.5	10.1	0.113	0.019
58.89 - 63.79: zebra textured dolomite with buff/orange light coloured bands and grey dark bands; coarser crystals in the lighter bands; calcite infiling between crystal faces rock readily fizzes with acid; some minor silicification appears to be replacing dolomite?; minor oxidation on some fractures; trace arsenopyrite seen in rock/possible stibnite, though too small to identify;											
<<Min: 58.89 - 63.79: 0.5% arsenopyrite>> no pyrite observed but some possible arsenopyrite was seen, also some possible stibnite, both minerals were microscopic and firm identification was not possible			60.96	62.16	1.20	E6567573	0.003	14.1	6.38	0.054	0.014
<<Alt: 58.89 - 63.79: moderate alteration - carbonate / weak to moderate alteration - Silicification / weak alteration - Iron Oxide Alteration>> carbonate calcite (ankerite?) being deposited between crystal faces and in fractures especially in light bands of zebra; silica replacing rock and some minor infilling between crystals; no real veining in this section just infilling in centre of light coloured zebra bands			62.16	63.79	1.63	E6567575	0.004	25.5	6.56	0.176	0.013
63.79	**70.58**	**S-Lmt limestone Blue-Grey vfgr**	63.79	65.43	1.64	E6567576	0.004	7.8	1.32	0.133	0.022
63.79 - 70.58: dark blue grey micritic limestone with abundant styolites and calcite tension veins; a 20cm quartz sandstone bed exists at the beginning of the interval major amounts of calcite in matrix; styolites contain a black silty material with some sulphide and is non carbonaceous; trace oxidation on some fractures;											
<<Min: 63.79 - 70.58: 0.5% sulfide>> trace sulphide seen in styolites, metalic grey difficult to identify			65.43	67.42	1.99	E6567577	0.003	6.8	0.97	3.56	0.012
<<Alt: 63.79 - 70.58: weak alteration - carbonate / trace alteration - Iron Oxide Alteration>> calcite tension veins; trace iron oxide on some fractures			67.42	69.47	2.05	E6567578	0.003	6.3	0.94	0.054	0.012

<<Vein: 63.79 - 70.59: 5% Calcite>> calcite tension veins in limestone						69.47	70.58	1.11	E6567579	0.004	4.8	0.7	0.075	0.013
70.58	**74.53**	**S-Dol**	**Dolostone**	**Grey**	**mcgr**	70.58	72.59	2.01	E6567580	0.002	12.6	1.22	0.092	0.008
70.58 - 74.53: grey dolostone with a few small bands where zebra texture is beginning to form not well developed; some oxidation on a couple fractures; small breccia are next to a fracture with an oxidized sandy clay coating from 73.80-74.24m, dolostone clasts have a rounded appearance; no sulphide mineralization observed in this interval; some minor sericite alteration seen; one calcite vein created by a ductile/brittle shear														
<<Alt: 70.58 - 74.53: weak alteration - sericite / weak alteration - carbonate / weak alteration - Iron Oxide Alteration>> minor disseminated sericite; calcite in fractures, small hairline fractures; iron oxide on major fractures						72.59	74.53	1.94	E6567581	0.0005	6.8	0.96	0.013	0.005
74.53	**82.81**	**S-Lmt**	**limestone**	**Blue-Grey**	**vfgr**	74.53	76.63	2.10	E6567582	0.009	1.6	0.9	0.124	0.015
74.53 - 82.81: dark blue grey fine grained micritic limestone; minor amount of styolite development, much less than what is normally seen in this kind of rock; some interbeds of a dolomitic limestone; minor amount of calcite tension veins; zero iron oxide seen; no observed sulphides, possibly some very fine grained in styolites;														
<<Alt: 74.53 - 82.81: weak alteration - carbonate>> calcite in tension veins						76.63	78.70	2.07	E6567584	0.006	0.05	0.56	0.017	0.007
<<Vein: 74.53 - 82.81: 2% Calcite>> calcite tension veins						78.70	80.74	2.04	E6567585	0.01	0.4	0.44	0.066	0.005
<<Struc: 78.56: macro evidence for deformation, but no foliation development or brecciation Veins - General>> calcite tension vein in limestone						80.74	82.81	2.07	E6567586	0.0005	0.8	1.04	0.242	0.006
82.81	**103.63**	**S-Dol**	**Dolostone**	**Grey**	**fgr**	82.81	84.80	1.99	E6567587	0.024	1	2.35	0.266	0.007
82.81 - 103.63: dolostone that is still fairly calcareous or had a secondary influx of calcium and a few interbeds/bands of micritic limeston; dolostone has a zebra texture in places, with light buff coloured bands, suspect lower iron content than zebra rocks up hole; the non zebra dolostone looks massive in appearance and has a fine grained sparry texture that is cut by small hairline fractures containing calcite; boundaries between zebra dolostone, dolostoe and limestone appear styolitic; in the limestone there are a minor amount of styolites that contain a very small amount of material which may be carbnaceous; no sulphide mineralization observed in whole interval; near end of interval there is some veins with quartz; minor oxidation on fractures which seems to increase downhole														
<<Alt: 82.81 - 100.06: weak alteration - carbonate / trace alteration - Iron Oxide Alteration>> minor carbonate alteration, calcite in microfractures and between crystal faces in zebra dolomite; some tension calcite veins in limestone; minor oxide on fractures increasing at end of interval, close to none in first half of interval						84.80	86.88	2.08	E6567588	0.002	6.7	1.18	0.246	0.013
<<Alt: 100.06 - 103.63: weak alteration - carbonate / trace alteration - Iron Oxide Alteration / weak alteration - Silicification>> quartz/carbonate in veins, more quartz than carbonate in veins; calcite in hairline fractures and between crystal faces of zebra dolomite; trace iron oxide on fractures decrease from end of last interval						86.88	88.71	1.83	E6567589	0.005	0.9	0.2	0.0025	0.002

Hole: F2-13-06

From (m)	To (m)		Rock Type & Description		
190.10	**203.70**	**S-IBSTL**	**Interbedded siltstone and limestone (packestone)**	**Blue-Grey**	**fgr**

190.1 - 203.7: dark blue grey limestone interbedded with some limey siltstone and a small dolostone interbed; one section around 198.5m there is a siltsone that has experienced some minor leeching of carbonate and some minor silicification in a siltsone layer; oxidation levels higher in this interval than previous, suspect it is due to higher silt levels and associated primary pyrite; there is one quartz carbonate vein that does appear to be a tension vein that contains trace pyrite; very minimal amount of styolite development

<<Min: 190.1 - 203.7: 0.5% pyrite>> trace pyrite seen usually associated with increased silt, suspect primary; one quartz carbonate vein near end of interval contains pyrite in centre

<<Alt: 190.1 - 203.7: weak to moderate alteration - Iron Oxide Alteration / trace alteration - Silicification / weak alteration - carbonate>> iron oxide strong around 198.5m in fractures with associated leeching of carbonate from a siltsone layer and some trace silicification with a few quartz carbonate veins, where the carbonate has been leeched; calcite tension veins through rest of rock

<<Vein: 190.1 - 203.7: 2% Calcite / 0.5% Quartz-Carbonate>> some calcite tension veins; trace amount of quartz carbonate veins, one containing observed pyrite;

<<Struc: 194.65: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding between limestone and silty layer

<<Struc: 199.37: Bedding - Unknown>> bedding between limestone and silty layer

<<Struc: 200.2: macro evidence for deformation, but no foliation development or brecciation Lithological Contact>> contact between limestone above and dolostone below, not a perfect planar contact, best estimate

<<Struc: 203.45: macro evidence for deformation, but no foliation development or brecciation Veins - General>> quartz carbonate vein with contained pyrite

From (m)	To (m)		Rock Type & Description		
203.70	**218.07**	**S-Dol**	**Dolostone**	**Grey**	**mgr**

203.7 - 218.07: mostly dark grey and white zebra dolomite, with an interbed of dark grey non zebra textured dolostone; white stripes in zebra texture have a colour that indicates similar amount of iron as previous zebra interval, main difference from last zebra interval is minor quartz infilling in centres of white dolomite stripes; trace amount of carbon starting to be seen on some fracture surfaces near end of interval; trace pyrite (possible aspy) seen in light bands of zebra dolomite; minor calcite coming in on small hairline fractures; minor qtz veining; trace oxidation on some fractures;

<<Min: 203.7 - 218.07: 0.5% pyrite>> trace pyrite seen in dolomite near where there has been some quartz infilling, not in the quartz; possibly some aspy; microscope needed to see mineralization

<<Alt: 203.7 - 218.07: trace alteration - Iron Oxide Alteration / weak to moderate alteration - Silicification>> trace iron oxide on some fractures; minor qtz veins and quartz infilling in centre of light bands in zebra dolomite

Hole: F2-13-06

From (m)	To (m)		Rock Type & Description		
			<<Vein: 203.7 - 218.07: 0.5% Quartz>> thin qtz veins cutting through zebra dolomite, non planar, fine grained; some calcite veins near end of interval in thin band of limestone		
			<<Struc: 217.7: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding in a silty limestone		
218.07	**283.46**	**S-IBSTL**	**Interbedded siltstone and limestone (packestone)**	**Grey**	**fmgr**
			218.07 - 283.46: dark grey limey siltsone, some interbeds of more clastic silty material and mudstone, silty micritic limestone, near end of interval rock grades into more of a laminated siltstone with a few interbeds of gritty material with some quartz sands with increasing disseminated pyrite, still highly calcareous; trace styolite development through interval; trace oxidation on some fractures corresponding to beds with a higher silt content; styolites in the beginning of interval have contained carbon and more sulphide rich later in the interval; at 252.65m there is a fold axis and it appears that above the axis the rock is carbon rich and below the rock is more sulphide rich (unsure if it is truly related)		
			<<Min: 218.07 - 252.65: 1% pyrite>> minor pyrite associated with mudstones and siltstone layers		
			<<Min: 252.65 - 283.46: 2% pyrite>> moderate amount of pyrite, large increase from previous interval; seen in blebs in silty layers, in styolites and in shear veins that are parallel to bedding; suspect some primary and some remobilized		
			<<Alt: 218.07 - 252.65: weak alteration - carbonate>> cacite tension veins and rock is carbon rich on fractures and in styolites		
			<<Alt: 252.65 - 283.46: weak alteration - carbonate>> minor calcite tension veins		
			<<Vein: 218.07 - 252.65: 0.5% Calcite>> minor amount of calcite tension veins; in silty zones there is some calcite veining coming in along bedding and crosscutting in limey rocks		
			<<Vein: 252.65 - 283.46: 0.5% Calcite>> calcite tension veins as well in more silt rich zones there are shears along bedding with an influx of calcite and some contained pyrite		
			<<Struc: 227.1: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding in laminated siltstone		
			<<Struc: 244.02: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding in silty limestone		
			<<Struc: 251.4: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding in silty unit, suspect beta might be a bit off		
			<<Struc: 252.65: macro evidence for deformation, but no foliation development or brecciation Fold axes - Fold axis>> no bottom line, but the fold axis seems to run almost exactly perpendicular to the core axis

Hole: F2-13-07

From (m)	To (m)	Rock Type & Description
0.00	**58.80**	**S-IBSST Interbedded sandstone and siltstone Brown-Grey mgr** 0 - 58.8: brown grey sandstone that has been considerably oxidized interbedded with laminated siltstone/shale; sandstone contains fine to coarse grained quartz sands in a black silty calcareous matrix; some ripple marks and thin crossbeds seen; mostly medium grained sands but anywhere form very fine to very coarse; individual beds appear to fine up hole; rock is highly fractured; on a fresh broken surface it is noticed that there is a moderate amount of sulphide in the matrix, thus high oxidation; from 43.31-43.59m there is a possible marker bed for the next hole that is sandstone/conglomerate with quartz clasts up to 6mm and a minor amount of black lithic clasts and some clasts of fine grained pyrite aggregrates up to 5mm; good recovery for first interval would indicate that there was a low amount of overburden; last metre of interval is highly brecciated fault zone;
		<<Min: 0 - 42.67: 2% pyrite>> moderate amount of pyrite seen in matrix of rock where a fresh face can be broken and high iron oxidation near fractures would indicate there was a consistent amount of pyrite through interval; suspect mostly primary
		<<Min: 42.67 - 58.8: 1% pyrite / 0.5% stibnite>> minor pyrite seen in interval and possibly some arsenopyrite, though very fine grained; assume stibnite seen associated with silicified zones, dark grey in colour and somewhat needle like
		<<Alt: 0 - 42.67: moderate alteration - carbonate / strong alteration - Iron Oxide Alteration / trace alteration - Silicification>> rock is highly calcareous in matrix (primary cement), and crosscut by a moderate amount of calcite veins; penetrative oxidation coming off of fractures, rock is highly fractured; one piece of quartz vein seen in section of highly broken rock around 17m
		<<Alt: 42.67 - 58.8: weak to moderate alteration - carbonate / moderate to strong alteration - Iron Oxide Alteration>> carbonate in matrix and veins, slightly less calcareous than last interval, especially where there has been silicification and in silty non porous units; iron oxide is slightly decreased from previous interval; trace sericite (suspect illite, fine grained micaceous with a greenish colour) seen associated with a quartz vein, minor quartz veining and silica infilling in porous sands, seems to increase to its maximum around 51m and then decreases after that
		<<Vein: 0 - 42.67: 1% Calcite / 0.5% Quartz>> minor amount of calcite veins which seem to be tension veins, some more grey in colour and appear to be offset by the white veins, but in other areas it seems the grey calcite veins are crosscutting the white veins; one piece of a quartz vein is seen around 17m
		<<Vein: 42.67 - 58.8: 1% Calcite / 1% Quartz>> calcaite veins mostly tension veins; some minor quartz veins seen in this interval associated with sulphide mineralization

Hole: F2-13-07

From (m)	To (m)	Rock Type & Description
58.80	**72.29**	**S-Lmt limestone orange**

58.8 - 72.29: brecciated orange and buff white colouration with some darker grey clasts; darker grey clasts are a dolomitic limestone; rock consists mostly of a soft ornge material which fizzes readily and may be limonite, ankerite and possibly some smithsonite?, no sulphide mineralization observed but may be masked/destroyed by oxidation; near end of interval there is a bright red to maroon colored clay/coating on fracture surfaces that has been seen in previous holes, hematite?, cinnabar?;

<<Alt: 58.8 - 72.29: moderate to strong alteration - carbonate / strong alteration - Iron Oxide Alteration / strong alteration - iron carbonate>> major amounts of iron oxide and iron carbonate, crosscut by numerous calcite veins

<<Vein: 58.8 - 72.29: 30% Calcite>> rock is crosscut by many calcite veins

From (m)	To (m)	Rock Type & Description
72.29	**82.47**	**S-Lmt limestone Grey fgr** 72.29 - 82.47: dark grey micritic limestone with a high amount of calcite veining; rock has minor amount of styolites; rock has a moderate amount of carbon in styolites and on fractures; no observed sulphides or iron oxidation; there is a vug tht is filled with large calcite crystals at 77.5m;
		<<Alt: 72.29 - 82.47: moderate alteration - carbonate>> calcite veining
		<<Vein: 72.29 - 82.47: 20% Calcite>> calcite veining decreasing towards end of interval; near beginning it is stockwork veinlets and then changes to more spaced out tension veins; downhole from major fault
		<<Struc: 72.29: non-penetrative cleavage\foliation development or brittle faults\brecciation Lithological Contact>> contact between highly altered and unaltered limestone, also a calcite vein
		<<Struc: 81.1: non-penetrative cleavage\foliation development or brittle faults\brecciation Veins - General>> set of calcite tension veinlets in limestone
82.47	**102.49**	**S-Lmt limestone Blue-Grey vfgr** 82.47 - 102.49: drk blue grey silty micritic limestone; minor amount of styolites that contain more of silty material, instead of carbon; trace carbon seen in this interval; trace oxidation on some fractures, along with minor pyrite, both oxidation and pyrite seem to go with increased silt content; near end of interval there is some ductile shearing;
		<<Min: 82.47 - 102.49: 1% pyrite>> minor amount of pyrite blebs seen in rock possibly prinmary, increased amount with increased silt content
		<<Alt: 82.47 - 102.49: weak to moderate alteration - carbonate>> minor calcite veining
		<<Vein: 82.47 - 102.49: 4% Calcite>> calcite tension veins and a white streaked/swirled appearance near end of intervl due to ductile shearing
		<<Struc: 85.03: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> faint bedding in a silty limestone
		<<Struc: 91.9: macro evidence for deformation, but no foliation development or brecciation Styolite>> styolite in limestone
		<<Struc: 98.75: non-penetrative cleavage\foliation development or brittle faults\brecciation Styolite>> styolite in limestone

132.18	**141.20**	**S-Lmt limestone Grey vfgr** 132.18 - 141.2: dark grey micritic limestone; has a bedded appearance some of the more prononced bedding planes look like styolites; no oxidation; no observed sulphide mineralization; minor amount of carbon along fractures and in styolites; minor amount of calcite tension veins	132.18	134.11	1.93	E6567778	0.005	11.1	10.9	0.241	0.066
		<<Alt: 132.18 - 141.2: weak to moderate alteration - carbonate>> minor amount of calcite veins	134.11	136.15	2.04	E6567779	0.002	0.05	2.14	0.064	0.034
		<<Vein: 132.18 - 141.2: 2% Calcite>> minor amount of calcite tension veins, minor brecciation in a vein near beginning of interval	136.15	138.15	2.00	E6567780	0.004	6.2	13.7	0.087	0.058
		<<Struc: 138.02: macro evidence for deformation, but no foliation development or brecciation Styolite>> styolite in limestone, parallels bedding	138.15	140.16	2.01	E6567781	0.005	0.05	2.57	0.085	0.039
			140.16	141.20	1.04	E6567782	0.023	0.8	1.72	0.08	0.047
141.20	**171.45**	**S-IBSTL Interbedded siltstone and limestone (packestone) Grey vfgr** 141.2 - 171.45: interbedded limestone and noncalcareous black siltstone and grey mudstone; amount of limestone decreases towards end of interval and limestone becomes silty; no sand sized particles seen; limestone beds have a major amount of styolites, styolites contain minor amount of carbon, moderate amount of pyrite and maor amounts of black silty material; there are a couple gouge zones in this interval; around 155.5m there is a fault zone with some gouge, below which quartz is starting to be seen in the veins, could be due to increase in non calcareous rocks; trace oxidation seen on some fractures with pyrite on fractures as well, oxidation has a very slight green colour to it;	141.20	143.26	2.06	E6567784	0.047	8.4	1.51	0.222	0.09
		<<Min: 141.2 - 156.22: 2% pyrite>> moderate amount of pyrite mineralization, in fine grained aggregrate blebs in silty layers, seems to increase if it is a thin black silt bed surrounded by limestone; in larger siltstone/mudstone beds it is more finely disseminated in rock	143.26	145.21	1.95	E6567785	0.029	0.8	0.2	0.116	0.048
		<<Min: 156.22 - 171.45: 2% pyrite>> same amount of pyrite as previous interval; this interval has larger cubic crystals and appears to be a brighter yellow colour as compared to more brassy looking colour last interval	145.21	147.25	2.04	E6567786	0.005	1.3	0.25	0.198	0.086
		<<Alt: 141.2 - 156.22: weak alteration - carbonate / trace alteration - Iron Oxide Alteration>> minor amount of calcite veining; trace iron oxide on fracture surfaces, seen with very mildy oxidized pyrite on same fracture surface, might be a faint green colour indicating the possibility of arsenic oxide	147.25	149.35	2.10	E6567787	0.002	11.5	1.21	0.365	0.173
		<<Alt: 156.22 - 171.45: weak alteration - carbonate / weak alteration - Silicification / trace alteration - Iron Oxide Alteration>> quartz carbonate veining; same oxidation as previous interval	149.35	151.35	2.00	E6567788	0.018	21.3	2.8	0.675	0.313
		<<Vein: 141.2 - 156.22: 1% Calcite>> minor amount of calcite veining, tension veins, more in limestone than silty beds, increase near end of interval where there is a fault zone;	151.35	153.16	1.81	E6567789	0.019	27.4	3.31	0.608	0.255
		<<Vein: 156.22 - 171.45: 2% Quartz-Carbonate>> quartz carbonate veins with about equal amounts of qtz and cb; carbonate tends to be next to the wallrock while the quartz is in the centre, has a somewhat mottled appearance	153.16	155.00	1.84	E6567790	0.003	9.9	2.16	0.163	0.063

Hole: F2-13-07

From (m)	To (m)	Rock Type & Description
		<<Struc: 152.3: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding in silty limestone
		<<Struc: 168.5: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding in silts
171.45	**174.90**	**S-Slt Siltstone Brown-Grey vfgr**
		171.45 - 174.9: orange grey laminated siltstone, with some bands of very fine grained sands and mudstone; rock is more calcareous near beginning of interval and decreases towards the end, very fine grained sands at beginning of interval with clacareous matrix and finer silts and muds near the end as well as higher oxidation; brittle fault through end of interval, with high oxidation as well oxidation on fractures that penetrates the rock further through more permeable/porous beds/bands; red mineral coating seen with iron oxidation on fractures, seen in other holes in oxidized areas;
		<<Min: 171.45 - 174.9: 1% pyrite>> minor pyrite seen in beginning of interval and not observed in end of interval, oxidized away?
		<<Alt: 171.45 - 174.9: weak alteration - carbonate / weak alteration - Silicification / moderate to strong alteration - Iron Oxide Alteration>> minor quartz carbonate veining; intense iron oxide in end of interval due to brittle fault, oxidation penetrates rock deeper along permeable beds;
		<<Vein: 171.45 - 174.9: 1% Quartz-Carbonate>> one larger quartz carbonate vein and a few smaller thin veins; more quartz than carbonate; vein cuts across bedding with some slip along bedding resulting in a hackly margin, vein is not planar and is oxidized on margins with carbonate
174.90	**201.17**	**S-SS Sandstone Black fmgr**
		174.9 - 201.17: black sandstone with a major amount of silt in the the beginning of the interval giving it a streaked appearance and coarsening downhole and becoming more sand rich and losing its streaked appearance, though still quite black due to silt content in matrix; there are also some minor interbeds of a grey sandstone with a highly calcareous matrix with a lowa amount of silt; entire interval is weakly calcareous with small white calcite specks; there a few minor fault and fracture zones that are highly oxidized with penetration of the wall rock but mostly oxidation is restricted to facture faces; unit fairly massive with no obvious bedding

222.77	**233.48**	**S-SS Sandstone Orange-Brown mcgr**	222.77	224.50	1.73	E6567834	0.004	74.4	5.91	0.065	0.065
		222.77 - 233.48: orange brown intensly oxidized sandstone with no detectable bedding; a fracture/fault zone near the beginning of the interval followed by breccia zones with angular clasts being supported by a calcite matrix; quartz sands are moderately to well sorted and are medium to coarse grained throughout; no sulphide mineralization seen probably due to intense oxidation									
		<<Alt: 222.77 - 233.48: moderate alteration - Silicification / weak to moderate alteration - carbonate / intense alteration - Iron Oxide Alteration>> carbonate veining near beginning of interval, becoming quartz carbonate through interval; rock becomes silicified in matrix earlier than quartz becomes significant in veins, matrix is not fully silicified and still contains trace amount of carbonate that has an ankeritic appearance; iron oxidation is pervasive throughout	224.50	226.40	1.90	E6567835	0.004	120	7.98	0.062	0.062

Hole: F2-13-07

From (m)	To (m)	Rock Type & Description
		<<Vein: 222.77 - 233.48: 7% Calcite / 3% Quartz-Carbonate / 2% Ankerite>> it appears that there was some initial quartz carbonate veins; some ankeritic veins which seem early, no good cross cutting relationshis, pure calcite veins are later occasionally crosscutting quartz veins, forming large crystals above a brecciated stockwork zone that seems fault related
233.48	**255.27**	**S-IBSST Interbedded sandstone and siltstone Brown-Grey mcgr**
		233.48 - 255.27: orange grey interbedded siltstone and sandstone; sandstone medium to very coarse grained, no bedding seen in sandstones; siltstones laminated and highly oxidized and clay altered, unusual for siltstones seen in F2 area so far; oxidation patchy but intense where present, some rock is non calcareous and does not fizz with acid, some rock looks highly leached but still fizzes readily with acid;
		<<Min: 233.48 - 239.49: 1% pyrite>> fine grained aggregrates in matrix of sandstone seen where oxidation was low; possibly some very fine grained aspy seen with microscope, grey coloured sulphide; sulphides not seen in highly oxidized sections
		<<Min: 239.49 - 242.48: 1% pyrite / 1% arsenopyrite>> minor pyrite, fine grained grey mineral suspect aspy (80% confident) seen especially near contact with small silt bed, below silicified section
		<<Min: 242.48 - 255.27: 1% pyrite / 1% arsenopyrite>> minor pyrite and arsenopyrite seen in less oxidized rocks; aspy seen near margins of altered siltstones in sandstone; near end of interval a fine grained black metallic mineral seen in the centre of quartz carbonate veins, the veins that are higher angle to the core axis not in the vein that is at a low angle to the core axis
		<<Alt: 233.48 - 239.49: weak alteration - carbonate / weak alteration - Silicification / strong alteration - Iron Oxide Alteration / moderate alteration - Generic clay alteration>> rock matrix is somewhat leeched especially in beginning of interval but it is also cut by carbonate veins that are somewhat ankeritic/dolomitic; sandstone units have experienced some minor silicification but no uartz veining seen; the silt units are clay altered to buff, dark grey orange, and red/maroon clay; interval is highly oxidized except for small zone in middle of snadstones
		<<Alt: 239.49 - 242.48: weak alteration - Silicification / weak to moderate alteration - Iron Oxide Alteration>> minor silicification seen infilling matrix of sandstone; iron oxide on fractures with minor rock penetration, lower amount of fracturs in this interval; also green oxidation seen on one fracture face, suspect scorodite

Hole: F2-13-07

From (m)	To (m)	Rock Type & Description
		<<Alt: 242.48 - 255.27: weak to moderate alteration - carbonate / weak to moderate alteration - Silicification / strong alteration - Iron Oxide Alteration / moderate alteration - Generic clay alteration>> strong oxidation of some rocks with leaching textures in some sandstones, red mineral coating seen again with strong oxide zones; siltstones altering to clay, grey, red, orange coloured clays; carbonate and quartz veins, along with some patchy infilling silica in matrix of sandstones; carbonate veins cut quartz veins in places; leeched looking sandstone still fizzes with acid, suggesting later carbonate coming into system, along with carbonate veins crosscutting quartz veins
		<<Vein: 233.48 - 239.49: 3% Calcium carbonate/Carbonate>> light buff coloured carbonate veins, dolomitic/ankeritic some appear to be more ankeritic than others,
		<<Vein: 242.48 - 255.27: 4% Quartz-Carbonate / 2% Calcium carbonate/Carbonate>> larger quartz carbonate veins that run at a low angle to the core axis, minor carbonate compared to quartz in veins; later carbonate veins cut quartz carbonate veins; carbonate in quartz carbonate veins is slightly ankeritic, while later carbonate veins appear to have less
		<<Struc: 255: macro evidence for deformation, but no foliation development or brecciation Veins - General>> quartz vein in sandstone, 3.5cm in width
255.27	**268.22**	**S-Slt Siltstone Grey vfgr**
		255.27 - 268.22: orange grey lamintaed siltstone with a few mudstone beds and some thin very fine grained sandtone beds; non calcareous except thin sandstone beds; moderate oxidation decreasing towards end of interval; one fault gouge zone around 261m; no veining
		<<Min: 255.27 - 268.22: 1% pyrite>> minor amount of very fine grained pyrite seen in bands parallel to laminations, not observed in oxidized rock
		<<Alt: 255.27 - 268.22: moderate alteration - Iron Oxide Alteration>> iron oxide penetrates rock from fractures at beginning of interval and oxidation decreases towards the end, suspect mostly due to lack of natural fractures near end of interval;
		<<Struc: 255.3: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding in silts
		<<Struc: 258.7: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding in siltstone
		<<Struc: 268.2: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding in silts

From (m)	To (m)	Rock Type & Description
0.00	**45.03**	**S-IBSST Interbedded sandstone and siltstone Grey mgr**
		0 - 45.03: grey sandstone interbedded with laminated siltstone/shale; sandstone contains fine to coarse grained quartz sands in a black silty calcareous matrix; some ripple marks and thin crossbeds seen; mostly medium grained sands but anywhere form very fine to very coarse; individual beds appear to fine up hole; rock is less fractured and oxidized than top of hole 7; on a fresh broken surface it is noticed that there is a minor amount of sulphide in the matrix while it seems in hole 7 there was more seen; bed thought to be a good marker in hole 7 not seen in this hole; last metre of interval is a brecciated fault zone;
		<<Min: 0 - 42.2: 1% pyrite>> minor pyrite seen disseminated in mtrix s well as thin bands/wisps parllel to bedding in silts, less pyrite seen then in top of hole 7
		<<Min: 42.2 - 45.03: 2% pyrite>> moderate amount of pyrite seen in this interval, increase from last interval; possible very fine grained aspy, a very fine grained sulphide? is present in this interval and is grey in colour
		<<Alt: 0 - 42.2: weak to moderate alteration - carbonate / moderate alteration - Iron Oxide Alteration / trace alteration - Silicification>> calcite veining and in matrix of sandstone (suspect primary); oxidation on fractures with minor penetration of rock, less oxidation than top of hole 7; trace silicification seen, vein running parallel to silt layer
		<<Alt: 42.2 - 45.03: moderate alteration - Silicification / weak alteration - carbonate / weak alteration - Iron Oxide Alteration>> moderate silicification in brecciated zone, infilling matrix along with broken pieces of quartz vein in breccia; minor calcite veining and carbonate in fracture gouge zone at end of interval; minor iron oxide on fractures
		<<Vein: 0 - 42.2: 1% Calcite / 0.5% Quartz>> minor calcite veins crosscutting bedding; on qurtz vein seen with silts parallel to bedding
		<<Vein: 42.2 - 45.03: 5% Quartz / 1% Calcite>> quartz vein fragments in brecciated zone; one larger calcite vein seen in interval seems to be later than quartz veins
		<<Struc: 24.55: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding of black silt layer, not perfectly planar, slightly wavy
		<<Struc: 36.68: macro evidence for deformation, but no foliation development or brecciation Bedding - Unknown>> bedding in silts, planar
		<<Struc: 37.3: macro evidence for deformation, but no foliation development or brecciation Veins - General>> top contact of a 40 cm wide carbonate vein in sandstone

Hole: F2-13-08

From (m)	To (m)	Rock Type & Description
45.03	**55.07**	**S-Lmt limestone Grey**
45.03 - 55.07: brecciated rock with extensive calcite veining, limestone, dolomite and minor sandstone clasts; white grey in colour with some minor orange colouration around fractures as seen in same interval of hole 7; minor mineralization seen in this interval		
<<Min: 45.03 - 55.07: 1% pyrite>> minor pyrite seen in this interval as wisps between brecciated clasts; suspect more sulphide existing as very fine grained dark grey material, since the amount of oxide seen in same interval of hole seven seems to intense to be just caused by the breakdown of the amount of pyrite seen in this interval		
<<Alt: 45.03 - 55.07: moderate to strong alteration - carbonate / weak to moderate alteration - Iron Oxide Alteration>> extensive calcite veining in breccia; iron oxide related to fractures with minor penetration of wall rock		
<<Vein: 45.03 - 55.07: 30% Calcium carbonate/Carbonate>> rock crosscut by any calcite veins, possible iron carbonate		
55.07	**77.70**	**S-Lmt limestone Blue-Grey vfgr**
55.07 - 77.7: dark blue grey micritic limestone with some thin bands of a grey limestone with trace/minor amounts of carbon; a thin band dolostone exists in the centre of the interval after some thin beds of siltstone; trace oxidation seen on fractures; moderate amount of styolites containing black silty material and minor amounts of carbon; a couple of beef calcite layers; beginning of interval there is 2m void encountered by the drillers		
<<Min: 55.07 - 77.7: 1% pyrite>> minor amount of pyrite seen associated with silt layers and beef calcite; at 69.50m there is a silt layer adjacent to a beef clacite bed that contains major amounts of fine grained pyrite and possibly arsenopyrite as a nearby fracture has a faint green scorodite colour; mineralization most intense at the contact between the silts and the beef calcite layer		
<<Alt: 55.07 - 77.7: weak to moderate alteration - carbonate / weak alteration - Iron Oxide Alteration>> minor amount of calcite veins, and iron oxide on fractures and some fractures have a slight green colouration (scorodite?)		
<<Vein: 55.07 - 77.7: 3% Calcite>> minor amount of calcite tension veins

		154.34 - 158.82: black siltstone grading into a black sandstone containing high silt matrix and wisp of silty material giving a swirled sort of apperance, trace calcite in matrix, some minor calcite veining; contains either a clay (illite) or maybe gypsum which appears to be fracture related but can exist away from fractures, white/clear somewhat translucent, easily scratched with fingernail, no fizz, no taste, no structure, suspect a clay, non swelling, almost wax like somewhat greasy feel; trace oxidation on some fractures near end of interval									
		<<Min: 154.34 - 158.82: 1% pyrite>> minor amount of pyrite seen in fine grained bands in silts and disseminated throughout	156.30	157.76	1.46	E6567953	0.006	210	9.01	0.325	0.227
		<<Alt: 154.34 - 158.82: weak alteration - carbonate / weak alteration - Silicification / trace alteration - Iron Oxide Alteration>> minor amount of calcite veins, also some minor quartz veins; trace oxidation on fractures near end of interval; clay or sericite alteration (possible gypsum but doubt it) suspect illite in some frctures and blebs	157.76	158.82	1.06	E6567954	0.006	151	10.7	0.254	0.187
		<<Vein: 154.34 - 158.82: 1% Quartz / 0.5% Calcite>> minor quartz veins near end of interval and some trace veins and veinlets of calcite seen throughout interval									
158.82	**175.65**	**S-IBSST Interbedded sandstone and siltstone Brown-Grey fmgr**	158.82	160.80	1.98	E6567955	0.018	99.3	8.2	0.193	0.153
		158.82 - 175.65: dark grey siltstone near the beginning interbedded with a calcareous sand unit, becoming an orange-brown interbedded silt/sand due to oxidation with minor interbands of grey stone; silts are laminated and some layers are more of a mudstone; sands are medium gained with a calcareous matrix, except some thin units similar to previous interval which are a dirty black silty matrix; some beds of a very intermixed look with silt layers providing a swirled appearance									

Hole: F2-13-08

From (m)	To (m)	Rock Type & Description
		<<Min: 158.82 - 175.65: 1% pyrite / 1% arsenopyrite>> disseminated pyrite throughout, aspy seen near silicification about 165.5; also there are thin black wisps that could contain significant fine grained sulphide
		<<Alt: 158.82 - 175.65: weak alteration - carbonate / trace alteration - Silicification / moderate alteration - Iron Oxide Alteration>> minor calcite veining; patchy silicified sandstones with silica infilling matrix; oxidation is fracture controlled and has minor penetration of rock especially in more porous units, in ares of high oxidation there is a bright red and maroon colouration, hematite?
		<<Vein: 158.82 - 175.65: 2% Calcite>> minor calcite veins, planar and crosscutting bedding
175.65	**186.42**	**S-SS Sandstone Brown-Grey mcgr**
		175.65 - 186.42: silicified medium to coarse grained sandstone with a minor amount of thin silt interbeds; trace amounts of calcite in rock, in highly oxidzed zones there is a minor leeching texture; slight increase in oxide level from last interval; silt layers are altered and highly oxidized
		<<Min: 175.65 - 186.42: 1% pyrite / 1% arsenopyrite>> minor amounts of pyrite and aspy seen disseminated in matrix of unoxidized rock, probably hidden by oxidization elsewhere
		<<Alt: 175.65 - 186.42: moderate alteration - Silicification / moderate to strong alteration - Iron Oxide Alteration / moderate alteration - Generic clay alteration>> sandstones are silicified with infilling of matrix increased amounts where quartz veining is more prevalent, calcite left in rock is orange and partially leeched out; iron oxide penetrating rock; silt layers are becoming clay altered and are coloured red and maroon and yellow from oxidation
		<<Vein: 175.65 - 186.42: 1% Quartz>> quartz veins with trace amounts of calcite in some; veins do not crosscut any silt layers
186.42	**219.02**	**S-Slt Siltstone Brown-Grey fgr**
		186.42 - 219.02: medium grey siltstone with some orange brown oxide colouration (no dark grey or black silts); some beds of very fine grained sands; some areas have thin laminations others contain faint thin fuzzy bedding; oxidation caused by fractures with minor pentration of rock; rock is non calcareous except rare healed fractures that are not oxidized; no veining

Legend Lithology

SELWYN BASIN STRATIGRAPHY

- Q — **Q- Quaternary: Unconsolidated glacial silt, sand and gravel**

LOWER TO MIDDLE CAMBRIAN

Road River Group, Dun Lake formation

- OSDr — **Cherts, Shales, minor limestone**

LOWER TO MIDDLE CAMBRIAN

Rabbitkettle Formation

- COr — **Medium to thick bedded grey limestone**

LOWER TO MIDDLE CAMBRIAN

Gull Lake Formation

- CGL(vSlst) — **Volcanic clastic rocks. Green weathering, fine to coarse-grained, poorly sorted, quart-rich arkose. Often found in close proximity to CGL(Dbrt)**
- CGL(sLst) — **Sandy limestone. Light grey-brown-weathering, locally partially dolomitized, limestone that is associated with a black fine grained calcareous sandstone**
- CGL(Sst) — **Coarser grained siltstone. Green to brown weathering interbeds with siltstone and shale**
- CGL(Slst) — **Dark grey to black and green weathering interbedded siltstone to very fine grained sandstone. Parted on the mm-scale, often strongly foliated**

NEOPROTEROZOIC TO LOWER CAMBRIAN

HYLAND GROUP

Narchilla Formation

- PC(Arnt) — **Quartz-pebble conglomerate, quartz-arenite and lithic-arenite. Interbedded with the maroon and brown siltstones and shale of PCNA.**
- PCNA — **Arrowhead Member. Green and maroon weathering siltstone to very-fine-grained sandstone**
- PChn — **Undifferentiated Narchilla Formation. Green, maroon, grey and brown weathering siltstone, fine-grained sandstone and shale.**
- PCNS — **Sennoah Member. Light brown weathering, very fine -to- fine grained sandstone. Mapped as Sennoah in the South-Mars area**

Argue Lake Formation

- PA(Arnt) — **Brown-tan weathering quartz-pebble conglomerate and fine to coarse-grained quartz-arenite.**
- PA(Sst) — **Brown weathering lithic arenite interbedded with siltstones and very-fine grained sandstones.**
- PA(Slst) — **Brown and tan- buff-weathering siltstone and very fine grained sandstone, calcareous, locally interbeds silty limestone**
- PA(Dolo) — **Grey to tan weathering dolostone mapped at Venus Zone area, with interbeds silty limestone zebra textured and brecciated**
- PA(Lst) — **Brown and tan-buff-weathering siltstones and very fine grained sandstones, calcareous**
- PA(cb) — **Dark grey to black weathering siltstone to fine grained sandstone, Carbonaceous. Found only in the eastern portion of Anthill's property structurally and stratigraphically below PA(Lst)**
- PA — **PA(Ls) - Grey limestone. Locally silty and sandy, cross-bedded, massive and bedded-on the cm-scale.**

Fuseya Formation

- PY — **Brown and grey weathering, fine to medium grained grit, lithic arenite, quartz-pebble conglomerate. Locally interbedded with brown and maroon shale.**
- HLGU — **HLGU- Undefferentiated Hyland Group**
- GB — **Undefferentiated gabbro dyke**

UPPER NADALEEN RIVER AREA STRATIGRAPHY

- Q — **Quaternary: Unconsolidated glacial silt, sand and gravel**

NEOPROTEROZOIC (EDIACARAN)

HYLAND GROUP, ALGAE FORMATION

- PHa — **Light grey to yellowish-buff weathering limestone and dolostone, variably dolomitized and variably silty/sandy; local debris flow units**

STENDARTEN ASSEMBLAGE

- PSs — **Upper mixed classic sequence- grey shale and siltstone; minor sandstone and grit, grey limestone and shale**
- PSl — **Brown-weathering, platy siliceous limestone**
- PSc — **Lower; "carbonate marker"- grey to orange-weathering dolostone, dolomitic sandstone and limestone, commonly planner and/or cross laminated**

NADALEEN ASSEMBLAGE, UPPER

- PNu — **Orange-weathering, greenish-brown rhythmitically bedded fine-grained sandstone, siltstone, mudstone; polymictic diamictite, conglomerate**

NADALEEN ASSEMBLAGE, LOWER

- PNl — **Brownish-grey siltstone, mudstone, limestone; rhythmically, thin to medium -bedded mudstone and limestone; local pink-grey quartz sandstone and quartzite;**
- PNbl — **Black crystalline limestone**
- PNq — **Pink-grey, quartz arenite and grit; quartzite**
- PNw — **Black, grey, and greenish quartz wacke, quartz-pebble conglomerate, mudstone**

LOWER TO MIDDLE CAMBRIAN

Gull Lake Formation

CGL(vSst) — Volcanic clastic rocks. Green weathering, fine to coarse-grained, poorly sorted, quart-rich arkose.

NEOPROTEROZOIC TO LOWER CAMBRIAN

HYLAND GROUP

Narchilla Formation.

PCNA — Arrowhead Member. Green and maroon weathering siltstone to very-fine-grained sandstone

Algae Lake Formation

PA(Arnt) — Brown-tan weathering quartz-pebble conglomerate and fine to coarse-grained quartz-arenite.

PA(Lst) — Brown and tan-buff-weathering siltstones and very fine grained sandstones, calcareous

PA(Sst) — Brown weathering lithic arenite interbedded with siltstones and very-fine grained sandstones.

PA(Slst) — Brown and tan -buff-weathering siltstone and very fine grained sandstone, calcareous, locally interbeds silty limestone

PA(Dolo) — Grey to tan weathering dolostone mapped at Venus Zone area, with interbeds silty limestone zebra textured and brecciated

Silic — Strongly silica replaced dolostone.

Legend Lithology

Neoproterozoic to Lower Cambrian
Narchilla Formation

- **PCNA: Arrowhead member**
  Interbedded maroon and green siltstone and shale
- **PCNS: Senoah Member**
  Brown weathering very fine grained sandstone and siltstone

Neoproterozoic
Algae Lake Formation

- **PA(Lst)**
  Grey weathering limestone, silty limestone, locally planar laminated
- **PA(Sst)**
  Calcareous ripple cross-bedded and planar laminated fine grained to coarse grained sandstone, quartz-rich, local debris flow
- **PA(Arnt)**
  Brown-tan weathering, fine to medium grained quartz-arenite, locally calcareous

Structure Legend

- Bedding - Overturned, General, Upright
  Cleavage
- Fold axes - Fold axis, S fold, Z fold
- fold axes-F1A, F2A

CERTIFICATE OF QUALIFICATIONS

Jeffrey A. Cary

As an author of this report entitled Assessment Report for the 2013 Exploration Program of Silt, Soil and Rock Chip Geochemical Surveys, Geological Mapping and Diamond Drilling prepared for Anthill Resources Yukon, Ltd, and dated April 18, 2014. I hereby make the following statements:

A. My name is Jeffrey A. Cary and I am a Consulting Geologist and Owner of Animas Exploration Services LLC. My office address is 2416 Needham Ct, Durango, Colorado 81031

B. I have received the following degrees in Geology:

a.	B.Sc.	1983	Fort Lewis College, Durango, CO
b.	M.Sc.	1990	Western Washington University, Bellingham, WA

C. I am a Certified Professional Geologist associated with the American Institute of Professional Geologist in the United States of America. CPG-11673. I am also a member of:

The Society of Economic Geologists (SEG)
Nevada Geological Society (NGS)
Four Corner Geological Society (FCGS)

D. I have read the definition of "qualified person" set out in National Instrument 43101 ("NI 43-101") and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience I fulfill the requirements to be a "qualified person" for the purposed of NI 43-101.

E. This report is based on field work on the property in the Yukon Territory between July 24, 2013 and Sept 28, 2013, and on my personal review of technical reports and other data supplied by the Anthill Resources, on discussions with the Anthill Resources and its representatives, discussions with the geologists working for Geological Team on the property.

F. I have been practicing as a professional geologist for over thirty years.

G. I have not had prior involvement with the property that is the subject of this technical report.

H. I am responsible for all sections in this technical report.

I. I am not aware of any material fact of material change with respect to the subject matter of this report which is not reflected in "the Report" the omission to disclose which makes this report misleading

J. I am independent of the Anthill Resources applying the tests set out in section 1.5 of National Instrument 43-101.

K. I have read National Instrument 43-101 and Form 43-101F1 and this report has been prepared in compliance with National Instrument 43-101 and Form 43101F1.

(signed and sealed) Jeffrey A Cary 4/18/2014

Dated at Durango, Colorado, USA Jeffrey A. Cary, M.Sc., CPG
April 18, 2014

Certificate of Author

I, Hua Jin, M.Sc., P.Geo., do hereby certify that:

1. I am a consulting geologist with an office at 118 Sapper St, New Westminster, British Columbia.

2. I graduated with an Honours Bachelor of Science degree in Geology from Peking University, Beijing, China, in 2003 and with a Masters of Science degree in Geology from the Western University (formerly The University of Western Ontario), London, Ontario in 2005.

3. I am registered as a Professional Geologist with the Association of Professional Engineers and Geoscientists of British Columbia (APEGBC) since 2012 with the license number 37813.

4. I have practiced my profession continuously since 2003 including as teaching assistant and research assistant from the Western University followed by over eight years of mining and mineral exploration industry experience in Nevada in US, Nunavut, Yukon Territory, Ontario and BC in Canada, China and West Africa.

5. I have read the definition of "qualified person" set out in National Instrument 43-101 and certify that by reason of education, experience, independence and affiliation with a professional association, I meet the requirement of an Independent Qualified Person as defined in National Instrument 43-101. This assessment report has been prepared in compliance with National Instrument 43-101 and Form 43101F1.

6. I am not aware of any material fact of material change with respect to the subject matter of this report which is not reflected in the assessment report the omission to disclose which makes this report misleading

Dated this 18th day of April 2014

Apr. 18th 2014

Hua Jin, M.Sc, P.Geo

Statement of qualifications, Wan Jin Yang B Sc in Geology

I, Wan Jin Yang, B. Sc. in Geology, an employee of Anthill Resources Ltd. Resident at 236 East 17th St. North Vancouver BC, do hereby certify that:

- I have worked primarily in geochemistry, geology survey, mineral exploration, mining, geological service in China and Canada since 1990.

- I am a registered Senior Geologist in China mining association system and a candidate for registration membership of Association of Professional Geoscientists of British Columbia with ID 164672.

- I graduated with the degree of Bachelor of Science in Geology from China University of Geoscience, 1990. I have ten years of exploration geochemistry, mineral exploration experience in China government geology, geochemical survey system and more than twelve years of commercial mineral exploration experience at Canadian mining companies.

- I have upgraded my knowledge in geoscience and mineral exploration technology by domestic and international short study tour and widely involving in mineral exploration since I graduated from university.

- I have read the definition of professional geoscientist set out in National Instrument 43-101 ("NI 43-101") and certify that by reason of my education, my past relevant work experience and supervision under Mr. Jeff Carry AIPG CPG and Hua Jin M Sc P. Geo. I fulfil the requirements to be a "professional geoscientist" for the purposes of dedicating my work in the NI 43-101 report.

- I am one co-author of this report entitled Assessment report for the 2013 Exploration program of Silt, Soil and Rock Chip Geochemical Surveys, geological mapping and Diamond Drilling prepared for Anthill Resources Yukon, Ltd, and Dated April 18, 2014.

- As of the date of this certificate, to the best of my knowledge, information and belief, the portion of the technical report for which I am responsible contains all scientific and technical information that is required to be disclosed to make the portion of the Technical Report for which I am responsible not misleading.
