Executive Summary

Ryan Gold Corp.'s Ida Oro property block is comprised of 3527 contiguous claims in the Dawson Mining District of the Yukon Territory, Canada, 721 of which are covered for assessment herein. The property block is located 90km east of Dawson City, and 30 km east of Brewery Creek Mine, northeast of the Tintina Fault Zone. Individual properties covered in this report include: Ida, ID, Idaoro, Oreo, Oreox, Oro, Pano and Toro. Additional properties within the Ida Oro block include Keiths, MLN, Pilsner and Zoro. Access to the project is by helicopter only, from either Dawson City or the staging area set up by Ryan Gold Corp. near the Tintina Lookout on the Klondike Highway.

Initially staked by Rio Tinto Canadian Exploration (RioCanex) Ltd. in 1979, the Ida Oro property has seen intermittent work performed on it since then. Initial staking followed anomalous arsenic, antimony and mercury values identified through regional silt sampling conducted by the Geological Survey of Canada. From 1979-1981 RioCanex performed geologic mapping, rock and soil sampling and blast trenching. Trench sampling returned a maximum value of 10.6 g/t Au. The property was restaked by Noranda Exploration Ltd. in 1987, who performed further mapping and sampling on property until 1989. Orinoco Gold Inc. then performed rock grab and soil sampling work in the south of the property in 1995, returning three samples greater than 2.0 g/t Au. NovaGold Inc. acquired the claims in 1999 and performed further rock sampling and mapping on the property. The property was restaked and optioned by Shawn Ryan and Henry Neugebauer in 2006. Grid and ridge and spur soil sampling was completed on the property between 2006 and 2009. The property was then acquired by Ryan Gold Corp. through a purchase agreement, in late 2010.

The 2011 Ryan Gold Corp. exploration program at Ida Oro consisted of soil sampling, geologic mapping, rock sampling and diamond drilling. The soil sampling program was conducted by Ground Truth Exploration and consisted of both ridge and spur and contour sampling at 50m spacing. 16512 soil samples were collected on the Ida Oro block. 2011 drilling on the property took place from July 27 to September 4, 2011. Drilling consisted of 11 diamond drill holes totalling 2854.50m. The property had seen no previous drilling prior to the 2011 Ryan Gold program. The 2012 Ryan Gold Corp. exploration program consisted of 28 additional diamond drill holes. As per the requirement of the Yukon Mining Recorder, 14 holes were covered in that assessment report, totaling 3970m. Drilling in 2011 and 2012 was contracted to Kluane Drilling Ltd., based in Whitehorse.

The 2013 Ryan Gold Corp. exploration program took place from July 9 to August 29, 2013. The program consisted of an extended drillcore relogging component, which resulted in the full reclassification of all 39 holes drilled on the Ida Oro property within the context of the property scale geologic model and surface observations. This relogging program resulted in the systematic reclassification of all discrete intrusive phases found in drill core. The monzogranitic intrusive rocks of Ida Oro were therefore subdivided into eight progressively younger phases, spanning and post-dating gold introduction. Based on this data, a complete geological model was constructed prior to a visit by an external consultant at the end of the field season. One day of geological mapping and grab sampling was also performed on the Ida Oro property in 2013. Three rock grab samples were collected.

1.0 Introduction

The Ida Oro Property is located 90km East of Dawson City, Yukon within the Dawson Mining District (Figure 1). The project area is made up of 3527 contiguous claims covering an area of approximately 71,107 hectares. This report summarizes the findings of the 2013 Ryan Gold Corp. exploration program on the Ida Oro property, which took place between July 9th and August 29th. The 2013 Ida Oro work program consisted of reconnaissance geologic mapping and grab sampling, along with an extended core relogging component. Three rock grab samples were taken in total during the 2013 exploration campaign. All samples were assayed at the ALS Chemex Laboratory in Whitehorse. A summary of expenditures for the program is presented in Appendix 4.

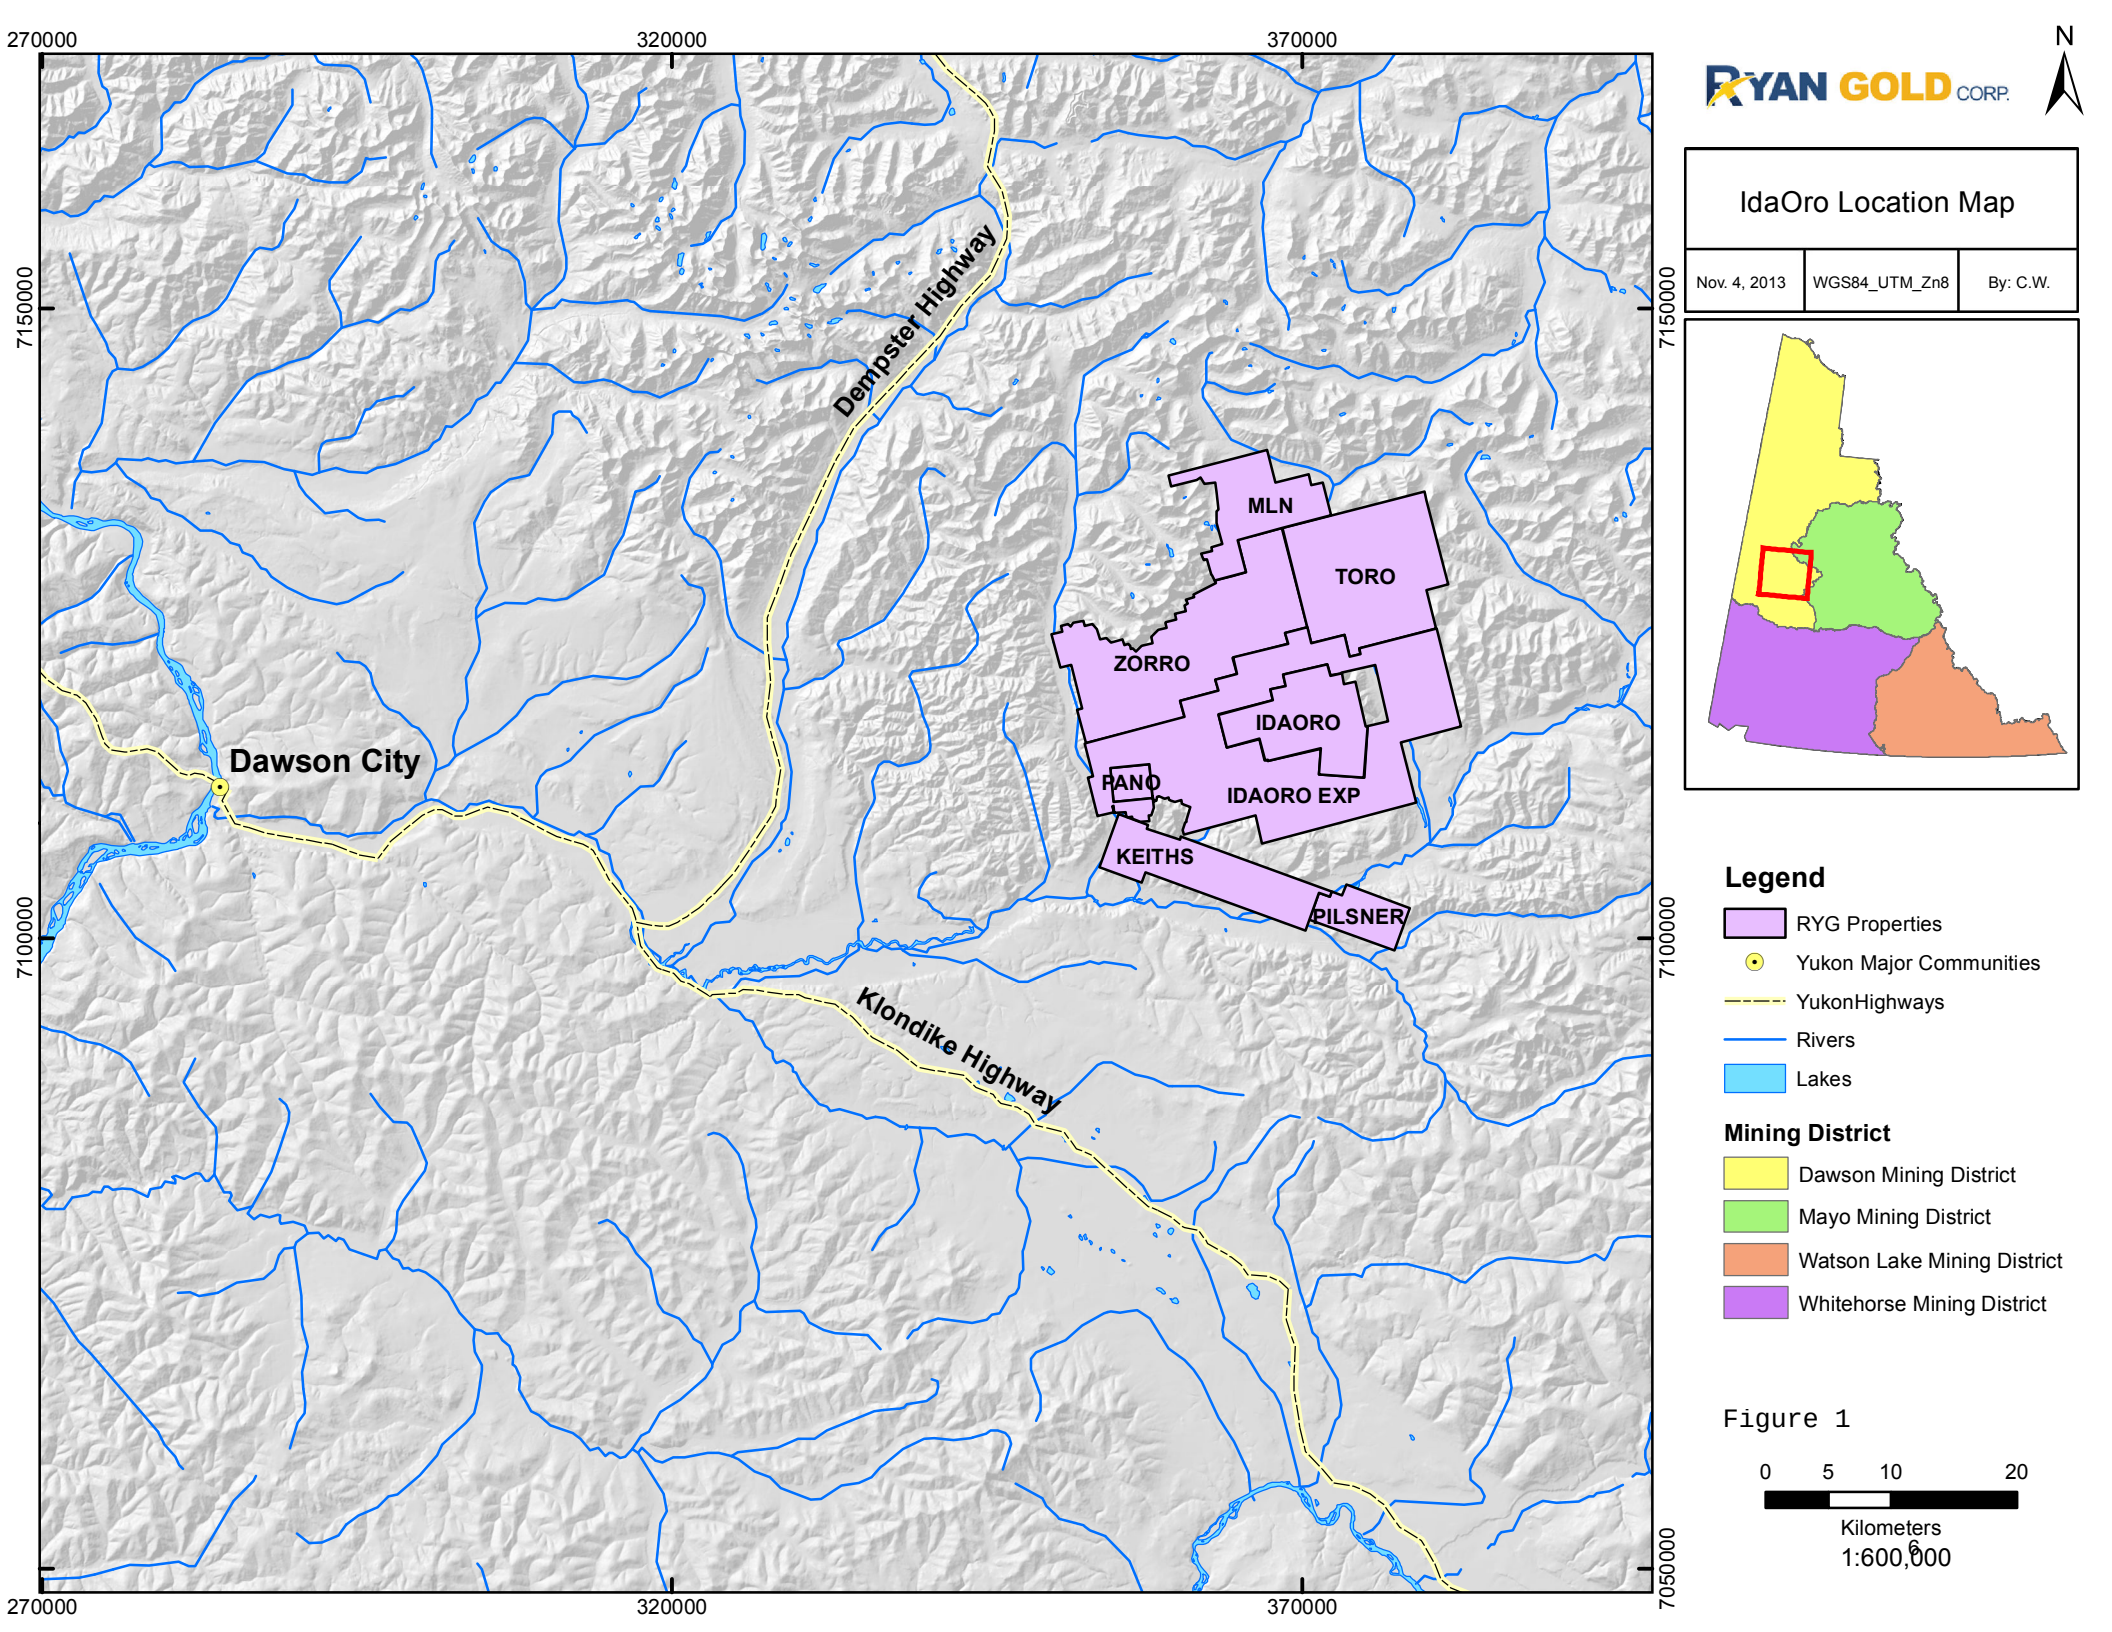

This report was prepared in accordance with the guidelines of the Yukon Quartz Mining Act and is based on field observations made by Ryan Gold geologists and geochemical data obtained from samples submitted to an accredited laboratory, with oversight from Qualified Person Ian Gendall. Background information is based on data and geological information gathered from public sources, assessment files and company reports and memorandum.

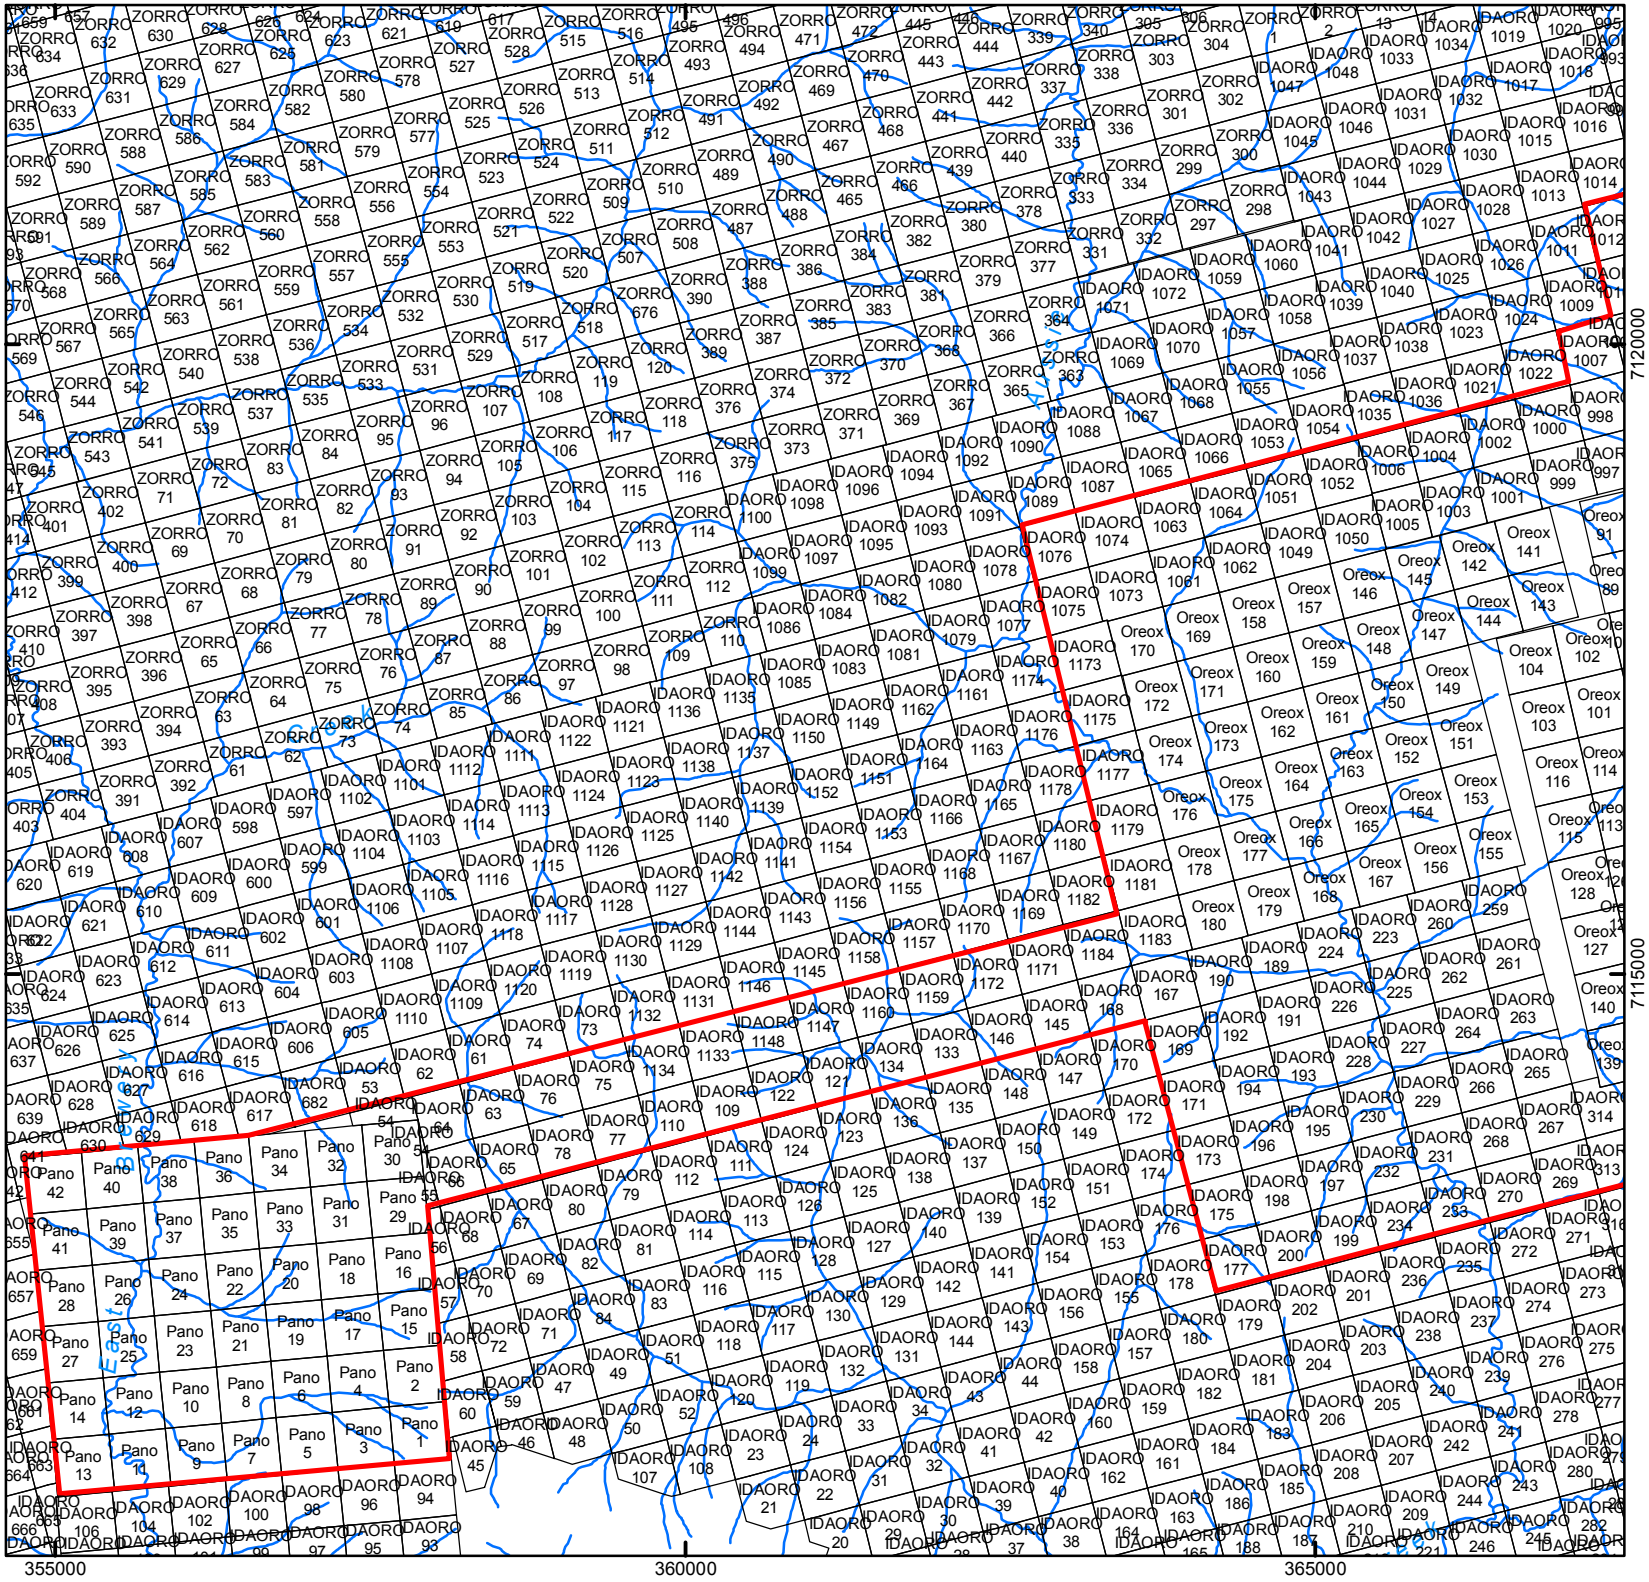

2.0 Location & Access

The Ida Oro Property block is located within the Ogilvie Mountain Range, 90 km East of Dawson City, Yukon, in the Dawson Mining District. The property is 405km northwest of the Yukon capital of Whitehorse. The centre of the property block is located at longitude 137°40' West and latitude 64°9' North, within NTS map sheets 116A, 116B, and 115P. Access to the project is by helicopter only, from either Dawson City or the staging area set up by Ryan Gold Corp. near the Tintina Lookout on the Klondike Highway. The property is also located 30 km east of Brewery Creek Mine, northeast of the Tintina Fault Zone. In previous years the 'Ditch Road', extending to Brewery Creek Mine from the Dempster Highway, had been used to access Ida Oro. The 2013 exploration program was helicopter-supported by TransNorth Helicopters (A-Star, 206 Bell Jet Ranger) from their base in Dawson City. The location of the property block is displayed in Figure 1.

3.0 Claim Information

The Ida Oro property block consists of 3527 contiguous registered claims, 721 of which are filed for assessment in this report. The claim breakdown by property is as follows: IDA (21 claims), ID (3 claims), IDAORO (201 claims), Toro (167 claims), Oreo (42 claims), Oreox (222 claims), Oro (25 claims) and PANO (42 claims). All claims are held in accordance with the Quartz Mining Act. All claims are 100% owned by Ryan Gold Corp., except for the Toro claims, where ownership is divided between Ryan Gold Corp. (70%) and 45127 Yukon Inc. (30%). The Ida Oro claims maps are displayed in Figures 2-4. The complete claims listing for the Ida Oro block is displayed in Appendix 2. The property block claims map is displayed in Appendix 6.

4.0 Physiography & Climate

The region encompassing the Ida Oro Project has a sub-arctic continental climate with a July mean of 15.6°C and a January mean of -26.7°C. Summer and winter temperatures can reach as high as 35°C and as low as -55°C, respectively (Environment Canada, 2013).

The land consists of rugged ridgelines and valleys ranging from below 1000m to over 1800m elevation. The majority of the property is below the treeline; however most sampling and drilling work was completed above the treeline on ridges and spurs. Land cover is mostly short coniferous trees, shrubs in the valleys, and, above treeline, moss and lichen cover. Major rivers and creeks within the project area include the Klondike River, Hamilton Creek, and Aussie Creek. Bedrock is abundant above the treeline and exposure decreases rapidly to less than 1% in valleys and depressions.

5.0 Exploration History

5.1 Pre-2011 Work

The Ida Oro project area was initially staked as the Ida 1-120 claims by Rio Tinto Canadian Exploration Ltd. (Rio Canex), in 1979. Regional silt sampling conducted by the Geological Survey of Canada found anomalous arsenic, antimony and mercury, and RioCanex staked the property following those results. Between 1979 and 1981, Rio Canex performed geologic mapping, rock and chip sampling, soil sampling, and hand blast trenching work at Ida Oro. In total, 3268 soil samples were collected on the property during the three years. Soils were analyzed for pathfinder elements such as arsenic, antimony, and mercury, but not gold. 1034 rock samples were also collected during that time period, including 486 samples from 51 blast trenches dug on the property. Blast trenching was contracted to McCrory Holdings of Whitehorse. The results of rock and chip sampling and trenching revealed a 300m by 800m zone of >500 ppb gold in the northern portion of the property. Rock chip samples returned a high value of 3820ppb Au in 1980, and trench sampling in 1981 returned a maximum value of 10.6g/t Au. In total, RioCanex expenditures totaled $79,500 over the three years (McClintock, 1981). The claims were dropped by Rio Algom Ltd. in 1986, when the company decided to focus exclusively on base metals mining and exploration (Johnson, Brownlee, & Schulze, 2001).

In 1987, the property was re-staked as IDA 1-23 and ORO 1-28 by Noranda Exploration Ltd. (Noranda). Subsequent exploration consisted of mapping and sampling of the central auriferous zone defined by RioCanex (Copland, 1988). 97 soil and 141 rock samples were collected in 1987, with grab sampling returning up to 13.4 g/t Au. Noranda then conducted an expanded program in 1988, consisting of geological mapping, soil and rock sampling. 1,500 soil samples and 183 rock samples were collected that year. 218 rock chip samples and 21 rock grab samples were then collected in 1989. 115 of the aforementioned chip samples were taken from ten hand dug trenches, returning values of 4.9 and 3.8 g/t Au. The IDA 24-25 claims were also added in 1989. Results overall were inconsistent with those observed by RioCanex. Citing lack of access and potential high cost of drilling in the rugged terrain, no further work was performed on the claims by Noranda (Duke, 1990; Copland, 1988). The claims were then transferred to Hemlo Gold Mines Inc. (Hemlo) in 1995 (Johnson, Brownlee, & Schulze, 2001).

Orinoco Gold Inc. then optioned the claims from Hemlo in 1995 and commissioned Aurum Geological Services Inc. to conduct a short work program in August and September of that year. The work program included the collection of 218 rock and 53 soil samples targeting the previously unexplored southernmost intrusive stock. A single reconnaissance traverse across the southern intrusion returned three anomalous samples of 2.05, 5.49 and 9.27 g/t Au, with the latter collected within weakly veined quartz monzonite (Johnson, Brownlee, & Schulze, 2001).

In 1999, NovaGold Resources Inc. (NovaGold) acquired the claims and performed rock sampling and mapping over the property (then called the Klondike property) in 1999 and 2000. 58 rock samples were taken in those two years. Work was conducted across sediment-hosted mineralization north of the northern stock, with lesser focus on the previously trenched areas of the central and eastern zones. No significant mineralization was observed in 1999, as most samples did not repeat high values returned from earlier companies. Results from rock sampling the following year returned values of 1.4, 2.9 and 4.5 g/t Au. The associated report noted the excellent potential of the property to host significant intrusive and sediment hosted gold mineralization and recommended drilling in late 2000 (Johnson, Brownlee, & Schulze, 2001; Roberts & Stammers, 2007).

Alexco Resource Corporation (Alexco) then acquired Spectrumsub, a NovaGold subsidiary, in 2005, along with the current Ida Oro claims. The subsequent brief 2006 exploration program consisted of one day of mapping, rock and soil sampling. Two rock samples, taken of hornfelsed sediments, returned significant results of 1.98 and 0.81 g/t Au respectively (Roberts & Stammers, 2007).

From 2006 to 2009, Ida Oro and surrounding properties were re-staked and optioned by Shawn Ryan and Henry Neugebauer and a joint venture agreement resulted. Rock and grid soil sampling confirmed the presence of gold mineralization over the property with several samples within a single soil line returning multi gram per ton gold proximal to historical anomalous zones. The property was acquired by Ryan Gold Corp. in 2010 through a purchase agreement with Mr. Ryan and Mr. Neugebauer.

5.2 2011 Ryan Gold Corp. Exploration Program

The 2011 exploration program at Ida Oro took place between May 12 and October 2, 2011, and was supervised by Qualified Persons Ian Gendall and Michael Skead. Surficial work consisted of soil sampling, rock grab sampling and bedrock geologic mapping. Soil sampling was conducted by Ground Truth Exploration and consisted of both ridge and spur and contour sampling at 50m spacing. 16512 soil samples were collected at Ida Oro in 2011. Mapping on the Ida Oro block was conducted by Ryan Gold geologists and was focused on the main ridgeline of the central claim area. Drilling on the property took place from July 27 to September 4, 2011, and was conducted by Kluane Drilling Ltd., based in Whitehorse. The program consisted of 11 diamond drill holes totalling 2854.50m. Restricted to the main North-South ridgeline at Ida Oro, 2011 drilling confirmed the presence of mineralization at depth, as mineralization was found in nine of eleven holes. 3410 drillcore samples were collected during the drill program. 2011 drilling statistics are displayed below in Table 1. All samples were analyzed by Acme Labs, based in Vancouver, BC.

Table 1: 2011 Ida Oro Drillhole Statistics

5.3 2012 Ryan Gold Corp. Exploration Program

The 2012 Ida Oro exploration program consisted of further exploratory diamond drilling focused on the IO North zone target, along with mapping and geochemical rock grab and soil sampling throughout the property block. Further petrographic work was also performed. 28 diamond drill holes were drilled during the 2012 exploration campaign. As per the requirements of the Yukon Mining Recorder, 14 of these holes were reported for assessment. Grab sampling results were not filed for assessment. Drilling was again contracted to Kluane Drilling Ltd., and focused on lateral (E-W) step out holes intended to complement existing data and test three dimensional continuity of the mineralization identified in the previous season. 12 of the 28 holes were drilled at IO North in grid fashion, complimenting holes IODD-002, -003, and -004 and enabling the construction of five 'stacked' cross-sections profiling the zone. 2012 drilling statistics are displayed below in Table 2. The average hole depth was 279.01m, with a total depth of 3907m. The following 14 drillholes were filed for assessment: IO-12-012, IO-12-013, IO-12-014, IO-12-015, IO-12-017, IO-12-021, IO-12-022, IO-12-025, IO-12-032, IO-12-035, IO-12-06, IO-12-037, IO-12-038, IO-12-039. All rock and drillcore samples were analyzed by ALS Chemex Labs in Whitehorse / North Vancouver. Drill collar locations, cross sections and additional figures are presented in Appendix 6.

Full Ida Oro collar location map is displayed in Figure 8.

Table 2: 2012 Ida Oro Reported Drillhole Statistics

6.0 Geology

6.1 Regional Geology

Adapted from Schulze & Johnson, 2000.

Ida Oro is located within the western portion of the Selwyn Basin. The regional geology of this area of the Yukon was initially mapped by Green (1972), at 1:250,000 scale. More detailed 1:50,000 scale mapping has been completed on the map sheets southeast of the property (Murphy, Heon, & Hunt, 1993). The regional geology surrounding the Ida Oro property is displayed in Figure 5.

The Selwyn Basin consists of a broad package of Paleozoic sediments extending east-southeast from north-west of Dawson City to the Yukon-Northwest Territory border north of the major northwest-southeast trending Tintina Fault. This stratigraphy consists of shallow shelf to off-shelf marine clastic and chemical sediments, as well as basinal clastic sediments derived from the ancient North American Platform to the northeast. Ages of deposition range from Late Precambrian to Permian. At least two major episodes of rifting have occurred: the first during deposition of the Late Precambrian Hyland Group sediments, and the second during deposition of the Devono-Mississippian Earn Group sediments. These major rift zones often host poorly sorted coarse clastic sediments, such as debris flows or turbidite horizons. Several episodes of continental uplift have led to periods of increased erosion and resulting continental margin or miogeosynclinal deposition, resulting in the creation of sequences of comparatively high energy, shallow water sediments, often coarsely grained and variably calcareous. These are separated by strata formed under deeper, quieter water conditions, resulting in formation of fine clastic sediments and chert. The Mid-Cretaceous Tombstone-Tungsten Plutonic Suites (95-89Ma) consisting primarily of monzonitic to quartz-monzonitic intrusive structures has been emplaced within the Selwyn Basin. Members of this suite occur along an east-southeast trending beltextending for over 500 kilometres from northwest of Dawson City to the Yukon-Northwest Territories border.

The Cordilleran Miogeocline records three major periods of geologic and tectonic evolution on the western edge of Ancestral North America. From the mid-Proterozoic to late-Precambrian, rifting of the cratonic margin led to deposition of a thick wedge (>10km) of clastic sediments known as the Windermere Supergroup. Sedimentation during this time was punctuated and separated by major regional deformation and rifting. In the late Precambrian, tectonic quiescence led to the development of passive margin sedimentation. Two contrasting but contemporaneous facies belts parallel to the cratonic margin resulted. To the northeast, shallow water, carbonate and clastic shelf facies rocks known as the Mackenzie Platform were deposited in a variably subsiding near shore environment. To the southwest, offshelf slope and basin deep water facies developed forming the outer edge of the Miogeocline known as the Selwyn Basin (Gordey & Anderson, 1993).

Extensive thrust faulting across the entire extent of the Selwyn Basin began during the Late Jurassic period. Most thrust faulting was directed north-west. Major regional thrust faults include the Dawson Thrust, the Tombstone Thrust and the Robert Service Thrust. These regional structures have been overprinted by a slightly less pronounced northeast-southwest lineation, marked by high angle orthogonal faults suggesting the compressional regime was followed by an extensional tectonic regime.

The Robert Service Thrust underlies and defines one of the largest thrust sheets in the Canadian Cordillera (Murphy, Heon, & Hunt, 1993). It extends eastward from Dawson City area through the Keno Hill area into the Lansing region. The Robert Service thrust typically juxtaposes Upper Proterozoic Hyland Group rocks on the upper plate over Mississippian Keno Hill Quartzite and Triassic-Jurassic schist on the lower plate. The Tombstone Thrust typically juxtaposes Proterozoic and Paleozoic Selwyn Basin rocks over Devonian to Late Jurassic footwall sediments (Murphy, et al, 1993). Structural evidence suggests early north-west movement, followed by north-east translation of the Tombstone thrust sheet and underlying Paleozoic rocks along the Tombstone Thrust plane (Murphy, Heon, & Hunt, 1993).

Regional metamorphism has imprinted a greenschist facies metamorphic mineral assemblage on rocks of the Hyland Group and Road River Group. Contact metamorphic aureoles consist of biotite hornfels enriched in iron and, locally, precious and base metals. Often the larger intrusions have a low magnetic signature surrounded by an area of high magnetic relief related to the hornfelsed zone.

6.2 Property Geology

Ida Oro property geology is displayed in Figure 6. Property scale mapping prior to Ryan Gold Corp. was performed by RioCanex and NovaGold. The geology of the Ida Oro Property is characterized by a closed to tightly folded, pervasively hornfelsed sedimentary package belonging to the Road River Group and Rabbitkettle Formation of the Selwyn Basin. Ordivician to Early Devonian in age, they are intruded by a complex calc-alkaline multi-phase intrusive body of the mid-Cretaceous Tombstone Plutonic Suite (TPS). Both rock packages have also been intruded by a late stage lamprophyric dyke phase, also of the TPS suite. Intrusive composition is gradational over the property and all sedimentary structures within the hornfelsed aureole have been destroyed by contact metamorphism except local remnant bedding.

Hornfelsed Sediments: The country rock at Ida Oro is composed of two major sedimentary sequences of the Ordivician to Silurian Road River Group. The package is placed within the Road River Group based

on composition, sedimentary structures, and mapped sedimentary units by Ryan Gold and previous companies. Sediments on the Ida Oro property consist of thin to thick bedded cherts, silstones, shales, mudstones and minor sandstones and limestones. Age contraints for these sediments on the Ida Oro property come from graptolites monograptus vomeriums and monograptus spiralis found in 1981 by A. Winkler working for RioCanex, and points to a lower Silurian age for the sediments.

Felsic TPS Intrusive Rocks: Several stocks and dykes intrude sediments and make up the main north-south ridge in the central and southern portions of the Ida Oro property. Both composition and texture of intrusive rocks are gradational across the property and within the bodies themselves from granodiorite to dominant monzogranite to quartz monzonite. Texture varies from medium grained equigranular to scattered porphyritic to crowded porphyritic with plagioclase and potassium feldspar as the primary phenocrysts, up to several centimeters in size. Groundmass composition is commonly feldspar + quartz. Mafic mineralogy is primarily biotite, commonly altered to actinolite.

Several highly altered dykes, which occur as discrete recessive notches within ridgelines and display strong clay-sericite alteration, are also believed to be part of the same intrusive suite. The orientation of these dykes often follows the bedding of country rock. The exposed intrusive bodies at Ida Oro display a strong east-west (~110^{o}) lineation, similar to the trend present at the Brewery Creek property. Both properties lie along the same 070^{o} trend. It has been noted that the Clear Creek, Red Mountain and Dublin Gulch properties lie along a parallel 070^{o} trend to the south.

Several small, fine to coarse grained lamprophyric dykes outcrop in the north end of the Ida Oro property and have been intersected by drilling**.** This unit commonly contains fresh sulphide mineralization of pyrrhotite +/- chalcopyrite. The unit has been extensively altered by amphibolization and biotitization of clinopyroxene, and saussuritization of feldspars (Lisson, 2012).

The Ida Oro prospect has many features in common with intrusion-related gold systems (IRGS) elsewhere in the Tintina gold belt, as emphasised by the reduced, ilmenite-series character of the associated felsic intrusions, the resulting dominance of pyrrhotite over pyrite and abundance of arsenopyrite and the Mo-Bi-Te-As-(W) signature that accompanies the gold (Sillitoe, 2013).

The system at Ida Oro does display some notable differences pointing to a possible transition between the typical reduced IRGS deposits, like Fort Knox and Dublin Gulch, and porphyry Mo-Cu deposits. The main differences are: the relative abundance of copper and molybdenum, the former attaining several hundred ppm; the evolution from potassic through sodic-calcic to tourmaline-bearing sericitic alteration; the A- or B-type character of many of the quartz veinlets; and the multidirectional stockwork rather than sheeted nature of the quartz veinlets. In combination, these distinctive features are reminiscent of the Shotgun gold prospect, Alaska, and so are not unique to Ida Oro (Sillitoe, 2013).

7.0 2013 Ryan Gold Corp. Exploration Program

The 2013 Ryan Gold exploration program on the Ida Oro property consisted of detailed core relogging of all holes drilled on the property in 2011 and 2012. All 39 holes drilled on the Ida Oro property were fully relogged, resulting in the systematic reclassification of all discrete intrusive phases and intrusive bodies found in Ida Oro drillcore. Data collected was used to construct a model of the IO North Zone using five cross sections and four level plans. This work was supplemented with one day of mapping and grab sampling to confirm surface trends of mineralized intervals observed in drill core. Three rock grab samples were collected on August 21, 2013. Sample locations are displayed in Figure 7. 2013 certificates of work are presented in Appendix 4. Grab sample location data is presented in Appendix 5.

8.0 Sampling and Analytical Procedure

Ryan Gold Corp. established a sampling and assay control program with insertion of assay blanks, standards, and preparation duplicates, in addition to the internal QA/QC program of ALS Labs. Blank samples consisted of crushed granite (sourced from a garden centre in Whitehorse) and were known to have no significant elements of interest. Standard reference materials (SRM's), OxC88, OXi81, were used in the 2011 and 2012 programs and were sourced from RockLabs, a commercial supplier. Preparation duplicates were prepared by the laboratory by splitting off a crushed portion of the sample (using a riffle splitter) which was then pulverized. A sample tag was placed in the sample bag and also stapled to the outside of the bag. The bag was secured using a cable tie. These samples were placed in a sample string with a systematic pattern of standards, blanks and duplicates to ensure QA/QC. Samples were grouped in rice bags and secured with security tags. The samples were shipped out of camp by helicopter to Dawson City and driven to Whitehorse to be processed at the ALS preparation lab. Throughout the shipment process, a chain of custody paperwork trail was maintained to ensure sample security. Once received in at the ALS Lab in Whitehorse the samples were weighed and logged. Samples were then crushed until 80% or better passes through a 2mm mesh screen. This resulting material was put through a rifle splitter, where a 1000g sample was isolated and the rest was collected as reject. The sample was pulverized further until greater than 85% passes through a 75 micron mesh screen. Following this step the pulp material was shipped to ALS Labs in North Vancouver for analysis. The remaining reject material was stored in Whitehorse. All 2013 assay certificates are displayed in Appendix 3.

The material shipped to the North Vancouver lab was then split using a rifle splitter where a 50g sample was isolated for gold analysis and the pulp reject material stored at the lab. This 50g sample was subjected to the ICP22 analysis method. The ICP22 package is a fire assay and ICP-AES method to assay for gold, and can detect gold values between 0.01 ppm and 10 ppm. Gold and 40 other elements were also analysed as part of the ME-MS41 geochemical package. This included 41 multi-element analysis by aqua regia digestion and a combination of ICP-MS and ICP-AES analysis. Assays for gold that are above 10ppm detection are then re-analysed using a gravimetric method. Other elements such as Ag, Cu, Pb, As, Zn and Sb that are above detection of the method requested for analysis are also re-analysed using a

similar method with higher detection to obtain true value. Final assay results are reported to Ryan Gold electronically, consisting of an excel spreadsheet and a PDF certificate of assay.

9.0 2013 Exploration Results

The three grab samples collected from the IO North zone returned 0.28 g/t, 3.15 g/t and 5.47 g/t Au respectively. Sample locations are displayed in Figure 7. Grab sample results are displayed in the table below.

Sample Number	Easting	Northing	Elevation (m)	Au (g/t)
45218	372502	7117458	1686	0.28
45219	372512	7117485	1686	3.15
45220	372502	7117488	1679	5.47

Table 3: 2013 Ida Oro grab sample results

All 39 holes drilled on the Ida Oro property were fully relogged in summer 2013, resulting in the systematic reclassification of all discrete intrusive phases found in drill core. Results from the relogging component are as follows. The monzogranitic intrusive rocks of Ida Oro were subdivided into eight progressively younger phases, spanning and post-dating gold introduction. Most intrusive contacts were found to be subvertical, facilitating the construction of cross sections and and level plans cutting the gridded drillholes of the IO North Zone (Sillitoe, 2013). A full suite of five cross sections across the IO North zone (A-A' though E-E') were constructed, along with four level plans of the same zone, ranging from 1450m-1600m elevation, at 50m intervals. All 2013 assay certificates are displayed in Appendix 3. Grab sample location information is displayed in Appendix 5. Drill collar locations, cross sections and additional figures are presented in Appendix 6.

10.0 Conclusions and Recommendations

Positive results from the sole day of mapping and grab sampling at Ida Oro in 2013 indicate presence of mineralized outcrop/subcrop at surface within the IO North zone. There is some evidence that this represents the surface expression of a plunging body, also present in the high grade interval in hole IO-12-026.

The 2013 logging and reconstruction of the Ida Oro intrusion-related system confirmed that the prospect is low grade and unlikely to contain shallow, potentially open-pittable gold mineralization. Therefore, further shallow (250–300 m) drilling is not warranted (Sillitoe, 2013).

Nonetheless, the core of the system at the IO North zone, defined by the highest intensity of early quartz veining, could possess potential at unknown depths below the current lower limit of drilling (~250 m). The potential could lie in either the downward extension of the stockworked phase or as stockwork veining in the inferred intrusion responsible for the early hornfels-hosted, gold- and molybdenum-bearing quartz veinlets (Sillitoe, 2013).

This hypothetical deep target is considered to have a relatively low probability of economic success and, hence, is clearly high risk. Should the target be tested, at least two inclined core holes drilled to a depth of at least 700 m would ideally be required. Precise positioning of the holes would be based on the plunge of the stockworked intrusive phases (Sillitoe, 2013).

Outside of the IO North zone, the remaining target areas (IO South, Thebe, Europa, Ganymede) remain relatively untested at depth, as it remains possible that previous drilling did not adequately test the potential of intrusive hosted mineralization in these zones.

Appendix 1 - Statement of Qualifications

I, Jarod Lapp, resident of Vancouver, British Columbia, do hereby certify that:

1. I have been employed full-time by Ryan Gold Corp. at Suite 600 – 666 Burrard St. Vancouver, BC, V6C 2X8, as a junior geologist since May 2012.
2. I am a graduate of the University of Victoria with a B.Sc. (2010) in Geosciences.
3. I am a registered Geoscientist-In-Training (GIT) with the Association of Professional Engineers and Geoscientists of British Columbia (APEG-BC) with member # 175242.
4. I personally participated in the 2013 Ryan Gold Corp. field work program at the Ida Oro property.
5. The foregoing report is based on the study of available data and company reports.

Dated in Vancouver this day the Tuesday, 26 November, 2013.

Respectfully Submitted,

Jarod Lapp, BSc., GIT

Finalized Date: 16- SEP- 2013
Account: RYGCOR

CERTIFICATE WH13158588

Project: Ida Oro

P.O. No.: IO13- 001

This report is for 3 Rock samples submitted to our lab in Whitehorse, YT, Canada on 30- AUG- 2013.

The following have access to data associated with this certificate:

SCOTT DORION	JAROD LAPP	CARRIE WONG

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
CRU- 33	Fine Crushing 95% < 2 mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME- MS41	51 anal. aqua regia ICPMS	
Au- ICP22	Au 50g FA ICP- AES finish	ICP- AES

To: RYAN GOLD CORP.
ATTN: CARRIE WONG
713 - 4TH AVENUE, LOT 12, BLOCK HD
P.O. BOX 5070
DAWSON CITY YT Y0B 1G0

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

Appendix 4 – Certificates of Work

Yukon
Energy, Mines and Resources

QUARTZ MINING ACT FORM 4 SECTION 56

APPLICATION FOR A CERTIFICATE OF WORK

Office Date Stamp

I, Robin Sudo ,

Land Manager/Ryan Gold Corp.

of #600 - 666 Burrard St., Vancouver, BC V6C 2X8

Phone 250-421-0939

Client I.D. Number: 4000351

make oath and say that:

1. I am the owner, or agent of the owner, of the mineral claim(s) to which reference is made herein.

2. I have done, or caused to be done, work, on the following mineral claim(s): (Here list claims on which work was actually done by number and name)

See attached Schedule A - List of Claims work was performed on

situated at Hamilton Creek Area Claim sheet No. 116A04 & 05 & 06

in the Dawson Mining District, to the value of at least $274,400 dollars,

since the 28th day of June to the 2nd day of Sept. 20 13 ,

to represent the following mineral claims under the authority of Grouping Certificate No. _____.
(Here list claims to be renewed in numerical order, by grant number and claim name, showing renewal period requested).

See attached Schedule B - List of Claims for Renewal

3. The following is a detailed statement of such work: (Set out full particulars of the work done indicating dates work commenced and ended in the twelve months in which such work is required to be done as shown by Section 56).

See attached Schedule C - Core Re-logging & Re-Interpretation Program/Rock Sampling/Demob

- total expenditures = $277,315.07

*** NOTE: Report to follow

Sworn before me at Grandforks this 3 day of March 20 14.

Donald Faoro
Barrister & Solicitor

Schedule C - DRILLHOLE RE-LOGGING/INTERPRETATION PROGRAM - 39 Holes

- INCLUDES DEMOBILIZATION OF DRILL EQUIPMENT & CAMP

Ida Property

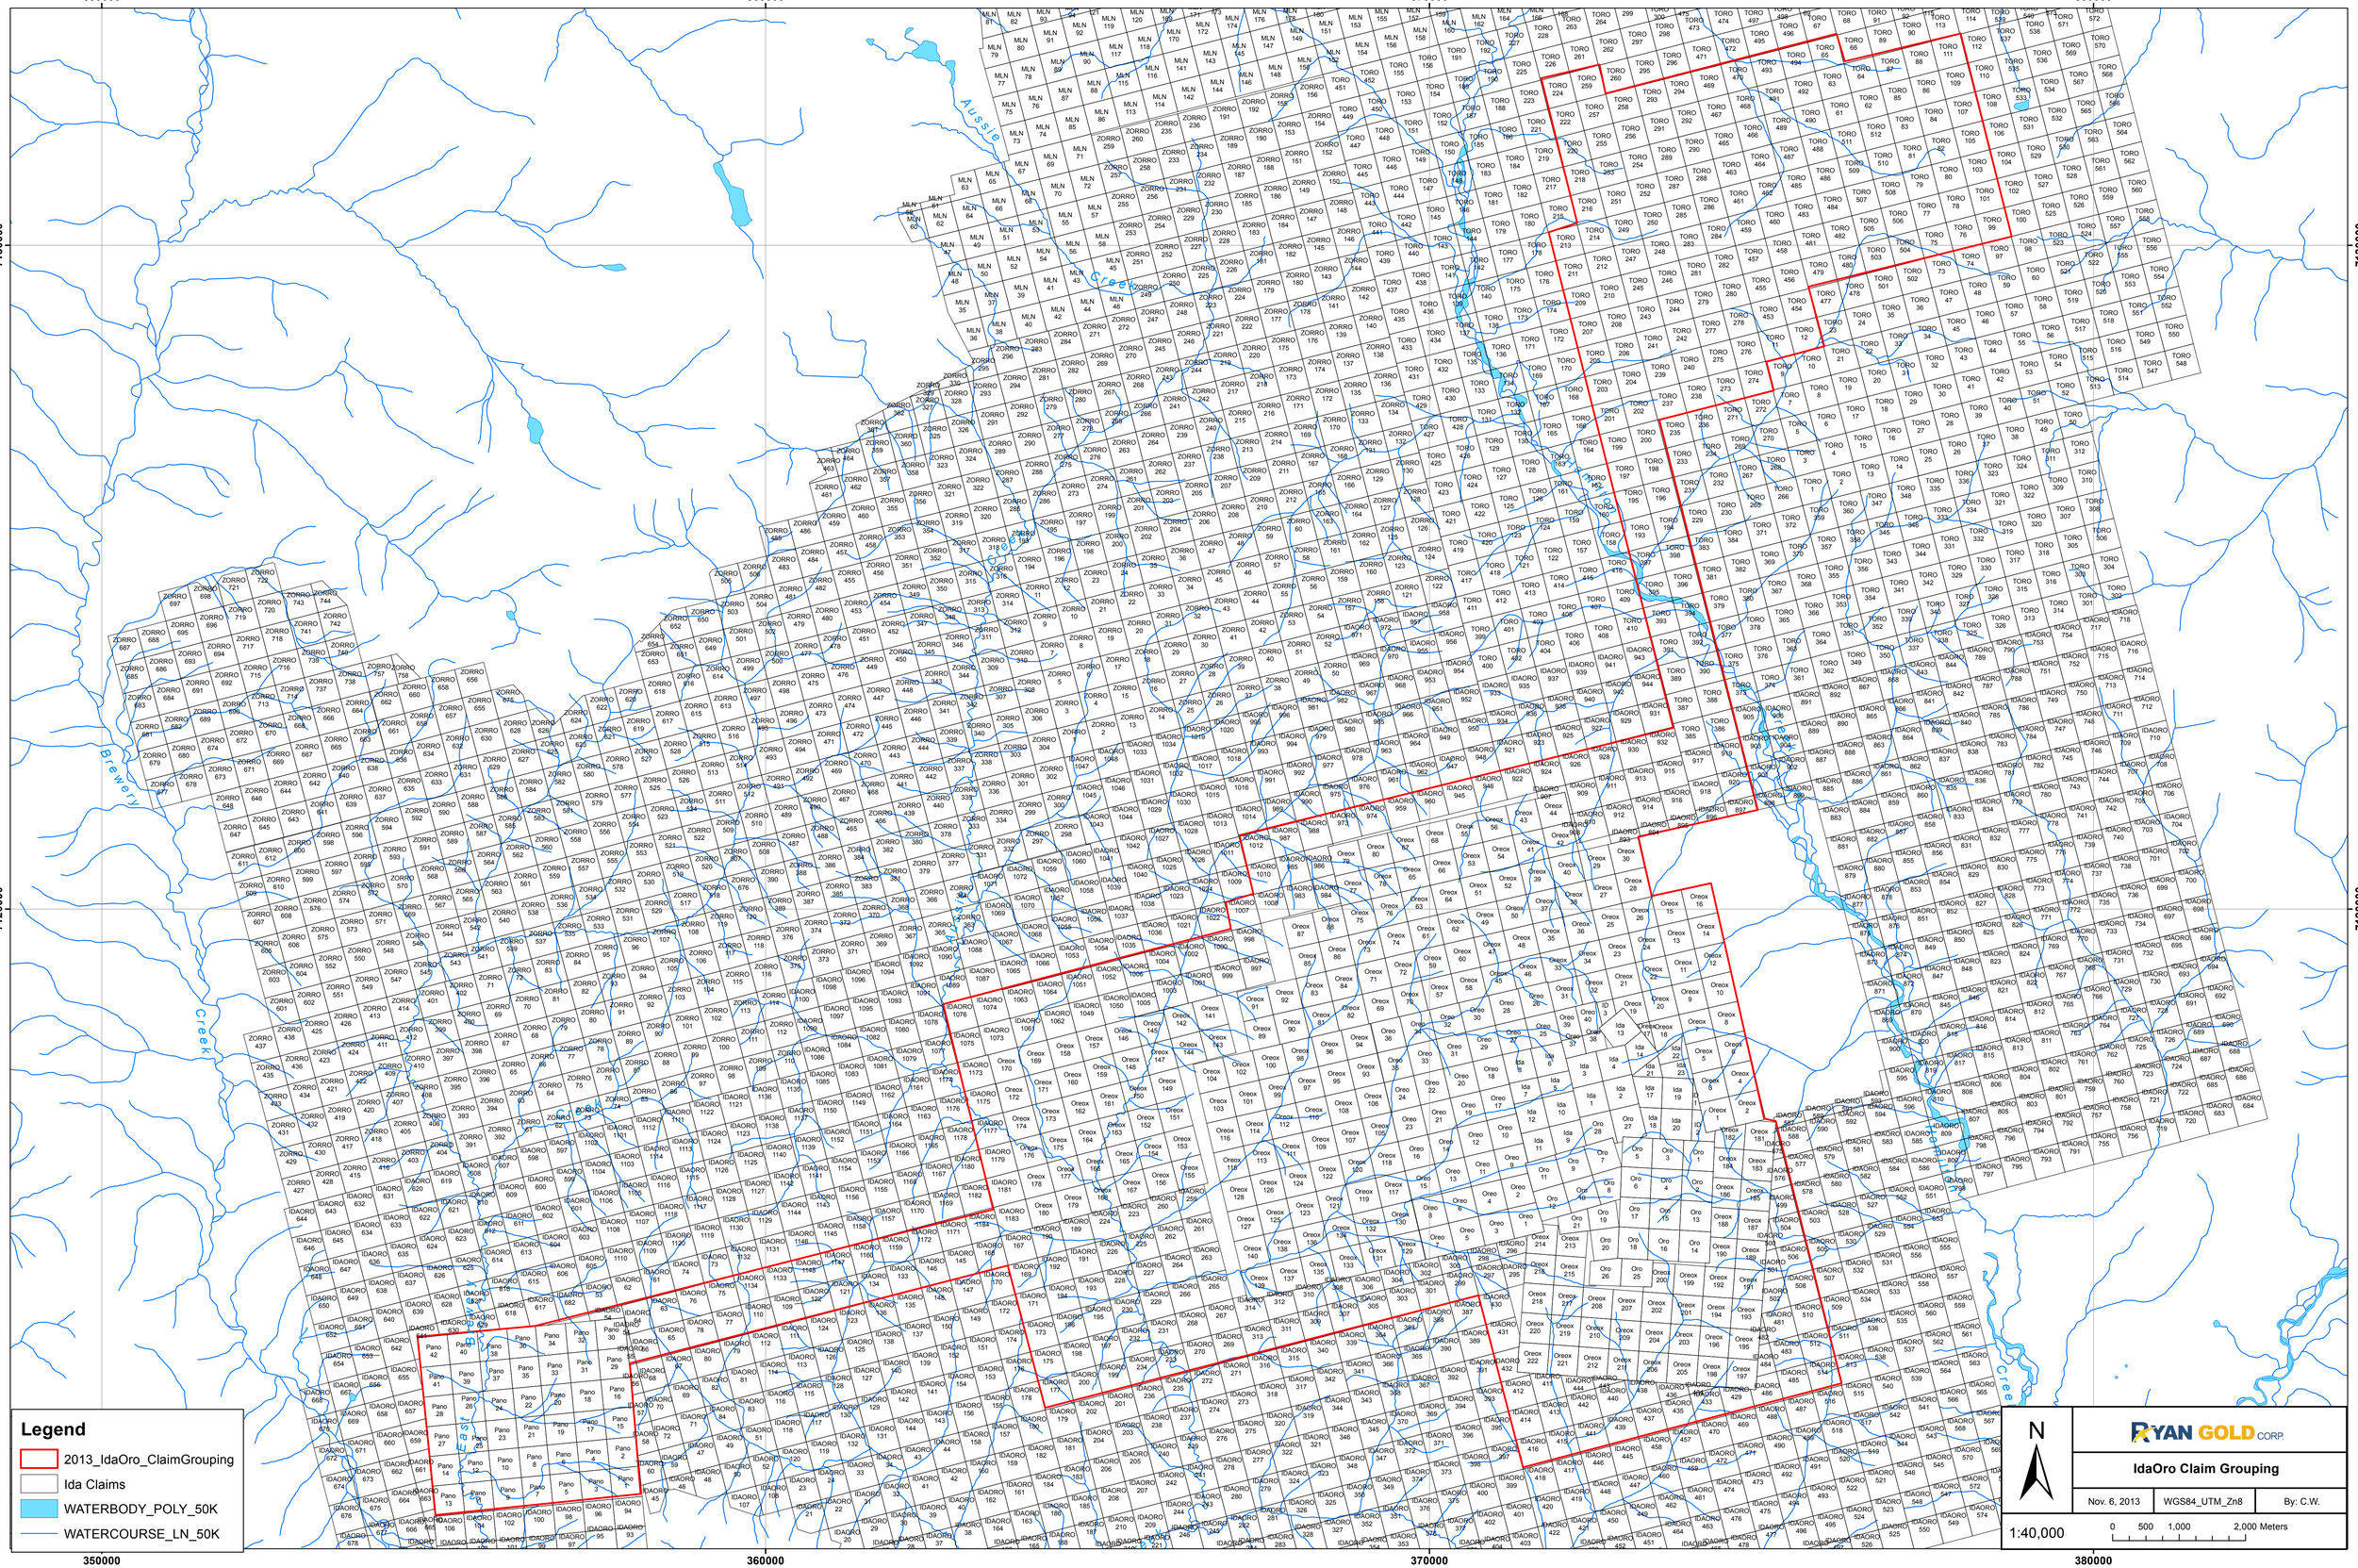

308 man days re: Core Re-logging&re-interpretation program/3 grab samples/demob drill equipment & camp from June 28 to Sept. 2, 2013

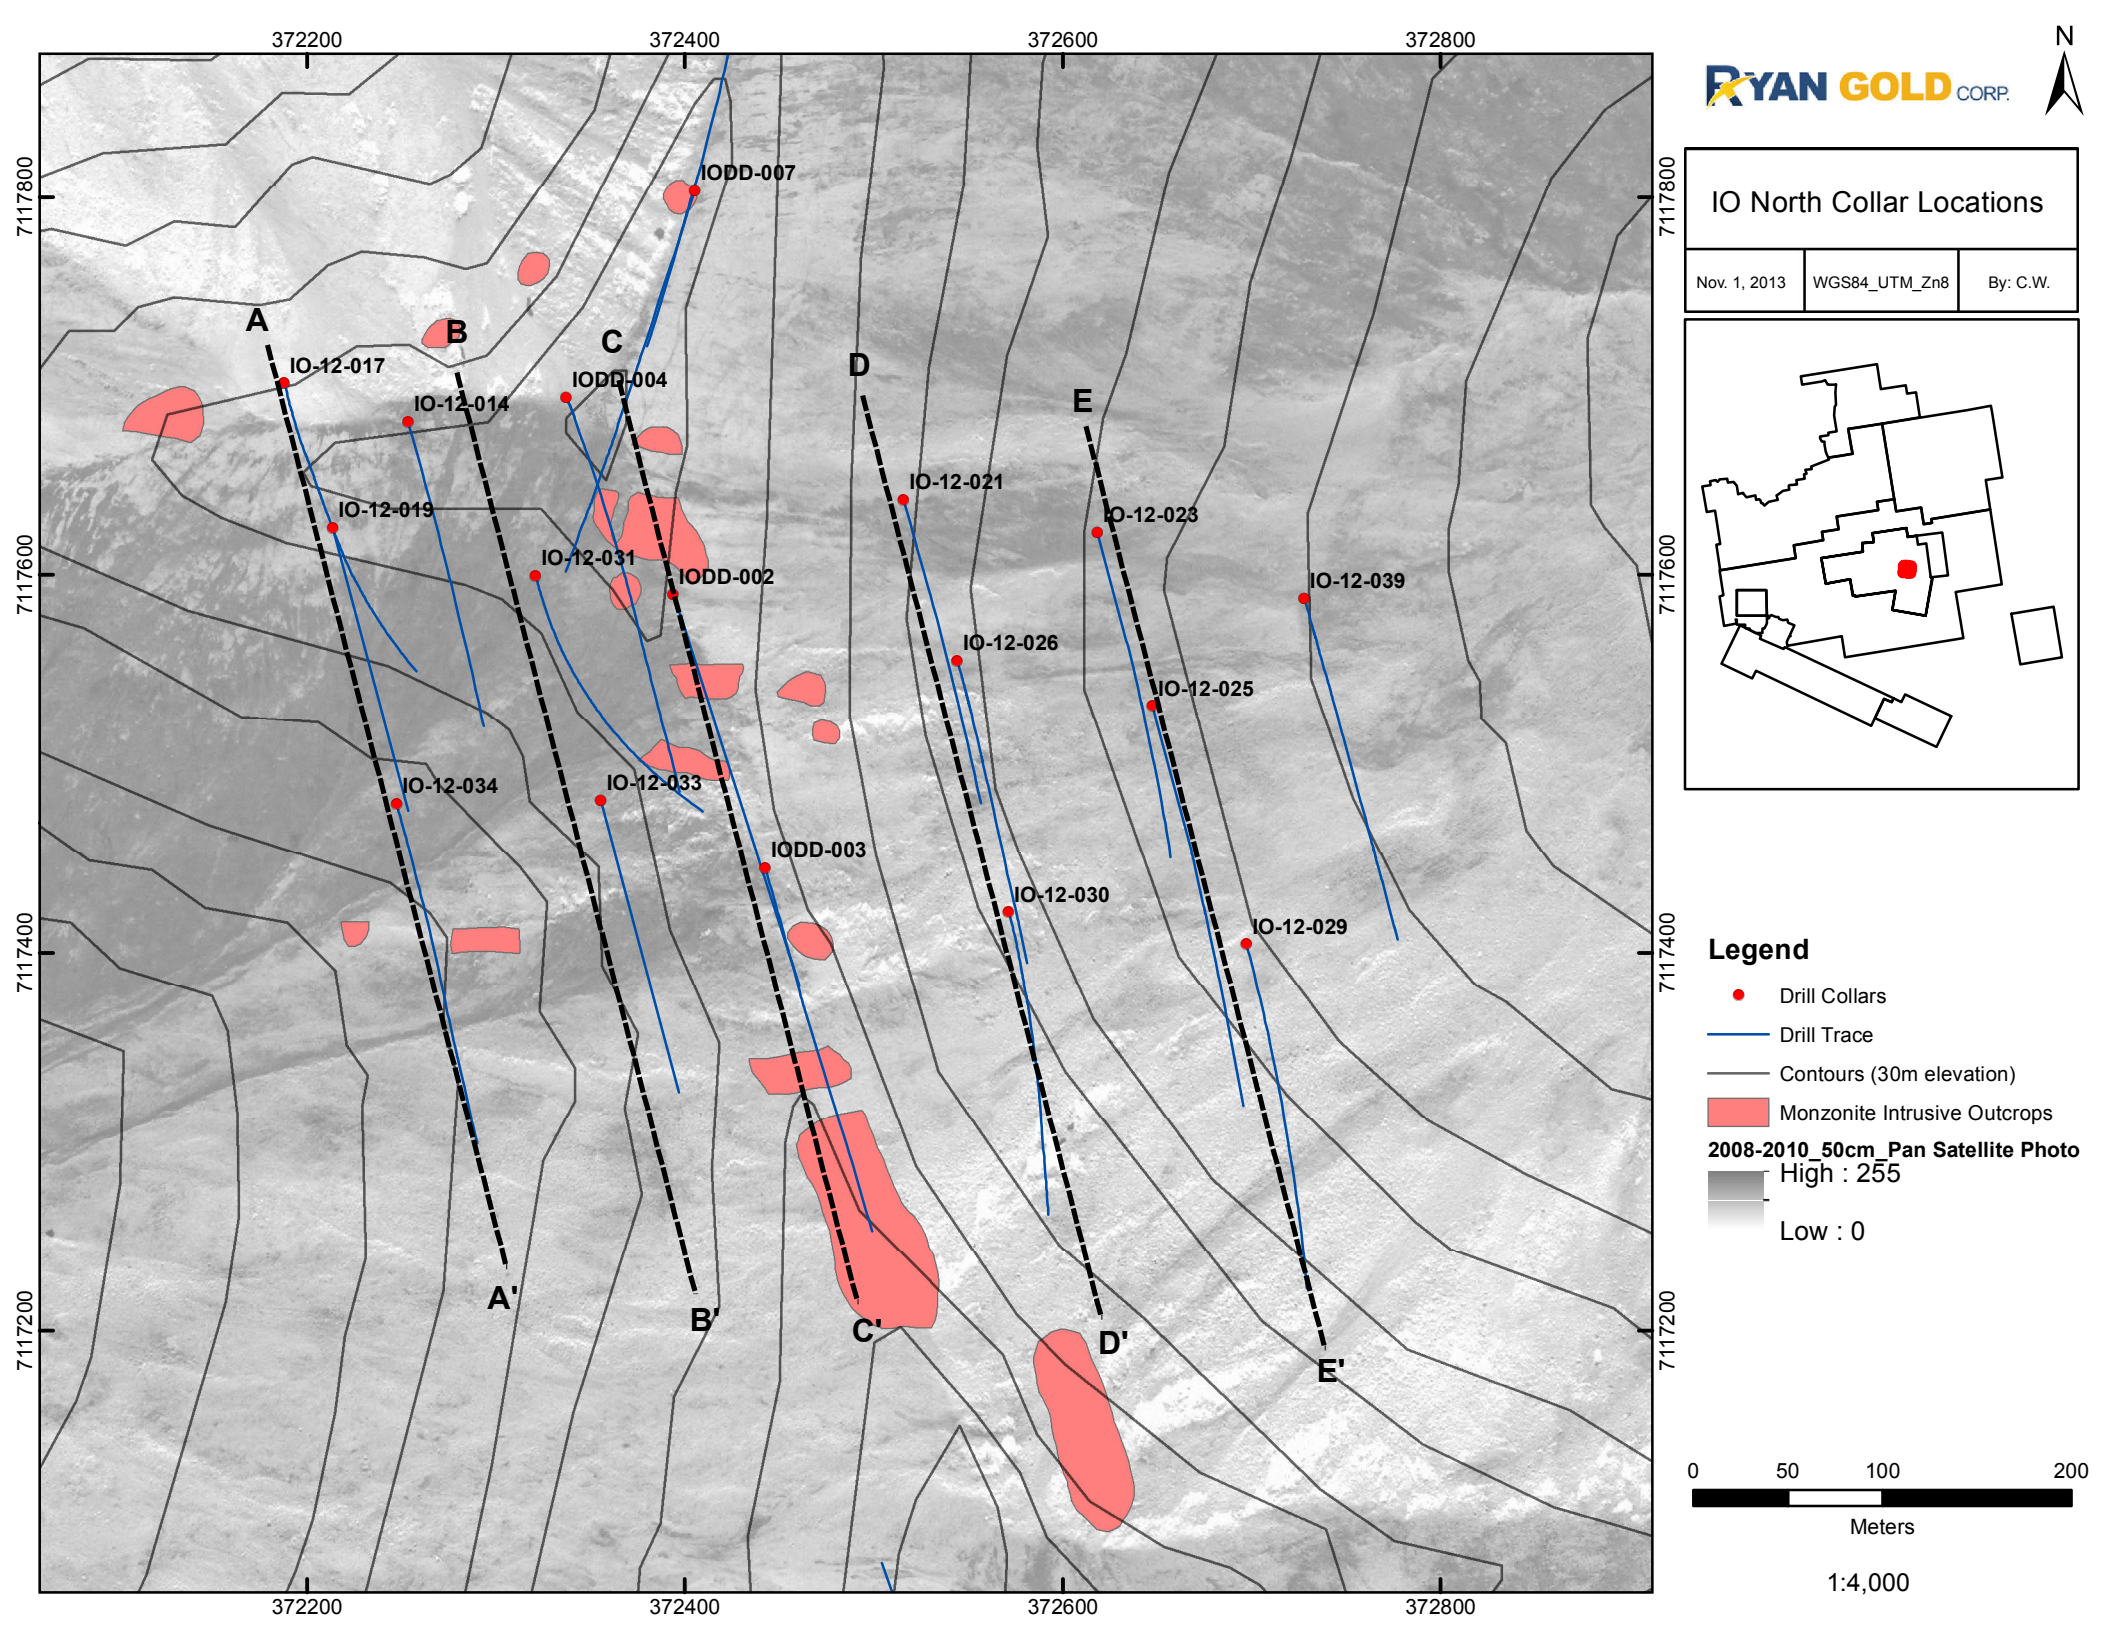

Description		Rate	Unit	Total
CONTRACTORS:				
Ground Truth Exploration - Camp Manager Costs - 28 days		$ 400.00	28	$ 11,200.00
- Camp Assistant - 18 days		$ 330.00	18	$ 5,940.00
Ian Gendall - Geological Services - over see re-logging program		$ 800.00	21	$ 16,800.00
Richard Sillitoe - Consulting Economic Geologist - 10 days				$ 24,623.00
WAGES:				
Project Geologist (6 days for demob portion)	per day	$ 395.00	41	$ 16,195.00
Geologist (6 days for demob portion)	per day	$ 310.00	37	$ 11,470.00
Geologist/GIS (5 days for demob portion)	per day	$ 310.00	39	$ 12,090.00
Jr. Geologist (5 days for demob portion)	per day	$ 300.00	47	$ 14,100.00
Camp Supervisor Person	per day	$ 450.00	20	$ 9,000.00
Camp Carpenter/Maintenance Person	per day	$ 325.00	20	$ 6,500.00
Camp Cook	per day	$ 285.00	37	$ 10,545.00
DRILL DEMOBILIZATION:				
Kluane Drilling - Aug 20 to 23/14 (Inv.8993)				$ 14,275.15
- move Drill Rig & Equipment out of Ida Camp				
CONSUMABLES & SUPPLIES:				$ 2,912.84
MAPS & REPRODUCTIONS:				$ 1,079.59
COMMUNICATIONS:				
Internet - Repair & Maintenance				$ 865.00
Xplornet - Internet Services				$ 1,388.64
ACCOMODATION and FOOD:				
Ida Oro Camp	per day	$ 35.00	308	$ 10,780.00
Food Costs	per day	$ 50.00	308	$ 15,400.00
FUEL:				
Propane/Camp				$ 4,385.24
HELICOPTER SUPPORT:				
Trans North Helicopter, Whitehorse, YK-July & Aug/14				$ 83,030.61
ANALYTICAL ANALYSIS COSTS:				
ALS Canada Ltd., North Vancouver, B.C./ROCK	per sample	$ 66.00	3	$ 198.00
REPORT WRITING:				$ 2,100.00
CORE RELOGGING/INTERPRETATION PROGRAM =				**$ 274,878.07**
