EXCAVATOR PIT AND TRENCH LOGS

Pit ID	Easting	Northing	Depth (m)	Length (m)	Width (m)	Volume (m^3)	Pit Summary
AnEx-1	619438	7113237	2.7	3.7	1.8	18.3	~9ft deep. Pit does not appear to be in alteration zone. Rock is bedded and very. competent. Lithology is fine grained micrite locally variable to fossiliferous wackestone and packstones. Minor calcite veining, oxidizing pyrite occurs within certain beds. Apparent orientation of strata is trending 105 dipping to the north. See photo 5999. Pit length and width measurements estimated from photo.
AnEx-3	619390	7113206	2.7	4.6	1.5	19.1	Pit occurs within alteration zone of footwall limestone package. ~9ft deep. Rock is still moderately competent but oxidation and decarbonitization are present. Oxidized, decarbed beds of calcareous siltstone are present. Looks very similar to material that ran in An-12-06. Photos 6006-6007. Strata is trending ~315 dipping 65 degrees to the North. Apparent orientation of moderate quality. Pit length and width measurements estimated from photo.
AnEx-4	619365	7113199	3.0	3.0	1.5	14.2	Frozen glacial till to a depth of ~10ft. Oxidizing clasts within till. Photos 6014-6015. Pit length and width measurements estimated from photo.
AnEx-5	619341	7113184	1.5	3.0	1.5	7.1	Extremely oxidized frozen material. Unable to get to a great depth. Pit is ~5ft deep. Oxidized material may be slightly transported till or fault rock as rounded clasts are noted within the oxidized clayey matrix. A layer of less oxidized material that appears to be till occurs on top. Photo 6017-6018. Pit length and width measurements estimated from photo.
AnEx-6	619311	7113238	3.7	3.0	1.5	17.0	~12 ft deep of transported cover. Top 1ft of pit is colluvial argillite horizon. Beneath that is ~5ft of sandy gravel with larger subrounded argillite clasts. Bottom of pit is oxidizing clayey till seen in AnEx-5. The gulley that is representative of the Northern fault was active during glaciation and later as a drainage and/or glaciofluvial channel. Some of the argillite clasts in the sandy transported fluvial horixon appear as though they may be altered. Photos 6021-6023. Pit length and width measurements estimated from photo. Pit length and width measurements estimated from photo.
AnEx-7	619320	7113166	1.2	3.0	1.5	5.7	Colluvial argillite horizon and then into frozen, transported cover. Pit abandoned at ~4ft depth. Pit length and width measurements estimated from photo.

Carbonate is dark grey, very fine grained and moderately calcareous. Minor interbeds of calcareous siltstone occur within the carbonate and are preferentially oxidized. Strata is folded in this pit. Apparent limb measurement of moderate quality: 135/vertical. Photo 6034. Pit length and width measurements estimated from photo.

Pit ID	Easting	Northing	Depth (m)	Length (m)	Width (m)	Volume (m^3)	Pit Summary
AnEx-12	619432	7113159	3.0	3.0	2.1	19.8	Pit approximately 10 ft in depth. Bedded limestone. Alteration is weak to non existant and largely consists of a surface oxidation. Bedding is not well defined and material in pit may be subcrop/heaved outcrop. Preferentially oxidized siltstone beds are not abundant. Photo 6037. Pit length and width measurements estimated from photo.
AnEx-13	619462	7113108	3.0	4.0	1.5	18.4	Pit is approximately 10 ft deep. Upper 2.5 ft consists of highly oxidized clay with entrained clasts. Below that horizon is 7.5 ft of dark, powdery carbonaceous argillite. Grey siliceous pods occurs disseminated throughout the argillite which may be decalicified. Grey pods are extremely low competency and contain fine grained euhedral to subhedral quartz crystals disseminated throughout. This material appears to be extremely decarbonitized and silicified. Photo 6638-6039, 6049. Alteration zone (light grey band) and upper oxide horizon appear to have parallel orientations. Both are striking ~060 dipping ~25 degrees to the SE. Pit length and width measurements estimated from photo.
AnEx-14	619423	7113108	1.8	3.7	1.8	12.2	~6 ft. Upper 3 ft consists of clayey black argillite over top of lower more competent highly fractured argillite for the bottom 3 ft. Bucket depth is restricted by bedrock. The upper argillite horizon has oxidizing seams. The lower argillite horizon is also oxidized and possibly decalcified. No obvious oxide horizon in this pit. Photo 6044. Pit length and width measurements estimated from photo.
AnEx-15	619450	7113123	2.1	4.0	1.8	15.5	~7ft deep. Appears to be very representative of fault zone. Upper 2 ft consists of colluvium. Below that ~1ft of clayey, dark carbonaceous argillite. Below that ~2.5 ft of intensely oxidized material. Bottom of pit is footwall limestone. Footwall limestone is apparently unaltered. If pit profile is representative of fault zone than it appears to confirm the fault dipping moderately to the SW. Photos 6046-6047. Pit length and width measurements estimated from photo.
AnEx-16	619390	7113132	4.6	3.0	1.8	25.5	Approximately 15 ft pit depth. The top 3ft is colluvial material. Underlying that horizon is 3 ft of black, clayey argillite with oxidizing seams. The bottom 9 ft is clayey, sandy oxide with abundant fragments of Silurian limestone. Appears to be representative of the fault zone. Photo 6050. Pit length and width measurements estimated from photo.
AnEx-17	619357	7113119	3.7	4.6	2.1	35.7	Pit ~12 ft deep in hanging wall carbonaceous argillites. Bedding is striking ~085 dipping ~50 degrees south (apparent orientation). Carbonaceous argillite outcrop, not powdery, fairly competent. No obvious alteration. Photo 5061-5062. Pit length and width measurements estimated from photo.
AnEx-18	619403	7113146	3.7	4.6	2.1	35.7	~12 ft pit depth. 2ft colluvial horizon on top. 3ft of oxidized fault zone material below and 7 ft of bedded, relatively unaltered foot wall limestone belown. Strata is trending ~285 dipping steeply to the north. Good quality apparent measurement. Photo 6053. Pit length and width measurements estimated from photo.
AnEx-19	619507	7113067	0.9	2.4	1.5	3.4	Pit abandoned after 3ft depth. Frozen boulder/subcrop of footwall limestone. Pit length and width measurements estimated from photo.
AnEx-20	619409	7113076	3.0	3.0	2.1	19.8	~10 ft of glacial till. Pit length and width are estimated based on pits with similar depth.

AnEx-212	617418	7113788	4.6	3.7	1.2	20.4	15x12x4. The upper 5ft is transported cover. 5ft-10ft is dark coloured gravelly sand (fluvial seds). The bottom of the pit is an intense alteration zone. Appears to be in bedrock. Intense oxidation of limestone. Limestone is micrite with CBx texture. More platy than is typically noted in the footwall limestone but does appear very similar in appearance to the footwall carbonate unit. Based on pit location there appears to be geometric devience in the Anubis fault at this location. Possibly a bend or stepover. Photos 6511-6518.
AnEx-213	617390	7113740	4.6	3.0	1.2	17.0	15x10x4. The entire pit is transported cover. Subrounded limestone boulders in a light brown sandy matrix. Non consolidated. P.6522-6523.
AnEx-214	617359	7113697	4.6	3.0	1.2	17.0	15x10x4. The entire pit is unconsolidated transported cover. Appears to be glacialfluvial sediments. Photos 6524-6525.

AnEx-251	619464	7113086	14.9	14.9	3.7	815.9	Trench running SE-NW through AnEx 13 which returned Au grades. Regarding location in trench, 0m is located at the NW end of the trench where the alteration begins. Alteration is sandy decarb with associated base metal alteration. Pb-Fe-As-Sb oxides found throughout the trench. the trench is 15m long with about 14m in the alteration zone. Starting from the NW the alteration is dominated by sandy decarb with galena in separate lenses in the first 8ft. At around 10ft the alteration changes to oxide zone with orange-yellow oxide, then back into sandy decarb alteration. Clay is variable throughout. Some blue-grey staining is notes in sections. Pit depth and width based on photos.

AnEx-252	619066	7113538	7.9	7.9	3.7	229.7	A N-S oriented trench was centred on the UTm above, and was in alteration zone of clay altered bedrock for 8meters. 4meters on either side of the UTM. A trench was started at the UTM trenching perpendicular to the N-S trench trenching to the west. It was only in alteration zone for 3m then hit bedded unaltered limestone. Bedding was 125/40. Alteration zone is bedding parallel. Pit depth and width based on photos.
AnEx-253	619055	7113548	3.7	2.4	1.2	10.9	12x8x4. This pit had 8ft of till cover then into clay altered bedrock with light color brown dirt that is limey. This is thought to represent the NE boundary of the alteration.
AnEx-254	619047	7113549	3.7	2.4	1.2	10.9	12x8x4. This pit had 6ft of till cover then into orange clay altered bedrock. The bedrock was very crumble and clay rich. There were many altered rock fragments in the pit. Some beige clay, some silicified and decarb alteration.

COMMENTS
The hole made water due to a large fault zone between ~270-300 m. The drillers had difficulty plugging the hole, but in the end were successful. Hole was ended because it was past the projected contact with the mudstone and the limestone was very barren looking.

3.35	43.20	39.85	LST	MG	Crystalline limestone interbedded with beef calcite and fine non - calcareous mudstone. Throughout interval rocks are veined with < 1cm calcite, only very locally with > 1cm calcite veins. Evidence for slip along bedding and hairline fractures that offsets bedding.							
						DK	GY	BD	OXI	1I	--	0
43.20	46.02	2.82	MST	FG	Non calcareous; brown-grey -green in colour. Highly strained/sheared particularly over first 1.82 m of interval.							
						MD	GN	SN	CLY	5I	--	0
46.02	54.82	8.80	LST	FG	micritic, interbedded with minor amounts of non-weakly calcareous siltstone/mudstone. Bedding looks to be offset along fractures. Locally find oxidation taking place along fractures.							
						LT	GY	BD	OXI	2I	--	0
54.82	59.74	4.92	MST	FG	Clay altered over 10cm at very start of interval. Overall light grey-green in colour. Well bedded and locally tightly folded (near to faults/fractures?). Bedding is offset along fractures.							
						LT	GY	BD	CLY	2I	--	0
59.74	75.15	15.41	DST	FG	Light grey to beige in colour. Relict bedding marked by dissolution seams that look to be stylolitic. Fractured and veined with dolomite and calcite. Crackled texture with fine black seams throughout this interval.							
						LT	BG	CR	---	--	--	0
75.15	79.17	4.02	MST	FG	Not entirely sure that this is O-DMT that may be folded with underlying O-DST?. Bedding in mudstone over first metre is roughly parallel to core axis. Looks a bit like interval between 65.40-67.49. Veined with calcite and dolomite perpendicular to bedding.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
79.17	96.66	17.49	DST	FG	For the most part, rocks in this interval appear to be massive. Crackled with fine black seams. Veined with calcite and dolostone. Locally interbedded with dark grey mudstone horizons.							
						LT	BG	CR	---	--	--	0
96.66	127.75	31.09	LST	FG	Interbedded/laminated and folded with non-weakly calcareous siltstone and mudstone. Visibly mineralized in veins starting at ~ 118.75m							
						LT	GY	BD	---	--	--	0
127.75	133.29	5.54	LST	FG	Folded and faulted. Looks quite clay altered (medium to dark grey-green in colour) over last 2m of interval. Evidence for slip parallel to bedding. Locally mineralized on bedding planes.

						MD	GN	SN	CLY	5I	Re	30
133.29	212.40	79.11	LST	FG	Fractured over first ~ 3m downhole of mineralized zone. Arsenic oxide on fractures and bedding planes up to 149m depth. Minor amounts of mineralization also. Rocks in this interval are very compentent. Bedding is folded.

						MD	GY	BD	ASO	2I	Re	0.5
212.40	219.76	7.36	MST	FG	20-30 cm down hole of contact, rocks are a medium grey colour and then quickly transitions into bleached green down to ~ 213.76 m where it becomes bleached green interbedded with bleached maroon to 216.71 m. Below 216.71 m to end of hole, mudstones become distinct maroon and green colour typical of this unit. Evidence for displacement along bedding in this interval.

2.41	18.59	16.18	LST	MG	Medium - coarse grained, crystalline limestone interbedded with beef calcite and minor floatstone. Contact with underlying green-brown mud-siltstone looks to be gradational and pervasively sheared. Rocks in this unit are quite faulted and calcite veined. Clay alteration is associated with fault and shear zones. Iron oxidation most noticable in veins immediately adjacent to wall rocks, could it be oxidation of pyrite?

18.59	23.46	4.87	MST	FG	First 1.5 m of interval is intesnely sheared with what looks like C-LST. Bedding is weakly preserved below ~ 20.12m to contact with underlying O-LST1. Brown-green colour dominates below ~ 19.80m

23.46	70.41	46.95	LST	FG	Limestone interbedded and intensely folded with green-grey, non-weakly calcareous mud/siltstone particularly over the first 5.5m immediately downhole of contact with O-DMT. A little bit of realgar mineralization visible along bedding at 55.17m.

70.41	73.46	3.05	LST	FG	Mineralized interval. De-calcified and clay altered limestone? Where mineralization is most intense, primary structures are not recognizable. Definitely folded and faulted here. Downhole of mineralization, orpiment and realgar mineralization is visible along bedding and fracture planes.

137.50	158.80	21.30	MST	FG	Noncalcareous, finely laminated/bedded green and maroon mud-siltstone. Grey in colour over first 60 cm downhole of contact. Faulted in a few sections with minor amounts of quartz veining.

2.44	59.20	56.76	MST	FG	Finely laminated, grey-green mud and siltstone. Weakly folded? Definitely faulted and fractured. Is this really basal O-MST1? Or the more siliceous upper part of C-LST2 that would roughly equate to the 'Mystery Unit' at Isis?

59.20	118.26	59.06	LST	MG	Crystalline limestone interbedded with beef calcite and weak-non calcareous mudstone. Fractured and faulted over entire interval. Clay alteration is associated with fault gouge. Evidence for displacement along bedding. Veined with calcite.

118.26	130.25	11.99	MST	FG	Bleached, light grey-green-maroon looking mud-siltstone. Arsenopyrite or pyrite disseminated most noticably over ~ 70cm uphole of contact with O-LST1

130.25	195.97	65.72	LST	FG	Strained, particularly 50 cm downhole of contact with overlying mudstone. Preserves lots of evidence for dissolution along bedding. Lots of calctite veining. Openly folded. Limestone is interbedded with thick intervals of green-grey, noncalcareous silt-mudstone.

COMMENTS
The hole was ended because it was was drilling nearly down bedding, it was in and out of fracture and vein hosted realgar zones in a rock type that showed no alteration and wasn't a particularily good looking host. The last run had realgar in it, but the call was made to shut down and move on.

Core competent, local fractures and faults infilled with dolomite, offset bedding, and develop local networks. Local decreases in core competency due to fracturing and local faulting, with several zones of mineralization. Core is very hard and overheats saws cutting, though designated as IA-SLT? COMMENTS
Hole ended because it was through the projected mineralized zone. Did not try to get to the mudstone contact.

3.96	62.20	58.24	SLT	FG	is this the correct unit classification?? Suspect this may actually be O-MST3, or the siliciclastic dominated 'top' of C-LST2. Rocks look to be fractured and highly strained in places, particularly down to ~ 26.80m. Interbedded with very minor, thin beds (~ 5-10 cm) of fine - medium grained sandstone (or dolostone?) with fine black seams throughout it. Clay alteration is associated with fault zones.

62.20	134.32	72.12	LST	MG	In gradational contact with mud/siltstone unit described above, over ~ 3.70m below contact. Interbedded with beef calcite and minor green-grey, non calcareous mud/siltstone with blebby - disseminated pyrite in main part of interval. Iron oxide commonly observed on bedding and fracture planes. Less than 1m uphole of contact with O-DMT, limestones are quite fractured and moderately deformed.

134.32	154.54	20.22	MST	FG	Appears to be interbedded and sheared with C-LST2. Below gradational contact, rocks look quite fractured though bedding is still preserved. A zone of brecciation begins at ~ 145.25m. Intensely brecciated over first 0.48m, reddish-brown and green in colour. Highly fractured and faulted with abundant black veinlets. Contact with underlying O-LST1 looks quite sharp and also openly folded. Pyrite mineralization is patchy and dissemintated.

Abundent evidence for dissolution and displacement along bedding. Mineralized with realgar and orpiment. Minor amounts of dissemenated pyrite also.
