60.88	63.01	2.13	GRD	MG	Pervasive strong phyllic with patchy moderate-weak argillic. Cut by many white calcite/white massive quartz stringers and veinlets, netted in places. Overall, feldspars are fully altered to clays/sericite. Some veinlets have red hematite staining. Blebby hematite at 61.90m. Weak-moderate clay development on fractures. Veinlets are often banded-interstitial blends of quartz and calcite. Mineralized veinlets have disseminated-blebby pyrite. Weak patchy overprinting potassic alteration.

66.40	71.35	4.95	GRD	MG	As at 60.88-63.01m. Patchy argillic, pervasive strong phyllic. Semi-netted to crackled calcite-colloform quartz veinlets. Vuggy, with partial infill by calcite-colloform quartz. Calcite can be massive, dogtooth spar, and coarse crystalline. Quartz is comb-colloform. White quartz vein hosting blebby galena at 69.60m. Limited massive smoky quartz veinlets. Blebby pyrite near smoky quartz, finer disseminated pyrite otherwise.

80.52	83.74	3.22	GRD	MG	Strong overprinting argillic and phyllic, with weak to moderate potassic. Combination of potassic alteration and weak hematite staining gives groundmass a very pink colour. Feldspars are fully altered, with white-green colour. Crosscut by quartz-calcite veinlets, mostly at 50-60 degrees TCA. Stronger phyllic alteration near veinlets.

6.10	41.95	35.85	GRD	MG	GRD with moderate fracturing throughout. Moderate orange-brown limonite oxidation on fractures, in some vein halos, and in broad patches. 23.46-25.30m is strongly oxidized, with up to 1cm orange gouge along fractures. Phyllic alteration is limited to vein halos. Halos range from0.5cm to greater than 5cm in width. Calcite veinlets are found throughout, less frequently between 6.10-20.90m. Calcite veinlet frequency is up to 5-10 veinlets per metre. One interval of silicification at approximately 36-39m where mineralized vein density increases. Mineralized veining consists of smoky-milky quartz with Py>>Cpy. Rare xenoliths of dark, mafic-rich material.

41.95	57.00	15.05	FLT	MG	Moderate argillic leading to crumbling (to sand in most places) and complete alteration of feldspars to clays. Patchy weak potassic alteration results in splotches of pink colour. Dyklets of black breccia at 43-43.45m. Breccia hosts fragments of granodiorite and carbonate fragments. Both breccia and granodiorite are cross cut by calcite veinlets/stringers. Entire interval is extremely fractured and broken. Some fracture faces are coated by white calcite with weak red hematite staining. Very poor recovery and RQD. Cut by calcite and mineralized veinlets, but their character and frequency are difficult to determine because of high degree of breakage. 2ft of lost core at 53.95m.

124.52	128.81	4.29	GRD	MG	Lower half of the alteration halo surrounding the quartz feldspar porphyry dyke. Halo hosts a large 1.3m quartz and massive sulphide veins and many quartz/carbonate/sulphide veins that are proximal to it. Granodiorite proximal to these veins is strong to intense phyllic altered and strongly silicified and hosts disseminated to blebby pyrite. Granodiorite located distal to vein zone is moderately phyllic altered and transitions to argillic alteration at the furthest extent from the vein zone.

197.55	212.40	14.85	GRD	MG	Moderately phyllic altered granodiorite with a patch of moderate argillic and weak propyllitic alteration. Portions of the interval have been altered to gouge. Phyllic alteration is strong proximal to quartz sulphide veins and hosts disseminated pyrite.

1.52	24.88	23.36	GRD	MG	Relatively unaltered granodiorite with oxides on fracture faces. Cobbley mafic xenoliths are common. Dominant veinlet set at 60 degrees TCA between 6.50-12.75m is quartz-calcite with a weak chlorite/propylitic halo. Occasional rubble zones with strong oxidization and gouge development.

50.22	54.90	4.68	GRD	MG	Moderate pervasive argillic with patchy phyllic and moderate pervasive brown oxidization. This interval may represent the drill hole runnig sub-parallel to a contact with QFP. Typical veining seen near QFP-granodiorite contacts can be found at 52.84-53.14m. Also, a fragment of QFP is seen at 53.99-54.11m. It doesn't fully intersect the core. Banded ankerite-quartz veinlets are seen near the QFP.

126.19	139.38	13.19	GRD	MG	Granodiroite following fault. Several overprinting alterations. Argillic and phyllic are patchy-pervasive and moderate-strong. Strong argillic is crumbled, often rubbly. Patchy weak potassic and weak clay alteration near gouge and rubble. Crosscut by quartz-calcite-ankerite veins with phyllic halos and argillic outer halos. Strong veining and gouge near contact with quartz feldspar porphyry dyke. This interval includes the BRX vein zone.

140.37	172.21	31.84	GRD	MG	Granodiorite with patchy-pervasive phyllic, patchy argillic, patchy potassic, and patchy propylitic. Crosscut by calcite-quartz-ankerite veins with phyllic into argillic halos. Upper interval near quartz feldspar porphyry dyke is veined and hosts disseminated-blebby pyrite. Occasional gouge in phyllic alteration. EOH

1.52	27.93	26.41	GRD	MG	Granodiorite with patchy and vein-associated argillic and phyllic alteration. Weak patchy silicification, propylitic, and potassic overprints. Semi-pervasive to fracture-associated moderate oxidation. Relatively coherrent recovery. Crosscut by calcite-chlorite with propylitic halos and massive dark grey quartz veins.

Pathcy weak potassic and silicification variably overprint other alterations. Potassic usually overprints argillic, and silicification is more common near veins. Kmost veins host sulphides (blebby pyrite/sphalerite). Veins tend to be white-smoky quartz-carbonates. Vein halos often overprint one another. Veins are rich, but widely spaced, inhibiting grade. Veining is dominated by white-massive quartz with massive pyrite. All vein featured are variably brecciated. Early ankerite veins were brecciated by the main quartz-pyrite mineralizing phase. Ankerite clasts show banded-colloform textures. Other sulphides include: blebby honey brown sphalerite, fine bladed arsenopyrite, blebby-banded-massive galena, and blebby-interstitial chalcopyrite (interstitial to pyrite). Calcite is found in crosscutting veins and interstitially within quartz-pyrite.

79.80	104.15	24.35	GRD	MG	Granodiorite with weak-moderate pervasive propylitic alteration, overprinted by phyllic and argillic vein halos. Pathcy weak potassic and silicification variably overprint other alterations. Potassic usually overprints argillic, and silicification is more common near veins. Kmost veins host sulphides (blebby pyrite/sphalerite). Veins tend to be white-smoky quartz-carbonates. Vein halos often overprint one another. Veins are rich, but widely spaced, inhibiting grade. No increased vein density near quartz feldspar porphyry contact.

105.31	118.88	13.57	GRD	MG	Weak pervasive propylitic alteration with overprinting patchy potassic and silicification. Patchy to vein-associated phyllic and argillic alteration due to vein halos. Halos variably overprint on another, leading to strong phyllic alteration overall. Zone of fracturing at 111.4-113.7m. Weak clay alteration in fracture zone.

118.88	119.49	0.61	QFP	FG	Moderate hydrothermally altered quartz feldspar prophyry dyke with limited flow banding, mainly near contacts. Very similar to the dyke at 121.68-122.00m, but different from the dyke at 104.15-105.31m.

119.49	139.82	20.33	GRD	MG	Granodiorite dominated by moderate phyllic and argillic from overprinting vein halos. Veins tend to be quartz-carbonate, with weaker mineralization than at 79.80-104.15m. Veins typically host blebby pyrite. Cut by narrow quartz feldspar porphyry dyke, likely due to interfingering.

3.20	9.14	5.94	GRD	MG	30 ft casing. Rubbly recovery, with patchy silicification, moderate oxidation, moderate pervasive propylitic, and patchy weak argillic. Some fractures have slickensides. Oxides and hematite staining on most fracture faces. Propylitic leads to high chlorite content and medium green colour. Patchy-pervasive hematite gives a dark purple colour. Crosscut by chlorite stringers. Similar alteration style as seen in BYG (2012 drill hole intercepts).
