INTRODUCTION

The Hooch and Moraine claims are referred to collectively as the Moraine property. This property lies in southwestern Yukon and covers the Moraine Showing (a copper, gold, silver, molybdenum and tungsten skarn horizons and a nearby auriferous quartz vein plus several geochemical and geophysical anomalies. The property is wholly owned by Strategic Metals Ltd.

This report describes geochemical sampling and hand pitting completed between May 29 and June 9, 2015 by Archer, Cathro & Associates (1981) Limited on behalf of Strategic Metals. The author interpreted all results from this work, and his Statement of Qualifications is in Appendix I. A Statement of Expenditures is in Appendix II.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Moraine property comprises 326 contiguous mineral claims, which are located on NTS map sheets 115A/15 and 115H/02 at latitude 61°01' north and longitude 136°38' west (Figure 1). The property covers an area of approximately 6500 ha (65 km²). The claims are registered in the name of Archer Cathro, which holds them in trust for Strategic Metals. Specifics concerning claim registration are tabulated below, while the locations of individual claims are shown on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>
Hooch 1-12	YD07557-YD07568	March 23, 2027
13-30	YF35513-YF35530	March 23, 2025
31-254	YF35741-YF35964	March 23, 2022
Moraine 1-72	YF30621-YF30692	March 23, 2025

* Expiry dates include 2015 work that has been filed for assessment credit, but has not yet been accepted.

The Moraine property lies 14 km east of the Aishihik Lake Road, at a point 20 km north of its junction with the Alaska Highway. Access to the property is generally via helicopter, but an old bulldozer trail extends to the property from Cracker Creek at km 1529 on the Alaska Highway (Figure 2). The Alaska Highway is usable in all seasons by two wheel drive vehicles. The community of Haines Junction is the nearest supply centre and is located 60 km southwest of the property.

HISTORY AND PREVIOUS WORK

The first recorded work at the Moraine Showing was done in 1934 or 1935 when Chief Hutshi Joe and Hutshi Jackson staked the Moosehide claims. Six hand pits, a four metre shaft and four, four metre long open cuts were completed at that time. No results were reported and the claims were allowed to lapse following this work.

The showing was restaked by independent prospectors as the Fox claims in 1947 and the Ox claims in 1954. Work programs from that era comprised only small scale trenching. No assessment reports were filed for this work.

In 1961, the showing was restaked by independent prospectors as the Ball claims. Bulldozer trenching was performed that year, and hand trenching was completed between 1964 and 1966. No assessment reports were filed for any of this work.

View of Moraine Showing outlined in red (facing northwest).

In 1966, Empress Mines Limited (Atlas Exploration Limited and Nippon Mining Limited) staked the AH claims immediately west of the Ball claims. Minor prospecting was done before the ground was allowed to lapse.

In 1967, the Ball claims were optioned by two prospectors who performed trenching before dropping their option. In 1968, Union Carbide Mining Limited optioned the Ball claims and performed bulldozer trenching, geochemical and magnetic surveys, and mapping. In 1972 and 1975, additional hand trenching was completed by the prospectors who staked the Ball claims. No assessment reports were filed to document any of this work. The Ball claims lapsed following the 1975 trenching.

In 1978, Whitehorse Copper Mines Limited restaked the showing as the Coot claims, and then formed a joint venture with Hudson Bay Exploration and Development Company Limited. Work performed by the joint venture comprised geochemical and magnetic surveys, as well as mapping (Downing, 1979). The magnetic survey identified two parallel magnetic highs that were interpreted to reflect magnetite and pyrrhotite skarn horizons. In 1981, Hudson Bay Exploration performed mapping, geochemical sampling, hand trenching and VLF-EM surveys. Results from this exploration program were not published.

In 1985, the Geological Survey of Canada (GSC) conducted a regional geochemical survey (RGS) consisting of low-density stream sediment and water samples on NTS map sheet 115H

(Friske et al., 1985). Four samples were taken from creeks draining the Hooch claims. The results are listed in Table I.

Table I – RGS Stream Sediment Samples – Open File 1219

Sample #	Year	Au (ppb)	Ag (ppm)	As (ppm)	Cu (ppm)	Hg (ppb)	Zn (ppm)
851622	1985	0.5	0.1	1.8	14	38	58
851624	1985	0	0.1	2.3	17	34	48
853070	1985	0.5	0.1	2.5	11	29	33
853071	1985	1	0.1	3	9	31	43

Relative to other samples collected from NTS map sheet 115H, these samples returned an 80th percentile value for silver, but less than 50th percentile results for gold, arsenic, copper, mercury and zinc.

In 1989, the Moraine Showing was restaked by Aurora Gold Limited. Work performed included a magnetometer survey and geological mapping (Stephen, 1990). Chip sampling across an epidote skarn exposure returned 2.06 g/t gold, 2.48% copper, 56.9 g/t silver, 693 ppm molybdenum and 366 ppm tungsten over 3.4 metres. A specimen of rusty, garnetiferous limestone assayed 2.47 g/t gold and 0.17% copper. The magnetic survey identified numerous broad magnetic highs, which were thought to outline magnetite-rich granodiorite, and a narrow linear high, which corresponds to the mapped skarn zone. The most interesting magnetic anomaly was reportedly located east of the known skarn zone in an area with thick overburden and vegetation cover. The claims later lapsed.

In 1993, the GSC conducted a regional geochemical survey consisting of low-density stream sediment and water samples on NTS map sheet 115A (Friske et al., 1994). Two samples were collected from creeks draining the Moraine claims. The results are listed in Table II.

Table II – RGS Stream Sediment Samples – Open File 2859

Sample #	Year	Au (ppb)	Ag (ppm)	As (ppm)	Cu (ppm)	Hg (ppb)	Zn (ppm)
931143	1993	9	0.2	2.1	106	140	21
931144	1993	15	0.4	36	105	78	76

Samples draining the Moraine claims returned strongly anomalous values relative to other samples taken from the same map sheet. Silver and copper were in the 99th percentile, arsenic and mercury were in the 95th percentile and gold was in the 90th percentile. Zinc and other elements were below the 80th percentile threshold.

In 2009, Strategic Metals staked the Hooch 1 to 30 claims, and in summer 2010 it performed one day of prospecting and soil sampling. Results from this work included a 4.5 m chip sample of skarn that returned 0.391 g/t gold, 10.6 g/t silver, 0.32% copper, 340 ppm molybdenum and 350 ppm tungsten. Soil samples collected from overburden on the floors of old trenches returned strongly anomalous results up to 636 ppb gold (average 50 ppb), 23.6 ppm silver (average

2.25 ppm), 13,350 ppm copper (average 1016 ppm), 170 ppm molybdenum (average 18 ppm) and 1680 ppm tungsten (average 134 ppm). Grid soil sampling in nearby, undisturbed areas yielded much weaker values up to 19 ppb gold, 0.4 ppm silver, 148 ppm copper, 47 ppm molybdenum and 10 ppm tungsten (Smith, 2011).

In July 2011, Bonaparte Resources Inc. optioned the Hooch claims from Strategic Metals. Bonaparte performed a small geochemical sampling program comprising 16 rock and 119 soil samples. Grid soil samples yielded a few moderately anomalous values for gold (up to 27 ppb), silver (up to 1.1 ppm), bismuth (up to 5 ppm), copper (up to 118 ppm) and molybdenum (up to 23 ppm). Values for iron and tungsten were low. Trench floor soil samples yielded some strong to very strong values for gold (up to 205 ppb), silver (up to 10.5 ppm), bismuth (up to 8 ppm), copper (up to 3570 ppm), iron (up to 16.7%), molybdenum (up to 130 ppm), and tungsten (up to 1780 ppm). Rock samples of skarn returned values up to 2.1 g/t gold, 425 g/t silver, 55 ppm bismuth, 7.22% copper, 38.6% iron, 804 ppm molybdenum and 930 ppm tungsten, while a quartz vein sample yielded 13.7 g/t gold, 9.9 g/t silver and 21 ppm bismuth with low copper, molybdenum and tungsten values (Smith, 2011).

In November 2011, Strategic Metals staked the Moraine 1 to 72 claims to cover the probable source area of the anomalous 1993 RGS samples.

In December 2011, Bonaparte contracted Geotech Ltd. of Aurora, Ontario to perform helicopter-borne VTEM and magnetic surveys over the Hooch 1 to 30 claims, Strategic Metals' Moraine 1 to 72 claims and open ground between them.

In February 2012, Strategic Metals staked the Hooch 31 to 254 claims to cover the geophysical survey area, thereby connecting the original Hooch and Moraine claim blocks.

In September 2012, Strategic Metals performed a soil and silt geochemical sampling program comprising 561 grid and contour soil samples and 72 silt samples in the southeastern part of the Hooch claim block. Grid soil sampling outlined a 1000 by 1000 m area with elevated silver, arsenic, copper and molybdenum, but low gold and bismuth values. In the northwest corner of the soil grid three isolated moderately to strongly anomalous gold values (up to 263 ppb) were returned; however, these samples lack pathfinder element support. Contour sampling south of the grid highlighted three zones of anomalous soil geochemistry. The first is an isolated very strongly anomalous gold (368 ppb) value near the southern property boundary. The second is a gold (29 ppb) and arsenic (21.5 ppm) anomaly that is also situated near the southern property boundary, and the third is a copper (253 ppm), silver (0.15 ppm) and arsenic (82.8 ppm) anomaly located about 800 m south of the soil grid (Montague, 2013).

In January 2013, Bonaparte dropped its option on the Moraine claims.

In June 2013, Strategic Metals performed a geochemical sampling, prospecting and geological mapping program in the southeastern and central parts of the property. A total of 31 rock samples were collected, but they returned low results for all elements of interest. A total of 952 soil samples were also collected, mostly from two grids. The grid in the central part of the property returned elevated values for gold, arsenic and copper, which collectively outlined a

linear northwest-trending anomaly located near the top of a knoll. The orientation of the anomaly appears to parallel foliation in nearby Nisling Assemblage mica schist. In the southeast part of the property, six strongly anomalous gold-in-soil point values (up to 356 ppb) were returned from the second grid, including one noteworthy sample (248 ppb gold) taken from the bottom of a two metre deep soil pit. A number of the moderately to strongly anomalous gold-in-soil results from this grid coincide with a northeast-trending creek, while six highly anomalous copper values (up to 313 ppm) are clustered in the east-central part of the grid (Flavelle, 2013).

GEOMORPHOLOGY

The Moraine property is located at the southeastern end of the Ruby Range within the Kluane Plateau. It is drained by creeks that flow into the Nordenskiöld River, part of the Yukon River watershed. Elevations on the property range from 950 to 1750 m above sea level (asl), and tree line is approximately 1500 m asl. The property is forested by spruce, willow and birch with an understory of buck brush, moss and lichen. Alpine areas are characterized by grasses and moss. Outcrop is locally abundant on knolls above approximately 1050 m asl.

This part of Yukon was glaciated during the Late Pleistocene (26,000 to 10,000 years ago) McConnell glaciation. Glacial features commonly include glacial lakes, drumlins, and moraines. In the Moraine area, the ice sheet generally moved in a northwesterly direction; however, local meltwater channels flowed northeasterly.

The climate in the Moraine area is typical of northern continental regions with long, cold winters, truncated fall and spring seasons and short, mild summers. The property is mostly snow free from late May to late September.

REGIONAL GEOLOGY

In 1973, the GSC published a geological map of the Aishihik Lake area (NTS map sheet 115H) at 1:250,000 scale (Templeman-Kluit, 1974) and in 1992, it published a geological map of the Dezadeash area (NTS map sheet 115A) at 1:250,000 scale (Dodds, 1992). Gordey and Makepeace (2003) later completed a Yukon-wide geological compilation, which updated the main lithological unit names.

The Moraine property is located within the Yukon-Tanana Terrane (YTT) as shown on Figure 3. The YTT represents a continental arc that developed along the ancient Pacific margin of North America from Late Devonian to Permian. Figure 4 illustrates regional geology as presented by Yukon Geological Survey (2013). The main lithological units are described in Table III.

Table III – Regional Stratigraphic Units

Unit Name	Age	Map Name	Description
Quaternary	Quaternary	Q	Unconsolidated glacial, glaciofluvial and glaciolacustrine deposits; fluvial silt, sand, gravel and local volcanic ash, in part with cover of soil and organic deposits.

TECTONIC SETTING

MORaine PROPERTY

FILE: P:/2015/MORaine

DATE: OCTOBER 2015

After Colpron, M. and Nelson, J.L., 2011

Ruby Range Suite	Early Tertiary	ETgN	Biotite-hornblende granodiorite (locally K-feldspar megacrysts), quartz monzonite, quartz diorite; minor granodiorite gneiss; hornblende and biotite-hornblende diorite; biotite-quartz-feldspar porphyry and porphyritic biotite-quartz monzonite.
		ETqN	Leucocratic biotite granites.
Skukum Group	Lower Eocene	IES1	Flow banded rhyolite and andesite flows and breccia, tuff, pyroclastic and epiclastic rocks, granite conglomerate; rhyolite feldspar porphyry domes, plugs and laccoliths; feldspar $\pm$ hornblende $\pm$ quartz-phyric felsite dykes and plugs.
Aishihik Suite	Early Jurassic	EJgA	Medium to coarse grained, foliated biotite-hornblende granodiorite; biotite rich screens and gneiss schlieren; foliated hornblende diorite to monzodiorite with local K-feldspar megacrysts.
Pelly Gneiss Suite	Late Devonian to Mississippian	DMgPW	Foliated medium grained, homogeneous biotite granite gneiss to biotite or hornblende granodiorite gneiss; massive to strongly foliated dioritic to granodioritic gneiss; includes interfoliated amphibolite, quartz-mica schist and phyllite.
Nisling Assemblage	Late Proterozoic and Paleozoic	PPN1	Dark grey to brown, biotite-muscovite-quartz-feldspar schist, quartzite and micaceous quartzite, garnetiferous; felsic chlorite-biotite orthogneiss; rare amphibolite; minor(?) two-mica gneiss and hornblende-diorite gneiss.
		PPN2	Bleached white-weathering, white to grey, coarsely crystalline, flow banded, fetid marble; graphite, chert, metabasite and calc-silicate lamina are common.

The Moraine property area is mostly underlain by the Nisling Assemblage, which is unconformably overlain by a sliver of the Pelly Gneiss Suite immediately southeast of the property. This metamorphic package has been intruded by numerous plutons of the Ruby Range Suite and one of the Aishihik Suite. Four stocks of the Ruby Range Suite have been inferred on the property through geophysical interpretation, as discussed in the Geophysics section below. Quaternary sediments of uncertain thickness blanket much of the south-central and eastern parts of the property, while thinner overburden layers mantle other parts. North-trending regional faults cut both the Nisling Assemblage and Ruby Range Suite south of the property.

PROPERTY GEOLOGY

Detailed geological mapping on parts of the Moraine property was completed by Stephens in 1990 and Strategic Metals in 2013. Due to limited outcrop, the mapped areas are restricted to the northwestern (Moraine Showing), central and southeastern parts of the property. The area of the Moraine Showing has been mapped at 1:2000 scale (Figure 5), while the central and southeastern

areas have been mapped at 1:2500 scale (Figures 6 and 7, respectively). Each of these areas are described in the following paragraphs.

Moraine Showing

Detailed mapping of the Moraine Showing focused in historical trenches where bedrock is exposed. Five metasedimentary and three intrusive sub-units have been identified in the vicinity of the showing, as described in the following paragraphs (Stephen, 1990). Metasedimentary units form a stratigraphic package with northwesterly strikes and dips ranging from 30° and 70° to the northeast. The stratigraphy includes a basal sub-unit composed of quartz-biotite gneiss and minor micaceous schist, which has a mapped thickness of about 250 m. This sub-unit is overlain by a 75 m thick package of quartz-rich gneiss grading to relatively clean quartzite, which is well fractured and generally rusty. The gneiss/quartzite package is conformably overlain by a 50 m thick section of white to grey limestone with thin bands of disseminated garnets. The other two stratigraphic units are skarn horizons (North and South), described later in this section.

The metasedimentary package has been intruded by granodiorite, hornblende diorite and andesite. The extents of these sub-units are not known and their contacts have been mostly inferred.

Granodiorite is grey to light pink and comprises fine to medium grained feldspar, hornblende, quartz and biotite. It is massive and forms a stock and dyke with north-trending, steeply dipping joints. The stock intrudes gneiss in the southwestern part of the Moraine Showing, while the dyke lies within the gneiss near the gneiss-limestone contact.

Hornblende diorite is fine to medium grained with porphyritic hornblende crystals. It lies immediately north of the granodiorite and may be a border phase to the granodiorite stock.

Andesite occurs as massive to fine grained, greenish to dark grey dykes on the edge of the North Skarn. The dykes are slightly fractured and feature minor malachite staining.

The North Skarn horizon occurs along the gneiss-limestone contact as discontinuous, calc-silicate altered lenses within limestone. The overlying gneiss locally varies from massive quartz-rich gneiss to highly sheared mica schist. The South Skarn horizon is globular in shape (120 by 70 m) and lies near the granodiorite-gneiss contact. Both skarn horizons contain calcite, epidote, actinolite and garnet with variable concentrations of magnetite, pyrrhotite, pyrite, chalcopyrite, molybdenum and molybdo-scheelite.

Central Area

Outcrop in the Central area (Figure 6) is generally confined to a prominent north-trending knoll. This area is mostly underlain by micaceous schist of the Nisling Assemblage. The schist is interbedded with limestone horizons that vary in thickness from less than 1 m to 15 m. Foliations within the schist strike northwest and dip between 50° and 80° to the northeast. A Ruby Range Suite granodiorite pluton intrudes the metasedimentary package in the northern part

of this map area and it is cut by minor hornblende diorite dykes. Andesite dykes with variable orientations intrude the metasediments in the centre and southern parts of this map area. Minor white quartz veins run sub-parallel to metasedimentary foliation and flank the andesite dykes.

Southeast Area

Mapping in this low-lying area was hindered by Quaternary cover and most outcrops within it are near the southern property boundary (Figure 7). Exposures comprise Nisling Assemblage metasediments that are intruded by andesite and Ruby Range Suite granodiorite dykes.

MINERALIZATION

Both skarn and vein type mineralization have been identified in the northwestern part of the property at the Moraine Showing. No mineralization has been discovered elsewhere on the property. The North and South skarn horizons are variably mineralized with pyrrhotite, chalcopyrite, magnetite and pyrite plus minor molybdenum and molybdo-scheelite.

In 2015, nine rock samples were collected from the Moraine Showing area. Sample locations and significant results from historical and 2015 programs are plotted on Figures 8 and 9, respectively. Rock sample descriptions appear in Appendix III and Certificates of Analysis are provided in Appendix IV. All rock samples were sent to ALS Chemex in North Vancouver where they were crushed to 70% passing 2 mm before a 250 g split was pulverized to 85% passing 70 microns. A split of the pulverized fraction was then dissolved in aqua regia and analyzed for 35 elements using the inductively coupled plasma-atomic emission spectroscopy technique (ME-ICP41). An additional 30 g charge was further analysed for gold by fire assay and inductively coupled plasma-mass spectroscopy finish (Au-ICP21).

The North Skarn has been discontinuously sampled over a 30 by 100 m area. Samples collected in 2011 yielded values up to 0.391 g/t gold, 25.2 g/t silver, 1.06% copper, 38.6% iron, 804 ppm molybdenum and 930 ppm tungsten. The North Skarn is open to the southeast where historical trenches were excavated, but did not reach bedrock. The South Skarn spans a 70 by 120 m area. Skarn samples collected in 2011 returned values up to 2.1 g/t gold, 425 g/t silver, 55 ppm bismuth, 7.22% copper, 37.3% iron, 178 ppm molybdenum and 740 ppm tungsten.

Rusty, mineralized quartz vein felsenmeer was discovered in 2011 in a shallow trench near the South Skarn. The vein comprised pale grey to white dusty quartz with up to 30% vugs hosting a fine grained disseminated black mineral. A sample from it returned 13.7 g/t gold, 9.9 g/t silver and 21 ppm bismuth with low copper, molybdenum and tungsten values. The vein float was confined to the trench, and no attempt has been made to trace it along strike.

Secondary copper minerals, such as malachite, occur on fractures in some sub-units, notably the andesite dykes.

In 2015, rock samples were collected as float and from hand pits dug into the floors of historical trenches. The best result came from a strongly oxidized skarn specimen that yielded 0.771 g/t gold, 29.0 g/t silver, 3.72% copper, and 780 ppm tungsten.

DATE: OCTOBER 2015

SOIL GEOCHEMISTRY

In 1985, the GSC conducted a regional geochemical survey consisting of low-density stream sediment and water samples on NTS map sheet 115H (Friske et al., 1985). Four samples were taken from creeks draining the Hooch claims that returned an 80th percentile value for silver, but less than 50th percentile results for gold, arsenic, copper, mercury and zinc.

In 1993, the GSC performed a regional geochemical survey consisting of low-density stream sediment and water samples on NTS map sheet 115A (Friske et al., 1994). Two samples were collected from creeks draining the Moraine claims, which produced silver and copper values in the 99th percentile, arsenic and mercury results in the 95th percentile and gold values in the 90th percentile. Other elements of interest were below the 80th percentile threshold.

In 2015, a total of 656 soil samples were collected in northwestern and southeastern parts of the property from grids, contour lines and the floors of hand pits that did not reach bedrock. One soil grid was established around the margin of a small intrusive stock outlined by mapping and geophysical surveys near the Moraine Showing, while two other grids were established in the southeast part of the property, extending previous soil grids to the northwest and southeast. Locations for 2015 soil samples are plotted on Figures 10 and 11. Thematic results from historical and 2015 programs for gold, silver, arsenic, copper, molybdenum and tungsten are plotted on Figures 12 to 17, respectively.

All soil sample locations were recorded using hand-held GPS units. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. Most of the soil samples were collected from 20 to 60 cm deep holes using hand-held augers. They were placed into individually pre-numbered Kraft paper bags. The soil samples were sent to ALS Minerals in Whitehorse where they were dried, screened to -180 microns, dissolved in aqua regia and then shipped to North Vancouver where they were analyzed for 35 elements using the inductively coupled plasma-atomic emission spectroscopy technique (ME-ICP41). An additional 30 g charge was further analyzed for gold by fire assay with inductively coupled plasma-atomic emission spectroscopy finish (Au-ICP21). Certificates of Analysis are given in Appendix IV.

Table IV lists anomalous thresholds and historical and 2015 peak values used to describe the soil sample results in the following paragraphs.

Table IV – Near-Surface Soil Geochemical Thresholds

Element	Weak	Moderate	Strong	Historical Peaks	2015 Peaks
Gold (ppb)	≥ 10 < 20	≥ 20 < 50	≥ 50	356	765
Silver (ppm)	≥ 0.1 < 0.2	≥ 0.2 < 0.5	-	1.1	0.8
Arsenic (ppm)	≥ 10 < 20	≥ 20 < 50	≥ 50	82.8	151
Copper (ppm)	≥ 20 < 50	≥ 50 < 100	≥ 100	313	175
Molybdenum (ppm)	≥ 5 < 10	≥ 10 < 20	≥ 20	47	28
Tungsten (ppm)	≥ 50 < 100	≥ 100 < 200	≥ 200	10	10

Soil sampling on the property has identified three copper-molybdenum±gold±silver± tungsten anomalies (Anomalies A, B and C), one broad copper-gold-molybdenum-silver anomaly (Anomaly D) and two areas with linear gold-arsenic-copper anomalies (Anomalies E and F).

Anomaly A is a 1000 by 350 m area located along the margin of the small Ruby Range Suite stock at the Moraine Showing. It comprises sporadic weakly to strongly anomalous gold (up to 64 ppb), and weakly to moderately anomalous silver, copper and molybdenum values. These results are much lower than soils taken from the bottoms of historical trenches, which returned strongly anomalous gold, silver, copper, molybdenum and tungsten values.

Anomaly B spans a 1400 by 300 m area located 1000 m southeast of Anomaly A. It straddles the contact between a Ruby Range Suite pluton and Nisling Assemblage metasedimentary rocks. The anomaly hosts weakly to strongly anomalous values for copper between 48 and 138 ppm with spotty gold (up to 45 ppb), silver (up to 0.4 ppm), and molybdenum (up to 14 ppm) support.

Anomaly C consists of two soil samples located 11 km southeast of Anomaly A, in an area of quaternary glacial sediments. The samples returned strongly anomalous values for molybdenum (20.9 and 29.1 ppm) and weakly to moderately anomalous values for silver (0.14 and 0.22 ppm) and copper (48.7 and 72.1 ppm).

Anomaly D is an irregular shaped 1300 by 600 m area, which lies immediately west of the Moraine Showing. It lies entirely within a Ruby Range Suite pluton and features weakly to strongly anomalous silver (up to 1.1 ppm) and molybdenum (up to 28 ppm) values with sporadic gold (up to 125 ppb) and copper (up to 175 ppm) spot highs.

Anomaly E is a 1700 m long, linear target situated 3000 m southeast of Anomaly A. It is underlain by Nisling Assemblage metasediments and consists of discontinuously elevated values for gold, arsenic and copper that returned up to 65 ppb, 74 ppm and 115 ppm, respectively. The most continuous string of anomalous values was collected near a glacially scoured knoll where overburden is relatively thin compared to elsewhere along trend.

Anomaly F covers a 2300 by 3500 m area located 8000 m southeast of Anomaly A. It is underlain by glacial sediments and comprises seven linear anomalies that have an average strike length of 1800 m. The linears contain scattered strongly to very strongly anomalous gold (up to 765 ppb) and copper (up to 313 ppm) results, with some weakly to strongly anomalous arsenic (up to 151 ppm) support.

In 2015, five deep-auger soil samples were collected from beneath hand pits dug at sites where previous near-surface soil samples had yielded strongly anomalous gold values. Four out of the five soil pits returned considerably lower values than the original samples, but one sample yielded a much higher value (248 vs 147 ppb gold). Surprisingly the best result (756 ppb gold) came from a deep soil horizon beneath a pit dug in an area of low near-surface gold-in-soil response.

GEOPHYSICS

In late 2012, Strategic Metals commissioned Condor Consulting, Inc. to carry out processing and interpretation of VTEM and magnetic survey data obtained by Geotech in 2011. The total magnetic intensity (TMI) response varies dramatically across the Moraine property. The margin of the main magnetic high is irregular and roughly parallels the contact between the Ruby Range Suite granodiorite and the Nisling Assemblage metasediments. This strong magnetic feature extends from the Moraine Showing to the southeast corner of the property. The North Skarn lies immediately north of this magnetic high and the South Skarn occurs within it. The magnetic signature across the remainder of the property is relatively subdued; however, a second, but weaker northwesterly-trending magnetic high lies along the northern edge of the survey area, close to the property boundary. Figure 18 illustrates numerous northwesterly-trending linear magnetic features, which were determined using tilted first vertical derivative data. These features have been interpreted by Condor as magnetic dykes or skarns within the metasediments. A series of northwest-trending magnetic lows coincide to intermittent gold-rich soil anomalies with some arsenic and copper support, which may represent demagnetized alteration zones hosting gold-enriched vein mineralization. These linears are cut by a northeast trending fault, inferred by another prominent magnetic low. Elevated gold-in-soil values are clustered at intersections of the two trends. The tilted magnetic data also identified northerly-trending glacial features.

The VTEM data revealed strong northwesterly-elongated conductive bodies on the northeastern side of the survey region, but none on the southwestern side (Figure 19). The conductive linears may represent graphite-rich beds within the metasediments. A 1500 by 1000 m strong electromagnetic conductor correlates with a topographic high in the centre of the property. Geological mapping of this area in 2013 did not identify the source of the conductor due to limited outcrop exposure. This anomaly was not followed up during the 2015 field program.

DISCUSSION AND CONCLUSIONS

The Moraine property is favourably situated in the southern part of the Dawson Range Gold Belt, about 25 km south-southeast of Strategic Metals' Hopper property where drilling has partially delineated high-grade copper-gold and gold skarn zones flanking a porphyry copper prospect.

Historical trenching and detailed geochemical, geological and geophysical surveys on the Moraine property have identified two copper, gold, silver, molybdenum and tungsten skarn horizons and a gold-rich quartz vein, which collectively comprise the Moraine Showing. There are also a number of other soil geochemical anomalies located elsewhere on the property, which could be sourcing from skarn, vein or even porphyry deposits.

Geochemical and geological mapping programs in most parts of the property are severely hampered by glacial overburden and heavy vegetation. Glacial and glacial-fluvial processes complicate geochemical interpretation because they can hide mineralization but also can spread anomalous soils well beyond their source areas.

Follow up work in the overburden covered southeastern part of the property should include additional near-surface soil geochemical sampling plus hand pitting/deep soil auger sampling at all high gold-in-soil sites to better define anomalous trends and determine if the anomalies are locally derived or glacially dispersed. Excavator trenching and/or self-propelled reverse circulation (RC) or rotary air blast (RAB) drilling should be done in areas where deep soil profile sampling suggest geochemical anomalies have local sources. Detailed geomorphological studies should be conducted to better understand the direction and nature of glacial and glacial-fluvial transportation on the property.

Future exploration at the Moraine Showing should include deepening of all existing trenches with the goal of sampling bedrock. Additional trenches should be dug along strike and across nearby geochemical anomalies. The soil grid should be extended to cover all of the nearby Ruby Range Suite stock and adjacent metasediments. Contour soil sampling should also be performed around other inferred Ruby Range suite stocks in the area. Pending encouraging results from trench sampling, self-propelled RC or RAB drilling or helicopter-supported diamond drilling should be done to evaluate the character and continuity of mineralization.

Respectfully submitted,

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

CERTIFICATE OF ANALYSIS WH15081889

CERTIFICATE COMMENTS

LABORATORY ADDRESSES

Applies to Method:	Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.	
	CRU - 31	CRU - QC
	PUL - QC	SPL - 21
		LOG - 21
		WEI - 21
		PUL - 31
Applies to Method:	Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.	
	Au - ICP21	Cu - OG46
		ME - ICP41
		ME - OG46

CERTIFICATE WH15081894

Project: HOOCH

This report is for 180 Soil samples submitted to our lab in Whitehorse, YT, Canada on 4-JUN-2015.

The following have access to data associated with this certificate:

HEATHER BURRELL

SARAH DRECHSLER

JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI - 21	Received Sample Weight
LOG - 22	Sample login - Rcd w/o BarCode
SCR - 41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au - AA24	Au 50g FA AA finish	AAS
ME - ICP41	35 Element Aqua Regia ICP - AES	ICP - AES

To: **STRATEGIC METALS LTD.**
ATTN: JOAN MARIACHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016 - 510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

CERTIFICATE WH15081897

Project: HOOCH

This report is for 92 Soil samples submitted to our lab in Whitehorse, YT, Canada on 4-JUN-2015.

The following have access to data associated with this certificate:

HEATHER BURRELL

SARAH DRECHSLER

JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI - 21	Received Sample Weight
LOG - 22	Sample login - Rcd w/o BarCode
SCR - 41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au - AA24	Au 50g FA AA finish	AAS
ME - ICP41	35 Element Aqua Regia ICP - AES	ICP - AES

To: **STRATEGIC METALS LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE WH15083972

Project: HOOCH

This report is for 147 Soil samples submitted to our lab in Whitehorse, YT, Canada on 9-JUN-2015.

The following have access to data associated with this certificate:

HEATHER BURRELL

SARAH DRECHSLER

JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

CERTIFICATE WH15083974

Project: HOOCH

This report is for 232 Soil samples submitted to our lab in Whitehorse, YT, Canada on 9-JUN-2015.

The following have access to data associated with this certificate:

HEATHER BURRELL

SARAH DRECHSLER

JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI - 21	Received Sample Weight
LOG - 22	Sample login - Rcd w/o BarCode
SCR - 41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au - AA24	Au 50g FA AA finish	AAS
ME - ICP41	35 Element Aqua Regia ICP - AES	ICP - AES
