INTRODUCTION

The Hy property covers multiple silver-lead-zinc±copper±tungsten, skarn- and structurally-hosted mineral occurrences. The property is located in southeastern Yukon and is wholly owned by Strategic Metals Ltd.

This report describes geochemical sampling, prospecting and geological mapping completed between June 6 and 15, 2015 by Archer, Cathro & Associates (1981) Limited on behalf of Strategic Metals. The report also describes ground surveys conducted by Underhill Geomatics Ltd. on June 15, 2015. The author participated in the program and interpreted the results from it, his Statement of Qualifications is provided in Appendix I. A Statement of Expenditures is located in Appendix II.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Hy property comprises 347 contiguous mineral claims, which are located on NTS map sheets 105H/01, 02, 07 and 08, at latitude 61°16′ north and longitude 128°34′ west (Figure 1). The claims cover an area of approximately 7000 hectares (70 km^2).

The claims are registered with the Watson Lake Mining Recorder in the name of Archer Cathro, which holds them in trust for Strategic Metals. The property surrounds two claims (Max 1 and 2) that are owned by an independent prospector. Claim data are listed below while the locations of individual claims are shown on Figure 2.

Claim Name	Grant Number	Expiry Date*
Hy 1-347	YC52861-YC53207	March 13, 2023

* Expiry dates include 2015 work that has been filed for assessment credit, but has not yet been accepted.

The property is located approximately 195 km by road, north of the town of Watson Lake, which is the closest community and supply centre. Access to the property from Watson Lake is possible via the first 110 km of the Robert Campbell Highway, followed by the first 78 km of the Nahanni Range Road, and finally a 17 km bush road. Once on the property, a 20 km network of roads and trails extends west-ward, providing access to various mineral showings. The Robert Campbell Highway and Nahanni Range Road are major haulage routes maintained year-round by the Yukon government and North American Tungsten Corporation Ltd., which operates the Cantung Mine (Figure 1). The secondary roads are not maintained and are best driven in summer with four-wheel drive or all-terrain vehicles (ATVs).

In 2015, the crews accessed the property using a Bell 206B helicopter operated by Trans North Helicopters from its year-round base in Watson Lake.

The Hy property lies within the traditional territory of the Kaska Dene Council, which has not yet concluded a land claims agreement. A large block of land, which is restricted from staking pending settlement of land claims, adjoins the northeast side of the property.

HISTORY AND PREVIOUS WORK

Silver-lead-zinc mineralization was first discovered in the vicinity of the current Hy property in 1964. Since then, four main areas on the property (Dusty/Tung, Marg, Miko and Elsa) have received the most work (Figure 2). Some work programs conducted within the current property boundary explored for tungsten skarn and intrusion-related gold mineralization, but the majority of the programs evaluated silver-lead-zinc potential. Table I summarizes work performed and results obtained by exploration programs conducted since 1964 at the Hy property.

Table I – Exploration History of the Hy Property (Includes Max Claims)

Year of Work (Report)	Owner/ Operator	Main Areas	Work Performed	Results
1964 - 1965 (017454)	Yukon-Pacific Syndicate	Dusty/Tung	Prospecting, hand trenching, magnetic surveys and geological mapping.	40 piece composite chip sample returned 360.0 g/t silver, 3.5% lead 7.3% zinc and a trench sample yielded 164.6 g/t silver, 2.5% lead and 3.2% zinc over 1.22 m.
1965-1966 (018910)	Norquest JV	Marg	Geological mapping, channel sampling and magnetic surveys.	Channel samples collected across two mineralized zones returned up to 202.3 g/t silver, 0.88% lead, 4.49% zinc and 0.35% copper over 7.62 m and 64.5 g/t silver, 0.74% lead, 1.85% zinc and 0.06% copper over 18.29 m.
1967-1968 (019125)	Silver Duke Mines Ltd.	Dusty/Tung	Constructed tote-trail to the property, conducted prospecting, geological mapping, electromagnetic (EM) and magnetometer surveys and diamond drilling.	Completed two diamond drill holes totalling 121.6 m. The best drill results from holes 1 and 2 graded 137.1 g/t silver, 1.86% lead and 2.45% zinc over 0.91 m and 13.7 g/t silver, 0.14% lead and 0.10% zinc over 1.52 m, respectively.

1968 (092909)	Fort Steele Mines Ltd.	Elsa	Prospecting, hand trenching and mapping	Two grab samples yielded 154.0 g/t silver, 16.65% lead and 11.95% zinc and 161.1 g/t silver, 23.56% lead and 16.55% zinc.
1968-1969 (No report)	Monarch Metal Mines Ltd.	Marg	Bulldozer trenching and diamond drilling.	A total of 453.8 metres in 12 diamond drill holes was completed. Trenching and diamond drill results were not reported.
1968-1969 (091171 and 060700)	Hyland River Mines Ltd.	Miko	Soil geochemical, ground magnetic and airborne magnetic and EM surveys, trenching and diamond drilling.	Trench samples at the Hillside and Creek zones returned up to 370.3 g/t silver, 8.22% lead and 14.01% zinc over 3.20 m and 65.1 g/t silver, 27.14% lead and 21.76% zinc over 2.80 m, respectively. A total of 306 m in seven diamond drill holes were completed.
1970 (091176)	Silver Mark Mines Ltd.	Marg	Diamond drilling	18 diamond drill holes totalling 1685.5 metres were completed. The most encouraging intervals from holes 70-16 and 70-18 assayed 70.7 g/t silver, 1.57% lead and 2.18% zinc over 6.82 metres and 77.7 g/t silver, 0.93% lead and 1.73% zinc over 6.69 m, respectively.
1970 (No report)	Welland Consolidated Mining Ltd.	Marg	Bulldozer trenching	Bulldozer trenching was conducted at the Ace Claim block, however; no results were reported and the claims lapsed.

1970 (No report)	Hyland River Mines Ltd.	Miko	Bulldozer trenching and x-ray drilling.	Eight x-ray drill holes totalling 62 m were completed at the Creek Showing.
1972 (061958)	Dusty Mac Mines Ltd.	Dusty/Tung	Grid soil sampling, geological mapping, trenching and magnetic surveying.	A grab sample graded 16.1 g/t silver, 0.08% lead, 8.14% zinc and 0.02% copper, while magnetite rich float assayed 300.0 g/t silver, 5.07% lead, 5.18% zinc and 0.09% copper. A trench sample returned 1.38 % scheelite over 1.22 m.
1973 (060144)	Pan Ocean Oil Ltd.	Dusty/Tung	Grid soil sampling Geological mapping, trenching and magnetic surveying.	A composite chip sample assayed 28.8 g/t silver, 11.20% lead, 8.80% zinc and 3.05% copper, while a trench sample yielded 18.9 g/t silver, 8.90% lead, 6.60% zinc and 2.55% copper, over 1.22 m.
1974 (No report)	Tandem Resources Ltd.	Miko	Mapping, prospecting and hand trenching.	N/R
1977 (090702 and 091177)	Turner-Hindmarsh Tungsten Ltd. and Canada Tungsten Mining Corp.	Max Claims	Bulldozer trenching, diamond drilling, installation of crushing/grinding circuit and set up substantial trailer camp (at the now Max claims).	Completed a total of 356.00 m in six short diamond drill holes.
1979-1980 (090702)	Tungco Resources Corp. (previously Turner-Hindmarsh Tungsten Ltd.)	Max Claims	Bulldozer trenching, stripping and diamond drilling.	In 1979 and 1980, eight holes containing a total of 408.20 m and four holes with a total of 304.9 m were drilled, respectively.
1979-1980 (090827)	Tungco Corporation and Morning	Marg	Trenching and diamond drilling.	In 1979 and 1980, seven diamond drill holes totalling 641 m and two

	Star Mines Ltd.			diamond drill holes totalling 282.9 m were completed, respectively. Results from the 1979 drill program were not reported.
1979 (No report)	Armor Resources Ltd.	Marg	Trenching	N/R
1979 (No report)	Patmar Resources Corp.	Miko	Trenching.	N/R
1979 (No report)	Trio Resources Ltd.	Miko	Hand Trenching	N/R
1980 (062080)	Patmar Resources Corp.	Miko	Diamond drilling.	Three diamond drill holes totalling 287.04 metres were completed. The best drill intercept returned 35.0 g/t silver, 1.59% zinc and 1.46% lead over 3.05 m.
1983 (No report)	Score Resources Corp. and Vancliffe Resources Corp.	Dusty/Tung	Magnetic surveys and geological mapping.	N/R
1983 (062200)	Clifton Star Resources Inc.	Dusty/Tung	Property examination.	Examination was conducted by helicopter with frequent landings and two traverses across the claims.
1992 (No report)	Placer Dome Inc.	Marg	Reconnaissance scale prospecting and mapping.	N/R
1996 (093633)	Finlayson Joint Venture In.	Dusty/Tung	Grid soil sampling, prospecting, geological mapping and geophysical surveys.	A one metre chip sample taken across a historical trench returned 533.5 g/t silver, 2.35% lead, 9.20% zinc and 0.18% copper.
1996 (No report)	Finlayson Joint Venture Inc.	Marg	Prospecting	A one metre wide shear zone was discovered and yielded 41.3 g/t silver, 2.3% lead and 1.25% zinc.
2007	Strategic	All Zones	Helicopter-borne	VTEM survey identified a

(Eaton, 2008)	Metals Ltd.		versatile time domain electromagnetic (VTEM) and magnetic surveys.	number of strong conductors across the property.
2013 (Flavelle, 2013)	Strategic Metals Ltd.	All Zones	Geochemical sampling, prospecting, hand trenching and geological mapping	All zones were re-visited and three new discoveries were made: Showing J – Dusty Zone; Showing 2 – Tung Zone; and Hike Showing – Elsa Zone.

N/R = No Results Reported

The following paragraphs provide brief descriptions of the historical work areas and the exploration programs conducted within them. Results are described in the appropriate sections later in this report.

Dusty/Tung Area

The Dusty/Tung Area lies in the western-most part of the property. In 1964, silver-lead-zinc mineralization was discovered and staked by Yukon-Pacific Syndicate. In 1965, Yukon-Pacific performed hand trenching, magnetic surveys and geological mapping before allowing the claims to lapse (Ostensoe, 1965).

The area was restaked in 1967 by Max Martin and optioned to Silver Duke Mines Ltd., which continued prospecting and mapping. In 1968, Silver Duke constructed a tote-trail to the property. Later that year it conducted electromagnetic (EM) and magnetometer surveys and completed two diamond drill holes totalling 121.6 m at the Dusty Zone (C-1 and C-2) (White, 1968).

The claims were optioned to Dusty Mac Mines Ltd. in 1972, which carried out geological mapping, magnetic surveying, grid soil sampling and trenching that year (Galloway, 1972). Pan Ocean Oil Ltd. later optioned the property and carried out geochemical surveying, mapping and bulldozer trenching in 1973 (Vincent, 1973).

In 1974, the claims reverted back to Max Martin who transferred them to Turner-Hindmarsh Tungsten Ltd., which completed bulldozer trenching and installed a crushing/grinding circuit in 1977 to test a mineralized zone on what are now the Max claims. In 1977, Canada Tungsten Mining Corporation briefly optioned the Max property and completed six diamond drill holes totalling 356 m. In 1978, Turner-Hindmarsh changed its name to Tungco Resources Corporation and continued exploration on the property. In 1979, it completed bulldozer trenching and eight diamond drill holes totalling 408.2 m (Tully, 1979). In 1980, Tungco drilled four additional holes totalling 304.9 m, but core from these holes was only analyzed for tungsten (Tully, 1980a).

In 1982, Score Resources Corporation and Vancliffe Resources Corporation acquired part of the current property south of the Max claims. They carried out magnetic surveys and geological

mapping in 1983 (Deklerk and Traynor, 2005). Clifton Star Resources optioned the surrounding claims in 1983 and carried out a brief examination (Brown, 1983).

In 1996, Finlayson Joint Venture Inc. (FJV) staked an area encompassing much of the Dusty Zone, including the Max claim block. FJV conducted soil geochemistry and geophysical surveys, prospecting and geological mapping. The program was designed to examine known base metal and tungsten showings and to test their potential for gold and further base metal mineralization (Verley, 1997).

Marg Area

The Marg Area is located in the northeastern part of the property. In 1965, Norquest JV staked the Lake and Glenna claims over part of the Marg Area. Norquest conducted mapping, channel sampling and magnetic surveying in 1965 and 1966. Monarch Metal Mines Ltd. optioned the claims in 1967 and performed bulldozer trenching in 1968 and 12 diamond drill holes totalling 453.8 m in 1969. The property was then optioned to Silver Mark Mines Ltd., which completed 18 diamond drill holes totalling 1685.5 m in 1970 (Trowsdale, 1970).

Welland Consolidated Mining Ltd. staked the CU and Ace claims to the north and south of Silver Mark's claims in 1970 and performed bulldozer trenching later that year. The claims were allowed to lapse following this work. Dual Resources Ltd. restaked the Ace claims in 1973 (Deklerk and Traynor, 2005).

Tungco Corporation and Morning Star Mines Ltd. restaked the Lake and Glenna claims as the Marg claims in 1978. In 1979, they undertook trenching and seven diamond drill holes totalling 641 m. Two more diamond drill holes totalling 282.9 m were completed in 1980 (Tully, 1980b).

The Arm claims were staked to the west in 1979 by J.C. Turner who transferred them to Armor Resources Ltd., which performed trenching later that year. The Arm claims lapsed and were restaked as part of the Con claims by Placer Dome Inc. in 1992, which then performed reconnaissance-scale prospecting and sampling (Deklerk and Traynor, 2005).

In 1996, FJV conducted an exploration program where prospecting discovered a one metre wide mineralized shear zone (Deklerk and Traynor, 2005).

Miko Area

The Miko Area lies immediately south of the Marg Area in the southeastern corner of the property. In 1966, the Miko claims were staked by Hyland River Mines Ltd. to cover the Creek, Hillside and Cirque showings. In 1968, Hyland conducted soil geochemical, ground magnetic and airborne magnetic and EM surveys over its claims. This work was followed by bulldozer trenching and seven diamond drill holes totalling 306 m at the Creek and Cirque showings (Simpson, 1969). In 1970, Hyland carried out additional bulldozer trenching and completed eight x-ray drill holes totalling 62 m at the Creek Showing (Deklerk and Traynor, 2005).

In 1973, Targus Resources Ltd. optioned the Miko claims, but performed no work. In 1974, the claims were optioned to Tandem Resources Ltd., which conducted mapping, prospecting and hand trenching. In 1977, the Miko claims were downsized to cover only the Creek Showing and were transferred to Trio Resources Ltd., which performed more trenching in 1979 (Deklerk and Traynor, 2005).

The Hillside and Cirque showings were restaked as the Marina claims in 1978 by Patmar Resources Corp., which completed trenching in 1979 and diamond drilling in 1980. This drilling included three diamond drill holes totalling 287 m on the Hillside Showing (Tully, 1980c).

Elsa Area

The Elsa Area lies in the north-central part of the property and separates the Dusty/Tung Area from the Marg Area. The Elsa Area is the most under-explored of the historical work areas. In 1968, Fort Steele Mines Ltd. conducted mapping and prospecting within the Elsa Zone (Timmins, 1968).

General

Strategic Metals staked the claims that comprise current Hy property in spring 2007. That summer, Strategic Metals contracted Geotech Ltd. of Aurora, Ontario to complete helicopter-borne versatile time domain electromagnetic (VTEM) and magnetic surveys across the property. The VTEM survey identified a number of strong conductors. Prospecting and grid soil sampling were carried out by Strategic Metals to follow up these conductors.

In 2011, Golden Predator Corp. (now Americas Bullion Royalty Corp.) optioned the property from Strategic Metals; however, no work was conducted before it dropped the option in early 2013.

In 2013, Strategic Metals performed additional soil geochemical sampling, prospecting, hand trenching and geological mapping within the four main areas on the property. Most of the historical showings were re-visited and three additional discoveries were made (Flavelle, 2013).

GEOMORPHOLOGY

The Hy property is located in the Logan Range of southeast Yukon. It is drained by Conglomerate Creek, which flows into the Hyland River and ultimately into the Arctic Ocean via the Liard and Mackenzie rivers.

The property was affected by the Late Pleistocene McConnell glaciation and numerous local alpine glaciers. Due to the complex glacial history of the area, the terrain is highly varied with steep alpine ridge systems surrounding a broad central valley. Elevations on the property range from 1160 m to 2140 m. The valley bottom gently rises from east to west across the property. The valley walls are relatively steep, but in many areas give way to wide bench-like plateaus at about 1550 m. Rugged north-facing slopes and moderate south-facing slopes comprise most of

the alpine terrain. Soil development is relatively poor at higher elevations where talus slopes are common. Glacial till and moraines predominate on lower slopes and the valley floor.

Outcrop and talus are abundant above 1550 m, but at lower elevations glacial overburden and swampy areas limit bedrock to a few exposures along eroding creek beds and scoured hummocks.

Vegetation ranges from stunted spruce, balsam and willow at lower elevations through a region of thick buckbrush and moss, to grass and lichen at higher elevations. Tree line is at about 1500 m.

REGIONAL GEOLOGY

The Hy property is located within Selwyn Basin (Figure 3), a tectonic element comprised of deep water clastic rocks, chert and minor carbonate accumulated along the North American continental margin during Paleozoic time (Pigage, 2004).

Lithologies on the property belong to three main units: Hyland Group metasediments and sediments; Earn Group metasediments and sediments; and, Selwyn Suite intrusives. These units are briefly described in the following table.

Table II – Geological Units (*after Gordey and Makepeace, 2003*)

NAME	AGE	DESCRIPTION
Selwyn Suite	Mid Cretaceous	Resistant, blocky, fine to coarse grained equigranular to porphyritic (K-feldspar) biotite-quartz monzonite and granodiorite with minor quartz diorite, leuco-quartz monzonite and syenite.
Earn Group	Upper Devonian to Mississippian	Thin bedded, laminated slate and phyllite with thin to thick interbeds of fine to medium grained chert-quartz arenite and wacke; thick members of chert-pebble conglomerate; black siliceous siltstone; nodular and bedded barite; rare limestone.
Unconformity		
Hyland Group	Upper Proterozoic to Lower Cambrian	Thin to thick bedded, brown to pale green shale; fine to coarse grained quartz-rich sandstone, grit and quartz-pebble conglomerate; minor argillaceous limestone; quartzite, pelite, mica-schist and gneiss.

Most of the property covers a large roof pendant composed of Upper Devonian to Mississippian Earn Group that unconformably overlies Upper Proterozoic to Lower Cambrian Hyland Group (Figure 4). Earn Group forms most of the bedrock exposures in the central and southern parts of the pendant, while Hyland Group is exposed in an up to two kilometre wide, north-trending band

located along its western edge. The roof pendant is surrounded by granodiorite belonging to the Mt. Billings Batholith, on all but the east side. An isolated body of Earn Group lies about 1500 m north of the main pendant. This outlying pendant is about 1600 m long and up to 1000 m wide. No regional-scale structures are mapped on the property.

PROPERTY GEOLOGY

Historical and recent property-scale mapping has mostly been done within five areas that approximately coincide with the four historical work areas and the newly recognized Dusty Northeast Area (Figure 4). Geological descriptions of the respective map areas are provided in the following sub-sections.

Dusty/Tung Area

The Dusty/Tung Area is underlain by Hyland Group mudstone, siltstone, phyllite and limestone that are unconformably overlain by Earn Group shale, slate and siltstone. The unconformity contact trends north and crosses the centre of this area. The Mt. Billings Batholith has intruded both groups in the northern and western parts of the Dusty/Tung Area (Figure 5).

Bedding measurements within the Hyland and Earn groups are nearly perpendicular to each other. Hyland Group sediments strike to the northeast and dip moderately to the southeast, while Earn Group sediments strike to the northwest and dip steeply to the northeast or southwest.

Throughout the Dusty/Tung Area, the sediments are cut by dykes and sills that are usually composed of fine grained biotite granodiorite with lesser monzonite. Pegmatite, orthogneiss, andesite and garnetiferous muscovite-rich granodiorite intrusions are also present in minor amounts. The dykes and sills show a variety of orientations and range in width from 5 to 60 m. Where dykes and sills intrude calcareous rocks, skarn horizons ranging from 1 to 30 m are developed.

Structurally, the Dusty/Tung Area hosts two main fault arrays. The first array trends north and exhibits steep dips to the east and west. These faults cut the host rock into slices up to 60 m wide. The second array trends north to northeast and dips steeply to the east or west. The apparent offsets along these faults vary from less than 10 m to greater than 100 m, but sense of movement is not known.

Veins, breccias and shears related to the faulting occur through the Dusty/Tung Area, but are most easily recognized within the alpine parts of the Tung Zone.

Local zones of intense quartz flooding within the shale may represent a northwesterly-trending structural feature; however, no direct evidence for faulting or shearing has been observed.

Dusty Northeast Area

The Dusty Northeast Area is underlain by Earn Group shale, arenite and wacke with rare fissile limestone. The Mt. Billings Batholith intrudes Earn Group to the north, while a fine grained

hornblende-biotite granodiorite satellite pluton occurs along the western edge of the mapped area (Figure 6).

Earn Group bedding is gently folded and roughly trends east-west and dips moderately to the southwest. Fracture sets within the Mt. Billings Batholith generally trend northerly and northeasterly and dip steeply to the east and west.

Two sets of quartz veins occur in the area. The first set (up to 10 cm wide) trends northwest and northeast and dips steeply, while the second set (up to 1.5 m thick) strikes southeast and dips steeply to the northeast. Small-scale faults are aligned northeasterly, with observed dextral offsets of less than 10 m. Skarn lenses up to 0.7 m wide and 30 m long are cut obliquely by an east-northeast trending shear zone, which dips moderately to the southeast. Prominent linear depressions mapped in this area have northeasterly and southeasterly trends.

Elsa Area

This area is underlain by Earn Group comprising interbedded argillite, mudstone, limestone, shale and siltstone. The Mt. Billings Batholith bounds the sediments in the northern part of the area, and in the western part numerous porphyritic granodiorite and diabase dykes and sills have intruded the country rocks. Skarn lenses up to 10 m wide occur adjacent to intrusions and fault zones throughout the Elsa area (Figure 7).

Gentle folding is observed within the Elsa Area. Bedding strikes northwesterly and dips shallowly to the northeast or southwest. Steeply dipping fractures within the Mt. Billings Batholith exhibit northerly and westerly strikes.

Marg Area

The Marg Area is underlain by Earn Group, which is bound by the Mt. Billings Batholith to the north. The contact between the two units is steep. Earn Group comprises impure quartzite, quartz-mica schist, paragneiss, limestone and phyllite, which are interbedded with chert, siltstone, argillite and greywacke. Bedding typically strikes east and dips moderately to steeply to the south (Figure 8). Several northerly striking porphyry dykes of unknown affinity cut Earn Group at various orientations and, where these dykes intrude calcareous beds, skarn horizons up to 15 m wide occur.

Miko Area

The Miko Area is mostly underlain by Earn Group comprising muscovite-quartz schist, biotite-muscovite schist, quartzite and limestone. Bedding usually strikes northwest and dips moderately to the southwest. The Miko Area has been mapped in detail at the Creek, Hillside and Cirque showings.

At the **Creek Showing** area, the Mt. Billings Batholith contact with the Earn Group is projected to lie near the northern edge of the mapped area (Figure 9). Two granodiorite sills, likely related to the batholith, interfinger with Earn Group in the central part of this area. Comparison of strata

north and south of Conglomerate Creek suggests it may coincide with the surface trace of a major fault, but if so, the magnitude and sense of movement on this structure are unknown.

The areas of **Hillside and Cirque showings** contain some laterally continuous beds of partially calc-silicate altered and skarnified Earn Group (Figure 10). Multiple skarn horizons up to 10 m wide occur near or at the contacts with Selwyn Suite intrusive rocks. They are most abundant in the western part of this map area.

MINERALIZATION

Mineralization on the Hy property is hosted within various zones and showings. The relationships between the zones and showings, and the map areas in which they occur, are described below. The Dusty/Tung and Dusty Northeast areas encompass the Dusty and Tung zones. The Dusty Zone is comprises 13 showings (A to M), while the Tung Zone hosts two showings (1 and 2). The Elsa Area hosts the Elsa Zone, which contains the Elsa, Elsa West and Hike showings. The Marg Area covers the Marg Zone, which has two showings (Upper and Lower). The Miko Area includes the Miko Zone, which contains four showings (Creek, Hillside, Cirque and Camp).

In 2015, a total of 48 rock samples were collected from the Dusty and Elsa zones. The remaining zones were not-revisited in 2015. Sample locations are plotted on Figures 11 and 13, while significant results from each of the five zones are shown on Figures 11 to 15. Certificates of Analysis and Rock Sample Descriptions appear in Appendices III and IV, respectively.

All rock samples were sent to ALS Minerals in Whitehorse, where they were crushed to 70% passing 2 mm before a 250 g split was pulverized to 85% passing 70 microns. Splits of the pulverized fractions were then sent to ALS Minerals in North Vancouver, where they were dissolved in a four acid solution and analyzed for 48 elements using inductively coupled plasma-mass spectroscopy and inductively coupled plasma-atomic emission spectroscopy techniques (ME-MS61).

Skarn mineralogy within the known showings usually comprises one of the following gangue assemblages: tremolite-actinolite-epidote, pyroxene-epidote-actinolite, epidote-wollastonite or magnetite-diopside. Sulphide minerals include pyrite, pyrrhotite, sphalerite and galena with minor bornite and chalcopyrite. Scheelite is present in some zones. Details pertaining to specific zones and showings are discussed below.

Dusty Zone (Showings A to M)

Most of the mineralization at the Dusty Zone occurs in Showings A to M. In 2015, Showings F, G, I, and J were re-visited and two new discoveries were made (Showings L and M). Detailed geology, rock sample locations, metal assemblage distributions and a table containing highlight assay results for the Dusty Zone are shown on Figure 11. The showings are described separately in the following paragraphs.

HY PROPERTY

0 500 m

UTM ZONE 9, NAD 83, 105H/07 Contour Interval: 20m

FILE: P:2015/Hy/ DATE: NOVEMBER 2015

Showing A lies in the northwest corner of the Dusty Zone. In 1965, a chip sample from a trench reportedly assayed 684.0 g/t silver, 11.01% lead and 9.20% zinc over 1.83 m (Ostensoe, 1965). In 2007, a composite sample consisting of chips from 21 float blocks of heavily weathered, hydrozincite coated epidote-calcite skarn with galena and sphalerite returned 14.8 g/t silver, 6.51% lead and 2.91% zinc (Eaton, 2008). In 2013, a grab sample taken 40 m north of the 2007 composite sample graded 573 g/t silver, 9.92% lead, 3.27% zinc, and 1560 ppm bismuth (Flavelle, 2013).

Showing B is located 300 m east of Showing A and is characterized by a diopside skarn containing minor sphalerite and galena. Previous sampling of this showing reported 155.7 g/t silver, 2.30% lead and 1.10% zinc over 0.91 m (Ostensoe, 1965). In 2007, three weakly mineralized float samples from this showing averaged 61.5 g/t silver, 0.86% lead and 0.44% zinc (Eaton, 2008). In 2013, a 70 cm continuous chip sample collected across an oxidized manganese-epidote-galena skarn graded 175 g/t silver, 3.12% lead, 3.09% zinc and 499 ppm bismuth (Flavelle, 2013).

Showing C lies 500 m east of Showing A and hosts variably mineralized skarn types. This showing covers a large area with thick overburden and dense vegetation, which makes exploration difficult. The showing has been sub-divided into four parts (west, north, east and south) as described below.

In the **west** part of Showing C, a trench sample taken in 1965 reportedly assayed 360 g/t silver, 3.50% lead and 7.30% zinc (Ostensoe, 1965). In 1968, two short diamond drill holes were completed near this trench. The best interval from these holes was 137.1 g/t silver, 1.86% lead and 2.45% zinc over 0.91 m (White, 1968). In 2007, a composite sample composed of chips from 30 variably mineralized blocks of diopside or epidote skarn taken from the old trench averaged 109 g/t silver, 2.91% lead and 6.58% zinc (Eaton, 2008). Another sample taken in 2007 from a block of well mineralized, hydrozincite-coated, sphalerite- and galena-bearing diopside skarn returned 466 g/t silver, 5.88% lead and 8.06% zinc. In 2013, a composite chip sample taken of skarn hosting semi-massive galena and sphalerite exposed within a hand trench graded 360 g/t silver, 6.26% lead, 7.19% zinc and 1060 ppm bismuth (Flavelle, 2013).

In the **north** part of Showing C, abundant, sphalerite-rich epidote-diopside skarn boulders are scattered along an old road cut. A composite sample of chips from 20 mineralized boulders returned 245 g/t silver, 2% lead, 6.52% zinc and 98.7 ppm indium, and a sample from a boulder of especially sulphide-rich mineralization yielded 605 g/t silver, 7.68% lead, 8.26% zinc and 88.6 ppm indium (Eaton, 2008).

In the **east** and **south** parts of Showing C, numerous boulders of magnetite-rich skarn with galena and 'blackjack' sphalerite were identified in 2013. A grab sample from the east part yielded 245 g/t silver, 1.29% lead, 12.15% zinc and 766 ppm bismuth, while a grab sample from the south part returned 325 g/t silver, 1.42% lead, 0.21% zinc and 1220 ppm bismuth.

Showing D is located approximately 200 m west of the Max claims along the batholith contact. A grab sample from the southwestern part of this showing reportedly assayed 2200 g/t silver with only 0.72% lead (Vincent, 1973). In 2013, two noteworthy results were returned from rock

samples taken in this area. Select chips from a steeply dipping fault zone yielded a strong tungsten value (4080 ppm), with weak multi-element support. A 30 cm chip sample of drusy quartz with fracture-filling sphalerite and galena returned 791 g/t silver, 1.06% lead, 0.14% zinc, greater than 1.0% bismuth and 171 ppm tellurium. A grab sample of weathered and pitted, limonite fault breccia with trace malachite assayed 1070 g/t silver, 4.57% lead, 0.67% zinc, 0.89% copper and 3530 ppm bismuth (Flavelle, 2013).

In 2013, Showing D was expanded to the north and northeast approximately 300 m with the discovery of a northeast-trending, steeply west-dipping epidote-wollastonite skarn hosting massive magnetite, galena, chalcopyrite and pyrite. A sample of this material returned 318 g/t silver, 2.75% lead, 0.98% zinc, 871 ppm bismuth, 26.9 ppm tellurium and 2.08 ppm thallium (Flavelle, 2013).

Showing E was historically identified slightly inside the southern boundary of the Max claims, but has since been expanded to cover skarn mineralization found in 2007 to the west. On the Max claims, mineralization consists of disseminated to nearly massive chalcopyrite, galena and sphalerite in epidote-quartz±magnetite skarn. A historical grab sample returned 37.0 g/t silver, 7.64% lead, 4.85% zinc and 1.38% copper, while a 4.57 m chip sample graded 56.6 g/t silver, 2.79% zinc and 1.32% copper (Tully, 1980a). Drilling for tungsten mineralization in 1980 yielded weighted averages of 0.60% WO_3 over 0.58 m, 0.44% WO_3 over 1.33 m and 0.20% WO_3 over 0.92 m.

In 2013, prospecting at Showing E to the west of the Max claims resulted in a 45 cm chip sample of epidote- orthoclase skarn with tarnished pyrite, magnetite and minor pyrrhotite, which returned 524 ppm bismuth and 1490 ppm tungsten, but low values for other elements of interest (Flavelle, 2013).

Showings F is exposed within a creek cut approximately 650 metres north-northeast of the Max claims. It consists of a 4 by 1.5 m wide xenolith/lens of magnetite-diopside skarn hosted within a fine grained hornblende-biotite granodiorite satellite pluton. The xenolith is cut by a 5 cm wide quartz vein that trends 120°/70SW with a 15 cm wide massive magnetite skarn along its footwall. Previous samples taken from the showing returned peak values of 189.3 g/t silver, 7.71% lead, 13.44% zinc and 1.08% copper. A chip sample taken across a 0.35 m wide by 1.2 m long exposure of massive magnetite-sphalerite skarn assayed 36.8 g/t silver, 13.40% lead, 8.56% zinc and 101 ppm indium (Eaton, 2008). In 2013, the best rock sample collected from the showing was a grab sample from a small lense of manganese-epidote skarn hosting 2-3% blebby galena and minor malachite, which returned 96.8 g/t silver, 5.56% lead, 3.88% zinc, 0.17% copper and 210 ppm bismuth (Flavelle, 2013). In 2015, a 15 cm wide chip sample of magnetite-diopside skarn with 10% combined sulphides graded 35.3 g/t silver, 12.1% lead and 7.5% zinc, while a 5 cm wide quartz vein returned 340 ppm tungsten.

Showing G outcrops along a creek approximately 900 m north-northeast of the Max claims and comprises a one metre wide diopside-garnet-epidote skarn that trends 100°/70SW. Mineralization has been traced over a 170 m strike length in float. Samples collected by previous operators returned peak values of 46.3 g/t silver, 7.43% lead and 6.23% zinc (Tully, 1980a). Follow up prospecting in 2007 produced two significant results; both from float

specimens. One of the float samples was rusty-weathering, malachite-stained, magnetite-diopside skarn hosting sphalerite and galena, which assayed 97.8 g/t silver, 10.95% lead, 18.20% zinc and 0.46% copper, while the other float specimen was anglesite- and cerussite-coated, semi-massive galena and sphalerite skarn, which returned 69.8 g/t silver, 15.65% lead and 17.75% zinc (Eaton, 2008). In 2015, a one metre chip sample across banded epidote-garnet-diopside skarn containing disseminated and semi-massive galena and sphalerite in up to 5 cm bands graded 14.05 g/t silver, 4.4% lead and 4.1% zinc, while a 30 by 30 cm boulder consisting of pyroxene skarn yielded 348 g/t silver, 7.0% lead and 0.9% zinc.

Showing H is located about 300 m southwest of Showing F along the same creek. In 2007, a grab sample of skarn float composed of magnetite and sphalerite with trace chalcopyrite and pyrite assayed 10.2% zinc; while another grab sample of epidote-diopside skarn with nearly massive magnetite and minor disseminated chalcopyrite, sphalerite and pyrite assayed 41.7 g/t silver, 1.19% zinc and 1.45% lead.

Showing I lies 1200 m southeast of Showing H and comprises a 5 cm wide mineralized shear zone that trends 055^{o}/35 SE. The skarn has an up to 70 cm wide mineralized skarn envelope that pinches and swells. The shear has been traced over a 200 m strike length; however, mineralization is discontinuous and best developed where the shear cuts limey horizons. In 2007, a grab sample taken from a black siliceous skarn with epidote lenses and trace sphalerite assayed 87.4 g/t silver and 3.00% lead. A second sample composed of epidote-quartz skarn with disseminated malachite, pyrite and an unknown silvery-black sulphide returned 29 g/t silver and 2.87% copper (Eaton, 2008). In 2015, a 70 cm chip sample was collected across a portion of the shear zone that hosts disseminated chalcopyrite, galena and sphalerite and is haloed by a malachite-stained epidote skarn horizon. This sample yielded 39.2 g/t silver and 1.4% copper.

Showing J was discovered in 2013 and lies approximately 1100 m east of Showing H. It consists of a well mineralized shear that trends 080^{o}/55SE, sub-parallel to bedding. The shear is flanked by a strongly manganese stained, skarn envelope. It is exposed over a 30 m strike length and varies from 60 to 70 cm thick. Mineralization comprises blebby chalcopyrite and brilliant malachite and azurite staining. In 2013, a 50 cm chip sample taken across it returned 123 g/t silver, 1.46% lead, 1.77% zinc and 1.99% copper (Flavelle, 2013). In 2015, 3 chip samples were collected along the mineralized exposure, with approximately 15 m spacings between samples. Table III below lists the results from the 2015 chip sampling.

Table III – Chip Sample Results from Showing J

Sample Number	Interval (cm)	Silver (g/t)	Copper (%)	Lead (%)	Zinc (%)
M897980	65	1.37	0.05	-	0.15
M897981	70	35.4	0.69	0.64	0.66
M897982	60	330	3.22	4.36	1.57

Showing K is a historical showing that lies immediately southeast of Showing E outside the Max claims. It reportedly hosts chalcopyrite and galena as fracture coatings in a fine grained dyke.

Showing L was discovered in 2015 and is located 1200 m north of the Max claim block. It consists of fracture hosted mineralization within medium grained, equigranular hornblende granodiorite that contains feldspar crystals altered to an aquamarine colour. Mineralization comprises chalcopyrite with minor malachite staining along chocolate brown weathered fractures. Two specimens of blocky talus within a 20 by 20 m area yielded 0.28% copper with 4.96 g/t silver and 0.25% copper with 5.6 g/t silver.

Showing M is located 550 m east-southeast of Showing J and was also discovered in 2015. It contains a mineralized quartz vein trending 135°/75NE. The vein varies from 50 cm to 1.5 m in width and is exposed intermittently over a 70 m strike length, before disappearing under talus and vegetation to the northwest and into a cliff/gully to the southeast. Mineralization comprises disseminated to blebby chalcopyrite, galena, sphalerite and malachite. The country rock is black shale with strong stockwork veining, which yielded weakly elevated silver, lead, zinc, copper and barium values. Two late stage faults (trending 050°/88SE) offset the zone by several metres. Two chip samples collected near the northwesterly and southeasterly ends of the exposed vein yielded 9.49 g/t silver, 0.41% copper and 0.91% barium over 65 cm and 4.4 g/t silver, 0.19% lead, 0.11% zinc and 0.18% copper over 1.5 m, respectively. A 3 cm piece of quartz vein float taken between the chip samples returned 4.78 g/t silver, 0.31% lead, 0.19% zinc, 0.43% copper, 577 ppm molybdenum and greater than 1% barium.

Tung Zone (Showings 1 and 2)

The Tung Zone is situated about 3000 m south of the Dusty Zone and hosts skarn mineralization. In 1973, a grab sample reportedly assayed 322.2 g/t silver and 0.01% WO_3 (Vincent, 1973). In 2007, prospecting within old trenches identified float of sucrosic limestone and rusty-weathering micaceous quartzite with rare 'blackjack' sphalerite, pyrite and magnetite, and an unidentified dark grey, non-magnetic, metallic mineral.

In 2013, two skarn showings were defined (Figure 11). Showing 1 comprises a 1.5 m wide, heavily oxidized and pitted, pyroxene-epidote skarn subcrop with blebby galena and disseminated sphalerite and chalcopyrite, which abuts barren micaceous schist and marble/limestone. A grab sample of intensely oxidized, limonite-pitted biotite-quartz schist to micaceous quartzite with disseminated galena returned 156 g/t silver, 3.69% lead, 5.06% zinc and 364 ppm bismuth (Flavelle, 2013). Showing 2 consists of skarnified boulders that are concentrated in a 5 by 10 m area, but are traceable 25 m to the north and 100 m to the south. The skarn comprises pyroxene-actinolite-epidote with heavy limonite staining and goethite pits. Mineralization includes minor chalcopyrite, galena, sphalerite and scheelite. Although visual mineralization was encouraging, no significant assays were returned from rock samples collected at Showing 2 (Flavelle, 2013).

A ground magnetic survey conducted across this target identified several magnetic highs that may correlate with other mineralized carbonate-rich bands that are obscured by overburden (Verley, 1997).

Elsa Zone (Elsa, Elsa West and Hike showings)

The Elsa Zone has been intermittently explored since the 1960s. It lies in the north-central part of the property and comprises three showings (Elsa, Elsa West and Hike). Rock sample locations, metal assemblage distributions and a table containing highlight results, all appear on Figure 13.

The **Elsa Showing** lies on the west side of a cirque, in the northwestern part of the zone. Previous work is poorly documented; however, a grab sample reportedly assayed 161.1 g/t silver, 16.55% zinc and 23.56% lead (Timmins, 1968). Mineralization is exposed in a small outcrop and consists of fracture-controlled and possibly stratiform pyrrhotite and pyrite with minor sphalerite, galena, chalcopyrite and malachite. Samples of this material returned up to 200 g/t silver, 3.88% lead, 2.36% zinc, 0.62% copper and 24.8 ppm indium (Eaton, 2008).

The **Hike Showing** lies about 1000 m southwest of the Elsa Showing. It was discovered in 2013 by following up strongly anomalous zinc- and lead-in-soil values (2170 ppm and 1095 ppm, respectively). This showing comprises a 12 by 20 m exposure of quartz-carbonate stockwork and breccia, with medium grained galena and sphalerite. The best results from select chip and composite samples in this structurally controlled showing graded 6.76% lead and 12.35% zinc (Flavelle, 2013).

The **Elsa West Showing** was identified in 2015 and sits approximately 500 m west of the Elsa Showing. It comprises brecciated and quartz veined float material collected from a steep talus slope of mostly black shale. A composite sample was collected from a 20 by 70 cm boulder composed of angular, 1 mm to 1 cm shale clasts in a quartz matrix containing fine grained disseminated galena, medium to coarse grained plumbojarosite and minor limonite pits. That sample yielded 29.4 g/t silver, 1.34% lead and 0.39% copper. A 4 cm wide sample of similar material taken 10 m downslope assayed 34 g/t silver, 1.99% lead and 0.50% copper. The mineralized float could not be traced uphill due to snow cover.

Marg Zone (Cliff and Lower Showings)

The Marg Zone is located in the northeastern part of the property and comprises the Cliff and Lower showings. Rock sample locations, metal assemblage distributions and a table containing highlight results are shown on Figure 14.

The **Cliff Showing** is in the northern part of the Marg Zone. Mineralization at this showing is hosted within diopside-magnetite skarns that strike east and dip steeply to the south. The main mineralized skarn horizon has been traced for about 1100 m along strike and is exposed over widths up to 15.8 m. Historical diamond drill intersections from this horizon include 552.7 g/t silver, 4.06% lead and 5.30% zinc over 0.40 m, and 131.0 g/t silver, 2.04% lead and 2.1% zinc over 0.74 m (Tully, 1980b). These intersections came from holes located 600 m apart. Fourteen float specimens, mainly sphalerite-bearing epidote skarns, were picked up from old trenches in 2007. Of these, the four best averaged 193.8 g/t silver, 2.92% lead and 4.03% zinc (Eaton, 2008). In 2013, a grab sample of oxidized, manganese-epidote altered, light green calc-silicate

hosting galena and sphalerite assayed 226 g/t silver, 1.72% lead, 1.43% zinc, 675 ppm bismuth and 560 ppm tungsten.

The **Lower Showing** lies about two kilometres southeast of the Cliff Showing. A historical sample collected from this showing reportedly assayed 171.5 g/t silver, 3.0% lead and 7.0% zinc (Tully, 1980b). In 2007, seven samples were collected – the best of which came from a 0.6 by 0.6 m subcrop exposure in an old trench. The subcrop comprised epidote-diopside skarn with small areas of limonitic boxwork, moderate sphalerite and traces of pyrite and malachite. A sample from the subcrop assayed 26.1 g/t silver, 5.22% lead, 3.65% zinc and 0.32% copper (Eaton, 2008), while a float sample collected 360 m up trench returned 75.7 g/t silver, 1.39% lead and 4.02% zinc. In 2013, a 0.4 by 1.0 m subcrop exposure of magnetite skarn with galena and sphalerite from the wall of another old trench returned 507 g/t silver, 4.85% lead, 5.06% zinc, 1375 ppm bismuth and 336 ppm tungsten. A specimen sample of chalcopyrite- and pyrrhotite-bearing skarn from the floor of a third trench returned 1.04% copper.

Miko Zone (Creek, Hillside, Cirque and Camp Showings)

The Miko Zone is situated in the southeastern part of the property and consists of four showings. Rock sample locations, metal assemblage distributions and a table containing highlight results are shown on Figure 15.

The **Creek Showing** hosts a poorly exposed skarn that has been traced for approximately 100 m along strike and which is up to five metres wide at surface. Mineralization strikes east and dips steeply to the south. Historical bulldozer trenching exposed massive sulphide, which reportedly assayed 65.1 g/t silver, 26.57% lead and 21.56% zinc over 2.8 m (Simpson, 1969). In 2007, samples were collected from a series of old trenches, including a composite sample of chips taken from 35 mineralized boulders. The chip sampled boulders comprise banded epidote-sphalerite to massive sphalerite-galena skarns. The composite sample of this material assayed 135 g/t silver, 28.71% lead and 24.30% zinc. Two samples of highly weathered, hydrozincite-coated epidote skarn float containing semi-massive to massive galena and sphalerite averaged 48.3 g/t silver, 37.21% lead and 29.25% zinc. In 2013, a grab sample of mixed limestone and epidote skarn hosting abundant galena and sphalerite returned 755 g/t silver, 7.29% lead, 6.97% zinc and 2210 ppm bismuth.

The **Hillside Showing** consists of three separate skarn lenses, each 50 to 160 m long and up to 12 m wide. The mineralized lenses occur over a total length of 650 m, strike east and dip steeply south. The best assays reported from historical trenching include 432.0 g/t silver, 9.62% lead and 0.93% zinc over 1.28 m; and 370.3 g/t silver, 8.22% lead and 14.01% zinc over 3.20 m. The best diamond drill interval graded 164.6 g/t silver, 3.45% lead and 2.35% zinc over 0.43 m (Tully, 1980c).

The **Cirque Showing** comprises a 1 m wide by 60 m long band of siliceous epidote skarn located adjacent to an intrusive sill. Little data is available for this showing; however, a historical surface sample reportedly assayed 116.6 g/t silver, 4.4% lead and 0.20% zinc. The best historical diamond drill intersection returned 83.0 g/t silver, 0.54% lead and 4.30% zinc over 2.13 m (Simpson, 1969).

In 2013, the **Camp Showing** was discovered approximately 1100 m southwest of the Creek Showing. This showing comprises a calc-silicate and epidote altered skarn subcrop with disseminated chalcopyrite, galena and sphalerite. A two metre chip sample across the subcrop returned 69.9 g/t silver, 2.4% lead and 0.64% zinc.

SOIL GEOCHEMISTRY

Historical soil sampling included grid soil sampling near the Dusty Zone and more localized sampling near other zones. Reconnaissance-scale contour sampling was also done along several of the main drainages and on adjacent hillsides. Due to advances in multi-element analytical techniques, improved sample digestion procedures and a lack of reference points on old maps, results for soil samples taken prior to 2007 have not been incorporated into the dataset.

In 2015, a total of 717 grid and contour soil samples were collected from the Dusty/Tung and Elsa areas. Grid soil samples were taken at 50 m intervals along lines that filled in and connected two grids that were sampled in 2013. Contour samples were collected at 50 m intervals at the base of a steep slope, between the grids. Locations for 2015 soil samples are plotted on Figure 16. Thematic results from historical and 2015 programs for silver, copper, bismuth, lead and zinc are plotted on Figures 17 to 21, respectively.

All soil sample locations were recorded using hand-held GPS units. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 50 cm wooden lath that were driven into the ground. Most of the soil samples were collected from 15 to 60 cm deep holes using hand-held augers. They were placed into individually pre-numbered Kraft paper bags. The soil samples were sent to ALS Minerals in Whitehorse, where they were dried and screened to -180 microns. The fine fractions were then shipped to ALS Minerals in North Vancouver, where they were dissolved in aqua regia and analyzed for 35 elements using the inductively coupled plasma-atomic emission spectroscopy technique (ME-ICP41). Soil samples taken in 2013 from undisturbed ground, or beneath the floors of historical trenches at the Marg Zone and Tung zones were analyzed using the same technique as the 2015 rock samples, which is described in the previous section. Certificates of Analysis are given in Appendix III.

Table IV below lists anomalous thresholds and peak values used to describe the soil results from undisturbed and disturbed ground.

Table IV – Soil Geochemical Thresholds

Element	Weak	Moderate	Strong	Peak Value – Undisturbed Soil Sample		Peak Value – Trench or Hand Pit Soil Sample	
				Value	Zone	Value	Zone
Silver (ppm)	≥ 0.5 < 1	≥ 1 < 2	≥ 2	11.4	Elsa	707	Tung
Copper (ppm)	≥ 50 < 100	≥ 100 < 200	≥ 200	432	Dusty	149	Marg
Bismuth (ppm)	≥ 5 < 10	≥ 10 < 20	≥ 20	164	Dusty	1655	Tung
Lead (ppm)	≥ 50 < 100	≥ 100 < 200	≥ 200	3390	Elsa	118,000	Tung
Zinc (ppm)	≥100 < 200	≥200 < 500	≥ 500	4150	Elsa	8310	Tung
Tungsten (ppm)	≥ 10 < 20	≥ 20 < 50	≥ 50	70	Dusty	43.1	Tung

Soil sampling on the property has successfully highlighted most of the known showings on the property.

Dusty Zone

A 1200 by 4000 m soil grid lies northwest, north and northeast of the Max claims and encompasses all showings in the Dusty Zone, except Showings E and K. The northwest part of the grid is mostly underlain by Hyland Group, straddles the contact between Hyland Group and Mt. Billings Batholith and covers Showings A, B, C and D. Soil samples taken near Showings A and B contain strongly anomalous values for lead (up to 1085 ppm), but only moderate values for other elements of interest. Soil from Showing C returned coincident, moderately to strongly anomalous values for silver (up to 2 ppm), bismuth (up to 13 ppm), lead (up to 560 ppm) and zinc (up to 602 ppm). Samples taken around Showing D showed weak response for silver, and weak to moderate response for bismuth, lead and zinc. Copper-in-soil geochemistry for this grid was mostly background.

The north and northeastern portions of the grid span the area between the Dusty and Elsa zones. They cover mostly Earn Group and encompass Showings F, G, H, I, J, and M.

The best multi-element anomaly discovered to date on the property covers a 1000 by 300 m area that encompasses Showings J and M. It comprises a broad copper-in-soil anomaly (up to 432 ppm) with clusters of moderately to strongly anomalous silver (up to 6.0 ppm), bismuth (up to 29 ppm), lead (up to 2110 ppm) and zinc (up to 3690 ppm) values near Showing J, but only moderately elevated silver and lead responses around Showing M. The copper-in-soil results at this showing are significant because they are much higher than those from samples taken elsewhere on the property – including those from previously trenched areas. Samples collected near Showing I yielded low values for all elements of interest; however, a sample collected upslope, 250 m northeast of the showing is the peak zinc-in-soil value on the property (4150 ppm zinc). A discontinuous string of weakly to strongly anomalous copper and silver results are located immediately west-southwest of Showing I. Showings F, G and H are characterized by relatively subdued results; however, this may be caused by thick glacial and glaciofluvial deposits in those areas.

The northern-most part of the grid sits atop the Mt. Billings Batholith and covers Showing L. Most soil values in this area are low, but coincident weak and moderately anomalous copper- and zinc-in-soil values were identified 90 m northwest of Showing L.

A few, small clusters of coincident, elevated soil geochemical values for silver, bismuth, lead and/or zinc also occur away from the known showings, within the Dusty Zone.

Tung Zone

Most of the soil samples at the Tung Zone were collected from previously undisturbed ground, along two lines centred on the historical trenches. A few samples were also taken along a contour line in the northern part of the zone and 23 samples were collected from hand pits, which were dug into the floors of historical trenches in the vicinity of Showing 1. The hand pit samples were taken from holes augered one metre below the bottoms of the pits. Although regional-scale mapping shows that the sampled areas are underlain by the Mt. Billings Batholith, detailed mapping indicates that the areas cover the batholith and Hyland Group sediments.

The soil lines returned background results for silver, copper and lead. A small cluster of samples near the middle of the lines yielded moderate values for zinc and moderate to strong values for bismuth (up to 12 ppm). An isolated moderately anomalous tungsten value (43.1 ppm) was also obtained from this area.

A soil sample taken near surface at Showing 1 returned strong lead (up to 296 ppm) and zinc (up to 553 ppm) values with weak to moderate silver, copper and bismuth support; however, a deep auger soil sample taken from a hand pit at the same location returned exponentially higher values including 707 ppm silver, 1655 ppm bismuth, 118,500 ppm lead and 8310 ppm zinc.

The contour sampling yielded mostly low values for all elements of interest.

Elsa Zone

The 2007 Elsa grid is underlain by Earn Group and covers the Elsa, Elsa West and Hike showings. Soil samples taken from within the area of the Elsa Showing yielded strongly anomalous values for silver (up to 11.4 ppm), bismuth (37 ppm), lead (3390 ppm) and zinc (3500 ppm). Nearby samples returned a strongly anomalous, single-point silver value with weak multi-element support, and a cluster of coincident, strongly anomalous bismuth, lead and zinc values.

The area of the Elsa West Showing includes a coincident, strongly anomalous lead (2110 ppm) and zinc (1140 ppm) point anomaly and a string of strongly anomalous lead values, which continue for 500 m to the west-southwest.

Soil samples taken at the Hike Showing yielded weakly to moderately anomalous values for silver, copper, bismuth and lead, plus two isolated, strongly anomalous value for zinc (2170 ppm). Other single point anomalies near this showing include 167 ppm copper, 1095 ppm lead and 1350 ppm zinc.

A cluster of coincident, strongly anomalous bismuth (up to 11 ppm) and lead (up to 693 ppm) values, with moderate silver and weak zinc support, lies in the northern-most part of the Elsa grid near the contact between Mt. Billings Batholith and Earn Group. These anomalies are unexplained.

Further southeast within the Elsa grid, there is a small group of coincident, strongly anomalous bismuth, lead and zinc values, and in the southeast corner of the grid, where it overlaps with contour samples taken west of the Marg Lower Showing, there are moderate bismuth and silver values with moderate to strong response for zinc (up to 1040 ppm).

Marg Zone

Sampling at the Marg Lower Showing mostly involved soil from holes augered beneath the floors of the historical trenches. Contour soil sampling was also completed to the north and west of this showing. Although a more complete digestion technique was used during the analysis of these samples, their values do not appear to be significantly elevated compared to samples processed with less complete digestion technique (see overlap with Elsa grid). No samples were taken in the vicinity of the Cliff Showing.

One of the samples taken beneath a trench floor in the northern part of the Marg Lower Showing returned strongly anomalous silver (6.98 ppm), bismuth (28 ppm), lead (1040 ppm) and zinc (1540 ppm) values, but other samples collected nearby returned weak to moderate values.

The core of the Marg Lower Showing is surrounded by a 250 by 250 m halo of strongly anomalous lead (up to 696 ppm) and zinc (up to 3320 ppm) values, with sporadic moderate to strong silver, copper and bismuth support.

Contour sampling north of the Marg Lower Showing identified a 200 m by 250 m cluster of coincident, moderately to strongly anomalous values for silver, lead and zinc, while sampling west of the showing returned weak to moderate values for all elements of interest.

Miko Zone

Two small soil grids were completed at the Miko Zone in 2013, both of which are underlain by Earn Group. Samples were collected at 50 by 100 m spacings, on a grid located along strike to the northwest of the Hillside Showing, and at 25 by 50 m spacings on a second grid southeast of the Creek Showing.

The Hillside grid returned sporadic, coincident strongly anomalous values for silver (up to 2.8 ppm), bismuth (up to 14 ppm), lead (up to 1570 ppm) and zinc (up to 1960 ppm) with weak to moderate copper support. The Creek grid yielded small clusters of elevated silver (up to 4.9 ppm), lead (up to 1570 ppm) and zinc (up to 598 ppm) values.

HISTORICAL GEOPHYSICAL SURVEYS

In 2007, property-wide, helicopter-borne VTEM and magnetic surveys were conducted by Geotech Ltd. of Aurora, Ontario using an AStar B3 helicopter operated by TRK Helicopters Ltd. The complete Geotech report including details concerning survey procedures, equipment used and results obtained can be found in the 2008 Hy Property Assessment Report (Eaton, 2008).

The magnetic survey recorded total magnetic field values ranging from 56900 nT to 57500 nT. Areas underlain by intrusive rocks in the extreme eastern and western parts of the property are characterized by high magnetic field values (Figure 22). Another area of magnetic highs in the southern part of the property may be underlain by shallowly-buried intrusive rocks. Smaller and weaker magnetic highs along the northern edge of the roof pendant coincide with some of the showings in the Miko and Marg zones and are likely caused by magnetic skarns in the Earn Group. Areas underlain by Hyland Group exhibit relatively low magnetic response. Although a number of linear magnetic lows are evident on vertical gradient and tilt derivative maps, their significance is uncertain because most do not coincide with known faults or mineralized zones.

Interpretation of VTEM data done by Geotech identified three zones with weak to moderate, late time B-field channel conductance (Zones A to C) as shown on Figure 23. Zone A lies east-southeast of the Hike Showing. Zone B comprises five semi-circular conductors, four of which are immediately southwest of the Camp Showing, while the fifth conductor is unexplained. Zone C coincides with an isolated block of Earn Group sediments located about 1500 m north of the main roof pendant. No mapping, prospecting or soil sampling has been done in the vicinity of Zone C.

Figure 24 layers Geotech's interpretation of the magnetic and EM data with the known showings in each of the five main zones. The best EM conductors are shown as circles on this figure. The red circles represent near-surface (less than 100 m deep) conductors, while the blue circles represent conductors at depths greater than 400 m.

At the Dusty Zone, only three showings partially coincide with a strong magnetic response (Showings A, D and F), which may be caused by buried Mt. Billings Batholith rocks. The remaining showings within this zone exhibit weak to moderate magnetism associated with the underlying Hyland and Earn groups. Interestingly, Showing J exhibits both poor magnetism and conductance despite having the strongest soil geochemical response on the property.

At the Tung Zone, the Mt. Billings Batholith has a strong magnetic signature that locally coincides with areas of shallow, strong conductance. Showing 1 has moderate magnetic response and a coincident conductor, which has an interpreted depth of 100 to 200 m.

The Elsa Zone has a moderate to strong magnetic signature, which is interesting considering the lack of mapped intrusive bodies in the area. There are a number of magnetic highs that coincide with strong conductors – one of which nearly underlies the Hike Showing. Similar geophysical signatures occur southeast of this showing in heavily vegetated terrain. The Elsa Showing has a generally weak geophysical signature, with the exception of a few shallow conductors. The Elsa West Showing lacks both magnetic highs and conductors.

At the Marg Zone, the Mt. Billings Batholith is marked by a moderate magnetic high. The most striking geophysical feature in this zone is the 2000 m long, northwesterly-trending coincident, magnetic high and conductor. This zone may be related to the magnetic skarn horizons that comprise the Cliff Showing. An area of high magnetic response within the Lower Showing may be the continuation of the skarn horizons, which have been offset by a fault.

The Miko Zone exhibits a relatively subdued geophysical signature. The Creek Showing and the northwestern part of the Hillside Showing have local magnetic highs with coincident weak conductors. About 500 m east of the Cirque Showing, there is a small, oval magnetic high and linear conductor that have not received any follow up work. The Camp Showing is underlain by a magnetic low with no conductors.

HISTORICAL TRENCHING AND DIAMOND DRILLING

Since 1965, numerous mechanized trenching and diamond drilling programs have been performed on the Hy property. No trenching or drilling were performed in 2015. Locations for most trenches and drill holes are illustrated by zone, on the appropriate figure referenced in the Mineralization section. Significant results for trenching and drilling are discussed in the following paragraphs.

Dusty Zone

Table V below shows historical trench results from Showings A to G (Ostensoe, 1965; White, 1986; Galloway, 1972; Vincent, 1973 and Tully, 1980a), and 2013 results from hand trenches dug at the Showing D.

Table V – Dusty Zone Trench Highlights

Miko Zone

Table VIII shows historical trench highlights for the Miko Zone's Hillside and Creek showings (Simpson, 1969). Table IX shows details for the eight drill holes completed in this area, while Table X highlights significant drill assay intervals for holes HR-2, MAR 2-80 and MAR 3-80 (Tully, 1980c). Figure 26 shows a cross section with the dominant lithologies encountered in holes HR-2 and HR-3 at the Cirque Showing.

Tung Zone

Ten historical bulldozer trenches were excavated at the Tung Zone. The trenches were dug into a very thick glacial moraine and bedrock was not encountered. No assessment reports detailing this work have been located.

AIR PHOTOGRAPHY AND GROUND SURVEYS

A high resolution, air photo survey was conducted by Underhill Geomatics Ltd. of Whitehorse, Yukon on September 10, 2013, across a grid that covered all of the Hy claims. The survey was flown with an Aero Commander 690A fixed wing airplane operated by Geographic Air Survey Ltd. of Edmonton, Alberta from the Whitehorse airport. The air photos were taken with a Zeiss DMC II 230 camera. A total of 151 images were collected across seven lines spaced 1000 m apart.

On June 15, 2015 Underhill Geomatics performed on-ground surveying in preparation of ortho-rectification of the air photos and creation of detailed topographic maps, which will be used for future exploration and compilation purposes. Appendix V contains the survey data.

DISCUSSION AND CONCLUSIONS

The Hy property continues to demonstrate potential for silver-lead-zinc±copper±tungsten skarn mineralization with locally strongly elevated bismuth, tellurium and indium values. Recent work has also identified breccia-hosted lead-zinc and fracture controlled copper-silver mineralization. Although numerous well mineralized showings have been exposed by trenching, many of the historical trenches did not reach bedrock and none of the showings have been fully delineated. Most historical diamond drill holes produced encouraging results over sub-economic widths.

Compilation of geophysical and soil geochemical data provides a comprehensive overview of the characteristics of the known showings. Some of these showings are marked by magnetic highs, strong conductors and elevated soil geochemical response; however, encouraging soil geochemistry and mineralization also occurs in areas with low magnetism and no conductors – such as Showing J and the Elsa Showing.

Further exploration on the Hy property is warranted and should include the following:

1. Orthorectification of air photos and preparation of detailed topographic maps;

2. Air photo interpretation – contacts, faults, bedding attitudes and geomorphological features should be identified;

3. Petrographic analysis – This study should be performed to reliably identify skarn minerals;

4. Mineralogical studies – This work is needed to determine the provenance and probable recoverability of metals, especially silver and indium;

5. Soil sampling – Widely spaced soil sampling should be done in the southern half of the property and more systematic grid sampling completed in the vicinity of all known showings and across coincident magnetic and EM geophysical anomalies;

6. Gravity surveys – Ground-based surveys should first be carried out over the Creek Showing (Miko Zone) and Showing 1 (Tung Zone) to delineate non-magnetic skarn

horizons in heavily vegetated or overburden covered areas. Pending favourable results this technique could be applied to other skarn occurrences;

7. Trenching – Hand trenching at the Hike Showing and Showing J should be completed. Mechanically deepening the historical trenches at the Lower (Marg) and Creek (Miko) showings would be beneficial because years of thaw have likely removed permafrost in soil so bedrock can be exposed. Additional mechanized trenching may be warranted at the Dusty or Elsa zones or within areas of strong soil geochemical response; and,

8. Diamond drilling - Pending favourable results from the above recommendations (specifically trenching), diamond drilling should be completed at the Lower (Marg), Creek (Miko) and Hillside (Miko) showings. Additional drilling may be warranted in other areas of the property where particularly promising results are obtained.

Respectfully submitted,

STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Andrew Mitchell, geoscientist in training, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in Vancouver, British Columbia, hereby certify that:

1. I graduated from the University of British Columbia in 2010 with a B.Sc. in Earth and Environmental Sciences.

2. From 2010 to present, I have been actively engaged in mineral exploration in Yukon Territory.

3. I am a Geoscientist in Training (GIT) with the Association of Professional Engineers and Geoscientists of British Columbia.

4. I have personally participated in the fieldwork reported herein and have interpreted all data resulting from this work.

A. Mitchell, B.Sc. GIT

L. Vinnedge (field assistant) 81 1/4 hours April to September at $51/hr	4,350.94
J. Irwin (field assistant) 16 hours April to September at $49/hr	823.20
A. Soucy-Fradette (field assistant) 72 hours April to September at $45/hr	3,402.00
C. Hughes (field assistant) 85 3/4 hours April to September at $43/hr	3,871.61
J. Mariacher (office) 8 hours April to September at $90/hr	756.00
L. Corbett (expedite) 20 hours April to September at $81/hr	1,701.00
D. Arnold-Wallinger (expedite) 6 hours April to September at $85/hr	535.50
S. Newman (office) 26 hours April to September at $64/hr	1,747.20
	30,113.74

Expenses (including management)

Field room and board – 47 mandays @ $180/manday	9,559.80
Trans North Helicopters – 8.1 hours Bell 206B at $990/hr plus fuel	9,771.20
ALS Chemex	18,254.30
Underhill Geomatics	5,336.99
	42,922.29

Total	$73,036.03

765 samples at $73,036.03= $95.47/sample

CERTIFICATE WH15089042

Project: HY

P.O. No.: HY

This report is for 48 Rock samples submitted to our lab in Whitehorse, YT, Canada on 16-JUN-2015.

The following have access to data associated with this certificate:

SARAH DRECHSLER	JOAN MARIACHER	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
LOG-21	Sample logging - ClientBarCode
BAG-06	Double Bagging Coarse Rejects

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Cu-OG62	Ore Grade Cu - Four Acid	VARIABLE
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
ME-MS61	48 element four acid ICP-MS

CERTIFICATE OF ANALYSIS WH15089042

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
PUL-31	PUL-QC	SPL-21	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Ag-OG62	Cu-OG62	ME-MS61	ME-OG62
Pb-OG62	Zn-OG62

CERTIFICATE WH15087607

Project: HY

This report is for 236 Soil samples submitted to our lab in Whitehorse, YT, Canada on 16-JUN-2015.

The following have access to data associated with this certificate:

HEATHER BURRELL	SARAH DRECHSLER	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **STRATEGIC METALS LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE WH15087617

Project: HY

This report is for 240 Soil samples submitted to our lab in Whitehorse, YT, Canada on 16-JUN-2015.

The following have access to data associated with this certificate:

HEATHER BURRELL	SARAH DRECHSLER	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **STRATEGIC METALS LTD.**
ATTN: JOAN MARIACHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS WH15087617

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

NSS is non-sufficient sample.
Applies to Method: ALL METHODS

LABORATORY ADDRESSES

Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.
Applies to Method: LOG-22 SCR-41 WEI-21

Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.
Applies to Method: Au-AA24 ME-ICP41

CERTIFICATE WH15087623

Project: HY

This report is for 241 Soil samples submitted to our lab in Whitehorse, YT, Canada on 16-JUN-2015.

The following have access to data associated with this certificate:

HEATHER BURRELL	SARAH DRECHSLER	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **STRATEGIC METALS LTD.**
ATTN: JOAN MARIACHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS WH15087623

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

NSS is non-sufficient sample.
Applies to Method: ALL METHODS

LABORATORY ADDRESSES

Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.
Applies to Method: LOG-22 SCR-41 WEI-21

Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.
Applies to Method: Au-AA24 ME-ICP41

APPENDIX IV

ROCK SAMPLE DESCRIPTIONS

Rock Sample Descriptions Property: Hy-Elsa

Sample Number:	M897952	UTM:	516214	mE	Nad83, Zone 9
Elevation:	1676 m	UTM:	6794215	mN	

Comments: Manganese stained, well banded pyroxene-quartz skarn hosting minor pyrhottite, galena(?) and pyrite stringers. Sample was taken from bouldery slope covered with half talus and vegetation. Epidote-garnet-pyroxene skarn in the area, but no specimens were mineralized.

Sample Number:	M897953	UTM:	516460	mE	Nad83, Zone 9
Elevation:	1845 m	UTM:	6794227	mN	

Comments: Approximately 30 centimetre wide rusty to manganese stained pyroxene-epidote skarn 1-2% fine to medium grained pyrhottite/galena/pyrite stringers. Not enough material for a rep. Skarn horizon sandwiched between quartzite beds. Couldn't trace it along strike due to vegetation/boulder cover. Exposed over a 3 metre strike length.

Sample Number:	M897954	UTM:	516682	mE	Nad83, Zone 9
Elevation:	1895 m	UTM:	6794217	mN	

Comments: Stockwork quartz vein comprising < 1mm seams of limonite. Rock is dense. No visible sulfides, however it looks like it will run. Taken from talus slope near to of a gully. Area shows hornfels alteration and minor stockwork veining within the adjacent metasedimentary rocks. Vein was up to 5 cm wide and couldn't be found in outcrop.

Sample Number:	M897955	UTM:	516811	mE	Nad83, Zone 9
Elevation:	1912 m	UTM:	6794149	mN	

Comments: Strong manganese stained pyroxene-epidote skarn hosting pyrrhotite +/- fine grained sulfides. Skarn was found adjacent to a shear zone/fault. The horizon was 40 cm, however due to the steepness, only a representative grab sample was taken.

Sample Number:	M897956	UTM:	516812	mE	Nad83, Zone 9
Elevation:	1914 m	UTM:	6794170	mN	

Comments: Approximately 5-15 cm wide strongly manganese stained pyroxene-epidote skarn with trace chalcopyrite. Malachite staining was present as a stockwork on the surface and was found locally (normally as zones in the centre of the horizon).

Rock Sample Descriptions Property: Hy-Elsa

Sample Number:	M897957	UTM:	516804	mE	Nad83, Zone 9
Elevation:	1856 m	UTM:	6794062	mN	

Comments: Lensey layer of moderately manganese and malachite stained pyroxene skarn hosting blebby fine grained chalcopyrite, galena(?) and sphalerite (?). Sample collected adjacent/within shear zone. No significant widths or continuity at this location.

Sample Number:	M897958	UTM:	517346	mE	Nad83, Zone 9
Elevation:	1812 m	UTM:	6794107	mN	

Comments: Rusty stained quartz vein with green micaceous blebs/seams. Sample taken from talus slope of mostly marble and quartz-chlorite-schist. Vein up to 5 centimetres.

Sample Number:	M897959	UTM:	517449	mE	Nad83, Zone 9
Elevation:	1871 m	UTM:	6794000	mN	

Comments: Black to rusty weathered shale with stockwork quartz +/- carbonate veinlets hosting variable fine grained to medium grained pyrite and trace chalcopyrite, malachite and galena (?).

Sample Number:	M897960	UTM:	516887	mE	Nad83, Zone 9
Elevation:	1943 m	UTM:	6794219	mN	

Comments: Strong manganese stained pyroxene-epidote skarn hosting trace fine grained pyrite, galena, sphalerite. Taken within talus slope and the only sample of this kind.

Sample Number:	M897961	UTM:	517107	mE	Nad83, Zone 9
Elevation:	1918 m	UTM:	6794404	mN	

Comments: black to strongly manganese stained green-black strongly altered rock with limonite pits (semi-circular) up to 2x3 mm.

Sample Number:	M897962	UTM:	517469	mE	Nad83, Zone 9
Elevation:	1892 m	UTM:	6793999	mN	

Comments: Strong stock work veining hosted within black shale. Veins comprise strong limonite alteration. Sample taken from linear on ridge top.

Rock Sample Descriptions Property: Hy-Elsa

Sample Number:	M897963	UTM:	517445	mE	Nad83, Zone 9
Elevation:	1887 m	UTM:	6794004	mN	

Comments: 1 m continuous chip sample across mineralized aplite dyke. Aplite dyke has limonite pits and trace galena (?). Appears to be trending 054 degrees and dipping 80 degrees to the northwest.

Sample Number:	M897964	UTM:	517445	mE	Nad83, Zone 9
Elevation:	1880 m	UTM:	6793997	mN	

Comments: Quartz-carbonate veins up to 3 cm wide. Rock is rubbly/crumbly (strongly altered). Hosts fine to medium grained chalcopyrite (weathered brown), malachite, pyrite and galena (?). Sample is float and makes up 2% of rocks in the area.

Sample Number:	M897965	UTM:	516466	mE	Nad83, Zone 9
Elevation:	1706 m	UTM:	6794469	mN	

Comments: Light green calc-silicate (pyroxene-quartz) with fracture controlled copper mineralization (fractures coated with malachite - no visible sulfides within the rock itself). Taken from large talus slope below gully of intrusive-metasedimentary contact. Only specimen observed with malachite staining. Sample was about 4 cm wide.

Sample Number:	M897966	UTM:	516478	mE	Nad83, Zone 9
Elevation:	1730 m	UTM:	6794462	mN	

Comments: Strongly manganese stained pyroxene skarn hosting up to 10% pyrrhotite with 1% chalcopyrite (trace malachite) and sphalerite. Taken from large talus slope below gully of intrusive-metasedimentary contact. Sample was about 5 cm wide.

Sample Number:	M897967	UTM:	516522	mE	Nad83, Zone 9
Elevation:	1748 m	UTM:	6794434	mN	

Comments: Moderately manganese stained pyroxene skarn with up to 2% chalcopyrite. Taken from large talus slope below gully of intrusive-metasedimentary contact. Sample was 5 cm wide and only specimen like this in the area.

Rock Sample Descriptions Property: Hy-Elsa

Sample Number:	M897968	UTM:	516535	mE	Nad83, Zone 9
Elevation:	1766 m	UTM:	6794433	mN	

Comments: Strongly silicified skarn with bands of dominantly quartz, epidote and pyroxene. Hosts medium to coarse grained blebs of fine grained galena (up to 1 cm). Galena is hosted in the quartz-rich bands. 1-2% galena. Taken from large talus slope below gully of intrusive-metasedimentary contact.

Sample Number:	M897969	UTM:	516482	mE	Nad83, Zone 9
Elevation:	1721 m	UTM:	6794442	mN	

Comments: Strongly manganese stained and irregular/rough limonite surface comprising pyroxene-pyrrhotite skarn with blebs of red/purple sphalerite (4%). Very heavy rock taken from talus slope at soil sample ZZ94542. Taken from large talus slope below gully of intrusive-metasedimentary contact.

Sample Number:	M897970	UTM:	516410	mE	Nad83, Zone 9
Elevation:	1690 m	UTM:	6794475	mN	

Comments: Moderately manganese stained boulder (up to 9 cm) of epidote-pyroxene skarn with fine to medium grained disseminated galena. Boulder was flagged by someone previously, but no sample was taken. Specimen was found within boulder field of metasediments within a large linear (major structure?) only rock like this in the area.

Sample Number:	M897971	UTM:	516213	mE	Nad83, Zone 9
Elevation:	1635 m	UTM:	6794602	mN	

Comments: Strongly manganese stained with vuggy surface of pyroxene-calcite skarn hosting ~ 10-15% disseminated galena and 1% sphalerite. Sample collected from talus slope and represents ~ 2% of slope. Adjacent to intrusive contact and also large structure (up to 20 cm wide).

Sample Number:	M897972	UTM:	516055	mE	Nad83, Zone 9
Elevation:	1568 m	UTM:	6794668	mN	

Comments: 1 metre wide continuous chip sample taken at Showing G. Sample comprised banded pyroxene-garnet-epidote skarn with intermittent bands of semi-massive to massive galena. The horizon trends 085 degrees and dips steeply to the southeast.

Rock Sample Descriptions Property: Hy-Elsa

Sample Number:	M897973	UTM:	515935	mE	Nad83, Zone 9
Elevation:	1540 m	UTM:	6794448	mN	

Comments: Quartz vein in sheared fault zone 5 cm wide. Grey to purple quartz with minor goethite blebs/crystals (2-5% of rock) and minor epidote. Vein is trending 120 degrees and dipping 70 to the southwest.

Sample Number:	M897974	UTM:	515936	mE	Nad83, Zone 9
Elevation:	1534 m	UTM:	6794447	mN	

Comments: 15 cm chip sample of massive to semi-massive magnetite-pyroxene skarn hosting 10-15% disseminated galena. Sample taken from footwall of the vein (sample M897973).

Sample Number:	M897975	UTM:	516864	mE	Nad83, Zone 9
Elevation:	1491 m	UTM:	6793325	mN	

Comments: Shear zone/skarn with alteration halo around the shear zone up to 70 cm into the skarn host rock. Strong manganese staining on the adjacent skarn and chlorite alteration of quartz-mica schist (mica-chlorite). Mineralization is strongest within the shear zone itself (~ 5 cm wide here) with up to 15% chalcopyrite and semi-massive to massive galena and sphalerite. High grade sample of the shear zone was taken here (5 cm wide). Shear zone is trending 55 degrees and dipping 35 to the southeast. It extends for about 10 metres, but mineralization is weak elsewhere along the structure.

Sample Number:	M897976	UTM:	517156	mE	Nad83, Zone 9
Elevation:	1622 m	UTM:	6793425	mN	

Comments: Strong manganese and oxide stained skarn with blebs of fine grained honey brown/red sphalerite disseminated (up to 1 cm blebs). 2-3% sphalerite in strongly altered skarn (?). Sample was dug up by a bear looking for a ground squirrel and it was the only piece of mineralization in the area. Limestone was prevalent on the slopes around the sample.

Sample Number:	M897977	UTM:	517938	mE	Nad83, Zone 9
Elevation:	1504 m	UTM:	6793277	mN	

Comments: Representative sample of strong manganese/rusty stained black shale with trace limonite stockwork veinlets (quartz veinlets). Horizon appears to be up to 10 m, thick, but trends into creek and may be thicker. Foliation/bedding? Is 034 Degrees/44NW

Rock Sample Descriptions Property: Hy-Elsa

Sample Number:	M897978	UTM:	518424	mE	Nad83, Zone 9
Elevation:	1736 m	UTM:	6792971	mN	

Comments: Yellow to green stained quartz vein with limonite pits on surface (up to 4 cm wide). Quartz vein is vuggy with vugs filled with limonite and yellow/green altered minerals. Quartz vein is hosted in black shale. Sample was collected from steep talus slope of mostly black shale and makes up about 1-2% of rocks in the talus. Looks similar to showing L on the ridge to the NW.

Sample Number:	M897979	UTM:	518434	mE	Nad83, Zone 9
Elevation:	1743 m	UTM:	6792972	mN	

Comments: 20 cm wide breccia comprising quartz matrix with angular clasts of black shale (up to 3 cm) Quartz matrix is riddled with yellow-green and limonite vugs (~ 50%) of rock. Breccia found on talus slope as a boulder (70 x 20 cm) and looks near source. Couldn't trace further uphill due to snow coverage and should be prospected again at a later month in the summer when the snow has mostly melted.

Sample Number:	M897980	UTM:	516916	mE	Nad83, Zone 9
Elevation:	1887 m	UTM:	6794138	mN	

Comments: Southeastern most sample collected from Showing J. Sample was a 65 cm chip sample across the shear zone and the mineralized skarn. Skarn comprises strong quartz alteration with disseminated chalcopyrite (1%), galena (2%), sphalerite (2%). Shear zone (5 cm wide) hosts semi-massive to massive galena and sphalerite with up to 5% chalcopyrite.

Sample Number:	M897981	UTM:	516904	mE	Nad83, Zone 9
Elevation:	1894 m	UTM:	6794147	mN	

Comments: Central sample collected from Showing J. Sample was a 70 cm chip sample across the shear zone and the mineralized skarn. Skarn comprises strong quartz alteration with disseminated chalcopyrite (1%), galena (2%), sphalerite (2%). Shear zone (5 cm wide) hosts semi-massive to massive galena and sphalerite with up to 5% chalcopyrite.

Sample Number:	M897982	UTM:	516901	mE	Nad83, Zone 9
Elevation:	1899 m	UTM:	6794149	mN	

Comments: Northwestern most sample collected from Showing J. Sample was a 60 cm chip sample across the shear zone and the mineralized skarn. Skarn comprises strong quartz alteration with disseminated chalcopyrite (1%), galena (2%), sphalerite (2%). Shear zone (5 cm wide) hosts semi-massive to massive galena and sphalerite with up to 5% chalcopyrite.

Rock Sample Descriptions Property: Hy-Elsa

Sample Number:	M897983	UTM:	516901	mE	Nad83, Zone 9
Elevation:	1898 m	UTM:	6794160	mN	

Comments: A 40 cm chip sample was collected across a strongly manganese stained semi-massive magnetite skarn with minor chalcopyrite and malachite staining.

Sample Number:	M897984	UTM:	517437	mE	Nad83, Zone 9
Elevation:	1875 m	UTM:	6794003	mN	

Comments: 70 cm chip sample collected from hanging wall of mineralized quartz vein. Hanging wall comprised stockwork quartz veins with disseminated limonite pits and minor sphalerite.

Sample Number:	M897985	UTM:	517437	mE	Nad83, Zone 9
Elevation:	1875 m	UTM:	6794003	mN	

Comments: 65 cm chip sample across quartz +/- carb vein hosting fine to medium grained chalcopyrite, pyrite, galena and sphalerite (2-10% mineralized). Vein is variably crumbly and strongly altered.

Sample Number:	M897986	UTM:	517437	mE	Nad83, Zone 9
Elevation:	1872 m	UTM:	6794004	mN	

Comments: 60 cm chip sample collected from footwall of mineralized quartz vein. Footwall comprised stockwork quartz veins with disseminated limonite pits and minor sphalerite.

Sample Number:	M897987	UTM:	517447	mE	Nad83, Zone 9
Elevation:	1881 m	UTM:	6793999	mN	

Comments: 1.9 m chip sample collected from strongly stockwork brecciated black shale. Black shale comprised stockwork quartz veins with disseminated limonite pits and minor sphalerite.

Sample Number:	M897988	UTM:	517447	mE	Nad83, Zone 9
Elevation:	1881 m	UTM:	6793999	mN	

Comments: 1.2 m chip sample collected from strongly stockwork brecciated black shale. Black shale comprised stockwork quartz veins with disseminated limonite pits and minor sphalerite.

Rock Sample Descriptions Property: Hy-Elsa

Sample Number:	M897989	UTM:	517447	mE	Nad83, Zone 9
Elevation:	1882 m	UTM:	6793999	mN	

Comments: 1.2 m chip sample collected from strongly stockwork brecciated black shale. Black shale comprised stockwork quartz veins with disseminated limonite pits and minor sphalerite.

Sample Number:	M897990	UTM:	517455	mE	Nad83, Zone 9
Elevation:	1886 m	UTM:	6793997	mN	

Comments: 1.0 m chip sample collected from hanging wall of mineralized quartz vein. Hanging wall comprised stockwork quartz veins with disseminated limonite pits and minor sphalerite.

Sample Number:	M897991	UTM:	517455	mE	Nad83, Zone 9
Elevation:	1885 m	UTM:	6793997	mN	

Comments: 70 cm chip sample across quartz +/- carb vein hosting fine to medium grained chalcopyrite, pyrite, galena and sphalerite (2-10% mineralized). Vein is variably crumbly and strongly altered.

Sample Number:	M897992	UTM:	517467	mE	Nad83, Zone 9
Elevation:	1883 m	UTM:	6793985	mN	

Comments: 1.0 m chip sample collected from hanging wall of mineralized quartz vein. Hanging wall comprised stockwork quartz veins with disseminated limonite pits and minor sphalerite.

Sample Number:	M897993	UTM:	517466	mE	Nad83, Zone 9
Elevation:	1886 m	UTM:	6793985	mN	

Comments: 1.5 m chip sample across two quartz +/- carb veins, which sandwich a strongly stockwork veined shale. Quartz +/- carb vein hosts fine to medium grained chalcopyrite, pyrite, galena and sphalerite (2-10% mineralized). Vein is variably crumbly and strongly altered. Stockwork veins in the black shale have abundant limonite pits within them.

Sample Number:	M897994	UTM:	517466	mE	Nad83, Zone 9
Elevation:	1879 m	UTM:	6793985	mN	

Comments: 1.0 m chip sample collected from footwall of mineralized quartz vein. Footwall comprised stockwork quartz veins with disseminated limonite pits and minor sphalerite.

Rock Sample Descriptions Property: Hy-Elsa

Sample Number:	M897995	UTM:	515685	mE	Nad83, Zone 9
Elevation:	1844 m	UTM:	6795028	mN	

Comments: Medium grained, equigranular, propylitic altered hornblende granodiorite with feldspar crystals altered to beryl (?) - brilliant aquamarine colour. Hosts fracture style chalcopyrite and malachite mineralization, where fracture surfaces weather to chocolate brown.

Sample Number:	M897996	UTM:	515697	mE	Nad83, Zone 9
Elevation:	1855 m	UTM:	6795040	mN	

Comments: Medium grained, equigranular, propylitic altered hornblende granodiorite with feldspar crystals altered to beryl (?) - brilliant aquamarine colour. Hosts fracture style chalcopyrite and malachite mineralization, where fracture surfaces weather to chocolate brown.

Sample Number:	M897997	UTM:	515896	mE	Nad83, Zone 9
Elevation:	1510 m	UTM:	6794348	mN	

Comments: 15 cm chip sample of shear zone from hanging wall contact into the shear zone. Altered quartzite? - well foliated with banded pyrite +/- chalcopyrite +/- galena +/- sphalerite.

Sample Number:	M897998	UTM:	515898	mE	Nad83, Zone 9
Elevation:	1528 m	UTM:	6794358	mN	

Comments: 2.8 m chip sample within the centre of the shear zone. Comprised calc-silicate, biotite-schist and quartzite with variable pyrite +/- chalcopyrite +/- galena +/- sphalerite.

Sample Number:	M897999	UTM:	515898	mE	Nad83, Zone 9
Elevation:	1527 m	UTM:	6794358	mN	

Comments: 2.5 m chip sample within the centre of the shear zone. Comprised calc-silicate, biotite-schist and quartzite with variable pyrite +/- chalcopyrite +/- galena +/- sphalerite.

Pyroxene, epidote, and actinolite dominant with minor garnet found locally; sometimes hosting semi-massive magnetite. White to green, siliceous, epidote rich skarn also present.

CS: Calc-silicate
Pale green, variably silicified and calc-silicate altered with pyroxene and epidote.

Mineralization: variable; trace to massive galena, disseminated to blebby sphalerite ± magnetite ± chalcopyrite.

UPPER DEVONIAN TO MISSISSIPPIAN
EARN GROUP

MS: Muscovite-quartz schist
Thin to thick bedded and moderately foliated. Often interbedded with minor quartzite and biotite-muscovite-chlorite schist.

LS: Limestone
Medium to dark grey with grey weathering.

Contact; known and inferred
