CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61	ME-OG62	Pb-OG62

CERTIFICATE WH15119561

Project: Klaza

P.O. No.: BATCH 107

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 9-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	

To: **ROCKHAVEN RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE WH15119596

Project: Klaza

P.O. No.: BATCH 108

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 9-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Ag-OG62	Au-AA24	ME-MS61	ME-OG62

CERTIFICATE WH15119613

Project: Klaza

P.O. No.: BATCH 109

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 9-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	

To: **ROCKHAVEN RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE OF ANALYSIS WH15119613

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61

CERTIFICATE WH15119615

Project: Klaza

P.O. No.: BATCH 110

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 9-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
As-OG62	Ore Grade As - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE WH15119620

Project: Klaza

P.O. No.: BATCH 111

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 9-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS

CERTIFICATE OF ANALYSIS WH15119620

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61

CERTIFICATE WH15120427

Project: Klaza

This report is for 14 Rock samples submitted to our lab in Whitehorse, YT, Canada on 11-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	

To: **ROCKHAVEN RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE OF ANALYSIS WH15120427

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
PUL-31	PUL-QC	SPL-21	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61

CERTIFICATE WH15121079

Project: Klaza

P.O. No.: BATCH 112

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 12-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	

To: **ROCKHAVEN RESOURCES LTD.**

CERTIFICATE WH15121082

Project: Klaza

P.O. No.: BATCH 113

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 12-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

Applies to Method:				
BAG-06	CRU-31	CRU-QC	LOG-21	
LOG-21d	LOG-23	PUL-31	PUL-31d	
PUL-QC	SPL-21	SPL-21d	WEI-21	

Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Applies to Method:	
Au-AA24	ME-MS61

ALS Canada Ltd.

CERTIFICATE WH15121092

Project: Klaza

P.O. No.: BATCH 114

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 12-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	

To: **ROCKHAVEN RESOURCES LTD.**
ATTN: JOAN MARIACHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016 - 510 W HASTINGS STREET
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH15123373

Project: Klaza

P.O. No.: BATCH 115

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
As-OG62	Ore Grade As - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

As-OG62	Au-AA24	ME-MS61	ME-OG62

CERTIFICATE WH15123380

Project: Klaza

P.O. No.: BATCH 116

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

To: **ROCKHAVEN RESOURCES LTD.**
ATTN: JOAN MARIACHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016 - 510 W HASTINGS STREET
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH15123383

Project: Klaza

P.O. No.: BATCH 117

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS

CERTIFICATE OF ANALYSIS WH15123383

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61

CERTIFICATE WH15123384

Project: Klaza

P.O. No.: BATCH 118

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

To: **ROCKHAVEN RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE OF ANALYSIS WH15123384

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Ag-OG62	Au-AA24	ME-MS61	ME-OG62

CERTIFICATE WH15123386

Project: Klaza

P.O. No.: BATCH 119

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE WH15123401

Project: Klaza

P.O. No.: BATCH 120

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61

CERTIFICATE WH15123404

Project: Klaza

P.O. No.: BATCH 121

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE WH15123407

Project: Klaza

P.O. No.: BATCH 122

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61

CERTIFICATE WH15123409

Project: Klaza

P.O. No.: BATCH 123

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

To: **ROCKHAVEN RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE OF ANALYSIS WH15123409

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

Applies to Method:				
	BAG-06	CRU-31	CRU-QC	LOG-21
	LOG-21d	LOG-23	PUL-31	PUL-31d
	PUL-QC	SPL-21	SPL-21d	WEI-21

Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Applies to Method:				
	Au-AA24	ME-MS61	ME-OG62	Zn-OG62

CERTIFICATE WH15123410

Project: Klaza

P.O. No.: BATCH 124

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE WH15123412

Project: Klaza

P.O. No.: BATCH 125

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE OF ANALYSIS WH15123412

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61	ME-OG62	Pb-OG62
Zn-OG62

CERTIFICATE WH15123413

Project: Klaza

P.O. No.: BATCH 127

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
Au-GRA22	Au 50 g FA-GRAV finish	WST-SIM
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE WH15123449

Project: Klaza

P.O. No.: BATCH 128

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61	ME-OG62	Pb-OG62
Zn-OG62

CERTIFICATE WH15123452

Project: Klaza

P.O. No.: BATCH 129

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE WH15123453

Project: KLAZA

P.O. No.: BATCH 130

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 17-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
CRU-32	Fine Crushing 90% <2mm
SPL-21	Split sample - riffle splitter
PUL-35a	Pulv 1 kg split to 95%<106 um
LOG-21d	Sample logging - ClientBarCode Dup
SPL-21d	Split sample - duplicate
PUL-35ad	Pulv 1 kg split to 95%<106 um DUP
BAG-01	Bulk Master for Storage
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
BAG-06	Double Bagging Coarse Rejects
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
As-OG62	Ore Grade As - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
Au-GRA22	Au 50 g FA-GRAV finish	WST-SIM
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Cu-OG62	Ore Grade Cu - Four Acid	VARIABLE
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE

To: **ROCKHAVEN RESOURCES LTD.**

CERTIFICATE WH15124775

Project: Klaza

P.O. No.: BATCH 126

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 19-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61

CERTIFICATE WH15124776

Project: Klaza

P.O. No.: BATCH 131

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 19-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

Applies to Method:				
	BAG-06	CRU-31	CRU-QC	LOG-21
	LOG-21d	LOG-23	PUL-31	PUL-31d
	PUL-QC	SPL-21	SPL-21d	WEI-21

Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Applies to Method:				
	Ag-OG62	Au-AA24	ME-MS61	ME-OG62
	Pb-OG62

CERTIFICATE WH15124777

Project: Klaza

P.O. No.: BATCH 132

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 19-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	

To: **ROCKHAVEN RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61

CERTIFICATE WH15124778

Project: Klaza

P.O. No.: BATCH 133

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 19-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE WH15127538

Project: Klaza

P.O. No.: BATCH 134

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 24-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	

To: **ROCKHAVEN RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE WH15127543

Project: Klaza

P.O. No.: BATCH 135

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 24-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE WH15127546

Project: Klaza

P.O. No.: BATCH 136

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 24-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS

CERTIFICATE WH15127591

Project: Klaza

P.O. No.: BATCH 137

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 24-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	

To: **ROCKHAVEN RESOURCES LTD.**
ATTN: JOAN MARIACHER

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REE's may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
LOG-21d	LOG-23	PUL-31	PUL-31d
PUL-QC	SPL-21	SPL-21d	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Au-AA24	ME-MS61

CERTIFICATE WH15127597

Project: Klaza

P.O. No.: BATCH 138

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 24-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	

To: **ROCKHAVEN RESOURCES LTD.**

CERTIFICATE WH15127599

Project: Klaza

P.O. No.: BATCH 139

This report is for 36 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 24-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21d	Sample logging - ClientBarCode Dup
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
BAG-06	Double Bagging Coarse Rejects
SPL-21d	Split sample - duplicate
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
PUL-31d	Pulverize Split - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
ME-MS61	48 element four acid ICP-MS	
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES

CERTIFICATE WH15127601

Project: KLAZA

P.O. No.: BATCH 140

This report is for 25 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 24-AUG-2015.

The following have access to data associated with this certificate:

MATT DUMALA	JOAN MARIACHER	JARED TARSWELL

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
CRU-32	Fine Crushing 90% <2mm
SPL-21	Split sample - riffle splitter
PUL-35a	Pulv 1 kg split to 95%<106 um
LOG-21d	Sample logging - ClientBarCode Dup
SPL-21d	Split sample - duplicate
PUL-35ad	Pulv 1 kg split to 95%<106 um DUP
BAG-01	Bulk Master for Storage
LOG-23	Pulp Login - Rcvd with Barcode
LOG-21	Sample logging - ClientBarCode
BAG-06	Double Bagging Coarse Rejects
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Zn-OG62	Ore Grade Zn - Four Acid	VARIABLE
As-OG62	Ore Grade As - Four Acid	VARIABLE
Au-AA24	Au 50g FA AA finish	AAS
Au-GRA22	Au 50 g FA-GRAV finish	WST-SIM
ME-MS61	48 element four acid ICP-MS	
Ag-OG62	Ore Grade Ag - Four Acid	VARIABLE
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Cu-OG62	Ore Grade Cu - Four Acid	VARIABLE
Pb-OG62	Ore Grade Pb - Four Acid	VARIABLE

142.53	149.44	6.91	GRD
149.44	157.58	8.14	GRD

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
1.52	4.50	2.98	GRD	MG	Granodiorite with weak-moderate pervasive oxidation and weak-trace patchy argillic alteration.							
						MD	BN	RB	ARG	1I		
						LT	OR	FR	OXI	3I		
4.50	6.59	2.09	GRD	MG	Phyllic and argillic altered granodiorite. Argillic dominates with patch of weak phyllic. Few pyrite stringers and carbonate stringers in phyllic alteration. Strong argillic is reduced to clay-rich sand. Oxidation overprints all previous alteration.							
						LT	OR	PA	ARG	3I	Py	0.01
						LT	GN	FR	PHC	1I		
								RB	OXI	3I		
6.59	8.75	2.16	GRD	MG	Granodiorite with patchy weak phyllic alteration hosting pyrite and carbonate stringers. Pervasive moderate oxidation overprint, with stronger oxidation on fracture surfaces.							
						LT	OR					
						LT	GN		PHC	2I	Py	0.01
						LT	BN		OXI	2I		
8.75	11.75	3.00	GRD	MG	Strong-moderately argillized granodiorite with oxidation overprint. Argillization is intense in short patches, with recovery completely reduced to clays.							
						LT	BN	RB	OXI	3I	Go	3
						LT	OR	FR	ARG	4I	Li	5
11.75	13.04	1.29	GRD	MG	Phyllic and patchy argillic altered granodiorite. Phyllic alteration dominates, with narrow argillic halos on fractures. Few pyrite stringers and carbonate stringers in phyllic alteration. Oxidation overprints all previous alteration.							
						LT	GN		PHC	3I	Py	0.01
						LT	OR		ARG	1I		
						LT	BN		OXI	2I		
13.04	14.61	1.57	GRD	MG	Very rubbly, fractured interval, likely with core loss. Strong oxide staining on fracture surfaces. RQD is zero. Weakly argillized.							
						LT	BN	RB	ARG	1I	Li	10
						LT	OR	FR	OXI	4I	Go	10

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
14.61	19.60	4.99	GRD	MG	Phyllic altered granodiorite with patches of argillic alteration, weak patchy/fracture-limited oxidation, and crosscutting pyrite-bearing milky quartz veinlets.							
						LT	GN	PA	PHC	3I	Py	1
						LT	BN		ARG	2I	Li	1
									OXI	2I		
19.60	21.89	2.29	GRD	MG	Weak argillic and moderate phyllic alteration cut by high density (1 per 15cm) milky quartz veinlets and veins hosting pyrite. Possibly trace arsenopyrite. Weak oxide overprint, stronger on fractures.							
						LT	GN		OXI	1I	Py	2
						LT	BN		ARG	2I		
									PHC	3I		
21.89	23.54	1.65	GRD	MG	Weak argillic, weak phyllic, and moderate oxide overprinted granodiorite. As in prev detailed interval, but with stronger oxidation.							
						LT	BN		OXI	2I	Py	1
									ARG	1I		
									PHC	1I		
23.54	27.33	3.79	GRD	MG	Weak argillic and weak phyllic altered granodiorite with weak oxide overprint. Cut by pyrite stringers.							
						LT	GN		PHC	1I	Py	1
						LT	BN		ARG	1I		
									OXI	2I		
27.33	28.05	0.72	GRD	MG	Short gouged, sandy, fractured interval with strong oxidation.							
						MD	BN	FR	OXI	3I		
								FL				
28.05	29.57	1.52	GRD	MG	Phyllic altered granodiorite with pervasive disseminated pyrite. Cut by milky quartz stringers hosting pyrite.							
						LT	GN		PHC	3I	Py	1
									OXI	1I		
29.57	33.52	3.95	GRD	MG	weak-moderate argillic altered granodiorite cut by netted gouge stringers. Mostly competent, but the most gouge is between 30-31.5m. Weak oxide overprint. Cut by milky quartz veinlets hosting pyrite. Disseminated pyrite throughout. Trace weak potassic alteration.							
						LT	PK	NE	OXI	1I	Py	2

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
						LT	GN		ARG	2I		
						LT	BN		POT	1I		
33.52	41.46	7.94	GRD	MG	Moderate-strongly phyllic altered granodiorite with disseminated pyrite and crosscutting quartz/pyrite stringers/veinlets/veins throughout. No oxides present. Patchy silicification in strongest phyllic halo. Pyrite stringers and veinlets are at several varying orientations. Milky quartz veinlets are sometimes crustiform.							
						LT	GN		PHC	3I	Py	5
											As	0.1
41.46	41.72	0.26	GRD	MG	Hanging wall vein zone. Strongly phyllic altered granodiorite is cut by high density sulphide-bearing stringers and two major smoky/milky quartz pyrite veins. Gouged contact with quartz feldspar porphyry dyke. Disseminated-blebby pyrite throughout granodiorite. Trace fine arsenopyrite.							
						LT	GN		PHC	4I	Py	10
											Py	2
											As	1
41.72	41.76	0.04	VEN	CG	Massive quartz-pyrite vein with trace fine arsenopyrite. Pyrite is dominant vein fill. Partially cut by white calcite stringers.							
						MD	BR	MA			Py	55
						MD	GY	BN			As	1
41.76	42.30	0.54	GRD	MG	Strongly phyllic altered granodiorite cut by pyrite stringers at <2cm spacing. High disseminated pyrite content. Rare blebby honey brown sphalerite. Fault gouged contact with quartz feldspar porphyry dyke.							
						LT	GN		PHC	4I	Py	8
						LT	GY				Sp	1
42.30	46.90	4.60	QFP	FG	Light grey quartz feldspar porphyry dyke with faulted contacts with granodiorite. Top contact is rubbly, showing a wider faulting zone. Bottom contact is weakly faulted with 3mm gouge. Quartz feldspar porphyry dyke itself is strongly hydrothermally altered by faulting, with nearly netted gouge zones hosting pebbly semi-rounded clasts. Interstitial calcite is weakly flow aligned near contacts.

									SIL	1I		
									CLY	2I		
46.90	47.09	0.19	VEN	MG	Major footwall vein. Smoky quartz hosting massive-blebby pyrite, disseminated arsenopyrite, blebby honey brown sphalerite, cut by fine white carbonate stringers. Highest concentration of pyrite/arsenopyrite is along the quartz feldspar porphyry dyke contact.							
						MD	GY	MA			Py	5
						MD	BR				Py	5
											As	1
											Sp	1
47.09	48.71	1.62	GRD	MG	Moderately phyllic and weakly argillic altered granodiorite, cut by high frequency veining. Milky quartz-carbonate veinlets are the dominant type, spaced at 1 per 2cm at various orientations. Wider milky quartz-carbonate veins are vuggy, and several host blebby galena and honey brown sphalerite.							
						LT	WH	NE	PHC	4I	Py	10
						LT	GY				Py	2
											Gn	1
											Sp	1
48.71	50.35	1.64	GRD	MG	Weakly argillic, moderately phyllic altered granodiorite with frequent fine pyrite stringers. Stringers are often discontinuous.							
						LT	GN	PA	ARG	1I	Py	1
									PHC	3I		
50.35	54.62	4.27	GRD	MG	Moderately phyllic altered granodiorite with patchy weak propylitic. Trace disseminated pyrite in groundmass. Cut by occasional (1 per 30 cm) fine white carbonate stringers hosting disseminated pyrite. Cut by one larger polymetallic vein at 51.50m, consisting of quartz host, chalcopyrite, arsenopyrite, galena, sphalerite, and pyrite.							
						LT	GN	PA	PHC	2I	Py	0.1
									PRO	1I		

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
54.62	56.15	1.53	GRD	MG	Moderate phyllic alteration with patches of stronger phyllic around well mineralized polymetallic vein at 54.70m and 55.08m. Cut by milky quartz veins/veinlets and discontinuous pyrite stringers/veinlets. Weak oxidation on fractures due to nearby faulting.							
						LT	BN		ARG	1I	Sp	0.1
						LT	GN		PHC	3I	Py	2
									OXI	1I	Gn	0.1
											As	0.1
56.15	57.99	1.84	GRD	MG	As previous, but lacking significant veining. Minor pyrite-bearing quartz-carbonate veinlets present. Trace pyrite disseminated in groundmass.							
						LT	GN		OXI	1I	Py	0.1
						LT	GY		PHC	2I		
						LT	BN					
57.99	58.36	0.37	FLT	MG	Faulted, crumbled granodiorite with pre-faulting pyrite stringers and some gouge development. Moderate oxide staining.							
						MD	BN	FR	OXI	3I	Py	0.1
								RB	PHC	1I		
58.36	69.19	10.83	GRD	MG	Granodiorite with patchy weak phyllic, weak argillic, and weak propylitic alteration cut by occasional well mineralized veins, pyrite stringers, and rare aplite dyklets.							
						MD	GN		PRO	1I		
						LT	GN	PA	PHC	1I	Py	0.1
									ARG	1I		
69.19	71.10	1.91	GRD	MG	Moderately phyllic and weak patchy argillic/propylitic altered granodiorite with weak oxides on fracture surfaces. Disseminated pyrite hosted in groundmass. Cut by milky quartz veins and smoky quartz-pyrite stringers.							
						MD	GN		ARG	2I		
						LT	GN		PHC	3I	Py	1
						LT	BN		PRO	2I		
									OXI	1I		

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
71.10	72.24	1.14	GRD	MG	Moderately oxide stained, rubbly, strongly phyllic granodiorite with medium-grained crystalline pyrite and galena. Pyrite is crumbled and sandy due to fracturing and weathering. Galena is blebby and generally exhibits poor crystal habit (unusual for galena in this property). Cut by milky-clear quartz veinlets hosting blebby pyrite.							
						LT	GY	RB	PHC	4I	Gn	1
						LT	BN	FR	OXI	2I	Py	2
72.24	73.04	0.80	GRD	MG	Strongly phyllic altered granodiorite with high silica content. High percentage of disseminated-blebby pyrite in the groundmass. Oxides on fracture faces. Cut by quartz-pyrite veins.							
						MD	GY		PHC	4I	Py	2
						LT	BN		OXI	1I	Py	2
73.04	74.37	1.33	GRD	MG	Moderate argillic and moderate phyllic altered granodiorite with weak oxidation on fractures. Cut by pyrite stringers.							
						LT	BN		ARG	3I		
						LT	GY		OXI	1I		
						LT	GN		PHC	3I	Py	1
74.37	78.51	4.14	GRD	MG	Granodiorite with patchy weak propylitic, phyllic, and argillic alterations. Weak oxide staining on fractures. Fine disseminated pyrite throughout groundmass. Pyrite is also hosted in milky quartz stringers.							
						MD	GN	PA	PRO	2I	Py	1
						LT	GN		ARG	2I		
						LT	BN		PHC	2I		
									OXI	1I		
78.51	82.85	4.34	GRD	MG	Moderate-weak propylitic and patchy argillic/phyllic altered granodiorite. Obvious faulting near 82m, with gouge, intense fracturing, and strong oxide staining. Disseminated pyrite in groundmass and in stringers. Rubbly recovery.							
						MD	BN	FR	ARG	1I		
						LT	GN	RB	PRO	3I	Py	0.1
									PHC	1I

88.06	88.89	0.83	FLT	FG	Fault with well developed gouge and moderate-weak oxide staining. Interval is approximately 50% gouge, 50% rubbly recovery. Trace disseminated pyrite throughout.							
						LT	BN	RB	CLY	3I	Py	0.1
						LT	GY	PB	OXI	1I		
88.89	99.10	10.21	GRD	MG	Relatively fresh or weakly propylitic altered granodiorite with patches of phyllic. Trace disseminated pyrite in groundmass and pyrite-bearing veinlets in phyllic patches. Weak oxidation on fractures.							
						LT	BN		PRO	1I		
						LT	GN		PHC	1I		
						MD	GY	PA	OXI	1I	Py	0.1
99.10	107.40	8.30	GRD	MG	Patchy phyllic and argillic alteration leading up to a pair of significant veins. Some phyllic alteration has a high quartz content, especially in diffuse veinlet halos. Some trace potassic alteration is present in argillic patches. Cut by quartz-pyrite veinlets and veins with wide silicified halos. Disseminated pyrite in groundmass.							
						LT	GY		PHC	4I		
						LT	WH		ARG	3I		
									SIL	1I		
						LT	GN	PA	POT	1I	Py	1
107.40	107.85	0.45	VEN	MG	Smoky quartz vein with large amounts of intergrown massive pyrite and chalcopyrite. Crosscut by later pyrite stringers.							
						MD	BR				Py	15
						MD	GY				Cp	40
107.85	109.67	1.82	GRD	MG	Strongly phyllic altered granodiorite cut by pyrite-bearing veinlets/stringers with strongly silicified halos.							
						LT	WH		SIL	1I		
						LT	GY		PHC	4I	Py	3
109.67	109.81	0.14	VEN	MG	White quartz vein with over 50% massive pyrite. A 1cm milky quartz-blebby galena vein parallels the upper selvedge.							
						MD	BR				Py	60

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
						LT	WH					
109.81	116.11	6.30	GRD	MG	Patchy phyllic and argillic altered granodiorite cut by several quartz-pyrite veins that were introduced at high temperatures, evidenced by strong argillic halos and recrystallization directly adjacent to their selvedges.							
						LT	WH	PA	ARG	3I	Py	2
						LT	GN		PHC	2I		
116.11	135.93	19.82	GRD	MG	Relatively fresh granodiorite, with patchy weak propylitic alteration and clay near faults. Faulting on several planes between 117-122m. Pyrite mineralization is negligible, only in rare stringers and absent in groundmass.							
						LT	GY					
						MD	GY					
						MD	GN		PRO	2I		
135.93	137.51	1.58	GRD	MG	Moderately phyllic altered granodiorite with crosscutting quartz-pyrite veins and veinlets. Weak oxide staining near fault. Disseminated pyrite in groundmass.							
						LT	GN		PHC	4I	Py	1
137.51	139.82	2.31	GRD	MG	Fractured and oxide stained fault through phyllic granodiorite. Little gouge development, some clay alteration on fractures. Cut by quartz-pyrite veins.							
						LT	GY	RB	PHC	3I	Py	1
						LT	BN	FR	OXI	1I		
139.82	142.53	2.71	GRD	MG	Patchy argillic and phyllic granodiorite with minor recrystallization halos on crosscutting clear-milky quartz-pyrite veins.							
						LT	WH		PHC	2I		
						LT	GN	PA	ARG	2I	Py	1
142.53	149.44	6.91	GRD	MG	Relatively fresh granodiorite with weak-moderate propylitic alteration. Cut by rare pyrite stringers.							
						MD	GY					
						MD	GN		PRO	3I	Py	0.1

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
149.44	157.58	8.14	GRD	MG	Granodiorite with patchy argillic-phyllic alteration related to crosscutting quartz-pyrite veins. Phyllic and argillic tend to overprint each other, though phyllic dominates in vein halos. EOH

32.77	33.50	0.73	BXA	--	Strongly silicified smokey quartz crackle breccia hosting disseminated to blebby pyrite, galena and arsenopyrite. The first 4cm of the breccia are semi-massive pyrite. Smokey quartz brecciates intensely silicified strongly phyllic altered granodiorite. The majority of the interval hosts 1-2% disseminated to blebby pyrite. Sporadic discontinuous nets of white carbonate veinlets. The are two 1-1.5cm perpendicular TCA grey quartz white carbonate veins at the end of the breccia with disseminate to blebby galena and arsenopyrite along their selvedges. Between these two veins is a piece of broken up quartz carbonate vein hosting disseminated to blebby pyrite. Smokey quartz hosts an abundance of small vugs.

280.53	281.17	0.64	VEN	--	Central klaza vein zone contains three distinct veins. Vein 1 is 34cm long and is a semi-massive sulphide quartz vein hosting blebby to semi-massive galena, sphalerite and pyrite and disseminated to blebby arsenopyrite. ~2/3 of the galena is located along the lower selvedge of the vein with the tan carbonate veining. Sphalerite is ~70% blackjack and 28% brown, and 2% honey brown. Occasional zonation of honey brown to brown sphalerite. Vein is cross-cut by multiple white carbonate veinlets and stringers oriented @ 80 and 30 TCA. Veins 1 and 2 are separated by 5cm of phyllic alteration hosting disseminated pyrite. Vein 2 in 8cm wide and consists of smokey quartz hosting blebby to semi-massive pyrite and disseminated to blebby galena, blackjack sphalerite and arsenopyrite. Quartz partially brecciates phyllic granodiorite and white carbonate. Veins 2 and 3 are separated by 4cm of silicified phyllic altered granodiorite hosting disseminated pyrite. Vein 3 is a 14cm long multiphase polymetallic vein hosting blebby to semi-massive pyrite, sphalerite and galena and disseminated to blebby arsenopyrite. Vein is cut in the middle by tan carbonate which is associated with the galena and sphalerite mineralization.

						LT	WH					
						LT	PK					
44.21	44.81	0.60	QFP	FG	Fine grained tan quartz feldspar porphyry dyke with strong hydrothermal alteration and gouge at contacts. Recovery is partially brecciated and clast supported with gouge inbetween.							
						LT	GY	FR	CLY	3I		
						LT	TN	BX	HYD	4I		
								PB				
44.81	45.04	0.23	BXA	FG	Clay gouge-supported breccia with clasts of quartz-sulphide veins. Clay is oxide stained and 75% of recovery. Some clay is darker grey due to sulphide grinding. Pyrite and galena are clearly seen on clasts and ni gouge, but other sulphides may be present and indistinguishable.							
						MD	GY	BX	CLY	4I	Py	10
						LT	GY	PB				
						LT	BN	FR	OXI	2I	Gn	3
45.04	45.96	0.92	BXA	FG	Multiphase breccia! First phase is grey-smoky quartz carrying pyrite and limited honey brown sphalerite. This is brecciated by milky quartz-carbonate that carries a high percentage of blebby galena and honey brown sphalerite. In some places, galena is so rich it appears to be a cement. Trace disseminated arsenopyrite near galena and sphalerite. Weak oxide staining.							
						LT	WH				As	2
						LT	GY				Sp	6
						LT	BN				Gn	12
						DK	BL	BX	OXI	1I	Py	4
45.96	46.23	0.27	CLY	FG	Grey gouge along breccia contact with light brown staining from oxidation. Fine pyrite in gouge. Darker grey from ground up sulphides.							
						MD	GY					
						LT	BN		CLY	5I	Py	3
						LT	GY				Gn	1

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
46.23	46.51	0.28	GRD	MG	Strongly silicified phyllic granodiorite with a brecciated contact with a narrow smoky quartz vein. There are blebs of pyrite and minor chalcopyrite, but silicification blurs most primary textures. Quartz eyes have formed, up to 0.7cm in diameter.							
						LT	GN	RX	SIL	4I	Py	3
						LT	GY	BX	PHC	4I	Cp	1
											Py	2
46.51	46.59	0.08	BXA	FG	Quartz feldspar porphyry dyke brecciated by milky quartz veins. Subrounded clast-supported with some interstitial pyrite/galena.							
						LT	TN	BX			Py	2
						LT	WH				Gn	4
46.59	46.95	0.36	BXA	FG	Multiphase breccia. Earliest phase is phyllic granodiorite brecciated by milky quartz-carbonate hosting honey brown sphalerite and galena. The second brecciating event is light grey quartz incorporating the milky quartz-carbonate and granodiorite. Finally, a dark smoky quartz hosting galena, sphalerite, and arsenopyrite further brecciates the previous phases. Disseminated arsenopyrite is richest in smoky quartz, and tends to form near galena and sphalerite.							
						LT	WH				Sp	3
						LT	GY				Gn	5
						DK	BL	BX			Py	3
											As	2
46.95	47.08	0.13	BXA	FG	This interval is dominated by a second milky quartz phase, which is relatively barren compared to previous milky quartz-carbonate. Clasts of smoky quartz with internal clasts of the first galena-bearing milky quartz phase are evidence. Second phase milky quartz is vuggy and shows zoning around clasts.

157.58	166.25	8.67	GRD	MG	Granodiorite with moderate pervasive phyllic and patchy argillic alteration. Cut by many quartz-pyrite veins with narrow strong phyllic halos. Fine disseminated pyrite in groundmass.							
						LT	GN		PHC	4I	Py	2
						LT	GY		ARG	2I		
166.25	166.36	0.11	VEN	MG	First 5cm is a polymetallic grey massive quartz vein followed by a 5cm wide polymictic breccia. The polymetallic quartz vein hosts semi-massive pyrite, blebby galena, blebby honey brown sphalerite, and disseminated arsenopyrite. Pyrite is hosted throughout the quartz. Arsenopyrite, honey brown sphalerite, and galena are near vein selvedges. Polymictic breccia is clast-supported, with 60% clasts and 40% milky quartz cement. Clasts are subrounded and consist of 70% pebble-sized phyllic granodiorite and 30% gravel-sized clasts of smoky quartz veinlet hosting disseminated pyrite.

						LT	WH		ARG	3I	Py	2

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
1.52	8.93	7.41	GRD	MG	Moderate-strongly oxidized granodiorite with moderate fracturing. Some intervals have been nearly reduced to soil.							
						MD	BN	FR				
						MD	GY	RB	OXI	2I		
8.93	27.85	18.92	GRD	MG	Granodiorite with patchy argillic, phyllic, and propylitic alteration. Cut by quartz veinlets with trace pyrite. Weak-moderate oxide staining on fractures and in some gouged surfaces.							
						LT	BN		OXI	3I		
						LT	GN		PHC	2I		
						MD	GY	PA	PRO	2I	Li	2
						MD	GN	FR	ARG	2I		
27.85	27.98	0.13	QFP	FG	Light green quartz feldspar porphyry dyke with strong hydrothermal alteration and weak semi-pervasive oxide staining stemming from the contact planes.							
						LT	BN	PO	OXI	2I		
						LT	GN	AN	HYD	4I		
27.98	45.31	17.33	GRD	MG	Fresh granodiorite with patches of propylitic alteration and oxidation on fractures.							
						MD	GY		PRO	1I		
						LT	BN		OXI	2I		
45.31	47.51	2.20	GRD	MG	Weak-moderately phyllic altered granodiorite cut by two 4-5cm wide quartz veins with disseminated tourmaline. Tourmaline (var. schorl) is fine, sometimes occuring in radiating clusters 1-2mm in diameter. A single quartz veinlet carries honey brown sphalerite, pyrite, and disseminated arsenopyrite. Weak oxide staining on fracture surfaces.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
47.51	58.73	11.22	GRD	MG	Relatively fresh granodiorite with patchy propylitic alteration and weak oxide staining on fractures.							
						MD	GY		OXI	2I		
						LT	BN		PRO	2I		
58.73	71.02	12.29	QFP	FG	Quartz feldspar porphyry dyke with several colour changes related to alteration. Strong pervasive hydrothermal alteration destroys primary crystal textures throughout, and larger phenocrysts are altered to clay. 1-5% clear quartz phenocrysts remain unaltered. Weak-moderate oxidation throughout, stronger near zones of fracturing and clay alteration. Low angle interfingered upper contact with gouge, and gouged lower contact.							
						LT	BN					
						MD	MR	RB	CLY	2I		
						MD	TN		OXI	3I		
						LT	GY	FR	HYD	5I		
71.02	71.96	0.94	VEN	MG	BRX vein zone with narrow veined phyllic granodiorite leading up to the main vein. BRX vein is polymetallic hosting pyrite, honey brown sphalerite, galena, and arsenopyrite. It has a wide cream-white-milky quartz carbonate vein along its lower selvedge, carrying disseminated-blebby galena, honey brown sphalerite, and arsenopyrite.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
3.23	27.10	23.87	GRD	MG	Top of hole consists of fractured, rubbly, strongly oxidized granodiorite. Some sections are completely reduced to soil/clay. Preceding alteration types are diffiult to determin, but appear to be primarily argillic. Goethite and limonite are typical on most (if not all) fractured surfaces. Intense fracturing throughout, with few pieces of competent core longer than 20cm. Most veining has been destroyed, however, there are some remaining calcite veins (any sulphides are oxidized).				CLY	2I		
						MD	BN	RB	OXI	4I	Li	5

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
3.95	5.05	1.10	QFP	FG	Light tan quartz feldspar porphyry dyke with intense fracturing and rubble, with moderate clay alteration along surfaces. Pervasive oxide staining. Trace dendritic goetite grows perpendicular from 15% of fractures.							
						MD	BN	RB	CLY	3I		
						LT	TN	FR	OXI	4I	Go	1
5.05	14.10	9.05	QFP	FG	Light tan quartz feldspar porphyry dyke with intense hydrothermal alteration. Primary phenocryst texture is mostly destroyed, except for unaltered quartz phenocrysts. Pervasive moderate-strong oxide staining throughout, with dendritic goethite forming perpendicular to 80% of fractures. Weak clay formation along fractures. Oxide staining becomes semi-pervasive nearing the granodiorite contact.							
						MD	BN		CLY	2I		
						LT	TN	FR	HYD	5I	Go	2
						LT	BN		OXI	4I		
14.10	15.10	1.00	GRD	MG	Narrow interval of phyllic granodiorite with disseminated pyrite in the groundmass. Contacts show semi-pervasive clay alteration and moderate oxide staining. Lower contact is rubbly, with moderate oxide staining and clay alteration.							
						MD	BN		CLY	1I		
						LT	GN		PHC	3I	Py	3
									OXI	2I		
15.10	22.47	7.37	QFP	FG	Light-medium green quartz feldspar porphyry dyke with moderate hydrothermal alteration. Phenocrysts are large and densely packed, with most altered to greenish feldspar and clay. Trace oxide staining on 80% of fractures.							
						MD	GN	PO	HYD	3I		
						LT	GN		OXI	1I		
						LT	BN					

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
22.47	28.53	6.06	QFP	FG	Light green quartz feldspar porphyry dyke with strong hydrothermal alteration and medium-fine grained phenocrysts. Trace oxide staining on 50% on fracture surfaces. Cut by a pair of narrow black breccias near the end of the interval.							
						LT	GN	PO	HYD	4I	Py	0.1
						LT	BN		OXI	1I		
28.53	32.60	4.07	QFP	FG	Light green-grey quartz feldspar porphyry dyke with trace pervasive softening/clay alteration, with stronger clay alteration at 31-33m. Clay softened quartz feldspar porphyry dyke surrounds sections of slightly more resistant dyke. Trace oxide staining in some clay.							
						LT	GN	PO	HYD	4I		
						LT	GY		CLY	2I		
						LT	BN		OXI	1I		
32.60	34.63	2.03	QFP	FG	Medium grey-tan quartz feldspar porphyry dyke with moderate hydrothermal alteration. Phenocrysts are altered to a white clay. Weak oxide staining on all fractures.							
						MD	GY	PO	HYD	3I		
						MD	TN	FR	OXI	2I		
						LT	BN					
34.63	37.98	3.35	GRD	MG	Strongly altered granodiorite with pervasive oxide staining, fracturing, and semi-pervasive clay alteration. Base alteration is moderate-weak phyllic accompanied by pervasive silicification, leading to quartz eyes. Cut by mineralized quartz veins.							
						MD	BN	FR	OXI	3I	Py	2
									PHC	3I		
									CLY	2I		
									SIL	1I

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
139.93	154.22	14.29	GRD	MG	Wide interval dominated by proximal phyllic and distal argillic vein halos with intermedtiate patches of propylitic/silicic alteration. Trace potassic alteration can be found overprinting argillic and propylitic alterations. Cut by frequent quartz-pyrite veinlets and rare veins.

317.94	318.58	0.64	VEN	--	Western Klaza zone vein consisting of a multiphase polymetallic crackle breccia. The first 14cm consist of a grey quartz breccia with phyllic granodiorite clasts hosting disseminated pyrite. The next 41cm is a smoky quartz crackle breccia. The center of the breccia has pink rhodochrosite and light tan ankerite breccia running through the center. Smoky quartz has clasts of grey quartz, tan ankerite and phyllic altered granodiorite. The Rhodochrosite/tan ankerite is weakly brecciated by smoky quartz veinlets and stringers. The last 9cm are heavily gouge altered smoky quartz. The breccia hosts disseminated to blebby pyrite, blackjack sphalerite, arsenopyirte and galena and disseminated jamesonite.

317.94	318.58	0.64	VEN	--	Western Klaza zone vein consisting of a multiphase polymetallic crackle breccia. The first 14cm consist of a grey quartz breccia with phyllic granodiorite clasts hosting disseminated pyrite. The next 41cm is a smoky quartz crackle breccia. The center of the breccia has pink rhodochrosite and light tan ankerite breccia running through the center. Smoky quartz has clasts of grey quartz, tan ankerite and phyllic altered granodiorite. The Rhodochrosite/tan ankerite is weakly brecciated by smoky quartz veinlets and stringers. The last 9cm are heavily gouge altered smoky quartz. The breccia hosts disseminated to blebby pyrite, blackjack sphalerite, arsenopyirte and galena and disseminated jamesonite.

357.61	358.40	0.79	BXA	--	Multiphase Central Klaza zone breccia. There appears to be five phases of the breccia. The first is a massive pyrite/arsenopyrite phase. The second phase is the emplacement of a tan ankerite vein along the lower selvedge with associated sphalerite and galena. The galena is found interstitial to the arsenopyrite. The third phase is smoky quartz which brecciates the first two phases. The fourth phase is brecciation by chalcedony/jasper. The upper portion of the breccia is brecciated by light grey chalcedony and the lower half of the breccia is brecciated by dark grey and deep red chalcedony/jasper. The final phase id weak brecciation by white carbonate stringers throughout the interval.

						LT	WH		PHC	1I		
100.19	102.71	2.52	GRD	MG	Pervasive phyllic and weak-moderate argillic alteration near upper end of interval. A weak propylitic overprint is found throughout, with trace potassic overprinting argillic alteration. Disseminated pyrite throughout phyllic alteration.							
						MD	GN		POT	1I		
						LT	PK		PRO	3I		
						LT	WH		PHC	3I		
						LT	GN		ARG	2I	Py	1
102.71	103.29	0.58	VEN	MG	Complex multiphase pryite-bearing breccia. Initial phase of black breccia hosting fine pervasive disseminated pyrite was brecciated by wide white-pink quartz-carbonate veins (calcite-rhodochrosite-tan ankerite with central band of quartz, hosting blebby pyrite and disseminated arsenopyrite). These were then partially brecciated/netted by grey chalcedony, and the final phase of brecciation involves barren white calcite veinlets.

384.25	401.60	17.35	GRD	MG	Overlapping proximal phyllic and distal argillic halos on mineralized quartz-carbonate veins. Patches of trace-moderate potassic alteration are found overprinting argillic alteration, and patchy weak propylitic alteration overprints argillic and some phyllic. Veins tend to host blebby-disseminated pyrite.

COMMENTS

Core is extremely gouge altered and rubbly between 5-17m. Recovery is poor and exact widths of veins are difficult to determine.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
4.84	5.33	0.49	GRD	MG	Unaltered granodiorite with weak oxidation along fracture surfaces.							
						LT	GY		OXI	2I		
5.33	7.55	2.22	GRD	MG	Rubbly intensely pervasively oxidized. With possible patchy weak argillic and phyllic alteration. Oxidation obscures rock textures and is difficult to determine. Goethite staining along fracture surfaces.							
						MD	OR	RB	OXI	5I		
						MD	GY		PHC	2I		
						DK	OR		ARG	2I		
7.55	9.70	2.15	GRD	MG	Appears to be primarily rubbly moderately phyllic altered granodiorite with patchy weak argillic alteration. Intense pervasive oxidation obscures rock textures. Strong goethite staining along fracture surfaces.							
						MD	OR	RB	OXI	5I		
						MD	GN		ARG	2I		
						DK	OR	FR	PHC	3I		
9.70	14.18	4.48	GRD	MG	Central klaza vein zone at surface. Strong to intensely pervasively oxidized rubbly moderate to strongly phyllic altered granodiorite. Zone host what appears to be 4 distinct polymetallic veins. Obscuring oxidation and very rubbly core make alteration and structures difficult to determine and measure. Patches of strong phyllic alteration hosts disseminated pyrite.

COMMENTS

Rubbly and oxidized with variable alteration from 3.30-25.48m. Intensily sericitized with blebby to pervasive pyrite from 25.48-26.64m. Patchy alteration from 26.64-49.96m. Three quartz veins up to 15 cm wide hosting py, as, cp, gn and sp occur between 49.96-53.52m. Patchy alteration from 53.52-130.79m. Stacked tan quartz-feldspar porphyry dykes occur

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
2.79	3.30	0.51	GRD	--	Unaltered granodiorite block.							
						MD	GY	MA				
3.30	10.82	7.52	GRD	--	Strongly altered and oxidized granodiorite. Clay-rich with "sugary" texture in some areas; hematite and geothite on most fracture surfaces.							
						MD	OR	RB	ARG	3I		
									OXI	4I		
10.82	17.02	6.20	GRD	--	Moderately to strongly oxidized, argillic and weakly phyllic altered granodiorite. Often rubbly with "sugary" fragments present.							
						MD	OR	RB	ARG	3I		
								PA	PHC	1I		
17.02	19.34	2.32	GRD	--	Phyllic altered granodiorite with patchy, pervasive oxidation. Hematite and some goethite on many fracture surfaces. Infrequent quartz-ankerite stringers and veinlets appear barren.							
						MD	GN	PA	PHC	3I		
						MD	OR		OXI	2I		
19.34	21.40	2.06	GRD	--	Strongly phyllic altered granodiorite with strong oxidation on fractures and often pervasive through rock. Disseminated pyrite occurs throughout the phyllic alteration with disseminated-blebby pyrite within quartz-ankerite stringers and veinlets. One, 2 cm wide anglesite vein occurs with blebby pyrite in the middle of the interval. Clay gouge brecciating strongly phyllic altered material occurs frequently, especially near the anglesite vein.							
						MD	OR	PA	PHC	4I	Py	1
						MD	GN		ARG	2I		
									OXI	3I		
21.40	23.08	1.68	GRD	--	Patchy, phyllic and argillic altered granodiorite with minor oxidation along fractures.							
						LT	GN	PA	ARG	2I

						MD	GN	EN	PHC	3I	Py	0.1
147.46	154.53	7.07	GRD	--	Unaltered granodiorite to EOH.							
						MD	GY					

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
2.79	3.30	0.51	GRD	--	Unaltered granodiorite block.							
						MD	GY	MA				
3.30	10.82	7.52	GRD	--	Strongly altered and oxidized granodiorite. Clay-rich with "sugary" texture in some areas; hematite and geothite on most fracture surfaces.							
									OXI	4I		
						MD	OR	RB	ARG	3I		
10.82	25.48	14.66	GRD	--	Patchy argillic and phyllic altererd granodiorite with moderate oxidation, also in patches. Infrequent quartz-ankerite stringers and veinlets hosting trace disseminated pyrite. One 2cm wide anglesite vein present in the middle of the interval within an area of prominent clay gouge material and breccias.							
						LT	GN	PA	PHC	2I		
						MD	OR	RB	ARG	2I	Py	0.01
									OXI	3I		
25.48	26.64	1.16	GRD	--	Intensely sericitized interval with disseminated to pervasive pyrite and blebby tourmaline. One, 15cm wide section has been turned into dark grey, sericite-rich gouge.							
									SER	5I	Se	30
						MD	GY		PHC	5I	Py	10
26.64	31.47	4.83	GRD	--	Dominantly phyllic altered, moderately oxidized granodiorite with quartz-ankerite stringers sometimes hosting disseminated to blebby pyrite. Minor clay gouge with brecciated and argillic altered granodiorite present.							
						LT	WH		ARG	2I		
						MD	GN	PA	PHC	3I		
31.47	49.96	18.49	GRD	--	Largely unaltered granodiorite with some patches of argillic and potassic alteration. Oxidation occurs along fractures only. Gougy material is present infrequently over intervals of less than a few centimetres, with the exception of one, 20 cm wide gougy section. Rare quartz stringers.							

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.

						MD	GN	PA	PHC	2I	Py	0.01
59.60	73.64	14.04	GRD	--	Rubbly and clay-rich, patchy propylitic, phyllic and argillic altered granodiorite; pyrite disseminated in phyllic altered material.							
						LT	GN	RB	PHC	2I	Py	0.1
								BX				
						LT	WH	PA	ARG	3I		
73.64	87.09	13.45	GRD	--	Mostly competent and patchy, weakly altered granodiorite (trace phyllic and argillic alteration) containing few, barren quartz stringers.							
									ARG	1I		
						MD	GY	PA	PHC	1I	Py	0.01
87.09	109.31	22.22	GRD	--	Patchy phyllic, argillic, propylitic and potassic altered sections. Quartz-carbonate stringers and veinlets are common, sometimes hosting pyrite. Phyllic altered envelopes often contain quartz-carbonate veins up to a few centimetres wide, hosting variable amounts of disseminated to blebby pyrite. Phyllic and propylitic alteration dominates at the top of the interval, whereas argillic and potassic alteration dominate near the bottom.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
7.50	25.20	17.70	GRD	MG	Intensely weathered and oxidized granodiorite, with pervasive strong clay alteration. The interval is devoid of coherent rocks, as almost the entire interval is crumbled or converted to clay. Clay typically retains cylindrical shape, but drier material crumbles. There are some rubbley fragments of intensely oxidized granodiorite, but most pieces are altered beyond recognition. Geothite is present on 25% of fractures.

						MD	GN	PB	OXI	4I		
						DK	BN		LIM	3I		
25.20	29.40	4.20	QFP	FG	Intensely oxide stained hydrothermally altered quartz feldspar porphyry dyke. Very rubbly recovery, but this interval contains the most competent core in the top of hole. There is still extensive clay alteration and gouge, and the rock fragments are pervasively stained brown.							
						MD	BN	FR	OXI	4I		
						LT	OR	RB	CLY	4I		
						LT	BN	PB	HYD	4I		
29.40	36.10	6.70	GRD	MG	Intensely weathered and oxidized granodiorite, with pervasive strong clay alteration. The interval is devoid of coherent rocks, as almost the entire interval is crumbled or converted to clay. Clay typically retains cylindrical shape, but drier material crumbles. There are some rubbley fragments of intensely oxidized granodiorite, but most pieces are altered beyond recognition. Geothite is present on 25% of fractures. Core recovery is very poor, often with less than 50% of interval recovered. Recovery is very clay rich and sticky.

COMMENTS

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
3.87	4.45	0.58	OVB	--	Overburden							
						MD	BN					
4.45	16.00	11.55	GRD	MG	Rubbly and broken up, strongly pervasively oxidized alternating patches of weak argillic and weak phyllic. Oxidation obscures rock textures.							
						MD	OR	RB	OXI	4I		
						MD	BN		PHC	2I		
						LT	GN		ARG	2I		
16.00	18.85	2.85	GRD	MG	Unaltered granodiorite with strong oxidation along fracture surfaces. Has rubbly patches.							
						MD	GY		OXI	4I		
						MD	OR					
						LT	GY					
18.85	36.30	17.45	GRD	MG	Pervasively moderate to strongly oxidized alternating patches of moderate phyllic alteration and weak to moderate argillic alteration. Interval contains rubbly patches and multiple gouge zones. Strong oxidation obscures rock textures.							
						MD	OR	PA	PHC	3I		
						MD	GN		OXI	4I		
						LT	GN	RB	OXI	3I		
						LT	WH		ARG	2I		
									ARG	3I		
36.30	63.27	26.97	GRD	MG	Primarily moderate argillic altered granodiorite with patches of unaltered granodiorite and sporadic weak phyllic envelopes. Argillic alteration areas are very broken up and rubbly and the unaltered granodiorite portions are more competent but still fractures. Interval overall is very rubbly and not competent. Sporadic weak to moderate oxidation along fractures.							
						MD	GY		OXI	3I		

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
						LT	WH	RB	OXI	2I		
						LT	GN		ARG	3I		
63.27	84.75	21.48	GRD	MG	Primarily unaltered granodiorite with small patches of rubbly argillic alteration. Rock is highly fractures in places. Weak to strong oxidation along fracture surfaces. Oxidation intensity decreases with depth.							
						MD	GY	FR	OXI	2I		
						MD	OR		OXI	3I		
									OXI	4I		
84.75	87.08	2.33	GRD	MG	Weak to moderate phyllic altered granodiorite hosting multiple quartz veins. Distal phyllic alteration transitions to moderate argillic alteration at the edges of the phyllic envelope. Argillic alteration is rubbly.							
						LT	GN	EN	PHC	2I		
						LT	WH		PHC	3I		
									ARG	3I		
87.08	89.69	2.61	GRD	MG	Primarily unaltered granodiorite with small patches of rubbly argillic alteration. Rock is highly fractures in places. Weak oxidation along fracture surfaces. Oxidation intensity decreases with depth.							
						MD	GY		OXI	2I		
89.69	90.38	0.69	GRD	MG	Weakly phyllic overpainted argillic alteration.							
						LT	GN		PHC	2I		
						LT	WH		ARG	3I		
90.38	91.88	1.50	GRD	MG	Weak to moderate phyllic and moderate to strongly propyllitic altered granodiorite. Host disseminated pyrite. Center of the interval appears to contain a vein zone but it is difficult to tell due to it being rubbly and broken up. Alterations in the center of the interval are the strongest and also has moderate sericite alteration. Appears to host some polymetallic quartz/carbonate veining.

28.77	38.78	10.01	GRD	MG	Moderately fractured granodiorite with semipervasive oxide staining and patchy moderate silicification. Silica and oxide overprints proximal phyllic and distal argillic halos on what were once mineralized quartz-carbonate veins. Now, most sulphides have been weathered away. Trace disseminated pyrite remains. Short crumbled argillic-gouge zones show the strongest oxide staining.

158.77	159.67	0.90	VEN	FG	BRX Vein. Dominated by massive pyrite with interstitial quartz and rarer tankerite. Pyrite crystals along fractures are large (up to 1cm diameter) and very well formed. There is some blebby chalcopyrite intergrown with the pyrite, generally near the quartz. Bebby black jack sphalerite is hosted adjacent to tan ankerite. The upper selvedge of the massive pyrite consists of massive tan ankerite hosting blebby black jack sphalerite, honey brown sphalerite, blebby galena, and blebby pyrite. The lower selvedge is a band of grey quartz with blebby-banded galena, blebby honey brown sphalerite, blebby black jack sphalerite, blebby pyrite, and blebby arsenopyrite. There is gouge along the lower selvedge hosting disseminated pyrite.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
3.74	11.10	7.36	GRD	MG	Moderate to strongly pervasively oxidized alternating patches of weak to moderate phyllic alteration and moderate argillic alteration.							
						MD	OR	PA	OXI	3I		
						LT	WH		OXI	4I		
						LT	GN		ARG	3I		
									PHC	2I		
									PHC	3I		
11.10	12.18	1.08	GRD	MG	Silicified moderate propyllitic altered granodiorite with patchy weak propyllitic alteration. Strong oxidation along fracture surfaces.							
						MD	GN		SIL	4I		
						MD	OR		PRO	2I		
						DK	GN		PHC	3I		
12.18	12.83	0.65	VEN	MG	Fractured milky white quartz vein with interstitial grey quartz and oxidized carbonate. The first 14cm has interstitial carbonate and hosts disseminated to blebby pyrite and galena. The rest of the vein hosts blebby pyrite. Fractures hosts strong oxidation.							
						LT	WH	FR	OXI	4I	Gn	3
						DK	OR				Py	2
12.83	23.52	10.69	GRD	MG	Strongly silicified moderate phyllic altered granodiorite. Strong oxidation along fracture surfaces and patchy pervasive alteration. Host sporadic patches of disseminated black tourmaline.							
						MD	GY		OXI	4I		
						MD	OR		SIL	4I		
						MD	GN		PHC	3I		

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
23.52	38.71	15.19	GRD	MG	Intensely silica flooded granodiorite. Intense silica flooding almost completely obliterates rock textures. Granodiorite appears to have initially been oxidized phyllic altered granodiorite. Hosts sporadic patches of disseminated black tourmaline. Rock is highly fractured and oxidized along fracture surfaces.							
						MD	OR	FR	OXI	3I	To	0.1
						MD	GY		OXI	4I		
									PHC	3I		
									SIL	5I		
38.71	39.13	0.42	BXA	--	Smoky quartz/massive sulphide vein brecciated by oxidized white carbonate. Quartz clasts hosts blebby to semi-massive galena, disseminated to blebby pyrite, sphalerite and disseminated arsenopyrite. Carbonate also has interstitial grey chalcedony.							
						MD	OR				Sp	2
						LT	WH				Py	2
						DK	GY	BX	OXI	3I	Gn	6
											As	1
39.13	41.52	2.39	GRD	MG	Significantly gouge altered and strongly pervasively oxidized moderate phyllic altered granodiorite. Relic rock textures are almost completely obliterate by silica flooding, oxidation and gouge alteration. Has rubbly patches.							
						MD	OR	RB	OXI	3I		
						MD	GY		SIL	4I		
									PHC	3I		
41.52	46.72	5.20	QFP	FG	Intensely silicified grey/brown/light tan quartz feldspar porphyry dyke that has patchy partial gouge alteration and rubbly patches. Fractures are oxidized proximal to dyke contacts with granodiorite.							
						MD	BN	RB	OXI	3I		
						MD	GY	PO	SIL	4I		
						LT	TN					

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
46.72	47.03	0.31	GRD	MG	Significantly gouge altered and pervasively oxidized phyllic granodiorite.							
						MD	GY		OXI	4I		
						MD	OR		PHC	3I		
47.03	47.55	0.52	BXA	--	Multiphase breccia. Smoky quartz breccia that is brecciated by light tan ankerite and cut by grey chalcedony veins. All phases are cut by white carbonate. Breccia hosts disseminated to blebby pyrite, galena and sphalerite and disseminated arsenopyrite. Moderate oxidation along fracture surfaces.							
						MD	OR				As	1
						DK	GY	BX	OXI	3I	Py	1
											Gn	5
											Sp	3
47.55	48.41	0.86	GRD	MG	Strongly silica flooded phyllic altered granodiorite hosting disseminated to blebby pyrite and polymetallic veining. Moderate oxidation along fractures.

COMMENTS

157.44	181.97	24.53	GRD

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
4.20	23.25	19.05	GRD	MG	Granodiorite with weak-moderate oxide staining on fractures, rarely semi-pervasive oxidation on argillic/clay altered patches. Competent recovery, with less fracturing than usual for top of hole. Few patches of weak argillic alteration,.							
						MD	BN		ARG	1I		
						MD	GY		OXI	2I		
									CLY	1I		
23.25	26.94	3.69	GRD	MG	Pervasive argillic and oxide stained granodiorite with several gouge seams. Argillic alteration is crumbled at 23.40m. Cut by few calcite veins.							
						MD	BN		OXI	3I		
						LT	WH	FR	ARG	3I		
						LT	OR		CLY	2I		
26.94	39.33	12.39	GRD	MG	Granodiorite with weak oxide staining on all fractures, and trace patchy argilllic alteration otherwise. Cut by rare barren carbonate veinlets. Stronger oxide staining in argillic patches.							
						MD	GY	PA	ARG	1I		
						LT	BN		OXI	2I		
39.33	39.76	0.43	GRD	MG	Narrow proximal phyllic and distal argillic halo on a banded quartz-carbonate vein with trace disseminated pyrite. Stronger oxide staining overprints the outer argillic halo.							
						MD	BN		ARG	3I	Py	0.1
						MD	OR		PHC	2I		
									OXI	3I		
39.76	40.90	1.14	GRD	MG	Granodiorite with semipervasive oxide staining.							
						MD	GY		OXI	2I		
						MD	BN					

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
40.90	48.16	7.26	GRD	MG	Overlapping proximal phyllic and distal argillic halos on veins and gouge seams. Patches of pervasive oxide staining are present on most argillic patches. Gouge seams show strong oxidation. White quartz-carbonate veining tends to host blebby pyrite.							
						MD	GY		OXI	2I		
						MD	BN		POT	1I		
						LT	WH	PA	PHC	3I	Py	0.1
						LT	GN	MO	ARG	2I		
48.16	53.68	5.52	GRD	MG	Fresher granodiorite with patchy trace potassic alteration, moderate oxide staining on fractures, and rare calcite veining with narrow proximal phyllic and distal argillic halos.							
						MD	GY		OXI	2I		
						MD	BN		PHC	1I		
									ARG	1I		
53.68	61.16	7.48	GRD	MG	Overlapping proximal phyllic and distal argillic halos on veins and gouge seams. Oxide staining is pervasive, and most intense on argillic alteration. Gouge seams show strong oxidation. White quartz-carbonate veining tends to host blebby pyrite.							
						MD	BN	PA	OXI	3I	Py	0.1
						LT	OR	MO	PHC	3I		
						LT	GN		ARG	3I		
						LT	WH		POT	1I		
61.16	74.94	13.78	GRD	MG	Fresh granodiorite with weak oxide staining on most fracture surfaces, rare proximal phyllic and distal argillic halos on quartz-carbonate veining, mafic xenoliths, and occasional pink aplite dykelets.							
						MD	GY	PA	OXI	2I

155.87	156.23	0.36	VEN	MG	BRX footwall zone. Vein has a 9cm band of finely intergrown white-dark grey quartz with interstitial very fine pyrite. This central zone is sandwiched by 7cm and 14cm of banded-crustiform-vuggy tan ankerite-quartz. Vugs are now filled by massive clear quartz. Tan ankerite banding preferentially hosts blebby zoned honey brown sphalerite and blebby galena, with some blebby pyrite. Very fine arsenopyrite is densely disseminated in most dark grey quartz. There tends to be wider bands of galena and honey brown sphalerite along the outer selvedges of the BRX vein. There is a short 6cm gap of altered granodiorite, then a 4cm wide vein of tan ankerite with bands of galena, honey brown sphalerite, blebby pyrite, and disseminated arsenopyrite.

						MD	GY	PO	HYD	4I		
						LT	GY	RX	CLY	3I		
						LT	RD					
225.93	227.34	1.41	VEN	MG	BRX Footwall vein zone. Wide mineralized quartz-carbonate breccia, dominated by grey-milky quartz matrix. Clasts are mineralized quartz veins, phyllic granodiorite, and minor quartz feldspar porphyry dyke. Sulphides are mostly distributed among quartz, though blebby pyrite is hosted in phyllic granodiorite. Quartz hosts disseminated-blebby arsenopyrite, blebby to semi-massive galena, and blebby honey brown sphalerite.

72.05	72.45	0.40	VEN	--	Multiphase Central Klaza polymetallic quartz/sulphide vein. The first 27cm are massive sulphide that have brecciated grey quartz that contains interstitial white carbonate. Sulphides are comprised of massive black jack sphalerite, disseminated to blebby pyrite, chalcopyrite and galena. Brecciated quartz hosts disseminated jamesonite. Both sulphides and quartz are cut by barren white carbonate veinlets and stringers. The last 12cm are a smoky quartz breccia. Smoky quartz brecciates phyllic altered granodiorite and quartz vein that hosts disseminated to blebby pyrite.

72.05	72.45	0.40	VEN	--	Multiphase Central Klaza polymetallic quartz/sulphide vein. The first 27cm are massive sulphide that have brecciated grey quartz that contains interstitial white carbonate. Sulphides are comprised of massive black jack sphalerite, disseminated to blebby pyrite, chalcopyrite and galena. Brecciated quartz hosts disseminated jamesonite. Both sulphides and quartz are cut by barren white carbonate veinlets and stringers. The last 12cm are a smoky quartz breccia. Smoky quartz brecciates phyllic altered granodiorite and quartz vein that hosts disseminated to blebby pyrite.

5.09	19.26	14.17	GRD	MG	Trace to moderately argillic altered granodiorite with a trace to weak potassic/propyllitic overprint. Rock competency decrease with increased argillic alteration forming rubble zones. Moderate oxidation along fractures surfaces with pervasive moderate to strong oxidation throughout moderately argillic altered patches. Sporadic small patches of unaltered granodiorite.

COMMENTS

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
3.78	19.45	15.67	GRD	MG	Moderate to strongly pervasively oxidized trace to moderate argillic altered granodiorite. Interval is very broken up and rubbly. Weathered moderated argillic portions are gravel. Host multiple small zones of clay gouge. Pervasive oxidation and weathering obscures and obliterates rock textures.							
						MD	GY		ARG	2I

ZONE: Western BRX

SECTION: BRX 9+250

HOLE: KL-15-291

CLAIM:

Contractor: Platinum

Drill: 1

Core Size: HQ-NQ2

Casing Depth: 4.5m, Out

Drilling Dates: Aug 16 - Aug 20, 2015

Geology Logged By: T. Cruz

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
4.50	5.18	0.68	VOL	FG	Mafic magnetic dyke. Highly fractured with oxidation occuring along fracture/joing faces.							
						LT	BK	RB				
						DK	GY	AN				
5.18	33.08	27.90	GRD	MG	Extremely rubbly alternating patches of highly weathered unaltered granodiorite to argillic altered granodiorite. Both types of granodiorite are very incompetent, and display pervasive oxidation throughout much of the interval. Occasional goethite staining is present along both fracture/joint faces, and within rubble zones. Colour varies from deep orange (extremely weathered+rubbly) to brown.							
						MD	OR	FR	ARG	3I		
						MD	BN					
						LT	OR		OXI	4I		
						LT	BN					
						DK	OR	RB	ARG	2I	Go	2
						DK	BN		OXI	5I		
33.08	43.28	10.20	GRD	MG	Intensely weathered and highly fractured rubble zone of pervasively oxidized argillic +- phyllic? Altered granodiorite. Deep orange colour along with goethite staining potentially indicate an oxidized/weathered zone of alteration.							
						MD	OR	FR	OXI	5I		
						MD	BN		ARG	2I		
						LT	OR	RB	OXI	4I		
									ARG	3I		
43.28	53.70	10.42	GRD	MG	Highly fractured rubbly zone of unaltered to argillic altered granodiorite. Interval displays moderate to high oxidation with pervasive oxidation occuring in rubbly sections of interval. Goethite staining is present within both rubbly and competent core. Core is ~40% competent, with the rest highly fractured and rubbly.							
						MD	OR	RB	ARG	2I	Go	2
						MD	BN		OXI	4I

Water Hole

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
10.02	40.24	30.22	GRD	MG	Strongly pervasively oxidized alternating patches of phyllic and argillic alteration. Interval is extremely weather and rubbly and hosts multiples zones of gouge alteration. Oxidation and gouge alteration obscures most of the rock textures. Has patches of goethite staing along fracture surfaces.

COMMENTS
Water Hole

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
4.67	25.22	20.55	GRD	MG	Pervasively strongly oxidized, strongly phyllic altered granodiorite. Has patchy moderate argillic and moderate propyllitic alteration. Hosts multiple sets of sheeted pyrite stringers and veinlets and a high abundance of large massive grey bull quartz veins. Bull quartz has interstiital white carbonate and hosts disseminated to blebby pyrite. Strong phyllic alteration hosts disseminated pyrite. Has a few rubbly patches.

						LT	GN					
						DK	OR		ARG	3I		
25.22	38.30	13.08	GRD	MG	Silicified moderate propyllitic altered granodiorite. Hosts a high abundance of large massive grey bull quartz veins. Bull quartz has interstitial white carbonate and hosts disseminated to blebby pyrite. Minor phyllic overprinting halo around bull quartz veining. Moderate oxidation along fracture surfaces. Strongest propyllitic altered sections are significantly magnetic, most likely due to patches of disseminated magnetic throughout.

COMMENTS
Water hole

KL-15-294

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
3.89	30.76	26.87	GRD	MG	Alternating patches of unaltered granodiorite and weak to moderate argillic alteration. Occasional phyllic halos around weathered quartz veins. Patchy pervasive oxidation throughout altered portion and oxidation along fracture surfaces. Has patches of gouge alteration. Interval is heavily weathered broken up and rubbly.							
						MD	BN	PA	OXI	2I

EXECUTIVE SUMMARY

The Klaza Property, which is 100% owned by Rockhaven, hosts high grade gold-silver-lead-zinc-copper veins and is located within the southern part of the Dawson Range Gold Belt. The property has been explored by Rockhaven since 2010. Recent exploration activities, all managed by Archer, Cathro & Associates (1981) Limited (Archer Cathro) on behalf of Rockhaven, have mainly focused on two of the nine identified mineralized zones on the property, namely the BRX and Klaza Zones.

In anticipation of a future application under the Yukon Environmental and Socioeconomic Assessment Act (YESAA) and the Waters Act as part of the mine permitting process, Tetra Tech EBA Inc. (Tetra Tech EBA) was retained by Rockhaven Resources (Rockhaven) to install a groundwater monitoring well network in the area of the identified resource and to conduct a preliminary hydrogeological assessment for the area of the mineralized zones at Klaza. The results of the preliminary hydrogeological assessment will also be useful for the purpose of a conceptual mine design as the Klaza project moves toward the pre-feasibility stage.

A preliminary monitoring well network consisting of five nested monitoring wells was installed at the Klaza Property with monitoring well locations downgradient of the main mineralized zones, including Western and Central Klaza, and Western, Central, and Eastern BRX. One shallow piezometer and one deep piezometer were installed at each location. The deep piezometers target the sub-permafrost aquifer whereas the shallow piezometers were installed within the anticipated active zone to monitor seasonal supra-permafrost groundwater.

In addition to the monitoring wells, four observations wells were installed with vibrating wire piezometers (VWPs) to monitor pore pressures at three different depths in each of the observation wells. The VWP observations wells were installed within the areas of the main mineralized zones, including Western and Central Klaza, and Western, Central, and Eastern BRX.

Ground temperatures and permafrost conditions were assessed using subsurface temperature data from the VWPs and one thermistor cable installed to a depth of about 100 m in the area of the Central Klaza zone.

The main conclusions of the preliminary hydrogeological assessment can be summarized as follows:

- Permafrost appears to act as a confining layer for the deeper bedrock aquifer. However, some uncertainty remains with respect to the permafrost temperature, extent, and interaction with groundwater that requires further data collection.
- The groundwater flow regime at the site is controlled by the steep terrain with groundwater flow from areas at higher elevations on the mountain slopes toward the valley bottoms with the groundwater flow generally mimicking the local topography.
- Hydraulic conductivities of the granodiorite bedrock aquifer were inferred from packer tests conducted in all four VWP observation wells and hydraulic response tests conducted in select monitoring wells. Inferred hydraulic conductivities ranged over several orders of magnitude from about 4×10^{-10} m/s to 1×10^{-5} m/s with an average hydraulic conductivity of 2×10^{-8} m/s. Hydraulic conductivity in bedrock is inferred to be largely controlled by fracture density and permeability.
- Groundwater samples for chemical analysis were collected from all monitoring wells in August 2015. The results show a similar hydrogeochemical composition with slight differences between samples due to sample location. All groundwater samples are of a calcium and/or magnesium dominant cation type, and bicarbonate and/or sulphate anion type.

- All groundwater samples, including those collected in the area of the ore deposit, showed a near neutral to slightly basic pH (between 7 and 8).
- Comparison of the groundwater chemistry results showed several natural exceedances of the Federal Interim Groundwater Quality Guidelines for Commercial and Industrial Land Uses and Protection of Freshwater Aquatic Life (FIG) guidelines. Exceedances included sulphate, fluoride, and the dissolved metals aluminum, cadmium, copper, iron, lead, selenium, silver, and zinc. The dissolved cadmium concentrations also exceeded the less stringent Yukon CSR Schedule 3, Generic Numerical Water Quality Standards for Aquatic Life (CSR-AW) standard in three of the samples.

Tetra Tech EBA makes the following recommendations for further hydrogeological assessment at Klaza:

- Seasonal groundwater monitoring should be continued for the existing monitoring and observation wells. A minimum of one year of baseline groundwater data will be required for a project proposal submission under YESAA to assess seasonal changes in groundwater quality and quantity. A future Type A Water Licence application will require a minimum of two consecutive years of baseline data.
- All monitoring wells should be surveyed for their location and elevation of the top of the PVC casing in the summer of 2016 with an accuracy of about ±1 cm or better.
- Given the inferred extent of permafrost at the site, a thorough understanding of the interaction between permafrost and groundwater will be a critical aspect of the hydrogeological baseline characterization at the site that is required for the environmental assessment and regulatory approval process as well as mine engineering purpose. We therefore recommend collecting additional ground temperature and hydrogeological data from the existing observation and monitoring wells as well as additional wells if required. The data should be used to update the preliminary conceptual hydrogeological model with an emphasis on permafrost-groundwater interaction.
- As the mine planning progresses, additional monitoring wells should be installed in the areas up- and downgradient of proposed mine infrastructure, including any proposed infrastructure that may affect groundwater quality and/or quantity during mine construction, operation, or closure (e.g., open pits, underground workings, tailings facility, waste rock dump(s), ore stock piles, mill, fuel and chemical storage, and camp facilities).
- The groundwater and surface water baseline data collection should be integrated and both data sets be interpreted with respect to groundwater-surface water interaction.

LIMITATIONS OF REPORT

This report and its contents are intended for the sole use of Rockhaven Resources Ltd. and their agents. Tetra Tech EBA Inc. (Tetra Tech EBA) does not accept any responsibility for the accuracy of any of the data, the analysis, or the recommendations contained or referenced in the report when the report is used or relied upon by any Party other than Rockhaven Resources Ltd., or for any Project other than the proposed development at the subject site. Any such unauthorized use of this report is at the sole risk of the user. Use of this report is subject to the terms and conditions stated in Tetra Tech EBA's Services Agreement. Tetra Tech EBA's General Conditions are provided in Appendix A of this report.

1.0 INTRODUCTION

Tetra Tech EBA Inc. (Tetra Tech EBA) was retained by Rockhaven Resources Ltd. (Rockhaven) to install groundwater monitoring wells and other subsurface instrumentation to conduct a preliminary hydrogeological assessment of the Klaza Property, northwest of Carmacks, Yukon.

This report contains well completion information for five nested monitoring wells, four observations wells with vibrating wire piezometers (VWPs) and one observation well with a ground temperature cable installed at the Klaza Property in July and August 2015. In addition, the report also contains the results of hydraulic well tests to infer aquifer properties, and the results of the first round of groundwater monitoring and sampling following well completion and development. The groundwater information collected as part of the summer 2015 field program was used to conduct a preliminary hydrogeological assessment for the Klaza Property.

The Klaza Property is located northwest of Carmacks, Yukon, and is accessible by all-weather road from the North Klondike Highway (Figure 1).

1.1 Purpose and Objective

The purpose of this project was to initiate the collection of baseline groundwater information for the area of the Klaza Property. Groundwater information forms an essential part of the environmental baseline characterization that is required for a future assessment under the Yukon Environmental and Socioeconomic Assessment Act (YESAA) and a Type A Water Use Licence application as part of the mine permitting process. A minimum of one year of seasonal groundwater data is typically required prior to a project proposal submission under YESAA and a minimum of two consecutive years of seasonal groundwater data is required for a Type A Water Licence application.

In addition, groundwater conditions also have to be considered in the ongoing mine design. Since the Klaza project is still in the early stages with respect to mine design and planning with no final locations identified for most infrastructure including the tailings facility, waste rock dump(s), mill, fuel storage, and camp facilities, the groundwater data collection and preliminary hydrogeological assessment is focused on the mineralized zones that would potentially host future open pits and underground workings. The groundwater information required for the aforementioned purpose includes a general understanding of the groundwater regime (both in terms of groundwater quantity and quality) in the area of the mineralized zones. Efforts were focused on the mineralized zones including Western BRX, Central BRX, Eastern BRX, Western Klaza, Central Klaza, and Eastern Klaza (see Figure 2). These mineralized zones and the area immediately downgradient form the study area for the purpose of this project.

1.2 Scope of Work

In accordance with our proposal entitled “Proposal for Hydrogeological Consulting Services, Klaza Property, Yukon” dated May 8, 2015, the scope of work included:

- Project management, budget tracking, and regular progress updates to the client;
- Review of pertinent geological and hydrogeological background information;
- Design of a field program to install groundwater monitoring wells and other subsurface instrumentation to initiate hydrogeological data collection;
- Field oversight and coordination of monitoring well drilling and instrumentation installation;
- Monitoring well development and groundwater sampling;

- Hydraulic testing including packer testing in select diamond drill holes and hydraulic response tests on monitoring wells;
- Monitoring well completion report and preliminary hydrogeological assessment;

This report presents the results of the scope of work summarized above.

1.3 Limitations

As stated previously, the purpose of this project was to install groundwater monitoring wells and other downhole instrumentation to initiate groundwater data collection at the site and to conduct a preliminary hydrogeological assessment for the area of the main mineralized zones at the Klaza Property including Western BRX, Central BRX, Eastern BRX, Western Klaza, Central Klaza, and Eastern Klaza (see Figure 2). The field instrumentation and preliminary hydrogeological assessment was neither designed to satisfy all aspects of a hydrogeological baseline assessment that would be needed for a project proposal submission under YESAB and a Type A Water Licence application, nor to provide all required hydrogeological information for the design of the various mine components (e.g., open pit, underground workings, water and waste management infrastructure). However, the groundwater information collected as part of this project provides an important basis for the understanding of the hydrogeological conditions at the site and will be useful in the design of a proper hydrogeological baseline program to collect all necessary groundwater information for the environmental assessment and regulatory approval process as well as for mine design.

1.4 Project Background

The Klaza Property, which is 100% owned by Rockhaven, hosts high grade gold-silver-lead-zinc-copper veins and is located within the southern part of the Dawson Range Gold Belt. The property has been explored by Rockhaven since 2010 including more than 70,000 m of diamond drilling in addition to some reverse circulation drilling, trenching, geophysical surveys, and extensive soil geochemistry. Recent exploration activities, all managed by Archer, Cathro & Associates (1981) Limited (Archer Cathro) on behalf of Rockhaven, have mainly focused on two of the nine identified mineralized zones on the property, namely the BRX and Klaza Zones.

In March 2015 (and amended in June 2015), Rockhaven published a NI43-101 Technical Report (Wengzynowski et al., 2015) with an inferred mineral resource estimate including the western and central portions of the Klaza and BRX zones totalling 7,040,000 t grading 4.19 g/t gold, 96.23 g/t silver, as well as notable grades of lead, zinc, and copper above a 1.5 g/t gold cut-off grade. Wengzynowski et al. (2015) recommended additional exploration work to extend the bounds of the current mineral resource to greater depth and along strike. The authors further recommend a preliminary economic assessment after additional metallurgical work is completed to assess potential mining methods and other economic factors.

As the project progresses toward a pre-feasibility and feasibility stage, environmental baseline data should be collected in preparation of the environmental assessment that forms part of the regulatory process. Environmental monitoring has been carried out on the Property from March 2012 to present. Baseline surface water quality/hydrology and meteorological studies have been conducted by J. Gibson Env. Consulting of Whitehorse, and has focused on drainages around the main areas of interest. Wildlife surveys have been conducted within the same general areas by Laberge Environmental Services of Whitehorse, over the same time period. In 2011, Matrix Research Ltd. (Matrix) of Whitehorse conducted a Heritage Resources Overview Assessment of the Klaza area. This work classified zones of high, moderate and low potential for heritage resources within the Property and immediately peripheral lands. In 2012, Matrix conducted ground studies and did not locate any heritage sites within the main areas of interest. To our knowledge, no groundwater information had been collected at the site prior to this project.

2.0 STUDY AREA

The study area (also referred to as the site) for the purpose of this preliminary hydrogeological baseline assessment encompasses the area of the mineral deposits and conceptual open pits and underground workings depicted on Figure 2.

2.1 Location

The Klaza Property is located in southwestern Yukon, approximately 300 km northwest of Whitehorse. The property has an approximate UTM/NAD83 location of 383011 E / 6889236 N in Zone 8N and lies on National Topography System (NTS) map sheets 115I/03.

2.2 Access

The Klaza Property is road accessible by a 77 km long two-wheel drive gravel road from the Klondike Highway. The gravel road joins the Klondike Highway in Carmacks about 180 km north of Whitehorse.

2.3 Physiography

The project area is located in the southern part of the Dawson Mountain Range of the Yukon Plateau-Central Ecoregion of the Boreal Cordillera Ecozone. The Dawson Range is characterized by a belt of low mountains, hills and relatively mature river systems. The sinuous eastern margin of the adjacent Klondike Plateau Ecoregion is located immediately west of Mt. Nansen. The area is characterized by smooth, rolling topography with moderate to deeply incised valleys. Most of the terrain lies between 1000 m and 1500 m elevation above sea level (asl). Notable peaks in the study area are Mount Nansen and Victoria Mountain at 1705 m and 1871 m above sea level, respectively. The eastern part of the Property covers a broad rounded northwesterly elongated ridge that lies between Mount Nansen and the Klaza River. The rest of the Property is characterized by low hills and valley bottom, flanking the Klaza River.

The Yukon Plateau-Central Ecoregion spans the boundary between the widespread and sporadic discontinuous permafrost subzones. Most of the study area lies west of the limits of the McConnell glaciation, so the surficial deposits are coarse and dry, and largely free of ground ice. However, fine-grained and moist sediments in valleys are prone to perennial freezing and occurrence of ground ice (Smith, Meikle, Roots, ed., 2004).

The density and size of vegetation gradually increases toward lower slopes and valley bottoms. Open black and white spruce forest, with some aspen stands and birch and a thick layer of sphagnum moss, occur in valleys and on lower slopes, but much of the terrain is above treeline (1200 m asl on north-facing slopes and about 1,400 m asl on south-facing slopes). Areas above treeline are vegetated with low-lying grass, moss and sparse brush.

2.4 General Hydrology and Meteorology

The Property is drained by tributaries of the Klaza River and Nansen Creek, both of which flow into the Nisling River, which is part of the Yukon River watershed and flows northwest to reach the Yukon River via the Donjek and White Rivers.

Located at the western portion of the Yukon Plateau-Central Ecoregion, the study area is in the rain shadow effect of the St. Elias–Coast Mountains and annual precipitation is relatively light, ranging from 250 mm to 300 mm, two-thirds of which falls during the summer. Snow cover generally exists from mid-October to mid-April in the valley floors and a month longer over the higher terrain. Mean annual air temperatures are near –4°C, with monthly means ranging from -30°C in January to 15°C in July. The period with mean daily temperatures above 0°C is from late April to mid-October, although frost can occur at any time of the year.

2.5 Geology

The following sections provide a brief summary of the surficial and bedrock geology in the area of the Klaza Property. A detailed discussion of the local geology and mineralization at Klaza can be found in Wengzynowski et al. (2015).

2.5.1 Surficial Geology

Surficial materials in the area include colluvium, fluvial material deposited by Quaternary to present streams and rivers, and glaciofluvial sands and gravels. Bedrock outcrops are scarce across most of the Property and overburden typically consists of a few centimetres of organics and up to about 2 m of loess and immature soil mixed with locally derived rock fragments, over weathered bedrock. At lower elevations, thick layers of fluvial material, glaciofluvial outwash and till blanket the valley floors. Permafrost is discontinuous, but extensive, particularly on north- and west-facing slopes.

2.5.2 Bedrock Geology

Most of the Klaza Property is underlain by Mid-Cretaceous granodiorite. In the southeast corner of the Property, a quartz-rich, granite to quart monzonite stock intruded the granodiorite that is believed to be the main heat source for the hydrothermal cells that deposited the mineralization found at Klaza. However, this intrusive stock was outside of the study area for this assessment and was not encountered in any of the monitoring and observation wells drilled as part of this project.

A swarm of northwesterly trending, Late-Cretaceous feldspar porphyry dykes emanate from the stock in the southeastern part of the Property and cut the granodiorite in the area of the main mineralized zones. These porphyry dykes are up to 30 m wide and commonly occupy the same structural zones as mineralized veins. The mineralization contains abundant sulphide minerals including pyrite, arsenopyrite, galena, sphalerite, and chalcopyrite.

2.5.3 Glacial History

The study area occurs at the western margin of the Yukon Plateau-Central Ecoregion and east of the limit of Cordilleran Pleistocene glaciation. Most of the ecoregion was not glaciated but both early and late Wisconsin advances covered the southwestern part (Oswald and Senyk, 1977). The Klaza area escaped Pleistocene continental glaciation but experienced some local Pleistocene to Holocene valley and alpine glaciation.

3.0 METHODS

The following sections describe the methods used for the field program and data analysis.

3.1 Monitoring Well and Instrumentation Installation

3.1.1 Drilling

All drilling was completed using a diamond drill rig with HQ-size tools which produce a borehole diameter of 96.1 mm. All drilling was conducted by Platinum Diamond Drilling Inc. of Winnipegosis, Manitoba. Drill water was taken from local creeks and water was continuously pumped from the creek to a water tank located at the drill rig. Excess and return water was drained to a sump at each drill site.

The diamond drill holes (DDHs) were drilled using a polymer-based drilling mud where required for borehole stability. Drillers were directed to use as little drilling polymer as possible. The borehole was flushed with water until there was no visible polymer in the return water prior to conducting a packer test.

Table 3-1 presents the location, depth, and dip angle for the exploration drill holes used as part of the hydrogeological investigations. Figure 2 shows the location of the exploration drill holes where VWPs and the ground temperature cable were installed, and where packer tests were conducted, as well as where monitoring wells were installed.

All drill hole collars were surveyed by Archer Cathro field staff using a Trimble SPS852 Real Time Kinematic (RTK) GPS system with a vertical accuracy of about ±0.1 m.

Drill logs are included in Appendix B. The lithological logging was completed by Archer Cathro geologists.

Table 3-1: Exploration drill holes used for hydrogeological investigations

[3] m bgs – metres below ground surface

3.1.2 Monitoring Wells

Nested groundwater monitoring wells were installed in exploration drill holes at five locations onsite. These wells are inferred to be downgradient of the various deposits and are to be used for the ongoing assessment of groundwater elevations and quality. At each location a “deep” well (30 m+) was installed in the bedrock aquifer and a “shallow” well (< 5 m deep) installed at surface to target the active zone.

Tetra Tech EBA observed drilling of each borehole as the drilled depth approached the anticipated groundwater depth. The following procedures were employed in the determination of whether groundwater had been intercepted and the interval the deep groundwater monitoring well was to be screened over:

- When drilling close to the expected groundwater depth, drilling was halted, water switched off and water levels were gauged. Where water levels were observed to be rising, the depth to water was recorded several times in order to estimate the recovery rate. Water was then added to the borehole in small volumes (to accelerate recovery) until the water level was observed to be falling.

  Where water levels were observed to be rapidly falling, stabilization was accelerated by evacuating water from the borehole by dropping the core barrel 10 to 20 m below the water level, then rapidly removing the barrel, removing an estimated 50 to 100 L of water. Water was removed in this manner until the water level was observed to be rising.

  The interval between the highest rising and lowest falling levels were recorded. This process was continued until the interval between falling and rising water levels was within approximately 1 m.

  Drilling was then continued another 3 m (10 ft) and the process repeated. If similar intervals between falling and rising levels were observed, it was considered that this reproducibility could not be due to water introduced during the drilling process. The static groundwater level was inferred to be within this interval, the borehole deemed to be within an unfrozen aquifer and the screened section of the well placed in this interval.

- The driller was asked about increases in water returns (an increase in return may indicate interception of groundwater). None of the drillers noted an increase in return at any of the wells, therefore this assessment method is not discussed further.

- Tetra Tech EBA recorded the electrical conductivity of the drilling water (prior to mud addition and following mud addition) and the return water (a marked change in electrical conductivity can be an indicator of intercepting groundwater). This data did not clearly identify any zones where groundwater had been encountered; therefore this assessment method is not discussed further.

Deep monitoring wells were constructed in accordance with the following general protocol:

- A minimum of 0.2 m of 10-20 filter sand was placed at the base of the borehole.

- A screened section of 10-slot (0.010”) 32 mm (1.25”) PVC was placed in the borehole annulus to span the desired depth interval. Screen lengths were either 9.1 m or 12.2 m (30 or 40 ft).

- Above the screened section, the PVC standpipe was completed to surface using 32 mm (1.25”) solid lengths.

- 10-20 filter sand was added to a minimum of 0.9 m above the top of the screened section.

- The borehole was backfilled from the top of the sand to between 5.2 and 5.5 m bgs with bentonite.

Shallow monitoring wells were constructed in accordance with the following general protocol:

- A minimum of 0.6 m of 10-20 filter sand was placed on top of the lower bentonite plug.
- A 1.5 m screened section of 10-slot (0.010") 32 mm (1.25") PVC was placed in the borehole annulus at the desired depth.
- The PVC standpipe was completed to surface using 32 mm (1.25") solid lengths.
- Sand was added to a minimum of 0.5 m above the top of the screened section.
- The borehole was backfilled from the top of the sand to 0.3 m bgs with bentonite.
- The borehole was completed to slightly above surface with concrete (to minimize water pooling around the well), then a protective steel casing placed over the PVC and set in concrete.
- Once the protective steel casing was installed, the solid 32 mm (1.25") PVC was extended from ground surface to an accessible point within the casing.

During the deep monitoring well construction, the following procedures were employed to ensure sand and bentonite intervals were placed at the correct intervals and to minimize the risk of bridging in the borehole annulus during addition:

- Sand and bentonite was added slowly to the well to minimize the risk of bridging in the borehole annulus.
- Coated bentonite pellets (which have a delayed swelling response when submerged in water) were used below the water table to ensure they would reach the base of the borehole.
- Settled depths were recorded regularly with the time it would take the bentonite/sand to fall through the water column allowed for to limit the possibility of overfilling the annulus to above the desired interval.

3.1.3 Vibrating Wire Piezometers

VWPs are used to measure piezometric levels and temperatures in boreholes. The sensing element of the VWP is a high strength steel wire attached to a diaphragm. The wire is excited by two coil magnets set around the connecting over tube. External pressure on the diaphragm will move the diaphragm a very small amount changing the tension on the vibrating wire. This tension change is directly proportional to the resonant frequency at which the wire will vibrate. The current resonant frequency of the wire is measured using a readout unit that connects to the cable at the surface. The resonant frequency is then converted into a pressure reading using the individual calibration record for each instrument. The calibration sheets for the VWPs installed at the Klaza Property are included in Appendix C.

The vibrating wire instrument measures absolute pressure; subsequently measurements should be corrected for temperature and barometric pressure to calculate the actual piezometric pressure or hydraulic head. Each instrument includes a thermistor which measures the temperature of the transducer and its surroundings. This temperature information is used to provide temperature correction to the output pressure readings. Barometric pressure is not being recorded at the Klaza weather station and therefore, no data were available for barometric pressure compensation of the VWP readings. However, barometric pressure changes are typically small and should not significantly affect the interpretation of the piezometric elevations inferred from the VWP data.

The VWPs were installed in exploration boreholes with three VWPs installed in each borehole at various depth below the anticipated groundwater table. The VWPs were attached to the outside of a 25.4 mm (1-inch) diameter Schedule 80 PVC pipe that was lowered downhole through the open hole or drill rods depending on borehole stability. The PVC pipe was then used as a tremie pipe to grout the VWPs in place. Each hole was tremie grouted

using a cement-bentonite grout until grout return was observed through the surface casing. The surface casing was then removed and the well was completed with a protective steel casing secured in concrete. The following grout mix was used for preparing the cement-bentonite grout (Table 3-2, Mikkelsen, 2002):

Table 3-2: Cement-bentonite mix

Material	Weight	Ratio by Weight
Water	30 gallons	2.5
Portland Cement	94 lbs (~2 bags)	1
Bentonite	25 lbs (1/2 bag, as required)	0.3

Dataloggers were installed on each VWP well for continuous data recording. The recording interval is currently set to six hours, i.e., the dataloggers record readings from each VWP every six hours. The six-hour frequency will allow seasonal variations in piezometric pressure to be recorded at an adequate resolution while keeping the data record to a manageable size.

3.1.4 Ground Temperature Cable

A ground temperature cable was installed in the area of the Central Klaza zone in exploration hole KL-15-257 to monitor subsurface temperatures and assess permafrost conditions at the site. The hole was chosen because of its central location on the Klaza Property and the fact that the hole is located on a north-facing slope with the high probability of encountering permafrost conditions. A solid, un-slotted 25.4 mm (1 inch) diameter Schedule 80 PVC pipe was installed in the drill hole and grouted in place with a cement-bentonite grout using the same grout mix as for the VWPs (cf. Section 3.1.3). The ground temperature cable was then deployed into the PVC pipe to measure the ground temperature at multiple depths.

3.2 Hydraulic Well Testing

3.2.1 Packer Testing

Packer tests are used to infer the in situ hydraulic conductivity of a rock mass over a specific interval. All packer tests were conducted as constant head injection tests, i.e., water was injected at specific pressure steps and the resulting injection rate is recorded when flow has reached a quasi-steady state condition.

A packer test system is composed of:

- A downhole assembly of two or three inflatable “packer” glands used to isolate the target interval within the DDH;
- A packer inflation system utilizing nitrogen (inert gas) to inflate the packer system and seal the test section; and,
- A water pressure system (in this case utilizing the drill mud pump and a clear water tank) to facilitate water injection at a constant pressure (head) into the tested interval with the ability to measure flow rate.

The tests were conducted after the drill had penetrated to a specified borehole depth or encountered a target test zone. Static water level measurement is important to determine the excess pressure (P_W^{max}) to apply over the specific test interval. This is calculated as follows:

$$P_W^{max} = \sigma_v' = \gamma_s'(z_s) + \gamma_r'(z_{tz} - z_s)$$

Where γ_s' is the submerged unit weight of the overburden deposits; γ_r' is the submerged unit weight of the bedrock; z_s is the thickness if the overburden deposits; and $(z_{tz} - z_s)$ is the thickness of bedrock over the tested interval. If the water pressure is too high, hydraulic fracturing or opening of fissures may alter the rock mass hydraulic conductivity. CANMET (1977) recommends a maximum excess water pressure (P_W^{max}) of 700 kPa. Therefore, the excess pressure was not allowed to exceed 700 kPa to avoid potential hydraulic fracturing of the bedrock. The packer inflation pressures ensure that the tested interval is properly sealed to prevent leakage of flow, slippage and damage to packers.

After the drill had reached the specified testing depth, the hole was flushed with clear water to remove any drill mud or cuttings, then the drill rods were pulled back to allow the water level to stabilize. Water for testing was pumped from a separate clean water tank. The downhole assembly was attached to the wireline and lowered through the drill rods with the bottom packer(s) extending through the drill bit into the open drill hole. The packer glands were then inflated using nitrogen gas and the water pressure assembly was attached to the drill mud pump (pumping from the clean water tank). Water was then injected into the bedrock interval isolated by the packers under a constant pressure. The injection rate (flow rate) was measured by recording readings of total flow at regular time intervals. The packer tests were conducted in stages where the excess pressure was increased from 33% to 67% to 100% of P_W^{max} to a maximum pressure of 700 kPa.

Data from these tests were then analyzed to determine the hydraulic conductivity of the bedrock interval tested. The results were interpreted using the Thiem solution and the following assumptions were made:

- Steady-state condition was reached during the test;
- Laminar flow applies; and,
- Radius of influence of the test did not exceed 10 m.

The hydraulic conductivity K of the rock mass over the test zone is inferred from the field data using the following modified Thiem equation (e.g., Doe et al., 1980):

$$K = \frac{Q}{2\pi LH} \cdot \ln\left(\frac{L}{r}\right)$$

Where *K* is the hydraulic conductivity, *Q* is the flow rate (m^3/s), *L* is the vertical length of the test zone (m), *H* is the excess head applied to the test zone (m water column), and *r* is the radius of the test zone (borehole radius) (m).

3.2.2 Hydraulic Response Testing

Hydraulic response tests were conducted to evaluate bulk hydraulic conductivity of the aquifer in the vicinity of the monitoring wells. Hydraulic response tests were conducted on select monitoring wells including MW15-01D, MW15-04D, and MW15-05D.

Hydraulic response tests involve the instantaneous injection or withdrawal of a slug of water or solid cylinder of a known volume which cause a sudden change of the well water level. The slug injection causes an instantaneous increase in water level and a subsequent recovery phase during which the water level drops back to the static water level. This test is also referred to as a falling head test. In contrast, slug withdrawal causes an instantaneous drop in water level followed by a recovery phase with the water level rising back to the static water level. This test is also referred to as a rising head test. The recovery phase of the well water level is recorded by manual measurements

and/or automatic pressure transducer readings. The recovery data can then be analyzed to infer the hydraulic conductivity of the aquifer material in the vicinity of the test well.

A series of falling and/or rising head tests were conducted on all test wells if the recovery was reasonably fast (i.e., less than 30 min.). Only one or two tests were conducted on monitoring wells completed in low hydraulic conductivity formations with an associated slow recovery of the well water level during the hydraulic response test.

All hydraulic response test data were analyzed using the methods presented in Appendix D that are implemented in the software AquiferTest Pro Version 2014.1.

3.3 Groundwater Level Measurements

Groundwater levels were recorded at each monitoring well using an electronic water level sounder. Groundwater levels were measured prior to purging and sample collection during the field program.

All groundwater levels were measured relative to the top of the PVC well casing. The depth-to-water measurements were converted into piezometric elevations in m asl using the GPS survey data. However, the vertical accuracy of the GPS data is only about ±0.1 m and therefore, the derived piezometric elevations contain a similar error.

3.4 Groundwater Sampling

The groundwater monitoring wells installed at the Klaza Property were purged and sampled using field methods in accordance with internal work methods that form part of Tetra Tech EBA's Quality Management System. Specifically, the groundwater monitoring and sampling was conducted in accordance with Work Method WM4203 *Groundwater Sample Collection* which is based upon generally accepted industry best practices and is in general accordance with applicable ASTM standards. Groundwater monitoring and sampling was completed by qualified Tetra Tech EBA hydrogeologists.

Prior to sampling, the static water level was measured in each well, using an electric measuring tape. Wells were then purged and sampled using one of the following three methods:

1. **Hand bailing:** Wells were purged by removing a minimum of three well volumes (where possible) using hand bailers prior to a sample being obtained. Field parameters were recorded during purging after the first hand bail was removed and then at regular intervals until sample collection. Where groundwater recovery was observed to be very slow, a sample was collected as the water level dropped towards the base of the well. Wells that were sampled in this manner were revisited to assess whether sufficient recovery had occurred to collect a second sample (insufficient recovery had occurred in the two wells sampled in this manner prior to departure from site for a second sample to be collected).

2. **Inertial Pump:** Wells were purged by removing a minimum of three well volumes (where possible) using a Waterra inertial pump prior to a sample being obtained. Where purge rates were high and required purged volumes low (i.e. less than 15 to 20 L), up to six holding volume were purged prior to sample collection. Field parameters were recorded after approximately the first litre was purged from the well and then at regular intervals to sample collection.

3. **Low-flow Purge and Sample:** Two wells were purged and sampled using a low flow technique. This method minimises drawdown in the well and assumes that through placing the pump in or close to the screened interval and minimising drawdown, groundwater representative of the aquifer is being purged and sampled. A Geotech low flow bladder pump was used to purge the wells at rates from 0.2 to 0.3 L/min (the maximum pump rate). Wells were purged until stabilisation of field parameters was observed for a minimum period of 15 min. Tetra

Tech EBA notes that temperature and dissolved oxygen field measurements recorded during the purging of MW15-04D are likely erroneous and stabilisation was based on pH and electrical conductivity readings.

As described above, while purging, physicochemical parameters (pH, temperature, electrical conductivity, and dissolved oxygen) were measured and recorded. All field measurements were conducted in a 1 L-bottle that was also used as a flow cell. The field parameters were measured using a YSI Professional Plus Multimeter. The pH probe was calibrated using a two-point calibration with pH 7 and pH 10 calibration solutions. The electrical conductivity probe was calibrated using a one-point calibration with a 1,413 µS/cm standard. pH and electrical conductivity readings were checked every one to two days while in the field using pre-made calibration solutions and found to have drifted very little from calibrated values.

After each monitoring well was purged, samples were collected for analysis of total and dissolved metals (CCME), acidity, alkalinity, anions, dissolved organic carbon, electrical conductivity, hardness, ammonia, total phosphorus, pH, total dissolved solids, dissolved orthophosphate and total Kjeldahl nitrogen.

Each sample was labelled with the location ID, project number and the date. New, clean sample containers and appropriate preservatives for each suite of tests were provided by the laboratory. Samples were appropriately preserved in the field and the majority of dissolved metals and dissolved organic carbon samples field filtered using a 0.45 um filter (several samples that could not be filtered in the field were delivered to the laboratory unpreserved and requested that filtration be conducted as soon as possible). Samples were stored in coolers containing ice packs and delivered to the laboratory (ALS Environmental) under chain of custody control within the appropriate holding times. The ALS laboratory is an accredited ISO/IEC 17025 testing laboratory.

4.0 RESULTS AND DISCUSSION

4.1 Monitoring Well Completion

The following sections provide the completion details for the five nested monitoring wells installed as part of the 2015 field program. The monitoring well completion details are also summarized in Table 1 (attached). Well logs are included in Appendix B.

MW15-01

The drilling of MW15-01 was observed by Tetra Tech EBA on August 19, 2015 and construction of nested monitoring wells directed by Tetra Tech EBA on August 19 and 20, 2015. Monitoring well installation details are provided in Table 1 and well logs in Appendix B.

MW15-01 was drilled to a total depth of 75.9 m bgs with water elevations in the borehole observed at 73.2 and 75.9 m bgs. At both depths, the water level in the borehole stabilized at approximately at the same elevation, indicating groundwater had been intercepted.

A deep monitoring well (MW15-01D) was constructed with a 9.1 m (30 ft) screen from 66.3 to 75.4 m bgs and a shallow well (MW15-01S) was constructed with a 1.5 m (5 ft) screen from 3.1 to 4.6 m bgs.

MW15-02

The drilling of MW15-02 was observed by Tetra Tech EBA on August 18, 2015 and construction of nested monitoring wells directed by Tetra Tech EBA on August 18 and 19, 2015. Monitoring well installation details are provided in Table 1 and well logs in Appendix B.

MW15-02 was drilled to a total depth of 66.8 m bgs with water elevations in the borehole observed at 60.5, 63.6 and 66.6 m bgs. Observations of water elevations at these three depths indicated groundwater had been intercepted within this interval.

A deep monitoring well (MW15-02D) was constructed with a 9.1 m (30 ft) screen from 55.4 to 64.5 m bgs and a shallow well (MW15-02S) was constructed with a 1.5 m (5 ft) screen from 3.4 to 4.9 m bgs.

MW15-03

The drilling of MW15-03 was observed by Tetra Tech EBA on August 17, 2015 and construction of nested monitoring wells directed by Tetra Tech EBA on the same day. Monitoring well installation details are provided in Table 1 and well logs in Appendix B.

MW15-03 was drilled to a total depth of 33.2 m bgs with water elevations in the borehole observed at 29.3 and 32.3 m bgs. At both depths, the water level in the borehole stabilized at approximately at the same elevation, indicating groundwater had been intercepted.

A deep monitoring well (MW15-03D) was constructed with a 9.1 m (30 ft) screen from 21.9 to 31.0 m bgs and a shallow well (MW15-03S) was constructed with a 1.5 m (5 ft) screen from 3.2 to 4.7 m bgs.

MW15-04

The drilling of MW15-04 was observed by Tetra Tech EBA on August 15 and 16, 2015 and construction of nested monitoring wells conducted on August 16, 2015. Monitoring well installation details are provided in Table 1 and well logs in Appendix B.

MW15-04 was drilled to a total depth of 84.4 m bgs and 2 m of sand added to the base of the well. Prior to the installation of the PVC standpipe, an Archer Cathro representative advised that the incorrect well location ID had been provided to the Tetra Tech EBA field hydrogeologist. The field hydrogeologist had been advised the well was MW15-01, which had an anticipated depth to groundwater of 64 m bgs, while MW15-04 had an anticipated depth to groundwater of 35 m bgs.

In order to span the desired interval in the upper aquifer, the borehole was backfilled with bentonite pellets from 83.1 to 65.5 m bgs. A deep monitoring well (MW15-04D) was installed with a 12.2 m (40 ft) screen, spanning the interval from 51.0 to 63.2 m bgs. A shallow monitoring well (MW15-04S) was constructed with a 1.5 m (5 ft) screen spanning the interval from 3.1 to 4.6 m bgs.

MW15-05

The drilling of MW15-01 was observed by Tetra Tech EBA on August 21, 2015 and construction of nested monitoring wells directed by Tetra Tech EBA on August 21 and 22, 2015. Monitoring well installation details are provided in Table 1 and well logs in Appendix B.

MW15-05 was drilled to a total depth of 48.5 m bgs with water elevations in the borehole observed at 44.73 and 47.73 m bgs. At both depths, the water level in the borehole stabilized at approximately at the same elevation, indicating groundwater had been intercepted.

A deep monitoring well (MW15-05D) was constructed with a 9.1 m (30 ft) screen from 37.4 to 46.5 m bgs and a shallow well (MW15-05S) was constructed with a 1.5 m (5 ft) screen from 2.9 to 4.4 m bgs.

4.2 Vibrating Wire Piezometers

VWPs were installed in select exploration boreholes within the areas of the main mineralized zones. Table 4-1 summarizes the completion details of the four VWP wells with the depths of installation. Table 2 (attached) includes the VWP installation and datalogger details for quasi-continuous monitoring of piezometric elevations and subsurface temperature.

The pressure reading from the VWP was converted into a piezometric elevation based on the elevation at which the instrument was installed. The raw and reduced data from the VWPs are presented in Appendix C. Inferred piezometric elevations and measured subsurface temperatures are also summarized in Table 4-4 and further discussed in Sections 4.3 and 4.4. The depths below ground presented in Table 4-1 below should be considered approximate as the values do not take into account elevation changes between the drill collar and the actual location of the VWPs based on the azimuth and dip of the borehole.

4.3 Ground Temperatures

A ground temperature cable was installed in exploration hole KL-15-257 (also referred to as GTC15-01) to a total depth of 130 m along the hole. Table 4-2 summarizes the installation details of the groundwater temperature cable. The ground temperature measurements are presented in Table 4-3. The calibration sheet for the thermistor cable installed in GTC15-01 is included in Appendix G.

Similar to the VWPs, the depths of the thermistors below ground surface shown in Table 4-2 should be considered approximate as the values do not take into account elevation changes between the drill collar and the actual location of the thermistors based on the azimuth and dip of the borehole.

Table 4-1: Summary of vibrating wire piezometers installed at the Klaza Property

Area	VWP ID	Rockhaven Hole ID	Azimuth	Dip	Depth (m bgs)
Eastern BRX	VWP15-01	KL-15-252	35	-50	147.97
					187.90
					225.49

Figure 4-1 shows the measured ground temperatures in GTC15-01 as well as ground temperatures recorded by the VWPs in VWP15-01 through VWP15-05 (cf. Table 4-3 and Appendix C for temperature data). The observed ground temperatures suggest that permafrost exists at all six well locations indicated by ground temperatures below 0°C. However, the permafrost thickness appears variable throughout the site depending on the location of the observation well, elevation and slope aspect. All observation wells are situated above tree line in areas with similar vegetation cover.

Table 4-4 summarizes the approximate depth to the base of permafrost at the different well locations. The depth to the base of permafrost ranges from about 50 to 150 m bgs at VWP15-04 and VWP15-01, respectively. Table 4-4 and Figure 4-2 suggest that the permafrost thickness is mainly controlled by elevation indicated by the significant correlation between elevation and permafrost thickness. Slope aspect also seems to affect permafrost thickness which is suggested by the fact that locations at a similar elevation show larger permafrost thickness on north-facing slopes (Figure 4-2).

The time series of ground temperature measurements from the thermistor cable in GTC15-01 and the VWPs in VWP15-01 through VWP15-04 consistently show decreasing temperatures over time. This is likely due to thermal disturbance due to drill water usage and heat generated by the curing of the cement-bentonite grout used for well completion. The last set of temperature readings were taken about six to nine weeks after installation. The ground temperatures should have mostly equilibrated during this period of time; however, additional measurements are required to determine the undisturbed ground temperatures at the site.

The ground temperatures observed at the various locations across the Klaza Property also allow the local geothermal gradient to be inferred. Especially the VWPs that were installed to depths of about 285 m bgs can be used to estimate the geothermal gradient at larger depth. All four VWP wells indicate a very similar geothermal gradient indicated by a similar slope of the ground temperature profiles shown in Figure 4-1 (right-hand graph). The inferred geothermal gradient at the Klaza Property is about 25°C per km of depth which is a typical average continental crust geothermal gradient.

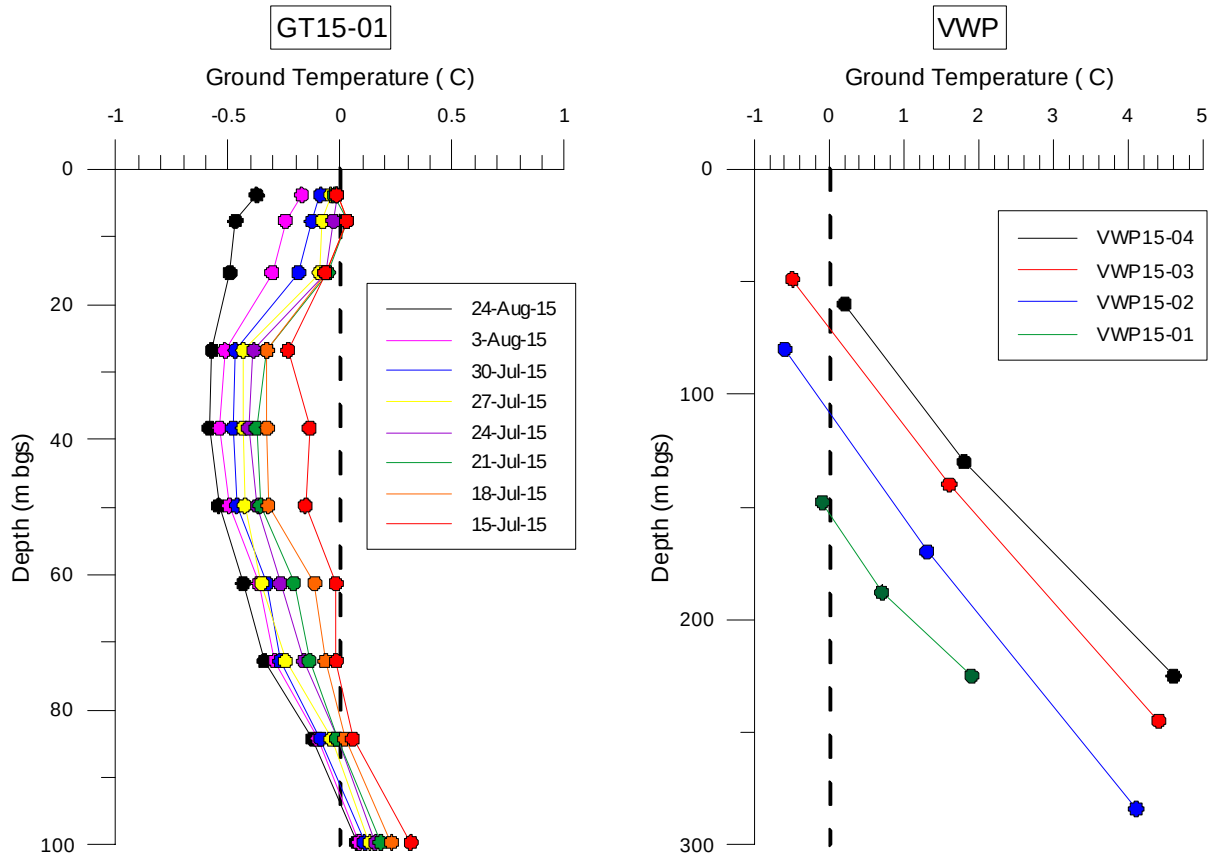

Figure 4-1: Ground Temperature Profiles

Table 4-4: Depth of base of permafrost relative to location, elevation, and slope aspect

Well ID	Easting	Northing	Elevation	Slope Aspect	Depth of Base of Permafrost	Elevation of Base of Permafrost
	m	m	m asl		m bgs	m asl
GTC15-01	382824	6890304	1360	NE	94	1266
VWP15-01	382739	6889158	1441	SW	153	1288
VWP15-02	382624	6890299	1367	N	108	1259

VWP15-04	381695	6889914	1303	WNW	50	1253

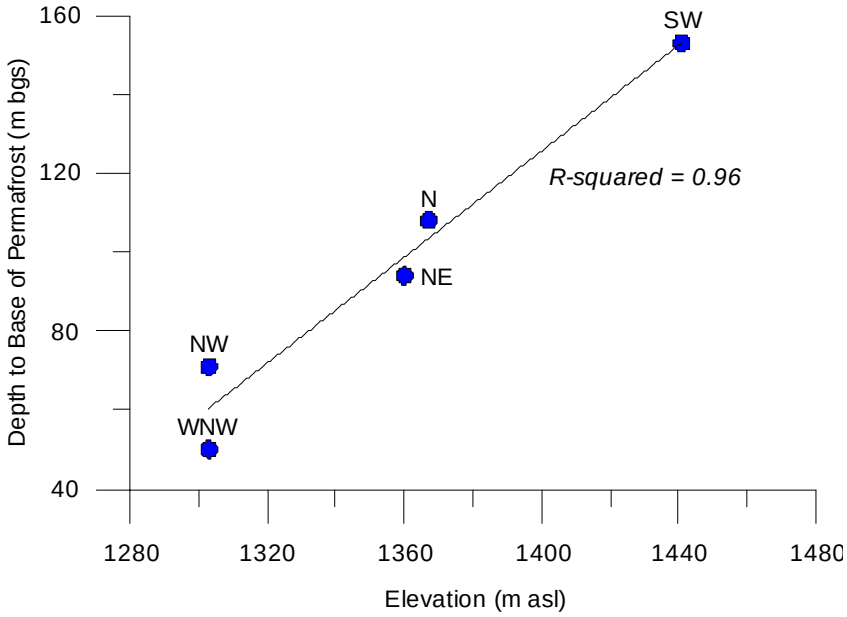

Figure 4-2: Correlation between permafrost thickness and elevation and slope aspect. The data point labels indicate the slope aspect at each observation well location.

4.4 Inferred Piezometric Elevations

Groundwater piezometric elevations were inferred from the pore pressure measurements with the VWPs and direct measurements of the depth to groundwater in the five nested monitoring wells. The inferred piezometric elevations for the bedrock aquifer at the Klaza Property are presented in Table 1 (attached) and Appendix C, and summarized in Table 4-5 below.

The pore pressure measured by the VWPs is usually significantly affected by the disturbance due to drilling and grouting of the observation well and depending on the permeability of the formation and grout it may take a considerable period of time for the pore pressures to re-equilibrate. The observed pore pressure readings form the VWPs (see Appendix C) suggest that the pore pressures have mostly returned to pre-disturbance conditions. However, additional readings from the VWPs are required to verify this observation.

The shallow monitoring wells MW15-01S through MW15-05S were installed within the anticipated active zone (zone of seasonal thawing above permafrost) in overburden or shallow bedrock where the overburden was absent or very thin. The piezometric elevations measured in the shallow monitoring wells therefore reflect shallow perched groundwater within the active zone. Groundwater flow within the active zone mostly depends on local topography and thickness of the active layer. Piezometric elevations observed in the shallow monitoring wells are summarized in Table 4-6.

As discussed in Sections 3.1.1 and 3.3, the vertical accuracy of the monitoring well elevation survey is only about ±0.1 m leading to a similar uncertainty of the derived groundwater elevations. Given the relatively steep topography at the site and large piezometric elevation differences (on the order of tens of metres) between monitoring well locations, an error of ±0.1 m would not affect the inferred groundwater flow regime significantly. However, we recommend that the monitoring wells be properly surveyed with an accuracy of about ±1 cm.

Table 4-5: Piezometric elevations inferred for the bedrock aquifer at the Klaza Property.

Well ID	Easting	Northing	Elevation	Depth to Groundwater	Piezometric Elevation	Vertical Hydraulic Gradient (positive down / negative up)
	m	m	m asl	m bgs	m asl	m/m
MW15-01D	383413	6888610	1318.00	17.79	1300.21	-
MW15-02D	383355	6890004	1345.38	59.00	1286.38	-

4.5 Hydraulic Well Testing

The following sections present the results of the hydraulic well tests conducted to infer the hydraulic conductivity of the bedrock aquifer at the Klaza Property.

4.5.1 Packer Testing Results

This section presents the results of the packer tests that were employed to collect preliminary data for determining the bedrock hydraulic conductivity in the areas of the main mineralized zones at Klaza. The results of the individual packer tests are presented in Table 3 (attached). The raw data for each packer test are included as Appendix E.

The packer tests were conducted at selected depth intervals deemed representative for both intersected bedrock sequences and structural features encountered as observed in the drill core. All test intervals were chosen over intervals expected to be below the groundwater table.

To assess the validity of the packer test data with respect to the assumptions implied by the analytical method of Thiem for inferring the aquifer hydraulic conductivity, the observed flow rate is plotted against the injection pressure for each pressure step (Figure 4 to Figure 7, attached). Ideally the flow rate should increase linearly with increasing injection pressure. However, deviation from the linear behaviour is often observed in packer test data and can be caused by a variety of reasons including, but not limited to, the following:

- Washing out of gouge material from fractures causing increased permeability;
- Fracture dilation or hydraulic fracturing due to excessive pressure;
- Clogging of fractures by transported material with a decrease in permeability; and,
- Turbulent (non-Darcian) flow due to excessive flow rate.

Table 4 (attached) summarizes the results of the diagnostic plot analysis and presents a data quality assessment. Packer tests with ideal linear flow behaviour are likely to result in reliable estimates of hydraulic conductivity using the method presented in Section 3.2.1. Moderate quality data will likely still result in reasonable estimates of hydraulic conductivity but should be used with some caution. Poor quality data with non-linear flow behaviour should be interpreted cautiously and may not result in reasonable estimates of hydraulic conductivity.

Table 3 presents the inferred hydraulic conductivities for each packer test. The inferred hydraulic conductivities range from about 4×10^{-10} m/s to about 3×10^{-6} m/s which are typical values for fractured bedrock (e.g., Freeze and Cheery, 1979).

Based on the observed ground temperatures from the VWPs, some of the packer tests were completed within the inferred permafrost zone (see highlighted cells in Table 3). The results from these tests may not be representative of the actual hydraulic conductivity of the frozen rock formation within the test interval as the test data may be affected by a thawed zone around the borehole when the hydraulic conductivity should be essentially zero. However, given the relatively warm temperatures of more than about -0.6°C observed within the inferred permafrost zone, it is also possible that unfrozen mineralized groundwater exists within the permafrost zone due to the freezing point depression caused by the water's salinity and in situ pressure (see Section 5.3 for further discussion). In the latter case the packer test results would indeed be representative of the bedrock hydraulic conductivity within the test interval.

Archer Cathro also logged all drill core for some basic geotechnical parameters, including Recovery and Rock Quality Designation (RQD). Both Recovery and RQD are related to the degree of fracturing of the bedrock and therefore potentially to the permeability as well. Figure 8 (attached) shows the inferred hydraulic conductivities from packer tests along with the Recovery and RQD values. However, there is no clear correlation between the inferred hydraulic conductivities and Recovery or RQD.

Figure 4-3 shows the inferred hydraulic conductivities as a function of depth. Typically, hydraulic conductivities decrease with depth as a result of increased pressure due to the overlying rock mass and the associated closure of permeable features such as joints and faults. However, this behaviour is not clearly observable in the data shown in Figure 4-3. This may be explained by dominant horizontal heterogeneity with the higher hydraulic conductivities being observed in areas with highly fractured rock or permeable fault zones.

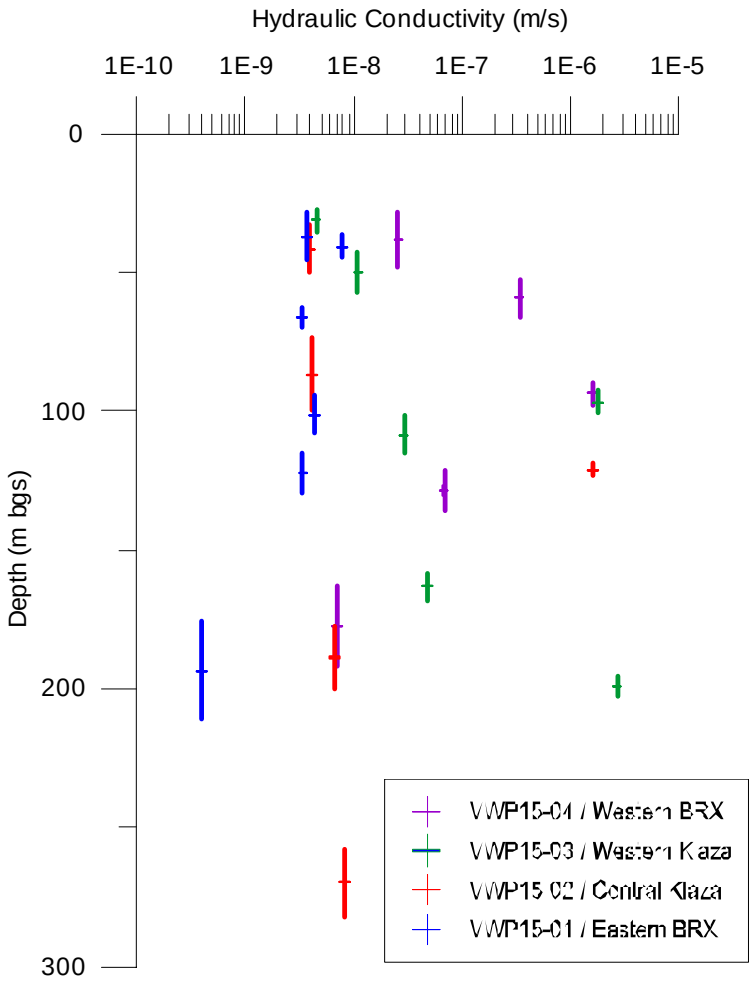

Figure 4-3: Hydraulic conductivities inferred from packer tests vs. depth

4.5.2 Hydraulic Response Testing Results

Hydraulic response tests were conducted on monitoring wells MW15-01D, MW15-04D, and MW15-5D to infer the hydraulic conductivity of the bedrock aquifer in the vicinity of the monitoring wells. Multiple tests were conducted on each monitoring well to confirm the test results and reduce uncertainty if the recovery was sufficiently fast. Only one or two tests were conducted on monitoring wells that exhibited a very slow recovery. However, all hydraulic response tests conducted on slow recovery wells produced suitable response data and Tetra Tech EBA therefore deems the inferred hydraulic conductivities reliable.

Table 4-7 summarizes the hydraulic response test results for each individual monitoring well. The hydraulic response test data and detailed analysis are included in Appendix D.

The inferred hydraulic conductivities agree reasonably well with the results from the packer tests discussed in Section 4.5.1. Monitoring wells MW15-01D and MW15-05D showed a very similar hydraulic conductivity of 9×10^{-6} m/s, indicating that both wells are completed in relatively permeable zones of the bedrock aquifer. Monitoring well MW15-04D, however, yielded a much lower hydraulic conductivity of 2×10^{-8} m/s, more similar to most of the packer testing results.

Table 4-7: Hydraulic response test results

Well ID	Test Type	Inferred Hydraulic Conductivity	
		Individual Test Results	Geometric Mean
		m/s	
MW15-01D	Falling Head Test 1	9E-06	9E-06
	Rising Head Test 1	1E-05	
	Falling Head Test 2	8E-06	
	Rising Head Test 2	9E-06	
	Falling Head Test 3	1E-05	
	Rising Head Test 3	1E-05	
MW15-04D	Falling Head Test 1	2E-08	2E-08
	Rising Head Test 1	4E-08	
	Falling Head Test 2	6E-09	
MW15-05D	Falling Head Test 1	8E-06	9E-06
	Rising Head Test 1	1E-05	
	Falling Head Test 2	9E-06	
	Rising Head Test 2	8E-06	

4.6 Groundwater Quality

The following sections present the results of the first groundwater monitoring event conducted following the monitoring well installation in August 2015. The laboratory analytical results of the monitoring event are summarized in Table 5 (attached). The laboratory report is included in Appendix F.

4.7 Quality Assurance and Quality Control (QA/QC)

A summary of the QA/QC procedures implemented for the groundwater monitoring program to ensure the validity of the data set is provided in Table 4-8. Sample duplicate results and relative percent differences (RPD) are presented in Table 6 (attached).

Table 4-8: Groundwater monitoring QA/QC

QA/QC Aspect	Evidence and Evaluation
Sample Integrity	All samples were collected in new sample bottles provided by the laboratory (ALS, Whitehorse). All preservatives were also provided by the laboratory. The samples were shipped on ice with a Chain of Custody immediately following the completion of the fieldwork.
Holding Times	All samples were received by the laboratory within appropriate holding times with the following exception: • pH: holding time of 15 min was exceeded; however, pH was also measured in the field • Nitrate/nitrite: holding time of 3 days was exceeded for separate analysis of nitrate and nitrite. However, nitrate+nitrite were also measured as a combined parameter within the appropriate holding time of 28 days.
Field Procedures	Monitoring wells were sampled using a submersible bladder pump or dedicated Waterra inertial pump. Field parameters were monitored while purging and samples were taken when field parameters were stabilized to ensure a representative sample was obtained.
Calibration of Field Equipment	Calibration of field equipment was undertaken regularly during fieldwork. • pH: two-point calibration with pH7 and pH10 calibration solutions • Electrical conductivity: one-point calibration with a 1,413 µS/cm standard
Ion Balance	To evaluate the quality of the analysis the ion balance for each sample was calculated, i.e., the balance between sum of anion and cation equivalent charges. Usually, an ion balance of within (0±10)% is considered satisfactory. The calculated ion balances vary from -5.4% to 2.7% (see Table 5), i.e., the ion balance for all samples is within (0±10)%. This suggests that analytical errors are within acceptable limits and all major cations and anions were included in the analyses.
Blind Duplicate	One blind duplicate sample was collected from MW15-05 (d) during the August 2015 monitoring program. Most duplicate results showed relative percent difference (RPD) of less than 30% when compared to concentrations measured in the respective sample from the same monitoring well for all concentrations greater than five times the method detection limit. The only exceptions are Total Kjeldahl Nitrogen with a RPD value of 51% and Dissolved Aluminum with an RPD value of 71%. The differences between the sample and duplicate for these two parameters are unknown and the results for Total Kjeldahl Nitrogen and Dissolved Aluminum should therefore be considered potentially unreliable. The RDP values for both duplicate samples collected are presented in Table 5.
Laboratory Internal QA/QC	Laboratory internal QA/QC is detailed within the laboratory reports (Appendix F). The laboratory showed acceptable testing frequency and results for method blanks, laboratory duplicates and matrix spikes.
Laboratory Detection Limit	Laboratory reports indicate that the method detection limits were lower than the respective assessment criteria for most parameters, with the exception of Mercury where the method detection limit of 0.025 µg/L was slightly higher than the Federal Interim Groundwater Guideline of 0.016 µg/L.
Validity of Data Set	The data quality review indicates no significant systematic errors in the data collection or analysis process for groundwater and therefore, the data set used as the basis for the groundwater assessment is considered valid and complete.

4.8 General Groundwater Chemistry

In general, the chemical composition of groundwater depends on the local and upgradient aquifer lithologies. As groundwater flows through an aquifer it assumes and continuously evolves a characteristic chemical composition due to interaction with the aquifer matrix. As such a groundwater sample represents the local and upstream aquifer conditions, and its composition is a function of aquifer lithology, solution kinetics, water residence time, mixing, and groundwater flow patterns.

A summary of the analytical results of the groundwater chemistry at the Klaza Property is provided in Table 5. The analytical results suggest that groundwater within the project area has relatively low to moderate concentrations of total dissolved solids (TDS) ranging from 167 to 401 mg/L. The pH values ranged from 6.81 to 8.05. Hardness values ranged from 62 to 327 mg/L. Field measured dissolved oxygen concentrations ranged from 0.5 to 6.7 mg/L. Groundwater temperatures ranged from 0.8 to 3.1°C.

4.9 Major Ion Chemistry

The groundwater samples can be classified based on their major ion chemical composition, taking into account all major anions and cations exceeding 10 meq-%[1]. The water type or hydrochemical facies is determined by listing the ions with concentrations greater than 10 meq-% in decreasing order (cations are listed first). Figure 4-4 shows a trilinear Piper Plot illustrating the major ion chemistry and hydrochemical facies for all groundwater samples collected. The water type and major ions for each sample are also presented in Table 5.

The dominating cations in the groundwater were found to be calcium and magnesium. The samples obtained from monitoring wells MW15-04D and MW15-05S also contained significant amounts of sodium in addition to calcium and magnesium. The dominating anions within the groundwater were found to be bicarbonate and sulphate. Sample from the shallow monitoring wells are mostly dominated by bicarbonate whereas samples from the deeper monitoring wells tend to contain more sulphate (see Figure 4-4).

In general, the major ion chemistry is relatively similar for the samples collected from both shallow and deep monitoring wells and do not show any clear differences between the two aquifers.

4.10 Comparison with Applicable Regulatory Water Quality Guidelines

Groundwater quality results were compared with the following regulatory guidelines and standards:

- Yukon CSR Schedule 3, Generic Numerical Water Quality Standards for Aquatic Life (CSR-AW) (Yukon Environment Act, Contaminated Sites Regulation, 2002).
- Federal Interim Groundwater Quality Guidelines for Commercial and Industrial Land Uses and Protection of Freshwater Aquatic Life (FIG) (Environment Canada, 2012).
- Canadian Council of Ministers of the Environment (CCME) Canadian Water Quality Guidelines for the Protection of Freshwater Aquatic Life (CCMW-AW) (CCME, 1999). It is important to note that these guidelines only apply to surface water and are only used for reference herein. Hence, exceedances of the CCME-AW guidelines are highlighted in Table 5 (grey-shaded cells) but not further discussed below.

The Yukon CSR AW standards and FIG guidelines apply to dissolved metals rather than total metals. This is also in accordance with general industry practice of using dissolved rather than total metals to characterize groundwater

[1] The unit meq-% represents the percentage of cations and anions calculated from their milliequivalents per litre (meq/L). The unit meq/L is the molar concentration multiplied by the charge of the ions.

quality. Total metal concentrations are often dependent on well completion, well development and sampling method and are typically less representative of in situ groundwater quality. Dissolved metals were therefore used for comparison with the applicable regulatory water quality standards and guidelines.

All exceedances of the aforementioned water quality standards and guidelines are discussed in more detail below and highlighted in Table 5.

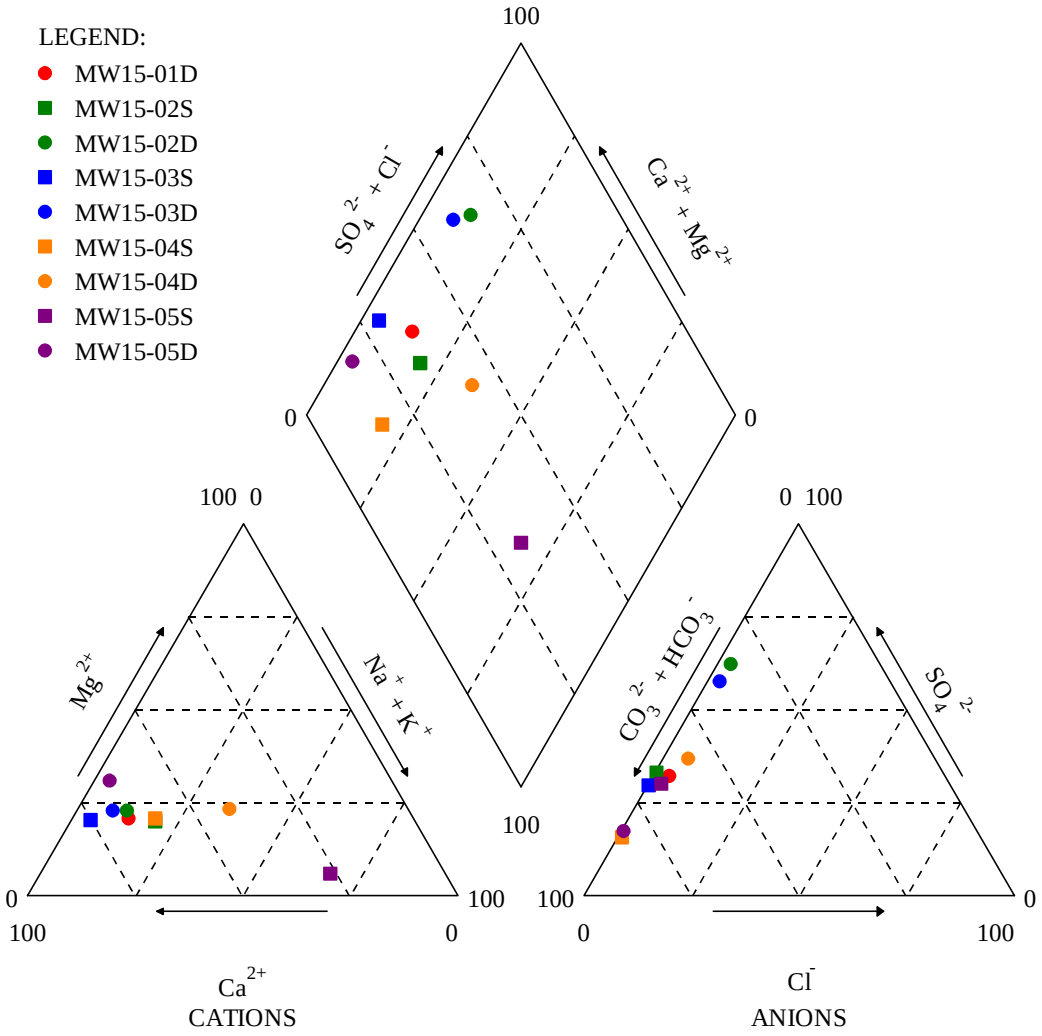

Figure 4-4: Trilinear Piper Plot illustrating the major ion composition of the groundwater samples collected at the Klaza Property.

Routine Parameters, Major Ions and Nutrients

The fluoride concentration in the samples collected from MW15-01D (333 µg/L), MW15-04D (246 µg/L) and MW-15-05S (201 µg/L) slightly exceeded the FIG guideline of 120 µg/L. The samples from MW15-03S (104 mg/L) and MW15-03D (138 mg/L) also slightly exceeded the FIG guideline for sulphate of 100 mg/L.

Dissolved Metals

The review of the analytical results for dissolved metals revealed exceedances for aluminum, cadmium, copper, iron, lead, selenium, silver, and zinc for the FIG guidelines. The cadmium concentration also exceeded the CSR AW standard in some samples.

The FIG guideline for **Aluminum** of 50 µg/L was exceeded by samples from MW15-01D, MW15-02D, MW15-03D, MW15-04S, MW15-04D, and MW15-05S.

Cadmium concentrations showed the most significant exceedances of the FIG and CSR-AW guidelines. All samples exceeded the FIG guideline of 0.017 µg/L. Samples from MW15-01D, MW15-02S, and MW15-02D also exceeded the CSR-AW standard of 0.3-0.6 µg/L (standard varies with hardness). Based on the preliminary results of this first round of groundwater samples it appears that groundwater across the Klaza property contains elevated concentrations of cadmium.

The FIG guideline for **Copper** of 2 µg/L was slightly exceeded by samples from MW15-01D, MW15-02S, MW15-02D, MW15-03D, and MW15-05S.

The **Iron** concentration in MW15-01D, MW15-02D, and MW15-05S slightly exceeded the FIG guideline of 300 µg/L. However, iron concentrations often exceed water quality standards in groundwater under reduced chemical conditions.

The **Lead** concentration in samples MW15-01D and MW15-05S exceeded the FIG guideline.

The **Selenium** and **Silver** concentrations in MW15-01D both exceeded the FIG guidelines.

The FIG guideline for **Zinc** of 10 µg/L was exceeded by samples from MW15-02S, MW15-02S, MW15-03S, and MW15-03D.

As summarized above, all groundwater samples collected at the Klaza Property exceeded a minimum of two FIG guidelines and three of the wells also exceeded the CSR-AW standard for cadmium. MW15-01D showed the most exceedances; however, there is no obvious spatial trend or difference between the shallow overburden and deeper bedrock aquifer with respect to exceedances of water quality guidelines.

Continued seasonal monitoring of the groundwater quality at the Site will indicate whether the above exceedances can be established as persistent natural exceedances of the water quality guidelines or whether some of them may only be isolated exceedances.

5.0 PRELIMINARY CONCEPTUAL HYDROGEOLOGICAL MODEL

The preliminary conceptual hydrogeological model is intended to conceptually describe the existing local hydrogeological conditions in the area of the main mineralized zones at Klaza with respect to groundwater flow and groundwater quality. The conceptual model is based upon information gathered during the 2015 hydrogeological field program and data interpretation, along with other pertinent geological information available for the Klaza Property.

5.1 Hydrostratigraphy

The local hydrogeological system in the area of the main mineralized zones primarily consists of a bedrock aquifer which is overlain and likely confined by permafrost. Based on the current level of subsurface information for the site, for the purpose of this preliminary hydrogeological assessment, we assume that the bedrock aquifer consists of one aquifer. Even though this assumption is simplistic it is further supported by the fact that the bedrock aquifer consists of the same lithology (granodiorite) throughout the site. Hydraulic conductivities inferred from packer tests do not show any significant correlation with depth and therefore, do not suggest stratification of the aquifer based on a decrease in hydraulic conductivity with depth, at least not within a depth of about 200 m bgs. Furthermore, interpolation of the observed groundwater elevations indicates a groundwater flow regime that agrees with anticipated groundwater flow directions based on the topography and therefore also supports the hypothesis of one hydraulically connected bedrock aquifer.

For this preliminary assessment, we further assume the regional groundwater flow divides to coincide with surface water divides. From first principles, groundwater flows from areas of higher piezometric elevations to lower piezometric elevations. Groundwater recharge occurs at higher elevations with the groundwater ultimately discharging to surface water bodies at lower elevations in the valleys. The presence of extensive permafrost may, however, reduce infiltration of surface water and therefore recharge to the bedrock aquifer below.

5.1.1 Overburden Aquifer

Overburden in the area of the main mineralized deposits mostly include a thin blanket of colluvium above shallow bedrock. Shallow perched groundwater seasonally exists in the overburden within the active layer above permafrost. Shallow groundwater in overburden was observed during the August 2015 field program in the following monitoring wells: MW15-02S, MW15-03S, and MW15-05S. The overburden encountered in MW15-01S was dry at the time of monitoring and overburden was very thin (about 1.4 m) at MW14-04S with only about 0.3 m of water above bedrock.

5.1.2 Bedrock Aquifer

The bedrock aquifer underlying the Klaza Property mainly consists of granodiorite locally intersected by quartz-feldspar porphyry dykes. Groundwater flow in bedrock aquifers predominantly occurs in secondary pore space (fractures and fault zones) as primary porosity is usually very small, or essentially non-existent as in the case of magmatic rocks like the granodiorite encountered at Klaza. Bedrock aquifers therefore typically act like confined aquifers. In general, groundwater flow in fractured rocks is complex and can vary greatly in direction and rate, depending on the local hydrogeological and structural geological conditions. Transmissivity values can change over several orders of magnitude within the same rock mass over short distances (scale of metres), and groundwater flow may be largely controlled by a few conductive fractures or other rock mass discontinuities.

Packer test results vary over several orders of magnitude, ranging from about 4×10^{-10} m/s to about 3×10^{-6} m/s. Packer test results are only representative for the short discrete test intervals and the immediate vicinity of the wellbore. Single features like fractures, faults, or shear zones can significantly affect and dominate the hydraulic

conductivity of the test interval. This explains the relatively large variability of inferred hydraulic conductivities. The geometric mean of 2×10^{-8} m/s for all packer tests conducted provides a reasonable average hydraulic conductivity for the shallow bedrock aquifer at Klaza to depths of about 200 m bgs.

5.2 Groundwater Flow Regime

The groundwater flow regime can be inferred from observed piezometric elevations as groundwater generally flows from areas with higher piezometric elevations to areas with lower piezometric elevations.

Figure 3 (attached) shows the preliminary inferred piezometric elevation contours for the bedrock aquifer based on the August 2015 monitoring event. The Kriging method was used to interpolate the observed piezometric elevations at the various observations points (MW15-01D through MW15-05D and VWP15-01 through VWP15-04). Based on the topographic characteristics of the area with mountainous terrain it can be assumed that the groundwater flow regime is mainly controlled by the area's topography.

In general, groundwater flow is from the upland areas at higher elevation on the mountain top and slopes toward the discharge zones in the valley bottoms. The groundwater flow direction is from the highest elevations at the Klaza Property near the exploration camp toward the west, north and east (see Figure 3).

The inferred horizontal hydraulic gradient is variable throughout the site ranging from less than 0.01 in the Central BRX area to more than 0.08 in the Western Klaza and Eastern BRX area with steeper topography. The vertical hydraulic gradient can also be inferred based on the VWP readings at three different depths in each VWP observation well (VWP15-01 through VWP15-04). Figure 5-1 illustrates the piezometric elevations observed in each well. The inferred piezometric elevations indicate a vertical downward gradient in each observation well ranging from 0.03 in VWP15-01 to 0.09 in VWP15-02 (see Table 4-5).

The average horizontal linear groundwater flow velocity can be estimated using a modification of Darcy's Law:

$$v = K \cdot i \cdot n^{-1}$$

where *v* is the groundwater flow velocity (m/s), *K* is the hydraulic conductivity of the aquifer (m/s), *i* is the hydraulic gradient (m/m), and *n* is the effective porosity of the aquifer material (–).

Using an average bulk hydraulic conductivity of 2×10^{-8} m/s (geometric mean of all packer tests conducted; cf. Section 4.5.1), a mean hydraulic gradient of 0.02, and assuming a fractured bedrock equivalent porosity of 1% (e.g., Freeze and Cheery, 1979), the resulting average linear groundwater flow velocity is 4×10^{-8} m/s or 1.3 m/year.

It should be noted that local groundwater flow velocities can be much larger or smaller based on the local aquifer hydraulic conductivity and hydraulic gradient. For examples, permeable faults can form preferential flow paths for groundwater with significantly higher flow velocities than the estimate above.

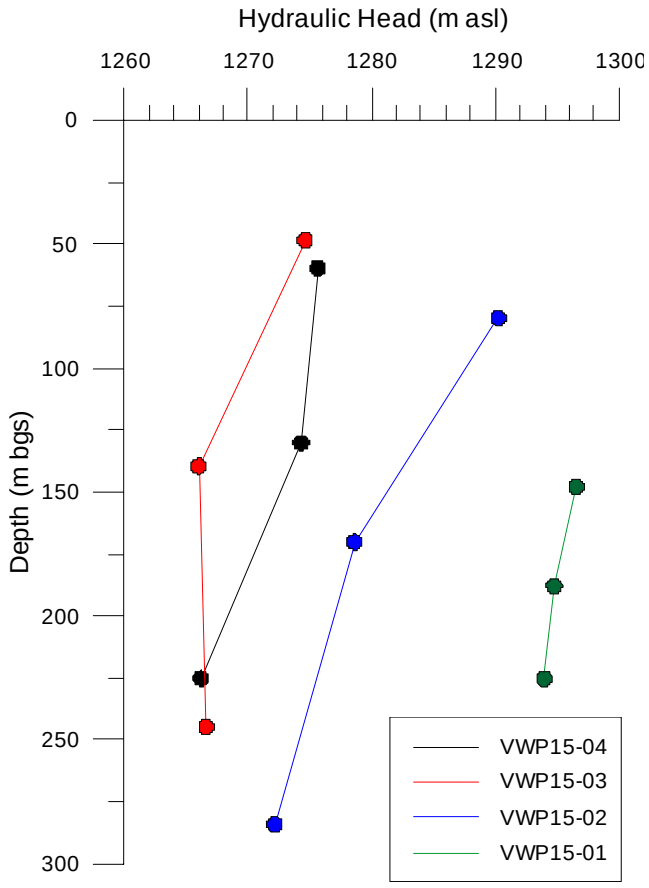

Figure 5-1: Piezometric elevations (hydraulic heads) inferred from pore pressure measurements using VWPs. All observations wells showed a vertical downward hydraulic gradient. All measurements were taken on August 22 and 23, 2015.

5.3 Permafrost

The results of this preliminary hydrogeological assessment along with other pertinent information for the area of the Klaza Property indicate that the site is located in an area with widespread discontinuous permafrost. Permafrost has been encountered in all VWP observation wells (VWP15-01 through VWP15-04) as well as in GTC15-01. The inferred permafrost thickness is variable and ranges from about 50 to 150 m, depending on elevation and slope aspect. Permafrost seems to be most extensive at higher elevations as well as north- and west-facing slopes. It should be noted that all ground temperature observation wells (VWP15-01 through VWP15-04 and GTC15-01) were completed at collar elevations above 1,300 m asl. It is likely that permafrost is less extensive or possibly absent at lower elevations near the valley bottoms and on south- and east-facing slopes.

All permafrost observed at the site showed ground temperatures of more than -0.6°C indicating that the permafrost in the area investigated can be considered ‘warm permafrost’. Warm permafrost typically remains just below 0°C (and above -1°C) and is generally susceptible to thawing and degradation. The ‘warm’ sub-zero ground temperatures within the permafrost zone are unusual given the inferred permafrost thickness of up to 150 m. However, this observation has to be confirmed with additional ground temperature measurements at GTC15-01 and VWP15-01 through VWP15-04. As stated above (cf. Section 4.3), it is possible that the ground temperatures

have not fully re-equilibrated to pre-disturbance conditions and that the actual ground temperatures are lower than those observed in August 2015.

Based on the observed piezometric elevations and inferred depth of permafrost from ground temperature measurements, it appears that the piezometric surface is situated within the permafrost zone in most areas of the site. This is likely due to the fact that the permafrost is acting as a confining layer above the sub-permafrost groundwater. However, given the 'warm' permafrost temperatures it is also possible that unfrozen groundwater exists within the permafrost zone due to the freezing point depression caused by the groundwater's salinity and pressure. Additional ground temperature measurements are required to confirm the undisturbed ground temperature profile and inferred extent of permafrost at the site.

There also remains some uncertainty with respect to the permafrost thickness at lower elevations. As stated above, all ground temperature observation wells were installed at elevations of more than about 1,300 m asl whereas the monitoring wells were mostly installed at slightly lower elevations downgradient of the mineralized zones. The fact that all monitoring wells recovered during well development and sampling suggests that all monitoring wells were successfully installed below the base of permafrost. Especially monitoring wells MW15-01D, MW15-04D and MW15-05D recovered relatively quickly and are very likely completed within the sub-permafrost aquifer (assuming permafrost exists at these locations). Continued monitoring will show if and at what depths the monitoring wells may freeze which would indicate the extent of permafrost at the locations of the five monitoring wells.

5.4 Hydrogeochemistry

The chemical composition of groundwater in bedrock strongly depends on the local and upgradient aquifer lithologies. As groundwater flows through the aquifer, it assumes and continuously evolves a characteristic chemical composition due to interaction with the aquifer matrix. As such, a groundwater sample represents the local and upstream aquifer conditions, and its composition is a function of aquifer lithology, solution kinetics, water residence time, mixing, and groundwater flow patterns.

All groundwater samples collected at the Klaza Property exhibited a similar hydrogeochemical composition with slight differences between samples due to sample location. All groundwater samples are of a calcium and/or magnesium dominant cation type, and bicarbonate and/or sulphate anion type. The groundwater shows a low to moderate mineralization and near neutral pH. Groundwater from the deeper monitoring wells completed within the sub-permafrost bedrock aquifer tend to be more dominated by sulphate whereas groundwater from the shallow active layer is more bicarbonate dominated. Beyond the anion composition, the groundwater samples from both aquifers are characterized by a very similar chemical composition.

Generally, all samples showed at least two exceedances of FIG guidelines for routine parameters or dissolved metals. The cadmium concentration in groundwater appears to be elevated across the site exceeding the FIG guideline in all samples and the CSR-AW standard in three of the samples collected.

5.5 Groundwater – Surface Water Interaction

Groundwater flow in the area of the mineralized zones is generally controlled by topography and groundwater divides are assumed to coincide with surface water divides. Groundwater is being recharged at higher elevations on the mountain slopes in areas where permafrost is absent or where the ground temperature is high enough to allow water flow. Groundwater generally flows down-valley mimicking the local topography. The groundwater eventually discharges to the receiving streams along the valley bottoms.

Groundwater originating from the area of the mineralized zones likely discharges into Klaza River to the north, Summit Creek to the southeast, and the Klaza River tributary to the west of the site.

The amount of baseflow, i.e., groundwater seepage into the creeks, depends on the hydraulic gradient and hydraulic conductivity of the shallow aquifer in the vicinity of the receiving stream. In general, the fraction of baseflow in the creek will be much larger in the winter when there is little or no surface runoff or shallow subsurface runoff (also referred to as interflow). The (late) winter creek discharge usually provides a good estimate of the baseflow as it amounts to nearly 100% of the total discharge observed during this time of the year.

We understand that seasonal surface water data have been collected for the Klaza project; however, no surface water data have been provided to Tetra Tech EBA. A more detailed assessment of groundwater-surface water interaction is therefore not possible at this time.

6.0 SUMMARY AND CONCLUSIONS

Based on the results of the monitoring well drilling and completion, and the preliminary hydrogeological assessment presented in this report, Tetra Tech EBA arrived at the following conclusions:

- A preliminary monitoring well network was successfully installed at the Klaza Property with monitoring well locations downgradient of the main mineralized zones, including Western and Central Klaza, and Western, Central, and Eastern BRX.
- One shallow monitoring well and one deep monitoring well were installed at each location consisting of 1.25-inch diameter PVC standpipes.
- In addition to the monitoring wells, four observations wells were installed with VWPs to monitor pore pressures at three different depths in each of the observation wells. The VWP observations wells were installed within the areas of the main mineralized zones, including Western and Central Klaza, and Western, Central, and Eastern BRX.
- Ground temperatures and permafrost conditions were assessed using subsurface temperature data from the VWPs and one thermistor cable installed in GTC15-01 in the area of the Central Klaza zone.
- Permafrost appears to act as a confining layer for the deeper bedrock aquifer. However, some uncertainty remains with respect to the permafrost temperature, extent, and interaction with groundwater that requires further data collection.
- The groundwater flow regime at the site is controlled by the steep terrain with groundwater flow from areas at higher elevations on the mountain slopes toward the valley bottoms with the groundwater flow generally mimicking the local topography.
- Hydraulic conductivities of the granodiorite bedrock aquifer were inferred from packer tests conducted in all four VWP observation wells and hydraulic response tests conducted in select monitoring wells. Inferred hydraulic conductivities ranged over several orders of magnitude from about 4×10^{-10} m/s to 1×10^{-5} m/s with an average hydraulic conductivity of 2×10^{-8} m/s. Hydraulic conductivity in bedrock is inferred to be largely controlled by fracture density and permeability.
- Groundwater samples for chemical analysis were collected from all monitoring wells in August 2015. The results show a similar hydrogeochemical composition with slight differences between samples due to sample location. All groundwater samples are of a calcium and/or magnesium dominant cation type, and bicarbonate and/or sulphate anion type.
- All groundwater samples, including those collected in the area of the ore deposit, showed a near neutral to slightly basic pH (between 7 and 8).
- Comparison of the groundwater chemistry results showed several natural exceedances of the FIG guidelines. Exceedances included sulphate, fluoride, and the dissolved metals aluminum, cadmium, copper, iron, lead, selenium, silver, and zinc. The dissolved cadmium concentrations also exceeded the less stringent CSR-AW standard in three of the samples.

7.0 RECOMMENDATIONS

The purpose of this preliminary hydrogeological assessment was to initiate the collection of hydrogeological information in the area of the main mineralized zone at the Klaza Property. However, additional data collection will be required to satisfy the requirements under YESAA and the Yukon Waters Act if the project moves ahead toward the environmental assessment and approval process. The hydrogeological information collected as part of the preliminary hydrogeological assessment and presented in this report will be very useful for the design of a comprehensive hydrogeological baseline and effects assessment that will form part of the environmental assessment. The information will also be useful for mine design purpose and should form the basis for additional hydrogeological data collection that may be required for geotechnical and mine engineering purpose.

Tetra Tech EBA makes the following recommendations for further hydrogeological assessment at Klaza:

- Seasonal groundwater monitoring should be continued for the existing monitoring and observation wells. A minimum of one year of baseline groundwater data will be required for a project proposal submission under YESAA to assess seasonal changes in groundwater quality and quantity. A future Type A Water Licence application will require a minimum of two consecutive years of baseline data.
- All monitoring wells should be surveyed for their location and elevation of the top of the PVC casing in the summer of 2016 with an accuracy of about ±1 cm or better.
- Given the inferred extent of permafrost at the site, a thorough understanding of the interaction between permafrost and groundwater will be a critical aspect of the hydrogeological baseline characterization at the site that is required for the environmental assessment and regulatory approval process as well as mine engineering purpose. We therefore recommend collecting additional ground temperature and hydrogeological data from the existing observation and monitoring wells as well as additional wells if required. The data should be used to update the preliminary conceptual hydrogeological model with an emphasis on permafrost-groundwater interaction.
- As the mine planning progresses, additional monitoring wells should be installed in the areas up- and down-gradient of proposed mine infrastructure, including any proposed infrastructure that may affect groundwater quality and/or quantity during mine construction, operation, or closure (e.g., open pits, underground workings, tailings facility, waste rock dump(s), ore stock piles, mill, fuel and chemical storage, and camp facilities).
- The groundwater and surface water baseline data collection should be integrated and both data sets be interpreted with respect to groundwater-surface water interaction.

8.0 CLOSURE

We trust this report meets your present requirements. If you have any questions or comments, please contact the undersigned.

Notes:

[1] Canadian Council of Ministers of the Environment (CCME) (Updated 2014). Canadian Water Quality Guidelines for the Protection of freshwater Aquatic Life (AW)

[2] Environment Canada (Revised March 2014). Guidance Document on Federal Interim Groundwater Quality Guidelines for Federal Contaminated Sites, for fine and coarse grained soil under Commercial/Industrial land use

[3] Environment Act. Contaminated Sites Regulation (CSR) (2002). Schedule 3, Generic Numerical Water Standards for freshwater Aquatic Life (AW)

[4] Guideline varies with pH and temperature. Values shown based on site pH range of 6.81 to 8.05

[5] Guideline varies with hardness. Values shown based on site hardness range of 61.6 mg/L to 327 mg/L

[6] Guideline varies with pH. Value shown based on site pH range of 6.81 to 8.05

[7] Guideline varies with chloride. Values shown based on site chloride range of 0.5 mg/L to 9.79 mg/L

[8] Guideline applied is for the most conservative ultra-oligotrophic

[9] Not compensated for temperature

"-" No applicable standard or guideline

Shaded - Greater than CCME AW Guideline

BOLD - Greater than Federal Interim Guideline

Red text - Greater than CSR AW Standard

Notes:

[1] Canadian Council of Ministers of the Environment (CCME) (Updated 2014). Canadian Water Quality Guidelines for the Protection of freshwater Aquatic Life (AW)

[2] Environment Canada (Revised March 2014). Guidance Document on Federal Interim Groundwater Quality Guidelines for Federal Contaminated Sites, for fine and coarse grained soil under Commercial/Industrial land use

[3] Environment Act. Contaminated Sites Regulation (CSR) (2002). Schedule 3, Generic Numerical Water Standards for freshwater Aquatic Life (AW)

[4] Guideline varies with pH and temperature. Values shown based on site pH range of 6.81 to 8.05

[5] Guideline varies with hardness. Values shown based on site hardness range of 61.6 mg/L to 327 mg/L

[6] Guideline varies with pH. Value shown based on site pH range of 6.81 to 8.05

[7] Guideline varies with chloride. Values shown based on site chloride range of 0.5 mg/L to 9.79 mg/L

[8] Guideline applied is for the most conservative ultra-oligotrophic

[9] Not compensated for temperature

"-" No applicable standard or guideline

Shaded - Greater than CCME AW Guideline

BOLD - Greater than Federal Interim Guideline

Red text - Greater than CSR AW Standard

Notes:

RDL - Reportable detection limit

RPD - Relative percent difference calculated as (abs(C1-C2)/average(C1+C2))*100

"-" Indicates RPD not calculated. RPD cannot be calculated if one or more of the analytical results are less than detection limits or within 5 times the detection limits.

BOLD - RPD value greater than 20%

APPENDIX A
TETRA TECH'S GENERAL CONDITIONS

GENERAL CONDITIONS

GEOENVIRONMENTAL REPORT

This report incorporates and is subject to these “General Conditions”.

1.0 USE OF REPORT AND OWNERSHIP

This report pertains to a specific site, a specific development, and a specific scope of work. It is not applicable to any other sites, nor should it be relied upon for types of development other than those to which it refers. Any variation from the site or proposed development would necessitate a supplementary investigation and assessment.

This report and the assessments and recommendations contained in it are intended for the sole use of Tetra Tech EBA’s client. Tetra Tech EBA does not accept any responsibility for the accuracy of any of the data, the analysis or the recommendations contained or referenced in the report when the report is used or relied upon by any party other than Tetra Tech EBA’s Client unless otherwise authorized in writing by Tetra Tech EBA. Any unauthorized use of the report is at the sole risk of the user.

This report is subject to copyright and shall not be reproduced either wholly or in part without the prior, written permission of Tetra Tech EBA. Additional copies of the report, if required, may be obtained upon request.

2.0 ALTERNATE REPORT FORMAT

Where Tetra Tech EBA submits both electronic file and hard copy versions of reports, drawings and other project-related documents and deliverables (collectively termed Tetra Tech EBA’s instruments of professional service), only the signed and/or sealed versions shall be considered final and legally binding. The original signed and/or sealed version archived by Tetra Tech EBA shall be deemed to be the original for the Project.

Both electronic file and hard copy versions of Tetra Tech EBA’s instruments of professional service shall not, under any circumstances, no matter who owns or uses them, be altered by any party except Tetra Tech EBA. The Client warrants that Tetra Tech EBA’s instruments of professional service will be used only and exactly as submitted by Tetra Tech EBA.

Electronic files submitted by Tetra Tech EBA have been prepared and submitted using specific software and hardware systems. Tetra Tech EBA makes no representation about the compatibility of these files with the Client’s current or future software and hardware systems.

3.0 NOTIFICATION OF AUTHORITIES

In certain instances, the discovery of hazardous substances or conditions and materials may require that regulatory agencies and other persons be informed and the client agrees that notification to such bodies or persons as required may be done by Tetra Tech EBA in its reasonably exercised discretion.

4.0 INFORMATION PROVIDED TO TETRA TECH EBA BY OTHERS

During the performance of the work and the preparation of the report, Tetra Tech EBA may rely on information provided by persons other than the Client. While Tetra Tech EBA endeavours to verify the accuracy of such information when instructed to do so by the Client, Tetra Tech EBA accepts no responsibility for the accuracy or the reliability of such information which may affect the report.

Calibration Record

Vibrating Wire Piezometer

Customer:		Tetra Tech EBA Inc.
Model:		VW2100-3.0
Serial Number:		**VW33195**
Mfg Number:		1515511
Range:		3.0 MPa
Temperature:		23.5 °C
Barometric Pressure:		1003.6 millibars
Work Order Number:		207287
Cable Length:		70 meters
Cable Markings:		918545 m - 918615 m
Cable Colour Code:	Red / Black (Coil)	Green / White (Thermistor)
Cable Type:		EL380004
Thermistor Type:		3 kΩ

Applied Pressure (MPa)	First Reading (B units)	Second Reading (B units)	Average Reading (B units)	Calculated Linear (MPa)	Linearity Error (% FS)	Polynomial Error (% FS)
0.0	8896	8898	8897	0.007	0.22	0.00
0.6	8194	8194	8194	0.599	-0.04	0.00
1.2	7486	7486	7486	1.195	-0.17	0.01
1.8	6774	6774	6774	1.794	-0.19	0.00
2.4	6057	6057	6057	2.398	-0.06	-0.01
3.0	5334	5334	5334	3.007	0.23	0.01
			Max. Error (%):		0.23	0.01

Linear Calibration Factor:	**C.F.=**	**0.00084207 MPa/B unit**
Regression Zero:	**At Calibration =**	**8905.0 B unit**
Temperature Correction Factor:	**Tk =**	**0.0004009 MPa/°C rise**

Polynomial Gage Factors (MPa) **A:** -4.0282E-09 **B:** -0.00078474 **C:** 7.3006

Pressure is calculated with the following equations:
Linear: $P(MPa) = C.F.(Li-Lc) - [Tk(Ti-Tc)] + [0.00010(Bi-Bc)]$
Polynomial: $P(MPa) = A(Lc)^2 + BLc + C + Tk(Tc-Ti) - [0.00010(Bc-Bi)]$

	Date (dd/mm/yy)	VW Readout Pos. B (Li)	Temp °C (Ti)	Baro (Bi)
Shipped Zero Readings:	18-Jun-15	8904	23.0	1015.1

Li, Lc = initial (at installation) and current readings
Ti, Tc = initial (at installation) and current temperature, in °C
Bi, Bc = initial (at installation) and current barometric pressure readings, in millibars
B units = B scale output of VW 2102, VW 2104, VW 2106 and DT 2011 readouts
B units = Hz^2 / 1000 ie: 1700Hz = 2890 B units

Technician: I. Kurchavov IK Date: 18-Jun-15

This instrument has been calibrated using standards traceable to the NIST in compliance with ANSI Z540-1

Calibration Record

Vibrating Wire Piezometer

Customer:		Tetra Tech EBA Inc.
Model:		VW2100-3.0
Serial Number:		**VW33197**
Mfg Number:		1515513
Range:		3.0 MPa
Temperature:		23.5 °C
Barometric Pressure:		1003.6 millibars
Work Order Number:		207287
Cable Length:		109 meters
Cable Markings:		918616 m - 918724 m
Cable Colour Code:	Red / Black (Coil)	Green / White (Thermistor)
Cable Type:		EL380004
Thermistor Type:		3 kΩ

Applied Pressure (MPa)	First Reading (B units)	Second Reading (B units)	Average Reading (B units)	Calculated Linear (MPa)	Linearity Error (% FS)	Polynomial Error (% FS)
0.0	8783	8783	8783	0.008	0.25	0.00
0.6	8070	8070	8070	0.598	-0.05	-0.01
1.2	7351	7351	7351	1.194	-0.20	0.00
1.8	6627	6628	6628	1.794	-0.22	-0.01
2.4	5897	5897	5897	2.399	-0.04	0.01
3.0	5162	5163	5163	3.007	0.24	-0.01
			Max. Error (%):		0.25	0.01

Linear Calibration Factor:	**C.F.=**	**0.00082854 MPa/B unit**
Regression Zero:	**At Calibration =**	**8792.2 B unit**
Temperature Correction Factor:	**Tk =**	**0.0006272 MPa/°C rise**

Polynomial Gage Factors (MPa) **A:** -4.3309E-09 **B:** -0.00076814 **C:** 7.0808

Pressure is calculated with the following equations:
Linear: $P(MPa) = C.F.(Li-Lc) - [Tk(Ti-Tc)] + [0.00010(Bi-Bc)]$
Polynomial: $P(MPa) = A(Lc)^2 + BLc + C + Tk(Tc-Ti) - [0.00010(Bc-Bi)]$

	Date (dd/mm/yy)	VW Readout Pos. B (Li)	Temp °C (Ti)	Baro (Bi)
Shipped Zero Readings:	18-Jun-15	8792	23.0	1015.1

Li, Lc = initial (at installation) and current readings
Ti, Tc = initial (at installation) and current temperature, in °C
Bi, Bc = initial (at installation) and current barometric pressure readings, in millibars
B units = B scale output of VW 2102, VW 2104, VW 2106 and DT 2011 readouts
B units = Hz^2 / 1000 ie: 1700Hz = 2890 B units

Technician: I. Kurchavov IK Date: 18-Jun-15

APPENDIX D

HYDRAULIC RESPONSE TEST DATA ANALYSIS

Field Procedure and Interpretation of Hydraulic Response Test Data

The following field procedure was followed for all hydraulic response tests:

- The static water level was measured prior to initiating the hydraulic response test;
- A pressure transducer/datalogger was installed in the well to record total pressure and water temperature during the test at a recording frequency of 1 s to 10 s, depending on the rate of recovery;
- Falling head test:
  - A solid slug consisting of a 1 m or 2 m long solid 1-inch diameter PVC pipe filled with sand (slug volume of 0.9 L or 1.8 L, respectively) was lowered quickly into the well and fully submerged to create a quasi-instantaneous rise in water level;
  - The water level recovery was recorded by the pressure transducer/datalogger.
- Rising head test:
  - After the water level had fully recovered, the slug was quickly withdrawn from the well to cause a quasi-instantaneous drop in water level;
  - Alternatively, a bailer was used to remove a slug of water (volume of 1 L) to cause a quasi-instantaneous drop in water level;
  - The water level recovery was recorded by the pressure transducer/datalogger.
- At the end of the testing sequence, the pressure/transducer datalogger was retrieved from the well and the data were downloaded onto a field laptop.

The hydraulic conductivity *K* of the aquifer in the vicinity of the monitoring well was inferred from the recovery data using the Bouwer and Rice (1976) method. The hydraulic conductivity is inferred from the test data as follows:

$$K = \frac{r^2 \ln\left(\frac{R_{cont}}{R}\right)}{2L} \cdot \frac{1}{t} \cdot \ln\left(\frac{h_0}{h_t}\right)$$

where

r – casing radius

R – radius measured from centre of well to undisturbed aquifer material (borehole radius)

R_{cont} – contributing radial distance over which the difference in head, h_0, is dissipated in the aquifer

L – the length of the screen

b – length from bottom of well screen to top of the aquifer

h_t – displacement as a function of time (h_t/h_0 must always be less than one, i.e. water level must always approach the static water level as time increases)

h_0 – initial displacement

Slug test models including the Bouwer and Rice (1976) method neglect storage in the formation and therefore predict that the logarithm of water level change should be a linear function of time. In reality, all formations are compressible to some extent and have some storage capacity. Storage in the formation is manifested by curvature in the data in semilog space. This introduces complications in the interpretation of some of the data sets collected the Site where the curvature in the recovery data makes it difficult to identify an unambiguous straight line fit. For the Bouwer and Rice analysis, Butler (1998) recommends that the straight line be fitted to the interval $\Delta H/\Delta H_0 = 0.2$ to $\Delta H/\Delta H_0 = 0.3$ which is judged to be the most representative portion of the response.

Additional Comments: Drillers lost return between 847 and 857 ft. Took about 10 minutes to fill rods. Unable to increase pressure more than 120 Kpa. No decrease in packer pressure.

No return through casing. Pulled pump apart, should get more pressure. Partially plugged, restarted test.

Additional Comments: Added 5 ft of casing at 9 pm, total 20 ft of casing.

Lost return, no water coming back through casing while flushing. Small return through casing after 10 minutes of flushing. Took a while and flush all of the mud. Tried 372 to 417 ft but could not fill drill rods.

Reduced interval to 392-417. Flowmeter leaking at 460kPa.

Measurements

Depth to Water from Top of Stickup:	99.7	m toc
Top of Packer Interval:	100.53	m ah*
Bottom of Packer Interval (or Bottom of Hole):	126.27	m ah
Packer Inflation Pressure:	400	psi
Rod Stickup Height:	2.00	m ags
Water Flushed (Vol./Time/Until Clean):	30 min	
Packer Pipe ID/ or Drill Rod ID (circle one):		
Borehole Outside Diameter:	96	mm
Vertical height of gauge above ground:	2.00	m ags

* m ah - metres along hole

Measurement Units

Volume:	m^3
Pressure:	kPa (psi for packer inflation)
Length:	m

Time

Start Flushing:	10:55
End Flushing:	11:25
Start Packer Testing:	12:06
End Packer Testing:	12:32

Additional Comments: No leaks from sub. Small leak from flow meter

At 380 kPa, small lea from sub. ~50-60 ml/2 min

At 540, leaking at 250 ml/min. Was able to tighten sub without twisting pucks.

APPENDIX F
LABORATORY REPORT

Tetra Tech EBA Inc.
ATTN: Stephan Klump
61 Wasson Place
Whitehorse YT Y1A 0H7

Date Received: 25-AUG-15
Report Date: 02-SEP-15 17:54 (MT)
Version: FINAL

Client Phone: 867-668-3068

Certificate of Analysis

Lab Work Order #: L1662569

Project P.O. #: NOT SUBMITTED
Job Reference:
C of C Numbers: 10-266880
Legal Site Desc:

Brent Mack, B.Sc.
Account Manager

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Alkalinity, Total (as CaCO3)	B	L1662569-1, -4, -8
Matrix Spike	Total Kjeldahl Nitrogen	MS-B	L1662569-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Phosphorus (P)-Total	MS-B	L1662569-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfate (SO4)	MS-B	L1662569-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Dissolved Organic Carbon	MS-B	L1662569-10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L1662569-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Dissolved Organic Carbon	MS-B	L1662569-1

Qualifiers for Individual Parameters Listed:

Qualifier	Description
B	Method Blank exceeds ALS DQO. All associated sample results are at least 5 times greater than blank levels and are considered reliable.
DLIV	Detection Limit Adjusted: Lower Initial Volume
DLM	Detection Limit Adjusted due to sample matrix effects.
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

Samples of industrial wastes, acid mine drainage, or other solutions that contain appreciable amounts of hydrolyzable metal ions such as aluminum, iron, and manganese may require hot peroxide treatment to ensure oxidation and hydrolysis of reduced forms of polyvalent cations. Acidity results may be highly variable if this procedure is not followed. Results in this report for 'Acidity (as CaCO3)' have not been peroxide treated.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

Samples of industrial wastes, acid mine drainage, or other solutions that contain appreciable amounts of hydrolyzable metal ions such as aluminum, iron, and manganese may require hot peroxide treatment to ensure oxidation and hydrolysis of reduced forms of polyvalent cations. Acidity results may be highly variable if this procedure is not followed. Results in this report for 'Acidity (as CaCO3)' have not been peroxide treated.

ALK-COL-VA	Water	Alkalinity by Colourimetric (Automated)	EPA 310.2

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.

ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310B TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

F-IC-N-WR	Water	Fluoride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

Reference Information

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-DIS-ICP-VA Water Dissolved Metals in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-TOT-ICP-VA Water Total Metals in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-PRES-COL-VA Water Total P in Water by Colour APHA 4500-P Phosphorus

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA Water Diss. Orthophosphate in Water by Colour APHA 4500-P Phosphorus

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

SO4-IC-N-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

Reference Information

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

10-266880

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.
