INTRODUCTION

The Connaught property hosts an extensive system of silver-lead-gold veins located in the Sixtymile placer gold camp of western Yukon Territory. The property is 100% owned by ATAC Resources Ltd. with no underlying royalties.

This report describes soil geochemical sampling, prospecting and geological mapping conducted between August 10 and 20, 2015 by Archer, Cathro & Associates (1981) Limited on behalf of ATAC. The author participated in the program and interpreted all resulting data. The author's Statement of Qualifications is located in Appendix I. A Statement of Expenditures is located in Appendix II.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Connaught property consists of 274 non-contiguous mineral claims located in western Yukon at latitude 63°55' north and longitude 140°48' west on NTS map sheet 115N/15 (Figure 1). The property covers an area of approximately 5535 ha (55.35 km^2). The claims are registered with the Dawson Mining Recorder in the name of Archer Cathro, which holds them in trust for ATAC. Claim data are listed below while the locations of individual claims are shown on Figure 2.

Claim Name	Grant Number	Expiry Date*
CN 1-120	YC44099-YC44218	May 26, 2025
125-162	YC44219-YC44256	May 26, 2025
167-178	YC44257-YC44268	May 26, 2025
189-198	YC44269-YC44278	May 26, 2025
199-202	YC62938-YC62941	May 26, 2025
203-216	YC63043-YC63056	May 26, 2025
NC 1-8	YC44412-YC44419	May 26, 2025
13-32	YC44220-YC44439	May 26, 2025
OM 1-48	YE60601-YE60648	January 27, 2021

* Expiry dates include 2015 work that has been filed for assessment credit, but has not yet been accepted.

The property lies 65 km due west of Dawson City and can be reached by four wheel drive vehicle via the Sixtymile Road, which runs south from the Top of the World Highway. An extensive system of bush roads and trails exist on the property but to reach them, the Sixtymile River must be forded. During spring runoff and following major storms, this ford is sometimes impassable. The Top of the World Highway extends west from Dawson City into Alaska. It is open during summer and fall when the ferry across the Yukon River is in service. Dawson City is situated 536 km by road north of Whitehorse, the Yukon's main supply centre, and is reached via the all-season Klondike Highway. Helicopters are based in Dawson City but were not utilized during the 2015 exploration program.

HISTORY AND PREVIOUS WORK

This section summarizes historical work in the Connaught property area. Figure 3 illustrates the location of the veins described in the following paragraphs.

Although silver-lead-gold veins were likely found in the Sixtymile area in the late 1890s, the first reported discovery was made by J. Lerner and M. Chefkoi in 1965. Their exploration consisted of "cold extraction" soil geochemistry and prospecting, which led to claim staking. Lerner and Chefkoi optioned the claims to A. Moisey, who later transferred them to the Sixtymile Mining Company Ltd.

In 1966 and 1967, Sixtymile Mining carried out bulldozer trenching and electromagnetic (EM) surveys. The trenching uncovered substantial lenses of massive galena on the No. 1 and No. 3 veins. In summer 1966, a total of 22.7 tonnes of hand sorted material was collected from open cuts on the No. 1 and No. 3 veins, and shipped to the Cominco smelter in Trail, British Columbia (Harper, 1967). This shipment averaged 2.1 g/t gold, 2297 g/t silver and 67.3% lead (Cholach, 1969).

During 1968 and 1969, the property was held under option by Connaught Mines Ltd, which completed geological mapping, geochemical sampling, 35200 m^3 of bulldozer trenching and 431.8 m of diamond drilling in eight holes. The 1969 soil sampling covered much of the property and generated new silver-lead targets. It also identified strong copper response in irregular clusters away from the veins. Bulldozer trenching on the geochemical anomalies led to the discovery or delineation of more vein zones, the best of which were the No. 4, No. 7 and No. 8 (Archer, 1969). Six of the diamond drill holes tested the No. 1 Vein and the other two holes explored the No. 3 Vein. Most of the holes intersected variably mineralized vein structures (Cholach, 1969).

In 1976, Connaught Mines transferred its interest to A. Tottrup, who optioned the property to J. Lerner. That summer J. Lerner extracted an additional 218 tonnes of ore from shallow pits on the No. 1 and No. 3 veins and shipped it to the Asarco smelter in East Helena, Montana. Combined, the 1966 and 1976 shipments totalled 240.7 tonnes at an average grade of 1.0 g/t gold, 2228.5 g/t silver and 60% lead.

In 1979, A. Tottrup re-optioned the claims to Westley Mines Ltd. but there is no record of work by that company and the option was dropped after one year.

In 1981, J. Lerner staked sixteen additional claims. The entire claim block was then sold to Lougheed Resources Ltd., which cut trenches on the No. 1 Vein totalling 4134 m^3. These trenches were not mapped or sampled until 1982 due to an early snowstorm. The claims were held in good standing by Lougheed Resources for four years but were allowed to lapse in 1986.

In spring 1987, Walhalla Exploration Ltd. re-staked the core of the property and optioned the claims to Croesus Resources Inc., which sub-optioned part of the claim block to Red Fox Minerals Ltd. and Kelan Resources Ltd. Aurum Geological Consultants Inc. was contracted to conduct an exploration program that consisted of geological mapping, geochemical sampling, geophysical surveys and bulldozer trenching (Price, 1988). The following year, Kelan Resources and Croesus Resources completed 315.8 m of diamond drilling in ten holes. Three of the holes tested the No. 9 Vein, which lies within claims that adjoin the Connaught project but are owned by another party (Figure 2). Another of the holes tested the No. 8 Vein and the other six holes explored beneath a magnetite skarn. Also in 1988, Red Fox Minerals drilled a total of 296.4 m in eight holes on the No. 4 Vein. Results from the drilling were not considered to be encouraging and all of the claims were allowed to lapse.

In 1998, 17363 Yukon Inc. re-staked the main showings and surrounding area. It conducted minor prospecting and geochemical sampling before contracting Equity Engineering Ltd. to perform geological mapping and geochemical sampling across the known veins and showings (Harris, 1998).

In 2005, R. Nordling staked the Mag claims to cover the No. 8 Vein and the magnetite skarn.

In spring 2006, the CN and NC claims were staked by ATAC, which immediately entered into a joint venture with Klondike Silver Corp. A property-wide helicopter borne VTEM survey was flown that summer.

In 2007, Klondike Silver preformed prospecting, geochemical sampling, excavator trenching and 556 m of diamond drilling in seven holes (Wengzynowski, 2008). Soil sampling was conducted on two grids to follow up anomalies from earlier soil geochemical and VTEM and magnetic surveys. Samples from both grids yielded positive results. Trenching led to the discovery of a new vein (Stirling Vein) and the formal recognition of another, previously identified structure (Core Shack Vein). Diamond drilling confirmed down dip continuity of mineralization at the No. 1, No. 3, and No. 4 veins. The VTEM and magnetic surveys conducted over the property yielded numerous VTEM conductors and magnetic low anomalies. Following up a VTEM conductor resulted in the discovery of the Rain Vein. None of the historically known veins have EM responses. The total field magnetic response showed a striking donut shaped magnetic anomaly in the eastern part of the property. The positive magnetic anomaly surrounding a central magnetic low has been mapped as partially underlain by hornfelsed metasediments. This evidence suggests a localized, but strong late-stage or post-magmatic hydrothermal event that may be related to calc-alkalic porphyry copper-gold systems as well as high-level porphyry-related precious metal epithermal deposits.

In fall 2007, ATAC and Klondike Silver optioned Mag claims from R. Nordling.

In 2008, ATAC and Klondike Silver continued with geochemical sampling, excavator trenching and excavator stripping of veins. Four thousand soil samples were collected in three grids, and analyzed for 34 elements, but not for gold. Prospecting and excavator trenching extended some known veins and resulted in the discovery of the AC/DC, Ice, Rain and PP veins. Forty-one trenches were excavated on 10 targets, with only 36 reaching bedrock due to permafrost. A total of 254 rock samples were analyzed. Parts of the No. 1, No. 7, No. 8, and Stirling veins were stripped in preparation for bulk sampling (Mann, 2010).

In 2009, a modest program of prospecting, geochemical sampling and excavator stripping was undertaken by Klondike Silver on behalf of the ATAC-Klondike Silver joint venture (Mann, 2010). The No. 1, No. 3, No. 8 and Stirling veins were stripped within existing excavations with the intention of improving access for future bulk sampling. Prospecting in areas of anomalous soils discovered or re-discovered several mineralized veins not previously documented, notably the 69-3 Vein from the 1969 exploration program and a northeasterly extension of the No.7 Vein. The Nordling option was terminated at the end of 2009 (Mann, 2010).

GEOMORPHOLOGY

The Connaught property is situated in the northern part of the Dawson Range, about 45 km southwest of the Tintina Trench. The Dawson Range features rounded ridges and low peaks,

which represent the top of an ancient peneplane that has been deeply incised by dendritic drainages. Continental ice sheets did not cover the area but there is evidence of localized alpine glaciation. The property is drained by creeks that flow into the Sixtymile River, part of the Yukon River watershed.

Local elevations range from about 800 m alongside the Sixtymile River to 1500 m atop a ridge near the centre of the claim block. Terrain is subdued with gentle to moderately steep hillsides flanking broad, rounded hilltops. Outcrop is rare and is mostly confined to ridge crests. In areas where drilling has been done, the rocks are typically weathered to about 30 m below surface (Cholach, 1969). Soil development is good but there has been considerable solifluction on hillsides.

Vegetation varies from mature spruce and poplar forests on the floor of the Sixtymile River valley to sparse, stunted spruce and buckbrush near ridge tops. North-facing slopes are often moss covered and permanently frozen, which presents a significant obstacle to soil sampling, trenching and road construction.

GEOLOGY

Geology in the vicinity of the Connaught project was most recently mapped by Mortensen (1996) and put into broader context by Gordey and Makepeace (1999).

The property lies between the Tintina and Denali faults (Figure 4) within a part of Yukon that is mostly underlain by Yukon-Tanana Terrane (YTT). That tectonic terrane is composed of continental margin sediments, island arc volcanics and coeval intrusions, which were metamorphosed and deformed during accretion to the North American continent during Mesozoic times. In the Sixtymile District, the YTT is subdivided into two stratigraphic elements (the Nasina and Klondike Schist assemblages) and a metaplutonic package (the South Fiftymile Batholith). The YTT units are intruded by undeformed Late Cretaceous plugs and stocks.

The geology in the vicinity of the Connaught project can be divided into two main domains. The southern domain which is mostly underlain by the South Fiftymile Batholith while the northern domain contains supracrustal rocks of the Nasina and Klondike Schist assemblages (Figure 5). The major lithological units are briefly summarized in the following paragraphs.

The Nasina Assemblage comprises Upper Proterozoic to Late Devonian and Mississippian fine grained, moderately to non-carbonaceous, quartz-muscovite-chlorite schist and quartzite with locally abundant interlayered mafic schist and amphibolite. Locally some higher grade metamorphic equivalent rocks are also present including coarse grained, garnetiferous biotite-quartz-muscovite schist and amphibolite. Lenses of recrystallized limestone are also present east of the project. The dominant foliation in the metamorphic sequences strikes 150° and dips 30° to the northeast.

The Klondike Schist Assemblage is largely Carboniferous to Upper Permian felsic schists of volcanic affinity. Micaceous quartzite and quartz-feldspar-muscovite-biotite schist are commonly interlayered with the felsic schist. This assemblage forms a klippen that sits atop the Nasina Assemblage.

DATE: FEBRUARY 2016

The South Fiftymile Batholith is a large body of granitic orthogneiss that contains coarse potassium feldspar augen. This unit is considered to be part of the Late Devonian to Early Mississippian Grass Lakes Suite (ca. 357–365 Ma).

An east-trending string of Late Cretaceous plugs and stocks intrude the Nasina Assemblage and South Fiftymile Batholith along the ridge that underlies the project area, extending eastward off the claim group. These magnetite-bearing plutons consist of fine to medium grained, equigranular biotite-hornblende quartz monzonite and granodiorite. Regional magnetic data demonstrates that the plugs and stocks are probably apophyses of a much larger east- trending batholith sized body. A dyke that is likely related to this suite is seen in the high wall of the No. 3 Vein pit.

The Connaught project lies along the recently identified Sixtymile-Pika fault system (Sanchez et al, 2014). This northeast-trending structure, identified from a systematic re-interpretation of regional aeromagnetic data sets from Alaska and Yukon, is thought to have focused Late Cretaceous porphyry, skarn and epithermal style mineralization at many locations along its 150 km length (Image 1). A number of local-scale, northeasterly-trending normal faults are also present in the region, probably subsidiary to the larger scale structure. Twenty major vein structures have been identified on the CN property. These veins form two sets: one striking east-northeasterly and the other north-northeasterly. These probably occupy dilatant structures related to the Sixtymile-Pika Fault.

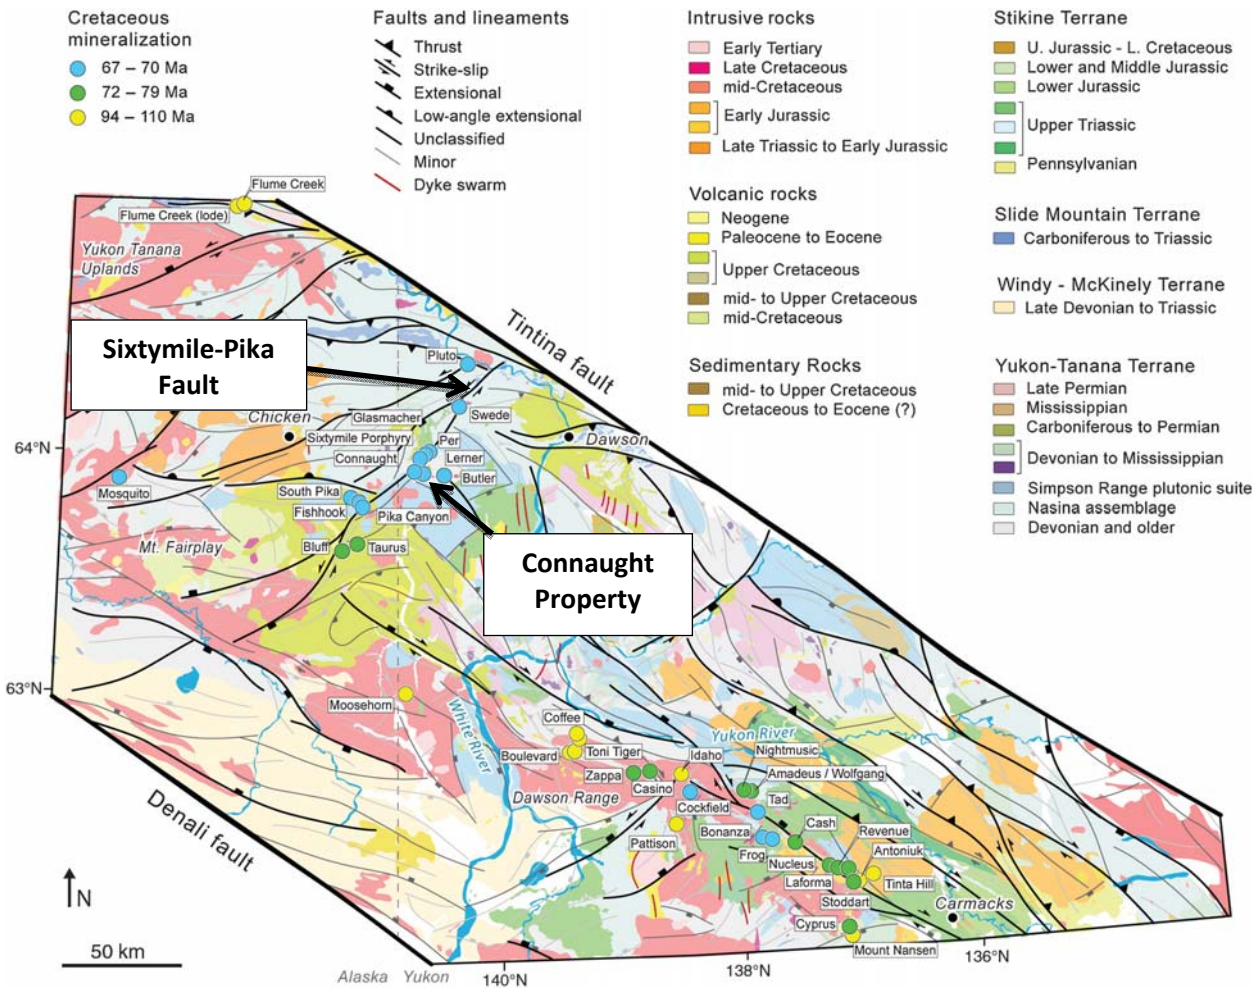

Image 1 – Regional fault systems and the spatial distribution of significant deposits and prospects of Cretaceous age (from Sanchez et al, 2014).

PROPERTY GEOLOGY

Only cursory property-scale mapping has been completed on the Connaught property because outcrops are typically restricted to ridges/spines and road/creek cuts. Figure 6 illustrates recent property-scale mapping, while scans of the original maps can be found in Appendix III.

There has been little geological mapping conducted during previous exploration of the Connaught project. Recent property-scale mapping has demonstrated that the intrusive complex is much more extensive than shown on the existing maps derived from 1:50,000 mapping by Mortensen (1996). The intrusive complex consists of a granodiorite phase that is relatively resistant weathering and a quartz monzonite phase that is recessive weathering. The recessive weathering quartz monzonite phase is more common in the eastern half of the Connaught property. A third phase of highly felsic dykes, with minor graphic granite pegmatite is also present near the eastern edge of the Connaught property. The property-scale mapping identified a nearly continuous east-trending band of granitic rocks underlying the eastern part of the Connaught property. The previous map showed a couple of nearly circular stocks of about one kilometre diameter in this area.

Most of the intrusive body is present on surface as felsenmeer boulders, with very little outcrop. The new mapping is consistent with the airborne magnetic signature of the project area.

Major north- and northeast-trending faults have been mapped offsetting the intrusive complex in the eastern part of the property, which suggests that the faults may be the youngest structures (Figure 5).

MINERALIZATION

The Connaught property lies within the Tintina Gold Belt, a mineralized belt that comprises a 200 km wide by 1200 m long arc that extends from northern British Columbia to Alaska. The project area has mostly been explored as a high-grade silver-lead ± gold vein prospect modelled after the highly productive mines in the Keno Hill District, located about 250 km to the east. Some exploration has also been directed to skarn and porphyry copper mineralization on adjoining claims further to the east. Placer gold has been mined from many creeks in the area for over 100 years.

There are about 20 veins on the Connaught property (Figure 3). These vein zones are hosted by dilatent fault structures up to several metres in thickness. Individual veins have been traced for lengths in excess of 260 m and most are open along strike and down dip. Typical vein exposures consist of multiphase quartz that is variably mineralized with blebby to massive arsenopyrite + galena ± chalcopyrite ± covellite ± stibnite ± sulphosalts. Massive galena ± anglesite lenses are intermittently exposed in the core of some veins. The galena is usually coarsely cubic and contains scattered blebs of chalcopyrite. Anglesite weathered surfaces often exhibit botryoidal textures and some show shear textures. The veins and adjacent selvages are usually light coloured compared to the surrounding units and are often tinted green, because of oxidization of arsenopyrite to scorodite and sericitization of mafic minerals. Bleached phyllic- and argillic-altered halos extend up to six metres into adjacent wallrocks.

The No. 1, No. 3, No. 8 and Stirling veins strike 050 to 094° and dip sub-vertically to 070° to the south, while the No. 2, No. 4, No. 5, No. 6, No. 7, Core Shack and AC/DC veins strike 020 to 038° and dip steeply. The AC/DC vein has a unique orientation, with a strike of 020° and steep dip. Historical data concerning individual veins are summarized in the following paragraphs, with details of channel samples presented in Eaton and Mundhenk (2009).

The **No. 1 Vein** has been delineated by 32 bulldozer trenches for roughly 200 m along strike but it is inferred to continue for an additional 1000 m based on anomalous lead-in-soil geochemistry. The surface trace is marked by a subtle linear gully that is evident intermittently along a talus covered, northwest facing slope. The host rocks are gently northeast dipping orthogneiss of the South Fiftymile Batholith with narrow layers of coarse biotite-muscovite schist. The vein strikes northeast and has a sub-vertical dip.

Mineralization is dominated by pale green and yellow stained, sulphosalt-bearing quartz. This material is exposed in all trenches excavated across the vein and ranges in width from 30 cm to four metres. Four semi-massive to massive galena lenses occur in the core of the vein along a 125 m strike length, with widths ranging from zero to 30 cm.

The largest and most continuous of the galena lenses is at the northeast end of the vein exposure, on the floor of the historical bulk sample pit. This lens is approximately 67 m long. The galena

lens frequently bifurcates from a single wide band into multiple narrow stringers. The best assays from this lens were 2550 g/t silver and 10.90 g/t gold. The pit from which most of the bulk sample has a seven metre tall, cracked pit wall and is currently filled with water.

The **No. 2 Vein** has been exposed for a strike length of about 90 m along a 030° trend. It exhibits steep southerly dips averaging 76°. This vein has a composition similar to the No. 1 Vein but it has stronger wallrock alteration, with a bleached halo that extends up to six metres into the footwall rocks. Much of the trenching was done in 1987, with detailed mapping and sampling (Kyser, 1988). No excavator trenching was done across this vein in recent years.

The **No. 3 Vein** is the most northwesterly vein on the property. It has been outlined by trenching for roughly 100 m along a 067° trend. It has steep southerly dips between 70 and 79°. The best mineralization is exposed at surface along a 10 m strike length where massive galena occurs with subordinate arsenopyrite and pyrite plus traces of covellite, in a multi-episodic quartz-sericite gangue. This portion of the vein is exposed in an approximately 8.5 m deep pit from which most of the historical bulk samples were taken. A five metre long massive anglesite and galena lens that is up to 1.25 m wide can be traced along the pit floor. The mineralization is hosted within highly fractured, bleached and rusty weathering quartzite and quartz-muscovite schist, tentatively assigned to the Klondike Schist Assemblage. A narrow intermediate dyke is exposed in the pit wall.

A series of narrow galena-rich veinlets and stringers bifurcate from the main lens into the footwall strata. Some sulphosalt minerals are also disseminated in quartz-rich wallrocks adjacent to this vein. A channel sample across the No. 3 Vein returned 0.87 g/t gold, 2450 g/t silver and 48.8% lead over 1.25 m.

Prospecting approximately 90 m northeast along strike from the bulk sample pit resulted in the discovery of massive galena ± anglesite and quartz-sulphosalt mineralized float alongside two old bulldozer trenches. Excavator trenches dug in 2007 into the floors of the old trenches exposed broad intervals of multi-coloured gouge but no quartz or metallic minerals. Chip samples collected along the base of the excavator trenches returned low values for silver, lead and gold. The gouge alteration could be an unmineralized portion of the vein but could also mark a thrust fault separating the Klondike Schist Assemblage from the underlying Nasina Assemblage. This area has been stripped in preparation for bulk sampling.

The **No. 4 Vein** lies approximately two kilometres northeast of the No. 1 Vein and is exposed for 260 m along the northwestern side of an alpine knoll. It is hosted by orange weathering hypidiomorphic medium-grained Cretaceous granodiorite locally interfingered with quartz-feldspar orthogneiss of the South Fiftymile Batholith. The vein strikes 035° and dips steeply south, averaging 77°. It dominantly consists of multi-episodic quartz that is variably mineralized with sulphosalts. The vein is surrounded by strong clay alteration. In 1969, operators reported an "average assay" of 624 g/t silver and 9.34% lead across 1.22 m for a series of chip samples collected along the northeastern most 152.4 m long portion of the exposure (Price, 1989). These samples include peak grades of 2451 g/t silver and 34.90% lead across 0.73 m.

In recent years, excavator trenches were cut at equal intervals along an 80 m section at the southwestern end of the No. 4 Vein exposure. Trenches tested the footwall portion of the previously defined vein, which was mostly covered by talus, and attempted to explore the projected trace of the vein to the southwest. The trenches dug into the footwall of the vein zone

discovered new mineralization in a splay off the main structure. The other trenches did not reach bedrock due to permafrost. One of the best intervals from this vein returned 1.295 g/t gold, 1550 g/t silver and 10.05% lead over 2.10 m. A chip sample from one of the new trenches yielded 0.115 g/t gold, 186 g/t silver and 2.44% lead across 1.0 m of strongly clay altered granodiorite mineralized with disseminated sulphosalts (Mann, 2010).

The **No. 5** and **6 veins** lie roughly on trend with the No. 1 Vein, about two kilometres to the northeast. Both veins are poorly exposed in old bulldozer trenches roughly 20 m apart. The No. 5 Vein trends east-northeast, and the No. 6 Vein trends east-southeast. Following this trend further northeast leads to the PP Vein.

The **No. 7 Vein** and the **Stirling Vein** are located approximately three kilometres west of the No. 4 Vein. There are several mineralized veins present in this area. The southwesterly extension of the No. 7 Vein trend was followed onto the next ridge across the creek, and was examined by trenching. This work discovered two parallel veins that yielded peak values of 0.5 g/t gold, 177 g/t silver and 2.28% lead across 1.32 m.

The southern-most trench in the No. 7 Vein area exposed a quartz-sulphosalt vein with massive galena lenses up to 55 cm wide and 23 m long, within a vein zone that is approximately 50 m long and open in all directions. The vein is hosted within competent orthogneiss and strikes between 020° and 045° with a steep dip to the west at 80°. The northern-most galena lens is open along strike to the northeast where it projects beneath an access road. Channel and rock samples taken at various points along this vein returned 0.997 g/t gold, 3150 g/t silver and 64.0% lead over 0.40 m.

Prospecting successfully identified mineralized float associated with a broad multi-element soil anomaly along the No. 7 Vein trend. Two samples collected at least 500 m northeast of the trenches returned 3.98 g/t gold, 201 g/t silver and 30% lead, and 1.71 g/t gold, 1705 g/t silver, and 12.2% lead. The No. 7 Vein trend appears to have excellent potential in this area, as the two samples were found several hundred meters apart.

The **Stirling Vein** was found by deepening an old bulldozer trench situated approximately 400 m northeast of the No. 7 Vein. The Stirling Vein is composed of strongly sulphosalt-bearing quartz with intermittent massive galena lenses up to 47 cm wide. The vein is exposed for a strike length of 22 m in tuffaceous quartz-feldspar-biotite-muscovite schist. It strikes 094° and dips steeply south at 70°. The mineralization is open along strike. Channel sampling returned 0.67 g/t gold, 2660 g/t silver and 64.5% lead over 0.47 m. Excavator trenching along the trend revealed an extension of the mineralized structure; however, the vein was relatively narrow and weakly mineralized.

The **Core Shack Vein** is exposed in old bulldozer trenches that were deepened with an excavator. This vein is one of a series of sulphosalt-bearing quartz veins that are marked by lead-in-soil geochemical anomalies in the area between the No. 1 and No. 2 veins. The excavator trenches exposed a 1.30 m wide quartz vein that is variably mineralized with yellow to green, arsenic and antimony secondary minerals, sulphosalts and minor coarse cubic galena. Chip samples collected across the vein zone returned peak values of 1.96 g/t gold, 1230 g/t silver and 15.0 % lead over 1.30 m.

The **No. 8** and **No. 9 veins** are located immediately adjacent to the Connaught property on claims owned by other operators. These veins are similar to the veins exposed on the Connaught property but have a slightly higher silver to lead ratio. The No. 9 Vein also has a substantial percentage of crystalline barite within the vein.

In 2015, prospecting up to 1000 m along strike of the No. 9 Vein resulted in the discovery of three mineralized quartz vein float occurrences. Four composite grab samples were collected and returned peak values of 7.13 g/t gold, 1040 g/t silver, 15% lead.

The **AC/DC Vein** is located alongside the main access road, approximately 1000 m east of the No. 4 Vein. The vein subcrop is exposed in an old bulldozer trench south of the main access road, and in four trenches dug, delineating it for a strike length of roughly 70 m on the north side of the road. Most of the bedrock is poorly exposed. The vein is up to one metre thick and contains comb quartz with small irregular masses of sulphosalts and weak to moderate, blebby and disseminated arsenopyrite. It is hosted in grey quartz-feldspar-biotite gneiss grading to quartzite. A selected rock sample of mineralized vein assayed 0.374 g/t gold, 12 g/t silver, 2.2% lead. Additional vein float was found 100 m south of the AC/DC Vein. A sample of this float returned 1.095 g/t gold, 8.41g/t silver and low lead.

The **Ice Vein** lies about 1000 m northeast of the No. 4 Vein on a northwest facing hillside. Mineralization consists of coarse cubic galena weathering to botryoidal anglesite or dense dark red limonite containing relict galena and/or crushed quartz. Yellow-green clay gouge is also present. The Ice Vein is hosted in grey quartz-feldspar-biotite gneiss. The vein strikes 049° and dips 80° to the southeast. The vein appears to be 70 cm wide with massive galena cores ranging from 20 to 25 cm wide. Chip sampling returned peak values of 2.88 g/t gold, 406 g/t silver and 4.0% lead over 1.20 m.

The **PP Vein** is located 1200 m north-northeast of the Ice Vein on a northeast facing hillside. Vein float containing galena and anglesite was discovered during a prospecting traverse that followed up soil geochemical anomalies. Five trenches were cut to locate the source of the float. A 15 cm wide galena-rich quartz-sulphosalt vein hosted in pale yellow quartzite and grey quartz-feldspar-biotite gneiss was identified. A chip sample collected from this vein returned 0.408 g/t gold, 259 g/t silver and 3.5% lead over 2.10 m. Grab samples of anglesite weathered galena float collected from the spoil piles of trenches suggest that an unexposed vein may exist to the north.

The **Rain Vein** is situated 1600 m northeast of the No. 4 Vein. It lies northwest downslope from the main access road. Trenches were cut across two strong geochemical anomalies. The Rain Vein is well exposed in one trench and is poorly exposed in two adjacent trenches. High values obtained from rock and soil samples taken from the area suggest the vein continues to the east. The Rain Vein is composed of quartz-poor sulphide bands with antimony-arsenic sulphosalts and galena cores and pyrite, arsenopyrite and possible stibnite margins. The sulphide-rich material is hosted in bright yellow clay gouge. The galena is coarsely cubic and weathers to anglesite on rims, with scorodite stains on some faces. The Rain Vein is hosted in quartz-feldspar-biotite gneiss. Select samples of well mineralized vein yielded values up to 2.45 g/t gold, 472 g/t silver, and 12% lead.

Prospecting resulted in the re-discovery of vein subcrop in a bulldozer trench from the 1969 exploration program. The **69-3 Vein** returned values of 4.13 g/t gold, 406 g/t silver, 10.4% lead.

This material was found in an area of multi-element elevated soil geochemistry. There were no assays previously reported from this trench. The 69-3 Vein is significant because it is the only vein located on the southern side of the ridge, which is underlain by the South Fiftymile Batholith.

The **Kitchen Vein** is located near the centre of the property under the current camp site, which was built in a bulldozer trench targeting a coincident multi-element soil geochemical anomalies identified. Mineralized float was collected within the trench and further to the east. Values up to 1.08 g/t gold, 783 g/t silver and over 20% lead were returned from the vein float.

The **69-2 Vein** is located about 400 m southeast of the Kitchen Vein and 700 m northwest of the 69-3 Vein, within a bulldozer trench dug in 1969 (Cholach, 1969). A grab sample of vein float from the trench returned 3.00 g/t gold, 1660 g/t silver and 14.2% lead. The mineralization is also elevated in antimony, bismuth and indium.

The **Ridge Vein** is located in an old bulldozer trench near the main access road, a few hundred meters from the junction between the ridge road and the road to the Sixtymile River. Samples from the trench returned 1.825 g/t gold, 182 g/t silver and 1.635% copper. Mineralized float taken about 50 m west of the trench returned 0.915 g/t gold and 111 g/t silver. This vein is also strongly anomalous for bismuth (1090 ppm), thallium (1.92 ppm), and tellurium (17.75 ppm).

The **Sandro Vein** is a re-discovery of a lead- and arsenic-rich quartz vein in a historical bulldozer trench. The vein is not exposed in outcrop, but the trench lies entirely within weathered intrusive rocks. A sample from this vein returned 5.27 g/t gold with and high silver to lead ratios (Mann, 2010).

The **Matt Vein** straddles the Connaught and Mag property boundary, with the visible mineralization located on the Mag claims. The surface expression of this vein occurs as a narrow string of talus with a northeasterly-trend. The vein is located in an area with abundant felsic dykes.

The 2015 program focussed on prospecting the eastern part of the property to evaluate the copper porphyry and gold vein potential. A total of 36 rock samples were collected (Figure 7). Figures 8 to 12 illustrate thematic values for gold, silver, copper, lead and zinc. Rock sample descriptions are located in Appendix IV, while Certificates of Analysis are provided in Appendix V.

All rock samples were analysed for 61 elements using ME-MS61 and gold using Au-AA26. Over limit values for silver, lead and zinc were determined using Ag-OG46, Pb-OG46 and Zn-OG46, respectively.

Rock samples collected near the porphyry target returned encouraging results indicative of high-level porphyry-style alteration and mineralization. These samples returned background to strongly anomalous results for gold (up to 0.01g/t), silver (up to 36.8 g/t), copper (up 0.14%), lead (up to 2.43%) and zinc (up to 2.14%).

Prospecting up to 1000 m along strike of the No. 9 Vein resulted in the discovery of three mineralized quartz vein occurrences. Four composite grab samples were collected and returned peak values of 7.5 g/t gold, 1040 g/t silver and 15% lead.

ROCK SAMPLE LOCATIONS

CONNAUGHT PROJECT

0 3 km

UTM ZONE 7, NAD 83, 115 N15

FILE: ...2015\CONNAUGHT

DATE: FEBRUARY 2016

SOIL GEOCHEMISTRY

Approximately 40% of the Connaught property has been grid soil sampled. The 2015 soil sampling was conducted on two detailed grids in the eastern part of the property. A total of 1689 soil samples were collected for analysis using Au-ICP21 and ME-ICP41. Figures 13 and 14 illustrate soil sample locations while Figures 15 to 19 illustrate thematic values for gold, silver, copper, lead and zinc. Certificates of Analysis are provided in Appendix V. For details relating to the pre-2015 sampling please see assessment reports from 2008, 2009 and 2010.

Table I below lists thresholds used to describe the new soil geochemical anomalies. The 2015 grids in the eastern part of the property yielded large clusters (up to 500 by 800 m) and linear trends (up to 1000 m long) of coincident anomalous soil geochemistry. The cluster of high values is centred on a ridge, which likely has more residual material versus samples taken farther downslope. There is a string of high values located to the northwest of the cluster in an area that has not previously been sampled. These values may provide additional vectors for future work.

The linear string of coincident, strongly anomalous soil values lies in the easternmost part of the property. It trends approximately 075° and follows the general orientation of the No. 9 Vein. A series of less distinct linear anomalies lie parallel to the main feature to the north and south.

Table I: Anomalous Thresholds - Soil Geochemistry

Element	Threshold Value			
	Weak	**Moderate**	**Strong**	**Peak**
Gold (ppb)	10	20	50	200
Silver (ppm)	1	2	5	44.1
Copper (ppm)	50	100	200	3350
Lead (ppm)	20	50	100	5470
Zinc (ppm)	50	200	500	2770

DISCUSSION AND CONCLUSIONS

The Connaught project hosts an extensive system of silver-lead-gold veins, which are located at the head of the Sixtymile placer gold camp. Mineralized veins are associated with east-northeasterly- to north-northeasterly-trending structural zones that cut all pre-Cretaceous units. The source of mineralization has not yet been determined, but it was likely deposited by a hydrothermal system related to Late Cretaceous plutonism. Porphyry copper and skarn occurrences in the area are probably associated with the same hydrothermal system.

Vein mineralogy is complex and consists of multiple episodes of quartz and sulphide emplacement. Weathering has resulted in a variety of oxide and carbonate minerals which can obscure the primary mineralization. Veins contain two main phases of mineralization: silver- lead-antimony and gold-arsenic-bismuth metal assemblages.

The 2015 exploration program successfully identified an area with alteration and mineralization that are indicative of a high level, copper-rich porphyry system. Additional work is definitely warranted in the eastern part of the property to continue evaluating the porphyry potential. The

area with strongly anomalous soil geochemical values northwest of the magnetic low donut should be grid sampled to help vector future exploration.

Tracing the No. 9 Vein up to 1000 m along strike within the Connaught property is very encouraging and has provided another viable exploration target that warrants follow up work.

Excavator trenching or rotary air blast drilling are considered to be the most cost effective tool for evaluating the soil geochemical anomalies, delineating the veins and testing the near-surface porphyry potential. Many soil anomalies remain untested and most veins are open along strike. Permafrost and deep overburden are significant impediments to effective trenching in some areas so careful planning should be done before selecting the piece of equipment. Ultimately, diamond drilling at systematic intervals along each vein structure will be required to provide structural geological data as well as locating the widest and richest sections of the veins.

Future exploration should also include detail geological mapping to delineate areas underlain by favourable host rocks such as the granitic orthogneiss of the South Fiftymile Batholith and quartzite of Nasina Assemblage. These units are particularly prospective hosts because they are brittle, and therefore were better able to form broad, continuous dilatent zones where rich veins could have precipitated from circulating hydrothermal fluids.

Respectfully submitted,

STATEMENT QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Heather Burrell, geologist, with business addresses in Vancouver and Squamish, British Columbia and Whitehorse, Yukon Territory and residential address in Squamish, British Columbia do hereby certify that:

1. I graduated from the University of British Columbia in 2006 with a B. Sc in Geological Sciences.

2. From 2004 to present, I have been actively engaged in mineral exploration in the Yukon Territory, British Columbia and Northwest Territories.

3. I am a Professional Geoscientist (P.Geo.) with the Association of Professional Engineers and Geoscientists of British Columbia (Member Number 34689).

4. I supervised the field program and have interpreted all data resulting from this work.

APPENDIX IV

ROCK SAMPLE DESCRIPTIONS

Rock Sample Descriptions Property: Connaught

Sample Number:	M676704	UTM:	515636	mE	Nad83, Zone 7
Elevation:	1384 m	UTM:	7088980	mN	

Comments: Composite grab sample of 12 pieces over a 6 m area. Epidote-calcite skarn. Reactive horizon within quartzite, not found in situ. Mineralization consists of <0.5% disseminated pyrite, dark grey to black, dull-finish mineral (chalcocite?).

Sample Number:	M676705	UTM:	515621	mE	Nad83, Zone 7
Elevation:	1386 m	UTM:	7088973	mN	

Comments: Specimen sample (10x10x40 cm) broken into small pieces. Argillic (kaolinite?) altered dyke with hairline stringers of manganese-magnetite. Weakly magnetic. <1% bright orange limonite pite. Rare glassy limonite to goethite. No residual sulphides. Dyke appears to have mafic phenocrysts that have gone to chlorite (1% phenos).

Sample Number:	M676706	UTM:	516134	mE	Nad83, Zone 7
Elevation:	1400 m	UTM:	7088826	mN	

Comments: Specimen sample off 0.5m3 block of extremely hornfelsed (skarnified?!) actinolite skarn. Dark green bladed minerals mixed with <10% disseminated pyrrhotite (strongly magnetic). Abundant over five metre area.

Sample Number:	M676707	UTM:	516058	mE	Nad83, Zone 7
Elevation:	1390 m	UTM:	7088732	mN	

Comments: Specimen sample from road cut. Hornfelsed-skarnified actinolite skarn with 10% pyrrhotite and trace chalcopyrite. Road cut exposes this unit for ~20 m.

Sample Number:	M676708	UTM:	516375	mE	Nad83, Zone 7
Elevation:	1459 m	UTM:	7088717	mN	

Comments: Composite grab sample of 15 pieces across one metre wide quartz vein. Vein is exposed along a 'bench' of a cat trench that targetted hornfelsed sediments/skarn. Vein pieces are orange weathering with rare white to dull grey anglesite on the surface. Mineralization is approximately 4% - galena, specularite/stibnite (bladed, shiny grey-black mineral), bornite, chalcopyrite and peacock-like tarnished pyrite. Host rock is ultramafic amphibolite with hornfelsed sediments/skarn.

Rock Sample Descriptions Property: Connaught

Sample Number:	M676709	UTM:	516604	mE	Nad83, Zone 7
Elevation:	1467 m	UTM:	7088665	mN	
Comments:	Composite grab sample of six pieces over two metres. From very orange soil along recessive linear. Quartz vein, white to orange with hairline fractures coated with manganese and limonite.				

Sample Number:	M676710	UTM:	516617	mE	Nad83, Zone 7
Elevation:	1461 m	UTM:	7088767	mN	
Comments:	Composite grab sample on same recessive linear as previous sample. Ten pieces over four metres. White to orange quartz vein with hairline fractures and trace black sulphides. No visible mineralization. Sample occurs within bright orange gouge/soil.				

Sample Number:	M676711	UTM:	517048	mE	Nad83, Zone 7
Elevation:	1486 m	UTM:	7088580	mN	
Comments:	Chip sample across two metre outcrop exposure of white weathering, chlorite-epidote altered intrusive. Quartz and feldspar look relatively fresh, moderate to intense magnetite flooding and stockwork. Occasionally epidote will follow (rim) magnetite seams.				

Sample Number:	M676712	UTM:	516562	mE	Nad83, Zone 7
Elevation:	1420 m	UTM:	7088575	mN	
Comments:	Composite grab of eight pieces over a five metre area along the main road cut. Well formed quartz crystals with intense limonite and boxwork limonite as cavity fillings. No outcrop nearby.				

Sample Number:	M676713	UTM:	515940	mE	Nad83, Zone 7
Elevation:	1275 m	UTM:	7087826	mN	
Comments:	Chip sample over 40 cm. Fine grained, bleached, pale pink sill with grey phenos (<2%) and limonite pits. From outcrop on knoll.				

Sample Number:	R608451	UTM:	517253	mE	Nad83, Zone 7
Elevation:	1282 m	UTM:	7087449	mN	
Comments:	Sample from 0.75 m by 0.25 m block of endoskarn. Pyroxene-chlorite altered granodiorite. Quartz still present as 'eyes.' Disseminated to blebby pyrite and arsenopyrite. Manganese dendrites on fractures.				

Rock Sample Descriptions Property: Connaught

Sample Number:	R608452	UTM:	517184	mE	Nad83, Zone 7
Elevation:	1289 m	UTM:	7087467	mN	
Comments:	Composite grab sample from push on road side. Orange, altered intrusive (granodiorite) with limonite veinlets and deep maroon boxwork limonite.				

Sample Number:	R608453	UTM:	517178	mE	Nad83, Zone 7
Elevation:	1288 m	UTM:	7087470	mN	
Comments:	Composite grab sample from road cut. Silicified, weakly clay altered granodiorite with disseminated pyrite (10%) and trace arsenopyrite. Orange weathering surface. No mafics.				

Sample Number:	R608454	UTM:	517106	mE	Nad83, Zone 7
Elevation:	1289 m	UTM:	7087489	mN	
Comments:	Matte-finish goethite to limonite (20x30x20 cm) on road cut.				

Sample Number:	R608455	UTM:	517102	mE	Nad83, Zone 7
Elevation:	1290 m	UTM:	7087494	mN	
Comments:	Boulder 50 cm3 of silicified quartz vein with hairline stockwork fractures. Limonite coated.				

Sample Number:	R608456	UTM:	517071	mE	Nad83, Zone 7
Elevation:	1351 m	UTM:	7087660	mN	
Comments:	Composite grab sample of 20 pieces over 5 m area. Dry bone ore to boxwork limonite. Skarn float nearby (diopride-chlorite).				

Sample Number:	R608457	UTM:	517420	mE	Nad83, Zone 7
Elevation:	1428 m	UTM:	7087871	mN	
Comments:	Specimen sample of epidote-garnet skarn (10x20x30 cm) with slickensides (polished) on one surface. Hematite (earthy and specularite) with trace pyrite.				

Rock Sample Descriptions Property: Connaught

Sample Number:	R608458	UTM:	517363	mE	Nad83, Zone 7
Elevation:	1470 m	UTM:	7087995	mN	

Comments: Specimen sample (20x20x30 cm) of diopside skarn with sphalerite or earthy hematite (red scratch). Layered sulphides. On trail cut at ridge crest - local source.

Sample Number:	R608459	UTM:	516908	mE	Nad83, Zone 7
Elevation:	1389 m	UTM:	7088194	mN	

Comments: Specimen sample from road cut. Argillic altered granodiorite with abundant white-orange-yellow boxwork limonite. Most rocks in area are gabbro (?) fine grained, magnetic mafic intrusive.

Sample Number:	R608474	UTM:	514516	mE	Nad83, Zone 7
Elevation:	1220 m	UTM:	7090100	mN	

Comments: Specimen sample - 20x20x10 cm. Orange weathered quartz vein with abundant limonite pits < 1cm 3. From old trench. Quartz veins nearly boudinaged within micaceous quartzite.

Sample Number:	R608475	UTM:	514643	mE	Nad83, Zone 7
Elevation:	1222 m	UTM:	7090219	mN	

Comments: Composite grab sample of six pieces over a two metre area. Limonite and manganese stained, buggy quartz vein. Residual pyrite in core of limonite. From old trench.

Sample Number:	R608476	UTM:	514531	mE	Nad83, Zone 7
Elevation:	1254 m	UTM:	7090073	mN	

Comments: Composite grab sample of 20 pieces over two metre area. Intense black-manganese stain with bright orange limonite on muscovite-rich quartzite with good foliation/fabric. Small limonite speckles stretched throughout (almost looks like VMS style mineralization).

Rock Sample Descriptions Property: OM (Connaught)

Sample Number:	M608463	UTM:	520318	mE	Nad83, Zone 7
Elevation:	1194 m	UTM:	7087160	mN	

Comments: the sample tag number should begin with R instead of M. Composite grab of vein fragments (20 pieces over four metres) along main road. No outcrop nearby. Most of the talus is intrusive. Sample is of quartz vein fragments with rare galena and anglesite, abundant bright yellow to green scorodite and boxwork limonite. These fragments are ~600 m along strike from the No. 6 vein (which trends 092/76S on adjacent property). JACKPOT! (Also, trenches between the historical workings on the adjacent property and this sample site were positioned too far east to intersect the surface trace of the vein.

Sample Number:	R608460	UTM:	520671	mE	Nad83, Zone 7
Elevation:	1218 m	UTM:	7087007	mN	

Comments: Specimen sample from floor of trench. Weakly argillic altered granodiorite, sucrosic quartz, moderate limonite and fine grained black mineral (sulphide?).

Sample Number:	R608461	UTM:	520751	mE	Nad83, Zone 7
Elevation:	1226 m	UTM:	7086568	mN	

Comments: Specimen sample 20x20x60 cm block of weakly phyllic to potassic altered, feldspar-phyric granodiotire. Disseminated pyrite <4%. Ratty (secondary?) biotite and hornblende.

Sample Number:	R608462	UTM:	520777	mE	Nad83, Zone 7
Elevation:	1281 m	UTM:	7086337	mN	

Comments: Composite grab sample of six pieces over a 2 m area. Orange altered quartz vein with intense orange-yellow-maroon boxwork limonite. Moderate brecciation within the vein. Rocks nearby are primarily magnetite-epidote skarn. Linear upslope trends 085 degrees.

Sample Number:	R608464	UTM:	521756	mE	Nad83, Zone 7
Elevation:	1346 m	UTM:	7085746	mN	

Comments: Specimen sample from east-side of strong linear. Manganese stained diopside skarn with rare bands, disseminated and blebby pyrite with limonite and rare magnetic zones. Rock type abundant in linear trending 040 degrees.

Rock Sample Descriptions Property: OM (Connaught)

Sample Number:	R608465	UTM:	521813	mE	Nad83, Zone 7
Elevation:	1341 m	UTM:	7085532	mN	

Comments: Composite grab sample of 10 pieces over four metre area. Manganese stained skarn with stringers of pyrite and arsenopyrite <1%.

Sample Number:	R608466	UTM:	521928	mE	Nad83, Zone 7
Elevation:	1400 m	UTM:	7085640	mN	

Comments: Specimen sample 25x30x15 cm. Pale green to pink (pyroxene-garnet) banded skarn with <2% mangetite and pyrrhotite as clots and seams/fracture fillings on west side of broad, grassy linear.

Sample Number:	R608467	UTM:	521374	mE	Nad83, Zone 7
Elevation:	1160 m	UTM:	7084724	mN	

Comments: Specimen sample from forest fire burnt area on knoll. Sample is 10x35x20 cm, orange to deep red, silicified vein with coarse cubic pyrite casts filled with limonite. Rare stringers of goethite throughout. Same rep as '469 - very similar rock type.

Sample Number:	R608468	UTM:	521373	mE	Nad83, Zone 7
Elevation:	1157 m	UTM:	7084721	mN	

Comments: Composite grab sample of six pieces over two metre area. Limonite to goethite, solid, heaavy. All pieces were small (10 cm by 5 cm maximum).

Sample Number:	R608469	UTM:	521372	mE	Nad83, Zone 7
Elevation:	1156 m	UTM:	7084709	mN	

Comments: Specimen sample of 20x20x15 cm sucrosic quartz vein with abundant limonite-filled cubic casts. Moderately glassy goethite and manganese on surfaces. From sample knoll as '467, '468 and '470.

Sample Number:	R608470	UTM:	521374	mE	Nad83, Zone 7
Elevation:	1155 m	UTM:	7084708	mN	

Comments: Composite grab sample of 20 pieces over a 6 m area. Nice green weathering surface (resembles tarnished copper) on epidote-diopside skarn. Irregular weathering surface. No visual mineralization. Abundant on knoll.

Rock Sample Descriptions Property: OM (Connaught)

Sample Number:	R608471	UTM:	519922	mE	Nad83, Zone 7
Elevation:	1154 m	UTM:	7087235	mN	

Comments: Composite grab sample from cat trench. Fifteen pieces over a five metre area. Weathered, highly altered granodiorite. Appearance of altered vein selvage adjacent to the No. 9 vein. All pieces <10 cm, slightly irregular surrface. Most of trench is relatively fresh, barred granodiorite. No vein material observed. Trench could be deepened significantly.

Sample Number:	R608472	UTM:	519863	mE	Nad83, Zone 7
Elevation:	1152 m	UTM:	7087174	mN	

Comments: Composite grab sample of 35 pieces over five metre area. Epithermal, banded quartz vein fragments. All pieces are less than six centimetres with rare cores of galena. Abundant limonite and scorodite. From southeast end of old cat trench - almost on ramp - most likely missed the first time around. Very bright, orange soil surrounds vein fragments on ramp.

Sample Number:	R608473	UTM:	520255	mE	Nad83, Zone 7
Elevation:	1187 m	UTM:	7087140	mN	

Comments: Composite grab sample from main road cut. Largest piece was 10x6x20 cm. The remaining 12 pieces were <10 cm x 4 cm. Epithermal quartz vein with strong scorodite stain and trace galena-anglesite. Small fragments of vein can be found between this sample and R608463 up-road to the north.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

BAG-06	CRU-31	CRU-QC	LOG-21
PUL-31	PUL-QC	SPL-21	WEI-21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

CERTIFICATE WH15126538

Project: Connaught

This report is for 135 Soil samples submitted to our lab in Whitehorse, YT, Canada on 22-AUG-2015.

The following have access to data associated with this certificate:

ROB CARNE	JULIA LANE	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

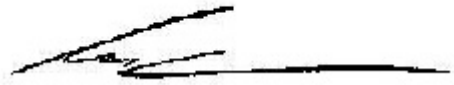

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: **ATAC RESOURCES LTD.**
ATTN: JULIA LANE

CERTIFICATE WH15126541

Project: CONNAUGHT

This report is for 165 Soil samples submitted to our lab in Whitehorse, YT, Canada on 22-AUG-2015.

The following have access to data associated with this certificate:

JULIA LANE	JOAN MARIACHER	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

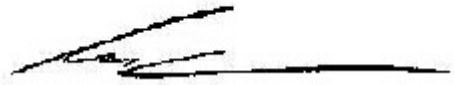

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **ATAC RESOURCES LTD.**
ATTN: JULIA LANE

CERTIFICATE WH15126523

Project: OM-Connaught

This report is for 168 Soil samples submitted to our lab in Whitehorse, YT, Canada on 22-AUG-2015.

The following have access to data associated with this certificate:

ROB CARNE	JULIA LANE	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

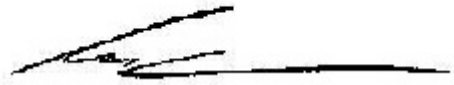

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: **ATAC RESOURCES LTD.**
ATTN: JULIA LANE
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS WH15126523

CERTIFICATE COMMENTS

LABORATORY ADDRESSES

Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.

Applies to Method:	LOG-22	SCR-41	WEI-21

Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Applies to Method:	Au-ICP21	ME-ICP41

CERTIFICATE WH15126539

Project: Connaught

This report is for 213 Soil samples submitted to our lab in Whitehorse, YT, Canada on 22-AUG-2015.

The following have access to data associated with this certificate:

ROB CARNE	JULIA LANE	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

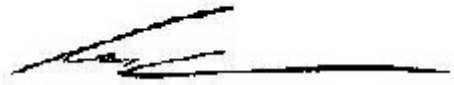

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: **ATAC RESOURCES LTD.**
ATTN: JULIA LANE
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH15126528

Project: OM-Connaught

This report is for 224 Soil samples submitted to our lab in Whitehorse, YT, Canada on 22-AUG-2015.

The following have access to data associated with this certificate:

ROB CARNE	JULIA LANE	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

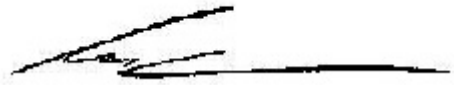

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: **ATAC RESOURCES LTD.**
ATTN: JULIA LANE
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH15126524

Project: OM-Connaught

This report is for 249 Soil samples submitted to our lab in Whitehorse, YT, Canada on 22-AUG-2015.

The following have access to data associated with this certificate:

ROB CARNE	JULIA LANE	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

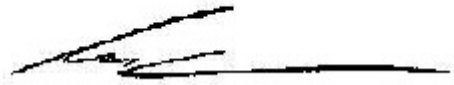

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: **ATAC RESOURCES LTD.**
ATTN: JULIA LANE
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH15126540

Project: CONNAUGHT

This report is for 294 Soil samples submitted to our lab in Whitehorse, YT, Canada on 22-AUG-2015.

The following have access to data associated with this certificate:

JULIA LANE	JOAN MARIACHER	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

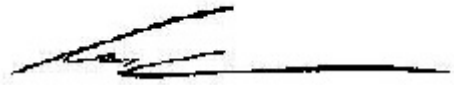

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: **ATAC RESOURCES LTD.**
ATTN: JULIA LANE

CERTIFICATE WH15126535

Project: CN

This report is for 48 Soil samples submitted to our lab in Whitehorse, YT, Canada on 22-AUG-2015.

The following have access to data associated with this certificate:

ROB CARNE	JULIA LANE	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

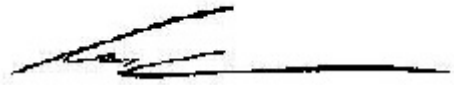

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: **ATAC RESOURCES LTD.**
ATTN: JULIA LANE

CERTIFICATE WH15126527

Project: OM Connaught

This report is for 81 Soil samples submitted to our lab in Whitehorse, YT, Canada on 22-AUG-2015.

The following have access to data associated with this certificate:

ROB CARNE	JULIA LANE	JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

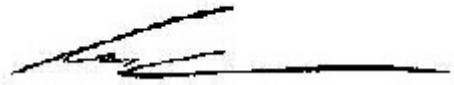

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: **ATAC RESOURCES LTD.**
ATTN: JULIA LANE
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.
