1 Introduction

1.1 General Introduction

The CHO, CHOC, CHOX and NWP claims form a contiguous block of land in the eastern central Yukon, totaling 258 claims within the Selwyn Basin. Golden Predator Canada Corp. staked the ground in fall of 2010 and owns the property 100%. The focus is targeting intrusion-related gold systems, possible skarn or Carlin-style gold systems which have become a major source of exploration in the area. The initial block consisted of over 900 claims. This has been paired down to a grouping of 258 claims of which work was applied, and 203 of which Golden Predator will apply assessment to.

The purpose of this report is to describe the work done in the 2012 field season carried out between June 6th and June 11th. Work performed consisted of soil sampling (contours and ridge and spurs) as well as rock samples at available locations. The program was designed as a follow up to the previous year's broad stream sediment sample program.

2 Property Location, Accessibility and Claim Data

2.1 Location and Accessibility

The claim group lies within the Mayo mining district in the eastern-central Yukon 170 kilometers due 013 azimuth from the town of Faro, Yukon (Figure 1). The grouping consists of 258 quartz claims. Access is limited to helicopter only, and is approximately a 70 minute flight from Ross River, or approximately 60 minutes from Mayo.

Figure 1 – Property location

2.2 Claim Data

Appendix 3 details the claim data for the contiguous property. Figure 2 displays claim locations, work performed and grant numbers. Golden Predator Canada Corp. was the operator for all work done on these claims.

3 History

3.1 Initial Geochemistry

Prior to the staking of the Cho, Choc, Chox and NWP claims by Golden Predator Canada Corp. a regional stream sediment sampling program was undertaken by the government as a first pass to assess the initial viability of exploration in the area.

3.2 Mineral Occurrences

(The following is an excerpt from the 2012 Assessment report by Golden Predator)

The mineral occurrences listed on the Yukon Mining and Lands Viewer on the CHO and CHOX claims have brief summaries of historical work which can't be confirmed due to the lack of correct reference. Relying upon the historical summaries found in the internet 'link' found in the Land Viewer with use of the 'info' selector, (<http://servlet.gov.yk.ca/ygsmin/occurrence.do?occurrenceID=105N+012>) the below data is collected.

On the CHO Property there are two polymetallic vein Ag-Pb-Zn+/-Au showings, Dean (Minfile #105N 010), and Bloom (Minfile #105N012); and a Cu+/-Ag quartz vein showing, Aureole (Minfile #105N011); and a Cu+/-Ag quartz vein float anomaly, Joy (Minfile #105N005). The four mineral occurrences are located within the boundaries of the CHO and CHOX claims in the Northwestern portion of the property. See Figure 3, for map locations of these mineral occurrences with relation to the claim boundaries. Sourced from: <http://servlet.gov.yk.ca/ygsmin/occurrence.do?occurrenceID=105N+012>.

In 1930, Treadwell Yukon Co. Ltd. prospected the Bloom showing area, and reported that arsenopyrite was abundant in the contact aureole around a large stock which cuts Devonian-Mississippian sedimentary rocks.

In 1967, the Dean mineral showing was located, but not staked, by Atlas Exploration Ltd. for the Hess Project (Atlas EL, Quebec Cartier Mg C, and Phillip Bros. (Can) L). Prospecting and sampling were conducted for this showing in 1968. Minor galena was found in quartz-filled shears cutting Devonian-Mississippian sedimentary rocks near a granodiorite stock.

In 1968, the Aureole and Bloom mineral showings and the Joy anomaly were discovered by Atlas Exploration Ltd. for the Hess Project (Atlas EL, Quebec Cartier Mg C, and Phillip Bros. (Can) L). The Joy anomaly consisted of boulders of vein quartz with chalcopyrite mineralization in a creek but the source was not located. Atlas exploration found seven small showings within a 0.8 km radius of the Bloom showing. Four of the showings contain coarse grained molybdenite and minor erythrite in narrow quartz veins. Of the remaining three showings, two are quartz veins with pyrrhotite and minor chalcopyrite and the other is a quartz vein containing galena and erythrite.

4 Geology

4.1 Regional Geology

The property is located within the Selwyn Basin on the Mackenzie Platform (Figure 4). The sediments which comprise the Selwyn Basin consists of late Proterozoic and Paleozoic sediments which collected within the offshore basin of the old continental margin of ancient North America. Basinal and platformal clastic and pelitic sediments as well as various stratabound volcanics make up the vast majority of this area. The basin underwent rifting during the Proterozoic as well as the Devonian, and during this time magmatic rocks were emplaced along rift zones as sills and volcanics. The collision of the Intermontane Belt and

Cordilleran rocks with the continental margin resulted in compression throughout the western flank of ancient North America. Murphy, 1997, describes the folding and failure along hinges which created three major thrust faults. These include the Robert Service, Tombstone and Dawson thrusts.

The rocks of the Selwyn Basin are all cut and intruded by Cretaceous aged intrusive rocks of the Tungsten, Mayo and Tombstone. The Tungsten suite granitoids play host to sheelite skarn deposits, including the Mactung and Cantung. The Mayo suite granitoids are host to intrusion related gold systems, such as Dublin Gulch and Clear Creek. Tombstone plutonic suite, lying close to the Tintina fault (Lang et al 2000), consist of both alkali monzonites and more alkali rich syenite units, also associated with intrusion-related gold deposits (Lindsay et al 1999).

Mineralization within these plutonic suites varies from sheeted veins, stockwork veins, breccias, as well as carbonate replacement. Sheeted veins are the most predominant form of mineralization within the intrusions. Quite often, more than one style of mineralization exists around these intrusions (Abbot et al., 1986).

4.2 Property Geology

The CHO/CHOC/CHOX/NWP claims predominantly cover the Carboniferous to Permian Mount Christie Formation, consisting of shales, black chert, slate, siltstone and minor quartzite, limestone and dolostone, (Roots 1995). These sediments are intruded by the Mid-Cretaceous Selwyn Suite quartz monzonite and granodiorite, which are specifically targeted by these claims. A map of property geology can be seen in figure 5.

Local variations within the Selwyn Suite, as described by Roots 1995, include more intermediate composition plutons and stocks, to narrow, more elongate intrusions of more felsic composition from biotite quartz monzonite to syenite.

Mineralization, as mentioned in the above section “History” is known as the Bloom, Aureole and Dean showings around the Joy anomaly. Mineralization found by Golden Predator employees consists of disseminated arsenopyrite found within intrusive bodies and semi-massive arsenopyrite/scorodite found in float. Historic mineralization is described as arsenopyrite within intrusive stocks, galena in veins and shears, molybdenite, minor chalcopyrite, pyrrhotite and erythrite.

5 Exploration

5.1 2012 Program

The 2012 exploration program consisted of a four person crew working on the CHO, CHOC, CHOX and NWP claims from June 6th to June 11th. Helicopter assistance was required for the first and last days of the program. The rest was carried out on foot. A total of 143 soil samples and 24 rock samples were collected by the crew, assay data can be located in Appendix 4. Many planned sample sites were not accessible due to higher than expected snow cover. Travel was limited due to avalanche prone slopes, however a general sense of geology and potential mineralization within the area visited was discerned. Enough work was done to retain 203 claims of the original 939, thus assessment is applied to this grouping and can be seen in figure 2, along with the work and grant numbers. Helicopter support was provided by Fireweed Helicopters. The crew cooked and sheltered themselves as it was a fly camp situation.

At the core of the CHO property, soil sampling was undertaken in an effort to follow up on geochemical anomalies identified by the 2011 campaign. A significant number of geochemical anomalies have been identified, with 7 values ranging between 29.4 ppb and 410 ppb Au. Soil sampling was completed on ridges and spurs which were located up stream and up slope of the anomalous silt samples of 2011. In addition to soil sampling, rock samples were taken where outcrop appeared to be favorable to mineralization (northwest trending dykes of bleached/alterd monzonite).

Soil sampling completed to the east of the NWP claims, and the far east of the CHO claims were confined to portions of the ridges above the anomalous silt samples of 44.8 ppb and 90 ppb Au. Mid-Cretaceous northwest-trending dykes cross cut stratigraphy here, as they do throughout the region; however there is less alteration and mineralization seen within. Snow cover prevented further soil sampling closer to the anomalous silt values.

5.2 Sampling Methodology and Protocols

Soil Sampling Program

Soil samples were collected at 50 or 100 meter intervals, depending on the amount of ground that could be covered with efficiency along the ridges. If a great distance along a ridge was open from snow cover, samples would be collected at 100 meter intervals to increase the amount of ground covered. If less ground was covered, samples would be collected at 50

meter intervals in order to have a tighter constraint on sampling and use time efficiently. A total of 143 soil samples were taken and locations can be seen in figures 6 and 7.

Samples were dug in best effort to reach, at very minimum, the top of the B horizon. The soil profile along ridges is weakly developed at best. Clasts are abundant and the soil profile is skeletal leaving little material and horizon generation. Surpassing the organic rich A horizon and semi leached elluviated E horizon was discernible at times. Samples were dug with trowels and rock hammers, material was collected and deposited into Kraft paper sample bags. Golden Predator Canada Corp sample tags were filled out at the site, and a sample identification portion of a card was deposited into the sample bag. Samples were then zip tied and transported by geologist back to camp in the back pack of the geologist. Samples were described on the sample ID card. Information on the card included sample I.D, UTM location, sample soil horizon, soil material, a description of the clasts, a description of the soil components (silt, sand, clay, clasts), and the colour of the soil.

Once out of the field, samples were dropped off at AGAT Laboratories ISO 9001:2008 certified full service lab in Whitehorse Y.T by the project's lead geologist, Linda Lewis.

Rock Sampling

A total of 24 rock samples were taken over the six day program on the CHO/CHOC/CHOX and NWP claims. The program was undertaken by three geologists, Linda Lewis, Monica Nordling and Tyler Bourne (author), as well as Luke Carlos, and experienced prospector whom has worked with Golden Predator for a number of years. With experienced members of the mining community making up the team, rock samples were taken at the liberty of the individual. Focus was put on intrusive rocks and sedimentary rocks proximal to these intrusions which may also have been mineralized. As the priority of the program was soils sampling, rock samples were limited to those area's which ran the length of the soil samples along the ridges and spurs.

Mid Cretaceous sills crosscut the sedimentary units in a number of locations across the property, and have been described in detail in the Geology section of this report. These sills were the target of the exploration program, as potential hosts to mineralization or conduits of such. Thus the Golden Predator team made an effort to sample as many intrusive and surrounding rocks as possible in the short program. Sample locations can be seen in figures 8 and 9 and the assay results from the rock samples can be seen in appendix 4.

A number of samples were taken from bedrock sources as well as float. Samples were described on Golden Predator sample cards, and brought back to camp by the collecting field geologist. Once back at camp petrogenesis and mineralization were generally discussed among the geologists. Samples were bagged and tagged with Golden Predator sample I.D's and at the end of the program, brought back to Whitehorse and dropped off at the AGAT ISO 9001:2008 certified lab.

5.3 Results

Highlights from the soil sampling program are displayed in the table below. One hundred and forty three (143) soil samples were taken. Most samples show below limits of detection for gold, however a number of samples show greater than 0.05 ppm Au (below).

Table 5-1. Anomalous Au in soil (>0.05)

Property	Sample Number	Sample type	Au(ppm)	Ag(ppm)	Cu(ppm)	Pb(ppm)	Zn(ppm)	As(ppm)	Sb(ppm)

CHO	AA050222	Arsenopyrite/scorodite altered intrusive	2.8	0.5	201	8.6	2.2	219900	148

5.4 Sample Analysis

Samples were analyzed at the AGAT ISO 9001 certified lab in Whitehorse Y.T, Canada. Analysis was by aqua-regia digestion and a mass spectrometer finish with a 52 metal analysis package. What follows are excerpts from the AGAT laboratory mining geochemistry package.

Samples are dried at 60 degrees centigrade, crushed to the point of 75% passing through a 2mm mesh, then split with a Jones riffler splitter or rotary split. The sample is then pulverized to the point of 85% passing through a 75 micrometer mesh. Finally, samples are screened

after drying, shaken on an 80 mesh sieve with the positive fraction stored and the negative fraction sent to the laboratory for analysis. This concludes the preparation portion of sampling.

Prepared samples are digested with aqua regia for one hour using temperature controlled hot blocks. Resulting digests are diluted with de-ionized water. Sample splits of 1 gram or routinely used. These 1 gram samples are then ran through a mass spectrometer. Perkin Elmer 7300DV and 8300DV ICP-OES (Optical Emission Spectroscopy) and Perkin Elmer Elan 9000 and NexION ICP-MS (Mass Spectrometer) are used in analysis. Inter-Element Correction (IEC) techniques are used to correct for any spectral interferences.

6 Conclusion

6.1 Conclusions and recommendations

The vast majority of elevated soil anomalies come adjacent (North West) of the historic Aureole showing, and lie south east of the Mount Joy syenite pluton. A small granitoid/monzonite sill is mapped proximal to these elevated soil anomalies, however the elevated gold values come from upslope of this mapped sill. Golden Predator employees encountered a number of smaller sills outcropping intermittently along this ridge. The possibility of a number of stacked sills is quite probable, as the government mapping was done over such a large amount of terrain that detailed mapping would not have been possible. The elevated gold values in rocks proximal and upslope to this mapped sill is hosted in mineralized (arsenopyrite/schorodite) monzonite float. High gold in soils were recorded downslope on multiple sides of the ridge upon which this sample was found.

In addition to the elevated samples in the Cho block previously described, distal to the Mount Joy syenite pluton, at the Bloom showing, a rock sample taken nearly 350 meters away from the initial Bloom showing showed elevated gold (1.13 g/t Au), copper (7160 ppm Cu) and silver (2.83 g/t Ag). The sample came from an intrusive body with a number of quartz veins which is exposed along the ridge, yet not mapped.

Recommendations for the property are, in advance of a small drilling campaign, to complete a number of contoured soil lines, followed by grid sampling over the area's which show good potential. The distance from any sort of civilization mean a fly camp is a necessity. Providing Golden Predator is doing work in the area from the Plata airstrip, work could be completed in house. However, the most economically feasible way of sampling baring Golden Predator working in the area, is to hire a sampling crew to complete a soil program over a number of days in a fly camp, with helicopter support. Timing would be essential to maximize sample locations in the short snowless summer months. With the completion of a proper soil sampling campaign, a mapping program to better define mineralized sill would be recommended, followed by a small drilling campaign.

It should be noted however, that at the current level of exploration, the properties size potential appears to be limited. The location and logistical issues being this far from any civilization make the likelihood of advancing this project beyond exploration very small.

I, Tyler Bourne, of the city of Penticton, in the Province of British Columbia, do hereby certify that:

- 1) From 2009 to present I have been an employee and geologist with Golden Predator Canada Corp. with an address at 1 Lindeman Road, Whitehorse Y.T, Canada, Y1A 5Z7.
- 2) I graduated from the University of British Columbia with a Bachelor of Science in Earth and Environmental Science in 2009.
- 3) From 2007 to present I have been actively engaged in mineral exploration in Canada, with a focus in gold exploration.
- 4) I am a member with the Society of Economic Geologists, membership number 900396.
- 5) The information for this report is based on information as itemized in the reference section of this report and from the works the authors of this report performed on the CHO/CHOC/CHOX and NWP claims from June 6th to June 11th 2012

Dated this 12th day of March 2013

Respectfully submitted

A handwritten signature in blue ink, appearing to read 'Tyler Bourne', with a long horizontal flourish extending to the right.

Sample I.D	Au ppm	Sample Description
Rock Samples		
Sample I.D		Sample Description
AA050051		Highly silicious SST/chert, intense QZ veins, subcrop
AA050052		Sedimentary (siltstone) at contact with intrusive.
AA050053		Altered Monzonite. Bleached, no remaining texture, FeOx pits
AA050054		Altered Monzonite intrusive. Py possibly weathered out (square vugs). Bleached, no texture, highly silicified, QZ eyes. At contact with siltstone on ridge top, all subcrop no structural data available.
AA050055		Siltstone @ monzonite intrusive
AA050056		Monzonite altered (bleached no texture) and abundant ASPY blebs
AA050057		Monzonite (?) intrusive. Scorodite tarnished ASPY blebs throughout, no texture.
AA050058		Aphanitic intrusive. Some plag/opx/bi (?) and pyrite/ASPY blebs (fine grained).
AA050059		QZ-rich Monzonite. FeOx pits - py?
AA050060		Monzonite. Bleached, QZ eyes, pitted FeOx possibly PY
AA050061		Mostly QZ vein, some monzonite (?), Appears to have copper oxide staining (malachite?)
AA050122		Intrusive body, possibly quartz monzonite, heavily weathered, traces of dissolved sulphides (pyrite) and traces of epidote (?)
AA050123		Country rock (cherty shales), heavily weathered, along side intrusive (AA050122)
AA050205		Talus, mm-cm wide, open-face fill quartz in blocky siltstone, veining has 5% ox. Sulphides
AA050207		Cherty siltstone with 20% QZ stockwork, 2% orange ox. Pods less than or equal to 2mm, very hard rock.
AA050214		Subcrop, brecciated, cherty siltstone, cemented with white qz, 3% oxidized blebs, contact (?) with felsic dyke.
AA050215		Outcrop, cherty or strongly silicified (?) siltstone, weakly brecciated with quartz infill, oxidized sulphides along fractures and discount. Stringers.
AA050219		Blocky weathering, stockwork veined chert, minor peacock staining on weathered surface, hematite and limonite oxidized fractures, qtz %-15% qtz veining
AA050222		Subcrop/Arseno/Scordite, possibly qtz monzonite as found below. Gold baby, GOLD!!
AA050233		Flost, solid qtz with qtz crystal cavities/soft rusty oxide throughout
AA050305		Outcrop, siltstone, irregular blocky weathering, weak FeOx stain, tr-1% fine disseminated py. Looks dead but maybe the pyrite will carry. Py could be diagenetic.
AA050313		Outcrop - Massive to vaguely bedded, rusty weathering, dyke vfg siltst, tr disseminated py. Strongly oxidized along fractures and layering.
AA050319		Outcrop, grey-brn irregular thin platy weathering, fg shaley siltstone, moderate FeOx stained along layering and fractures. Trace disseminated py layering (075/40)
AA050326		Subcrop, grab of qtz vn - trend approx sub-parallel to strike of host siltstone 075, dip?. White to grey, cg, with void filled euhedral to subhedral qtz. Trace FeOx stain, manganese staining, minor clay coating, NVS
AA050328		Outcrop, approx 1m wide feld porphyry dyke, trend subparallel to strike of siltstone ~065 (dyke), 15-20% feld in fg green grey groundmass. Trace disseminated py, moderate FeOx frac. (photo taken)
AA050330		Float, source is from subcrop 30m N, Tan buff weathering, feld-qtz porphyry dyke, bleached, weak clay alt, tr-1% sxs (mainly py, tr asp?), moderate manganese staining.
AA050335		Blocky, strong rust weathering, mass fg siltst. Tr fine disseminated py throughout
