267.29 - 276.53: Fine grained black and white carbonaceous mudstone with bands of white carbonate material, minor thin beds (?) of fine grey-green MAFt, less than 50 cm

<<Min: 267.29 - 296.82 0.01% Min: Pyrite>> Patches of mm sized blebs, usually associated with carbonate alteration

<<Vein: 271.83 - 272.22 90% Quartz-Carbonate>>

<<Struc: 270.9 - 271 Weak-Moderate Fault>> Interval containing 5 small sub-10cm gouge-crushed rock faults

<<Struc: 274.34 - 275.25 Strong Shear>> Interval of strong shearing, fabric is deformed withiin the shear zone, gouge development on the margins of the shear

276.53 278.62 MAFt Mafic Volcaniclastics grey-green FMG

276.53 - 278.62: Fine to medium grained grey-green well sorted mafic volcanislastic

278.62 286.23 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

278.62 - 286.23: Fine grained black and white carbonaceous mudstone with bands of white carbonate material, minor thin beds (?) of fine grey-green MAFt, less than 50 cm

<<Min: 278.62 - 296.82 0.01% Min: Pyrrhotite>> Patches of mm sized blebs, usually associated with carbonate alteration

<<Struc: 281.9 - 284.55 Moderate-Strong Fault>> Zone of broken rock including 4 2-30 cm intervals of gouge and broken rock

286.23 292.71 MAFt Mafic Volcaniclastics grey-green FMG

286.23 - 292.71: Fine to medium grained grey-green well sorted mafic volcanislastic interlayered with thin layers (beds?) of fine grained black carbonaceous mudstone 1-5 cm thick

292.71 296.82 FLZ Fault Zone light grey

292.71 - 296.82: Thick, intense fault zone, composed predominantly of rubbly/crushed rock with 4 20-30 cm zones of crushed rock and gouge

<<Alt: 292.71 - 296.82 Trace Calcite>> Weak calcite within the fault zone

<<Struc: 292.71 - 296.82 Strong Fault>> Thick, intense fault zone, composed predominantly of rubbly/crushed rock with 4 20-30 cm zones of crushed rock and gouge

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

296.82 304.91 RHYvx Quartz and/or feldspar crystal tuff light grey MCG

296.82 - 304.91: Light grey medium to coarse grained, clast rich, moderately to poorly sorted grit. The clasts present are dominantly angular crystal forms which have been pseudomorphed by quartz and calcite as well as abundant quartz eyes. Within the unit, there are two 5-20 cm ashy beds that grade in to the crystal rich portions. Common 1-4 cm black bands, oriented parallel to the foliation may represent welded (and flattened) pumice fragments.

<<Min: 296.82 - 307.43 0.01% Min: Pyrite>>

<<Alt: 296.82 - 329.23 Weak Calcite>> Weak calcite within the KZK ashy volcaniclastic rocks.

<<Vein: 297.41 - 298.84 20% Quartz-Carbonate>>

<<Struc: 299.68 - 300 Moderate Fault>> Zone of gouge andcrushed rock in equal parts, upper contact is at 45 degrees tca

<<Struc: 302.75 - 303.8 Weak-Moderate Fault>> Small interval of gouge and crushed rock

304.91 307.43 RHYvl Lapilli tuff light grey MG

304.91 - 307.43: Light to dark grey, poorly sorted lapilli bearing volcaniclastic conglomorate with rare quartz eyes. The lapilli have been pseudomorphed by quartz and calcite (quartz dominant).

<<Vein: 306.92 - 307.43 30% Quartz-Carbonate>>

<<Struc: 306.85 - 306.85 Moderate-Strong dominant foliation>> foliation defined by micaceous partings

307.43 308.05 FLZ Fault Zone light grey

307.43 - 308.05: light to medium grey fault zone comprising 30% gouge,30% crushed rock,and 40% rubbly/broken rock.

<<Struc: 307.43 - 308.05 Moderate-Strong Fault>> Intensely deformed foliation and development of gouge and crushed rock

308.05 309.80 RHYvl Lapilli tuff light grey MCG

308.05 - 309.8: light to mediu grey poorly sorted, lapilli and crystal (fragment?) bearing heterolithic tuffaceous conglomerate.

<<Min: 308.05 - 315 0.5% Min: Pyrite>>

<<Struc: 308.05 - 313.3 Weak-Moderate Fault>> Zone of broken rock with small (<5 cm) zones of crushed rock and minor gouge

309.80 311.03 RHYva Coarse grained to ash tuff grey-green FMG

309.8 - 311.03: light grey, moderately to well sorted, layered, tuffaceous siltstone, with rare (~1%) round lapilli clasts.

311.03 322.76 RHYva Coarse grained to ash tuff medium grey FCG

311.03 - 322.76: light grey rhyolitic vocaniclastic (resedimented?) with sections of scarce lapilli and sections containing what appear to be subrounded lithic fragments (crystalline, replaced by calcite and quartz, and crystal fragments.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Exploration
						Parent Hole:	

Comments:

The purpose of hole K16-385 was to test the down dip extension of the Krakatoa ore bodies. Total hole depth is 645 m.
The upper Krakatoa lens is thought to have been intersected as moderate-strong muscovite alteration and narrow intervals of pyrite-rich (with trace CP/SP) semi-massive sulphide was found along strike of upper lens mineralization in K16-369 (K16-385 depth 493-508 m).
The lower Krakatoa lens was not intersected in this hole, though moderate to moderate-strong muscovite alteration is present along strike of K16-369 lower lens mineralization (K16-385 depth 525-560 m).
Moderate muscovite alteration is continuous between 460-625 m. Trace-weak chlorite alteration is found between 530-645 m and is concentrated in lapilli of the RHYvl units.
The drill hole collared into the Wind Lake formation at 5 m depth, which consists of intercalated calcareous mafic tuffs and mudstone down to 269 m core depth. The contact between the Wind Lake formation and the KZK formation is conformable. The KZK formation consists of felsic volcanics stretching from 269 m to EOH at 645 m depth. Felsic volcanic rocks consist mostly of unaltered to weakly altered (muscovite and or chlorite) ash and or lapilli tuff with lesser abundances of coherent rhyolite, mixed ash and pelite.
Large rhyolite dikes (RHYi) occur between 309.45-328 m and 430-442 m, and are each associated with silicification, weak to moderate muscovite alteration (intensity 2-4) and pyrite (up to 5-10% in short intervals usually less than 20 cm).
Large fault zones are observed between 39-48 m, 61-66 m and 417-425 m.

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
						Parent Hole:	

Comments:

The purpose of hole K16-386 was to conduct a geotechnical investigation pertaining to the construction of a Class A storage facility in the area. 1 SPT test and 3 packer tests were conducted in overburden and bedrock respectively. A standpipe piezometer was also installed. The stratigraphy covered in the hole consisted of Wind Lake Formation ash-rich mafic volcaniclastic underlain by calcareous and carbonaceous mudstone. Local concentrations of PY and PO reached 3 and 5% respectively within the mudstone unit, with trace CP being present within some qtz-carb veins. No significant alteration was observed in this hole.

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
						Parent Hole:	

Comments:

The purpose of hole K16-387 was for engineering infrastructure purposes, specifically pertaining to the Class A storage facility, south-extent. Knight Piesold conducted one SPT test in overburden and three packer tests in bedrock; a thermistor was installed. K16-387 did not intercept massive sulphide or strong alteration. The hole is composed of interbedded mudstone, fine-coarse grained mafic tuff and coarse grain mafic intrusive lithologies. Pyrite and pyrrhotite mineralization does not exceed 1%. Carbonate mineralization intensity is on average a 4 (moderate) from top to bottom of hole.

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	7/9/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	7/13/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource/Met
						Parent Hole:	

Comments:

The purpose of the drill hole is resource infill confirmation and to collect a metallurgical sample of GP4F main lens mineralization. The DDH intersected a good looking lens of upper (GP4F) mineralization with sections of OF and OL plus OJ from 157.20-166.90m. The lower lens, consisting of intermittent OJ type mineralization, was intersected from 220.66-230.65m. It consists of three weakly to moderately OJ horizons surrounded by weaker alteration and minor disseminated sulfides. The lower lens is skarny looking (due to a nearby granite?), has maroon - brown biotite in irregular bands, local strong qtz-tourmaline veins, mineralization is possibly replacing upper portion of a calcareous horizon. No sign of proximal yellow - white muscovite alteration near mineralization as noted at ABM and Krakatoa but there is fine white muscovite near mineralization and concentrated in and near fractures, faults, and qtz veins, this muscovite was more abundant near the lower lens.

0.00 6.00 OVBN Overburden

6.00 28.40 RHYvl Lapilli tuff

6 - 28.4: Patchy BI Bippo on folia,surrouding lpl, sparse below 14m. Qtz veins approx. 7-16.3m. 24.2-28.4: Fault zone, broken and missing core.

<<Alt: 6 - 18.3 Weak Calcite>>

<<Alt: 18.3 - 28.4 Weak Calcite>> also calcite stringers

<<Vein: 6 - 16.3 8% Quartz 70 deg. >> mostly qtz vein rubble but some 1cm 'sheeted' veinlets as well.

<<Vein: 21.15 - 22.5 10% Quartz-Carbonate 80 deg. >> qtz-calcite veinlets, BI selvege.

<<Struc: 6 - 18.38 Weak-Moderate Fault>> numerous zones of broken and missing core, 0.3-1.3m long, commonly associated with qtz veining.

<<Struc: 17 - 18 Moderate-Strong dominant foliation>>

<<Struc: 18.38 - 24 Weak Fault>> broken core, steep (low angle to core axis) fractures with clay and Fe oxide - limonite coatings.

<<Struc: 23.7 - 24.25 Moderate-Strong dominant foliation>>

<<Struc: 24 - 28.5 Strong Fault>> cor rubble, missing core, fine sand and limonite on steep fractures.

28.40 29.60 PEL Equigranular biotite + calcite +/- quartz rock

28.4 - 29.6: ash-PEL, local silic blebby texture on <1cm scale (29.6-33.5m), felsic fragmental?

<<Alt: 28.4 - 29.6 Moderate-Strong Calcite>>

<<Struc: 28.5 - 29.6 Weak Fault>> broken core, step fractures as above.

29.60 37.70 RHYvl Lapilli tuff

29.6 - 37.7: blebby siliceous lpl. Curdy texture but on mm scale. Likely more a felsic fragmental rock than a lpl tuff.

<<Min: 34.5 - 36.4 0.1% Min: Pyrite>>

<<Alt: 29.6 - 33.8 Weak Calcite>> mostly blebs, fracture filling and veinlets

<<Alt: 33.8 - 37.7 Weak-Moderate Calcite>> mostly blebs, fracture filling and veinlets

<<Struc: 29.6 - 31.7 Moderate Fault>> broken core and core rubble, steep fractures.

<<Struc: 31.7 - 33.55 Trace Fault>> fractures

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 33.55 - 33.8 Weak-Moderate Fault>>

<<Struc: 33.8 - 34.9 Weak Fault>> fractures

<<Struc: 34.9 - 35 Moderate Fault>>

<<Struc: 35 - 36.8 Trace Fault>> fractures

<<Struc: 36.8 - 38.2 Weak Fault>> broken core and rubble

37.70 38.30 PEL Equigranular biotite + calcite brown +/- quartz rock

37.7 - 38.3: Oxidized, proximal to fault zone, biotite destroyed.

<<Alt: 37.7 - 38.3 Moderate Calcite>>

<<Struc: 38.2 - 43.87 Strong Fault>> missing core, minor gouge recovered, broken core and core rubble.

38.30 49.74 RHYva Coarse grained to ash tuff

38.3 - 49.74: proximal to fault zone and oxidized, original textures obscured.

<<Min: 45 - 46 0.1% Min: Pyrite>>

<<Alt: 38.3 - 45.3 Weak Calcite>>

<<Alt: 45.3 - 50.7 Weak-Moderate Calcite>> also calcite stringers and fracture filling

<<Struc: 46.1 - 47 Moderate-Strong Fault>> missing core, minor gouge recovered, broken core and core rubble.

<<Struc: 47 - 49.35 Weak-Moderate Fault>> minor broken, fractured, crushed zones

<<Struc: 49.35 - 49.6 Strong Fault>> clay gouge, missing core

<<Struc: 49.6 - 51.85 Moderate Fault>> rubble, crushed, steep fractures

49.74 51.57 PEL Equigranular biotite + calcite +/- quartz rock

49.74 - 51.57: proximal to fault zone and partially oxidized

<<Alt: 50.7 - 51.57 Moderate-Strong Calcite>>

<<Vein: 50.5 - 51.75 10% Quartz-Carbonate 80 deg. >>

51.57 52.67 RHYvl Lapilli tuff

<<Alt: 51.57 - 54 Moderate-Strong Calcite>>

<<Vein: 52.64 - 54 10% Calcite 75 deg. >>

52.67 54.00 PEL Equigranular biotite + calcite +/- quartz rock

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

54.00 67.20 RHYi Aphanitic Rhyolite (intrusion)

54 - 67.2: Possible RHYc and RHYcw but looks like RHYi, massive,glassy, shattered glassy texture on sub mm scale and no foliation. Rare blebby texture. Very rare blue qtz phenos.

<<Min: 54 - 65 0.1% Min: Pyrite>>

<<Alt: 54 - 57 Weak Muscovite>> on folia

<<Alt: 54 - 57.75 Weak Calcite>> mostly fracture filling

<<Alt: 57 - 59.6 Moderate Muscovite>> sericite - clay with fault zone

<<Alt: 57.75 - 67.2 Trace Calcite>> fracture filling

<<Vein: 59.4 - 60.85 10% Quartz 75 deg. >>

<<Vein: 63.9 - 79.4 5% Quartz>> glassy qtz veins, locally dismembered, irregular margins.looks like Qtz veins in RHYi

<<Struc: 55 - 55.7 Weak-Moderate dominant foliation>>

<<Struc: 58.9 - 59.7 Strong Fault>> gouge, crushed

<<Struc: 64.75 - 66.6 Weak-Moderate Fault>> crushed zones on fractures

67.20 67.50 PEL Equigranular biotite + calcite +/- quartz rock

67.2 - 67.5: strongly oxidized

<<Alt: 67.2 - 67.5 Moderate-Strong Calcite>>

67.50 67.77 RHY undifferentiated rhyolite

67.77 68.00 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

<<Alt: 67.77 - 68 Moderate Calcite>>

68.00 77.60 RHYi Aphanitic Rhyolite (intrusion)

68 - 77.6: locally mm size curdy - blebby texture and in places definitley looks like RHYi. Same as 54.00-67.20m.

<<Min: 68 - 72.1 0.1% Min: Pyrrhotite>>

<<Min: 77.5 - 79.53 0.1% Min: Pyrite>>

<<Alt: 68 - 79.53 Trace Calcite>> fracture filling

<<Alt: 77.1 - 79.53 Weak Biotite>> Bippo

<<Struc: 71.55 - 71.6 Moderate Vein>>

<<Struc: 73 - 75 Weak Fault>>

77.60 79.53 RHY undifferentiated rhyolite

77.6 - 79.53: Grey. Foliated with biotite folia and qtz bands. Missing textures describd for above RHYi.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 78 - 79 Weak-Moderate dominant foliation>>

79.53 81.40 PEL Equigranular biotite + calcite +/- quartz rock

<<Alt: 79.53 - 81.4 Moderate-Strong Calcite>>

<<Alt: 79.53 - 81.4 Weak Biotite>> Bippo

<<Struc: 79.65 - 79.95 Moderate-Strong Fault>> crushed, minor gouge

81.40 96.50 RHYvl Lapilli tuff

81.4 - 96.5: localy blebby clasts versus more typical flattened stretched lpl. Blue qtz - eyes 81.4-85.0m. Biotile increases downhole from 93.6m. Weak BCQlpl blotchy texture from 94m down.

<<Min: 91.2 - 93.52 0.1% Min: Pyrite>>

Comments:						Parent Hole:	

Hole K16-389 was planned to test the ground for a class A Storage Facility, north extent; the Knight-Piésold crew conducted 6 SPT tests in overburden, 3 packer tests in bedrock, and installed a 10 node thermistor. Mafic tuffaceous siltstones-sandstones and mudstone containing intervals of conglomerate. No significant mineralized intervals are present in the hole however, there is pyrrhotite and pyrite in minor quantities throughout the majority of the hole and a quartz carbonate vein containing pyrite and galena from 32.56 to 32.68 m depth.

18.12 21.02 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black FG

18.12 - 21.02: Fine grained black-grey, well laminated mudstone (MDS) with lithic (or rip-up) clasts of mudstone showing discordant bedding, with minor beds(<5cm) of MAFt

<<Min: 18.12 - 21.02 0.5% Min: Pyrrhotite>> Associated with carbonate bands and blebs

21.02 28.89 MAFt Mafic Volcaniclastics grey-green FMG

21.02 - 28.89: Fine to medium grained grey-green MAFt with minor interbedded MDS (<40cm). Poorly bedded, with a mix of large massive beds and sub-cm beds. The lower 2m has finely interbedded MDS. Black euhedral foliation parallel and disseminated biotite porphyroblasts are present throughout the unit.

<<Min: 26.2 - 30.9 0.01% Min: Pyrite>> Associated with carbonate bands and blebs

<<Min: 26.2 - 30.9 0.01% Min: Pyrrhotite>> Associated with carbonate bands and blebs

<<Alt: 23.93 - 25.7 Moderate Biotite>> Disseminate 1-2mm porphyroblasts of black biotite

<<Alt: 25.7 - 26.22 Weak Biotite>> Sparsely disseminated coarse black biotite porhphyroblasts

<<Vein: 23.12 - 23.15 100% Quartz-Carbonate>>

<<Vein: 23.27 - 23.94 50% Quartz-Carbonate>> Patches of Muscovite-chlorite are most likely incorporated and altered wall-rock

<<Vein: 24.88 - 24.9 100% Quartz-Carbonate>>

<<Struc: 27 - 27 Moderate dominant foliation>> Partings along calcite bands and/or chloritic/micaceous surfaces

28.89 30.33 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black FG

28.89 - 30.33: Fine grained, finely laminated black-grey carbonaceous mudstone with thin beds of MAFt as well as clasts of mudstone and mafic tuff disrupting bedding

30.33 30.90 MAFt Mafic Volcaniclastics grey-green FMG

30.33 - 30.9: Massive to poorly bedded grey-green ashy (?) mafic tuff unit with fine interbeds of grey and white chaotically bedded mudstone and blebs of carbonate-pyrrhotite.

<<Vein: 30.34 - 30.35 100% Quartz-Carbonate>>

30.90 33.09 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black FG

30.9 - 33.09: Fine grained, finely but chaotically laminated black-grey carbonaceous mudstone with thin beds of MAFt as well as clasts of mudstone disrupting bedding

<<Min: 32.56 - 32.68 4% Min: Pyrite>>

<<Min: 32.56 - 32.68 1% Min: Galena>>

<<Vein: 32.56 - 32.68 60% Quartz-Carbonate>> Sulphides comprise 80% pyrite, 20% galena

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

33.09 34.19 MAFt Mafic Volcaniclastics grey-green MG

33.09 - 34.19: Poorly to well bedded grey-green ashy (?) mafic tuff unit with small black biotite blebs (clasts?)

34.19 41.75 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

34.19 - 41.75: Fine grained, finely but chaotically laminated dark grey carbonaceous mudstone with clasts of mudstone and possibly lapilli disrupting bedding.

<<Min: 34.19 - 42 0.01% Min: Pyrite>> Associated with carbonate bands and blebs

<<Min: 34.19 - 42 0.5% Min: Pyrrhotite>> Associated with carbonate bands and blebs

<<Struc: 36.5 - 36.5 Moderate dominant foliation>> Partings along calcite bands and/or chloritic/micaceous surfaces

<<Struc: 41 - 41 Moderate dominant foliation>> Partings along calcite bands and/or chloritic/micaceous surfaces

41.75 42.00 MAFt Mafic Volcaniclastics grey-green CG

41.75 - 42: Massive to poorly bedded grey-green ashy (?) mafic tuff unit.

Comments:

The purpose of K16-390 was to test the overburden and bedrock below the Class A storage facility, north extent. Three SPT tests were conducted in overburden and three packer tests in bedrock. Additionally, a thermistor was installed. Core from K16-390 is observed to be a package of interbedded mudstones and mafic tuffs from the Wind Lake Fm. Several faults intersect K16-390 leaving most of the core rubbly. Weak to partial oxidation was observed from 1.5 m to end of hole. No mineralization or strong alteration was present.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	7/13/2016
Local Elev. (m):				Hole Completed?:	Abandoned	Purpose:	Exploration
Comments:						Parent Hole:	

Drill Hole K16-391 was drilled as a second attempt at planned hole SEB001 after the abandonment of K16-384 due to excessive azimuth deviation. K16-391 was abandoned at 101m depth due to excessive azimuth deviation. The lithologies in the core comprise the mudstone-conglomerate MDS and the volcaniclastic MAFt of the Wind Lake Formation. No significant mineralized intercepts are present in the core. Two silicified zones near the top and bottom of the hole may indicate syn-mineralization fluids within the Wind Lake Formation however, this inference is tenuous at best.

<<Struc: 70.2 - 70.2 Moderate dominant foliation>> Foliation defined by micaceous/pyritic partings

<<Struc: 75.02 - 75.18 Moderate Fault>> Zone of well consolidated gouge and crushed rock

76.04 79.09 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

76.04 - 79.09: Fine dark grey-black mudstone with thin chaotic bands of carbonate material, brecciated locally by a through-going fault zone.

<<Min: 76.18 - 76.38 0.5% Min: Galena>> Galena bearing quartz-carbonate vein

<<Vein: 76.18 - 76.38 95% Quartz-Carbonate-Sulphide>> <1% Galena

<<Struc: 76.38 - 79.88 Moderate Fault>> Zone of crushed rock with firm gouge as a matrix and intervals of broken rock/rubble

79.09 82.17 MAFt Mafic Volcaniclastics grey-green FMG

79.09 - 82.17: Fine grained, well foliated (bedded?) ashy volcaniclastic rock with bands and flecks of carbonate material

<<Min: 79.09 - 86.72 3% Min: Pyrite>> discodant branching veins of pyrite

<<Vein: 79.09 - 86.72 2% Pyrite>>

<<Struc: 80.5 - 80.5 Weak-Moderate dominant foliation>> Foliation defined by chloritic partings

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

82.17 86.72 MDS Carbonaceous Mudstone & Tuffaceous Mudstone light grey FMG

82.17 - 86.72: Fine to medium grained light grey and black to black and light grey siltstone-sandstone(???). light portions have a granular appearance with minimal carbonate material and bands of black materail that appear to be normal MDS. Interbeds of grey-green MAFt are common. Could be ableached unit

<<Alt: 82.17 - 86.72 Weak-Moderate Silicification>> Texturally very simiar to the typical MDS of the Wind Lake Formation. Carbonate bands replaced by siliceous material

86.72 93.99 FLZ Fault Zone grey-green FCG

86.72 - 93.99: Intense, large fault zone comprises gouge, crushed rock, and rubble. From the colour it is apparent that it cuts the MAFt.

<<Alt: 93.94 - 97.75 Weak Calcite>> Rare patches of calcite in the ashy MAFt

<<Vein: 86.72 - 88 60% Quartz-Carbonate>>

<<Struc: 86.72 - 93.97 Moderate Fault>> Zone primarily composed of rubble with three 40 cm sections of crushed rock consolidated by firm gouge

93.99 97.75 MAFt Mafic Volcaniclastics grey-green MG

93.99 - 97.75: light grey green sandy textured medium grained volcaniclastic rock with carbonate material bands and clots of pyrite.

97.75 99.66 FLZ Fault Zone grey-green FCG

97.75 - 99.66: Fault zone composed exclusively of gouge an pebble-granule sized crushed rock

<<Alt: 97.75 - 99.66 Moderate Calcite>> Abundant calcite throughout the fault interval

<<Struc: 97.75 - 99.66 Strong Fault>> Zone of gouge with minor crushed rock and rubble

99.66 100.22 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

99.66 - 100.22: Fine grained black and white streaked carbonaceous mud/siltstone

<<Min: 99.66 - 100.22 1% Min: Pyrite>> Bleb of pyrite in a quartz-carbonate vein.

<<Alt: 99.66 - 101 Trace Calcite>> Rare patches of calcite in the silicified MDS

100.22 101.00 MDS Carbonaceous Mudstone & Tuffaceous Mudstone light grey MG

100.22 - 101: Light and dark grey, massive rock, highly siliceous. cut by calcite veins. Possiblya silicified mudstone or a dirty sandstone (???)

<<Alt: 100.22 - 101 Moderate-Strong Silicification>> This has the same textures as the MDS, could it be a sandstone though?\

Comments:						Parent Hole:	

K16-392 was drilled to test the geotechnical properties of the proposed north extent of the mill site. 4 SPT tests were performed in the overburden, and 4 packer tests in the bedrock. A 10 node thermistor was installed.
K16-392 encounters bedrock at ~4.5 m, and consists of mixed mudstone and mafic tuffs of the Wind Lake Formation.

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource/Met
						Parent Hole:	

Comments:

The purpose of the DDH was resource infill and to collect a metallurgical sample of the GP4F sulfide lens. The drill hole was successful and met the objectives. The GP4F lens was intersected at 76.37-80.12 m, near the anticipated depth, below and within the Qtz eye marker unit. As seen in other holes a 10+m thick RHYcf unit underlies the GP4F lens. A weak set of sheeted calcite-qtz-chlorite-sulfide veinlets, hosted by RHY units, is found in both the hanging wall and footwall of the GP4F. An obvious lower lens was not intersected although from about 120.18-127.3 weak chlorite alteration and trace sp-gl was noted and strong chlorite-biotite alteration and 1-3% pyrite was observed from about 142.2-147.00 m in an area of high core loss. From 133.6-147.00m the PEL and RHY units are weakly to intensely sheared and faulted and from 147.00-156.00m the DDH is in a gouge fault zone with lots of lost core. Rounded core rubble of intense chlorite alteration with Py-Sp-Gl was noted from 154.50-154.80m - could be OJ type mineralization of lower lens or cave material.

101.02 113.75 RHYcf Feldspar & feldspar quartz porphyry

101.02 - 113.75: massive light grey unit, very little foliaform biotite unlike adjacent RHYvx, 5-10% feldspar phenocrysts, sparse blue qtz eyes (unlike abunadant QE in adjacent RHYvx). Uniform except for rare wispy biotite bands).

<<Alt: 101.9 - 105.2 Weak-Moderate Muscovite>> sericite on fractures

<<Alt: 105.2 - 120.18 Weak Muscovite>>

<<Alt: 108 - 120.18 Weak-Moderate Calcite>>

<<Struc: 107.42 - 108.1 Moderate Fault>> broken, core rubble

<<Struc: 109 - 113.75 Weak Fault>> fractured with clay-sericite

113.75 117.00 RHYvx Quartz and/or feldspar crystal tuff

113.75 - 117: as RNYvx QE above. Feldspar phenocrysts increase increase over last 0.75m.

<<Min: 113.75 - 117 3% Min: Pyrite>>

<<Min: 113.9 - 116.1 1% Min: Pyrrhotite>>

<<Alt: 113.75 - 117 Weak-Moderate Chlorite>>

<<Struc: 113.75 - 114 Moderate dominant foliation>>

117.00 120.18 RHYcf Feldspar & feldspar quartz porphyry

117 - 120.18: similar to RHYcf above but more feldspar phenocrysts.

<<Min: 117 - 139.15 1% Min: Pyrite>>

<<Alt: 119.7 - 125.9 Weak-Moderate Biotite>> PATCHY

<<Struc: 117 - 119 Weak-Moderate Fault>> broken, fractured with clay-sericite

120.18 122.20 RHY undifferentiated rhyolite

120.18 - 122.2: altered, strong sericite zone, some missing core.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 120.18 - 122.2 Moderate Muscovite>> sericite in healed shear zone

<<Alt: 120.18 - 124 Moderate-Strong Calcite>>

<<Struc: 120.25 - 122 Weak-Moderate Fault>> broken, fractured with clay-sericite, missing core

122.20 122.70 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

122.2 - 122.7: med grained qtz-biot-feldspar (dyke?), finer grained on margins.

<<Alt: 122.2 - 129.48 Weak Muscovite>>

122.70 125.96 RHYva Coarse grained to ash tuff

122.7 - 125.96: Messy unit, RHYva-PEL, rare blue qtz eyes in RHYva sections. Unit is approximately where lower lens was expected.

<<Min: 123.4 - 125.4 0.5% Min: Sphalerite>> mm veinlets

<<Min: 123.4 - 125.4 0.5% Min: Galena>>

<<Alt: 124 - 127 Weak Calcite>>

<<Alt: 124.6 - 127.5 Weak-Moderate Chlorite>> PATCHY

<<Vein: 125.6 - 125.75 50% Quartz>> qtz flooding

<<Struc: 122.75 - 124.1 Moderate-Strong Fault>> broken and crushed core, minor gouge, sericite-clay on fractures.

125.96 127.00 RHY undifferentiated rhyolite

125.96 - 127: possibly a partly silicified RHYva.

<<Struc: 126.15 - 126.25 Weak dominant foliation>>

<<Struc: 126.9 - 127 Weak Fault>> broken, fractured with clay-sericite

127.00 132.07 PEL Equigranular biotite + calcite +/- quartz rock

127 - 132.07: Bi-r PEL at margins and bleached PEL in center (128,70-130.06m). Minor qtz-cal-chl bands with trace diss sulphides below 130.06m.

<<Alt: 127 - 132.1 Trace Calcite>>

<<Alt: 128.38 - 128.58 Weak Garnet>>

<<Vein: 127 - 127.3 50% Calcite>> calcite vein breccia, margin of PEL unit

<<Vein: 128.5 - 132.2 5% Calcite>> calcite bands

<<Struc: 128.8 - 129.5 Weak Fault>> broken, fractured with clay-sericite

<<Struc: 129.6 - 129.9 Moderate dominant foliation>> Calcite bands

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

132.07 136.66 RHYvx Quartz and/or feldspar crystal tuff

132.07 - 136.66: 133.42m; 15cm PEL unit. 133.57-136.34m; fault zone in RHYvx - QE

<<Alt: 132.07 - 139.15 Weak-Moderate Muscovite>> in breccciated fault zone

<<Alt: 132.1 - 133.4 Weak Calcite>>

<<Alt: 133.4 - 138 Moderate Calcite>>

<<Struc: 133.11 - 136 Strong Fault>> missing core, broken and crushed core, minor gouge, sericite-clay on fractures.

136.66 137.50 PEL Equigranular biotite + calcite +/- quartz rock

137.50 139.10 RHYvx Quartz and/or feldspar crystal tuff

137.5 - 139.1: broken, crushed RHYvx - in fault zone, missing core

<<Alt: 138 - 139.15 Weak Calcite>> patchy

<<Struc: 137.5 - 139.15 Strong Fault>> broken and crushed core, minor gouge, sericite-clay on fractures.

139.10 147.00 PEL Equigranular biotite + calcite +/- quartz rock

139.1 - 147: broken, crushed PEL - in fault zone, missing core. Minor RHYvx-QE with abundant biotite at approx.139.7-140.80m.

<<Min: 139.15 - 143.6 0.5% Min: Pyrite>>

<<Min: 143.6 - 147 3% Min: Pyrite>>

<<Alt: 139.14 - 143.4 Weak-Moderate Chlorite>>

<<Alt: 139.15 - 153 Moderate-Strong Calcite>> patchy, minor non calc or wekly calcareous sections. Blebs, veins, diss cc.

<<Alt: 143.4 - 147.3 Moderate Chlorite>> and as diss and blebs. In sheared PEL unit

<<Alt: 143.4 - 147.3 Weak-Moderate Biotite>> with chlorite

<<Vein: 139.15 - 147 10% Calcite>> calcite bands, veins and vein clasts, both foliaform and cross cutting

147.00 156.00 FLZ Fault Zone

147 - 156: Gouge and crushed - broken core, missing core. Pieces of PEL, RHY and possibly weakly mineralized OJ at 154.50-154.80m (Chlorite with minor diss SP and PY). 154.5-156.0m :wash and cave.

<<Min: 154.5 - 154.8 0.5% Min: Sphalerite>>

<<Min: 154.5 - 154.8 10% Min: Pyrite>>

<<Min: 154.5 - 154.8 0.5% Min: Galena>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
<<Alt: 153 - 154.2 Trace Calcite>> fault gouge											
<<Alt: 154.5 - 154.8 Strong Chlorite>> could be cave material											
<<Vein: 147.1 - 149.9 20% Quartz-Carbonate>> fault breccia, qtz clasts cemented by calcite											
End of Hole @ 156

Local Elev. (m):				Hole Completed?:	Abandoned	Purpose:	Exploration
						Parent Hole:	

Comments:

Northeastern-most of three Sebesi exploration holes designed to test for offset Krakatoa Zone mineralization in between the Sunda and Fault Creek Faults.
The top of the hole consists of calcareous and siliceous mudstone interbedded with mafic tuff units belonging to the Wind Lake Formation. The KZK Formation was intercepted at 293.06 m. A conformal interfingered contact is observed, followed by reworked material -detrital/volcaniclastic-mixed with pelite and muddy ash.
Lapilli and crystal fragments within a fine matrix are observed from 495.05m to 517.50 m, followed by a fault zone from 517.50 m to 562.06 m. Siliceous units are encountered from 615.20 m to 639.70 m, consisting in feldspar porphyry and quartz eyes in aphanitic groundmass.
A second major fault zone occurs from 684.18 m to 746.79 m.
At 769.15 m, interbedded mudstone and mafic tuff occurs, similar to the Wind Lake Formation. A 0.50 m interval of OF type massive sulfide (PO/SP/PY/CP/GL) occurs from 797.38 - 797.88 m and underlies a rhyolite flow. Sedimentary sequences alternating with felsic volcanics occur from 834.30 - 953.31 m.
Weak to moderate muscovite alteration (other than related to faulting) is noticed from 652.37m to 724.80 m, with a maximum intensity between 684.19 m to 703.15 m. This interval is also marked by increasing amount of disseminated PY.
Hole K16-394 ends at 953.31 m in volcaniclastic rhyolite that displays weak to moderate muscovite alteration. The hole was stopped at 953.31 m when the drill string became stuck. Four cuts were completed in order to retrieve the HQ drill string and complete a DHEM survey from ~860 m that includes the massive sulfide mineralization at 797.38m as well as the main muscovite alteration zone.

<<Alt: 4 - 19.07 Weak-Moderate Calcite>>

8.02 12.34 MAFt Mafic Volcaniclastics

8.02 - 12.34: Light grey/green, containing wavy CA crenulated veinlets (clots/pseudo fragmental texture). Intermediate composition. PO/PY disseminated.

12.34 14.67 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

12.34 - 14.67: CA veined mudstone, weakly graphitic, thinly foliated.

14.67 16.10 RHY undifferentiated rhyolite

14.67 - 16.1: Episclastic intermediate, Silicic bands at contacts, clasts.

16.10 19.07 MAFt Mafic Volcaniclastics

16.1 - 19.07: Oxidized mafic tuff. Locally rounded clasts, possibly reworked sediments.

<<Struc: 16.3 - 16.7 Weak-Moderate Fault>>

<<Struc: 18.4 - 19 Weak Fault>>

19.07 24.70 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

19.07 - 24.7: "Cherty" mudstone. Crenulated, irregular SI bands.

<<Alt: 19.07 - 24.7 Trace Calcite>>

24.70 48.83 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

24.7 - 48.83: Interbedded with mafic tuff. Calcite veining. Locally silica bands. From 41.00m to 43.00m, few mineralization (CP/SP/PY/PO). Bulk QZ veins and CA veins up to 15cm wide.

<<Min: 41 - 43 0.5% Min: Sphalerite>>

<<Min: 41 - 43 0.5% Min: Chalcopyrite>>

<<Min: 43 - 120.6 0.5% Min: Pyrite>> and wispy fine grain PY.

<<Min: 43 - 120.6 2% Min: Pyrrhotite>> Mostly in mafic tuff unit.

<<Alt: 24.7 - 48.3 Moderate-Strong Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 48.3 - 85.28 Moderate Calcite>>

<<Vein: 38.8 - 38.9 Calcite>> CA, minor QZ.

<<Vein: 46.1 - 48.37 Quartz-Carbonate>> Massive QZ veins containing fragment of schist and semi massive QZ/CA vein.

<<Struc: 37 - 38 Weak-Moderate Fault>> Fault gouge, folded mudstone.

48.83 50.64 MAFt Mafic Volcaniclastics

48.83 - 50.64: CA veining. Aggregated ferro-carbonate ("pseudo-leucoxene"), PY in fracture.

50.64 73.33 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

50.64 - 73.33: Fractured, locally faulted weakly graphitic mudstone and mafic tuff interbedded containing brown mica in foliation and elongated PO and clots/fine grain PY veinlets. CA veining. Bulk CA/glassy QZ veins up to 60cn wide. Foliation crenulated, Si veining and patch.

<<Vein: 58.92 - 61.15 Quartz-Carbonate>> CA/QZ veins representing 40% of the interval.

<<Vein: 69.49 - 70.14 Quartz-Carbonate>> CA/QZ massive vein containing fragments of mafic tuff.

73.33 85.28 MAFta Coarse grained to ash tuff

73.33 - 85.28: Interbedded with CA veined mudstone. Locally faulted. Patch of brown mica in foliation. Speck of elongated PO. Massive QZ/CA/TML vein.

<<Vein: 82.96 - 84.25 Quartz-Tourmaline>> QZ/TML veins containing fragments of schist.

<<Struc: 79.12 - 80.2 Weak Fault>> Highly fractured.

85.28 91.35 MAFt Mafic Volcaniclastics

85.28 - 91.35: Interbedded with mudstone. Faulted/sheared, locally oxidized. Sharp upper contact.

<<Alt: 85.28 - 120.6 Weak Calcite>>

<<Struc: 85.28 - 88 Moderate Fault>> Core washed. Gouge.

<<Struc: 89 - 100 Moderate-Strong Fault>> Fault gouge, weak shearing.

91.35 97.00 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

91.35 - 97: Graphitic mudstone disaggregated, gougy. Core washed over 2 m.

97.00 106.50 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

97 - 106.5: Highly fractured graphitic mudstone, siliceous.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

106.50 109.00 MAFt Mafic Volcaniclastics

106.5 - 109: Fractured/gougy mafic tuff, CA veining.

<<Struc: 107 - 111 Moderate Fault>> Fault gouge, weak shearing.

109.00 116.00 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

109 - 116: Graphitic gougy/disaggregated mudstone. Locally oxidized (probably mafic tuff interbedded). Siliceous.

<<Alt: 113 - 120.6 Moderate-Strong Silicification>> Silicified mudstone.

<<Struc: 111 - 120.6 Weak-Moderate Fault>> Fault gouge, moderate shearing.

116.00 117.50 MAFta Coarse grained to ash tuff

116 - 117.5: Sheared at lower contact.

117.50 120.60 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

117.5 - 120.6: Weakly sheared mudstone, lack of CA veining. Sharp upper and lower contacts.

120.60 145.71 MAFt Mafic Volcaniclastics

120.6 - 145.71: CL/CA/BI schist. Strongly CA veined mafic tuff, folded at upper contact. Locally granular texture and possible clasts up to 0.5cm. Partially oxidized from 128.00m to 130.75m. CA alteration obscuring the texture from 140.75m to 143.30m, CA veins and possibly clasts at 142.50m of ablitized mafic tuff or felsic dike fragment.

<<Min: 120.6 - 145 0.1% Min: Pyrite>>

<<Min: 120.6 - 145 0.5% Min: Pyrrhotite>>

<<Min: 145 - 154.75 2% Min: Pyrite>>

<<Min: 145 - 154.75 3% Min: Pyrrhotite>>

<<Alt: 120.6 - 145 Strong Calcite>> Locally intense.

<<Alt: 130.75 - 184.22 Moderate Biotite>>

<<Alt: 145 - 154.75 Weak Chlorite>> Could be original.

<<Alt: 145 - 284.89 Moderate-Strong Calcite>>

<<Vein: 140.65 - 143.3 Calcite>> Intense CA alteration marked by CA veins.

<<Struc: 127.9 - 129.9 Weak-Moderate Shear>> Folded and oxidized sandy gouge.

145.71 154.75 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

145.71 - 154.75: Patchy CL altered , CA veined poorly graphitic mudstone. PO clots and fine grain PY. Fine grain BI bands.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

154.75 169.60 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

154.75 - 169.6: Banded and disseminated BI porphyroblasts. CA veining. Mudstone interbedded.

<<Min: 154.75 - 188.03 1% Min: Pyrite>>

<<Min: 154.75 - 188.03 1% Min: Pyrrhotite>>

169.60 170.35 MAFt Mafic Volcaniclastics

169.6 - 170.35: BI porphyroblasts overprinted. Narrow interval showing silicification or albitization. Sharp upper contact, folding at lower contact. This unit could be interpreted as a felsic intrusion (dike) suggesting proximity of pluton.

<<Alt: 169.6 - 170.35 Strong Albite>>

170.35 184.22 MAFt Mafic Volcaniclastics

170.35 - 184.22: Vein interval from 176.72m to 178.65m (QZ/TML/brown BI and mafic tuff fragments, brecciated at lower contact. Possibly albite altered fragment, similar texture than encountered from 169.90m to 170.35m.

<<Vein: 176.72 - 178.65 Quartz-Tourmaline>> QZ/CA/brown biotite/TML/mafic tuff fragments.

<<Vein: 181.98 - 182.25 Quartz-Chlorite>> QZ/CA/CL/brown biotite vein.

<<Struc: 181.7 - 182 Weak-Moderate Shear>> Folded.193.80

184.22 188.03 MAFta Coarse grained to ash tuff

184.22 - 188.03: Unfoliated, fine grain, rare wavy CA veining, strong CA in matrix.

188.03 190.70 MAFt Mafic Volcaniclastics

188.03	189.00	0.97	D00005601	-0.005	1.3	0.03	0.01	0.1

188.03 - 190.7: BI banded. Possibly clasts up to 5cm wide showing primary wavy lamination "pillow style". Weak CL alteration (original?). PY/PO/CP associated in disseminated patch.

<<Min: 188.03 - 190.7 5% Min: Pyrite>>

189.00	190.00	1.00	D00005602	-0.005	2.3	0.05	0.02	0.22

<<Min: 188.03 - 190.7 3% Min: Pyrrhotite>>

281.08 283.27 MAFt Mafic Volcaniclastics

281.08 - 283.27: Light green, CA veining.

283.27 291.93 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

283.27 - 291.93: Blue/grey, siliceous mudstone, containing rare mafic tuff beds.

<<Alt: 284.89 - 291.93 Moderate-Strong Silicification>>

<<Alt: 284.89 - 291.93 Weak Calcite>>

<<Vein: 290.06 - 290.91 Quartz>> Massive QZ vein. Containing trace PO/PY/CP in fracture

291.93 293.06 MAFt Mafic Volcaniclastics

291.93 - 293.06: Light green, CA veining. Sharp upper contact, gradual conformable lower contact with KZK formation.

<<Alt: 291.93 - 293.06 Weak-Moderate Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

293.06 296.26 RHYvx Quartz and/or feldspar crystal tuff

293.06 - 296.26: Gradual upper contact. Some mafic interval interbedded. From 295.22 m to 295.83 m, mafic tuff containing 10 cm interval of cherty mudstone-Wind Lake.

<<Min: 293.26 - 363.24 0.1% Min: Pyrite>> and rare fractures.

<<Alt: 293.06 - 302.2 Weak Calcite>>

296.26 297.77 MAFt Mafic Volcaniclastics

296.26 - 297.77: Light green, containing possibly AK crystal. Sharp contacts. Interpreted as Wind Lake unit interfingered.

<<Min: 297.7 - 299.4 5% Min: Pyrrhotite>>

297.77 300.90 RHYvx Quartz and/or feldspar crystal tuff

297.77 - 300.9: Some 3 to 10 cm wide light grey/fine grain (ash).

<<Min: 299.4 - 363.24 1% Min: Pyrrhotite>>

<<Struc: 300.05 - 300.06 dominant foliation>> In KZK formation.

<<Struc: 300.55 - 300.56 dominant foliation>> In KZK formation.

300.90 302.20 MDSc Carbonaceous dominant mudstone

300.9 - 302.2: Strongly graphitic mudstone, could be associated with Wind Lake Formation. Disaggregated/faulted/gougy.

<<Struc: 301.15 - 302.2 Weak-Moderate Fault>> Gougy and highly fractured graphitic mudstone.

302.20 305.30 MDSt Rhyolite tuff dominant mudstone

302.2 - 305.3: Possibly carbonaceous content or BI giving dark blue color. Gradual lower contact, coarser grain at upper contact, possibly lithic fragments. Foliated. Rare QE at upper contact.

<<Alt: 302.2 - 313.54 Moderate Calcite>>

305.30 312.57 SED undifferentiated Sediment

305.3 - 312.57: "Dirty rhyolite" (?) containing calcareous pelitic interval from 306.36 m to 306.64 m as well as thin brownish beds. Elongated clasts possibly lapilli. Granular/gritty texture suggesting meta sandstone. Banded chlorite or green sericite locally, discordant QZ/TML veins.

<<Alt: 308.66 - 309.5 Moderate Chlorite>> Or green sericite-Halo associated with QZ/TML veins.

<<Vein: 306.64 - 310 Quartz-Tourmaline 20 deg. >> 3 large QZ/TML or TML deformed veins, shallow angle, alteration halo penetrating foliation.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

312.57 318.96 RHYvl Lapilli tuff

312.57 - 318.96: Light grey, well sorted lapilli tuff. Few BI porphyroblasts.

<<Alt: 313.54 - 314.27 Strong Calcite>>

<<Alt: 314.27 - 318.96 Moderate Calcite>>

<<Struc: 315.9 - 315.91 dominant foliation>>

<<Struc: 318 - 318.94 Weak-Moderate Fault>> Fault gouge, washed during drilling. Possibly moderate intensity.

318.96 319.95 MAFt Mafic Volcaniclastics

318.96 - 319.95: Light green, fine grain, faulted at upper contact. Probably pelite input.

<<Alt: 318.96 - 319.95 Strong Calcite>>

319.95 322.30 RHYva Coarse grained to ash tuff

319.95 - 322.3: Fine grain, dark grey, containing BI porphyroblasts.

<<Alt: 319.95 - 323.58 Weak-Moderate Calcite>>

322.30 326.77 MAFt Mafic Volcaniclastics

322.3 - 326.77: Fine grain, light green, CL/CA banded and CA in matrix. Including two narrow RHYvl intervals, 10 cm wide, sharp contacts.

<<Alt: 323.58 - 326.77 Moderate-Strong Calcite>>

326.77 328.09 RHYvl Lapilli tuff

326.77 - 328.09: Light grey, well sorted. Including 10cm wide MAFt interval (light green).

<<Alt: 326.77 - 328.09 Weak-Moderate Calcite>>

<<Struc: 326.8 - 326.81 dominant foliation>>

328.09 329.80 MAFt Mafic Volcaniclastics

328.09 - 329.8: Fine grain, CA banded, CL in matrix, locally fine biotite bands. Diamond shape white porphyroblasts (ankerite?). Sharp contacts.

<<Alt: 328.09 - 329.8 Strong Calcite>>

329.80 337.18 RHYvl Lapilli tuff

329.8 - 337.18: Light grey, well sorted lapilli tuff.

<<Alt: 329.8 - 349.39 Moderate Calcite>>

<<Struc: 333.75 - 333.76 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

337.18 338.30 RHYva Coarse grained to ash tuff

337.18 - 338.3: Biotite porphyroblasts disseminated suggesting pelitic input. Fine grain, light grey. Lapilli content increases at lower contact. Rare white, mm size possibly crystals.

338.30 339.39 PEL Equigranular biotite + calcite +/- quartz rock

338.3 - 339.39: Light brown, banded (grading?). Sharp upper contact marked by 0.5 cm wide CL band. Gradual lower contact, biotite porphyroblasts in the unit bellow.

339.39 341.88 RHYvl Lapilli tuff

339.39 - 341.88: Blue-green, ash supported. Rare crystals. CL altered blebs interpreted as lapilli.

<<Alt: 339.39 - 341.88 Weak-Moderate Chlorite>> Altered lapilli.

341.88 351.07 RHYv Rhyolite volcaniclastic

341.88 - 351.07: Well sorted volcaniclastic ash/lapilli sequences. Few biotite patches. Possibly weak CL alteration (or biotite calcite quartz altered lapilli) from 349.39 m to 350.62 m.

<<Alt: 349.39 - 355.3 Weak-Moderate Chlorite>> Altered lapilli.

<<Alt: 349.39 - 358.02 Weak-Moderate Calcite>>

<<Struc: 346.8 - 346.81 dominant foliation>>

351.07 354.34 RHYvl Lapilli tuff

351.07 - 354.34: Blue-green. Rare crystals.

354.34 358.02 RHYvl Lapilli tuff

354.34 - 358.02: Grey, fine grain matrix. Large discordant QZ/TML vein at lower contact.

<<Struc: 356 - 363.5 Weak-Moderate Fault>> Highly fractured zone accentuated by texture, QZ/TML veins and multiple narrow faults.

358.02 363.24 RHYvx Quartz and/or feldspar crystal tuff

358.02 - 363.24: Light grey, heterogeneous, poorly sorted, fragmental. Could be crystals and/or lapilli fragments, possibly reworked material. Unit fractured/highly broken on its top.

<<Alt: 358.02 - 378.25 Weak Calcite>>

<<Vein: 358.1 - 358.77 Quartz-Tourmaline 10 deg. >> Large QZ/TML in fracture, shallow angle vein.

<<Vein: 359.3 - 360 Tourmaline 28 deg. >> TML vein set associated with QZ in fracture zone.

685.30 691.93 RHYcf Feldspar & feldspar quartz porphyry

685.3 - 691.93: Granular texture, phenocrysts aggregated (possiby clasts), micro fractured, MU altered.

<<Min: 691.35 - 703.15 0.1% Min: Pyrite>>

<<Alt: 690 - 693.71 Moderate Calcite>>

<<Struc: 687.22 - 691.93 Moderate-Strong Fault>> Micro fractured, brecciaed texture, indured fault zone.

691.93 694.43 FLZ Fault Zone

691.93 - 694.43: Fault breccia, black/grey layers intercaled, gougy (mudstone?). Rounded clasts. CA in matrix and clasts-mylonitic texture.

<<Alt: 693.71 - 721.63 Weak Calcite>>

<<Struc: 691.93 - 694.43 Intense Fault>> Fault breccia, rounded clasts, dark matrix, indured.

694.43 703.15 FLZ Fault Zone

694.43 - 703.15: Dominantly rhyolite (RHYcf) clasts, crackobrecciated, cataclastic. Healed fault, indured.

<<Struc: 694.43 - 703.15 Strong Fault>> Brecciated, fracture and microfracture, indured fault, healed.

703.15 719.86 RHYcf Feldspar & feldspar quartz porphyry

703.15 - 719.86: Shattered, strongly siliceous. Feldspar phenos relics. Rare QE.

<<Min: 703.15 - 705 3% Min: Pyrite>> Fracture in siliceous feldspar porphyry.

<<Min: 705 - 718 0.5% Min: Pyrite>>

<<Min: 718 - 723.64 3% Min: Pyrite>> and finely disseminated.

<<Alt: 703.15 - 716.86 Strong Silicification>> Silicified RHYcf.

<<Alt: 703.15 - 721 Weak-Moderate Muscovite>>

<<Struc: 703.15 - 716.86 Moderate Fault>> Solid rock intervals and shattered rhyolite (feldspar porphyry), brecciated in some intervals. Large block within healed fault. Possibly under estimated intensity.

<<Struc: 716.86 - 719.86 Moderate-Strong Fault>> Solid rock/micro fractured and sandy gouge.

719.86 723.64 RHYvx Quartz and/or feldspar crystal tuff

719.86 - 723.64: Light blue, medium grain, siliceous. QE highly concentrated. Microfracture containing clay. Possibly preserved unit in larger fracture zone

<<Alt: 721 - 724.8 Weak Muscovite>>

<<Alt: 721.63 - 723.64 Moderate Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 719.86 - 729.4 Weak-Moderate Fault>> Micro fracture, brittle and friable intervals/solid rock intercaled. Probably preserved block within fault zone.

723.64 724.80 MDSc Carbonaceous dominant mudstone

723.64 - 724.8: Possibly preserved unit in larger fault zone. Fine grain, black, siliceous (or silicified). Sharpe, faulted lower contact.

<<Min: 723.64 - 727.3 1% Min: Pyrite>> Elongated, in ash (?) beds.

<<Alt: 723.64 - 729.4 Weak-Moderate Calcite>>

724.80 727.30 RHYv Rhyolite volcaniclastic

724.8 - 727.3: Microfractured/shattered. Mid strain CA altered possibly lapilli and interval showing finer grain (ash?) containing elongated PY disseminated.

<<Alt: 724.8 - 729.4 Moderate-Strong Muscovite>>

727.30 729.40 RHYcw Curdy textured-flow banded (flows, subvolcanics)

727.3 - 729.4: Flow banded, microfractured, locally breccia texture.

<<Min: 727.37 - 745 0.5% Min: Pyrite>> Rare veins.

729.40 733.02 FLZ Fault Zone

729.4 - 733.02: Fault breccia, black, grey bands (rhyolitic) intercaled. Rounded clasts dominantly Qz/CA. Mylonitic texture.

<<Alt: 729.4 - 732.63 Moderate Calcite>>

<<Alt: 729.4 - 733.5 Weak Muscovite>> In rhyolite interval.

<<Alt: 732.63 - 741.02 Weak Calcite>>

<<Struc: 729.4 - 733 Strong Fault>> Fault breccia, polymictique, gougy. Dominant black matrix (mudstone).

733.02 733.50 RHY undifferentiated rhyolite

733.02 - 733.5: Narrow rhyolitic interval, grey, poorly aggregated/friable.

733.50 734.81 CHT Chert

733.5 - 734.81: 1 to 3mm translucent QZ bands in siliceous mudstone unit.

<<Alt: 733.5 - 757.7 Moderate Muscovite>> Proximity of fault. But could be original.

734.81 735.70 RHY undifferentiated rhyolite

734.81 - 735.7: Texture bleached, grey, friable, containing mudstone intercaled. 5cm QZ vein.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

735.70 741.02 FLZ Fault Zone

735.7 - 741.02: Fine grain, black, graphitic mudstone dominant in fault zone, gougy in some interval. White bands (CA and possibly feldspar. Sheared/friable. Containing possibly beached mafic unit, BI porphyroblasts rich.

<<Struc: 735.7 - 742 Moderate-Strong Fault>>

741.02 746.79 RHY undifferentiated rhyolite

741.02 - 746.79: Beige, bleached rhyolite, possibly flow banded, gougy over 50 cm, microfractured to sheared. QZ/PY vein relics.

<<Min: 745 - 753.26 1% Min: Pyrite>> Associated with QZ and PO.

<<Alt: 741.02 - 758 Weak-Moderate Calcite>>

<<Struc: 742 - 746.79 Moderate Fault>> Friable rhyolite, fault gouge intervals over 50cm.

746.79 753.26 RHY undifferentiated rhyolite

746.79 - 753.26: Mu altered rhyolite, QZ/PY veins and blebs, partly silicified.

<<Alt: 750.86 - 751.8 Weak-Moderate Silicification>>

753.26 754.02 SED undifferentiated Sediment

753.26 - 754.02: Brownish, PY/PO rich, QE concentrated at lower contact. Possibly "dirty" rhyolite.

<<Min: 753.26 - 754 5% Min: Pyrite>> In possibly sediment.

<<Min: 754 - 758.5 0.5% Min: Pyrite>>

<<Alt: 754 - 755.1 Moderate Silicification>>

754.02 755.76 RHYvl Lapilli tuff

754.02 - 755.76: Locally "dirty" (brown BI bands). PO rich. Silicified at upper contact.

<<Struc: 754.55 - 754.56 Foliation>>

755.76 756.70 SED undifferentiated Sediment

755.76 - 756.7: BI bands, calcareous.

<<Struc: 756.58 - 756.59 Foliation>>

756.70 758.00 RHYv Rhyolite volcaniclastic

756.7 - 758: Locally "dirty bands" (brown BI rich). Granular texture observed in some narrow interval showing medium to coarse grain,

From (m)	To (m)	Rocktype & Description
758.00	**762.00**	**RHY** **undifferentiated rhyolite**

758 - 762: QZ/BI/CL. Mineralized unit containing PO stringers associated with CP, PY disseminated, SP/GL wispy. Specks of with mineral-possibly fine cordierite. Weak CL alteration.

<<Min: 758.5 - 762 0.5% Min: Sphalerite>>

<<Min: 758.5 - 762 2% Min: Pyrite>>

Comments:						Parent Hole:	

K16-395 was drilled to test the geotechnical properties of the proposed south extent of the mill site. 2 SPT tests were performed in the overburden, and 4 packer tests in the bedrock. A 10 node thermistor was installed.
K16-395 encounters bedrock at ~2 m, and consists of mixed mudstone and mafic tuffs of the Wind Lake Formation.

Comments:						Parent Hole:	

The purpose of this DDH is resource infill and to collect a metallurgical sample from the GP4F sulfide lens. Both objectives were accomplished. The GP4F lens was intersected at 83.74-90-90.53m (with minor interval of rhyolite) and consisted mainly of OJ type mineralization and lesser OF type. Sphalerite was up to 20% in some sections of OF. The lower lens was intersected from 160.57-167.72 and consisted of OJ type mineralization with strong cordierite alteration. Sphalerite content was up to 10% in one short interval but otherwise sulfides of interest were low. A major fault zone was intersected from 190.00-208.00m. Minor MDSt and MDS was recovered below 206.40m.

K16-397 was drilled to test the geotechnical properties of the proposed overburden stockpile. 3 SPT tests were performed in the overburden, and 4 packer tests in the bedrock. A monitoring well was installed.
K16-397 encounters bedrock at 3.9 m, and consists of mixed mudstone and mafic tuffs of the Wind Lake Formation.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-399

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	David Nuttal
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	7/20/2016
UTM Easting	415448.345	Core Size:	HQ3	Azimuth:	203.8	Date Logging Complete:	8/1/2016
UTM Northing:	6815529.371	Casing Pulled?:	Yes	Dip:	-75.4	Drill Company:	Hytech
UTM Elev. (m):	1518.146	Casing Depth (m):	6	Length (m):	810	Drill Rig:	Tech 5000
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	7/19/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	8/1/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Exploration
Comments:						Parent Hole:	

The purpose of hole K16-399 was to test the down dip extension of the Krakatoa lens, approximately 80-100 m down dip from the intercept in K16-385. Total hole depth is 810 m.
No Massive sulphide was intersected in hole K16-399. Patchy to pervasive, moderate to strong muscovite alteration is observed from 483-548 m. Aggregates of pyrite (up to 5% modal abundance) and a 13 cm band of massive pyrite are found between 497-537 m.
Trace-weak chlorite alteration is found concentrated in lapilli of the RHYvl units between 283-449 m and 549-670 m. Weak-moderate chlorite and biotite porphyroblasts are present within (as well as proximal to) narrow pelitic intervals throughout the stratigraphy.
The drill hole intersects the Wind Lake formation at 6 m depth, which consists of intercalated calcareous mafic tuffs and mudstone down to 283.5 m. The contact between the Wind Lake formation and the KZK formation is faulted. The KZK formation consists of felsic volcanics and narrow biotite and/or pelitic sediments stretching from 283.5 m to EOH at 810 m depth. Felsic volcanic rocks consist mostly of unaltered to weakly altered (muscovite and or chlorite) ash, crystal and or lapilli tuffs with lesser abundances of coherent rhyolite.
An aphanitic rhyolite dike is present between 450.2-452.62 m. Significant faulting is noted between 40-87 m, 97-112 m and 707-737 m.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

6.00 14.71 MAFt Mafic Volcaniclastics green

6 - 14.71: Mixed unit of dominantly calcareous grey-green MAFt with narrow intercalations of MDS.

<<Min: 6 - 22 0.5% Min: Pyrrhotite>>

<<Min: 6 - 40.7 0.5% Min: Pyrite>> Pyrite mineralization is found to have higher modal abundance in MDS units.

<<Alt: 6 - 40 Moderate Calcite>>

<<Struc: 8.8 - 8.8 Moderate dominant foliation>>

14.71 23.06 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

14.71 - 23.06: Dark grey, calcareous, well foliated mudstone.

<<Min: 22 - 25.3 1% Min: Pyrrhotite>>

23.06 23.68 MAFt Mafic Volcaniclastics green

23.68 32.22 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

<<Min: 24.5 - 25.3 0.1% Min: Sphalerite>>

<<Min: 25.3 - 40.7 0.5% Min: Pyrrhotite>>

<<Struc: 26.6 - 26.6 Moderate dominant foliation>> no orientation

32.22 34.00 MAFt Mafic Volcaniclastics green

32.22 - 34: Minor mudstone component

34.00 34.68 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

34.68 40.70 MAFt Mafic Volcaniclastics green

34.68 - 40.7: Conglomerate bearing subround lithic fragments/clast (0.5-4 cm across) present from 37.4-40.7 m.

<<Alt: 40 - 87 Weak-Moderate Calcite>>

<<Struc: 39.2 - 40.7 Moderate Shear>> Sheared margin of fault zone below.

40.70 41.82 FLZ Fault Zone

40.7 - 41.82: Lithologies expected to be MDS and MAFt.

<<Min: 40.7 - 105 0.1% Min: Pyrrhotite>>

<<Min: 40.7 - 123.16 0.1% Min: Pyrite>>

<<Struc: 40.7 - 52.65 Strong Fault>> Strongly faulted interval with vestiges of sheared MAFt/MDS units.

41.82 42.62 MAFt Mafic Volcaniclastics green

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

42.62 46.08 FLZ Fault Zone

42.62 - 46.08: Lithology suspected to be MAFt.

46.08 48.62 MAFt Mafic Volcaniclastics grey-green

46.08 - 48.62: Sheared interval between large faults.

48.62 52.65 MAFt Mafic Volcaniclastics green

48.62 - 52.65: Faulted and sheared interval.

52.65 54.50 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

52.65 - 54.5: Sheared and faulted interval

<<Struc: 52.65 - 55.26 Moderate Shear>> Sheared margin of fault zone above.

54.50 55.26 MAFt Mafic Volcaniclastics green

<<Vein: 54.85 - 65.79 90% Quartz-Carbonate>> Large interval of massive foliation parallel Qz vein.

55.26 58.90 INT undifferentiated (granitic) intrusive rocks leucocratic

55.26 - 58.9: Massive quartz vein

58.90 59.40 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

59.40 63.19 INT undifferentiated (granitic) intrusive rocks leucocratic

59.4 - 63.19: Massive quartz vein.

<<Struc: 62.89 - 64 Moderate Shear>> Sheared margin of fault zone below.

63.19 64.20 MAFt Mafic Volcaniclastics green

63.19 - 64.2: Sheared margin of fault.

<<Struc: 64 - 67.24 Moderate-Strong Fault>> Strongly faulted interval with vestiges of sheared MAFt/MDS units.

64.20 66.74 FLZ Fault Zone

64.2 - 66.74: Lithology is suspected to be mixed MDS and MAFt.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

66.74 70.05 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

66.74 - 70.05: Sheared margin to large fault

<<Struc: 67.24 - 74.7 Moderate-Strong Shear>> Sheared margin of fault zone above and below.

70.05 73.70 MAFt Mafic Volcaniclastics green

70.05 - 73.7: Sheared interval along fault margin.

73.70 80.80 FLZ Fault Zone grey-green

73.7 - 80.8: Intense faulting. Lith is suspected to be dominantly MAFt.

<<Vein: 74.45 - 74.7 100% Quartz-Carbonate>>

<<Struc: 74.7 - 80.8 Strong Fault>> Strongly faulted interval with vestiges of sheared MAFt/MDS units.

80.80 108.96 MAFt Mafic Volcaniclastics green

80.8 - 108.96: Interval is pervasively sheared and or faulted.

<<Min: 105 - 131.57 0.5% Min: Pyrrhotite>>

<<Alt: 87 - 97 Moderate Calcite>>

<<Alt: 97 - 112 Weak-Moderate Calcite>>

<<Vein: 85.83 - 86.15 80% Quartz-Carbonate>>

<<Vein: 100.06 - 100.58 70% Quartz>> Brecciated by faulting

<<Struc: 80.8 - 86 Strong Shear>> Sheared margin of fault zone above.

<<Struc: 86.65 - 87 Weak-Moderate Fault>>

<<Struc: 88.2 - 88.2 Moderate dominant foliation>>

<<Struc: 94.5 - 102.77 Moderate Fault>> Interval of several moderate faults (10-50 cm wide) spaced 0.5-1.5 m apart. Rock rubble and shearing is present between faults and along margins of fault zone.

<<Struc: 107 - 107 Moderate dominant foliation>>

<<Struc: 107.78 - 109.69 Weak-Moderate Fault>> Four weak-moderate clay gouge-filled faults (<30cm) spaced <40 cm apart with proximal rock rubble.

108.96 111.97 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black FG

108.96 - 111.97: Interbedded MDS and MAFt. Dominantly MDS.

<<Struc: 111.25 - 111.4 Weak-Moderate Fault>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

111.97 113.27 MAFt Mafic Volcaniclastics green

111.97 - 113.27: Interbedded MDS and MAFt. Dominantly MAFt

<<Alt: 112 - 238 Moderate-Strong Calcite>> intensity slightly higher in mafic tuffs than mudstones.

113.27 114.06 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

<<Min: 113.27 - 114.06 0.1% Min: Chalcopyrite>>

114.06 115.60 MAFt Mafic Volcaniclastics green

<<Struc: 114.29 - 114.58 Trace Fault>>

115.60 117.10 MAFt Mafic Volcaniclastics grey-green

117.10 118.80 MAFta Coarse grained to ash tuff grey-green FG

118.80 123.16 MAFt Mafic Volcaniclastics green

123.16 124.54 MAFta Coarse grained to ash tuff grey-green FG

<<Min: 123.16 - 129.48 0.1% Min: Chalcopyrite>>

<<Min: 123.16 - 133.43 0.5% Min: Pyrite>>

124.54 127.63 MAFt Mafic Volcaniclastics green

<<Struc: 125.15 - 125.75 Weak Fault>>

127.63 131.57 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

<<Vein: 129.48 - 130.36 95% Quartz 50 deg. >> PY/PO clots

131.57 133.43 MAFt Mafic Volcaniclastics green

<<Min: 131.57 - 133.43 1% Min: Pyrrhotite>>

<<Vein: 132.02 - 132.09 100% Quartz-Carbonate 45 deg. >>

<<Vein: 133.2 - 133.43 100% Quartz-Carbonate 60 deg. >>

133.43 142.40 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

<<Min: 133.43 - 156.26 0.1% Min: Chalcopyrite>>

<<Min: 133.43 - 166.82 1% Min: Pyrite>> Also commonly found as a fracture filling mineral.

<<Min: 133.43 - 166.82 0.5% Min: Pyrrhotite>>

<<Vein: 134.43 - 134.51 100% Quartz-Carbonate 55 deg. >>

<<Vein: 137.41 - 137.51 90% Quartz-Carbonate 50 deg. >>

<<Struc: 134.8 - 135 Trace Fault>>

<<Struc: 136.2 - 136.4 Weak Fault>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 137.83 - 138 Weak-Moderate Fault>>

142.40 146.67 MAFt Mafic Volcaniclastics green

142.4 - 146.67: Contains rounded lithic clasts. Narrow (1-3 cm wide qz/cb bands host disseminated Py and Sp.

<<Min: 142.4 - 156.26 0.1% Min: Sphalerite>>

146.67 156.26 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

<<Vein: 151.13 - 151.21 90% Quartz-Carbonate>>

<<Struc: 150.92 - 151.07 Weak Fault>>

<<Struc: 152.43 - 152.6 Weak Fault>>

156.26 159.00 MAFt Mafic Volcaniclastics green

<<Struc: 158.93 - 159 Weak Fault>>

159.00 160.80 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

160.80 161.82 MAFt Mafic Volcaniclastics green

161.82 168.00 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

<<Min: 166.82 - 176.35 0.1% Min: Pyrrhotite>>

<<Min: 166.82 - 184 0.5% Min: Pyrite>>

<<Vein: 167.7 - 167.93 90% Quartz-Carbonate 15 deg. >> PY/PO clots.

<<Struc: 166.82 - 174 Weak-Moderate Shear>> Mix of low angle (to core axis) shearing and faulting.

168.00 176.30 MAFt Mafic Volcaniclastics green

<<Vein: 169.71 - 170.05 100% Quartz 40 deg. >>

<<Vein: 173.3 - 173.56 70% Quartz-Carbonate 10 deg. >>

<<Struc: 174.68 - 174.81 Weak Fault>> Clay gouge

176.30 195.24 MAFt Mafic Volcaniclastics grey-green

176.3 - 195.24: Interval of thinly bedded MAFt and MDS, mixed MAFt/MDS and short intervals matrix supported MAFt/MDS conglomerate.

<<Min: 176.35 - 189 2% Min: Pyrrhotite>>

<<Min: 184 - 189 1% Min: Pyrite>>

<<Min: 189 - 192.6 0.1% Min: Pyrite>>

<<Min: 189 - 216 1% Min: Pyrrhotite>>

<<Min: 192.6 - 196.68 1% Min: Pyrrhotite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 192.6 - 232.38 0.1% Min: Pyrite>>

<<Struc: 179.92 - 180.43 Weak Fault>> Interval of rock rubble; no gouge.

<<Struc: 183 - 183.05 Weak Fault>> Clay gouge

<<Struc: 190.48 - 190.6 Trace Fault>> Rock rubble fault

<<Struc: 193.05 - 193.2 Weak Fault>> Rock rubble and clay gouge filled fault

195.24 196.68 MAFt Mafic Volcaniclastics green

195.24 - 196.68: Mafic tuff with white-cream colored siliceous/calcareous bands.

<<Struc: 196.31 - 196.68 Weak Fault>> Rock breccia and minor clay gouge.

196.68 207.38 MAFta Coarse grained to ash tuff grey-green FG

196.68 - 207.38: Fine grained, grey-green, siliceous-calcareous mafic (ash) tuff.

<<Min: 196.68 - 228.96 0.1% Min: Pyrrhotite>>

<<Struc: 200.2 - 200.2 Weak-Moderate dominant foliation>> 2 foliations visible

<<Struc: 200.25 - 200.25 Weak Foliation>> 2nd foliation

<<Struc: 203.9 - 203.9 Weak dominant foliation>>

<<Struc: 206 - 206.34 Weak Fault>> Rock rubble and clay gouge filled fault

<<Struc: 206.67 - 206.84 Trace Fault>> Rock rubble and clay gouge filled fault

207.38 209.81 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

207.38 - 209.81: Mudstone with rounded clasts occurring locally.

<<Struc: 208.48 - 208.58 Weak Fault>> Clay gouge

209.81 217.02 MAFt Mafic Volcaniclastics green

209.81 - 217.02: Fine-medium grained green mafic tuff, with fine-grained disseminated biotite and calcite bands.

<<Vein: 213.66 - 214.24 60% Quartz-Carbonate>>

<<Struc: 215.33 - 215.75 Weak-Moderate Fault>>

217.02 228.96 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

<<Struc: 217.13 - 217.41 Weak-Moderate Fault>> Rock rubble and clay gouge filled fault

228.96 232.04 MAFt Mafic Volcaniclastics green FG

228.96 - 232.04: calcite banded mafic tuff.

<<Vein: 231.55 - 232.38 80% Quartz>> PY/PO 1%

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource/Met
						Parent Hole:	

Comments:

The purpose of this DDH is resource infill and to collect a metallurgical sample from the GP4F sulfide lens. Both objectives were accomplished. The GP4F lens was intersected at 46.14-57.82m (including minor to significant sections of altered rhyolite) and consisted mainly of OJ and OI type mineralization. Short, <30cm sections of semi-massive mineralization are included in the wider OI and OJ units. Sphalerite content was up to 15% in some sections. The DDH did not go deep enough to intersect the lower lens. A major fault zone was intersected from 26.50-34.70m with poor to no core recovery. There was also missing and poor core recovery between 34.70 - 50.20 m due to faulting and/or possibly poor drilling technique (lots of rounded pebbles and evidence of ground core). After shift change at 50.2 m core recovery and quality improved markedly.

Comments:

K16-402 was drilled to test the geotechnical properties of the proposed Class C Storage Facility. 4 SPT tests were performed in the overburden, and 6 packer tests in the bedrock. A thermistor was installed.
K16-402 encounters bedrock at 6.3 m, and consists of intercalated mudstone, wackes, and mafic tuffs of the Wind Lake Formation.

UTM Elev. (m):	1353.282	Casing Depth (m):	20.5	Length (m):	343.7	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	7/22/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	7/27/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
Comments:						Parent Hole:	

K16-403 was drilled as a resource definition hole at GP4F.
Bedrock was encountered at 6 m. K16-403 intersected a large sequence of intercalated sedimentary and felsic volcanic rocks. Within this package there are thick intervals of alteration with smaller intervals of mineralization and a few significant marker horizons (QZ-eye rhyolites and a carbonaceous mudstone).
A large zone of pervasive alteration (MU and/or CL-BI-GA) with disseminated sulfides occurs from 201.4-265.84 m. Within this alteration zone there are 6 horizons of heavily disseminated to semi-massive sulfide: OJ (217.77-218.6 m), OL (221.5-222.8 m), OL (236.8-238 m), OJ (250.27-250.54 m), OJ (253.08-253.22 m), and OJ (256.94-257.32 m). A second zone of alteration (without any mineralized horizons) occurs from ~294.5-298 m. Finally, a third zone of alteration with 2 horizons of mineralization occurs at ~324.14-337.65 m. The mineralized horizons occur from 326.4-326.75 m (OJ) and 334.6-334.78 m (OJ) respectively.
The QZ-eye rhyolites (marker horizons?) were encountered from 193.12-200.53 m and 222.8-233.5 m, with the upper horizon being in the hanging wall of main lens and alteration zone, and the later being in the footwall. A carbonaceous mudstone was intersected at the end of the hole, from 336.6-343.7 m (EOH).
R. Hulstein logged 0.00-167.50 m.
D. Hume logged 167.50-343.70 m.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 6.00 OVBN Overburden

0 - 6: Casing to 21.5m

<<Struc: 1 - 13.3 Weak Fault>> broken core, low angle fractures

6.00 11.16 RHYva Coarse grained to ash tuff medium grey

6 - 11.16: Likely a RHYva with minor PEL component manifesting as biotite rich bands. Below 9.10 m brecciated - fragmental in appearance (mm - cm scale), likely clastic texture, has calcite 'clasts', blebs and brecciated & silicified due to proximity to RHYi.

<<Alt: 6 - 9.1 Trace Calcite>>

<<Alt: 9.1 - 9.8 Moderate Calcite>>

<<Alt: 9.8 - 13.2 Trace Calcite>>

11.16 13.15 RHYi Aphanitic Rhyolite (intrusion) light grey

11.16 - 13.15: RHYi or RHYc? Brecciated - pepperite texture, minor biotite in fractures. Could be silicified RHYva - sed in part.

13.15 24.06 SEDc calcareous Sediment grey-brown

13.15 - 24.06: variably bleached and silicified. Maroon - brown biotite. Lenticular grey calcareous clasts and bands up to 0.5cm thick.

<<Alt: 13.2 - 23.07 Moderate Calcite>> calcareous sed

<<Alt: 23.07 - 25.9 Weak Calcite>> patchy

<<Struc: 14 - 20.06 Weak Fault>> five 10-20cm sections with broken core

<<Struc: 16.8 - 17.1 Moderate dominant foliation>>

<<Struc: 23.35 - 30.65 Weak Fault>> 10 sections, avg <10cm, with broken core and minor gouge - clay on fractures.

24.06 24.17 RHYi Aphanitic Rhyolite (intrusion)

24.06 - 24.17: dykelet, altering PEL on margins.

24.17 25.90 SED undifferentiated Sediment

24.17 - 25.9: Silicified, minor calcite -chlorite veinlets, biotite on fractures and folia

25.90 29.64 RHYi Aphanitic Rhyolite (intrusion)

25.9 - 29.64: RHYi and silicified wallrock - gradational contacts. Unit does not have well developed foliation. Has a blebby fragmental texture with biotite - calcite on fractures. Likely a good portion of the unit is silicified sediment and not RHYi.

<<Alt: 25.9 - 34 Trace Calcite>> and as diss and veinlets

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

29.64 36.07 CHT Chert

29.64 - 36.07: 29.64-32.5; foliated, silica (chert) bands separated by biotite -calcite folia and fractures and this section could be a silicified fine grained sediment - volcaniclastic. 36.07-36.07: well foliated - banded (<1-4mm) silica and fine maroon biotite and muscovite on folia. Bleached and limonite stained from 34.90-35.90m around 10cm clay gouge fault zone at 35.40-35.50m.

<<Min: 31.5 - 76 0.01% Min: Pyrite>> sulfide deficient!

<<Alt: 34 - 36 Weak Calcite>>

<<Alt: 36 - 41.4 Moderate-Strong Calcite>>

36.07 41.50 PEL Equigranular biotite + calcite +/- quartz rock

36.07 - 41.5: Typical PEL but well foliated, with mm calcite folia, maroon biotite. Chlorite - calcite alteration at lower contact.

<<Alt: 41.4 - 45.25 Weak-Moderate Calcite>> and as diss and veinlets

<<Vein: 38.2 - 38.5 100% Quartz>>

<<Vein: 40.1 - 46.6 5% Quartz-Carbonate 62 deg. >> mostly calcite

<<Struc: 38.15 - 38.5 Weak Fault>> qtz vein with 5cm gouge on contacts

41.50 44.37 PEL Equigranular biotite + calcite +/- quartz rock

41.5 - 44.37: Mixed sediment unit; PEL, chert and possibly RHYa or equivalent epiclastic. Variably bleached and silicified, cut by qtz - calcite bands, Also weakly limonite stained - oxidized, due to

<<Alt: 41.5 - 46.7 Weak Muscovite>> associated with RHYi

44.37 44.78 RHYi Aphanitic Rhyolite (intrusion)

44.37 - 44.78: RHYi dykelet

44.78 45.85 PEL Equigranular biotite + calcite +/- quartz rock

44.78 - 45.85: Variably silicified and bleached, cut by abundant calcite veining.

<<Alt: 45.25 - 46.35 Trace Calcite>>

45.85 46.35 RHYi Aphanitic Rhyolite (intrusion)

45.85 - 46.35: RHYi dykelet, likely includes adjacent silicified PEL.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

46.35 47.85 PEL Equigranular biotite + calcite +/- quartz rock

46.35 - 47.85: PEL unit with grey silicified sections

<<Alt: 46.35 - 46.7 Moderate-Strong Calcite>>

<<Alt: 47.05 - 47.8 Moderate Calcite>>

<<Alt: 47.8 - 77.85 Trace Calcite>> mostly veinlets - fracture filling

<<Struc: 46.35 - 47.5 Weak-Moderate Fault>> broken core, minor gouge

47.85 52.45 RHYi Aphanitic Rhyolite (intrusion)

47.85 - 52.45: Massive grey - green RHYi with crackled texture, locally minor biotite in fractures. At upper contact RHYi is foliated and is likely silicified PEL for first 30cm. 51.25-52.45m; RHYi has maroon biotite on fractures, blebby - brx texture with indistinct biotite bands - likely representing assimilated PEL.

<<Alt: 48 - 51 Weak Chlorite>> diffuse, fine grained

<<Vein: 50.25 - 50.4 5% Quartz>>

52.45 54.13 PEL Equigranular biotite + calcite +/- quartz rock

52.45 - 54.13: Marron biotite PEL, silicified, little calcite left. Partly assimilated by surrounding RHYi.

54.13 73.77 RHYi Aphanitic Rhyolite (intrusion)

54.13 - 73.77: Massive grey - green RHYi with local crackled texture, biotite on fractures. At upper contact RHYi is locally foliated and banded and is likely silicified PEL, partly assimilated PEL to 57.7 m. Below 57.7 m RHYi blebby - brx texture is common along with moderately siliceous foliated sections & bands (likely representing partly assimilated RHYva?).

<<Alt: 62.8 - 73.77 Trace Chlorite>> diffuse, fine grained

<<Vein: 59.85 - 73.7 3% Quartz>> white - light grey qtz veins and qtz vein fragments

<<Struc: 54.65 - 56 Weak-Moderate dominant foliation>>

<<Struc: 70 - 70.3 Weak dominant foliation>>

<<Struc: 71.6 - 73 Weak-Moderate Fault>> broken core, missing core, fracture at low angle to core axis.

73.77 77.85 SLT Siltstone - fine-grained sedimentary rock

73.77 - 77.85: Med grey, maroon biotite, muscovite and calcite on folia and fractures. Blebby bands, rarely calcareous (limestone component). Not chert as originally thought as not siliceous enough and fine grains are identifiable with hand lens.

<<Alt: 73.77 - 77.85 Moderate Silicification>>

<<Struc: 74.5 - 75.5 Trace Fault>> low angle fractures with clay - calcite - local Fe stain.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 77.75 - 77.85 Weak Fault>>

77.85 79.90 PEL Equigranular biotite + calcite +/- quartz rock

<<Alt: 77.85 - 79.9 Strong Calcite>>

<<Vein: 79.83 - 85.35 5% Quarzt-Chlorite-Carbonate>> white qtz, qtz-calcite +/- chlorite

<<Struc: 77.9 - 81.6 Weak Fault>> 5 zones, <10 broken core-crushed.

79.90 85.44 SLT Siltstone - fine-grained sedimentary rock

79.9 - 85.44: as previous SLT

<<Alt: 79.9 - 85.2 Weak Calcite>> limy blebs and calcite on fractures

<<Alt: 79.9 - 85.44 Moderate Silicification>>

<<Alt: 85.2 - 95.2 Trace Calcite>>

<<Struc: 85.1 - 85.5 Weak Fault>> 2 zones, <10 broken core-crushed.

85.44 89.80 RHYi Aphanitic Rhyolite (intrusion)

85.44 - 89.8: Crackle brecciated. Chlorite and calcite on fractures

<<Alt: 85.44 - 89.8 Weak Muscovite>> musc - sericite on fractures

<<Vein: 89.2 - 93.4 70% Quartz>> white qtz - related to RHYi contact

<<Struc: 86.6 - 94.1 Weak-Moderate Fault>> broken core, crushed, minor gouge, missing core

89.80 102.05 RHY undifferentiated rhyolite

89.8 - 102.05: Brecciated, sericite - argillic altered, non siliceous, rhyolite. 189.80-193.15m: Qtz veining (quartzolite?). Locally banded and not brecciated.

<<Min: 97.72 - 98.75 0.5% Min: Pyrite>>

<<Min: 97.72 - 98.75 0.01% Min: Arsenopyrite>> AS or some other fine grained silver sulfide

<<Min: 99.5 - 102.5 0.1% Min: Pyrite>> dirty 'grey' pyrite

<<Alt: 91.3 - 102.05 Moderate Muscovite>> musc - sericite

<<Alt: 95.2 - 102.05 Weak-Moderate Calcite>>

<<Struc: 100.5 - 113.3 Weak-Moderate Fault>> numerous zones broken core, crushed, minor gouge

102.05 104.50 RHYi Aphanitic Rhyolite (intrusion)

102.05 - 104.5: Incorporates altered RHY.

<<Min: 103.82 - 104.35 0.1% Min: Pyrite>>

<<Alt: 102.05 - 104.5 Weak Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 102.05 - 105 Weak Muscovite>> musc - sericite on fractures

104.50 111.47 PEL Equigranular biotite + calcite +/- quartz rock

104.5 - 111.47: bleached at contacts and adjacent to small shear zones around 107m.

<<Min: 108.9 - 113.3 0.1% Min: Pyrite>>

<<Min: 108.9 - 113.3 0.1% Min: Pyrrhotite>>

<<Alt: 104.5 - 111.47 Moderate Calcite>> pervasive to diss and fracture filling.

<<Alt: 106.6 - 107.5 Moderate-Strong Muscovite>> musc - sericite with fault zone

<<Alt: 111.2 - 115.6 Weak Muscovite>> musc - sericite on fractures and in fault - brx zones

<<Vein: 105.55 - 105.81 70% Carbonate-Chlorite>>

111.47 115.50 RHYi Aphanitic Rhyolite (intrusion)

111.47 - 115.5: incorporates bleached -silicified PEL. 30cm qtz veining at upper contact.

<<Alt: 111.47 - 115.5 Weak Calcite>> diss to blebs

<<Vein: 111.47 - 111.91 60% Quartz>>

<<Vein: 112.25 - 112.43 80% Quartz>>

<<Vein: 113.2 - 114.9 30% Quartz>>

<<Struc: 113.3 - 115.5 Moderate-Strong Fault>> broken core, crushed, minor gouge, missing core

115.50 116.34 PEL Equigranular biotite + calcite +/- quartz rock

<<Alt: 115.5 - 116.37 Moderate-Strong Calcite>>

116.34 116.69 RHY undifferentiated rhyolite

116.34 - 116.69: 50% qtz vein and 4 cm shear zone

<<Alt: 116.37 - 116.69 Trace Calcite>>

<<Vein: 116.4 - 116.55 100% Quartz>>

116.69 118.20 PEL Equigranular biotite + calcite +/- quartz rock

<<Min: 118.1 - 127.58 0.5% Min: Pyrite>>

<<Min: 118.1 - 127.58 0.1% Min: Pyrrhotite>>

<<Alt: 116.69 - 118.2 Moderate-Strong Calcite>>

<<Vein: 116.72 - 118.16 20% Quartz-Carbonate>> also crosscutting stringers

<<Struc: 117.6 - 117.75 Moderate Vein>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

118.20 118.80 RHYvl Lapilli tuff

<<Alt: 118.2 - 118.8 Weak-Moderate Calcite>>

<<Struc: 118.5 - 118.8 Moderate dominant foliation>>

118.80 119.39 RHYcw Curdy textured-flow banded (flows, subvolcanics)

<<Alt: 118.8 - 119.39 Weak Muscovite>> in bands

<<Alt: 118.8 - 119.39 Weak Calcite>>

<<Vein: 118.8 - 119 40% Quartz>> silicified envelope

119.39 127.58 RHYvl Lapilli tuff

119.39 - 127.58: contains variable amounts of biotite, including thin (<20cm) biotite rich PEL bands. 125.80-125.30: minor silic bands, RHYcw.

<<Alt: 119.39 - 120.55 Weak-Moderate Calcite>> calcareous PEL bands

<<Alt: 120 - 126.65 Weak Muscovite>> in minor fault - brx zones with clay - sericite, and on fractures

<<Alt: 120.55 - 127.58 Weak Calcite>> rare bands, fracture filling and diss

<<Alt: 122.2 - 127 Weak-Moderate Silicification>>

<<Alt: 127 - 128.4 Weak Biotite>>

<<Alt: 127.55 - 128.6 Weak-Moderate Chlorite>>

Comments:						Parent Hole:	

Collared at Class A Storage Facility projected site. Four SPT tests were conducted in overburden, three packer tests in bedrock as well as deep monitoring well install. Hole K16-404 consists of mafic tuff and interbedded calcareous mudstone units recognized as Wind Lake Formation. Trace oxidation is visible from 4.80m to 16.50m. Fine grain disseminated pyrrhotite is observed in the mafic horizons. The hole was completed at 40.20m (Engineer's call) in mafic ash tuff showing massive calcite/quartz vein.

Comments:

This drill hole cuts a volcano-sedimentary package including flows, volcaniclastic rocks and epiclastic rocks. No economic intervals of mineralization are present in this hole however, several sub-economic zones do occur. At 96 m there is a 0.1 m semi-massive zone of bedding parallel pyrite-pyrrhotite-sphalerite mineralization with no significant associated alteration. A wide zone of moderate to strong muscovite alteration is present from 152-219 m. At the lower end of this alteration interval from 211 m there is a Po-Cp-Py-Sp bearing breccia-vein and below this from 213-225 m there is a zone of weak chlorite alteration with weak spalerite and chalcopyrite mineralization, associated with a tuffaceous mudstone unit. Mineralisation was not considered significant enough to be sampled. A DHEM survey was completed on this drill hole.

<<Struc: 180.56 - 180.63 Weak-Moderate Fault>> Zone of micaceous gouge and crushed rock

181.97 184.28 RHYcw Curdy textured-flow banded (flows, subvolcanics) light grey FG

181.97 - 184.28: Chaotic bands of muscovite and silica

<<Min: 181.97 - 184.28 0.5% Min: Pyrite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 181.97 - 212.73 Trace Calcite>> Rare carbonate blebs

184.28 195.47 RHY undifferentiated rhyolite grey-green

184.28 - 195.47: Strongly muscovite altered interval with fine, chaotically folded to planar banding and a small component of silica. Possibly a mudstone (???) but more likely some mixture of ash tuff and coherent flow

<<Min: 184.28 - 195.47 0.5% Min: Sphalerite>>

<<Min: 184.28 - 195.47 1% Min: Pyrite>>

<<Min: 184.28 - 195.47 0.01% Min: Galena>>

<<Alt: 184.28 - 194.75 Moderate Muscovite>> Pervasive muscovite, most textures are destroyed

<<Alt: 194.75 - 200.39 Moderate-Strong Muscovite>> Pervasive muscovite (but not texture destructive) through MDS and RHYva

<<Vein: 185.48 - 192.44 35% Quartz-Carbonate>> Pyrite 0.25%, Sphalerite 0.5%, Galena 0.25%

<<Vein: 195.12 - 204.08 50% Quartz-Carbonate>> Py 0.9%, GL 0.1%

<<Struc: 187.6 - 187.7 Moderate Fault>> Zone of micaceous gouge and crushed rock

195.47 197.20 MDSt Rhyolite tuff dominant mudstone grey-green FG

195.47 - 197.2: Predominantly strongly muscovite altered with chaotically folded bands, however, on interval remains relatively unaltered, showing the alternating white and black banding of the typical mudstone. Interval is cut by thick, massive quartz veins

<<Min: 195.47 - 197.2 0.5% Min: Pyrite>>

<<Struc: 196.1 - 197.6 Moderate Fault>> Zone of micaceous slip planes and minor micaceous gouge development

197.20 202.22 RHYva Coarse grained to ash tuff grey-green FMG

197.2 - 202.22: Poorly banded, fine grained, muscovite altered unit. Rare white, round lapilli.

<<Min: 197.2 - 202.22 0.5% Min: Pyrite>>

<<Alt: 200.39 - 202.22 Weak-Moderate Muscovite>> Muscovite in certain layers/bands of the RHYva, not texturally destructive

<<Struc: 200.34 - 200.37 Weak-Moderate Fault>> Zone of micaceous gouge

202.22 210.52 RHYcw Curdy textured-flow banded (flows, subvolcanics) medium grey FG

202.22 - 210.52: Poorly developed alternating silica and muscovite bands on the cm scale. Banding is chaotically folded. Some zones have a more "curdy" texture. Zone is cut by brecciating veins of sulphide material, forming matrix supported (sulphide) brecciated veins-zones. This unit was likely impermeable to sulphide fluids, and therefore was brecciated rather than replaced

<<Min: 202.22 - 205.88 0.5% Min: Pyrite>>

<<Min: 205.88 - 209.85 1% Min: Sphalerite>> fine aggregates and patchy disseminations

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource/Met
Comments:						Parent Hole:	

K16-407 is a twin of K16-388, in order to gain more sample material from the main ore zone and resolve an issue of no core recovery through the zone in K16-388.
K16-407 encountered bedrock at 5.3 m, consisting of intercalated felsic volcanics and pelitic sediments. The quartz-eye bearing marker units occur from 141.3-158 m, and from 169.7-185 m, where they host the mineralized zone. Mineralization occurs from 159.94-169.7 m, consisting of intercalated OJ, strongly altered wallrock, and OL ore types. The alteration halo surrounding mineralization is not very strong, continuous or pervasive.
Core was sampled as whole core metallurgical samples.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-408

Prospect:	Sebesi	Hole Type:	DD	Survey Type:	PLND-LiDAR	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Dillon Hume	Date Logging Start:	8/4/2016
UTM Easting	415424	Core Size:	HQ3	Azimuth:	228	Date Logging Complete:	8/17/2016
UTM Northing:	6815263	Casing Pulled?:	No	Dip:	-67	Drill Company:	New Age
UTM Elev. (m):	1548	Casing Depth (m):	7.5	Length (m):	491	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	8/2/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	8/17/2016
Local Elev. (m):				Hole Completed?:	Abandoned	Purpose:	Exploration
						Parent Hole:	

Comments:

K16-408 was drilled as an exploration hole to test the Sebesi target on the East side (footwall) of the Fault Creek/Sunda Fault. The downhole EM survey was not completed due to rods becoming stuck in the Fault Creek Fault. The HQ3 rods became stuck at 365 m, at which point the hole was reduced to NQ3. The NQ3 string became stuck at 491 m.
K16-408 intersected intercalated mafic tuffs and carbonaceos mudstones of the Wind Lake Formation from 7.2-182.2 m. The Kudz Ze Kayah formation has a conformable interfingered contact with the overlying Wind Lake Formation. Intercalated felsic volcanic and pelitic sedimentary rocks of the Kudz Ze Kayah formation occur from 182.2-333.85 m. A strongly faulted zone (Fault Creek Fault?) occurs from 333.85-397.68 m which includes a predominantely gouge supported fault breccia and some large coherent blocks consisting of MAFi, and altered RHY. Below the fault zone, from 397.68-491 m (EOH), the hole intersected strongly muscovite altered rhyolite.

Downhole Surveys:

170.00 171.68 MAFt Mafic Volcaniclastics

170 - 171.68: Light green, massive CL-CA mafic with blebby to wavy CA.

171.68 175.40 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

171.68 - 175.4: Carbonaceos mudstone with minor intercalated chert.

<<Min: 171.68 - 217.05 0.5% Min: Pyrite>>

<<Alt: 171.68 - 175.4 Trace Calcite>>

<<Vein: 172.1 - 172.5 95% Quartz-Carbonate>> Massive QZ-carbonate vein with minor wallrock fragments.

175.40 179.57 MAFt Mafic Volcaniclastics

175.4 - 179.57: Light green-grey, massive CL-MU-CA intermediate tuff with blebby to wavy CA.

<<Alt: 175.4 - 182.2 Weak-Moderate Calcite>>

179.57 182.20 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

179.57 - 182.2: Intercalated MU-CL schist (MAFt) and carbonaceous mudstone. At contact with KZK Group.

<<Struc: 181.2 - 182.15 Weak-Moderate Fault>>

182.20 185.00 MDSt Rhyolite tuff dominant mudstone

182.2 - 185: QZ-eyes and felsic lpl with a carbonaceous and ashy matrix. Similar to unit seen at Wind Lake-KZK contact elsewhere.

<<Alt: 182.2 - 200.68 Weak Calcite>>

<<Vein: 182.5 - 182.75 100% Quartz-Carbonate>> Massive QZ-carbonate vein

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

185.00 187.17 MDSc Carbonaceous dominant mudstone

185 - 187.17: Carbonaceous mudstone with minor felsic volcaniclastic material and QZ-eyes.

<<Struc: 185.9 - 187 Moderate Fault>>

187.17 188.00 RHYvx Quartz and/or feldspar crystal tuff

187.17 - 188: QZ-eyes and felsic lpl with a carbonaceous and ashy matrix. Similar to unit seen at Wind Lake-KZK contact elsewhere.

188.00 197.00 RHYv Rhyolite volcaniclastic

188 - 197: Fine grained QZ-MU schist with local BCQlpl and weak MU-alteration

<<Alt: 193.2 - 197 Weak Muscovite>> Weak yellowish sericite/muscovite alteration.

<<Vein: 188 - 216.65 15% Quartz-Tourmaline>> Large zone with massive to veinlets of QZ-TML-carbonate. Mostly at a high angle to foliation (cross-cutting). As well there are 5-10 cm wide cremy veins of QZ-carbonate.

197.00 200.68 RHYvl Lapilli tuff

197 - 200.68: Cream-coloured felsic lpl in a light grey ashy matrix.

<<Struc: 197.31 - 197.32 Moderate dominant foliation>>

<<Struc: 198.75 - 198.85 Weak Fault>>

200.68 201.52 PEL Equigranular biotite + calcite +/- quartz rock

200.68 - 201.52: Light brown, mixed ash and pelitic sediment with calcareous veining.

<<Alt: 200.68 - 201.52 Moderate Calcite>>

201.52 213.47 RHYvl Lapilli tuff

201.52 - 213.47: Cream-coloured felsic lpl in a light grey ashy matrix. Large zone of massive QZ-cabonate-TML vein from ~205-208.5 m.

<<Alt: 201.52 - 216.65 Weak-Moderate Calcite>>

<<Struc: 204.25 - 209.65 Weak Fault>>

248.5 - 249: Silicic banded rhyolite.

249.00 249.15 PEL Equigranular biotite + calcite +/- quartz rock

249.15 250.07 RHYvl Lapilli tuff

249.15 - 250.07: White calcareous lpl in fine grained gey ash matrix.

250.07 252.95 PEL Equigranular biotite + calcite +/- quartz rock

250.07 - 252.95: Black, massive BI with banded to disseminated CA.

<<Alt: 250.07 - 252.95 Moderate-Strong Calcite>>

<<Struc: 251.44 - 251.45 Moderate dominant foliation>>

252.95 253.40 RHYva Coarse grained to ash tuff

252.95 - 253.4: Grey, fine grained ash tuff.

<<Min: 252.95 - 259.8 1% Min: Pyrite>>

<<Min: 252.95 - 259.8 0.1% Min: Pyrrhotite>>

<<Alt: 252.95 - 259.8 Weak Calcite>>

253.40 255.30 RHYc Rhyolite coherant volcanics

253.4 - 255.3: Silicic banded rhyolite.

255.30 257.56 RHYi Aphanitic Rhyolite (intrusion)

255.3 - 257.56: Light grey, aphanitic, glassy rhyolite with randomy oriented brittle fractures.

257.56 259.80 RHYc Rhyolite coherant volcanics

257.56 - 259.8: Silicic banded rhyolite.

<<Vein: 258.4 - 258.95 40% Quartz-Carbonate>> Patchy to massive QZ-carbonate veining with minor sericitic vein selvage

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

259.80 263.42 RHYva Coarse grained to ash tuff

259.8 - 263.42: Grey, ash dominated tuff with minor calcareous lpl.

<<Min: 259.8 - 263.42 2% Min: Pyrrhotite>>

<<Alt: 259.8 - 278.4 Weak-Moderate Calcite>>

<<Struc: 259.95 - 260 Weak Fault>>

263.42 268.90 RHYvl Lapilli tuff

263.42 - 268.9: White cm-sized calcareous lpl (~20%) in light grey ash matrix, with ~10% disseminated fgr BI.

<<Min: 263.42 - 336.5 0.1% Min: Pyrrhotite>>

268.90 278.40 RHYvx Quartz and/or feldspar crystal tuff

268.9 - 278.4: Fine grained ash tuff with disseminated (10-25%) fine gained sbhedral to euhedral sericite-after-feldspar. Moderate faulting/brecciation from 269.7-271.8 m.

<<Struc: 269.55 - 270.6 Weak Fault>>

<<Struc: 270.6 - 271.75 Moderate Fault>>

<<Struc: 278.15 - 278.2 Weak-Moderate Fault>>

278.40 285.20 SED undifferentiated Sediment

278.4 - 285.2: Brown, mixed ash and pelitic sediment with local cgr sand clasts. Disseminated BI throughout with vfgr matrix. Blebs to bands of CA.

<<Alt: 278.4 - 285.2 Moderate Calcite>>

285.20 287.75 RHYv Rhyolite volcaniclastic

285.2 - 287.75: Light green-grey, fine grained tuff (?) with blebby CA and disseminated BI.

<<Alt: 285.2 - 287.75 Weak-Moderate Calcite>>

287.75 288.43 PEL Equigranular biotite + calcite +/- quartz rock

287.75 - 288.43: Medium green-brown, fine grained pelitic sediment (?) with disseminated BI and wavy bands of CA.

<<Alt: 287.75 - 295.05 Moderate-Strong Calcite>>

288.43 289.90 RHYv Rhyolite volcaniclastic

288.43 - 289.9: Light green-grey, fine grained ash (?) with wavy bands of CA+/-QZ. Local texturally resembles RHYc.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

289.90 295.05 SED undifferentiated Sediment

289.9 - 295.05: Medium green-brown, fine grained pelitic sediment (?) with disseminated BI and wavy bands and blebs of CA.

295.05 297.40 RHYva Coarse grained to ash tuff

295.05 - 297.4: Grey, fine grained ash tuff with disseminated BI and minor calcareous lpl.

<<Alt: 295.05 - 297.4 Weak Calcite>>

297.40 297.60 PEL Equigranular biotite + calcite +/- quartz rock

297.4 - 297.6: Brown, very fine grained pelitic sediment with disseminated fgr and minor CA blebs.

<<Alt: 297.4 - 302.4 Weak-Moderate Calcite>>

297.60 302.40 RHYvl Lapilli tuff

297.6 - 302.4: White cm-sized calcareous lpl (~20%) in light grey ash matrix, with ~10% disseminated fgr BI.

<<Vein: 298.5 - 298.9 30% Quartz-Carbonate 70 deg. >> QZ-carbonate veins

302.40 304.50 PEL Equigranular biotite + calcite +/- quartz rock

302.4 - 304.5: Brown-black, fine grained BI with disseminated to banded CA+/-AK.

<<Alt: 302.4 - 304.5 Moderate-Strong Calcite>>

304.50 313.75 RHYvl Lapilli tuff

304.5 - 313.75: White cm-sized calcareous lpl (~20%) in light grey ash matrix, with ~10% disseminated fgr BI.

<<Alt: 304.5 - 333.85 Weak-Moderate Calcite>>

<<Struc: 309.15 - 309.3 Weak Fault>>

313.75 323.15 RHYvl Lapilli tuff

313.75 - 323.15: Calcareous and felsic lpl within fine grained ash tuff. Lpl content appears to increase toward the lower contact (Fining upward?).

<<Struc: 318.84 - 318.85 Weak dominant foliation>>

323.15 328.20 RHYv Rhyolite volcaniclastic

323.15 - 328.2: Light green-grey, clast-supported breccia. Clasts range from ~0.5 to 2 cm and are felsic rhyolitic composition. Matrix is predominantley fine grained medium grey-green ash? Potentially a healed fault breccia?

<<Vein: 324.1 - 324.55 100% Quartz-Carbonate>> Massive QZ-carbonate vein

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

328.20 332.45 RHYv Rhyolite volcaniclastic

328.2 - 332.45: Light grey mixed lpl and ash tuff.

<<Vein: 328.45 - 336.5 5% Quartz-Carbonate 80 deg. >> Zone with 2-3 ~1 cm wide QZ-carbonate veins per metre and minor ~20 cm massive QZ-carbonate veins.

332.45 333.85 RHYc Rhyolite coherant volcanics

332.45 - 333.85: Silicic banded rhyolite with minor horizons of RHYv.

333.85 337.60 FLZ Fault Zone

333.85 - 337.6: Strongly faulted zone with core of fault gouge-supported polylithic breccia. Clasts include QZ, CA, SED, RHY, and PY.

<<Min: 336.5 - 337.6 2% Min: Pyrite>> Minor pyritic clasts

<<Alt: 333.85 - 337.6 Moderate Calcite>>

<<Struc: 333.85 - 336.5 Weak-Moderate Fault>>

<<Struc: 336.5 - 337.6 Intense Fault>>

337.60 342.70 SED undifferentiated Sediment

337.6 - 342.7: Light brown BI-MU-CA+/-SI schistwith AK-porphyroblasts. Large block within fault zone?

<<Min: 337.6 - 342.7 0.1% Min: Pyrite>>

<<Alt: 337.6 - 342.7 Moderate Calcite>>

<<Struc: 337.6 - 338 Weak-Moderate Fault>>

342.70 356.00 FLZ Fault Zone

342.7 - 356: Fault gouge-supported fault breccia. Intense faulting of rhyolite (?) from 342.7-348.5 m and 353.6-356 m. From 348.5-353.6 m, faulted and sheared MAFi occurs. The MAFi appears to have deformed more ductilely than the rhyolitic unit ?? Minor clasts of massive pyrite at ~354.7 m.

<<Min: 342.7 - 348.5 2% Min: Pyrite>> Minor pyritic clasts

<<Min: 348.5 - 353.6 0.1% Min: Pyrrhotite>>

<<Min: 353.6 - 356 2% Min: Pyrite>> Minor pyritic clasts

<<Alt: 342.7 - 348.5 Weak-Moderate Calcite>>

<<Alt: 348.5 - 353.6 Moderate-Strong Calcite>>

<<Alt: 353.6 - 356 Moderate Calcite>>

<<Struc: 342.7 - 348.5 Intense Fault>>

<<Struc: 348.5 - 353.6 Moderate Shear>> Sheared ductile deformation of MAFi. Also, brittle faulting.

<<Struc: 348.5 - 353.6 Strong Fault>> Sheared ductile deformation of MAFi. Also, brittle faulting.

<<Struc: 353.6 - 356 Intense Fault>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

356.00 358.85 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

356 - 358.85: Cl-CA banded schist with disseminated BI. Maybe a coherent block within a larger fault zone?

<<Min: 356 - 358.85 0.1% Min: Pyrrhotite>>

<<Alt: 356 - 358.85 Moderate-Strong Calcite>>

<<Vein: 356.75 - 358.8 5% Calcite>> ~3 1 cm wide CA-QZ veins per metre. Veins are parallel to foliation

<<Struc: 356 - 358.85 Weak-Moderate Fault>>

358.85 379.00 FLZ Fault Zone

358.85 - 379: Gouge-supported fault breccia with clasts of RHY, MDS, MAFi, and minor semi-massive PY.

<<Min: 358.85 - 378.5 2% Min: Pyrite>> Minor pyritic clasts

<<Min: 378.5 - 385.1 3% Min: Pyrite>> Disseminated PY in MU-altered RHY block within fault zone.

<<Alt: 358.85 - 401.8 Weak-Moderate Calcite>>

<<Alt: 378.5 - 386 Moderate Muscovite>> Yellow coloured MU, noted in coherent block within the fault zone. Potentially an altered block that was then faulted into the zone.

<<Struc: 358.85 - 378.5 Intense Fault>>

<<Struc: 378.5 - 380.4 Moderate Fault>>

379.00 383.20 RHY undifferentiated rhyolite

379 - 383.2: Weak-moderate MU-altered, weak-moderately faulted, rhyolite with a spaced MU-cleavage and siliceous domains.

<<Vein: 383 - 384.1 20% Quartz-Carbonate>> Two massive QZ-carbonate veins within moderately faulted and MU-altered RHY. A block within the larger fault zone that displays MU-alteration with QZ-veining assemblage?

<<Struc: 380.4 - 383.2 Weak Fault>>

383.20 397.68 FLZ Fault Zone

383.2 - 397.68: Moderate-strongly faulted RHY. Locally gouge-supported breccia with clasts of RHY and MDS. From 390-397.68 m, the fault consists of strongly faulted rhyolite with strong MU-alteration.

<<Min: 385.1 - 390 2% Min: Pyrite>> Minor pyritic clasts

<<Min: 390 - 401.8 3% Min: Pyrite>> Disseminated PY in MU-altered RHY block within fault zone.

<<Alt: 390 - 401.8 Strong Muscovite>>

<<Struc: 383.2 - 385.1 Moderate-Strong Fault>>

<<Struc: 385.1 - 390 Intense Fault>>

<<Struc: 390 - 397.68 Strong Fault>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

397.68 401.80 RHY undifferentiated rhyolite

397.68 - 401.8: Yellow-grey, moderately faulted, strongly MU-altered rhyolite. RHYv?

<<Struc: 397.68 - 399.9 Weak Fault>>

<<Struc: 399.9 - 401.8 Moderate Fault>>

401.80 402.60 MDSc Carbonaceous dominant mudstone

401.8 - 402.6: Black, carbonaceous mudstone. Quite hard, potentially due to silicification. Blebby PY.

<<Min: 401.8 - 402.6 5% Min: Pyrite>>

<<Alt: 401.8 - 405.05 Weak Muscovite>> Silver coloured MU in MDS unit.

<<Alt: 401.8 - 405.05 Trace Calcite>>

402.60 405.05 MDSt Rhyolite tuff dominant mudstone

402.6 - 405.05: Black and grey, carbonaceous bands in rhyolite tuff.

<<Min: 402.6 - 405.05 3% Min: Pyrite>>

405.05 462.70 RHY undifferentiated rhyolite

405.05 - 462.7: Strongly Mu-altered forming pervasive sericitic cleavages. Yellowish-grey, QZ-sericite schist with disseminated PY and minor CA bands. Locally texture ~resembles silicic banding and elsewhere RHYv textures? Strong alteration and moderate faulting makes differentiating RHYv from RHYc very difficult.

<<Min: 405.05 - 462.7 2% Min: Pyrite>>

<<Min: 405.05 - 462.7 2% Min: Pyrrhotite>>

<<Alt: 405.05 - 464.12 Strong Muscovite>> Yellow coloured sericitic cleavages

<<Alt: 405.05 - 464.12 Weak Calcite>>

<<Struc: 411 - 448.6 Weak Fault>> Highly broke core (Rubble zone) with local gougey material. Coincides with strong sericite alteration.

<<Struc: 459.5 - 459.6 Weak Fault>>

<<Struc: 462.4 - 462.7 Weak-Moderate Fault>>

462.70 464.12 OI Heavilly disseminated sulphides in host schist

462.7 - 464.12: ~15% patchy to disseminated PY in strongly MU-altered RHY.

<<Min: 462.7 - 464.12 15% Min: Pyrite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

464.12 491.00 RHYv Rhyolite volcaniclastic

464.12 - 491: Strongly Mu-altered rhyolite, with some clastic textures includig minor fine grained ashy bands and local lpl.

<<Min: 464.12 - 491 3% Min: Pyrite>>

<<Alt: 464.12 - 491 Moderate-Strong Muscovite>> Yellow coloured sericitic cleavages

<<Alt: 464.12 - 491 Weak-Moderate Calcite>>

<<Vein: 471 - 480.8 5% Quartz-Carbonate>> Zone with minor ~5-15 cm wide massive QZ +/- patchy carbonate veins

<<Struc: 464.15 - 464.5 Weak-Moderate Fault>>

<<Struc: 479.15 - 479.6 Weak-Moderate Fault>>

End of Hole @ 491

						Parent Hole:	

Comments:

K16-409 was drilled to target the down-dip extension of the ABM sulphide lens. Neither the expected ABM lens nor the associated mafic sill are present in the hole. A 20 m thick zone of strong, green, muscovite alteration of the type associated with ABM mineralization, occurs at the top of the hole in a position with no known mineralization. This may indicate another pathway taken by mineralizing fluids at a stratigraphic position above known mineralization. The hole cuts a flow rich volcanic pile. Quartz eye bearing crystal tuffs are present in the top 50 and bottom 50 m. There is also a package of carbonaceous tuffs and flows from 185-200 m.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
0.00	**4.50**	**OVBN Overburden**									
4.50	**18.35**	**RHYva Coarse grained to ash tuff grey-green FG**									

4.5 - 18.35: Fine grained, finely banded, rhyolitic ash tuff. Green colour come from muscovite alteration.

<<Min: 4.5 - 15.3 1% Min: Pyrite>> Bands, blebs and aggregate of pyrite associated with strong MU alteration

<<Min: 13.3 - 20.96 1% Min: Pyrrhotite>> Foliation parallel bands and wisps

<<Alt: 4.5 - 17.55 Moderate Muscovite>> Altering the non-siliceous component

<<Alt: 4.5 - 20.96 Weak Calcite>>

<<Alt: 17.55 - 18.35 Weak Silicification>> Possibly related to the adjacent RHYcw?

<<Alt: 17.55 - 20.96 Weak-Moderate Muscovite>> Altering the non-siliceous component

<<Struc: 16.6 - 16.61 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

18.35 20.96 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green FG

18.35 - 20.96: Aphanitic, siliceous, muscovite altered unit of coherent rhyolite.

20.96 29.45 RHYvx Quartz and/or feldspar crystal tuff medium grey FCG

20.96 - 29.45: Thick, massive unit of poorly sorted volcano-epiclastic material, comprising 1-4mm fragments of quartz/siliceous material and dark and light lithic fragments.

<<Min: 20.96 - 24.85 0.5% Min: Pyrrhotite>> Foliation parallel wisps

<<Min: 24.6 - 25.4 0.5% Min: Sphalerite>> Foliation parallel aggregates

<<Min: 25.4 - 27.55 0.5% Min: Pyrite>>

<<Min: 27.55 - 29.45 0.5% Min: Pyrrhotite>>

<<Alt: 20.96 - 24.85 Weak Muscovite>> Altering the non-siliceous component

<<Alt: 20.96 - 27.55 Weak-Moderate Silicification>> Through the RHYvx

<<Alt: 20.96 - 38.35 Trace Calcite>> Rare blebs.

<<Vein: 21.5 - 21.87 20% Quartz-Carbonate>>

<<Vein: 27.55 - 32.75 35% Quartz-Carbonate 60 deg. >>

<<Struc: 27.4 - 32.75 Weak Fault>> Narrow fault gouge zones associated with MU alteration and massive QZ veins.

29.45 33.35 RHYva Coarse grained to ash tuff grey-green FMG

29.45 - 33.35: Strongly altered unit of rhyolitic ash tuff with thin, coarser beds of 0.5-1 mm bands of medium grained material, and crystals increasing towards the bottom. There are rare thin, siliceous wavy/flattened (pumice?) clasts.

<<Min: 29.45 - 37.85 0.5% Min: Pyrite>>

<<Alt: 29.45 - 30.58 Moderate-Strong Muscovite>> Strong, pervasive muscovite alteration, small zone of muscovite mush

<<Alt: 30.58 - 36.76 Weak-Moderate Muscovite>> Altering the non-siliceous component

<<Struc: 33.33 - 33.34 dominant foliation>>

33.35 39.00 RHYvx Quartz and/or feldspar crystal tuff grey-green FCG

33.35 - 39: Abundant round quartz eyes and white-green feldspar? crystals? in a fine grained ashy matrix.

<<Min: 37.85 - 40.58 0.01% Min: Pyrite>>

<<Alt: 36.76 - 37.85 Moderate Muscovite>> Altering the non-siliceous component

<<Alt: 37.85 - 49.66 Weak Muscovite>> Altering the non-siliceous component

<<Alt: 38.35 - 41.14 Weak Calcite>> Blebs and crystal replacement

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 37.6 - 37.7 Weak Shear>> Weak shearing associated with QZ/CA vein.

39.00 39.36 PEL Equigranular biotite + calcite +/- quartz rock dark grey FG

39 - 39.36: Thin unit of fine grained sedimentary rock with porphyroblasts of biotite and ankerite

<<Alt: 39 - 39.36 Moderate Biotite>> Black euhedral biotite porphyroblasts, associated with diamond shaped ankerite porphyroblasts

<<Alt: 39 - 39.36 Moderate Ankerite>> Cream coloured diamond shaped porphyroblasts, fizz after scratching

39.36 40.13 RHYvx Quartz and/or feldspar crystal tuff grey-green FCG

39.36 - 40.13: Abundant round quartz eyes and white-green feldspar? crystals? in a fine grained ashy matrix.

<<Alt: 40.11 - 40.58 Weak-Moderate Biotite>> Black euhedral biotite porphyroblasts, associated with diamond shaped ankerite porphyroblasts

<<Alt: 40.11 - 40.58 Weak-Moderate Ankerite>> Cream coloured diamond shaped subhedral porphyroblasts, fizz after scratching

40.13 41.11 PEL Equigranular biotite + calcite +/- quartz rock medium grey FMG

40.13 - 41.11: Thin unit of fine to medium grained sedimentary rock with porphyroblasts of biotite and ankerite

<<Min: 40.58 - 41.14 0.01% Min: Pyrrhotite>>

41.11 49.66 RHYvx Quartz and/or feldspar crystal tuff grey-brown FCG

41.11 - 49.66: Abundant round quartz eyes and white-green feldspar? crystals? in a fine grained ashy matrix.

<<Min: 41.14 - 49.66 0.5% Min: Pyrrhotite>>

<<Alt: 41.14 - 43.05 Moderate Calcite>>

<<Alt: 43.05 - 49.66 Weak Calcite>> Blebs and crystal replacement

<<Struc: 41.52 - 41.53 Foliation>>

<<Struc: 46.46 - 46.47 dominant foliation>>

49.66 51.40 RHYcw Curdy textured-flow banded (flows, subvolcanics) light grey FCG

49.66 - 51.4: Curdy-textured siliceous unit comprising clots of silica material divided by thin domains of green-brown muscovite and/or biotite

<<Struc: 49.96 - 49.97 Foliation>> Flow band.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

51.40 53.96 PEL Equigranular biotite + calcite +/- quartz rock dark grey FG

51.4 - 53.96: Unit of fine grained sedimentary rock with porphyroblasts of biotite and ankerite

<<Min: 53.56 - 53.96 0.01% Min: Pyrrhotite>>

<<Alt: 51.4 - 53.96 Weak-Moderate Calcite>> Patches of pervasive calcite, where ankerite porphyroblasts have not grown

<<Alt: 51.4 - 53.96 Moderate Biotite>> Black euhedral biotite porphyroblasts, associated with diamond shaped ankerite porphyroblasts

<<Alt: 51.4 - 53.96 Moderate Ankerite>> Cream coloured diamond shaped porphyroblasts, fizz after scratching

53.96 56.19 RHYcw Curdy textured-flow banded (flows, subvolcanics) light grey FCG

53.96 - 56.19: Curdy-textured siliceous unit comprising clots of silica material divided by thin domains of green-brown muscovite and/or biotite

<<Alt: 53.96 - 79.13 Trace Calcite>>

56.19 58.19 RHYvx Quartz and/or feldspar crystal tuff grey-brown FCG

56.19 - 58.19: Abundant round quartz eyes and white-green feldspar? crystals? in a fine grained ashy matrix.

<<Min: 56.19 - 114 0.5% Min: Pyrrhotite>>

<<Vein: 57.31 - 58.52 20% Quartz-Carbonate 75 deg. >> SUL=Sphalerite

58.19 59.72 RHYva Coarse grained to ash tuff dark grey FG

58.19 - 59.72: A thin unit of generally well sorted, massive, fine grained ash tuff with rare quartz eye clasts

<<Struc: 59.39 - 59.4 dominant foliation>>

59.72 60.11 MDSt Rhyolite tuff dominant mudstone dark grey FG

59.72 - 60.11: a thin unit comprising alternating light and dark, well formed bands of fine sediment. some bands are chaotically folded

60.11 71.44 RHYva Coarse grained to ash tuff medium grey FCG

60.11 - 71.44: Abundant round quartz eyes and white-green feldspar? crystals? in a fine grained ashy matrix.

<<Min: 63 - 64.4 0.01% Min: Pyrite>>

<<Min: 64.4 - 114.4 1% Min: Pyrrhotite>> Bands of disseminated pyrrhotite

<<Alt: 60.11 - 64.4 Trace Biotite>> Patches of disseminated euhedral black biotite

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 64.4 - 71.44 Weak Biotite>> Patches of disseminated euhedral black biotite

<<Vein: 63 - 66 10% Tourmaline 5 deg. >>

<<Vein: 66.5 - 67.38 85% Quartz-Carbonate 75 deg. >>

<<Struc: 62.25 - 62.26 Foliation>> Flow band.

<<Struc: 64.98 - 64.99 dominant foliation>>

71.44 79.13 RHYvl Lapilli tuff medium grey FCG

71.44 - 79.13: A thick unit comprising a matrix of fine grained grey ashy material (with biotite porphyroblasts) and 0.5-5 cm flattened white siliceous clasts (lapilli). The lower 50 cm of the unit contains a higher abundance of lapilli (50-60%) with larger sizes, possibly indicating a graded bed, tops up.

<<Alt: 71.44 - 79.13 Trace Biotite>> Patches of disseminated euhedral black biotite

<<Alt: 71.44 - 114.4 Weak Tourmaline>> Small clots and rare fans of tourmaline

<<Struc: 72.09 - 72.1 dominant foliation>>

<<Struc: 74.65 - 74.66 dominant foliation>>

79.13 81.04 PEL Equigranular biotite + calcite +/- quartz rock grey-green FG

79.13 - 81.04: A thin unit of well banded, well sorted, fine grained pelite. Rare black euhedral biotite porphyroblasts are present with euhedral ankerite porphyroblasts and bands of calcite.

<<Alt: 79.13 - 81.04 Moderate Chlorite>> Pervasive chlorite flakes, possibly indicating a mafic source for the pelitic sediment

<<Alt: 79.13 - 81.04 Weak-Moderate Calcite>> porphyroblasts with calcite and bands

<<Alt: 79.13 - 81.04 Weak Biotite>> Patches and ankerite associated aggregates of disseminated euhedral black biotite

<<Alt: 79.13 - 81.04 Weak-Moderate Ankerite>> Cream coloured diamond shaped porphyroblasts, fizz after scratching

81.04 83.45 RHYva Coarse grained to ash tuff dark grey FMG

81.04 - 83.45: Primarily comprises fine grained siliceous ashy material with rare siliceous flattened lapilli. biotite and chlorite in the groundmass make the rock appear dark

<<Alt: 81.04 - 83.45 Trace Calcite>>

<<Alt: 81.4 - 83.45 Weak-Moderate Biotite>> Fine dark brown biotite in bands throughout the unit.

83.45 84.72 PEL Equigranular biotite + calcite +/- quartz rock brown FG

83.45 - 84.72: Pelitic unit composed of biotite material, both fine brown shreddy biotite and large2-4 mm black euhedral biotite porphyroblasts. Also present, giving the rock its distinctive appearance are euhedral diamond shaped ankerite porphyroblasts in bands

<<Alt: 83.45 - 84.72 Moderate Biotite>> Fine dark brown biotite in bands throughout the unit.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 83.45 - 84.72 Weak-Moderate Ankerite>> Cream coloured diamond shaped porphyroblasts, fizz after scratching

<<Alt: 83.45 - 84.78 Moderate Calcite>> porphyroblasts with calcite and pervasive throughout the rest of the unit

84.72 85.87 RHYva Coarse grained to ash tuff dark grey FCG

84.72 - 85.87: Primarily comprises fine grained siliceous ashy material with rare biotite-chlorite altered flattened lapilli. biotite and chlorite in the groundmass make the rock appear dark.

<<Alt: 84.72 - 85.87 Weak Biotite>> Fine dark brown biotite in patches.

<<Alt: 84.78 - 85.87 Trace Calcite>>

<<Struc: 84.97 - 84.98 dominant foliation>>

85.87 87.04 PEL Equigranular biotite + calcite +/- quartz rock brown FG

85.87 - 87.04: Pelitic unit composed of biotite material, both fine brown shreddy biotite and large2-4 mm black euhedral biotite porphyroblasts. Also present, giving the rock its distinctive appearance are euhedral diamond shaped ankerite porphyroblasts in bands. from 86.21-86.40, there is an interval of INT, with sharp contacts, possibly a baked margin (locally bleached)

<<Alt: 85.87 - 87.04 Moderate Calcite>> Pervasive, except for two small zones of silica alteration

<<Alt: 85.87 - 87.04 Moderate Biotite>> Fine dark brown biotite in bands throughout the unit.

<<Alt: 86.24 - 86.4 Moderate-Strong Silicification>> Strong, texture destroying silica alteration. Looks like a felsic dyke perhaps?

87.04 87.54 RHYva Coarse grained to ash tuff dark grey FCG

87.04 - 87.54: Primarily comprises fine grained siliceous ashy material with rare biotite-chlorite altered flattened lapilli. biotite and chlorite in the groundmass make the rock appear dark.

<<Alt: 87.04 - 87.54 Trace Calcite>>

<<Alt: 87.04 - 87.54 Weak Biotite>> Fine dark brown biotite in pseudoclastic patches

87.54 88.01 PEL Equigranular biotite + calcite +/- quartz rock brown FG

87.54 - 88.01: Pelitic unit composed of biotite material, both fine brown shreddy biotite and large2-4 mm black euhedral biotite porphyroblasts. Also present, giving the rock its distinctive appearance are euhedral diamond shaped ankerite porphyroblasts in bands.

<<Alt: 87.54 - 88.01 Moderate Calcite>>

<<Alt: 87.54 - 88.01 Moderate Biotite>> Fine dark brown biotite in bands throughout the unit.

88.01 91.03 RHYvl Lapilli tuff medium grey FCG

88.01 - 91.03: A thick unit comprising a matrix of fine grained grey ashy material (with biotite porphyroblasts) and 0.5-5 cm flattened white siliceous clasts (lapilli).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 88.01 - 91.03 Trace Biotite>> Disseminated euhedral black porphyroblasts of biotite

<<Alt: 88.01 - 114.4 Trace Chlorite>> Weak chlorite alteration in patches throughout the units

<<Alt: 88.01 - 118.48 Weak Calcite>> Blebs and bands of calcite

91.03 114.40 RHYva Coarse grained to ash tuff dark grey FCG

91.03 - 114.4: Primarily comprises fine grained siliceous ashy material with rare biotite-chlorite altered or siliceous flattened lapilli. Biotite and chlorite in the groundmass make the rock appear dark.

<<Alt: 91.03 - 114.4 Trace Biotite>> Fine dark brown biotite in patches.

<<Vein: 94.5 - 98.5 10% Tourmaline 45 deg. >> SUL (CP 0.5%, GL 0.5%) Cockade form in one vein, tourmaline on the outside, quartz on the inside.

<<Vein: 102.5 - 113 5% Tourmaline>>

<<Struc: 96.76 - 96.77 dominant foliation>>

<<Struc: 101.39 - 101.4 dominant foliation>>

<<Struc: 104.89 - 104.9 dominant foliation>>

<<Struc: 109.29 - 109.3 dominant foliation>>

114.40 117.39 RHYvl Lapilli tuff light grey FCG

114.4 - 117.39: This unit comprises 1-3cm lensoid white-green clasts (monomictic) with a matrix of fine grained material. It appears that these clasts (lapilli) are more common than in the preceding unit however this may be the result of alteration surrounding the fault that runs through the unit.

<<Min: 114.4 - 117.39 3% Min: Pyrite>>

<<Min: 114.4 - 117.39 0.5% Min: Pyrrhotite>> Bands of disseminated pyrrhotite

<<Struc: 114.94 - 117.03 Moderate Fault>> Multi-zone fault, comprising 3 gougy zones 5-25 cm thick, separated by intervals of boken rock or rubble.

117.39 128.30 RHYva Coarse grained to ash tuff dark grey FCG

117.39 - 128.3: Primarily comprises fine grained siliceous ashy material with rare biotite-chlorite altered and/or siliceous flattened lapilli. The biotite altered lapilli may be pseudoclasts. Biotite and chlorite in the groundmass make the rock appear dark.

<<Min: 117.39 - 146.67 1% Min: Pyrite>>

<<Min: 117.39 - 146.67 0.5% Min: Pyrrhotite>>

<<Alt: 117.39 - 119.68 Weak Biotite>> Fine dark brown biotite in bands

<<Alt: 117.39 - 142.35 Trace Chlorite>> Weak chlorite alteration in patches throughout the units

<<Alt: 118.48 - 119.68 Moderate Calcite>>

<<Alt: 119.68 - 120.79 Moderate Biotite>> Fine dark brown biotite throughout the interval

<<Alt: 119.68 - 122.2 Moderate-Strong Calcite>>

<<Alt: 120.79 - 122.2 Weak Biotite>> Fine dark brown biotite

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 122.2 - 126 Weak-Moderate Calcite>>

<<Alt: 122.2 - 142.35 Trace Biotite>> Patches of fine dark brown biotite

<<Alt: 126 - 143.53 Weak Calcite>>

<<Vein: 120.22 - 120.26 100% Quarzt-Biotite 45 deg. >>

<<Vein: 126.64 - 126.95 100% Quartz>> SUL= GL

<<Struc: 124.46 - 124.46 dominant foliation>> Chloritic parting

128.30 131.44 RHYvl Lapilli tuff medium grey FCG

128.3 - 131.44: This unit comprises 1-3cm lensoid white-green clasts (monomictic) with a matrix of fine grained material. It appears that these clasts (lapilli) are more common than in the preceding unit however this may be the result of alteration surrounding the fault t that runs through the unit.

<<Vein: 131.05 - 144 1% Tourmaline-Sulphide 45 deg. >> sulphide = pyrrhotite UND = talc

131.44 143.53 RHYva Coarse grained to ash tuff dark grey FCG

131.44 - 143.53: Primarily comprises fine grained siliceous ashy material with rare biotite-chlorite altered and/or siliceous flattened lapilli. The biotite altered lapilli may be pseudoclasts. Biotite and chlorite in the groundmass make the rock appear dark.

<<Alt: 142.35 - 143.53 Weak Muscovite>> Bands of cream-green muscovite cutting the BCQ alteration

<<Struc: 134.4 - 134.4 dominant foliation>> Chloritic parting

143.53 146.67 RHYva Coarse grained to ash tuff grey-green FCG

143.53 - 146.67: This moderately muscovite altered unit comprises mainly fine grained ash material, with subangular/deformed 1-5 mm light green patches, interpreted as clasts.

<<Alt: 143.53 - 149.85 Weak-Moderate Muscovite>> Patchy/pervasive cream green alteration.

<<Vein: 144.89 - 145.6 5% Ankerite 45 deg. >>

<<Struc: 144.2 - 144.2 Vein>> Tourmaline-quartz-biotite vein, cut by py-qtz vein

146.67 148.14 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green FG

146.67 - 148.14: This moderately to strongly altered unit comprises wavy bands of siliceous material in a mass of muscovite with pyrite. interpreted as a coherent flow

<<Min: 146.67 - 148.14 3% Min: Pyrite>>

148.14 151.44 RHYva Coarse grained to ash tuff grey-green FCG

148.14 - 151.44: This moderately muscovite altered unit comprises mainly fine grained ash material, with subangular/deformed 1-5 mm light green patches, interpreted as clasts.

<<Min: 148.14 - 155.82 0.5% Min: Pyrite>>

<<Min: 148.14 - 155.82 1% Min: Pyrrhotite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 149.85 - 149.9 100% Quartz-Carbonate 10 deg. >>

151.44 151.60 RHYva Coarse grained to ash tuff dark grey FG

151.44 - 151.6: Well sorted fine grained, relatively unaltered, well bedded ash tuff

151.60 154.57 RHYva Coarse grained to ash tuff medium grey FG

151.6 - 154.57: Weakly altered unit of poorly banded , homogeneous fine grained material. No strong distinguishing features

<<Alt: 151.6 - 154.57 Weak Muscovite>>

<<Vein: 154.35 - 183.42 15% Quartz>>

<<Struc: 154.2 - 154.28 Weak Fault>> small gougy fault in weak rock

154.57 155.82 MDSt Rhyolite tuff dominant mudstone dark grey FG

154.57 - 155.82: Well banded, strongly deformed unit with bands of black carbonaceous material with light green muscovite altered alternating bands, interpreted as ashy layers.

<<Min: 154.57 - 155.82 0.01% Min: Pyrite>>

<<Struc: 155.23 - 155.23 dominant foliation>> Carbonaceous parting

155.82 166.70 RHY undifferentiated rhyolite green FG

155.82 - 166.7: Strongly muscovite altered rhyolitic material with ptygmatic bands (veins?) of quartz and pyrite as well as massive quartz pods/veins. primary textures not preserved

<<Min: 155.82 - 160.1 1% Min: Pyrite>>

<<Min: 160.1 - 160.9 1% Min: Pyrite>>

<<Min: 166.14 - 189.76 1% Min: Pyrite>>

<<Min: 166.14 - 189.76 0.01% Min: Pyrrhotite>>

<<Alt: 155.82 - 159.2 Moderate Muscovite>> Pervasive alteration, barring the siliceous zones

<<Alt: 159.2 - 166.14 Moderate-Strong Muscovite>> No textures left, but rock is still coherent

<<Alt: 166.14 - 170.56 Moderate Muscovite>>

<<Struc: 166.5 - 166.5 dominant foliation>> Micaceous parting

166.70 175.51 RHY undifferentiated rhyolite green FMG

166.7 - 175.51: Strongly muscovite altered rhyolitic material with ptygmatic bands (veins?) of quartz and pyrite as well as massive quartz pods/veins. The sole primary texture preserved is the siliceous quartz eyes present in the rock.

<<Alt: 170.56 - 172.57 Weak-Moderate Muscovite>> Does not alter the siliceous pods

<<Alt: 172.57 - 180.3 Moderate Muscovite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

175.51 176.11 RHYcw Curdy textured-flow banded (flows, subvolcanics) green FG

175.51 - 176.11: Strongly muscovite altered unit. Curdy silica texture has been preserved through the alteration, suggesting a unit of RHYcw.

176.11 181.70 RHY undifferentiated rhyolite green FMG

176.11 - 181.7: Strongly muscovite altered rhyolitic material with ptygmatic bands (veins?) of quartz and pyrite as well as massive quartz pods/veins. The sole primary feature preserved are the rare siliceous quartz eyes present in the rock.

<<Alt: 180.3 - 181.7 Moderate-Strong Muscovite>>

<<Struc: 179.41 - 179.41 dominant foliation>> Micaceous parting

181.70 187.56 RHYv Rhyolite volcaniclastic green FMG

181.7 - 187.56: strongly muscovite altered unit, well developed banding is preserved, as well as rare quartz eyes, suggesting a sedimentary process. The lack of additional features suggests an ash tuff

<<Alt: 181.7 - 187.56 Moderate Muscovite>> Banding is preserved, despite pervasive alteration

<<Struc: 186.97 - 186.97 dominant foliation>> micaceous fault

187.56 192.10 MDSw Coherent rhyolite flow with carbonaceous content light grey FG

187.56 - 192.1: This unit primarily consists of curdy-textured silica with deformed bands of carbonaceous material and muscovite.

<<Min: 189.76 - 235.63 1% Min: Pyrite>> In bands with quartz and disseminated

<<Alt: 187.56 - 188.47 Weak-Moderate Muscovite>> Moderately altered between curdy silica pods and carbonaceous material.

<<Alt: 188.47 - 189.21 Weak Muscovite>> Weakly altered between curdy silica pods and carbonaceous material.

<<Vein: 188.87 - 188.9 100% Quartz 75 deg. >>

192.10 195.34 MDSt Rhyolite tuff dominant mudstone grey-green FG

192.1 - 195.34: Comprises moderately muscovite altered rhyolitic material with deformed and dismembered bands of carbonaceous material as well bands/veins of quartz-pyrite. Due to the lower levels of poddy-curdy silica in this unit it is interpreted as a tuffaceous unit.

<<Alt: 192.72 - 195.08 Weak-Moderate Muscovite>> Moderately altered between the ptygmatic quartz-pyrite bands and carbonaceous material.

<<Alt: 195.08 - 270.02 Weak Muscovite>> Overprint white/silver muscovite

<<Struc: 192.94 - 193 Weak-Moderate Fault>> 95% gouge, 5% crushed rock

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

195.34 202.38 MDSw Coherent rhyolite flow with carbonaceous content medium grey FG

195.34 - 202.38: This unit primarily consists of curdy-textured silica with deformed bands of carbonaceous material and muscovite.

202.38 224.40 RHYcw Curdy textured-flow banded (flows, subvolcanics) medium grey FG

202.38 - 224.4: Comprises primarily curdy textured silica. The interstitial material to this silica is muscovite. Quartz eyes are very rare, possible xenocrysts

224.40 224.80 RHYva Coarse grained to ash tuff light grey FG

224.4 - 224.8: A thin zone of ash? within a sequence of coherent rhyolitic flow units. This could e a xenolith within a single flow, or possibly an intra-flow layer however, there does not appear to be a flow top breccia on either margin.

224.80 235.63 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green FG

224.8 - 235.63: Comprises primarily curdy textured silica. The interstitial material to this silica is muscovite.

235.63 238.84 RHYva Coarse grained to ash tuff light grey FCG

235.63 - 238.84: Comprises a matrix of fine grained, weakly muscovite altered siliceous ashy material, with rare 0.5-2.5 cm siliceous lapilli, <15%.

<<Min: 235.63 - 255.02 1% Min: Pyrrhotite>>

<<Alt: 235.63 - 270.02 Weak Calcite>>

238.84 242.95 RHYvl Lapilli tuff light grey FCG

238.84 - 242.95: Comprises a matrix of fine grained, weakly muscovite altered siliceous ashy material, with rare 0.5-2.5 cm siliceous lapilli, >15%.

<<Struc: 239.36 - 239.36 dominant foliation>> lapilli flattening plane

242.95 256.02 RHYvl Lapilli tuff medium grey FCG

242.95 - 256.02: Comprises a matrix of fine grained, weakly muscovite or chlorite altered siliceous ashy material, with lapilli of various varieties (siliceous, BCQlpl, carbonate bearing) lapilli, >15% and lithic fragments.

<<Min: 255.02 - 300 0.5% Min: Pyrrhotite>>

<<Alt: 242.95 - 251.82 Weak Chlorite>> Patchy chlorite in the matrix of the RHYvl and occasionally in the lapilli too.

<<Vein: 248.78 - 248.8 100% Quartz 25 deg. >>

<<Struc: 253.1 - 253.1 dominant foliation>> Micaceous parting plane

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	8/8/2016
Local Northing:		Cemented?:	THM	Core Storage Loc.:	KZK Camp	Drill Completed:	8/9/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
Comments:						Parent Hole:	

This hole was drilled as part of a geotechnical investigation of the Class C storage facility that included Standard Penetration Tests (SPT's), Packer Testing and Thermistor installation. It intersected black mudstone of the Wind Lake Formation interbedded with thin mafic tuff units, followed by a thicker, possibly crystal bearing mafic tuff unit. It is possible that this lower unit is the uppermost portion of the KZK Formation however without additional context, it is difficult to make a positive determination.

UTM Elev. (m):	1595	Casing Depth (m):	6	Length (m):	147	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	8/12/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	8/15/2016
Local Elev. (m):				Hole Completed?:	Abandoned	Purpose:	Exploration
						Parent Hole:	

Comments:

Drill hole intersected units of the Wind Lake Formation from 4.6m to 147.0m (EOH). Hole was abandoned at 147.0m due to excessive diviation from planned azimuth of 240 degrees and redrilled as K16-414.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-65	238.5	1.4	239.9	TN14	Roger Hulstein	8/12/2016		☑	Muddy drill pad, drill likely settled during drilling. At 8pm Aug 15 azimuth of drill rod in chuck was 237.8 (+1.4=239.2 degrees) and dip was -64.6 deg (as measred by TN14) prior to being aligned for K16-414.

						Parent Hole:	

Comments:

Exploration and down hole geophysical (EM) drillhole K16-414 was abandoned at 342.25m due to excessive deviation. A new hole, K16-414W1 was then wedged off at 266.50m in an ultimately unsuccessful attempt to correct the azimuth. K16-414W1 was abandoned at 285.00m due to excessive deviation. No geophysical survey was carried out on either hole.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	9/4/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Exploration
Comments:						Parent Hole:	

K16-415 was designed to test a shallow geophysical anomaly in the Rhyolite Peak area and to continue into the underlying stratigraphy.
The likely source of the geophysical anomaly was a 0.52 m zone of massive sulphide interval containing pyrrhotite, pyrite, chalcopyrite, and sphalerite with tourmaline porphyroblasts, intersected from 46.45 m to 46.97 m. The mineralized zone lies between an intrusive rhyolite body/strongly silicified ash tuff above it and a siliceous coherent flow below.
The stratigraphy below the massive sulphide comprises amygdaloidal rhyolite bodies from 82-95 m interlayered with and underlain by a series of moderately to intensely silicified volcaniclastic rocks and fine grained epiclastic rocks.
From 525.21m to 641.84m, the lithology is marked by narrow quartzite units characterized by sharp contacts and intercalated intermediate volcanic (epiclastic) units. Those could be aplitic dykes (or sills) or meta sandstone (possibly channels within the volcanic sediments). Contacts, texture and occurrence tend to suggest sedimentary origin nevertheless porphyroblast ghosts seem occasional.
The bottom of the hole consists in volcaniclastic rhyolite and pelite interbedded. A unique lapilitic/garnet porphyroblasts unit is observed from 510.53m to 519.75m (potential marker unit).
No significant mineralization zones are intercepted excluding the massive sulphide crosscut at 46.45m. When observed, muscovite alteration is weak whereas silicification occurs pervasively.
The hole ends in at 854.50m in mudstone and mafic tuff interbedded.
DHEM survey was processed successfully from bottom to top by Aurora Geosciences.

502.02 503.80 MAFt Mafic Volcaniclastics green FG

502.02 - 503.8: Fine grained chloritic matrix, medium grained clasts (lapilli altered CA), BI and CA bands.

503.80 511.30 SLT Siltstone - fine-grained sedimentary rock light grey FMG

503.8 - 511.3: Or RHYva/QE. Granular texture, weakly chloritic at upper contact. BI porphyroblasts patches.

<<Min: 506 - 511.3 2% Min: Pyrrhotite>>

<<Alt: 503.8 - 569.79 Weak Calcite>>

511.30 515.60 SED undifferentiated Sediment dark grey FMG

511.3 - 515.6: QZ/BI/MU unit, intermediate composition, locally chloritic (or green sericite(?)). Mottled texture and clasts at upper contact, biotite rich. Could be volcaniclastic.

<<Min: 511.3 - 517.14 0.5% Min: Pyrrhotite>>

515.60 517.14 MDS Carbonaceous Mudstone & Tuffaceous Mudstone beige FG

515.6 - 517.14: Black, fine grained, foliated, few CA bands. QZ vein at upper contact/bleaching, sharp lower contact, Multiple QZ/A vein (2 to 5cm wide).

<<Vein: 516.65 - 517.14 Quartz-Carbonate>> Multiple QZ and QZ/CA veins representing 30 % of the interval.

517.14 517.75 RHYva Coarse grained to ash tuff light grey FG

517.14 - 517.75: Abundant QE eyes at upper contact. Gradual lower contact. Fine grain matrix,

<<Min: 517.14 - 525.94 1% Min: Pyrite>> In fracture.

<<Min: 517.14 - 525.94 2% Min: Pyrrhotite>> In fracture.

<<Struc: 517.68 - 517.69 dominant foliation>>

517.75 518.18 RHY undifferentiated rhyolite light grey

517.75 - 518.18: Texture obscured, coarser aspect/granular to massive, almost coherent rhyolite, silica rich, few QZ eyes. Sulphide in fracture (RHYc?).

518.18 520.58 RHYva Coarse grained to ash tuff light grey FG

518.18 - 520.58: Abundant small QE eyes at upper contact. Gradual lower contact. Fine grain matrix, Including fine grained, light blue, probably ash (40 c interval).

520.58 523.02 RHY undifferentiated rhyolite leucocratic

520.58 - 523.02: Texture obscured, coarser grained/granular to massive, almost coherent rhyolite, silica rich, few QZ eyes. Possibly fracture containing PO. Glassy from 522.66m to 523.02m. Sulphides in fracture (RHYc?).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

523.02 523.56 RHYva Coarse grained to ash tuff leucocratic FG

523.02 - 523.56: Fine grained matrix, few lapilli. Few QE.

523.56 525.21 RHYva Coarse grained to ash tuff medium grey FG

523.56 - 525.21: Fine grained, biotite patch and in foliation. Gradual contacts.

<<Struc: 524.75 - 524.76 dominant foliation>>

<<Struc: 525.15 - 525.16 dominant foliation>>

525.21 525.65 RHYvl Lapilli tuff light grey FMG

525.21 - 525.65: Mid strained lapilli in fine to fine to medium grained matrix.

525.65 525.94 INT undifferentiated (granitic) intrusive rocks beige VFG

525.65 - 525.94: Light color, very sharp contacts, siliceous, fine crystals. Probably intrusive aplitic unit/felsic dyke. Less possibly homogeneous fine grained sandstone channel.

525.94 526.38 RHYva Coarse grained to ash tuff medium grey FG

525.94 - 526.38: With pelitic content marked by biotite.

<<Min: 525.94 - 556.07 0.5% Min: Pyrrhotite>>

<<Min: 525.95 - 542.92 0.5% Min: Pyrite>> and few disseminated.

526.38 526.58 INT undifferentiated (granitic) intrusive rocks beige VFG

526.38 - 526.58: Light color, very sharp contacts, siliceous, fine crystals. Probably intrusive aplitic unit/felsic dyke. Less possibly homogeneous fine grained sandstone channel.

526.58 526.80 RHYva Coarse grained to ash tuff medium grey FG

526.58 - 526.8: With pelitic content marked by biotite.

526.80 527.13 INT undifferentiated (granitic) intrusive rocks beige VFG

526.8 - 527.13: Light color, very sharp contacts, siliceous, fine crystals. Probably intrusive aplitic unit/felsic dyke. Feldspar phenocrysts.

527.13 530.02 SED undifferentiated Sediment medium grey FG

527.13 - 530.02: Some clasts could be lapilli. Heterogeneous composition. BI small porphyroblasts elongated.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

530.02 530.21 INT undifferentiated (granitic) intrusive rocks beige FG

530.02 - 530.21: Light color, very sharp contacts, siliceous, fine crystals. Probably intrusive aplitic unit/felsic dyke. Less possibly homogeneous fine grained sandstone.

530.21 532.12 RHYva Coarse grained to ash tuff medium grey FG

530.21 - 532.12: Few BI porphyroblasts, bleached lower contact, possibly chill margin.

<<Vein: 532 - 532.15 Quarzt-Tourmaline-Sulphide 48 deg. >> Veins, different composition, from possibly TML to glassy silica with phenocrysts and sulfides, marking the contact on sheared/fault zone.

<<Struc: 532 - 534.15 Moderate Shear>> Measurement from the upper contact between rhyolite and sheared/faulted zone (marked by veins) and probably intrusive felsic unit.

532.12 534.15 INT undifferentiated (granitic) intrusive rocks light grey

532.12 - 534.15: Faulted/sheared possibly felsic dyke containing lapilitic rhyolite clasts. Upper contact showing wavy veining, maybe TML, glassy with crystals and inclusion (?) amygdaloidal. Large chill margin at upper contact.

534.15 539.31 PEL Equigranular biotite + calcite +/- quartz rock grey-green FMG

534.15 - 539.31: Biotite/chlorite/feldspar unit. Could be mafic dyke. Similar by some aspect with mafic sill but low carbonate content.

539.31 539.83 INT undifferentiated (granitic) intrusive rocks beige FG

539.31 - 539.83: Light color, very sharp contacts, siliceous, fine crystals. Probably intrusive aplitic unit/felsic dyke. Biotite needles overprinted.

539.83 540.44 PEL Equigranular biotite + calcite +/- quartz rock grey-green FMG

539.83 - 540.44: Biotite/chlorite/feldspar unit. Could be mafic dyke. Similar by some aspect with mafic sill but low carbonate content.

<<Struc: 540.33 - 540.34 Contact>> Upper contact with aplitic dyke in pelite.

540.44 540.57 INT undifferentiated (granitic) intrusive rocks beige FG

540.44 - 540.57: Light color, very sharp contacts, siliceous, fine crystals. Probably intrusive aplitic unit/felsic dyke. Feldspar phenocrysts. Biotite needles overprinted.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

540.57 542.92 PEL Equigranular biotite + calcite +/- quartz rock black FMG

540.57 - 542.92: Biotite/chlorite/feldspar unit. Could be mafic dyke. Similar by some aspect with mafic sill but low carbonate content.

542.92 544.55 RHYva Coarse grained to ash tuff medium grey FG

542.92 - 544.55: Bleached upper contact possibly due to QZ vein. Small BI porphyroblasts.

<<Min: 542.92 - 699.71 0.1% Min: Pyrite>> Rare, in fracture.

<<Alt: 542.92 - 556.07 Weak-Moderate Silicification>>

544.55 544.71 INT undifferentiated (granitic) intrusive rocks beige VFG

544.55 - 544.71: Light color, very sharp contacts, siliceous, fine crystals. Probably intrusive aplitic unit/felsic dyke. Feldspar phenocrysts ghosts. Biotite needles overprinted.

544.71 545.65 RHYvl Lapilli tuff medium grey FMG

544.71 - 545.65: Well developed BI porphyroblasts, lapilli in fine grained matrix.

545.65 548.66 RHYva Coarse grained to ash tuff medium grey FG

545.65 - 548.66: Pelitic content marked by biotite in foliation.

548.66 548.79 INT undifferentiated (granitic) intrusive rocks beige VFG

548.66 - 548.79: Light color, very sharp contacts, siliceous, fine crystals. Probably intrusive aplitic unit/felsic dyke. Biotite needles overprinted.

548.79 550.15 RHYva Coarse grained to ash tuff medium grey FG

548.79 - 550.15: Pelitic content marked by biotite in foliation.

550.15 550.26 INT undifferentiated (granitic) intrusive rocks beige VFG

550.15 - 550.26: Light color, very sharp contacts, siliceous, fine crystals. Probably intrusive aplitic unit/felsic dyke.

550.26 556.07 RHYva Coarse grained to ash tuff medium grey FG

550.26 - 556.07: Few lapilli. Pelitic content marked by biotite in foliation. Silicic bands at lower contact from 555.13m.

<<Struc: 551.26 - 551.27 dominant foliation>>

<<Struc: 556.06 - 556.07 Contact>> Upper contact pelite/rhyolite.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

556.07 560.55 PEL Equigranular biotite + calcite +/- quartz rock black FG

556.07 - 560.55: Homogeneous texture, crosscut by milky QZ veins and aplitic dyke (?).

<<Min: 556.07 - 558.43 1% Min: Pyrrhotite>> and in veinlets.

<<Min: 558.43 - 569.79 0.1% Min: Pyrrhotite>> Concentrated in rare pelite bands.

<<Alt: 558.43 - 569.79 Weak-Moderate Silicification>>

560.55 562.77 INT undifferentiated (granitic) intrusive rocks beige VFG

560.55 - 562.77: Light color, very sharp contacts, siliceous, fine crystals. Probably intrusive aplitic unit/felsic dyke. Feldspar phenocrysts.

<<Struc: 561.41 - 561.42 dominant foliation>>

562.77 565.45 RHYvl Lapilli tuff medium grey FG

562.77 - 565.45: Rare crystals. Large lapilli poorly sorted in fine grained matrix. Marrow pelitic intervals (10cm and less wide).

<<Struc: 565.08 - 565.09 Contact>> Lower contact narrow pelite/lapilitic ash tuff.

565.45 565.86 INT undifferentiated (granitic) intrusive rocks beige VFG

565.45 - 565.86: Light color, very sharp contacts, siliceous, fine crystals. Probably intrusive aplitic unit/felsic dyke. Feldspar phenocrysts.

565.86 569.79 RHYv Rhyolite volcaniclastic medium grey FG

565.86 - 569.79: Fine grained matrix, rare QE, silicic bands at lower contact.

<<Struc: 566.62 - 566.62 dominant foliation>>

569.79 572.30 PEL Equigranular biotite + calcite +/- quartz rock black FG

569.79 - 572.3: Black, fine grain biotite, weakly to moderately calcareous, few QZ/CA veins. Gradual upper contact, sharp lower contact.

<<Min: 569.79 - 572.3 0.1% Min: Pyrrhotite>>

<<Alt: 569.79 - 572.3 Weak-Moderate Calcite>>

572.30 578.15 RHYvl Lapilli tuff grey-green MG

572.3 - 578.15: Some fine grained bands (mud or ash?), muscovite content increases at lower contact. Clasts (?) containing QE from 575.13m to 575.31m. Epiclastic sediment, could be logged as SED.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 572.3 - 578.15 0.1% Min: Pyrrhotite>>

<<Struc: 575.93 - 575.94 dominant foliation>>

578.15 579.80 PEL Equigranular biotite + calcite +/- quartz rock beige FG

578.15 - 579.8: Black, fine grain. Some rounded CA replaced clasts could be amygdules (mafic dyke (?). Faulted at lower contact. CA veinlets.

<<Min: 578.15 - 594.42 1% Min: Pyrrhotite>>

<<Alt: 578.15 - 594.42 Weak-Moderate Calcite>>

579.80 580.18 RHYvl Lapilli tuff grey-green MCG

579.8 - 580.18: Gougy narrow interval, clastic, coarse, heterogeneous. Epiclastic sediment, could be logged as SED.

<<Struc: 579.8 - 580 Weak Fault>> And weak shearing at contact between pelite and sediments.

580.18 580.45 INT undifferentiated (granitic) intrusive rocks beige VFG

580.18 - 580.45: Very fine crystals, light color, siliceous (quartzite type unit).

580.45 584.62 PEL Equigranular biotite + calcite +/- quartz rock green-brown FMG

580.45 - 584.62: Biotite rich unit, locally coarse texture/clastic (sediments intercaled).

<<Struc: 581.83 - 581.84 dominant foliation>>

<<Struc: 583.03 - 583.04 dominant foliation>>

<<Struc: 584.54 - 584.55 dominant foliation>>

584.62 584.87 INT undifferentiated (granitic) intrusive rocks beige VFG

584.62 - 584.87: Siliceous, probably intrusive, sharp contact, quartzite (?).

584.87 587.52 PEL Equigranular biotite + calcite +/- quartz rock black FG

584.87 - 587.52: Fine grain biotite, weakly to moderately calcareous.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

587.52 589.33 RHYvl Lapilli tuff grey-green MCG

587.52 - 589.33: Siliceous, strained clasts (lapilli (?)), heterogeneous, conglomerate texture, biotite porphyroblasts. Maybe intermediate composition volcaniclastic unit. Epiclastic sediment, could be logged as SED.

589.33 594.42 PEL Equigranular biotite + calcite +/- quartz rock black FG

589.33 - 594.42: Fine grain biotite, weakly to moderately calcareous, phenocrysts feldspar, sharp at upper contact replaced calcite (late crystallization). Possibly mafic unit but narrow sediment interval from 592.90m to 593.00m suggests sedimentary origin.

594.42 595.25 RHYvl Lapilli tuff grey-green FMG

594.42 - 595.25: Muscovite/sericite rich matrix, locally conglomerate texture with possibly mid strained lapilli, heterogeneous. Intermediate volcaniclastic unit or sediment.

<<Min: 594.42 - 635.84 0.1% Min: Pyrrhotite>>

<<Alt: 594.42 - 608.45 Weak Silicification>>

<<Alt: 594.42 - 638.97 Trace Calcite>>

595.25 595.46 INT undifferentiated (granitic) intrusive rocks beige VFG

595.25 - 595.46: Siliceous, fine crystals, sharp contacts, quartzite aspect.

595.46 599.77 RHYvl Lapilli tuff grey-green MG

595.46 - 599.77: Muscovite/sericite rich matrix, locally conglomerate texture with possibly mid strained lapilli, heterogeneous. Intermediate volcaniclastic unit or sediment.

<<Struc: 595.5 - 599.5 Trace Fault>> Multiple narrow gouge (2 to 5 cm wide). Minor.

599.77 608.45 RHYva Coarse grained to ash tuff dark grey FMG

599.77 - 608.45: Muscovite/sericite rich matrix, few clasts (possibly lapilli). Epiclastic sediment, could be logged as SED.

<<Struc: 603.58 - 603.59 dominant foliation>>

<<Struc: 604.86 - 604.87 dominant foliation>>

<<Struc: 608.3 - 608.31 dominant foliation>>

608.45 612.26 RHYvx Quartz and/or feldspar crystal tuff dark grey VFG

608.45 - 612.26: Silicified unit showing feldspar and quartz porphyry (1 to 3mm, automorph) in a granular to granophyric texture. Could be intrusive (INT-large felsic dyke). Sharp upper contact.

<<Alt: 608.45 - 613.46 Intense Silicification>> Quartzite (?).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

612.26 613.46 INT undifferentiated (granitic) intrusive rocks light grey VFG

612.26 - 613.46: Probably same unit than above, strongly silicified, bleached, very fine crystals (granophyric), few feldspar ghosts preserved. Could be silicified crystal tuff.

613.46 616.28 RHYva Coarse grained to ash tuff medium grey FG

613.46 - 616.28: Intermediate ash tuff.

<<Alt: 613.46 - 649.31 Weak Silicification>>

<<Struc: 613.8 - 613.81 dominant foliation>>

616.28 623.25 RHYva Coarse grained to ash tuff medium grey FMG

616.28 - 623.25: Lapilli at upper contact. Probably epiclastic sediments, Biotite porphyroblasts, heterogeneous composition, some clasts, dominantly fine grain matrix.

<<Struc: 616.4 - 616.41 dominant foliation>>

<<Struc: 620.35 - 625.36 dominant foliation>>

623.25 624.02 SLT Siltstone - fine-grained sedimentary rock beige FG

623.25 - 624.02: Fine grain, homogeneous, felsic, biotite porphyroblasts overprinted.

624.02 628.14 RHYvl Lapilli tuff medium grey

624.02 - 628.14: Heterogeneous, pebble size clasts, poorly sorted, locally granular, containing elongated silica clasts possibly lapilli. Interpreted as reworked material-epiclastic sediment. Epiclastic sediment, could be logged as SED.

628.14 628.43 PEL Equigranular biotite + calcite +/- quartz rock black VFG

628.14 - 628.43: Very fine grain biotite, homogeneous.

628.43 629.30 RHYvl Lapilli tuff dark grey CG

628.43 - 629.3: Coarse grain, pebble size clasts, conglomerate texture, muscovite/sericite matrix. Epiclastic sediment, could be logged as SED.

629.30 630.06 RHYva Coarse grained to ash tuff dark grey FG

629.3 - 630.06: Fine grain, homogeneous, biotite porphyroblasts.

<<Struc: 629.75 - 629.76 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

630.06 635.84 RHYvl Lapilli tuff dark grey MG

630.06 - 635.84: Conglomerate texture, heterogeneous. Siliceous clasts, white, containing rare phenocrysts (porphyry clasts/lapilli (?)). Epiclastic sediment, could be logged as SED.

<<Struc: 633.2 - 633.21 dominant foliation>>

635.84 636.15 PEL Equigranular biotite + calcite +/- quartz rock black FG

635.84 - 636.15: Fine grain biotite containing angular, poorly sorted clasts or porphyroblasts (possibly rhyolite clasts, deformed bands observed inside/tube pumice (?)), heterogeneous. Wavy contacts contouring clasts suggesting sedimentary sequence.

<<Min: 635.84 - 636.15 2% Min: Pyrrhotite>>

636.15 638.97 RHYv Rhyolite volcaniclastic dark grey FMG

636.15 - 638.97: Heterogeneous, locally granular. Some clasts, matrix supported. Sharp lower contact.

<<Min: 636.84 - 657.53 0.1% Min: Pyrrhotite>>

638.97 639.52 PEL Equigranular biotite + calcite +/- quartz rock black FG

638.97 - 639.52: Fine grain biotite, sharp contacts, granular o the upper part. Thinly foliated.

<<Alt: 638.97 - 639.52 Weak Calcite>>

639.52 641.47 PEL Equigranular biotite + calcite +/- quartz rock dark grey FG

639.52 - 641.47: Biotite bands/ash tuff thinly interbedded, heterogeneous composition. Locally granular and felsic intervals.

<<Alt: 639.52 - 649.31 Trace Calcite>>

641.47 641.84 INT undifferentiated (granitic) intrusive rocks beige FG

641.47 - 641.84: Siliceous intervals, granular(or granophyric), possibly felsic dyke but sharp contact, no chill margin. Maybe sandstone channel crosscutting muddy pelitic sequence.

641.84 644.59 RHYv Rhyolite volcaniclastic medium grey FG

641.84 - 644.59: Fine grain matrix containing few rhyolite clasts and/or lapilli. Gradual upper upper contact, sharp lower contact.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

644.59 649.31 PEL Equigranular biotite + calcite +/- quartz rock dark grey FG

644.59 - 649.31: Biotite bands/ash tuff thinly interbedded, heterogeneous composition. Locally granular and felsic intervals. Felsic dyke/sandstone/quartzite from 648.42m to648.61m. Sharp contacts.

<<Struc: 644.8 - 644.81 dominant foliation>>

649.31 654.87 SLT Siltstone - fine-grained sedimentary rock beige FG

649.31 - 654.87: Siliceous unit, locally texture changes from fine grain to granular. Containing pelite interval crosscut by narrow felsic interval. Sediment bands at lower contact suggests that al the unit is sedimentary (interpreted as meta sandstone).

<<Alt: 649.31 - 654.87 Strong Silicification>> Quartzite (?).

<<Alt: 649.31 - 657.53 Weak Calcite>>

654.87 656.90 PEL Equigranular biotite + calcite +/- quartz rock black FG

654.87 - 656.9: Possibly mafic dyke but no chill margin. Angular clasts/late porphyroblasts. Sharp upper and lower contacts. Weakly calcareous.

<<Struc: 656.79 - 656.8 Contact>> Contact between felsic dyke/narrow sandstone unit and RHYv.

<<Struc: 656.85 - 656.86 dominant foliation>>

656.90 657.53 RHYv Rhyolite volcaniclastic grey-brown FG

656.9 - 657.53: Light grey, dominantly ash tuff, banded (strongly strained lapilli (?). Containing a 15cm wide siliceous interval (intrusive or sandy/quartzite).

657.53 659.96 PEL Equigranular biotite + calcite +/- quartz rock black FMG

657.53 - 659.96: Moderately calcareous. Porphyroblasts replaced calcite over 12cm at upper contact. Heterogeneous at upper contact, locally granular.

<<Min: 657.53 - 659.96 0.5% Min: Pyrrhotite>>

<<Alt: 657.53 - 659.96 Weak-Moderate Calcite>>

659.96 666.47 RHY undifferentiated rhyolite light grey VFG

659.96 - 666.47: Siliceous unit, very fine grain, few silica clasts (possibly lapilli). Could be log as RHYc/RHYi. Probably RHYva silicified or siltstone. Weakly calcareous. One light yellow band, very fine grain, possibly mud clasts suggesting sedimentary unit.

<<Min: 659.96 - 669.78 0.5% Min: Pyrrhotite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

666.47 667.71 PEL Equigranular biotite + calcite +/- quartz rock black FMG

666.47 - 667.71: Interbedded with RHYva.

667.71 668.64 SLT Siltstone - fine-grained sedimentary rock beige VFG

667.71 - 668.64: Fine grain, homogeneous, siliceous. Possibly meta siltstone.

668.64 669.78 RHY undifferentiated rhyolite light grey FG

668.64 - 669.78: Siliceous unit, very fine grain, few silica clasts (possibly lapilli). Could be log as RHYc/RHYi. Probably RHYv silicified or siltstone. Weakly calcareous.

669.78 671.76 PEL Equigranular biotite + calcite +/- quartz rock black

669.78 - 671.76: Different grain size bands, heterogeneous texture, calcareous.

<<Alt: 669.78 - 671.76 Weak-Moderate Calcite>>

671.76 674.34 RHY undifferentiated rhyolite light grey FG

671.76 - 674.34: Siliceous or silicified unit, fine grin. Could be ash tuff or siltstone. Could be log as RHYc/RHYi. Pinkish patches, possible albite alteration.

<<Alt: 671.76 - 674.34 Strong Silicification>>

<<Alt: 671.76 - 674.34 Weak Calcite>>

674.34 676.66 PEL Equigranular biotite + calcite +/- quartz rock black

674.34 - 676.66: Different grain size bands, heterogeneous texture, calcareous.

<<Min: 674.5 - 699.71 0.5% Min: Pyrrhotite>>

<<Alt: 674.34 - 680.64 Trace Calcite>>

676.66 680.64 RHYva Coarse grained to ash tuff medium grey FG

676.66 - 680.64: Some banded silica rich patch with obscured texture.

<<Alt: 676.66 - 680.64 Weak Silicification>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

680.64 683.15 PEL Equigranular biotite + calcite +/- quartz rock black FG

680.64 - 683.15: Weakly to moderately calcareous, CA veinlets, Fine grain and coarser grain bands.

<<Alt: 680.64 - 683.15 Moderate Calcite>>

683.15 686.35 RHYv Rhyolite volcaniclastic medium grey FG

683.15 - 686.35: Pelite interval from 685.65m to 685.96m. Could be SED/heterogeneous texture.

<<Alt: 683.15 - 698.27 Trace Calcite>>

<<Struc: 685.07 - 685.08 dominant foliation>>

<<Struc: 685.65 - 685.66 Contact>> Contact RHYv/PEL.

686.35 688.30 PEL Equigranular biotite + calcite +/- quartz rock black MG

686.35 - 688.3: Weakly calcareous, sorted bands.

688.30 692.27 RHYva Coarse grained to ash tuff medium grey FG

688.3 - 692.27: Fine grain, few biotite porphyroblasts, homogeneous.

692.27 694.35 PEL Equigranular biotite + calcite +/- quartz rock black FMG

692.27 - 694.35: Weakly calcareous, homogeneous, faulted at upper contact.

<<Alt: 694.27 - 698.27 Weak Silicification>>

694.35 698.27 RHYva Coarse grained to ash tuff medium grey FG

694.35 - 698.27: Pelite from 695.89m to 69630m and some siliceous interval showing obscured texture.

698.27 699.74 PEL Equigranular biotite + calcite +/- quartz rock black FG

698.27 - 699.74: Homogeneous, fine grain, weakly calcareous.

<<Min: 699.71 - 704.5 0.5% Min: Pyrrhotite>>

<<Min: 699.71 - 720.27 1% Min: Pyrite>> Local aggregated euhedral crystal.

<<Alt: 698.27 - 699.74 Weak-Moderate Calcite>>

699.74 703.27 RHYv Rhyolite volcaniclastic grey-brown FG

699.74 - 703.27: Chaotic volcaniclastic interval containing abundant QZ veins/pods-muscovite halo/silicic bands.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 699.74 - 704.55 Weak Muscovite>> Associated with QZ veins/pods.

<<Alt: 699.74 - 706 Moderate Silicification>>

<<Alt: 699.74 - 706.13 Trace Calcite>>

<<Vein: 699.74 - 704.55 Quartz>> Multiple QZ veins and pods representing 25% of the interval associated with MU alteration.

<<Struc: 702.7 - 703.6 Trace Shear>> Weak deformation along QZ veins.

703.27 703.62 PEL Equigranular biotite + calcite +/- quartz rock black FG

703.27 - 703.62: Weakly sheared.

703.62 706.13 RHYv Rhyolite volcaniclastic grey-green FG

703.62 - 706.13: Rare silica clasts, fine grain. Probably ash tuff.

<<Min: 704.5 - 720.27 0.1% Min: Pyrrhotite>>

<<Alt: 704.55 - 714.5 Trace Muscovite>>

<<Struc: 706 - 706.01 dominant foliation>>

706.13 706.69 PEL Equigranular biotite + calcite +/- quartz rock black

706.13 - 706.69: Grains or crystals aggregated in bands. CA veins, moderately calcareous.

<<Alt: 706.13 - 706.69 Weak-Moderate Calcite>> and bands.

706.69 710.50 RHYvl Lapilli tuff grey-green FG

706.69 - 710.5: Locally sericite/muscovite matrix bands showing clasts. Possibly reworked volcaniclastic (or sediment). Heterogeneous composition, texture mostly obscured..

<<Alt: 706.69 - 720.27 Trace Calcite>>

710.50 720.27 RHYv Rhyolite volcaniclastic medium grey MCG

710.5 - 720.27: Coarse grain dominantly, some QZ clasts (lapilli?), PY disseminated, possibly large clasts (pumice silicified?) showing obscured texture. BI needles, rare QE.

720.27 729.12 PEL Equigranular biotite + calcite +/- quartz rock

720.27 - 729.12: Homogeneous, poorly calcareous, rare rhyolite bands intercaled, PY disseminated from 728.50m to lower contact, large euhedral crystals observed, CA veinlets.

<<Min: 720.27 - 729.72 0.1% Min: Pyrite>>

<<Min: 720.27 - 729.72 2% Min: Pyrrhotite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 720.27 - 729.72 Weak Calcite>> and bands (veinlets).

729.12 735.65 RHYvl Lapilli tuff light grey FMG

729.12 - 735.65: Rhyolite and pelite intercaled. QZ bands/silicic bands, chaotic texture, PY disseminated. Pelite from 730.16m to 730.76m and from 732.32m to 730.03m.

<<Min: 729.72 - 750 2% Min: Pyrite>> Euhedral, large crystals in pelite, aggregated/discontinuous bands in rhyolite.

<<Min: 729.72 - 752.54 0.5% Min: Pyrrhotite>>

<<Alt: 729.72 - 752.54 Trace Calcite>> In pelite units.

<<Vein: 729.72 - 732 Quartz>> Multiple QZ veins/silicic bands representing 20% of the interval.

<<Struc: 735.1 - 735.5 Weak Fault>> Minor fault gouge.

735.65 736.20 PEL Equigranular biotite + calcite +/- quartz rock black FG

735.65 - 736.2: Fine grain matrix, white mineral clasts or phenocrysts (replaced calcite), possibly amygdules.

736.20 737.00 RHYv Rhyolite volcaniclastic medium grey MG

736.2 - 737: Dirty rhyolite.

737.00 737.60 PEL Equigranular biotite + calcite +/- quartz rock black FG

737 - 737.6: Fine grain, homogeneous.

737.60 742.48 RHYv Rhyolite volcaniclastic medium grey

737.6 - 742.48: Probably epiclastic. Dirty rhyolite, Biotite bands, heterogeneous texture (various grain size bends). Some CL blebs and muscovite alteration trace.

<<Alt: 739.3 - 742.48 Trace Muscovite>>

<<Alt: 739.3 - 742.48 Trace Chlorite>> And/or green sericite.

<<Vein: 741.45 - 750.3 Quartz>> Multiple QZ blebs/veins representing 10% of the interval.

742.48 743.26 PEL Equigranular biotite + calcite +/- quartz rock black FG

742.48 - 743.26: Fine grain, homogeneous, sharp contacts.

743.26 752.54 RHYv Rhyolite volcaniclastic medium grey

743.26 - 752.54: Pelite intercaled. PY disseminated (euhedral dominantly), QZ patches and weak MU alteration. Locally silicic bands/large strained lapilli (?).

<<Min: 750 - 764 0.5% Min: Pyrite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 746.5 - 749.5 Weak Muscovite>> Associated with QZ blebs.

<<Struc: 745.1 - 745.11 dominant foliation>>

<<Struc: 745.76 - 745.77 dominant foliation>>

752.54 758.76 PEL Equigranular biotite + calcite +/- quartz rock black FG

752.54 - 758.76: Including rhyolitic intervals intercaled. Homogeneous, fine grain, sharp contacts.

<<Min: 752.54 - 765.15 1% Min: Pyrrhotite>>

<<Alt: 752.54 - 755.34 Weak Calcite>>

<<Alt: 755.34 - 756.04 Trace Calcite>>

<<Alt: 756.04 - 758.76 Weak Calcite>>

758.76 765.15 RHYva Coarse grained to ash tuff medium grey FMG

758.76 - 765.15: Dominantly fine grain, heterogeneous texture. Some clasts aggregated suggesting multiple sorted interval sequences (coarse grain/fine grain).

<<Min: 764 - 780.82 0.1% Min: Pyrite>>

<<Alt: 758.76 - 766.52 Trace Calcite>>

<<Struc: 762.15 - 762.16 dominant foliation>>

765.15 766.52 RHY undifferentiated rhyolite light grey FG

765.15 - 766.52: Possibly silicified pumice/sericite intercaled.

<<Min: 765.15 - 793.47 0.5% Min: Pyrrhotite>>

<<Alt: 765.15 - 766.52 Moderate-Strong Silicification>>

766.52 767.60 PEL Equigranular biotite + calcite +/- quartz rock black FG

766.52 - 767.6: Fine grain, weakly calcareous.

<<Alt: 766.52 - 767.6 Weak Calcite>>

<<Struc: 767.38 - 767.65 Trace Fault>> Minor fault gouge.

767.60 771.54 RHY undifferentiated rhyolite light grey FG

767.6 - 771.54: Silicic bands/chert (?). Pelite intercaled from 769.61m to 770.01m. Possibly silicified pumice. Ash interval at upper contact.

<<Alt: 767.6 - 771.54 Strong Silicification>>

<<Alt: 767.6 - 772.32 Trace Calcite>>

<<Struc: 770.85 - 770.86 dominant foliation>>

From (m)	To (m)	Rocktype & Description			From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

771.54 772.32 RHYva Coarse grained to ash tuff light grey FG

771.54 - 772.32: Gradual upper contact.

772.32 775.88 PEL Equigranular biotite + calcite +/- quartz rock black FG

772.32 - 775.88: Rhyolite interval intercaled from 773.80m to 774.08m. Sharp contacts.

<<Alt: 772.32 - 775.88 Weak Calcite>>

<<Alt: 775.08 - 777.7 Weak Muscovite>> Could be original with regard to the color.

<<Struc: 773.56 - 773.61 dominant foliation>>

775.88 779.15 RHYv Rhyolite volcaniclastic dark grey MG

775.88 - 779.15: Dirty rhyolite. Biotite bands, MU alteration trace. Epiclastic sediments (?). Pelite intercaled.

<<Alt: 775.88 - 783.51 Trace Calcite>>

779.15 783.51 SED undifferentiated Sediment dark grey MG

779.15 - 783.51: Or dirty rhyolite. Chaotic unit, wavy QZ veining, weak muscovite associated, PY disseminated (2%). Possibly clasts relics, biotite bands and patches.

<<Min: 780.82 - 785.58 2% Min: Pyrite>>

<<Vein: 780.8 - 782.4 Quartz>> QZ vein patches, 5% of the interval.

<<Struc: 779.35 - 779.36 dominant foliation>>

783.51 785.58 SED undifferentiated Sediment grey-brown FMG

783.51 - 785.58: Banded brown/black, micaceous, mottled texture.

<<Alt: 783.51 - 785.68 Weak Calcite>> and in fracture.

785.58 786.60 PEL Equigranular biotite + calcite +/- quartz rock black VFG

785.58 - 786.6: Very fine grain, calcite in fracture.

<<Min: 785.58 - 793.47 0.5% Min: Pyrite>>

<<Alt: 785.68 - 793.47 Trace Calcite>>

786.60 790.40 SED undifferentiated Sediment grey-brown FMG

786.6 - 790.4: Gradual lower contact. Micaceous, bands/blebs brown/black.

790.40 793.47 RHYva Coarse grained to ash tuff dark grey FMG

790.4 - 793.47: Dirty rhyolite, gradual upper contact.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

793.47 810.53 PEL Equigranular biotite + calcite +/- quartz rock green-brown FG

793.47 - 810.53: Fine grain, chlorite blebs at upper contact associated with white clasts/porphyroblasts replaced calcite. Chlorite banded intervals, Medium size biotite porphyroblasts, non foliated, homogeneous.

<<Min: 793.47 - 819.74 2% Min: Pyrrhotite>>

<<Min: 793.47 - 854.5 0.1% Min: Pyrite>>

<<Alt: 793.47 - 810.53 Weak Chlorite>>

<<Alt: 793.47 - 810.53 Weak-Moderate Calcite>>

<<Struc: 810.2 - 810.21 dominant foliation>>

810.53 819.75 RHYvl Lapilli tuff light grey FG

810.53 - 819.75: Fine grain matrix, mid strained clasts (lapilli), silicified, biotite porphyroblasts (overprint). Disseminated garnet (orange/pink-amandine (?)) subhedral, well developed. Sharp upper contact, gradual lower contact.

<<Min: 819.74 - 854.5 1% Min: Pyrrhotite>>

<<Alt: 810.53 - 819.75 Moderate-Strong Silicification>>

<<Alt: 811.8 - 818.4 Moderate Garnet>> Probably not original(not associated with muscovite or chlorite).

<<Struc: 811.56 - 811.57 dominant foliation>>

<<Struc: 817.63 - 817.64 dominant foliation>>

819.75 826.83 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey VFG

819.75 - 826.83: CA banded, narrow mafic tuff intervals, locally mixed. Biotite in foliation. Sharp lower contact.

<<Alt: 819.75 - 828.63 Moderate-Strong Calcite>>

<<Vein: 820.46 - 820.8 Quartz>> QZ vein/pod in mafic tuff interval.

<<Struc: 821.35 - 821.36 dominant foliation>>

<<Struc: 824.45 - 824.46 dominant foliation>>

826.83 827.25 MAFt Mafic Volcaniclastics green FG

826.83 - 827.25: Sharp contact, homogeneous, biotite porphyroblasts, non foliated.

827.25 828.63 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey VFG

827.25 - 828.63: CA banded, narrow mafic tuff intervals, locally mixed. Biotite in foliation

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

828.63 846.04 MAFt Mafic Volcaniclastics green FG

828.63 - 846.04: Homogeneous, weak biotite content, banded BI/CA at upper contact.

<<Min: 829.3 - 831 0.1% Min: Galena>> I QZ vein.

<<Alt: 828.63 - 846.04 Weak-Moderate Calcite>>

<<Vein: 829.3 - 831 Quartz>> Multiple narrow QZ vein, GL trace representing 20% of the interval.

<<Struc: 829.92 - 829.93 dominant foliation>>

<<Struc: 835.43 - 835.44 dominant foliation>>

<<Struc: 839.71 - 839.72 dominant foliation>>

<<Struc: 843.6 - 843.61 dominant foliation>>

846.04 848.38 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey VFG

846.04 - 848.38: CA banded and light grey bands/clasts strongly calcareous (limestone), gradual contacts. Biotite in foliation.

<<Alt: 846.04 - 848.38 Moderate Calcite>>

<<Struc: 846.6 - 846.61 dominant foliation>>

848.38 849.66 MDS Carbonaceous Mudstone & Tuffaceous Mudstone light grey FMG

848.38 - 849.66: Strongly calcareous, coarser grain, banded, dirty limestone.

<<Alt: 848.38 - 849.66 Strong Calcite>>

849.66 854.50 MAFt Mafic Volcaniclastics black VFG

849.66 - 854.5: Weakly faulted/fractured, fine grain, CA veins, possibly lithic fragments. EOH.

<<Alt: 849.66 - 854.5 Moderate Calcite>> EOH.

<<Struc: 849.66 - 849.67 dominant foliation>>

<<Struc: 850.3 - 854.5 Weak Fault>> Minor fault gouge, weak shearing, fractured mudstone.

End of Hole @ 854.5

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-416

Prospect:	Sebesi	Hole Type:	DD	Survey Type:	PLND-LiDAR	Logged By:	Roger Hulstein
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Roger Hulstein	Date Logging Start:	8/26/2016
UTM Easting	415440	Core Size:	HQ3	Azimuth:	183	Date Logging Complete:	9/18/2016
UTM Northing:	6815276	Casing Pulled?:	Yes	Dip:	-68	Drill Company:	New Age
UTM Elev. (m):	1550	Casing Depth (m):	6	Length (m):	834	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	8/24/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	9/17/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Exploration
Comments:						Parent Hole:	

The purpose of K16-416 was to test for possible offset Krakatoa Zone mineralisation at the Sebesi exploration target and follow up on the PO-rich sulphide horizon intersected in K16-394, which is expected at approximately 700m depth.
Bedrock was encountered at 6m; followed by the Wind Lake Formation to a depth of 190.58m. KZK Formation rocks occur from 190.58 m to EOH and consist of alternating felsic volcanic ash and lapilli tuffs, intercalated with minor pelitic-beds, mudstone, mafic tuffs, and feldspar + quartz phyric, glassy, RHYif intrusive's (531.2-601.3m). Strong muscovite-silica alteration was encountered between 614.5 - 618.0 m associated with minor disseminated PO+SP+PY+/-GL. Patchy-disseminated CP+PO+/-GL occurs within quartz veins from 696.8 - 696.95 m, and 726.91 - 727.09 m correlating with the expected depth of mineralisation from K16-394. A DHEM survey was completed by Aurora Geosciences on September 17th, 2016.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 6.00 OVBN Overburden

6.00 10.60 SLT Siltstone - fine-grained sedimentary rock

6 - 10.6: massive homogeneous black fine grained silicified siltstone (looks like chert), locally crosscut by minor white qtz veins with associated bleaching

<<Alt: 6 - 10.6 Intense Silicification>> chert like unit

<<Alt: 6 - 12 Trace Calcite>> fracture filling

<<Vein: 6.3 - 7.6 50% Quartz>> poor core recovery. Locally bleached envelope

<<Vein: 10.5 - 10.6 80% Quartz>>

<<Struc: 10.5 - 12 Moderate Fault>> missing and broken core, minor gouge.

10.60 14.45 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

10.6 - 14.45: minor siliceous zones, broken with minor gouge 10.60-12.30

<<Min: 12 - 26 0.1% Min: Pyrite>>

<<Alt: 12 - 14.45 Moderate Calcite>>

<<Vein: 12.05 - 12.12 100% Quartz-Carbonate>>

<<Struc: 10.6 - 16 Moderate dominant foliation>>

14.45 17.64 MAFta Coarse grained to ash tuff

14.45 - 17.64: lower 25cm is qtz vein - silica flooding with minor chlorite - silica and alteration from underlyng unit?

<<Min: 16 - 17 1% Min: Pyrrhotite>>

<<Alt: 14.45 - 17.64 Moderate-Strong Calcite>>

<<Alt: 17.44 - 20.25 Intense Silicification>> chert like unit

<<Vein: 17.4 - 17.64 100% Quarzt-Chlorite-Carbonate>> veining at unit contact

17.64 20.25 SLT Siltstone - fine-grained sedimentary rock

17.64 - 20.25: black fine grained weakly & faintly banded silicified siltstone in upper section of unit while lower section resembles a more massive grey silicified siltstone with interstitial calcite (originally limestone unit?).

<<Alt: 17.64 - 19 Trace Calcite>> fracture filling

<<Alt: 19 - 22 Moderate Calcite>> and diss

<<Vein: 19.1 - 19.6 15% Quartz 10 deg. >>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

20.25 21.10 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

20.25 - 21.1: dominated by MDS, 20cm band MAFta at upper contact.

21.10 27.19 MAFta Coarse grained to ash tuff

<<Min: 24 - 36 1% Min: Pyrrhotite>>

<<Alt: 22 - 25.7 Moderate-Strong Calcite>>

<<Alt: 25.7 - 27.19 Weak Calcite>>

<<Struc: 22.4 - 24 Moderate-Strong dominant foliation>>

27.19 27.67 MAFt Mafic Volcaniclastics

27.19 - 27.67: coarse lappilli.

<<Alt: 27.19 - 27.67 Strong Calcite>>

27.67 34.68 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

27.67 - 34.68: upper 3 m has high ash content, transitional contact with true MDS in lower section of unit.

<<Alt: 27.67 - 30.9 Weak Calcite>>

<<Alt: 30.9 - 31.6 Moderate Calcite>>

<<Alt: 31.6 - 34.68 Weak-Moderate Calcite>>

<<Struc: 30.3 - 31.2 Weak-Moderate Fault>> scattered thin (<3cm) zones of gouge, minor crushed gouge.

<<Struc: 32.2 - 33 Moderate dominant foliation>>

34.68 45.00 MAFt Mafic Volcaniclastics

34.68 - 45: 35.43-36.42m: minor mudstone component

<<Min: 36 - 50.4 0.5% Min: Pyrite>>

<<Alt: 34.68 - 38.5 Moderate-Strong Calcite>>

<<Alt: 38.5 - 41.2 Weak Calcite>>

<<Alt: 41.2 - 45 Moderate-Strong Calcite>>

<<Vein: 36.67 - 37.95 30% Quartz-Carbonate 80 deg. >>

<<Struc: 41.85 - 52 Moderate dominant foliation>>

<<Struc: 42.5 - 48 Moderate Fault>> broken and crushed core, scattered thin (<3cm) zones of gouge.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

45.00 50.40 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

45 - 50.4: mix of MAFta and MDS

<<Alt: 45 - 47.15 Weak Calcite>>

<<Alt: 47.15 - 51 Weak Calcite>>

<<Alt: 49.4 - 50.4 Trace Chlorite>> associated with adjacent rhyolite

<<Vein: 47.15 - 47.25 100% Quartz-Carbonate>>

<<Vein: 49.4 - 50.4 50% Quartz-Carbonate>> rubble in fault zone

<<Struc: 49.4 - 50.4 Strong Fault>> broken and crushed core, scattered thin (<3cm) zones of gouge. Missing core.

50.40 55.27 RHY undifferentiated rhyolite light grey FG

50.4 - 55.27: light grey, fine grained rhyolite, possible dyke, flow, ? Upper contact sharp but marked by about a meter of missing core, broken core, gouge, qtz veining and possible remnant chlorite alteration - possible hornfels. Up to 3% rounded 0.2 - .-5 mm feldspar grains & up to 5% 1-2mm chlorite after mafic mineral, both in fine grained (<0.1mm) groundmass of qtz - feldspar +/- calcite groundmass. Lower contact sharp over 1cm and marked by increase in biotite, Bippo, in RHY over 30cm.

<<Min: 50.4 - 53.36 0.5% Min: Pyrite>>

<<Alt: 51 - 53.35 Weak-Moderate Calcite>>

<<Alt: 53.35 - 55.27 Moderate-Strong Calcite>>

<<Struc: 51 - 51.5 Weak Fault>>

<<Struc: 53.56 - 54.2 Weak-Moderate Fault>>

<<Struc: 55.25 - 55.3 Strong Contact>>

55.27 56.69 MAFta Coarse grained to ash tuff

55.27 - 56.69: Slight increase in calcite banding along foliation at contacts.

<<Min: 55.75 - 71.73 3% Min: Pyrite>>

<<Alt: 55.27 - 56.69 Strong Calcite>>

<<Struc: 55.35 - 56.6 Moderate dominant foliation>>

<<Struc: 56.65 - 56.69 Strong Contact>>

56.69 60.40 RHY undifferentiated rhyolite

56.69 - 60.4: as 50.40-55.27m

<<Alt: 56.69 - 60.4 Weak Calcite>>

60.40 61.00 MAFta Coarse grained to ash tuff

60.4 - 61: as 55.27-56.69m.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 60.4 - 66.1 Moderate Calcite>>

61.00 71.73 RHY undifferentiated rhyolite

61 - 71.73: as 50.40-55.27m but less siliceous, more chloritic groundmass from 61.00 - 66.00m. At 65.60-70.20m brittle fractures with hairline - 2mm py filling with py selvege. At 70.20-70.30m flow banding(?) with calcite on some bands. Lower contact marked by finer grained size and end of Bippo.

<<Alt: 61 - 66.19 Weak Chlorite>>

<<Alt: 66.1 - 71.1 Weak Calcite>> dis, blebs

<<Alt: 71.1 - 75.8 Weak-Moderate Calcite>> dis, blebs, bands

<<Vein: 64 - 64.2 70% Quartz-Carbonate>>

<<Vein: 67.8 - 67.84 100% Quartz-Carbonate 57 deg. >>

<<Vein: 70.5 - 71 20% Quartz-Carbonate 65 deg. >>

<<Struc: 70 - 70.15 Weak Fault>> broken core

<<Struc: 71.65 - 71.85 Weak Fault>>

71.73 79.10 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

71.73 - 79.1: mixed bands of fine ash and mudstone, some grey calcite rich bands with Bippo. Lithic clasts - lappilli in some bands/sections.

<<Min: 71.73 - 73.2 1% Min: Pyrite>>

<<Min: 73.2 - 76.4 1% Min: Pyrite>>

<<Min: 73.2 - 76.4 1% Min: Pyrrhotite>>

<<Min: 76.4 - 80 0.1% Min: Pyrite>>

<<Alt: 75.8 - 81 Moderate Calcite>> dis, blebs, bands

<<Struc: 72 - 72.7 Moderate dominant foliation>>

<<Struc: 76.4 - 78.4 Moderate Fault>> broken and crushed core, minor gouge

<<Alt: 184.8 - 190.58 Trace Calcite>>

<<Struc: 183.9 - 186.2 Weak-Moderate Fault>> zones of gouge and broken core

184.83 190.58 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

184.83 - 190.58: most of unit is medium green grey, cut by grey MDS bands. Medium - green - grey ash tuff is not calcareous, unusual for Wind Lake package, more likely an intermediate ash tuff belonging to KZK.

<<Struc: 189.9 - 190.2 Weak-Moderate Fault>> zones of gouge and broken core

190.58 194.50 RHY undifferentiated rhyolite

190.58 - 194.5: light tan green, fine - medium grained, banded (silic) homogonous - massive unit. Upper contact interbanded with MDS over approx 40cm. Silic bands, cut by foliation, unit could be a RHYc.

<<Min: 194 - 195 0.5% Min: Pyrrhotite>>

<<Alt: 190.58 - 197.3 Trace Calcite>>

<<Struc: 192 - 196.85 Weak Fault>>

194.50 198.22 RHYva Coarse grained to ash tuff

194.5 - 198.22: Similar to unit above but light green grey in color. Upper contact is sharp along fine grained bleached band of ash. Lower contact from 197.30 - 198.22m is bleached, light tan - brown (fine grained phlogopite - biotite), hornfeldsed looking ash unit, terminating at a thin (<1cm) qtz-pyrite-gouge band that cuts the foliation of the underlying brown RHY unit. Unconformable contact at core scale.

<<Min: 195 - 225 0.1% Min: Pyrite>>

<<Alt: 197.3 - 198.7 Moderate Calcite>>

<<Vein: 198.2 - 198.22 50% Quartz-Carbonate-Sulphide 20 deg. >> qtz-pyrite-gouge on contact, bleached envelope with calcite

<<Struc: 196.2 - 198.7 Weak-Moderate Fault>> gouge zones on folia

198.22 198.70 RHYvl Lapilli tuff

198.22 - 198.7: Brown (biotite) fine grained ash with light grey qtz clasts and disrupted bands. Upper contact is unconformable, appears to cut banding at low angle, against a thin (<1cm) qtz-pyrite-gouge band. Lower contact is light grey gouge.

198.70 205.00 RHYvx Quartz and/or feldspar crystal tuff

198.7 - 205: Granular ash unit with blue qtz eyes. Bleaching and weak muscovite alteration increasing towards lower contact over 1 m.

<<Alt: 198.7 - 201.9 Weak-Moderate Calcite>>

<<Alt: 201.9 - 204.9 Trace Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 204.9 - 207 Weak-Moderate Calcite>>

<<Struc: 202.2 - 202.6 Weak-Moderate dominant foliation>>

205.00 205.98 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

205 - 205.98: Calcite altered feldspar phyric MAFi dyke with fine grained banded contacts. About 30% feldspars, up to 0.5 cm. Could also just be calcite porphyroblasts in a volcaniclastic… Dyke is likely intermediate, has a fine gr groundmass of qtz-feld-musc.

205.98 214.80 RHYvl Lapilli tuff

205.98 - 214.8: Blue qtz eyes, about 5%, 1-4mm size and possibly up to 3% broken white 1-3 mm feldspar crystals.10% white - light grey lapilli. Unit is coarser than 198.70-205.00m. Lower contact in bleached, muscovite - sericite altered, fault-shear zone with qtz vein.

<<Alt: 207 - 213 Weak Calcite>>

<<Alt: 213 - 216 Moderate Muscovite>> musc-sericite-clay associated with shear - fault zones.

<<Alt: 728.04 - 743 Weak Biotite>>

<<Vein: 723.54 - 727.8 Quartz-Carbonate>> Regular-massive quartz veins with patchy-carbonate, and traces of sulphides (PO, CP, + GL).

<<Struc: 725.53 - 725.54 dominant foliation>>

728.13 729.75 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

728.13 - 729.75: Biotite-altered (weak) mudstone intercalated with felsic volcaniclastics, containing quartz eyes.

<<Alt: 728.13 - 730.46 Moderate Calcite>>

729.75 733.40 RHYvx Quartz and/or feldspar crystal tuff

729.75 - 733.4: Quartz-rich, MU-altered RHYvx with quartz eyes (< 3%) and disseminated biotite (10%). Minor intercalated MDS.

<<Alt: 730.46 - 733.4 Trace Calcite>> Disseminated CA; rare banding.

<<Struc: 731.8 - 731.81 Crenulation cleavage>>

733.40 736.30 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

733.4 - 736.3: Mudstone intercalated with felsic volcaniclastics, containing quartz eyes. Moderate FLT from 735 - 736.3m; approx 50% recovered within FLT zone.

<<Alt: 733.4 - 738.76 Weak-Moderate Calcite>> Banded CA; patchy within quartz veins.

<<Vein: 733.65 - 734.9 Quartz-Carbonate 80 deg. >> Quartz veins with patchy-carbonate.

<<Struc: 735 - 736.3 Moderate Fault>> Sheared MDS and gouge, with cm-size, sub-angular quartz-carbonate clasts. ~ 50% recovered.

736.30 743.16 RHYv Rhyolite volcaniclastic

736.3 - 743.16: Volcaniclastic RHY with disseminated biotite (<10%), and biotite ppo. Two massive quartz veins are intercepted between 741.23-741.99m and 742.45-743m; MU alteration and shearing is common along the margins of the veins.

<<Min: 741.21 - 741.69 0.5% Min: Pyrite>>

<<Min: 741.21 - 741.69 2% Min: Pyrrhotite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 741.69 - 747.1 0.1% Min: Pyrite>>

<<Alt: 738.76 - 741.21 Weak Calcite>>

<<Alt: 741.21 - 743.16 Weak-Moderate Calcite>> CA FRA and blebs within quartz veins; CA is pervasive within altered RHY.

<<Alt: 741.99 - 746.76 Weak Muscovite>> Weak MU alteration visible along foliated RHYv. MU alteration is stronger adjacent to the two massive quartz veins.

<<Vein: 741.23 - 741.99 Quartz-Carbonate-Sulphide>> Massive quartz vein with calcite (<5%) and pyrrhotite (2%) FRA.

<<Vein: 742.45 - 743 Quartz-Carbonate>> Massive quartz vein with calcite FRA.

<<Struc: 737.3 - 737.31 dominant foliation>>

<<Struc: 741.14 - 741.15 Foliation>> Carbonate banding.

743.16 746.76 RHYv Rhyolite volcaniclastic

743.16 - 746.76: Light grey, quartz-rich RHYv with quartz eyes, and weak muscovite alteration. Minor FLTing is evident between 745.6-746.3m.

<<Min: 743.16 - 747.1 0.5% Min: Pyrrhotite>> Disseminated blebs-bands; trace disseminated PO within quartz veins.

<<Alt: 743.16 - 746.76 Trace Calcite>>

<<Struc: 743.25 - 743.26 dominant foliation>>

<<Struc: 743.31 - 743.46 Moderate Fault>> Sericitic gouge and shear zone, with mm-size quartz clasts.

<<Struc: 745.34 - 745.35 Crenulation cleavage>>

<<Struc: 745.6 - 746.3 Weak-Moderate Fault>> Sharp boundaries; upper and lower CNT range between 15 - 20 deg. Fractured, MU-altered RHY, with sericitic gouge.

746.76 747.10 PEL Equigranular biotite + calcite +/- quartz rock

746.76 - 747.1: Biotite-rich pelite with quartz-carbonate veining; veins contain traces of disseminated pyrrhotite.

<<Alt: 746.76 - 747.1 Moderate-Strong Calcite>> Pervasive within PEL; patchy-CA within quartz veins.

<<Vein: 746.82 - 747.1 Quartz-Carbonate-Sulphide>> Quartz-carbonate veins with disseminated PO (<1%).

747.10 752.00 RHYvl Lapilli tuff

747.1 - 752: Light green-grey, MU-altered (weak) lapilli tuff. Lapilli range in size from 1-10mm wide; localized zones contain up to 30% lapilli. Quartz eyes are rare. Minor FLTing is prominent throughout the unit.

<<Min: 747.1 - 752.01 0.5% Min: Pyrite>> FRA within FLT zone (weak); trace FD throughout RHY.

<<Min: 747.1 - 752.01 0.5% Min: Pyrrhotite>> Localized FRA throughout weakly-faulted RHY; disseminated blebs within quartz-carbonate veins.

<<Alt: 747.1 - 752.01 Weak Calcite>> CA alteration within lapilli; FRA.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 747.1 - 752.9 Weak Muscovite>> Weak MU alteration within lapilli tuff; alteration is most prominent within the sheared-FLT zones, and along the margins of quartz-carbonate veins.

<<Struc: 747.18 - 749.65 Weak Fault>> Several zones of incompetent, sheared-fractured RHY with occasional bands of sericitic gouge.

<<Struc: 749.95 - 749.96 Crenulation cleavage>>

752.00 755.55 MAFt Mafic Volcaniclastics

752 - 755.55: Medium green, biotite-rich, mafic volcaniclastics. Quartz-carbonate veins contain traces of disseminated pyrrhotite.

<<Min: 752.01 - 755.55 0.5% Min: Pyrrhotite>> Disseminated PO blebs within quartz veins.

<<Min: 752.01 - 758.15 0.1% Min: Pyrite>>

<<Alt: 752.01 - 755.55 Weak-Moderate Calcite>> CA is pervasive throughout the mafic volcaniclastics; CA is stronger within quartz-carbonate veins, and FRA.

<<Vein: 752.01 - 752.05 Quartz-Carbonate-Sulphide 50 deg. >> Quartz-carbonate vein with disseminated PY+PO (<2%).

<<Vein: 752.56 - 752.72 Quartz-Carbonate-Sulphide>> Massive quartz-carbonate vein with dissseminated PO (<1%).

<<Vein: 752.8 - 754.38 Quarzt-Chlorite-Carbonate>> DEF quartz veins with patchy-carbonate, chloritic blebs, and trace disseminated pyrrhotite.

<<Vein: 755.33 - 755.46 Quarzt-Chlorite-Carbonate>> Quartz-carbonate vein with chloritic blebs, and traces of disseminated pyrite.

<<Struc: 754.35 - 754.36 Foliation>>

755.55 756.43 RHYvl Lapilli tuff

755.55 - 756.43: Quartz-rich, volcaniclastic-lapilli tuff with disseminated biotite alteration (weak), and trace disseminated pyrrhotite.

<<Min: 755.55 - 758.15 0.5% Min: Pyrrhotite>>

<<Alt: 755.55 - 756.43 Weak Calcite>>

<<Alt: 755.55 - 756.43 Weak Biotite>> 5-10% disseminated biotite.

<<Vein: 756.42 - 758.15 Quartz-Carbonate 75 deg. >> Quartz-carbonate banding within PEL.

<<Struc: 755.7 - 755.75 Weak-Moderate Fault>> Gouge-crumbled RHY.

756.43 758.15 PEL Equigranular biotite + calcite +/- quartz rock

756.43 - 758.15: Biotite-rich pelite intercalated with minor felsic volcaniclastics. Quartz-carbonate banding is common throughout the unit.

809.40 810.04 PEL Equigranular biotite + calcite +/- quartz rock

<<Struc: 809.4 - 809.41 Contact>> RHYvl-PEL CNT.

<<Struc: 809.65 - 809.66 dominant foliation>>

810.04 811.40 RHYvl Lapilli tuff

810.04 - 811.4: Trace disseminated pyrite.

<<Alt: 810.04 - 811.4 Trace Biotite>>

<<Struc: 811.24 - 811.25 dominant foliation>>

811.40 814.26 PEL Equigranular biotite + calcite +/- quartz rock

811.4 - 814.26: Pelite intercalated with biotite-altered, felsic volcaniclastics (~30%). Massive quartz vein from 811.64-811.91m.

<<Min: 811.4 - 818.15 0.5% Min: Pyrite>>

<<Alt: 811.4 - 814.26 Weak-Moderate Calcite>> Disseminated-banded.

<<Vein: 811.64 - 811.91 Quartz>> Massive quartz vein with patchy-carbonate; carbonate contains disseminated pyrrhotite, pyrite, and chlorite.

<<Vein: 813.93 - 814.9 Quartz-Carbonate 80 deg. >>

<<Struc: 812.22 - 812.23 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

814.26 820.30 RHYva Coarse grained to ash tuff

814.26 - 820.3: Light grey-green, biotite-altered (weak) ash tuff intercalated with minor pelitic sediments. Minor FLT from 818.64-819.1m.

<<Min: 815.45 - 834 0.5% Min: Pyrrhotite>> Disseminated PO throughout interval; blebs within quartz veins.

<<Min: 818.15 - 834 0.1% Min: Pyrite>> Disseminated PY; trace FRA within FLT (826.39-827.75m).

<<Alt: 814.26 - 816.1 Trace Calcite>> Trace disseminated CA within bands and quartz veins.

<<Alt: 814.26 - 820.3 Weak Biotite>> Trace-weak, disseminated-patchy biotite.

<<Alt: 816.1 - 816.6 Weak-Moderate Calcite>> Banded CA; blebs within quartz veins.

<<Alt: 816.6 - 819.82 Weak Calcite>>

<<Alt: 819.82 - 821.26 Weak Ankerite>>

<<Alt: 819.82 - 821.45 Weak-Moderate Calcite>> Banded-blebs.

<<Vein: 815.16 - 815.3 Quartz-Carbonate>> Massive DEF quartz vein with patchy-carbonate, and traces of chlorite, biotite, and pyrite.

<<Vein: 815.45 - 815.52 Quartz>> Quartz veins with disseminated calcite and chlorite.

<<Vein: 816.34 - 816.6 Quartz>> Massive quartz veins with blebby-calcite.

<<Struc: 814.26 - 814.27 Contact>> PEL-RHYva CNT.

<<Struc: 815.78 - 815.79 dominant foliation>>

<<Struc: 818.64 - 819.1 Weak-Moderate Fault>> Clay-gouge, and fractured RHY.

820.30 821.26 PEL Equigranular biotite + calcite +/- quartz rock

820.3 - 821.26: Biotite-rich pelite intercalated with felsic volcaniclastics (<20%). Minor ankerite alteration.

821.26 834.00 RHYva Coarse grained to ash tuff

821.26 - 834: Trace-weak biotite alteration (disseminated); intercalated with minor pelitic sediments. FLTing between 822.77-823.03m, and 826.39-827.75m. Localized quartz-rich lapilli.

<<Alt: 821.26 - 830 Trace Biotite>>

<<Alt: 821.45 - 823.73 Weak Calcite>> Disseminated blebs-bands.

<<Alt: 823.73 - 828.5 Weak-Moderate Calcite>> Banded-pervasive; quartz-carbonate veins.

<<Alt: 828.5 - 834 Weak Calcite>> Disseminated-pervasive; rare FRA.

<<Alt: 830 - 831.62 Weak Biotite>>

<<Alt: 831.62 - 834 Trace Biotite>>

<<Vein: 826.8 - 827.12 Quartz-Carbonate>> Quartz-carbonate veins, and subrounded, quartz-carbonate clasts within FLT BRX.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 827.76 - 828 Quartz-Carbonate>> Massive quartz-carbonate vein, intercepted by a DEF tourmaline veinlet sub-parallel TCA. Trace BI and MU FRA.

<<Vein: 829.09 - 831.16 Quartz-Carbonate>> Cm-size quartz-carbonate veins, parallel to foliation.

<<Struc: 822.29 - 822.3 dominant foliation>>

<<Struc: 822.76 - 823.03 Weak-Moderate Fault>> Sharp upper and lower CNT. Clay-gouge, with pulverized RHY. FLT is most intense between 822.76-822.86m.

<<Struc: 824.47 - 824.48 Crenulation cleavage>>

<<Struc: 825.93 - 825.94 dominant foliation>>

<<Struc: 826.39 - 827.75 Weak Fault>> FLT BRX: sheared-RHY to gouge matrix with 1-20 mm-size, subrounded quartz and RHY clasts. Trace disseminated PY within gouge. FLT is weaker-less competent along outer margins.

<<Struc: 830.23 - 830.24 dominant foliation>>

<<Struc: 833.74 - 833.75 dominant foliation>>

End of Hole @ 834

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	9/14/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
						Parent Hole:	

Comments:

K16-417 is a Krakatoa resource infill hole. The top of the hole consists of graphitic calcareous mudstone and interbedded mafic tuff of the Wind Lake formation. The contact with the KZK formation occurs at 46.88m which comprises volcaniclastic, aphanitic and coherant rhyolite.
Muscovite alteration increases progressively from 198.50 - 270.70 m with two narrow zones of OI type mineralization (dominantly PO/PY/minor SP and GL) intercepted at 241.33 m and 248.54 m. The Krakatoa upper lens occurs at 270.70m with the zone of mineralisation extending to 292.20 m. Here mineralization consists of OA, OB, and OI types with minor OK/OL intercalated with muscovite altered rhyolite for a total of 11.44meters of massive sulphide. The contact with the footwall mafic intrusion occurs at 288.41 m.
The footwall mafic is cut by a fault zone and also contains thin massive sulphide lenses from 304.72m to 305.60 m, 323.29 to 323.61 m, and 329.61 to 329.80 m. Below the narrow lenses is a weakly muscovite altered rhyolite volcaniclastic rock with disseminated pyrite and pyrrhotite, as well as sphalerite in proximity to the sulphide lenses.

28.12 - 36.6: Fine grain, black, CA veinlets, rare light blue bands-CA rich (limestone relics). PO in foliation. Narrow mafic tuff intervals intercaled.

<<Vein: 30.6 - 31.4 Quartz-Carbonate>> QZ/Ca veins representing 35% of the interval.

<<Struc: 34.4 - 34.6 Trace Fault>> Multiple narrow fault gouge intervals-sandy clay.

<<Struc: 34.7 - 34.71 dominant foliation>>

36.60 37.36 CHT Chert grey-green

36.6 - 37.36: Silica banded, green grey, felsic interval, could be flow or silicified pumice, PO disseminated.

37.36 42.36 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black FG

37.36 - 42.36: Graphitic mudstone, thin foliation.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

42.36 43.76 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

42.36 - 43.76: Silica banded, PO patch. Cherty mudstone.

43.76 46.88 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black FG

43.76 - 46.88: Fine grain, black, foliated, interval including large QZ vein at lower contact.

<<Min: 45.88 - 116 1% Min: Pyrrhotite>> Concentrated in and at contact with narrow possibly sediment intervals.

<<Vein: 46.3 - 46.88 Quartz-Tourmaline>> Massive QZ/TML vein, gougy at upper contact, marking the contact between Wind Lake and KZK formations.

<<Struc: 45.4 - 47.4 Weak-Moderate Fault>> Chaotic interval showing weak folding, QZ/TML massive veins, fault gouge at contact between Wind Lake and KZK formation.

46.88 48.80 SEDc calcareous Sediment grey-brown FMG

46.88 - 48.8: Calcareous, fine to medium grain, banded, few biotite, heterogeneous.

<<Min: 46.88 - 78.17 0.1% Min: Pyrite>>

<<Alt: 46.88 - 65 Trace Calcite>>

48.80 49.50 RHYvx Quartz and/or feldspar crystal tuff light grey FMG

48.8 - 49.5: Light blue crystal tuff, weakly carbonaceous (1 to 2mm wide, euhedral), locally abundant QZ eyes, faulted at lower contact. Recognized as maker unit between Wind Lake and KZK formations.

49.50 78.17 RHYvl Lapilli tuff grey-green FMG

49.5 - 78.17: Fine to medium grain, light grey/green, possibly intermediated composition, containing strained lapilli. Locally gougy and Qz veins. Few calcareous sediment narrow intervals, grey-brown. QZ/TML at upper contact, friable.

<<Vein: 50.9 - 51.6 Quartz-Tourmaline>> Large QZ/TML vein.

<<Vein: 54.93 - 56.12 Quartz-Tourmaline>> Large QZ/TML vein (possibly late TML).

<<Vein: 75.04 - 75.18 Carbonate-Chlorite>> QZ and black greasy mineral (chlorite?)

<<Vein: 76.96 - 77.35 Quartz>> QZ vein, fracture.

<<Struc: 50.9 - 52.05 Weak-Moderate Fault>> Chaotic interval showing weak folding, QZ/TML massive veins, fault gouge, similar to contact between Wind Lake and KZK formation above.

<<Struc: 56.8 - 56.81 dominant foliation>>

<<Struc: 59.97 - 59.98 dominant foliation>>

<<Struc: 61.45 - 73.25 Trace Fault>> Multiple narrow minor fault gouge zone, up to 15 cm wide, sandy clay.

<<Struc: 68.81 - 68.82 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 77.88 - 77.89 dominant foliation>>

78.17 79.38 RHYva Coarse grained to ash tuff grey-green FG

78.17 - 79.38: Fine grain matrix, PY disseminated.

<<Min: 78.17 - 79.38 0.5% Min: Pyrite>>

<<Alt: 78.17 - 82.62 Weak-Moderate Calcite>>

79.38 82.62 RHYvl Lapilli tuff grey-green

79.38 - 82.62: Silicic bands, possibly flow, probably volcaniclastic. Few small feldspar disseminated. SP trace at upper contact.

<<Min: 79.38 - 80 0.1% Min: Sphalerite>> Along the foliation, low content.

<<Min: 79.38 - 95 0.1% Min: Pyrite>>

82.62 84.31 RHYi Aphanitic Rhyolite (intrusion) grey-green

82.62 - 84.31: Siliceous, locally clastic (fractured/banded), QZ veins, few CL.

<<Alt: 82.62 - 98.35 Moderate-Strong Silicification>>

<<Alt: 82.62 - 111.62 Weak Calcite>> Disseminated and in fracture.

84.31 85.35 RHYv Rhyolite volcaniclastic grey FMG

84.31 - 85.35: Locally silicic bands, possibly flow, probably volcaniclastic. Few small feldspar disseminated.

85.35 101.27 RHYi Aphanitic Rhyolite (intrusion) grey-brown

85.35 - 101.27: Silica rich, locally fragmental/banded to glassy. Main body between 98.35m to 101.27m. Upper margin is possibly silicified RHYv.

<<Min: 95 - 101.22 0.5% Min: Pyrite>>

<<Min: 101.22 - 111.46 0.1% Min: Pyrite>>

<<Alt: 98.35 - 101.27 Strong Silicification>> RHYi. Could be associated with albite alteration.

<<Vein: 92 - 92.2 Quartz>> QZ, fractured, few CA in fracture.

101.27 106.17 RHYvl Lapilli tuff grey-green

101.27 - 106.17: Silicic bands, lower margin of RHYi. Banded yellow muscovite alteration.

<<Alt: 101.27 - 106.17 Moderate Silicification>> Lower margin of RHYi.

<<Alt: 101.62 - 106.17 Moderate-Strong Muscovite>> Sharp contacts.

<<Vein: 104.69 - 105.09 Quartz>> QZ veining representing 70% of the interval.

106.17 111.46 RHYvl Lapilli tuff grey-green FG

106.17 - 111.46: Mid strained lapilli, fine grain matrix.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 108 - 111 Trace Fault>> Multiple narrow minor fault gouge zone, up to 10 cm wide, sandy clay.

111.46 114.47 MAFi Mafic Intrusions (primarily footwall mafic intrusion) light grey

111.46 - 114.47: Possibly mafic material. CA in matrix and veinlets, BI porphyroblasts (low density), white/orange specks. Heterogeneous texture.

<<Min: 111.46 - 123 0.5% Min: Pyrite>> and patchy.

<<Alt: 111.46 - 114.47 Moderate Calcite>> and veinlets.

114.47 117.05 RHY undifferentiated rhyolite grey-brown FG

114.47 - 117.05: CA veins, skarny aspect from 115.00m to 117.05m, banded, heterogeneous/chaotic.

<<Min: 116 - 134.17 0.5% Min: Pyrrhotite>>

<<Alt: 114.47 - 117.05 Weak-Moderate Calcite>> and QZ/CA veins.

<<Vein: 115 - 116.07 Quartz-Carbonate>> QZ/CA veining, deformed, large halo of alteration, skarny aspect.

117.05 120.26 RHYvl Lapilli tuff grey FG

117.05 - 120.26: Fine grain matrix, mid strained lapilli, curdy like at lower contact.

<<Alt: 117.05 - 120.26 Weak Calcite>>

120.26 122.65 PEL Equigranular biotite + calcite +/- quartz rock black FMG

120.26 - 122.65: Homogeneous, BI/C rich, sharp upper contact, QZ/TML vein at lower contact, weak possibly secondary foliation.

<<Alt: 120.26 - 121.8 Strong Calcite>>

<<Alt: 121.8 - 142.57 Weak Calcite>>

<<Vein: 121.8 - 122.65 Quartz-Tourmaline>> QZ/TML vein containing host rock. Contact between PEL (MAFi?) and RHYv. The presence of large QZ tends to mafic dyke assumption.

122.65 126.97 RHYvl Lapilli tuff grey-green FMG

122.65 - 126.97: Fine to medium grain matrix, poorly sorted, possibly crystal fragments (angular clasts), locally silicic bands and curdy like texture undeveloped.

<<Min: 123 - 135 2% Min: Pyrite>> Associated with QZ bands.

126.97 132.95 RHYva Coarse grained to ash tuff grey-green FG

126.97 - 132.95: Few lapilli, locally weakly sheared, wavy translucent QZ veinlet set.

<<Struc: 130.07 - 131.9 Moderate Fault>> And shearing. Gravelly/ sandy gouge. Weak damage zone.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

132.95 134.97 RHYvx Quartz and/or feldspar crystal tuff grey-green FG

132.95 - 134.97: Fine grain matrix, feldspar crystals (possibly fragments) and some euhedral showing locally jigsaw fit texture, poorly sorted, weakly foliated.

<<Min: 134.17 - 138.5 1% Min: Pyrrhotite>> Associated with PY.

<<Struc: 134.41 - 134.42 dominant foliation>>

134.97 136.10 RHYv Rhyolite volcaniclastic grey-green

134.97 - 136.1: Fine grain at lower contact, weak MU alteration, locally QZ/PY patch showing vuggy texture.

<<Min: 135 - 150.32 3% Min: Pyrite>> Discontinuous QZCA//sometime PO?PY veins.

136.10 137.34 RHYvx Quartz and/or feldspar crystal tuff grey-green

136.1 - 137.34: Crystal aggregated, PY/QZ patch/vuggy texture. PO patch, green clots (altered lapilli or crystal ?) and large angular clasts (crystal fragments?). No QE.

137.34 142.57 RHYva Coarse grained to ash tuff grey-green FG

137.34 - 142.57: Few lapilli, weakly sheared.

<<Min: 138.5 - 158.8 0.5% Min: Pyrrhotite>>

142.57 143.30 SEDc calcareous Sediment grey-brown VFG

142.57 - 143.3: Strongly calcareous, very fine grain, could be ash/mud layer.

<<Alt: 142.57 - 143.3 Strong Calcite>>

143.30 150.32 RHYva Coarse grained to ash tuff grey-green FG

143.3 - 150.32: Few lapilli or clasts at lower contact, heterogeneous texture. QZ/PY/PO patch associated with silvery muscovite.

<<Alt: 143.3 - 151.32 Weak Calcite>>

<<Struc: 143.3 - 143.31 Contact>> Contact calcareous ash/sediment and RHYva.

150.32 152.06 PEL Equigranular biotite + calcite +/- quartz rock black FMG

150.32 - 152.06: Calcareous, weakly foliated, BI/CA.

<<Min: 150.32 - 157.8 0.5% Min: Pyrite>>

<<Alt: 151.32 - 152.06 Moderate-Strong Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

152.06 153.07 RHYva Coarse grained to ash tuff grey-green FMG

152.06 - 153.07: Weakly foliated, fine to medium grain.

<<Alt: 152.06 - 153.87 Weak Calcite>>

153.07 157.80 SEDc calcareous Sediment grey-brown VFG

153.07 - 157.8: Strongly calcareous, banded, fine grain biotite, sharp contact, non chill margin.

<<Alt: 153.97 - 157.8 Strong Calcite>>

<<Struc: 156.46 - 156.47 dominant foliation>>

157.80 159.55 RHY undifferentiated rhyolite grey-green

157.8 - 159.55: Chaotic interval, probably volcaniclastic rhyolite at contact with RHYi/transition.

<<Min: 157.8 - 182.65 2% Min: Pyrite>> In fracture in RHYi.

<<Min: 158.8 - 177 2% Min: Pyrrhotite>> In fracture in RHYi.

<<Alt: 157.8 - 189.3 Weak Calcite>>

159.55 165.18 RHYi Aphanitic Rhyolite (intrusion) grey-green

159.55 - 165.18: Siliceous, aphanitic, fracture ion the margin, sulphide infill (PO/PY/GL/SP trace).

<<Min: 159.55 - 165.18 0.1% Min: Sphalerite>> Associated with PO/PY/GL in RHYi.

<<Min: 159.55 - 165.18 0.1% Min: Galena>> Associated with PO/PY/SP in RHYi.

<<Alt: 159.55 - 165.18 Intense Silicification>> RHYi.

165.18 166.84 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

165.18 - 166.84: Muscovite altered, silica bands, possibly flow.

<<Alt: 165.18 - 171.85 Strong Silicification>>

166.84 167.34 RHY undifferentiated rhyolite grey-green

166.84 - 167.34: Possibly ash layer at contact with RHYi, texture obscured.

167.34 169.25 RHYc Rhyolite coherant volcanics grey-green

167.34 - 169.25: Siliceous, heterogeneous, fracture at margin, could contain clasts of RHYi.

169.25 171.85 RHYcf Feldspar & feldspar quartz porphyry grey-green

169.25 - 171.85: Very few QE. Poorly sorted, angular clasts micro fractured.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

171.85 173.42 RHYi Aphanitic Rhyolite (intrusion) grey

171.85 - 173.42: Aphanitic, fractured, sulphide infill, grey.

<<Alt: 171.85 - 173.42 Intense Silicification>> RHYi.

173.42 175.25 RHYcf Feldspar & feldspar quartz porphyry grey-green

173.42 - 175.25: Containing feldspar poorly sorted showing jigsaw fit texture, possibly angular fragments.

<<Alt: 173.42 - 178.49 Strong Silicification>>

<<Vein: 174.18 - 174.44 Quartz>> QZ vein crosscutting siliceous unit.

175.25 178.49 RHYc Rhyolite coherant volcanics grey-green

175.25 - 178.49: Siliceous, texture obscured, fractured, weak foliated.

<<Min: 177 - 189.3 0.5% Min: Pyrrhotite>>

178.49 182.65 RHYi Aphanitic Rhyolite (intrusion) grey

178.49 - 182.65: Aphanitic, fractured, sulphide infill, grey to orange at lower contact, possibly albite alteration.

<<Alt: 178.49 - 182.65 Intense Silicification>> RHYi.

<<Alt: 180 - 181 Moderate-Strong Albite>> Orange color, possibly albite alteration.

182.65 186.43 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

182.65 - 186.43: Possibly flow banded. Lower margin of RHYi usually show this silicic banded texture. QZ/CA vein, whitish to purple (skarny aspect) destroying texture at lower contact.

<<Min: 182.65 - 189.3 0.5% Min: Pyrite>>

<<Alt: 182.65 - 186.43 Moderate Silicification>>

186.43 189.30 RHYvl Lapilli tuff grey

186.43 - 189.3: Rare crystals or crystal fragments, mid strained lapilli, heterogeneous texture.

189.30 197.73 SEDc calcareous Sediment grey-brown VFG

189.3 - 197.73: Calcareous fine grain layers, very fine grain, banded, pyrite discontinuous veinlets, rare clasts (1 to 3 mm wide).

<<Min: 189.3 - 194.73 5% Min: Pyrite>>

<<Min: 189.3 - 194.73 1% Min: Pyrrhotite>>

<<Min: 194.73 - 198.6 1% Min: Pyrite>>

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-418

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	PLND-LiDAR	Logged By:	Oscar Nielsen
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Oscar Nielsen	Date Logging Start:	9/18/2016
UTM Easting	415360	Core Size:	HQ3	Azimuth:	213.8	Date Logging Complete:	9/30/2016
UTM Northing:	6815332	Casing Pulled?:	Yes	Dip:	-76.7	Drill Company:	New Age
UTM Elev. (m):	1502	Casing Depth (m):	10.5	Length (m):	475.5	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	9/16/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	9/28/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
						Parent Hole:	

Comments:

K16-418 was designed to expand the Krakatoa resource downdip. The hole intersected two 0.35 m blocks of massive sulphide within a fault structure, but no in situ massive sulphide was intersected. Wind Lake formation mudstones and mafic tuffaceous sediments are present within the first 159.50 m. The KZK formation below this is a mixed volcano sedimentary package with only one coherent unit from 212.00 - 222.00 m. Moderate-strong muscovite alteration begins at ~342 m and continues through the rest of the hole. The two blocks of massive sulphide present are within the fault from ~433.00 - 437.00 m.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 10.50 OVBN Overburden

0 - 10.5: Casing to 10.5 m

10.50 44.79 MAFt Mafic Volcaniclastics grey-green FMG

10.5 - 44.79: Grey green sandy/granular bands of tuffaceous mafic derived sediment, interbedded with thin units (<10 cm) of grey-blue to black mudstone (MDS). In the top 10 m there is significant oxidation and 1-2m intervals of a biotite porphyroblast bearing, subtly banded rock. This may represent thin intermediate dykes or bleached/altered zones of mafic tuff however, the oxidation present and faulting obscures the relationship between the two domains.

<<Min: 24 - 105.82 0.1% Min: Pyrite>> Isolated clots and blebs of pyrite, sometimes associated with quartz-carbonate veins

<<Min: 24 - 105.82 0.1% Min: Pyrrhotite>> Small, finely disseminate blebs along foliation planes

<<Alt: 10.5 - 12.25 Moderate Albite>> Bleached white area of rock, interpreted provisionally as albite alteration

<<Alt: 10.5 - 12.79 Weak-Moderate Biotite>>

<<Alt: 12.25 - 15.05 Weak-Moderate Calcite>>

<<Alt: 12.79 - 15.05 Weak Biotite>>

<<Alt: 15.05 - 17 Weak-Moderate Biotite>>

<<Alt: 15.05 - 17 Moderate Albite>> Bleached white area of rock, interpreted provisionally as albite alteration

<<Alt: 17 - 31.33 Weak Biotite>>

<<Alt: 17 - 62.05 Weak-Moderate Calcite>>

<<Vein: 14.41 - 15.05 90% Quartz-Carbonate>>

<<Alt: 279.86 - 280.04 Moderate Biotite>>

280.04 287.03 RHYv Rhyolite volcaniclastic medium grey FG

280.04 - 287.03: Light grey-pink patchy, massive unit. The unit grades within itself between more and less altered volcaniclastic rock.The more altered portions have been altered by albite and/or silica and have pseudoclastic textures, with the clasts appearing to be coherent rholite. No sharp contacts exist between these portions of the rock and the zones that look to be massive volcaniclastic, suggesting the alteration interpretation, however, these rocks could easily be logged a RHY as well.

465.74 466.85 PEL Equigranular biotite + calcite +/- quartz rock grey-brown FG

465.74 - 466.85: Finely banded, biotite and chlorite bearing pelitic sediment. 1-2mm disseminated black clots are present, possibly tourmaline porphyroblasts?

<<Alt: 465.74 - 466.85 Weak Muscovite>>

<<Alt: 465.74 - 466.85 Moderate Calcite>>

<<Struc: 466.32 - 466.32 Bedding>> Bedding within pelitic unit

466.85 475.50 RHYv Rhyolite volcaniclastic green-brown FG

466.85 - 475.5: Banded, mottled, altered rock. Domains of muscovite surround isolated patches of chlorite, biotite and quartz (BCQLPL?) Alternately, could be a sheared Pelitic sediment, where the shear network has been altered to muscovite.

<<Min: 466.85 - 475.5 0.5% Min: Pyrite>>

<<Min: 466.85 - 475.5 0.5% Min: Pyrrhotite>> foliation parallel blebs

<<Alt: 466.85 - 475.5 Moderate Muscovite>>

<<Alt: 466.85 - 475.5 Weak Calcite>>

<<Struc: 472.27 - 472.37 Weak-Moderate Fault>> Fault filled with crushed rock and gouge.

End of Hole @ 475.5

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-419

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	PLND-LiDAR	Logged By:	Alicia Vainio
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Oscar Nielsen	Date Logging Start:	9/18/2016
UTM Easting	415242	Core Size:	HQ3	Azimuth:	7.8	Date Logging Complete:	9/29/2016
UTM Northing:	6815246	Casing Pulled?:	Yes	Dip:	-86.8	Drill Company:	New Age
UTM Elev. (m):	1440	Casing Depth (m):	8	Length (m):	416.22	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	9/18/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	9/28/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
						Parent Hole:	

Comments:

K16-419 was designed as a step-out hole to test the down-dip extents of Krakatoa Zone mineralization. Two massive sulphide lenses were encountered; the upper lens occured between 296.73-299.40 m, and the main lens was intercepted within the expected zone, from 333.20-346.55 m. The Wind Lake Formation occurs to a depth of 44.85 m followed by the KZK Formation to EOH. Here the KZK Formation consists of alternating felsic volcanic ash-lapilli tuffs and coherent volcanics, intercalated with minor pelitic-beds and mudstone. Moderate-strong, muscovite-silica alteration began around 198.20 m, and increases in intensity when proximal to both the upper and main lens mineralisation. The upper lens (296.73 -299.40 m) consisted of OB-type mineralization with disseminated sulphides (OI) immediately before this from 296.35 m - 296.73 m. The main lens consisted of mixed OB and OA-type mineralization with a significant pyrrhotite-component within the final 50cm (OF). Moderate muscovite-silica-biotite alteration with disseminated pyrite was pervasive throughout the felsic footwall. Previous drillholes in the Krakatoa Zone show a similar alteration assemblage at this depth but no further mineralization has been intercepted. A DHEM survey was completed by Aurora Geosciences on September 28th, 2016.

0.00 8.15 OVBN Overburden

8.15 9.69 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

8.15 - 9.69: Weakly-oxidized, dark grey to black, fine-grained, carbonaceous mudstone interbedded with cm-size zones of mafic tuff. FLT zone between 8.42- 8.55m; FLT consists of gouge and fractured MDS.

<<Min: 8.15 - 11.85 0.1% Min: Pyrite>>

<<Min: 8.15 - 11.85 0.1% Min: Pyrrhotite>>

<<Alt: 8.15 - 9.69 Weak-Moderate Calcite>> Banded CA; patchy-carbonate within quartz bands.

<<Vein: 8.55 - 8.91 Quartz-Carbonate 55 deg. >> Weakly-oxidized, carbonate-rich, quartz veins.

<<Struc: 8.42 - 8.62 Weak-Moderate Fault>> Gouge - Fractured MDS.

<<Struc: 9.33 - 9.38 Weak Fault>> Minor shear-gouge zone within oxidized MDS.

<<Struc: 9.48 - 9.49 dominant foliation>>

9.69 11.85 MAFt Mafic Volcaniclastics MG

9.69 - 11.85: Weakly-oxidized, greyish-green, medium-grained, well-sorted mafic tuff. Upper CNT is sharp; quartz vein-FLT lower CNT.

<<Alt: 9.69 - 19 Weak-Moderate Calcite>> Pervasive and FRA.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 11.8 - 11.85 Quartz-Carbonate 65 deg. >> Competent, quartz-carbonate vein within a minor sheared-FLT zone. Vein contains small (<3mm), subangular MDS clasts.

<<Struc: 10.91 - 10.92 dominant foliation>>

<<Struc: 11.7 - 11.88 Trace Fault>> Sheared-gouge, vein-FLT CNT between mafic tuff and mudstone.

11.85 30.00 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

11.85 - 30: Dark grey to black, fine-grained, carbonaceous mudstone intercalated with minor siltstone. Oxidation is visible on fractured surfaces; the oxidation-intensity decreases downhole. Oxidized quartz-carbonate bands are vuggy (up to 14.80m). Carbonate-rich bands undulate in localized zones. Minor FLT gouge-zones occur throughout the unit.

<<Min: 11.85 - 26.4 0.5% Min: Pyrrhotite>> Disseminated, isolated blebs; rare FRA.

<<Min: 11.85 - 62.76 0.5% Min: Pyrite>> Disseminated; rare FRA.

<<Min: 26.4 - 27.3 3% Min: Pyrrhotite>>

<<Min: 27.3 - 34.15 1% Min: Pyrrhotite>>

<<Alt: 19 - 22.5 Weak Calcite>>

<<Alt: 22.5 - 27.3 Trace Calcite>>

<<Alt: 27.3 - 32.8 Weak Calcite>> Banded CA; quartz-carbonate veins.

<<Vein: 28.15 - 28.21 Quartz-Carbonate>> Weakly-oxidized, quartz-carbonate vein with trace disseminated pyrrhotite.

<<Struc: 13.16 - 13.17 dominant foliation>>

<<Struc: 13.37 - 15.5 Trace Fault>> Fractured mudstone.

<<Struc: 15.5 - 15.6 Moderate Fault>> MDS gouge with trace oxidation.

<<Struc: 17.6 - 17.61 dominant foliation>>

<<Struc: 17.64 - 18.18 Weak Fault>> Incompetent, fractured mudstone; ~75% recovered.

<<Struc: 21.16 - 21.17 dominant foliation>>

<<Struc: 21.9 - 21.91 dominant foliation>>

<<Struc: 22 - 27.15 Trace Fault>> Localized zones with fractured mudstone, and rubble.

<<Struc: 28.35 - 30 Moderate Fault>> Fractured-pulverized mudstone, with traces of gouge visible on fractured surfaces; <10% recovered.

30.00 31.42 MAFt Mafic Volcaniclastics

30 - 31.42: Green, well-sorted mafic tuff; carbonaceous bands become prominent around 31m, due to gradational MDS lower CNT. The upper CNT occurs within a FLT between 28.35-30m; ~90% loss occurred wthin the FLT zone. Localized bands (<5cm) have undergone bleaching.

<<Struc: 30.87 - 30.88 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

31.42 34.15 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

31.42 - 34.15: Light-medium grey, carbonaceous mudstone interbedded with mafic tuff (32.68-32.88m). Minor FLTing occurs between 31.67- 32.06m.

<<Alt: 32.8 - 42.5 Weak-Moderate Calcite>> Banded CA; CA is more intense within quartz-carbonate veins.

<<Vein: 32.85 - 33.14 Quartz-Carbonate 65 deg. >> Quartz-carbonate veins (1-4cm wide).

<<Struc: 31.85 - 31.91 Weak-Moderate Fault>> Mudstone with chloritic gouge, on fractured surfaces.

<<Struc: 33.68 - 33.69 dominant foliation>> 180 deg. off?

34.15 34.85 MAFt Mafic Volcaniclastics

34.15 - 34.85: Green, chloritic mafic tuff with minor disseminated pyrrhotite. Sharp upper and lower CNT.

<<Min: 34.15 - 34.85 1% Min: Pyrrhotite>>

<<Struc: 34.35 - 34.36 dominant foliation>> 180 deg. off?

34.85 44.85 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

34.85 - 44.85: Medium-dark grey, carbonaceous mudstone. Moderate - strong FLT zones are common throughout the unit; >50% loss has occurred within the MDS. There is a massive quartz-carbonate-sericite vein from approx 41.7-42.5m; the vein might be larger, depending on where the loss within the FLT is most prominent. Disseminated blebs of pyrrhotite and pyrite are most common within the fractured-FLT zones.

<<Min: 34.85 - 85.3 0.5% Min: Pyrrhotite>> Disseminated PO; blebs within rare quartz-carbonate veins; minor FRA.

<<Alt: 42.5 - 63.1 Trace Calcite>> Trace disseminated CA; more intense within rare quartz-carbonate veins.

<<Vein: 36.07 - 36.52 Quartz-Carbonate 45 deg. >> Undulating-brecciated, quartz-carbonate veins with mm-size, subrounded quartz clasts.

<<Vein: 41.7 - 42.5 Quartz-Carbonate-Sericite>> Incompetent, fractured quartz-carbonate vein with sericite FRA; disseminated pyrrhotite blebs, and traces of pyrite.

<<Struc: 35.43 - 36 Moderate Fault>> Fractured-pulverized MDS with fine-grained PY-rich zones; >50% loss.

<<Struc: 36.51 - 45 Moderate-Strong Fault>> MDS rubble-gouge. FLT-intensity decreases downhole, within the massive quartz-carbonate-sericite vein. ~40% recovered.

44.85 59.90 RHYvl Lapilli tuff

44.85 - 59.9: Light-medium green, felsic volcaniclastics with moderate-strong FLT zones. Subrounded, carbonate-poor, poorly-sorted lapilli are localized, and proximal to FLT zones. Quartz-carbonate vein - FLT upper CNT; gradational lower CNT.

<<Vein: 44.85 - 48.12 Quartz-Carbonate-Sericite>> Fractured quartz-carbonate veins with sericite FRA, and disseminated pyrite and pyrrhotite. Rare pyrite FRA (stringers).

<<Struc: 45 - 45.3 Weak-Moderate Fault>> Fractured RHY with sericitic gouge.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 46.52 - 48 Moderate Fault>> Sheared RHY and quartz veins, with sericitic gouge; gouge contains mm-size, brecciated clasts of RHY. ~70% washed away.

<<Struc: 48.7 - 55.6 Moderate-Strong Fault>> Localized zones with moderate-strong FLT-intensity; zones consist of sericitic gouge-shear. The gouge contains small (1-10mm), subangular clasts of RHY and MDS. 25% of the interval consists of competent, non-faulted RHY; there is approx 60% core loss within the unit.

<<Struc: 55.72 - 55.73 dominant foliation>>

<<Struc: 57.2 - 60 Weak Fault>> Incompetent, fractured RHYv with small zones of gouge; interval has approx 60% core loss.

59.90 85.30 RHYva Coarse grained to ash tuff

59.9 - 85.3: Light-medium green, ash-dominant, felsic volcaniclastics intercalated with minor bands (cm-size) of localized, biotite-rich sediment. Localized porphyritic texture between 62.36-62.6m. Joint-set with QC+PY+/-PO FRA between 62.76-63.42m. Localized, cm-size tourmaline veinlets, and minor FLTing occur throughout the unit.

<<Min: 62.76 - 63.43 3% Min: Pyrite>> QC+PY+/-PO FRA within a well-developed joint set. FD along foliation.

<<Min: 63.43 - 67.7 0.1% Min: Pyrite>>

<<Min: 67.7 - 71.59 2% Min: Pyrite>> Quartz-carbonate-tourmaline stringers +/- PY. Vugs contain coarse-grained, euhedral PY.

<<Min: 71.56 - 71.59 2% Min: Galena>> GL-filled vugs within quartz vein.

<<Min: 71.59 - 79.8 0.5% Min: Pyrite>> Trace disseminated PY; occasional blebs within quartz-carbonate stringers.

<<Min: 79.8 - 80.95 2% Min: Pyrite>> PY FRA; blebs within tourmaline stringers. Disseminated PY is visible within gouge.

<<Min: 80.95 - 85.3 0.1% Min: Pyrite>>

<<Alt: 62.9 - 67.15 Trace Biotite>> Trace disseminated biotite.

<<Alt: 63.1 - 85.3 Weak Calcite>> Disseminated-banded CA; quartz-carbonate FRA.

<<Alt: 75 - 77.4 Weak Ankerite>> Patchy-zones of banded AK (?).

<<Alt: 79 - 85.3 Trace Muscovite>>

<<Alt: 84.5 - 85.3 Weak Silicification>> Weak silicification proximal to RHYi.

<<Vein: 62.76 - 63.42 Quartz-Carbonate-Sulphide 45 deg. >> Parallel, joint set of mm-size QC+PY+/-PO stringers.

<<Vein: 67.7 - 70.45 Tourmaline>> Tourmaline-dominant, quartz-carbonate stringers +/- pyrite. Stringers contain mm-size, subrounded clasts of RHY host. Vugs are rare, and contain med-grained, euhedral pyrite.

<<Vein: 71.56 - 71.59 Quartz-Sulphide 35 deg. >> Quartz vein with mm-scale vugs; vugs contain fine-grained PY (3%), and med-grained GL (< 2%).

<<Vein: 75.15 - 80 Quartz-Carbonate-Sulphide 25 deg. >> Quartz-carbonate and tourmaline stringers with disseminated PY +/- PO.

<<Struc: 60.77 - 60.78 dominant foliation>>

<<Struc: 62.93 - 62.94 dominant foliation>>

<<Struc: 65.95 - 65.96 dominant foliation>>

<<Struc: 67.93 - 68 Weak Fault>> Fractured RHY with minor gouge.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 69.38 - 69.39 dominant foliation>>

<<Struc: 70.11 - 70.12 dominant foliation>>

<<Struc: 73.08 - 73.09 dominant foliation>>

<<Struc: 73.3 - 75 Weak Fault>> Fractured-pulverized RHY; 1m wash.

<<Struc: 76.96 - 76.97 dominant foliation>>

<<Struc: 78.5 - 78.58 Weak Fault>> Sheared, strong-gouge RHY.

<<Struc: 80.12 - 80.95 Weak-Moderate Fault>> Minor FLT zones within competent RHY (mottled texture); 30% competent RHY. FLT zones consist of pulverized RHY and rubble. Interval has approx ~50% loss.

<<Struc: 81.57 - 81.58 dominant foliation>>

<<Struc: 82.26 - 83.7 Weak-Moderate Fault>> RHY shear, gouge, and rubble; ~50% recovered.

<<Struc: 84.33 - 84.34 dominant foliation>>

<<Struc: 84.92 - 85 Weak Fault>> Shear-gouge.

85.30 91.10 RHYi Aphanitic Rhyolite (intrusion)

85.3 - 91.1: Light greenish-grey to reddish-grey, siliceous, aphanitic RHYi. Minor sulphide mineralization FRA; dom. PY +/- PO. Massive quartz vein (35cm) at lower CNT.

<<Min: 85.3 - 91.1 0.5% Min: Pyrrhotite>> QC+PY +/- PO fracture infill.

<<Min: 85.3 - 91.2 4% Min: Pyrite>> QC+PY +/- PO fracture infill.

<<Alt: 85.3 - 93.48 Trace Calcite>> Quartz-carbonate (weak) FRA within hairline fractures.

<<Vein: 85.3 - 91.1 Quartz-Carbonate>> Hairline quartz-carbonate, and PY +/- PO FRA within RHYi.

<<Struc: 86.3 - 86.34 dominant foliation>>

<<Struc: 88 - 93.47 Trace Fault>> Several RHY rubble zones within competent core (25% competent); ~50% loss.

91.10 96.83 RHYva Coarse grained to ash tuff

91.1 - 96.83: Light green, ash-dominant, felsic volcaniclastic tuff with weak MU-alteration, and localized lapilli-rich zones. MU-alteration is stronger proximal to FLT zones disseminated PY is common within gouge.

<<Min: 93.46 - 96.83 1% Min: Pyrite>> Disseminated throughout unit; patchier within gouge zones.

<<Min: 93.46 - 120.45 0.5% Min: Pyrrhotite>> Disseminated PO; rare blebs within quartz veins.

<<Alt: 93.46 - 96.83 Weak Muscovite>> Weak MU alteration; alteration is stronger within FLT zones.

<<Alt: 93.48 - 96.83 Weak-Moderate Calcite>> Disseminated-blebs.

<<Vein: 91.1 - 91.45 Quartz>> Massive quartz vein with PY + CC FRA.

<<Vein: 91.45 - 93 Quartz>> Quartz and RHY rubble; < 20% recovered.

<<Vein: 93.46 - 94.52 Quartz-Carbonate>> Cm-size, quartz-carbonate veinlets within sheared zones. Veins contain blebs of disseminated PY.

<<Struc: 93.85 - 93.86 dominant foliation>>

<<Struc: 94.4 - 94.44 Weak Shear>> Weak shear zone.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 96.26 - 96.3 Weak-Moderate Fault>> Sericitic gouge with mm-size, subrounded clasts of quartz and RHY, and disseminated PY.

<<Struc: 96.49 - 96.5 dominant foliation>>

96.83 102.14 RHYi Aphanitic Rhyolite (intrusion)

96.83 - 102.14: Light grey, siliceous RHYi. Hairline fractures are prominent throughout the unit. Calcite FRA contains trace disseminated CL +/- PY +/- SP (?)

<<Min: 96.83 - 102.14 0.5% Min: Sphalerite>>

<<Min: 96.83 - 102.14 1% Min: Pyrite>> QC FRA +/- PY +/- SP

<<Alt: 96.83 - 102.14 Weak-Moderate Calcite>> Quartz-carbonate infill within hairline fractures; disseminated blebs.

<<Vein: 96.83 - 102.14 Quartz-Carbonate>> Hairline quartz-carbonate, chlorite, and sulphide FRA. Sulphides consist of PY +/- SP.

<<Struc: 100.1 - 101.34 Weak-Moderate Fault>> Fractured-rubble RHY; ~75% loss.

102.14 104.15 RHYvl Lapilli tuff

102.14 - 104.15: Light greyish-green, volcaniclastic lapilli tuff with clasts of silica-rich, RHYc (?)

<<Min: 102.14 - 121.57 0.1% Min: Pyrite>>

<<Alt: 102.14 - 114.35 Weak-Moderate Calcite>> Disseminated blebs-banded CA.

<<Vein: 102.9 - 103.4 Quartz-Carbonate 30 deg. >> Quartz stringers with disseminated calcite.

<<Struc: 103 - 103.2 Trace Fault>> Cm-size bands of gouge (< 20%) within competent RHY.

<<Struc: 103.9 - 103.91 dominant foliation>>

104.15 117.43 RHYva Coarse grained to ash tuff

104.15 - 117.43: Light green, ash-dominant, volcaniclastic tuff intercalated with minor pelitic beds. Weak-disseminated biotite alteration occurs from 111.37-117.43m.

<<Alt: 111.37 - 117.43 Weak Biotite>>

<<Alt: 114.35 - 117.43 Trace Calcite>> Trace disseminated blebs.

<<Vein: 110.62 - 110.63 Quartz 50 deg. >> Quartz stringer with subangular blebs of PO (< 5mm), and CL FRA.

<<Struc: 106.76 - 107.71 Weak Fault>> Heavily-jointed RHY with small-rare gouge zones.

<<Struc: 107.85 - 107.86 dominant foliation>>

<<Struc: 109.55 - 109.56 dominant foliation>>

<<Struc: 110.68 - 111 Weak Fault>> RHY rubble; ~ 65% recovered.

<<Struc: 114 - 114.2 Weak Fault>> Weak-shear zone with small (< 5mm), subangular quartz clasts.

<<Struc: 115.58 - 115.59 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

117.43 121.37 PEL Equigranular biotite + calcite +/- quartz rock

117.43 - 121.37: PEL interbedded with biotite-rich, ash-dominant, felsic volcaniclastics. FLT zone between 118.7-119.00m; FLT consists of RHY-gouge, and pulverized PEL. Sharp upper and lower CNT.

<<Min: 120.45 - 120.8 1% Min: Sphalerite>>

<<Min: 120.45 - 120.8 2% Min: Pyrrhotite>>

<<Min: 120.45 - 120.8 0.5% Min: Galena>> Disseminated GL within quartz-carbonate bands.

<<Min: 120.8 - 129.57 0.5% Min: Pyrrhotite>>

<<Alt: 117.43 - 121.57 Trace Calcite>> Trace-weak pervasive CA within PEL.

<<Vein: 120.45 - 120.8 Quartz-Carbonate-Sulphide>> Quartz-carbonate bands with trace PO+SP+/-GL.

<<Struc: 117.9 - 117.91 dominant foliation>>

<<Struc: 118.66 - 119 Moderate Fault>> RHY gouge and pulverized PEL. Sharp upper CNT (~30 deg.)

121.37 124.70 RHYva Coarse grained to ash tuff

121.37 - 124.7: Light-medium green, ash-dominant volcaniclastic tuff with weak MU-alteration. Weak-moderate FLT zones occur throughout the unit.

<<Min: 121.57 - 124.7 1% Min: Pyrite>> DEF, mm-size QC-PY stringers.

<<Alt: 121.57 - 124.7 Trace Calcite>> Trace disseminated-blebs of CA.

<<Struc: 121.57 - 121.58 Contact>> CNT between PEL-RHYv.

<<Struc: 121.65 - 122.7 Weak-Moderate Fault>> RHY gouge and rubble zone; ~30% recovered.

<<Struc: 123.5 - 124 Weak Fault>> Sheared-fractured, gouge zone; ~50% recovered.

124.70 129.57 PEL Equigranular biotite + calcite +/- quartz rock

124.7 - 129.57: Pelite intercalated with biotite-altered, felsic volcaniclastics. Hairline fractures with QC infill is common; minor FLTing between 126-127.6m.

<<Min: 124.7 - 129.57 0.1% Min: Pyrite>>

<<Alt: 124.7 - 125.6 Weak-Moderate Calcite>> Banded-pervasive CA within PEL.

<<Alt: 125.6 - 129.57 Trace Calcite>>

<<Vein: 125 - 129.57 Quartz-Carbonate>> Undulating quartz-carbonate veins (1-5cm wide) with trace disseminated BI, due to host PEL.

<<Struc: 126 - 127.6 Trace Fault>> Fractured, volcaniclastic RHY within PEL. Minor zones of sericitic gouge.

<<Struc: 128.25 - 128.26 dominant foliation>>

173.74 180.21 RHYvl Lapilli tuff grey-green

173.74 - 180.21: Light greenish-grey, volcaniclastic lapilli tuff. Subrounded, quartz-carbonate (poor) lapilli (< 1cm) are poorly-sorted. Lapilli abundance is greatest within the centre of the unit. PY-rich (+/- PO) kink bands are sporadic, throughout the interval.

<<Min: 173.74 - 180.21 3% Min: Pyrite>> Disseminated kink-bands of PY +/- PO within lapilli tuff.

<<Min: 173.74 - 180.21 0.5% Min: Pyrrhotite>> Disseminated kink-bands of PY +/- PO within lapilli tuff.

<<Alt: 173.74 - 180.21 Weak-Moderate Calcite>> Disseminated-blebs; quartz-carbonate lapilli.

<<Vein: 175.5 - 176.42 Quartz-Carbonate>> Quartz carbonate veinlets (1-2cm wide) containing disseminated PY blebs.

<<Struc: 174.87 - 174.88 dominant foliation>>

<<Struc: 179.46 - 179.47 dominant foliation>>

180.21 184.32 RHYc Rhyolite coherant volcanics light grey

180.21 - 184.32: Light-grey, gritty, coherent RHY. QC +/- PY stringers are common, and create a brecciated-look. Upper and lower CNT are gradational.

<<Min: 180.21 - 184.32 3% Min: Pyrite>> QC stringer-network +/- PY +/- PO.

<<Min: 180.21 - 184.32 0.5% Min: Pyrrhotite>> QC stringer-network +/- PY +/- PO.

<<Alt: 180.21 - 184.32 Weak-Moderate Calcite>> Disseminated CA; mostly FRA.

<<Vein: 180.21 - 183.15 Quartz-Carbonate-Sulphide>> QC +/- PY stringers; stringers brecciate coherent RHY.

<<Vein: 183.1 - 183.66 Quartz-Carbonate>> Quartz-carbonate bands.

<<Struc: 183.44 - 183.45 dominant foliation>>

184.32 189.00 RHYvl Lapilli tuff

184.32 - 189: Light greenish-grey, volcaniclastic, lapilli tuff. Subrounded, quartz-carbonate lapilli are < 10mm, and are poorly-sorted; abundance is < 25%. There is a moderate FLT between 187.12-187.32m; the FLT consists of hard-sericitic gouge, and large, subangular quartz clasts (< 2cm). PY is disseminated within clasts. PY-rich disseminated-bands are common throughout the RHY.

<<Min: 184.32 - 198.21 3% Min: Pyrite>> Disseminated PY-rich (+/- PO) QC bands.

<<Min: 184.32 - 198.21 0.1% Min: Pyrrhotite>> Disseminated PY-rich (+/- PO) QC bands.

<<Alt: 184.32 - 191.73 Weak Calcite>> Disseminated-blebs of CA; rare FRA.

<<Struc: 184.55 - 184.56 dominant foliation>>

<<Struc: 186.8 - 186.81 dominant foliation>>

<<Struc: 187.12 - 187.32 Moderate Fault>> Semi-hard, sericitic gouge. The gouge contains cm-size clasts of quartz; disseminated PY is visible within the quartz.

<<Struc: 196.75 - 196.76 dominant foliation>>

198.21 204.97 RHYvl Lapilli tuff

198.21 - 204.97: MU-SI-altered, volcaniclastic lapilli tuff. Minor FLT zone between 199.13-200m.

<<Min: 198.21 - 207.23 1% Min: Pyrite>> Disseminated-banded PY.

<<Min: 198.21 - 207.23 0.1% Min: Pyrrhotite>> Trace, disseminated PO.

<<Alt: 198.21 - 205.34 Moderate Muscovite>> Pervasive MU-alteration, most prominent within folia, creating a banded-appearance.

<<Alt: 198.21 - 205.34 Weak Calcite>> Disseminated blebs of CA; quartz-carbonate lapilli.

<<Struc: 198.21 - 198.22 Contact>>

<<Struc: 199.66 - 200 Weak-Moderate Fault>> Soft-sericitic gouge; gouge contains mm-size, subrounded RHY clasts. ~ 50% of the unit is competent RHY.

<<Struc: 202.34 - 202.35 dominant foliation>>

<<Struc: 204.54 - 204.55 dominant foliation>>

204.97 207.23 RHYva Coarse grained to ash tuff FG

204.97 - 207.23: Fine-grained, ash-dominant, volcaniclastic tuff with strong, pervasive muscovite alteration. Coarse-grained, disseminated, subhedral PY is common along foliation.

<<Alt: 205.34 - 206.27 Strong Muscovite>> Pervasive-patchy, MU-alteration proximal to a massive quartz vein-FLT zone.

<<Alt: 205.34 - 206.27 Moderate Calcite>> Patchy-carbonate within quartz veins.

<<Alt: 206.27 - 207.23 Moderate Muscovite>>

<<Alt: 206.27 - 207.53 Moderate Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 205.35 - 206.43 Quartz-Carbonate>> Regular - undulating quartz-carbonate veins, and a massive - faulted vein (205.6-206.15m).

<<Vein: 207 - 208.2 Quartz-Carbonate 60 deg. >> Quartz-carbonate bands; occasional PY-replacement within bands.

<<Struc: 205.73 - 206.15 Weak-Moderate Fault>> Rubble-quartz vein.

<<Struc: 206.95 - 206.96 dominant foliation>>

207.23 215.20 RHYv Rhyolite volcaniclastic

207.23 - 215.2: Light greenish-grey, MU-SI altered RHY. Disseminated PY is common within silica-rich bands. PY-rich bands occur in localized zones. Disseminated (singular) PY +/- PO is visible throughout the unit.

<<Min: 207.23 - 233.86 5% Min: Pyrite>> Disseminated PY; banding is common within silica-rich zones.

<<Min: 207.23 - 233.86 1% Min: Pyrrhotite>>

<<Alt: 207.23 - 245.88 Weak-Moderate Muscovite>> Weak-moderate MU-alteration; alteration is most intense within FLT zones.

<<Alt: 207.53 - 209.7 Weak-Moderate Calcite>> Quartz-carbonate aggregates-disseminated blebs.

<<Alt: 209.7 - 220.5 Weak Calcite>> Disseminated-blebs of CA; rare FRA.

<<Struc: 208.45 - 208.65 Trace Fault>> Heavily-fractured, incompetent RHY.

<<Struc: 209.85 - 209.86 dominant foliation>>

<<Struc: 211.61 - 211.62 dominant foliation>>

215.20 247.50 RHY undifferentiated rhyolite

215.2 - 247.5: Light greenish-grey, MU-SI altered, undifferentiated RHY with disseminated PY +/- PO. Disseminated PY-rich bands are common within silica-rich zones.

<<Min: 233.86 - 240.38 8% Min: Pyrite>> Disseminated PY; banding is common within silica-rich zones.

<<Min: 233.86 - 240.38 0.1% Min: Pyrrhotite>>

<<Min: 240.38 - 247.5 0.5% Min: Pyrite>> Trace disseminated PY.

<<Min: 240.38 - 247.5 4% Min: Pyrrhotite>> Disseminated PO +/- PY; PO is elongated-strained along foliation.

<<Alt: 220.5 - 228.55 Moderate Calcite>> Moderate CA within aggregates and quartz-carbonate bands; trace disseminated.

<<Alt: 228.55 - 273 Trace Calcite>> Trace disseminated; rare FRA. Weak, patchy-carbonate within quartz veins.

<<Alt: 245.88 - 248.87 Moderate Muscovite>> Stronger alteration within FLT zone.

<<Alt: 245.88 - 272.23 Weak-Moderate Silicification>>

<<Vein: 220.45 - 221.38 Quartz-Carbonate>>

<<Vein: 227.7 - 228.47 Quartz-Carbonate>> 1-3cm wide, quartz-carbonate veins.

<<Vein: 240.27 - 241.08 Quartz-Carbonate 65 deg. >> Quartz-carbonate veins (1-5cm wide) with trace disseminated-blebs of PO.

<<Struc: 215.2 - 215.35 Weak-Moderate Fault>> Fractured-pulverized RHY.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 215.78 - 215.79 dominant foliation>>

<<Struc: 217.11 - 217.19 Moderate Fault>> Sericitic-gouge; gouge contains mm-size, subrounded quartz clasts, and trace disseminated PY.

<<Struc: 218.53 - 218.63 Moderate Fault>> FLT gouge with mm-size, subangular quartz clasts.

<<Struc: 221.9 - 221.91 dominant foliation>>

<<Struc: 222.51 - 222.52 dominant foliation>>

<<Struc: 236.35 - 236.92 Weak-Moderate Fault>> Weak-sheared RHY to semi-hard gouge; 1-10mm size, subangular quartz clasts, and disseminated PY.

<<Struc: 238.5 - 238.54 Weak-Moderate Fault>> RHY-gouge with mm-size, subangular quartz clasts, and patchy-PY.

<<Struc: 241.71 - 241.72 dominant foliation>>

<<Struc: 244.36 - 244.37 dominant foliation>>

<<Struc: 245.9 - 247.5 Weak Fault>> Trace-weak, sheared, MU-altered RHY with minor bands of gouge.

247.50 248.87 FLZ Fault Zone

247.5 - 248.87: Brecciated, silica-rich, MU-altered RHY. Cm-scale, subrounded quartz clasts contain disseminated PY. Soft, sericitic-gouge FRA.

<<Min: 247.5 - 249.34 6% Min: Pyrite>> Subrounded quartz clasts within RHY-FLT contain disseminated PY.

<<Struc: 247.5 - 248.87 Moderate Fault>> Sheared-brecciated RHY; sericitic gouge-clay within fractures. Clasts range from mm-size to cm-scale, and are generally made up of quartz. PY-replacement within quartz clasts is localized.

248.87 263.20 RHY undifferentiated rhyolite

248.87 - 263.2: MU-SI altered, undifferentiated RHY. Weak-moderate FLTing has created minor brecciated zones. Disseminated PO +/- PY is visible throughout the unit; pyrite-rich bands occur in zones with strong SI-alteration.

<<Min: 249.34 - 263.2 1% Min: Pyrite>> Disseminated PO +/- PY; disseminated PY is patchy within silica-rich zones. Rare FRA.

<<Min: 249.34 - 263.2 4% Min: Pyrrhotite>> Disseminated PO +/- PY; PO is elongated-strained along foliation.

<<Alt: 248.87 - 273.05 Weak-Moderate Muscovite>> Pervasive weak-moderate MU-alteration; alteration is stronger within FLT zones.

<<Struc: 250.5 - 250.95 Weak Fault>> Fractured RHY; ~ 50% recovered.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 252.62 - 253.4 Weak-Moderate Fault>> Pulverized RHY, and rubble.

<<Struc: 255.36 - 257.3 Weak Fault>> Trace-weak FLT zones, within competent RHY; zones consist of fractured-sheared RHY, and pyrite-rich gouge within fractures.

<<Struc: 261.7 - 261.71 dominant foliation>>

<<Struc: 262 - 262.37 Weak Fault>> Fractured RHY; small pulverized zones.

263.20 264.89 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

263.2 - 264.89: Dark grey, mudstone intercalated with MU-SI altered RHY (30%). Trace disseminated PO + PY.

<<Min: 263.2 - 267.13 0.1% Min: Pyrite>> Disseminated PO +/- PY.

<<Min: 263.2 - 272.03 3% Min: Pyrrhotite>> Disseminated PO +/- PY; PO-banding occurs in silica-rich zones within RHY.

264.89 265.78 RHY undifferentiated rhyolite

264.89 - 265.78: MU-SI altered RHY with disseminated PY+PO. FLT upper CNT; gradational lower CNT.

<<Struc: 264.9 - 265 Moderate-Strong Fault>> Soft-gouge with mm-size, subangular RHY clasts. FLT represents CNT between MDS and RHY.

<<Struc: 265.63 - 265.64 dominant foliation>>

265.78 267.13 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

265.78 - 267.13: Med-dark grey, siliceous (?) mudstone with disseminated PY+PO.

267.13 296.35 RHY undifferentiated rhyolite

From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
292.00	293.50	1.50	D00005751	0.03	3.2	0.02	-0.01	0.01

267.13 - 296.35: MU-SI altered, undifferentiated RHY. MU alteration becomes strong around 273m; alteration is strongest within foliation and fractures. Localized zones contain brecciated quartz-aggregates; clasts are seperated with strongly-altered sericite. RHY ranges from well-sorted-banded to a poorly-sorted, mottled texture. Alteration and textural-distortion increases downhole.

<<Min: 267.13 - 272.03 5% Min: Pyrite>> Disseminated-banded PY.

From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
293.50	295.00	1.50	D00005752	0.007	1.2	-0.01	-0.01	0.05

<<Min: 272.03 - 296.35 3% Min: Pyrite>> Disseminated PY +/- PO; PY is elongated-strained along foliation.

From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
295.00	296.35	1.35	D00005753	0.062	7.5	0.09	0.03	0.16

<<Min: 272.03 - 296.35 1% Min: Pyrrhotite>> Disseminated PY +/- PO; PO is elongated-strained along foliation.

<<Min: 294 - 296.35 0.1% Min: Sphalerite>> Trace disseminated SP.

<<Min: 296.25 - 296.35 5% Min: Chalcopyrite>> Blebs of CP within quartz vein; trace subhedral PY +/- SP.

<<Alt: 272.23 - 296.35 Moderate Silicification>> SI-alteration within quartz-rich RHY; brecciated apart by strong MU-alteration.

<<Alt: 273 - 274.4 Weak-Moderate Calcite>> Patchy-carbonate within quartz-carbonate veins; FRA.

<<Alt: 273.05 - 274.4 Moderate-Strong Muscovite>> Moderate-strong MU-alteration; tight foliation gives a banded-appearance.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 274.4 - 291.28 Strong Muscovite>> Banded-FRA MU alteration. Olive-lime green, sericite is visible along folia, and within fractures; alteration is pervasive throughout the interval, and has destroyed the original texture of the undifferentiated RHY, creating a brecciated-mottled look in weaker zones.

<<Alt: 274.4 - 296.35 Weak Calcite>> Trace to weak, disseminated-blebs and FRA. CA is weak-moderate within quartz-carbonate veins.

<<Alt: 291.28 - 293.17 Strong Muscovite>> Strong, pervasive MU alteration with more intense, patchy, MU-altered zones.

<<Alt: 293.17 - 296.44 Moderate Muscovite>>

<<Vein: 268.04 - 269.68 Quartz-Carbonate>> Undulating quartz veins with CA patches and FRA.

<<Vein: 270.82 - 271.11 Quartz>> Massive quartz vein, broken apart by RHY host; vein contains carbonate blebs and FRA.

<<Vein: 272.72 - 274.4 Quartz-Carbonate 70 deg. >> Quartz-carbonate veins (0.5-4cm wide).

<<Vein: 279.46 - 285.23 Quartz-Carbonate 70 deg. >> Quartz veins with patchy-carbonate, and CA FRA.

<<Vein: 285.45 - 295.5 Quartz-Carbonate>> DEF-undulating quartz-carbonate veins within heavily-altered RHY.

<<Vein: 296.26 - 296.35 Quartz-Sulphide>> Fractured, quartz vein with angular-brecciated clasts of RHY host; CP blebs.

<<Struc: 271.42 - 271.52 Moderate Fault>> Semi-soft RHY gouge-shear zone, with disseminated PY.

<<Struc: 273.37 - 273.47 Weak-Moderate Fault>> Clast-supported, FLT BRX. Large, angular RHY clasts have undergone strong sericite alteration, and are surrounded with semi-soft, sericitic gouge.

<<Struc: 273.85 - 274.4 Foliation>> Tight-foliation - shear zone (?) proximal to FLT.

<<Struc: 275.72 - 277.34 Weak-Moderate Fault>> Brecciated RHY with strong sericite alteration. Minor bands of gouge.

<<Struc: 279.58 - 279.59 dominant foliation>>

<<Struc: 283.25 - 283.26 dominant foliation>>

<<Struc: 283.46 - 283.7 Weak Fault>> Fractured-brecciated, MU-altered RHY with minor gouge.

<<Struc: 293.9 - 293.91 dominant foliation>>

<<Struc: 295.68 - 295.69 dominant foliation>>

296.35	**296.73**	**OK**	**Heavilly disseminated sulphides and/or stringer style mineralization associated with barite ± quartz ± carbonate gangue**	296.35	296.85	0.50	D00005754	0.807	128	0.85	0.7	2.78

296.35 - 296.73: Heavily-disseminated PY + SP +/- CP within a silicate-rich gangue. There is strong MU-alteration at the beginning of the interval.

<<Min: 296.35 - 296.73 10% Min: Sphalerite>> Heavily-disseminated PY + SP +/- CP within a silicate-rich gangue.

<<Min: 296.35 - 296.73 15% Min: Pyrite>> Heavily-disseminated PY + SP +/- CP within a silicate-rich gangue.

		<<Min: 328.04 - 328.8 3% Min: Galena>> GL blebs and FRA within a fractured, massive quartz vein.									
		<<Min: 328.04 - 329 0.5% Min: Pyrite>> Disseminated PY is visible on fractured, quartz surfaces. FD along foliation of RHY.									
		<<Min: 329 - 329.1 5% Min: Sphalerite>> Disseminated blebs and FRA within a quartz-carbonate vein.									
		<<Min: 329 - 329.1 2% Min: Chalcopyrite>> Disseminated-blebs of CP+SP within a quartz-carbonate vein.									

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 329 - 329.89 2% Min: Pyrite>> Disseminated PY within quartz-carbonate vein; FD along foliation of RHY.

<<Alt: 299.4 - 326.28 Moderate Muscovite>> Mod-strong, pervasive MU-alteration, most visible along cleavage planes. MU-alteration is strongest within the FLT zone (~302.9-303.3m).

<<Alt: 299.4 - 326.28 Weak Calcite>> Trace-weak, disseminated CA; occasional FRA. CA blebs within massive quartz veins.

<<Alt: 299.4 - 333.2 Moderate Silicification>>

<<Alt: 320.85 - 331 Moderate Ankerite>> Disseminated-blebs of AK, pervasive throughout the RHY.

<<Alt: 326.28 - 329.02 Trace Calcite>> Trace disseminated CA; blebs and FRA within quartz veins.

<<Alt: 326.28 - 333.2 Moderate-Strong Muscovite>>

<<Alt: 329.02 - 330.13 Weak-Moderate Calcite>> CA-rich patches within quartz-carbonate veins.

<<Vein: 321.03 - 321.6 Quartz>> Blebs of GL +/- SP within a massive quartz vein; CA blebs and FRA.

<<Vein: 323.26 - 323.71 Quartz>> Massive quartz vein with blebs of SP+GL.

<<Vein: 324.7 - 326.28 Quartz>> Massive quartz vein with blebs of carbonate. CP+GL+SP+PY blebs and FRA within vein.

<<Vein: 327.72 - 327.81 Quartz-Carbonate>> DEF quartz veins with blebby-carbonate.

<<Vein: 328.04 - 328.8 Quartz>> Fractured, massive quartz vein with patchy-carbonate, and blebs of GL+SP; ~70% recovered.

<<Vein: 329.02 - 330.3 Quartz-Carbonate-Sulphide>> Quartz-carbonate veins with disseminated PY+SP.

<<Struc: 299.4 - 299.41 Contact>> Lower CNT of massive sulphide, between OB mineralization and RHY.

<<Struc: 301.3 - 301.31 dominant foliation>>

<<Struc: 302.85 - 303.55 Moderate Fault>> Weak, fractured-brecciated RHY with strong MU-alteration, minor gouge, and disseminated PY.

<<Struc: 305.72 - 305.73 dominant foliation>>

<<Struc: 306.4 - 306.87 Weak Fault>> Competent, fractured-brecciated RHY with strong MU alteration, and minor gouge.

<<Struc: 308 - 308.01 dominant foliation>>

<<Struc: 313.27 - 314.65 Moderate Fault>> MU-altered, RHY BRX and RHY. The matrix surrounding cm-size, subrounded quartz and RHY clasts consists of weak, sericitic gouge.

<<Struc: 316.83 - 316.84 dominant foliation>>

<<Struc: 319.84 - 319.85 dominant foliation>>

<<Struc: 321.6 - 322.9 Weak-Moderate Fault>> MU & AK-altered RHY rubble, with small pulverized zones.

<<Struc: 327.22 - 327.23 Foliation>>

<<Struc: 329.81 - 329.82 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
329.89	**330.13**	**OI** **Heavilly disseminated sulphides in host schist**									
329.89 - 330.13: Heavily-disseminated PY + SP +/- GL within host RHY, and a quartz-carbonate vein (330.01-330.07m).											
<<Min: 329.89 - 330.13 3% Min: Sphalerite>> Disseminated SP; blebs within quartz-carbonate veins.											
<<Min: 329.89 - 330.13 20% Min: Pyrite>> Banded to semi-massive PY; PY is disseminated within quartz-carbonate veins.											
<<Min: 329.89 - 330.13 0.5% Min: Galena>> Trace disseminated GL within quartz-carbonate veins.

382.80 384.93 PEL Equigranular biotite + calcite +/- quartz rock

382.8 - 384.93: Greenish-brown, biotite-rich PEL with localized MU-alteration, and disseminated PO +/- PY.

<<Min: 382.8 - 387.98 1% Min: Pyrrhotite>> Disseminated-banded PO; PO blebs within quartz vein.

<<Alt: 382.8 - 387.98 Weak Chlorite>> Chloritic PEL. CL blebs are stronger within massive quartz-carbonate-chlorite, altered vein.

<<Alt: 382.8 - 387.98 Weak-Moderate Calcite>> Patchy, CA is stronger within the massive quartz-carbonate-chlorite vein.

<<Struc: 383.52 - 383.53 dominant foliation>>

384.93 387.98 PEL Equigranular biotite + calcite +/- quartz rock

384.93 - 387.98: Alternating beds of PEL and altered-RHY, with gradational contacts. Minor FLT zones occur throughout the interval. There is a massive quartz-carbonate-chlorite vein with disseminated biotite +/- pyrite from approx 385.7-385.9m.

<<Alt: 384.93 - 387.98 Moderate Silicification>> Pervasive SI-alteration within RHY.

<<Alt: 384.93 - 416.22 Moderate Muscovite>> Pervasive, web-like texture surrounding BI-SI blebs; alteration is stronger within FLZ.

<<Vein: 385.59 - 386.05 Quarzt-Chlorite-Carbonate>> Regular to massive quartz veins with patchy carbonate and chlorite, disseminated biotite is most prominent within the carbonate. Trace disseminated pyrite.

<<Vein: 386.05 - 393.85 Quartz-Carbonate>>

<<Struc: 384.94 - 384.95 dominant foliation>>

<<Struc: 385.14 - 385.75 Weak-Moderate Fault>> Heavily-fractured RHY - rubble zone; <50% recovered.

<<Struc: 387.6 - 387.61 dominant foliation>>

<<Struc: 387.7 - 387.97 Weak-Moderate Fault>> Fractured RHY - rubble zone.

387.98 416.22 RHY undifferentiated rhyolite

387.98 - 416.22: MU-SI-BI altered RHY (?) with disseminated PO + PY. FLZ from approx 390.15-391.5m. Tourmaline FRA and localized, mm-size blebs are rare.

<<Min: 387.98 - 400.6 2% Min: Pyrite>> Disseminated PY; gen localized within SI-BI altered blebs.

<<Min: 387.98 - 400.6 5% Min: Pyrrhotite>> Disseminated PO localized within SI-BI blebs.

<<Min: 400.6 - 401.62 0.5% Min: Pyrite>>

<<Min: 400.6 - 401.62 0.1% Min: Pyrrhotite>>

<<Min: 401.62 - 406.03 3% Min: Pyrite>> Disseminated PY; rare bands.

<<Min: 401.62 - 406.03 2% Min: Pyrrhotite>>

<<Min: 406.03 - 406.85 1% Min: Pyrite>> Disseminated-banded.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 406.03 - 406.85 1% Min: Pyrrhotite>> Disseminated PO; localized within SI-rich zone.

<<Min: 406.85 - 416.22 4% Min: Pyrite>> Fine-grained blebs to coarse-grained disseminated PY. Subhedral, med-coarse grained PY is visible on fractured surfaces. FRA is rare.

<<Min: 406.85 - 416.22 4% Min: Pyrrhotite>> Disseminated PO+PY; PO is gen localized within silica-rich blebs. Difficult to approximate percentage, based on amount of mixed biotite alteration.

<<Alt: 387.98 - 394.5 Weak Calcite>>

<<Alt: 387.98 - 405.3 Weak Biotite>> Blebs of disseminated BI +/- PO within silica-rich blebs.

<<Alt: 387.98 - 416.22 Weak-Moderate Silicification>> SI-rich blebs host disseminated BI+PO+/-PY. SI appears brecciated, due to surrounding MU-alteration, web-like texture.

<<Alt: 394.5 - 416.22 Trace Calcite>>

<<Alt: 406.85 - 416.22 Weak Biotite>> Blebs of disseminated BI +/- PO within silica-rich blebs.

<<Vein: 402.22 - 403.46 Quartz-Carbonate>> Quartz veins with blebby-carbonate.

<<Struc: 390.17 - 391.5 Moderate-Strong Fault>> MU-BI altered RHY FLT consists of sheared-RHY and gouge. The weak, sericitic gouge contains mm-size, subangular clasts of RHY, quartz, and disseminated PY. Gouge FRA is common within fractures. ~ 60% of the unit was recovered.

<<Struc: 393.1 - 393.11 dominant foliation>>

<<Struc: 399 - 400 Trace Fault>> Fractured, incompetent RHY.

<<Struc: 401.98 - 401.99 dominant foliation>>

<<Struc: 405.65 - 406.24 Weak Fault>> Sheared-fractured zones, within competent RHY.

<<Struc: 406.41 - 406.42 dominant foliation>>

<<Struc: 406.7 - 406.85 Moderate-Strong Fault>> Weak, sericitic gouge with mm-size quartz clasts, and disseminated pyrite.

<<Struc: 411.18 - 411.85 Trace Fault>> Fractured zone.

<<Struc: 413.1 - 413.11 dominant foliation>>

End of Hole @ 416.22

Appendix K: Geological Sections

This appendix contains 16 geological sections through the Krakatoa Zone and GP4F deposit, as summarized in Table K-1 below.

Table K-1: Table of contents for Krakatoa Zone and GP4F deposit sections in appendix K

Section	Deposit/Zone	Orientation	Looking	Width	Figure No
K-D	Krakatoa	030°	300°	±12.5 m	Figure K-1
K-E	Krakatoa	030°	300°	±12.5 m	Figure K-2

Appendix L: Certificates of Analysis

This appendix contains all of the certificates of analysis (COA) pertaining to resource definition, exploration and metallurgical drilling at the KZK Project during 2016. Elements analyzed for all DDHs include Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb and Se. Additional elements were analyzed in the Krakatoa check assay program (VA16113176). COAs are listed in alphanumeric order, with the first page of each COA indicated in the Page Number column in Table L-1 below.

Table L-1: Table of contents for COAs in this appendix

Certificate	Elements Assayed	Drill holes	Target	Samples (#)	Page Number
VA16113176	Ag, Au, Cu, Fe, Pb, Zn, S, Al, As, B, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Ga, Ge, Hf, Hg, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Rb, Re, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zr	Various	Krakatoa Check Assay	46	1
VA16136024	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	Various	GP4F Check Assay	18	13
VC161371	Pycnometer	Various	-	200	17
VC161661	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-337, 338	Krakatoa	85	24
VC161668	Pycnometer	Various	-	23	34
VC161774	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-339, 341	Krakatoa	112	36
VC161844	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-340	Krakatoa	153	50
VC161846	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-343, 344	Krakatoa	95	68
VC161847	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-345	Krakatoa	21	80
VC161848	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-346	Krakatoa	35	84
VC161881	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-350	Krakatoa	75	91
VC161903	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-349	Krakatoa	67	98
VC161904	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-351	Krakatoa	37	108
VC161905	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-348	Krakatoa	27	113
VC161906	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-347	Krakatoa	41	118
VC161919	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-353	Krakatoa	39	125
VC162012	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-352	Krakatoa	34	130
VC162013	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-352	Krakatoa	6	135
VC162014	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-355	Krakatoa	38	138
VC162015	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-357	Krakatoa	81	143
VC162016	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	Various	Krakatoa	10	150
VC162046	Ag, Au, Cu, Fe, Pb, Zn, S, As, Ba, Bi, Hg, Sb, Se	K16-358	Krakatoa	87	154

CERTIFICATE VA16113176

Project: KZK Project

P.O. No.: BMC16-01_CA1

This report is for 46 Pulp samples submitted to our lab in Vancouver, BC, Canada on 13-JUL-2016.

The following have access to data associated with this certificate:

R. BLACK	NEIL MARTIN	RON VOORDOUW

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-24	Pulp Login - Rcd w/o Barcode
LOG-QC	QC Test on Received Samples

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP81	ICP Fusion - Ore Grade	ICP-AES
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES
ME-MS41	Ultra Trace Aqua Regia ICP-MS	
Ag-OG46	Ore Grade Ag - Aqua Regia	VARIABLE
Cu-OG46	Ore Grade Cu - Aqua Regia	VARIABLE
Pb-OG46	Ore Grade Pb - Aqua Regia	VARIABLE
Zn-OG46	Ore Grade Zn - Aqua Regia	VARIABLE
Au-AA25	Ore Grade Au 30g FA AA finish	AAS
ME-MS85	Lithium Borate Fusion - Select Elements	ICP-MS
Ag-AA45	Trace Ag - aqua regia/AAS	AAS
Ag-AA46	Ore grade Ag - aqua regia/AA	AAS

[Report File No.: 0000017104]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Apr 28, 2016

P.O. No.	:	PO# BMC15-01_3
Project No.	:	KZK
No. Of Samples	:	200
Date Submitted	:	Apr 18, 2016
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

G_PHY03V analysis was performed by SGS Sudbury.

Certified By : _____

Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted

Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Work Order : VC161661

[Report File No.: 0000017600]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Jun 06, 2016

P.O. No.	:	PO# BMC16-01_2
Project No.	:	KZK
No. Of Samples	:	85
Date Submitted	:	May 17, 2016
Report Comprises	:	Pages 1 to 10 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Samples may have coarse gold.
Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :

John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

Project No.: KZK
Samples: 23
Received: May 18, 2016
Pages: Page 1 to 2
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
23	G_LOG02	Pre-preparation processing, sorting, logging, boxing
23	G_PHY03V	Specific Gravity - Pycnometer

Storage: Pulp & Reject

PULP STORAGE	:	STORE FOR 90 DAYS
REJECT STORAGE	:	STORE FOR 30 DAYS

Comments:

G_PHY03V analysis was performed by SGS Sudbury.

Certified By : _____

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Jun 20, 2016

P.O. No.	:	PO# BMC16-01_5
Project No.	:	KZK
No. Of Samples	:	95
Date Submitted	:	Jun 01, 2016
Report Comprises	:	Pages 1 to 12 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Samples may have coarse gold.
Se values greater than 1000ppm were done by dilution and are informational only.
Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Date: Jun 17, 2016

P.O. No.	:	PO# BMC16-01_7
Project No.	:	KZK
No. Of Samples	:	35
Date Submitted	:	Jun 01, 2016
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Samples may have coarse gold.
Se values greater than 1000ppm were done by dilution and are informational only.
Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :
John Chiang

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

[Report File No.: 0000017759]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Jun 21, 2016

P.O. No.	:	PO# BMC16-01_10
Project No.	:	KZK
No. Of Samples	:	67
Date Submitted	:	Jun 08, 2016
Report Comprises	:	Pages 1 to 10 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Se values greater than 1000ppm were done by dilution and are informational only.
Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By : _____
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted

Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Distribution of unused material:
Active files:

Comments:

Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

Active files:

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

Comments:

Ba and S data is informational only.
Samples this job were analyzed with VC162013.

Certified By :

John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Certificate of Analysis

Work Order : VC162015

[Report File No.: 0000017847]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Jul 05, 2016

P.O. No.	:	PO# BMC16-01_16
Project No.	:	KZK
No. Of Samples	:	81
Date Submitted	:	Jun 16, 2016
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :

John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

[Report File No.: 0000017936]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Jul 12, 2016

P.O. No.	:	PO# BMC16-01_19
Project No.	:	KZK
No. Of Samples	:	87
Date Submitted	:	Jun 23, 2016
Report Comprises	:	Pages 1 to 8 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Active files:

Comments:

Lower limit for and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Distribution of unused material:
Active files:

Comments:

Lower limit for and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

P.O. No.	:	PO# BMC16-01_25
Project No.	:	KZK
No. Of Samples	:	95
Date Submitted	:	Jul 04, 2016
Report Comprises	:	Pages 1 to 12 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :

John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Jul 22, 2016

P.O. No.	:	PO# BMC16-01_29
Project No.	:	KZK
No. Of Samples	:	42
Date Submitted	:	Jul 11, 2016
Report Comprises	:	Pages 1 to 5 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Samples may have coarse gold.
Lower limit for and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :

John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Active files:

Comments:

Ba and S data is informational only.

Certified By : _____
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted

Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Work Order : VC162227

[Report File No.: 0000018202]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Jul 29, 2016

P.O. No.	:	PO# BMC16-01_26 / 4157-4230
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Jul 15, 2016
Report Comprises	:	Pages 1 to 10 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Aug 02, 2016

P.O. No.	:	PO# BMC16-01_27
Project No.	:	KZK
No. Of Samples	:	68
Date Submitted	:	Jul 15, 2016
Report Comprises	:	Pages 1 to 10 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Samples may have coarse gold.
Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :

John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

[Report File No.: 0000018415]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Aug 11, 2016

P.O. No.	:	PO# BMC16-01_37
Project No.	:	KZK
No. Of Samples	:	38
Date Submitted	:	Jul 28, 2016
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :

John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

Work Order : VC163022

[Report File No.: 0000019312]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Oct 07, 2016

P.O. No.	:	PO# BMC16-01_51
Project No.	:	KZK
No. Of Samples	:	76
Date Submitted	:	Sep 26, 2016
Report Comprises	:	Pages 1 to 10 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Samples may have coarse gold.
Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By : _____
John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Oct 17, 2016

P.O. No.	:	PO# BMC16-01_52
Project No.	:	KZK
No. Of Samples	:	33
Date Submitted	:	Oct 04, 2016
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Samples may have coarse gold.
Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By :

John Chiang
QC Chemist

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

Appendix M: Geochemical Assay QA/QC Report

Review of QA/QC results for 2016 KZK Project

Release 1.0, January 5th, 2017

Ron Voordouw

Equity Exploration Consultants Ltd.

SUMMARY

This technical document describes the quality assurance (QA) protocols used in collecting, sampling and analyzing drill core for the 2016 KZK Project, and summarizes quality control (QC) data returned for certified reference materials (CRMs) and blanks. The aim of the 2016 QA/QC program was to ensure that geochemical sampling and assays met industry standards, and that the analytical results were sufficiently accurate and free of contamination to be included in a new resource estimate. Assay results for the 134 CRM samples indicate an average analytical bias of -3.4% for Ag, +0.9% for Au and +0.2% for Pb, whereas Cu, Fe and Zn all returned biases of <0.05%. None of blank sample assays exceeded the 10**dl* threshold established to indicate contamination. A check assay program shows high correlation (≥0.99) of Ag, Cu, Pb and Zn between the original SGS analyses and the ALS duplicates, and somewhat weak correlation for gold (ρ = 0.94). Overall, review of QA/QC data for the 2016 KZK project indicates that SGS core assays are most likely accurate and free of contamination, and thereby suitable for inclusion in resource calculation.

KEYWORDS: KZK Project, QA/QC

INTRODUCTION

The 2016 KZK exploration program followed up on the 2015 program (Hughes et al., 2016), with focus on infill, expansion and/or metallurgical drilling at the Krakatoa Zone, GP4F deposit and ABM Zone, as well as exploration drilling on the Sebesi and Tarawera (or Rhyolite Peak) targets. The ABM Zone, Krakatoa Zone and GP4F deposits are all polymetallic (Pb-Zn-Ag ± Cu-Au) volcanogenic massive sulphide (VMS) deposits consisting mostly of pyrite, sphalerite, pyrrhotite, galena and chalcopyrite.

The following sections describe the procedures used to sample and analyze drill core on the 2016 KZK Project, as well as the quality assurance and control (QA/QC) program that was used to monitor the accuracy and contamination of geochemical assays.

Sampling

The 2016 KZK resource drilling, exploration drilling and core re-logging programs collected 2094 samples for geochemical assay, comprising 1858 core samples, 102 blanks and 134 certified reference material (CRM) samples. All core samples were identified with a unique sample ID number and marked with sample tags in the core box. Core samples were taken from every mineralized intersection as well as 5–10 m into the immediate hanging wall and footwall host rock in order to characterize potential waste rock dilution. Primary core samples conformed to lithological boundaries where possible, with core loggers attempting to constrain alteration and mineralization features within the lithological boundaries as well. Sample lengths range from 0.25–3.50 m, with a median of 1.04 m and an average length of 1.11 m. Sample weights range from 0.2–12.8 kg with a median weight of 2.8 kg and average of 3.1 kg. Sample weights show a poor correlation (R^2 = 0.11) with sample length (Figure 1), most likely due to the range in rock density (2.5–4.7 g/cm^3) and the artificially long lengths, coupled with low weights, for samples taken from intervals with significant core loss (e.g. fault zone).

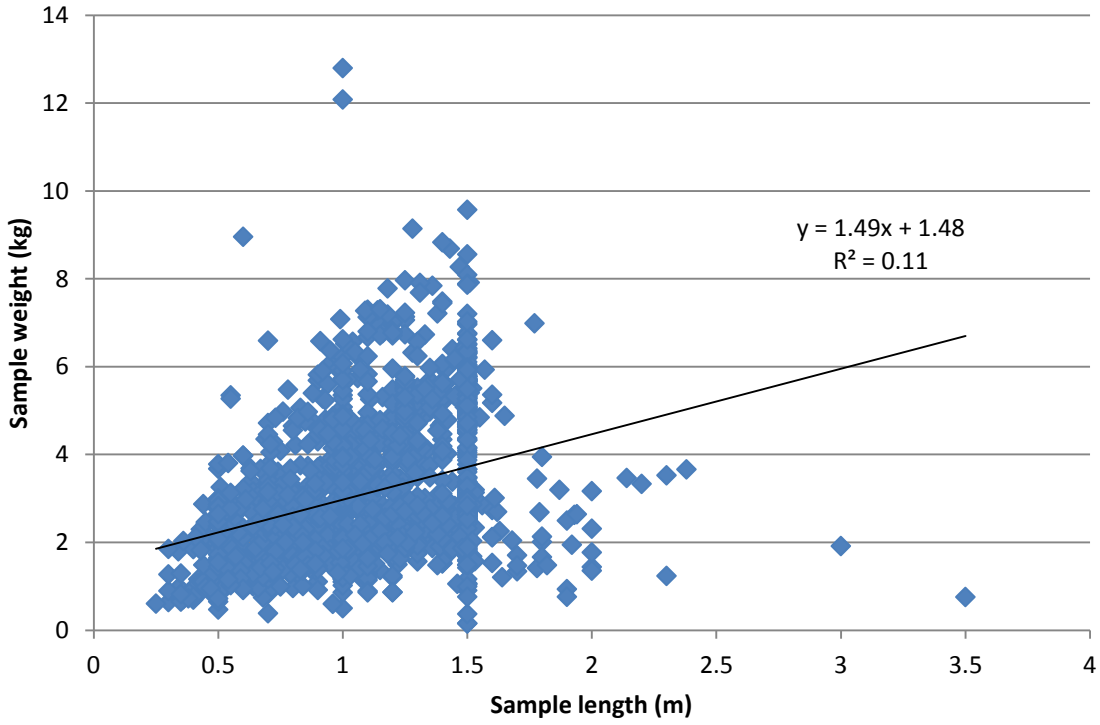

Figure 1: Length (m) against weight (kg) for all core samples collected as part of the 2016 sampling program.

Drill core samples were cut using an open circulation rock saw. Split core was consistently sampled from the same side, then placed into a labelled plastic sample bags sealed with a plastic zip tie. Groups of 4–7 sample bags were packed into rice bags that were then sealed with individually numbered security tags and shipped to the assay lab via two or more of the following contractors; Tu-Lidlini Petroleum (Ross River, YT), Small's Expediting (Whitehorse, YT), Air North (Whitehorse, YT) and/or Canadian Freightways (Whitehorse, YT). A list of required quartz washes was submitted to the analytical lab that would follow suspected high-grade samples in order to avoid contaminating adjacent lower grade samples. These quartz washes were completed at the crush and pulveriser stage of sample preparation.

Analytical methods

Drill core samples were sent to SGS Mineral Services Geochemistry Vancouver ("SGS Vancouver" or "SGS") for geochemical analysis of base (Cu, Pb, Zn) and precious (Ag, Au) metals for use in the resource calculation, as well as Fe and several other major and trace elements (As, Ba, Bi, Hg, S, Sb, Se). SGS Vancouver is an ISO 9001:2008 certified laboratory (accredited laboratory No. 744) that also conforms with the requirements of CAN-P-1579, CAN-P-1578 and CAN-P-4E (ISO/IEC 17025-2005) for the analytical methods used on the 2016 KZK Project. Accreditation details were provided in the 2015 QA/QC review (Voordouw, 2016b).

Prior to analysis, samples were weighed, dried and crushed to 75% passing 2 mm, with a 250 g split pulverized to 85% passing 75 microns. Gold was analysed by 30 g fire assay with an AAS finish and silver analysed by ICP with an AAS finish on a two-gram 2-acid digest aliquot (Table 1). Gold and silver over limits were triggered at Au >5 g/t and Ag >250 g/t respectively, resulting in re-analysis using a 30 g fire assay with gravimetric finish. Copper, lead, zinc and iron assays were done with Na_2O_2 fusion and ICP-AES analysis. This fusion results in complete digestion of the sample and so provides a near total chemical analysis. Arsenic, Bi, Hg, S, Sb and Se were analyzed by ICP-MS on a two-acid aqua regia digest of 3:1 HCl:HNO_3. A smaller aliquot was used for samples with relatively high Ba and S, in order to prevent the precipitation of Pb along with $BaSO_4$. Samples with >4% Ba and low base metals were fused with pyrosulphate and analyzed by XRF.

QA/QC program

Quality assurance and control for Au, Ag, Cu, Fe, Pb and Zn assays was monitored through the insertion of Certified Reference Material (CRM) and blanks at alternating 20th sample intervals within the drill core sample sequence. The selection and insertion of low-, medium- or high-grade CRMs was matched to the visually estimated grade of surrounding mineralization. The selected CRM were manufactured from sulphide ore with a similar mineralogy to the ABM deposit and are generally certified for Cu, Pb, Zn and Fe at the percent level, as well as Au and Ag at the ppm level. Quartz washes were requested after particularly high-grade samples.

Six different CRMs were utilised in the 2016 KZK Project (Table 2), with CND-ME-1311 used to match low-grade intervals, OREAS 621 and OREAS 623 used for medium grade and OREAS 113, GBM310-16 and G312-4 used to match the highest grades. Certification details for each of these CRM were provided in last year's QA/QC report (Voordouw, 2016b). Back-to-back insertion of standards was done where intervals were inferred to be both moderate- to high-grade and poly-metallic. A minimum weight of 100 g was used for CRM samples so that reanalyses could be completed if required. Each CRM sample has its own unique sample number.

Blank material consisted of landscaping stone acquired from Premier Horticulture Ltd. in 18 kg bags. Ten of these blank samples were calibrated in 2015(Voordouw, 2016b) and are considered acceptable for use as a blank material.

Table 2: Certified means and standard deviations (SD) for CRMs used in 2015 KZK Project

CRM Name	Threshold	Ag (ppm)		Au (ppm)		Cu (%)		Fe (%)		Pb (%)		Zn (%)	
		Mean	*SD*	*Mean*	*SD*	*Mean*	*SD*	*Mean*	*SD*	*Mean*	*SD*	*Mean*	*SD*
CDN-ME-1311	Low-grade	44.9	1.1	0.839	0.033	0.468	0.011			0.303	0.006	1.12	0.02
OREAS 621	Medium-grade	69.0	6.7	1.250	0.042	0.368	0.017	3.71	0.11	1.33	0.06	5.22	0.22
OREAS 623	Medium-grade	22.7	3.5	0.827	0.039	1.73	0.09	13.45	0.38	0.247	0.010	1.03	0.04
OREAS 113	High-grade					13.3	0.5	28.0	2.1	0.025*	0.001*	0.4158	0.0196

G312-4	High-grade			5.30	0.22								

Notes: * = not used to monitor QA/QC for 2016 KZK Project; blank cells = not certified;

Criteria for failure and re-assay

The three criteria used to flag CRM and blank samples as "QA/QC failures" include:

(i) Any CRM sample with a Z-score >3 standard deviations (SD) from the mean ("3-SD failures");
(ii) Two consecutive, or two out of three consecutive, CRM samples with Z-scores between 2 and 3 SDs from the mean ("2-SD failures"); Z-scores must be of the same sign (i.e. positive or negative) and for the same element;
(iii) Any blank sample returning >10 times the analytical detection limit (*dl*).

When a CRM or blank exceeds one of the three failure thresholds defined above, a request for re-analysis also depends on whether it is associated with "mineralized" core samples or not. Minimum values used to define the boundary between "mineralized" and unmineralized" are in Table 3.

For failed CRMs and blanks, the "associated core samples" are the 10 sample numbers preceding the CRM/blank and the 10 sample numbers that follow it, meaning each CRM/blank is typically associated with 20 samples. A CRM/blank occurring near the beginning or end of a certificate may have a lower number of associated core samples whereas those occurring near a sequence-numbering switch may have a lower or higher number.

Table 3: Detection and mineralized limits for selected precious and base metals

Element	Detection limit (dl)	10x *dl*	"Mineralized"
Ag	0.3 g/t	3 g/t	20 g/t
Au	0.005 g/t	0.05 g/t	0.1 g/t
Cu	0.01%	0.10%	0.10%
Fe	0.05%	0.50%	n/a
Pb	0.01%	0.10%	0.50%
Zn	0.01%	0.10%	0.50%

REVIEW OF CERTIFIED REFERENCE MATERIALS

This section reviews the performance for each of the four certified reference materials (CRMs) used on the 2016 KZK Project. Two of the high-grade standards (OREAS 113, G312-4) were not used in 2016.

A summary of CRM analyses is shown in Table 4 whereas Shewart charts for Au, Ag, Cu, Fe, Pb and Zn are attached as Appendix M-A at the end of this report. The total number of failures for each CRM are summarized in Table 5 and Appendix M-B.

Table 4: Mean values and % difference (relative to certified mean) for CRMs used in 2016 KZK Project

Standard	Description	N.o. Analyses	Ag (ppm)	Au (ppm)	Cu (%)	Fe (%)	Pb (%)	Zn (%)
CDN-ME-1311	Certified mean	65	44.9	0.839	0.468		0.303	1.12
	Measured mean		44.6	0.846	0.464		0.308	1.14
	% difference		-0.76%	0.87%	-0.76%		1.70%	1.68%

Notes: "0" = no failures

CDN-ME-1311

This CRM is manufactured by CDN Resource Laboratories in Langley, BC, Canada, and consists of material from the Campo Morado VMS deposit in Mexico. It is certified for Ag, Au, Cu, Pb and Zn with mineralogy comprising pyrite, quartz, ankerite, sphalerite, chalcopyrite and galena, as well as trace tennanite-freibergite, arsenopyrite and pyrrhotite. Pulp material is packaged in either 60 or 100 g paper envelopes that are individually vacuum-sealed and labelled with a sticker.

A total of 67 of these CRM are noted in the drill hole database and 65 analyses were returned from SGS Vancouver. The two missing standards are related to samples that were sent to SGS but not analyzed.

Mean concentrations of Ag, Au, Cu, Pb and Zn for the 65 assays of CDN-ME-1311 lie within ±1.7% of the certified mean. The average bias for silver and copper is negative and averages -0.7 to -0.8% whereas Au, Pb and Zn show positive bias between +0.9 to +1.7%.

One quality control failure was recorded for CDN-ME-1311, comprising two consecutive Zn assays with Z-scores between +2 and +3 (i.e. 2-SD failure). The failure rate of 1.5% is notably lower than last year's 3.4% for CDN-ME-1311 (Voordouw, 2016b). No re-assay work was done to address this QA/QC failure, which is consistent with how 2-SD failures were handled in 2015.

OREAS 621

OREAS 621 is manufactured by Ore Research & Exploration Pty Ltd of Bayswater North, Australia, ("Ore Research") and consist of zinc VMS ore from Gossan Hill, Western Australia, blended with barren rhyodacite that hosts and underlies the deposit. Certified elements relevant to the KZK project include Ag, Au, Cu, Fe, Pb and Zn (Table 2). Ore mineralogy consists mostly of sphalerite and chalcopyrite with lesser amounts of galena, in addition to pyrite, pyrrhotite and magnetite. Pulp material is packaged in 60 g laminated foil packets with nitrogen flush to prevent oxidation, and so two packets were submitted for each OREAS 621 sample number in order to exceed the minimum 100 g threshold. The packets come pre-printed with the CRM label that can be removed with a solvent.

Thirty-four OREAS 621 standards were noted in the drill hole database and were assayed by SGS, meaning every one of these standards that was submitted was also analyzed. Mean concentrations of Ag, Au, Cu, Fe, Pb and Zn all lie within ±3.0% of the certified mean (Table 6). Silver, Cu and Zn show a negative bias (-0.7 to -3.0%), whereas gold, Fe and Pb show positive bias of +1.1 to +1.5% (Table 6).

No QC failures were recorded for OREAS 621 in 2016 (Table 7), as compared to a failure rate of 0.5% in 2015.

OREAS 623

OREAS 623 is also manufactured by Ore Research and, likewise, consists of zinc VMS ore from Gossan Hill that is blended with barren rhyodacite. Certified elements include Ag, Au, Cu, Fe, Pb and Zn (Table 2). Ore mineralogy consists mostly of sphalerite and chalcopyrite with lesser amounts of galena, in addition to pyrite, pyrrhotite and magnetite. Pulp material is provided in 60 g laminated foil packets with a nitrogen flush to prevent oxidation, and so, once again, two packets were needed to exceed the minimum 100 g threshold. The packets come pre-printed with the CRM label that is removed with a solvent.

Thirty-four OREAS 623 standards were noted in the drill hole database and 34 analyses were returned from SGS. Mean abundances for most base and precious metals lies within ±2.1% of the certified mean, with the exception of silver (-10.8%). Gold also shows a negative bias (-1.08%) whereas Cu, Fe, Pb and Zn show a mean positive bias between 0.5% to 2.1%. For silver, the high ratio of the certified standard deviation (6.7 ppm) to the mean (68.7 ppm) prevented QA/QC failures even though the average CRM assay was 10.8% below the certified mean. A similar low bias of -10.6% was recorded for this CRM in 2015 (Voordouw, 2016b).

There were no quality control failures for OREAS 623 in comparison to a failure rate of 1.4% in 2015.

GMB310-16

GBM310-16 was sourced from GeoStats Pty Ltd ("GeoStats") of O'Connor, Western Australia, and is prepared from zinc sulphide ore. Certified elements include Ag, Pb and Zn (Table 6). This CRM is generally available in 20 g heat-sealed plastic packets but were likewise provided in custom 100 g packets for the 2015 KZK Project.

Just a single GBM310-16 standard was noted in the drill hole database and analysed by SGS. Mean abundances of Ag, Pb and Zn all lie within ±2.6% of the certified mean (Table 6). Silver shows a negative average bias of -2.6%, which is similar to the 2015 value of -2.4%, whereas Pb and Zn show mean bias 0.4% and -0.1% respectively.

No quality control failures were recorded for this standard in 2016.

REVIEW OF BLANKS

Blank material used on the 2016 KZK Project comprised landscaping stone acquired from Premier Horticulture Ltd. ("Premier") in 18 kg bags. One hundred and five blanks are recorded in the drill hole database and 102 of these were assayed by SGS. The three "missing" blanks were sent to SGS but were not analyzed as per request.

On average, >89% of blank assays returned values for base and precious metals that were less than the detection limit (*dl*) (Table 6). Copper, Pb and Zn showed the lowest levels of contamination, with >98% of blanks assays below detection. Contamination levels for gold and Zn were slightly higher whereas only 33% of Fe assays returned values below detection. Low-level but pervasive Fe contamination may be related to the Fe-rich nature of most analyzed rocks and/or the processing equipment. Whatever the case, the maximum levels of Fe contamination are insignificant compared to its abundance within the assayed material and, in addition, irrelevant to the resource calculation.

There were no blank analyses that exceeded the failure threshold of 10 x *dl*, indicating that assays are generally free of contamination.

Table 6: Summary statistics for blanks analyzed as part of 2016 KZK program

Statistic	Ag	Au	Cu	Fe	Pb	Zn
Detection limit	0.3 ppm	0.005 ppm	0.01%	0.05%	0.01%	0.01%
Mean (N = 102)	<dl	<dl	<dl	0.06%	<dl	<dl
N.o. samples <*dl*	100	96	101	34	101	91
% of samples <*dl*	98.0%	94.1%	99.0%	33.3%	99.0%	89.2%
N.o. samples >10 x *dl*	0	0	0	0	0	0
% of samples >10 x *dl*	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Maximum assay	0.6 ppm	0.007 ppm	0.02%	0.36%	0.03%	0.03%
Maximum assay/*dl*	2.0	1.4	2.0	7.2	3.0	3.0

CHECK ASSAYS

Two check assay programs were done in 2016, the first to confirm assays from the Krakatoa drilling program (Hughes, 2016) and the second for the GP4F work (Voordouw, 2016a). For both of these check assay programs, pulps were sent from SGS to ALS Minerals ("ALS") in North Vancouver, BC, Canada, for geochemical analysis of base (Cu, Pb, Zn) and precious (Ag, Au) metals, as well as Fe. The ALS lab in North Vancouver is an ISO 9001:2008 certified laboratory (accredited laboratory No. 579) that also conforms with the requirements of CAN-P-1579 and CAN-P-4E (ISO/IEC 17025-2005) for the analytical methods used, which are analogous to those used by SGS Vancouver (Table 1).

All check assay pulp samples submitted to ALS were analyzed for Ag, Au, Cu, Fe, Pb and Zn. Gold was analysed by 30 g fire assay with an AAS finish and silver analysed by ICP with an AAS finish. The silver over limit analysis was triggered at Ag >250 g/t, resulting in re-analysis using a 30 g fire assay with gravimetric finish. Over limit analysis for Au was not requested. Copper, lead, zinc and iron assays were done with sodium peroxide fusion and ICP-AES analysis. This fusion results in complete digestion of the sample and so provides a near total chemical analysis.

Nine CRMs and two blanks were submitted with the check assays, with CRMs comprising four CDN-ME-1311, three OREAS 621 and two OREAS 623. Two of the CDN-ME-1311 assays returned Z-scores of -3.6 for silver, thereby comprising a 3-SD failure. These samples were not re-assayed. All of the other CRM and blank assays appear to be accurate and free of contamination.

Gold assays reported by ALS are an average of 6.5% higher than the SGS analyses (Table 7), which themselves assayed an average of 0.5% above the certified CRM means (Table 6). This suggests that SGS assays are more accurate than ALS. The Pearson correlation coefficient (ρ) for the two datasets is 0.94, which is somewhat low in comparison to the other precious and base metals (see below). Removal of sample D00004396, which assayed 7.5 g/t Au by ALS and 10.58 g/t Au with SGS, has a marked effect on all comparative statistics, increasing the positive bias of the ALS data (to +11.0%) but also improving the correlation with SGS data (R^2 = 0.95, ρ = 0.97)

Table 7: Selected statistics for SGS original assays and ALS check assays

Analysis	Unit	Au (ppm)		Ag (ppm)		Cu (%)		Fe (%)		Pb (%)		Zn (%)	
		ALS	*SGS*	*ALS*	*SGS*	*ALS*	*SGS*	*ALS*	*SGS*	*ALS*	*SGS*	*ALS*	*SGS*
Samples	N.o.	52	52	52	52	52	52	52	52	52	52	52	52
Samples >*dl*	N.o.	42	45	50	50	46	50	52	52	42	42	51	51
Mean	ppm or %	1.54	1.44	120	124	0.23	0.24	16.7	16.9	2.0	2.1	4.29	4.29
Mean bias	%	6.5%		-3.2%		-1.8%		-1.6%		-3.1%		-0.2%	
Median	ppm or %	0.54	0.71	72.5	80.4	0.13	0.14	14.5	14.4	1.0	1.0	3.615	3.6
Median bias	%	-24.4%		-9.9%		-5.7%		0.5%		-3.8%		0.4%	
Min	ppm or %	<0.01	<0.005	<0.2	<0.3	<0.002	<0.01	1.7	1.8	<0.01	<0.01	<0.002	<0.01
Max	ppm or %	7.52	10.58	397	426	1.08	1.04	39.3	44.2	9.85	9.99	16.9	17.6
Range	ppm or %	7.52	10.58	397	426	1.08	1.04	37.6	42.4	9.85	9.99	16.9	17.6
Standard dev	ppm or %	1.98	2.00	129	134	0.28	0.28	10.4	10.7	2.38	2.46	4.43	4.50
R2 value (samples >*dl*)		0.89		0.99		1.00		0.99		1.00		1.00	
Pearson correl (samples >*dl*)		0.94		1.00		1.00		1.00		1.00		1.00	

Silver values determined by ALS are, on average, 3.2% lower than the SGS values, with a Pearson correlation coefficient (ρ) of 1.00 between the two data sets. The negative average bias for ALS check assays would be on top of the negative bias for SGS assays relative to CRM means, suggesting ALS silver assays are less accurate than SGS.

ALS copper assays are an average of 1.8% lower than the SGS assays and correlation between the two data sets is high (ρ = 1.00). The negative ALS bias is on top of the negative bias recorded by the SGS assays relative to certified CRM means, suggesting that the SGS assays are more accurate than ALS.

Iron values are an average of 1.6% lower in the ALS dataset relative to SGS, whereas SGS returned values an average of 0.8% higher than the certified means for the CRM. These results suggest that ALS and SGS assays for Fe have comparable accuracy. Measurements of correlation (R^2, ρ) are range from 0.99–1.00.

Pb assays are on average of 3.1% lower in the ALS data relative to SGS assays, essentially counterbalancing the 1.6% positive bias shown by SGS assays against certified CRM means. Measurements of correlation (R^2, ρ) are both 1.00. The Pb analyses reported by both ALS and SGS are therefore considered accurate and comparable.

Check assays for Zn are, on average, nearly identical to the original SGS assays, showing an average difference of just 0.2%. Relative to the certified CRM means, the SGS assays are an average of 1.2% higher. Measurements of correlation between ALS and SGS datasets (R^2, ρ) are both 1.00. Zn assays by ALS and SGS are therefore comparable and are both biased at approximately +1%

Results of the Krakatoa and GP4F check assay programs therefore both indicate that base metal (Cu, Fe, Pb, Zn) and precious metal (Ag, Au) assays are accurate, although with a bit more variability within the precious metal results.

DISCUSSION AND CONCLUSIONS

The quality assurance (QA) protocols used as part of the 2016 KZK geochemical assay program followed industry standard by inserting a minimum of 10% QA/QC samples (CRMs, blanks, check assays) within the core sample stream. This 10% considers only those QA samples inserted and requested by BMC, and does not include the internal QA/QC monitoring done by SGS and ALS. Both the SGS and ALS lab facilities are ISO 9001:2008 certified for the analytical methods used on the 2016 KZK Project.

Quality control of CRM and blank analyses was monitored in as close to real-time as possible. Only one failure was recorded for the core assays, comprising a 2-SD failure for which no re-assay was requested. Two additional 3-SD failures were returned by ALS as part of the check assay program, but no re-assay was requested. None of the blank analyses exceeded the failure threshold of ten times the detection limit. As a result, QC monitoring of the 2016 KZK assays suggests that the results are generally accurate and free of contamination.

Gold assays of CRM averaged 0.5% higher than the certified mean, which corresponds to an error of 5–10 ppb Au (or 0.005–0.01 g/t) at typical ABM resource grades of 1.0–1.5 g/t Au. No QA/QC failures (CRMs or blanks) were recorded for gold assays. The ALS check results show a reasonable correlation with SGS data (ρ = 0.94) and are an average of 6.5% higher than SGS analyses. When compared with the weakly positive bias of SGS relative to CRM, the check assay results suggest that the SGS analyses are more accurate than those done by ALS.

Silver assays of CRM returned an average analytical bias of -3.4%, equal to an error of around 5 g/t at typical ABM resource grades of 140 g/t Ag. An exceptionally high bias of -10.8% was recorded for OREAS 623 and is likely a function of its low certified grade (22.7 ppm) and the relatively high detection limit for the analytical method employed (0.3 ppm). No CRM or blank failures were recorded for the core assays although two 3-SD failures occurred as part of the check assay program, neither of which was followed up with re-assay. Check assay results indicate strong correlation between ALS and SGS datasets (ρ = 1.00), with ALS assays averaging 3.2% lower than SGS. Since the SGS assays were already negatively biased relative to the CRMs, it appears that SGS assays are, again, more accurate than ALS.

Copper assays of CRM were, on average, 0.9% lower than the certified mean, which equates to an error of 0.009% (90 ppm) on typical resource grades of 0.9%. The ALS copper assays show very strong correlation with SGS analyses but are an average of 1.8% lower. The negative bias in the ALS data is on top of the negative bias of SGS assays relative to CRMs, suggesting that the SGS assays are more accurate than ALS. No QA/QC failures were recorded.

CRM analyses for iron averaged 0.8% higher than the certified mean with no QA/QC failures. The ALS analyses were an average of 1.6% lower than SGS, thereby counterbalancing the positive bias shown in the SGS data. The iron analyses done by ALS and SGS are therefore of comparable accuracy.

Pb assays of standards were an average of 1.6% higher than the certified mean, which equates to an error of 0.024% (or 240 ppm) for typical ABM resource grades of 1.5% Pb. No QA/QC failures were recorded for either CRM or blanks. Check assay results are, on average, 3.1% lower than the SGS analyses and therefore counterbalance the positive bias of SGS assays relative to CRM.

Zn assays for CRM averaged 1.2% higher than the certified mean, corresponding to an error of 0.07% (700 ppm) at typical resource grades of 5.5–6.0% Zn. A single 2-SD failure was recorded for the zinc assays and was not followed up, in accordance with 2015 procedures (Voordouw, 2016b). There were no blank failures. Check assay results show that ALS assays are an average of 0.2% lower than SGS, indicating that both data sets likely show a ~1% positive bias relative to CRMs.

In summary, the analytical biases quantified through the analyses of certified reference materials and check assays indicate that SGS core assays of Au, Ag, Cu, Pb and Zn assays are sufficiently accurate. Analytical results for blank samples indicate that these analyses are free of contamination. For these reasons, the 2016 core assay data is likely of sufficiently high quality for use in resource estimation.

Appendix N: Petrographic Report

PETROGRAPHIC REPORT ON 4 ROCK SAMPLES

Report for: Danielle Mountjoy, Geologist
BMC Minerals (No.1) Ltd.
530-1130 West Pender Street,
Vancouver, B.C. V6E 4A4

Invoice 160664

Oct. 27, 2016.

SUMMARY:

In general, these 4 samples are well foliated, locally crenulated or cleaved, schistose metamorphic rocks composed of variable proportions of quartz, sericite, carbonate (calcite), chlorite, local plagioclase, minor biotite, accessory opaques (mostly iron sulfides, sphene/rutile, microscopic carbon?), local tourmaline and apatite, with foliation-parallel veinlets of carbonate and quartz. Capsule descriptions are as follows:

PET 2016-01: strongly foliated/crenulated sericite-quartz-carbonate-local plagioclase, minor accessory opaque (carbon, sulfide, rutile?), biotite, tourmaline and chlorite schist. Carbonate (mainly calcite) and quartz are locally coarsened/concentrated in "knots" or veins (?). Tourmaline abundance may be more than expected in normal meta-sediment, possibly suggesting a hydrothermal origin?

PET 2016-02: well foliated, quartz-sericite-chlorite-carbonate (calcite)-accessory plagioclase-opaques (sulfides, sphene/rutile?)-trace (relict) biotite-allanite/monazite? schist, with foliation-parallel veins of carbonate ±quartz. Protolith for this rock could be transitional between PET-01 (metasediment?) and 03 (meta-volcanic or volcaniclastic?), as suggested by the decrease in sericite/increase in chlorite and possible sphene/rutile.

PET 2016-03: foliated chlorite-quartz-plagioclase-carbonate (calcite)-accessory opaques (sulfides, sphene/rutile?)-apatite-trace (relict) biotite-allanite/monazite? schist, with foliation-parallel veins of carbonate ±quartz. Protolith for this rock could be meta-volcanic or volcaniclastic?), as suggested by the absence of sericite, increase in chlorite, plagioclase, apatite, sphene/rutile (?).

PET 2016-04: strongly foliated/locally crenulation cleaved carbonate-sericite-quartz-minor biotite-chlorite-accessory opaque (carbon, sulfide?), tourmaline schist. Carbonate (mainly calcite) and quartz are locally coarsened/concentrated in bands or veins (?). Tourmaline abundance may be more than expected in normal meta-sediment, suggesting hydrothermal origin?

Detailed petrographic descriptions and photomicrographs are appended (by email attachment). If you have any questions regarding the petrography, please do not hesitate to contact me.

PET 2016-01: STRONGLY FOLIATED/CRENULATED SERICITE-QUARTZ-CARBONATE-LOCAL PLAGIOCLASE, MINOR ACCESSORY OPAQUE (CARBON, SULFIDE, RUTILE?), BIOTITE, TOURMALINE AND CHLORITE SCHIST. CARBONATE (MAINLY CALCITE) AND QUARTZ ARE LOCALLY COARSENED/CONCENTRATED IN "KNOTS" OR VEINS (?)

From K16-418 123.38-123.5m; hand specimen shows dark blackish grey (carbon-rich?), fine-grained, strongly foliated/schistose rock of uncertain derivation with thin crenulations of white material that react strongly to cold dilute HCl (calcite). The rock is not magnetic, is fairly readily scratched by steel, shows no stain for K-feldspar in the etched offcut (but minor white etch indicates the presence of minor plagioclase). Modal mineralogy (regular thin section only) is approximately as follows:

Sericite/muscovite	50%
Quartz	25%
Carbonate (mainly calcite?)	17%
Plagioclase (mainly concentrated in certain bands only)	5%
Opaque (minute, possibly carbon?)	1-2%
(coarse, sulfide and rutile?)	<1%
Biotite	<1%
Tourmaline (schorlitic)	<1%
Chlorite (magnesian)	<1%

This sample consists mainly of highly foliated, strongly crenulated, fine-grained sericite, quartz, and carbonate with accessory opaques, widely scattered very minor biotite, chlorite and tourmaline, with local crenulated concentrations of plagioclase-rich rock (white in etched offcut). In places there are "knots" or incipient veins of coarser-grained carbonate-quartz that are not obvious in hand sample.

In the bulk of the slide, sericite forming sub- to euhedral flakes mostly <0.2 mm in diameter are strongly aligned in and define the crenulated foliation, commonly intimately mixed with the carbonate. Both of these commonly contain the majority of the extremely fine-grained opaque (minute particles mostly <5 μm, possibly carbonaceous matter?). Quartz typically forms subhedral crystals in the 0.1-0.2 mm range, but locally up to about 0.35 mm (and coarser in the "knots" or veins). The quartz crystals typically show only mild undulose extinction, minor sub-grain development, and rare suturing of grain boundaries, but locally show triple junctions, so may have been annealed. Carbonate crystals are either somewhat flattened/elongated (length:width up to 2:1) in the plane of foliation, mostly <0.1 mm long, or are coarsened in crenulation fold hinges to subhedra up to 0.3 mm. Strong reaction to HCL in hand sample indicates it is likely mainly calcite.

In the coarser-grained "knots" or veins (?), carbonate forms subhedra up to almost 1 mm long (somewhat elongated in the foliation) and quartz forms subhedra up to 0.5 mm (not elongated). Traces of biotite, tourmaline and opaque (see below) are found around the margins of the "knots".

In the crenulated feldspar-rich portion, plagioclase forms small subhedral crystals mostly <0.15 mm (rarely to 0.3 mm); rare twinning (extinction Y^010 about 15º suggests composition either near albite or oligoclase-andesine (?); no adjacent grains of quartz allow comparison of indices. Scattered flakes of biotite with ragged or rounded subhedral outlines to 0.25 mm show pale/medium brown pleochroism and are associated with accessory tourmaline as slender euhedral prisms up to 0.4 mm long with medium khaki/green pleochroism suggestive of schorlitic composition (Fe:Fe+Mg, or F:M, ratio, around 0.6-0.7?). Rare chlorite forms euhedral flakes to 0.2 mm with almost no colour/pleochroism and length-fast, anomalous greyish green birefringence suggestive of F:M around 0.4 (?). Although local elongated aggregates of sulfide (non-magnetic, pyrite?) up to 2 mm long are seen in the offcut (and in the coarser carbonate-quartz, most aggregates of opaque in thin section appear to be dark brown in strongly concentrated transmitted light, suggestive of rutile (?).

In summary, this is strongly foliated/crenulated sericite-quartz-carbonate-local plagioclase, minor accessory opaque (carbon, sulfide, rutile?), biotite, tourmaline and chlorite schist. Carbonate (mainly calcite) and quartz are locally coarsened/concentrated in "knots" or veins (?). Tourmaline abundance may be more than expected in normal meta-sediment, suggesting hydrothermal origin?

PET 2016-02: WELL FOLIATED, QUARTZ-SERICITE-CHLORITE-CARBONATE (CALCITE)-ACCESSORY PLAGIOCLASE-OPAQUES (SULFIDES, SPHENE/RUTILE?)-TRACE (RELICT) BIOTITE -ALLANITE/MONAZITE? SCHIST, WITH FOLIATION-PARALLEL VEINS OF CARBONATE ±QUARTZ

From K16-418 106.32-106.44m; hand specimen shows pale greenish grey (chlorite-rich?), fine-grained, strongly foliated/schistose rock of uncertain derivation with thin veinlets of white material that react strongly to cold dilute HCl (calcite). The rock is weakly magnetic, readily scratched by steel, shows strong reaction to cold dilute HCl throughout, and no stain for K-feldspar in the etched offcut (but minor white etch may indicate the presence of minor plagioclase). Modal mineralogy (regular thin section only) is approximately as follows:

Quartz	25%
Sericite/muscovite	25%
Chlorite (partly after biotite, traces of which remain)	25%
Carbonate (mainly calcite?)	17%
Plagioclase (scattered, oligoclase-albite?)	3%
Opaque (mainly sulfide?)	2%
Sphene/minor rutile?	2%
Biotite (relict in chlorite)	<1%
Allanite/monazite (?)	<1%

This sample consists of well foliated quartz, sericite, chlorite, carbonate and somewhat coarser-grained segregations of quartz-carbonate, with accessory plagioclase, opaque (sulfides?), sphene/rutile, and traces of relict biotite, minute allanite or monazite (?).

In the body of the rock, quartz typically occurs as somewhat elongated subhedral crystals up to about 0.5 mm long (length:width up to 3:1 in the plane of foliation), with relatively weak undulose extinction or sub-grain development, only rare suturing of grain boundaries, but common triple junctions, suggestive of annealing post-deformation. Sericite forms slender euhedral flakes rarely over 0.4 mm in diameter, strongly aligned in and defining the foliation, intimately mixed with chlorite of similar or slightly larger size. The chlorite shows very pale green colour with weak pleochroism and near-zero birefringence, suggestive of F:M around 0.4-0.5 (?), except dark grey-green in radiation-damaged haloes around minute crystals mostly <20 μm of possible allanite or monazite (?), or where there are minor included flakes of pale brown biotite (subhedral, mostly <0.2 mm; likely mainly replaced by the chlorite). Carbonate forms somewhat elongated subhedral crystals up to about 0.5 mm long (length:width up to 3:1 in the plane of foliation), likely mainly calcite to judge by the strong reaction to HCl in hand specimen. Plagioclase is only locally recognized, forming ragged subhedra to about 0.25 mm without any twinning, but slight negative relief compared to quartz suggestive of composition near albite-oligoclase (?).

Opaques are not identifiable in the absence of a polished surface, but appear likely to be mainly sulfides (likely pyrrhotite, to judge by the magnetism of the sample?) forming strongly elongated blebs up to 0.5 cm long, aligned in the foliation, composed of subhedra mainly <0.5 mm, and finer-grained, disseminated sphene ±rutile (?) occurring in small subhedral or rounded aggregates to about 0.4 mm in size composed of subhedra mainly <0.1 mm. In places the sulfides (?) are associated with lens-like aggregates up to 0.5 cm long (parallel to foliation) composed of quartz (interlocking subhedra to ~1.5 mm) and/or carbonate (grading to veins, see below).

Veins are sub-planar, mostly parallel to foliation, and up to 1.5 mm thick, composed mainly of carbonate as interlocking subhedra to 0.8 mm diameter, somewhat elongated in the foliation (length:width up to 3:1) and local quartz (subhedra mostly <0.5 mm, lacking elongation).

In summary, this is well foliated, quartz-sericite-chlorite-carbonate (calcite)-accessory plagioclase-opaques (sulfides, sphene/rutile?)-trace (relict) biotite-allanite/monazite? schist, with foliation-parallel veins of carbonate ±quartz. Protolith for this rock could be transitional between PET-01 (metasediment?) and 03 (meta-volcanic or volcaniclastic?), as suggested by the decrease in sericite/increase in chlorite and possible sphene/rutile.

PET 2016-03: FOLIATED CHLORITE-QUARTZ-PLAGIOCLASE-CARBONATE (CALCITE)-ACCESSORY OPAQUES (SULFIDES, SPHENE/RUTILE?)-APATITE-TRACE (RELICT) BIOTITE-ALLANITE/MONAZITE? SCHIST, WITH FOLIATION-PARALLEL VEINS OF CARBONATE ±QUARTZ

From K16-394 267.81-267.92m; hand specimen shows medium greenish grey (chlorite-rich?), fine-grained, foliated rock of uncertain derivation with thin veinlets of white material that react strongly to cold dilute HCl (calcite). The rock is weakly magnetic, fairly readily scratched by steel, shows strong reaction to cold dilute HCl throughout, and no stain for K-feldspar in the etched offcut (but fine-grained white etch likely indicates presence of modest plagioclase abundance). Modal mineralogy (regular thin section only) is approximately as follows:

Chlorite (partly after biotite, traces of which remain)	35%
Quartz	25%
Plagioclase (throughout, oligoclase-andesine?)	20%
Carbonate (mainly calcite?)	12%
Opaque (mainly sulfide, possibly pyrrhotite?)	3%
Sphene/minor rutile?	3%
Apatite (accessory)	<1%
Biotite (relict in chlorite)	<1%
Allanite/monazite (?)	<1%

This sample consists of well foliated chlorite, quartz, plagioclase, and somewhat coarser-grained segregations of carbonate, with accessory opaque (sulfides?), sphene/rutile, apatite, and traces of relict biotite, minute allanite or monazite (?).

In the body of the rock, quartz typically occurs as somewhat elongated subhedral crystals mostly <0.3 mm long (length:width mostly <2:1 in the plane of foliation), with relatively weak undulose extinction or sub-grain development, only rare suturing of grain boundaries, but common triple junctions, suggestive of annealing post-deformation. Plagioclase is generally difficult to distinguish from quartz except where it shows slight incipient alteration, forming ragged subhedra to almost 1 mm, or twinning (extinction Y^010 to 17º) and slight negative relief compared to quartz (?) suggestive of composition near oligoclase-andesine (?). Plagioclase commonly contains traces of accessory apatite (stubby to slender euhedral prisms <0.2 mm long).

Chlorite forming euhedral flakes to 0.5 mm, mainly aligned in and defining the foliation, shows pale green pleochroism and near-zero/weakly length-slow birefringence, suggestive of F:M around 0.5 (?), with dark grey-green in radiation-damaged haloes around minute crystals mostly <20 µm of possible allanite or monazite (?), and including minor flakes of pale brown biotite (subhedral, mostly <0.2 mm; likely mainly replaced by the chlorite). Carbonate is typically segregated in coarser-grained lenses/incipient veinlets, forming somewhat elongated subhedral crystals up to about 2 mm long (length:width up to 4:1 in the plane of foliation, somewhat blastic due to inclusions of quartz <0.15 mm), likely mainly calcite to judge by the strong reaction to HCl in hand specimen.

Opaques, not precisely identifiable in the absence of a polished surface, appear likely to be mainly sulfides (mostly pyrrhotite, to judge by the magnetism of the sample?) forming strongly elongated blebs up to 3 mm long, aligned in the foliation, composed of subhedra mainly <0.5 mm, and finer-grained, disseminated sphene ±rutile (?) occurring in small subhedral or rounded aggregates to about 0.4 mm in size composed of subhedra mainly <0.15 mm. In places the sulfides (?) appear to be associated with lens-like aggregates up to 0.5 cm long (parallel to foliation) composed of quartz (interlocking subhedra to ~0.5 mm) and/or carbonate (grading to poorly defined sub-planar veins sub-parallel to foliation, <1 mm thick, composed of carbonate and/or quartz as described above).

In summary, this is foliated chlorite-quartz-plagioclase-carbonate (calcite)-accessory opaques (sulfides, sphene/rutile?)-apatite-trace (relict) biotite-allanite/monazite? schist, with foliation-parallel veins of carbonate ±quartz. Protolith for this rock could be meta-volcanic or volcaniclastic?), as suggested by the absence of sericite, increase in chlorite, plagioclase, apatite, sphene/rutile (?).

PET 2016-04: STRONGLY FOLIATED/LOCALLY CRENULATION CLEAVED CARBONATE-SERICITE-QUARTZ-MINOR BIOTITE-CHLORITE-ACCESSORY OPAQUE (CARBON, SULFIDE?), TOURMALINE SCHIST. CARBONATE (MAINLY CALCITE) AND QUARTZ COMMONLY COARSENED/CONCENTRATED IN BANDS OR VEINS (?)

From K16-394 263.76-263.85m; hand specimen shows laminated grey, fine-grained, strongly foliated/schistose rock of uncertain derivation with local thin white veinlets that react strongly to cold dilute HCl (calcite). The rock is distinctly magnetic in places, fairly readily scratched by steel, shows rapid reaction to cold dilute HCl throughout, and no stain for K-feldspar in the etched offcut (but very minor fine-grained white etch could indicate presence of minor plagioclase?). Modal mineralogy (regular thin section only) is approximately as follows:

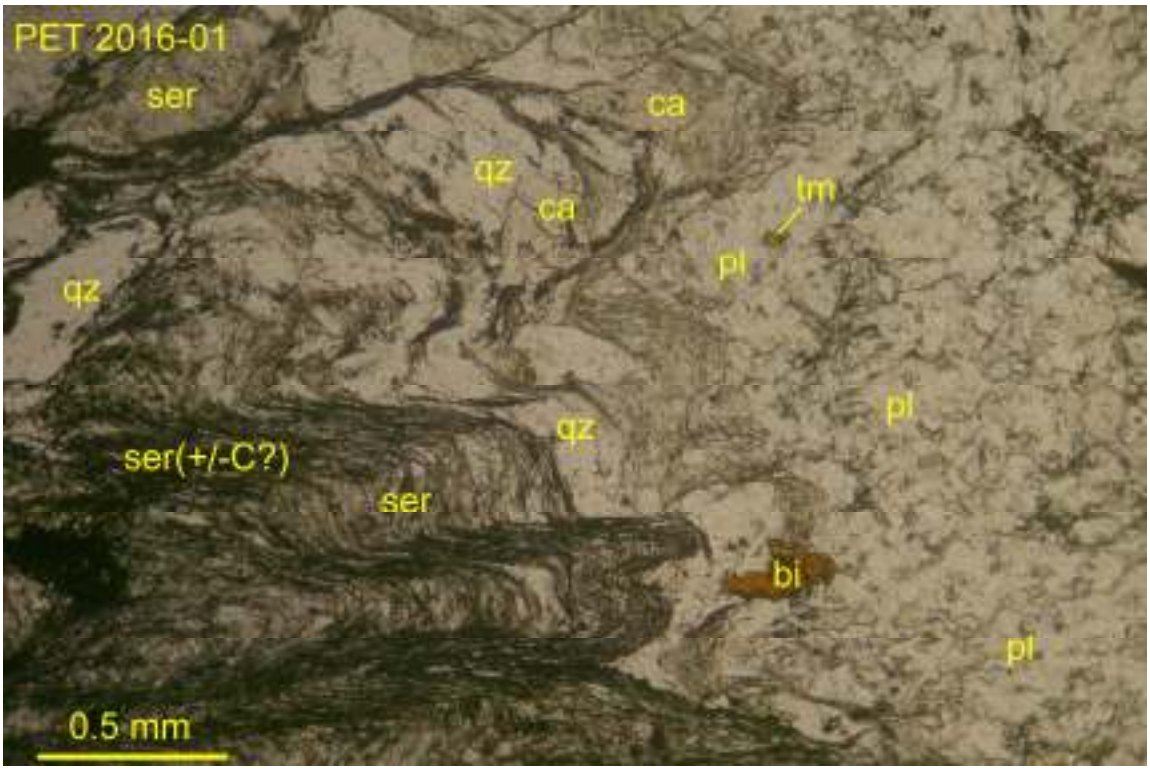
Carbonate (mainly calcite?)	40%
Sericite/muscovite	25%
Quartz	25%
Biotite	3-5%
Chlorite (magnesian)	3-5%
Opaque (coarse, mostly sulfide?)	~1%
(minute, possibly carbon?)	<1%
Tourmaline (schorlitic)	<1%

This sample consists mainly of strongly foliated, locally crenulation cleaved, fine-grained quartz, carbonate, sericite, minor biotite or in places chlorite, accessory opaques and tourmaline, alternating with lensy/vein-like aggregates s of coarser-grained carbonate-quartz, locally with opaques (sulfide?).

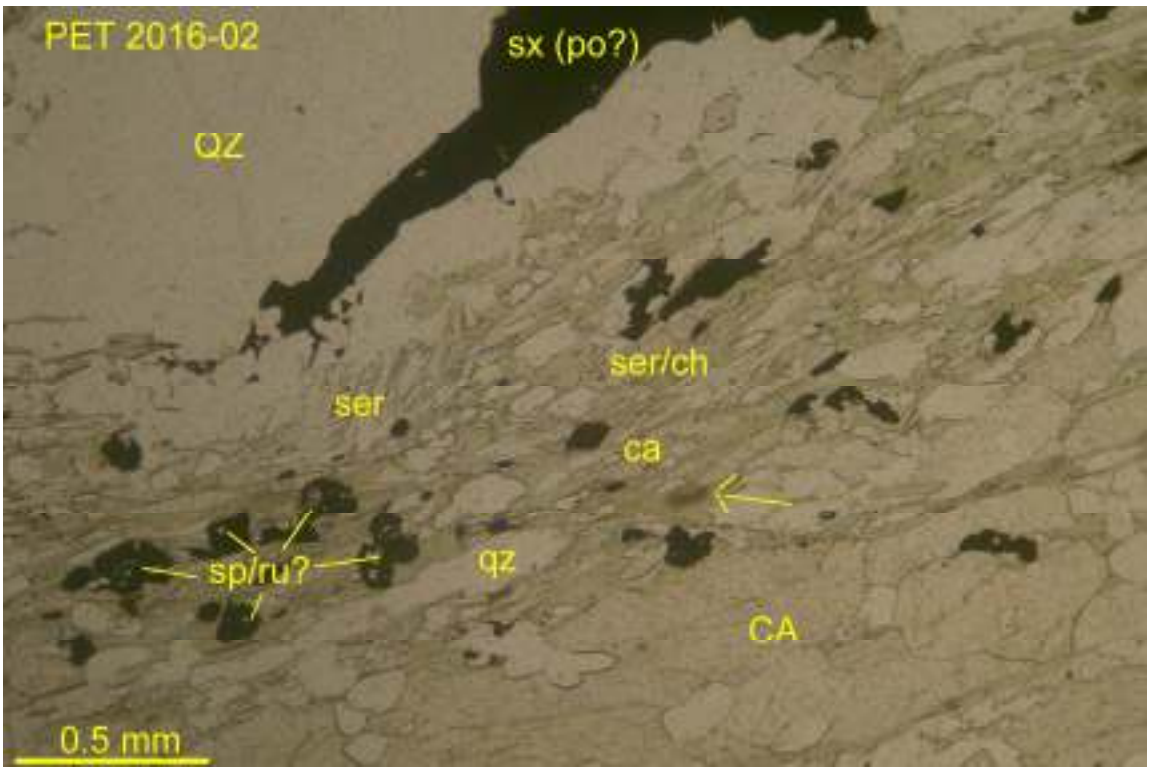
In the finer-grained parts, sericite forming sub- to euhedral flakes mostly <0.4 mm in diameter are strongly aligned in and define the foliation (locally semi-continuous optically to ~1 mm), commonly intimately mixed with (replacing?) much lesser biotite as subhedral flakes to 0.35 mm with pale brown pleochroism, also strongly aligned in the foliation. Both of these commonly contain most of the extremely fine-grained opaque (minute particles mostly <5 μm, possibly carbonaceous matter?). Quartz typically forms subhedral crystals in the 0.1-0.2 mm range, but locally up to about 0.35 mm (much coarser in the carbonate-quartz bands/veins). The quartz crystals typically show only mild undulose extinction, minor sub-grain development, and rare suturing of grain boundaries, but locally show triple junctions, so may have been annealed. Carbonate crystals are either somewhat flattened/elongated (length:width up to 2:1) in the plane of foliation, mostly <0.15 mm long, or are coarser in to subhedra up to 0.35 mm long (also flattened) where more abundant to semi-massive. Strong reaction to HCL in hand sample indicates it is likely mainly calcite. Chlorite appears to take the place of biotite in the latter areas, forming mainly euhedral flakes to 0.4 mm with almost no colour/pleochroism and length-fast, anomalous greyish green birefringence suggestive of F:M around 0.4 (?). Accessory tourmaline forms slender euhedral prisms up to 0.4 mm long with medium khaki/green pleochroism suggestive of schorlitic composition (F:M around 0.6-0.7?).

In the coarser-grained bands (grading to foliation-parallel veins up to 3.5 mm thick?), carbonate forms subhedra up to almost 2 mm long (commonly somewhat elongated in the foliation, length:width up to4:1) and quartz forms subhedra up to 0.5 mm (typically not so elongated, rarely to 2:1, with common triple junctions indicative of annealing post-deformation). Biotite is not seen in these areas, and tourmaline is rare, but chlorite (as described above) and opaque are common. The opaque occurs in somewhat elongated aggregates up to ~1 mm long in the foliation, composed of subhedra <0.35 mm that are likely sulfide (pyrrhotite?).

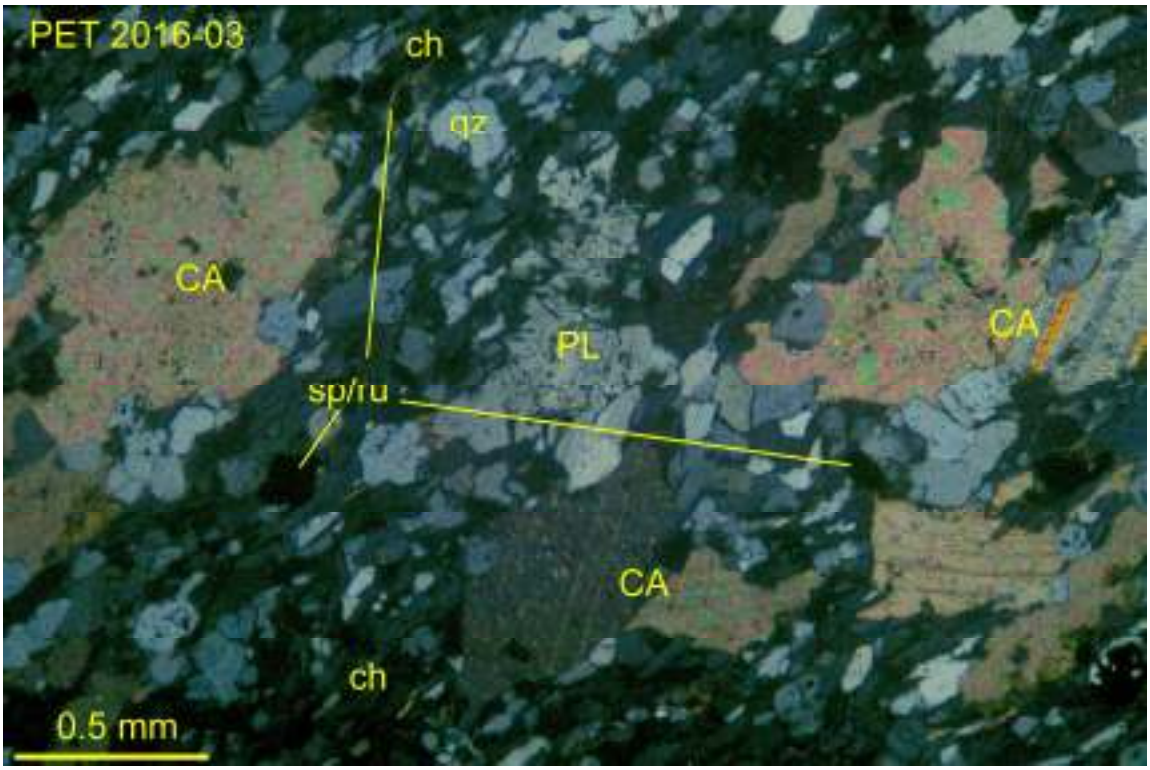
In summary, this is strongly foliated/locally crenulation cleaved carbonate-sericite-quartz-minor biotite-chlorite-accessory opaque (carbon, sulfide?), tourmaline schist. Carbonate (mainly calcite) and quartz are locally coarsened/concentrated in bands or veins (?). Tourmaline abundance may be more than expected in normal meta-sediment, suggesting hydrothermal origin?



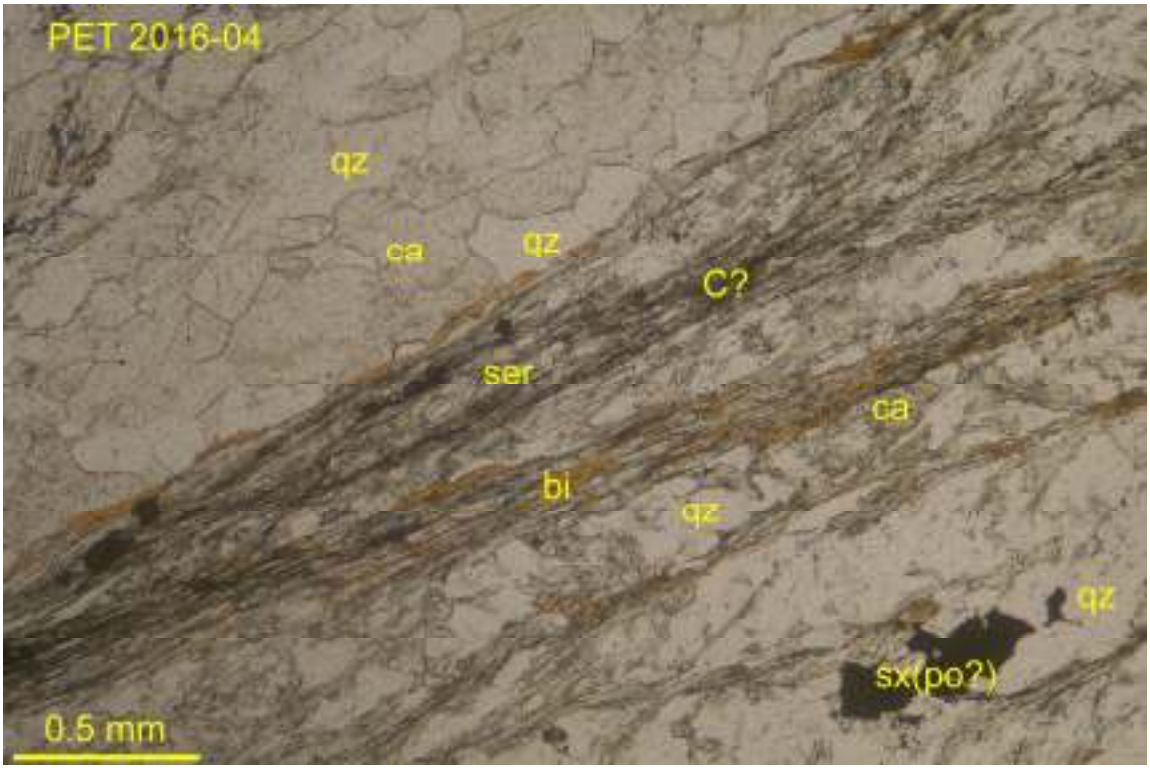
PET 2016-01: contact between fine-grained, strongly foliated/crenulated sericite-quartz-carbonate (coarse opaques may be rutile, minute opaques carbon, C?) and coarser-grained plagioclase (pl)–rich portion, partly separated by coarse quartz (qz)-carbonate (calcite, ca)-minor brown biotite, trace tourmaline (tm). Transmitted plane light, field of view ~3 mm wide.



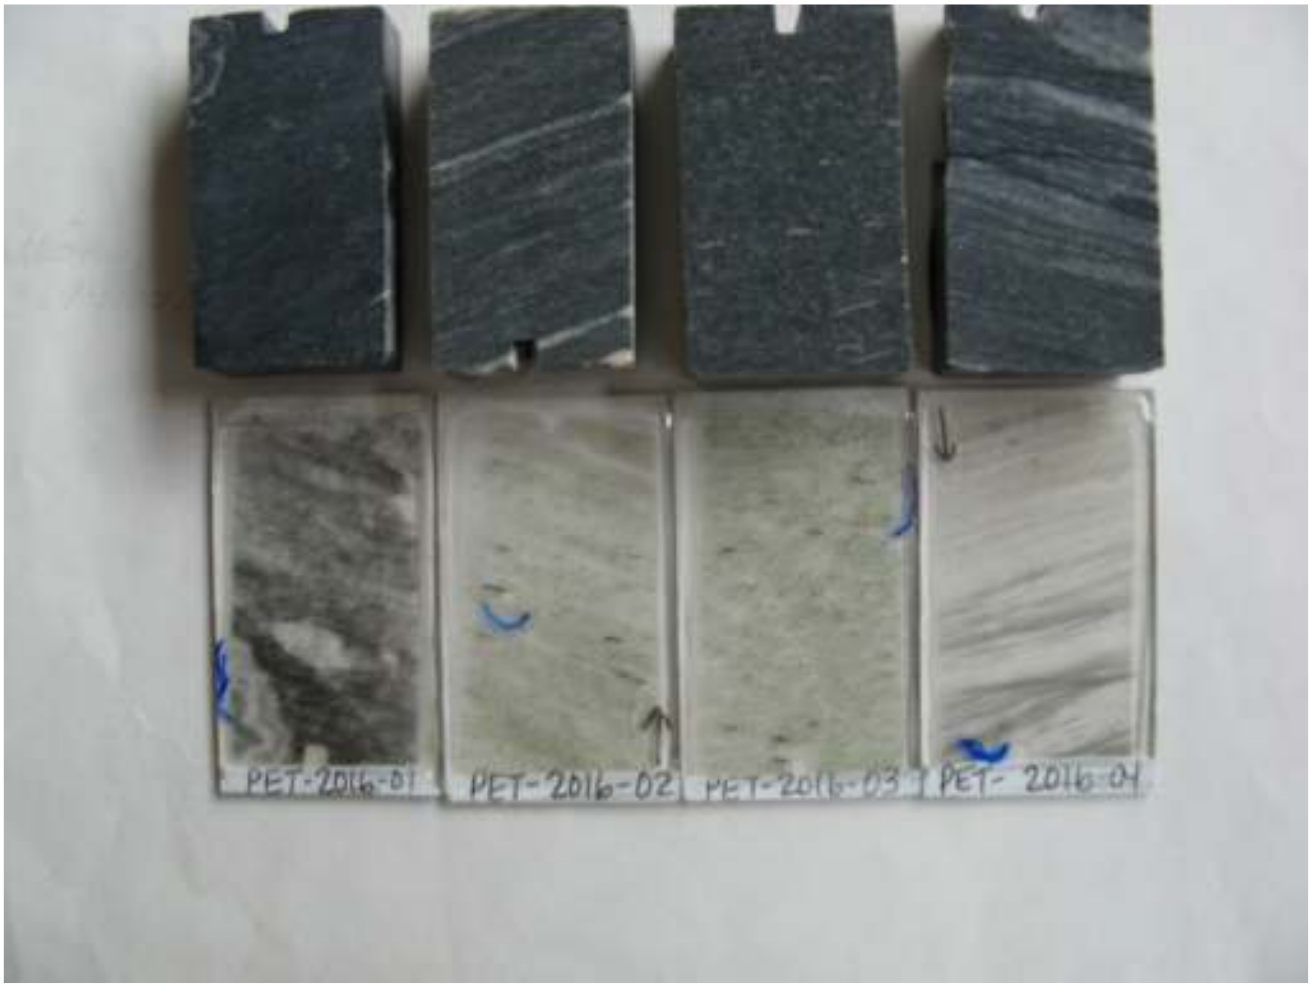
PET 2016-02: well-foliated quartz-sericite-chlorite-carbonate-accessory opaques (sulfides, sphene/rutile?) schist with lensy aggregates of coarser quartz (QZ), elongated blebs of sulfide (pyrrhotite?), or foliation-parallel veins of coarser carbonate (CA). Note dark pleochroic (radiation-damaged) halo (arrowed) in chlorite around possible allanite/monazite (?). Transmitted plane light, field of view ~3 mm wide.



PET 2016-03: ragged, somewhat blastic, vaguely twinned plagioclase (PL) and blastic, lensy aggregates of calcite (CA) crystals in foliated matrix of chlorite (dark) and quartz (qz); opaques (mainly sphene/rutile) are difficult to distinguish. Transmitted light, crossed polars, field of view 3 mm wide.



PET 2016-04: contrast between fine-grained, strongly foliated sericite (ser, ±carbon, C?)-quartz-lesser carbonate-pale brown biotite and coarser-grained, carbonate (mainly calcite, ca)-quartz-local opaque (sulfide, sx, possibly pyrrhotite, po?) bands of schist. Transmitted plane light, field of view ~3 mm wide.



Overview of thin sections and offcuts (blue semi-circles mark photomicrograph locations).

Appendix O: List of Metallurgical Samples

Table O-1: List of metallurgical samples collected in 2016.

Appendix P: Mine Site Investigation

Geotechnical Logs and Data

This appendix contains all geotechnical data from the 2016 mine site investigation program. Data is taken directly from the Knight Piésold 2016 Geotechnical Site Investigation Data Report. Data is presented in separate appendices, with the first page of each appendix starting on the page number indicated in Table P-1 below.

Table P-1: Table of contents for the mine site geotechnical data in this appendix

Appendix	Appendix Name	Page Number	Number of Pages
A	Test Pit Summary Logs	1	54
B1	Geotechnical Drillhole Logs	56	37
B2	RMR_{89} Field Sheets	93	29
C	Field PLT Results	122	6
D1	Laboratory Soil Testing Results	129	89
D2	Laboratory Rock Testing Results	218	16
E1	Hydrogeology Data-Constant Head Tests	235	53
E2	Hydrogeology Data-Monitoring Well Completion Logs	288	10
E3	Hydrogeology Data-Vibrating Wire Piezometer Plots	298	3
E4	Hydrogeology Data-Vibrating Wire Piezometer Calibration Records	301	4
F1	Thermistor Plots	306	19
F2	Thermistor Calibration Records	325	6
G1	Test Pit Photographs	332	146
G2	Drill Site Photos	478	35
G3	SPT Photos	513	36
G4	Core Box Photos	549	48
G5	Installation Photos	597	10

APPENDIX A

TEST PIT SUMMARY LOGS

(Pages A-1 to A-53)

Contractor: Tim Moon Construction
Location: Fault Creek
Coordinates: 415,073 E , 6,814,580 N
Coordinate System: UTM ZONE 9N

Test Pit No.: TP16-01
Equipment Used: Linkbelt 290
Total Depth: 4.5 m
Elevation: 1398 m

Page: 1 of 1
Date Started: 18 May 16
Date Completed: 18 May 16
Logged by: MAP
Reviewed by: LJG

DEPTH - (m)	ELEVATION - (m)	SAMPLES	SAMPLE NO.	GRAPHIC LOG	WATER LEVEL	MATERIAL DESCRIPTION	COMMENTS
0						**ORGANICS** (0 to 0.2 m) Topsoil and SILT, dark brown, saturated, root inclusions, no ice	
						SAND & GRAVEL (0.2 to 0.5 m) SAND and GRAVEL, some silt, trace cobbles, fine to coarse grained, rounded to subangular, well graded, dark brownish grey, compact, massive, no ice inclusions, dry to slightly moist [ALLUVIAL FAN]	
1	1397					**GRAVELLY SILT & SAND** (0.5 to 4.5 m) Gravelly SILT and SAND, trace cobbles, trace boulders, fine to coarse grained, subrounded to subangular, well graded, low to non plastic, dark grey, dense, massive, ice inclusions (Nf, Vx, Vc), moist [ALLUVIAL FAN]	
		G B	1				1.5 m - Grab sample from 1.5 - 1.6
2	1396						
3	1395						
4	1394						
						End of Test Pit: 4.5 m Limit of excavator	
5	1393						

GENERAL REMARKS:

Difficult excavation due to boulders, walls stable but began sloughing at depth, [illegible] water

GEOTECHNICAL DRILLHOLE LOGGING DATA SHEET
ROCK MASS CLASSIFICATION - RMR 1989
DRILLHOLE I.D. K16-402

Project: KUDZ ZE KAYAH PROJECT
Client: BMC MINERALS (NO.1) LTD.
Drilling Company: HY-TECH
Drill Type: Tech 5000
Date Started: 22-Jul-16
Date Completed: 24-Jul-16

Location: Class C Storage Facility
Drill Hole ID: K16-402
Coordinates: 415,844 m easting
6,816,485 m northing

Surface Elevation: 1,443 m
Total Depth: 70.6 m
Azimuth: - °
Inclination: -90 °

NOTES:

1. RESULTS PRESENTED AS Is(50) BECAUSE INSUFFICIENT UCS TESTING DATA EXISTS TO DETERMINE PLT SCALE FACTOR 'k' FOR THE PROJECT SITE.
2. ONLY VALID PLT RESULTS ARE SHOWN. PLT TESTS WITH BLANK UCS VALUES ARE INVALID.
3. TEST TYPE 'D' REFERS TO DIAMETRAL LOADING.

Parameters for Specimen No. 2

Specimen Parameter	Initial	Saturated	Consolidated	Final
Moisture content: Moist soil+tare, gms.	636.600			1779.600
Moisture content: Dry soil+tare, gms.	587.300			1647.000
Moisture content: Tare, gms.	110.670			413.500
Moisture, %	10.3	12.9	10.7	10.7
Moist specimen weight, gms.	1354.2			
Diameter, in.	2.88	2.88	2.84	
Area, in.²	6.51	6.51	6.32	
Height, in.	5.74	5.74	5.67	
Net decrease in height, in.		0.00	0.07	
Net decrease in water volume, cc.			26.30	
Wet density, pcf	138.0	141.2	144.7	
Dry density, pcf	125.0	125.0	130.6	
Void ratio	0.3481	0.3481	0.2902	
Saturation, %	80.2	100.0	100.0	

Test Readings for Specimen No. 2

Membrane modulus = 0.124105 kN/cm²
Membrane thickness = 0.0635 cm
Consolidation cell pressure = 122.800 psi (846.68 kPa)
Consolidation back pressure = 50.204 psi (346.14 kPa)
Consolidation effective confining stress = 500.53 kPa
Strain rate, %/min. = 0.03
Fail. Stress = 697.64 kPa **at reading no.** 140

Parameters for Specimen No. 3

Specimen Parameter	Initial	Saturated	Consolidated	Final
Moisture content: Moist soil+tare, gms.	636.600			1770.800
Moisture content: Dry soil+tare, gms.	587.300			1643.900
Moisture content: Tare, gms.	110.670			411.700
Moisture, %	10.3	13.0	10.3	10.3
Moist specimen weight, gms.	1354.0			
Diameter, in.	2.88	2.88	2.83	
Area, in.²	6.51	6.51	6.30	
Height, in.	5.75	5.75	5.63	
Net decrease in height, in.		0.00	0.12	
Net decrease in water volume, cc.			33.00	
Wet density, pcf	137.7	141.0	145.5	
Dry density, pcf	124.8	124.8	131.9	
Void ratio	0.3506	0.3506	0.2780	
Saturation, %	79.6	100.0	100.0	

Test Readings for Specimen No. 3

Membrane modulus = 0.124105 kN/cm²
Membrane thickness = 0.0635 cm
Consolidation cell pressure = 195.680 psi (1349.17 kPa)
Consolidation back pressure = 50.075 psi (345.25 kPa)
Consolidation effective confining stress = 1003.91 kPa
Strain rate, %/min. = 0.03
Fail. Stress = 1096.74 kPa **at reading no.** 140

			Max.Hyd.Gradient:	18.3	

General Test Notes:
1) Tap water was used as the permeant.
2) Back pressure saturation continued until 'B' parameter a minimum of 0.95.
3) Target remolding parameters: 125.0 pcf @ 10.0% moisture content.

Re: Rock core testing – Kudz Ze Kayah Project (VA101-640/03)

Dear Ms. Galavan:

One shipment of twenty core specimens was received for which unconfined compression strength tests were to be performed on eight designated specimens. All other core sections were retained as spares. All designated samples were successfully tested within the Rock Mechanics Laboratory of the Robert M. Buchan Department of Mining, Queen's University at Kingston.

Each specimen that was subjected to unconfined compression failure testing was subjected to a process of preparation that included:

-diamond sawing to prepare cylindrical samples having nearly parallel end faces
-diamond lathing, to prepare sample faces parallel to within $\pm$ 0.025 mm
-testing to failure within a servo-controlled compression frame; all tests were performed under axial strain control at rates approximating 10^{-5} s^{-1}, and simultaneous recording of axial force, axial deformation and circumferential deformation, from which determination of standard failure parameters was made.

Photo images of specimens both prior to and following failure testing are also appended to the written report for your information. Stress/strain plots for each unconfined compression test will also be forwarded to you electronically following submission of this report. Summary billing for work completed will also be included with a mailed copy of this report.

Please note that this Department assumes no liability for any test information that has been generated due to the selection of sample materials at source or for testing procedures requested. Additionally, we assume no responsibility for design application of any information that is transmitted. Should you also require any additional information concerning work that has been performed, please do not hesitate to contact me by telephone at (613)-533-2198 or by FAX at (613)-533-6597.

Yours sincerely,

J. F. Archibald, Ph.D., P. Eng., FCIM

TEST COMMENTS:

Drillhole flushed for 10 minutes prior to test. Test conducted using a flowmeter in m^3. Inflating packer from 3:48 AM to 4:02 AM. Constant head test run for 15 minutes (last 10 minutes used for analysis). Packer out of hole at 5:00 AM. Initial water level estimated from water level recovery after the test.

Hoek, E., Bray, J., 1981. Rock Slope Engineering, CRC Press, pp 368

TEST COMMENTS:

Drillhole flushed for 10 minutes prior to test. Test conducted using a flowmeter in m^3. Transducer started at 10:21 PM and lowered at 10:24 PM. Inflated packer from 10:28 to 10:55 PM. Pressure applied during testing exceeded the maximum allowable injection pressure (Pmax), to minimize the potential for inducing hydraulic fracturing. Pmax is calculated in the literature as distance from ground to top of test interval multiplied by a factor of safety of 0.98 psi/m - 1.64 psi/m (Read and Stacey 2009). Test results do not appear to be affected by the higher applied pressure.

Hoek, E., Bray, J., 1981. Rock Slope Engineering, CRC Press, pp 368

TEST COMMENTS:

Drillhole flushed for 10 minutes prior to test. Test conducted using a flowmeter in m^3. Lower packer at 3:30 AM, inflate packer bladder with nitrogen at 3:32 AM, start constant head test at 3:56 AM. Flow rate during constant head slowly decreased over test duration from ~8L/min initially to ~0L/min. Hose was removed from stuffing box at end of constant head, and water poured out at an initial rate of ~4gal/min and decreased 5 minutes later to `2gal/min. Artesian conditions were not observed from hole prior to test but continued until end of drill hole. Estimate of K less certain because injected flow not well constrained during testing.

Hoek, E., Bray, J., 1981. Rock Slope Engineering, CRC Press, pp 368

TEST COMMENTS:

Drillhole flushed for 10 minutes prior to test. Test conducted using a flowmeter in m3. The packer was lowered at 8:29 PM, and the packer was inflated from 8:38-8:50 PM. The test began at 9:35 PM. Pressures up to ~20 psi applied prior to constant head test (not shown on plot) during attempt to use flow system to inject water for testing. Injected flows too low to measure using flow system and instead water level maintained at top of rods using a 1 L container. Initial water level estimated from water level recovery after the test.

Hoek, E., Bray, J., 1981. Rock Slope Engineering, CRC Press, pp 368

TEST COMMENTS:

Drillhole flushed for 10 minutes prior to test. Test conducted using a flowmeter in m^3. Transducer started at 5:44 AM, packer tool lowered at 5:49 AM, inflated from 6:12 to 6:25 AM. Packer deflated at 7:41 AM and removed at 7:58 AM. Water level at or below transducer (top of test interval) based on plotted transducer data. Initial water level assumed to be at the mid-point of the test interval for the analysis. K estimate for qualitative purposes only as initial water level was assumed and methodology/analysis valid only for saturated conditions.

Hoek, E., Bray, J., 1981. Rock Slope Engineering, CRC Press, pp 368

TEST COMMENTS:

Drillhole flushed for 10 minutes prior to test. Test conducted using a flowmeter in m^3. Lowered the packer at 3:32 AM, inflated from 3:37 - 3:55 AM, started constant head test at 4:04 AM, analyzed results from 4:11 - 4:17 AM (end test). Initial water level estimated from water level recovery after the test.

TEST COMMENTS:

Drillhole flushed for 10 minutes prior to test. Test conducted using a flowmeter in m^3. Start transducer at 10:03 AM, lower packer at 10:11 AM, inflate from 10:15 to 10:25 AM. Deflate packer at 11:02 AM, and remove at 11:14 AM. Water level at or below transducer (top of test interval) based on plotted transducer data. Initial water level assumed to be at the mid-point of the test interval for the analysis. K estimate for qualitative purposes only as initial water level was assumed and methodology/analysis valid only for saturated conditions.

Hoek, E., Bray, J., 1981. Rock Slope Engineering, CRC Press, pp 368

TEST COMMENTS:

Drillhole flushed for 10 minutes prior to test. Start transducer at 8:50 AM, lower packer at 9:22 AM, inflate from 9:26 AM to 9:35 AM, start test at 9:50 AM, end at 9:55 AM. Pressures up to ~40 PSI applied prior to constant head test (not shown on plot) during attempt to use flow system to inject water for testing. Injected flows too low to measure using flow system and instead water level maintained at top of rods using a 1 L container. Deflate packer at 10:00 AM, and remove at 10:15 AM. Initial water level estimated from water level recovery after the test.

Hoek, E., Bray, J., 1981. Rock Slope Engineering, CRC Press, pp 368

TEST COMMENTS:

Drillhole flushed for 10 minutes prior to test. Started transducer at 9:30 PM, lower packer at 9:34 PM, start inflation at 9:35 PM, and finish inflation at 9:55 PM. Attempted test using flow meter system from 10:12 to 10:33 PM (not shown on plot), but flows were too low to meausure with flow meter system. Constant head test from 10:37 PM to 10:47:30 PM by maintaining water level at top of rods using a 1 L container. Estimate of K value less certain because of small head applied during test.

Hoek, E., Bray, J., 1981. Rock Slope Engineering, CRC Press, pp 368

TEST COMMENTS:

Drillhole flushed for 10 minutes prior to test. Packer lowered at 3:45 AM, inflation started at 3:50 AM and finished at 4:10 AM. Pressures between about 10 to 25 PSI applied prior to constant head test (not shown on plot) during attempt to use flow system to inject water for testing. Injected flows too low to measure using flow system and instead water level maintained at top of rods using a 1 L container. Estimate of K value less certain because of small head applied during test.

TEST COMMENTS:

Drillhole flushed for 10 minutes prior to test. Packer lowered at 21:50, begin and end inflation at 21:52 and 22:05 respectively. Pressure of ~65 PSI applied for less than 30 seconds prior to constant head test (not shown on plot) during attempt to use flow system to inject water for testing. Injected flows too low to measure using flow system and instead water level maintained at top of rods using a 1 L container. Initial water level estimated from water level recovery after the test.

Calibration Record

Vibrating Wire Piezometer

Customer:		Knight Piesold Consulting	
Model:		VW2100-2.0	
Serial Number:		**VW37334**	
Mfg Number:		1611606	
Range:		2.0	MPa
Temperature:		23.1	°C
Barometric Pressure:		979.5	millibars
Work Order Number:		210263	
Cable Length:		25	meters
Cable Markings:		1376876 m - 1376900 m	
Cable Colour Code:	Red / Black (Coil)	Green / White	(Thermistor)
Cable Type:		EL380004	
Thermistor Type:		3	kΩ

Applied Pressure (MPa)	First Reading (B units)	Second Reading (B units)	Average Reading (B units)	Calculated Linear (MPa)	Linearity Error (% FS)	Polynomial Error (% FS)
0.0	8950	8948	8949	0.004	0.18	-0.01
0.4	8268	8268	8268	0.400	-0.01	0.02
0.8	7585	7585	7585	0.797	-0.15	0.01
1.2	6898	6898	6898	1.197	-0.17	-0.01
1.6	6207	6206	6207	1.599	-0.05	-0.01
2.0	5510	5510	5510	2.004	0.20	0.01
			Max. Error (%):		0.20	0.02

Linear Calibration Factor:	**C.F.=**	**0.00058171**	**MPa/B unit**
Regression Zero:	**At Calibration =**	**8955.1**	**B unit**
Temperature Correction Factor:	**Tk =**	**0.0004919**	**MPa/°C rise**

Polynomial Gage Factors (MPa) **A:** -2.4495E-09 **B:** -0.00054629 **C:** 5.0847

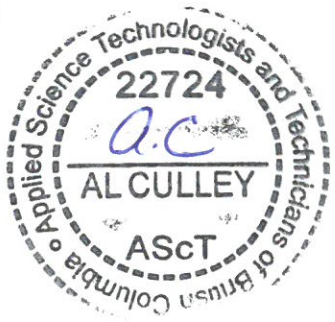
Pressure is calculated with the following equations:
Linear: $P(MPa) = C.F.(Li-Lc) - [Tk(Ti-Tc)] + [0.00010(Bi-Bc)]$
Polynomial: $P(MPa) = A(Lc)^2 + BLc + C + Tk(Tc-Ti) - [0.00010(Bc-Bi)]$

	Date (dd/mm/yy)	VW Readout Pos. B (Li)	Temp °C (Ti)	Baro (Bi)
Shipped Zero Readings:	7-Jun-16	8954	22.0	1010.6

Li, Lc = initial (at installation) and current readings
Ti, Tc = initial (at installation) and current temperature, in °C
Bi, Bc = initial (at installation) and current barometric pressure readings, in millibars
B units = B scale output of VW 2102, VW 2104, VW 2106 and DT 2011 readouts
B units = Hz^2 / 1000 ie: 1700Hz = 2890 B units

Technician: S. Kim SK Date: 7-Jun-16

This instrument has been calibrated using standards traceable to the NIST in compliance with ANSI Z540-1



Document Number: ELL0143H

Temperature calculated using:

Steinhart-Hart Linearization

$$T_C = \frac{1}{C_0 + C_1(\ln R) + C_3(\ln R)^3} - 273.15$$

3000 Ohm @ 25C NTC Thermistor

C_0= 0.0014051
C_1= 0.0002369
C_3= 0.0000001019
lnR= Natural Log of Resistance
T_C= Temperature in °C

Appendix Q: Krakatoa Rock Quality

Geotechnical Logs and Data

This appendix contains all geotechnical data from the 2016 Krakatoa Zone rock quality investigation program. Data is taken directly from the Rockland Ltd. 2016 Geotechnical Pre-feasibility Study of the Underground Mine Design Report. Data is presented in separate appendices, with the first page of each appendix starting on the page number indicated in Table Q-1 below.

Table Q-1: Table of contents for the Krakatoa Zone rock quality data in this appendix

Appendix	Appendix Name	Page Number	Number of Pages
II	Laboratory Test Results – Unconfined Compressive Test	1	64
IV	Geotechnical Logs and Point Load Test Results	65	62
IV	Packer Test Summary: Table 1-22 to Table 1-28	128	2
IV	Outcrop Survey	130	4

APPENDIX II

LABORATORY TEST RESULTS

UNCONFINED COMPRESSIVE TEST

Laboratory Determination of Uniaxial Compressive Strength of Intact Rock Core Specimens.

Summary of Test Results

ASTM D7012 Method C

Project No.:	1658755
Project:	KZK
Location:	Not provided
Client:	BMC Minerals Ltd.
Lab ID No:	219

Failure Modes

(1) Simple Extension
(2) Multiple Extension
(3) Multiple Fracturing
(4) Multiple Shear
(5) Single Shear
(6) Spalling
(7) Other

Note: (deg) measured from core axis
Wet density based on as received moisture

Area	(cm^2)	30.09
Volume	(cm^3)	374.00
Mass	(g)	1649.70
Moisture Content	(%)	0.06
Wet Density	(kg/m^3)	4411
Dry Density	(kg/m^3)	4408

BEFORE TEST

Failure Mode

Type: **5/6**

Degrees:* **29**

* Degrees measured with respect to core axis.

The impact of any pre-existing feature on the test results will be noted in the comments, if applicable.

Notes

- Water content as received
- Wet density based on as received moisture

Mode:

(1) Simple Extension
(2) Multiple Extension
(3) Multiple Fracturing
(4) Multiple Shear
(5) Single Shear
(6) Spalling
(7) Other

AFTER TEST

Moisture Content	(%)	0.10
Wet Density	(kg/m^3)	3016
Dry Density	(kg/m^3)	3013

BEFORE TEST

Failure Mode

Type: **5**

Degrees:* **27**

* Degrees measured with respect to core axis.

The impact of any pre-existing feature on the test results will be noted in the comments, if applicable.

Notes

- Water content as received
- Wet density based on as received moisture

Mode:

(1) Simple Extension
(2) Multiple Extension
(3) Multiple Fracturing
(4) Multiple Shear
(5) Single Shear
(6) Spalling
(7) Other

Uniaxial Compressive Strength of Intact Rock Core Specimens (Method C)

ASTM D7012

Project No.:	1658755	**Borehole:**	K16-358
Project:	KZK	**Sample Number:**	190421-A
Location:	Not provided	**Depth (m):**	64.15-64.46
Client:	BMC Minerals Ltd.	**Lab ID No:**	270

Testing Results

Max Load (kN)	**94.30**
Stress σ_u (MPa)	**32.1**
Pace Rate (kN/s)	1.25
Lithology	RHY

Sample Measurements

Diameter	(mm)	61.12
Height	(mm)	125.59
Area	(cm^2)	29.34
Volume	(cm^3)	368.48
Mass	(g)	1037.70
Moisture Content	(%)	0.29
Wet Density	(kg/m^3)	2816
Dry Density	(kg/m^3)	2808

BEFORE TEST

Failure Mode

Type: **5**

Degrees:* **37**

* Degrees measured with respect to core axis.

The impact of any pre-existing feature on the test results will be noted in the comments, if applicable.

Notes

- Water content as received
- Wet density based on as received moisture

Mode:

(1) Simple Extension
(2) Multiple Extension
(3) Multiple Fracturing
(4) Multiple Shear
(5) Single Shear
(6) Spalling
(7) Other

Comments

Shear along foliation with rock bridges.

AFTER TEST

BMC MINERALS

UCS TEST RESULTS - MDU

August 23, 2016

Imran Haque, EIT

SUMMARY

A total of six samples were gathered for testing where a total of seven tests were possible given the length and diameter ratios as per ASTM standards. One sample was broken upon arrival whereas two samples broke when attempting to sulfur cap. Therefore, a total of four UCS tests were completed successfully.

Due to the weak nature of the sedimentary rock, a wet weight was excluded for measurement due to excessive handling required which may cause further damage to the sample. Preparation of the sample included an average measurement of the length and diameter, dry weight, and sulfur capping or saw cutting, if possible.

Before testing, a pace rate of 2.4 kN/s was applied. Core length and diameter were input on to the machine before testing. All tests required plates on the base due to the sample length and any debris or material was wiped off before each test.

Out of the four samples, Q190446 was the most carbonaceous weakly foliated sample which was the best representation of KZK's mudstone unit. The UCS strength of said sample was 9 MPa with a Type 4 failure breaking along foliation at 62°.

The remaining three samples, Q190450-A, Q190450-B, and Q930551, were noted as an MDU unit but did consist of biotite and calcite veining and was not as carbonaceous as Q190446. The three samples collected were a gradational contact between the MDU and MAFt units. The UCS results were 24.9 MPa, 29.3 MPa, 35.3 MPa. This results in an average strength of 29.8 MPa and a standard deviation of +/- 5.2 MPa.

Given the results above and due to the lacking number of MDU unit samples that meet the standard length and diameter ratio, as well as weak engineering and strength properties, it is fair to assume a carbonaceous MDU unit is <25 MPa.

Sample ID:	Q930551	**σ (MPa):**	35.3
Length (mm):	130	**α (°):**	55
Diameter (mm):	61.1	**Type:**	2
Dry Weight (kg):	1.0661	**Preparation:**	Sulfur Cap

Comments: Broke along weak plane of foliation as well as vertical cracks observed from both ends of cap.

Sample ID:	Q190448	**σ (MPa):**	-
Length (mm):	-	**α (°):**	-
Diameter (mm):	-	**Type:**	-
Dry Weight (kg):	-	**Preparation:**	Broken

Comments: Sample broken upon arrival.

Sample ID:	Q190448	**σ (MPa):**	9.0
Length (mm):	99	**α (°):**	62
Diameter (mm):	61.1	**Type:**	4
Dry Weight (kg):	1.0254	**Preparation:**	Sulfur Cap

Comments: Best representation of MDU unit due to amount of carbonaceous material and weak planes of foliation. Sample does not meet L/D ratio. Fresh diagonal cut failure which may be the cause of unbonded sulfur cap.

Sample ID:	Q190447	**σ (MPa):**	-
Length (mm):	-	**α (°):**	-
Diameter (mm):	-	**Type:**	-
Dry Weight (kg):	-	**Preparation:**	Broke

Comments: Broke when attempting to sulfur cap.

Sample ID:	Q190449	**σ (MPa):**	-
Length (mm):	-	**α (°):**	-
Diameter (mm):	-	**Type:**	-
Dry Weight (kg):	-	**Preparation:**	Broke

Comments: Broke when attempting to sulfur cap.

Sample ID:	Q190450-A	**σ (MPa):**	24.9
Length (mm):	142	**α (°):**	38
Diameter (mm):	61.1	**Type:**	2
Dry Weight (kg):	1.1723	**Preparation:**	Saw

Comments: Well defined cone at bottom with vertical cracks on top end of cone.

Sample ID:	Q190450-B	**σ (MPa):**	29.3
Length (mm):	145	**α (°):**	85
Diameter (mm):	61.1	**Type:**	3
Dry Weight (kg):	1.2061	**Preparation:**	Saw

Comments: Vertical cracking on both ends of cone.

023-013	Waste	MAFI	33.0	35.7	2.7	2.3	82%	13	2	56%	W2	R3	6				3	J	3.0	3.0	9	JF	3.0	3.0	57-0	324-0	J	2.0	20		50%			Broken zone within run but mino or similar joint conditions. but end of run clayey due to change in lith
024-013	Waste	SHV	35.7	39.0	3.3	3.0	91%	130	0	0%	W1	R1	15 to 20														6		30%	60%	70%		After ch angeo n lith very broken up almost crushed rock in most portions of run and in most areas microdefects where picking up sample breaks no orient line due to poor ground
025-013	Waste	SHV	39.0	40.3	1.3	0.8	62%	27	0	0%	W1	R1	15														6		10%	60%	50%		Small run due to lith change on start run.
026-013	Waste	SHV	40.3	42.0	1.7	1.6	95%	44	0	0%	W3	R1	15								15	JF	2.0	4.0			6		30%	60%			Small run due to lith change. Majority of run very silicified with veining and microdefects visible throughout. to areas where there is jointing it is very closely spaced. Clay coatings inaccurate to sericitic on joint surfaces.
027-013	Waste	SHV	42.0	45.0	3.0	1.7	56%	41	0	56%	W2/W4	R1	15								13	JF	3.0	4.0			6	10%		90%	70%		Poor recovery due to washing out of material (gouge?). All joints have clay to gouge filling approx. 2-5mm thick where joints are very closely spaced.
028-013	Waste	SHV	45.0	48.3	3.3	2.0	60%	45	0	56%	W4	R1/R2	15-20														6		80%	90%	90%		Unable to excl point mes urements as very crushed up fractured rock. Large QTZ veining through run with clay cohtings. Altchr present within vein as well. Poor recovery again due to washing of material possible gouge?lith change.
029-013	Waste	SHV	48.3	52.1	3.9	3.2	81%	35	2	65%	W2	R1	6				2	J	2.0	4.0	18	JF	2.0	3.0	70-0	345-0	JF	3.0	6				100%	A lot better run with minimal thick gouge or QTZ veining in comparison to to the runs. Consistent dominate fol. Throughout with multiple mechanical breaks. Lith change.
030-013	Waste	SHV	52.1	54.0	1.9	1.8	91%	72	0	0%	W2/W4	R2	15-20														12		80%	100%	80%		Back to QTZ veining with in silicha and meccoonchoricritic coatings on surfaces of most fractures. Very rubble zone like no orientation line available. Longer run due to change or lith.
031-013	Waste	SHV	54.0	57.0	3.0	2.9	97%	90	0	5%	W3/W4	R2/R3	15-20														12		90%	75%	60%		Similar as last run where all run is rubble with multiple fractures due to high content in silica and altchr where in some cases infilling of 5-9mm coatings on surface of fracture/joint zones. Unable to dark orientation due to no line
032-013	Waste	SHV	57.0	60.0	3.0	2.1	69%	85	0	5%	W3	R1	15-20																80%	50%	50%		Similar as previous run very rubble like to broken rock throughout with microdefects. Again no orientation line due to poor rock. Poor recovery as noted in block got washed out.
033-013	Waste	SHV	60.0	63.0	3.0	2.6	86%	60	0	10%	W3	R2-R3	15-20																60%	60%	60%		Similar as previous run.
034-013	Waste	SHV	63.0	66.0	3.0	2.9	97%	110	0	0%	W3	R2	15-20																90%	50%	50%		Similar as previous run. No orient poor ground cannot measure any joints as too broken just like last runs.
035-013	Waste	SHV	66.0	69.0	3.0	2.7	89%	105	0	0%	W3	R2	15-20																90%	75%	50%		Similar as previous run. No orient poor ground cannot measure any joints as too broken just like last runs.
036-013	Waste	SHV	69.0	72.0	3.0	3.1	103%	100	0	0%	W3	R2	15-20																90%	90%	90%		No distinct block for the 72m mark to had use our own meter stick therefore no or R20 not too accurate. Similar to last run very broken up and rubble throughout run very mecoonchi rich and in areas silicified.
037-013	Waste	SHV	72.0	75.0	3.0	2.6	86%	62	2	16%	W3	R1	6								8	JF	3.0	2 to 3			12		90%	45%			Change to FF and I as I counted rubble zones as 4.25cm. Very silicified with QTZ veining with altchr with multiple microdefects and fractures but earlier in the run dominate fol present with random jointing and another secondary jointing difficult to measure. No orient line.
038-013	Waste	SHV	75.0	78.0	3.0	3.1	103%	21	2	16%	W2/W4	R2	6								9	JF	3.0	3.0			6/12		50%	60%			No orient line. One dominate joint visible with some random jointing but jointing very fel spaced. Initial run with QTZ veining then into Conventional RetWork with multiple mechanical clay breaks throughout. GEO has this zone has Ret/Web but I have continued with the Lone Lith as Ret/ for simplicity due to small run.
039-013	Waste	SHV	78.0	81.3	3.3	3.8	97%	73	2	16%	W3	R1	6	7	J	3.5	3.0				9	JF	3.0	3.0			6		20%	50%	20%		Longer run due to lith change next run. At the RWT in this run but combined it with RWT as useless to continue the two with such small length of lith. Clay coated infills with some joint surfaces. Noticed a joint set almost parallel to core axis with a rougher surface than the dominate fol.). Also some random jointing. No orient line available.
040-013	Waste	RWT	81.3	84.0	2.7	2.2	105%	27	1	15%	W2/W4	R3	12	3	J	3.0	3.0	6	9	JF	2.0	4.0				6/12		20%				Short run due end of block and lith change. Three joints spotted with random jointing this run but dominate fol has to flow weaker joint surface condition.
041-013	Waste	RWT	84.0	85.6	1.6	1.6	100%	27	1	59%	W2/W4	R3	6								6	JF	2.0	4.0			12		20%				Short run due to lith change again. FF do not match due to broken zone consist. One J set seen with some random. No orient line available.
042-013	Waste	RWT	85.6	87.6	2.0	1.7	87%	35	1	15%	W3	R1	6								10	JF	2.0	4.0			12		20%				Again short run due to lith change One dominate joint visible with lots of random jointing throughout run. Some areas there is fracturing right parallel to core axis. No orient line.
043-013	Waste	RWT	87.6	89.0	1.4	1.3	74%	15	0	17%	W4	R1	15-20														6	35%		50%	25%		Short run due to lith change Mostly gouged up material and rubble zones. No orient line available.
044-013	Waste	RWT	89.0	91.0	2.0	0.8	41%	85	0	0%	W1	R2	20														6	15%		60%	25%		Short run again due to lith change. Majority of run gouged to rubble like zone. Unable to make any measurements a no orient line due to poor rock
045-013	Waste	RWT	91.0	93.0	2.0	0.8	43%	65	0	10%	W1	R1	6								11	JF	3.0	3.0			12		15%	10%			Change in lith due to run change again. More competent rock this portion of lith with its dominate fol with some random jointing apparent. Minor rubble zone. at initial of run due to the different in FF and I reading count.
046-013	Waste	RWT	93.0	96.0	3.0	2.6	87%	45	1	69%	W3	R1	6								8	JF	3.0	4.0	68-0	330-0	JF	4.0	12	15%		25%			Most noted were mechanical breaks. High number between FF and joint. due to R2 and gouged areas. Random jointing present as well.
047-013	Waste	RWT	96.0	99.0	3.0	2.9	96%	42	0	13%	W2/W4	R2	15								11	JF	3.0	4.0			6/12		30%	20%	70%		Close spacing of random jointing with dominate fol present throughout. No orient line. Crushed rock in some areas as #2 or #3.
048-013	Waste	RWT	99.0	102.0	3.0	2.9	96%	120	0	0%	W3	R2	15														6		80%	20%	70%		Microdefected throughout with NO very poor run.
049-013	Waste	RWT	102.0	105.0	3.0	1.8	60%	120	0	0%	W4	R2	15-20														6	20%		80%	90%		Similar as previous run. Poor recovery due to poor ground. Gouged in one portion of run ~20cm long
050-013	Waste	RWT	105.0	108.0	3.0	2.9	96%	45	1	17%	W4	R1/R2	15														6	15%		90%	90%		No orientation line, fault breccia zone run at a low angle to the core axis.
051-013	Waste	RWT	108.0	111.0	3.0	3.0	100%	38	2	41%	W3	R1	6								12	JF	2.0	4.0			6	15%		10%			No orientation line, gouge zones are at a high angle to the core axis.
052-013	Waste	RWT	111.0	114.0	3.0	3.1	103%	19	2	40%	W3	R1	6								10	JF	2.0	4.0	68-0	330-0	J	4.0	12			100%			Decent run with fairly competent rock with visible jointing some random in areas but dominate fol visible.
053-013	Waste	RWT	114.0	117.0	3.0	2.7	89%	18	2	62%	W2/W4	R2	6								12	JF	3.0	4.0	68-0	330-0	JF	3.0	12	15%				Similar as previous run with minor gouge sericite
054-013	Waste	RWT	117.0	120.0	3.0	3.1	103%	27	1	28%	W3	R2/R3	6								24	JF	2.0	4.0			12	15%		10%			No meter block for 118 used meter stick for accumption. Joints filled with clay fill sericitic coating mainly undulated.
055-013	Waste	RWT	120.0	123.0	3.0	2.5	82%	46	1	35%	W3	R2/R3	6								23	JF	2.0	4.0			12	40%	10%	25%			Several broken zones throughout run. No orientation line available. Similar to last run where surface of joint very clay like coating.
056-013	Waste	RWT	123.0	126.0	3.0	2.7	90%	12	1	69%	W2/W4	R2/R3	6								23	JF	2.0	4.0			12	20%		20%			Minor gouge zone within run as well as a rubble zone colurial no orientation line available. Similar joint surface conditions as previous run.
057-013	Waste	RWT	126.0	129.0	3.0	2.7	91%	120	0	7%	W4	R2/R3	15								12	JF	2.0	4.0			12	15%		20%			Gouged material throughout run with microdefects high intensity no orientation line available. Longer run due to lith change next run.
058-013	Dike	Syenogr	129.0	132.0	3.0	2.6	86%	12	2	69%	W4	R1	6								12	JF	3.0	4.0			12	10%				25%	Highly chlorotic altered syenogr zone with pyrite-majority. No orientation line visible gouged areas with sharp contact
059-013	Waste	RHYv	132.0	135.0	3.0	2.7	91%	15	1	31%	W3	R1	6								12	JF	3.0	3.0			12		20%	80%			Minor broken zones run small due change in lith
060-013	Waste	RHYv	135.0	138.0	3.0	2.7	90%	58	1	37%	W3/W4	R2	6								11	JF	2.0	4.0			12	30%	50%	50%			Difference in FF due to broken and rubble areas which is microdefected. No orientation line
061-013	Waste	RHYv	138.0	141.0	3.0	2.8	93%	29	2	66%	W3	R1	6								10	JF	2.0	4.0			12	5%		25%			Proximal alteration for half of run but mostly RHYv unit. No orient line.
062-013	Waste	RHYv	141.0	144.0	3.0	2.9	96%	17	2	82%	W2/W4	R1	6								11	JF	3.0	3.0			12		10%	10%			Competent run with larger spacing of discont. No orient line.
063-013	Waste	RHYv	144.0	147.0	3.0	2.9	93%	36	2	58%	W3	R1	6								19	JF	2.0	4.0			12		50%	50%			Competent run broken through parallel to core axis but dominate j set visible no orient mark.
064-013	Waste	RHYv	147.0	150.0	3.0	2.8	92%	45	1	38%	W3	R1	6								16	JF	3.0	2.0			12	25%	10%	10%			~40cm gouge within run but mostly competent rock but close spacing of discont.
065-013	Waste	RHYv	150.0	153.0	3.0	2.9	94%	17	2	82%	W2/W4	R1	6								11	JF	3.0	2.0	70-0	330-0	JF	3.0	12	10%		10%			~15cm gouge within run but competent rock with dominate fol present.

K16-367 (UG Hole 1)	Volcaniclastic Rhyolite (RHYv)	264.00	265.50	1.50	1.50	100%	28	0.64	43%	-	W2/W3	R2	6					9	JN/JF	3.0	4.0	11	JF/JN	2.0	4.0			5%		40%	
K16-367 (UG Hole 1)	Volcaniclastic Rhyolite (RHYv)	265.50	267.00	1.50	1.50	100%	20	0.41	27%	-	W3	R1/R2	6					10	JN/JF	2.0	4.0	4	JN/JF	2.0	4.0		20%			85%	5cm of clay at the top of the run - likely mechanical. Blocked at 265.91m in high chlorite alteration band (5cm thick). Healed fault composed of cemented clay from 266.66 - 266.74m.
K16-367 (UG Hole 1)	Volcaniclastic Rhyolite (RHYv)	267.00	268.50	1.50	1.50	100%	17	0.43	29%	-	W3	R1	6					3	JN	3.0	4.0	9	JN/JF	1.0	4.0		8%			80%	Blocked at 268.1. No orientation for run. Easily broken with hands along foliation.
K16-367 (UG Hole 1)	Volcaniclastic Rhyolite (RHYv)	268.50	269.83	1.33	1.33	100%	19	0.23	17%	-	W3	R0/R1	15														70%			90%	Broken discs of core at the end with no visible orientation. Weak chloritized rock surrounding quartz veins - multiple throughout run. Foliation is contorted and appears to be a healed fault zone. Cemented clay from 268.85 - 269.14m. Textures are not preserved enough to pick joint sets.
K16-367 (UG Hole 1)	Volcaniclastic Rhyolite (RHYv)	269.83	271.50	1.67	1.67	100%	16	0.89	53%	NEW	W2/W3	R1/R2	4					5	JN	3.0	4.0	11	JF	1.0	4.0					90%	Texture is better preserved. Likely fringe of fault zone above.
K16-367 (UG Hole 1)	Volcaniclastic Rhyolite (RHYv)	271.50	273.00	1.50	1.50	100%	10	1.18	79%	0	W3	R1	6					1	JN	3.0	4.0	8	JF/JN	1.0	4.0		5%			85%	
K16-367 (UG Hole 1)	Fault Breccia - Sediment (SED)	273.00	274.50	1.50	1.50	100%	30	0.12	8%	-	W3	R1	3					15	JF	1.0	4.0						95%	20%		60%	No orientation and redrilled core at top of run. Fault zone starts at approx. 273.10m. Obviously because rock has hematite alteration and more chlorite. An 80 deg fold in the foliation occurs at the top of the fault zone.
K16-367 (UG Hole 1)	Fault Breccia - Sediment (SED)	274.50	276.00	1.50	1.50	100%	18	0.70	47%	-	W3	R1	3	6	JF	1.0	4.0	3	JF	1.0	4.0						100%	5%		80%	Orientation attempted but core ground at bottom of run so can't carry it through. Foliation is contorted from 275.28 - 275.58m. Below 275.58m foliation is opposite orientation from start of run. Cemented fault breccia can be broken with hands.
K16-367 (UG Hole 1)	Fault Breccia - Sediment (SED)	276.00	276.58	0.58	0.58	100%	7	0.48	83%	-	W3	R2	3					3	JF	2.0	4.0						100%			100%	Foliation is contorted from 276.12 - 276.58m
K16-367 (UG Hole 1)	Fault Breccia - Sediment (SED)	276.58	279.00	2.42	2.42	100%	52	0.36	15%	-	W3/W4	R0/R1	20														100%			100%	Cemented clay fault zone. Very little strength (crumbles in hand) but liquefies when wet.
K16-367 (UG Hole 1)	Fault Zone (FLZ)	279.00	280.50	1.50	1.50	100%	60	0.00	0%	-	W4	R0	20														100%			100%	Cemented clay fault zone. Very little strength (crumbles in hand) but liquefies when wet
K16-367 (UG Hole 1)	Fault Zone (FLZ)	280.50	282.00	1.50	1.50	100%	60	0.00	0%	NEW	W4	R0	20														97%			97%	Cemented clay fault zone. Very little strength (crumbles in hand) but liquefies when wet. Into core again at 281.95m with orientation.

POINT LOAD TEST RESULTS

Equipment: PiL-7 Load Correction Factor = 0.0948

A total of seven packer tests were completed for four geotechnical holes (GT-01 – GT-04). Three tests were in the fault areas whereas the remaining four tests were in HW areas. Table 1-22 to Table 1-28 summarises the packer tests completed:

OUTCROP SURVEY

An outcrop survey was completed between August 17-18, 2016 for the purpose of determining orientation, lithology, type of structure, slope height, weathering, rock mass characteristics, where applicable, for pit and pit wall areas.

A compass was used to determine strike and dip for orientation where the right hand rule was applied. A magnetic declination of 22.1° was added to achieve grid north (NAD83 Z9). Majority of the west pit wall areas for both Krakatoa and ABM were reclaimed and therefore, insignificant data was collected. Similarly, portions of the east pit walls were also reclaimed or consisted of vegetation which resulted in no data. Majority of measurements were recorded within road cuts and excavation due to greater exposure of bedrock.

The primary structures noted were dominant joint/foliation and normal joint sets. Both Wind Lake and KZK formations were recorded which resulted in similar orientation for foliation. Several massive normal joint sets were also observed particularly for the KZK formation.

Figure 1-18 outlines a point summary drawing of the outcrop survey and Table 1-29 summarises in detail of each outcrop surveyed.

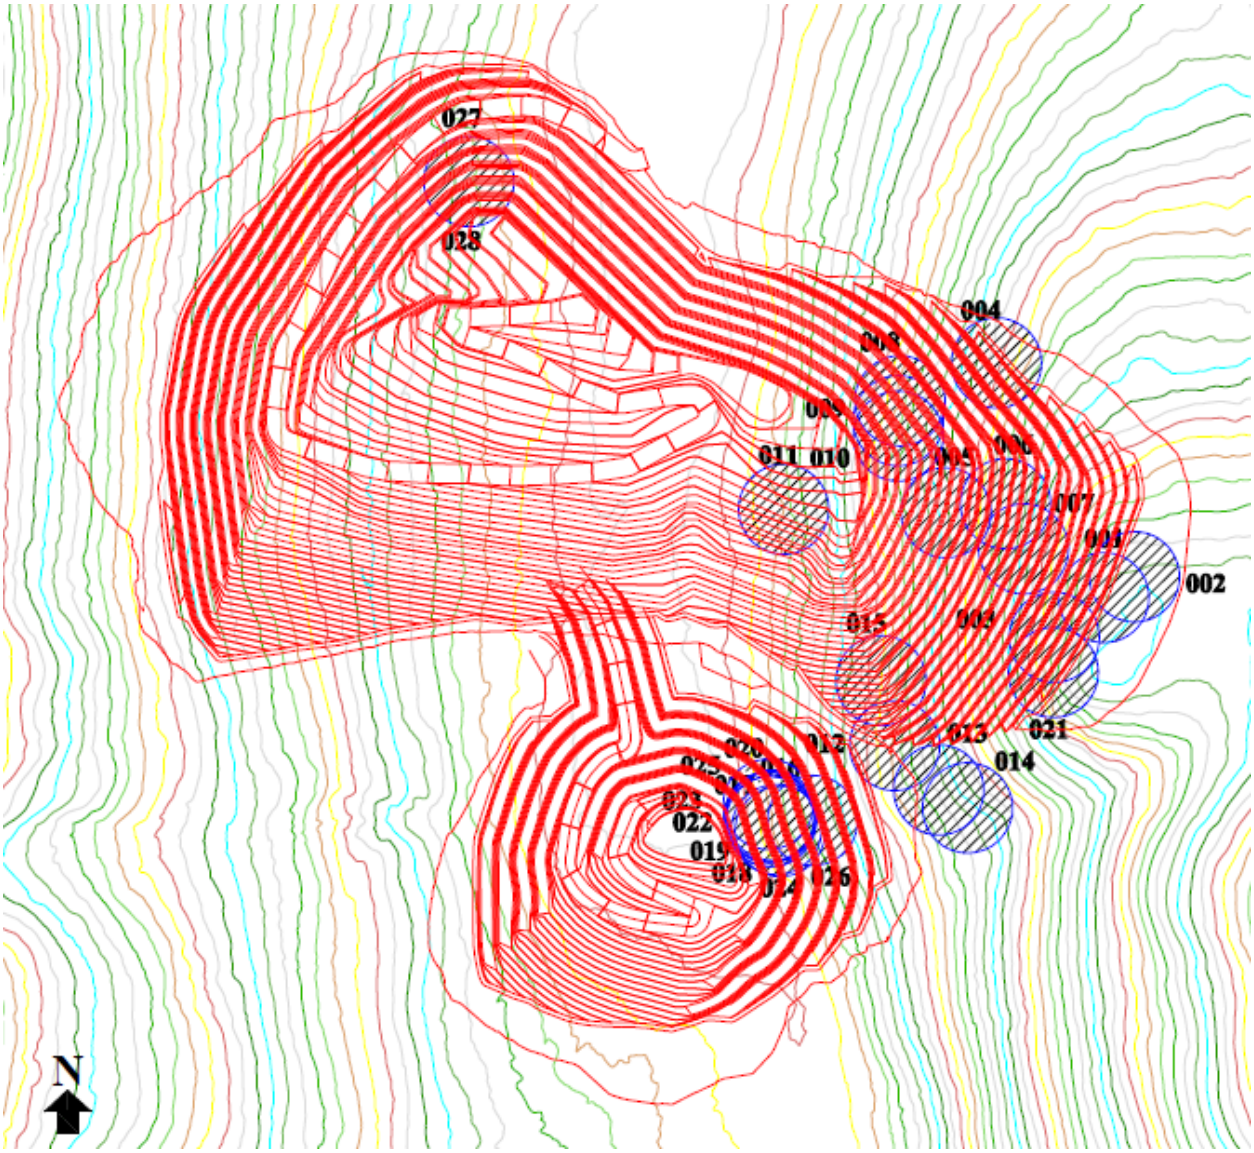

Figure 1-18: Summary of Outcrop Points with Respect to Proposed Open Pit Areas

Appendix S: Geologist Certificates

GEOLOGIST'S CERTIFICATE

Christopher Hughes
704-900 Jervis Street
Vancouver, B.C., Canada

I, **CHRISTOPHER HUGHES**, M.Sc., do hereby certify that:

1. I am a Senior Project Geologist at Equity Exploration Consultants Ltd., a geological consulting and contracting firm with offices at Suite 1510–250 Howe Street, Vancouver, British Columbia.
2. I am a graduate of the University of Auckland, New Zealand, with Bachelor of Science (2003) and Masters of Science (2005) degrees in Geology, and I have practiced my profession continuously since 2005.
3. Since 2005 I have been involved in mineral exploration for gold, silver, copper, lead, zinc, iron ore and coal in New Zealand, Australia, Republic of Guinea, Cameroon, Republic of Congo and Canada.
4. I am co-author of the Assessment Report entitled "*2016 Geological, Geophysical, Diamond Drilling and Geotechnical Program Report on the Kudz Ze Kayah (KZK) Property"* prepared for BMC Minerals LTD.
5. I was directly involved with the planning, managing and execution of the 2016 exploration program at Kudz Ze Kayah and have examined the property which is subject of the Assessment Report.

Dated 17th March, 2017, at Vancouver, British Columbia.

Christopher Hughes, M.Sc.

GEOLOGIST'S CERTIFICATE

Ronald J. Voordouw
2327 Mary Hill Road
Port Coquitlam, BC, Canada
V3C 3A6

I, **RONALD VOORDOUW**, Ph.D., P.Geo., do hereby certify that:

1. I am presently a Project Geologist with Equity Exploration Consultants Ltd, with offices at Suite 1510, 250 Howe Street, Vancouver, British Columbia, Canada.
2. I graduated from the University of Calgary, Alberta, Canada, with a Bachelor of Science degree in geology in 1999, and with a Doctorate in geology in 2006 from the Memorial University of Newfoundland, Canada.
3. I am a professional geoscientist in good standing (#06962) in the province of Newfoundland and Labrador.
4. Since 2006 I have been involved in natural resource exploration for base metals and gold (2006, 2011 to present); research on PGE deposits (2007, 2008); and regional geological mapping (2009, 2010) in Canada and South Africa.
5. I am a co-author of the assessment report titled "*2016 Geological, Geophysical, Diamond Drilling and Geotechnical Program Report on the Kudz Ze Kayah (KZK) Property"* prepared for BMC Minerals LTD.
6. I co-managed the 2016 exploration work on the KZK Property from 15 April to 16 September 2016.

Dated 17th March 2017, at Vancouver, British Columbia.

#06962

Signed and sealed: "*Ronald J. Voordouw*"

Ronald J. Voordouw, Ph.D., P.Geo
