SUMMARY

BMC Minerals' Kudz Ze Kayah ("KZK") Property consists of 879 quartz claims that cover 16005 hectares (160 km^2) of south-central Yukon, and is centred at 61˚ 31' N latitude and 130˚ 33' W longitude on NTS map sheets 105G/7–10, within the Watson Lake Mining District. It is notable for containing the ABM and GP4F volcanogenic massive sulphide (VMS) deposits, which are located 5 km apart. Following the 2016 exploration work described in this report, BMC announced an updated (indicated + inferred) resource for the ABM deposit comprising 19.2 Mt at 0.9% Cu, 1.9% Pb, 6.3% Zn, 1.4 g/t Au and 148 g/t Ag (BMC Minerals Ltd., 2016a). In addition, an updated indicated + inferred resource for the GP4F deposit was estimated at 1.7Mt grading 0.2%Cu, 2.6% Pb, 5.3% Zn, 1.4 g/t Au and 73 g/t Ag (BMC Minerals Ltd., 2016a).

The 2016 field program included earthworks, work on the historical core archive, terrain surveys (airborne LiDAR, ground-based DGPS), geophysics (airborne magnetics and EM, ground-based borehole EM), resource and exploration drilling (on Krakatoa Zone, GP4F deposit, ABM Zone, Sebesi and Tarawera targets), metallurgical drilling (Krakatoa, GP4F, ABM), geotechnical investigations (mine site, Krakatoa rock quality), hydrogeological drilling, and environmental baseline surveys (Table 1).

Earthworks included building of trails and pads for the 2016 drilling program, followed by extensive reclamation of 2015/16 trails (65% reclaimed) and pads (95% reclaimed).

Historical core work included relocation of archived core (5464 boxes, 33902.6 m of drill core) five kilometres up the tote road to the new KZK Camp, and completion of the comprehensive re-logging program started in 2015. Re-sampling and assay of historical GP4F core suggests that Cominco's assays were likely accurate. Re-coding of historical and 2015 core was done to generate a consistent lithological interpretation across the GP4F deposit.

Table 1: Summary of work done and filed for the 2016 KZK Project

Program	Work type/target	Description	Filed?
Earthworks	Construction	5.8 km of drill trail, 59 drill pads	Yes
	Reclamation	17.5 km of drill trail from 2015/16, 140 drill pads from 2015/16	Yes
Historical core	Relocation	Historical core relocated from km-25 to new KZK Camp at km-20	Yes
	Re-logging, -coding	Re-logged 24 holes for 4030.3 m, re-coded 13 holes for 3535.5 m	Yes
	Re-sampling and assay	24 samples from historical GP4F core	Yes
Terrain surveys	Airborne LiDAR	341 km² survey over high priority core of the Property	Yes
	DGPS	246 surveyed points including all 2016 collars, outstanding 2015 collars, wells	Yes
Geophysical surveys	Airborne magnetics and EM	902 line-km magnetics and VTEM + 38 line-km reflights to redress QA/QC	Yes
	Borehole EM	11 holes surveyed for 6790.5 m	Yes
Resource and exploration drilling	Krakatoa Zone	32 holes for 8623.2 m, 1276 samples assayed	Yes
	GP4F deposit	7 holes for 1553.6 m, 196 samples assayed	Yes
	ABM Zone	3 holes for 770.0 m	Yes
	Sebesi target	4 completed holes for 3185.3 m, 7 abandoned holes for 1911.3 m; 35 samples assayed, petrography	Yes
	Tarawera target	1 hole for 854.5 m, 6 samples assayed	Yes
Metallurgical drilling	Krakatoa Zone	2 dedicated holes for 443.5 m and 173 assays, 4 dual purpose holes for 757.9 m	Yes
	GP4F deposit	5 dual purpose holes for 886.3 m	Yes
	ABM Zone	5 dedicated holes for 611.9 m, 405 samples assayed	Yes
Geotechnical investigations	Mine site	53 test pits; 16 drill holes for 631.0 m	Yes
	Krakatoa rock quality	4 dedicated holes for 608.1 m; 15 dual purpose holes for 3665.5 m	Yes
Hydrogeological	Mine site	3 dedicated holes for 18.0 m, 6 dual purpose holes for 209.9 m	Yes
Environmental	Krakatoa ARD static testing	79 samples collected from historical and 2015 drill holes	Yes
	Baseline studies	Water quality, wetland, vegetation and wildlife surveys	No
2016 TOTAL	**All work**	**84 holes for 19210.5 m, 2094 samples assayed, 902 km airborne EM-mag, 6790.5 m BHEM, 7565.8 re-logging/coding, engineering and environmental studies**	

A 341 km² airborne LiDAR survey was flown over the proposed mining area and tote road corridor to provide a high-resolution topographic surface. Ground-based differential GPS surveys measured the last 30 collars drilled in the 2015 program and all collars drilled in 2016.

The 2016 airborne magnetic and VTEM survey (902 line-km) used the same contractor and equipment as the 2015 survey, and completed coverage over the KZK Property. Preliminary review reveals broad formational responses, especially for the Wind Lake Formation, structurally influenced magnetic lows, and at least one EM anomaly (here called the "GLF EM high") that merits ground-based investigation. The "core rack" anomaly is retained as a weak EM and magnetic response even after the metal core racks were removed, and is spatially associated with an intercept of mafic footwall intrusion that is untested along at least 150 m of strike length and 300 m of downdip extent. Further groundwork on the GLF EM high and core rack anomalies is recommended, possibly comprising prospecting and/or ground-based geophysical work.

Borehole EM surveys were done in 11 holes for 6790.5 m, with responses showing a strong correlation with sulphide intercepted in drill core. Both geophysical data sets require further analysis and interpretation by an expert geophysicist.

A total of 84 holes for 19210.5 m were drilled on the KZK project in 2016, with 54 holes and 16898.0 m drilled for resource (infill, expansion) and exploration (± metallurgical) purposes. DGPS and downhole (EZ-shot ± Gyro) surveys show that the actual drilling accurately reflects the planned drilling. Core was oriented from the base of overburden to the end of each hole. Recovery and RQD averaged 91.7% and 51.6% respectively, and is lowest in the GP4F area (85.0% recovery, 48.2% RQD). A total of 2094 samples were submitted for geochemical assay, comprising 1858 core samples, 134 certified reference materials (CRMs) and 102 blanks. QA/QC review suggests that these assays are accurate and free of contamination.

Resource infill and expansion drilling on the Krakatoa Zone, which was discovered by BMC in 2015, mostly closed off mineralization along strike and at depth. Along-strike drill testing found that the bounding East and Fault Creek Faults are wider than previously recognized and consumed areas of the inferred resource modelled in January 2016 (Green et al., 2016), decreasing the indicated + inferred tonnage from 5.1 Mt to 4.2 Mt. On the other hand, the proportion of indicated resource rose from 40% to 90%, thereby meeting a key objective of the Krakatoa work program. The overall probability of significant resource expansion at Krakatoa has dropped through the 2016 work, although there are still untested gaps that could add incremental tonnage.

Resource infill drilling at the GP4F deposit was done in six holes for 1368.7 m, with a seventh (K16-407, 185.0 m) drilled as a twin to confirm a coincident core block placement and rod count error through the GP4F lens of K16-388. Results increased the proportion of indicated resource from 0% to 60%, thereby meeting a key objective of the program. Re-logging and re-coding were used to generate consistency between the 1998, 2015 and 2016 logs, and so develop a coherent lithological model across the deposit. Additional infill drilling is proposed on sections 419550E and 600E, and downdip expansion drilling is recommended for sections 419400E, 450E and 500E.

Resource expansion drilling on the ABM Zone failed to extend mineralization along strike to the west or downdip to the north, thereby closing off those parts of the deposit. BHEM surveys, done on two of three expansion holes, did not show an obvious response. Any future exploration drilling in this area should focus on the untested deep footwall rocks near the East Fault, which are prospective for Krakatoa-equivalent mineralization.

Exploration drilling on the Sebesi target did not intersect significant sulphide mineralization, with the best intercept comprising 0.5 m of pyrrhotite-rich massive sulphide grading 9.3% Zn and 0.5% Cu. This layer occurs within a ~50 m thick "Sebesi mudstone marker" unit, which was intersected in each completed drill hole (as well as, possibly, Tarawera and GP4F) and occurs 450–700 m below the top of the KZK Formation. A short mafic interval, similar to the Krakatoa Zone, occurs near the top of K16-372 and is untested along 150 m of projected strike up to the Fault Creek Fault, and for 300 m downdip. This unexplored area is spatially associated with the "core rack" airborne EM anomaly.

Exploration drilling on the Tarawera target also intersected a 0.5 m pyrrhotite-rich sulphide layer (grading 9.0% Zn, 0.8% Cu) at 46.5–47.0 m core depth, which may explain the other prospective features of this area (EM and soil anomalies, mineralized float). The Tarawera sulphide shows similar width, mineralogy

and grade to the sulphide layer hit at Sebesi, but stratigraphic interpretation suggests that the Tarawera layer lies ~400 m above the Sebesi one. Recommended future work should start with assessing whether the 2016 drilling results explain the 2015 VTEM data, as well as the historical soil and float anomalies.

Metallurgical drilling generated 792 samples of various ore types and grades from the Krakatoa Zone, GP4F deposit and ABM Zone. Composite samples for Krakatoa and GP4F have been sent for metallurgical testwork.

The mine site geotechnical program was successful in testing the proposed infrastructure sites with a combination of test pits and drill holes. Bedrock quality within the proposed mine site is generally classified as “fair” and locally ranges from “good” to “poor”. Nine 10-node thermistors were also installed to monitor ground temperature profiles across the project site.

The rock quality investigation comprised four holes drilled into each wall of the proposed Krakatoa open pit and detailed logging of 15 Krakatoa resource infill holes, with the aim of characterizing the geotechnical and engineering properties of sulphide and host silicate rocks. Results indicate that massive to semi-massive sulphide is relatively strong whereas Wind Lake Formation mudstone and fault zone intervals are weak, weathered and highly fractured. Rock strength proxies for felsic volcanic (RHYv) and footwall mafic intrusion (MAFi) typically fall between these end members, with aphanitic rhyolite (RHYi) generally stronger than other felsic volcanic types and coherent rhyolite (RHYc) somewhat weaker. Structural measurements on oriented core confirm the orientation of the dominant foliation in the project area and the trend of larger-scale fault structures, and show that brittle failure occurred on planes subparallel to the dominant foliation.

The hydrogeological investigation included drilling and installation of six deep monitoring wells, three shallow wells as well as packer testing. Ground water depths range from above surface to 19 m below ground level. Packer testing shows that the most permeable bedrock occurs in the class C storage area.

Environmental baseline studies are an ongoing part of the KZK work program. The methodology for these studies are summarized in this report but results are not presented, as this is part of an on-going study in the KZK project area. The environmental baseline work has not been filed for assessment.

1.0 INTRODUCTION

This report has been prepared for BMC Minerals Ltd ("BMC") in order to document the procedures and results of the 2016 exploration work undertaken on the Kudz Ze Kayah ("KZK") Property and to satisfy assessment reporting requirements for the Yukon Department of Energy, Mines and Resources ("EMR"). Equity Exploration Consultants Ltd. ("Equity") was engaged by BMC to undertake the 2016 KZK fieldwork and to prepare this assessment report. The report has been prepared on the basis of personal observations, assessment reports filed with EMR, data and reports supplied by BMC, regional geological publications by EMR, and on the 2016 fieldwork undertaken by Equity under the direct supervision of the authors. A complete list of references is provided in Appendix A.

Units and abbreviations used in this report are as follows:

Units:

cm	centimetre
C$	Canadian dollar
g	gram
g/t	grams/tonne
km	kilometre
kg	kilogram
Koz	thousand troy ounces
Kt	thousand tonnes
kW	kilowatt
m	metre
mGal	milligal
mm	millimetre
Mt	million tonnes
Moz	million troy ounces
nT	nanotesla
ppm	part per million
psi	pounds per square inch
"	inch

Abbreviations:

AAS	atomic absorption spectroscopy (an analytical technique)
AES	atomic emission spectroscopy (an analytical technique)
Ag	silver
APS	azimuth pointing system (a DDH orientation system)
ARD	acid rock drainage
As	arsenic
Au	gold
Ba	barium
BI	biotite
Bi	bismuth
CB	carbonate
CI	cordierite
CL	chlorite
CP	chalcopyrite
CRM	certified reference material (QA/QC standard)
Cu	copper
DDH	diamond drill hole
DGPS	differential global positioning system
DO	dissolved oxygen
EM	electromagnetic

EDTA	ethylenediaminetetraacetic acid (a metallurgical test)
EMR	Yukon Department of Energy, Mines and Resources
Fe	iron
FP	feldspar
GL	galena
GNSS	global navigation satellite system
GPS	global positioning system
Hg	mercury
HLEM	horizontal loop EM
HQ	drill core measuring 63.6 mm in diameter
HQ3	drill core measuring 61.2 mm in diameter
ICP	inductively coupled plasma (an analytical technique)
ID	identification
KZK	Kudz Ze Kayah
LiDAR	light detection and ranging
Ma	million years ago
MG	magnetite
MS	mass spectrometry (an analytical technique)
MU	muscovite
NAD83	North American datum (1983)
NQ3	drill core measuring 45.2 mm in diameter
Pb	lead
pH	measure of hydrogen ion concentration (acidity)
PLT	point load testing
PO	pyrrhotite
PVC	polyvinyl chloride (a plastic)
PY	pyrite
QA	quality assurance
QC	quality control
QZ	quartz
RQD	rock quality designation
RTK	real-time kinetic (a GPS enhancement)
S	sulphur
Sb	antimony
Se	selenium
SEPA	socio-economic participation agreement
SP	sphalerite
SPT	standard penetration test
UCS	unconfined compressive strength
UTEM	University of Toronto electromagnetic (a geophysical technique)
UTM	universal Transverse Mercator
VMS	volcanogenic massive sulphide
VTEM	versatile time-domain electromagnetic (a geophysical survey system)
VWP	vibrating wire piezometer
WAAS	wide area augmentation system (a GPS enhancement)
WAD	weak acid dissociable
wt%	weight per cent
XRF	X-ray diffraction (an analytical technique)
Zn	zinc

2.0 RELIANCE ON OTHER EXPERTS

In Section 3.0, the authors have relied entirely upon information provided by BMC concerning their purchase agreement with Teck and the extent of any underlying interests and royalties. Also in Section 3.0, the authors have relied entirely on the Geomatics Yukon website for downloaded shapefile tenure data. Also in Section 3.0, the authors have relied entirely upon information provided by BMC regarding their Socio-Economic Participation Agreement ("SEPA") with the Ross River Dena Council. The authors have not relied upon a report, opinion or statement of another expert concerning legal, political, environmental or tax matters relevant to this assessment report.

3.0 PROPERTY DESCRIPTION AND LOCATION

The KZK Property is one of three properties controlled by BMC in the Finlayson Lake area of the Yukon Territory, and consists of 879 quartz claims that cover an area of approximately 16005 hectares (160 km^2) of south-central Yukon (Figure 1). It is centred at 61˚ 31' N latitude and 130˚ 33' W longitude (NAD83 UTM Zone 9: 416000E 6817000N) on NTS map sheets 105G/7–10, within the Watson Lake Mining District.

The KZK Property consists of three separate claim blocks. The main claim block, with 864 contiguous claims, covers an area of about 11 km x 20 km and hosts the ABM and GP4F deposits. A single line of claims extends for 14 km north from the main claim block, covering the tote road from where it extends to the Robert Campbell highway. The EL 1–8 and Limy 1–9 claim blocks are not contiguous with the other claim blocks, lying a few kilometres to the west and east of the tote road respectively (Figures 2a, 2b). All claims were acquired through staking on the ground. The area covered by each claim is determined by the location of the two claim posts on the ground. Mineral claim data is summarized in Appendix C.

All claims are registered in the name of BMC Minerals Ltd. ("BMC"). BMC purchased the KZK Property 100% from Teck Resources Limited ("Teck") on 24 January 2015 and there are no residual royalties across the known mineral resources. The KZK Property area is covered by a 2004 SEPA that includes all Kaska First Nations. The SEPA was assigned to BMC upon purchase of the project from Teck. No significant environmental liabilities were noted by the authors on the KZK Property.

The claims confer title to hard rock mineral tenure only. Surface rights are held by the Crown, as administered by the Yukon Territory. Trapping rights over the western portion of the KZK Property are held by the Ross River Dena Council under Group Trapline #405, while Ted and Franklin Charlie hold trapping rights over the rest of the Property under Single Holder Trapline #250. KZK overlaps with part of Outfitter Concession #20, held by Yukon Big Game Outfitters. There are several parcels of land in the vicinity of the KZK Property which have been reserved for a future land claim settlement with the Ross River Dena Council. Most importantly, a parcel of Interim Protected Land (RRDC-R15A) adjoins the southern boundary of the KZK Property and covers the along-strike continuation of host stratigraphy for the GP4F deposit. Teck explored the RRDC-R15A parcel in 2004, successfully identifying the R-15 VMS prospect (MacRobbie and Holroyd, 2005b). Currently, staking is not permitted within a large area surrounding the KZK Property due to a government moratorium.

Yukon law requires eligible assessment expenditures of C$100/claim/year on the KZK Property to extend tenure ownership past the current expiry dates. Five claim groupings, containing a maximum of 750 contiguous claims, making up the KZK Property were filed with EMR to allow the representation of work done on one or more claims to be distributed to other claims where work was not done.

2b

Exploration programs in the Yukon are divided into Class 1 (grassroots) through Class 4 (advanced), depending on threshold levels of camp person-days, fuel storage and extent of exploration activities. In the KZK area, notification of EMR is required for Classes 1 and 2, but submittal of a plan of operations and granting of a Quartz Mining Land Use Permit by EMR is necessary prior to undertaking Class 3 and 4 programs. The 2016 KZK exploration work was carried out under Class 3 Quartz Mining Land Use Permit LQ00424, which is valid to June 28th, 2020. Additional permits, leases and licenses used to complete the exploration activities include: Tote Road and Gatehouse Lease 105G07-001, Type A Water Use License QZ97-026-1, Approval to Use a Sewage Disposal System 4599, Special Waste Permit 41-289, Storage Tank System Permit 2015-22 and Fuel Tank Registration T-1004 and T-1005.

The KZK Property lies within the traditional territory of the Ross River Dena Council. Land claims have not been settled in this part of Yukon and their future impact on the Property's access, title or the right and ability to perform work remain unknown. However, the SEPA provides assurances that the Ross River Dena Council will support exploration and mining of the Property, subject to certain terms and conditions.

4.0 HUMAN AND PHYSICAL GEOGRAPHY

4.1 Accessibility

Access to the KZK Property is via a 25 km long, gated, single lane gravel tote road that connects to the Robert Campbell Highway (Highway 4) near Finlayson Lake, at a point 135 road-km east of Ross River and 237 road-km northwest of Watson Lake. Fixed wing aircraft can land on Finlayson Lake or at an airstrip located at its northwestern end.

The mainly gravel Robert Campbell Highway connects the Property to Watson Lake on the paved Alaska Highway and Carmacks on the paved Klondike Highway, giving access to Whitehorse and points south (Figure 1). All highways are maintained by the government for use year-round but maintenance of the tote road is the responsibility of the KZK Project operator. The ABM deposit on the KZK Property is accessible by the tote road for skid-supported drilling, but helicopters are still necessary for access to most of the remainder of the Property, including the GP4F deposit.

4.2 Local Resources and infrastructure

Ross River, the nearest settlement to the KZK Property, has a population of about 300 and provides basic services (groceries, fuel, accommodation and meals). Whitehorse (population 25000), which is located 260 km west of KZK, offers a full range of services and supplies for mineral exploration and mining, including skilled and unskilled labour, bulk fuel, freight, heavy equipment, groceries, hardware and daily jet service to Vancouver (Figure 1).

The Yukon electrical grid supplies 138 kV electrical power to Faro, located 170 km northwest of the KZK Property but only 25 kV electricity to Ross River. Concentrates from the Wolverine Mine, located 25 kilometres to the east of KZK, were trucked 900 kilometres south to port facilities at Stewart, BC prior to Wolverine's shutdown in early 2015.

4.3 Physiography and climate

The KZK Property, which lies in the Pelly Mountains, covers portions of several creeks which ultimately drain north-easterly into the Finlayson River. The ABM deposit lies near the head of Geona creek, which drains into Finlayson Creek near where the tote road intersects the Robert Campbell Highway. The topography is fairly rugged, and typical of mountainous terrain. Elevations range from 1000 m ASL near Finlayson Lake to over 2000 m ASL on the peaks southwest of the ABM deposit. The surface elevations in the vicinity of the ABM and GP4F deposits are between 1300 and 1500 m ASL.

Below the tree line (1350–1500 m), white and black spruce are the most common tree types. Black spruce is usually dominant in wetter areas; white spruce predominates in drier areas. Paper birch, aspen, balsam and lodgepole pine are also present. Alpine fir grows near the tree line. In dense coniferous stands,

feather moss dominates the understory, but in more open areas willows and heath-like shrubs become prevalent.

Sedge or sphagnum tussocks are common in wetlands and under black spruce. Shrub birch and willow occur in the subalpine and extend well above the tree line. The region has intermittent permafrost with moist depressions comprising peat plateaus, patterned fen and bog complexes.

The climate is cold continental with a mean daily summer temperature of 15˚C and a mean daily winter temperature of -25˚C. Precipitation falls fairly evenly throughout the year, predominantly as rain from May through September, and snow for the balance of the year. The mean annual precipitation is 655 mm. Groundwork on the Property is possible from May until October, while snow may cover parts of higher elevations late into the summer. Drilling can be conducted year round by using heated water for drilling.

During the last glacial period, ice moved across the eastern part of the area in a northwesterly to westerly direction and extended to heights of about 1525 m (Ritson, 2000).

5.0 HISTORY

The following description of pre-2004 exploration history of the KZK Property has been adapted from MacRobbie and Holroyd (2005b).

No work had been reported in the KZK area prior to 1992, when Cominco Ltd. ("Cominco"), which merged with Teck Corp. in 2001 to form Teck Cominco Ltd. (and ultimately Teck Resources Ltd., both of which are referred to as "Teck" in this report), confirmed and expanded an anomalous regional silt sample from earlier work (Hornbrook and Friske, 1988). In the following year prospector A. B. Mawer discovered a well-mineralized, layered sulphide cobble in the anomalous drainage area. This was immediately followed by a reconnaissance UTEM geophysical survey over the projected trace of the suspected host stratigraphy that outlined an EM conductor. Staking of the first TAG claims over the conductor was accompanied by a ground magnetic survey. Further magnetic and horizontal loop EM and soil surveys were completed later that fall and defined a compelling drill target (Schultze, 1993).

The target was drilled in April 1994, with the first hole intersecting 22.5 m of massive sulphide in two sections (Schultze, 1995). Three additional holes were drilled in April, and each of them intersected sulphide mineralization over significant widths. The weighted average grade of sulphide in the discovery hole was 0.5% Cu, 2.8% Pb, 10.0% Zn, 278 g/t Ag and 2.9 g/t Au over 22.5 m. The sulphide body was named ABM after the long-time Cominco prospector who made the initial float discovery. In total, 52 diamond drill holes (DDHs) (8485 m) were drilled in 1994 along with ground and airborne geophysical surveys, detailed mapping in the vicinity of the deposit, regional and detailed exploration geochemistry and baseline environmental sampling (Schultze, 1996).

In 1995 an additional 133 DDHs (16178 m), were completed at the ABM deposit and on regional targets. Additional soil sampling, minor geological mapping and ground geophysical surveys were completed (Schultze, 1996). Engineering and environmental work included geotechnical investigations, bulk metallurgical sampling, construction of the tote road and environmental baseline and archaeological studies (Stacey, 1996). A pre-feasibility engineering study was completed by Cominco in July 1995 (Brown, 1995).

The 1996 program involved regional, 1:20,000 scale geological mapping outside the immediate ABM deposit area, minor line cutting, ground geophysical surveys and soil geochemistry over the northeastern part of the TAG Property. Diamond drilling (99 m) was completed in the southwest corner of the current KZK Property. Minor structural mapping and core logging were completed at the ABM deposit.

The 1997 program consisted of ground geophysical surveys and diamond drilling. An extensive UTEM and magnetic survey was done east of the ABM deposit and additional gravity and magnetic surveying was done over several coincident EM-magnetic targets proximal to ABM. A total of 17 drill holes were completed for 3566 m, with seven aimed at expanding the ABM deposit, two testing regional targets and eight holes completed on the Fault Creek target. Drilling at Fault Creek intercepted 6.4 m of Cu-rich sulphide in K97-181, which assayed 5.2% Cu, 1.0% Pb, 5.6% Zn, 141 g/t Ag and 2.4 g/t Au. This poorly defined occurrence

represented the first discovery of significant sulphide mineralization south of the Fault Creek Fault (MacRobbie and Bannister, 1998). By the end of 1997, 168 geological and 15 metallurgical drill holes had been completed in the immediate ABM deposit area, and another 20 drill holes had been completed elsewhere on the Property (including the eight on the Fault Creek target). Environmental studies, metallurgical testing and permitting activities were ongoing.

In 1998 additional line cutting, soil sampling and limited ground geophysical surveys were completed in several areas. A further 11 DDHs (K98-188 to 198; 1755 m) were completed, nine of which tested the GP4F area and two testing a coincident magnetic-EM feature northeast of GP4F (MacRobbie and Holroyd, 1999). The most significant result was the discovery of the GP4F deposit located 5 km southeast of ABM, which was estimated by Cominco to comprise a (non 43-101 compliant) resource of 1.5 Mt grading 0.1% Cu, 3.1% Pb, 6.4% Zn, 89.7 g/t Ag and 2.0 g/t Au (MacRobbie and Holroyd, 2000).

In 1999 a small geophysical program was completed, including an In-Loop UTEM survey over the GP4F deposit As well as HLEM and magnetics in the GP4F deposit area (MacRobbie and Holroyd, 2000).

In 2000 the KZK Property and properties in the Wolverine Lake area were optioned to Expatriate Resources Ltd. (“Expatriate”) (Schultze, 2001), a predecessor company to Yukon Zinc Corporation who currently own the Wolverine VMS deposit located 23 km east of ABM. Expatriate carried out ground geophysical surveys (UTEM, magnetics) in the area south of the ABM deposit and extending south of the Fault Creek target (Klein, 2000). Expatriate allowed the option to lapse in late 2001.

In 2004 Teck optioned the R-15 block, immediately south of the KZK Property, from Kaska Minerals Corporation, an entity controlled by the Kaska First Nation in Ross River. That summer, Teck carried out mapping, ground geophysical (UTEM and magnetic) surveying and drilled 7 DDHs (1481 m) on the R-15 block, discovering the R-15 deposit. The program extended north into the area of the GP4F deposit on the KZK Property, with 6.8 line-km of UTEM, 0.4 line-km of magnetics and one drill hole (K04-199; 246 m) (MacRobbie and Holroyd, 2005a).

The R-15 option was subsequently terminated and no further exploration was done on the KZK Property until 2015, after BMC purchased it from Teck. Following approval of exploration permits in July 2015 BMC began an ambitious exploration program that included building exploration infrastructure, data compilation, re-logging historical drill core, LiDAR and ground-based differential GPS surveys, geophysics (airborne VTEM, ground-based gravity and borehole EM), resource and exploration drilling, metallurgical drilling, petrographic studies, geotechnical drilling, hydrogeological drilling and environmental baseline studies (Hughes et al., 2016). The highlight of this program was the discovery of the Krakatoa Zone immediately southeast of the ABM Zone, which (at the time) added 5.1 Mt (2.1 Mt indicated, 3.0 Mt inferred) to the ABM deposit resource inventory (Green et al., 2016).

Several mineral resource estimates have been completed for the ABM and GP4F deposits by Cominco and Teck (Cominco, 1995; Teck-Cominco, 2007), and also by CSA Global Pty Ltd (“CSA”) on behalf of BMC (Green, 2015a, b; Green et al., 2016). The most recent estimate (Table 2) was completed by CSA in November 2016, (BMC Minerals Ltd., 2016a) and incorporates all of the data up to the end of the 2016 exploration program.

Table 2: Mineral resource estimates for the ABM and GP4F deposits

Deposit	Date	Category	Mt	Cu (wt%)	Pb (wt%)	Zn (wt%)	Au (g/t)	Ag (g/t)	Reference

6.0 2016 WORK PROGRAM DESIGN

Work at KZK during 2016 comprised a multifaceted geological and engineering program that included construction and rehabilitation of new and historical exploration trails, completion of the historical re-logging program, airborne LiDAR and orthophoto survey, airborne and ground-based geophysics (magnetics, EM), diamond drilling (resource, exploration, metallurgical), geochemical assay, petrographic analysis, geotechnical and hydrogeological drilling, test pitting and environmental baseline studies.

6.1 Earthworks

Construction work related to the 2016 drilling program included building of new drill sites and trails, followed by their reclamation when they were no longer needed. Both the construction and reclamation earthworks were completed by Cliff McLeod Contracting of Ross River, Yukon, and Tim Moon Construction Ltd, also from Ross River (both here referred to as “machine operators”). Heavy machinery used included a Hitachi 270 and Link-Belt 290 excavators, Caterpillar D6R and D7 bulldozers, and a Western Star dump truck.

Trails were laid out by Equity staff and/or machine operators, with an emphasis on avoiding tree (mostly spruce) stands. The dozer and/or excavator were used to clear the trail, after which the excavator would cut ditches and place bars/culverts across the trail to guide runoff. Where possible, problematic soft spots were filled with till burrowed from the 18-km mark on the tote road.

Post-drilling reclamation work involved recontouring and stabilizing of trails and pads. Sumps were backfilled after sediment cuttings had settled and the drill fluids had either drained away or was pumped and dispersed into the surrounding vegetation. Reclaimed pads and trails were reseeded with native vegetation.

6.2 Historical core program

Work on “historical” core (Cominco 1994–1998) include relocation to the new KZK Camp, as well as re-logging, -coding and -sampling. Before the 2016 field season, historical core was stored in metal racks at km-25 on the tote road (Figure 3a) whereas BMC’s 2015 core was stored at km-20 in KZK Camp. Reasons for relocating the historical core include consolidation, and clearing out an area targeted for potential exploration and mine infrastructure. Historical core was relocated on 20–24 May 2016, through hand stacking of boxes on pallets followed by forklift-assisted transport to KZK Camp by truck and trailer, where it was wrapped in TYVEK and placed in a cleared out area (Figure 3b). Metal core racks were broken down and also trucked up to KZK Camp.

Re-logging of historical core aimed to complete the significant re-logging work done in 2015, which reviewed 85% (24953 m) of all historical core stored at km-25. Core that was not re-logged in 2015 includes some of the GP4F drilling and several wildcat holes.

The re-logging and re-coding programs were done by Equity personnel in three campaigns; 17 April to 5 May, 21–24 May and 10–29 August 2016. Re-logging was done at KZK Camp, with data collected in GeoSpark core logging software. A total of 24 drill holes were re-logged for 4030 m with the logs attached as Appendix D.

Whereas re-logging only loosely followed the historical drill logs, re-coding generally respected previously defined geological boundaries but changed the lithological codes if necessary. Re-coding work in 2016 focussed on historical and 2015 GP4F drilling, in an attempt to establish consistency with 2016 data. A total of 13 holes were re-coded for 3535.5 m.

A re-sampling program of historical GP4F core was done to confirm Cominco's assay results. Twenty-one samples were taken from nine of the 1998 drill cores, with each re-sample matching the original interval. Re-sampling removed all remaining drill core for that interval. Samples were bagged, sealed and shipped to SGS Mineral Services Geochemistry Vancouver in Burnaby, BC ("SGS"), along with two CRMs and one blank to monitor assay QA/QC. Results of this re-assay program are included with the other 2016 analytical certificates in Appendix L.

Figure 3: Photos of the historical and new core storage areas. (a) Aerial photo of Cominco's historical core racks located at km-25 on the tote road. (b) New storage area for historical core at KZK Camp, where it is stored on pallets and wrapped in TYVEK.

6.3 Terrain surveys

Terrain surveys included an airborne LiDAR survey, as well as ground-based differential GPS (DGPS) surveys. Contractors, procedures and methods used for these programs are summarized below.

6.3.1 Airborne LiDAR

A 341 km² airborne LiDAR survey was completed over the KZK Property by Eagle Mapping Ltd of Port Coquitlam, BC, with the aim of providing a high resolution topographic surface for the core part of the Property ("high priority area"). A large buffer was collected around the 2016 survey area to guarantee accuracy and proper data density within the high priority area.

The airborne LiDAR survey was completed in a single flight out of Watson Lake, Yukon, on 10 June 2016, using a Piper Navajo aircraft operated by Peregrine Aerial Surveys from Abbotsford, BC, fitted with a Riegl Q1560 dual-channel LiDAR system. The survey area comprised a high priority area, which covers the deposit, camp and tote road areas, and a lower priority buffer. High priority surveying comprised 10 lines spaced at 620 m and flown 1000 m above ground level ("AGL") at a speed of 140 knots, in comparison to 1550 m spacing, 1400 m AGL and 160 knots for the low priority area. Point densities averaged 10 points per square metre (p/m^2) as high priority and 2 p/m^2 at low. The scan field of view for the Q1560 is 29° either side of the nadir, for a total scan 58°. A report written by the contractor (Eagle Mapping) is attached as Appendix E.

6.3.2 DGPS

Ground-based DGPS surveys were done by Challenger Geomatics Ltd of Whitehorse, Yukon ("Challenger"), over five campaigns through the course of the 2016 field program (27–30 April, 1–2 June, 1 July, 2–4 August, 30 September 2016). All surveying was completed in NAD83 UTM Zone 9 with Leica Real Time Kinematic (RTK) DGPS survey equipment and Leica Viva Global Navigation Satellite Systems (GNSS). Radio base stations were set up in proximity to the survey sites providing RTK corrections when radio contact was possible, which applies to most of the KZK project. However, radio contact could not be established from the GP4F area and so the GNSS vectors were post-processed to provide the final survey location.

A report and data from Challenger is attached as Appendix F. Surveyed coordinates for all of the 2016 drill holes as well as the un-surveyed 2015 holes are included in Appendix G.

6.4 Geophysical surveys

Geophysical work done in 2016 includes an airborne magnetic and versatile time domain electromagnetic (VTEM) survey and ground-based borehole electromagnetic (BHEM) surveys. The procedures and methods for these surveys are summarized below and described in more detail by the contractor reports (Geotech Ltd, Aurora Geosciences) attached as Appendices H and I, respectively.

6.4.1 Airborne magnetics and VTEM

A 902 line-km VTEM survey was flown over the KZK Property to the north, west and north-east of the 2015 survey (Hughes et al., 2016), in order to cover the remainder of the Property and identify anomalous areas that could reflect additional VMS targets. Work was undertaken by Geotech Ltd. from Aurora, Ontario, ("Geotech") between 23 April and 3 May 2016. An Astar 350 B3 helicopter and pilot was contracted by Trans North Helicopters of Whitehorse, Yukon, ("Trans North"). The survey was flown as part of a larger airborne survey on all of BMC's property holdings in the area. The contractor report is attached as Appendix H.

The 2016 VTEM survey covered an area of approximately 121 km² and was flown at an azimuth of 015° with a traverse line spacing of 150 m. The total distance surveyed includes 902 line-km of first pass surveying and 36.3 line-km of reflights, for a total 938.3 line-km flown. Tie lines were flown perpendicular to the traverse lines at a spacing of 1500 m. Navigation was achieved using a NovAtel Wide Area Augmentation System (WAAS) -enabled GPS receiver and screen display, for the pilot to direct flight, as well as a NovAtel GPS antenna mounted on the helicopter tail. During the survey an average altitude of 81 m above ground surface was maintained using a Terra TRA 3000/TRI 40 radar mounted beneath the cockpit, and an average speed of 80 km/hr was maintained. This allowed for an average transmitter-receiver loop terrain clearance of 50 m and a magnetic sensor clearance of 60 m.

Data acquisition was made with a Geotech versatile time-domain electromagnetic (VTEMplus) system with receiver and transmitter coils in a concentric-coplanar and Z direction oriented configuration. The receiver system also included a coincident-coaxial X direction coil. The transmitter-receiver loop was towed at a mean distance of 31 metres below the helicopter with measurements consisting of the vertical (Z) and In-line horizontal (X) components of the EM fields. The aeromagnetic total field was measured using a horizontal magnetic gradiometer with two Geometrics split-beam field magnetic sensors with a sampling interval of 0.1 seconds. The sensors are mounted 12.5 metres apart on a separate loop, 10 metres above the EM transmitter-receiver. A GPS and gyro inclinometer are also installed on aeromagnetic field loop to accurately record the tilt and position of the magnetic bird. A magnetometer/GPS base station was set up away from all infrastructure at the back of KZK Camp. Base station data was used during the post-processing of survey data at the end of each day.

Quality assurance and quality control (QA/QC) of airborne survey data was monitored by Dr. Jules Lajoie, P.Eng., of Vancouver, BC. QA/QC checks included assessment of (a) horizontal deviation from the planned flight path, (b) terrain clearance, (c) noise on magnetic recordings, (d) magnetic diurnal variation, (e) recording failures in the navigational systems or deliverable instrumentation, (f) connectivity to navigational satellites, (g) along-line sampling and (h) the normally processed last time gate for the Z component. Excessively high terrain clearance led to 36.3 line-km of reflights to bring the survey within QA/QC specifications.

6.4.2 Borehole EM (BHEM)

The ground-based borehole electromagnetic (BHEM) surveys were done to try and detect off-hole EM conductors that could represent additional drill targets. Work was undertaken by Aurora Geosciences Ltd of Whitehorse, Yukon, ("Aurora") over five separate campaigns lasting from 28 June to 7 July, 29 July to 12 August, 2–5 September, 16–18 September and 26–28 September, 2016. Surveys were completed on the Krakatoa Zone, ABM Zone, Sebesi target and Tarawera target.

Eleven drill holes were surveyed for a total of 6790 m, split between the Sebesi target (4 holes, 3185 m), Krakatoa Zone (4 holes, 2152 m), Tarawera terget (1 hole, 855 m) and ABM Zone (2 holes, 599 m). Four transmitter loops were utilized during the course of the program with the largest of these encompassing all of the Sebesi and Krakatoa drill holes. Smaller single-use survey loops were used for the ABM and Tarawera holes. All surveyed drill holes were located inside the transmitter loops, with the loops positioned so as to optimize coupling with the expected conductor geometry.

BHEM surveys were done with a Volterra Borehole EM probe with a Volterra transmitter assembly and a receiver powered by a Honda 2 kW generator. Ten of the 11 surveys were completed through the drill string as the diamond drill crew pulled rods, which ensured the hole did not collapse before the survey could be completed. The probe assembly was hung through the core barrel and the drill bit, extending 9 m from the drill bit to the bottom of the probe. Station spacing was in multiples of 3 m to account for the intervals available with 3 m drill rods so that the actual station spacing varied between 6 m and 15 m. The larger station spacing was used in lower priority parts of the hole dictated by the project geologist prior to completing the survey. Readings were made 20 seconds after the drill crew had shut down the drill after removing the selected rods. Each reading was at least 120 seconds in length to provide an adequate signal to noise ratio while allowing a large number of readings to be recorded in a single survey. Measurements were made for four components at each survey station: A (axial down hole), U (transverse to axial in the vertical plane containing the drill hole), V (transverse to axial in the horizontal plane containing the drill hole) and B-field coil (axial down hole), utilising 20 channels (channel 20 = early time, channel 1 = late time). A logistics report provided by Aurora, along with the processed results for each survey, are included as Appendix I.

DDH K16-369 was surveyed in an open hole with the use of a hand winch, with survey stations located via a winch counter and station spacing set at 5 m intervals. A discrepancy between the counter and EOH depth likely resulted from poor calibration of the counter, and required reduction of the final station spacing to 4.6 m.

6.5 Resource and exploration drilling

The 2016 drilling program included, resource infill and expansion drilling of the Krakatoa Zone (N = 32), infill drilling at the GP4F deposit (N = 7), expansion drilling on the ABM Zone (N = 3), and exploration drilling on the ABM-proximal Sebesi (N = 11) and Tarawera (N = 1) targets, for a total of 53 drill holes and 16897.98 m (Table 3). Nine of these holes also helped to meet the objectives of the metallurgical program (see section 6.6). Surveyed drill collar locations are presented in Appendix G and drill logs are attached as Appendix J. Sectional interpretations are attached as Appendix K.

The Krakatoa Zone resource infill drill program was designed to upgrade mineralization categorized as "inferred" (Green et al., 2016) into "indicated" or "measured" status. Drilling aimed to generate a staggered pierce point pattern with nominal 50 m spacing between points that tied into the 2015 program. Expansion drilling was designed to test downdip of pierce points like DDH K15-277, which intersected a thick upper lens and lacked any further downdip pierce points. Borehole EM surveys were completed on two of the 2016 expansion and two infill holes.

Infill drilling on the GP4F deposit was designed to upgrade mineralization from inferred (Green, 2015b) to indicated, and test the "lower target" described by Jones (2016). Drilling was designed to complete six 50 m-spaced pierce points over two sections.

Resource expansion drilling at ABM was designed to test for ABM Zone to the west ("west target") and downdip of the defined resource. Borehole EM surveys were completed on two of the three holes.

The Sebesi drill target encompasses a fault-bounded block of KZK stratigraphy lying adjacent to the fault-bound block hosting the Krakatoa Zone. Drill holes were designed to test for mineralization that was downthrown or laterally offset relative to the Krakatoa Zone and were spaced to maximize coverage of both drilling and subsequent borehole EM surveys.

The Tarawera target was recognized through anomalous Zn + Ba historic soil geochemistry, sphalerite- and galena-bearing float found on a reconnaissance traverse in 2015, prospective stratigraphy and an EM anomaly identified in the 2015 airborne VTEM survey that was modelled as a northeast-dipping plate. A single hole was drilled to test the plate model and prospective stratigraphy, and a borehole EM survey was also completed.

Hy-Tech Drilling Ltd. of Smithers, BC, ("Hy-Tech") and New Age Drilling Solutions of Whitehorse, Yukon ("New Age") completed the 2016 KZK drilling program. Hy-Tech drilled from 1 May to 14 August 2016, completing the geotechnical and most of the Krakatoa Zone programs using two skid-mounted Tech 5000 diamond drill rigs. New Age drilled from 17 June to 28 September 2016, using one skid-mounted and one helicopter-portable Zinex A5 diamond drill rig to complete the GP4F and Tarawera drilling, and parts of the Sebesi and Krakatoa program. All drilling was done as either triple tube HQ3 or NQ3, with inner splits used to maximize core recovery.

Trans North Helicopters Ltd of Whitehorse, Yukon, ("Trans North") provided helicopter support for drill moves and logistical support. Yukon-based contractors hired through Equity built lumber drill pads for helicopter-supported drilling, with sites cleared by the pad builders using a CanDig Mini Excavator.

Table 3: Summary of 2016 resource and exploration drilling

Zone	Target	DH Type	DHs (N.o.)	Metres	Comments
Krakatoa	Upper and main lenses	Resource infill ± metallurgical	28*	6283.2*	Includes 5 abandoned holes for 248.1 m
		Resource expansion	4	2340.0	Downdip tests
GP4F	GP4F lens	Resource infill ± metallurgical	7*	1553.6*	Includes one twinned hole drilled to correct block error
ABM	ABM lens	Resource expansion	3	770.0	Downdip and west-marginal tests
n/a	Sebesi	Exploration	11	5096.6	Includes 7 abandoned holes for 1911.3 m
n/a	Tarawera	Exploration	1	854.5	
2016 Total			**54**	**16897.9**	

*Includes dual purpose infill and metallurgical drill holes

6.5.1 Collar and downhole surveys

Drill hole collars were spotted with either a handheld GPS or were laid out by Challenger using their RTK DGPS. After completion of the hole, drill collars were marked with a wooden stake and surveyed with an RTK DGPS. These coordinates and other collar data are attached as Appendix G.

Prior to drilling, the drill rig was aligned to the planned azimuth using a Reflex Azimuth Positioning System (APS) or TN14 gyrocompass. The APS is a GPS-based compass that is unaffected by ferromagnetic materials and produces azimuth measurements whose accuracy depends on satellite connectivity ("integrity"), with 80% integrity yielding approximately 0.5° accuracy. The TN14 gyrocompass is a gyroscope-based compass that is likewise unaffected by ferromagnetic materials but has an advantage over the APS in that it does not rely on a satellite GPS signal, which can be blocked and/or reflected by drill machinery (e.g. Frischman and Clifford, 2010). Azimuth measurements are reportedly accurate to within ±0.2°, depending on latitude. Holes K16-338 to 357 were aligned with the APS whereas K16-358 to 419 were lined up with the TN14. For both units, alignment was completed in true north and converted to UTM grid north by adding 1.4°. The dip was generally set by the drill crew under instruction from the site geologists, using an inclinometer with a magnetic base.

Downhole orientation surveys were completed using both a Reflex EZ-shot system and Reflex Gyro downhole probe. The EZ-Shot measures drill hole azimuth relative to magnetic north, as well as dip and magnetic field strength. Magnetic north azimuth readings were converted to UTM grid north by adding 22.1°. The first EZ-shot survey was typically completed once the drill hole had penetrated 12–18 m into bedrock,

followed by tests at 24 m intervals as the hole progressed. Survey results were flagged as “false” if the measured azimuth was strikingly different from those on either side of it, which is due mainly to magnetic interference (i.e. magnetic bedrock, drill string). Such interference is often indicated by magnetic field strength readings of <5600 nT or >6000 nT.

The Reflex Gyro probe utilizes a surface referenced micro-electromechanical system (MEMS) that measures drill hole azimuth and dip deviation relative to a known starting point (i.e. TN14 or APS azimuth, setup dip). Measurements are unaffected by ferromagnetic materials so that the Gyro can be used inside the drill string. Gyro surveys are typically done at the completion of the drill hole with readings taken at 5 m intervals and a second survey done to provide a check on data quality. The “0 m” starting azimuth for the Gyro survey was set equivalent to the TN14 alignment.

All resource and exploration drill holes were surveyed with the EZ-shot system whereas 51% were also surveyed with the Gyro, including all ABM expansion holes, all GP4F drilling and 44% of the Krakatoa resource holes.

Drill core was oriented in every 2016 hole, from the base of overburden until the end of hole (EOH). The bottom-of-hole orientation mark was placed by the drill crew with the help of a Reflex ACTII RD core orientation system. Following transport to the core shack, geotechnicians would realign the core and draw a blue orientation line if the bottom of hole mark could be accurately related to the rest of the drill run. Orientation lines were transposed onto adjacent runs if the start or end of the runs could accurately fit together. Alpha and beta angles of structural features were recorded along with a confidence rating on a scale of 1 to 3 as follows: (1) not certain of orientation and measurement, (2) moderate confidence since core matches well with orientation mark, and (3) high confidence because orientation line matches well for entire drill run.

6.5.2 Geotechnical core logging

All drill core (100%) was geotechnically logged, with logging data captured in GeoSpark software, an Access-based database management system. Geotechnical core logging was done by geotechnicians and involved measuring recovery, rock quality designation (RQD), magnetic susceptibility and bulk density. Results are captured within data tables named “Geotech” (recovery, RQD), “Geophysics” (magnetic susceptibility) and “Specific Gravity” (bulk density).

Recovery was measured to the nearest centimetre, from core block to core block and from the base of overburden to the end of hole. The total recovery for the 2016 drilling program was 91.7%, which is calculated by summing all of the core recovered and then dividing by the difference of drilled metres minus overburden. Overall, the 2016 recovery is slightly higher than the 2015 program (89.8%).

Rock quality designation (RQD) was also measured from core block to core block, comprising the sum of all naturally fractured core lengths >10 cm in length divided by the run length. Natural fractures include breaks that are inherent to the lithology (e.g. joints) but not mechanical breaks generated by drilling. Average RQD is broadly similar for the 2015 (47.9%) and 2016 (51.6%) programs, thereby more-or-less validating the accuracy of both data sets.

Magnetic susceptibility on the first 14 holes (K16-337 to 350) was measured with a Terraplus KT-10 magnetic susceptibility meter (“KT-10”) whereas holes K16-351 to 419 were measured with a multi-parameter (MPP) probe from Instrumentation GDD Inc.. KT-10 measurements were taken at 1 m intervals and then averaged over 3 m lengths, starting from below the base of overburden to the end of hole. A switch to the MPP probe was made to expedite the measurement process, as this instrument provides more rapid readings and file transfer capabilities. MPP measurements were taken 0.5 m intervals from the top to the bottom of the drill hole. Descriptive statistics (Table 4) show a reasonable match between the 2016 KT-10 and MPP data. The slight differences are likely a result of the KT-10 data being an average of three measurements.

Table 4: Magnetic susceptibility data collected as part of the 2016 drill program

Campaign	Instrument	Readings	Mean	Std dev	Skew	Min	25th %ile	Median	75th %ile	Max
2016	KT-10	846	1.7	12.9	13.5	0.0	0.0	0.2	0.3	248
	MPP probe	31484	2.4	21.4	21.7	0.0	0.0	0.3	1.1	796

A total of 3175 bulk density (BD) measurements were completed, mostly on each entire half- or quarter-core sample submitted for analysis (N = 1921) as well as representative 10–15 cm long whole core samples of various hanging wall and footwall lithologies (N = 865) and standards (N = 389). Each of these samples was twice weighed in a basket suspended below a digital metric balance, once in air and a second time in water (i.e. "water immersion method"). Measuring directly on the scale was avoided due to magnetic interference concerns. No measurements were taken on excessively friable or broken samples.

The two standards used to monitor BD measurements were each calibrated by averaging 50 measurements, which returned bulk densities of 4.60 ± 0.10 g/cm^3 for a piece of NQ-sized massive sulphide (SG MXSX standard) and 2.65 ± 0.05 g/cm^3 for a BQ-sized piece of porphyritic rhyolite (SG RHY standard). Weights of these standards overlap with core samples. One standard was weighed for every nine bulk density measurements.

Additional bulk density measurements were completed by SGS on 223 sample pulps using the pycnometer method, as an independent confirmation of the accuracy of the water immersion method. Certificates of analysis for the pycnometer testing program are attached in Appendix L, along with the analytical certificates.

6.5.3 Geological core logging

Geological logging was completed by the onsite geologists, who collectively logged 100% of the core drilled in 2016. Core logging focussed on lithology, mineralization, alteration, structure, veining, oxidation intensity and geodomain classification, with data captured in GeoSpark software. All drill core was photographed prior to sampling and is stored on pallets at the KZK Camp, along with relocated historical core. Drill logs are attached as Appendix J.

Lithology was logged with the same coding system defined in 2015 (Hughes et al., 2016), with the addition of new codes for pelite (PEL) and chert (CHT). As well, the Wind Lake-specific mudstone code (MDU) was dropped in favour of a generic code for mudstone (MDS), and a column was added to specify the geological formation (e.g. KZK, Wind Lake). Intervals logged with sparsely used codes (e.g. WCK for greywacke) were re-coded as a more generic lithology (e.g. SED) and the sparely used code was then eliminated as a coding option.

Mineralized intervals are recorded in the mineralization table and, if modal sulphide abundances are high enough, the lithology table as well. Within the lithology table, mineralized intervals with >60% modal sulphide are logged as massive sulphide (e.g. OA, OB) and those with 20–60% sulphide are broken out as semi-massive sulphide (e.g. OI, OJ). At GP4F, however, semi-massive lithologies are broken out at ≥10% modal sulphide due to the high sphalerite proportions and the possibility that some of the base metal budget is carried by non-sulphide phases like gahnite. Intervals with <20% sulphide (or <10% at GP4F) are logged as silicate rock with the type and abundance of sulphide recorded in the mineralization table (e.g. 5% PY).

Alteration is logged in the alteration table of the GeoSpark database, with key features recorded including mineral type (e.g. MU for muscovite, CL for chlorite) and an interpreted origin as either "original" (OR) or "overprint" (OP) alteration, corresponding to syngenetic hydrothermal and regional metamorphic events respectively. So an interval logged as "original muscovite" (OR MU) refers to syngenetic hydrothermal alteration that includes, for example, the Type 3 muscovite alteration that envelopes the ABM deposit. "Overprint muscovite" (OP MU) alteration, on the other hand, relates to widely developed sericitic alteration of felsic volcanic and lacks an obvious link to a localized hydrothermal system. Other important alteration types include original chlorite (OR CL), which is equal to Type 4 proximal chlorite alteration, and original cordierite (OR CI), which is equivalent to Type 5 restricted cordierite alteration.

Structures were characterized as "type" (i.e. fault, foliation), attributed an intensity on a scale of 1 to 7 (1 = trace, 7 = intense) and, at the very least, given an angle to core axis (alpha angle). Orientations measured on oriented core were also given a beta angle and orientation confidence on a scale of 1 to 3, where 1 is lower certainty and 3 is highest. Approximately 90% of all structural records (N = 3362) are for the dominant, or joint,

foliation (DFOL, FOL) and fault zones (FLT). Fault zones that prevent reliable interpretation of protoliths are recorded as fault zone (FLZ) within the lithology table as well.

Veins were logged as sets that were characterized by a core depth from and to, mineralogy, angle to core axis and percent abundance within the defined interval. Oxidation was logged on an intensity scale of 0 to 4, where 0 is unoxidized and 4 is completely oxidized. The geodomain classification was typically applied by the project geologist after core logging was complete and the drill trace plus data was imported into MicroMine. Classifications include three metallurgical domains for ore and nine metallurgical domains for waste rock, and used the codes developed in 2015 (Baker, 2015a; Duncan, 2015).

6.5.4 Geochemical sampling and assay

A total of 2094 samples were submitted for geochemical assay, comprising 1858 HQ3 and NQ3 half-core and quarter core samples, 102 blanks and 134 certified reference material (CRM) samples. Each of the core samples was marked with a unique sample tag in the core box. All mineralized intersections were sampled along with 1–10 m of the immediate hanging wall and footwall rock to characterize waste rock dilution. Core samples were constrained by lithological contacts and, if possible, alteration and mineralization features as well. Mineralized samples had a nominal sample length of 1.0 m and a minimum length of 0.3 m whereas barren or weakly mineralized samples have typical nominal and minimum sample lengths of 1.5 m and 0.5 m respectively.

Half core samples were cut parallel to the core axis with an open circulation rock saw. Quarter core samples were initially split to provide a half core metallurgical sample, then quartered parallel to provide one sample for geochemical assay and a second quarter retained in the core box for reference. Split core was consistently sampled from the same side, then placed into labelled plastic sample bags that were sealed with a plastic zip tie. Samples were then packed into rice bags together with QA/QC samples (i.e. certified reference materials, blanks), sealed with security tags and then shipped to SGS Mineral Services Geochemistry Vancouver in Burnaby, BC, (“SGS”) for geochemical assay. A list of required quartz washes to follow suspected high-grade samples was also submitted to SGS, in order to avoid contaminating adjacent lower grade samples. These quartz washes were completed at the crush and pulveriser stage of sample preparation.

Each core sample was analyzed for selected base metals (Cu, Fe, Pb, Zn), precious metals (Ag, Au) and trace elements (As, Ba, Bi, Hg, S, Sb, Se), with all analytical certificates attached in Appendix L. Quality assurance and quality control (QA/QC) of these analyses was monitored through the insertion of certified reference materials (CRMs) and blanks alternately every 10 samples into the sample sequence, and through two check assay programs. A review of the QA/QC program is attached as Appendix M.

All CRMs were manufactured from sulphide ores and are the same as those used during the 2015 drill program (Hughes et al., 2016; Voordouw, 2016b). The CRMs are certified for Cu, Pb, Zn at the % level, as well as Au and Ag at the ppm level, and were originally selected to match low-, medium- and high-grade mineralization. During sampling, CRM selection was based on the tenor of surrounding mineralization, with CDN-ME-1311 used for low-grade, OREAS 621 and 623 used sequentially for medium-grade, and OREAS 113, GBM310-16 and G312-4 used for high-grade. A minimum weight of 100 g was used for CRM samples so that reanalyses could be completed if required. Blank material comprised the same barren landscaping stone that was calibrated in 2015 (Hughes et al., 2016; Voordouw, 2016b). The CRM suite was more widely used in 2015 with three CRMs preferentially used in 2016 and GBM310-16 only used once (Table 5).

Table 5: CRM usage during the 2015 and 2016 drilling programs

CRM Type	Number of times used	
	2015	*2016*
CDN-ME-1311	109	65
OREAS 621	63	34
OREAS 623	62	34
OREAS 113	14	0
GBM310-16	15	1
G312-4	9	0

ALS Minerals of North Vancouver, BC, completed check assays on 64 pulps with methods analogous to those used by SGS (Table 6). Overall, QA/QC samples including blanks, CRMs and check assays comprised 14% of all 2016 analyses.

Drill core and blank samples were weighed, dried and crushed to 75% passing 2 mm, and then separated into a 250 g split that was pulverized to 85% passing 75 microns. Analytical methods are summarized in Table 6 for each element and for those elements requiring different methods at higher concentrations (i.e. Ag, Au, Ba). Descriptions of these methods can be found in the services brochure of the SGS and ALS websites. An Na_2O_2 fusion was picked for base metal analysis as it provides a complete digestion and thereby a near total chemical analysis.

Table 6: Overview of assay methods used for 2016 core (SGS) and check assays (ALS)

Element	SGS			ALS		
	Code	*Range*	*Method*	*Code*	*Range*	*Method*

6.5.5 Petrographic studies

Four samples were submitted to Vancouver Petrographic Ltd of Langley, BC, for petrographic analysis. These analyses were done with a transmitted light microscope, with results including an estimate of the modal mineralogy and descriptions of mineralogy and texture. A report written by Vancouver Petrographic (Leitch, 2016) has more detailed descriptions and is attached as Appendix N.

6.6 Metallurgical drilling

The 2016 metallurgical drilling program consisted of seven dedicated drill holes (1055.4 m) and nine dual purpose holes, with eight of these drilled as resource infill holes (1459.2 m) and the ninth drilled to confirm a coincident core measurement and rod count error (185.0 m), for a total of 2699.6 m of drilling (Table 7). Drilling was split between the Krakatoa Zone, GP4F deposit and ABM Zone, and was done by the same two contractors (Hy-Tech, New Age) who completed the resource and exploration drilling (section 6.5). All metallurgical drilling was done as HQ3 size core to maximize material for metallurgical testing. Collar data, including coordinates, azimuth and dip, are included in Appendix G.

Metallurgical work on the Krakatoa Zone aimed to collect representative samples of the upper and main lenses. Upper lens material was collected from four drill holes (K16-344, 345, 347, 349) located within the proposed open pit whereas main lens material was collected from two holes (K16-340, 378), one of which (K16-340) was drilled downdip through a thick segment that occurs in both the proposed open pit and underground mining areas.

Table 7: Summary of the 2016 metallurgical drilling program

Zone	Target	DH Type	Dedicated holes			Dual-purpose holes		
			DHs (N.o.)	*Metres*	*Samples*	*DHs (N.o.)*	*Metres*	*Samples*
Krakatoa	Upper and main lenses	Metallurgical	2	443.5	153			
		Resource infill + metallurgical				4	757.9	177
GP4F	GP4F lens	Resource infill + metallurgical				4	701.3	97
		Twin + metallurgical				1	185.0	22
ABM	ABM lens	Metallurgical	5	611.9	344			
2016 Total			**7**	**1055.4**	**497**	**9**	**1644.2**	**296**

The GP4F metallurgical program was designed to collect representative samples of the GP4F and lower lens, and was done in conjunction with infill drilling. Hence, all of these hole were drilled perpendicular to the dip direction rather than parallel as in most dedicated metallurgical holes.

The primary purpose of the ABM metallurgical drilling was to collect additional near-surface samples that would reflect years 1 and 2 of the mine plan. All five of holes were drilled downdip to maximize the amount of mineralized material per metre drilled.

A total of 771 HQ3 half core samples and 22 HQ3 whole core samples were collected as metallurgical samples from 16 drill holes, for 793 samples. Each sample interval was matched to a parent assay sample that was submitted for geochemical assay. Metallurgical samples were marked with a unique, wax coated, sample tag in the core box. Half core samples were initially cut in half with an open circulation rock saw, parallel to the core axis, with one-half forming the metallurgical sample and the second half cut into quarters to form the assay (or “metallurgical parent”) and reference samples. Metallurgical samples were placed into labelled plastic sample bags, sealed with a plastic zip tie and shipped in sealed rice bags to Small’s Expediting in Whitehorse, Yukon, for storage in a refrigerated sea container. A list of metallurgical samples collected in 2016 is attached as Appendix O.

6.7 Geotechnical investigations

Geotechnical investigations completed in 2016 included diamond drilling, test pitting, geotechnical logging as well as field and laboratory testing of geological materials. The bulk of this work, including 16 of the 20 geotechnical drill holes (631.0 m) and all 53 test pits, was carried out as part of the mine site geotechnical investigation conducted by Knight Piésold Consulting of Vancouver, BC ("Knight Piésold"). The remaining four holes (608.1 m) were drilled as part of the Krakatoa rock quality investigation, which also included detailed geotechnical logging of several Krakatoa resource drill cores. Both programs are summarized in the subsections below and geotechnical drill production is summarized in Table 8. Geotechnical data collected as part of the mine infrastructure and Krakatoa rock quality programs is attached in Appendices P and Q respectively.

Table 8: Summary of the 2016 geotechnical drilling program

Program	DH Type	Dedicated holes		Dual-purpose holes	
		DHs (N.o.)	*Metres*	*DHs (N.o.)*	*Metres*
Mine site geotechnical	Geotechnical	10	381.6		
	Geotechnical and hydrogeological	6	249.4		
Krakatoa rock quality	Geotechnical	4	608.1		
	Resource and geotechnical			15	3665.5
2016 Total		**20**	**1239.1**	**15**	**3665.5**

6.7.1 Mine site

The 2016 KZK mine site geotechnical investigation was conducted by Knight Piésold and comprised excavation and logging of 53 test pits, followed by the drilling and logging of 16 geotechnical drill holes. In addition, Knight Piésold conducted standard penetration testing (SPT) on surficial materials, point load testing on representative rock core samples, and *in situ* packer testing at regular intervals during drilling (Knight Piésold Ltd., 2016). Laboratory index testing of select test pit and SPT overburden samples was also done, as well as lab-based unconfined compressive strength (UCS) testing of select rock core samples. Geotechnical data collected by Knight Piésold during the mine site investigation is attached as Appendix P.

Test pitting was completed between 18–26 May 2016, with a total of 53 pits dug by a Link-Belt 290 excavator provided by T. Moon Construction Ltd of Ross River, Yukon ("Tim Moon") and under the supervision of Knight Piésold. Test pits were spotted with a handheld GPS and dug to the top of bedrock, unless the excavation was stopped because of machine capabilities, groundwater ingress, wall instability and/or permafrost. Test pit walls and stockpiles were geotechnically logged and samples were collected for additional laboratory testing. Pits were accessed using existing trails and roads when possible but required making some new trails. Each test pit was reclaimed through backfilling and recontoured to match the pre-excavation ground profile.

Forty overburden samples collected from the test pits underwent off-site laboratory testing to supplement the field data. Samples were sent to the Knight Piésold Geotechnical Soils Laboratory in Denver, Colorado, ("KP Soils Lab") for tests on natural moisture content, particle size distribution and hydrometer analysis, standard proctor compaction, triaxial compression and flexible wall permeability.

Sixteen geotechnical holes were drilled by Hy-Tech, using a skid-mounted and then helicopter-portable Tech 5000 diamond drill retrofitted with an SPT hammer. This drill was converted from skid-mounted to heli-portable at KZK Camp. Drill hole locations were spotted by the project geologist using a hand held GPS whereas actual collar locations were measured with a RTK DGPS (see also section 6.5.1). Downhole surveys were not requested, as all of the drill holes were vertical. Core was drilled as HQ3 size using triple tube methods to maximize recovery. The methodology summarized below is adapted from Knight Piésold (2016).

Drilling and logging of the geotechnical drill holes also included standard penetration testing (SPT) of surficial materials, point load testing (PLT) on representative core samples, and *in situ* packer hydraulic conductivity testing ("packer testing") at regular intervals. SPTs were performed at approximately 1.5 m

intervals until bedrock was encountered to estimate the state (compactness) of the material and to obtain samples for laboratory testing. Tests were conducted with an automatic hammer equipped with a 610 mm AWJ split spoon sampler. Blow counts were recorded at four continuous 150 mm intervals for a maximum sampling length of 600 mm. The N-value was determined as the sum of the blow counts for the second and third interval and can be related to the compactness of the soil. The tests were terminated prior to reaching the maximum sampling length when less than 150 mm penetration per 50 blows was achieved. The length of the incomplete test was recorded when early refusal occurred.

PLTs were performed on core samples at the drill using a portable hydraulic testing apparatus with calibrated gauges. The field PLT results provide a preliminary indication of intact rock strength (Appendix P). The PLT test procedure consists of inserting a rock specimen between two conical steel platens. The distance between the platens is recorded and then a load is steadily applied and increased until the sample fails. The test data allows the calculation of the Point Load Index (Is50), which is used as an index for strength classification and for correlation with UCS. This strength classification can be used to qualitatively assess the differences in rock mass strength across the site.

Packer testing was completed at 6–10 m intervals with a nitrogen-inflatable single-packer system manufactured by RST Instruments Ltd of Maple Ridge, BC. The procedure involved flushing the drill hole with water, inflating the packer and 10–15 minutes of constant pressure water injection into the isolated zone, with injected water volume measured with a flow meter. The injection pressure and volume of water pumped into the bedrock are used to calculate the hydraulic conductivity of the rock mass.

Ten-node thermistor cables were installed in nine of the geotechnical drill holes, with the purpose of establishing ground temperature profiles across the project site. Six of these installations were completed during the drill program, with each attached to PVC pipe, lowered downhole and then grouted in place with a mixture of cement and bentonite powder. The three installations completed after the drill program were done by lowering thermistor cables into an empty PVC housing installed by the drill crew, and then encasing the thermistor in silicone oil. A DT2055B data logger was installed at each location to collect and record temperature measurements at regular intervals. A plastic protective casing was installed over the data logger at each site.

Geotechnical logging involved applying soil and rock mass classification systems for each drill hole. Attributes collected for soil classification include type, particle size, particle shape, plasticity, moisture content, unit, colour, odour, fabric, structure and compactness (or consistency). Characteristics described for rock mass classification include rock quality designation (RQD), estimated UCS, lithology, and the number and condition of discontinuities. The RMR_{89} system (Bieniawski, 1989) for rock mass classification was implemented to define zones of weakness and general rock mass conditions for bedrock.

Select overburden and rock samples underwent off-site laboratory testing to supplement field data collected across the mine infrastructure sites. Twenty overburden samples collected during SPT tests were sent to the the KP Soils Lab to determine natural moisture content, particle size distribution and hydrometer analysis. In addition, eight samples of bedrock were sent to the Rock Mechanics Laboratory at Queen's University in Kingston, Ontario, for UCS testing to characterize the strength of the shallow bedrock.

6.7.2 Krakatoa rock quality

The 2016 Krakatoa rock quality investigation was completed by BMC and Rockland Ltd. of North Vancouver, BC ("Rockland"). This aim of this work was to define geotechnical engineering properties for lithological units comprising and associated with the Krakatoa Zone. The work program included drilling of four dedicated diamond drill holes for 608.1 m (Table 7) as well as detailed geotechnical logging on 15 of the 2016 Krakatoa resource holes, for an additional 3665.5 m. The four dedicated holes were planned to intersect the vertical centre of the pit wall at four equidistant locations within the proposed open pit design, and penetrate ~50 m into the primary faults that bound the Krakatoa Zone (Haque, 2016). Geotechnical data collected during the Krakatoa rock quality investigation program is attached as Appendix Q.

Drilling alignment, downhole survey and collar survey procedures were the same as those used for the resource and exploration drilling (Section 6.5). Core was drilled as HQ3 size using triple tube methods with

inner split tubes and drill crews used a Reflex ACTII RD core orientation system to orient drill core from the base of overburden to the end of hole. Geotechnical logging was completed at the drill site whilst the core was still in the splits.

The geotechnical logging system used to developed a rock mass classification involved measuring rock strength proxies (e.g. recovery, RQD, fracture frequency), structural orientations (e.g. alpha and beta angles, structure type, orientation confidence level) and specific engineering properties, like joint set number, joint roughness, joint alteration, weathering/alteration index and rock strength (hammer, point load and UCS testing). Packer tests were completed following the same procedures described in Section 6.7.1.

6.8 Hydrogeological investigations

The 2016 hydrogeological work program was done in conjunction with the mine site geotechnical investigation program (i.e. section 6.7.1), and involved drilling six deep monitoring wells and three shallow wells (Table 9).

Drilling contractors and methods were the same as those used in the geotechnical site investigation (section 6.7.1), although each well hole was drilled without the use of drilling additives or rod grease. Once drilling was complete the holes were then flushed with clean water until the water return out of the casing was clear. Recovered core was reviewed by Knight Piésold staff to select a suitable zone over which the well screen would be installed. Screened zones were selected to target areas of increased permeability identified by geotechnical logging and packer testing.

Hydraulic conductivity packer testing was completed in 16 drill holes comprising all six of the deep monitoring wells and 10 holes drilled for geotechnical purposes. No packer testing was done on the three shallow wells. Single packer profile testing was completed at 6–10 m intervals during drilling to estimate the hydraulic conductivity of the bedrock, following the same procedure described in Section 6.7.1.

Table 9: Summary of the 2016 hydrogeological drilling program

Program	Type	Dedicated holes		Dual-purpose holes	
		DHs (N.o.)	*Metres*	*DHs (N.o.)*	*Metres*
Mine site hydrogeological	Hydrogeological	3	18.0		
	Geotechnical and hydrogeological			6	249.4
2016 Total		**3**	**18.0**	**6**	**249.4**

Monitoring wells were installed in all nine hydrogeological holes and were constructed using 1.5” diameter flush-threaded schedule 50 PVC riser pipe. Holes that extended below the base of the selected screen zone were backfilled to the required depth with alternating layers of sand and bentonite pellets. This was followed by a layer of bentonite pellets to seal off the drill hole below the completion zone. A 0.5 m layer of coarser filter sand was placed above the bottom bentonite seal to protect the well screen. A bottom end cap was placed on the slotted PVC screen and lowered onto the coarse sand layer down hole along with the PVC riser pipe assembly. Filter sand was poured down the drill hole to fully encompass the screened section and approximately 0.5 m of riser pipe above the screened interval. A bentonite plug with a minimum thickness of 1 m, was placed on top of the sand pack and the hole was then grouted to surface. Depths to the sand pack and bentonite horizons were monitored throughout the installation using a tag line. Each installation was completed with the placement of a lockable steel monument over the exposed PVC at surface.

Three vibrating wire piezometers (“VWP”) were installed at different depths in K16-379 to monitor the pore water pressure profile with depth and time. The VWPs were attached the schedule 40 PVC pipe as it was lowered down the hole. The pipe and piezometers were then grouted into place from the bottom of the hole using a cement and bentonite powder mixture that was pumped down through the PVC. The VWPs were monitored throughout the grouting process to track grouting progress and to ensure no damage was done to the instruments. A permanent DT2055B data logger was installed at surface to regularly record pressure and temperature measurements. A plastic protective casing was also installed to protect the data logger.

6.9 Environmental studies

Several environmental and social studies were continued in 2016 in an effort to characterize the baseline conditions of the project area. This work includes ongoing studies on the acid rock drainage (ARD) potential, monitoring of surface and groundwater water quality and quantity, fish and fish habitat surveys, wildlife and wildlife habitat surveys, vegetation and soil studies, climate measurements and heritage surveys. Alexco Environmental Group ("Alexco") of Whitehorse, Yukon, completed most of this work. In addition, Knight Piésold did some of the groundwater work, and Ecofor Consulting Ltd of Whitehorse, Yukon ("Ecofor") did the heritage surveys. A summary of the 2016 field activities is provided below.

Work done to help characterize ARD potential and/or metal leaching behaviour included the collection of 79 additional core samples to further characterize the Krakatoa Zone waste rock geodomains. Each individual sample was marked in the core box, weighed, placed and sealed in a labelled plastic sample bag, packed into rice bags and then shipped to Global ARD Testing Services Inc. in Burnaby, BC ("Global ARD"). Test work done by Global ARD includes static geochemical analyses of neutralising potential, sulphate sulphur by HCl leach, total sulphur, total organic carbon, and ultratrace metals by aqua regia digest and ICP-MS. A list of the ARD samples collected in 2016 is included in Appendix R.

Surface water quality and quantity monitoring was undertaken on a monthly basis for all of 2016, tying into the work that was started in April 2015. Samples to assess water quality were collected from 11 surface water stations and five seep locations, with field measurements collected including pH, specific conductivity, temperature, redox potential, dissolved oxygen, temperature and turbidity. Laboratory testing of various other parameters was done by Maxxam Analytics of Whitehorse, YT, ("Maxxam") and included anions, alkalinity, acidity, ammonia, dissolved organic carbon, total and dissolved metals, total cyanide and weak acid dissociable (WAD) cyanide. Water quantity was assessed through monthly manual discharge measurements at the 11 surface water stations. Each station was also surveyed biannually (June, September) to quantify any staff gauge drift. Eight continuous data collection hydrometric stations were also installed on the Property (six at historical locations and two at new locations that correspond to historical sampling locations) and water seeps/artesian conditions were evaluated in the ABM deposit area.

Ground water quality monitoring was done on a monthly basis in conjunction with the surface water program, lasting from May until November 2016. Prior to sample collection, monitoring wells were purged so that field parameters stabilized to less than 10% variability. Measured field and laboratory parameters are the same as those measured for the surface water, with lab tests also completed by Maxxam. Split duplicates were analyzed at a frequency of one for every 10 samples, and blanks were collected as part of each sampling program.

Fish and fish habitat surveys were completed on Geona creek and the Geona-Finlayson creek confluence, with an emphasis on re-sampling the sites previously surveyed in 1995 and 2015. A scientific collection license was obtained from the Department of Fisheries and Oceans (DFO) prior to sampling. Captured fish were identified, measured, weighed and assessed for abnormalities, then released at the point of capture. Catch per unit effort (CPUE) was calculated to enable semi-quantitative comparisons of populations over space and time. Sampling locations and *in situ* water parameters (i.e. temperature, dissolved oxygen, conductivity) were also characterized. Ground- and air-based Arctic grayling spawning surveys were conducted in mid-May and early June, in the most suitable habitats and after the water temperature had increased to at least 4 °C so as to trigger spawning. These surveys were complemented with angling efforts. Overwintering habitat investigations were carried out in later winter (February-March) on Geona creek and related ponds, by measuring dissolved oxygen, ice thickness and depth of water below ice cover.

Wildlife and wildlife habitat surveys focussed on caribou, moose, bear, beaver, pika, marmot, bats, breeding birds, waterfowl and raptors. Caribou studies included a post-calving aerial survey in early July and a rut aerial survey in early October. Both surveys focussed on the same areas used for the 1995 and/or 2015 surveys and were conducted with contour flight line patterns over alpine and subalpine areas. Moose studies included air-based late winter and post-rut surveys done in March and November, respectively. Aerial bear denning surveys were done in April and May to overlap with their emergent period. Beaver studies were completed for Geona creek and included a review of the most up-to-date aerial photographs for beaver signs (e.g. dams, lodges, caches), followed by helicopter- and ground-based follow-up. Pika and marmot surveys

were undertaken in the four pre-identified locations that matched those used in 2015 and comprised 30 minute surveys by two observers who independently recorded sightings, hay piles and calls. Bat surveys focussed on wetland areas and were done by placing an AnaBat portable acoustic recorder unit at the end of a 6.5 m pole, with the recorder timed to operate for a six-hour period between dusk and dawn for a total of 42 hours. Breeding bird and waterfowl surveys were done at locations within the proposed mine site, along the tote road and where the tote road intersects creeks and wetlands. Both surveys utilized standard five minute point counts. Breeding birds were identified through sight and/or sound, and species of interest observed between point counts were also recorded. Ground- and air-based raptor surveys were done in late June and as part of the breeding bird surveys.

Vegetation and soil surveys done in 2016 included ecosystem plots, assessment of plant metal uptake, rare plant surveys, invasive plant surveys, soil characterization, wildlife habitat suitability surveys and timber plots.

Heritage surveys were completed in June and July 2016, starting with reconnaissance surveys and followed by shovel testing of high priority areas. Tested locations included those associated with access roads, ditching, proposed mine infrastructure sites (e.g. open pit, mill site, storage facilities, stockpiles, water management pond, settling pond), drill holes and potential construction laydown areas. A total of 186 shovel tests were completed at five locations with an additional 41 shovel tests done at one heritage site identified in 2015.

7.0 GEOLOGICAL SETTING AND MINERALIZATION

7.1 Geological setting

In the following sections, the geological setting of the KZK Property is described at regional, local and property scales.

7.1.1 Regional geology

The KZK Property is underlain by polydeformed Devonian to Mississippian meta-sedimentary, -volcanic and -plutonic rocks assigned to the Yukon-Tanana terrane, which extends from central British Columbia to eastern Alaska. These rocks are interpreted as the product of middle Palaeozoic continental arc magmatism in a pericratonic setting that was separated from Ancestral North America by a back-arc rift basin occupied by the Slide Mountain Ocean. In central Yukon the Finlayson Lake belt is comprised of lithologies assigned to both the Yukon Tanana and Slide Mountain terranes (Nelson et al., 2013). Syngenetic volcanogenic massive sulphide (VMS) mineralization occurs in both terranes and is hosted in multiple settings.

The Finlayson Lake belt is a crescent-shaped area that is approximately 300 km long and 50 km wide, extending from Ross River in the north to Watson Lake in the south. It is juxtaposed with Proterozoic and Palaeozoic strata of the ancient North American continental margin to the southwest, along the Tintina Fault, and with Carboniferous rocks of the Slide Mountain Terrane to the northeast (Figure 4). The main part of the Yukon-Tanana terrane, which underlies most of west-central Yukon, is contiguous with the Finlayson Lake district through 456 km of Late Cretaceous right lateral strike-slip movement along the Tintina Fault (Layton-Matthews et al., 2008).

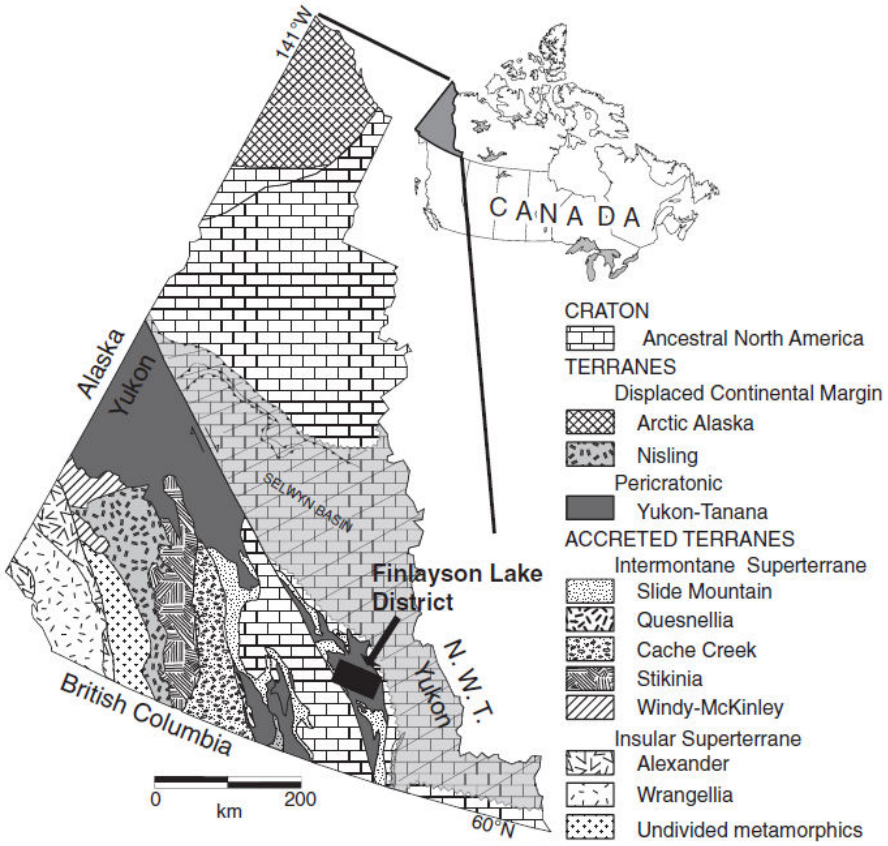

Figure 4: Regional geology of the Yukon showing the Finlayson Lake district (from Layton-Matthews et al., 2008)

7.1.2 Local geology

The Finlayson Lake belt of the Yukon-Tanana terrane is composed of foliated and lineated greenschist- to lower amphibolite-grade meta-sedimentary, -volcanic and -plutonic rocks (Figures 5a, 5b) that were imbricated by Permian thrust faulting into the Cleaver Lake, Money and Big Campbell thrust sheets. The final stage of thrusting placed this rock package onto North America and occurred along the Big Campbell and Inconnu thrusts in Late Triassic to Early Jurassic (MacRobbie and Holroyd, 2005b). With the exception of the Limy 1–9 claim block and the line of claims along the tote road to the Robert Campbell Highway, the KZK Property lies entirely within the Big Campbell thrust sheet in what is the structurally deepest part of the Yukon-Tanana terrane. Two middle Palaeozoic unconformity-bounded groups (Grass Lake and Wolverine) are exposed within the Big Campbell thrust sheet.

The lowermost part of the Grass Lakes Group (North River Formation) consists of pre-Early Mississippian (pre-365 Ma) quartz-rich, non-carbonaceous metaclastic rocks (**Dm**, **Dfv**, **Dqm** and **Dq**) dominated by quartzite psammite and metapelite with minor felsic metavolcanic schist, calcareous schist/metapelite and marble members. The North River Formation is conformably overlain by 30 to >200 metres of the *c.* 365 to 360 Ma mafic-dominated arc- and back-arc-related Fire Lake Formation (**DF**), which consists of mafic metavolcanic schist and phyllite with minor carbonaceous phyllite and quartzite, rare marble and felsic metavolcanic, and locally significant meta-gabbro, -pyroxenite and -ultramafic bodies. The Besshi-style Fyre Lake Cu-Co-Au VMS deposit is hosted in boninite at the top of the Fire Lake Formation.

Conformably overlying the Fire Lake Formation is the felsic volcanic and sedimentary rock-dominated Kudz Ze Kayah ("KZK") Formation (**DK**, **DKcp** and **DKcs**), whose lower parts consist predominantly of Devono-Mississippian (*c.* 360–356 Ma) felsic volcanic and variably carbonaceous sedimentary rocks. These rocks are interpreted to have formed within a continental back-arc rift to back-arc basin (Layton-Matthews et al., 2008). The thickest accumulation of felsic metavolcanic rocks within the KZK Formation occur on the KZK Property, which hosts the ABM and GP4F VMS deposits. The KZK Formation grades conformably upwards into the Wind Lake Formation, which comprises a thick sequence of carbonaceous to locally calcareous phyllite with lesser siltstone, mafic metavolcanic, blue quartz-bearing grits, conglomerate, psammite and quartzite (**DMq**, **DMm**, **DMcp**, and **DMcg**). Coeval with the KZK and Wind Lake formations are Devonian-Mississippian (360±1 Ma) peraluminous K-feldspar porphyritic to megacrystic granites of the Grass Lakes plutonic suite (**MGg** and **MGag**), which are inferred to be subvolcanic feeders (MacRobbie and Holroyd, 2005b; Murphy et al., 2001; Piercey et al., 2001).

The Wolverine Group unconformably overlies the Grass Lakes Group and consists predominantly of Early Mississippian (*c.* 356–346 Ma) felsic volcanic and carbonaceous sedimentary rocks (**MWb**, **MWt**, **MWf**, **MWcp** and **MWcl**). The succession contains, from bottom to top, a lower conglomerate, felsic volcanic-dominated unit, carbonaceous argillite, the immediate footwall felsic volcanic and subvolcanic rocks to the Wolverine VMS deposit, and a hanging wall consisting of aphyric rhyolite and carbonaceous sedimentary rocks that, near their top, host basalt flows. Rocks of the Wolverine succession are interpreted to have formed within an ensialic back-arc rift basin that evolved to seafloor spreading (Layton-Matthews et al., 2008). The Wolverine Kuroko-style VMS deposit occurs at the contact between footwall felsic volcaniclastic rocks and either hanging wall carbonaceous argillite or exhalative rocks (Murphy et al., 2001; Piercey et al., 2001).

A subhorizontal to moderately steep north to northeast dipping, penetrative ductile deformation fabric overprints all Grass Lakes Group lithologies, and is associated with isoclinal folds and mid-greenschist facies (chlorite-biotite grade) metamorphic assemblages. It is less prominent or absent in the Wolverine Group. These fabrics and the metamorphism may reflect two phases of deformation: an early Mississippian event; and, an event related to continent arc collision during the Late Permian to early Triassic time (Schultze, 2001).

LEGEND FOR KZK LOCAL GEOLOGY (OPEN FILE 2001-33)

POST-THRUST INTRUSIVE ROCKS

CRETACEOUS

Kg — Equigranular biotite-muscovite granite

JURASSIC

Jg — Equigranular hornblende-biotite granite

YUKON-TANANA TERRANE

Footwall of Jules Creek Thrust

CARBONIFEROUS?

C?cs — Phyllite, ribbon chert, sandstone, grit, conglomerate

C?iv — Chlorite-feldspar-quartz phyllite (intermediate metavolcanic rocks)

Hanging wall of Jules Creek Thrust

PENNSYLVANIAN

Pcl — Phyllite, chert, conglomerate, greywacke, diamictite, limestone

Hanging wall of Money Creek Thrust

PENNSYLVANIAN

Pq — Quartz sandstone/quartzite

UPPER MISSISSIPPIANTO MID-PENSYLVANIAN

Cc — Bioclastic crinoidal limestone

EARLY MISSISSIPPIAN

SIMPSON RANGE PLUTONIC SUITE

MSg — Granite, quartz monzonite

LOWER MISSISSIPPIAN

Miv — Chlorite-muscovite-quartz phyllite (intermediate composition)

UPPER DEVONIAN

DF — Chloritic phyllite with lesser clastic rocks, marble

Footwall of Money Creek Thrust

EARLY MISSISSIPPIAN

WOLVERINE SUCCESSION

MWb — Chloritic phyllite

MWt — Thinly interbedded siliceous rock and phyllite (metatuff and exhalites)

MWf — Muscovite-quartz phyllite

MWcp — Carbonaceous phyllite and quartz sandstone

MWcl — Feldspathic meta-sandstone, grit and carbonaceous phyllite

EARLY MISSISSIPPIAN

GRASS LAKES PLUTONIC SUITE

MGg/ MGag — Granitic to monzonitic equigranular meta-plutonic rocks/Augen-textured granitic to monzonitic meta-plutonic rocks

LATE DEVONIAN

NORTH LAKES META-DIORITE

DNd — Foliated hornblende-biotite meta-diorite

UPPER DEVONIAN (TO LOWER MISSISSIPPIAN?)

GRASS LAKES SUCCESSION

DMq — Quartzite

DMm — Chloritic phyllite

DMcp — Carbonaceous phyllite and quartzite

DMcg — Meta-conglomerate

Kudz Ze Kayah felsic metavolcanic unit

DK — Undifferentiated feldspar-muscovite-quartz schist/ phyllite, siliceous muscovite-quartz schist/phyllite, augen schist/phyllite (meta-porphyry)

DKcp — Carbonaceous phyllite and quartzite

DKcs — Calcareous meta-sandstone and grit

Fire Lake metavolcanic unit

DF — Plagioclase-chlorite phyllite/schist, carbonaceous phyllite, muscovite-quartz phyllite

UPPER DEVONIAN AND OLDER?

Dq — Psammitic and meta-pelitic schist

Dqm — Marble, calcareous schist and lesser carbonaceous phyllite

Dm — Biotite-plagioclase-actinolite-chlorite schist

Dfv — Feldspar-muscovite-quartz schist (felsic metavolcanic rock)

Figure 5b

7.1.3 Property geology

The KZK Property was fully mapped in 1996 at 1:20,000 scale by Cominco geologists (Schultze and Hall, 1997). Since then, no property-wide geological mapping has been reported, although more detailed mapping has been done locally. The following discussion is modified from Schultze and Hall (1997). Lithologic codes used on the 2016 KZK Project are summarized in Table 10. A map showing the property geology around the ABM and GP4F deposits is included as Figure 6.

The Grass Lakes Group on the KZK Property is divided into three main components (Figure 6): (1) Kudz Ze Kayah (KZK) Formation felsic volcanic, which hosts all significant VMS mineralization on the Property, (2) overlying Wind Lake Formation (or "upper sedimentary and mafic volcanic sequence" in MacRobbie and Holroyd, 2000), and (3) underlying lower sedimentary KZK Formation (or "lower sedimentary sequence" in MacRobbie and Holroyd, 2000), which is equivalent to the **DKcp** unit in Murphy et al (2001) (Figure 6). In a gross sense, stratigraphy trends easterly, dips moderately to the north and is right way up.

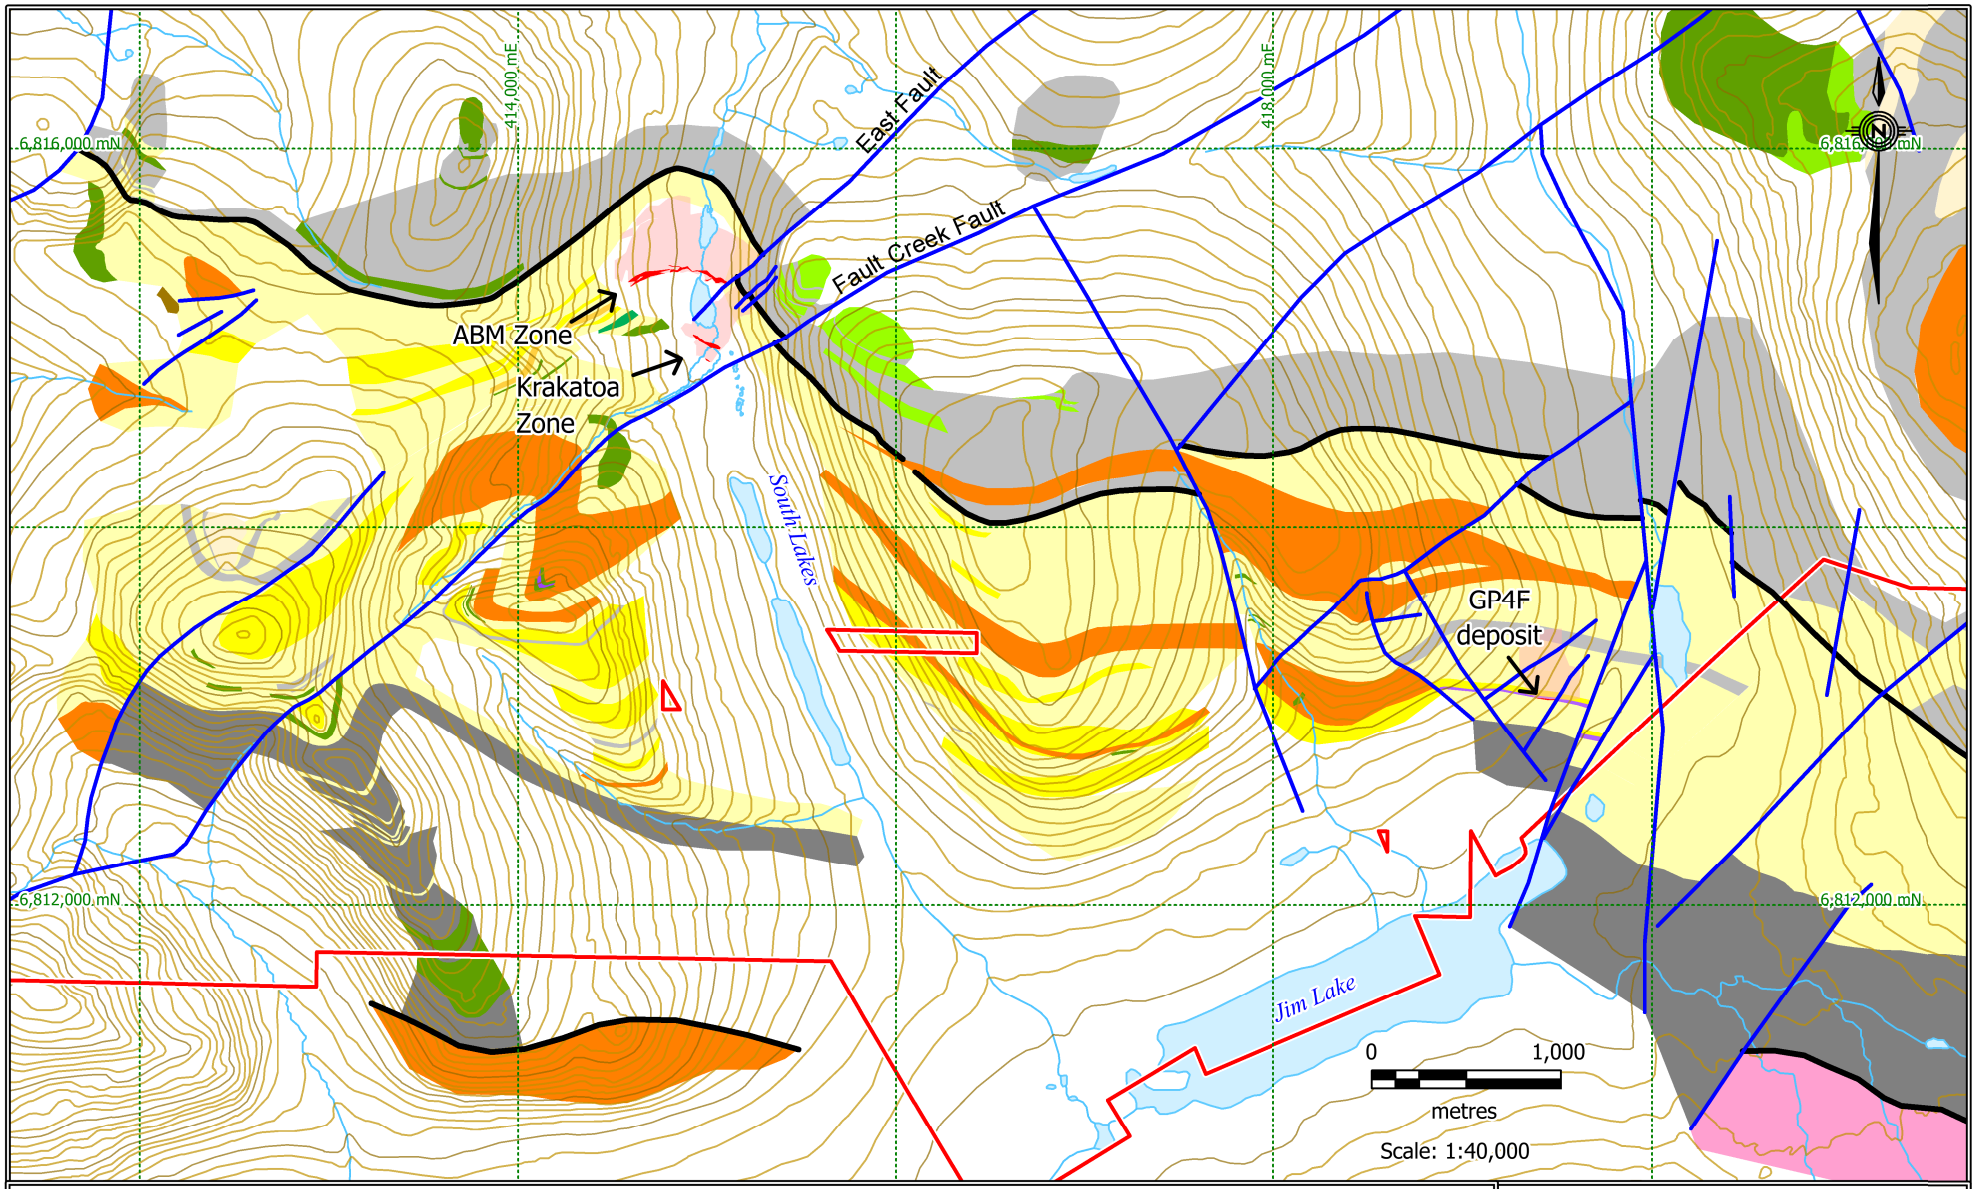
The lower sedimentary KZK Formation consists of siltstone, phyllitic schist, light grey quartzite and massive tuffaceous wacke that is interfingered with feldspar porphyry. Lithologies of minor abundance include mudstone, carbonaceous mudstone and felsic tuff. Mafic sills and dykes (flows?) (**MAFi**) are common and locally associated with thinly banded cherty layers.

Felsic volcanic of the KZK Formation can be subdivided into mappable end member units that comprise felsic volcaniclastic (**RHYv**), coherent felsic volcanic flows and intrusives (**RHYc**), and aphanitic to feldspar-quartz porphyritic intrusives (**RHYi**). Minor abundances of mafic intrusive (**MAFi**) and mudstone (**MDS**) also occur. The most abundant lithology is volcaniclastic rhyolite (**RHYv**), which comprises thinly bedded tuffs, lapilli tuffs and crystal tuffs that are locally intercalated with thin layers of mudstone. With increasing grain size these fine-grained felsic tuffs grade into crystal-rich ash tuffs containing up to 35% light grey to white feldspar and clear grey quartz crystals. Feldspar-augen crystal tuffs are well exposed along ridges southeast of ABM. The fissile character and internal variations of feldspar augen content and lateral extent suggest that this unit is a crystal-rich tuff.

Rhyolite flows and associated intrusives (**RHYc**) are thickest, most abundant and best exposed on Rhyolite Peak, west of the ABM deposit. These units are typically dense, siliceous, and aphanitic. Some outcrops along Fault Creek contain up to 70% spherulites ranging from 5–25 mm in diameter. Feldspar-quartz porphyry intrusions (**RHYi**) are characterized by 15–30% feldspar and/or 5–20% quartz phenocrysts set in a very fine-grained quartz-sericite-feldspar ± chlorite-ankerite groundmass. Feldspar phenocrysts are euhedral, light grey and range from 3–18 mm in size. Quartz crystals are subhedral, clear grey and 2–4 mm in diameter. Porphyry units are likely cogenetic with the epiclastic rocks.

Mafic intrusions (**MAFi**) are mapped throughout the KZK Formation, the best defined of which occurs immediately below the ABM deposit. This so-called "mafic footwall intrusion" consists of strongly foliated porphyroblastic chlorite-biotite-calcite schist. Other types of mafic intrusion consist of coarse-grained mafic schist with less deformed enclaves exhibiting a relict gabbroic texture. Biotite-rich units with quartz, feldspar and/or calcite are logged as both mafic intrusion and sedimentary rocks, and in 2016 were reinterpreted as "pelite" (**PEL**) on the basis of their mineralogy and typically finely intercalated contacts with enveloping felsic volcanic rocks. Mafic tuffs (**MAFt**) consist of fine-grained chlorite-calcite phyllitic schist and are volumetrically minor in the KZK Formation.

The base of the Wind Lake Formation lies about 200 m above the ABM deposit. It is finer-grained than the lower KZK Formation and comprises carbonaceous and calcareous mudstone (**MDS**) that is intercalated with mafic volcanic (**MAFt**) along with minor quartzite, siltstone, chert and felsic volcanic. The package underlies the northern half of the KZK Property (Murphy et al., 2001).



Wind Lake Formation
- Carbonaceous argillite, phyllitic quartzite
- Mafic-intermediate flow, dyke, sill

Kudz Ze Kayah Formation

Felsic volcanic
- Felsic crystal-rich to aphyric tuff
- Felsic flow/sill, augened, possibly some RHYif
- Undifferentiated sediment and carbonaceous mudstone

Lower KZK
- Carbonaceous mudstone, tuffaceous schist, biotitic metapelites, mudstone

VMS mineralization
- Massive sulphide (surface/sub-surface)
- GP4F "Horizon": Sulphide-rich chlorite-altered schist

Grass Lakes Plutonic Suite
- Feldspar+quartz porphry, augened porphyry
- Biotite and biotite chlorite schist

- Formation Contact
- Faults
- Property Boundary
- 100m Index contour
- 20m contour
- Lake
- Stream

Figure 6

Table 10: Lithological legend for KZK Project

Rock Type	Code	Subcode	Name	Description
Unconsolidated sediments	OVBN	-	Overburden	Unconsolidated overburden
Felsic volcanic and (related?) intrusive	RHY	-	Undifferentiated rhyolite	Typically strongly altered, deformed or gouged; difficult to identify protolith
	RHYc	-	Undifferentiated coherent rhyolite	Undifferentiated coherent rhyolite
		RHYcw	Curdy-textured and/or flow-banded coherent rhyolite	Flows or subvolcanic intrusions with definitive siliceous flow banding or relict flow banding textures
		RHYcf	Feldspar ± quartz phyric rhyolite	Medium- to coarse-grained FP ± QZ porphyritic rhyolite
		RHYcq	Quartz phyric rhyolite	Medium- to coarse-grained QZ porphyritic rhyolite
	RHYi	-	Undifferentiated intrusive (or aphanitic) rhyolite	Aphyric massive to semi-massive siliceous rhyolite
		RHYif	Feldspar + quartz porphyry intrusion	Medium- to coarse-grained FP-QZ porphyry with a siliceous groundmass
	RHYv	-	Undifferentiated volcaniclastic rhyolite	Undifferentiated fine- to medium-grained volcaniclastic rhyolite
		RHYvl	Lapilli tuff	Heterolithic tuff with >15% lapilli typically in an ash-dominated groundmass
		RHYva	Coarse-grained to ash tuff	Phaneritic ash tuff with >10% of crystals of 1–2 mm size; typically in an ash-dominated groundmass
		RHYvx	Quartz ± feldspar crystal tuff	>10% QZ and/or FP crystals in ash-dominated groundmass
Sedimentary rocks	SED	-	Undifferentiated sedimentary rock	Undifferentiated sedimentary rocks
		SEDc	Calcareous sedimentary rock	Dominantly fine-grained calcareous sediment with rare rounded clasts
	MDS	-	Undifferentiated mudstone	Undifferentiated mudstone
		MDSc	Carbonaceous mudstone	Heterolithic (>15% MDS) to semi massive mudstone; typically black and with slaty cleavage
		MDSt	Rhyolite tuff-dominant mudstone	Volcaniclastic rhyolite with 1–15% (typically carbonaceous) mudstone
		MDSw	Coherent rhyolite with minor carbonaceous mudstone	Coherent rhyolite with 1–15% (typically carbonaceous) mudstone
	SLT	-	Siltstone	Fine-grained, siliceous siltstone with rare BI, dominantly homogeneous
	PEL	-	Pelite	BI-rich with CB, QZ and/or FP and generally lacking CL; typically has finely intercalated contacts
	CHT	-	Chert	Hard, amorphous, siliceous rock often with thin carbonaceous or mudstone bands
Mafic volcanic and (related?) intrusive	MAFt	-	Undifferentiated mafic volcaniclastic	Undifferentiated mafic volcaniclastic
		MAFta	Mafic ash tuff	Dominantly fine- to coarse-grained, calcareous, mafic ash tuff
	MAFi	-	Undifferentiated mafic intrusion	Porphyroblastic CL-BI-CA schist; predominantly within the mafic footwall intrusion
Intermediate intrusive	DIOf	-	Feldspar augen diorite	North Lakes meta-diorite or Grass Lakes plutonic suite?
Sulphide	Massive	OA	MG-rich massive sulphide	Massive sulphide (PY-MG-SP-GL ± CP-PO) with abundant disseminated euhedral medium-grained and/or laminated MG
		OB	MG-free massive sulphide	Wispy, laminate, fine buckshot-textured fine- to coarse-grained massive sulphide (PY-SP-GL ± CP-PO) with trace to no MG

Rock Type	Code	Subcode	Name	Description
		OC	CP + PO-rich massive sulphide	Net-textured fine- to coarse-grained massive sulphide with 10–50% CP-PO
		OF	PO-rich sulphide	Massive sulphide with >50% PO in addition to MG ± CP-PY-SP-GL
		OG	CP-rich sulphide	Semi-massive to massive sulphide with >30% CP in addition to PO-PY-SP ± GL-MG
		OH	PY-rich massive sulphide	Fine-grained, homogeneous, with >80% PY
		OL	Coarse PY in SP ± PO matrix	Semi-massive to massive sulphide comprising 10–40 % coarse buckshot-textured PY in a SP ± PO-BI matrix; mostly at the GP4F deposit
	Semi-massive	OI	Semi-massive sulphide in schistose host rock	20–50% sulphide (PY ± CP-SP-PO-GL) as stringer, disseminations and/or bands in schistose host rock
		OJ	Semi-massive sulphide in proximal altered rock	20–50% sulphide (PY-CP-SP ± PO-GL) as stringer, disseminations and/or bands in proximal (CL-CI) altered host rock
		OK	Semi-massive sulphide with BA-SI gangue	20–50% sulphide as stringer, disseminations and/or bands associated with BA ± SI-CB gangue in proximal (CL-CI) altered host rock
	Brecciated	OD	Brecciated sulphide	Sulphide (PY-SP-GL ± CP-PO-MG) with crackle to mosaic breccia texture
Structure	FLZ		Fault Zone	Intervals of gouge and/or breccia in which it is not possible to recognize the protolith

The Yukon-Tanana rocks on the KZK Property are strongly structurally transposed, polydeformed, and overprinted by mid-greenschist metamorphism. Locally developed higher-grade metamorphism (i.e. upper greenschist to amphibolite) is more likely related to thermal (or contact) effects. Cominco noted evidence of five distinct phases of deformation. The first three phases (D1, D2. D3) were regionally penetrative and involved ductile simple shearing, faulting and folding. Early-stage fabrics (S1), which range from weak, bedding-parallel schistosity to a well-developed mylonitic fabric, are transposed into a strong, shallowly dipping, axial plane crenulation cleavage (S2) that formed during the development of south- to southeast-verging F2 folds. North- to northeast dipping S3 cleavage and shear bands commonly offset S2 fabrics in a top-to-the-south/southeast shear sense.

The last two phases of deformation (D4, D5) were relatively minor and involved non-penetrative compression and extension. D4 deformation is characterized by broad open folds whereas D5 deformation is characterized by late-stage, commonly north- and northeast-striking, brittle-style normal faults. In addition, early thrust faults commonly display late-stage (D5) extensional reactivation.

7.2 Mineralization

Mineralization on the KZK Property consists of the ABM and GP4F deposits, with the ABM deposit further subdivided into the ABM and Krakatoa Zones. Each is described in more detail below.

7.2.1 ABM deposit

Cominco originally discovered the ABM deposit in 1994 by following up on anomalous silt and soil samples, as well as a mineralized float, with ground-based geophysics and drilling. BMC has since expanded on Cominco's discovery and now recognizes that the ABM deposit comprises the ABM and Krakatoa Zones, separated from each other by the northeast striking East Fault (Figures 7, 8). Movement on the East Fault appears to have been down and to the right, so that Wind Lake Formation in the Krakatoa Zone is juxtaposed against KZK Formation in the ABM Zone.

The ABM Zone comprises massive sulphide and stringer-style sulphide mineralization primarily hosted within felsic volcanic and directly overlying the chlorite-altered mafic footwall intrusion (MAFi). Unlike the Krakatoa Zone, the ABM Zone appears to consist of just one main lens (named the "ABM lens") that typically coalesces at shallow depth and splits into an upper and lower part further down (see sections in Hughes et al.,

2016). There are no other named lenses within the ABM Zone. The ABM lens is up to 39 m thick with a 400 m downdip extent and 700 m strike length (Hughes and Baknes, 2015), and strikes ~290° with a ~35° dip to the north. A flexure occurs ~200 m downdip that flattens the dip to 10–15°. Semi-massive sulphide at the margins of the ABM lens appear to pass laterally into an intercalated package of volcanic and sedimentary rocks (Hughes and Baknes, 2015).

The Krakatoa Zone comprises numerous lenses and pods of massive to semi-massive sulphide, the larger and more continuous of which are referred to as the main, lower and upper lenses. The main lens typically occurs within the mafic footwall intrusion (MAFi) or at its lower contact whereas the upper lens occurs immediately above this mafic unit, in more-or-less the same stratigraphic position as the ABM lens. The lower lens is the thinnest and least extensive of the three, and generally occurs at the base of the mafic footwall intrusion or below it within the underlying felsic volcanic rocks. Mineralization is generally concordant to stratigraphy and oriented subparallel to the ABM Zone at ~300º/35º NNE, which is broadly similar to the ABM lens. The Krakatoa main lens has a true thickness of up to 22 m, width of 150 m and downdip continuity of at least 430 m. The width of the mineralized zone is constrained by the East Fault to the west and the Fault Creek Fault to the east. Mineralization extends to the top of bedrock but fails to daylight, as it is buried under 2–30 m of glacial overburden.

The most recent mineral resource estimate for the ABM deposit was completed in November 2016 (BMC Minerals Ltd., 2016a) in accordance with the JORC Code (JORC, 2012), and is reported in Table 11.

Sulphide mineralization in the ABM deposit is generally dominated by pyrite with lesser amounts of sphalerite, pyrrhotite, galena and chalcopyrite, and gangue minerals that include chlorite, magnetite, quartz, Fe-carbonate, calcite, sericite, cordierite, albite, celsian and barite. Mineralized lenses typically occur within an envelope of chlorite and muscovite alteration and are subdivided into massive and semi-massive styles, the latter consisting of disseminations, stringers and/or bands. These styles are further subdivided into ten end member “ore” types (Table 12, Figure 9) based on macroscopic mineralogical and textural features (Hughes and Baknes, 2015; Hughes et al., 2016; Schultze, 1995).

Brecciated	OD	Brecciated	Variable						

Massive sulphide forms the bulk of the ABM, Krakatoa main and Krakatoa upper lenses. Pyrite is the predominant sulphide mineral, comprising 60–70% of the mode, and ranging from fine- to coarse-grained and massive to buckshot-textured. The upper parts of the ABM lens are strongly magnetic, containing up to 10% fine- to coarse-grained magnetite as laminar bands and heavily disseminated pods. Magnetite also occurs within the main and upper lenses of the Krakatoa Zone but appears to be absent from the lower lens. Sphalerite forms two distinct types: (1) dark brown sphalerite intergrown with magnetite and (2) red-brown sphalerite occurring as wispy laminations and/or disseminations within pyrite. Galena is difficult to identify but occurs throughout the ABM and Krakatoa zones as fine- to medium-sized grains. Chalcopyrite is generally minor and occurs as coarse-grained clots, blebs and disseminations. Silica, barite and carbonate gangue are most abundant within the lower portions of both zones, with Krakatoa containing more barite than ABM.

Semi-massive mineralization occurs throughout the ABM deposit but is more restricted and less abundant in the Krakatoa Zone. In the ABM lens, stringer- and disseminated-style mineralization forms a 1–10 m thick halo around massive sulphide mineralization. Additional zones of semi-massive sulphide also occur between stacked lenses where it has the appearance of a deformed stockwork-style zone and is typically associated with strong chlorite ± cordierite alteration. Sulphide mineralogy consists of chalcopyrite + pyrrhotite + pyrite ± sphalerite ± galena with trace magnetite, with Cu typically assaying >2% but ranging anywhere from 0.1–14% Cu. This variability in grade correlates with the textural and mineralogical diversity inherent to this style of mineralization, which ranges from thick chalcopyrite-rich stringers to Cu-poor disseminated sulphide. Grades of Cu, Au and Ag appear to be lower in Krakatoa semi-massive sulphide than at ABM (Duncan and Baker, 2015).

Some intercepts of the Krakatoa main lens preserve the partial replacement of felsic tuff and/or mafic footwall host rock by sulphide, the former typically sandwiched between intervals of mafic footwall. These occurrences typically comprise a combination of OB-type ore with relatively high gangue content and OI-type with relic lapilli or ashy groundmass, and provide support for a replacement-style origin. The downdip gradation of the ABM lens into sedimentary and epiclastic rocks likewise suggests that the ABM Zone may have a similar origin (Duncan and Rabb, 2015; Hughes and Baknes, 2015).

The alteration framework for the ABM deposit is based on the work by Cominco (e.g. Schultze, 2001) that recognized five superimposed alteration styles within the structural hanging wall of the deposit. Four of these alteration types were systematically logged in the 2015 and 2016 programs (Table 13). The exception is the weak pyrrhotite alteration (i.e. Type 1) that was generally found to be pervasive and lacking in log-able variability.

Table 13: Summary of alteration types associated with the ABM deposit

Type	Name	Key feature	Comments
Type 1	Weak PO	PO	~1% disseminated PO as foliation-parallel wisps in felsic groundmass
Type 2	Greenish-grey	CL-SE ± FU	Greenish-grey alteration possibly related to aphanitic rhyolite (RHYi) intrusions, especially near MAFi; locally obscures sulphide-MAFi contact zones
Type 3	Pervasive MU/SE	MU/SE	Distinctive silvery grey to waxy greyish-yellow-green MU/SE ± disseminated sulphide; usually within 50 m of sulphide mineralization; preferentially developed in felsic volcanic; shows inverse relation with AK alteration.
Type 4	Proximal CL	CL >> MU/SE	Dark green CL typically occurring within <5 m wide of massive sulphide; associated minerals include BI, AK, MG and disseminated PO-CP; also as stratabound zones marking distal expression of massive sulphide lenses
Type 5	Restricted CI	CI-CL	Spatially associated with proximal CL alteration or as distal stratabound zones extending beyond sulphide; CI forms grey glassy porphyroblasts up to 2 cm in size and hosted within CL-rich matrix; associated minerals include ferroan DO, SI and sulphide

Host rocks of the ABM deposit typically show a penetrative schistosity, the intensity of which is dependent on host rock type. For example, most of the volcaniclastic rhyolite units (RHYv) exhibit a tightly spaced penetrative foliation whereas foliation within the more coherent rhyolite flow units (RHYc) is more broadly developed between silica- and sericite-dominant domains. Schistosity is broadly concordant to the lithological contact and is folded about cm-scale tight to isoclinal parasitic folds that are widespread in drill core. Similar metre-scale folds are more difficult to see in drill core but are present in outcrops west of the ABM deposit (Szybinski, 1996). Within fold hinges, an earlier foliation that is concordant to bedding is preserved, so that folds are defined by both this primary bedding and early foliation. Along fold limbs, however, the folded fabrics and later axial-planar foliation are transposed and so form a coplanar fabric that comprises the dominant tectonic foliation throughout the ABM deposit area.

Schistosity is truncated by brittle faulting along the East and Fault Creek Faults (Baker, 2015b), as well as smaller structures possibly related to these larger faults. Although no direct age of this faulting exists, it is likely these faults formed during the ~425 km of Eocene dextral slip along the Tintina Fault, which is located about 30 km southwest of the ABM deposit.

7.2.2 GP4F deposit

The GP4F deposit lies near the southern margin of the Property, located about five kilometres southeast of the ABM deposit (Figure 6, 10). It is hosted within an interval of the KZK Formation interpreted to lie stratigraphically below the ABM deposit (Jones, 2016). Last year's work split the GP4F deposit into GP4F, lower and upper zones (Jones, 2016) and then the GP4F lens and lower target (Hughes et al., 2016). The 2016 program, however, established predictable continuity of the "lower target" so that it is now upgraded to "lens".

The GP4F lens is the thickest and most continuous part of the deposit, and contains 90% of all massive sulphide intercepts. The width of most intercepts falls between 3–20 m, averaging 9.8 m and decreasing to the east with only one (suspect) occurrence in the three drill holes on the eastern-most section (419650E). Strike length ranges from 200–325 m on plan maps 1150 RL to 1250 RL (see Voordouw et al., 2016), respectively, and downdip extents range from 300–400 m on sections 419350E to 500E. The GP4F lens dips an average of 30° towards 025°–030°, and is either naturally undulating or gently folded along east-west trending fold axes.

The lower lens lies 20–85 m (average = 45 m) below the GP4F lens and occurs on all six sections. Drilling intercepts range from 0.7–24.0 m in width, average 8.0 m and thicken in the opposite direction of the GP4F lens (i.e. from west to east), averaging 4.9, 9.0 m and 11.8 m on sections 419400E, 500E and 650E respectively. Strike length measures ~200 m on plan map 1250 RL and downdip extents range from 200–300 m on sections 419500E and 650E. The relatively thick lower lens on 419650E, coupled with a paucity of GP4F lens, suggests that the lower lens may become the more important sulphide layer further east.

Table 14: Updated mineral resource estimate for the GP4F deposit

Category	Tonnage	Cu	Pb	Zn	Au	Ag	Cu metal	Pb metal	Zn metal	Au	Ag
	Mt	*(wt%)*	*(wt%)*	*(wt%)*	*(g/t)*	*(g/t)*	*(Kt)*	*(Kt)*	*(Kt)*	*(Koz)*	*(Moz)*
Indicated	1.0	0.2	2.7	5.7	1.0	83	1.6	26.9	56.7	31.3	2.7
Inferred	0.7	0.2	2.4	4.8	2.0	59	1.1	16.4	33.3	43.8	1.3
Total	1.7	0.2	2.6	5.3	1.4	73	2.7	43.3	90.0	75.1	4.0

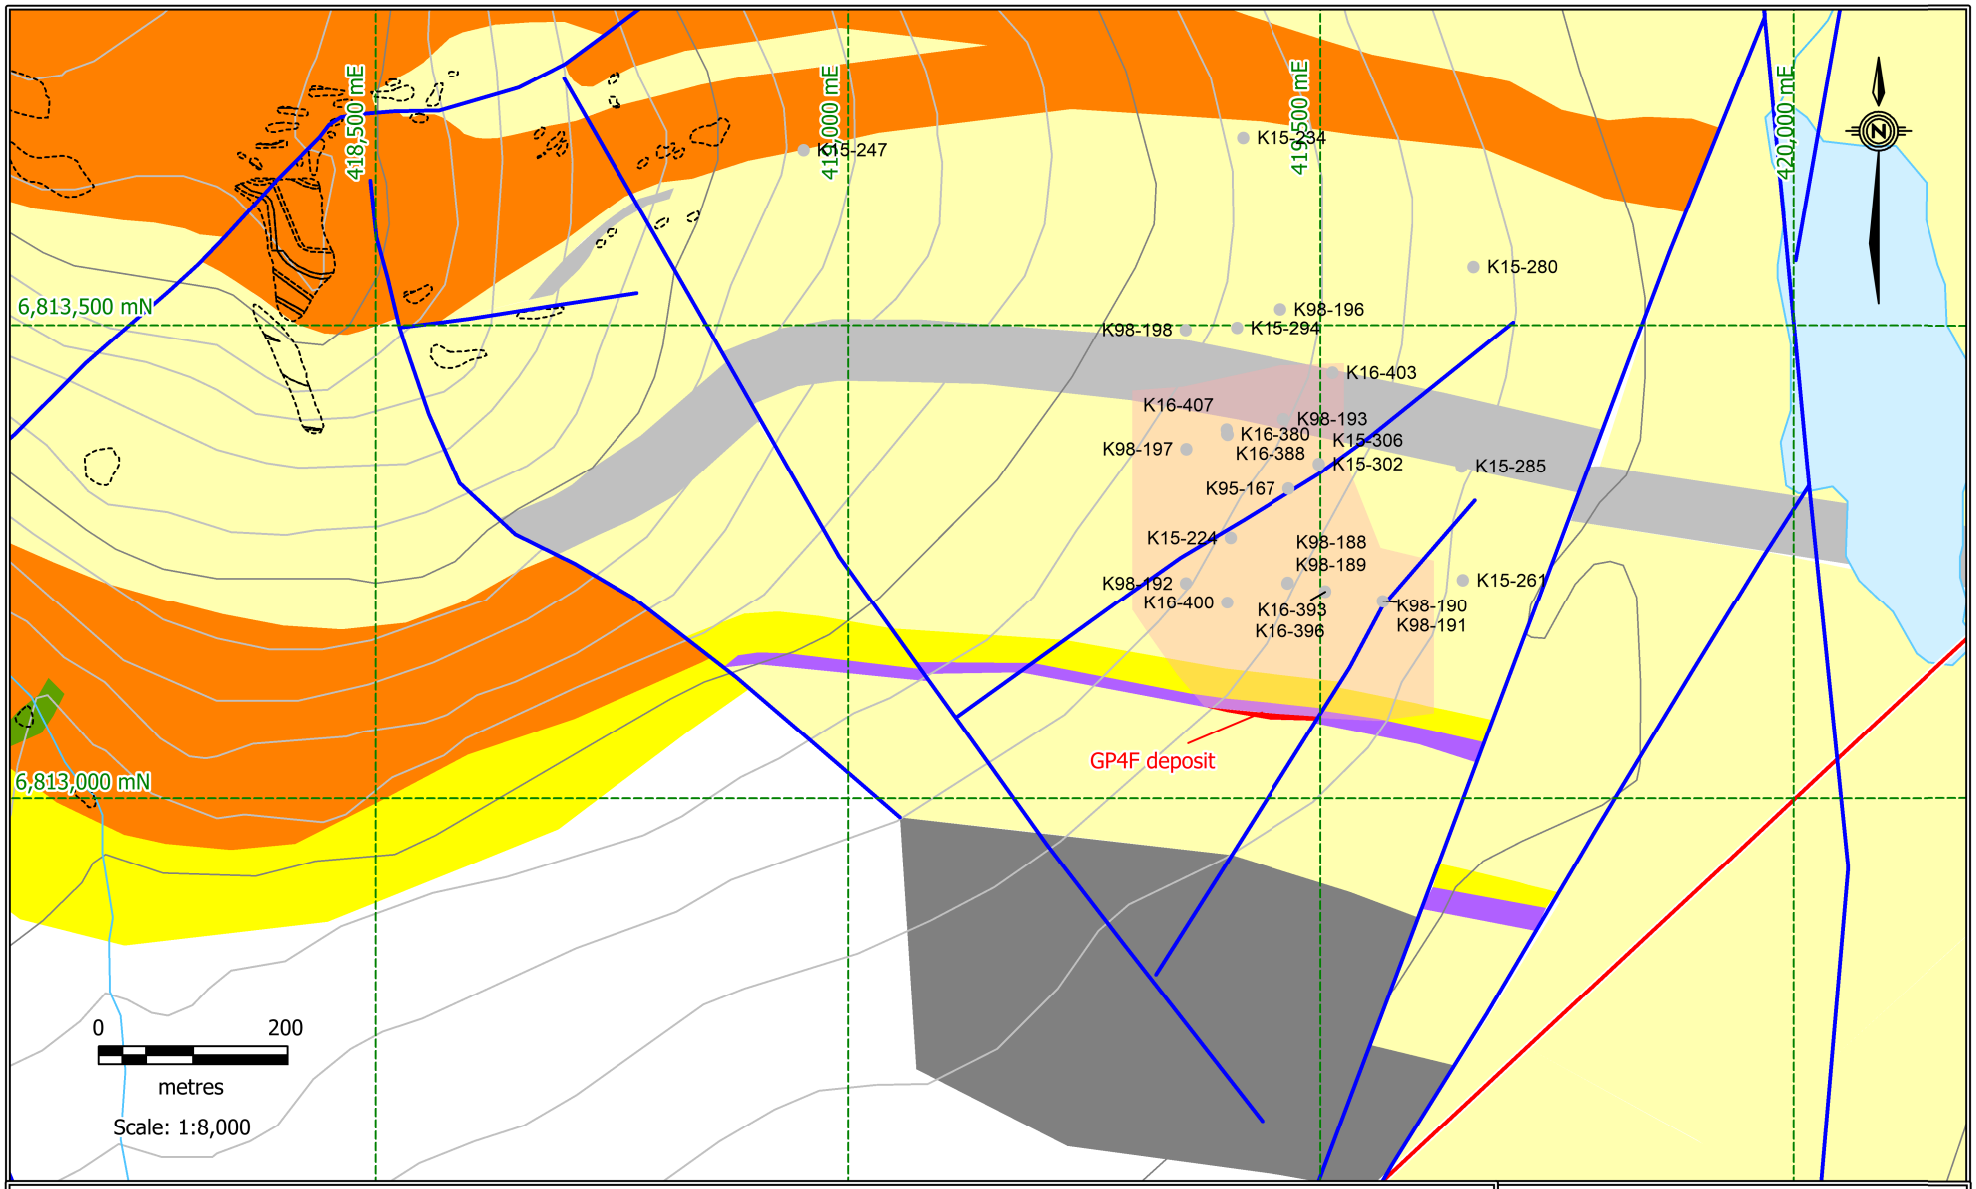
An updated resource for the GP4F deposit was generated as the result of 2016 work (BMC Minerals Ltd., 2016a), and is broadly similar to the inferred resource of July 2015 (Green, 2015b). Both resources are in accordance with the JORC code (JORC, 2012), with the 2016 estimate summarized in Table 14.

Mineralization in the GP4F lens consists of narrow, high-grade, layers of massive sulphide enveloped by stringer- and disseminated-style semi-massive sulphide. Lenses of massive sulphide are similar to the OB ore type at the ABM deposit, with 50–70% massive to buckshot-textured pyrite along with semi-massive to massive bands of sphalerite and/or pyrrhotite. Sphalerite also forms larger blebs whereas galena and chalcopyrite occur mostly as interstitial fillings and disseminated blebs. Some of the better grades in the deposit are returned from intervals comprising stacked bands of OB-type mineralization, typically ranging from 0.1–0.4 m in width, within an interval of semi-massive OJ-type. Examples of such intervals include 9.7% Zn, 4.1% Pb, 117 g/t Ag and 1.7 g/t Au over 8.9 m in K98-188, as well as 7.4% Zn, 2.8% Pb, 123 g/t Ag, and 1.0 g/t Au over 4.65 m in K15-306 (Jones, 2016).

More typically, the GP4F and lower lenses consist of stringer- and disseminated-style sulphide mineralization associated with strong chlorite-biotite alteration (Jones, 2016). Modal sulphide abundances range from 5–40% and form blebs, stringers (0.1–1 cm wide) and bands (1–4 cm wide). Sulphide assemblages include sphalerite-dominant, sphalerite-galena and pyrrhotite-pyrite-chalcopyrite, and various combinations in between. There is some evidence of the sulphide overprinting the altered groundmass (Boulton, 2002), suggesting replacement-style mineralization.

The GP4F deposit occurs within a much larger, tabular zone of alteration and weakly disseminated mineralization (Jones, 2016). Alteration in close proximity to the GP4F and lower lenses is similar to the proximal and restricted alteration types associated with the ABM deposit, while also including biotite, garnet (in places Zn-rich) and gahnite (Boulton, 2002). Garnet and gahnite are unreported from ABM. The distinct silvery-grey to waxy yellow muscovite (Type 3) alteration is less pervasively developed at GP4F than at ABM but still shows a mappable spatial association with sulphide mineralization (Hughes, 2016b). At GP4F, this so-called “original muscovite” alteration is associated with disseminated pyrite. Other alteration minerals include cordierite and possibly albite (Boulton, 2002), which was widely reported by Cominco as comprising whitish porphyroblasts and vitreous masses that, in essence, are similar to cordierite habits seen at the ABM and GP4F deposits.

There is evidence for brittle faulting in the GP4F area but there appear to be no significant disruptions of the deposit, as it forms a fairly continuous and predictable tabular ore body. The most prominent zone of fault gouge occurs below the deposit and appears to strike 35°/270° N, which is more-or-less parallel to stratigraphy. There are no constraints on the movement direction or offset across this fault. Plan-based interpretations (Voordouw et al., 2016) shows several kinked lithological contacts that could be manifested through 25–35 m of dextral offset along NNE-trending faults. Property-scale airborne geophysical data suggests there is a prominent ENE-trending structure that runs between the GP4F deposit and the R15 deposit to the ESE. This lineament runs broadly parallel to the Fault Creek and East faults in the ABM area, and lies 4.0–4.5 km south of the Fault Creek Fault. At this time, however, there is no geological evidence (e.g. drill intercepts, outcrops) that this lineament is related to faulting.



Wind Lake Formation

- Carbonaceous argillite, phyllitic quartzite
- Mafic-intermediate flow, dyke, sill

Kudz Ze Kayah Formation

Felsic volcanic

- Felsic crystal-rich to aphyric tuff
- Felsic flow/sill, augened, possibly some RHYif
- Undifferentiated sediment and carbonaceous mudstone

Lower KZK

- Carbonaceous mudstone, tuffaceous schist, biotitic metapelites, mudstone

VMS mineralization

- Massive sulphide (surface/sub-surface)
- GP4F "Horizon": Sulphide-rich chlorite-altered schist

Grass Lakes Plutonic Suite

- Feldspar+quartz porphry, augened porphyry
- Biotite and biotite chlorite schist

- Formation Contact
- Faults
- Mapped Outcrop
- Property Boundary
- 100m Index Contour
- 20m Intermediate Contour
- Lake
- Stream

Figure 10

8.0 RESULTS OF THE 2016 WORK PROGRAM

The 2016 KZK Project comprised a multifaceted geology and engineering program primarily geared towards upgrading “inferred” resources to “indicated” within the Krakatoa Zone and GP4F deposit, expanding the ABM Zone, exploring the Sebesi and Tarawera targets, metallurgical sampling, and characterizing the geotechnical and environmental baseline parameters for the project area. The following sections describe significant results from the 2016 program that were available at the time of reporting.

8.1 Earthworks

Drilling activities in 2016 required the construction of 59 new drill sites and 5.8 km of new drill trail. These earthworks, together with unreclaimed pads and trails from the 2015 program, were progressively reclaimed during the 2016 season as they were no longer needed. At the end of the 2016 field season, approximately 17.5 km of trail and 140 drill sites were reclaimed, comprising 65% of all trails and 95% of all 2015/16 drill pads (Figure 11). Trails that remain open lead to monitoring wells that need to be accessed as part of the ongoing groundwater-monitoring program.

Reclaimed pads and trails were reseeded with native vegetation, with follow-up monitoring planned for 2017 to evaluate the success in re-establishing the vegetative mat.

8.2 Historical core program

The historical core relocation program involved transport of 5464 core boxes, totalling 33902.6 m of drill core, from km-25 on the tote road to the KZK Camp at km-20. No significant core loss was incurred during transport and all drill core from the Property is now consolidated at the KZK Camp.

Twenty-four historical holes were re-logged for 4030 m, leaving just three historical holes (for 286 m) that have not been re-logged (Table 15). Holes that were re-logged in 2016 include eight of the ten 1998 GP4F holes, several 1995–1997 and 2004 wildcat holes, and a single ABM deposit hole (K94-002). The three historical holes that have not been re-logged include one hole that is entirely missing (K94-001), one hole where most of the core is missing (K95-168) and a short hole that was likely abandoned in overburden (K97-183A). Hence, the historical re-logging program is, at this point, considered complete.

Key findings of the re-logging program were centred on lithological coding and Cominco’s wildcat drilling. New codes developed through this work include “PEL” (pelite) and “CHT” (chert), of which the former proved especially useful in advancing the lithological model for the GP4F deposit. Chert was identified in some of the wildcat holes that tested Wind Lake Formation rocks.

A total of fourteen chert (CHT) intervals were identified during the re-logging, within four drill holes. The highlight of these occurrences was in K97-180, which hosts seven closely spaced chert intervals, totalling 19.4 m in thickness, over 41.7 m from 47.2–88.9 m core depth. This chert-rich interval is also associated with felsic volcanic rocks suggesting that there may be felsic volcanic centres in the Wind Lake Formation.

Re-coding of 1998 and 2015 GP4F drill core placed particular emphasis on applying the PEL and semi-massive sulphide (OJ, OI) codes. The PEL code was used for chlorite-deficient units of biotite + carbonate, quartz and/or feldspar schist that, in 2015, were logged as both mafic intrusions (MAFi) and undifferentiated sedimentary rocks (SED). These units were characterized as “pelite” on the basis of their mineralogy and finely intercalated contacts with adjacent felsic volcanic. It was also found that the 20% modal sulphide required to break out semi-massive sulphide units at the ABM deposit is too high for GP4F because (1) sphalerite is abundant but can be difficult to identify, and (2) some of the base metal budget may be carried by non-sulphide phases like gahnite. The lower limit for breaking out OI and OJ units was therefore dropped to ~10% sulphide.

Figure 11: Before (left) and after (right) pictures of drill trail and pad reclamation done as part of the 2016 KZK Project.

A re-sampling program of historical GP4F core was done to confirm Cominco's assay results. Twenty-one samples were taken from nine of the 1998 drill holes, with each re-sample matching the original interval. One of the re-assayed samples (D00005575) showed a poor match with its historical duplicate, reporting Ag (17 g/t), Pb (0.3%) and Zn (0.2%) that are significantly lower than Cominco's 513 g/t Ag, 7.4% Pb and 13.7% Zn. However, the measured density, received weight and sample length suggest that the wrong interval may have been sampled (Voordouw, 2016a). The other 20 samples show strong Pearson and rank correlation for Ag, Pb and Zn, moderate-strong for copper and moderate correlation for gold. Furthermore, one of the re-assayed samples returned 573 g/t Ag, 20.3% Pb and 27.9% Zn (over 0.2 m) against a historical assay of 566 g/t Ag, 20.0% Pb and 26.3% Zn, indicating precise duplication of a high-grade historical assay. The generally strong correlation between re-assayed samples and historical assay data, with the exception of what is likely a mis-sampled interval, suggests that the historical GP4F assay data is likely accurate as reported.

Table 15: Summary of 2015/16 re-logging programs

8.3 Terrain surveys

Terrain surveys included differential GPS (DGPS) surveys of 2015/16 collar locations, as well as airborne LiDAR over the tote road corridor and proposed mine infrastructure area. Each is described in more detail below.

8.3.1 Airborne LiDAR

The 2016 airborne LiDAR survey was completed in a single flight from Watson Lake on 10 June 2016. Products delivered to BMC include a digital elevation model (DEM) with 1 m contours, "bare earth" DEM on a 1 m grid and "highest hit" digital surface model at 1 m grid, all of which are included on the data disk attached as Appendix T.

LiDAR data was positioned with an average density of 4–6 points/m^2 for all returns, including 2–3 points/m^2 for first-returns and 12–15 p/m^2 for the tote road corridor and proposed mine infrastructure block (Eagle Mapping Ltd., 2016). Data accuracy was calibrated with ground control points and is accurate to within <6.7 cm vertically and <30 cm horizontally at 95% confidence (Eagle Mapping Ltd., 2016). A report written by the contractor (Eagle Mapping) is attached as Appendix E.

8.3.2 DGPS

Survey measurements of collar locations, using a real time kinematic differential GPS (RTK DGPS), were done over five campaigns during the 2016 field season (Table 16). Coordinates surveyed in the first campaign included un-surveyed holes from the 2015 program, refurbished monitoring wells, proposed 2016 collar locations and new drill trails (Figures 12a, 12b). The next two campaigns focussed on surveying the 2016 drill hole collars and laying out proposed drill holes, followed by the fourth and fifth campaigns measuring the remaining 2016 collars. The 2nd and 3rd campaigns were timed to follow up on the Krakatoa resource infill drilling whereas the 4th survey was done at the conclusion of the GP4F infill program. The fifth, and last, survey captured all remaining 2016 holes and marked in some key infrastructure points.

Three of the 2015 drill collars (K15-281, 303, 318) and two of the 2016 collars (K16-356, 391) were not surveyed by Challenger as the collar locations were either destroyed by ongoing earthworks or were not marked following completion of drilling. In these cases, the final collar location is an integration of X and Y coordinates derived from an azimuth positioning system (APS) or TN14 gyrocompass, with the Z coordinate corrected to the LiDAR topographic surface. The collar coordinate for K16-391 is the planned coordinate with the LiDAR elevation. Wedged holes (e.g. K16-414W1) have the same collar coordinates as their parent.

Results of the RTK DGPS surveys show that the average error between the planned and actual coordinate for each drill hole is 1.7 m for easting and 0.1 m for northing. The total average offset of planned and actual coordinates is 3.2 m within a range of 0.0 to 12.0 m. Averages are slightly lower for the GP4F (0.9 m) and Krakatoa (2.9 m) infill programs than they are for ABM metallurgical (4.0 m) and Sebesi/Tarawera exploration drilling (4.8 m). Overall, collar locations are considered to accurately reflect the drill plan.

Table 16: Overview of 2016 geomatic survey campaigns

Campaign	Date	DHs and wells		Collar layouts	Other	Comments
		≤2015	*2016*			
1	27–30 April	61		23	36	"Other" is survey on new cat trail
2	1–2 June		17	20		First of two surveys to finalize Krakatoa resource infill program
3	1 July		20	17		Second of two surveys on Krakatoa
4	2–4 August		32			Survey to finalize GP4F infill drilling
5	30 September		12		8	Last survey to capture remaining 2016 collars, key infrastructure points
Totals		**61**	**81**	**60**	**44**	

8.4 Geophysical surveys

Geophysical work done in 2016 consists of an airborne magnetic and VTEM survey, and borehole EM (BHEM) surveys. This work is summarized below.

8.4.1 Airborne magnetics and VTEM

The 2016 airborne VTEM survey was designed to tie into the 2015 survey (Hughes et al., 2016) and complete coverage over the KZK Property. A total of 938.3 line-km was surveyed (902 km of first pass, 36.3 km of reflights to redress QA/QC), covering the northern, eastern and western parts of the Property. The southern part, which hosts the ABM and GP4F deposits, was flown in 2015.

The contractor report (Venter et al., 2016) attached as Appendix H shows magnetic data mapped as total intensity (TMI), calculated vertical gradient (CVG), total horizontal gradient (TotHGrad) and tilt-angle derivative (TiltDrv), as well as cross- (Hgcxline) and in-line (Hginline) gradients. These gridded map products each show a broadly similar pattern of high magnetic response in central part of the 2016 survey area (i.e. northern half of KZK Property) with a moderate response to the east and west (Figure 13a). The stronger response is spatially associated with the Wind Lake Formation and appears to comprise highly magnetic and non-magnetic units (Figure 13b). Handheld magnetic susceptibility measurements on Wind Lake drill core suggests that, on average, mafic volcanic is slightly more magnetic (1.3 SI units) then carbonaceous phyllite (0.9 SI). However, both rock types feature strongly magnetic subunits so that the intercalated highs and lows are unlikely to be exclusively lithology-dependent.

12b

A prominent magnetic high occurs within a generally moderately magnetic area, near the eastern boundary of the KZK Property (see “East mag high” label on Figures 13a, b) and within bedrock that is regionally mapped as KZK Formation (Murphy et al., 2001). There is currently no geological explanation for this anomaly.

Regional-scale faults appear to be manifested as linear magnetic lows. The East and Fault Creek Faults (labelled on Figures 13a, b), for example, form a 750 m wide fault corridor that extends across the KZK Property for a minimum strike length of 15 km. Six kilometres to the northwest, a subparallel fault corridor is mapped by Murphy et al (2001) and also suggested by a prominent magnetic low lying ~1 km southeast of the mapped fault (see ‘Grass Lk fault” and “Grass Lk mag low?” labels on Figures 13a, b). Together, this “Grass Lakes Fault” area appears to comprise a similar magnetic signature, trend and width as the East/Fault Creek Fault system.

Geotech mapped the conductivity data as calculated time constant with vertical derivative contours (TauSF) and for channels 15 (SFz15), 30 (SFz30) and 45 (SFz45), time constant with B-field Z component (TauBF) and component channel 36 (BFz36) and Fraser filtered B-field X component for channel 20 (SFxFF20) (Venter et al., 2016). Each of these maps shows a similar pattern comprising a prominent response at the northern end of the survey area, with smaller responses to the south and west (Figure 13c). The strong northern response is spatially associated with Wind Lake Formation and likely related to carbonaceous material within phyllitic units.

The weaker EM response in the southern part of the 2016 survey area (or central part of the KZK Property) is also associated with Wind Lake Formation, possibly suggesting volumetrically less and/or thinner carbonaceous phyllite units. Results from the 2016 drill program indicate 5:4 ratio of phyllite and mafic volcanic in the lower (i.e. southern) part of the Wind Lake Formation, suggesting that the upper (or northern?) part may contain >>50% carbonaceous phyllite.

One of the more interesting EM anomalies lies in the western part of the survey area and consists of a moderate to strong EM response that is spatially associated with the “Grass Lakes” fault (see “GLF EM high” on Figure 13c). Regional mapping (Murphy et al., 2001) suggests that this fault juxtaposes Wind Lake Formation against the older Fire Lake Formation, which also hosts VMS deposits (Hunt, 2002).

The historical core storage area was resurveyed after the core and metal core racks had been removed as part of the historical core relocation program. Results show that weak EM and magnetic anomalies occur 50–100 m north of the former core rack location, and that these signals were formerly masked by the strong core rack response.

8.4.2 Borehole EM (BHEM)

Borehole electromagnetic (BHEM) surveys were completed in 11 drill holes as part of the 2016 work program (Aurora Geosciences, 2016), as summarized in Table 17. BHEM surveys can typically detect conductors lying within ~100–150 m of the drill hole. A report written by the contractor (Aurora Geosciences) is attached as Appendix I and the surveyed holes and loop layouts are shown on Figure 14.

The 11 surveys were done in five separate deployments in order to minimize the time that the BHEM contractor would spend on site. Instrument failure was responsible for partial loss of data in several instances. On hole K16-406, B-field coil data was properly recorded but all flux-magnetometer data was unrecoverable. This issue could not be resolved in the field and resulted in the instrument being replaced by the supplier. Toroid data was lost on several occasions; a battery failure caused irregular waveforms to be recorded on holes K16-394 and K16-409 and a corrupt file meant that no toroid data was collected on K16-419. In all cases, data collection from a backup current monitor allowed the timing of the transmitter signal to be faithfully recorded resulting in good quality raw data. The raw data could then be properly aligned and normalized but not deconvolved.

A preliminary review of BHEM data shows notable EM responses for all of the drill holes that intersected massive sulphide layers whereas the EM response for those holes that did not intersect sulphide was generally flat (BHEM profile plots are attached as Appendix I). Drill holes with sulphide layers that generated EM responses are listed in Table 17.

Table 17: Preliminary summary of the 2016 BHEM surveys

Drill hole	Target	Length (m)	Sulphide			Summary of BHEM results
			From (m)	*To (m)*	*Length (m)*	
K16-369	Krakatoa	450.0	369.2	392.9	23.7	EM response associated with 23.7 m of Krakatoa Zone
K16-372	Sebesi	597.0				No sulphide in core; relatively flat EM profile
K16-374	Sebesi	801.0				No sulphide in core; relatively flat EM profile
K16-394	Sebesi	953.3	797.4	797.9	0.5	EM response associated with 50 cm of OF-type sulphide
K16-399	Krakatoa	810.0				No sulphide in core; relatively flat EM profile
K16-406	ABM	299.0				No sulphide in core; relatively flat EM profile
K16-409	ABM	300.0				No sulphide in core; relatively flat EM profile
K16-415	Tarawera	854.5	46.5	47.0	0.5	EM response associated with 50 cm of OF-type sulphide
K16-416	Sebesi	834.0				No sulphide in core; relatively flat EM profile
K16-418	Krakatoa	475.5	435.0	436.7	1.7	EM response associated with 1.7 m of faulted OB-type sulphide
K16-419	Krakatoa	416.2	333.2	346.6	13.4	EM response associated with 13.4 m of Krakatoa Zone

8.5 Resource and exploration drilling

The 2016 drilling program included resource infill and expansion drilling on the Krakatoa Zone, infill drilling on the GP4F deposit, expansion drilling on the ABM Zone, and exploration drilling on the Sebesi and Tarawera targets. The following sections describe significant results from these drill programs.

8.5.1 Krakatoa Zone

The Krakatoa Zone was discovered in 2015 (BMC Minerals Ltd., 2016b; Hughes et al., 2016) after following up on historic intercepts (K95-124, K97-173) that Cominco interpreted as the ABM equivalent lens east of the East Fault (Schultze, 2001). The 2016 work program on the Krakatoa Zone comprised resource infill and expansion drilling with the primary aims of upgrading inferred resources to indicated, as well as testing the downdip and along-strike extents. The program successfully upgraded the indicated proportion of the resource from 40% to 90% and generated some downdip expansion. A summary of the drill program is provided below, along with a drill collar map (Figure 15) and interpretive cross-sections showing lithology and alteration (Table 18, Appendix K). Significant assay composites are summarized in Table 19.

The 2016 Krakatoa work program included 9066.7 m of resource, exploration and metallurgical drilling over 34 holes (Figure 15), which generated 21 new intercepts through the upper lens, 8 through the main lens and 14 through the lower lens. Pierce points generated by the two dedicated metallurgical holes were also used as part of the infill program.

Twenty-nine of the 34 drill holes were brought to completion, with five abandoned due to excessive drill hole deviation at core depths of 20–75 m. RTK DGPS surveys show that the average offset between the planned and actual coordinate for each drill hole is 2.9 m, indicating that the actual collar locations are consistent with the drill plan. All Krakatoa holes were surveyed with the EZ-shot and 48% were also surveyed with the Gyro, with the two surveys generally yielding complementary results (Hughes, 2016a). The average core recovery of 90.3% is higher than 2015 (86.4%) and similar to the 2016 program as a whole. Recovery through the sulphide lenses was even higher, averaging 93.7%.

Magnetic susceptibility measurements were made on all drill core, with anomalies typically matching up against OA-type mineralization and/or pyrrhotite-rich intervals. Bulk density measurements were completed on 1866 half and whole core samples of sulphide and various silicate hanging wall and footwall lithologies. QA/QC monitoring through measurement of a rhyolite and sulphide standard as well as through pycnometer analyses on pulps shows that the BD measurements are accurate.

A total of 1276 Krakatoa samples were submitted for geochemical assay, comprising 1130 core samples, 82 CRM and 64 blanks. These totals do not include the two dedicated metallurgical holes (K16-340, 378) but does include the dual-purpose resource and metallurgical drilling. QA/QC monitoring of geochemical assays recorded one failure, comprising two consecutive CRMs where the Zn assays returned Z-scores between +2 and +3. This failure was not submitted for re-assay, in line with 2015 procedures where only 3-SD (SD = standard deviation) failures in mineralized intervals were re-assayed (Voordouw, 2016b). In light of this, the 2016 Krakatoa core assays are considered accurate and free of contamination (Appendix M). Check assays by ALS further confirms that core assays of Ag, Cu, Pb and Zn are accurate, although the SGS assays are an average of 0.6–2.5% higher for Ag, Cu and Pb, as well as 2.7% lower for Zn and 7.1% for Au.

Significant 2016 intercepts that helped to expand mineralization include a series of three holes drilled on sections K-L and K-M (Appendix K). The first of these holes (K16-363) tested a pierce point ~50 m further downdip than previous drilling, and intersected 19.7 m (true width) of massive sulphide grading 0.3% Cu, 3.7% Pb, 8.7% Zn, 2.0 g/t Au and 218 g/t Ag. A follow-up hole (K16-369) intersected 5.2 m (true width) of massive sulphide another 70 m further downdip, which assayed 1.5% Cu, 0.5% Pb, 12.2 % Zn, 0.8 g/t Au and 102 g/t Ag. Together these two holes added ~120 m of downdip extent to the Krakatoa Zone. An additional follow-up hole (K16-419) deviated towards K16-363 and intersected just ~15 m away from it, returning 0.3% Cu, 2.8% Pb, 8.3% Zn, 1.9 g/t Au and 215 g/t Ag over 6.4 m (true width). There is still room for expansion of mineralization to the northwest of K16-419, and it is recommended that this area is tested in 2017.

The downdip extent of the Krakatoa upper lens was also increased through drilling of K16-417, K16-360 and K16-357, which are shown on sections K-I, K-H and K-J respectively (Appendix K). There is still some room to extend mineralization downdip from each of these three holes. For example, there is no pierce point downdip of K16-417 although K15-248 appears to have been heading towards the projected Krakatoa upper lens and pulled up short, stopping in Type 3 muscovite alteration within what could be the hanging wall of the Krakatoa Zone (see Section K-I in Appendix K). K16-385 closed off the downdip extents of Krakatoa Zone mineralization and the 2016 results also showed that the width of the Krakatoa main lens can rapidly change from up to 20 m to <1 m over short downdip distances (e.g. K16-367 on section K-F; K16-357 on section K-J).

Holes testing the along-strike extents of the Krakatoa Zone were less successful. The 2016 drill program showed that Krakatoa Zone mineralization abuts the Fault Creek Fault but the fault has a shallower dip than previously recognized which consumes some of the space where mineralization was inferred to exist. Drilling also showed that the East and Fault Creek Faults comprise 10–70 m wide damage zones that contain anastomosing networks of fault gouge enclosing displaced panels of more coherent bedrock. Drilling generally failed to locate mineralization within these damage zones with the exception of holes like K16-368, which intersected five short intervals of massive sulphide within a 145 m long hole dominated by fault gouge.

8.5.2 GP4F deposit

The 2016 work program on the GP4F deposit comprised resource infill drilling aimed at upgrading inferred resources to indicated. The program was successful in meeting these aims, with the latest resource estimate (BMC Minerals Ltd., 2016a) increasing the indicated proportion of the resource from 0% to 60%. A summary of the drill program is provided below, map of drill collars is shown as Figure 14 and interpretive cross-sections through the deposit, showing both lithology and alteration, are listed in Table 20 and attached as Appendix K. Significant assay composites from the 2016 work are summarized in Table 21.

The 2016 GP4F work program comprised 1553.6 m of infill drilling over seven drill holes, generating six new intercepts through the GP4F lens, five intercepts through the lower lens and a single intercept of the “lower II target”. A duplicate intercept of the GP4F lens was generated through drilling K16-407, which was drilled to validate a coincident core block placement and rod count error in K16-388. All 2016 drilling was completed on two of the five sections through the GP4F deposit (419400E, 419500E).

All six drill holes were brought to completion. RTK DGPS surveys show that the average offset between the planned and actual coordinate for each drill hole is 0.9 m, indicating that the actual collar locations are in line with the drill plan. Downhole EZ-shot and Gyro surveys were done on each hole and are complementary except for a 24° offset in azimuth between readings from subvertical drill hole K16-396. The average core recovery of 85.0% is similar to 2015 and historical recovery at GP4F but lower than the 2016 program as a whole. Recovery through the sulphide lenses averaged a combined 86.4% for the 2015/16 programs.

Magnetic susceptibility measurements taken in the 2015 and 2016 programs show enough similarities that they validate each other and can be used together in a single data set. Sulphide units typically show high magnetic susceptibility most likely related to pyrrhotite contents. Bulk density measurements are similar for the 2015 and 2016 programs, and were validated through the measurement of QA/QC rhyolite and sulphide standards.

A total of 196 GP4F samples were submitted for geochemical assay, comprising 176 core samples, 10 CRM and 10 blanks. All drill assays passed QA/QC based on monitoring of CRMs and blanks (Appendix M), so that all of the 2016 core assays are considered accurate and free of contamination. The ALS check assay program further confirms that SGS assays of Ag, Cu, Pb and Zn are accurate, though an average of 2–5% higher (for Ag, Pb, Zn) than duplicate assays from ALS. There is no indication that non-sulphide phases like gahnite retain significant amounts of base metals in an aqua regia digestion (Voordouw, 2016a). Duplicate samples collected from historical drill core show strong correlation with historical assays, suggesting that the Cominco assays are also accurate. These re-assays include the precise duplication of a very high-grade historical sample.

Table 20: List of sections through the GP4F deposit

Section	X centre	Y centre	Z centre	Orientation	Looking	Width	Figure reference
419350E	419350	6813400	1150	0°	270°	±25 m	Appendix K - Figure 11
419400E	419400	6813400	1150	0°	270°	±25 m	Appendix K - Figure 12
419450E	419450	6813400	1150	0°	270°	±25 m	Appendix K - Figure 13
419500E	419500	6813400	1150	0°	270°	±25 m	Appendix K - Figure 14
419550E	419550	6813400	1150	0°	270°	±25 m	Appendix K - Figure 15

The three new intercepts of GP4F lens on 419400E provide the highest Ag, Au, Pb and Zn composites from this section to date, with the best of these assaying 11.5% Zn + Pb and 170 g/t Ag over 4.9 m in K16-388 (Table 21). The previous best intercept of 5.3% Zn + Pb and 62 g/t Ag over 5.6 m was from the 2015. Drilling on section 419500E returned a GP4F lens intercept of 15.6% Zn + Pb and 164 g/t Ag over 3.8 m in K16-393, which is comparable to the previous best of 9.3% Zn + Pb with 136 g/t Ag over 5.8 m that was also generated during the 2015 program. Overall, the 2016 drill program returned four composites for the GP4F lens that are comparable or better than the previous best intercepts on their respective sections.

New intersections of the lower lens were also generated on both of sections. Two new intercepts on section 419400E include an assay of 12.7% Zn + Pb and 140 g/t Ag over 0.55 m (Table 21), which improves significantly on the previous best assay of 1.7% Zn + Pb and 10 g/t Ag over 1.0 m from the 2015 program. Drilling on 419500E returned assays of 11.9% Zn over 0.45 m as well as 9.4% Zn + Pb and 360 g/t Ag over 1.2 m, both of which are higher-grade but narrower than the best 2015 assay of 6.2% Zn + Pb and 16 g/t Ag over 6.6 m.

K16-403 returned the third ever intersection of the lower II target, 150 m west of the only other two intercepts on section 419650E (in K15-261 and K15-285). A single sample taken from K16-403 returned 5.3% Zn + Pb and 80 g/t Ag over 0.35 m, which is similar to previous assays of lower II target from K15-261 (6.5% Zn + Pb, 117 g/t Ag, over 0.45 m) and K15-285 (8.5% Zn + Pb, 80 g/t Ag, over 0.54). Given the similarities in geology and geochemistry, the 2016 program appears to have added 150 m of east-west strike length to the lower II target.

8.5.3 ABM Zone

The 2016 resource expansion drilling program on the ABM Zone consisted of three holes for 770 m with BHEM surveys completed on two of these holes. Neither the drilling nor the BHEM surveys returned any indications of significant sulphide mineralization. A summary of the drill program is provided below, along with a map of drill collars (Figure 17).

All three of the expansion holes were brought to completion. RTK DGPS surveys show that the average offset between the planned and actual coordinate is 6.4 m, which is high relative to other programs as the holes were spotted with a handheld GPS, but still accurate enough to meet the program objectives. Downhole EZ-shot and Gyro surveys were done on all three holes and are complementary. Average recovery and RQD are 97.4% and 79.3% respectively. The mean magnetic susceptibility (1.4 SI units) is relatively low and typical of unmineralized KZK Formation. Bulk density measurements range from 2.6 to 2.9 g/cm^3 with one sample returning 3.3 g/cm^3, which is typical of silicate rocks and, in one case, semi-massive sulphide. No samples were taken for geochemical assay.

Two of the three expansion holes were drilled along the western margin of the ABM Zone, and the third was drilled at the northern downdip extent (Figure 17). No massive sulphide mineralization was intersected. K16-375, which was collared 50 m west of the ABM Zone, intersected ~35 m of 5–10% pyrite from ~100–135 m core depth, which is associated with moderate Type 3 muscovite-sericite alteration and minor to trace sphalerite contents. This is probably the western extent of the ABM lens. Within K16-406, which was collared another 200 m further west, the ABM lens equivalent horizon is most likely indicated by nearly 70 m of Type 3 muscovite-sericite alteration from 152–219 m core depth. Approximately 75 m above this lies 0.7 m of semi-massive OI-type sulphide at ~96 m core depth. Results from K16-409, which tested the northern downdip extent, include 20 m of strong Type 3 alteration within an interval overlying the downdip projection of the ABM lens, possibly indicating an additional horizon of (VMS-related?) alteration.

8.5.4 Sebesi target

The “Sebesi target” encompasses a fault bounded block of prospective KZK Formation stratigraphy that lies adjacent and southeast of the Krakatoa Zone and was identified under the assumption that part of the Krakatoa Zone was cut off and displaced by the Fault Creek Fault. The 2016 Sebesi program was designed to test this hypothesis and assumed that the prospective stratigraphy was either downthrown or displaced dextral relative to the Krakatoa Zone. BHEM surveys were carried out on all completed drill holes. A summary of this program is given below and drill collar locations are shown on Figure 15.

The 2016 Sebesi drilling program was planned as six holes drilled in two fences, with the first fence located immediately southeast of the Fault Creek Fault and the second fence located ~150 m further southeast. Proposed hole lengths ranged from 600–1000 m to test a good package of KZK Formation stratigraphy. Difficult ground conditions, however, resulted in only three of these planned holes being brought to completion, with other attempts ending stuck in one of several large fault zones or deviating strongly off course. A seventh hole was designed to traverse these fault structures at a higher angle, and so comprised the fourth, and final, of the completed Sebesi drill holes. As a result, a total of 11 drill holes were attempted on the Sebesi target for 4830.1 m, with the four completed holes totalling 3686.3 m or 75% of the metres drilled.

RTK DGPS collar surveys show that the average offset between the planned and actual coordinate for each drill hole is 4.8 m, which is higher than the Krakatoa and GP4F programs. Nonetheless, these offsets are insignificant in terms of the program objective and exploration nature of the drilling. Downhole EZ-shot tests show acceptable values and typically correlate well with adjacent measurements, suggesting they are reliable. A Gyro downhole survey was done on K16-384 and correlates well with the EZ-shot readings. Core recovery averaged 92.7% and is similar to the average of all 2016 programs. Very low RQD was recorded in holes that ended stuck in fault zones, like K16-368 (RQD = 12.4%) and K16-408 (RQD = 33.4%).

Magnetic susceptibility readings are generally low, averaging 0.9 SI units for all readings with ~80% measuring ≤1 SI unit. The highest reading of 137 SI units is associated with the ~50 cm thick layer of pyrrhotite-rich OF-type massive sulphide intersected in K16-394. Bulk densities range from 2.6 to 3.7 g/cm^3, with the latter corresponding to the same 50 cm layer of OF sulphide in K16-394.

A total of 34 Sebesi samples were submitted for geochemical assay, comprising 34 core samples and 1 CRM that passed QA/QC, so that the assay results are considered accurate and free of contamination.

Six narrow intercepts of massive sulphide were returned from the Sebesi drilling program, five of which comprise Krakatoa mineralization caught up and dismembered within a long interval of Fault Creek Fault gouge in K16-368 (not included in Table 22). The sixth intercept was returned from K16-394 at a core depth of 797.4–797.9 m (Table 22), and comprised massive pyrrhotite-rich sulphide with lesser amounts of pyrite, sphalerite, chalcopyrite and galena. Assays returned 9.3% Zn, 0.5% Cu, 0.2% Pb and 8 g/t Ag over 50 cm. Other intercepts of interest include 1.4 m of OI-type disseminated sulphide (~15% pyrite) in K16-408 and 1.8 m of chert in K16-372 that returned assays with up to 18 g/t Ag and 0.15 g/t Au.

Intersected gabbro (MAFi) similar to the footwall mafic intrusion in the Krakatoa Zone occurs in three Sebesi drill holes. In two of these holes (K16-368, 408), intervals of MAFi occur within significant intervals of fault gouge related to the Fault Creek Fault. In K16-368 the MAFi is also intercalated with the aforementioned narrow massive sulphide intercepts. In K16-408 a 2.8 m block of MAFi is hosted in 64 m of fault gouge. The up dip position of MAFi that hosts Krakatoa Zone mineralization projects into the Fault Creek Fault at a similar elevation to the dismembered MAFi and massive sulphide blocks in K16-368. This suggests that there is potential for additional mineralization down dip from K16-368.

The third interval of MAFi occurs ~150 m southeast of the Fault Creek Fault near the top of K16-372, where it is overlain by ~1.5 m of volcaniclastic rhyolite and then overburden. It is unclear if the rhyolite unit overlies the MAFi or is an inclusion within it. The MAFi unit has a minimum width of 16.8 m, extending from 22.5–39.3 m core depth, and is thinner than most of the MAFi unit in the Krakatoa Zone, which ranges from ~20–90 m in width. The lowest ~5 m interval of MAFi shows weak syngenetic chlorite alteration. This is the only MAFi intercept on the southeast side of the Fault Creek Fault, and it is untested in all directions.

The contact between the KZK and Wind Lake Formations, which marks the top of the KZK Formation, was intersected in three of the completed holes and three of the abandoned ones (Table 22). Contact morphology ranges from sharp and/or faulted (e.g. K16-384, 416) to interleaved over core lengths of 40 m (e.g. K16-394). All six holes that crossed the Wind Lake-KZK contact include a unit of quartz eye-bearing rhyolite at, or near, the very top of the KZK Formation, which averages 5.5 m in width within a range of 0.8–8.1 m. Since crystal tuff is not particularly abundant within the KZK Formation (4% of all lithologies logged), it is possible that the same crystal tuff was intersected in six different holes, providing support for a concordant Wind Lake-KZK contact.

The base of the KZK Formation may have been intersected in K16-372, where the deepest 14.6 m of the drill hole comprises feldspar-phyric diorite that is tentatively grouped as Grass Lakes plutonic suite (or the North Lakes meta-diorite). Above this contact, the bottom-most 65 m of KZK Formation comprises volcaniclastic rhyolite and pelite that is cut by a felsic dyke swarm possibly also related to the Grass Lakes suite.

A potentially useful mudstone marker unit was intersected in all four of the completed Sebesi holes, and comprises a 25–85 m thick (average = 50 m) package of 70% mudstone + 25% mafic volcanic rock, that lies 450–700 m below the base of the Wind Lake Formation. This unit is referred to as the “Sebesi mudstone marker”. This marker is also notable for hosting thin intervals of pyrrhotite-rich massive to semi-massive sulphide, in addition to chert (Table 22). A similar unit was also intersected in the Tarawera drilling, suggesting that it may be widely developed across the property.

Table 22: Sulphide, chert and stratigraphic features intersected in 2016 Sebesi drilling

Hole ID	Formation	Feature	From (m)	To (m)	Length (m)	Comments
K16-372	KZK	MAFi unit	22.5	39.3	16.8	MAFi unit similar to Krakatoa Zone

Four thin sections of Wind Lake Formation were examined by Vancouver Petrographic (Leitch, 2016), with the aim of further characterizing the mudstone (MDS) and mafic tuff (MAFt) lithologies of the Wind Lake Formation. The four samples were logged as mudstone (N = 2), mafic tuff (N = 1) and mafic ash tuff (N = 1). An overview of these samples is shown as Table 23 and detailed thin section descriptions are provided in the report (Leitch, 2016) provided as Appendix N.

The two samples of mudstone are characterized by relatively high sericite/muscovite (25–50 modal%) and carbonate (17–40%) contents, as well as minor to trace abundances of carbonaceous material and tourmaline. Abundances of tourmaline are higher-than-expected for typical metasediment, suggesting a possible hydrothermal input (Leitch, 2016). Both samples are also crenulated.

The mafic tuff and ash tuff samples contain higher proportions of chlorite (25–35%) and plagioclase (3–20%), in addition to significant proportions of quartz (25%), carbonate (12–17%) and sericite/muscovite (0–25%). Minerals of minor to trace abundance include rutile, monazite and apatite. Both samples are strongly foliated, but not crenulated, and both host foliation-parallel veins of carbonate ± quartz.

8.5.5 Tarawera target

Drilling on the Tarawera target comprised a single hole designed to test an EM anomaly identified with the 2015 VTEM survey, in addition to anomalous Zn + Ba historic soil geochemistry and sphalerite- and galena-bearing float. The hole was drilled to a depth of 854.5 m and surveyed with BHEM. The location of the drill collar is shown on Figure 15.

An RTK DGPS survey confirms that the hole was collared 2.2 m from where it was planned, which is well within the tolerance needed to meet the program objectives. Downhole EZ-shot tests show a gradual change in azimuth from 195° to 210° near the end of hole, with a few readings thrown off by ferromagnetic interference. Recovery averaged 99.1% and RQD averaged 79.3%, indicating the rock is competent in this area.

Magnetic susceptibility is low for the overall length of the hole, with slightly higher average values (1.5 SI units) in the upper ~80 m compared to the rest of the hole (0.7 SI). Slightly elevated values may be related to increased disseminated pyrrhotite content associated with the 0.5 m thick sulphide layer at ~47 m depth. Bulk density measurements range from 2.8–3.5 g/cm^3, with the highest values again related to the thin sulphide layer intersected at ~47 m depth (see next paragraph).

Six Tarawera samples were submitted for geochemical assay, comprising five core samples and one CRM that passed QA/QC, so that the assays are considered accurate and free of contamination.

Mineralization intersected at Tarawera comprised 0.5 m of pyrrhotite-rich semi-massive sulphide between 46.5–47.0 m depth (Table 24). Mineralogy comprises an estimated 30% pyrrhotite with 10% pyrite, 5% chalcopyrite and 5% sphalerite, and is associated with moderate chlorite, tourmaline, biotite and muscovite alteration. Assays returned 9.0% Zn, 0.8% Cu and 26 g/t Ag over 0.5 m, which is similar to grades returned from pyrrhotite-rich sulphide at Sebesi. It is likely that this thin sulphide horizon accounts for the VTEM anomaly.

Two intervals of sediment bearing rock packages were intersected, the first between 472.3 m to 517.1 m core depth and a second from 819.8 m to the end of hole at 854.5 m. The first of these two packages comprises ~45 m of 40% mudstone, 35% other sedimentary rocks, 15% mafic volcanic and 10% chert, which is similar in terms of both length and lithology to the marker unit defined from the Sebesi drilling. The second interval consists of 65% mafic volcanic and 35% mudstone, and is either lower KZK Formation or a different, underlying formation all together. The first interval most likely correlates with the Sebesi mudstone marker, since it lies a minimum of 470 m below the top of KZK Formation in comparison to the 450–700 m range measured at Sebesi. The second interval is too deep to match up with the Sebesi area marker unit.

The lower-most unit of felsic volcanic, which occurs immediately above the second sedimentary package, shows moderate garnet and silica alteration.

Table 24: Sulphide and stratigraphic features intersected in 2016 Tarawera drilling

Hole ID	Formation	Feature	From (m)	To (m)	Length (m)	Comments

	?	Mudstone and mafic volcanic	819.8	845.5	>25.8	Marker or different formation?

8.6 Metallurgical drilling

Metallurgical samples were collected from the Krakatoa Zone, ABM Zone and GP4F deposit, through a combination of dedicated metallurgical holes and dual-purpose holes (i.e. most of which were infill holes). The drilling and sampling is the first step in a comprehensive metallurgical testing program for both the ABM and GP4F deposits, which also includes 3-D modelling of geodomain, EDTA analysis and metallurgical test work (Black, 2015). Only the drilling and sampling is described here as it is the only element of this work program that will be filed for assessment. A list of the metallurgical samples collected during 2016 is included as Appendix O.

The 2016 metallurgical drilling and sampling program comprised 16 drill holes for 2699.6 m, with seven of these holes (1055.4 m) dedicated metallurgical drill holes (Figures 15, 16, 17). Six of the 16 holes were drilled on the Krakatoa Zone, five were drilled at the ABM Zone and five were drilled at the GP4F deposit.

All of the metallurgical drill holes were brought to completion. RTK DGPS surveys reveal an average offset of 2.1 m from the planned coordinates, indicating close correspondence between the planned and actual locations of drill holes. Downhole EZ-shot surveys are reliable outside of the mineralized zones and less reliable within them, especially those with significant proportions of OA-type massive sulphide (i.e. most of the downdip ABM holes). Average recovery from metallurgical drilling is 89.7% which is slightly lower than the 2016 program average. Magnetic susceptibility and bulk density measurements are consistent with sampling of massive sulphide. A total of 793 half and whole core samples were collected.

Geochemical assays were obtained for most metallurgical samples except for 22 samples from K16-407, which was sampled as whole core because it was drilled as a twin (see paragraph on GP4F below). All drill assays passed QA/QC based on monitoring of CRMs and blanks, so that all of the 2016 core assays are considered accurate and free of contamination.

Metallurgical samples (N = 330) from the Krakatoa Zone were collected from six drill holes, two of which were drilled downdip to generate more sampling material and four drilled perpendicular to dip direction to achieve their primary objective as infill drill holes. The 1201.4 m of drilling generated 122.2 m of massive and semi-massive sulphide, with 70.9 m derived from downdip hole K16-340. Sulphide intercepts comprised ~90% massive sulphide and ~10% semi-massive, and were mostly logged as OB-type (68% of all sulphide) with lesser amounts of OK (13.9%), OJ (6.1%), OI (5.0%), OA (4.5%) and OF (2.6%).

The five ABM metallurgical holes generated 344 samples from 193.2 m of massive and semi-massive sulphide over 611.9 m of drilling. The high ratio of sulphide to meters drilled is derived from the downdip orientation of each drill hole. Mineralization comprised ~90% massive sulphide and ~10% semi-massive, with loggers recording 61.6% OB-type, 23.9% OA, 10.1% OI and ≤ 2.0% of OC, OJ, OF and OH.

The GP4F metallurgical samples (N = 119) were collected from dual purpose holes, with four of these drilled to generate new pierce points and the fifth (K16-407) drilled to validate a coincident core block placement and rod count error through the GP4F lens. Because K16-407 was essentially a duplicate of K16-388, no samples were taken for geochemical assay and all metallurgical samples were taken as whole core. The five holes totalled 886.3 m and generated 37.5 m of mineralized material split into 70% semi-massive sulphide and 30% massive sulphide. Core loggers recorded these intercepts as 66.2% OJ-type, 11.7% OL, 9.5% OF and ≤ 6% each of OC, OI and OD.

Metallurgical samples were shipped to Small's Expediting Services in Whitehorse, Yukon, where they were stored in a refrigerated sea can to prevent oxidation. Samples were later assembled into composites of anticipated ore types and grade ranges for metallurgical testing.

8.7 Geotechnical investigations

Geotechnical investigations included test pitting and drilling in support of the proposed mine site design, as well as drilling and geotechnical core logging to characterize Krakatoa rock quality for mine planning. Each of these programs is summarized below and data is included as Appendix P and Appendix Q. A map showing the proposed infrastructure, test pits and geotechnical drill collar locations is presented as Figure 18.

8.7.1 Mine site

The 2016 mine site investigation was managed by Knight Piésold and involved both test pitting and geotechnical drilling. The objective of the test pit program was to characterize the overburden materials from across the proposed mine site and to identify potential borrow sources for construction materials. Fifty-three pits were completed and reached an average depth of 3.3 m below ground surface, within a range of 1.3–5.1 metres. Tested sites of proposed infrastructure include the class A storage facility (N = 14 test pits), ABM open pit area (N = 14), class B storage facility (N = 11), mill site (N = 6), Fault Creek area (N = 4), Krakatoa open pit (N = 2) and the topsoil stockpile (N = 2). Test pit logs are included in Appendix P. Wherever possible, test pits were accessed through the existing road and trail network. Pits were typically abandoned due to either hitting bedrock or reaching the operational limit of the excavator, with other causes including over-sized boulders, wall instability, groundwater ingress and permafrost. Each pit was backfilled and recontoured after work was completed.

Geotechnical drilling was completed between 2 July to 14 August 2016, with a total of 16 diamond drill holes for 631 m (Table 25). For each hole, geotechnical engineers completed detailed geotechnical logs, standard penetration testing (SPT), point load testing (PLT) and packer testing. The following summary of this work is adapted from the report provided by Knight Piésold (2016). Geotechnical logs are included in Appendix P.

All of the mine site geotechnical drill holes were brought to completion. RTK DGPS surveys show that the planned and actual coordinates are an average of 5.5 m apart, within a range of 0.7–19.3 m. This program recorded the largest offset between planned and actual holes, although these offsets did not interfere with program objectives. No downhole EZ-shot or Gyro surveys were completed since all 16 holes were vertical and short (≤70.6 m). Core recovery averaged 91.2% and RQD averaged 48.8%, both of which are similar to the 2016 project averages. The low RQD is related to the shallow depth for all of these holes, since bedrock closer to surface is generally more fractured.

The 2016 mine site drill program was also used to characterize surficial deposits and complement the test pit program. Drilling results indicate that surficial deposits range from 0.1 m to 19.2 m in depth, with the deepest deposits occurring underneath the proposed class C storage facility and the Geona creek valley floor. The shallowest deposits occur on valley walls, especially at higher elevations. The typical overburden profile comprises 0.1–0.5 m of organic material overlying silt and sand deposits with varying amounts of gravel and cobbles. Fine-grained clay and silt deposits occur in the class C area, where they are interbedded with more sandy layers.

Encountered bedrock includes lithologies of the KZK and Wind Lake formations, most of which exhibits an extreme strength anisotropy due to pervasive and strong foliation. Field-estimated and lab-determined UCS values suggest medium strong to strong bedrock with zones of extremely weak rubble and clay-rich material. Field RMR_{89} (Bieniawski, 1989) logging resulted in a classification of “fair” quality rock for the majority of the site.

Previous work (e.g. Golder Associates Ltd., 1996) identified discontinuous permafrost at several locations around the project site. The nine thermistors installed in 2016, however, did not identify permafrost. Ice was found during standard penetration testing of K16-410, which was drilled into the proposed class C facility site. Monitoring well MW16-13 (K16-383), which targeted the proposed class A facility, was also found to be frozen in bedrock at 6 m below ground surface. A total of 52 packer tests were also completed.

Table 25: Overview of drilling done for the 2016 mine site geotechnical investigation

8.7.2 Krakatoa rock quality

The primary aim of the 2016 Krakatoa rock quality program was to define the geotechnical and engineering properties of lithological units that fall within the proposed open pit and underground workings. Program objectives were achieved through dedicated drilling and geotechnical logging of four holes, in addition to detailed geotechnical logging on 15 Krakatoa resource holes. These holes are listed in Table 26 and collar locations are shown on Figure 18. The Krakatoa rock quality geotechnical data is included in Appendix Q.

The four dedicated Krakatoa rock quality drill holes totalled 608.1 m, and were designed to intersect each mid pit wall, extend ~50 m into primary faults and have equidistant spacing with respect to each other. All four of these holes were brought to completion. Downhole surveys were done with the EZ-shot and show acceptable values and good correlation with adjacent tests that suggest the results are accurate. Core recovery averaged 96.3% and RQD averaged 58.8%, both of which are well above the 2016 project average. There is a fairly regular distribution from low to high RQD, with 25% of all measurements recording RQD <25%, 20% showing RQD between 25–50%, another 20% of runs showing RQD between 50–75% and the remaining 35% showing RQD of 75–100% (Haque, 2016).

Lithologies were characterized by joint set numbers (Jn), weathering and alteration (W/A) code, rock hammer tests, point load testing and UCS testing. The most fractured lithology are intervals logged as “fault zone” (FLZ), where >50% of intervals have a joint number >15. Among the more coherent lithologies, mudstone and quartz vein are the most fractured rock types whereas semi-massive and massive sulphide are the most coherent. Aphanitic rhyolite (RHYi) is typically more fractured than coherent rhyolite (RHYc) and volcaniclastic rhyolite (RHYv).

Logging of W/A codes followed the classifications of Brown (1981) and shows that FLZ intervals are the most weathered whereas massive sulphide intersections are the least. Quartz vein is an example of a unit with relatively strong fracturing (i.e. high joint set number) but little weathering and alteration, presumably because massive quartz is essentially inert. Undifferentiated rhyolite (RHY) and mudstone (MDS) are also among the more weathered and altered lithologies.

Rock hammer testing followed the classification in ISRN (1978), with results more-or-less consistent with data from the Jn and W/A logging. Fault zone intervals are the weakest and classified as extremely weak to very weak rock. Massive and semi-massive sulphide intervals, on the other hand, are classified as medium strong to strong rock. RHY, MDS and mafic tuff (MAFt) are also relatively weak whereas quartz vein, RHYi and MAFi are stronger.

Point load tests were preformed at orientations parallel (42% of all tests) and perpendicular (58%) to core axis, with results suggesting massive sulphide and RHYi are relatively strong whereas FLZ and MDS are weak. Perhaps the most surprising result is how much stronger the RHYi is compared to the other types of rhyolite, which was not apparent from the hammer testing. MAFi and semi-massive sulphide are slightly stronger than the other types of rhyolite, but weaker than massive sulphide and RHYi.

Lab-based UCS testing showed that massive sulphide and RHYi are relatively strong, failing at an average of 100 and 105 Mpa respectively. MDS and RHYc on the other hand, fail at around 25 Mpa. The result for RHYc, in particular, was a surprise and may be due to the relatively marked compositional and textural heterogeneity of this lithology, which locally comprises mm- to cm-scale alternations of silica- and muscovite-rich domains. MAFi, semi-massive sulphide and RHYv, on the other hand, typically fail at intermediate stress of 46–66 Mpa.

Structural measurements on oriented core included joint foliation (N = 1541), normal joints (N = 2131) and fault structures (N = 269). The average orientation for joint foliations at the highest confidence level (i.e. level 3) is 279°/29° N, which is similar to the range defined in previous work (Golder Associates Ltd., 1996). Three normal joint sets can be distinguished at high confidence, with each showing an average orientation of 247°/10° NW, 110°/53° SW and 202°/45° WNW. Fault structures were found at orientations of 304°/30° NW, 027°/46° SE, 222°/71° NW and 060°/70° SE, the latter three of which are subparallel to the 230°–240° trending East and Fault Creek faults. Additional structural measurements on the Wind Lake Formation indicate a similar joint foliation and a single normal joint set oriented subparallel to foliation.

Seven packer tests were done as part of the rock quality program, with three tests completed within fault intervals and four done within more coherent KZK Formation rocks. Results are summarized in Tables 1-22 to 1-28 in Appendix Q.

The 2016 rock quality program also included a survey of outcrops within the proposed pit and pit wall areas. An outcrop summary is included as Table 1-29 as part of Appendix Q. Fieldwork confirmed the joint foliation and subparallel joint sets although, otherwise, normal joints were not particularly comparable to oriented core data.

8.8 Hydrogeological investigations

The 2016 hydrogeological drilling program was designed to build on baseline work started in 2015, with particular focus on the proposed open pit areas (ABM, Krakatoa) and mine infrastructure locations. Collar locations were picked to tie into a network of re-developed historical monitoring wells and wells that were drilled in 2015 (Hughes et al., 2016). New wells drilled in 2016 include six deep monitoring wells and three shallow monitoring wells, for a total of 267.4 m (Table 27). A summary of the 2016 hydrogeological drilling program is provided below.

All nine holes were drilled to completion and monitoring wells were successfully installed. RTK DGPS surveys show that the actual collar locations are an average of 3.2 m from the planned locations, which is within the tolerance guidance provided by Knight Piésold. No downhole surveys were completed, as all of the holes were vertical and short. Core recovery and RQD measurements were made for holes that were also drilled for geotechnical purposes, and this data was used, in part, to select screened zones.

Groundwater levels ranged from above the ground surface to approximately 19 m below the ground surface. Artesian conditions were encountered in drill holes completed in the Geona creek valley bottom.

Hydraulic conductivity packer testing was completed in 16 drill holes during the mine site investigation, comprising all six deep monitoring wells and ten geotechnical holes. No packer testing was done on the three shallow monitoring wells. Hydraulic conductivity values from packer testing ranged from 5 x 10-5 m/s to 9 x 10-8 m/s. The most permeable bedrock was encountered in the class C facility area.

Table 27: Overview of drilling done for the 2016 hydrogeological investigation

9.0 DISCUSSION

The following sections provide some discussion on the results of the 2016 KZK work program, presented in the same order as the above sections. Summaries for 2016 program elements and recommendations for future work are presented in the Section 10.0.

9.1 Historical core program

Historical core was relocated to KZK Camp, and is now stored together with BMC's 2015 and 2016 drill core. All of the drill core is stored on pallets so that it can be easily moved once a more permanent long-term storage facility is available.

The 2016 re-logging program completed the work that was started in 2015 (Baknes, 2015; Hughes et al., 2016), with 198 of 201 historical holes now re-logged. It is unlikely that the three missing holes will be re-logged, since two of them are not on the Property and the third one is essentially destroyed. The historical core re-logging program is therefore considered complete.

Re-coding work focussed on application of the pelite (PEL) and semi-massive sulphide (OI, OJ) codes at GP4F, and was useful in generating a more coherent lithological deposit model. Addition of the chert (CHT) code was aimed at helping to highlight silica-rich intervals that could be exhalative in nature, most of which were previously logged as silicified mudstone (Jerome de Pasquale, personal communication, May 2016). Chert and other exhalite units play an important role in defining some of the VMS-prospective horizons within the Finlayson Lake district (e.g. Hunt, 2002), so it is important to break out even suspect examples of such lithologies.

Re-sampling and assay of GP4F historical core suggests that Cominco's assays are accurate. This result is consistent with an extensive twin drilling and re-assay program done on the ABM deposit in 2015 (Hughes et al., 2016), which also concluded that Cominco's geochemical assay data was reliable.

9.2 Terrain surveys

The 2016 collar survey program completed surveying previously un-surveyed 2015 holes and monitoring wells, as well as all of the 2016 drill collars using an RTK DGPS. Historical collars were surveyed in 2015 (Hughes et al., 2016). The collar survey program on the KZK Property is therefore complete up to October 2016.

RTK DGPS work showed that actual drill collar coordinates were offset an average of 3–4 m from the planned ones. The magnitude of this offset averaged 2–3 m for the resource programs and 4–6 m for the exploration and geotechnical drill holes suggesting offset magnitudes are, in part, related to how much leeway there is in drill plan that still allows for the drill hole to meet its objective. Although these offsets are mostly negligible in terms of meeting project objectives, it is worth noting that the majority of planned collars were also spotted by DPGS, so it would be reasonable to expect less offset between planned and actual coordinates. Reasons for the observed offsets likely include one or more of the following additive errors: (1) relocation of the collar picket to facilitate safe drill rig positioning after drill pads were constructed (0–10 m), (2) placement of the skid drill on the drill pad (0–5 m), (3) errors related to twisting of the rig during pre-drilling azimuth alignment (0–1 m), and/or (4) DGPS and/or RTK correction errors (0–0.5 m?).

9.3 Geophysical surveys

Results of the 2016 airborne magnetics and VTEM survey, as well as the borehole EM surveys, require review and interpretation by a qualified geophysicist.

The airborne magnetic and VTEM survey shows broad formational and structural responses that should be integrated with property-scale geological maps. The "Grass Lakes fault corridor" is one such example, which is marked as a discrete planar fault on the regional map of Murphy et al (2001) whereas the 2016 airborne data suggests it may comprise a fault zone up to 1 km wide. Parallel structures of similar width to the Grass Lakes fault corridor include the East and Fault Creek Faults.

Two large-scale airborne anomalies were identified for ground-based follow-up work. The first of these is the so-called “East mag high” (Figure 13a, 13b), comprising a magnetic high within an area that is regionally mapped as KZK Formation (Murphy et al., 2001). This magnetic anomaly occurs in the remote eastern part of the Property and at an elevation similar to the GP4F deposit, implying that it is likely entirely under cover.

The second anomaly of note is an EM high that occurs within the Grass Lake fault corridor (GLF high on Figure 13c). Its topographic position is on a covered slope near a valley bottom, so it is unlikely that there is extensive exposure near this anomaly. A possible source for this anomaly could be Wind Lake Formation rocks. However, its position with the inferred fault zone and mapped Fire Lake Formation rocks, without other sizable nearby anomalies, make it a compelling target for follow-up work.

Resurveying over the historical core storage area, which was broken down in 2016, revealed that a weak EM and magnetic anomaly is retained even after the metal core racks were removed. In addition, drill hole K16-372 indicated that there is a mafic unit in this area similar to the MAFi unit that hosts mineralization in the Krakatoa Zone. The area around K16-372 is untested over ~150 m of strike length, from the drill collar to the Fault Creek Fault in the northwest, and ~300 m downdip. Additional surface work, like a focussed ground-based HLEM survey for example, is recommended for this area.

9.4 Resource and exploration drilling

The bulk of the 2016 drilling program comprised resource (infill, expansion) and exploration drilling, on the Krakatoa Zone, GP4F deposit, ABM Zone, Sebesi target and Tarawera target. Results are discussed in the sections below.

9.4.1 Krakatoa Zone

The 2016 resource infill and expansion drill program on the Krakatoa Zone was successful in upgrading a signification proportion of the inferred resource to indicated, but also resulted in an overall loss of tonnage from 5.1 Mt estimated in January 2016 (Green et al., 2016) to 4.2 Mt in November (BMC Minerals Ltd., 2016a). The leading cause for this reduction was increased understanding and model refinement of the East and Fault Creek Faults, which were found to comprise 10–70 m wide zones with the Fault Creek Fault now having a more shallow dip than previously recognised. Inferred resources that were initially extended to the modelled faults (Green et al., 2016) were therefore consumed by the updated fault interpretation.

It is possible that Krakatoa Zone mineralization is preserved within these fault zones, as it is within K16-368, for example, and in light of the 2016 geotechnical work showing that massive sulphide is among the stronger rock types in the area. However, the jumbled nature of stratigraphy within these faults makes it very difficult to target and find fault-hosted massive sulphide.

Downdip testing of the Krakatoa Zone revealed some additional continuity beyond the previously defined maximum depth extent (Green et al., 2016). One of the interesting geological features of the deep Krakatoa Zone is the abrupt termination of the MAFi unit across an inferred structure informally referred to as the “MAFi growth fault”. In some cases, thick massive sulphide will occur on either side of the MAFi growth fault but will be hosted within MAFi on the up dip side and felsic volcanics downdip. This geometry suggests that the MAFi unit was emplaced along the MAFi growth fault and flowed in the up dip direction.

Some units within the Krakatoa Zone may be more altered than currently recognized and include aphanitic rhyolite (RHYi) and coherent rhyolite (RHYc), both of which typically contain significant proportions of amorphous silica. Evidence that the silica in these units is secondary includes its (1) amorphous and locally pervasive character, especially within RHYi, and (2) spatial association with VMS mineralization and other types of hydrothermal alteration.

9.4.2 GP4F deposit

Following completion of the 2016 drilling, the GP4F deposit remains sparsely drilled in some areas of the resource and is open in several directions (Voordouw, 2016a). The most notable gap is section 419550E (see Appendix K), on which there are currently just two short holes (K98-190, 191) with historical intercepts that include 4.8% Zn, 3.4% Pb and 104 g/t Ag over 5.9 m as well as 77 g/t Au over 1.4 m and 566 g/t Ag over

0.2 m. The section lying immediately west (419500E) is adequately drilled and has returned some of the better grade-metre composites from the GP4F deposit whereas there is no drilling for another 100 m east of this section. Additional drilling on sections 419550E and 419600E would better help define the eastern half of the GP4F deposit and would likely upgrade significant proportions of the remaining inferred resource to indicated.

The downdip extent of the GP4F deposit is open on sections 419400E, 450E and 500E. The furthest downdip intercepts on these sections include composites of 21.1% Zn + Pb and 513 g/t Ag over 0.4 m (section 419450E) and 12.0% Zn + Pb and 330 g/t Ag over 1.3 m (419500E). On-section follow-up of these intercepts with 100 m downdip step-outs can be achieved with 350–400 m long drill holes.

The existing nomenclature for the GP4F deposit should be updated to establish consistency with deposit nomenclature used for the Krakatoa Zone. In particular, the “GP4F lens” should be renamed as the “main lens”, which then together with the lower lens comprises the GP4F deposit (Table 28). A similar change should be made for the “ABM lens”, which should be renamed as the “main lens” of the ABM Zone to establish a consistent nomenclature for naming deposit features in the project area.

Table 28: Proposed revisions to deposit nomenclature for the KZK Project

Deposit	Zone	Lens or target	Historical equivalents
ABM	ABM	Main lens	ABM lens
	Krakatoa	Upper lens	
		Main lens	
		Lower lens	
GP4F	GP4F	Upper target	Upper target
		Main lens	GP4F lens
		Lower lens	Lower target
		Lower II target	

9.4.3 ABM Zone

No massive sulphide was intersected in the ABM expansion drilling program. A key part of this work was also the BHEM surveys, which appear flat but are pending analysis by a geophysicist.

The 2016 drilling did intersect an altered and weakly mineralized horizon located ~75 m above the ABM lens. This horizon was intercepted in both K16-406 and -409, which were collared 200 m west and 100 m downdip of the ABM lens respectively. This altered and weakly mineralized horizon could represent an additional exploration target.

9.4.4 Sebesi target

The 2016 Sebesi exploration program targeted the fault-bounded block of KZK stratigraphy located on the southeast side of the Fault Creek Fault, immediately across from the Krakatoa Zone. The most significant result from this program was the intersection of a mafic unit in K16-372, which is similar to the MAFi unit that hosts mineralization in the Krakatoa Zone. K16-372 is collared 150 m southeast of the Fault Creek Fault and the mafic intercept is untested along strike up to the Fault Creek Fault, and along 300 m of downdip extent until it is cut off by K16-374. In addition, this prospective area is spatially associated with a weak to moderate EM anomaly that was previously referred to as the “core rack anomaly”, but where weakly anomalous EM and magnetism was retained even after removal of the core racks in 2016.

Other results from the Sebesi program include the identification of two marker horizons/units that can be used to characterize and model the KZK Formation. The first of these is the contact between the Wind Lake and KZK formations, which is marked by the abrupt transition from carbonaceous phyllite and mafic volcanics into underlying felsic volcanics. Despite the marked lithological change, however, there is some evidence that this contact is concordant, including the occurrence of units similar to the Wind Lake Formation in the upper-most 40 m of the KZK Formation and the widespread occurrence of an otherwise rare quartz-phyric crystal tuff unit immediately below the base of the Wind Lake Formation.

Another prominent marker is a package of carbonaceous phyllite ± mafic volcanic rock that occurs in each of the Sebesi holes, at a depth of 450–700 m below the base of the Wind Lake Formation and is informally referred to as the Sebesi mudstone marker. Similar units were logged at Tarawera and may be corelatable to the Sebesi marker. Other features suggest this marker may have an exhalative component, including 10–50 cm thick layers of semi-massive to massive pyrrhotite ± chalcopyrite (K16-394, K16-416) and 1.7 m of chert (K16-372). KZK Formation rocks underlying the Sebesi marker appear to contain a more significant component of sedimentary rocks than overlying KZK Formation.

9.4.5 Tarawera target

The 2016 Tarawera exploration program also intersected a 50 cm wide layer of pyrrhotite-rich massive sulphide that is nearly identical - in terms of width, grade and mineralogy - to the sulphide layer intersected in Sebesi hole K16-394. However, the inferred stratigraphic position of these two layers suggests that the Tarawera sulphide layers lies ~400 m above the Sebesi one, and so it is unlikely that they are corelatable.

The pyrrhotite-rich sulphide layer at Tarawera occurs at ~50 m depth and projects to daylight ~100 m south of the drill collar. It is possible that this sulphide layer accounts for the airborne EM anomaly, as well as the soil anomaly and mineralized float in the area. Additional review of float mineralogy and soil enrichments is suggested for a more complete assessment of whether this sulphide layer explains these anomalies.

The Tarawera drill program also intersected two packages of intercalated mudstone + mafic volcanic ± chert, the first occurring from 472–517 m depth and the second at the end of the hole. The first of these two intervals has a similar width to the Sebesi mudstone marker and, given its core depth, occurs at a minimum of 470 m below the top of the KZK Formation. This is within the range of 450–700 m below top of the KZK Formation measured for the marker in the Sebesi area. The second interval occurs a minimum of 815 m below the top of the KZK Formation, which is outside the range measured at Sebesi. For this reason, the first interval is the most likely correlative of the marker at Sebesi. The second interval thereby either comprises a lower felsic volcanic-poor part of the KZK Formation or, possibly, another formation altogether.

9.5 Geotechnical work

9.5.1 Mine site

The 2016 mine site investigation included excavating 53 test pits and drilling 16 geotechnical holes for 631.0 m. The aim of the investigation was to determine the geotechnical properties of soil and shallow bedrock at proposed mine infrastructure sites. Sites that were investigated with both test pits and drilling include the class A storage facility (14 test pits, 5 drill holes), class B storage facility (11 pits, 2 holes), mill site (6 pits, 2 holes), overburden stockpile (2 pits, 1 hole) and the Fault Creek area (4 pits, 2 holes), which lies upstream from the proposed open pits. Infrastructure sites examined only with test pits include the ABM (14 pits) and Krakatoa (2 test pits) open pit areas. The class C storage facility (2 drill holes) and seepage pond (1 hole) was inaccessible for test pitting and was drilled using helicopter support.

The property geological map shows that the class C storage facility holes lie within 90–150 m of the East Fault. The observed geotechnical features in this area are likely related to the proximity of these drill holes to the East Fault and/or subparallel fault structures.

9.5.2 Krakatoa rock quality

Results of the Krakatoa rock quality program can be used to further characterize lithological units broken out through geological core logging. Intervals logged as fault zone, for example, were characterized as having high joint set numbers, strong weathering and alteration, extremely weak to weak strength, and structural orientations that trend parallel to larger-scale structures (e.g. East and Fault Creek Faults). Other interesting results show that aphanitic rhyolite (RHYi) is typically more fractured than other types of felsic volcanic (i.e. RHYv, RHYc) but much stronger as measured through PLT and UCS testing. Coherent rhyolite (RHYc), on the other hand, fails more readily under UCS testing than other types of rhyolite, possibly because of its' locally marked textural and mineralogical heterogeneity. Carbonaceous mudstone of the Wind Lake Formation is also

among the weaker, weathered and altered lithologies, and may have accommodated significant amounts of strain during regional deformation.

Structures measured in oriented core confirm the predominant structural orientations known for the project area, including the dominant (or joint) foliation (30°/280°–300° N to NE) and the parallel trend of several fault zones to the larger-scale East and Fault Creek Faults. In addition, the rock quality work reveals a set of brittle structures developed subparallel to the dominant foliation, suggesting that foliation (and likely transposed lithological contacts as well) acted as planes of weakness during regional deformation.

9.6 Hydrogeological investigations

Packer testing of fault intervals as part of the Krakatoa rock quality program indicates that these are significantly more permeable than non-faulted bedrock. Packer tests at the proposed class C storage facility suggest that the East Fault may have influenced this area.

10.0 SUMMARY AND RECOMMENDATIONS

Earthworks done as part of the 2016 work program included drill pad and trail construction as well as reclamation. By the end of the 2016 field program, 65% of the 2015/16 exploration trails had been reclaimed and 95% of the drill pads.

Work on the historical core (1994–1998) archive included relocation, re-logging, re-coding and re-sampling. All historical, 2015 and 2016 core is now consolidated at the KZK Camp, where it will be stored on pallets until a longer-term storage facility is available. The 2016 re-logging program (24 holes, 4030 m) completed the comprehensive re-logging program started in 2015 (Baknes, 2015; Hughes et al., 2016). Re-sampling, coupled with assay, confirmed that Cominco's GP4F assays are accurate and suitable for use in current resource calculations given that historical samples were analysed differently (aqua regia digestion) to the 2015/2016 samples (sodium peroxide fusion). No further relocation, re-logging or re-sampling work is therefore recommended.

Additional re-coding work should be done as the geological understanding of the project area improves. Examples of possible re-coding projects include re-examination of mafic (or pelite?) layers in the hanging wall of the ABM deposit, determining (and breaking out if necessary) the extent of silica alteration within the aphanitic rhyolite (RHYi) and coherent rhyolite (RHYc) units, and applying larger-scale stratigraphic groupings to facilitate modelling.

Airborne LiDAR data collected in 2016 is included on the data disk attached as Appendix T. The 2016 surveying program measured all previously un-surveyed 2015 holes and monitoring wells, as well as all 2016 drill collars. Historical collars were surveyed in 2015 (Hughes et al., 2016). The RTK DGPS collar survey program on the KZK Property is now complete.

A 902 line-km airborne magnetics and VTEM survey was completed that ties into the 304 line-km survey done in 2015 (Hughes et al., 2016), for a total of 1206 line-km of new airborne geophysical data. Together, these two surveys provide complete airborne coverage over the KZK Property. Results indicate broad formational and structural responses that should be integrated into the Property-scale geology map. The "GLF EM high" is spatially associated with the inferred Grass Lakes fault corridor and should be targeted for follow-up surface work, starting with reconnaissance prospecting. The "core rack" anomaly is retained as a weak EM and magnetic response even after the metal core racks were removed. This is spatially associated with an intercept of mafic rock, similar to the MAFi unit that hosts mineralization in the Krakatoa Zone, which is untested along at least 150 m of strike length and 300 m of downdip extent.

Ground-based borehole EM surveys were also done in 11 holes totalling 6790.5 m. Preliminary review suggests a strong correlation between EM response and intersected sulphide layers, and a generally flat response from unmineralized rock. Both the airborne magnetic and VTEM survey and the BHEM surveys, however, require review and interpretation by a qualified geophysicist.

Resource drilling on the Krakatoa Zone (32 holes, 8623.2 m) helped to increase the proportion of indicated resource from 40% to 90% (BMC Minerals Ltd., 2016a), but also decreased the resource size and largely closed off the ore body. Along-strike drilling was the primary cause of resource contraction, where the locations of the East and Fault Creek Fault zones were better refined. Downdip resource extension was limited and closed off with most tests, although a few areas remain open for minor additions to the resource inventory, particularly the Krakatoa upper lens on sections K-H, K-I, K-J and K-K. Future work should include infill drilling in any remaining resource gaps.

Infill drilling on the GP4F deposit (7 holes, 1553.6 m) met its primary objective of upgrading the GP4F resource, with 60% of the resource now classified as indicated (BMC Minerals Ltd., 2016a). The deposit is open at depth, with the deepest pierce points on most sections comprising decent intercepts. Along-strike expansion is limited as the eastern- and western-most sections both host a relatively poorly developed GP4F lens. On the other hand, the lower lens is widest on the eastern-most section. Proposed future work would include infill drilling on section 419550E with possible expansion drilling on 419600E, downdip expansion drilling on sections 419400E to 500E, and lower priority expansion drilling on sections 419650E and 300E (Voordouw, 2016a).

Resource expansion drilling on the ABM Zone (3 holes,770.0 m) was unsuccessful and closed off parts of the western and downdip margins of the ABM lens. This program did identify a possible new exploration target located ~75 m above the ABM lens, which is defined by Type 3 muscovite alteration and/or weak sulphide mineralization. Future work on the ABM Zone could include infill drilling identified from the 2015 work (Hughes et al., 2016) and test for underlying (i.e. Krakatoa-type) mineralization, especially near the East Fault.

Exploration drilling on the Sebesi target (4 completed holes for 3385.3 m; 7 abandoned holes for 1911.3 m) was unsuccessful at intersecting significant sulphide mineralization, with the best intercept comprising 0.5 m of pyrrhotite-rich sulphide that assayed 9.3% Zn and 0.5% Cu. The most significant finding of this program was the intersection of a mafic unit in K16-372, similar to the MAFi unit that hosts mineralization in the Krakatoa Zone, which is unexplored along at least 150 m of strike length, right up to the Fault Creek Fault, and 300 m of downdip extent. In addition, this target area overlaps with the core rack EM anomaly. Other findings from the Sebesi program include the identification of a possible marker unit, named the Sebesi mudstone marker, which occurs 450–700 m below the base of the Wind Lake Formation. Future work should asses the prospectivity of the KZK Formation around K16-372 - possibly with ground-based geophysics and/or drilling, and focus on wider-scale correlations of the Sebesi marker across the Property.

Exploration drilling on the Tarawera target (1 hole, 854.4 m) was also unsuccessful in finding significant sulphide mineralization, with the best intercept comprising 0.5 m of pyrrhotite-rich sulphide that assayed 9.0% Zn and 0.8% Cu. Stratigraphic highlights include intersection of a marker unit that could correlate with a similar unit at Sebesi, as well as garnet- and silica-alteration in the lower-most felsic volcanic unit.

The mine site geotechnical program included 53 test pits and 16 holes (631.0 m). Most of the proposed infrastructure sites were investigated with two or more test pits and at least one shallow vertical drill hole, except for the less accessible class C storage facility and seepage pond (no test pits, 4 drill holes). Bedrock quality is generally classified as “fair” across the project site and locally ranges from “good” to “poor”. Unambiguous permafrost was not identified although ice was encountered in two drill holes.

The Krakatoa rock quality investigation comprised four dedicated holes for 608.1 m that were drilled into each wall of the proposed Krakatoa open pit, with the aim of geotechnically characterizing lithologies within the Krakatoa Zone. An additional 15 resource holes (4190.2 m) were geotechnically logged. Results indicate that massive to semi-massive sulphide is relatively strong whereas Wind Lake mudstone and fault zone intervals are weak, weathered and highly fractured. Felsic volcanic (RHYv) and the mafic footwall intrusion (MAFi) typically fall in between these endmembers, with aphanitic rhyolite (RHYi) generally stronger than other felsic volcanic types and coherent rhyolite (RHYc) somewhat weaker. Structural measurements on oriented core generally confirm the orientation of the dominant foliation and trend of larger-scale fault structures, and also indicate brittle failure on planes subparallel to the dominant foliation.

The hydrogeological investigation comprised nine drill holes for 267.4 m, six of which were dual purpose holes (with the mine site investigation) completed as deep monitoring wells and three shallow wells drilled only

for the hydrogeological program. Ground water depths were found to range from surface to 19 m below ground level and the highest permeability was found in the class C storage area.

Appendix B: Statement of Expenditures

STATEMENT OF EXPENDITURES

KZK Project

February 01, 2016 - December 31, 2016

PROFESSIONAL FEES AND WAGES:

Henry Awmack, P. Eng.		
3.75 days @ $700/day	$	2,625.00
Darcy Baker, P. Geo.		
4.69 days @ $700/day		3,283.00
Crystal Beaudry, Environmental Manager		
15.00 days @ $625/day		9,375.00
Thomas Branson, P. Geo		
4.88 days @ $700/day		3,416.00
Matt Brickenden, Exploration Assistant		
18.00 days @ $400/day		7,200.00
Steve Bultitude, Assistant Geologist		
29.50 days @ $400/day		11,800.00
Darrin Dawson, Exploration Assistant		
26.00 days @ $400/day		10,400.00
Jerome de Pasquale, Geologist		
107.50 days @ $575/day		61,812.50
Henry Dick, Environmental Services		
5.00 days @ $400/day		2,000.00
Robert Duncan, Project Geologist		
76.64 days @ $700/day		53,648.00
Rafe Etzel, Padbuilder		
52.72 days @ $450/day		23,725.00
Kellin Friesen, Senior Sampler		
73.50 days @ $325/day		23,887.50
Annette Giesbrecht, Head Cook		
41.50 days @ $550/day		22,825.00
Rory Heaney, First Aid Attendant Level III		
119.00 days @ $400/day		47,600.00
Brian Hegarty, Project Manager		
170.51 days @ $625/day		106,568.75
Morgan Hendrie, Exploration Assistant		
10.00 days @ $400/day		4,000.00
Chris Hughes, Project Geologist		
188.29 days @ $700/day		131,803.00
Roger Hulstein, P. Geo		
57.25 days @ $700/day		40,075.00
Dillon Hume, Geologist		
83.50 days @ $575/day		48,012.50
Jody Inkster, Environmental Monitor		
66.50 days @ $400/day		26,600.00
Doris John, Head Cook		

122.45 days @ $550/day	67,350.00
Grace Johnny, Assistant Cook	
44.00 days @ $325/day	14,300.00
Sheila Johnny, Cook	
87.00 days @ $475/day	41,325.00
Whitney Johnson-Ward, Senior Sampler	
15.00 days @ $325/day	4,875.00
Murray Jones, P. Geo.	
4.00 days @ $700/day	2,800.00
Doreen Ladue, Assistant Cook	
82.00 days @ $325/day	26,650.00
Shirley Ladue, Assistant Cook	
29.00 days @ $325/day	9,425.00
Philippe LaPointe, Senior Sampler	
10.00 days @ $325/day	4,875.00
Martine Le Levier, Head Cook	
60.00 days @ $550/day	33,000.00
Cecile Legare, First Aid Attendant Level III	
8.00 days @ $400/day	3,200.00
Scott MacNeill, Project Environmental Manager	
102.50 days @ $700/day	71,750.00
Jamie McLennan, Project Manager	
70.50 days @ $625/day	44,062.50
Danny Menacho, Senior Sampler	
30.00 days @ $325/day	9,750.00
Dennis Menacho, Senior Sampler	
43.00 days @ $325/day	13,975.00
Heiko Mueller, Geologist	
18.78 days @ $575/day	10,800.00
Trent Newkirk, Project Environmental Manager	
54.00 days @ $700/day	37,800.00
Oscar Nielsen, Geologist	
104.64 days @ $525/day	54,937.50
Richard Ney, Senior Sampler	
31.50 days @ $325/day	10,237.50
Dave Nuttall, Geologist	
33.50 days @ $575/day	19,262.50
Tara Ollie, Environmental Monitor	
13.00 days @ $325/day	4,225.00
Terry Ollie, Environmental Monitor	
14.00 days @ $325/day	12,285.00
Scott Parker, GIS / Logistics	
27.00 hours @ $75/hour	20,100.00
Neil Perk, P. Geo.	
14.00 days @ $700/day	2,800.00
Tyler Porter, First Aid Attendant Level III	
52.00 days @ $400/day	20,800.00

Trevor Rabb, P. Geo			
16.75 days @ $700/day	11,725.00		
Will Shawcross, Site Services			
127.50 days @ $400/day	51,000.00		
Colin Slauenwhite, Project Manager			
132.46 days @ $625/day	82,787.50		
John Sterriah, Senior Sampler			
67.50 days @ $325/day	21,937.50		
Jason Stone-Smith, Senior Sampler			
93.50 days @ $325/day	30,387.50		
Sean Suttie, Environmental Manager			
19.70 days @ $625/day	12,312.50		
David Swanton, P.Geo.			
1.00 day @ $700/day	700.00		
Jennifer Tom, Assistant Cook			
84.00 days @ $325/day	27,300.00		
Abraham Tutcho, Site Services			
64.00 days @ $325/day	20,800.00		
Alicia Vainio, Geologist			
99.00 days @ $575/day	56,925.00		
Ron Voordouw, P. Geo			
170.79 days @ $700/day	119,553.00		
Agata Zurek, GIS			
565.50 hours @ $75/hour	42,412.50		
Clerical			
46.02 hours @ $35/hour	1,610.70	$	1,660,692.45

EQUIPMENT RENTALS:

Chainsaw			
1.00 day @ $30/day	$ 120.00		
Core Saw (Gas)			
90.00 days @ $60/day	5,400.00		
Field Camp			
6,398.00 days @ $20/manday	127,960.00		
Field Computers			
1,588.00 days @ $20/day	31,760.00		
First Aid Rental			
467.33 days @ $45/day	21,030.00		
Generator Rental			
771.67 days @ $45/day	34,725.00		
Power Auger			
6.00 days @ $30/day	180.00		
Magnetic Susceptibility Meter			
27.00 days @ $15/day	405.00		
Micromine Software			
347.00 hours @ $50/hour	17,350.00		
Burnadette Incinerator			

	253.14 days @ $43/day	10,885.00	$	249,815.00

EXPENSES:

Licenses	19,238.81
Claim Management	19,380.52
Chemical Analyses	164,840.86
Database Administration	36,438.19
Field Equipment Repairs & Maint.	7,580.55
Field Consumables	7,769.29
Materials and Supplies	249,001.36
Small Tools and Equipment (<$200)	775.06
Plot Charges	1,511.45
Printing and Reproductions	790.11
Camp Food	198,649.35
Meals	3,013.59
Accommodation	22,026.56
Taxis and Airporters	2,672.82
Parking	108.63
ATV Rental (Non-Equity)	29,800.00
Truck Rental (Non-Equity)	154,948.80
Automotive Fuel	2,157.53
Automotive Expenses	2,004.33
Aircraft Charters	239,865.21
Helicopter Charters	362,449.03
Busfare	8.29
Airfare	64,832.00
Telephone Distance Charges	421.86
Courier	815.91
Freight	233,720.02
Bulk Fuel + Tank Rental	364,681.32
Airborne Geophysics: Field Work	168,984.94
Ground Geophysics: Field Work	110,791.79
Geophysical Consulting	2,668.75
Health/Fitness	32,620.75
Camp Maintenance / Catering	67,057.27
Blasting, Linecutting, Padbuilding	4,188.58
Dump Disposal Fees	70.23
Road Rehabilitation + Maintenance	17,400.33
Satellite Phone Rental (Non-Equity)	5,330.06
Radio Rental (Non-Equity)	31,616.59
Chainsaw Rental (Non-Equity)	2,840.00
Downhole Survey Tool Rental (Non-Equity)	147,922.43
Generator Rental (Non-Equity)	2,225.00
Other Equipment Rental (Non-Equity)	24,099.46
Earthworks	403,606.79
Excavator	13,250.00
Loader	24,600.00

Drilling: Footage	2,745,381.01	
Drilling: Materials	2,273.92	
Drilling: Coreboxes	56,090.00	
Surveying: Field Work	119,017.15	
Geological Consulting	431,136.46	
Engineering Consulting	1,003,701.87	
Petrography	18,068.44	
Health & Safety + Training	39,712.31	
Expediting	81,905.38	
Rent: Other Storage	3,500.00	
Utilities (Warehouse)	28.57	
Postage	21.91	
Internet Charges	89,461.83	
Course or Lecture Fees, MEG	424.05	
Report (estimated)	10,000.00	7,849,497.32
SUB-TOTAL:		$ 9,760,004.77
PROJECT SUPERVISION CHARGES:		669,000.02
TOTAL:		$ 10,429,004.79

Appendix C: Claim Data

This appendix contains a list of all claims comprising the KZK Property as of March 2017. Claims are ordered by grant number in Table C-1 below.

Table C-1: Tenure details for KZK Property claims

Grant Number	Tenure Type	Claim Name	Claim Number	Staking Date	Recording Date	Expiry Date	Claim Status
YB46227	Quartz	TAG	1	18-Aug-93	20-Aug-93	2-Apr-28	Active

Appendix D: Geological Logs for Re-Logged Drill Core

This appendix contains all of the drill logs generated during the 2016 historical core re-logging program. Drill logs are presented in alphanumeric order, with the first page of each log starting on the page number indicated in Table D-1 below.

Table D-1: Table of contents for re-logged historical drill holes in this appendix

Hole ID	Length (m)	Target	Core Storage Location	Page Number	Number of Pages
K94-002	72.00	ABM	KZK Camp	1	1
K94-017	108.51	ABM	KZK Camp	2	5

From (m)	To (m)	Rocktype & Description			From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
0.00	**23.70**	**OVBN**	**Overburden**										
23.70	**31.64**	**MDS**	**Carbonaceous Mudstone & Tuffaceous Mudstone**	**black**	**VFG**								

23.7 - 31.64: Black to grey, finely laminated (bedding and bed-parallel foliation?), graphitic mudstone; oxidized and pitted

<<Struc: 29.2 - 29.21 Moderate-Strong Foliation>> Well-developed foliation between graphite and calcite rich bands

<<Struc: 29.8 - 39.25 Weak-Moderate Fault>> Pervasive fracturing with short intervals of in situ fault gouge and complete disintegration

31.64	**33.00**	**MAFi**	**Mafic Intrusions (primarily footwall mafic intrusion)**	**yl**	**FG**								

31.64 - 33: Light grey to yellow orange, strongly oxidized (and clay altered?), mafic intrusion?; similar to oxidized units logged as MAFi in K95-163; lithological ID based on softness and Cominco description (which ranges from mafic to intermediate)

<<Min: 31.64 - 33 5% Min: Pyrite>> Lenticular blebs of PY that range from pristine to strongly oxidized

<<Struc: 31.64 - 31.65 Contact>> Contact between MAFi and MDS

<<Struc: 32.6 - 32.61 Moderate-Strong Foliation>> Defined by aligned lenticular pyrite aggregates in MAFi

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

33.00 35.90 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

33 - 35.9: Black to grey, finely laminated (bedding and bed-parallel foliation?), strongly fractured, graphitic mudstone; oxidized and pitted

35.90 36.87 MAFi Mafic Intrusions (primarily footwall mafic intrusion) yl FG

35.9 - 36.87: Yellow orange, strongly oxidized, foliated mafic intrusion (?); same as MAFi previous interval; ID based on similar rock types in K95-163, softness and Cominco logging

36.87 37.80 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

36.87 - 37.8: Black to grey, finely laminated (bedding and bed-parallel foliation?) graphitic mudstone; oxidized and pitted; shows gradational contact with mafic volcaniclastic

37.80 40.30 MDS Carbonaceous Mudstone & Tuffaceous Mudstone grey-brown FG

37.8 - 40.3: Well-laminated (bedding with parallel foliation?) very fine-grained graphitic mudstone with slight coarser-grained limonite-altered (mafic) material; limonite oxidation similar to that of more massive mafic units; entire unit appears sedimentary but with more mafic input than overlying graphite-rich interval

<<Alt: 37.8 - 40.3 Moderate-Strong Chlorite>> Pervasive alteration of mafic elements to CL

<<Struc: 38 - 38.01 Moderate-Strong Bedding>> Within MDS; foliation appears to be parallel to bedding

40.30 40.80 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

40.3 - 40.8: Black to grey, finely laminated (bedding and bed-parallel foliation?) graphitic mudstone with minor MAFt; oxidized and pitted; shows gradational contact with mafic volcaniclastic on either side

40.80 54.80 MDS Carbonaceous Mudstone & Tuffaceous Mudstone grey-brown FG

40.8 - 54.8: Well-laminated (bedding with parallel foliation?) very fine-grained graphitic mudstone with slight coarser-grained limonite-altered (mafic) material; limonite oxidation similar to that of more massive mafic units; entire unit appears sedimentary but with more mafic input than overlying graphite-rich interval

<<Alt: 40.8 - 65.15 Moderate-Strong Chlorite>> Pervasive alteration of mafic elements to CL

<<Struc: 45.8 - 46.3 Weak Fault>> Strong fracturing with short interval of gravel-sized particles

<<Struc: 50.8 - 50.81 Weak-Moderate Bedding>> Bedding defined by alternations of mafic-rich and graphite-rich material; foliation is parallel to bedding

<<Struc: 54 - 54.5 Strong Fault>> Only gravel to clay sized particles; fault gouge

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

54.80 57.60 MAFi Mafic Intrusions (primarily footwall mafic intrusion) light grey FMG

54.8 - 57.6: Homogeneous and massive MAFi, both in terms of texture and grain size; mineralogy dominantly chlorite-plagioclase; patchy limonite staining

<<Struc: 54.8 - 54.81 Contact>> Bedding parallel contact between MAFi and MDS

57.60 62.15 MDS Carbonaceous Mudstone & Tuffaceous Mudstone grey-brown FG

57.6 - 62.15: Grey-brown to yellow, showing significantly more limonite staining than overlying intervals; well-laminated (bedding with parallel foliation?); very fine-grained graphitic mudstone with slight coarser-grained limonite-altered (mafic) material.

<<Struc: 59.6 - 59.61 Weak-Moderate Bedding>> Bedding defined by alternations of mafic-rich and graphite-rich material; foliation is parallel to bedding

62.15 65.15 MAFi Mafic Intrusions (primarily footwall mafic intrusion) light grey FG

62.15 - 65.15: Fine medium to fine-grained, relatively massive but with xenoliths (or interlayered?) MDS near the lower contact; abundant leucoxene, weak limonite staining and localized overgrowth by biotite porphyroblasts

<<Alt: 62.55 - 63.6 Moderate Biotite>> Biotite porphyroblasts in MAFi

65.15 65.80 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

65.15 - 65.8: Black to grey, finely laminated (bedding and bed-parallel foliation?) graphitic mudstone with minor MAFt; pitted; shows sharp contacts with adjacent MAFi

<<Struc: 65.15 - 65.16 Contact>> Sharp contact between MAFi and MDS

65.80 66.65 MAFi Mafic Intrusions (primarily footwall mafic intrusion) light grey FG

65.8 - 66.65: Massive to strongly laminated near basal contact; ranges from MAFi seen in above interval to MDS-like; most of this interval is gone (either by GSC sampling and/or faulting

<<Alt: 65.8 - 66.65 Moderate-Strong Chlorite>> Pervasive alteration of MAFi to CL

<<Struc: 65.8 - 65.81 Contact>> Sharp contact between MDS and MAFi

66.65 69.88 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

66.65 - 69.88: Typical graphitic mudstone with relatively high proportion of calcite-rich layers

<<Struc: 68 - 68.01 Strong Foliation>> Defined by calcite-rich and graphite-rich bands

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

69.88 70.53 MAFi Mafic Intrusions (primarily footwall mafic intrusion) yl FMG

69.88 - 70.53: Massive MAFi with pervasive limonite alteration; pitted

<<Min: 69.88 - 70.53 3% Min: Pyrite>> Strongly oxidized lenticular blebs

<<Alt: 69.88 - 70.53 Moderate-Strong Chlorite>> Pervasive alteration of MAFi to CL

<<Alt: 69.88 - 70.53 Weak-Moderate Biotite>> Biotite porphyroblasts in MAFi

<<Struc: 69.88 - 69.89 Contact>> Sharp contact between MDS and MAFi

70.53 71.20 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

70.53 - 71.2: Typical graphitic mudstone with relatively high proportion of calcite-rich layers

<<Struc: 70.53 - 70.54 Contact>> Sharp contact between MDS and MAFi

<<Struc: 71.15 - 71.16 Strong Foliation>> Defined by calcite-rich and graphite-rich bands

71.20 71.52 MAFi Mafic Intrusions (primarily footwall mafic intrusion) yl FMG

71.2 - 71.52: Strongly oxidized MAFi

<<Alt: 71.2 - 71.52 Moderate-Strong Chlorite>> Pervasive alteration of MAFi to CL

71.52 71.80 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

71.52 - 71.8: Typical graphitic mudstone with relatively high proportion of calcite-rich layers

<<Struc: 71.52 - 71.53 Contact>> Sharp contact between MDS and MAFi

71.80 72.95 MAFi Mafic Intrusions (primarily footwall mafic intrusion) light grey FG

71.8 - 72.95: Massive to foliated, light grey to strongly oxidized over short intervals; similarity to most previous MAFi layers

<<Min: 72.4 - 72.8 10% Min: Pyrite>> Lenticular blebs of PY that range from pristine to strongly oxidized

<<Alt: 71.8 - 72.95 Moderate-Strong Chlorite>> Pervasive alteration of MAFi to CL

<<Alt: 71.8 - 72.95 Weak-Moderate Biotite>> Biotite porphyroblasts in MAFi

72.95 74.87 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

72.95 - 74.87: Typical graphitic mudstone with relatively high proportion of calcite-rich layers

<<Struc: 72.95 - 72.96 Contact>> Sharp contact between MDS and MAFi

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 73 - 73.01 Strong Foliation>> Defined by calcite-rich and graphite-rich bands

<<Struc: 73.6 - 74.55 Moderate-Strong Fault>> Strong fracturing with some in situ fault gouge

74.87 75.30 MAFi Mafic Intrusions (primarily footwall mafic intrusion) light grey FMG

74.87 - 75.3: Relatively unaltered and massive mafic dyke to EOH

<<Alt: 74.87 - 75.3 Moderate-Strong Chlorite>> Pervasive alteration of MAFi to CL

<<Alt: 74.87 - 75.3 Weak-Moderate Biotite>> Biotite porphyroblasts in MAFi

<<Struc: 74.87 - 74.88 Contact>> Sharp contact between MDS and MAFi

Comments:

K95-165 consists in calcareous mafic tuff and silicified mudstone very similar to those encountered East of ABM deposit, in the Wind Lake formations, Regarding to the geological map (Murphy's), it could be the same units. This is not confirmed by Cominco's geological map.

74.6 - 75.41: BI porphyroblasts.

<<Alt: 74.8 - 84 Moderate Calcite>>

75.41 79.75 MAFw mafic volcanic flows

75.41 - 79.75: Intermediate composition. Light green, foliated, locally flow banded.

79.75 87.00 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

79.75 - 87: CA veining. AK bands.

<<Alt: 84 - 94.4 Moderate Ankerite>> Or dolomite.

<<Alt: 84 - 258.5 Weak-Moderate Calcite>> 5 percent.

87.00 88.50 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

87 - 88.5: Sheared. Broken zone.

<<Struc: 87 - 88.5 Moderate-Strong Fault>> In graphitic mudstone. Shreared/creulation.

88.50 94.80 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

88.5 - 94.8: CA veining. Thin foliation. Mixed with sediment and/or mafic material tightly interbedded.

<<Alt: 94.64 - 99.8 Strong Silicification>>

<<Vein: 90.05 - 90.15 Quartz>> QZ vein

<<Vein: 94.4 - 94.64 Quartz-Carbonate>> QZ/CA vein.

94.80 99.80 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

94.8 - 99.8: Strongly silicified mudstone. Weakly carbonaceous, weakly calcareous. White veining (possibly feldspar) locally crenulated.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

99.80 104.02 MAFt Mafic Volcaniclastics

99.8 - 104.02: CA veining. Mafic tuff crosscut but 10 cm wide CA/QZ veins associated with CL patch. Gradual lower contact with mudstone. Few lapilli. Foliation well marker downhole.

<<Vein: 99.89 - 102.17 Quarzt-Chlorite-Carbonate>> QZ/CA/CL.

104.02 105.83 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

104.02 - 105.83: CA veining. Poorly carbonaceous.

105.83 106.11 MAFt Mafic Volcaniclastics

105.83 - 106.11: CA veining. Sharp upper and lower contact.

<<Struc: 105.83 - 107.98 Moderate Shear>> In highly graphitic mudstone, broken zone.

106.11 107.98 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

106.11 - 107.98: Graphitic mudstone, sheared, almost brecciated. CA veining. Gradual lower contact.

107.98 128.64 MAFt Mafic Volcaniclastics

107.98 - 128.64: Could be partly MAFw. Lapilli/ashes interbedded suggesting normal grading. BI patchy.

<<Vein: 115 - 115.68 Quarzt-Chlorite-Carbonate>> QZ/CA/CL.

128.64 129.50 MDSt Rhyolite tuff dominant mudstone

128.64 - 129.5: Granular patch, possibly Xtl. QZ eyes aggregated suggesting felsic content. Probably QE in mudstone interbedded with mafic tuff and grading normal sequence.

129.50 135.02 MAFt Mafic Volcaniclastics

129.5 - 135.02: Dominantly mafic material mixed with mudstone. Some argilitic thin bands in larger mafic bands, Secondary schistosity observed.

135.02 137.75 MAFw mafic volcanic flows

135.02 - 137.75: Mix of mafic (silicic bands and QZ) and felsic material interbedded. Medium grain to fine grain at upper contact.

137.75 143.60 MAFw mafic volcanic flows

137.75 - 143.6: CA veining.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

143.60 145.05 MAFt Mafic Volcaniclastics

143.6 - 145.05: Lapilli to ash from bottom to top.

145.05 162.02 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

145.05 - 162.02: Gradual upper contact from 149.90. CA veining. Wavy beds disrupted locally. Narrow shear zone. Gradual lower contact.

<<Struc: 158.3 - 158.8 Moderate Shear>>

<<Struc: 159.5 - 162.5 Weak Fault>> Multiple narrow fault, minor.

162.02 165.03 MAFt Mafic Volcaniclastics

162.02 - 165.03: Massive QZ vein at lower contact. CA veining.

165.03 168.00 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

165.03 - 168: Folded, secondary schistosity observed. CA veining.

<<Vein: 165.03 - 165.2 Quartz-Carbonate>> QZ/CA vein.

168.00 169.91 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

168 - 169.91: Bleached mudstone in fault zone. QZ vein at lower contact. Late QZ/PY discordant vein (up to 1 cm wide).

<<Struc: 168 - 171.2 Moderate-Strong Fault>> Fault gouge over 20 cm, expended broken zone, bleached mudstone suggesting fluid circulation.

169.91 172.79 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

169.91 - 172.79: Graphitic mudstone. Broken zone. Large bull QZ vein from 171.20 to 172.50.

<<Vein: 171.2 - 175.4 Quartz>> QZ containing schist. Vuggy.

172.79 176.60 MAFt Mafic Volcaniclastics

172.79 - 176.6: Crosscut by vuggy QZ veins. Faulted (gouge).

<<Struc: 172.79 - 174.4 Moderate-Strong Fault>>

176.60 189.00 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

176.6 - 189: Gradual lower contact. CA veining, crenulated and folded.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 178.7 - 181 Quartz-Carbonate>> Multiple QZ/CA veins up to 30 cm wide.

189.00 191.92 MAFt Mafic Volcaniclastics

189 - 191.92: CA/QZ vein.

<<Struc: 190 - 191.75 Moderate-Strong Fault>> Few gouge.

191.92 197.52 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

191.92 - 197.52: Containing bull QZ vein over 1.20 m. Some MAFt in the QZ vein.

<<Vein: 197.3 - 197.42 Quartz-Carbonate>> QZ/CA vein.

197.52 199.95 RHYva Coarse grained to ash tuff

197.52 - 199.95: Few lapilli. Thin foliation

<<Alt: 197.52 - 337.4 Moderate Ankerite>> In lapilli.

199.95 213.00 RHYvl Lapilli tuff

199.95 - 213: Locally few fine grain bands (Bl rich-dark blue). Ash at lower contact.

<<Alt: 203.11 - 206.8 Strong Silicification>>

213.00 214.96 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

213 - 214.96: Bl/CA. Sharp contacts.

214.96 216.70 RHYvx Quartz and/or feldspar crystal tuff

214.96 - 216.7: Almost curdy texture. High density of lapilli and/or porphyroblasts.

216.70 221.43 RHYvl Lapilli tuff

216.7 - 221.43: Ash locally. Biotite rich.

221.43 223.70 RHYva Coarse grained to ash tuff

221.43 - 223.7: Bluish. Fine to very fine grain at lower contact.

<<Alt: 221.43 - 223.7 Strong Silicification>>

223.70 223.94 MDSt Rhyolite tuff dominant mudstone

223.7 - 223.94: Banded. Very fine grain and carbonaceous.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

223.94 224.60 RHYvl Lapilli tuff

224.60 225.53 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

224.6 - 225.53: CA in matrix/BI.

225.53 231.80 RHYvx Quartz and/or feldspar crystal tuff

225.53 - 231.8: Locally sheared (from 228.6 to 230)

<<Struc: 228.4 - 230 Moderate-Strong Shear>>

<<Struc: 231 - 231.6 Moderate Shear>>

231.80 232.00 RHYva Coarse grained to ash tuff

231.8 - 232: BI porphyroblasts. Locally folded.

232.00 234.54 RHYvx Quartz and/or feldspar crystal tuff

232 - 234.54: Strongly Lapillitic and heterogeneous.

234.54 235.09 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

234.54 - 235.09: CA in matrix/BI.

235.09 242.04 RHYvx Quartz and/or feldspar crystal tuff

235.09 - 242.04: Low strained.

242.04 245.86 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

242.04 - 245.86: CA in matrix/BI. Locally banded, sharp contacts. Could be pelitic.

<<Struc: 245 - 245.2 Weak-Moderate Shear>> In mafic dike (or pelite).

245.86 248.61 RHYva Coarse grained to ash tuff

245.86 - 248.61: Ash dominant. BI rich, silicified from 247.84 to lower contact.

<<Alt: 247.84 - 251.42 Strong Silicification>>

<<Vein: 247.5 - 247.84 Quartz-Carbonate>> QZ/CA vein.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

248.61 252.96 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

248.61 - 252.96: CA in matrix/BI. CA veinlets.

252.96 253.60 RHYv Rhyolite volcaniclastic

252.96 - 253.6: Maybe sedimentary. Thin foliation. Probably RHYv mixed with mafic or pelitic material. Few CA, possibly QZ. Proximity of massive QZ vein and mafic dyke.

253.60 259.00 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

253.6 - 259: BI rich. Large peperitic contact (upper and lower). Very fine grain BI. Bull QZ vein at upper contact.

<<Alt: 258.5 - 442 Moderate Calcite>> 10 percent and lapilli. More intense in mafic material

<<Vein: 254.26 - 256.66 Quartz>> Bull QZ vein associated with large peperitic texture.

<<Vein: 258.67 - 258.82 Quartz>> QZ vein at upper contact of mafic dike showing peperitic texture.

259.00 261.40 RHYvx Quartz and/or feldspar crystal tuff

259 - 261.4: BI rich, extension of the peperitic texture. BI porphyroblasts. Large crystals.

261.40 264.96 RHYvl Lapilli tuff

261.4 - 264.96: Almost curdy texture and intense silicification locally.

264.96 269.60 RHYvx Quartz and/or feldspar crystal tuff

264.96 - 269.6: Or low strained lapilli, high density. QZ veins crosscutting (up to 2 cm wide).

269.60 274.55 RHYvx Quartz and/or feldspar crystal tuff

274.55 276.34 RHYvl Lapilli tuff

274.55 - 276.34: BI rich.

276.34 281.34 RHYvl Lapilli tuff

276.34 - 281.34: BI rich (bluish). High stained lapilli.

281.34 282.90 RHYva Coarse grained to ash tuff

281.34 - 282.9: Medium grain lapilli.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

282.90 283.73 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

282.9 - 283.73: CA in matrix/brown biotite.

283.73 286.34 RHYva Coarse grained to ash tuff

283.73 - 286.34: BI rich.

286.34 295.68 RHYvl Lapilli tuff

286.34 - 295.68: Locally brown ash with Bippo and fine grain bands (pelite?)

295.68 296.67 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

295.68 - 296.67: CA in matrix/BI.

296.67 303.82 RHYvl Lapilli tuff

296.67 - 303.82: BI rich. Faulted at lower contact.

<<Struc: 300.22 - 300.36 Weak-Moderate Fault>> 20 cm of gouge.

<<Struc: 303.5 - 304.55 Moderate-Strong Shear>>

303.82 306.14 RHYva Coarse grained to ash tuff

303.82 - 306.14: Sheared at upper contact.

306.14 306.86 RHYvl Lapilli tuff

306.14 - 306.86: Heterogeneous, high density of lapilli.

306.86 309.72 RHYva Coarse grained to ash tuff

306.86 - 309.72: Fine grain, weakly foliated.

309.72 312.40 RHYvl Lapilli tuff

309.72 - 312.4: Ash at lower contact.

312.40 313.18 RHYva Coarse grained to ash tuff

312.4 - 313.18: Crosscut by a narrow dike showing chill margin and amygdules.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

313.18 317.17 RHYvx Quartz and/or feldspar crystal tuff

313.18 - 317.17: QZ veinlets.

317.17 320.03 RHYva Coarse grained to ash tuff

317.17 - 320.03: Faulted and sheared from 3.17.20 to 320.84.

<<Struc: 317.17 - 320.85 Moderate-Strong Fault>> And broken zone. 2 fault gouge (50 cm wide each).

320.03 324.30 RHYvl Lapilli tuff

320.03 - 324.3: Fault gouge.

324.30 325.61 PEL Equigranular biotite + calcite +/- quartz rock

324.3 - 325.61: CA/BI, ash interbed. Sharp upper contact, gradual lower contact.

325.61 334.15 RHYvl Lapilli tuff

325.61 - 334.15: Lapilli and ash interbedded.

<<Struc: 327 - 327.6 Weak-Moderate Fault>> Minor fault and shearing.

334.15 334.85 RHYcw Curdy textured-flow banded (flows, subvolcanics)

334.15 - 334.85: Base of sequence flow/lapilli/ash.

334.85 337.40 RHYvl Lapilli tuff

334.85 - 337.4: From 335.36 to 335.64, fine grain CA rich, weakly sheared.

<<Struc: 335.36 - 335.65 Weak-Moderate Shear>> In CA rick layer logged as ash.

337.40 343.72 RHYvl Lapilli tuff

<<Alt: 337.4 - 442 Trace Ankerite>>

343.72 344.42 PEL Equigranular biotite + calcite +/- quartz rock

343.72 - 344.42: Interbedded with RHY. B/QZ/CA.

344.42 347.53 RHYvl Lapilli tuff

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

347.53 356.20 RHYva Coarse grained to ash tuff

347.53 - 356.2: Maybe xtl.

<<Alt: 347.53 - 428.7 Moderate Biotite>> Locally strong.

356.20 356.94 PEL Equigranular biotite + calcite +/- quartz rock

356.2 - 356.94: Could be MAFi. Mixed with RHY.

356.94 359.59 RHYvx Quartz and/or feldspar crystal tuff

359.59 377.74 RHYva Coarse grained to ash tuff

359.59 - 377.74: BI rich. Dominantly ash. Few beds CA rich.

377.74 382.68 RHYva Coarse grained to ash tuff

377.74 - 382.68: Flow banded at lower contact over 20 cm.

<<Vein: 381.64 - 381.95 Quartz>> QZ veins, ribboned.

382.68 391.73 MAFt Mafic Volcaniclastics

382.68 - 391.73: Or flow. Silicified CL/BI/CA. Chlorite alteration locally strong. Ribboned QZ vein from 381.62 to 381.84, could be flow. CA veining. BI goes from very fine grain to coarse grain. Possibly relic of amygdules.

<<Alt: 382.95 - 384.5 Moderate-Strong Chlorite>>

<<Alt: 383.62 - 393.5 Strong Silicification>>

<<Alt: 384.5 - 389.14 Strong Chlorite>>

<<Alt: 389.14 - 390.4 Moderate Chlorite>>

391.73 392.40 RHY undifferentiated rhyolite

391.73 - 392.4: Silicified.

392.40 392.93 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

392.93 393.40 RHY undifferentiated rhyolite

392.93 - 393.4: BI rich.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

393.40 394.54 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

393.4 - 394.54: CA at upper contact. Maybe ash layer.

394.54 397.24 RHYva Coarse grained to ash tuff

397.24 397.65 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

397.24 - 397.65: CA. Foliated.

397.65 403.33 RHYva Coarse grained to ash tuff

397.65 - 403.33: BI rich.

<<Vein: 399 - 402.6 Quartz>> Several QZ vein from 1 cm to 25 cm wide, 3/metre.

403.33 403.75 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

403.33 - 403.75: CA in matrix/BI. Gradual lower contact.

403.75 408.61 RHYva Coarse grained to ash tuff

408.61 409.27 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

408.61 - 409.27: CA in matrix/BI. Few CL.

409.27 413.78 RHYva Coarse grained to ash tuff

409.27 - 413.78: Biotite rich. Some BI/MU bands. Speck of AK.

<<Vein: 411.44 - 411.64 Quartz-Carbonate>> QZ/CA.

413.78 414.83 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

413.78 - 414.83: Banded BI/CL/CA/SI.Speck of AK. Strong foliation.

<<Alt: 413.78 - 414.83 Moderate-Strong Chlorite>>

<<Struc: 413.78 - 417.2 Weak Fault>> Multiple minor fault with gouge up to 3 cm wide.

414.83 417.63 RHY undifferentiated rhyolite

414.83 - 417.63: Speck of AK. Locally flow banded. CA/QZ vein.

<<Vein: 415.1 - 415.33 Quartz-Carbonate>> QZ/CA, ribonned.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

417.63 418.60 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

417.63 - 418.6: CA in matrix/BI.

418.60 421.80 RHYvl Lapilli tuff

421.80 422.40 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

421.8 - 422.4: CA in matrix ad veining/BI.

422.40 428.70 RHYvx Quartz and/or feldspar crystal tuff

428.70 432.17 MAFt Mafic Volcaniclastics

428.7 - 432.17: And Bi porphyroblasts. Possibly mafic flow. Silicified. Few RHY interbedded at upper contact.

<<Alt: 428.7 - 432.17 Moderate-Strong Chlorite>>

<<Alt: 428.7 - 439.3 Strong Biotite>>

<<Alt: 430 - 439.2 Strong Silicification>>

432.17 434.59 RHYvx Quartz and/or feldspar crystal tuff

434.59 438.24 RHY undifferentiated rhyolite

434.59 - 438.24: And BI porphyroblasts. Silicified.

438.24 442.00 RHYvl Lapilli tuff

438.24 - 442: E.O.H.

<<Alt: 439.3 - 442 Moderate Biotite>>

40.33 - 41.66: Possibly chert interbedded with MAFt.

41.66 50.03 MAFw mafic volcanic flows

41.66 - 50.03: Fine grain SI (could be Fspar, few BI/MU. Weakly foliated.

50.03 52.05 MAFw mafic volcanic flows

50.03 - 52.05: CL/MU. Folded. Few BI and granular SI (Fspar?).

52.05 57.31 MAFw mafic volcanic flows

52.05 - 57.31: Few BI and MU.

<<Min: 57.3 - 73.6 3% Min: Pyrrhotite>>

<<Vein: 54.6 - 57 Calcite 40 deg. >> CA veinlet set.

57.31 67.03 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

57.31 - 67.03: Mafic tuff and mudstone interbedded. SI rich. Thinly foliation.

<<Alt: 57.31 - 67.03 Moderate Silicification>>

<<Struc: 63.7 - 72 Weak Fault>> Highly fractured.

67.03 79.91 MAFw mafic volcanic flows

67.03 - 79.91: BI banded. CA veins, limonite/AK. Locally SI rich. Few MDS beds up to 10 cm wide.

<<Min: 73.6 - 76.32 1% Min: Pyrrhotite>>

<<Min: 76.32 - 86.8 0.1% Min: Sphalerite>>

<<Min: 76.32 - 86.8 1% Min: Pyrite>>

<<Min: 76.32 - 86.8 3% Min: Pyrrhotite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 72.83 - 73.68 Moderate-Strong Silicification>>

<<Alt: 75.9 - 89.9 Moderate Calcite>> Associated with fractures.

<<Alt: 79.9 - 86.4 Moderate Silicification>>

<<Vein: 76.5 - 78.8 Calcite 30 deg. >> CA veinlet set, fracture, broken zone.

<<Struc: 76.32 - 79.89 Weak Fault>> Few gouge. Multiple fractures.

79.91 85.72 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

79.91 - 85.72: Mafic tuff and mudstone interbedded. SI rich. Thinly foliation. Folded locally, MU/QZ/CL bedding crenulated. Sulfide lamination associated with QZ. Maybe epidote in matrix.

85.72 92.57 MAFw mafic volcanic flows

85.72 - 92.57: BI, granular SI.

<<Min: 86.8 - 99.2 0.1% Min: Pyrite>>

<<Min: 86.8 - 99.2 1% Min: Pyrrhotite>>

92.57 96.25 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

92.57 - 96.25: Patchy silicification. CL and MU bands locally. Sheared and faulted (20 cm gouge).

<<Alt: 92.95 - 97.3 Moderate-Strong Calcite>> In sheared zone.

<<Struc: 94.2 - 96.25 Moderate Shear>> See below.

<<Struc: 94.2 - 96.25 Moderate Fault>> 20 cm of gouge in a shear zone. Primary ductile deformation.

96.25 99.20 MAFw mafic volcanic flows

96.25 - 99.2: BI, granular SI.

End of Hole @ 99.2

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
0.00	**12.40**	**OVBN** **Overburden**									
12.40	**16.65**	**MDS** **Carbonaceous Mudstone & Tuffaceous Mudstone**									

12.4 - 16.65: Strongly calcareous. Wavy veining. Thin shistosity. PO clots in vening.

<<Min: 12.4 - 21.96 1% Min: Pyrrhotite>> And in foliation.
<<Min: 12.4 - 117.92 0.1% Min: Pyrite>>
<<Alt: 12.4 - 21.96 Strong Calcite>> 40
<<Alt: 12.4 - 52 Moderate Ankerite>> Lapilli. 10

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

16.65 17.58 MAFt Mafic Volcaniclastics

16.65 - 17.58: QZ/CA veins. Fine grain. Oxidized at upper contact.

<<Vein: 16.65 - 17.85 Quartz>> QZ/CA crosscutting MAFt. PY/PO

17.58 21.96 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

17.58 - 21.96: Locally mixed with MAFt. Large discordant QZ vein. Wavy CA veining, crenulated. Thin foliation. Possibly hematite veinlets.

<<Vein: 19.5 - 19.84 Quartz>> Large QZ/CA irregular vein.

21.96 26.11 RHYv Rhyolite volcaniclastic

21.96 - 26.11: Locally lapilitic. QZ vein. Lapilli altered AK. From 25.28 to 26,10, Ribboned QZ vein with oxidized sulfide surrounded by solve light grey material, possibly MAFt xenolith.

<<Min: 21.96 - 117.95 0.5% Min: Pyrrhotite>> Elongated, foliation oriented.

<<Alt: 21.96 - 38.12 Weak-Moderate Calcite>> and veins. 2

<<Alt: 21.96 - 57.7 Weak-Moderate Muscovite>>

26.11 28.70 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

26.11 - 28.7: Possibly intermediate composition. QZ/CA veinlet. Lots of BI.

<<Alt: 26.11 - 30.45 Moderate Chlorite>>

<<Alt: 26.11 - 30.45 Strong Biotite>>

28.70 29.41 RHYvl Lapilli tuff

28.7 - 29.41: Could be locally RHYc curdy.

29.41 30.45 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

29.41 - 30.45: Brownish color. No CL. Few CA veins.

30.45 31.92 RHY undifferentiated rhyolite

30.45 - 31.92: Could be locally RHYc. But probably large strained lapilli highly concentrated. Kind of repetitive of lapilli to ash sequences. AK lapilli.

31.92 38.12 RHYv Rhyolite volcaniclastic

31.92 - 38.12: some flow like texture but probably strained lapilli accumulated.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

38.12 41.31 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

38.12 - 41.31: Moderate CL altered. AK phenoblasts. BI at contacts.

<<Alt: 38.12 - 41.31 Moderate-Strong Chlorite>>

<<Alt: 38.12 - 41.31 Moderate-Strong Calcite>> 30

<<Alt: 38.12 - 41.31 Weak-Moderate Biotite>>

41.31 43.46 RHYva Coarse grained to ash tuff

41.31 - 43.46: Few lapilli altered AK.

<<Alt: 41.31 - 92.4 Weak Calcite>> 2

43.46 45.56 RHYva Coarse grained to ash tuff

43.46 - 45.56: Fine grain. Oxidation and limonite bands (might be weathering).

45.56 48.37 RHYva Coarse grained to ash tuff

48.37 50.04 RHYvl Lapilli tuff

50.04 52.00 RHYva Coarse grained to ash tuff

52.00 54.34 RHYvl Lapilli tuff

<<Alt: 52 - 84.52 Moderate-Strong Ankerite>> Lapilli. 20

54.34 55.20 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

54.34 - 55.2: Strongly altered by crosscutting QZ vein associated with PY. Chill margins. Oxidation. CA in matrix.

<<Vein: 54.55 - 54.86 Quartz>> QZ vein crosscutting probably mafic dike. PY. Near breccia texture. Rusty aspect.

55.20 56.90 RHYvl Lapilli tuff

<<Struc: 56 - 58.4 Strong Fault>> Gouge, core loss.

56.90 58.40 FLZ Fault Zone

56.9 - 58.4: Fault gouge, missing core.

<<Alt: 57.7 - 71.5 Moderate Muscovite>> Could be original.

58.40 59.40 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

58.4 - 59.4: Altered CA.

<<Struc: 58.4 - 67 Weak Fault>> Fractured, minor fault, gouge up to 10 cm wide.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

59.40 60.70 RHYvl Lapilli tuff

59.4 - 60.7: QE eyes. Possibly lightly carbonaceous.

60.70 84.52 RHYvl Lapilli tuff

60.7 - 84.52: Lapilli altered AK.

<<Alt: 71.5 - 84.1 Moderate-Strong Muscovite>> Could be original.

<<Struc: 73 - 77 Moderate-Strong Fault>> Multiple narrow fault, gouge fron 73.70 to 74.10.

<<Struc: 77 - 83.7 Moderate Fault>> Multiple minor fault, fractured.

84.52 87.54 RHYva Coarse grained to ash tuff

<<Alt: 84.52 - 122.17 Moderate Ankerite>> Lapilli. 10

87.54 88.53 RHYvl Lapilli tuff

87.54 - 88.53: BI/CL lapilli. CA altered.

88.53 92.40 RHYva Coarse grained to ash tuff

88.53 - 92.4: Weakly CL altered.

92.40 96.51 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

92.4 - 96.51: Strongly altered CL/CA. QZ/CA veins.

<<Alt: 92.4 - 96.51 Strong Chlorite>>

<<Alt: 92.4 - 96.51 Intense Calcite>> 50

<<Vein: 93.6 - 96.51 Quartz-Carbonate>> QZ/CA veins, 3 per metre, 5 cm wide.

96.51 103.48 RHYvl Lapilli tuff

96.51 - 103.48: Lapilli altered AK. Locally weak CL alteration. From 103.24 to 103.48, coarse grain, sandy texture.

<<Alt: 96.51 - 110.15 Weak Chlorite>>

<<Alt: 96.51 - 111.78 Moderate Calcite>> 5

<<Alt: 98.61 - 101.7 Moderate Biotite>>

<<Alt: 103.24 - 107.5 Moderate Biotite>>

103.48 110.60 RHYvl Lapilli tuff

103.48 - 110.6: BI/CL lapilli. Three mafic dikes, 30 cm wide each, CA altered, surrounded by silica bands.CA altered.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

110.60 111.78 RHYvl Lapilli tuff

110.6 - 111.78: Lapilli altered AK.

111.78 114.36 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

111.78 - 114.36: CA bands and CA in matrix. Strong CL alteration.

<<Alt: 111.78 - 114.36 Strong Chlorite>>

<<Alt: 111.78 - 114.36 Strong Calcite>> 40

114.36 117.92 RHYvl Lapilli tuff

114.36 - 117.92: Lapilli altered AK. Fractured, 30 cm of consolidated gouge. MU alteration.

<<Alt: 114.5 - 117.9 Moderate Calcite>> CA 5 to 10 when no AK (altered lapilli).

<<Alt: 114.68 - 115.9 Moderate Muscovite>> Could be original.

<<Alt: 115.9 - 117.9 Moderate-Strong Muscovite>> Could be original.

<<Alt: 117.9 - 132.16 Moderate Muscovite>> Could be original.

<<Alt: 117.9 - 364.8 Moderate Calcite>> Calcite is associated with RHYvl containing BI/CL/QZ lapilli. See lithology. About 15 percent of CA in those units. Up to 30 percent in the mafic dikes.

<<Struc: 115.9 - 117.3 Weak-Moderate Fault>> Fractured, minor fault.

117.92 122.92 RHYvl Lapilli tuff

117.92 - 122.92: BI/CL lapilli. CA altered.

<<Min: 117.95 - 136.6 0.5% Min: Pyrite>> Locally replacing BI.

<<Min: 117.95 - 136.6 1% Min: Pyrrhotite>> Elongated, foliation oriented.

<<Alt: 122.17 - 141.51 Moderate-Strong Ankerite>> Lapilli. 15

<<Alt: 122.17 - 364.8 Weak Chlorite>> In lapilli when lithology is logged as RHYvl (BCQlpl). Few CL bands in RHYvl, lapilli AK altered.

<<Alt: 122.17 - 364.8 Moderate Ankerite>> Ankerite is found as replacement in lapilli. About 10 percent of Ankerite in the unit RHYvl.

122.92 130.51 RHYvl Lapilli tuff

122.92 - 130.51: Lapilli altered AK.

<<Struc: 123.14 - 123.8 Moderate-Strong Fault>> Core must loss. Fault gouge.

130.51 131.72 RHYvl Lapilli tuff

130.51 - 131.72: BI/CL lapilli. CA altered.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

131.72 141.51 RHYvl Lapilli tuff

131.72 - 141.51: Lapilli altered AK. MU alteration.

<<Min: 136.6 - 136.7 1% Min: Sphalerite>> QZ vein, sulfide assemblage.

<<Min: 136.6 - 136.7 3% Min: Pyrite>> QZ vein, sulfide assemblage.

<<Min: 136.6 - 136.7 1% Min: Pyrrhotite>> QZ vein, sulfide assemblage.

<<Min: 136.6 - 136.7 5% Min: Galena>> QZ vein, sulfide assemblage.

<<Min: 136.6 - 136.7 2% Min: Arsenopyrite>> If ASPY, could be silvery PY. Maybe few CP in this vein.

<<Min: 136.7 - 166.4 0.1% Min: Pyrite>>

<<Min: 136.7 - 166.4 2% Min: Pyrrhotite>>

<<Alt: 132.16 - 141.41 Moderate-Strong Muscovite>> Could be original.

<<Vein: 136.5 - 136.7 Quartz-Carbonate>> QZ/CA vein mineralized PY/GL/SP possibly AS/CP.

<<Struc: 133.5 - 141.51 Weak-Moderate Fault>> Fractured, minor fault.

141.51 149.50 RHYvl Lapilli tuff

141.51 - 149.5: BI/CL lapilli. CA altered.

<<Alt: 141.51 - 145.4 Moderate Muscovite>> Could be original.

<<Alt: 141.51 - 149.9 Weak Ankerite>> Lapilli. 2

<<Alt: 145.4 - 185 Weak-Moderate Muscovite>>

<<Vein: 148.9 - 149.02 Quartz-Tourmaline>> QZ/TO

<<Struc: 144.9 - 145.4 Weak Fault>> Fractured, minor.

149.50 150.47 RHYvl Lapilli tuff

149.5 - 150.47: Lapilli altered AK.

150.47 152.93 RHYvl Lapilli tuff

150.47 - 152.93: BI/CL lapilli. CA altered.

152.93 155.39 RHYvl Lapilli tuff

152.93 - 155.39: Lapilli altered AK.

155.39 158.12 RHYvl Lapilli tuff

155.39 - 158.12: Dominantly coarse lapilli altered CL. CA altered.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

158.12 158.32 MAFi **Mafic Intrusions (primarily footwall mafic intrusion)**

158.12 - 158.32: CA/BI/CL.

158.32 160.10 RHYvl **Lapilli tuff**

158.32 - 160.1: CA altered.

160.10 160.32 MAFi **Mafic Intrusions (primarily footwall mafic intrusion)**

160.1 - 160.32: CA/BI/CL.

160.32 163.75 RHYvl **Lapilli tuff**

160.32 - 163.75: Lapilli altered AK.

163.75 166.53 RHYvl **Lapilli tuff**

163.75 - 166.53: Large lapilli. CA altered.

<<Min: 166.4 - 180.8 1% Min: Pyrite>>

<<Min: 166.4 - 180.8 3% Min: Pyrrhotite>>

166.53 167.78 RHYvl **Lapilli tuff**

166.53 - 167.78: Lapilli altered AK.

167.78 170.36 RHYvl **Lapilli tuff**

167.78 - 170.36: Banded MU. Late MS alteration, secondary foliation. CA altered.

170.36 176.36 RHYvl **Lapilli tuff**

170.36 - 176.36: Lapilli altered AK.

176.36 178.86 RHYvl **Lapilli tuff**

176.36 - 178.86: CA altered.

178.86 180.80 RHYvl **Lapilli tuff**

178.86 - 180.8: Lapilli altered AK.

<<Struc: 179.75 - 180.5 Weak Fault>> Broken zone, minor gouge.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

180.80 187.81 RHYvl Lapilli tuff

180.8 - 187.81: CA altered.

<<Min: 180.8 - 203.3 0.5% Min: Pyrrhotite>>

<<Min: 180.8 - 227.07 0.5% Min: Pyrite>>

<<Alt: 185 - 198.88 Moderate Muscovite>> Could be original.

187.81 194.20 RHY undifferentiated rhyolite

187.81 - 194.2: Flow banded. Dacitic composition.

194.20 200.04 RHY undifferentiated rhyolite

194.2 - 200.04: Intermediate composition. Ribonned blue QZ, QZ vein creating local alteration. Possibly peperitic texture. CA/sulfide.

<<Vein: 194.2 - 198.88 Quartz>> Multiple QZ veins associated with CA, TO and PO/PY. Limonite/oxidation halo.

200.04 205.79 RHYcw Curdy textured-flow banded (flows, subvolcanics)

200.04 - 205.79: Curdy texture.

<<Min: 203.3 - 215.7 1% Min: Pyrrhotite>>

205.79 210.61 RHYcw Curdy textured-flow banded (flows, subvolcanics)

205.79 - 210.61: Qz veins, TO/PY.

<<Alt: 206.79 - 212.84 Moderate-Strong Muscovite>> Could be original.

<<Vein: 206.79 - 212.34 Quartz>> Multiple QZ/CA veins. One ribboned, cherty like, wavy vein. TO/sulfide associated. Limonite/oxidation.

210.61 210.73 CHT Chert

210.61 - 210.73: Not chert but very similar. Ribboned blue/translucent QZ, folded, crosscutting RHYcw. Logged as chert in case it could be use as a stratigraphic marker.

210.73 212.34 RHY undifferentiated rhyolite

210.73 - 212.34: Crosscut by large QZ veins.

212.34 219.15 RHYcw Curdy textured-flow banded (flows, subvolcanics)

212.34 - 219.15: Large wavy/crenulated QZ band

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 215.7 - 250 0.1% Min: Pyrrhotite>> In QZ clots and discontinuous veins.

<<Alt: 215.55 - 222.35 Moderate Muscovite>> Could be original.

219.15 219.33 CHT Chert

219.15 - 219.33: Not chert but very similar. Ribboned blue/translucent QZ, folded, crosscutting RHYcw. Logged as chert in case it could be use as a stratigraphic marker.

<<Vein: 219.15 - 219.44 Quartz>> Ribonned, cherty like blue QZ veins.

219.33 245.00 RHYcw Curdy textured-flow banded (flows, subvolcanics)

219.33 - 245: Curdy to flow banded, locally pseudo fragmental.

<<Min: 227.07 - 245 1% Min: Pyrite>>

<<Alt: 222.35 - 223.8 Moderate-Strong Muscovite>> Could be original.

<<Alt: 223.8 - 245 Moderate Muscovite>> Could be original.

<<Vein: 221.85 - 222.2 Quartz>> QZ/TO/CA veins, limonite.

<<Struc: 222.2 - 222.4 Weak Fault>> Broken zone, minor gouge.

<<Struc: 241.8 - 242 Weak Fault>> Gouge over 10 cm.

245.00 246.30 RHY undifferentiated rhyolite

245 - 246.3: Transition with intermediate composition (dacitic?).

<<Min: 245 - 300 0.1% Min: Pyrite>>

246.30 250.79 RHYvl Lapilli tuff

246.3 - 250.79: CA altered. From 247.40 to 250.00, wavy QZ vein and flow banded texture.

<<Min: 250 - 255.8 3% Min: Pyrrhotite>>

250.79 258.00 RHYvl Lapilli tuff

250.79 - 258: Lapilli altered AK.

<<Min: 255.8 - 262.78 2% Min: Pyrrhotite>>

258.00 259.22 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

258 - 259.22: CA rich. Ribboned. Heterogeneous texture. Could be sedimentary unit but very sharp CA boundary with surrounded units.

259.22 271.75 RHYvl Lapilli tuff

259.22 - 271.75: CA altered.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 262.78 - 315.8 0.1% Min: Pyrrhotite>>

271.75 275.89 RHYvl Lapilli tuff

271.75 - 275.89: Lapilli altered AK.

275.89 277.23 RHY undifferentiated rhyolite

275.89 - 277.23: Dark color. Lapillitic texture obscured. QZ/BI rich, few CA.

277.23 282.95 RHYvl Lapilli tuff

277.23 - 282.95: CA altered.

<<Vein: 280.8 - 280.95 Quartz-Tourmaline 25 deg. >> TO/QZ.

282.95 284.95 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

282.95 - 284.95: BI/CL/CA. Sharpe CA change at contact.

284.95 288.77 RHYvl Lapilli tuff

284.95 - 288.77: CA altered.

<<Vein: 286.55 - 286.6 Tourmaline>> TO/QZ.

288.77 289.30 RHYvl Lapilli tuff

288.77 - 289.3: Lapilli altered AK.

289.30 302.17 RHYvl Lapilli tuff

289.3 - 302.17: CA altered.

302.17 302.67 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

302.17 - 302.67: CA/BI.

302.67 306.70 RHYvl Lapilli tuff

302.67 - 306.7: CA altered.

306.70 307.52 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

306.7 - 307.52: CA/BI.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

307.52 315.80 RHYvl Lapilli tuff

307.52 - 315.8: QZ/TO veins. Maybe narrow mafic dike from 315.42 to 315.80 (chlorite bands and speck of black mineral, amphibole or tourmaline).

<<Vein: 308.38 - 308.4 Tourmaline 30 deg. >> TO.

<<Vein: 310.81 - 311.49 Quartz-Tourmaline 20 deg. >> QZ/TO., few PY. Almost brecciated.

315.80 323.54 RHYvl Lapilli tuff

315.8 - 323.54: Lapilli altered AK.

<<Min: 315.8 - 330.05 0.5% Min: Pyrrhotite>>

<<Alt: 317.7 - 319.58 Moderate Muscovite>>

<<Struc: 318.4 - 319.48 Moderate Fault>> Up to 10 cm of gouge, fractured.

323.54 326.22 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

323.54 - 326.22: CL/AK banded, speck of black mineral (amphibole or tourmaline).

326.22 333.94 RHYvl Lapilli tuff

326.22 - 333.94: Lapilli altered AK.

<<Min: 330.05 - 333.94 2% Min: Pyrrhotite>>

333.94 338.00 RHYva Coarse grained to ash tuff

333.94 - 338: Medium grain lapilli altered AK.

<<Min: 333.94 - 338 0.1% Min: Pyrrhotite>>

<<Alt: 337.7 - 344.93 Moderate Muscovite>>

<<Struc: 336.15 - 344.93 Weak >> Fractured zone. Rare gouge (1 to 3 cm wide).

338.00 343.90 RHYvl Lapilli tuff

338 - 343.9: Lapilli altered AK.

<<Min: 338 - 364.8 1% Min: Pyrrhotite>>

343.90 344.40 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

343.9 - 344.4: CL/AK banded. Speck of black mineral.

344.40 348.71 RHYvl Lapilli tuff

344.4 - 348.71: Lapilli altered AK.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

348.71 349.51 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

348.71 - 349.51: CL/AK banded. Speck of black mineral. Large chill margin at lower contact.

349.51 361.91 RHYvl Lapilli tuff

349.51 - 361.91: Medium grain lapilli, ash.

<<Min: 350.1 - 364.8 0.5% Min: Pyrite>>

<<Alt: 353.45 - 355.35 Moderate Muscovite>>

<<Vein: 349.9 - 350.1 Quartz>> QZ vein.

<<Struc: 353.45 - 355.55 Weak Fault>> Fracture bzone. Rare goue (1 to 3 cm wide).

361.91 362.76 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

361.91 - 362.76: CL.

362.76 364.80 RHYva Coarse grained to ash tuff

362.76 - 364.8: Fine to medium grain lapilli. E.O.H.

0.00 3.10 OVBN Overburden

3.10 24.30 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

3.1 - 24.3: Could be MAFt, texture obscured. Patchy BI, CA veining.

<<Min: 3.1 - 67.28 0.1% Min: Pyrite>>

<<Alt: 3.1 - 63.5 Moderate Biotite>>

<<Alt: 3.1 - 67.28 Strong Chlorite>> Mafic tuff and mafic sill.

<<Alt: 3.1 - 74.9 Moderate Calcite>>

<<Alt: 3.1 - 195 Weak-Moderate Ankerite>>

24.30 27.90 MAFt Mafic Volcaniclastics

24.3 - 27.9: Maybe mixed with carb sediments. Strongly foliated.

<<Vein: 27.8 - 27.9 Quartz>> QZ/CA

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

27.90 49.80 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

27.9 - 49.8: Locally bleached, texture obscured possibly due to SI fluids. Patchy BI.

<<Alt: 44.6 - 44.9 Moderate Silicification>>

<<Vein: 33.7 - 34 Quartz>> QZ/CA/CL

49.80 55.00 FLZ Fault Zone

49.8 - 55: Fault gouge and MAFt. 10 to 15 cm QZ/CA veins.

<<Struc: 49.8 - 55 Moderate Fault>> Fault gouge and mafic tuff, QZ/CA veins.

55.00 74.90 MAFt Mafic Volcaniclastics

55 - 74.9: Calcite veining. Large patch of hematite from 67.28 to 73.30 with QZ veins.

<<Min: 67.28 - 73.3 1% Min: Pyrite>> Discontinuous veinlets, disseminated and few patch.

<<Min: 67.28 - 162 1% Min: Pyrrhotite>> Foliation oriented. More concentrated in MDS.

<<Min: 73.3 - 502.3 0.1% Min: Pyrite>> Few patch associated with QZ veins.

<<Alt: 67.28 - 73.3 Weak Muscovite>>

<<Alt: 67.28 - 213.44 Moderate-Strong Chlorite>>

74.90 82.70 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

74.9 - 82.7: Locally MAFt interbedded (or mafic dyke p to 40cm wide).

<<Alt: 74.9 - 162 Moderate-Strong Calcite>>

<<Vein: 79.62 - 79.9 Quartz>> QZ/CA

82.70 84.10 MAFt Mafic Volcaniclastics

84.10 89.20 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

89.20 96.27 MAFt Mafic Volcaniclastics

89.2 - 96.27: Patch of hematite at contact. Mafic according to the LITHO whole rock assay.

<<Alt: 92.82 - 95 Weak Biotite>>

96.27 116.37 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

96.27 - 116.37: Patch of hematite (?).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 107.9 - 108.2 Weak Fault>> Fault gouge.

116.37 118.75 MAFt Mafic Volcaniclastics

116.37 - 118.75: MDS interbedded. Sharpe contact, could be narrow dyke.

118.75 130.85 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

118.75 - 130.85: Few MAFt interbedded.

<<Vein: 125.42 - 125.61 Quartz>> QZ/CA

130.85 132.37 MAFt Mafic Volcaniclastics

132.37 133.21 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

133.21 134.80 MAFt Mafic Volcaniclastics

134.80 136.79 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

136.79 139.65 RHY undifferentiated rhyolite

136.79 - 139.65: According to the LITHO whole rock assay. The percentage of SI could be biased by QZ veining.

139.65 142.88 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

142.88 144.10 RHY undifferentiated rhyolite

<<Vein: 143.16 - 143.26 Quartz>> QZ/CA

144.10 151.18 MAFt Mafic Volcaniclastics

144.1 - 151.18: Dark green, deformed CA veins. Patch of hematite (?).

<<Vein: 149.1 - 149.4 Quartz>> QZ/CA

151.18 172.64 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

151.18 - 172.64: BI/CL. Deformed CA veining. Crosscut by narrow mafic dykes up to 60 cm wide. Thinly foliated.

<<Min: 162 - 290 0.5% Min: Pyrrhotite>> Locally with SP/GL/PO?GL in QZ/CA vein.

<<Alt: 162 - 213.44 Strong Calcite>>

172.64 174.25 MAFt Mafic Volcaniclastics

172.64 - 174.25: Mixed with argillite.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

174.25 184.70 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

174.25 - 184.7: Containing tuffaceous material at lower contact. CA veining. Thinly foliated. QZ/CA veins, hematite veinlets.

184.70 186.04 MAFt Mafic Volcaniclastics

184.7 - 186.04: Fine grain. Mixed with argillite at lower contact.

186.04 193.24 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

186.04 - 193.24: BI rich. QZ/CA veining.

193.24 194.94 MAFt Mafic Volcaniclastics

193.24 - 194.94: Fine to medium grain.

194.94 203.97 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

194.94 - 203.97: Containing tuffaceous material. QZ/CA (maybe dolomite) veining and patch.

<<Alt: 195 - 213.44 Moderate-Strong Ankerite>>

203.97 204.32 MAFt Mafic Volcaniclastics

203.97 - 204.32: Sharpe contacts, could be dike.

204.32 209.48 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

204.32 - 209.48: Tuffaceous.

<<Vein: 205.36 - 205.6 Quartz>> QZ/CA/CL

209.48 213.44 MAFt Mafic Volcaniclastics

209.48 - 213.44: CA veining. Sharpe contacts. Could be dike.

213.44 215.95 SED undifferentiated Sediment

213.44 - 215.95: Tuffaceous. Mix with mudstone/siltstone containing locally QE in RHYva layers.

<<Alt: 213.44 - 234.72 Weak-Moderate Ankerite>>

<<Alt: 213.44 - 502.3 Weak-Moderate Calcite>> and clots. Strong in the mafic dikes.

215.95 217.60 RHYva Coarse grained to ash tuff

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 215.95 - 502.3 Moderate-Strong Muscovite>>

217.60 221.55 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

217.6 - 221.55: Medium grain locally.

221.55 222.58 RHYcw Curdy textured-flow banded (flows, subvolcanics)

222.58 229.10 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

222.58 - 229.1: Faulted, strongly foliated.

<<Struc: 224 - 226 Weak Fault>> Multiple narrow gouge zones.

<<Struc: 227.9 - 229.1 Moderate Fault>> Fault gouge in graphitic mudstone.

229.10 234.74 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

229.1 - 234.74: QZ/CA veining.

<<Alt: 234.72 - 502.3 Moderate Ankerite>> Replacing lapilli. Locally strong due to strong lapilli density.

<<Vein: 231.45 - 231.9 Quartz>> QZ/CA/FeCA/TO

<<Vein: 232.18 - 232.58 Quartz>> QZ/CA/PO

234.74 240.52 RHYva Coarse grained to ash tuff

234.74 - 240.52: Dominantly ash.

240.52 242.68 RHYvl Lapilli tuff

242.68 243.59 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

243.59 251.05 RHYvl Lapilli tuff

243.59 - 251.05: BI porphyroblasts, overprinted. Crosscut by narrow mafic dyke from 247.05 to 247.52 showing PO in chill margins. Two foliations observed.

251.05 262.85 RHYvl Lapilli tuff

262.85 265.13 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

262.85 - 265.13: CL.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

265.13 270.80 RHYvl Lapilli tuff

270.80 272.25 RHYvl Lapilli tuff

270.8 - 272.25: Crosscut by narrow chloritized mafic dikes.

272.25 276.82 RHYva Coarse grained to ash tuff

272.25 - 276.82: Crosscut by narrow chloritized mafic dikes.

276.82 280.41 RHYvl Lapilli tuff

280.41 282.54 RHYva Coarse grained to ash tuff

280.41 - 282.54: Crosscut by narrow chloritized mafic dikes.

282.54 284.20 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

282.54 - 284.2: CL/CA.

284.20 287.10 RHYva Coarse grained to ash tuff

287.10 332.83 RHYvl Lapilli tuff

287.1 - 332.83: Few CL bands. BI could be due to pelitic material.

<<Min: 290 - 502.3 0.1% Min: Pyrrhotite>>

<<Alt: 287.3 - 502.3 Moderate Biotite>> Porphyroblasts.

<<Vein: 291.81 - 292 Quartz>> QZ/CA

<<Vein: 298.3 - 299.13 Quartz>> QZ/CA vein set, up to 8 cm wide.

<<Vein: 301.86 - 302.12 Quartz>> QZ vein with PO/PY/SP/GL patch.

<<Vein: 303.07 - 303.61 Quartz>> QZ vein with PY/GL/PO patch

<<Vein: 304.2 - 304.49 Quartz>> QZ

332.83 341.50 RHYv Rhyolite volcaniclastic

332.83 - 341.5: Few lapilli. Narrow rich BI bedding up to 10 cm wide. Possibly mafic dikes. Mafic dike form 341.50 to 342.02, CL/BI/CA.

341.50 349.39 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

341.5 - 349.39: Confirmed by Whole rock assay. BI/CA. No CL. CA/BI/QZ veins.

<<Vein: 348.5 - 348.7 Calcite>> CA/BI.

<<Struc: 344.9 - 346.35 Trace Fault>> Logged by Cominco, really minor structure.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

349.39 352.46 RHY undifferentiated rhyolite

349.39 - 352.46: Showing BI rich bedding. Silicified at upper contact with MAFi.

<<Alt: 349.39 - 350.3 Moderate-Strong Silicification>> Associated with MAFi lower contact.

352.46 355.94 RHYv Rhyolite volcaniclastic

352.46 - 355.94: Some lapilli. Possibly pelitic locally, high concentration of BI. Ash and lapilli show sort of graded bed sequences.

355.94 358.62 RHYcf Feldspar & feldspar quartz porphyry

355.94 - 358.62: Could be RHYvl at lower contact.

358.62 369.02 RHYva Coarse grained to ash tuff

358.62 - 369.02: Mixed with BI rich bedding. Shows to foliation at 361.50.

369.02 380.54 RHYvx Quartz and/or feldspar crystal tuff

380.54 383.17 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

380.54 - 383.17: BI/CA.

383.17 389.28 RHYvx Quartz and/or feldspar crystal tuff

<<Alt: 388.89 - 390.3 Weak Muscovite>> Yellow-green muscovite. Could be original alteration.

389.28 391.65 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

389.28 - 391.65: Confirmed by Whole rock assay. BI/CA rich. QZ/CA veins.

391.65 402.12 RHYvl Lapilli tuff

402.12 403.13 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

402.12 - 403.13: BI/CA.

403.13 406.25 RHYva Coarse grained to ash tuff

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

406.25 408.66 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

406.25 - 408.66: Two dikes separated by QZ/CA vein and 15 cm of RHYvl.

408.66 411.12 RHYva Coarse grained to ash tuff

411.12 425.61 RHYvx Quartz and/or feldspar crystal tuff

411.12 - 425.61: Could be locally RHYc (curdy like texture). Strong lapilli density and some angular clasts at lower contact.

425.61 443.90 RHYva Coarse grained to ash tuff

443.90 444.34 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

443.9 - 444.34: BI/CA.

444.34 446.12 RHY undifferentiated rhyolite

444.34 - 446.12: Almost curdy texture like. Xtl up to 0.5cm. Could be porphyritic.

446.12 452.04 RHYva Coarse grained to ash tuff

446.12 - 452.04: Locally BI in foliation.

<<Alt: 450 - 502.3 Trace Chlorite>> Locally in fracture.

452.04 461.78 RHYva Coarse grained to ash tuff

452.04 - 461.78: And Bippo.

<<Vein: 461.5 - 461.6 Quartz>> QZ/TO and narrow QZ/BI banded interval, sedimentary looking.

461.78 463.91 RHY undifferentiated rhyolite

461.78 - 463.91: Could be curdy texture.

463.91 465.14 RHYcw Curdy textured-flow banded (flows, subvolcanics)

465.14 466.72 RHYva Coarse grained to ash tuff

466.72 467.21 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

466.72 - 467.21: BI/CA. 10 cm of RHYvl interbedded showing sharp contacts.

467.21 467.60 RHYv Rhyolite volcaniclastic

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

467.60 469.57 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

467.6 - 469.57: BI/CA banded.

469.57 470.02 RHYv Rhyolite volcaniclastic

470.02 470.37 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

470.02 - 470.37: CI/CA

470.37 472.69 RHYvx Quartz and/or feldspar crystal tuff

470.37 - 472.69: Mixed with possibly mafic material. Lost of BI in foliation. Maybe intermediate composition or non consolidated while intruded by MAFi.

472.69 476.56 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

472.69 - 476.56: BI/CA banded.

476.56 478.92 RHYvx Quartz and/or feldspar crystal tuff

478.92 480.00 RHY undifferentiated rhyolite

478.92 - 480: Possibly curdy texture. Probably RHYvx.

480.00 480.40 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

480 - 480.4: BI/CA.

480.40 482.20 RHYvl Lapilli tuff

480.4 - 482.2: BI in foliation.

482.20 484.72 RHY undifferentiated rhyolite

482.2 - 484.72: Possibly ash dominant unit with RHYc locally.

484.72 484.87 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

484.72 - 484.87: Sharp contact. BI/CA/AK.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

484.87 485.23 RHYv Rhyolite volcaniclastic

485.23 487.76 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

485.23 - 487.76: Confirmed by Whole rock assay. BI/CA banded.

487.76 493.35 RHYvx Quartz and/or feldspar crystal tuff

487.76 - 493.35: Trace of deformation visible as the foliation change.

493.35 499.95 RHYvx Quartz and/or feldspar crystal tuff

499.95 500.18 RHY undifferentiated rhyolite

500.18 500.66 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

500.18 - 500.66: BI/CA.

500.66 502.30 RHYvx Quartz and/or feldspar crystal tuff

500.66 - 502.3: AK at contact with MAFi. Intermediate composition, BI rich in foliation. E.O.H.

0.00 9.10 OVBN Overburden

9.10 14.11 MDSt Rhyolite tuff dominant mudstone dark grey FG

9.1 - 14.11: Alternating bands of black graphitic mudstone and grey rhyolite lapilli tuff; Cominco logged the tuff layers as quartzite, likely on the basis of their granular texture

<<Alt: 9.1 - 14.11 Weak Muscovite>> 1-2 mm thick layers of muscovite (+/-graphite) cutting rhyolite tuff layers and oriented at an angle to bedding

<<Vein: 13.6 - 14.11 70% Quartz-Carbonate 50 deg. >> Fairly massive quartz-ankerite vein interleaved with host MDSt

<<Struc: 11.9 - 11.91 Moderate-Strong Foliation>> Bedding-parallel foliation in graphitic mudstone and rhyolite tuff

<<Struc: 11.9 - 11.91 Moderate-Strong Bedding>> Alternations between graphitic mudstone and rhyolite tuff

14.11 18.04 RHYvl Lapilli tuff grey FMG

14.11 - 18.04: Relative massive interval of granular-textured rhyolite lapilli tuff (Cominco logged as quartzite); tuff contains thin bands of muscovite-rich, graphitic and black mudstone

<<Alt: 14.11 - 18.04 Moderate Muscovite>> 1-3 mm thick layers of muscovite (+/-graphite) cutting rhyolite tuff

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

18.04 20.40 MDSt Rhyolite tuff dominant mudstone dark grey FG

18.04 - 20.4: Alternating bands of black graphitic mudstone and grey rhyolite lapilli tuff; Cominco logged the tuff layers as quartzite, likely on the basis of their granular texture

<<Alt: 18.04 - 20.4 Weak Muscovite>> 1-2 mm thick layers of muscovite (+/-graphite) cutting rhyolite tuff layers and oriented at an angle to bedding

<<Vein: 19.7 - 26.2 15% Quarzt-Chlorite-Carbonate 20 deg. >> Fairly massive quartz-ankerite veins with chlorite- and muscovite-rich selvages; partially hematized

<<Struc: 19.5 - 19.51 Moderate-Strong Foliation>> Bedding-parallel foliation in graphitic mudstone and rhyolite tuff

<<Struc: 19.5 - 19.51 Weak-Moderate Bedding>> Alternations between graphitic mudstone and rhyolite tuff

20.40 25.40 FLZ Fault Zone dark grey

20.4 - 25.4: Heavily fractured, partially hematized fault zone with significant stretches of fault gouge; also contains thick quartz veins

<<Alt: 25.3 - 26.56 Weak Muscovite>> 1-2 mm thick layers of muscovite (+/-graphite) cutting rhyolite tuff layers and oriented at an angle to bedding

<<Struc: 20.4 - 25.3 Strong Fault>> Extensive fracturing, brecciation, fault gouge development and oxidation; well-developed and prominent fault zone

25.40 26.56 MDSt Rhyolite tuff dominant mudstone dark grey FG

25.4 - 26.56: Alternating bands of black graphitic mudstone and grey rhyolite lapilli tuff; Cominco logged the tuff layers as quartzite, likely on the basis of their granular texture

26.56 27.90 RHYvl Lapilli tuff grey FMG

26.56 - 27.9: Relative massive interval of granular-textured rhyolite lapilli tuff (Cominco logged as quartzite); tuff contains thin bands of muscovite-rich, graphitic and black mudstone

<<Alt: 26.56 - 27.9 Moderate Muscovite>> 1-3 mm thick layers of muscovite (+/-graphite) cutting rhyolite tuff

<<Alt: 27.5 - 27.9 Weak-Moderate Calcite>> Patches of yellowish calcite alteration associated with interleaved mudstone layers

27.90 29.61 MDSt Rhyolite tuff dominant mudstone dark grey FG

27.9 - 29.61: Alternating bands of black graphitic mudstone and grey rhyolite lapilli tuff; Cominco logged the tuff layers as quartzite, likely on the basis of their granular texture

<<Alt: 27.9 - 29.61 Weak Muscovite>> 1-2 mm thick layers of muscovite (+/-graphite) cutting rhyolite tuff layers and oriented at an angle to bedding

<<Vein: 28.69 - 29.61 60% Quartz 75 deg. >> Massive quartz veins with only minor carbonate

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

29.61 35.06 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

29.61 - 35.06: Finely laminated graphitic mudstone; laminations include yellowish-grey calcite rich bands; also some biotite-rich (pelitic?) layers

<<Alt: 29.61 - 35.06 Weak-Moderate Calcite>> Scattered patches and bands of yellowish-grey calcite

<<Alt: 29.61 - 40.44 Weak-Moderate Biotite>> Up to 5 cm thick bands of biotite-rich alteration; possibly pelitic layers within mudstone?

<<Vein: 33.65 - 46.1 10% Quartz-Carbonate 70 deg. >> Scattered massive quartz-ankerite veins ranging from 5-20 cm in core width and generally with high angle TCA

<<Struc: 31 - 31.01 Moderate-Strong Foliation>> Bedding-parallel foliation defined by biotite-calcite layering within graphitic mudstone

35.06 40.44 MDSt Rhyolite tuff dominant mudstone dark grey FG

35.06 - 40.44: Alternating bands of black graphitic mudstone and grey rhyolite lapilli tuff; Cominco logged the tuff layers as quartzite, likely on the basis of their granular texture

40.44 41.51 RHYc Rhyolite coherent volcanics light grey VFG

40.44 - 41.51: Granular- to glass-textured rhyolite that could be a composite tuff-coherent interval; cut by numerous 1-3 mm thick muscovite-rich bands

<<Alt: 40.44 - 41.51 Moderate Muscovite>> 1-3 mm thick layers of muscovite (+/-graphite) cutting coherent rhyolite

41.51 43.46 MAFt Mafic Volcaniclastics green FG

41.51 - 43.46: Distinctly green (i.e. chlorite-rich) fine-grained and relative massive; abundant bands and patches of yellow-ish calcite alteration; also locally interlayered with RHYvl and graphitic mudstone

<<Min: 43.1 - 43.46 5% Min: Pyrite>> Euhedral pyrite in quartz-tourmaline vein

<<Alt: 41.51 - 43.46 Strong Muscovite>> Patches of very strong biotite-muscovite alteration; associated with interleaved mafic and rhyolite tuff, as well as mudstone

<<Alt: 41.51 - 43.46 Moderate-Strong Chlorite>> Pervasive alteration of mafic protolith to chlorite and, locally, biotite

<<Alt: 41.51 - 43.46 Strong Biotite>> Patches of very strong biotite-muscovite alteration; associated with interleaved mafic and rhyolite tuff, as well as mudstone

<<Vein: 43.1 - 43.46 100% Quarzt-Tourmaline-Sulphide 75 deg. >> Massive quartz-tourmaline vein with 5% pyrite

<<Struc: 41.8 - 41.81 Moderate-Strong Foliation>> Calcite layers within chloritized mafic tuff

43.46 44.50 RHYvl Lapilli tuff grey FG

43.46 - 44.5: Short interval of granular-textured rhyolite

<<Alt: 43.46 - 47.18 Moderate Silicification>> Patchy silicification over MDSt and RHYvl units immediately overlying chert interval

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

44.50 47.18 MDSt Rhyolite tuff dominant mudstone dark grey FG

44.5 - 47.18: Alternating bands of black graphitic mudstone and grey rhyolite lapilli tuff; Cominco logged the tuff layers as quartzite, likely on the basis of their granular texture

47.18 49.96 CHT Chert grey VFG

47.18 - 49.96: Fine to coarsely laminated grey to white chert and silicified graphitic mudstone; overall, rock is very hard; planar laminated to complexly folded and disrupted texture

<<Alt: 47.18 - 64.21 Strong Silicification>> Strong pervasive silicification of graphitic mudstone intervals and layers closely associated with chert

49.96 51.86 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

49.96 - 51.86: Interval of strongly silicified mudstone within much longer interval of chert; complexly folded and disrupted texture

51.86 59.16 CHT Chert grey VFG

51.86 - 59.16: Fine to coarsely laminated grey to white chert and silicified graphitic mudstone; overall, rock is very hard; planar laminated to complexly folded and disrupted texture

<<Min: 53.59 - 53.67 10% Min: Pyrite>> Blebs and veins of pyrite associated with ankerite-rich interval (exhalative?) within chert

<<Struc: 53.5 - 53.51 Strong Bedding>> Well-defined bedding between chert and graphitic mudstone

59.16 60.81 CHT Chert grey-brown FG

59.16 - 60.81: As above but with three 5-30 cm ankerite-rich intervals (carbonate exhalative?)

<<Min: 59.16 - 60.81 3% Min: Pyrite>> Pyrite bands and veins; typically associated with ankerite-rich (exhalative?) intervals but also cutting chert

<<Alt: 59.16 - 60.81 Strong Ankerite>> Possibly exhalative; three 5-30 cm thick ankerite-rich bands within chert

60.81 62.05 MDSt Rhyolite tuff dominant mudstone dark grey FG

60.81 - 62.05: Strongly silicified interval of tuffaceous graphitic mudstone

<<Min: 60.81 - 63.63 1% Min: Pyrite>> Scattered veins and blebs

<<Struc: 61 - 61.01 Strong Bedding>> Well-defined bedding between chert and graphitic mudstone

62.05 64.21 CHT Chert grey VFG

62.05 - 64.21: Weakly magnetic and locally brecciated chert that is interbedded with graphitic mudstone; layering ranges from finely laminated to complexly folded and chaotic

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 62.05 - 63.8 1% Min: Pyrrhotite>> Imparts weakly magnetic characteristic to the rock

<<Min: 63.63 - 63.8 5% Min: Pyrite>> Large blebs in basalt part of chert breccia interval

<<Vein: 63.63 - 73.02 5% Quartz-Carbonate 45 deg. >> Massive 5-30 cm thick quartz with minor ankerite veins

64.21 66.82 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green FMG

64.21 - 66.82: Relatively massive and distinctly green; pervasively altered with biotite and ankerite porphyroblasts, as well as muscovite along hairline fractures

<<Alt: 64.21 - 66.82 Moderate Silicification>> Overall lower intensity of silicification relative to surrounding rocks

<<Alt: 64.21 - 66.82 Strong Chlorite>> Abundant in the groundmass

<<Alt: 64.21 - 66.82 Weak Biotite>> 5-10 cm intervals with 10-20% biotite porphyroblasts

<<Alt: 64.21 - 66.82 Moderate Ankerite>> 1 mm sized porphyroblasts

<<Struc: 64.21 - 64.22 Contact>> Sharp contact between mafic and chert units

66.82 69.55 CHT Chert grey VFG

66.82 - 69.55: Massive to laminated chert; the most massive chert interval seen yet; graphitic mudstone is interbedded with chert

<<Min: 66.82 - 74.11 0.5% Min: Pyrite>> Scattered blebs in chert and silicified mudstone

<<Min: 66.82 - 74.11 0.5% Min: Pyrrhotite>> Scattered blebs in chert and silicified mudstone

<<Alt: 66.82 - 69.55 Intense Silicification>> Strong to intense silicification of graphitic mudstone associated with chert

69.55 70.26 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green FG

69.55 - 70.26: Strongly biotite-muscovite-ankerite altered mafic intrusion

<<Alt: 69.55 - 70.26 Strong Chlorite>> Abundant in the groundmass

<<Alt: 69.55 - 70.26 Moderate-Strong Ankerite>> Abundant 1 mm ankerite porphyroblasts overgrowing chloritized groundmass

<<Alt: 69.55 - 71.05 Moderate-Strong Silicification>> Silica-dominant blebs and bands

<<Alt: 69.55 - 71.05 Moderate Muscovite>> Hairline fractures filled with hematite and muscovite

<<Alt: 69.55 - 71.05 Weak-Moderate Biotite>> Bands with 10-30% biotite porphyroblasts

70.26 71.05 RHYvl Lapilli tuff grey FG

70.26 - 71.05: Ankerite-altered rhyolite tuff with fine interbeds of silicified graphitic mudstone

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

71.05 72.59 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

71.05 - 72.59: Strongly silicified mudstone with complexly folded and disrupted texture

<<Alt: 71.05 - 88.87 Moderate-Strong Silicification>> Moderate strong to strong pervasive silicification in graphitic mudstone and mafic units underlying chert interval

72.59 74.11 CHT Chert dark grey VFG

72.59 - 74.11: Finely laminated chert and silicified graphitic mudstone, with relatively high mudstone content

<<Struc: 73.1 - 73.11 Moderate-Strong Bedding>> Laminated graphitic and calcic mudstone

74.11 83.01 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

74.11 - 83.01: Finely laminated, locally sheared, silicified graphitic mudstone with thin calcite-rich bands

<<Min: 74.11 - 83.01 2% Min: Pyrite>> Mostly as blebs and vein-like pyrite-pure veins

<<Struc: 82 - 82.01 Weak Bedding>> Weakly defined bedding between graphitic and silicic layers

83.01 87.58 SEDc calcareous Sediment dark grey FMG

83.01 - 87.58: Relatively massive to weakly bedded quartz-muscovite-ankerite rock; dark grey colour, mostly massive character and interbedded graphitic mudstone distinguish it from rhyolite units

<<Alt: 83.01 - 88.87 Weak Muscovite>> Mostly within hairline veins

<<Alt: 83.01 - 89.12 Moderate Ankerite>> Ranges from disseminated blebs to thick bands

<<Vein: 84.73 - 112.75 5% Quartz-Carbonate 70 deg. >> Massive 1-10 cm thick quartz +/- ankerite veins

<<Struc: 83.01 - 83.02 Contact>> Sharp contact between graphitic mudstone and wacke

87.58 88.87 CHT Chert black VFG

87.58 - 88.87: Strongly silicified graphitic mudstone to chert with carbonate-rich blebs and bands

<<Min: 87.58 - 88.87 2% Min: Pyrite>> Associated with silicification and ankerite alteration

88.87 89.12 INT undifferentiated (granitic) intrusive rocks beige FMG

88.87 - 89.12: Pervasively altered to beige muscovite with quartz grains and biotite porphyroblasts; sharp contacts and lithological transition suggest a dyke

<<Alt: 88.87 - 89.12 Intense Muscovite>> Near total replacement of protolith with muscovite overgrown by biotite and ankerite porphyroblasts

<<Alt: 88.87 - 89.12 Moderate-Strong Biotite>> Near total replacement of protolith with muscovite overgrown by biotite and ankerite porphyroblasts

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

89.12 94.60 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

89.12 - 94.6: Strongly silicified graphitic mudstone; minor development of chaotic chert-like texture

<<Min: 89.12 - 94.6 0.5% Min: Pyrite>> Scattered pyrite-dominant veins

<<Alt: 89.12 - 94.6 Strong Silicification>> Moderate to intense silicification, including 30 cm interval of chert

<<Alt: 89.12 - 95.23 Moderate Ankerite>> Blebs and bands of ankerite with minor calcite

<<Vein: 93 - 93.6 100% Quartz 55 deg. >> 60 cm wide (core width) quartz vein with minor ankerite and strongly chlorite-altered selvages

<<Struc: 92.7 - 92.71 Moderate-Strong Bedding>> Between cherty and graphitic mudstone layers

94.60 95.23 MAFt Mafic Volcaniclastics green FG

94.6 - 95.23: Silicified and fragmental mafic units; green chlorite is considered distinctive; mafic intrusive and tuff appear somewhat similar, though intrusive generally more massive; could be intrusive with peperitic contact?

<<Alt: 94.6 - 95.23 Weak-Moderate Muscovite>> Pervasive alteration of mafic unit to chlorite, muscovite and ankerite

<<Alt: 94.6 - 95.23 Moderate-Strong Chlorite>> Pervasive alteration of mafic unit to chlorite, muscovite and ankerite

<<Struc: 94.6 - 94.61 Contact>> Sharp contact between graphitic mudstone and MAFi

95.23 96.83 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

95.23 - 96.83: Strongly silicified graphitic mudstone; minor development of chaotic chert-like texture

<<Min: 95.23 - 96.83 1% Min: Pyrite>>

<<Alt: 95.23 - 96.83 Strong Silicification>> Pervasively silicified graphitic mudstone

96.83 100.80 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green FG

96.83 - 100.8: Relatively massive, greenish, chlorite- and muscovite-altered mafic dykes with inclusions of sedimentary rock; sharp contacts; biotite porphyroblasts

<<Min: 100.3 - 100.8 1% Min: Pyrrhotite>> Small lenticular blebs that help define foliation

<<Alt: 96.83 - 100.8 Strong Muscovite>> Predominant alteration mineral together with dolomite

<<Alt: 96.83 - 100.8 Moderate-Strong Dolomite>> Imparts characteristic greyish tint to groundmass; replaces chlorite?

<<Alt: 96.83 - 100.8 Moderate Biotite>> Patches with 10-20% biotite porphyroblasts

100.80 101.30 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

100.8 - 101.3: Strongly silicified graphitic mudstone

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 100.8 - 103.45 1% Min: Pyrite>> Mostly as pyrite-pure veins

<<Alt: 100.8 - 103.45 Strong Silicification>> Pervasively silicified graphitic mudstone

<<Alt: 100.8 - 106.93 Weak-Moderate Ankerite>> Prominent downward decrease in intensity

<<Struc: 100.8 - 100.81 Contact>> Weakly bedding/foliation discordant contact between mafic and graphitic mudstone

101.30 101.40 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green FG

101.3 - 101.4: Thin interval of mafic dyke similar to larger interval above

101.40 103.45 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

101.4 - 103.45: Strongly silicified, locally cherty-like, graphitic mudstone with 1-10 cm thick layers of wacke near lower contact

<<Struc: 102.1 - 102.11 Weak-Moderate Bedding>> Weakly defined between graphitic and ankerite-rich layers

103.45 106.93 SEDc calcareous Sediment dark grey FMG

103.45 - 106.93: Massive, granular-textured rock consisting mostly of quartz and muscovite; likely silicified

<<Min: 103.45 - 106.93 0.1% Min: Pyrite>>

<<Alt: 103.45 - 106.93 Moderate Silicification>> Slight decrease in silicification intensity across wacke unit

<<Struc: 105 - 105.01 Weak-Moderate Bedding>> Narrow graphitic mudstone layer in wacke

106.93 108.69 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

106.93 - 108.69: Strongly silicified, locally cherty-like, graphitic mudstone with 1-10 cm thick layers of wacke near lower contact

<<Min: 106.93 - 109.42 1% Min: Pyrite>> Mostly as veins cutting both mudstone and mafic rock

<<Alt: 106.93 - 108.69 Strong Silicification>> Silicified graphitic argillite with proto-chert like textures

<<Struc: 106.93 - 106.94 Contact>> Sharp contact between wacke and mudstone

108.69 108.87 MAFi Mafic Intrusions (primarily footwall mafic intrusion) grey-brown MG

108.69 - 108.87: Completely altered to chlorite, muscovite, biotite and ankerite

<<Alt: 108.69 - 108.87 Moderate-Strong Muscovite>> Short interval of mafic rock that is strongly altered to biotite, muscovite and dolomite

<<Alt: 108.69 - 108.87 Moderate-Strong Dolomite>> Short interval of mafic rock that is strongly altered to biotite, muscovite and dolomite

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 108.69 - 108.87 Moderate-Strong Biotite>> Short interval of mafic rock that is strongly altered to biotite, muscovite and dolomite

108.87 109.42 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

108.87 - 109.42: Strongly silicified, locally cherty-like, graphitic mudstone with 1-10 cm thick layers of wacke near lower contact

<<Alt: 108.87 - 109.42 Moderate-Strong Silicification>> Silicified graphitic argillite

<<Alt: 108.87 - 109.42 Weak-Moderate Ankerite>> Scattered ankerite crystals to 1 mm in size

109.42 109.87 MAFi Mafic Intrusions (primarily footwall mafic intrusion) grey-brown MG

109.42 - 109.87: Completely altered to chlorite, muscovite, biotite and ankerite

<<Min: 109.81 - 110.9 2% Min: Pyrite>> Lenticular to massive blebs

<<Alt: 109.42 - 109.87 Moderate-Strong Muscovite>> Short interval of mafic rock that is strongly altered to biotite, muscovite and dolomite

<<Alt: 109.42 - 109.87 Moderate-Strong Dolomite>> Short interval of mafic rock that is strongly altered to biotite, muscovite and dolomite

<<Alt: 109.42 - 109.87 Moderate-Strong Biotite>> Short interval of mafic rock that is strongly altered to biotite, muscovite and dolomite

109.87 110.19 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

109.87 - 110.19: Strongly silicified, locally cherty-like, graphitic mudstone with 1-10 cm thick layers of wacke near lower contact

<<Alt: 109.87 - 110.9 Strong Silicification>> Proto-chert like textures

<<Alt: 109.87 - 110.9 Weak-Moderate Ankerite>> Scattered blebs and fracture-fills

110.19 110.29 MAFi Mafic Intrusions (primarily footwall mafic intrusion) grey-brown MG

110.19 - 110.29: Completely altered to chlorite, muscovite, biotite and ankerite

110.29 110.90 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

110.29 - 110.9: Strong biotite and muscovite overprint

<<Struc: 110.85 - 110.86 Moderate Bedding>> Between silicic and graphitic layers

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

110.90 111.73 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green FMG

110.9 - 111.73: Banded and altered mafic intrusions; bands are silicic or calcite-rich; silicic bands altered to chlorite, muscovite and biotite

<<Min: 110.93 - 113.45 1% Min: Pyrrhotite>> Blebs and veins

<<Alt: 110.9 - 111.73 Moderate Silicification>> Blebs and vein-like aggregates

<<Alt: 110.9 - 111.73 Moderate-Strong Calcite>> Pervasive replacement of groundmass by chlorite and ankerite

<<Alt: 110.9 - 111.73 Moderate-Strong Ankerite>> Rock has a reddish tint and 1 mm sized ankerite porphyroblasts

111.73 113.45 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

111.73 - 113.45: Strongly silicified graphitic mudstone with minor chert intervals

<<Alt: 111.73 - 129.57 Weak-Moderate Silicification>> Pervasive silicification of graphitic to calcareous mudstone; at least two 30-40 cm intervals of strong silicification

113.45 119.51 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black FG

113.45 - 119.51: Typical silicified graphitic mudstone with 15% calcareous bands

<<Min: 113.45 - 129.57 0.5% Min: Pyrite>> Mostly lenticular to massive blebs; scattered veins

<<Min: 113.45 - 129.57 0.5% Min: Pyrrhotite>> most massive to lenticular blebs

<<Struc: 118 - 118.01 Moderate-Strong Bedding>> Well-defined bedding between graphitic, siliceous and carbonate-rich layers

119.51 126.50 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

119.51 - 126.5: Moderately strong to intensely silicified graphitic mudstone, locally passing into well-laminated chert; 1-10 cm thick layers of wacke also occur, showing sharp contacts with surrounding mudstone

<<Struc: 122.4 - 122.41 Moderate-Strong Bedding>> Well-defined bedding between graphitic, siliceous and carbonate-rich layers

<<Struc: 125.2 - 125.21 Moderate-Strong Bedding>> Well-defined bedding between graphitic, siliceous and carbonate-rich layers

126.50 129.57 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black FG

126.5 - 129.57: Typical silicified graphitic mudstone with 15% calcareous bands

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

129.57 129.89 MAFi Mafic Intrusions (primarily footwall mafic intrusion) brown FMG

129.57 - 129.89: Massive mafic dyke (or lamprophyre?) consisting of biotite, dolomite and muscovite; either completely altered mafic dyke (i.e. where is chlorite?) or lamprophyre

<<Alt: 129.67 - 129.89 Weak Muscovite>> Scattered occurrence of muscovite flakes

<<Alt: 129.67 - 129.89 Moderate-Strong Dolomite>> Pinkish grey mineral that dominates the groundmass

<<Alt: 129.67 - 129.89 Moderate-Strong Biotite>> Abundant 1 mm-sized porphyroblasts

<<Struc: 129.57 - 129.58 Contact>> Sharp contact between mudstone and rhyolite tuff

129.89 131.64 RHYvl Lapilli tuff light grey FMG

129.89 - 131.64: Relatively fine-grained and light coloured lapilli tuff, compared to interval underneath it; scattered quartz eyes, relatively high abundance of quartz-dominant lapilli to 5 mm in length; matrix predominantly muscovite and quartz

<<Alt: 129.89 - 131.64 Moderate Silicification>> Appears to overprint muscovite and ankerite alteration

<<Alt: 129.89 - 131.64 Moderate Muscovite>> Groundmass dominated by fine-grained to flakey muscovite

<<Alt: 129.89 - 132.94 Moderate Ankerite>> Forms blebs and porphyroblasts up to 1 mm in size

131.64 132.94 RHYvl Lapilli tuff grey MCG

131.64 - 132.94: Flattened lapilli up to 3 cm in length in a relatively dark matrix of muscovite and biotite

<<Min: 131.64 - 132.94 0.1% Min: Pyrite>> Scattered blebs in biotite-rich groundmass

<<Alt: 131.64 - 132.94 Moderate Biotite>> Mostly biotite, rather than muscovite, in the groundmass

<<Struc: 132 - 132.01 Moderate-Strong Foliation>> Strong foliation defined by flattened lapilli and biotite in the groundmass

132.94 133.64 MAFi Mafic Intrusions (primarily footwall mafic intrusion) brown FMG

132.94 - 133.64: Massive mafic dyke (or lamprophyre?) consisting of biotite, dolomite and muscovite; either completely altered mafic dyke (i.e. where is chlorite?) or lamprophyre

<<Alt: 132.94 - 133.64 Moderate Dolomite>> Near total replacement of mafic protolith with biotite and dolomite; or lamprophyre?

<<Alt: 132.94 - 133.64 Strong Biotite>> Near total replacement of mafic protolith with biotite and dolomite; or lamprophyre?

<<Vein: 132.94 - 133.64 15% Quartz-Carbonate-Sulphide 80 deg. >> Swarm of 0.5-1 cm thick calcite-pyrite-quartz veinlets within strongly biotite-altered mafic dyke (lamprophyre?)

133.64 136.44 RHYvl Lapilli tuff grey-brown MCG

133.64 - 136.44: Flattened lapilli up to 3 cm in length in a relatively dark matrix of muscovite and biotite

<<Min: 133.64 - 136.44 0.1% Min: Pyrite>> Scattered blebs in biotite-rich groundmass

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 133.64 - 136.44 Weak-Moderate Muscovite>> Generally more biotite than muscovite in the groundmass, though ratio flips downwards

<<Alt: 133.64 - 136.44 Moderate-Strong Biotite>> Generally more biotite than muscovite in the groundmass, though ratio flips downwards

<<Alt: 133.64 - 139.63 Weak-Moderate Silicification>> Patches of harder and softer material

<<Alt: 133.64 - 139.63 Trace Ankerite>> Scarce and restricted to lapilli

136.44 139.63 RHYv Rhyolite volcaniclastic grey MG

136.44 - 139.63: Somewhat finer-grained (in terms of lapilli) and lighter lapilli tuff, comprising mostly a muscovite-rich groundmass with biotite porphyroblasts; contact with adjacent RHYvl is gradational

<<Alt: 136.44 - 139.63 Strong Muscovite>> Near total replacement of groundmass with greenish-grey muscovite/sericite

<<Alt: 136.44 - 139.63 Moderate Biotite>> Around 20% biotite porphyroblasts across most of this interval, increasing to 30% in the bottom 40 cm

<<Struc: 137.3 - 137.31 Moderate-Strong Foliation>> Strong foliation defined by flattened lapilli and biotite in the groundmass

139.63 140.62 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

139.63 - 140.62: Silicified graphitic mudstone

<<Min: 139.63 - 140.62 0.5% Min: Pyrite>> Blebs within hairline calcite vein

<<Alt: 139.63 - 140.62 Moderate-Strong Silicification>> Relatively hard graphitic argillite but lacking siliceous layers

<<Vein: 140.2 - 140.31 100% Quartz 70 deg. >> Massive quartz-dominant vein with minor ankerite; similar to more abundant veins further up hole

<<Struc: 139.63 - 139.95 Weak-Moderate Fault>> Heavily fractured interval with minor development of fault gouge

140.62 141.02 PEL Equigranular biotite + calcite +/- quartz rock dark grey FG

140.62 - 141.02: Finely interlaminated grey chert and black silicified mudstone with coarser laminations of biotite-ankerite-rich pelite (?)

<<Alt: 140.62 - 141.02 Moderate Biotite>> Biotite-ankerite-rich metapelite bands interbedded with silicified graphitic argillite

<<Alt: 140.62 - 141.02 Moderate Ankerite>> Biotite-ankerite-rich metapelite bands interbedded with silicified graphitic argillite

<<Struc: 141 - 141.01 Moderate-Strong Bedding>> Well-developed foliation-parallel bedding between siltstone and mudstone layers

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

141.02 159.29 SLT Siltstone - fine-grained sedimentary rock dark grey FG

141.02 - 159.29: Silicified and intercalated grey siltstone and black graphitic mudstone

<<Min: 141.02 - 159.29 0.1% Min: Pyrrhotite>> Scattered blebs

<<Alt: 141.02 - 159.29 Weak-Moderate Silicification>> Still somewhat hard graphitic argillite and siltstone layers, though not as hard as overlying intervals

<<Alt: 141.02 - 159.29 Weak-Moderate Muscovite>> Greenish-grey patches

<<Struc: 145.5 - 145.51 Moderate-Strong Bedding>> Well-developed foliation-parallel bedding between siltstone and mudstone layers

<<Struc: 151 - 151.01 Moderate-Strong Bedding>> Well-developed foliation-parallel bedding between siltstone and mudstone layers

<<Struc: 157 - 157.01 Moderate-Strong Bedding>> Well-developed foliation-parallel bedding between siltstone and mudstone layers

159.29 159.71 CHT Chert dark grey VFG

159.29 - 159.71: Either chert interlayered with mudstone or intensely silicified mudstone; finely laminated with chaotic and folded texture

<<Min: 159.29 - 159.71 1% Min: Pyrrhotite>> Slightly elevated pyrrhotite content associated with chert interval

<<Alt: 159.29 - 159.71 Intense Silicification>> Very strong silicification on chert interval

<<Vein: 159.29 - 178.35 7.5% Quartz-Carbonate 80 deg. >> Massive to foliation parallel quartz-ankerite veins ranging from 0.1-25 cm in core width

159.71 161.39 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

159.71 - 161.39: Mostly silicified graphitic mudstone with lesser amounts of siltstone

<<Min: 159.71 - 179.96 0.1% Min: Pyrite>>

<<Min: 159.71 - 179.96 0.1% Min: Pyrrhotite>>

<<Alt: 159.71 - 161.39 Weak-Moderate Calcite>> Manifested as a swarm of 1-5 mm wide bands

<<Alt: 159.71 - 163.28 Moderate Silicification>> Ranges from weakly to strongly silicified

161.39 163.28 SED undifferentiated Sediment grey FMG

161.39 - 163.28: Strongly silicified greenish-grey wacke; greenish tint likely related to sericite alteration

<<Alt: 161.39 - 163.83 Weak-Moderate Muscovite>> Pervasive muscovite alteration in the groundmass provides a greenish tint

<<Struc: 163 - 163.01 Moderate-Strong Bedding>> Well-developed foliation-parallel bedding between siltstone and mudstone layers

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

163.28 163.83 PEL Equigranular biotite + calcite +/- quartz rock brown MG

163.28 - 163.83: Biotite-rich metapelite (or lamprophyre?) with numerous carbonate-quartz bands; carbonate includes both ankerite and calcite, and is much more abundant that quartz; matrix consists mostly of quartz

<<Alt: 163.28 - 163.83 Moderate-Strong Calcite>> Manifested as a swarm of 1-5 mm wide bands

<<Alt: 163.28 - 163.83 Moderate-Strong Biotite>> Near total alteration of (pelitic?) protolith to biotite and muscovite

163.83 167.95 SLT Siltstone - fine-grained sedimentary rock dark grey FG

163.83 - 167.95: Silicified and intercalated grey siltstone and black graphitic mudstone; hosts 5-10% carbonate +/- quartz rich bands

<<Alt: 163.83 - 182.14 Moderate Silicification>> Ranges from weakly to strongly silicified

<<Alt: 163.83 - 182.14 Moderate Muscovite>> Most abundant within sub-intervals of wacke, which generally has a greenish tint

<<Alt: 163.83 - 182.14 Weak-Moderate Calcite>> Manifested as a swarm of 1-5 mm wide bands

167.95 178.35 SEDc calcareous Sediment grey FMG

167.95 - 178.35: Fairly diverse looking wacke with greenish-tinted intervals indicating sericite alteration, reddish intervals reflecting oxidation and ankerite, and then the more typical stretches of grey wacke

<<Alt: 176.4 - 182.66 Weak-Moderate Ankerite>> Increases in abundance towards the chert layer

<<Struc: 169 - 169.01 Moderate-Strong Bedding>> Well-developed foliation-parallel bedding between wacke and mudstone layers

<<Struc: 170.75 - 171.09 Weak-Moderate Fault>> Fractured interval of which 50% is gravel to clay-sized fault gouge

<<Struc: 175 - 175.01 Moderate-Strong Bedding>> Well-developed foliation-parallel bedding between siltstone and mudstone layers

178.35 182.14 SLT Siltstone - fine-grained sedimentary rock dark grey FG

178.35 - 182.14: Interbedded mudstone, siltstone and wacke with individual beds ranging from 0.1-20 cm thick; wacke forms the thickest beds; also notable for relatively abundant quartz veining as well as increased oxidation

<<Min: 179.96 - 184.52 0.5% Min: Pyrite>>

<<Vein: 178.35 - 182.63 15% Quartz-Carbonate 80 deg. >> Quartz-ankerite veins with chlorite selvages and associated with faulting and relatively strong oxidation

<<Struc: 178.4 - 178.85 Weak-Moderate Fault>> Fractured interval of which 50% is gravel to clay-sized fault gouge

<<Struc: 181.5 - 181.51 Moderate-Strong Bedding>> Well-developed foliation-parallel bedding between siltstone and mudstone layers

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

182.14 182.63 CHT Chert grey VFG

182.14 - 182.63: Massive grey to finely laminated

<<Alt: 182.14 - 182.66 Intense Silicification>> Very strong silicification on chert interval

182.63 184.52 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

182.63 - 184.52: Relatively massive interval of silicified graphitic mudstone

<<Alt: 182.66 - 184.52 Moderate-Strong Silicification>> Strongly silicified and very hard graphitic mudstone

184.52 184.78 RHYcf Feldspar & feldspar quartz porphyry red FMG

184.52 - 184.78: Short interval of pervasively ankerite- and greenish sericite-altered rhyolite (?); scattered quartz and feldspar eyes (<1%) suggest felsic protolith; quartz patches suggest silicification; sharp lithological and mineralogical contacts with surrounding sedimentary rock

<<Min: 184.52 - 184.78 10% Min: Pyrite>> Increased pyrite in associated with narrow felsic unit that is strongly altered to ankerite and muscovite

<<Alt: 184.52 - 184.78 Weak-Moderate Silicification>> As small patches and pseudo-veins

<<Alt: 184.52 - 184.78 Moderate-Strong Muscovite>> Near total replacement of felsic dyke by muscovite and ankerite

<<Alt: 184.52 - 184.78 Moderate-Strong Ankerite>> Near total replacement of felsic dyke by muscovite and ankerite

<<Struc: 184.52 - 184.53 Contact>> Sharp contact between mudstone-siltstone unit and pervasively altered felsic

184.78 188.11 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

184.78 - 188.11: Relatively massive interval of silicified graphitic mudstone

<<Min: 184.78 - 188.84 0.5% Min: Pyrite>> Calcite-pyrite hairline veins appear to extend of altered felsic intervals

<<Alt: 184.78 - 188.11 Moderate Silicification>> Ranges from weakly to strongly silicified

<<Vein: 185.67 - 185.81 100% Quartz 60 deg. >> Quartz vein with minor ankerite and chlorite selvage

<<Struc: 184.78 - 185.67 Weak-Moderate Fault>> Heavily fractured with local development of in situ fault gouge

188.11 188.23 RHYcf Feldspar & feldspar quartz porphyry red FMG

188.11 - 188.23: Short interval of pervasively ankerite- and greenish sericite-altered rhyolite (?); scattered quartz and feldspar eyes (<1%) suggest felsic protolith; quartz patches suggest silicification; sharp lithological and mineralogical contacts with surrounding sedimentary rock

<<Alt: 188.11 - 188.23 Weak-Moderate Silicification>> As small patches and pseudo-veins

<<Alt: 188.11 - 188.23 Moderate-Strong Muscovite>> Near total replacement of felsic dyke by muscovite and ankerite

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 188.11 - 188.23 Moderate-Strong Ankerite>> Near total replacement of felsic dyke by muscovite and ankerite

188.23 188.84 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

188.23 - 188.84: Relatively massive interval of silicified graphitic mudstone

<<Alt: 188.23 - 188.84 Moderate-Strong Silicification>> Ranges from weakly to strongly silicified

188.84 189.18 RHYcf Feldspar & feldspar quartz porphyry red FMG

188.84 - 189.18: Short interval of pervasively ankerite- and greenish sericite-altered rhyolite (?); scattered quartz and feldspar eyes (<1%) suggest felsic protolith; quartz patches suggest silicification; sharp lithological and mineralogical contacts with surrounding sedimentary rock

<<Min: 188.84 - 189.18 2% Min: Pyrite>> Increased pyrite in associated with narrow felsic unit that is strongly altered to ankerite and muscovite

<<Alt: 188.84 - 189.18 Weak-Moderate Silicification>> As small patches and pseudo-veins

<<Alt: 188.84 - 189.18 Moderate-Strong Muscovite>> Near total replacement of felsic dyke by muscovite and ankerite

<<Alt: 188.84 - 189.18 Moderate-Strong Ankerite>> Near total replacement of felsic dyke by muscovite and ankerite

189.18 190.75 CHT Chert dark grey VFG

189.18 - 190.75: Finely laminated grey to dark grey chert with silicified graphitic mudstone

<<Min: 189.18 - 190.75 1% Min: Pyrite>> Hosted in pyrite +/- calcite veins

<<Alt: 189.18 - 190.75 Intense Silicification>> Very strong silicification on chert interval

<<Struc: 190.4 - 190.41 Moderate-Strong Bedding>> Well-defined laminations between chert and graphitic mudstone

190.75 193.13 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black FG

190.75 - 193.13: Nearly a 50:50 split between graphitic mudstone and siltstone

<<Min: 190.75 - 206.8 0.5% Min: Pyrite>> Mostly stretches of 0.1% pyrite with short intervals of pyrite-bearing veins and/or blebs that locally average 1-2% over 10-40 cm

<<Alt: 190.75 - 196.6 Weak-Moderate Silicification>> Ranges from weakly to strongly silicified

<<Alt: 190.75 - 196.6 Weak-Moderate Ankerite>> Patches of disseminated to blebby ankerite alteration

<<Vein: 192.29 - 194.75 3% Quartz-Carbonate 80 deg. >> Quartz +/- ankerite veins with muscovite-pyrite selvages

193.13 196.60 SLT Siltstone - fine-grained sedimentary rock dark grey FG

193.13 - 196.6: Similar to the above interval but with slightly more siltstone than mudstone

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

196.60 196.88 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green FMG

196.6 - 196.88: Dark greenish-grey tinted, biotite-altered, interval; fairly abundant calcite as veins and disseminated as blebs in the matrix; greenish tint appears to be due to chlorite (but could be sericite too); sharp contacts with adjacent rocks suggest mafic dyke; could be pelite too

<<Alt: 196.6 - 196.88 Moderate Chlorite>> Pervasive replacement of mafic (or pelitic?) protolith with biotite, calcite and chlorite

<<Alt: 196.6 - 196.88 Moderate Calcite>> Pervasive replacement of mafic (or pelitic?) protolith with biotite, calcite and chlorite

<<Alt: 196.6 - 196.88 Moderate Biotite>> Pervasive replacement of mafic (or pelitic?) protolith with biotite, calcite and chlorite

196.88 201.99 SLT Siltstone - fine-grained sedimentary rock dark grey FG

196.88 - 201.99: Finely bedded sedimentary rock containing slightly more siltstone than graphitic mudstone

<<Alt: 196.88 - 206.8 Weak Silicification>> Mostly weakly silicified with narrow intervals of moderate to strong silicification

<<Alt: 196.88 - 206.8 Weak-Moderate Ankerite>> Patches of disseminated to blebby ankerite alteration

<<Vein: 201.52 - 201.99 80% Quartz-Carbonate 80 deg. >> Interval of four quartz-ankerite veins that are interleaved with host rock

<<Struc: 197 - 197.01 Moderate Bedding>> Interbedded wacke and siltstone

<<Struc: 200.05 - 200.36 Weak-Moderate Shear>> At high angle TCA but in opposite direction to bedding; also several notable deflections in foliations as well as 5 cm of fault gouge

<<Struc: 200.28 - 200.33 Moderate-Strong Fault>> Short interval of fault gouge in the middle of shear zone

201.99 205.58 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black VFG

201.99 - 205.58: Graphitic mudstone with thin layers and wisps of grey siltstone

<<Struc: 202 - 202.01 Moderate Bedding>> Interbedded graphitic argillite and siltstone

<<Struc: 203.05 - 203.1 Moderate Fault>> Fault gouge at top of shear zone interval

<<Struc: 203.05 - 203.35 Weak-Moderate Shear>> Notable deflection in foliation away from bedding/foliation at 80-90; shear zone starts with 5 cm of fault gouge

<<Struc: 205.5 - 205.51 Moderate-Strong Bedding>> Well-defined foliation-parallel bedding between siltstone and graphitic mudstone

Comments:

Note: the UTM coordinates come from Challenger's survey. They do not match with the coordinate written on the Cominco document (Easting: 419553/Northing: 6813219/Elevation: 1392m-NAD27(?)). In the mineralization zone, the depth are from the Cominco log (mineralization and alteration sections). Accurate measurements were not possible due to core deterioration. In order to be consistent, most of the BI/CA rich units have been logged as MAFi. This has to be consider carefully. Below the "rhyolite dome unit", many of the upper contacts are sharp whereas the lower contacts are more often. Abundant tourmaline is observed at depth as well as QZ/CA/CL/BI/TML/maybe fuchsite (and a light green fibrous mineral) veins, discordant and crenulated along the foliation. This elements may be related to mineralization. Garnet is observed until E.O.H.

79.60 82.09 RHYc Rhyolite coherant volcanics

79.6 - 82.09: Sampled for GP4F library. Could be logged as RHYi. Aphanitic texture. Probably rhyolitic flow dome. QZ/BI in fracture.

<<Alt: 79.6 - 87.4 Strong Silicification>>

<<Alt: 79.7 - 89.27 Trace Calcite>>

82.09 82.60 PEL Equigranular biotite + calcite +/- quartz rock

82.09 - 82.6: Black, fine grain,

82.60 87.40 RHYc Rhyolite coherant volcanics

82.6 - 87.4: Siliceous, fractured, whitish.

87.40 89.20 RHYc Rhyolite coherant volcanics

87.4 - 89.2: Strongly fractured, BI in fracture, siliceous, Locally granular texture. Disaggregated at lower contact.

<<Alt: 87.4 - 92.6 Moderate Silicification>>

89.20 90.20 PEL Equigranular biotite + calcite +/- quartz rock

89.2 - 90.2: Black, fine grain, CA in groundmass, sharp upper contact, progressive lower contact. The unit is relatively homogeneous and does not show RHY clasts suggesting dike but possibly sedimentary.

<<Alt: 89.27 - 90.2 Strong Calcite>>

90.20 92.50 RHYc Rhyolite coherant volcanics

90.2 - 92.5: Disaggregated RHYc, mixed with dark material. The foliation progressively increases downhole . Black material could be intrusive as well as sedimentary. Some beds seems to crosscut the primary fracturation. Could be RHYc massive flow collapsing in unconso

<<Alt: 90.2 - 93.7 Weak Calcite>>

92.50 93.12 PEL Equigranular biotite + calcite +/- quartz rock

92.5 - 93.12: CA veining, fine grain BI, sharp contacts, thin foliation.

93.12 93.70 RHYc Rhyolite coherant volcanics

93.12 - 93.7: Short interval on top of the larger porphyritic unit. Could be the result of a strong shearing.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

93.70 105.51 RHYvx Quartz and/or feldspar crystal tuff

93.7 - 105.51: Low to medium strain (could be logged as RHYcq). 80 percent of the core are missing from 99.00 to 103.70, sample by Piercey.

<<Alt: 93.7 - 114.66 Trace Calcite>>

<<Struc: 105.5 - 105.88 Strong Foliation>> Shearing within the foliation, very strong schistosity and rapid change within a short interval.

105.51 105.88 RHY undifferentiated rhyolite

105.51 - 105.88: High strain, foliation/schistosity very strong, shearing. Could be RHYcf.

105.88 107.00 RHYvx Quartz and/or feldspar crystal tuff

105.88 - 107: Small xtl, BI content increases with the strain.

107.00 110.38 RHYvx Quartz and/or feldspar crystal tuff

107 - 110.38: High strain, xtl still visible. BI increases/porphyroblasts appear. Granular texture in groundmass could be ghost xtl.

110.38 110.39 FLZ Fault Zone

110.38 - 110.39: Note: according to the Cominco log (core missing and fault). No evidence of fault in the box, just core missing (no gouge, no shearing).

110.39 116.27 PEL Equigranular biotite + calcite +/- quartz rock

110.39 - 116.27: Black, fine grain FI/feldspar, thin foliation, CA veining parallel to the foliation. Speck of tourmaline, QZ/BI/MS/CL vein at contact.

<<Min: 115.81 - 116.52 0.5% Min: Pyrite>>

<<Min: 115.81 - 160.36 0.5% Min: Pyrrhotite>>

<<Alt: 114.66 - 119.15 Weak-Moderate Calcite>> In mafic (sedimentary) unit and veining.

<<Vein: 115.21 - 116.2 Quarzt-Chlorite-Carbonate>> CA/QZ/BI/MS/CL/TML vein set.

116.27 118.48 RHYvx Quartz and/or feldspar crystal tuff

116.27 - 118.48: Very few blue quartz eyes. This unit could be RHYcf. Progressive lower and upper contact.

<<Min: 116.52 - 117.52 1% Min: Pyrite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 117.52 - 142 0.5% Min: Pyrite>>

118.48 119.08 PEL Equigranular biotite + calcite +/- quartz rock

118.48 - 119.08: Black, fine grain, BI/feldspar, speck of tourmaline, veining.

<<Vein: 118.48 - 129.34 Quarzt-Chlorite-Carbonate>> CA/QZ/BI/MS/CL/TML vein set.

119.08 119.27 RHY undifferentiated rhyolite

119.08 - 119.27: Interbedded in mafic dikes.

<<Alt: 119.15 - 126.51 Trace Calcite>>

119.27 120.35 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

119.27 - 120.35: Black, fine grain, BI/feldspar, speck of tourmaline, veining.

120.35 128.90 RHYv Rhyolite volcaniclastic

120.35 - 128.9: Mixed with black material from 126.21 to 128.90. From 120.50 to 121.60, QZ vein. TML speck abundant, aggregated. Foliated.

<<Alt: 126.51 - 141 Moderate Calcite>> In mafic (sedimentary) unit and veining.

128.90 129.80 FLZ Fault Zone

128.9 - 129.8: Sheared and fault gouge.

<<Vein: 128.9 - 135 Quarzt-Chlorite-Carbonate>> CA/QZ/BI/MS/CL/TML vein set. Possibly some fuchsite. Well developed from 130.72 to 130.92m.

<<Struc: 128.9 - 129.8 Moderate Fault>> Sandy fault gouge, broken vein or shearing.

129.80 130.10 PEL Equigranular biotite + calcite +/- quartz rock

129.8 - 130.1: QZ/BI/MS/CL vein.

<<Struc: 130 - 135 Weak Fault>> Large broken zone. No gouge and shearing. Could be the result of drilling issues.

130.10 135.00 PEL Equigranular biotite + calcite +/- quartz rock

130.1 - 135: Core missing (poor recovery or block error). Large QZ/MS/CA/TML/BI vein (maybe fuchsite and a light green fibrous mineral). TML specks. Fine grain BI.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

135.00 137.30 RHYv Rhyolite volcaniclastic

135 - 137.3: Broken zone. Maybe some xtl.

137.30 137.67 PEL Equigranular biotite + calcite +/- quartz rock

137.3 - 137.67: PY veinlet at upper contact. Fine grain BI.

137.67 150.00 RHYv Rhyolite volcaniclastic

137.67 - 150: MU altered. PY veinlets (stringers (?)). Broken zone, poor recovery.

<<Min: 142 - 160.36 1% Min: Pyrite>>

<<Alt: 137.67 - 179.1 Moderate-Strong Muscovite>>

<<Alt: 141 - 174.4 Weak-Moderate Calcite>>

150.00 150.40 PEL Equigranular biotite + calcite +/- quartz rock

150 - 150.4: CA/BI.

150.40 160.36 RHY undifferentiated rhyolite

150.4 - 160.36: Crosscut by narrow mafic dike or sediment unit. BI bands locally.

160.36 162.40 RHY undifferentiated rhyolite

160.36 - 162.4: Some BI rich bands.

<<Min: 160.36 - 173.9 0.1% Min: Sphalerite>>

<<Min: 160.36 - 173.9 3% Min: Pyrite>>

<<Min: 160.36 - 173.9 1% Min: Pyrrhotite>>

162.40 168.04 PEL Equigranular biotite + calcite +/- quartz rock

162.4 - 168.04: Or sediments.

<<Vein: 167.06 - 167.4 Quartz>> QZ vein and QZ/BI/CL/TML vein.

<<Struc: 165 - 165.4 Moderate-Strong Fault>> Fault gouge.

168.04 173.90 RHYcf Feldspar & feldspar quartz porphyry

168.04 - 173.9: Mid strain. Locally no feldspar, and BI bands.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 171 - 171.4 Moderate Fault>> Fault gouge.

173.90 174.40 OJ **Heavilly disseminated sulphides and/or stringer style mineralization in proximal altered rock**

173.9 - 174.4: Proximal alteration. Cordierite/chlorite.

<<Min: 173.9 - 174.9 5% Min: Sphalerite>>
<<Min: 173.9 - 174.9 5% Min: Pyrite>>
<<Min: 173.9 - 174.9 2% Min: Pyrrhotite>>
<<Min: 173.9 - 174.9 0.5% Min: Chalcopyrite>>
<<Alt: 173.9 - 174.4 Weak-Moderate Garnet>>
<<Alt: 173.9 - 174.4 Moderate-Strong Chlorite>>
<<Alt: 173.9 - 174.4 Weak-Moderate Cordierite>> Aggregated.

174.40 174.90 OI **Heavilly disseminated sulphides in host schist**

174.4 - 174.9: Rhyolite hosted.

<<Alt: 174.4 - 179.1 Moderate Calcite>>

174.90 175.50 OB **Wispy laminar, fine buckshot textured, massive sulphide with lesser magnetite**

174.9 - 175.5: Semi massive, buckshot texture. Medium grain pyrite.

<<Min: 174.9 - 179.1 10% Min: Sphalerite>>
<<Min: 174.9 - 179.1 60% Min: Pyrite>>
<<Min: 174.9 - 179.1 3% Min: Pyrrhotite>>
<<Min: 174.9 - 179.1 2% Min: Magnetite>>
<<Min: 174.9 - 179.1 3% Min: Galena>>
<<Min: 174.9 - 179.1 0.5% Min: Chalcopyrite>>
<<Alt: 174.9 - 175.5 Moderate Garnet>>

0.00 16.20 OVBN Overburden

16.20 22.80 RHYv Rhyolite volcaniclastic

16.2 - 22.8: Foliated, muscovite altered schist. QZ/CA vein. Some darker beds.

<<Min: 16.2 - 30.07 2% Min: Pyrrhotite>>

<<Alt: 16.2 - 30.07 Moderate-Strong Calcite>>

<<Alt: 22.3 - 30.07 Weak Chlorite>> Heterogeneous sediment. Alteration controlled by lithology.

<<Vein: 19.7 - 20.6 Quarzt-Chlorite-Carbonate>> Discontinuous QZ/CA vein containing CL

22.80 23.98 SED undifferentiated Sediment

22.8 - 23.98: Irregular band size, heterogeneous composition. Strongly foliated, CA in foliation. Locally felsic material (rhyolitic).

23.98 24.43 MAFt Mafic Volcaniclastics

23.98 - 24.43: Chlorite altered, fine grain homogeneous unit. CA in foliation.

24.43 30.07 SED undifferentiated Sediment

24.43 - 30.07: Thinly banded, heterogeneous composition including mafic material.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

30.07 31.63 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

30.07 - 31.63: Or MAFw. Chlorite altered, massive homogeneous unit, low BI content, CA content. Sharp upper contact, gradual lower contact.

<<Min: 30.07 - 31.63 1% Min: Pyrrhotite>>

<<Alt: 30.07 - 31.63 Weak-Moderate Chlorite>> Mafic dike.

<<Alt: 30.07 - 31.63 Weak Calcite>>

31.63 31.90 MAFt Mafic Volcaniclastics

31.63 - 31.9: Foliated mafic tuff, CA veining.

<<Min: 31.63 - 68 0.5% Min: Pyrrhotite>>

<<Alt: 31.63 - 57.2 Moderate-Strong Calcite>>

31.90 33.00 FLZ Fault Zone

31.9 - 33: Fault gouge and core loss.

<<Struc: 32.7 - 48.5 Weak-Moderate Fault>> Large broken zone. 2 set of fractures. Locally sheared and minor offset on micro fault (alpha angle 25).

33.00 35.58 MAFt Mafic Volcaniclastics

33 - 35.58: Foliated mafic tuff, CA veining.

35.58 38.75 MAFt Mafic Volcaniclastics

35.58 - 38.75: Mixed of mafic tuff and mudstone (60/40). Some argilitic siliceous bands. Thin foliation.

38.75 48.93 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

38.75 - 48.93: Dominantly siliceous mudstone. Strong CA veining. Foliated and fractured with minor MAFt beds. Two massive QZ veins (from 45.69 to 46.45 and from 47.46 to 47.75). Locally sheared.

<<Alt: 48.59 - 69.18 Moderate Silicification>> Locally strong. Silicification of mudstone and dikes. Lithology controlled.

<<Vein: 45.69 - 46.45 Quarzt-Chlorite-Carbonate>> QZ/CA massive vein containing mafic tuff.

<<Vein: 47.46 - 48.93 Quartz-Carbonate>> QZ/CA vein.

48.93 55.90 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

48.93 - 55.9: Siliceous mudstone. Few light grey band highly silicified (quartzite).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

55.90 56.97 MAFt Mafic Volcaniclastics

55.9 - 56.97: Moderately foliated.

<<Struc: 56.77 - 57.96 Moderate-Strong Fault>> Strongly foliated, fault gouge, brittle.

56.97 57.36 FLZ Fault Zone

56.97 - 57.36: Fault gouge and weak shearing.

<<Alt: 57.2 - 92 Moderate Calcite>>

57.36 59.10 MAFt Mafic Volcaniclastics

57.36 - 59.1: Fine grain, few CA discontinuous veinlets.

59.10 60.50 MAFw mafic volcanic flows

59.1 - 60.5: Homogeneous, CL altered. BI/feldspar.

<<Alt: 59.1 - 60.56 Weak Chlorite>> Dike.

60.50 65.65 MAFt Mafic Volcaniclastics

60.5 - 65.65: Interbedded with mudstone, Some siliceous argillite weakly foliated beds. Fractured, locally faulted.

<<Struc: 63.6 - 63.9 Moderate Fault>> Fautl gouge and brittle.

<<Struc: 65 - 66.5 Moderate-Strong Fault>> Strongly fracture, powder and brittle.

65.65 67.31 MDSc Carbonaceous dominant mudstone

65.65 - 67.31: Strong CA veining in foliation. Locally sheared and faulted.

67.31 68.09 MAFt Mafic Volcaniclastics

67.31 - 68.09: Calcareous mafic tuff dominantly. Some mudstone interbedded.

<<Min: 68 - 95.7 1% Min: Pyrrhotite>> Seems to be more concentrated in the brownish, soft beds.

68.09 69.18 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

68.09 - 69.18: Some brown coarser grain beds, soft, 8 to 12 cm wide.

69.18 70.65 SED undifferentiated Sediment

69.18 - 70.65: Possibly felsic dike or metasandstone (quartzite). Light grey, homogeneous texture, SI/few BI.

<<Alt: 69.18 - 70.63 Strong Silicification>> Dike

<<Alt: 70.63 - 73.8 Moderate Silicification>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

70.65 73.80 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

70.65 - 73.8: Thinly foliated mudstone containing mafic tuff bands and QZ/CA veins.

73.80 74.59 SED undifferentiated Sediment

73.8 - 74.59: Possibly felsic dike. Highly siliceous unit (quartzite?), bleached. Chill margin at lower contact.

<<Alt: 73.8 - 74.58 Strong Silicification>> Dike.

74.59 76.59 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

74.59 - 76.59: CA banded.

<<Alt: 76.39 - 77.17 Weak-Moderate Chlorite>> Dike.

76.59 77.17 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

76.59 - 77.17: CL altered. Silicified dike. Highly siliceous chill margins. Low BI content. CL concentrated in the middle of the unit. Similar contact than at 74.58. Possibly intermediate composition.

77.17 81.26 MDSc Carbonaceous dominant mudstone

77.17 - 81.26: Strong CA veining.

81.26 81.75 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

81.26 - 81.75: Silicified dike. Granular texture in the middle of the unit. Brown, sofl, medium size grain bed at lower contact.

<<Alt: 81.26 - 81.75 Moderate Chlorite>> Dike

81.75 87.34 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

81.75 - 87.34: Mudstone containing brown, soft, coarse grain beds (5 to 10 cm wide) and at lower contact. Thin foliation.

87.34 87.86 SED undifferentiated Sediment

87.34 - 87.86: Siliceous unit, quartzite? Crosscut by QZ vein. Homogeneous, QZ/BI, could be felsic dike.

<<Alt: 87.34 - 89 Moderate Silicification>>

<<Vein: 87.54 - 87.75 Quartz-Carbonate>> QZ/CA vein.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

87.86 89.07 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

87.86 - 89.07: Brown, silicified. CA veinlets set. fine grain biotite, homogeneous, BI/feldspar.

<<Vein: 88 - 89.07 Quartz-Carbonate 80 deg. >> QZ/CA veinlet set.

89.07 89.90 FLZ Fault Zone

89.07 - 89.9: Fault gouge (MAFt)

89.90 92.80 MAFt Mafic Volcaniclastics

89.9 - 92.8: Medium grain mafic tuff, CA in matrix and veining.

<<Alt: 92 - 95 Moderate-Strong Calcite>> And in matrix in tuff.

<<Struc: 89.9 - 91.7 Moderate-Strong Fault>> Fault gouge, core loss.

92.80 95.70 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

92.8 - 95.7: CL/BI/feldspar unit. CL altered. CA veinlet set. Fine grain. Gradual contact on the last 10 cm with highly siliceous unit, quartzite?.

<<Alt: 95.51 - 95.7 Strong Silicification>>

End of Hole @ 95.7

Comments:

Collared to test UTEM/HLEM conductor with near, flanking MAG approximately 300 metres SE of K98-194. Carbonaceous units are present. The unit intercepted from 41.13 m to 44.27 m seems easy to identify (glassy/unfoliated/silty-muddy/sorted/ dark blue/high silica content) and could be a good geological marker (logged as SLT_crb).

0.00 9.10 OVBN Overburden

9.10 13.81 MAFt Mafic Volcaniclastics

9.1 - 13.81: Lithology obscured by oxidation. CA in foliation.

<<Min: 9.1 - 41.13 0.5% Min: Pyrrhotite>> in foliation.

<<Min: 9.1 - 97.48 0.1% Min: Pyrite>> very rare.

<<Alt: 9.1 - 15 Moderate-Strong Calcite>>

13.81 25.12 MAFw mafic volcanic flows

13.81 - 25.12: Or MAFt. Patch of BI. CA veining with sediments from 19.47 to 19.75. Lithology obscured by oxidation from 22.3 to 24.50.

<<Alt: 15 - 29.58 Moderate Calcite>>

<<Vein: 23.7 - 23.9 Quartz-Carbonate>> QZ/CA vein.

<<Struc: 22.3 - 23.3 Weak Fault>> Few fautl gouge and brokebn zone.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

25.12 26.95 SED undifferentiated Sediment

25.12 - 26.95: Bedded, foliated. CA veining in foliation. Some coarse grain beds (siltstone to sandstone). Lithology locally obscured by foliation. Some mafic material interbedded.

26.95 29.57 MAFw mafic volcanic flows

26.95 - 29.57: BI/CA.CL. Irregular CA vening.

<<Vein: 29.45 - 29.6 Quartz-Carbonate>> QZ/CA vein.

29.57 31.06 SED undifferentiated Sediment

29.57 - 31.06: Heterogeneous. Brown sediment containing QZ/BI beds and few CL. (sandy silty locally).

<<Alt: 29.58 - 37.99 Strong Calcite>>

31.06 33.06 SED undifferentiated Sediment

31.06 - 33.06: CA veining I foliation.

33.06 34.62 MAFw mafic volcanic flows

33.06 - 34.62: CL altered. Mafic flow crosscut by CL/QZ vein. Probably mixed with mudstone material.

34.62 37.90 SED undifferentiated Sediment

34.62 - 37.9: BI rich schist. CA veining locally, possibly silicified patch.

37.90 38.94 MAFt Mafic Volcaniclastics

37.9 - 38.94: Low CA content.

<<Alt: 37.99 - 41.13 Moderate-Strong Calcite>>

38.94 41.13 SED undifferentiated Sediment

38.94 - 41.13: CA in foliation. Some strong siliceous bands.

41.13 44.27 SLT Siltstone - fine-grained sedimentary rock

41.13 - 44.27: Silicified mudstone and siltstone, glassy, dark blue, unfoliated.

<<Alt: 41.13 - 44.27 Intense Silicification>>

<<Vein: 43.6 - 59.4 Quartz-Carbonate>> Multiple QZ/CA vein, 10 to 15 cm wide..

44.27 47.60 SED undifferentiated Sediment

<<Min: 44.27 - 97.48 0.5% Min: Pyrrhotite>> And disseminated. Seems more concentrated in mafic units.

<<Alt: 44.27 - 49.56 Moderate-Strong Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 44.27 - 97.48 Weak-Moderate Silicification>>

<<Struc: 46.6 - 53 Weak Fault>> Multiple narrow fault and broken zone.

47.60 49.50 MAFt Mafic Volcaniclastics

49.50 57.02 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

49.5 - 57.02: Foliated mudstone crosscut by QZ/CA vein. Some graphitic bed and some silicified bed or highly siliceous.

<<Alt: 49.56 - 52.24 Moderate Calcite>>

<<Alt: 52.34 - 57 Weak Calcite>>

<<Alt: 57 - 57.61 Strong Calcite>>

57.02 57.61 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

57.02 - 57.61: BI/CL. QZ vein at upper contact and QZ vein crosscutting the unit.

57.61 58.56 MDSc Carbonaceous dominant mudstone

57.61 - 58.56: Low CA content.

<<Alt: 57.61 - 97.48 Weak-Moderate Calcite>>

58.56 59.30 MAFt Mafic Volcaniclastics

58.56 - 59.3: MAFi interbedded from 59.06 to 59.54. BI rich, blue, possibly andesitic composition.

59.30 64.60 MDSc Carbonaceous dominant mudstone

59.3 - 64.6: Or WCK. Thinly foliated. Sheared from 60.30 to 60.60. Could contain mafic material.

<<Struc: 60.2 - 60.6 Weak-Moderate Shear>> Shearing marks.

<<Struc: 64.5 - 67.75 Strong Fault>> Brittle and gouge in carbonaceous mudstone. Core loss.

64.60 67.75 FLZ Fault Zone

64.6 - 67.75: Sheared and faulted mudstone. Brittle and gouge.

67.75 70.95 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

70.95 72.05 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

70.95 - 72.05: Or MAFt mixed with mudstone.

72.05 76.69 MAFt Mafic Volcaniclastics

72.05 - 76.69: Poorly foliated.

76.69 81.98 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

76.69 - 81.98: Some brown coarse grain beds, non carbonaceous.

<<Vein: 79.62 - 79.85 Quartz-Carbonate>> QZ/CA vein.

<<Struc: 77.1 - 77.49 Weak Fault>> 2 narrow fault gouges.

81.98 82.68 SED undifferentiated Sediment

81.98 - 82.68: Brownish unit, poorly sorted. QZ grain, coarse matrix.

82.68 84.23 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

82.68 - 84.23: CA veining. Brown coarse grain bed at lower contact, SED showing MDS thinly interbedded..

84.23 85.21 MAFt Mafic Volcaniclastics

85.21 86.28 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

86.28 87.37 MAFt Mafic Volcaniclastics

86.28 - 87.37: Silicified on the edge, no foliation, green. QZ vein at lower contact.

87.37 87.95 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

87.95 89.75 MAFw mafic volcanic flows

87.95 - 89.75: With 10 cm of mudstone interbedded. Could be MAFt.

89.75 90.01 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

90.01 90.44 RHY undifferentiated rhyolite

90.01 - 90.44: Felsic, probably volcaniclastic, granular.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

90.44 92.17 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

<<Alt: 92.14 - 93.77 Weak-Moderate Muscovite>>

<<Struc: 91.2 - 91.3 Weak Fault>> Narrow, minor fault gouge.

92.17 93.77 RHYv Rhyolite volcaniclastic

92.17 - 93.77: Felsic composition. Granular to clastic. Possibly rhyolite.

93.77 96.60 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

96.60 97.48 MAFt Mafic Volcaniclastics

97.48 98.10 SED undifferentiated Sediment

97.48 - 98.1: Felsic composition (80 to 90 percent of QZ), BI. Meta sandstone/quartzite?. E.O.H.

<<Alt: 97.48 - 98.01 Strong Silicification>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 6.70 OVBN Overburden

6.70 13.60 RHYv Rhyolite volcaniclastic medium grey

6.7 - 13.6: Granular (1-4mm) grey quartz,minor quartz bands with lesser biotite and sercite as discontinuous mm bands and irregular filling around quartz grains, locally mottled.

<<Min: 6.7 - 41.8 0.1% Min: Pyrite>> Trace diss pyrite

<<Alt: 6.7 - 14.3 Weak Calcite>> diss and as mm veinlets

13.60 14.55 PEL Equigranular biotite + calcite +/- quartz rock dark grey

13.6 - 14.55: Biotite calcite rich. Contacts along foliation at approx. 70 deg.

<<Alt: 14.3 - 14.7 Moderate Calcite>> and as foliaform veinlets

14.55 24.77 RHYv Rhyolite volcaniclastic medium grey

14.55 - 24.77: As 6.7-13.6m; minor 0.5-2cm bands of cacite-chlorite-biotite parallel to 75 deg foliation.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 14.7 - 24.77 Weak Calcite>> mostly as mm veinlets and blebs and clots.

<<Vein: 16.2 - 16.5 45% Quartz-Tourmaline>>

<<Vein: 20.8 - 23.8 3% Carbonate-Chlorite 70 deg. >> intergrown calcite-chlorite-biotite as bands

24.77 25.33 PEL Equigranular biotite + calcite +/- quartz rock dark grey

24.77 - 25.33: sharp contacts at 75 deg parallel to foliation.

<<Alt: 24.77 - 25.35 Moderate Calcite>>

25.33 38.40 RHYv Rhyolite volcaniclastic medium grey

25.33 - 38.4: as above 6.7 - 13.6m & 14.55 - 24.77m (but only very minor calcite-chlorite-biotite bands.

<<Alt: 25.35 - 38.4 Weak-Moderate Calcite>> and as veinlets

38.40 38.75 PEL Equigranular biotite + calcite +/- quartz rock

38.4 - 38.75: upper ontact appears gradational but increase in calcite is adrupt.

<<Alt: 38.4 - 38.85 Moderate-Strong Calcite>> and as veinlets

38.75 42.00 RHYc Rhyolite coherant volcanics

38.75 - 42: As 25.35-38.4m but rhy clasts and foliatin disrupted siliceous bands present - gradational to RHYc at 42.0-48.2m.

<<Min: 41.8 - 46 1% Min: Pyrite>>

<<Alt: 38.85 - 44.7 Trace Calcite>> on fractures, mm veinlets

42.00 48.20 RHYc Rhyolite coherant volcanics cream

42 - 48.2: Good RHYc, clast supported and crackle brecciated (all due to foliation and competent RHY or some is original brecciation?). Minor biotite-sericite-calcite folia and as breccia matrix.

<<Min: 46 - 58.5 0.25% Min: Pyrite>>

<<Alt: 44.7 - 57.4 Moderate Calcite>> and as veinlets and 48.2-56m; mostly in bands with chlorite - biotite

<<Vein: 47.3 - 56 15% Carbonate-Chlorite 70 deg. >> foliaform and cross cutting calcite-chlorite-biote-qtz bands and veinlets. Looks like a foliated stringer vein zone.

48.20 57.15 RHYv Rhyolite volcaniclastic

48.2 - 57.15: problematic unit. RHYv similar to above units but this unit is crosscut but numerous (15-30% total) calcite-chlorite-biotite +/- cord veins or bands at 55-65 deg and foliaform (foliation at consistant 75 deg) . RHYv has local grey mottled -granular textur

<<Alt: 48.2 - 56.1 Weak Chlorite>> bands and blebs, asociated with cord, biot and calcite, crosscutting RHYv but also foliated (unlike qtz-tourmaline veins). Possibly related to mineralizing event?

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 48.2 - 56.1 Weak Biotite>> see comments for chlorite for same interval

<<Alt: 49 - 49.6 Weak Cordierite>> replaced/altered by calcite.

<<Vein: 51.1 - 51.5 70% Quartz-Tourmaline 30 deg. >> irregular

<<Vein: 56.1 - 56.8 80% Quartz 30 deg. >>

57.15 58.50 RHYc Rhyolite coherant volcanics cream

57.15 - 58.5: similar to 42.0-48.2m.

<<Alt: 57.4 - 58.4 Weak Calcite>> blebs, diss and as veinlets

<<Alt: 58.4 - 60.7 Moderate-Strong Calcite>> mostly inbands with chlorite - biotite

58.50 60.52 RHYv Rhyolite volcaniclastic

58.5 - 60.52: silicic bands and clasts. Bands and fillings of biotite - calcite, about 20% overall.

<<Min: 58.5 - 74.5 0.25% Min: Pyrite>>

<<Min: 58.5 - 74.5 0.25% Min: Pyrrhotite>>

<<Vein: 58.5 - 64 10% Carbonate-Chlorite 70 deg. >> foliaform and cross cutting calcite-chlorit-biotite-qtz bands

60.52 62.70 RHYc Rhyolite coherant volcanics cream

60.52 - 62.7: unit over printed by qtz vein and attendant silicification and bleaching and calcite veining on fractures; might be RHYv in part.lower 0.6m is crackle brecciated rhy.minor feldspar phenos.

<<Alt: 60.7 - 64.5 Weak-Moderate Calcite>> and as veinlets

<<Vein: 61.5 - 61.8 Quartz>>

62.70 64.55 RHYc Rhyolite coherant volcanics grey

62.7 - 64.55: local brecciated siliceous bands, folia, bands and breccia matrix of qtz-biotite and later calcite-chlorite-biotite.

<<Alt: 64.5 - 66.1 Moderate Calcite>>

64.55 66.10 PEL Equigranular biotite + calcite +/- quartz rock

64.55 - 66.1: includes 0.3m section of calcareous RHYv. Unit is a

66.10 83.80 RHYv Rhyolite volcaniclastic grey

66.1 - 83.8: minor sections with quartz and or feldspar phenocryts.

<<Min: 74.5 - 80.8 0.5% Min: Pyrite>>

<<Min: 74.5 - 80.8 0.5% Min: Pyrrhotite>>

<<Min: 80.8 - 90.65 0.1% Min: Pyrite>>

<<Alt: 66.1 - 83.8 Weak Calcite>> as diss, blebs, fracture filling and veinlets

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 81.9 - 83.2 100% Quartz-Tourmaline 70 deg. >> 5% tourmaline, diss tour in wallrock.

<<Struc: 67.3 - 67.6 Moderate Fault>>

<<Struc: 73.5 - 74 Weak Fault>>

Comments:

The units logged as mafic dikes contain calcite in matrix and calcite veining but do not show relevant chlorite alteration. They are fin grain unit and most of them could be sedimentary formation. From 133 m to 141 m, significant veins containing QZ/CA/MS/CL/BI/TML are encountered. Similar veins were observed underneath the first mineralized zone. Those veins suggest hydrothermal fluid circulation.

Local Elev. (m):				Hole Completed?:		Purpose:	Exploration
Comments:						Parent Hole:	

Hole tests stratigraphy east of GP4F and north of R15. Altered and pyrite-pyrrhotite mineralized volcaniclastic and inter tuff pelitic sediments occur between 70 and 104 m depth and are thought to be distal horizon equivalents to GP4F. Very little felsic flow rocks and no porphyritic rocks were encountered. The hole entered the lower sedimentary sequence around 17 0m depth before crossing a significant fault that may have 60 m of reverse movement such that felsic units are repeated down hole.

Downhole Surveys:

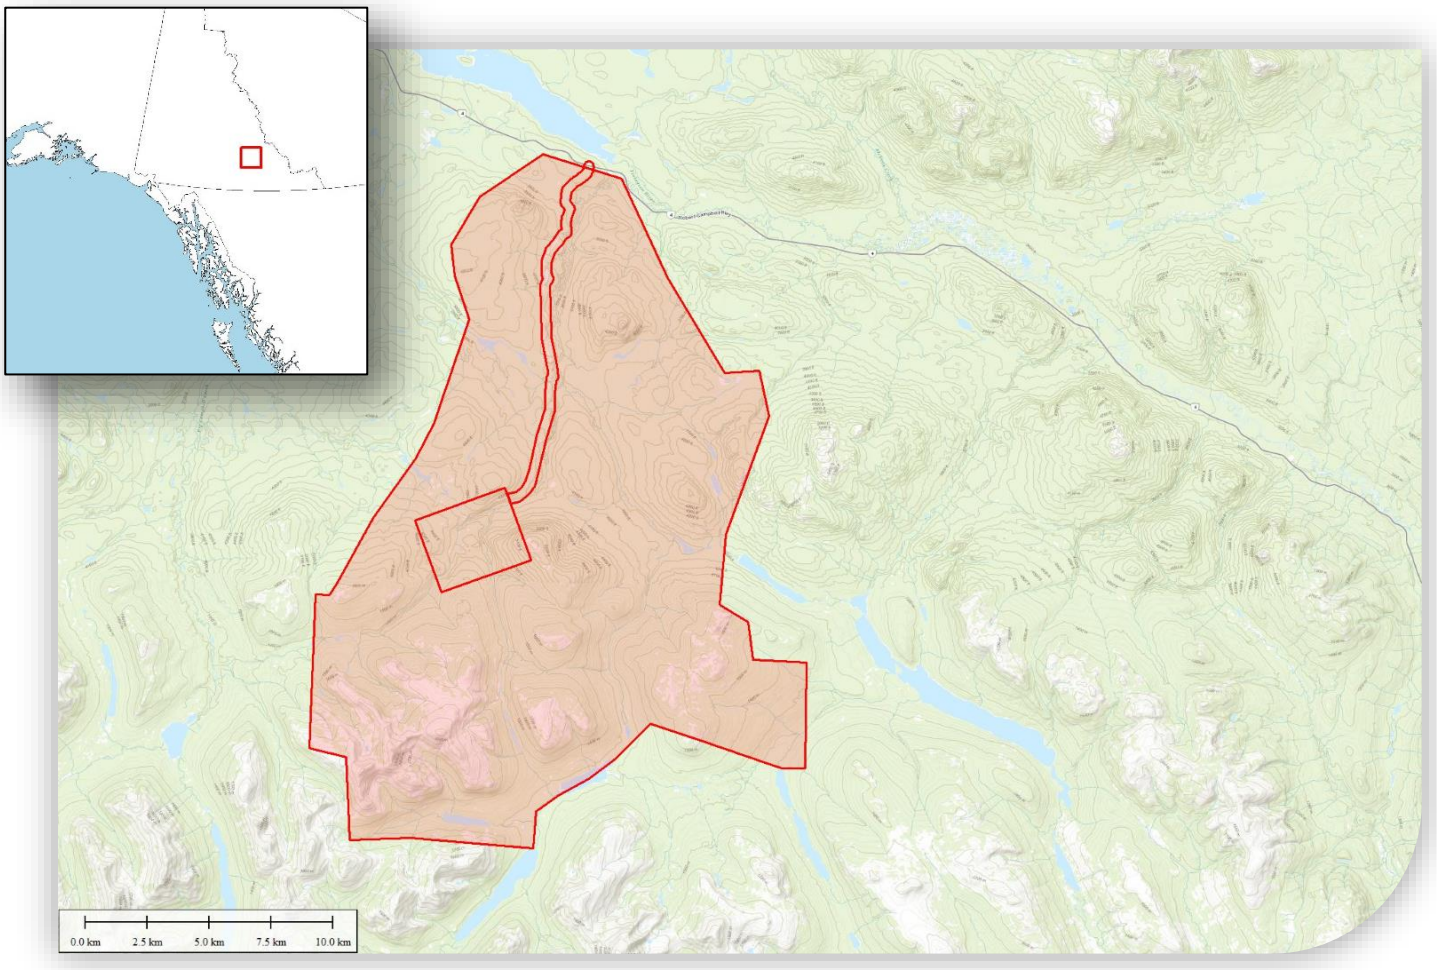
1. Project Overview

1.1 Area of Interest

Eagle Mapping Ltd. collected aerial LiDAR of BMC Minerals' KZK project near Finlayson Lake, YT. The Area of Interest (AOI) for this project covers a total of 341 sq. km. A significant buffer was collected surrounding the project AOI in order to guarantee accuracy and density within the boundary.



1.2 Acquisition Conditions

LiDAR and photo acquisition was completed in a single flight out of Watson Lake, YT on June 10, 2016. Both datasets were collected simultaneously, and equipment was co-mounted in the same aircraft. Weather was mainly clear with scattered clouds at 18000' MSL. The clouds posed no problem for LiDAR acquisition, but resulted in very significant broken shadows in the imagery. After analysis, the images were deemed unfit for delivery and flagged for reflight (as yet unflown).

1.3 File Formats, Units, and Projection

Project deliverables include the following:

Digital Elevation Contours – 1m interval

- ESRI Shapefile format
- Delivered as one file clipped to the AOI

'Bare Earth' Digital Elevation Model – 1m grid

- ArcASCII Grid format
- Delivered as one file clipped to the AOI

'Highest Hit' Digital Surface Model – 1m grid

- ArcASCII Grid format
- Delivered as one file clipped to the AOI

LiDAR Data Report

- Overview of project specifications, methodology and accuracies achieved

Map Projection Information	
Projection	UTM zone 9N
Horizontal Datum	NAD83 (CSRS)
Vertical Datum	CGVD28
Geoid	HTv2.0
Units	Meters
EPSG Code	3156

2. Acquisition & Calibration

2.1 Airborne LiDAR Collection

A Riegl Q1560 dual-channel LiDAR system was used for acquisition of the LiDAR data. This system was installed in a Piper Navajo aircraft operated by Peregrine Aerial Surveys out of Abbotsford, BC. In total, 24 flight lines were required to cover the AOI. Of these, 10 lines covered the tote road corridor and block at 10 ppm point density. Nominal flying height for 2ppm was 1400m above ground level (AGL) and flying speed was approximately 160kts, and 1000m AGL at 140kts for the 10ppm corridor. The scan field of view for the Q1560 is 29° either side of nadir, for a total scan field of view of 58°. The scan rate used for this project was 800 kHz. However, due to the nature of the 4-sided rotating mirror in Riegl scanners only 2/3 of pulses are recorded (533 kHz useable). This yields an average pulse density of 1 pulse per channel per swath (2 pulses per dual-channel flight line). The project was flown with a minimum of 25% side overlap, to ensure seamless coverage of the entire AOI. Note, each pulse may result in one or more returned points as the pulse filters through vegetation, etc. Water or highly absorbent material may result in very few or no LiDAR returns as these materials poorly reflect the laser pulse or may absorb it entirely.

LiDAR Specifications – 10ppm	
Flight Altitude	1400m AGL
Flying Speed	140kts nominal
Scan Rate	800khz (533khz usable)
Scan Field of View	58°
Line Spacing	620m
Minimum Overlap	60%

LiDAR Specifications – 2ppm	
Flight Altitude	2000m AGL
Flying Speed	160kts nominal
Scan Rate	800khz (533khz usable)
Scan Field of View	58°
Line Spacing	1550m
Minimum Overlap	25%

2.2 Aerial Photography Collection

Aerial photography was collected simultaneously with the LiDAR data, using a Trimble IQ-180 80 Megapixel digital camera co-mounted with the Q1560 LiDAR system. A total of 437 images were collected in 14 flight lines, and nominal photo resolution was 30cm.

2.3 Aircraft GNSS Trajectory Processing

GNSS post-processing determines the position and attitude of the aircraft at 200Hz along the entire flight path. This data is logged on the Q1560 via an Applanix POS AV510. Post-processing requires data from the onboard GNSS and Inertial Measurement Unit (IMU) as well as data from one or more static GNSS base station(s) with known coordinates.

Processing is done with Applanix PosPAC MMS software. Here the aircraft GNSS / IMU data is referenced to the base station data to provide adjusted positions for the aircraft in latitude, longitude, and height, roll, pitch, and yaw / heading. The final trajectory is then smoothed, and exported in .pos format for use in RiProcess for LiDAR processing. The resulting flight path is commonly referred to as a Smoothed Best Estimate of Trajectory (SBET).

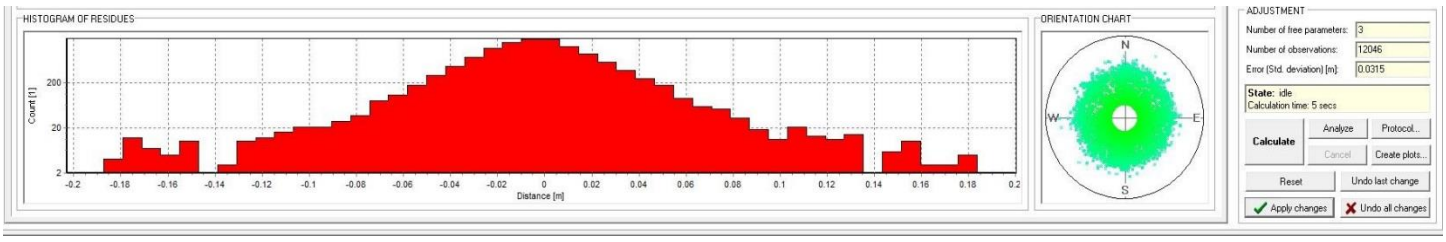
Mission planning ensures the project is flown during a period of good satellite visibility and distribution, resulting here in a minimum PDOP of 1.0 and maximum of 2.5. Statistical accuracy (RMS) of the SBET trajectory is < 2.5cm.

Trimble RTX real-time correction service was used for differential processing of the GPS trajectory. This service is able to converge to within several cm of accuracy, and is very helpful when surveying remote projects with limited base station coverage.

Trajectory Processing Results	
Min. # of Satellites	9
Max. # of Satellites	21
Minimum PDOP	1.0
Maximum PDOP	2.5
RMSE	2.5 cm

2.4 LiDAR Calibration

LiDAR data was calibrated using Riegl RiProcess software. A quality check was performed using matching tie planes which are calculated automatically and analyzed via a least-squares adjustment. Manual cross section checks were also performed to verify the automatic results. Internal accuracy of the LiDAR data was calculated at ±3cm. Once deemed properly calibrated, the LAS data is exported along with individual 'trajectories' for each scan line. All data is projected into UTM and adjusted to the proper geoid (HTv2.0) at this time.

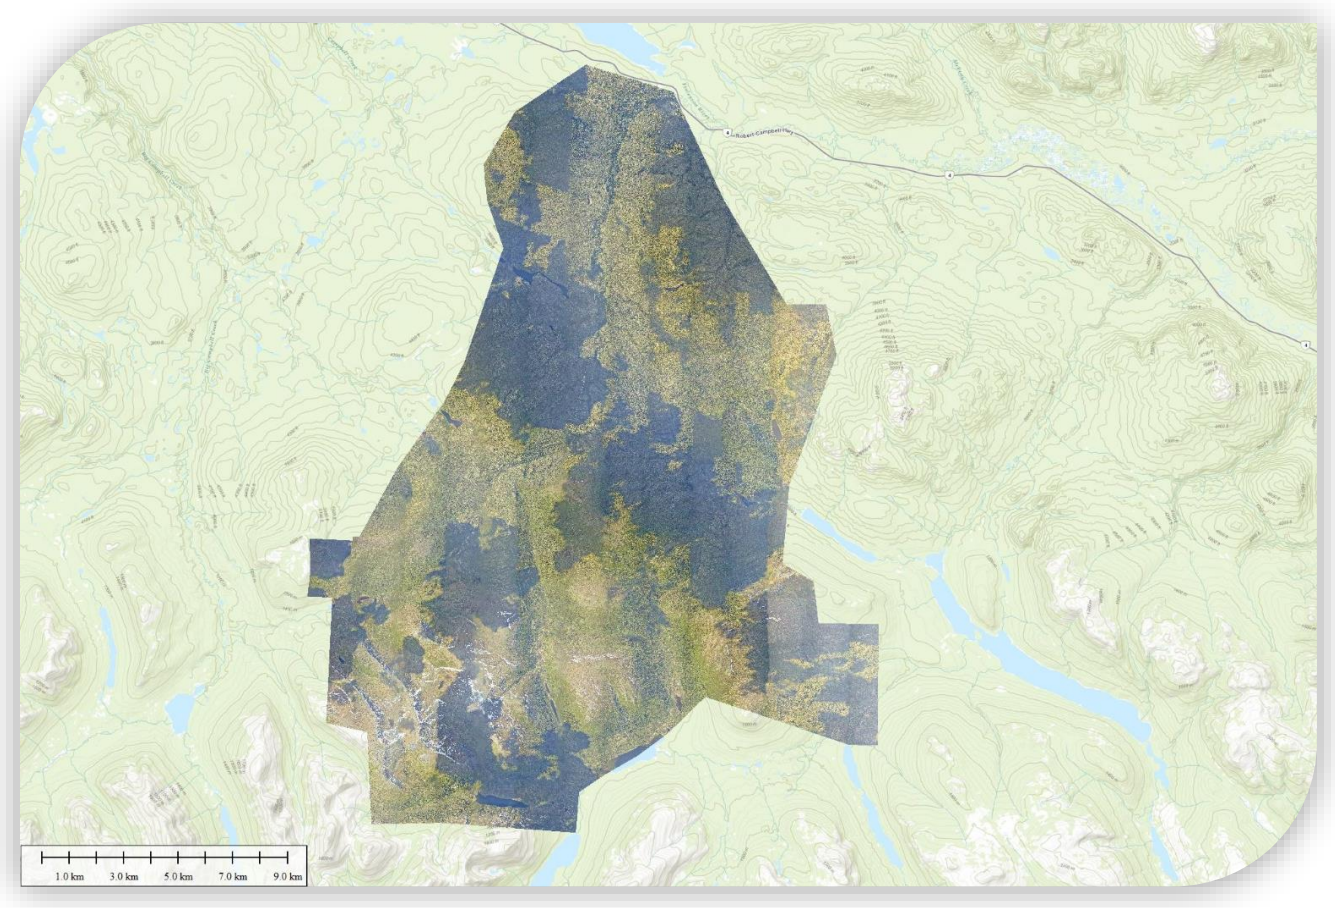


2.5 Photo Processing

Imagery is first colour-balanced to adjust for lighting differences between lines. It is then exported as GeoTiffs for use in the orthorectification process. Ortho processing is performed with Trimble OrthoVista software. With this software, images are aligned geographically (mosaicked) using their time stamp and the position from the SBET which corresponds to this time. The software also references the attitude information from this time stamp, and the LiDAR-derived DEM in order to 'project' the image on the correct ground location depending on where the aircraft was pointing at that moment.

The overall mosaic of all images is then inspected for busts or other discrepancies and image seam lines are adjusted to have the least visual impact. Control points are measured and checked for accuracy. Finally, once approved, the mosaic is cut into tiles and exported in the appropriate deliverable format.

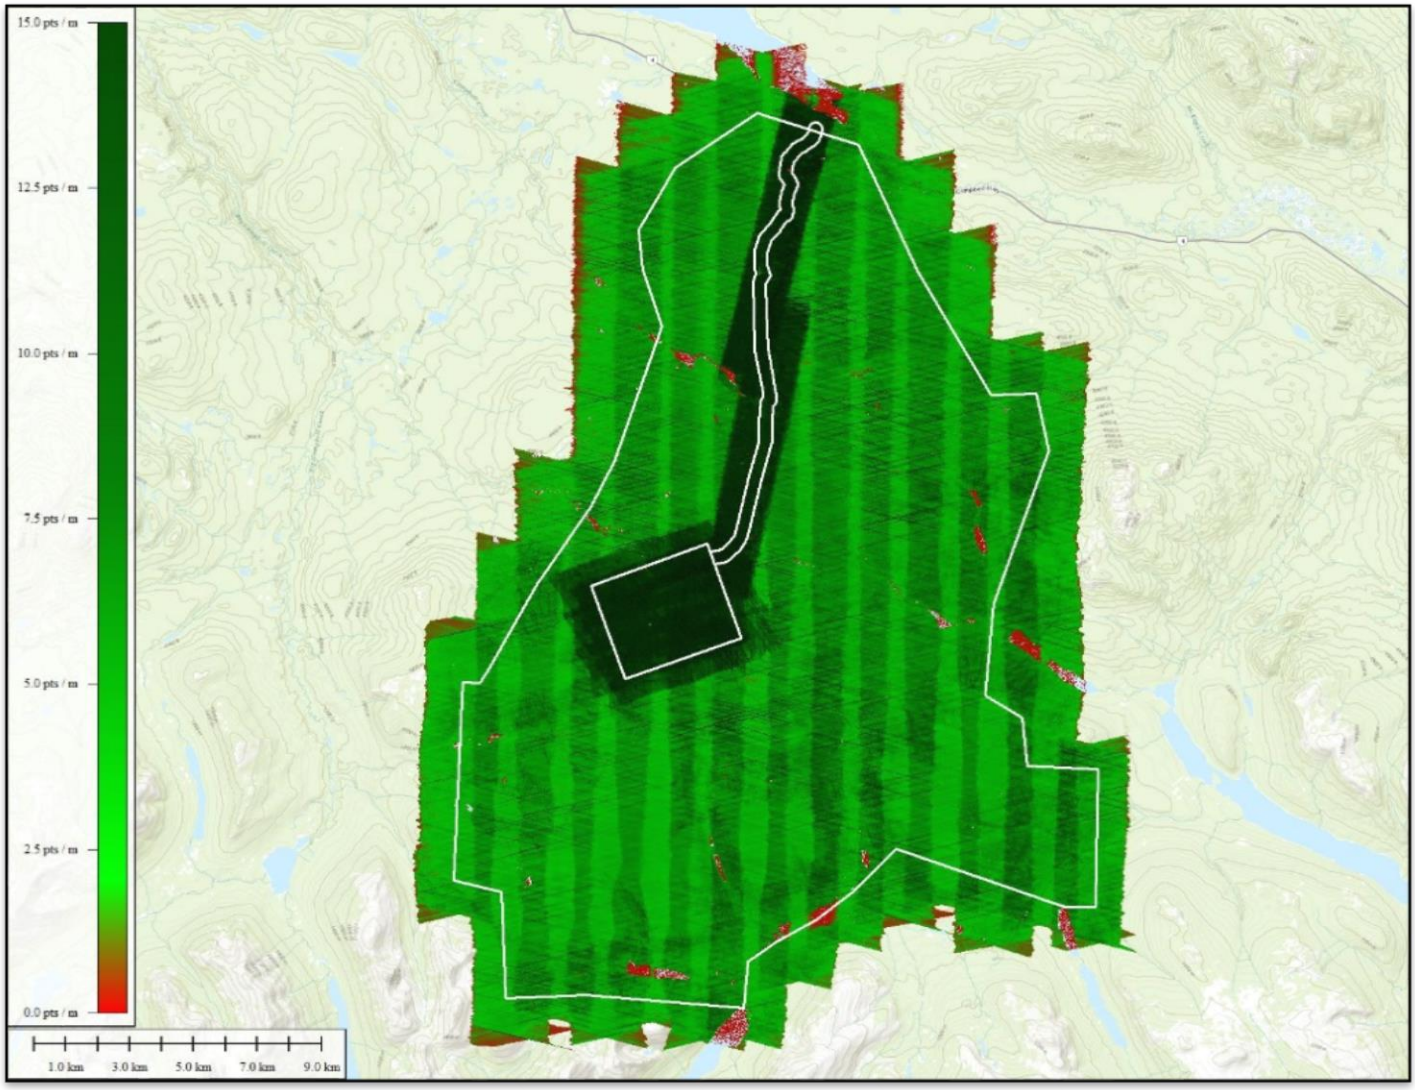
In this case, after delivery of the orthophoto, it was decided that too much cloud shadow was present and that the photos would need to be reflown.



3. Results and Conclusions

3.1 Point Density and Coverage

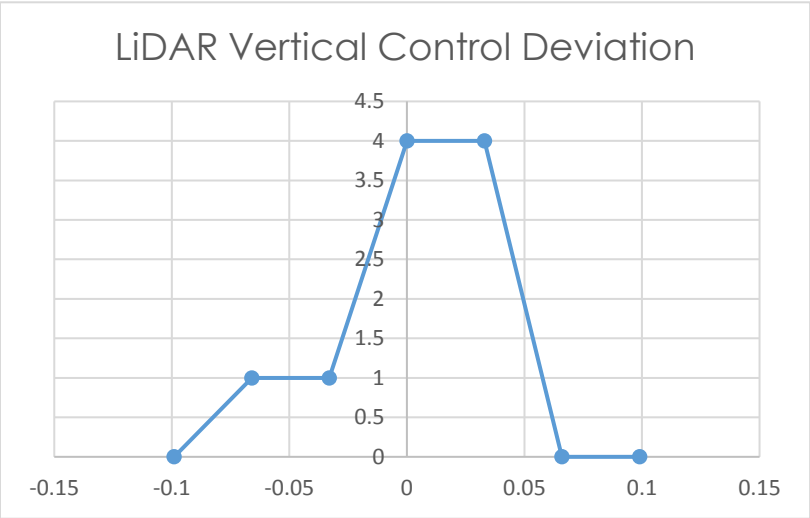
The delivered LiDAR data is positioned with an average density of 4-6 points / sq. meter for all returns, and 2-3 points / sq. meter counting only first-returns. Density for the tote road corridor and block is 12-15 points / sq. meter for all returns. Density is much greater for all returns vs first-returns due to the full waveform analysis performed by the Q1560 laser. By analyzing the full LiDAR waveform, the Q1560 is able to extract many additional points in vegetation, or other terrain where the laser pulse is 'filtered' through many objects in close proximity to each other.



3.2 Accuracy

LiDAR Accuracy

Accuracy of the LiDAR data was determined via comparison to a set of ground control points provided to Eagle Mapping by BMC Minerals. LiDAR data was measured to fit these control points very well – within 3cm and so no adjustment of the data was required. It is Eagle Mapping's conclusion that the LiDAR data is accurate to within <6.7cm vertically, and <30cm horizontally quoted at 95% confidence level as per ASPRS LiDAR vertical accuracy guidelines.



LiDAR Control Statistics	
Average dZ	0.001
Minimum dZ	-0.05
Maximum dZ	0.05
Average magnitude	0.031
Root mean square	0.034
Std deviation	0.034

Orthophoto Accuracy

The orthophoto was rectified using the ground control targets provided to Eagle Mapping, and was referenced against the LiDAR-derived intensity imagery. No busts greater than 1-2 pixels were observed, however more thorough examination was not performed as the orthophoto was rejected due to the cloud cover.

Dear Ms. Mountjoy;

Re: Survey Methodology and Equipment; Kudz Ze Kayah (KZK), Yukon

Thank you for the opportunity to work on this interesting project. The following outlines our general survey methodology and the technical equipment we use at KZK.

Challenger uses exclusively Leica Geomatics Ltd. survey grade technical equipment. In open areas (almost all of KZK) we use Leica Viva Global Navigation Satellite Systems (GNSS). GNSS includes GPS and other satellite constellations and is more robust than GPS alone. We have used differentially corrected Real Time Kinematic (RTK) GNSS for most measurements at KZK. These measurements are possible when we have radio contact with our base receiver. When we do not have radio contact (ie in GP4F) we post process the GNSS vectors. We have survey control that will reach the GP4F area with radio however the cost to move the GNSS base station with the helicopter is too high unless we are measuring many locations in GP4F.

Challenger also has several total stations available in case GNSS techniques are not appropriate (heavy trees). Thus far we have not used anything other than GNSS on the KZK site. Please find attached a fact sheet for the Leica Viva GS15 GNSS receiver.

Coordinates for our control have been derived using Natural Resources Canada's Precise Point Positioning (PPP) service which uses precise GNSS orbit information to compute the absolute position of a measured point. Uncertainty statistics are provided and are primarily a function of observation time and satellite constellation. Once a PPP solution for our primary control point was obtained we processed static GNSS vectors within our control network to determine the coordinates of all other control. These values were compared against PPP values for these points as a check. Several control stations are located in various areas to allow for checks (performed each day to ensure equipment is performing correctly) and are available in case of destruction of other control points. All check measurements are recorded in hard copy and digitally.

Item	Metadata
Horizontal Datum:	NAD83 CSRS Epoch 2002
Vertical Datum:	CGVD28 (HT v2.0 Geoid)
Coordinate Projection:	UTM Zone 9 North, metres
Date:	April 30 2016
Prevailing weather conditions including temperature:	Not recorded
Purpose of data collection for that day:	Measure Monitoring Wells and Drill Holes
Name of company submitting the data:	Challenger Geomatics Ltd.
Name, license number, and stamp, of the licensed surveyor:	Paul Burbidge, Commission number 1787
Name of field crew chief:	Geoff Anderson, Party Chief
Names of other crew members and responsibilities:	John Usselman, assistant
Type of data collection (GPS RTK, handheld GPS, other):	Leica Viva RTK GNSS
ID of pre-existing control monument used as RTK base station or initial check for handheld:	2819
Other control monuments checked and amount of measured discrepancy:	2800 (0.005 H, 0.015 V)
ID of new control monuments established:	NA
Issues encountered and how they were resolved:	None
Notes from field crew chief;

Item	Metadata
Horizontal Datum:	NAD83 CSRS Epoch 2002
Vertical Datum:	CGVD28 (HT v2.0 Geoid)
Coordinate Projection:	UTM Zone 9 North, metres
Date:	August 3 2016
Prevailing weather conditions including temperature:	Not recorded
Purpose of data collection for that day:	Measure Drill Holes and Monitoring Wells
Name of company submitting the data:	Challenger Geomatics Ltd.
Name, license number, and stamp, of the licensed surveyor:	Paul Burbidge, Commission number 1787
Name of field crew chief:	Nathan Conroy, Party Chief
Names of other crew members and responsibilities:	Mason Grey, assistant
Type of data collection (GPS RTK, handheld GPS, other):	Leica Viva RTK GNSS
ID of pre-existing control monument used as RTK base station or initial check for handheld:	2816, 2819
Other control monuments checked and amount of measured discrepancy:	2800 (0.003 H, 0.002 V), 2800 (0.002 H, 0.016 V)
ID of new control monuments established:	NA
Issues encountered and how they were resolved:	None
Notes from field crew chief;	K16-391 not found, under active drill

Appendix G: 2016 and Outstanding 2015 Drill

Hole Collar Coordinates and Orientations

This appendix contains the most up-to-date collar coordinates for all 2016 drill holes (Table G-1) as well as un-surveyed drill holes from the 2015 program and historic monitoring wells (Table G-2). The survey type used to locate the collar is indicated as either differential GPS ("RTK DGPS") or as an integration of LiDAR elevation data with eastings and northings from a handheld GPS ("GPS-LiDAR"), azimuth pointing system ("APS-LiDAR") or the planned co-ordinates ("PLND-LiDAR").

Table G-1: Survey collar information for 2016 diamond drill holes

Hole ID	Easting	Northing	Elevation (m)	Length (m)	Azimuth (°)	Dip (°)	Survey Type

EXECUTIVE SUMMARY

KUDZ ZE KAYAH, PELLY AND WOLF - WOLVERINE LAKE, YUKON

During April 23rd to July 31st 2016 Geotech Ltd. carried out a helicopter-borne geophysical survey over Kudz Ze Kayah, Pelly and Wolf situated near Wolverine Lake, Yukon.

Principal geophysical sensors included a versatile time domain electromagnetic (VTEMplus) system and horizontal magnetic gradiometer with two caesium sensors. Ancillary equipment included a GPS navigation system and a radar altimeter. A total of 1589 line-kilometres of geophysical data were acquired during the survey.

In-field data quality assurance and preliminary processing were carried out on a daily basis during the acquisition phase. Preliminary and final data processing, including generation of final digital data and map products were undertaken from the office of Geotech Ltd. in Aurora, Ontario.

The processed survey results are presented as the following maps:

- Electromagnetic stacked profiles of the B-field Z Component,
- Electromagnetic stacked profiles of dB/dt Z Component,
- B-Field Z Component Channel grids,
- dB/dt X Component Fraser Filtered Channel grid,
- Total Magnetic Intensity (TMI),
- Magnetic Total Horizontal Gradient,
- Magnetic Tilt-Angle Derivative of TMI,
- Calculated Time Constant (Tau) with Calculated Vertical Derivative contours and
- Resistivity Depth Images (RDI) sections are presented.

Digital data includes all electromagnetic and magnetic products, plus ancillary data including the waveform.

The survey report describes the procedures for data acquisition, processing, final image presentation and the specifications for the digital data set.

1. INTRODUCTION

1.1 GENERAL CONSIDERATIONS

Geotech Ltd. performed a helicopter-borne geophysical survey over Kudz Ze Kayah, Pelly and Wolf situated near Wolverine Lake, Yukon (Figure 1 & Figure 2).

Robin Black represented BMC Minerals (No. 1) Ltd during the data acquisition and data processing phases of this project.

The geophysical surveys consisted of helicopter borne EM using the versatile time-domain electromagnetic (VTEMplus) system with Full-Waveform processing. Measurements consisted of Vertical (Z), In-line Horizontal (X) and Cross-line Horizontal (Y) components of the EM fields using induction coils and the aeromagnetic total field using a magnetic gradiometer. A total of 1589 line-km of geophysical data were acquired during the survey.

The crew was based out of Watson Lake (Figure 2) in Yukon for the acquisition phase of the survey. Survey flying started on April 23rd and was completed on July 31st, 2016.

Data quality control and quality assurance, and preliminary data processing were carried out on a daily basis during the acquisition phase of the project. Final data processing followed immediately after the end of the survey. Final reporting, data presentation and archiving were completed from the Aurora office of Geotech Ltd. in October, 2016.

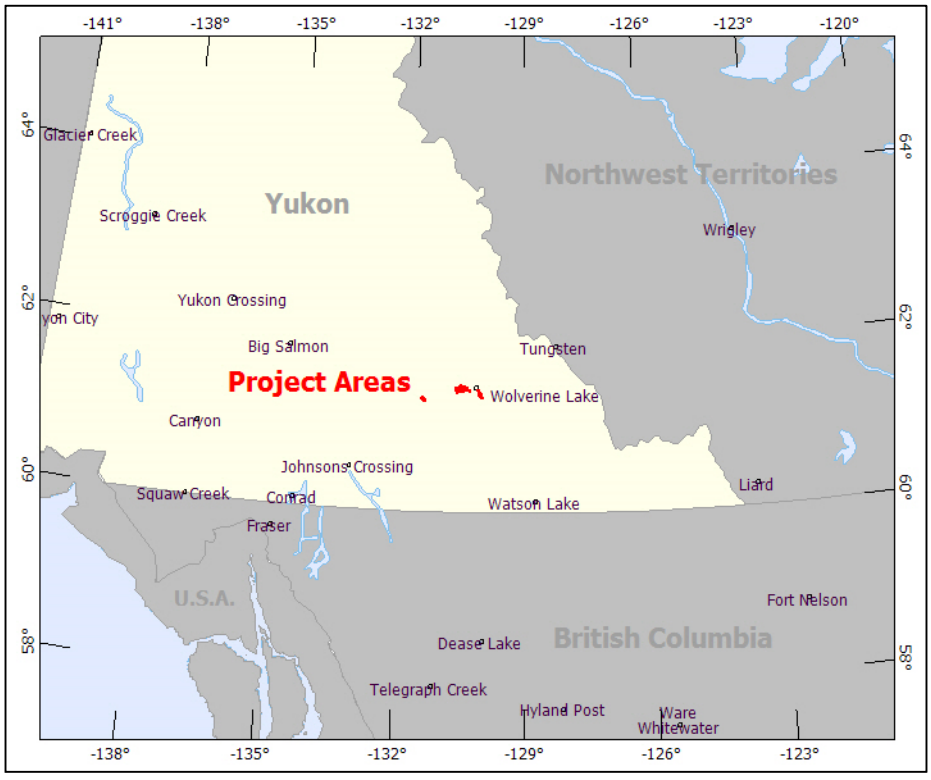

Figure 1: Survey location

1.2 SURVEY AND SYSTEM SPECIFICATIONS

The survey areas, Kudz Ze Kayah, Pelly and Wolf are located approximately 8 kilometres west, 2 kilometres east and 71 kilometres southwest of Wolverine Lake, Yukon respectively (Figure 2).

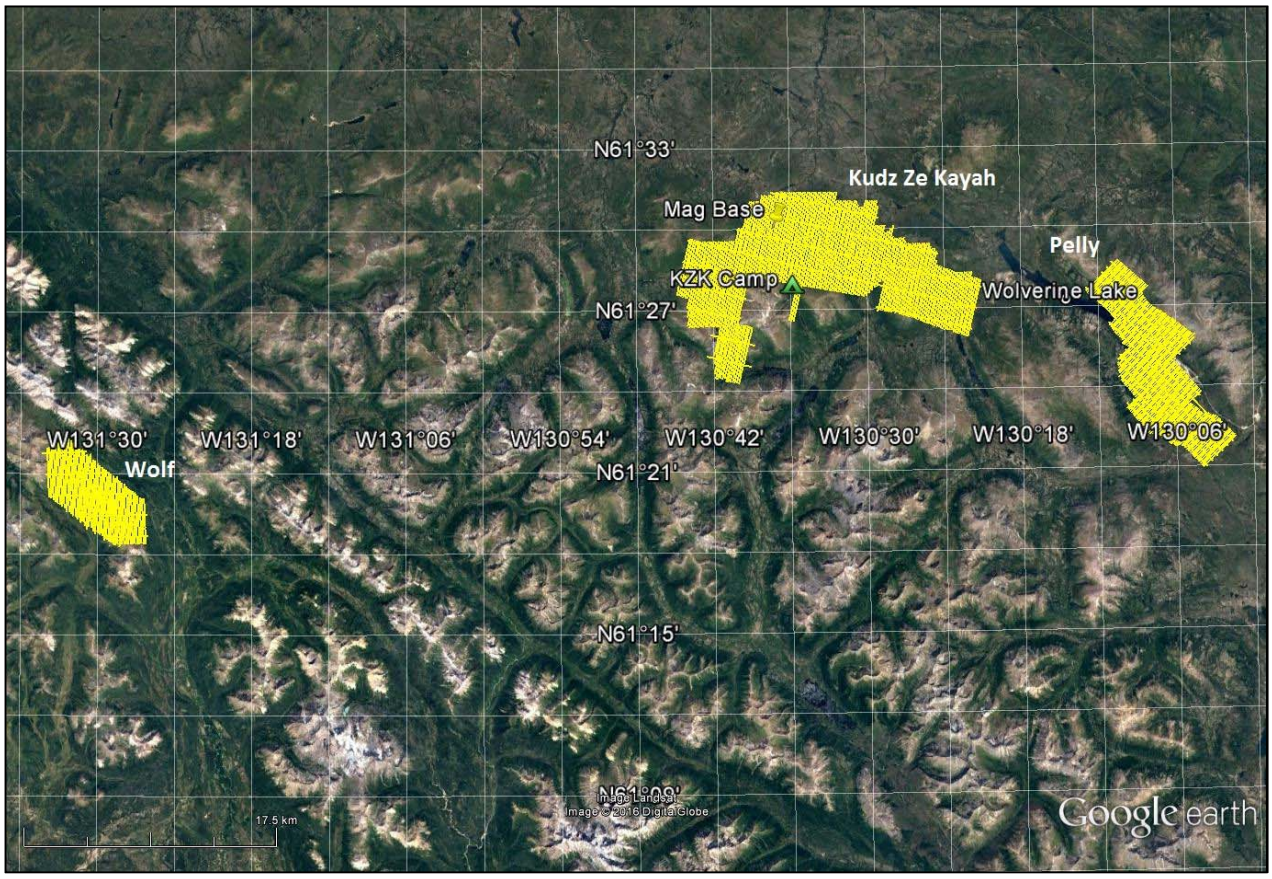

Figure 2: Survey area location on Google Earth.

The block, Kudz Ze Kayah was flown in a northeast to southwest (N 15° E azimuth) direction; Pelly was flown in a southwest to northeast (N48° E azimuth) direction and Wolf was flown in a north to south (N0° E azimuth) direction with traverse line spacing of 150 metres as depicted in Figure 3 to 4. Tie lines were flown perpendicular to the traverse lines at a spacing of 1500 metres respectively. For more detailed information on the flight spacing and direction see Table 1.

1.3 TOPOGRAPHIC RELIEF AND CULTURAL FEATURES

Topographically, the survey areas exhibits an extremely rugged relief with an elevation ranging from 1104 to 2079 metres above mean sea level over an area of 241 square kilometres (Figure 3 to 5).

There are various rivers and streams running through the survey areas which connect various lakes. There are no visible signs of culture such as roads, transmission lines, mining areas and settlements located in the survey areas (Figure 3 to 5).

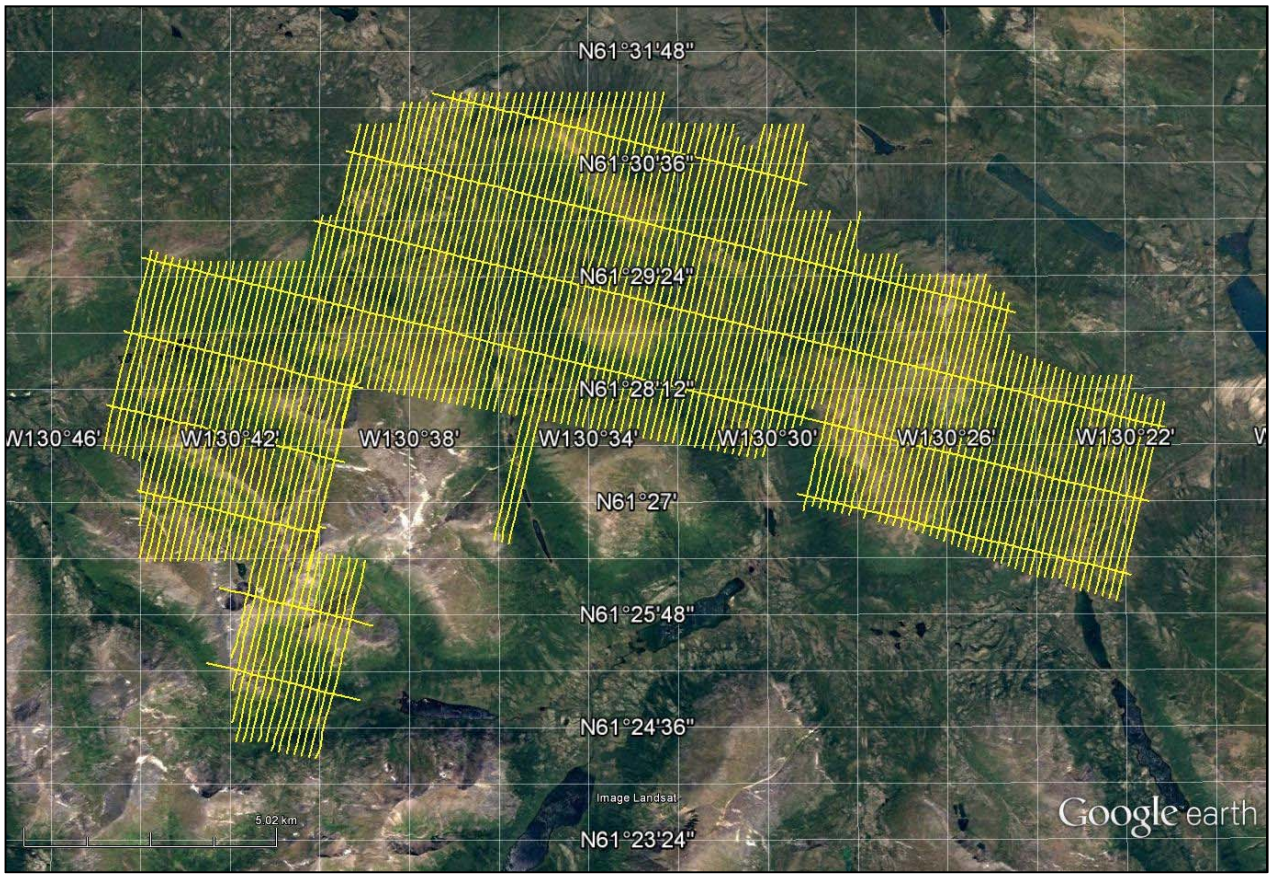

Figure 3: Flight path of Kudz Ze Kayah over a Google Earth Image.

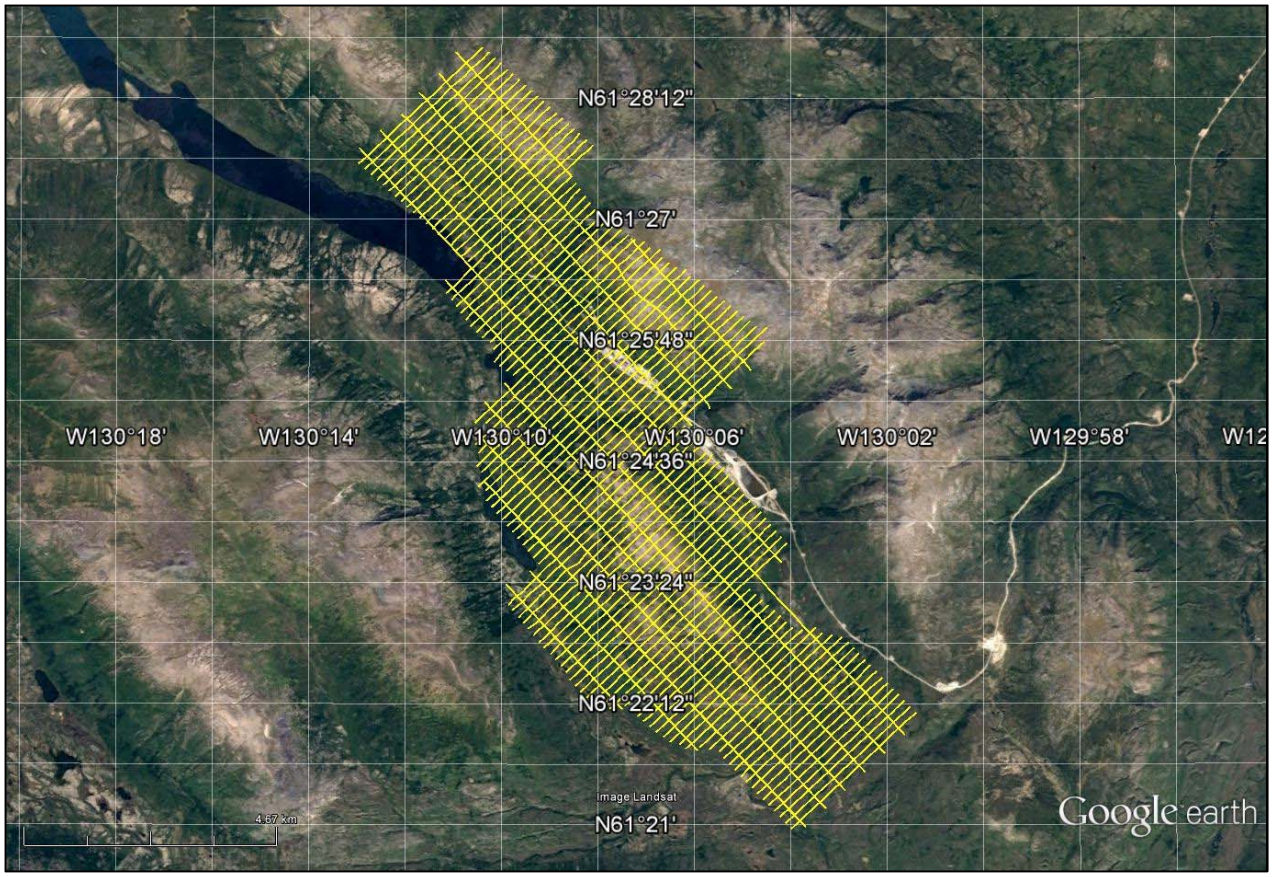

Figure 4: Flight path of Pelly over a Google Earth Image.

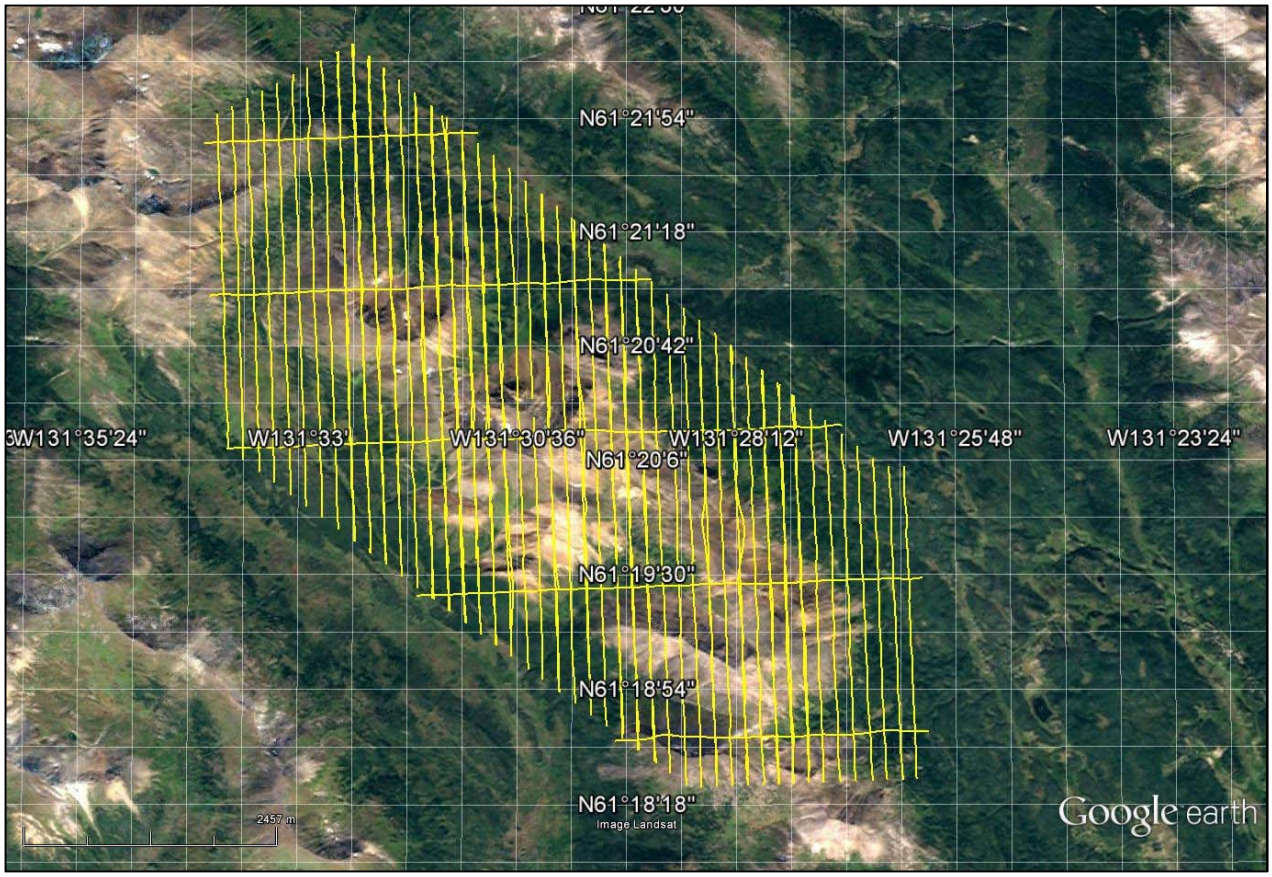

Figure 5: Flight path of Wolf over a Google Earth Image.

2. DATA ACQUISITION

2.1 SURVEY AREA

The survey areas (see Figure 3, Figure 4, Figure 5 and Appendix A) and general flight specifications are as follows:

Table 1: Survey Specifications

Survey block	Line spacing (m)	Area (Km^2)	Planned[1] Line-km	Actual Line-km	Flight direction	Line numbers
Kudz Ze Kayah	Traverse: 150	121	902	851.8	N 15° E / N 195° E	L3000 - L4350 L1305 - L1555
	Tie: 1500			86.5	N 105° E / N 285° E	T5000 - T5080
Pelly	Traverse: 150	91	473	370.1	N 48° E / N 228° E	L4000 - L4960
	Tie: 1500			111.5	N 138° E / N 318° E	T5000 - T5040
Wolf	Traverse: 150	29	214	295.5	N 0° E / N 180° E	L6000 - L6440
	Tie: 1500			21.1	N 90° E / N 270° E	T7000 - T7040
TOTAL		241	1589	1736.5		

Survey area boundaries co-ordinates are provided in Appendix B.

2.2 SURVEY OPERATIONS

Survey operations were based out of Watson Lake and Kudz Ze Kayah Camp in Yukon from April 11th until July 31st 2016. The following table shows the timing of the flying.

Table 2: Survey schedule

Date	Flight #	Flown km	Block	Crew location	Comments
11-Apr-2016				Watson Lake, Yukon	Crew arrived
12-Apr-2016				Watson Lake, Yukon	System assembly limited due to weather
13-Apr-2016				Watson Lake, Yukon	System assembly
14-Apr-2016				Watson Lake, Yukon	Testing
15-Apr-2016				Watson Lake, Yukon	No production due to technical issues
16-Apr-2016				Watson Lake, Yukon	No production due to technical issues
17-Apr-2016				Watson Lake, Yukon	No production due to technical issues & recon flight
18-Apr-2016				Watson Lake, Yukon	No production due to technical issues
19-Apr-2016				Watson Lake, Yukon	No production due to technical issues
20-Apr-2016				Watson Lake, Yukon	No production due to technical issues & test flight
21-Apr-2016				Watson Lake, Yukon	Mobilized to camp
22-Apr-2016				KZK CAMP, Yukon	Set up & testing – no production

[1] Note: Actual Line kilometres represent the total line kilometres in the final database. These line-km normally exceed the Planned Line-km, as indicated in the survey NAV files. However, flying was stopped early as requested by the client.

Date	Flight #	Flown km	Block	Crew location	Comments
					due to weather
23-Apr-2016	1,2,3	280	KZK	KZK CAMP, Yukon	280km flown
24-Apr-2016	4,5	188	KZK	KZK CAMP, Yukon	188km flown
25-Apr-2016	6	25	KZK	KZK CAMP, Yukon	25km flown limited due to weather
26-Apr-2016	7,8,9	247	KZK	KZK CAMP, Yukon	247km flown
27-Apr-2016				KZK CAMP, Yukon	No production due to weather
28-Apr-2016	10,11	149	KZK	KZK CAMP, Yukon	149km flown
29-Apr-2016				KZK CAMP, Yukon	No production due to weather
30-Apr-2016				KZK CAMP, Yukon	No production due to weather
1-May-2016	12	6	Pelly	KZK CAMP, Yukon	6km flown limited due to weather
2-May-2016				KZK CAMP, Yukon	No production due to weather
3-May-2016	13,14	155	KZK	KZK CAMP, Yukon	155km flown – Stopped until July
5-Jul-2016				KZK CAMP, Yukon	Crew arrived
6-Jul-2016				KZK CAMP, Yukon	System set & recon flight
7-Jul-2016	15	56	wolf	KZK CAMP, Yukon	56km flown limited due to technical issues
8-Jul-2016	16,17	106	wolf	KZK CAMP, Yukon	160km flown
9-Jul-2016	18,19,20	52	wolf	KZK CAMP, Yukon	52km flown

31-Jul-2016		103	wolf	KZK CAMP, Yukon	Remaining kms were flown – flying complete

2.3 FLIGHT SPECIFICATIONS

During the survey the helicopter was maintained at a mean altitude of 101 metres above the ground with an average survey speed of 80 km/hour. This allowed for an actual average Transmitter-receiver loop terrain clearance of 70 metres and a magnetic sensor clearance of 80 metres.

The on board operator was responsible for monitoring the system integrity. He also maintained a detailed flight log during the survey, tracking the times of the flight as well as any unusual geophysical or topographic features.

On return of the aircrew to the base camp the survey data was transferred from a compact flash card (PCMCIA) to the data processing computer. The data were then uploaded via ftp to the Geotech office in Aurora for daily quality assurance and quality control by qualified personnel.

2.4 AIRCRAFT AND EQUIPMENT

2.4.1 SURVEY AIRCRAFT

The survey was flown using a Eurocopter Aerospatiale (Astar) 350 B3 helicopter, registration C-GTNI and C-FVTM. The helicopter is owned and operated by Trans North Helicopters. Installation of the geophysical and ancillary equipment was carried out by a Geotech Ltd crew.

2.4.2 ELECTROMAGNETIC SYSTEM

The electromagnetic system was a Geotech Time Domain EM (VTEM™Plus) full receiver-waveform streamed data recorded system. The "full waveform VTEM system" uses the streamed half-cycle recording of transmitter and receiver waveforms to obtain a complete system response calibration throughout the entire survey flight. The VTEM™ transmitter current waveform is shown diagrammatically in Figure 6. VTEM with the Serial number 17 and 31 had been used for the survey.

The VTEM™ Receiver and transmitter coils were in concentric-coplanar and Z-direction oriented configuration. The receiver system for the project also included a coincident-coaxial X-direction coil to measure the in-line dB/dt and calculate B-Field responses. The Transmitter-receiver loop was towed at a mean distance of 31 metres below the aircraft as shown in Figure 7.

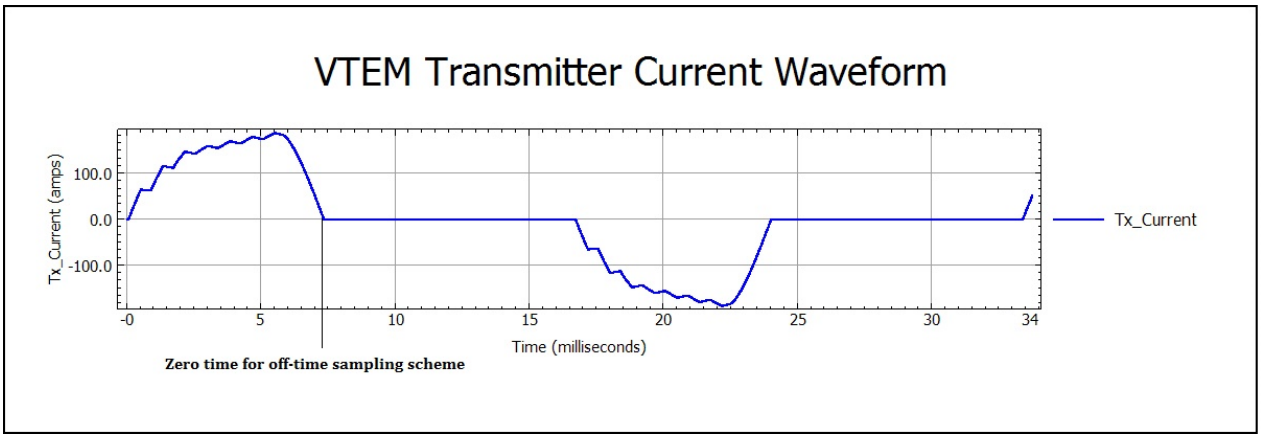

Figure 6: VTEM™ Transmitter Current Waveform

The VTEM™ decay sampling scheme is shown in Table 3 below. Forty-three time measurement gates were used for the final data processing in the range from 0.021 to 8.083 msec. Zero time for the off-time sampling scheme is equal to the current pulse width and is defined as the time near the end of the turn-off ramp where the dI/dt waveform falls to 1/2 of its peak value.

VTEM™ system specifications:

Transmitter	Receiver
• Transmitter loop diameter: 26 m • Number of turns: 4 • Effective Transmitter loop area: 2123.7 m^2 • Transmitter base frequency: 30 Hz • Peak current: 189 A • Pulse width: 7.34 ms • Waveform shape: Bi-polar trapezoid • Peak dipole moment: 401,382 nIA • Actual average Transmitter-receiver loop terrain clearance: 70 metres above the ground	• X Coil diameter: 0.32 m • Number of turns: 245 • Effective coil area: 19.69 m^2 • Z-Coil and Y-coil diameter: 1.2 m • Number of turns: 100 • Effective coil area: 113.04 m^2

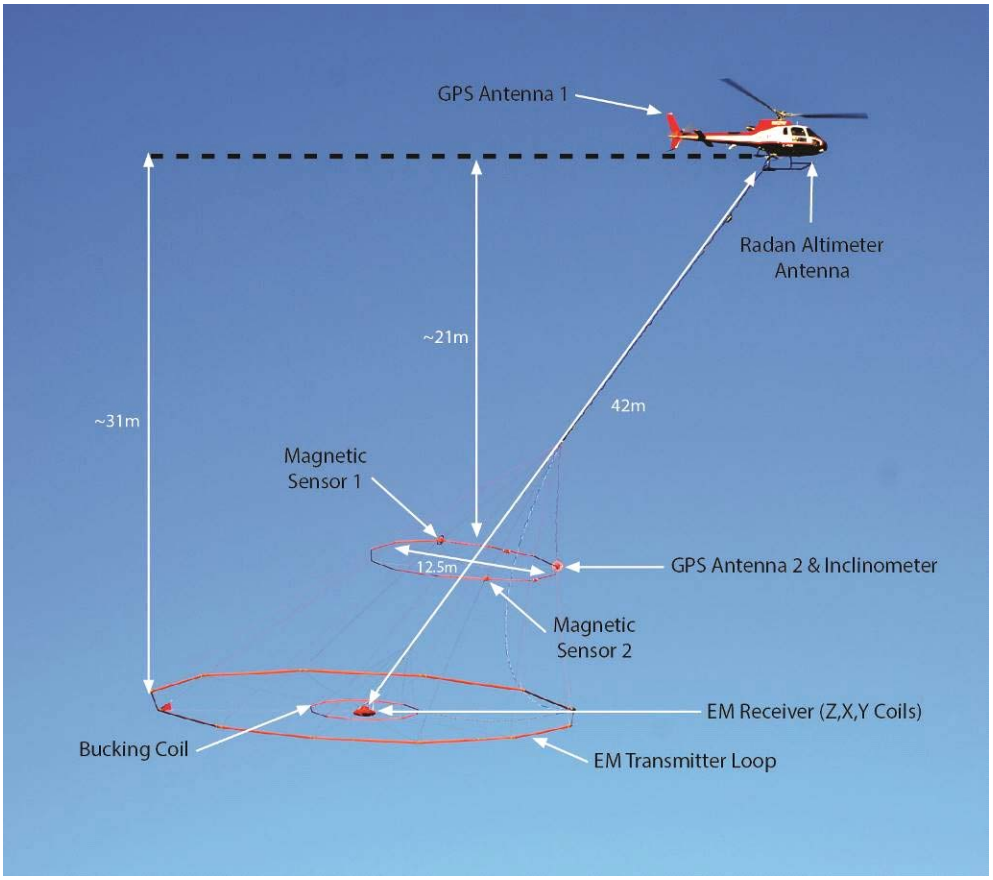

Figure 7: VTEM™Plus System Configuration.

2.4.3 FULL WAVEFORM VTEM™ SENSOR CALIBRATION

The calibration is performed on the complete VTEM™ system installed in and connected to the helicopter, using special calibration equipment.

The procedure takes half-cycle files acquired and calculates a calibration file consisting of a single stacked half-cycle waveform. The purpose of the stacking is to attenuate natural and man-made magnetic signals, leaving only the response to the calibration signal.

2.4.4 HORIZONTAL MAGNETIC GRADIOMETER

The horizontal magnetic gradiometer consists of two Geometrics split-beam field magnetic sensors with a sampling interval of 0.1 seconds. These sensors are mounted 12.5 metres apart on a separate loop, 10 metres above the Transmitter-receiver loop. A GPS antenna and Gyro Inclinometer is installed on the separate loop to accurately record the tilt and position of the magnetic gradiomag bird.

2.4.5 RADAR ALTIMETER

A Terra TRA 3000/TRI 40 radar altimeter was used to record terrain clearance. The antenna was mounted beneath the bubble of the helicopter cockpit (Figure 7).

2.4.6 GPS NAVIGATION SYSTEM

The navigation system used was a Geotech PC104 based navigation system utilizing a NovAtel's WAAS (Wide Area Augmentation System) enabled GPS receiver, Geotech navigate software, a full screen display with controls in front of the pilot to direct the flight and a NovAtel GPS antenna mounted on the helicopter tail (Figure 7). As many as 11 GPS and two WAAS satellites may be monitored at any one time. The positional accuracy or circular error probability (CEP) is 1.8 m, with WAAS active, it is 1.0 m. The co-ordinates of the survey area were set-up prior to the survey and the information was fed into the airborne navigation system. The second GPS antenna is installed on the additional magnetic loop together with Gyro Inclinometer.

2.4.7 DIGITAL ACQUISITION SYSTEM

A Geotech data acquisition system recorded the digital survey data on an internal compact flash card. Data is displayed on an LCD screen as traces to allow the operator to monitor the integrity of the system. The data type and sampling interval as provided in Table 4.

Table 4: Acquisition Sampling Rates

Data Type	Sampling
TDEM	0.1 sec
Magnetometer	0.1 sec
GPS Position	0.2 sec
Radar Altimeter	0.2 sec
Inclinometer	0.1 sec

2.5 BASE STATION

A combined magnetometer/GPS base station was utilized on this project. A Geometrics Caesium vapour magnetometer was used as a magnetic sensor with a sensitivity of 0.001 nT. The base station was recording the magnetic field together with the GPS time at 1 Hz on a base station computer.

The base station magnetometer sensor was installed at the tree line; back of the camp (61°30.0666'N, 130°37.3108'W); away from electric transmission lines and moving ferrous objects such as motor vehicles. The base station data were backed-up to the data processing computer at the end of each survey day.

3. PERSONNEL

The following Geotech Ltd. personnel were involved in the project.

FIELD:

Project Manager:	Darren Tuck (Office)
Data QC:	Nick Venter (Office)
Crew chief:	Jan Dabrowski
Operator:	Jan Dabrowski
	Roger Leblanc

The survey pilot and the mechanical engineer were employed directly by the helicopter operator – Trans North Helicopters

Pilot:	Doug Hladun
	Pierre Forand
Mechanical Engineer:	Clayton Whitney

OFFICE:

Preliminary Data Processing:	Nick Venter
Final Data Processing:	Gaurav Nailwal
Final Data QA/QC:	Geoffrey Plastow
Reporting/Mapping:	Liz Mathew

Data acquisition phase was carried out under the supervision of Andrei Bagrianski, P. Geo, and Chief Operating Officer. Processing phase was carried out under the supervision of Geoffrey Plastow, P. Geo, Data Processing Manager. The customer relations were looked after by David Hitz.

4. DATA PROCESSING AND PRESENTATION

Data compilation and processing were carried out by the application of Geosoft OASIS Montaj and programs proprietary to Geotech Ltd.

4.1 FLIGHT PATH

The flight path, recorded by the acquisition program as WGS 84 latitude/longitude, was converted into the NAD83 Datum, UTM Zone 9 North coordinate system in Oasis Montaj.

The flight path was drawn using linear interpolation between x, y positions from the navigation system. Positions are updated every second and expressed as UTM easting's (x) and UTM northing's (y).

4.2 ELECTROMAGNETIC DATA

The Full Waveform EM specific data processing operations included:

- Half cycle stacking (performed at time of acquisition);
- System response correction;
- Parasitic and drift removal by deconvolution.

A three stage digital filtering process was used to reject major sferic events and to reduce noise levels. Local sferic activity can produce sharp, large amplitude events that cannot be removed by conventional filtering procedures. Smoothing or stacking will reduce their amplitude but leave a broader residual response that can be confused with geological phenomena. To avoid this possibility, a computer algorithm searches out and rejects the major sferic events.

The signal to noise ratio was further improved by the application of a low pass linear digital filter. This filter has zero phase shift which prevents any lag or peak displacement from occurring, and it suppresses only variations with a wavelength less than about 1 second or 15 metres. This filter is a symmetrical 1 sec linear filter.

The results are presented as stacked profiles of EM voltages for the time gates, in linear - logarithmic scale for the B-field Z component and dB/dt responses in the Z and X components. B-field Z component time channel recorded at 2.021 milliseconds after the termination of the impulse is also presented as a colour image. Calculated Time Constant (TAU) with Calculated Vertical Derivative contours is presented in Appendix C and E. Resistivity Depth Image (RDI) is also presented in Appendix F and G.

VTEM has three receiver coil orientations. Z-axis coil is oriented parallel to the transmitter coil axis and both are horizontal to the ground. The X-axis and Y-axis coil is oriented parallel to the ground and along the line-of-flight. This combined three coil configuration provides information on the position, depth, dip and thickness of a conductor. Generalized modeling results of VTEM max data are shown in Appendix D.

In general X-component data produce cross-over type anomalies: from "+ to – "in flight direction of flight for "thin" sub vertical targets and from "- to +" in direction of flight for "thick" targets. Z component data produce double peak type anomalies for "thin" sub vertical targets and single peak for "thick" targets.

The limits and change-over of "thin-thick" depends on dimensions of a TEM system (Appendix D, Figure D-16).

Because of X component polarity is under line-of-flight, convolution Fraser Filter (Figure 8) is applied to X component data to represent axes of conductors in the form of grid map. In this case positive FF anomalies always correspond to "plus-to-minus" X data crossovers independent of the flight direction.

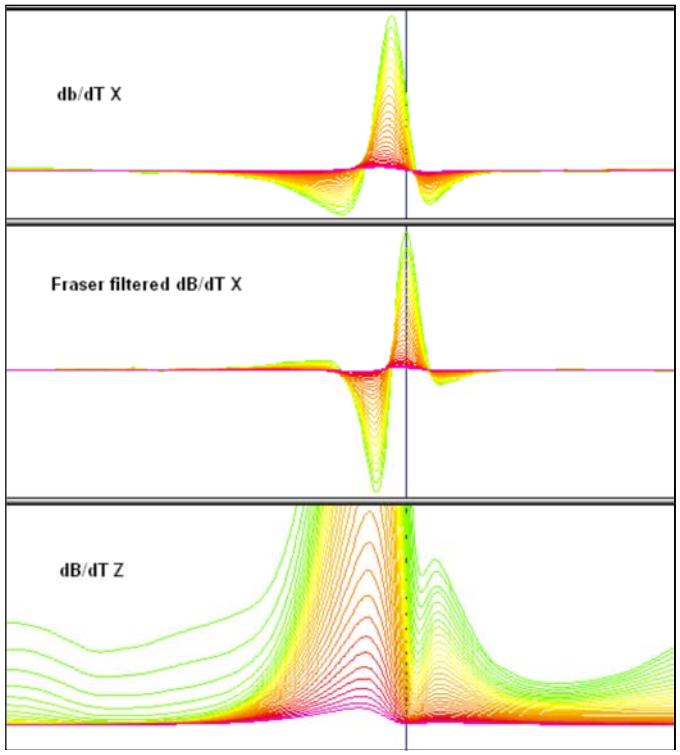

Figure 8: Z, X and Fraser filtered X (FFx) components for "thin" target.

4.3 HORIZONTAL MAGNETIC GRADIOMETER DATA

The horizontal gradients data from the VTEM™Plus are measured by two magnetometers 12.5 m apart on an independent bird mounted10m above the VTEM™ loop. A GPS and a Gyro Inclinometer help to determine the positions and orientations of the magnetometers. The data from the two magnetometers are corrected for position and orientation variations, as well as for the diurnal variations using the base station data.

The position of the centre of the horizontal magnetic gradiometer bird is calculated form the GPS utilizing in-house processing tool in Geosoft. Following that total magnetic intensity is calculated at the center of the bird by calculating the mean values from both sensors. In addition to the total intensity advanced processing is done to calculate the in-line and cross-line (or lateral) horizontal gradient which enhance the understanding of magnetic targets. The in-line (longitudinal) horizontal gradient is calculated from the difference of two consecutive total magnetic field readings divided by the distance along the flight line direction, while the cross-line (lateral) horizontal magnetic gradient is calculated from the difference in the magnetic readings from both magnetic sensors divided by their horizontal separation.

Two advanced magnetic derivative products, the total horizontal derivative (THDR), and tilt angle derivative and are also created. The total horizontal derivative or gradient is defined as:

THDR = sqrt(Hx*Hx+Hy*Hy), where Hx and Hy are cross-line and in-line horizontal gradients.

The tilt angle derivative (TDR) is defined as:

TDR = arctan(Vz/THDR), where THDR is the total horizontal derivative, and Vz is the vertical derivative.

Measured cross-line gradients can help to enhance cross-line linear features during gridding.

5. DELIVERABLES

5.1 SURVEY REPORT

The survey report describes the data acquisition, processing, and final presentation of the survey results. The survey report is provided in two paper copies and digitally in PDF format.

5.2 MAPS

Final maps were produced at scale of 1:20,000 (Kudz Ze Kayah and Pelly) and 1:10,000 (Wolf) for best representation of the survey size and line spacing. The coordinate/projection system used was NAD83 Datum, UTM Zone 9 North. All maps show the flight path trace and topographic data; latitude and longitude are also noted on maps.

The preliminary and final results of the survey are presented as EM profiles, a late-time gate gridded EM channel, and a colour magnetic TMI contour map.

- Maps at 1:20,000 (Kudz Ze Kayah and Pelly) and 1:10,000 (Wolf) in Geosoft MAP format, as follows:

GL160037_*scale*k _*bb*_dBdtz: dB/dt profiles Z Component, Time Gates 0.220 – 7.036 ms in linear – logarithmic scale.
GL160037_ *scale*k _*bb*_Bfieldz: B-field profiles Z Component, Time Gates 0.220 – 7.036 ms in linear – logarithmic scale.
GL160037_ *scale*k _*bb*_BFz36: B-field Z Component Channel 36, Time Gate 2.021 ms colour image.
GL160037_ *scale*k _*bb*_SFxFF20: dBdt X Component Fraser Filtered Channel 20, Time Gate 0.220 ms colour image.
GL160037_ *scale*k _*bb*_TMI: Total magnetic intensity (TMI) colour image and contours.
GL160037_ *scale*k _*bb* _TauSF: dB/dt Calculated Time Constant (Tau) with Calculated Vertical Derivative contours
GL160037_ *scale*k _*bb*_TotHGrad: Magnetic Total Horizontal Gradient colour image.
GL160037_ *scale*k _*b*b_TiltDrv: Magnetic Tilt-Angle Derivative colour image.

where *scale* represents the scale of the map
bb represents the block name

- Maps are also presented in PDF format.
- The topographic data base was derived from 1:50,000 NRC (Natural Resources Canada) NTDB data, www.geogratis.ca.
- A Google Earth file *GL16*0037_*FP.kml* showing the flight path of the block is included. Free versions of Google Earth software from: http://earth.google.com/download-earth.html

5.3 DIGITAL DATA

Two copies of the data and maps on DVD were prepared to accompany the report. Each DVD contains a digital file of the line data in GDB Geosoft Montaj format as well as the maps in Geosoft Montaj Map and PDF format.

- DVD structure.

Data contains databases, grids and maps, as described below.
Report contains a copy of the report and appendices in PDF format.

Databases in Geosoft GDB format, containing the channels listed in Table 5.

Table 5: Geosoft GDB Data Format

Channel name	Units	Description
X:	metres	UTM Easting NAD83 Zone 9 North
Y:	metres	UTM Northing NAD83 Zone 9 North

6. CONCLUSIONS AND RECOMMENDATIONS

A helicopter-borne versatile time domain electromagnetic (VTEMplus) and horizontal magnetic gradiometer geophysical survey has been completed over Kudz Ze Kayah, Pelly and Wolf situated near Wolverine Lake, Yukon.

The total area coverage is 241 km^2. Total survey line coverage 1589 line kilometres. The principal sensors included a Time Domain EM system and a horizontal magnetic gradiometer using two caesium magnetometers. Results have been presented as stacked profiles, and contour colour images at a scale of 1:20,000 (Kudz Ze Kayah and Pelly) and 1:10,000 (Wolf). A formal Interpretation has not been included or requested.

Based on the geophysical results obtained, a number of TEM anomalous zones are identified across the blocks. All of these anomalies are considered to be induced by low to moderate conductive targets. They can be seen overlapping the TAU decay parameter image presented with the calculated vertical magnetic gradient (CVG) contours in the Appendix C.

The main conductive zones in the Kudz Ze Kayah blocks are oriented NE-SW in the western part to NW-SE in the centre part having strong association with the magnetic anomalies. The conductive zone in the southern part of L3252-L3370 oriented NE-SW exhibits AIIP phenomenon and follows the magnetic trend. Most of the conductors can be approximated as “thick” subvertical plates and some as “thin” plates with the inherent double-peak response. Some of the zones being on the edge of the survey boundary are not well defined. Detailed resistivity depth sections were created for all the survey lines. According to the detailed resistivity depth imaging, the top of the EM response sources varies in depth from about 50-80m deep).

The main conductive zones in the Pelly and Wolf blocks are oriented NE-SW and are associated with the magnetic anomalies. Most of the conductors can be approximated as “thick” subvertical plates and some as “thin” plates with the inherent double-peak response. Some of the zones being on the edge of the survey boundary are not well defined. Detailed resistivity depth sections were created for all the survey lines. According to the detailed resistivity depth imaging, the top of the EM response sources varies in depth from about 50-80m deep).

If the conductors correspond to an exploration model, it is recommended picking anomalies with conductance grading and center localization of the targets, detail resistivity depth imaging and Maxwell plate modelling prior to ground follow up and drill testing. Since the EM conductors have close associations with the magnetic anomalies, 3D inversions and detailed structural interpretation for magnetic data are also suggested.

APPENDIX D

GENERALIZED MODELING RESULTS OF THE VTEM SYSTEM
INTRODUCTION

The VTEM system is based on a concentric or central loop design, whereby, the receiver is positioned at the centre of a transmitter loop that produces a primary field. The wave form is a bi-polar, modified square wave with a turn-on and turn-off at each end.

During turn-on and turn-off, a time varying field is produced (dB/dt) and an electro-motive force (emf) is created as a finite impulse response. A current ring around the transmitter loop moves outward and downward as time progresses. When conductive rocks and mineralization are encountered, a secondary field is created by mutual induction and measured by the receiver at the centre of the transmitter loop.

Efficient modeling of the results can be carried out on regularly shaped geometries, thus yielding close approximations to the parameters of the measured targets. The following is a description of a series of common models made for the purpose of promoting a general understanding of the measured results.

A set of models has been produced for the Geotech VTEM® system dB/dT Z and X components (see models D1 to D15). The Maxwell ™ modeling program (EMIT Technology Pty. Ltd. Midland, WA, AU) used to generate the following responses assumes a resistive half-space. The reader is encouraged to review these models, so as to get a general understanding of the responses as they apply to survey results. While these models do not begin to cover all possibilities, they give a general perspective on the simple and most commonly encountered anomalies.

As the plate dips and departs from the vertical position, the peaks become asymmetrical.

As the dip increases, the aspect ratio (Min/Max) decreases and this aspect ratio can be used as an empirical guide to dip angles from near 90º to about 30º. The method is not sensitive enough where dips are less than about 30º.

EM TIME CONSTANT (TAU) ANALYSIS

Estimation of time constant parameter[1] in transient electromagnetic method is one of the steps toward the extraction of the information about conductances beneath the surface from TEM measurements.

The most reliable method to discriminate or rank conductors from overburden, background or one and other is by calculating the EM field decay time constant (TAU parameter), which directly depends on conductance despite their depth and accordingly amplitude of the response.

THEORY

As established in electromagnetic theory, the magnitude of the electro-motive force (emf) induced is proportional to the time rate of change of primary magnetic field at the conductor. This emf causes eddy currents to flow in the conductor with a characteristic transient decay, whose Time Constant (Tau) is a function of the conductance of the survey target or conductivity and geometry (including dimensions) of the target. The decaying currents generate a proportional secondary magnetic field, the time rate of change of which is measured by the receiver coil as induced voltage during the Off time.

The receiver coil output voltage ($\mathbf{e_0}$) is proportional to the time rate of change of the secondary magnetic field and has the form,

$$e_0 \, \alpha \, (1 / \tau) \, e^{-(t/\tau)}$$

Where,
τ = L/R is the characteristic time constant of the target (TAU)
R = resistance
L = inductance

From the expression, conductive targets that have small value of resistance and hence large value of τ yield signals with small initial amplitude that decays relatively slowly with progress of time. Conversely, signals from poorly conducting targets that have large resistance value and smallτ, have high initial amplitude but decay rapidly with time[1] (Fig. E1).

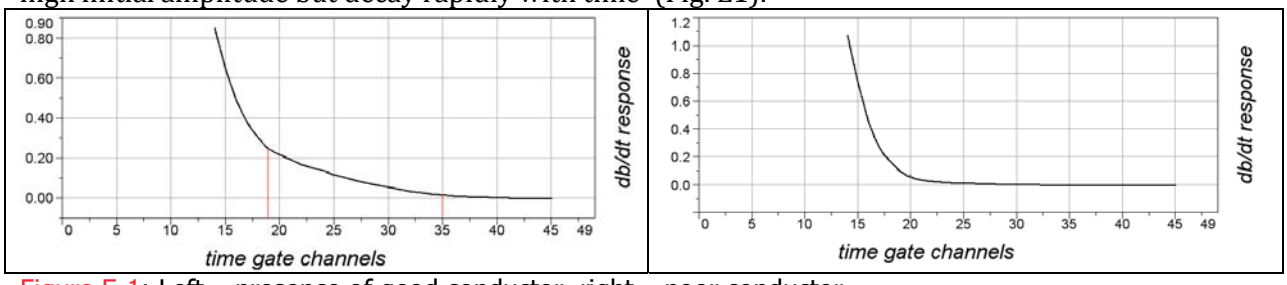

Figure E-1: Left – presence of good conductor, right – poor conductor.

[1] McNeill, JD, 1980, "Applications of Transient Electromagnetic Techniques", Technical Note TN-7 page 5, Geonics Limited, Mississauga, Ontario.

EM Time Constant (Tau) Calculation

The EM Time-Constant (TAU) is a general measure of the speed of decay of the electromagnetic response and indicates the presence of eddy currents in conductive sources as well as reflecting the "conductance quality" of a source. Although TAU can be calculated using either the measured dB/dt decay or the calculated B-field decay, dB/dt is commonly preferred due to better stability (S/N) relating to signal noise. Generally, TAU calculated on base of early time response reflects both near surface overburden and poor conductors whereas, in the late ranges of time, deep and more conductive sources, respectively. For example early time TAU distribution in an area that indicates conductive overburden is shown in Figure 2.

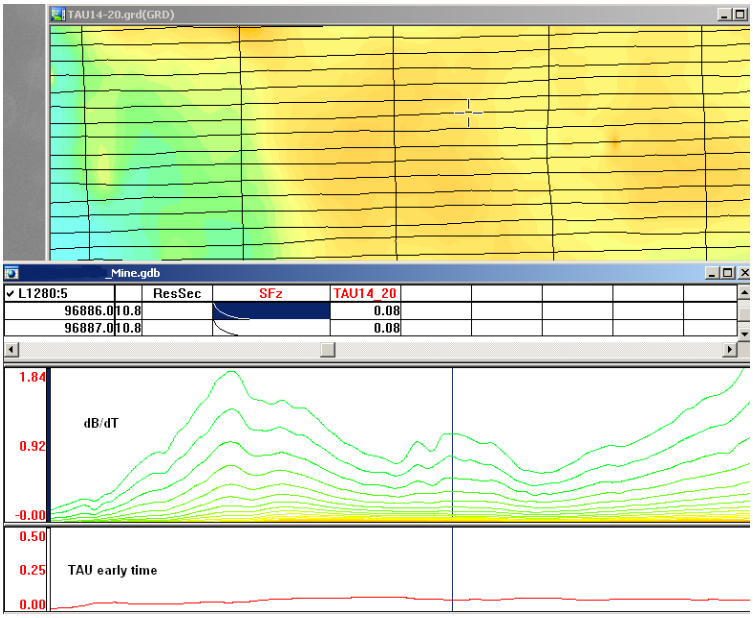

Figure E-2: Map of early time TAU. Area with overburden conductive layer and local sources.

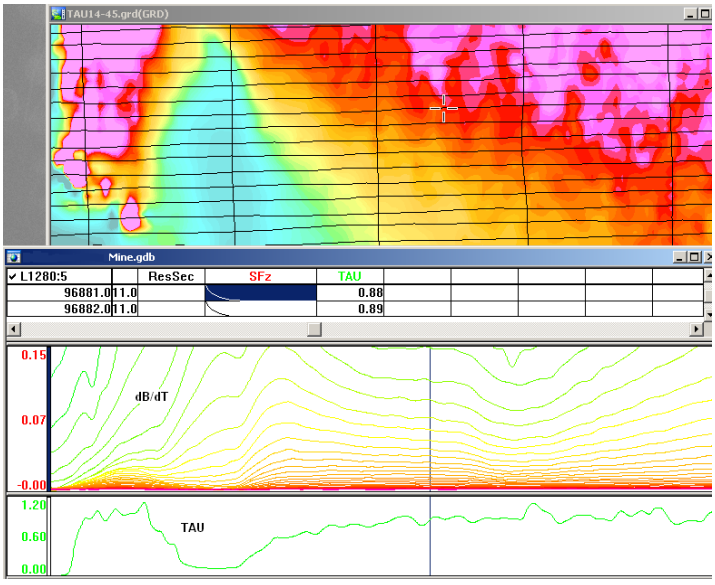

Figure E-3: Map of full time range TAU with EM anomaly due to deep highly conductive target.

There are many advantages of TAU maps:

- TAU depends only on one parameter (conductance) in contrast to response magnitude;
- TAU is integral parameter, which covers time range and all conductive zones and targets are displayed independently of their depth and conductivity on a single map.
- Very good differential resolution in complex conductive places with many sources with different conductivity.
- Signs of the presence of good conductive targets are amplified and emphasized independently of their depth and level of response accordingly.

In the example shown in Figure 4 and 5, three local targets are defined, each of them with a different depth of burial, as indicated on the resistivity depth image (RDI). All are very good conductors but the deeper target (number 2) has a relatively weak dB/dt signal yet also features the strongest total TAU (Figure 4). This example highlights the benefit of TAU analysis in terms of an additional target discrimination tool.

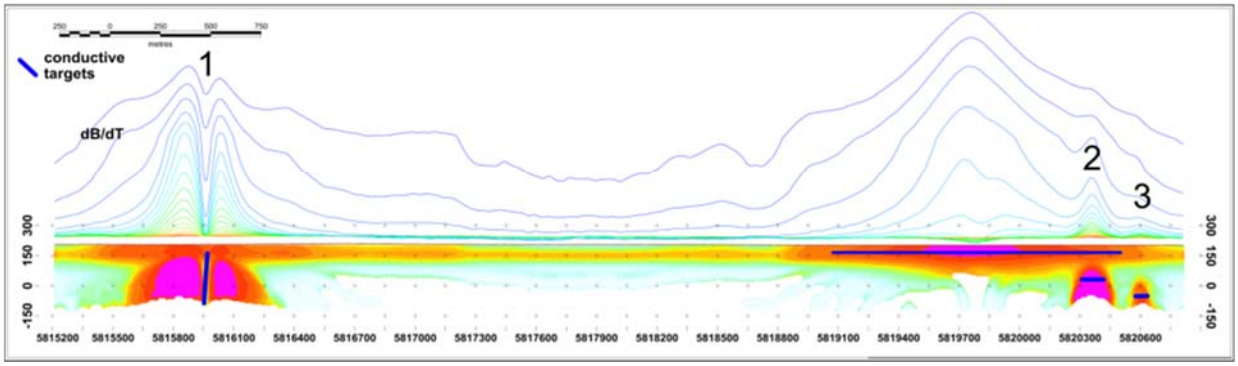

Figure E-4: dB/dt profile and RDI with different depths of targets.

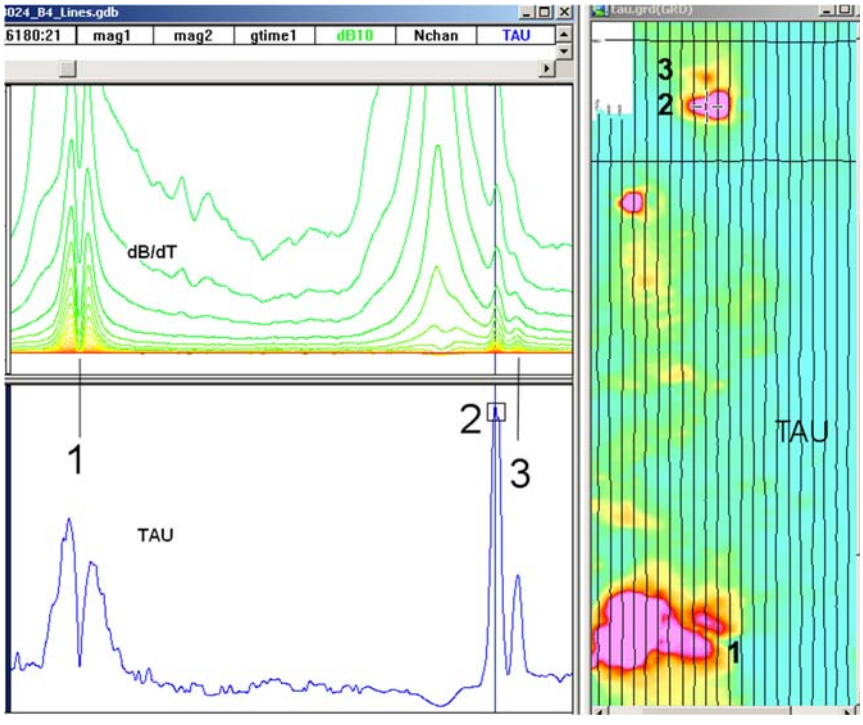

Figure E-5: Map of total TAU and dB/dt profile.

The EM Time Constants for dB/dt and B-field were calculated using the "sliding Tau" in-house program developed at Geotech2. The principle of the calculation is based on using of time window (4 time channels) which is sliding along the curve decay and looking for latest time channels which have a response above the level of noise and decay. The EM decays are obtained from all available decay channels, starting at the latest channel. Time constants are taken from a least square fit of a straight-line (log/linear space) over the last 4 gates above a pre-set signal threshold level (Figure F6). Threshold settings are pointed in the "label" property of TAU database channels. The sliding Tau method determines that, as the amplitudes increase, the time-constant is taken at progressively later times in the EM decay. Conversely, as the amplitudes decrease, Tau is taken at progressively earlier times in the decay. If the maximum signal amplitude falls below the threshold, or becomes negative for any of the 4 time gates, then Tau is not calculated and is assigned a value of "dummy" by default.

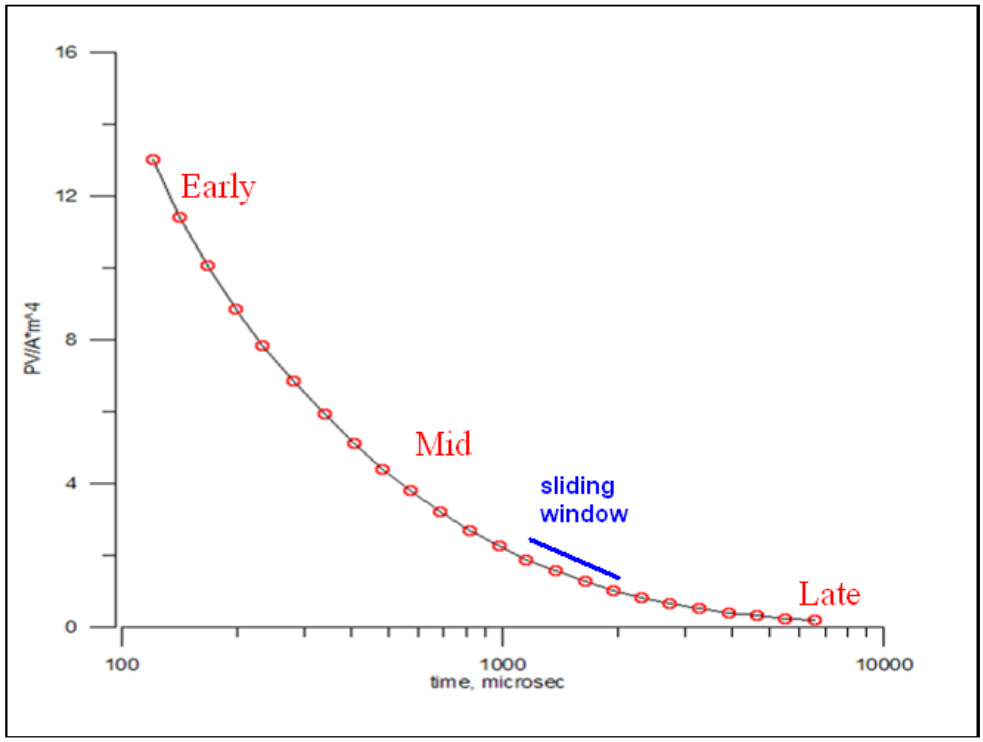

Figure E-6: Typical dB/dt decays of Vtem data

APPENDIX F

TEM RESISTIVITY DEPTH IMAGING (RDI)

Resistivity depth imaging (RDI) is technique used to rapidly convert EM profile decay data into an equivalent resistivity versus depth cross-section, by deconvolving the measured TEM data.
The used RDI algorithm of Resistivity-Depth transformation is based on scheme of the apparent resistivity transform of Maxwell A.Meju (1998)[1] and TEM response from conductive half-space. The program is developed by Alexander Prikhodko and depth calibrated based on forward plate modeling for VTEM system configuration (Fig. 1-10).

RDIs provide reasonable indications of conductor relative depth and vertical extent, as well as accurate 1D layered-earth apparent conductivity/resistivity structure across VTEM flight lines. Approximate depth of investigation of a TEM system, image of secondary field distribution in half space, effective resistivity, initial geometry and position of conductive targets is the information obtained on base of the RDIs.

Maxwell forward modeling with RDI sections from the synthetic responses (VTEM system).

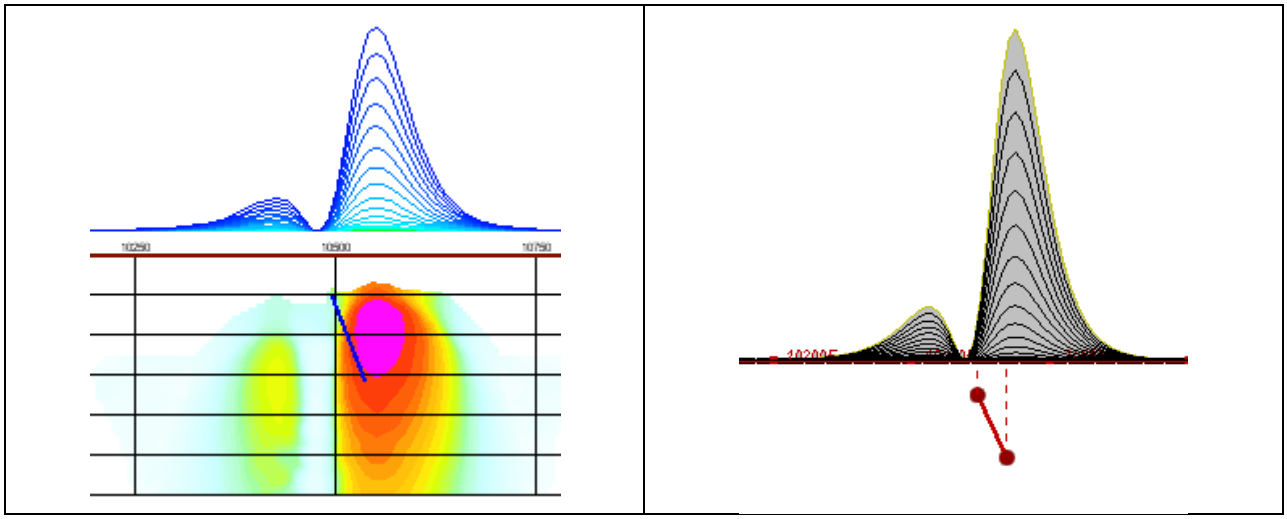

Figure F-1: Maxwell plate model and RDI from the calculated response for conductive "thin" plate (depth 50 m, dip 65 degree, depth extend 100 m).

[1] Maxwell A.Meju, 1998, Short Note: A simple method of transient electromagnetic data analysis, Geophysics, **63**, 405–410.

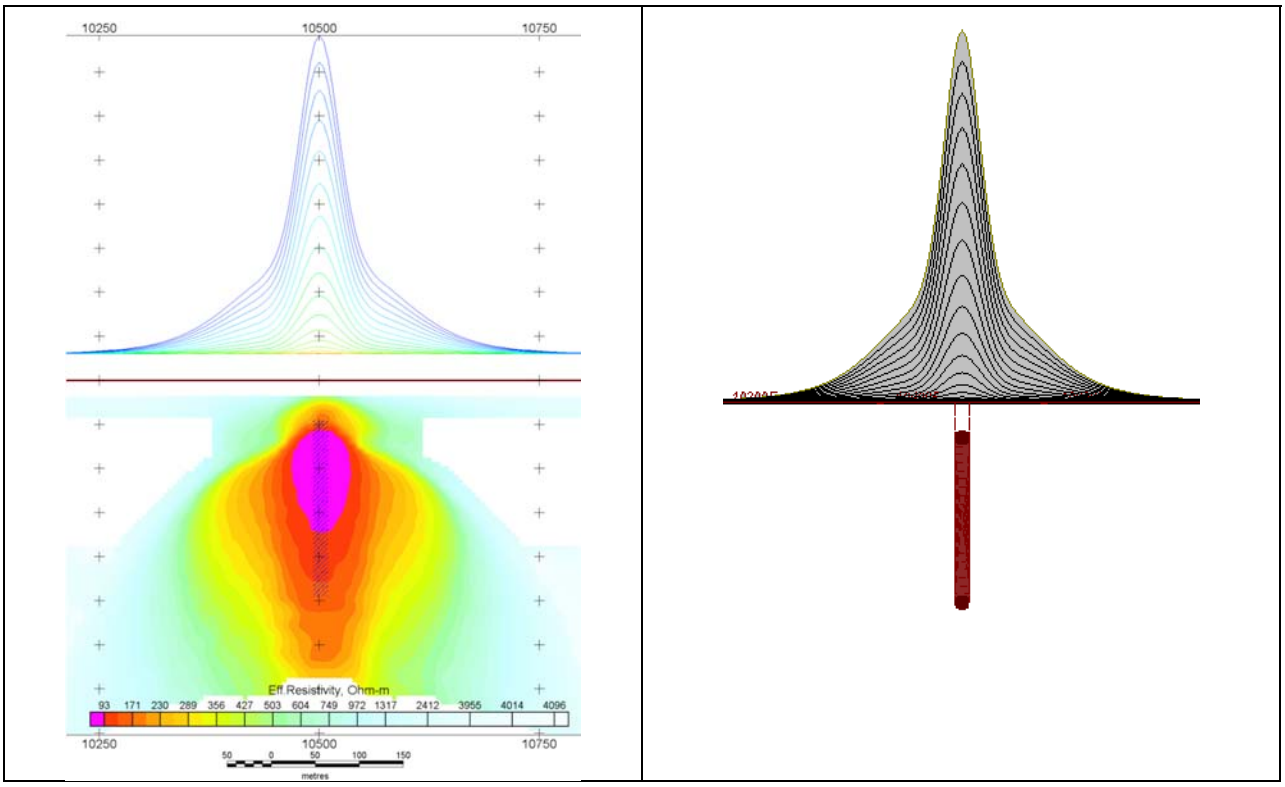

Figure F-2: Maxwell plate model and RDI from the calculated response for "thick" plate 18 m thickness, depth 50 m, depth extend 200 m).

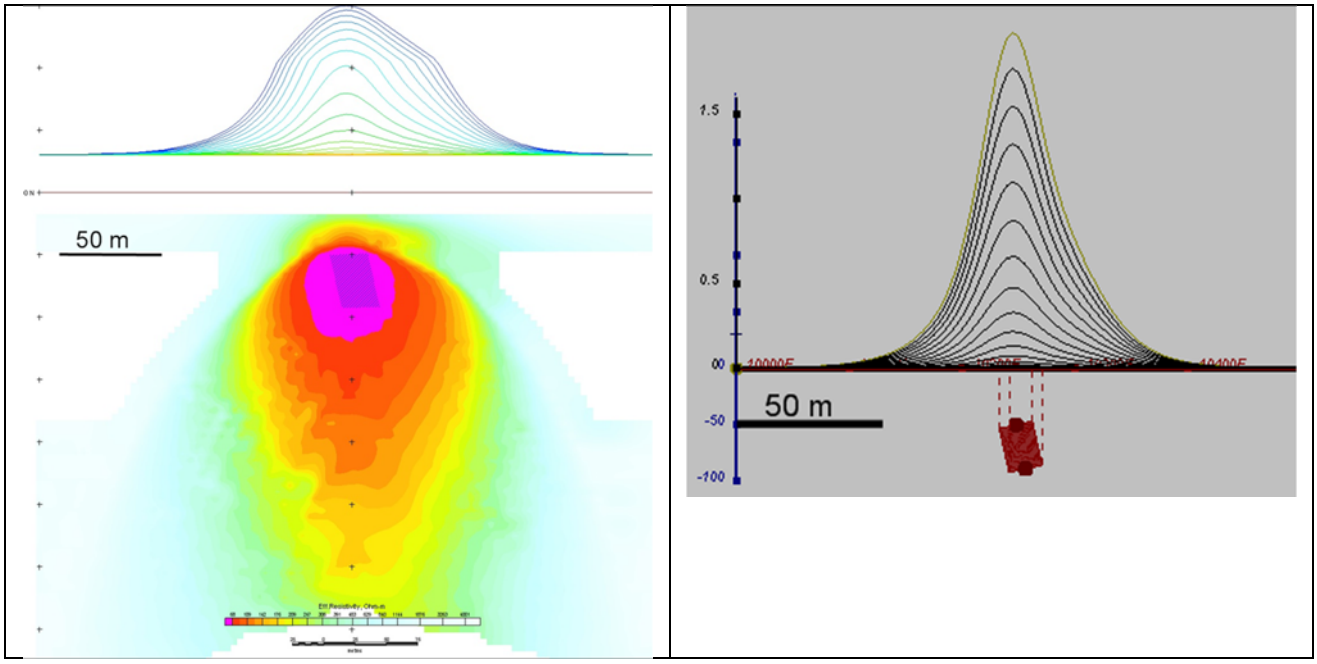

Figure F-3: Maxwell plate model and RDI from the calculated response for bulk ("thick") 100 m length, 40 m depth extend, 30 m thickness

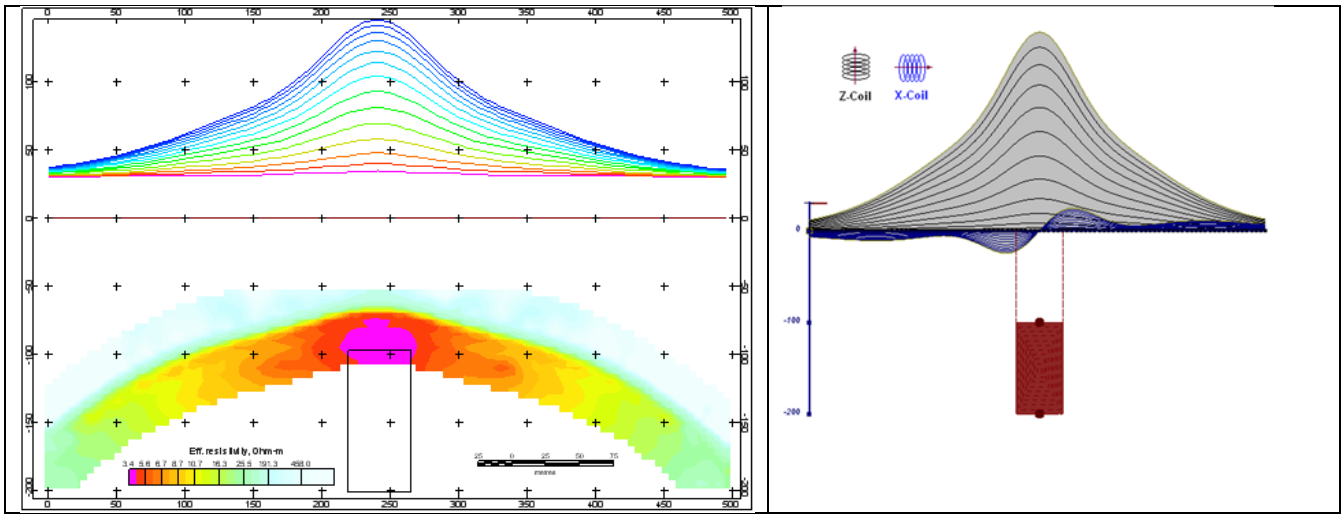

Figure F-4: Maxwell plate model and RDI from the calculated response for "thick" vertical target (depth 100 m, depth extend 100 m). 19-44 chan.

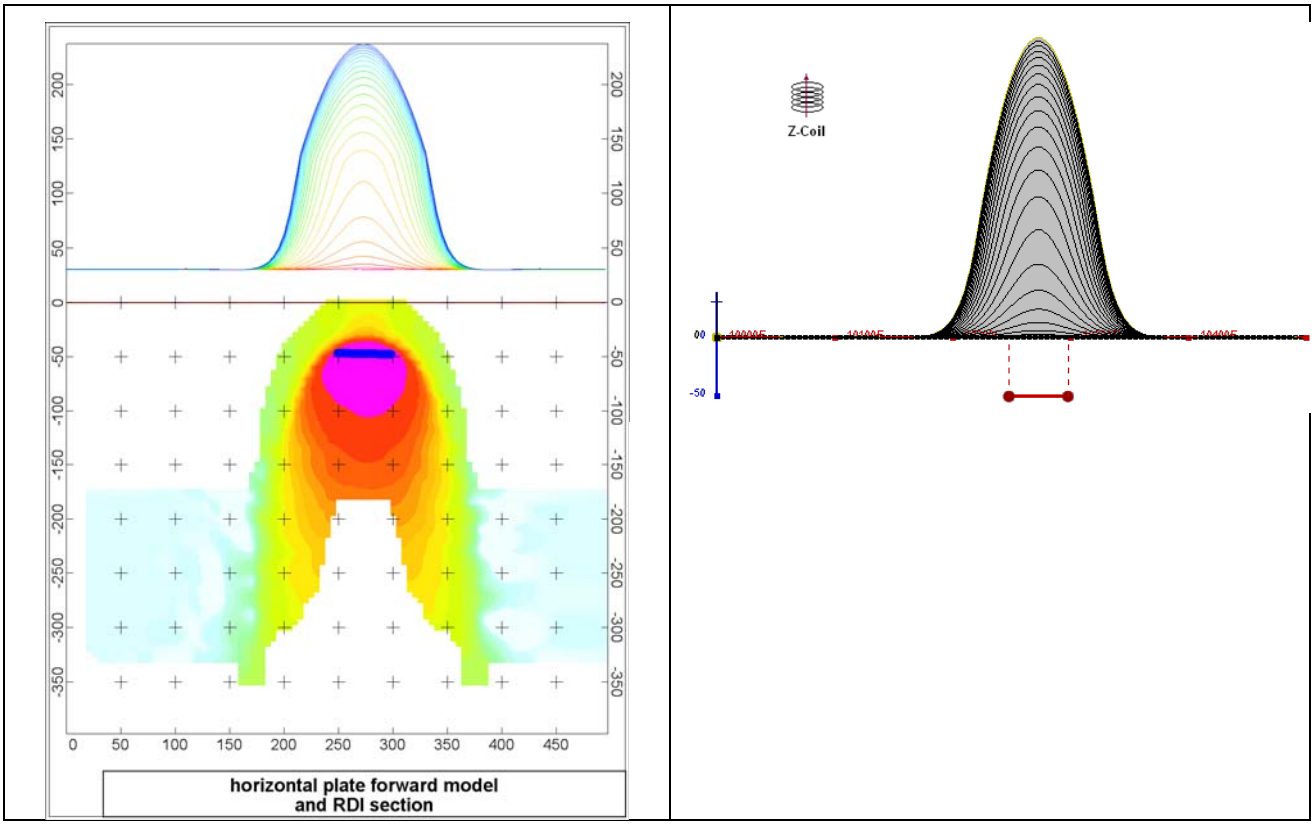

Figure F-5: Maxwell plate model and RDI from the calculated response for horizontal thin plate (depth 50 m, dim 50x100 m). 15-44 chan.

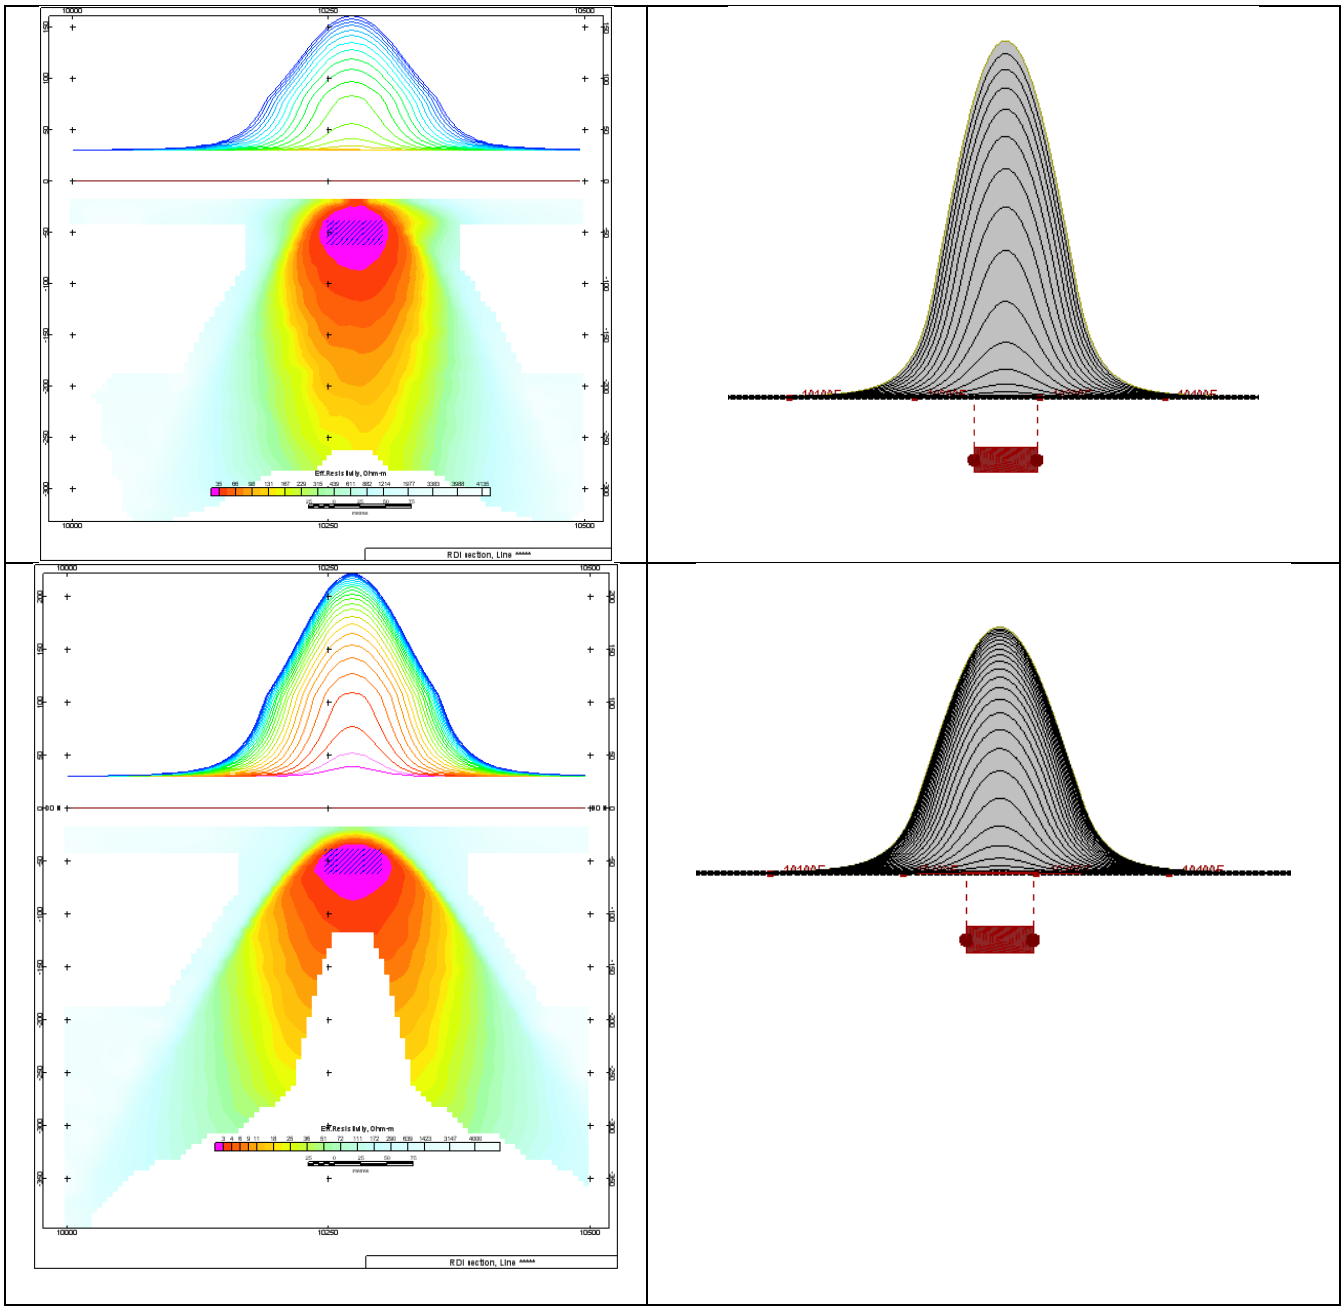

Figure F-6: Maxwell plate model and RDI from the calculated response for horizontal thick (20m) plate – less conductive (on the top), more conductive (below).

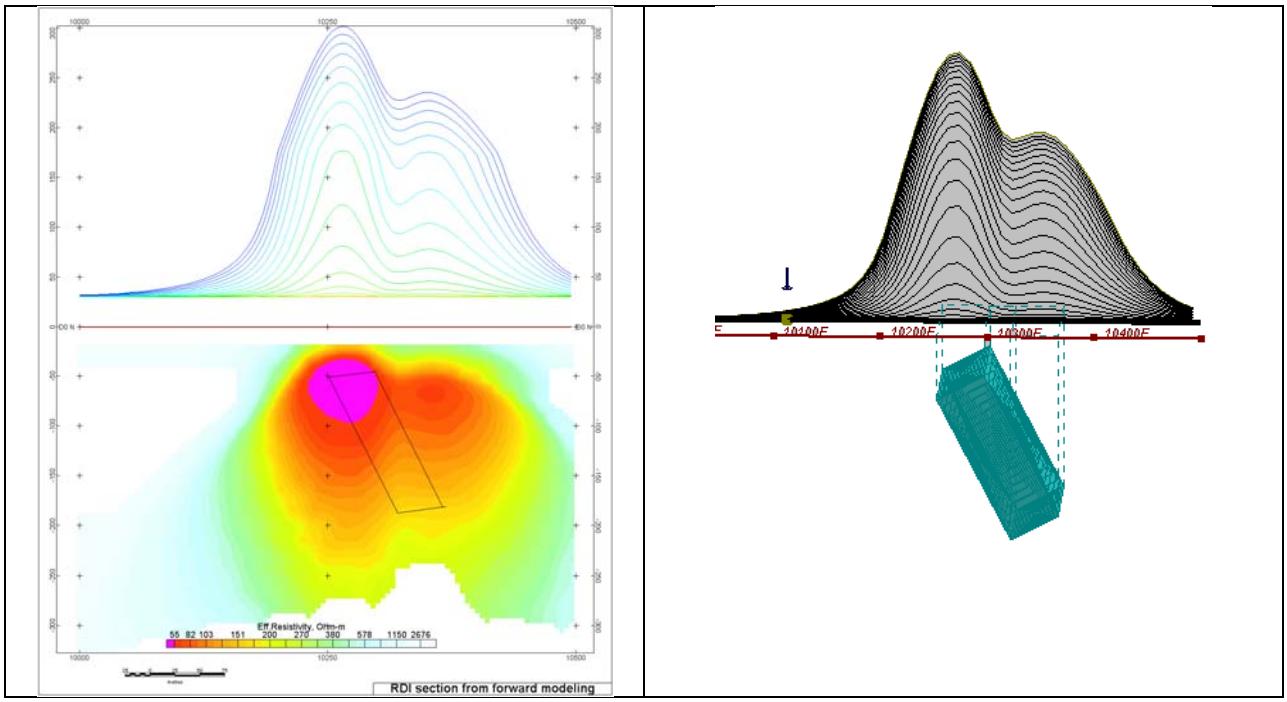

Figure F-7: Maxwell plate model and RDI from the calculated response for inclined thick (50m) plate. Depth extends 150 m, depth to the target 50 m.

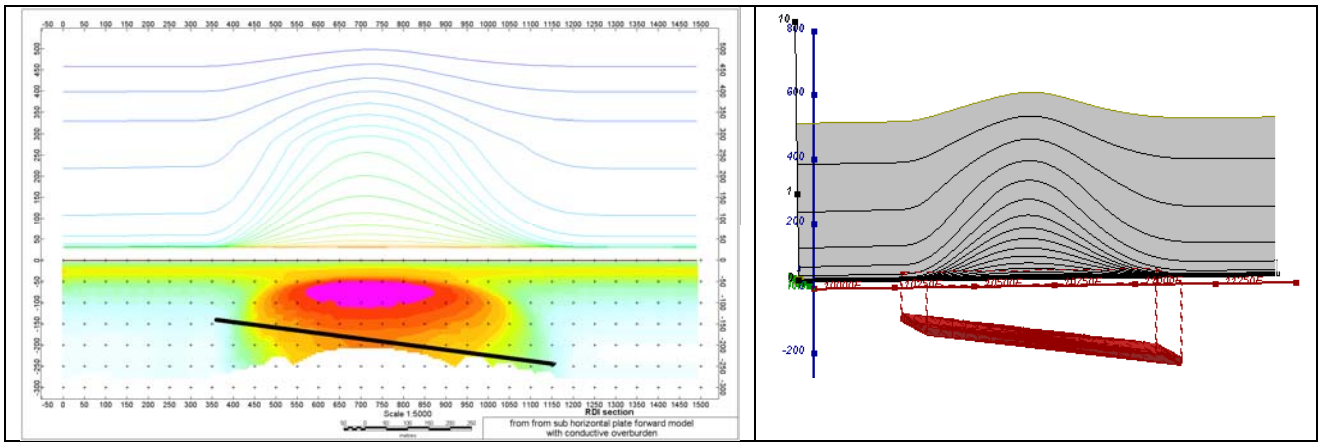

Figure F-8: Maxwell plate model and RDI from the calculated response for the long, wide and deep subhorizontal plate (depth 140 m, dim 25x500x800 m) with conductive overburden.

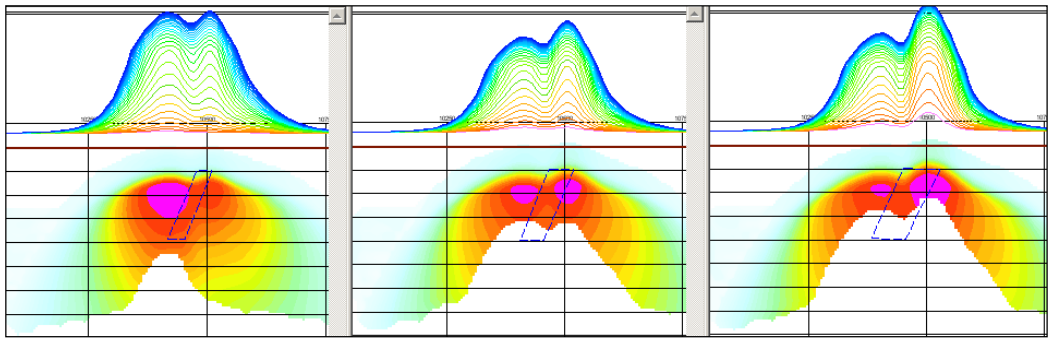

Figure F-9: Maxwell plate models and RDIs from the calculated response for "thick" dipping plates (35, 50, 75 m thickness), depth 50 m, conductivity 2.5 S/m.

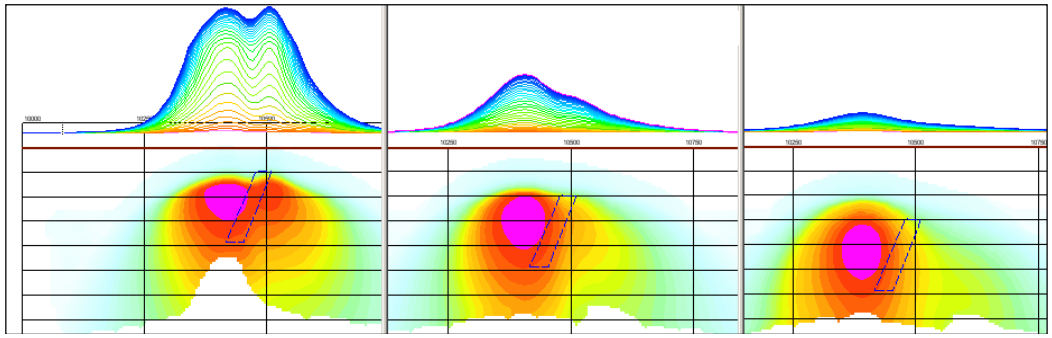

Figure F-10: Maxwell plate models and RDIs from the calculated response for "thick" (35 m thickness) dipping plate on different depth (50, 100, 150 m), conductivity 2.5 S/m.

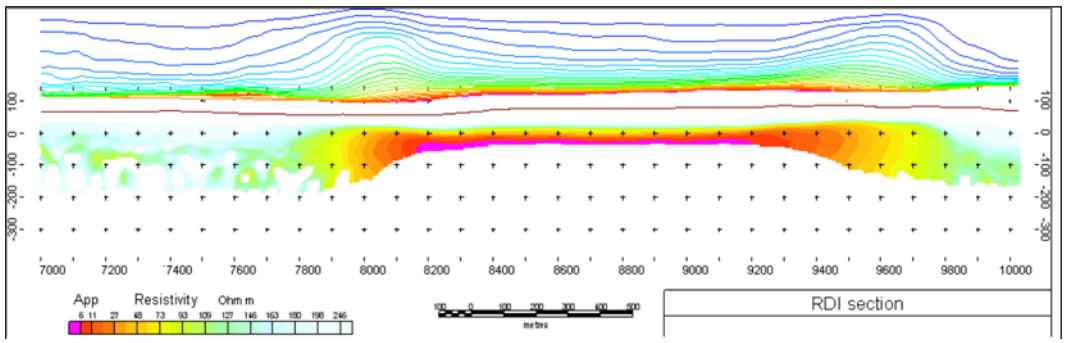

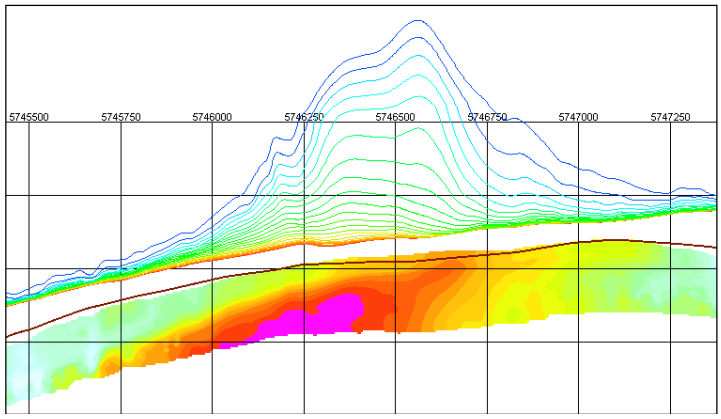

Figure F-11: RDI section for the real horizontal and slightly dipping conductive layers

TABLE 2: CHANNEL TIMES IN MILLISECONDS 5

1 SUMMARY

This report describes the borehole electromagnetic survey (BHEM) conducted for BMC Minerals Ltd. on the Kudz Ze Kayah property, Yukon to assist in locating VMS ore deposits in the near proximity of select diamond drill holes.

The project consisted of 11 BHEM surveys, using 4 transmitter loops on 11 individual drill holes. The majority of drill holes were concentrated in one area allowing them to be surveyed using the Sebesi loop that was set up on the first day of the project. Surveys on holes K16-406, K16-409 and K16-415 each required a new transmitter loop to be built for single-survey use. Most of the drill holes were surveyed through the drill string as the diamond drill crew pulled rods to ensure that the hole did not collapse before the survey could be completed. The crew was prepared for open-hole surveying using a hand-winch but used it only once, on hole K16-369.

Aurora Geosciences completed the work in 5 separate deployments: June 28- July 7, July 29 - August 12, September 2-5, September 16-18 and September26-28. Transportation to the site from Whitehorse was by truck or, when timing allowed, on board scheduled chartered flights. The crew stayed on site in accommodations provided by BMC. The survey drill holes and loops were accessed by truck, all-terrain vehicle or helicopter depending on the proximity of the loops and the survey holes to the access road. The transmitter loops were tested and repaired as required prior to each hole being surveyed. A crew log describing daily operations and production is included with this report.

2 CREW AND EQUIPMENT

Typical surveys were conducted with one Aurora Geosciences technician with help from the drill crew on site. The first deployment had three people on site, including a consultant from the BHEM instrument (Volterra) supplier, allowing multiple people to familiarize themselves with the equipment.

Additional support was provided periodically by BMC and Equity Exploration staff to help set-up, maintain and tear down the transmitter loops.

The following personnel conducted the survey:

Dave Hildes	Senior Geophysicist	June 28- July 5, 2016
Shawn Scott	Geophysical Technician	June 28 – September 28, 2016
Ross Polutnik	Volterra Consultant	June 28- July 5, 2016

Wire intended for use in transmitter loops was shipped to site via Small's Expediting before the project began, all remaining instruments and equipment were brought in by flatbed truck with the first crew rotation. All Volterra related equipment was packed and returned to Whitehorse between rotations in order to qualify for standby rates as per Aurora Geoscience's agreement with the instrument supplier. All other gear was left on-site between rotations.

The crew was equipped with the following instruments and equipment

Volterra BHEM:	1	-	Borehole dabtube s/n 8063 & 8064 (June and July), 8061&8062 (August and September)
	1	-	Borehole magnetometer sensor (s/n 006)
	1	-	Borehole b-field coil sensor (s/n 004)
	2	-	Borehole battery pack (s/n 004 & 006)
	10	-	Extension rods
	2	-	Tablets with Volterra Monitor and EM Timer software (s/n 007 & 029)
	1	-	Asus Laptop with Volterra CSPROC software
	1	-	Zonge coil
	1	-	Volterra transmitter assembly
	3	-	Dabtubes (s/n 8033, 8049, 8057)
	1	-	Toroid current monitor
	1	-	Downhole winch and cable
	1	-	Downhole cable counter
	2	-	Volterra battery chargers
Other Equipment:	1	-	Flatbed truck (depending on rotation)
	1	-	Laptop with Geosoft
	2	-	Honda 2Kw Generators
	1	-	20L gas can
	12	-	Large spools of 10 – 14 gauge wire
	2	-	Backpack wire reel
	1	-	Iridium Satellite Phone
	3	-	Bear spray and bear bangers
	2	-	Handheld Garmin GPS
	1	-	Geonics ProTem Transmitter (back-up)
	1	-	AGL standard Office Box

3 SURVEY LOCATION

The drill holes and BHEM parameters are described in Table 1. Figure 1 is a map showing the drill holes and loop locations. The transmitter loops were located so that the surveyed drill holes were inside the loop and positioned to have good coupling with expected conductor geometry. All loops were slightly modified on the ground to account for waterways, wetlands and other obstacles. All loop modifications were tracked by the operator as they were laid out. Coordinates in this report are in the NAD 83 datum, UTM Zone 9N projection, elevations are height above ellipsoid.

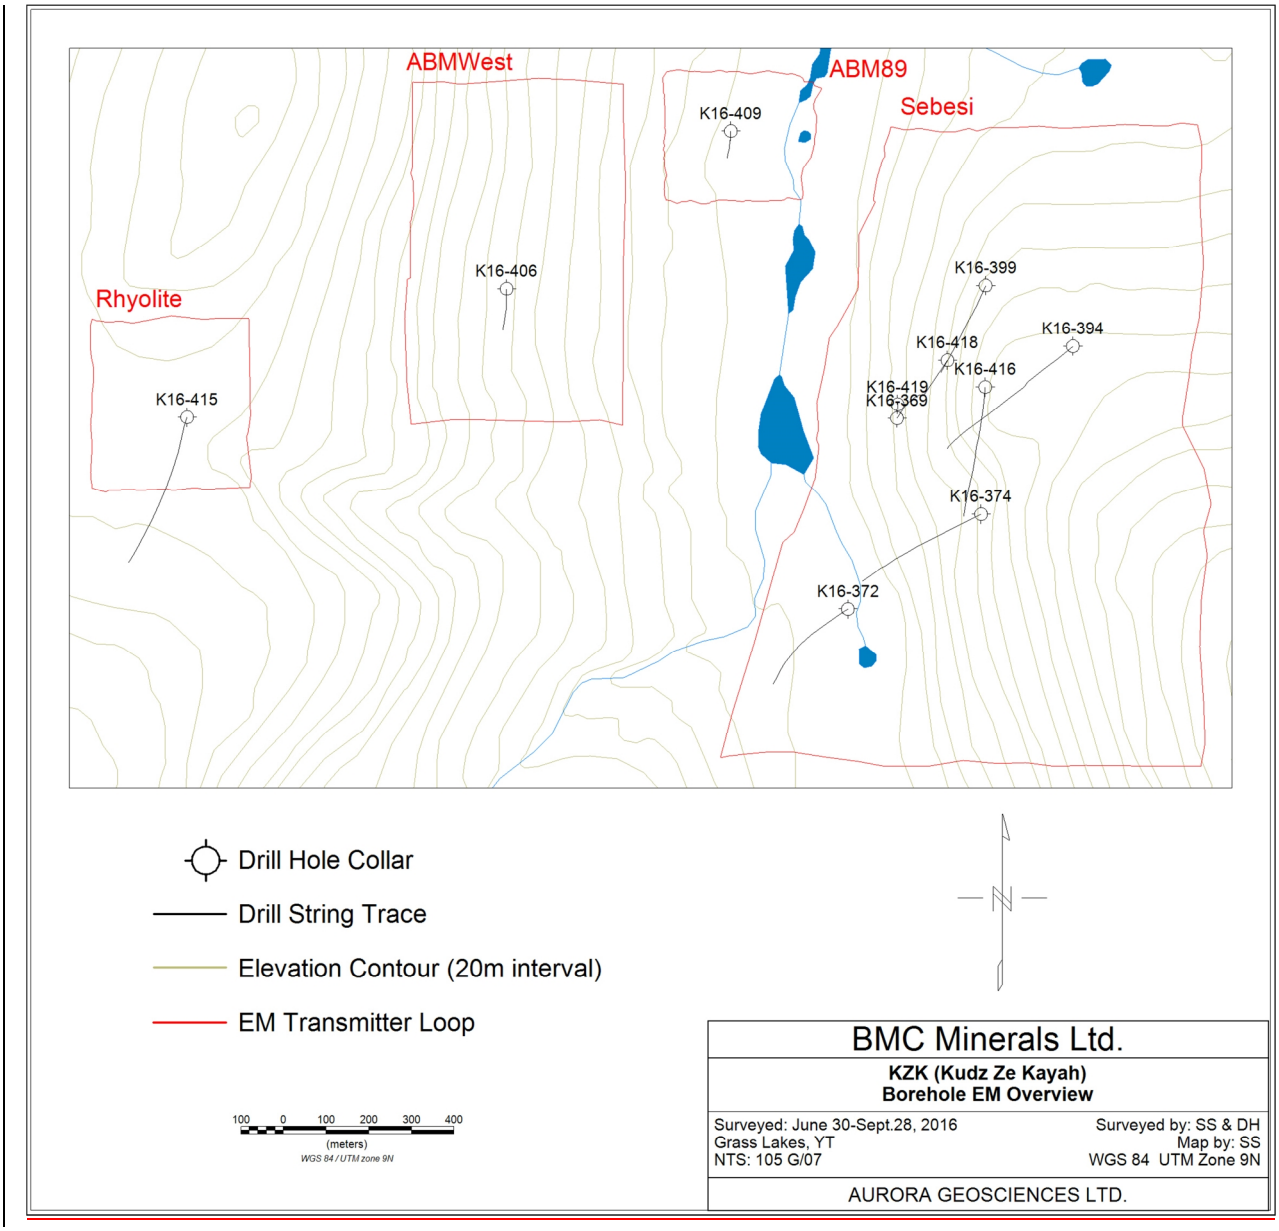

Figure 1: Drill hole and loop locations.

Table 1: Summary of surveys performed.

DDH-ID	UTM Z9N	Az.	Dip	Depth	Readings	Loop used	Date surveyed
K16-369	415239, 6815212	31˚	-72˚	450 m	57	Sebesi	June 30, 2016
K16-372	415140, 6814775	240˚	-60˚	600 m	75	Sebesi	July 2, 2016

K16-374	415540, 6814995	245˚	-60˚	800 m	73	Sebesi	July 6, 2016
K16-406	414325, 6815522	180˚	-70˚	300 m	43	ABMWest	July 29, 2016
K16-399	415450, 6815529	205˚	-76˚	800 m	88	Sebesi	August 2, 2016
K16-409	414851, 6815891	180˚	-80˚	300 m	47	ABM89	August 6, 2016
K16-394	415655, 6815385	233˚	-65˚	860 m	80	Sebesi	August 11, 2016
K16-415	413579, 6815228	195˚	-60˚	855 m	77	Rhyolite	September 4, 2016
K16-416	415448, 6815293	184˚	-68˚	835 m	72	Sebesi	September 17, 2016
K16-418	415362, 6815355	214˚	-77˚	476 m	52	Sebesi	September 29, 2016
K16-419	415242, 6815246	6˚	-87˚	510 m	51	Sebesi	September 28, 2016

4 SURVEY SPECIFICATIONS

Station depth was determined by the length of the drill string, or when necessary by the winch counter. Depths were adjusted to reflect a depth of 0 m when the middle of the Volterra tool was at the top of the drill hole collar. Coordinates of the drill hole collars were supplied by Equity Exploration. Station spacing was set at 5 m for the single open-hole surveys using the winch. Discrepancies between the winch counter and the hole depth supplied by geologists appear to indicate poor calibration of the counter and as a result the final data the assumes a station spacing of 4.6 m. Station spacing for through-the-bit surveys were set at 6 m to account for the intervals available with 3 m drill rods; larger station spacing was used in low-priority parts of the hole to expedite the survey.

The survey was performed with the following specifications:

Geographic datum & projection: NAD83(CSRS) datum, UTM Zone 9N projection

Elevation datum: Height Above Ellipsoid

Station locations:	6 m, 9 m, 12 m or 15 m (tailored to the targets set by geologists) when surveying through the bit, 5 m intervals when using the winch counter.
Frequency:	5.00 Hz
Waveform:	100% duty cycle square wave
Components:	A (axial, down hole), U (transverse to axial, in the vertical plane containing the drill hole), V (transverse to axial, in the horizontal plane containing the drill hole), B-field coil (axial, down hole)
Reading length:	Readings were recorded for 120 seconds following a 20 second settling period at each station.
Synchronisation:	Transmitter and receiver were synchronized via GPS immediately prior to and following the survey.
Sample rate:	32 kHz
Channels:	20 Channels. Channel 20 is early time and channel 1 is late time as detailed in Table 2.

Table 2: Channel times in milliseconds.

Channel	Start (ms)	End (ms)	Width (ms)
20	0.097656	0.138107	0.040451
19	0.138107	0.195313	0.057206
18	0.195313	0.276214	0.080901
17	0.276214	0.390625	0.114411
16	0.390625	0.552428	0.161802
15	0.552428	0.781251	0.228823
14	0.781251	1.104855	0.323605
13	1.104855	1.562501	0.457646
12	1.562501	2.209710	0.647209

5 DATA COLLECTION

Data was collected over the course of 5 site visits. One hole (K16-369) was surveyed with a hand-cranked winch, all others were surveyed in the presence of a diamond drill through the drill string. When surveying at the drill, 5 drill rods were removed leaving a 15 m gap at the bottom of the hole. The instrument and extension rods were assembled into 3 sets and combined and attached to the latch head as they were lowered into the hole. The full assembly was lowered down the hole using the drill's wire line and released when the latch head was sitting in the landing ring of the core barrel.

The full assembly hung through the core barrel and the bit, extending 9 m from the brill bit to the bottom of the instrument. The elevation of the instrument was considered to be the bit depth plus 7 m, approximately the centre of the instrument. The readings were conducted 20 seconds after the drill crew finished removing rods and had shut down the drill. Readings were at least 120 seconds in length. During the initial survey on the first hole, reading length was set at 270 seconds, allowing the data to be reprocessed using various reading lengths. After several tests it was decided that 120 seconds provided an adequate signal to noise ratio while still allowing a high volume of readings to be recorded on a single battery charge. Station spacings were in multiples of 3 m to account for drill rod length and actual station spacing varied between 6 m and 15 m. High and low priority targets were detailed by Equity or BMC geologists ahead of time and the survey was tailored to best accommodate these targets without fully exhausting the battery life of the instrument.

Instrument failure was responsible for partial loss of data in several instances. On hole K16-406, B-field coil data was properly recorded but all flux-magnetometer data was unrecoverable. This issue could not be resolved in the field and resulted in the instrument being replaced by the supplier on August 2. Toroid data was lost on several occasions: a battery failure caused irregular waveforms to be recorded on holes K16-409 and K16-394 and a corrupt file meant that no toroid data was collected on hole K16-419. In all cases, data collection from a back-up current monitor allowed the timing of the transmitter signal to be faithfully recorded resulting in good quality raw data. The raw data could then be properly aligned and normalized but not deconvolved.

6 DATA PROCESSING

The BHEM data were downloaded from the Volterra receiver dabtubes and from the current monitor dabtubes and reading timing files were downloaded from tablets running Volterra EM Timer software. Loop files were created using waypoints from hand-held Garmin GPS units, hole location files were created from files given by Equity Exploration geologists. All data were imported into Csproc software where all location data was visually inspected and any timing errors were identified and adjusted manually.

All plots were made using TEMplot software. On the plots channel 01 is presented as the HSensor value (measured primary field, in pT) subtracted from the channel 01 values (last time channel, in pT).

Channels 02 through 20 use channel 01 as a reference and are plotted as point normalized to channel 1 (channel X – channel 01 in pT).

Final data is presented in three formats: user-aligned, normalized and deconvolved. User-aligned data is raw data where receiver and transmitter timing has been verified and adjusted by a technician. Normalized data is user-aligned data that has been adjusted to account for the measured transmitter current. Deconvolved data is normalized data that has been adjusted to account for the measured transmitter waveform.

Appendix J: Geological Logs for 2016 Drill Core

This appendix contains all of the drill logs generated from the 2016 drilling program, which includes resource definition, exploration, metallurgical, hydrogeological and geotechnical holes. Drill logs are placed in hole number order with the first page of each log starting on the page number indicated in Table J-1.

Table J-1: Table of contents for 2016 diamond drill hole logs in this appendix

Hole ID	Length (m)	Target	Purpose	Core Storage Location	Page Number	Number of Pages

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-337

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Roger Hulstein
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	5/2/2016
UTM Easting	414917.0864	Core Size:	NQ3	Azimuth:	23.63	Date Logging Complete:	5/6/2016
UTM Northing:	6815014.0669	Casing Pulled?:	Yes	Dip:	-75	Drill Company:	Hytech
UTM Elev. (m):	1385.888	Casing Depth (m):	24	Length (m):	220	Drill Rig:	Tech 5000
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	5/1/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK camp	Drill Completed:	5/4/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
Comments:						Parent Hole:	

The drill hole was successful in intersecting the Krakatoa Main lens. The overall stratigraphic package and style of mineralization is very similar to adjacent drill holes Of note is the considerable amount of mineralized calcite within the more typical OB sulfide mineralization. The mineralized calcite occurs as disseminations, blebs and breccia matrix and appears to be a later event remobilizing mineralization. The RHYi unit (122.0-127.7m) has gradational contacts with sericite altered rhyolite on either side. Following cementing, the casing was pulled and the rig moved off the hole. The next day it was noticed that the drill hole was making a small amount of water, in the order of 2-4 liters per minute.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-75	22.23	1.4	23.63	APS	Roger Hulstein	5/2/2016		☑	Rig aligned to true north (measured azimuth). Grid convergence of 1.4 deg applied to correct to UTM azimuth.

Comments:

K16-338 abandoned at 76.4m after two down hole reflex tests showed downhole deflection greater than acceptable. Immediately below the overburden magnetite bearing OB type mineralization was intersected from 23.88m - 24.24m and OJ chlorite pyrrhotite type from 24.24m - 24.62m. Below the sufides, 7 cm of rhyolite was recovered at the top of the MAFi unit (24.62 - 76.40m EOH). Poor core recovery from 23.88-36.0m. Following abandonment the target was redrilled by K16-339 on a slightly different azimuth and with a HQ drill string to reduce the chance of deflection.

Downhole Surveys:

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
						Parent Hole:	

Comments:

K16-339 replaces K16-338 which was abandoned at 76.4m due excessive deviation.The drill hole was successful in intersecting the Krakatoa Main lens (145.62 - 173.60 m). The overall stratigraphic package and style of mineralization is very similar to adjacent drill holes although obvious RHYi is absent. A massive quartz vein was intersected from 127.15 - 144.26 m (approx 75% quartz) which may be related to the RHYi unit.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-65	34.9	1.4	36.3	APS	Chris Hughes	5/6/2016		☑	Rig aligned to true north (measured azimuth). Grid convergence of 1.4 deg applied to correct to UTM azimuth.
30	-65.8	12.8	22.1	34.9	ReflexEZS	Hytech	5/6/2016	5869	☑	Measured azimuth relative to magnetic north. Grid declination of 22.1 deg applied to correct to UTM azimuth.

<<Struc: 210.5 - 210.7 Intense Shear>>

211.15 223.60 RHY undifferentiated rhyolite grey-green

211.15 - 223.6: Possibly ash tuff?

<<Min: 214.8 - 216.7 1% Min: Pyrrhotite>>

<<Min: 216.7 - 220.6 5% Min: Pyrrhotite>> and in thin bands

<<Min: 220.6 - 240 3% Min: Pyrrhotite>>

<<Alt: 211.15 - 231.5 Trace Calcite>>

<<Alt: 211.5 - 240 Moderate Muscovite>> fine muscovite - sericite

<<Alt: 212.2 - 222 Trace Chlorite>>

<<Struc: 211.35 - 212.2 Moderate-Strong dominant foliation>>

<<Struc: 212 - 213.45 Weak-Moderate Fault>>

<<Struc: 213.45 - 215.5 Moderate dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 215.5 - 217 Moderate dominant foliation>>

<<Struc: 216.75 - 216.8 Weak-Moderate Shear>>

<<Struc: 216.8 - 216.9 Weak-Moderate Shear>>

<<Struc: 217.2 - 221.2 Moderate-Strong Fault>> Fault zone; numerous approx 30 cm zones of intense shearing, wider sections of strong brecciation.

<<Struc: 217.33 - 217.43 Moderate-Strong Shear>>

<<Struc: 217.55 - 217.7 Weak-Moderate Shear>>

<<Struc: 217.7 - 218.2 Moderate-Strong Shear>>

<<Struc: 218.2 - 218.7 Moderate dominant foliation>>

<<Struc: 220.3 - 220.45 Strong Shear>> gouge - brx zone

<<Struc: 221.6 - 222 Moderate-Strong Foliation>> shear planes on foliation

223.60 226.90 RHYc Rhyolite coherant volcanics light grey

223.6 - 226.9: Silicic bands. Could also be sheared siliceous ash tuff… Unit is bracketed by fault - shear zones, what you would expect around a competent body.

<<Struc: 224 - 225 Moderate dominant foliation>>

<<Struc: 225.95 - 226 Strong Shear>>

<<Struc: 226 - 226.9 Moderate Foliation>> shearing along foliation planes.

226.90 240.00 RHYv Rhyolite volcaniclastic grey-green

226.9 - 240: rare silicic bands, ash and lappilli more common.

<<Struc: 230.2 - 230.6 Weak-Moderate dominant foliation>>

<<Struc: 230.7 - 230.8 Weak-Moderate Shear>> shear plane, basically parallel to foliation.

<<Struc: 233 - 236 Moderate dominant foliation>>

<<Struc: 236.6 - 237 Moderate dominant foliation>>

<<Struc: 237 - 240 Moderate dominant foliation>>

End of Hole @ 240

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-340

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Roger Hulstein
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	5/12/2016
UTM Easting	414973.9852	Core Size:	HQ3	Azimuth:	31.38	Date Logging Complete:	5/18/2016
UTM Northing:	6814927.3398	Casing Pulled?:	Yes	Dip:	-45	Drill Company:	Hytech
UTM Elev. (m):	1389.268	Casing Depth (m):	40.5	Length (m):	353	Drill Rig:	Tech 5000
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	5/10/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	5/16/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Metallurgical
						Parent Hole:	

Comments:

DDH finished 8 am May 16. Drill hole was largely successful in drilling downdip to collect metallurgical samples from the Krakatoa Main Lens, Mineral (sulfide) banding - foliations in the sulfides were at low angles or parallel to the core axis. Of note was a sequence of RHYi with lesser RHY (164.36 - 232.33 m) between the upper and lower lens. The Upper sulfide lens was intersected from 137.48-164.36 m (26.88 m) and the lower lens from 232.33 - 275.11 m (42.78 m) including 7.01 m of barren MAFi.

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
Comments:						Parent Hole:	

K16-341 was drilled to test an inferred portion the Krakatoa upper lens.
Bedrock was encountered at 31.5 m depth and consists of rhyolite to a depth of 56.9 m. Below the rhyolite there is a mudstone unit from 56.9-61 m with a lower faulted contact (61-66 m). Below this fault, rhyolite persists to 144.7 m depth, with moderate MU alteration and an interval of strong pervasive MU alteration (130.2-136.7 m) and patchy BI alteration associated with disseminated sulfides (134-135.8 m). Below the rhyolite unit, the mafic sill occurs from 144.7-162 m. From 162-162.25 m there is a small lens of massive sulfide (OB) above another MU-altered rhyolite (135.8-166.1 m). The lower contact of this rhyolite grades into the mafic sill with disseminated sulfides (166.1-166.6 m). The mafic sill persists from 166.6-190 m (EOH). This hole was terminated before intersecting the Krakatoa main lens in order to avoid drilling a main lens pierce point that will be tested with a subsequent drill hole..

Comments:						Parent Hole:	

K16-342 was intended to be a resource infill hole but was abandoned at 51m due to unacceptable hole deviation, likely a result of hole deflection within the overburden.
The hole collared into bedrock at 28.08m. Below this, the felsic hanging wall package was encountered; the hanging wall consists of weak to moderate muscovite altered RHYv, RHYc, and MDSc.
A moderately-intense fault occurs from 39.49 to 41.1m.

						Parent Hole:	

Comments:

K16-343 was intended to be a resource infill hole,replacing K16-342 but was abandoned at 62.7m due to unacceptable hole deviation. The hole collared into bedrock at 28m; RHYvl, RHYc, and MDSc continued to a depth of 55.4m. OI mineralization occurred from 55.4-57.9m. The OI was characterized with disseminated-patchy pyrite +/- sphalerite, chalcopyrite, and galena within a brecciated RHY unit with strong biotite, albite, and sericite alteration. OB was encountered from 57.9-59.7m; it was composed of massive pyrite +/- sphalerite, galena, and chalcopyrite. The hole was abandoned at 62.7m, within the mafic sill footwall.

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource/Met
						Parent Hole:	

Comments:

K16-344 was drilled to test the inferred resource of the Krakatoa lenses, as well as to collect metallurgical samples of mineralized and wall rock domains.
Due to large drill hole deviation through the overburden, a wedge was set at 45.6 m, thus causing extra core (~1.1 m) in the box from drilling side by side over this distance. Orientation of the core was not marked between 45.6-67.5 m due to use of a 1.5 m drill rod during wedging.
Bedrock was encountered at 26.2 m. From 26.2-56.7 m the felsic hanging wall package occurs, consisting of volcaniclastic rhyolite, coherent rhyolite, and mudstone. From 56.7-61.9 m (5.2 m), disseminated to massive sulfide occurs, consisting of OB surrounded by OI. The OI mineralization was strongly altered and brecciated. Below this mineralization, the mafic sill occurs from 61.9-82.1 m. From 82.1-84.1 m (2 m), massive sulfide (OB) occurs. Below the OB mineralization undifferentiated, faulted, and strongly MU-altered rhyolite occurs from 84.1-89.4 m. From 89.4-94.6 m, the mafic sill occurs. From 94.6-98.7 m (4.1 m) heavily disseminated to semi-massive sulfide occurs in a calcite+silica matrix (OK). Below this mineralization lens, the aphanitic rhyolite (RHYi), with a minor interval of coherent rhyolite, occurs from 94.6-167.6 m. Below the RHYi the mafic sill occurs again from167.6-169.7 m. From 169.7-170.3 m (0.5 m) OJ style mineralization occurs. Below this final mineralization lens, a felsic footwall package occurs to 224.2 m, consisting of coherent rhyolite, volcaniclastic rhyolite, and minor mudstone. Note that weak MU-alteration persists to the bottom of the hole.

Comments:						Parent Hole:	

Hole K16-346 was collared to test the Krakatoa upper lens.
Hole K16-346 is made up of muscovite altered rhyolitic (hanging wall) unit from 42m to 54.85m. The upper lens is intercepted from 54.95m to 64.97m showing OA, OB (possibly containing BA) and OI domains, mineralized PY/SP/GL/MG/CP.
The footwall, consisting in mafic sill, is encountered from 64.97m to 88.95m and 94.04m to 102.20m. Muscovite altered volcaniclastic and flow rhyolite is seen from 88.95m to 94.02m.
Hole K16-346 ends at 102.20m and confirmed the presence of the upper lens.

Comments:

The purpose of K16-347 was to test inferred portions of the up-dip, Krakatoa upper lens, and to collect metallurgical samples from the upper lens. The hole collared into bedrock at 31.3 m; the felsic hanging wall consisted of RHYva, RHYvl, and RHYcw. Weak to moderate faulting was prominent to a depth of 60.96 m, followed by a strong fault (60.96 - 69.6 m) characterized with strong sericite alteration, brecciation, and gouge. OI mineralization was encountered at 127.56 m, followed with OB (128.22-135.58 m), and OA (135.58-137.28 m). Sericite alteration was intense within the OI unit. RHY continued to a depth of 148.23 m, and contained moderate to strong sericite alteration and occasional mineralized quartz veins. The mafic footwall was encountered at 148.23 m, with a zone of OJ mineralization from 148.23-151.27 m.

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
Comments:						Parent Hole:	

K16-348 was collared to test the upper Krakatoa lenses.
Hole K16-348 is made up of strongly muscovite altered rhyolitic (hanging wall) foliated along the core axis showing two narrow zones mineralized PY/PY, trace of CP (from 51.22 m to 52.26 m and from 60.00 to 61,00 m). No massive sulfide was intercepted except for 40 cm of mineralization (PY/SP/GL) at the base of the overburden, which may be interpreted as a boulder. Note, however, that a similar "lens" is seen in hole K16-339.
The hole is marked by a fault zone extending from 83.40 m to 93.80 m at contact between the felsic sequence and the mafic sill. This fault might be correlated to the one observed deeper in hole K16-339. PY clasts are present within the fault gouge. The hole was shutdown at 129.50 m.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-349

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	5/22/2016
UTM Easting	415023.1173	Core Size:	HQ3	Azimuth:	74.52	Date Logging Complete:	5/26/2016
UTM Northing:	6815019.6122	Casing Pulled?:	Yes	Dip:	-75	Drill Company:	Hytech
UTM Elev. (m):	1384.497	Casing Depth (m):	28.5	Length (m):	201	Drill Rig:	Tech 5000
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	5/21/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	5/23/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource/Met
Comments:						Parent Hole:	

K16-349 was drilled to test inferred portions of up-dip Krakatoa upper and main lenses. HQ half core metallurgical samples were collected of the upper, main, and lower lenses. K16-349 encountered bedrock at 27.1 m. The hanging wall package (27.1-78 m) consists of rhyolite and mudstone, with a minor section of elevated pyrite content (OI) in the rhyolite from 40.1-41.4 m. Below the mudstone a fault occurs, which has been observed in surrounding holes at the same stratigraphic horizon. The upper lens occurs from 74-82.2 m and consists of OB mineralization with a minor interval of rhyolite in the middle (79.3-80 m). The stratigraphy between the upper and main lenses consists of interlayered rhyolite and mafic sill. The main lens occurs from 104.4-117.3 m and consists of OB, OA, OI, and OK mineralization. The interval (117.3-168.8 m) between the main and lower lenses consists of RHY, RHYi, and MAFi. The lower lens occurs from 168.8-169.8 m, consisting of OJ mineralization. From 169.8-201 m (EOH), the felsic footwall package occurs.

Comments:

K16-350 was collared to test Krakatoa upper lens in proximity to east fault.
Hole K16-50 is made up of upper volcaniclastic rhyolite sequence following by a mafic sill and lower felsic sequence. The upper lens is intercepted within the mafic sill from 105.40m to 113.21m.
Mineralization consists in OB, OJ and OI domains (PY/SP/GL/minor CP and PO, trace of AS).
The contact between the mafic sill and the lower rhyolitic sequence is marked by a fault breccia zone from 152.30m to 155.20m. Two graphitic silicified mudstones are observed underneath the fault and may represent potential marker units.
The bottom of the hole consists in highly fractured to faulted volcaniclastic units.
Hole K16-350 ends at 247.6m on a distinctive feldspar porphyry quartz eyes unit.
The main lens has not been intercepted.

144.68 147.20 RHY undifferentiated rhyolite

144.68 - 147.2: Could strongly muscovite altered MAFi. Gougy upper contact. Muscovite altered, low chlorite, no biotite. Wavy foliation, CA, crenulated. PY/PO.

<<Alt: 144.68 - 147.2 Moderate Muscovite>>

<<Alt: 144.8 - 152.3 Weak-Moderate Calcite>>

<<Struc: 144.68 - 145.5 Weak-Moderate Fault>> Fault gouge and strongly altered contact between MAFi and probably RHY.

<<Struc: 145.52 - 145.53 dominant foliation>>

147.20 152.30 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

147.2 - 152.3: CA/CL schist, strongly altered CL, no biotite.

<<Alt: 147.2 - 153.45 Strong Chlorite>>

<<Struc: 147.9 - 147.91 dominant foliation>>

<<Struc: 150 - 152.3 Moderate-Strong Shear>> Sheared, disaggregated MAFi.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

152.30 155.20 FLZ Fault Zone

152.3 - 155.2: Brecciated, Subrounded clasts, MU altered, QZ clasts containing GL. Clasts up to 20 cm. Mafic and felsic material in gouge.

<<Alt: 152.3 - 201 Weak Calcite>>

<<Alt: 153.45 - 162.23 Moderate-Strong Muscovite>>

<<Struc: 152.3 - 155.2 Intense Fault>> Polymictic fault /breccia, clasts up to 10 cm wide. QZ containing GL. Strong chlorite alteration. Contact between MAFi and RHY.

155.20 158.07 RHY undifferentiated rhyolite

155.2 - 158.07: Fragmented rhyolite, sheared, boudinage.

<<Struc: 155.2 - 158.3 Moderate-Strong Shear>> Sheared, disaggregated rhyolite, locally brecciated.

<<Struc: 156.95 - 156.96 dominant foliation>>

158.07 158.23 MDSc Carbonaceous dominant mudstone

158.07 - 158.23: Graphitic silicified mudstone containing PO/PY.

158.23 162.23 RHY undifferentiated rhyolite

158.23 - 162.23: Fragmented rhyolitic schist.

<<Struc: 158.3 - 162.23 Moderate Shear>> Sheared to locally brecciated/gougy rhyolite.

<<Struc: 160.2 - 160.21 dominant foliation>>

<<Struc: 161.3 - 161.31 dominant foliation>>

162.23 162.85 RHYv Rhyolite volcaniclastic

162.23 - 162.85: Strongly foliated, BI in foliation, light blue, probably carbonaceous material (MDSw).

162.85 163.50 MDSc Carbonaceous dominant mudstone

162.85 - 163.5: Graphitic silicified mudstone..

163.50 168.04 RHYv Rhyolite volcaniclastic

163.5 - 168.04: BI in foliation, light blue rhyolite, probably some carbonaceous material (MDSw). Strong crenulation, undulated silicic bands, possible flow..

<<Struc: 165.87 - 165.88 dominant foliation>> Crenulated foliation

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

168.04 171.36 MDSc Carbonaceous dominant mudstone

168.04 - 171.36: Graphitic silicified mudstone.

<<Min: 168.75 - 185.7 0.5% Min: Pyrite>> And few in discontinuous veins.

<<Min: 168.75 - 185.7 1% Min: Pyrrhotite>> And few patches.

171.36 177.26 RHYvl Lapilli tuff

171.36 - 177.26: PY/PO in foliation. Mid to high strain.

<<Struc: 172.2 - 172.21 dominant foliation>>

177.26 178.66 RHYvx Quartz and/or feldspar crystal tuff

177.26 - 178.66: Crystal up to 0.5cm,

178.66 179.95 RHYv Rhyolite volcaniclastic

178.66 - 179.95: MU altered.

179.95 182.50 RHYvx Quartz and/or feldspar crystal tuff

179.95 - 182.5: Could be porphyroblasts 2 to 5 mm wide.

<<Struc: 182.2 - 182.5 Weak Fault>> Fault gouge.

182.50 188.16 RHYv Rhyolite volcaniclastic

182.5 - 188.16: Altered MU rhyolite, strong foliation, weak CL alteration.

<<Min: 185.7 - 194.9 2% Min: Pyrrhotite>> Possibly GL trace associated.

<<Min: 185.7 - 247.6 1% Min: Pyrite>>

<<Alt: 185.7 - 187.5 Weak-Moderate Muscovite>>

<<Alt: 187.5 - 194.9 Weak-Moderate Chlorite>> Lapilli replacement.

<<Struc: 185.6 - 185.61 dominant foliation>>

188.16 194.90 RHYvl Lapilli tuff

188.16 - 194.9: Light green, specks of tourmaline, ashes at lower contact.

194.90 201.30 RHY undifferentiated rhyolite

194.9 - 201.3: Dominantly coherent rhyolite. Fractured, locally disaggregated rhyolite flow and crystal ash interbedded.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 194.9 - 247.6 1% Min: Pyrrhotite>>

<<Alt: 194.9 - 201 Moderate-Strong Muscovite>> Associated with fractured flow disaggregated.

<<Alt: 201 - 244 Weak-Moderate Muscovite>>

<<Alt: 201 - 247.6 Trace Calcite>>

<<Struc: 198.8 - 201 Weak-Moderate Shear>> Boudinage and breccia in rhyolite flow.

201.30 201.62 RHYva Coarse grained to ash tuff

201.3 - 201.62: Fine grain, homogeneous groundmass ash tuff, few PY/PO..

201.62 210.40 RHYcw Curdy textured-flow banded (flows, subvolcanics)

201.62 - 210.4: Pseudo fragmental. Pink/orange color from 208.50 to 210.50, could be albitization. Locally flow banded.

<<Struc: 204.5 - 204.51 dominant foliation>>

<<Struc: 207.5 - 218.7 Weak-Moderate Fault>> Multiple narrow fault, one per metre, Locally gouge, highly fractured.

210.40 233.00 RHY undifferentiated rhyolite

210.4 - 233: Probably volcaniclastic. Patch of tourmaline, PY clots, few reddish bands (hematite?), locally xtl. Unit fractured and sheared.

<<Struc: 216.55 - 216.56 >> Dominant shearing/fracture angle.

<<Struc: 218.7 - 228 Moderate Fault>> Fractured, sheared and gougy rhyolite. Less the 30 percent of solid rock.

<<Struc: 224.5 - 224.51 >> Dominant shearing/fracture angle.

<<Struc: 229 - 229.01 dominant foliation>>

<<Struc: 232 - 232.01 Vein>> QZ/PY/L vein, offfsetted by discordant fracture.

233.00 235.20 FLZ Fault Zone

233 - 235.2: Clay matrix, QZ/maybe silicified mudstone containing PY/rhyolite clasts. Dark grey bands (carbonaceous bands relics?).

<<Struc: 233 - 235.2 Strong Fault>> Fault gouge, clay, QZ clasts and boudinage. Dark gray clay bands (carbonaceous material?). Possibly clasts of PY rich mudstone.

<<Struc: 234.2 - 234.21 >> Dominant lamination angle within fault gouge.

235.20 247.60 RHYcf Feldspar & feldspar quartz porphyry

235.2 - 247.6: Fractured up 240.50m, locally gouge up to 50 cm, feldspar porphyroblasts (0.5 cm wide), blue QZ eyes. Fine grain ground mass (ash). QZ pods. E.O.H.

<<Alt: 244 - 247.6 Weak Muscovite>>

<<Struc: 237 - 240.5 Moderate Fault>> Less than 50 percent of competent rock. Gougy, highly fracture sericite filled.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
<<Struc: 239 - 239.01 >> Dominant fracture/shearing angle.

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
Comments:						Parent Hole:	

K16-351 was drilled to confirm the resource of the Krakatoa lenses near the Sunda Fault.
K16-351 encountered bedrock at 9.3 m. The hanging wall package consists of mixed PEL, RHYv, RHYi, RHYc, and minor MAFi to a depth of ~110.9 m, where the upper contact of the MAFi occurs. Within this hanging wall package moderate to strong MU-alteration occurs from 73-110.9m, with a zone of intense alteration from 93-94.6 m. This intense alteration occurs near where the upper lens mineralization has been modelled from surrounding drill holes. The MAFi occurs from 110.9-131.8 m. From 131.8-133.4 m, OJ mineralization occurs as bands of strong chlorite alteration with stringer style mineralization within the MAFi. From 133.4-140.2 m, MXSX occurs, consisting of OB and OK style mineralization. The footwall zone consists of mixed MU-altered RHY and RHYi from 140.2-163.2 m. From 163.2-198 m (EOH), an intense fault with polylithic clasts in a gouge matrix occurs. This fault is believed to be the Sunda Fault.

Comments:						Parent Hole:	

K16-352 was drilled to test inferred portions of the Krakatoa upper and Krakatoa main lenses. Drill rods became stuck at 192 m, and were cut free at a depth of 153 m, leaving ~39 m of drill rods in the ground.
K16-352 encountered bedrock at 1.5 m. The felsic hanging wall package was encountered from 1.5-124 m, consisting of mixed coherent rhyolite, volcaniclastic rhyolite, pelitic sediments, and mudstones. Moderate to strong MU-alteration occurs from 77.5-126.3 m, continuing into the MAFi. MAFi occurred from 124-152.9 m, with strong MU-alteration occurring at 146.1-152.9 m (continues into underlying RHY as well). From 147.5-149.3 m, banded chlorite alteration associated with disseminated to stringer style mineralization occurs. Below the MAFi, strongly MU-altered RHY occurs (152.9-164.7 m) with a zone of semi-massive to patchy mineralization (OI) from 155.1-156 m. Underlying the RHY, brecciated RHYi occurs to 173.5 m, where intense faulting occurs. This fault persists to the bottom of the hole, consisting of matrix-supported polylithic clasts (RHY, MAFi, MXSX, MDS, QZ-vein, etc.) with sericite-chlorite-clay gouge matrix. Both horizons where mineralization was anticipated to be intercepted contained zones of strong alteration plus or minus disseminated to semi-massive sulfide, and potentially represent the extent of mineralization in their respective lenses.

1.50 10.40 RHYc Rhyolite coherant volcanics

1.5 - 10.4: Unit varies from RHYi near the center to flow-banded and silica banded outward. Potentially representing a flow with more flow movement along edges ??

<<Min: 1.5 - 10.4 2% Min: Pyrite>>

<<Alt: 1.5 - 10.4 Trace Calcite>>

10.40 12.70 PEL Equigranular biotite + calcite +/- quartz rock

10.4 - 12.7: BI-CA schist with heterogeneous composition. Interpreted to be a pelitic sedimentary horizon.

<<Alt: 10.4 - 12.7 Moderate Calcite>>

12.70 20.10 RHYvl Lapilli tuff

12.7 - 20.1: Volcaniclastic rhyolite with variable amounts of lpl, local flow textures, and BI content (sediment input?)

<<Min: 12.7 - 20.1 0.5% Min: Pyrite>>

<<Min: 12.7 - 20.1 0.1% Min: Pyrrhotite>>

<<Alt: 12.7 - 20.1 Weak-Moderate Calcite>>

<<Struc: 16.5 - 16.8 Weak Fault>> Minor fault gouge and wash away

20.10 33.30 RHYi Aphanitic Rhyolite (intrusion)

20.1 - 33.3: Aphanitic rhyolite with silica banded texture near upper contact and ~gradational lower contact

<<Min: 20.1 - 33.3 1% Min: Pyrite>>

<<Alt: 20.1 - 33.3 Weak Calcite>>

<<Struc: 30.7 - 30.71 Weak-Moderate dominant foliation>>

33.30 34.00 RHYvl Lapilli tuff

<<Min: 33.3 - 72.2 0.5% Min: Pyrite>>

<<Alt: 33.3 - 34 Weak-Moderate Calcite>>

<<Struc: 33.5 - 33.51 Weak-Moderate dominant foliation>>

34.00 37.40 PEL Equigranular biotite + calcite +/- quartz rock

34 - 37.4: Black to olive green BI-CA-CL schist with heterogeneous texture and composition

<<Alt: 34 - 37.4 Moderate Calcite>>

37.40 38.50 RHYcw Curdy textured-flow banded (flows, subvolcanics)

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 37.4 - 38.5 Weak Calcite>>

<<Struc: 37.4 - 37.6 Weak Fault>> Broken ground and minor fault gouge at PEL/RHYcw contact

38.50 38.80 PEL Equigranular biotite + calcite +/- quartz rock

<<Alt: 38.5 - 38.8 Moderate Calcite>>

38.80 40.30 RHYcw Curdy textured-flow banded (flows, subvolcanics)

<<Alt: 38.8 - 40.3 Weak Calcite>>

40.30 65.80 RHYvl Lapilli tuff

40.3 - 65.8: Dominated by lpl tuff, with variable composition of lpl from BI-CL-CA to felsic lpl.

<<Alt: 40.3 - 75.3 Weak-Moderate Calcite>>

<<Alt: 60.7 - 77.5 Weak Muscovite>>

<<Vein: 42 - 42.2 100% Quartz-Sericite/White mica>> Broken QZ-Sericite vein in fault zone

<<Vein: 64.6 - 64.8 20% Quartz>> Minor folded and deformed (ptigmatic) QZ veins

<<Struc: 41.3 - 44.1 Weak-Moderate Fault>> Zone of fault planes with gouge every ~15 cm. Minor veining within zone. Wash away also recorded in zone.

<<Struc: 44.94 - 44.95 Moderate dominant foliation>>

<<Struc: 52.89 - 52.9 Moderate dominant foliation>>

<<Struc: 54.6 - 62.7 Weak-Moderate Fault>> Zone of fault planes with some gouge every ~20-50 cm. Minor wash away recorded in zone.

65.80 66.20 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

65.8 - 66.2: Small Ca-phyric mafic dyke

66.20 73.00 RHYvl Lapilli tuff

<<Min: 72.2 - 73 1% Min: Pyrrhotite>>

<<Vein: 67.4 - 71.6 5% Quartz 70 deg. >> Zone with White QZ-veining and poor recovery (faulting?)

<<Struc: 67.3 - 78.7 Moderate Fault>> Zone of many fault planes with gouge surfaces and high core loss. Zone appears to have low RQD rating. As well, a transposition foliation appears to be superimposed on the original foliation. This can be seen where a crenulation cleavage is oveperprinting the original foliation at a high angle.

73.00 75.30 MDSw Coherent rhyolite flow with carbonaceous content

73 - 75.3: Flow banded rhyolite with minor carbonaceous material

<<Min: 73 - 77.5 1% Min: Pyrite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
75.30	**77.50**	**MDSc Carbonaceous dominant mudstone** 75.3 - 77.5: Argillaceous mudstone									
77.50	**107.90**	**RHYcw Curdy textured-flow banded (flows, subvolcanics)** 77.5 - 107.9: Good flow banded texture. Local crenulation cleavage appears to transpose original foliation. Maybe the dominant foliation in other units (i.e. RHYv) is this transposed foliation. <<Min: 77.5 - 107.9 2% Min: Pyrite>> <<Alt: 77.5 - 116.5 Moderate Muscovite>> <<Alt: 77.5 - 116.5 Weak Calcite>> <<Vein: 93.2 - 93.3 100% Quartz 60 deg. >> Massive QZ vein with cross-cutting cleavage of MU-GL-PY <<Struc: 84.28 - 84.29 Weak-Moderate dominant foliation>> <<Struc: 85.2 - 85.3 Moderate-Strong Fault>> Narrow zone of strongly faulted material with milled clasts in a gouge matrix <<Struc: 91.24 - 91.25 Weak-Moderate dominant foliation>> <<Struc: 100.69 - 100.7 Weak-Moderate dominant foliation>> <<Struc: 101.8 - 103.4 Weak-Moderate Fault>> Zone of broken rock with fault gouge. Clasts supported zone.									
107.90	**121.80**	**RHYvl Lapilli tuff** 107.9 - 121.8: Felsic and pyrite lpl <<Min: 107.9 - 124 2% Min: Pyrite>> <<Alt: 116.5 - 121.8 Weak-Moderate Calcite>> <<Alt: 116.5 - 124 Strong Muscovite>> <<Vein: 114 - 114.03 90% Quartz 75 deg. >> QZ vein <<Vein: 117.5 - 118 30% Quartz 50 deg. >> Zone with massive QZ veining in strong MU-alteration. Comments:						Parent Hole:	

K16-353 was collared to test up-dip exploration potential of lower Krakatoa lens and collect HQ half core met sample of lower main lens.
The top of K16-353 is made up of volcaniclastic rhyolite sequence intruded by a mafic sill from 21.10m to 34.10 m. Above the mafic unit the lithology consists in volcaniclastic rhyolite crosscut by aphanitic rhyolite unit showing varying thickness and containing 3% of pyrite in veinlets.
Mineralization encountered at the top of the hole are made up of OA domain probably in the overburden and OB in the bed rock from 11.40m to 12.80m. OJ domain (PY/PO stringers-CL/CI alteration) is intercepted from 129.77m to 132.77m and could be correlated to the Main lens.
From 106.95m to 108.43m, a unit interpreted as mafic dike shows CL/AK and fuchsite. This unit could be an alteration zone.
Hole K16-353 ends at 159.00m in volcaniclastic rhyolite.
No massive sulfide were intercepted where the Main lens was projected. No MET samples has been collected.

81.36 85.60 RHY undifferentiated rhyolite

81.36 - 85.6: Light green, foliated, CA bands, locally pinkish (RHYi intrusion), altered MU.

<<Struc: 82.7 - 82.71 Contact>> Contact between pinkish (albite?) and grey RHYi.

<<Struc: 85.2 - 85.21 dominant foliation>>

85.60 86.07 RHYi Aphanitic Rhyolite (intrusion)

85.6 - 86.07: Grey, aphanitic, gradual upper contact, sericite in joint at lower contact.

86.07 87.21 RHY undifferentiated rhyolite

86.07 - 87.21: Containing RHYi "clasts", light green, MU altered, gradual lower contact.

87.21 87.60 RHYi Aphanitic Rhyolite (intrusion)

87.21 - 87.6: PY stringers/discontinuous veinlets at upper contact. Aphanitic.

87.60 88.95 RHYva Coarse grained to ash tuff

87.6 - 88.95: Light grey, fine grain, PY disseminated.

88.95 91.00 RHYi Aphanitic Rhyolite (intrusion)

88.95 - 91: Grey, aphanitic.

91.00 97.90 RHYv Rhyolite volcaniclastic

91 - 97.9: Light green, NU altered, locally pinkish bands (RHYi), fine grain, CA bands, PY stringers.

<<Struc: 93 - 93.01 dominant foliation>>

<<Struc: 95.5 - 95.51 dominant foliation>>

97.90 98.08 RHYi Aphanitic Rhyolite (intrusion)

97.9 - 98.08: Grey, aphanitic.

98.08 100.90 RHY undifferentiated rhyolite

98.08 - 100.9: Silicified, PY veinlets.

100.90 101.80 RHYi Aphanitic Rhyolite (intrusion)

100.9 - 101.8: Pinkish, PY veinlets (stringers).

101.80 105.70 RHY undifferentiated rhyolite

101.8 - 105.7: MU altered, light green/yellow, locally silicic bands.

						Parent Hole:	

Comments:

K16-354 was drilled to test inferred portions of the Krakatoa upper and Krakatoa main lens near the Sunda Fault. The hole was abandonded at 39 m due to excess deviation toward the Sunda Fault.
K16-354 intersects the felsic hanging wall package from 3.5-39 m, consisting of layered volcaniclastic rhyolite, coherent rhyolite, pelitic sediments, and RHYi (maybe extrusive here or sub-volcanic intrusion). No significant alteration or mineralization was observed.

Downhole Surveys:

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 3.50 OVBN Overburden

0 - 3.5: Overburden may extend deeper, but is composed of mainly broken bedrock below 3.5 m.

3.50 11.70 RHYvl Lapilli tuff

3.5 - 11.7: Light grey felsic lpl in medium-dark grey ash matrix. Grades upward from coherent rhyolite to ~curdy-lpl rich to ~10% lpl in ashy matrix.

<<Min: 3.5 - 12.6 0.5% Min: Pyrite>>

<<Alt: 3.5 - 12.6 Weak-Moderate Calcite>>

<<Vein: 6 - 7.5 10% Calcium carbonate/Carbonate 60 deg. >> 7 ~5 cm wide QZ-carb veins in rubble and broken zone in RHYvl

11.70 12.30 RHYcw Curdy textured-flow banded (flows, subvolcanics)

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

12.30 12.60 RHYvl Lapilli tuff

12.60 14.00 PEL Equigranular biotite + calcite +/- quartz rock

12.6 - 14: ~sharp crenulated contacts. Varies from BI-CA dominant to local ashy grey dominant (Heterogenous).

<<Alt: 12.6 - 14 Moderate Calcite>>

14.00 28.10 RHYcw Curdy textured-flow banded (flows, subvolcanics)

14 - 28.1: Good flow banded texture. High density of massive QZ-veining. Both upper and lower contacts appear to grade from PEL to RHYva +/- diss BI to RHYcw.

<<Min: 27.6 - 32.5 0.1% Min: Pyrite>>

<<Alt: 14 - 28.1 Weak-Moderate Calcite>>

<<Vein: 14 - 28.6 30% Quartz>> RHYcw with abundant massive QZ-veining with local patchy carbonate and tourmaline blebs. Veins vary from 10-90 cm and appear to be folded/deformed without sharp contacts.

<<Struc: 26.81 - 26.82 Moderate dominant foliation>>

28.10 32.50 PEL Equigranular biotite + calcite +/- quartz rock

28.1 - 32.5: Heterogenous BI-CA meta-pelite with a gradational upper contact and sharp lower contact with RHYva that grades into RHYcw over ~15 cm and RHYi over another ~15cm.

<<Alt: 28.1 - 32.5 Moderate Calcite>>

<<Vein: 31 - 31.1 60% Quartz-Carbonate 65 deg. >> ~5 cm wide QZ-CA vein

<<Struc: 31.2 - 31.4 Weak Fault>>

<<Struc: 32.28 - 32.29 Moderate dominant foliation>>

32.50 39.00 RHYi Aphanitic Rhyolite (intrusion)

32.5 - 39: Upper contact grades from RHYva into RHYcw over ~15 cm and RHYi over another ~15cm. Suggests that RHYi is extrusive with a carapice ??? No brecciated RHYi clasts along contact…

<<Min: 32.5 - 39 1% Min: Pyrite>>

<<Alt: 32.5 - 39 Weak Calcite>>

<<Struc: 35.6 - 35.7 Weak Fault>>

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
Comments:						Parent Hole:	

K16-355 was drilled to test inferred portions of the Krakatoa upper and Krakatoa main lenses.
K16-355 encountered bedrock at 4.5 m depth. The hanging wall felsic package consists of mixed coherent rhyolite, volcaniclastic rhyolite, aphanitic rhyolite, and pelitic sedimentary horizons, to a depth of 185.3 m. Moderate to strong MU-alteration is pervasive from 133.8-187 m. The mafic sill occurs from 185.3-247.5 m. Below the mafic sill the felsic footwall package occurs to the end of the hole (329.7 m), consisting of volcaniclastic rhyolite, sheared BI-MU schist, and fault zones. Below the mafic sill, moderate MU-alteration is pervasive from 244.7-254.6 m. No significant mineralization was encountered in K16-355. Faulting in the footwall may be the Sunda fault zone.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 4.50 OVBN Overburden

4.50 12.00 RHYvl Lapilli tuff

4.5 - 12: Lpl content increases toward the lower contact with RHYcw. Upper portion of unit may be considered overburden, but is broken/rubbly rock of same lithology as bedrock.

<<Min: 4.5 - 32.5 0.5% Min: Pyrite>>

<<Alt: 4.5 - 12.6 Weak-Moderate Calcite>>

<<Vein: 6 - 8 10% Quartz>> QZ-vein in rubble section near overburden-bedrock interface

12.00 12.40 RHYcw Curdy textured-flow banded (flows, subvolcanics)

12.40 12.60 RHYvl Lapilli tuff

12.60 14.30 PEL Equigranular biotite + calcite +/- quartz rock

12.6 - 14.3: Heterogeneous foliated pelitic sediments

<<Alt: 12.6 - 14.3 Moderate Calcite>>

14.30 27.80 RHYcw Curdy textured-flow banded (flows, subvolcanics)

14.3 - 27.8: Well developed flow banded texture with abundant MU-cleavages (non-alteration) which resembles ashy material. Peperitic texture? Abundant massive QZ-veins.

<<Alt: 14.3 - 27.8 Weak Calcite>>

<<Vein: 15.8 - 28.5 35% Quartz-Carbonate>> Zone with abundant massive QZ+/-CA veins varying from 10 cm to 1.5 m wide (core length). Trace disseminated PY+PO in veins.

<<Struc: 27.53 - 27.54 Weak dominant foliation>>

27.80 32.50 PEL Equigranular biotite + calcite +/- quartz rock

27.8 - 32.5: Heterogeneous pelitic sediment with well developed gradational margins, grading from RHYcw to RHYva to PEL.

<<Alt: 27.8 - 32.5 Moderate Calcite>>

<<Struc: 32.4 - 32.41 Moderate dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

32.50 66.60 RHYi Aphanitic Rhyolite (intrusion)

32.5 - 66.6: Light grey to pink, aphanitic rhyolite, with abundant randomly oriented cemented fractures. Upper contact appears to grade from silicic banded to aphanitic. Lower contact is gradational to interlayered with RHYcw (brecciated margin? Flow top breccia on RHYcw with RHYi flowing in pore space??).

<<Min: 32.5 - 66.6 1% Min: Pyrite>>

<<Alt: 32.5 - 70.5 Weak Calcite>>

66.60 70.50 RHYc Rhyolite coherant volcanics

66.6 - 70.5: Dominated by flow banded texture, but with local patches of fine grained ash (?) material and RHYi.

<<Min: 66.6 - 107.7 0.5% Min: Pyrite>>

70.50 77.20 PEL Equigranular biotite + calcite +/- quartz rock

70.5 - 77.2: ~gradational contacts

<<Alt: 70.5 - 77.2 Moderate Calcite>>

<<Vein: 72.27 - 72.3 100% Quartz-Carbonate 65 deg. >> Small QZ-CA vein

<<Struc: 71.2 - 71.6 Weak Fault>>

<<Struc: 71.35 - 71.5 Weak Fault>> Fault or zone of alteration? Disseminated QZ grains in light brown clay alteration

77.20 81.30 RHYc Rhyolite coherant volcanics

77.2 - 81.3: Grades from RHYvl at upper contact to RHYcw over ~30 cm, then into aphanitic rhyolite (RHYi). Broken and foliated lower margin.

<<Min: 77.2 - 81.3 0.5% Min: Pyrrhotite>>

<<Alt: 77.2 - 185.3 Weak Calcite>>

<<Vein: 78 - 81.3 20% Quartz-Sulphide>> Diffuse QZ-CA veining/alteration with minor thin QZ+/-PY veinlets

81.30 81.90 SED undifferentiated Sediment

81.3 - 81.9: PEL? or MAFi? Dark purple-olive green fine grained layer with minor wispy CA. Maybe RHYva. May be similar to WCK in K16-357?

<<Struc: 81.8 - 83.7 Weak Fault>> Zone of broken ground with minor gouge fault planes

81.90 87.20 RHYva Coarse grained to ash tuff

81.9 - 87.2: Fine grained medium grey ash tuff with minor lpl

<<Vein: 84.1 - 85.1 2% Quartz-Carbonate 75 deg. >> Minor thin QZ+CA+/-blebby tourmaline

<<Struc: 86.4 - 86.5 Weak Fault>> Minor gouge fault plane

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
87.20	**105.20**	**RHYvl Lapilli tuff**									
87.2 - 105.2: Unit is dominated by felsic lpl in ash matrix, with local zones of CL-BI lpl or ash-dominant layers.											
		<<Vein: 92.5 - 93 5% Quartz>> Minor folded/ptigmatic (?) QZ-veins in fault/shear zone									
		<<Struc: 89.07 - 89.13 Weak Fault>> Minor gouge fault plane									
		<<Struc: 90.7 - 93.65 Weak-Moderate Fault>> Zone with weak-moderate fault density

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

138.10 140.10 FLZ Fault Zone

138.1 - 140.1: Strong MU-alteration and faulting of rhyolite

<<Struc: 138.1 - 140.5 Strong Fault>> Clast-supported fault gouge breccia, with clasts of RHY and QZ-vein in sericitic matrix.

<<Struc: 138.8 - 143.3 Weak Fault>>

140.10 155.60 RHY undifferentiated rhyolite

140.1 - 155.6: Moderate-strong MU-alteration and shearing have obscured the original texture

<<Alt: 146.4 - 167.1 Strong Muscovite>>

<<Struc: 148.9 - 149.9 Moderate Fault>>

<<Struc: 151.5 - 155.6 Moderate-Strong Fault>>

155.60 157.30 FLZ Fault Zone

<<Struc: 155.6 - 157.3 Strong Fault>> Gouge-supported fault breccia, with clasts of RHY

157.30 181.40 RHY undifferentiated rhyolite

157.3 - 181.4: Well developed continuous transposition foliation. Strong MU-alteration and shearing obscures the texture making the lithology hard to determine (RHYc vs RHYv). Local coherent texture is preserved.

<<Min: 167.1 - 185.3 0.1% Min: Sphalerite>>

<<Min: 167.1 - 185.3 1% Min: Pyrite>>

<<Alt: 167.1 - 176.8 Moderate Muscovite>>

<<Alt: 176.8 - 185.6 Strong Muscovite>>

<<Vein: 179 - 179.2 40% Quartz>> Zone with patchy QZ-veining

<<Struc: 161.2 - 161.4 Moderate-Strong Fault>> Fault gouge

<<Struc: 163 - 163.2 Moderate-Strong Fault>> Fault gouge

<<Struc: 166 - 167.5 Weak-Moderate Fault>> Minor fault planes with ~5 cm of fault gouge

<<Struc: 169.3 - 169.6 Moderate-Strong Fault>> Fault gouge

<<Struc: 172.9 - 173.1 Moderate-Strong Fault>> Fault gouge

<<Struc: 176.2 - 176.21 Strong dominant foliation>>

<<Struc: 176.8 - 180.2 Weak-Moderate Fault>> Zone with weak-moderate faulting. Many sericitic cleavages with minor gouge.

181.40 185.30 RHYc Rhyolite coherant volcanics

181.4 - 185.3: Silica banded rhyolite with MU cleavages. Strong MU-alteration.

<<Min: 181.4 - 185.3 0.5% Min: Pyrrhotite>>

<<Struc: 182.4 - 182.5 Weak-Moderate Fault>> Minor fault gouge surface

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	5/30/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	5/31/2016
Local Elev. (m):				Hole Completed?:	Abandoned	Purpose:	Resource Definition
						Parent Hole:	

Comments:

K16-356 was collared to test down-dip inferred portions of Krakatoa upper lens and explore potential of down-dip Krakatoa main lens. The lithology consists in graphitic calcareous mudstone and mafic ash tuff interlayered in the Wind Lake formation. The hole was abandoned due to unacceptable deviation at low depth, realigned and restarted as K15-357.

Comments:

K16-357 was planned to test the down-dip inferred portions of Krakatoa upper lens and, in addition, to test the exploration potential of down-dip Krakatoa main lens.
Interlayered mafic tuff and graphitic calcareous mudstone of the Wind Lake formation occur to 42.82 m. From 42.82 m the KZK formation occurs and looks to be in a conformable contact with the Wind Lake formation. KZK formation hanging wall consists of volcaniclastic and coherent units that show increasing muscovite alteration from 159.00m to 253.26m. The upper lens occurs as 3 horizons from 252.24 - 257.27 m and comprises a total of 2.51 m of OB ore type (PY/SP/GL/CP/TT/PO). The mafic sill occurs at 257.27m.
Two distinctive units were observed in the hanging wall. A pelite, biotite rich, from 114.12m to 118.89m and a narrow calcareous wacke from 185.90m to 185.65m which may be marker units.
The Main lens has not been intercepted.
Hole K16-357 ends at 381.00m in volcaniclastic units showing weak chlorite alteration and patchy PY/PO up to 3% in some intervals.

0.00 12.00 OVBN Overburden

12.00 12.84 MAFta Coarse grained to ash tuff

12 - 12.84: Mafic ash tuff. Fine grain, light green, calcareous, homogeneous.

<<Min: 12 - 43.42 0.1% Min: Pyrite>>

<<Min: 12 - 147.44 0.5% Min: Pyrrhotite>> Associated with mafic tuff units.

<<Alt: 12 - 18 Moderate-Strong Calcite>> Pervasive in mafic unit.

12.84 21.20 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

12.84 - 21.2: Graphitic mudstone, wavy CA veining, dark blue, thinly foliated crenulated.

<<Alt: 18 - 42.82 Moderate Calcite>>

21.20 22.44 MAFta Coarse grained to ash tuff

21.2 - 22.44: Mafic ash tuff. Light green, fine grain, calcareous.

22.44 25.65 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

22.44 - 25.65: Graphitic mudstone. CA veining, thinly foliated, crenulated.

<<Struc: 24.34 - 24.35 dominant foliation>>

25.65 27.52 MAFt Mafic Volcaniclastics

25.65 - 27.52: Mafic ash tuff. Light green, fine grain, calcareous.

27.52 33.47 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

27.52 - 33.47: Graphitic mudstone, locally highly graphitic, gougy. Core missing, washed during drilling.

<<Struc: 27.9 - 33 Weak Fault>> Probably not an intense structure but gouge washed during drilling and poor recovery.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

33.47 37.60 MAFt Mafic Volcaniclastics

33.47 - 37.6: Core loss. Mafic tuff, light green, fractured.

37.60 42.82 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

37.6 - 42.82: Graphitic mudstone, dark blue, QZ vein/rhyolite locally, large fine grain TML vein (30cm) at lower contact.

<<Min: 42.42 - 81.81 0.5% Min: Pyrite>> Locally aggregated.

<<Vein: 42.1 - 42.52 Quartz-Tourmaline>> QZ,/TML,/CA foliated vein.

42.82 43.48 SEDc calcareous Sediment

42.82 - 43.48: Contact between Wind Lake and KZK formation marked by highly calcareous narrow unit, possibly RHY altered CA.

<<Alt: 42.82 - 43.48 Strong Calcite>> Calcareous interval at contact between Wind Lake and KZK formations.

<<Vein: 42.82 - 58.37 Quartz>> Multiple massive QZ veins (up to 80 cm wide) consisting in about 30 percent of the interval. Contact unit between Wind Lake and KZK formations.

43.48 69.00 RHYva Coarse grained to ash tuff

43.48 - 69: Unit showing large massive QZ veins from 42.82m to 58.37m representing about 30% of the interval). Heterogeneous, high strain lapilli. Some CA rich/brown beds, possibly CA sediments, could be mafic material (from 52.50m to 53.20m, faulted lower contact).

<<Alt: 43.48 - 106.78 Weak-Moderate Calcite>> Lapilli replacement and veining.

<<Struc: 47.5 - 47.51 dominant foliation>>

<<Struc: 52 - 67.5 Trace Fault>> Narrow gouge in joints.

<<Struc: 61.3 - 61.31 dominant foliation>>

<<Struc: 65.3 - 65.31 dominant foliation>>

69.00 69.69 RHYcw Curdy textured-flow banded (flows, subvolcanics)

69 - 69.69: Curdy texture, wavy QZ bands in fin grain bluish matrix.

69.69 75.22 RHYva Coarse grained to ash tuff

69.69 - 75.22: Light grey. Fine grain matrix. Locally angular clasts or crystals, possibly reworked material.

<<Struc: 72.4 - 72.41 dominant foliation>>

75.22 81.81 RHYvl Lapilli tuff

75.22 - 81.81: Fine grain, light grey, mid strain.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 78.2 - 78.21 dominant foliation>>

81.81 93.29 RHYi Aphanitic Rhyolite (intrusion)

81.81 - 93.29: Aphanitic rhyolite, sharp upper contact, texture flow banded/curdy on the edge, locally granular texture. Probably extrusive, large RHYc unit.

<<Min: 81.81 - 92.29 0.5% Min: Pyrite>>

<<Min: 92.29 - 164.45 1% Min: Pyrite>> and in vein associated with QZ.

<<Alt: 81.81 - 93.29 Moderate-Strong Silicification>> RHYi or silicified/albitized zone.

<<Alt: 89.3 - 89.5 Weak Chlorite>> Associated with QZ vein.

<<Alt: 91 - 93.29 Moderate Muscovite>> Silicified MU altered.

93.29 97.46 RHYvl Lapilli tuff

93.29 - 97.46: Light grey, mid strain.

97.46 99.20 RHYcw Curdy textured-flow banded (flows, subvolcanics)

97.46 - 99.2: Flow banded.

99.20 103.00 RHYvl Lapilli tuff

99.2 - 103: Locally BI rich bands (pelitic), high strain, QZ vein (10cm), heterogeneous unit, narrow gouge zone.

<<Alt: 99.2 - 103 Weak Chlorite>>

103.00 106.78 RHYcw Curdy textured-flow banded (flows, subvolcanics)

103 - 106.78: Could be interpreted as RHYi locally. Large QZ vein at lower contact, massive aphanitic to silica banded/ash interbedded. Similar to RHYi seen at 75.22m, different scale.

<<Vein: 105.95 - 106.6 Quartz>> Massive QZ vein.

<<Vein: 106.6 - 106.8 Quarzt-Tourmaline-Sulphide>> QZ vein, fractured, brecciated containing PY/TML.

106.78 108.08 RHYva Coarse grained to ash tuff

106.78 - 108.08: Fine grain, light grain, BI rich (15%).

<<Alt: 106.78 - 108.08 Strong Calcite>> Pelitic material.

108.08 109.27 RHYcw Curdy textured-flow banded (flows, subvolcanics)

108.08 - 109.27: Silica bands/ash interbedded.

<<Alt: 108.08 - 114.12 Weak-Moderate Calcite>> and veining.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

109.27 114.12 RHYvx Quartz and/or feldspar crystal tuff

109.27 - 114.12: Light grey, low to mid strain, some angular clasts, narrow fault gouge zones.

114.12 118.89 PEL Equigranular biotite + calcite +/- quartz rock

114.12 - 118.89: Bluish, highly calcareous fine grain, BI rich, possibly TML bands, gradual upper and lower contacts, Locally BI bands in foliation associated with PO.

<<Alt: 114.12 - 118.89 Strong Calcite>> Pelitic unit.

118.89 120.72 RHYvl Lapilli tuff

118.89 - 120.72: Light grey, mid strain.

<<Alt: 118.89 - 144.98 Weak-Moderate Calcite>> Lapilli replacement and veining.

120.72 138.00 RHYv Rhyolite volcaniclastic

120.72 - 138: Dominantly ash, containing BI porphyroblasts suggesting pelitic material. Low to mid strain.

<<Struc: 135 - 137.4 Weak-Moderate Fault>> 50% gouge, sandy/silty.

138.00 141.24 RHYvl Lapilli tuff

138 - 141.24: Dominantly lapillitic, light grey, mid strain. Could contain crystals.

141.24 141.48 RHYva Coarse grained to ash tuff

141.24 - 141.48: BI porphyroblasts in fine grain, light grey groundmass.

141.48 144.48 RHYvl Lapilli tuff

141.48 - 144.48: Dominantly lapillitic, light grey, mid strain, heterogeneous.

144.48 147.44 RHYcw Curdy textured-flow banded (flows, subvolcanics)

144.48 - 147.44: Curdy flow.

<<Alt: 144.98 - 147.44 Strong Calcite>> Mafic dike.

147.44 148.93 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

147.44 - 148.93: Highly calcareous, fie grain BI, homogeneous, sharp contacts, brownish, PO/PY associated with CA veining, possibly amygdule.

UTM Northing:	6815167.039	Casing Pulled?:	Yes	Dip:	-86.2	Drill Company:	Hytech
UTM Elev. (m):	1393.96	Casing Depth (m):	7.5	Length (m):	348	Drill Rig:	Tech 5000
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	6/2/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/6/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
						Parent Hole:	

Comments:

K16-358 was drilled to test an inferred portion of the down-dip Krakatoa upper, main, and lower lenses. All three lenses were successfully intersected. The planned drill hole length was extended by 20 m to test alteration noted in the footwall. Driller core meter marker block error at 269m (originally labelled by drillers as 266m); all block markers changed below 269m by adding 3m.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

6.30 10.00 RHYvl Lapilli tuff

6.3 - 10: Varies from local coherent flow banded rhyolite to more abundant felsic lpl in ash matrix. Appears to have a gradational lower contact with RHYva (Bl-r).

<<Min: 6.3 - 10 0.5% Min: Pyrite>>

<<Alt: 6.3 - 10 Weak-Moderate Calcite>>

10.00 11.90 RHYva Coarse grained to ash tuff

10 - 11.9: Fine grained grey ash tuff with disseminated Bl and CA porphyroblasts. May correlate with PEL horizons in other holes.

<<Min: 10 - 27.2 0.5% Min: Pyrrhotite>>

<<Alt: 10 - 11.9 Moderate Calcite>>

11.90 13.50 RHYvl Lapilli tuff

<<Alt: 11.9 - 65.5 Weak-Moderate Calcite>>

13.50 14.60 RHYva Coarse grained to ash tuff

13.5 - 14.6: Fine grained grey ash tuff with disseminated Bl and minor rounded silicic clasts

14.60 33.50 RHYvl Lapilli tuff

<<Min: 27.2 - 54.6 0.5% Min: Pyrite>>

<<Struc: 16.1 - 24 Weak Fault>> Zone with moderate fracturing and local fault planes with gouge surfaces

<<Struc: 26.07 - 26.08 Moderate dominant foliation>>

<<Struc: 31.5 - 37 Moderate-Strong Fault>> Moderate to strong fault zone, dominated by gouge-supported fault breccia

33.50 54.60 RHYva Coarse grained to ash tuff

33.5 - 54.6: Local lpl

<<Vein: 44 - 50.6 15% Quartz>> Zone with masive QZ-veining

<<Struc: 37 - 45.7 Weak Fault>> Highly fractured (damage zone) with weak-moderate density of fault planes with gouge

54.60 63.80 RHYi Aphanitic Rhyolite (intrusion)

54.6 - 63.8: Light grey very siliceous (silicified?) unit with locally schistosity and zones of massive aphanitic rhyolite. Where schistosity is present minor disseminated Q-eyes, with disseminated CL+PO+PY can be found.

<<Min: 54.6 - 57.2 2% Min: Pyrite>> Stringers of PY+PO in fractured/foliated RHYi associted with minor Chlorite+/- Muscovite alteration

<<Min: 54.6 - 57.2 1% Min: Pyrrhotite>> Stringers of PY+PO in fractured/foliated RHYi associted with minor Chlorite+/- Muscovite alteration

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 57.2 - 65.5 0.5% Min: Pyrite>>

<<Min: 57.2 - 65.5 1% Min: Pyrrhotite>>

<<Alt: 54.6 - 57.2 Weak Chlorite>>

<<Vein: 54.7 - 55.2 100% Quartz>> Massive QZ vein with disseminated CL-CA blebs

<<Vein: 58.5 - 63.8 20% Quartz-Carbonate>> Thin (~1 cm) to wide (~50 cm) massive QZ-CA veins. Cross-cut all fabrics

<<Struc: 58.2 - 58.4 Weak Fault>>

63.80 65.50 RHY undifferentiated rhyolite

63.8 - 65.5: Local zone of brecciated RHYv (?) between RHYi zones.

<<Alt: 63.8 - 65.5 Moderate Muscovite>>

<<Struc: 64.38 - 64.39 Weak-Moderate dominant foliation>>

65.50 78.00 RHYif feldspar and quartz porphyry intrusions

65.5 - 78: Light grey, apahanitic siliceous groundmass, QZ-FD phyric, rhyolite. Upper margin is brecciated with PO+PY stringers. Lower contact appears to grade into silicified RHYv into PEL.

<<Min: 65.5 - 66.2 2% Min: Pyrite>> Stringers of PY+PO in fractured/foliated RHYi associted with minor Chlorite+/- Muscovite alteration

<<Min: 65.5 - 66.2 1% Min: Pyrrhotite>> Stringers of PY+PO in fractured/foliated RHYi associted with minor Chlorite+/- Muscovite alteration

<<Min: 66.2 - 75.4 0.5% Min: Pyrite>>

<<Min: 66.2 - 75.4 1% Min: Pyrrhotite>>

<<Min: 75.4 - 78 2% Min: Pyrite>> Stringers of PY+PO in fractured/foliated RHYi associted with minor Chlorite+/- Muscovite alteration

<<Min: 75.4 - 78 1% Min: Pyrrhotite>> Stringers of PY+PO in fractured/foliated RHYi associted with minor Chlorite+/- Muscovite alteration

<<Alt: 65.5 - 66.2 Weak Muscovite>>

<<Alt: 65.5 - 66.2 Weak Chlorite>>

<<Alt: 65.5 - 78 Weak Calcite>>

<<Vein: 76.3 - 76.4 100% Quartz>> Fractured massive QZ vein

<<Struc: 76.4 - 76.5 Weak-Moderate Fault>>

78.00 78.60 PEL Equigranular biotite + calcite +/- quartz rock

78 - 78.6: Purple-brown, BI phyric, metapelite or mafic dyke (?). Contact are cooling margins or gradational?

<<Min: 78 - 85.2 1% Min: Pyrite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 78 - 85.2 1% Min: Pyrrhotite>>

<<Alt: 78 - 78.6 Moderate Calcite>>

78.60 81.90 RHYvl Lapilli tuff

78.6 - 81.9: Abundant FD and QZ crystal clasts in well foliated ash matrix. Local pathes of CL-alteration with diss PO+PY.

<<Alt: 78.6 - 100.1 Weak Calcite>>

<<Alt: 81.1 - 81.9 Weak Muscovite>> Intense MU-CL alteration at bottom portion of interval next to RHYi

<<Alt: 81.1 - 81.9 Weak Chlorite>>

<<Vein: 80.1 - 84.8 20% Quartz-Carbonate>> Thin (~1 cm) to wide (~50 cm) massive QZ-CA veins. Cross-cut all fabrics

81.90 86.30 RHYi Aphanitic Rhyolite (intrusion)

81.9 - 86.3: Light grey, aphanitic, siliceous rhyolite. Internal brecciated contact between two (flows or dykes) that resembles a fow top breccia. (at 85.2 m). This breccia is right way up grading from massive RHYi to brecciated RHYi. Stringers of PO+PY have cemented the breccia.

<<Min: 85.2 - 86.3 2% Min: Pyrite>> Stringers of PY+PO in fractured/foliated RHYi associted with minor Chlorite+/- Muscovite alteration

<<Min: 85.2 - 86.3 2% Min: Pyrrhotite>> Stringers of PY+PO in fractured/foliated RHYi associted with minor Chlorite+/- Muscovite alteration

<<Alt: 86.2 - 86.7 Weak Chlorite>>

86.30 91.00 RHYvl Lapilli tuff

<<Min: 86.3 - 92.4 3% Min: Pyrrhotite>> Associated with weak-moderate MU-alteration around RHYi

<<Alt: 86.3 - 86.7 Strong Muscovite>> Alteration from RHYi?

<<Alt: 86.7 - 92.4 Weak Muscovite>>

<<Struc: 89.1 - 91.9 Moderate Fault>> Moderate fault intensity with moderate MU-alteration and massive QZ-veining

91.00 96.50 RHYva Coarse grained to ash tuff

91 - 96.5: Lower contact displays soft sediment deformation. Flame and load structures, which indicate a right way up direction.

<<Min: 92.4 - 105 1% Min: Pyrrhotite>>

<<Vein: 91.3 - 92.5 50% Quartz-Carbonate>> Massive QZ-CA veining in zone of moderate to strong alteration and faulting

96.50 100.10 RHYva Coarse grained to ash tuff

<<Struc: 98.91 - 98.92 Weak dominant foliation>>

<<Struc: 99 - 200 Moderate dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

100.10 100.50 PEL Equigranular biotite + calcite +/- quartz rock

100.1 - 100.5: Zone with two ~15 cm thick layers of pelitic sediment with sharp lower contacts and gradational upper contacts.

<<Alt: 100.1 - 100.5 Moderate Calcite>>

100.50 125.60 RHYva Coarse grained to ash tuff

100.5 - 125.6: Weak to moderately ash tuff

<<Min: 105 - 125.6 1% Min: Pyrrhotite>> Stringers of PY+PO in fractured/foliated RHYi associted with minor Chlorite+/-Muscovite alteration

<<Alt: 100.5 - 148.9 Weak Calcite>>

<<Alt: 105 - 123.6 Weak Muscovite>>

<<Alt: 123.6 - 135.4 Moderate Muscovite>>

<<Vein: 110.8 - 110.9 100% Quartz>> Massive QZ-vein

<<Struc: 100.5 - 100.51 Moderate-Strong Contact>> Sharp contact between overlyine PEL and underlying RHYva

<<Struc: 102.99 - 103 Weak-Moderate dominant foliation>>

<<Struc: 104.8 - 105 Weak Fault>>

						Parent Hole:	

Comments:

Collared to test the inferred portion of Krakatoa Main lens 50 m down-dip of K15-297.
The top of the hole K16-359 consists in Wind Lake formations characterized by calcareous graphitic mudstone and mafic tuff interlayered. The contact with KZK formations lays at 48.40m. From 48.80m to 258.00m the lithology in made up of coherent and volcaniclastic rhyolite with local pelitic content. A fault zone is observed from 188.70m to 191,10m.
Several massive sulfide lens containing PY/SP/GL/MG/CP are intercepted from 249.10m to 267.86m (upper lens) for a total of 10.67m of OB and OI domains. Muscovite alteration increases progressively on top of the mineralization.
The mafic sill is encountered right underneath the first mineralized zone. The lower (main?) lens-OB/OA/OF domains- is intercepted at 339.90m at contact with volcaniclastic rhyolite muscovite altered.
Hole K16-359 ends at 390.00m in sedimentary unit containing cordierite.
The lower/main lens is not well developed (1.77m thick).

0.00 12.00 OVBN Overburden

12.00 21.10 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

12 - 21.1: Dark blue, fine grain, wavy CA veining. Calcareous graphitic mudstone. Thin foliation. QZ/CA veins.

<<Min: 12 - 80.7 1% Min: Pyrrhotite>> Along the foliation in MAFt.

<<Alt: 12 - 43.67 Moderate Calcite>> And veining. Locally strong in SED and weak in MAFt units.

<<Struc: 21 - 21.01 dominant foliation>>

21.10 22.12 MAFta Coarse grained to ash tuff

21.1 - 22.12: Calcareous mafic tuff, fine grain, light green, CA in foliation, elongated PO, sharp contacts. QZ/CA veins.

22.12 24.34 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

22.12 - 24.34: Dark blue, fine grain, wavy CA veining. Calcareous graphitic mudstone. Thin foliation. QZ/CA veins and pods. Locally silica banded.

<<Struc: 23 - 23.01 dominant foliation>>

24.34 27.03 MAFta Coarse grained to ash tuff

24.34 - 27.03: Calcareous mafic tuff, fine grain, light green, CA in foliation, elongated PO, sharp contacts.

<<Struc: 26.6 - 26.61 dominant foliation>> CA veinlets in foliation.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

27.03 34.00 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

27.03 - 34: Dark blue, fine grain, wavy CA veining. Calcareous graphitic mudstone. Thin foliation. Locally strongly graphitic.

<<Struc: 32.7 - 32.71 Contact>> Contact mudstone/mafic tuff bed (dominant foliation?).

34.00 36.23 CHT Chert

34 - 36.23: Light green, silicified, banded.

36.23 41.64 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

36.23 - 41.64: Dark blue, wavy CA bands. Calcareous wacke from 37.66m to 38.00m, fine grain. QZ/CA veins. Silica/carbonaceous/CA bands, could be bedding.

<<Struc: 36.85 - 36.86 dominant foliation>>

<<Struc: 37.45 - 37.46 dominant foliation>>

41.64 42.87 SEDc calcareous Sediment

41.64 - 42.87: Banded brown biotite/CA/MU. Sharp lower contact marked by QZ vein and muscovite patch.

<<Min: 41.9 - 80.7 0.1% Min: Pyrite>>

<<Struc: 41.71 - 41.72 dominant foliation>>

42.87 43.67 MDS Carbonaceous Mudstone & Tuffaceous Mudstone

42.87 - 43.67: Wavy, crenulated CA veining. Dark blue, fine grain.

43.67 48.40 MAFt Mafic Volcaniclastics

43.67 - 48.4: Containing 30% of carbonaceous material. Singular CL altered pod showing pillow style structure, thinly laminated, SI veinlets/PY, possibly fold nose.

<<Alt: 43.67 - 80.7 Weak-Moderate Calcite>> Strong in narrow SED bands.

<<Struc: 46.7 - 46.71 dominant foliation>>

48.40 57.90 RHYva Coarse grained to ash tuff

48.4 - 57.9: Unit showing contact between Wind Lake and KZK formation marked by large massive QZ vein (bout 3.00m wide) at upper contact and faulted at lower contact. Mix of MAFt and RHYva (intermediated composition, low silica content). QZ/ferrocarbonate/sulfide veins.

<<Vein: 48.8 - 51.8 Quartz>> Massive QZ vein at contact between Wind Lake and KZK formations. Containing TML/PO/PY, vuggy.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 52.43 - 52.44 dominant foliation>>

<<Struc: 55 - 57.5 Moderate Fault>>

57.90 78.11 RHYva Coarse grained to ash tuff

57.9 - 78.11: Blue/grey, probably biotite rich, epiclastic sediments. Intermediate composition ash tuff. Locally mixed with narrow SEDc layers (banded, BI/CA/MU). Possibly amygdules locally. Low silica content, foliated. Rare carbonaceous bands, could be interpreted as MDSt.

<<Struc: 61.28 - 61.29 dominant foliation>>

<<Struc: 62.97 - 62.98 dominant foliation>>

<<Struc: 64.46 - 64.47 dominant foliation>>

<<Struc: 75.74 - 75.75 dominant foliation>>

78.11 80.70 RHYvl Lapilli tuff

78.11 - 80.7: Blue/grey, locally BI or carbonaceous in foliation. Mid strain.BI content decreases downhole. Locally brecciated texture associated with weak shearing.

<<Struc: 78.82 - 78.83 dominant foliation>>

80.70 93.07 RHYi Aphanitic Rhyolite (intrusion)

80.7 - 93.07: Aphanitic, beige/grey unit containing elongated pebble size clasts, fractured. Marked by a large massive QZ vein at upper contact.

<<Min: 82.9 - 93.07 2% Min: Pyrite>> In RHYi.

<<Min: 82.9 - 93.07 0.1% Min: Pyrrhotite>> In RHYi.

<<Alt: 80.7 - 93.07 Trace Calcite>>

<<Vein: 80.7 - 80.9 Quartz>> Massive QZ vein at RHYi upper contact.

<<Struc: 86.55 - 86.56 Vein>> PY veinlets in RHYi.

<<Struc: 88.4 - 89.5 Weak-Moderate Shear>> Brecciated, in RHYi. Angle of the main fracture set.

93.07 99.17 RHYvl Lapilli tuff

93.07 - 99.17: Light grey, mid strain, narrow gouge zone, BI content increases at lower downhole.

<<Min: 93.07 - 145.15 0.1% Min: Pyrite>>

<<Min: 93.07 - 145.15 1% Min: Pyrrhotite>> Concentrated in fine grain, contact with ash/pelite and few veinlets.

<<Alt: 93.07 - 141.43 Weak-Moderate Calcite>> Lapilli replacement and veining.

<<Struc: 93.4 - 93.41 dominant foliation>>

99.17 103.28 RHY undifferentiated rhyolite

99.17 - 103.28: Silicic bands and weak curdy texture locally to unfoliated. Light grey,

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

103.28 103.75 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

103.28 - 103.75: Mafic dike. Sharp contacts, medium to coarse grain, finer on the edge, BI/MU/AK.

103.75 107.02 RHYv Rhyolite volcaniclastic

103.75 - 107.02: Containing few BI. Light grey , foliated, some silicic bands locally, fine grain homogeneous groundmass at upper contact, clastic at lower contact.

<<Struc: 105.1 - 105.11 dominant foliation>>

107.02 108.68 PEL Equigranular biotite + calcite +/- quartz rock

107.02 - 108.68: Dark grey to black, fine grain BI, thin foliation, CA veinlets, gradual contact with ash layer interbedded.

108.68 111.45 RHYvl Lapilli tuff

108.68 - 111.45: Possibly xtl, subangular clasts. Could be low strained lapilli. Heterogeneous, ash a upper contact, fine grain at lower contact. Light grey.

111.45 113.00 PEL Equigranular biotite + calcite +/- quartz rock

111.45 - 113: Pelitic material content increases downhole. Fine grain BI, speck of ferrocarbonate mineral, gradual contacts.

<<Struc: 112.8 - 112.81 >>

113.00 113.68 RHYva Coarse grained to ash tuff

113 - 113.68: Ash tuff, light grey containing few BI, homogeneous, light grey.

113.68 118.03 PEL Equigranular biotite + calcite +/- quartz rock

113.68 - 118.03: Fie to medium grain, heterogeneous. Dark grey to black. Two foliation observed. PY and CA content.

118.03 120.49 PEL Equigranular biotite + calcite +/- quartz rock

118.03 - 120.49: Biotite rich, containing 40 % of ash mixed.

120.49 124.85 RHYva Coarse grained to ash tuff

120.49 - 124.85: Biotite rich, coarse grain on the edge, fading out at lower contact., Fine grain groundmass.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

124.85 128.49 RHYvl Lapilli tuff

124.85 - 128.49: Light gray, mid strain, CA replacing lapilli, specks of BI in fine grain (ash) groundmass.

128.49 134.11 RHYc Rhyolite coherant volcanics

128.49 - 134.11: Heterogeneous unit, grey/gray, MU altered, locally flow banded.

<<Alt: 128.49 - 134.11 Moderate Muscovite>>

134.11 141.43 RHYcw Curdy textured-flow banded (flows, subvolcanics)

134.11 - 141.43: Strongly siliceous, containing massive QZ veins consisting in 20% of the unit. Light green groundmass altered MU. PY/PO in fracture.

<<Alt: 134.11 - 141.43 Moderate-Strong Muscovite>>

<<Vein: 137.8 - 140 Quartz>> Multiple massive QZ veins consisting in 70% of the interval crosscutting rhyolite flow.

141.43 142.98 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

141.43 - 142.98: Calcareous, fine grain on the edge, sharp upper and lower contacts (QZ vein).Grey to black in its center, possibly amygdules. CA banded.

<<Alt: 141.43 - 142.98 Strong Calcite>> Mafic dike.

142.98 146.90 RHYcw Curdy textured-flow banded (flows, subvolcanics)

From (m)	To (m)	Width
144.00	145.00	1.00

142.98 - 146.9: Locally CL altered, MU altered, greenish to yellow, PY/PO in fracture.

<<Min: 145.15 - 146.64 2% Min: Pyrite>>

From (m)	To (m)	Width
145.00	146.00	1.00

<<Min: 145.15 - 146.64 1% Min: Pyrrhotite>>

From (m)	To (m)	Width
146.00	146.90	0.90

<<Min: 146.64 - 184 0.5% Min: Pyrrhotite>> Fine grain, elongated.

<<Min: 146.64 - 188.7 0.1% Min: Pyrite>>

<<Alt: 142.98 - 143.5 Moderate-Strong Muscovite>>

<<Alt: 142.98 - 221 Weak-Moderate Calcite>> Lapilli replacement and veining.

<<Alt: 146.15 - 146.75 Moderate-Strong Chlorite>>

146.90 149.69 RHYc Rhyolite coherant volcanics

From (m)	To (m)	Width
146.90	148.00	1.10

146.9 - 149.69: Large SI/feldspar (?) bands (1 to 2cm wide), Fractured, PY/PO infill. Possibly rhyolite dome.

From (m)	To (m)	Width
148.00	149.00	1.00

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

149.69 153.92 RHYcw Curdy textured-flow banded (flows, subvolcanics)

149.69 - 153.92: Silicic bands, altered MU, light green, heterogeneous. Dark PY/QZ wavy clots, patchy RHYcw interlayered.

153.92 160.54 RHYvl Lapilli tuff

153.92 - 160.54: Light grey, low to mid strain lapilli, patchy CA in fine grain, light gray layers (possibly mud) containing fine elongated PO. Locally secondary foliation/pseudo fragmental (?).Upper contact marked by dramatic MU alteration decreasing.

<<Alt: 153.92 - 173.1 Moderate Muscovite>>

<<Struc: 155.3 - 155.75 Weak Shear>>

160.54 164.24 RHYva Coarse grained to ash tuff

160.54 - 164.24: Light grey, large lapilli up to 4 cm wide/silica rich, mid strain.

164.24 173.10 RHYva Coarse grained to ash tuff

164.24 - 173.1: Light grey/heterogeneous, low to mid strain, wavy dark QZ/PY clots/patch concentrated at lower contact.

173.10 174.53 RHYva Coarse grained to ash tuff

173.1 - 174.53: Low CL content. Mid strain, grey/banded. Mixed with ash. Medium to large lapilli.

174.53 178.76 RHYva Coarse grained to ash tuff

174.53 - 178.76: Heterogeneous texture, dominantly ash (fine grain/light grey). Some PY/QZ dark patch. Rare QE.

178.76 181.15 RHYvl Lapilli tuff

178.76 - 181.15: Low CL content.

<<Struc: 180.09 - 180.1 dominant foliation>>

181.15 184.77 RHYvl Lapilli tuff

181.15 - 184.77: Light grey, low lapilli content, fine grain groundmass.

184.77 185.88 RHYva Coarse grained to ash tuff

184.77 - 185.88: Light grey, homogeneous, fine grain, planar foliation.

<<Struc: 185.65 - 185.66 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

185.88 188.70 RHYcw Curdy textured-flow banded (flows, subvolcanics)

185.88 - 188.7: Strong muscovite alteration, QZ veins at lower contact, wavy silica flow bands, gradual upper contact.

<<Alt: 185.88 - 190.56 Moderate-Strong Muscovite>>

188.70 190.10 FLZ Fault Zone

188.7 - 190.1: Fault breccia. Polylithic. QZ/rhyolite/PY clasts. MU alteration. Pinkish mineral associated, could be feldspar

<<Min: 188.7 - 190.1 1% Min: Pyrite>> Clasts in fault breccia.

<<Struc: 188.7 - 190.1 Moderate-Strong Fault>> Fault breccia containing PY/rhyolite/QZ clasts and moderate shearing.

190.10 191.92 RHYv Rhyolite volcaniclastic

190.1 - 191.92: Light grey, weak MU alteration. Possibly calcareous sediments or ash from 191 to 191,40m (maybe mafic dike).

<<Min: 190.1 - 195.3 0.1% Min: Pyrite>>

<<Alt: 190.56 - 202.4 Weak-Moderate Muscovite>>

191.92 193.30 RHY undifferentiated rhyolite

191.92 - 193.3: Faulted/sheared rhyolite, 40 cm of gouge.

<<Struc: 191.92 - 195.3 Moderate-Strong Fault>> Fault gouge over 40 cm, shearing in rhyolite unit.

193.30 213.75 RHYvl Lapilli tuff

193.3 - 213.75: Light grey, dark patch of PY/QZ (locally wavy, deformed along the foliation. Brecciated texture from 209.05m to 210.51m, sub angular clasts, weak CL alteration/weak shearing. Locally patch of BI/CL/QZ altered lapilli. Heterogeneous texture. Trace of late muscovite alteration in secondary foliation.

<<Min: 195.3 - 210 5% Min: Pyrite>> QZ/PY patch and disseminated.

<<Min: 195.3 - 236.65 2% Min: Pyrrhotite>> Fine grain, elongated along the foliation.

<<Min: 210 - 236.65 0.5% Min: Pyrite>>

<<Struc: 203.52 - 203.53 dominant foliation>>

<<Struc: 206.04 - 206.05 dominant foliation>>

213.75 221.14 RHYvl Lapilli tuff

213.75 - 221.14: Weak to moderate CL alteration. Mid strain.

<<Alt: 213.75 - 227.25 Moderate Chlorite>> Lapilli replacement.

<<Alt: 221 - 249.1 Trace Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
221.14	**227.25**	**RHYvl Lapilli tuff**									
221.14 - 227.25: Well marked foliation, high strain. Weak original muscovite alteration.											
<<Struc: 225 - 225.01 dominant foliation>>											
227.25	**229.34**	**RHY undifferentiated rhyolite**									
227.25 - 229.34: Dark blue, BI rich unit, possibly carbonaceous content. Gradual contacts. Foliation weakly crenulated											
229.34	**231.83**	**RHYc Rhyolite coherant volcanics**									
229.34 - 231.83: High silica content, sharp texture changing at lower contact.											
231.83	**236.65**	**RHYvl Lapilli tuff**									
231.83 - 236.65: Light grey, weak muscovite alteration, large massive QZ vein at lower contact.											
<<Vein: 236.06 - 236.65 Quartz>> Massive QZ vein, containing muscovite altered rhyolite. Mark the beginning of the original muscovite alteration as well as PO content drop down.											
<<Struc: 232.42 - 232.43 dominant foliation>>

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/9/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
Comments:						Parent Hole:	

Succesfull test upper, main and lower Krakatoa lens. Footwall below thin lower lens (OC) was remarkably uniform RHYvl. 274.40-275.60: Thin unit of qtz-calcite of unknown origin (related to mineralization?) below lower lens. Three sections of RHYcf between 49.80-89.12m and typical RHYcw unit, about 7 m thick (core length), above upper lens.

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Rob Duncan
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	6/15/2016
UTM Easting	415048.707	Core Size:	HQ3	Azimuth:	359.95	Date Logging Complete:	6/16/2016
UTM Northing:	6815308.954	Casing Pulled?:	Yes	Dip:	-48.8	Drill Company:	Hytech
UTM Elev. (m):	1385.429	Casing Depth (m):	9	Length (m):	68.9	Drill Rig:	Tech 5000
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	6/9/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/10/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Metallurgical
Comments:						Parent Hole:	

K16-361 was designed to intersect the up-dip near surface portion of the ABM deposit to provide a sample suitable for metallurgical testing. The hole was drilled down the dip of the ABM lens. The hole intersected OB mineralization of the ABM lens at the overburden bedrock interface @ 7.57m and continued to 39.48m with a narrow interval of weakly developed OA mineralization from 21.45 - 22.79 m; RHYva from 27.77 - 30.78m; and muscovite altered RHY from 34.00 - 36.28m.
Below the massive sulphide lens, muscovite +/- chlorite altered RHYvl was encountered to 48.42m followed by the MAFi footwall mafic to the E.O.H at 68.9m

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Metallurgical
						Parent Hole:	

Comments:

The purpose of K16-362 was to collect metallurgical samples of the up-dip portion of the ABM lens. The hole collared into bedrock at 22.72m; the hanging wall consisted of RHY and MDSt. Mineralization was first encountered at 60.28m, and continued to a depth of 89.08m; the lens consisted of alternating OA and OB, with small zones of OH, OF, and OJ. RHY continued to a depth of 146.91m, with OC mineralization encountered between 118.8-121.48m. Banded sulphides surrounded the lens, with mineralization visible from 118.16-122.92m. A MAFi sill occurred from 124.47-133.79m, with a zone of OJ (127.3-128.1m). RHYi was encountered at 146.91m, and ended at 152.88m where the second MAFi sill began.

Comments:						Parent Hole:	

K16-363 is a 75m step out from K15-277 that tests the down-dip potential of the Krakatoa upper lens under the hypothesis that the upper lens is equivalent to the ABM lens. Two significant massive sulphide lenses were intersected from 285.58 - 288.45 m and 323.17 - 344.00 m respectively consisting of OA and OB style mineralisation.

197.78	**203.65**	**RHYi Aphanitic Rhyolite (intrusion)**	197.78	199.00	1.22						
197.78 - 203.65: 199.40-202.25: brecciated and qtz flooded RHYi with chlorite aggregates - replacement at upper contact and in cm size altered clasts. White calcite (replacing feldspar?) filling - pegmatitic 'brain rock' in appearance. Blebs, stringers and local zones of pyrite breccia matrix. Fluid - pyrite rich RHYi differentiate? 202.25-203.65: brecciated, silicified and weakly pyritized RHY - intensity decreases down hole.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-364

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Rob Duncan
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	6/17/2016
UTM Easting	414795.816	Core Size:	HQ3	Azimuth:	0.3	Date Logging Complete:	6/19/2016
UTM Northing:	6815348.846	Casing Pulled?:	Yes	Dip:	-59	Drill Company:	Hytech
UTM Elev. (m):	1400.502	Casing Depth (m):	6	Length (m):	105	Drill Rig:	Tech 5000
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	6/12/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/13/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Metallurgical
Comments:						Parent Hole:	

K16-364 was designed to provide a metallurgical sample for the up - dip edge of the ABM deposit. The hole successfuly intersected two main stacked lenses of OB/OA massive sulphides from 5.65- 36.28m with narrow intervals of RHYv and RHYva between @ 26.05 - 26.70m; 29.26 - 30.42m; 33.37 - 34.84m and 35.31 - 35.84m.
Below the massive sulphides, a sequence of MAFi intruded by RHYi was encountered. Sections of MAFi exhibited foliaform replacement by PY - SP and were sampled such as 103.5 - 105m.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-365

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Alicia Vainio
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	6/22/2016
UTM Easting	414747.648	Core Size:	HQ3	Azimuth:	0.9	Date Logging Complete:	6/26/2016
UTM Northing:	6815398.31	Casing Pulled?:	Yes	Dip:	-53.6	Drill Company:	Hytech
UTM Elev. (m):	1409.232	Casing Depth (m):	10.5	Length (m):	183	Drill Rig:	Tech 5000
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	6/13/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/14/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Metallurgical
Comments:						Parent Hole:	

K16-365 is designed to provide a metallurgical sample from the up-dip portion of the ABM deposit.
K16-365 successfully interesected massive sulphide mineralization consisting of OI/OB/OA styles from 34.64m - 148.76m with numerous narrow RHY/RHYcw layers between MXSX lenses.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-366

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Rob Duncan
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	6/22/2016
UTM Easting	414676.455	Core Size:	HQ3	Azimuth:	359.8	Date Logging Complete:	6/23/2016
UTM Northing:	6815345.271	Casing Pulled?:	Yes	Dip:	-62.9	Drill Company:	Hytech
UTM Elev. (m):	1424.284	Casing Depth (m):	9	Length (m):	90	Drill Rig:	Tech 5000
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	6/15/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/15/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Metallurgical
Comments:						Parent Hole:	

K16-366 was designed to provide material for metallurgical testng from the up-dip portions of the ABM lens.
The hole succesfully intersected MXSX mineralization from beneath the OVBN @ 8.57m to 16.57m consisting of OB and OA ore types. Additional MXSX was intersected from 30.94 - 36.49m; 40.71 - 51.35m; 63.77 - 64.86m and 65.70 - 66.00m, all consisting of the OB ore type.
A thick intersection of RHYi was intersected below mineralization and intrudes into possible RHYva. The upper contact of RHYi shows possible replacement by sulphides to form OI. RHYi also exhibits silica and cabonate filled vesicles including remnant crystal forms indicating exsolution of volatiles.

Downhole Surveys:

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/18/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
Comments:						Parent Hole:	

K16-367 was drilled to test inferred portions of the Krakatoa upper and main lenses. As well as detailed geotechnical logging for proposed underground mine.
K16-367 encountered bedrock at 8.7 m. From 8.7-118.2 m, the felsic hanging wall package is encountered, with a zone of OJ mineralization from 107.8-111.5 m. The mafic sill occurs from 118.2-173.1 m, with zones of mineralization from 147.5-148.2 (OJ), 151.9-152.8 (OJ and OB), and 155.1-156.1 (OK). Below the mafic sill three lenses of massive sulfide occur: OK from 173.1-177.1 m (OK), 178.8-180 m (OK), and 184.3-188.8 m (OB). Each lens is separate by strongly MU-altered rhyolite. Below these lenses the mafic sill occurs again (188.8-207.6 m), with minor OJ mineralization at the lower contact (207.6-207.9 m). Below the OJ mineralization the felsic footwall package persists to 273.1 m with decreasing MU-alteration. From 273.1-282 m (EOH) a moderately to strongly faulted CL-BI unit (SED?) occurs.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/20/2016
Local Elev. (m):				Hole Completed?:	Abandoned	Purpose:	Exploration
Comments:						Parent Hole:	

K16-368 is designed to test for ABM and Krakatoa mineralization fault offset down and to the south east of the Sunda and Fault Creek Faults.
K16-368 intersected fault damaged rocks from the collar. A gross stratigraphy of MDS followed by MU altered RHY followed by MAFi is observed and preserved to 118.25m despite faulting. From 118.25 - 145m E.O.H, FLZ with milled fragments of RHY within a clay gouge matrix of MDS and RHY persists.
Massive sulphide OB mineralization was intersected from 100.74 - 101.35m, 103.9 - 105.42m and 108.4 - 108.73m hosted within and at the edge of blocks of MAFi. These are interpreted as possible faulted blocks of Krakatoa between the Sunda and Fault Creek Faults. If correct, these occur approximately 40m shallower than Krakatoa itself.
A boulder and cobbles of OB mineralization are encountered within the fault from 125.00 - 128.00m.

The hole was abandoned at 145.00m after the hole got stuck due to extensive faulting and swelling clays.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K16-369

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	6/27/2016
UTM Easting	415240.268	Core Size:	HQ3	Azimuth:	31.7	Date Logging Complete:	7/1/2016
UTM Northing:	6815212.141	Casing Pulled?:	Yes	Dip:	-70.9	Drill Company:	Hytech
UTM Elev. (m):	1441.236	Casing Depth (m):	4.5	Length (m):	450	Drill Rig:	Tech 5000
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	6/17/2016
Local Northing:		Cemented?:	No	Core Storage Loc.:	KZK Camp	Drill Completed:	6/23/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Exploration
Comments:						Parent Hole:	

K16-369 was drilled as a step out from K15-263 and tests the down-dip potential of the Krakatoa upper lens under the hypothesis that the upper lens is the equivalent of the ABM lens.
K16-369 encountered bedrock at 4.5 m, where it collared into the Wind Lake Formation, which persists from 4.5-33.3 m, consisting of mudstones and mafic tuffs. Below the Wind Lake Formation, the felsic hanging wall (Kudz Ze Kayah Formation) was encountered to a depth of 369.2 m, where massive sulfide was first encountered. Moderate to strong MU-alteration is encountered from 301-369.2 m. From 369.2-372.8 m, heavily disseminated to massive mineralization was encountered, consisting of OF, OJ, and OI. From 372.8-385 m, strongly MU+/-CL altered rhyolite occurs. From 385-392.9 m massive and minor heavily disseminated sulfide was encountered, consisting of OA, OJ, and chalcopyrite-rich OC mineralization styles. Below the massive sulfide weak to moderately altered felsic volcaniclastics occur to the end of the hole (450 m).
Note that no CL-BI-CA schist (MAFi) was encountered within this hole, yet the hanging wall and footwall are very similar to that observed elsewhere at Krakatoa and ABM.

UTM Northing:	6815186.12	Casing Pulled?:	Yes	Dip:	-80	Drill Company:	Hytech
UTM Elev. (m):	1386.375	Casing Depth (m):	6	Length (m):	280.5	Drill Rig:	Tech 5000
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	6/18/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/20/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Resource Definition
Comments:						Parent Hole:	

K16-370 was drilled to test inferred portions of the Krakatoa main and upper lenses. As well K16-370 was used for detailed geotechnical logging for the proposed underground mine.
K16-370 intercepted bedrock at 6.8 m. The felsic hanging wall package occurs from 6.8-130 m, consisting of mixed rhyolites and pelitic sediments. The mafic sill was encountered from 130 m to 139.1 m, followed by OJ mineralization from 139.1-140.6 m. Undifferentiated rhyolite was encountered from 140.6-145.7, with heavily disseminated sulfides (OI) from 141.7-142.3 m. Below this rhyolite massive sulfide (OA) occurs from 145.7-146.9 m. Another horizon of undifferentiated and altered rhyolite occurs from 146.9-148.4 m. Below this rhyolite another massive sulfide (OB) lens occurs from 148.4-150.7 m. The mafic sill occurs from 150.7-224.2 m, with 3 more lense of heavily disseminated to massive sulfide lenses, consisting of OJ (174.6-175.1 m), OF (180.8-181.7 m), and OB (198.1-199.4 m and 200.1-200.45 m). There is one more massive sulfide (OB) lens at the lower contact of the mafic sill from 224.2-224.6 m. Below this lens the felsic footwall package persists to the end of the hole (280.5 m) with weak alteration.
K16-370 intersected 9 separate horizons of mineralization with a total thickness of 9.05 m of ore mineralization.

Comments:						Parent Hole:	

K16-371 is designed to provide detailed geotechnical information for the pit wall at Krakatoa.
K16-371 intersected the expected package of RHYi amd MAFi rock units followed by muscovite altered RHYv from 75.22 - 97.88m above another MAFi unit from 97.88 - 100.55m. Below this, an interval of OB style mineralization was intersected from 100.55 - 100.73m and is interpreted to be equivalent to the Krakatoa Lower lens. Beneath this mineralization, RHYc with 5% PY was intersected until the E.O.H at 117m.

Comments:

K16-372 is designed to test a package of KZK Formation stratigraphy located on the south - east side of the Sunda and Fault Creek Fault. K16-372 is collared in the vicinity of the "Core Rack" VTEM anomaly.

K16-372 successfuly drilled volcano-sedimetary stratigraphy of the KZK Formation and is thought to have returned feldspar augen diorite of the North Lakes Formation @ 582.84m to 597m E.O.H.

K16.372 collared in felsic rocks immediately followed by the MAFi footwall sill to 39.26m. At this location it is only approximately 25m thick and was not host to any mineralization; however, very weak BI destructive alteration was observed. A sequence of muscovite altered and py-po bearing RHYv/vl/vx are encountered to approximately 225m depth and broadly correlate to similar altered and pyritic rocks encountered in the footwall of Krakatoa.

Chlorite altered and po mineralized RHYva is encountered in short intervals from approximately 260 - 280m and may represent significant distal alteration horizons to economic mineralization.

Various volcaniclastic units (RHYv, vx, vl) continue with minor pelitic sediments (PEL) and mafic dykes (MAFi) to 416.7m where mudstones are encountered (MDS, MDSc, CHT) and are thought to correlate with the "Lower Sedimentary Sequence" of the KZK formation as depicted on property maps and on GP4F drill sections.

Disseminated to wispy stringer style po, cp mineralization is encountered within a chert encountered at 423.17 - 425m depth and wispy stringer py-po-cp-sp-gl mineralization in chlorite altered RHYvl is encountered above @ 412.40 - 412.57m. These occurences at, or near, a significant time horizon may be important vectors for more extensive mineralization elsewhere at or near this horizon.

A mixed package of RHYvl and PEL with felsic dyke intrusions, coded as RHYi with "FELSIC DYKE" in the commetns field, begins @ 523.7m with an increasing component of PEL to 582.84m down hole where a feldspar augen Bippo diorite is encountered and may correlate with deformed intrusive rocks of the North Lakes Formation. Alternatively, it could be a diorite intrusion deep within the KZK formation.

Summary conversations with the geophysists indicate that the downhole EM survey picks up some early time results that correlates well with the pyritic volcaniclastic rocks at the top of the hole, bu no significant off hole conductors were encountered here or elsewhere down the hole.

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	6/23/2016
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/26/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
						Parent Hole:	

Comments:

K16-373 is designed to provide detailed geotechnical information of the East fault structure and north wall stability as well as the footwall conditions.
The expected stratigraphy consisting of MAFi, Rhyva and RHYi was interesected.
The East Fault was first encountered at 115.68m.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

18.80 48.20 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green FMG

18.8 - 48.2: Strongly foliated calcareous fine to medium grained mafic cut by several zones of fault gouge and two significant QZ+CA veins. Strongly calcareous up hole with patchy pale green calcareous domains, white granular calcite rhombs to 5mm and thin calcite veinlets. Calcareous alteration gives way down hole to stronger biotite and muscovite alteration with biotite defining foliation and muscovite occuring as patchy pale green to buff coloured alteration in the groundmass. Both biotite and muscovite bleaching increase in intensity towards underlying contact with OJ.

<<Alt: 18.8 - 28.4 Moderate Calcite>> Patchy pale green domains react in the groundmass, granular rhombs to 5mm thin chaotic veinlets along fractures

<<Alt: 28.4 - 46.2 Weak Calcite>>

<<Alt: 35.4 - 38.9 Weak Biotite>> appears to define a foliation due to previously foliated mafic domains. 2-3 mm laths oriented randomly in up to 1 cm aggregates.

<<Alt: 37.8 - 47.3 Weak Muscovite>> patchy "bleaching of the groundmass to pale yellow

<<Alt: 38.9 - 46.2 Moderate-Strong Biotite>> Similar texture as above increasing in intensity downhole toward contact with OJ.

<<Alt: 46.2 - 48.2 Moderate Calcite>>

<<Alt: 47.3 - 48.8 Moderate-Strong Muscovite>> pervasive through groundmass of mafic

<<Vein: 21.1 - 21.8 Calcite>>

<<Vein: 31.3 - 32.2 Quartz-Carbonate>>

<<Struc: 21.1 - 24.8 Moderate-Strong Fault>> Geotech Hole, more detailed information can be found in the geotech lof

<<Struc: 34.2 - 35.3 Weak-Moderate Fault>>

48.20 53.45 OJ Heavilly disseminated sulphides and/or stringer style mineralization in proximal altered rock grey-green VFG

48.2 - 53.45: Pale green grey chalky well foliated with increasing sulphides toward lower contact with the Mafic. Gradation of muscovite alteration through groundmass of the mafic to intensely altered OJ.

<<Min: 48.2 - 50.3 1% Min: Pyrite>>

<<Min: 50.3 - 52 3% Min: Pyrite>>

<<Min: 52 - 52.4 5% Min: Pyrite>>

<<Min: 52.4 - 52.6 5% Min: Sphalerite>>

<<Min: 52.4 - 52.6 20% Min: Pyrite>> 20 cm band of fine to medium grained equigranular semi-massive sulphide

<<Min: 52.4 - 52.6 2% Min: Pyrrhotite>>

<<Min: 52.4 - 52.6 1% Min: Galena>>

<<Min: 52.4 - 52.6 1% Min: Chalcopyrite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Min: 52.6 - 53.1 3% Min: Pyrrhotite>> Contaned in calcareous domains 1-10mm wide within intense grey green alteration

<<Alt: 48.2 - 69.5 Trace Calcite>>

<<Alt: 48.8 - 53.4 Intense Muscovite>>

<<Alt: 53.4 - 74.6 Weak Biotite>>

53.45 78.10 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green-brown FMG

53.45 - 78.1: Fine to medium grained MAFi, biotite alteration increases downhole, with patchy MU and CA alteratio throughout. Locally CC domains contain PO clots.

<<Alt: 69.5 - 71.8 Weak-Moderate Calcite>> domainal CA-CB alteration imparts pseudo granular texture

<<Alt: 71.8 - 78.1 Weak Muscovite>>

<<Alt: 74.6 - 78.1 Moderate Biotite>>

78.10 81.80 RHYi Aphanitic Rhyolite (intrusion) grey pink

78.1 - 81.8: Mottled pink and green, aphanitic siliceous rock with abundant foliation parallel pyrite and phyrrotite veins to 5 mm wide. Contains fine grained disseminated ahedral pyrite

<<Min: 78.1 - 81.8 3% Min: Pyrite>>

<<Min: 78.1 - 81.8 1% Min: Pyrrhotite>> with PY in thin folia parallel QZ-CA veins

<<Alt: 78.1 - 83.6 Weak Muscovite>>

81.80 86.10 RHYva Coarse grained to ash tuff grey-green FG

<<Min: 81.8 - 107.5 1% Min: Pyrite>>

<<Alt: 83.6 - 103.7 Moderate Muscovite>>

86.10 103.90 RHYi Aphanitic Rhyolite (intrusion)

<<Alt: 103.7 - 107.5 Weak Muscovite>>

103.90 109.50 RHYva Coarse grained to ash tuff

<<Min: 107.5 - 108.1 3% Min: Pyrite>>

<<Min: 108.1 - 170.3 0.1% Min: Pyrite>> Trace pyrite through fault zone occuring as fine grained disseminated or clots to 1 cm. they do not look like MXSX

<<Alt: 107.5 - 108.5 Weak Chlorite>>

109.50 114.10 RHYi Aphanitic Rhyolite (intrusion)

<<Alt: 111.1 - 170.3 Moderate-Strong Muscovite>>

114.10 115.68 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

<<Struc: 114.1 - 170.3 Strong Fault>>

						Parent Hole:	

Comments:

The purpose of hole K16-374 was for exploration of the Sebesi target south of Krakatoa. Total hole depth is 801m.
Neither strong alteration or massive sulphide was intersected in this hole.
A massive carbonate vein with 15-20% PO and traces of SP was found between 578.53-581.77 m. Alteration proximal to this vein is trace to weak muscovite and/or chlorite.
A pelite unit from 591.23-59.05 m is moderately to strongly chlorite altered and contains sub-rounded quartz grains, as well as biotite rimmed euhedral (square-shaped) possible cordierite porphyroblasts replaced by carbonate.
The drill hole collared into the Wind Lake formation at 8.7 m depth, which consists of intercalated calcareous mafic tuffs and mudstone down to 51 m core depth. The contact between the Wind Lake formation and the KZK formation is marked by a fault. The KZK formation consists of felsic volcanics stretching from 51m to EOH at 800m depth. Felsic volcanic rocks consist mostly of unaltered to weakly altered (muscovite and or chlorite) ash and or lapilli tuff with lesser abundances of coherent rhyolite, mixed ash and pelite.
Sets of narrow rhyolite dikes (RHYi) occur between 163-187 m, 290-324 m, 365-375 m and 750-800 m, and are each associated with silicification, weak to moderate muscovite alteration (intensity 2-4) and pyrite (up to 5-15% in short intervals usually less than 20 cm).
Weak to moderate chlorite alteration is present from 590m to 801m and is stronger in intervals proximal to RHYi dikes. Trace amounts of CP, SP, Py and PO commonly occur within finer-grained chlorite-altered units, which appear to have been subjected to a higher intensity of chlorite alteration.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
		<<Vein: 578.53 - 581.75 90% Calcium carbonate/Carbonate>>									
579.05	**582.22**	**RHYc Rhyolite coherant volcanics**	579.05	580.55	1.50	B00266302	-0.005	0.3	-0.01	0.02	0.03
		579.05 - 582.22: Interval is cut by large 1m wide Cb/Qz veins bearing heavily disseminated sulphides (PO-SP-PY)									
		<<Min: 581.75 - 680 0.1% Min: Chalcopyrite>> % ranges from 0 to 0.1 in large package of weakly chlorite altered ash/pelite rocks. Cp is not seen in dark fine grained biotite-rich intervals.	580.55	581.77	1.22	B00266303	-0.005	0.7	-0.01	0.05	0.03
		<<Min: 581.77 - 680 0.1% Min: Pyrite>> % ranges between 0 to 0.5 across large interval. In more pelitic rocks pyrite is absent.									
		<<Min: 581.77 - 705.15 1% Min: Pyrrhotite>> % ranges between 1-2% through large interval of ash and pel.									
		<<Alt: 581.75 - 591.23 Weak-Moderate Calcite>>									
582.22	**582.33**	**RHYva Coarse grained to ash tuff**									
		582.22 - 582.33: Dark brown-black color, Bi-porphyroblasts, fine grained calcite/Fe-crb groundmass, sharp margins.									
582.33	**590.20**	**RHYc Rhyolite coherant volcanics**									
		<<Vein: 589.74 - 590.04 100% Quartz>>									
		<<Struc: 587.21 - 587.22 Moderate dominant foliation>>									
590.20	**591.23**	**RHYva Coarse grained to ash tuff**									
591.23	**593.05**	**PEL Equigranular biotite + calcite green +/- quartz rock**									
		591.23 - 593.05: Green, Crb/Bi/(possible cordierite), chlorite alteration that intensifies towards middle of interval, thin foliation parallel carbonate rich veins. Ground mass is composed of fine grained carbonate, biotite, chlorite, qz. Possibility of this being a sediment as there are sub-rounded 0.5 cm diameter blue-ish quartz domains sparsely and randomly situated within the ground mass. Also possible this could be a MAFi.									
		<<Alt: 591.23 - 593.05 Moderate Chlorite>>									
		<<Alt: 591.23 - 593.05 Moderate Cordierite>> suspected carbonate-altered cordierite; possible restricted alteration?									
		<<Alt: 591.23 - 593.05 Moderate Calcite>>									
593.05	**595.35**	**RHYva Coarse grained to ash tuff**									
		593.05 - 595.35: Trace chalcopyrite. Foliation is defined more dominantly by Bi than Mu, giving the rock a dark color. Trace chlorite in veins that cross cut this unit. Dominantly ash.									
		<<Alt: 593.05 - 613.66 Moderate Calcite>>									
595.35	**595.74**	**RHYc Rhyolite coherant volcanics**									
		595.35 - 595.74: Minor porphyritic textures. Biotite is concentrated in dominant foliation planes. Minor chlorite alteration.									

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

595.74 596.77 RHYva Coarse grained to ash tuff

595.74 - 596.77: Dark brown - black pelitic rock with minro ash component. Biotite rich, fine grained carbonate/biotite ground mass.

596.77 601.30 RHYva Coarse grained to ash tuff

596.77 - 601.3: Ash dominant pelite. Unit has trace CP, SP, PO

<<Alt: 596.77 - 724.17 Trace Chlorite>> concentrated in patches within ash units and lapilli

<<Vein: 599 - 600.22 50% Quarzt-Chlorite-Carbonate>>

<<Struc: 600.07 - 600.25 Moderate Fault>> Contains gravel, sand, gouge

601.30 601.82 RHYc Rhyolite coherant volcanics

601.82 610.62 RHYva Coarse grained to ash tuff

601.82 - 610.62: Felsic fine-grained ash/pel bearing trace sub-round to round silicious xtals/lapilli. Chlorite alteration is trace.

610.62 611.48 RHYc Rhyolite coherant volcanics

611.48 613.66 RHYva Coarse grained to ash tuff

613.66 617.08 RHYc Rhyolite coherant volcanics

613.66 - 617.08: Trace PEL

<<Min: 615.64 - 617.12 1% Min: Sphalerite>> Appears to be associated with locallized qz veins.

<<Min: 615.64 - 617.12 0.5% Min: Galena>> Appears to be associated with locallized qz veins.

<<Alt: 613.66 - 640.03 Weak-Moderate Calcite>> concentrated inmore pelitic units

<<Vein: 615.64 - 617.12 30% Quartz>> Galena and Sphalerite sulphides.

617.08 645.53 RHYva Coarse grained to ash tuff

617.08 - 645.53: Dominantly RHYva with minor components of lapilli and pelite. Chlorite alteration is patchy and weak through interval. Fine-medium grained biotite porphyroblasts are disseminated through interval and a consistent constituent of the ground mass.

<<Alt: 640.03 - 656.11 Moderate Calcite>> concentrated inmore pelitic units

<<Struc: 622.81 - 623.2 Moderate Fault>> sand and clay gouge.

645.53 646.03 RHYcf Feldspar & feldspar quartz porphyry

646.03 648.44 RHYva Coarse grained to ash tuff

Comments:						Parent Hole:	

Collared in order to test lens continuity 50 m step out from last intersected ore horizon, West of ABM deposit.
From 12.00m to 98.54m, K16-375 is made up of volcaniclastic and flow banded rhyolitic units containing varying carbonaceous content. At 98.54m, K16-375 intercepts a fractured/pyrite rich (up to 10%) aphanitic unit (minor sphalerite/pyrrhotite, chalcopyrite trace). A mafic sill interrupts this unit from 135.16m to 149.08m. The contact is marked by silica/muscovite alteration (fuchsite).
The end of the hole consists in mafic tuff and flow banded rhyolite.
Muscovite alteration, considered as original, is observed from 25.58m to 135.16m.
No ore horizon was intercepted.
The hole was shut down at 171.00m.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

12.00 20.44 MDSw Coherent rhyolite flow with carbonaceous content light grey FG

12 - 20.44: Wavy flow bands, folded/crenulated, heterogeneous texture, carbonaceous banded.

<<Min: 20.38 - 76.7 0.5% Min: Pyrrhotite>> Associated with QZ/PY patch and rare disseminated PO.

20.44 22.19 MDSc Carbonaceous dominant mudstone black FG

20.44 - 22.19: Fine grain, black, silicified mudstone (glassy), folded.

<<Alt: 20.44 - 22.19 Moderate-Strong Silicification>>

22.19 25.32 MDSt Rhyolite tuff dominant mudstone light grey FMG

22.19 - 25.32: Thinly foliated, light to medium grey.

<<Min: 22.19 - 40.77 0.5% Min: Pyrite>>

<<Alt: 22.19 - 44 Weak Calcite>>

<<Struc: 24.32 - 24.33 dominant foliation>>

25.32 36.50 RHYc Rhyolite coherant volcanics

25.32 - 36.5: Texture obscured, MU altered, brecciated from 30.0m to 31.80m. Patch mineralization (SP/CP/GL/PY-possibly AS (silvery mineral)).

<<Min: 28.38 - 44.15 0.5% Min: Sphalerite>> Associated with QZ/PY patch.

<<Min: 28.38 - 44.15 0.1% Min: Galena>> Associated with QZ/PY patch.

<<Min: 28.38 - 44.15 0.1% Min: Chalcopyrite>> Associated with QZ/PY patch.

<<Alt: 25.58 - 52.72 Moderate-Strong Muscovite>>

<<Struc: 27 - 29.5 Weak-Moderate Fault>>

<<Struc: 29.5 - 32 Moderate Fault>> Brecciated.

36.50 46.05 RHY undifferentiated rhyolite

36.5 - 46.05: Texture obscured by MU alteration, possibly volcaniclastic unit. Weak CL alteration locally, QZ/PY patch and few SP/GL, rare PO. Massive QZ vein at lower contact.

<<Min: 40.77 - 46.05 1% Min: Pyrite>>

<<Alt: 43 - 45 Moderate Silicification>>

<<Alt: 44 - 50 Weak-Moderate Calcite>>

<<Vein: 45.61 - 45.94 Quartz>> QZ few CA in fracture

<<Struc: 42 - 42.36 Weak Fault>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

46.05 47.73 RHYcw Curdy textured-flow banded (flows, subvolcanics)

46.05 - 47.73: Flow banded, MU altered, light green. Gradual lower contact.

<<Min: 46.05 - 82 3% Min: Pyrite>>

47.73 48.78 RHYvl Lapilli tuff light grey

47.73 - 48.78: Mu altered, gradual lower contact.

48.78 49.81 RHYcw Curdy textured-flow banded (flows, subvolcanics)

48.78 - 49.81: Flow banded, almost curdy. Altered MU, few PO. Gradual contacts.

49.81 57.97 RHY undifferentiated rhyolite

49.81 - 57.97: MU altered, locally fault gouge/breccia containing RHY clasts up to 5 cm wide in grey clay/sandy matrix.

<<Alt: 50 - 64 Weak Calcite>>

<<Alt: 52.72 - 57.97 Moderate Muscovite>>

<<Struc: 53.8 - 55.1 Weak-Moderate Fault>> Fault gouge and fault breccia, clay and rhyolite clasts.

57.97 70.14 RHYcw Curdy textured-flow banded (flows, subvolcanics)

57.97 - 70.14: Possibly carbonaceous content. Flow banded. Weakly faulted at lower contact.

<<Alt: 64 - 82 Trace Calcite>>

70.14 83.79 MDSw Coherent rhyolite flow with carbonaceous content light grey

70.14 - 83.79: Flow banded, light grey, containing mineralized patch (PY/PO/CP/GL/SP). Locally fault gouge, sandy clay. Lower contact marked by TML/QZ/MU over 1.50 and granular texture.

<<Min: 70.7 - 81.7 0.5% Min: Sphalerite>>

<<Min: 70.7 - 81.7 2% Min: Pyrrhotite>>

<<Min: 70.7 - 81.7 0.1% Min: Galena>> Possibly some ASPY.

<<Min: 70.7 - 81.7 0.5% Min: Chalcopyrite>>

<<Min: 76.07 - 150 0.5% Min: Pyrrhotite>>

<<Min: 82 - 99.15 2% Min: Pyrite>>

<<Alt: 81.74 - 83.79 Strong Muscovite>> Associated with TML vein.

<<Alt: 82 - 83.5 Weak Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 83.5 - 98.5 Trace Calcite>>

<<Vein: 82.1 - 83.28 Quartz-Tourmaline>> TML/QZ in strongly muscovite altered rhyolite

<<Struc: 70.14 - 72.5 Weak-Moderate Fault>> Multiple narrow fault and gouge. Highly sericitic.

83.79 88.12 RHYcw Curdy textured-flow banded (flows, subvolcanics)

83.79 - 88.12: Altered MU (moderate to strong). Light grey/green. Possibly some carbonaceous material and locally flow.

<<Alt: 83.79 - 85 Moderate Muscovite>>

<<Alt: 85 - 89.93 Weak Muscovite>>

88.12 90.44 RHYv Rhyolite volcaniclastic

88.12 - 90.44: Gradual contacts.

90.44 96.38 RHYcw Curdy textured-flow banded (flows, subvolcanics)

90.44 - 96.38: Altered MU, flow banded.

<<Alt: 93.63 - 95.95 Moderate-Strong Muscovite>>

<<Alt: 95.95 - 98.54 Weak Muscovite>>

96.38 98.54 MDSt Rhyolite tuff dominant mudstone

96.38 - 98.54: Or RHYv BI rich, fine to medium grain. Medium grey to blue. Marked by lack of MU alteration.

<<Alt: 98.5 - 135.16 Weak-Moderate Calcite>> And in RHYi fractured with QZ/PY.

98.54 116.60 RHYi Aphanitic Rhyolite (intrusion)

98.54 - 116.6: Aphanitic texture, possibly extrusive (RHYc). Silica rich fractured filled by QZ/PY up to 10%, few SP/GL. Locally MU bands and pinkish color suggesting feldspar alteration. Silica patch showing amygdular silica "tear drop". Possibly rhyolitic dome.

<<Min: 99.15 - 101.7 5% Min: Pyrite>>

<<Min: 101.7 - 113.93 8% Min: Pyrite>>

<<Min: 113.93 - 116.07 5% Min: Pyrite>>

<<Min: 116.07 - 120.83 3% Min: Pyrite>>

<<Alt: 98.54 - 103.66 Moderate Muscovite>>

<<Alt: 103.66 - 135.16 Moderate Silicification>> Locally cherty.

<<Alt: 103.66 - 135.16 Weak-Moderate Muscovite>>

<<Vein: 98.54 - 135.16 Pyrite>> PY stringer with rare SP/GL in fractured RHYi or RHYc

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

116.60 118.57 RHYva Coarse grained to ash tuff

116.6 - 118.57: Greenish color, fine to medium grain, possibly intermediate composition, MU altered.

<<Struc: 117.26 - 117.27 dominant foliation>>

118.57 118.83 CHT Chert

118.57 - 118.83: Highly silicified, banded, translucent silica showing cherty aspect (exhalite?).

118.83 120.87 RHYva Coarse grained to ash tuff

118.83 - 120.87: Greenish color, fine/med grain, possibly mafic content.

<<Min: 120.83 - 130.14 5% Min: Pyrite>>

120.87 130.14 RHYi Aphanitic Rhyolite (intrusion)

120.87 - 130.14: Fractured, PY filling, possibly RHYc. Color from grey to pinkish.

130.14 130.94 RHYva Coarse grained to ash tuff

130.14 - 130.94: RHYva mixed with RHYi, marked by local granular texture. Greenish color, gradual contacts.

<<Struc: 130.63 - 130.64 dominant foliation>>

130.94 135.16 RHYi Aphanitic Rhyolite (intrusion)

130.94 - 135.16: Strong MU alteration in fracture, PY/SP stringers. Could be interpreted as RHYc.

<<Min: 130.94 - 135.16 2% Min: Sphalerite>>

<<Min: 130.94 - 135.16 5% Min: Pyrite>>

<<Struc: 133.76 - 133.77 dominant foliation>>

135.16 149.08 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

135.16 - 149.08: Or MAFt. Pervasive CA alteration at upper contact turning to CA banded. CL/MU altered. BI overprint. Green/grey alteration at lower contact/fuchsite. Specks of ferro-carbonate (pseudo leucoxene).

<<Min: 135.16 - 149.08 1% Min: Pyrrhotite>>

<<Alt: 135.16 - 149.09 Moderate-Strong Calcite>> And banded.

<<Alt: 139.35 - 148.06 Moderate-Strong Biotite>>

<<Alt: 147.54 - 155.38 Moderate Silicification>> Green/grey alteration/proximity of RHYi.

<<Alt: 147.54 - 170 Moderate Muscovite>>

<<Struc: 138.16 - 138.17 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

149.08 151.20 RHYc Rhyolite coherant volcanics

149.08 - 151.2: Fractured, PY/SP stringers, few PY, CP trace. Strong MU in fracture.

<<Min: 149.08 - 155.38 3% Min: Pyrite>>

<<Min: 149.08 - 155.38 3% Min: Pyrrhotite>> Mostly concentrated at upper contact with MAFi.

<<Min: 149.08 - 155.38 0.1% Min: Chalcopyrite>>

<<Alt: 149.09 - 165.49 Moderate Calcite>> Veining.

151.20 152.39 MAFt Mafic Volcaniclastics

151.2 - 152.39: Fine grain, QZ/CA veining. MU altered.

152.39 155.38 RHYcw Curdy textured-flow banded (flows, subvolcanics)

152.39 - 155.38: Large silica bands, PY/SP stringers. Could be interpreted as RHYi.

<<Min: 152.39 - 155.38 0.5% Min: Sphalerite>>

155.38 157.30 RHYcw Curdy textured-flow banded (flows, subvolcanics)

155.38 - 157.3: Locally flow banded. Possibly intermediate composition. MU altered.

<<Min: 155.38 - 171 1% Min: Pyrite>>

<<Min: 155.38 - 171 0.5% Min: Pyrrhotite>>

157.30 165.49 MAFt Mafic Volcaniclastics

157.3 - 165.49: Or RHYva. Texture obscured. CA veining suggesting mafic content or intermediate composition.

<<Struc: 158.36 - 158.37 dominant foliation>>

<<Struc: 165.3 - 165.31 dominant foliation>>

165.49 166.70 RHYcw Curdy textured-flow banded (flows, subvolcanics)

165.49 - 166.7: Flow banded. Greenish color/MU alteration.

<<Alt: 165.49 - 171 Weak Calcite>>

166.70 170.15 MAFt Mafic Volcaniclastics

166.7 - 170.15: Or RHYva. Texture obscured.

<<Struc: 167.26 - 167.27 dominant foliation>>

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	6/30/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
						Parent Hole:	

Comments:

Geotechnical borehole GT03. Collared in order to investigate East fault and north-east wall stability including footwall and saddle area of ABM and Krakatoa, about 40m offset from north-east mid-wall and projected fault. Ongoing geotechnical logging was processed at the drill rig.
K16-376 is made up of volcaniclastic and coherent rhyolite, felsic KZK formations sequence.
From 132.26m to 157.20, fault zone (locally brecciated) and sheared rhyolite are intercepted. Weak to moderate muscovite alteration is observed from top to bottom.
No mineralization zone is encountered. K16-376 was shut down on engineer call.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

9.20 29.00 RHYvl Lapilli tuff

9.2 - 29: Green/grey, locally MU altered. Mid strain. Thin foliation. Lapilli/crystal concentration increases at lower contact (pressure shadow ?). Locally narrow possibly SEDc or calcareous ash intervals.

<<Min: 9.2 - 25.75 0.5% Min: Pyrrhotite>>

<<Min: 9.2 - 35.8 2% Min: Pyrite>>

<<Min: 25.75 - 29 2% Min: Pyrrhotite>>

<<Alt: 9.2 - 24.3 Weak-Moderate Muscovite>>

<<Alt: 9.2 - 77.96 Weak-Moderate Calcite>> and lapilli replacement.

<<Alt: 24.3 - 24.8 Moderate Muscovite>>

<<Alt: 24.8 - 29 Weak Muscovite>>

<<Struc: 17 - 17.01 dominant foliation>>

<<Struc: 22.6 - 23.2 Weak-Moderate Fault>> Narrow fault gouge, partially washed away during drilling.

<<Struc: 27.6 - 27.61 dominant foliation>>

29.00 35.80 RHYcf Feldspar & feldspar quartz porphyry

29 - 35.8: Few quartz eyes. Locally aphanitic texture in the groundmass, Feldspar up to 1cm long, mid strained. Heterogeneous texture, narrow fault gouge interval.

<<Struc: 31.3 - 31.9 Weak-Moderate Fault>> Narrow gouge interval.

35.80 45.81 RHYc Rhyolite coherant volcanics

35.8 - 45.81: Dark green/grey. Fspar phenos, non-deformed, 1cm long, aggregated. Possibly TML alteration responsible of the color. Locally aphanitic (RHYi), peperitic or hyaloclastic texture. QZ vein from 39.52m to 41.70m. This unit could also be sedimentary, coarse grain/conglomerate.

<<Min: 35.8 - 49.21 3% Min: Pyrite>>

<<Min: 35.8 - 49.21 5% Min: Pyrrhotite>>

<<Alt: 36.58 - 46.2 Weak-Moderate Tourmaline>>

<<Vein: 39.6 - 41.7 Quartz>> QZ vein, in and out, Ca in fracture.

<<Struc: 45.4 - 45.41 dominant foliation>>

45.81 47.93 RHYcw Curdy textured-flow banded (flows, subvolcanics)

45.81 - 47.93: Flow banded rhyolite.

<<Alt: 47.83 - 63.6 Weak Muscovite>>

<<Struc: 47.8 - 47.81 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

47.93 63.30 RHYva Coarse grained to ash tuff

47.93 - 63.3: Grey/green, foliated, mid strain, dominantly fine grain/ash.

<<Min: 49.21 - 58.75 2% Min: Pyrrhotite>>

<<Min: 49.21 - 62.7 0.5% Min: Pyrite>>

<<Min: 58.75 - 71.1 0.5% Min: Pyrrhotite>>

<<Min: 62.7 - 75.7 5% Min: Pyrite>>

<<Vein: 50.2 - 50.9 Quartz>> Massive QZ vein.

<<Struc: 52.26 - 52.27 dominant foliation>>

<<Struc: 60.2 - 60.21 dominant foliation>>

63.30 74.04 RHYcf Feldspar & feldspar quartz porphyry

63.3 - 74.04: Locally flow banded, abundant quartz eyes. From 71.10m to 72.05m, texture obscured, dirty interval, QE preserved, phenoblasts replaced by black mineral (possibly TML).

<<Min: 71.1 - 77.36 2% Min: Pyrrhotite>>

<<Alt: 63.6 - 75.7 Moderate Muscovite>>

<<Struc: 66.8 - 66.81 dominant foliation>>

74.04 77.96 RHYva Coarse grained to ash tuff

74.04 - 77.96: Dominantly fine grain/ash. MU altered.

<<Min: 75.7 - 85.75 1% Min: Pyrite>>

<<Min: 77.36 - 85.75 5% Min: Pyrrhotite>>

<<Alt: 75.7 - 85.75 Weak Muscovite>>

<<Struc: 75.65 - 75.66 dominant foliation>>

77.96 85.75 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

77.96 - 85.75: Heterogeneous, foliated, containing amygdule/brown biotite, weakly altered MU. Cain veinlets and groundmass. Large chill margins (partly due to drilling dip). Few CL. Crosscut by a 5cm large QZ/dolomite vein-breccia texture).

<<Alt: 77.96 - 85.75 Moderate-Strong Calcite>> Mafic dike.

<<Vein: 79.55 - 79.61 Quartz-Carbonate>> Brecciated QZ/dolomite/few BI vein, foliation oriented. Unusual.

<<Struc: 82 - 82.01 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

85.75 95.60 RHYv Rhyolite volcaniclastic

85.75 - 95.6: Heterogeneous, probably volcaniclastic.

<<Min: 85.75 - 102.7 0.5% Min: Pyrrhotite>>

<<Min: 85.75 - 132.6 0.1% Min: Pyrite>>

<<Alt: 85.75 - 95.6 Weak-Moderate Calcite>>

<<Alt: 85.75 - 131.2 Weak-Moderate Muscovite>>

<<Struc: 87.3 - 87.31 dominant foliation>>

<<Struc: 92.2 - 93.7 Weak-Moderate Fault>> Broken zone, weak shearing, narrow gouge interval.39.6

95.60 111.67 RHYv Rhyolite volcaniclastic

95.6 - 111.67: Heterogeneous, showing dark weakly altered possibly lapilli. Fractured, weakly MU altered matrix. From 107.46m to 107.85m, biotite rich interval (pelite?). Possibly coherent rhyolite locally, disaggregated flow bands.

<<Min: 102.7 - 132.6 1% Min: Pyrrhotite>> Locally elongated along the foliation. Irregular repartition.

<<Alt: 95.6 - 111.67 Weak Calcite>>

<<Struc: 98.27 - 98.28 dominant foliation>>

<<Struc: 100.32 - 100.66 Moderate Fault>>

<<Struc: 107.66 - 107.67 dominant foliation>>

<<Struc: 111.6 - 111.61 dominant foliation>>

111.67 114.00 RHYva Coarse grained to ash tuff

111.67 - 114: Very fine grain, light brown, homogeneous matrix. Gradual upper contact (few lapilli), sharpe lower contact. Dark band fading out.

<<Alt: 111.67 - 114 Moderate Calcite>> Associated with fin e grain volcaniclastic unit.

114.00 116.31 RHY undifferentiated rhyolite

114 - 116.31: Elongated PO in foliation few PY. Possibly coherent rhyolite, wavy QZ bands over 50 cm.

<<Alt: 114 - 170.2 Weak Calcite>>

<<Struc: 115.8 - 115.81 dominant foliation>>

116.31 119.10 RHYvl Lapilli tuff

116.31 - 119.1: Possibly lapilli (dark/elongated locally banded).

119.10 120.20 RHYv Rhyolite volcaniclastic

119.1 - 120.2: Narrow interval marking the heterogeneity of the entire sequence.

<<Struc: 120.08 - 120.09 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

120.20 129.60 RHYvl Lapilli tuff

120.2 - 129.6: Mid strain, elongated clasts, banded texture locally, CL alteration well marked.

<<Alt: 120.2 - 129.6 Weak-Moderate Chlorite>> Lapilli replacement.

<<Vein: 127.3 - 127.35 Tourmaline>> TML "spider web" style vein

<<Struc: 128.36 - 128.37 Shear>> Also DFOL.

129.60 132.26 RHY undifferentiated rhyolite

129.6 - 132.26: MU altered, texture obscured. Partially faulted, 3 to 5 cm QZ veins.

<<Alt: 131.2 - 132.26 Moderate Muscovite>>

<<Struc: 129.6 - 132.26 Moderate Shear>>

132.26 134.42 FLZ Fault Zone

132.26 - 134.42: Dominantly RHY/QZ clasts. PY as vein relic (or clasts). Gouge at upper contact.

<<Min: 132.6 - 157.2 2% Min: Pyrite>> Clasts or disaggregated veins.

<<Min: 132.6 - 157.2 0.1% Min: Pyrrhotite>>

<<Alt: 132.26 - 170.2 Weak Muscovite>>

<<Struc: 132.26 - 134.42 Moderate-Strong Fault>>

134.42 136.91 RHYv Rhyolite volcaniclastic

134.42 - 136.91: Silicic bands. Weakly to moderately sheared, texture obscured.

<<Struc: 134.52 - 136.91 Moderate Shear>>

<<Struc: 135.15 - 135.16 Shear>> Also DFOL.

136.91 137.50 MDSc Carbonaceous dominant mudstone

136.91 - 137.5: Strongly graphitic. Faulted at lower contact., foliated (white bands in foliation, non calcareous-Fspar?).
Foliation differs from RHY surrounding, upper contact suggests allochthone material.

137.50 144.02 FLZ Fault Zone

137.5 - 144.02: Sheared and brecciated, locally CL alteration picking up.

<<Alt: 141.6 - 145 Weak-Moderate Chlorite>> Associated with fault zone.

<<Struc: 137.5 - 144.02 Moderate-Strong Fault>>

144.02 146.02 RHY undifferentiated rhyolite

144.02 - 146.02: Sheared, locally silicic bands, quick changes in foliation.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Vein: 145.7 - 145.9 Quartz-Tourmaline>> QZ/TML remnant vein in sheared zone.

<<Struc: 144.02 - 146.02 Moderate Shear>>

<<Struc: 144.25 - 144.26 dominant foliation>> Preserved RHY in sheared zone.

<<Struc: 145.55 - 145.56 Vein>> Remnant QZ/TML/PY vein in sheared zone.

146.02 147.30 RHYc Rhyolite coherant volcanics

146.02 - 147.3: Aphanitic (RHYi) to silica banded on the edge.

147.30 151.30 FLZ Fault Zone

147.3 - 151.3: Brecciated, containing dark (possibly graphitic bands). Angular and sub rounded clasts (mostly rhyolite/quartz).

<<Struc: 147.3 - 151.3 Moderate-Strong Fault>>

<<Struc: 149 - 149.01 Shear>> Main shearing orientation, in gouge.

151.30 157.20 RHY undifferentiated rhyolite

151.3 - 157.2: Sheared rhyolite, texture obscured.

<<Struc: 151.3 - 157.2 Weak-Moderate Shear>>

157.20 170.20 RHY undifferentiated rhyolite

157.2 - 170.2: Possibly sedimentary. Conglomeritic texture from 160m to 161.50m. Heterogeneous suggesting mixing with sediment, epiclastic formation. E.O.H.

<<Min: 157.2 - 170.2 1% Min: Pyrite>> And patchy.

<<Min: 157.2 - 170.2 0.5% Min: Pyrrhotite>> Rare patches.

<<Struc: 162.26 - 162.27 dominant foliation>>

<<Struc: 167.5 - 167.51 dominant foliation>>

End of Hole @ 170.2

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
Comments:						Parent Hole:	

Collared in order to investigate Sunda fault and south wall stability, located 50m offset from projected fault and south mid-wall.
K16-377 is dominantly made up coherent and thick aphanitic rhyolite as well as pelite and possibly mafic dikes.
The fault zone is intercepted from 124.45m to 128.00m. Surrounding the fault zone, the units are gougy and weakly sheared. The fractured zone extents from 124.45m to 150.60m -End Of Hole- showing a moderate intensity.
Detail geoteching was carried out at drill site.
Drill shut down at 150.60m upon engineer call.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

4.00 7.23 RHYvl Lapilli tuff

4 - 7.23: Aphanitic groundmass, Fspar phenos automorph. Fractured. Gradual upper contact marked by SI bands (flow?).

<<Min: 4 - 14.15 0.5% Min: Pyrite>>

<<Min: 4 - 14.15 1% Min: Pyrrhotite>>

<<Alt: 4 - 7.23 Weak-Moderate Calcite>> Veining and lapilli replacement.

7.23 12.65 RHYi Aphanitic Rhyolite (intrusion)

7.23 - 12.65: Grey, aphanitic, Flow banded at upper and lower contact. Containing Fspar phenos automorph. Fractured, PY infill.

<<Alt: 7.23 - 35.38 Weak Calcite>> Fractures and veins.

12.65 14.15 RHY undifferentiated rhyolite

12.65 - 14.15: Probably volcaniclastic at upper contact, flow banded from 13.20m to 14.15m. Gradual lower contact.@% cm of PEL/SED.

14.15 32.80 RHYi Aphanitic Rhyolite (intrusion)

14.15 - 32.8: Fractured RHYi containing low density of Fspar automorph. PY infill (5%).

<<Min: 14.15 - 24.8 3% Min: Pyrite>> Fracture infill.

<<Min: 24.8 - 32.8 5% Min: Pyrite>> Fracture infill.

32.80 33.57 RHY undifferentiated rhyolite

32.8 - 33.57: Probably volcaniclastic (lapilli and/or xtl). Sharpe upper contact, faulted lower contact. QZ/CA veining. PY in carbonate veinlets.

<<Min: 32.8 - 33.57 0.5% Min: Pyrite>>

33.57 35.58 RHYcw Curdy textured-flow banded (flows, subvolcanics)

33.57 - 35.58: Flow banded, crenulated, gradual lower contact.

<<Alt: 35.38 - 40.42 Moderate-Strong Calcite>>

35.58 40.42 PEL Equigranular biotite + calcite +/- quartz rock

35.58 - 40.42: Foliated, sharpe contacts. CA rich. Could be mafic dike. RHY at lower contact foliated over 40 cm.

<<Min: 35.88 - 40.42 1% Min: Pyrrhotite>>

<<Min: 38.38 - 40.42 0.1% Min: Pyrite>>

<<Struc: 38.25 - 38.26 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

40.42 43.67 RHYc Rhyolite coherant volcanics

40.42 - 43.67: Foliated RHY (v) at upper contact. SI rich unit, almost curdy texture.

<<Alt: 40.42 - 111.75 Weak Calcite>> Fractures and veins.

<<Struc: 42.3 - 42.31 dominant foliation>>

43.67 65.45 RHYi Aphanitic Rhyolite (intrusion)

43.67 - 65.45: Pinkish to grey, fractured, PY infill, containing Fspar automorph (up to 4 mm long).

<<Min: 43.67 - 65.45 3% Min: Pyrite>> Fracture infill.

<<Struc: 60 - 60.01 dominant foliation>>

65.45 67.13 RHY undifferentiated rhyolite

65.45 - 67.13: Weakly foliated. Heterogeneous unit containing 30 cm of PEL/SED. Curdy texture at lower contact.

<<Min: 65.45 - 67.13 5% Min: Pyrite>>

<<Struc: 66.9 - 66.91 dominant foliation>>

67.13 72.60 RHYi Aphanitic Rhyolite (intrusion)

67.13 - 72.6: Pinkish to grey, fractured, PY infill, containing Fspar automorph.

<<Min: 67.13 - 111.75 3% Min: Pyrite>> Fracture infill.

<<Struc: 70.25 - 70.26 Foliation>> Main foliation in RHYi.

<<Struc: 70.3 - 70.31 >> Mineralized PY fracture in RHYi.

72.60 74.54 RHYv Rhyolite volcaniclastic

72.6 - 74.54: Containing RHYi clasts up to 10 cm wide.

<<Vein: 73.05 - 73.2 Quartz>> QZ/brecciated vein. Translucent (late) and milky QZ.

74.54 111.75 RHYi Aphanitic Rhyolite (intrusion)

74.54 - 111.75: Pinkish to grey, fractured, PY infill. Rare xtl. Locally brecciated texture rhyolite supported and narrow interval of RHYv from 84.53 m to 85.23 m.

111.75 121.27 RHYcf Feldspar & feldspar quartz porphyry

111.75 - 121.27: Texture obscured/broken zone/heterogeneous. Wavy silica bands I groundmass suggesting coherent rhyolite. Containing crystal (up to 5mm long) Sharp contacts.

<<Min: 111.75 - 124.45 0.1% Min: Pyrite>>

<<Alt: 111.75 - 121.27 Weak-Moderate Calcite>>

<<Alt: 111.75 - 150.6 Weak Chlorite>> Proximity of fault zone.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 116.4 - 116.41 dominant foliation>>

121.27 124.45 PEL Equigranular biotite + calcite +/- quartz rock

121.27 - 124.45: Foliated pelite, locally sheared. Carbonaceous, fine grain, brown biotite.

<<Min: 121.27 - 128 0.5% Min: Pyrrhotite>>

<<Alt: 121.27 - 128 Moderate-Strong Calcite>> And veining.

<<Struc: 122.5 - 124.45 Moderate Shear>>

<<Struc: 122.6 - 122.61 dominant foliation>>

124.45 128.00 FLZ Fault Zone

124.45 - 128: MAFi/RHY mixed or discordant contacts. Sub rounded clasts in gouge as well as grey clay gouge over 50 cm.

<<Min: 124.45 - 128 0.5% Min: Pyrite>> Associated with QZ, late mineralization..

<<Struc: 124.45 - 128 Moderate-Strong Fault>>

128.00 132.95 RHYcf Feldspar & feldspar quartz porphyry

128 - 132.95: Flow banded rhyolite containing Fspar crystal pseudo automorph. Locally narrow gougy intervals (5cm large).

<<Min: 128 - 133.57 0.1% Min: Pyrite>>

<<Alt: 128 - 133.57 Weak-Moderate Calcite>>

<<Struc: 128 - 137.38 Weak-Moderate Fault>> Multiple narrow gouge intervals.

<<Struc: 132.55 - 132.56 dominant foliation>>

132.95 133.57 RHY undifferentiated rhyolite

132.95 - 133.57: BI specks. Could suggest gradual contact (mixed with pelitic material).

133.57 146.30 PEL Equigranular biotite + calcite +/- quartz rock

133.57 - 146.3: Interpreted as pelite regarding the presence of biotite porphyroblasts of the units surrounding at contact. Carbonaceous (matrix and veining), locally weakly altered MU/CL, grain size heterogeneous. Including 15 to 25 cm of rhyolite intervals.

<<Min: 133.57 - 146.3 0.5% Min: Pyrite>> Along the foliation.

<<Min: 133.57 - 146.3 2% Min: Pyrrhotite>>

<<Alt: 133.57 - 146.3 Moderate Calcite>>

<<Struc: 133.57 - 133.58 Contact>> RHY/PEL contact.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 134.4 - 134.41 dominant foliation>>

<<Struc: 136.05 - 136.07 dominant foliation>>

<<Struc: 137.2 - 137.21 dominant foliation>>

<<Struc: 137.38 - 146.4 Moderate Fault>> 30% gouge in the interval. Foliation randomly oriented, locally sheared (folded).

146.30 150.60 RHY undifferentiated rhyolite

146.3 - 150.6: Possibly mixed with pelitic material (Bl porphyroblasts). Texture obscured. Milky clasts interpreted as Fspar crystals. E.O.H.

<<Min: 146.3 - 150.6 0.1% Min: Pyrite>>

<<Alt: 146.3 - 150.6 Weak Calcite>> Few veinlets.

<<Struc: 146.4 - 150.6 Weak-Moderate Fault>> Multiple gougy intervals over 20 cm.

<<Struc: 149 - 149.01 dominant foliation>>

Comments:

Short Krakatoa hole targetting CSA pierce point #3. Drill hole intersected two narrow sulfide lenses at 85.31-85.73m and 89.70-90.13m below a sequence of MAFi and RHYi - RHY. The main lens at 127.98-129.77m was intersected below a thick RHYi unit. Strongly muscovite altered RHY, below the main lense to the contact with MDSc at 151.5m, contains disseminated tetrahedrite - sulphosalts.

Local Northing:		Cemented?:	VWP	Core Storage Loc.:	KZK Camp	Drill Completed:	7/3/2016
Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Geotech
Comments:						Parent Hole:	

The purpose of drillhole K16-379 was to collect geotechnical and hydrological information for a potential site of infrastructure. The drillhole collared into bedrock at 5.67 m; the bedrock consisted of alternating coherent and volcaniclastic rhyolite, with a small mafic dyke (32.17-32.43m). Weak to moderate biotite and chlorite alteration was prominent between 11.53-23.06 m, with chlorite alteration ending at 2 0m. Wisps of sulphosalts (?) were encountered within the undifferentiated-altered rhyolite (7.71-8.25 m).

						Parent Hole:	

Comments:

K16-380 was designed to infill between existing GP4F drill holes to provide confidence for upgrading the resource. The drillhole intersected the main GP4F lens as predicted from 153.26-159.70 m, below the blue qtz eye marker unit. Mineralization, with the exception of one thin band of OF type mineralization, consisted of OJ type proximal alteration with minor sulfides. A thin lens of OB mineralization (164.3-164.77 m) was intersected below a PEL unit that separates the two lens. Discontinuous disseminated and thin foliaform qtz - sulfide bands (typically <0.5 cm thick and spaced 0.25-0.5 m) was intersected from 229.50-250.00 m. Intensely chlorite altered units, with sharp contacts were intersected at 282.91-284.31 m, 287.67-288.30 m and 308.90-314.53 m. The lowermost unit contains garnets and traces of chalcopyrite. These chlorite units are thought to be altered pelitic horizons based on the presence of calcite and remnant biotite. The drill hole ends in faulted rhyolite with minor mudstone (and missing core).

Comments:

This hole was drilled for the prupose of installing a deep monitoring well.

Drilling collared into 50 cm of semi-massive sulphide at 5.7 m depth, followed by volcaniclastic and coherent rhyolite from 5.7-28.2 m, volcaniclastic mudstone from 28.2-35.8 m and then more volcaniclastic rhyolite to the EOH at 42.2 m depth. Semi-massive sulphide consists mostly of pyrite. Notable alteration includes a short interval of strongly silicified mudstone as well as chlorite alteration at the bottom of the hole.

Knight Piésold conducted 5 SPT tests in overburden and 3 packer tests in bedrock, and then installed a monitoring well.

Local Elev. (m):				Hole Completed?:	Completed	Purpose:	Hydro
						Parent Hole:	

Comments:

The purpose of hole K16-383 was to conduct a geotechnical investigation pertaining to the construction of a class B storage facility in the area. 1 SPT test and 3 packer tests were executed in overburden and bedrock respectively. A monitoring well was also installed. The stratigraphy covered in the area consists of mainly calcareous and carbonaceous mudstone interbedded with ash-rich mafic tuffs. The mudstone/tuff package is underlain by a fine-grained mafic dyke. Weak to moderate muscovite and calcite alteration is present within the mudstone units, with weak biotite and strong calcite alteration characterization the mafic units. Sulphide mineralization is mainly PO, reaching 2% between 12.9 and 20.4 metres depth within the mudstone unit. Py is minor, occurring mainly as small blebs and disseminations.

Local Northing:		Cemented?:	No	Core Storage Loc.:	KZK Camp	Drill Completed:	7/12/2016
Local Elev. (m):				Hole Completed?:	Abandoned	Purpose:	Exploration
Comments:						Parent Hole:	

Drill hole K16-384 was designed to test prospective stratigraphy on the south-east side of the Sunda fault and also to provide a deep conduit for downhole geophysics. Due to excessive azimuth deviation, the hole was cancelled at 400 m. Casing was left in and the hole was not cemented to allow for potential re-entry with a wedge. CASING SHOULD BE PULLED AND HOLE PLUGGED PRIOR TO LEAVING THIS SITE.
Mafic tuffs, mudstones, and conglomerates of the Wind Lake Formation are present from surface to 292.71 m. Two groups of samples were taken within the Wind Lake Formation. The first covers a fault zone with pyrite, chalcopyrite, galena, and a dark sooty mineral interpreted to be a sulphosalt. The second group of samples covers a zone of increased pyrrhotite and chalcopyrite content. The Kudz Ze Kayah Formation was encountered following a faulted contact from 292.71 m to 296.82 m. Immediately following the fault, a distinctive unit of crowded, quartz eye-feldspar bearing crystal tuff was encountered. If it is extensive, this unit may be a valuable marker horizon. Below this unit are the typical lapilli and crystal bearing tuffaceous sedimentary rocks of the Kudz Ze Kayah Formation. From 229-244 m there are three ~1m long cordierite-biotite bearing intervals of ashy volcaniclastic rocks though this likely represents a distal expression of the mineralizing event rather than the restricted, ore-proximal cordierite-'chlorite alteration.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

0.00 3.30 OVBN Overburden

3.30 7.20 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey

3.3 - 7.2: Dark grey to black, banded unit consisting of interbedded fine grained carbonaceous mudstone and medium to light grey-green,coarse grined mafic tuff.

<<Alt: 3.3 - 16 Weak-Moderate Calcite>> Calcite bands in both mudstone and Mafic tuff

<<Alt: 3.3 - 73.22 Moderate Chlorite>> Green bands of chlorite within the Mafic tuff beds and units of the Wind Lake Fm.

<<Struc: 6.27 - 6.35 Weak Fault>>

7.20 12.61 MAFta Coarse grained to ash tuff grey-green

7.2 - 12.61: Medium grey-green, well foliated medium to fine grained chlorite bearing mafic (to intermediate) tuff. Less deformed areas have round carbonate bearing clasts (?) in a fine carbonate poor matrix.

<<Min: 7.2 - 12.61 0.5% Min: Pyrrhotite>> Fine pyrrhotite blebs less than 5mm long, present along the foliation planes

12.61 16.00 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

12.61 - 16: Thin, finely banded, dark grey-black and white carbonaceous mudstone.

<<Struc: 13.6 - 16 Moderate Fault>>

16.00 19.00 MAFta Coarse grained to ash tuff grey-green

16 - 19: Fine grey green, banded mafic ash tuff. There is a patch of light coloured fine, non-calcite bearing zone, with a lobate shape, suggesting a volcanic bomb?

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Alt: 18.48 - 19.27 Weak-Moderate Calcite>> Calcite bands in mafic tuff

<<Struc: 18.8 - 18.8 Weak-Moderate dominant foliation>>

19.00 37.65 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

19 - 37.65: Finely laminated, banded, carbonaceous mudstone, with sub 1 m interbeds of fine, grey-green ashy mafic volcanicalstic sediment, Bands show tight to isoclinal folding around an axis that defines the foliation of the rock.

<<Min: 31.1 - 48.98 0.5% Min: Pyrite>>

<<Min: 31.1 - 48.98 0.5% Min: Pyrrhotite>>

<<Alt: 23.69 - 58.7 Weak-Moderate Calcite>> Calcite bands in both mudstone and Mafic tuff

<<Vein: 19 - 19.27 100% Quartz>>

<<Struc: 28.57 - 29.13 Moderate Fault>>

37.65 40.39 MAFt Mafic Volcaniclastics grey-green

<<Struc: 37.85 - 41.68 Strong Fault>> Gougy

40.39 42.47 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey

<<Vein: 42.15 - 42.47 70% Quartz-Carbonate>>

42.47 46.64 MAFta Coarse grained to ash tuff

42.47 - 46.64: Sedimentary sequence dominated by fine grey green mafic tuffs with thin interbeds of dark grey mud-siltstone. Brown biotite growing alonng floiation planes

46.64 48.98 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey

46.64 - 48.98: Dark grey to black carbonaceous mudstone and bands of white carbonate material, with minor interbeds of grey green, fine grained mafic ash tuff.

<<Struc: 47.07 - 47.4 Moderate Fault>>

48.98 53.94 MAFta Coarse grained to ash tuff grey-green FG

48.98 - 53.94: Light grey green fine grained ashy mafic to intermediate tuff.

<<Min: 48.98 - 52 1% Min: Pyrite>>

<<Min: 48.98 - 52 1% Min: Pyrrhotite>>

<<Min: 50.37 - 50.54 0.01% Min: Chalcopyrite>> A clot of Py-Po-Cp within a quartz-carbonate vein

<<Min: 52 - 73.22 0.5% Min: Pyrite>>

<<Min: 52 - 73.22 0.5% Min: Pyrrhotite>>

<<Vein: 52.59 - 53.06 50% Quartz-Carbonate>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

<<Struc: 51.05 - 51.05 Weak-Moderate dominant foliation>>

53.94 70.15 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

53.94 - 70.15: Dark grey-black and white, foliated fine grained carbonaceous mudstone, with minor interbeds 10-50cm of grey-green fine grained mafic ash tuff.

<<Min: 55.1 - 55.2 2% Min: Galena>> Fine well formed galena in a light coloured carbonate band within MDS

<<Alt: 53.97 - 73.22 Weak Biotite>> Patchy biotite growth on along foliation planes

<<Alt: 58.7 - 70.15 Trace Calcite>> Rare calcite bands in MDS and MAFt

<<Vein: 55.38 - 56.54 90% Quartz-Carbonate>> Quartz dominant with ~5% carbonate

<<Vein: 59.11 - 59.59 50% Quartz-Carbonate>>

<<Vein: 63.18 - 63.26 100% Quartz-Carbonate>>

<<Struc: 55.6 - 56.5 Weak-Moderate Fault>>

<<Struc: 62.58 - 62.83 Weak-Moderate Fault>>

<<Struc: 63.9 - 63.9 Weak-Moderate dominant foliation>> Perpendicular to core axis

70.15 73.22 MAFt Mafic Volcaniclastics grey-green

70.15 - 73.22: Light grey green fine grained, well banded, calcitic mafic tuff with patchy zones of coarse grained euhedral black biotite porphyroblasts.

<<Alt: 70.15 - 88.05 Weak Calcite>> Calcite bands in MAFt

73.22 79.92 FLZ Fault Zone grey

73.22 - 79.92: Grey crushed rock, gouge, and rock fragments.

<<Struc: 73.22 - 79.92 Strong Fault>> Gougy

79.92 82.51 MAFt Mafic Volcaniclastics grey-green FG

79.92 - 82.51: Light grey green fine grained ashy mafic to intermediate tuff.

<<Min: 79.92 - 82.51 0.5% Min: Pyrite>>

<<Struc: 81.3 - 82.05 Moderate Fault>> crushed rock

		<<Min: 84.85 - 87 0.5% Min: Chalcopyrite>>									
85.76	**88.05**	**MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG**	86.00	87.09	1.09	B00291954	-0.005	0.5	-0.01	-0.01	0.02
		85.76 - 88.05: Dark grey and white, finely banded, moderately faulted carbonaceous mudstone									
		<<Vein: 87.09 - 87.85 100% Quartz-Carbonate>> Some clast of wallrock eithin the vein have been altered to brown biotite									
		<<Struc: 87.85 - 88.05 Strong Fault>> Gougy fault									
88.05	**92.85**	**MAFta Coarse grained to ash tuff grey-green FG**									
		88.05 - 92.85: Medium grey green fine grained ash tuff, strong carbonate									
		<<Alt: 88.05 - 97.05 Moderate Calcite>> Pervasive carbonate alteration throughout the MAFt unit, especially strong in the bands of cacite.									
		<<Struc: 92.33 - 92.57 Moderate-Strong Fault>> Gougy w/ crushed rock									
92.85	**108.50**	**FLZ Fault Zone buff**									
		92.85 - 108.5: Well developed, gougy fault zone. Some gouge zones have developed a foiation. Some parts have been healed with quartz.									
		<<Vein: 98.1 - 106.67 85% Quartz-Carbonate>> Quartz vein running up and healing a fault/ being faulted									
		<<Struc: 92.85 - 94.79 Strong Fault>> Gouge rich fault , possible consolidated gouge zone (or very alteered wall rock) in the middle									
		<<Struc: 95.28 - 96.4 Moderate-Strong Fault>> Gouge and crushed rock									
		<<Struc: 96.5 - 108.5 Strong Fault>> Gougy zones, qtz healed zones, zones of crushed rock									
108.50	**116.71**	**MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG**									
		108.5 - 116.71: Strongly carbonaceous, dark grey to black,finely laminated mudstone.									
		<<Min: 108.5 - 127.04 2% Min: Pyrite>>									
		<<Alt: 110.25 - 116.71 Weak Calcite>> Fine calcite bands in the mudstone									
		<<Struc: 110.6 - 112 Weak Fault>> Zone of crushed rock in MDS (weak)									
		<<Struc: 114 - 114.83 Weak Fault>> Zone of crushed rock in MDS (weak)									
		<<Struc: 114.83 - 114.83 Moderate-Strong dominant foliation>>									

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

116.71 117.82 MAFt Mafic Volcaniclastics beige FMG

116.71 - 117.82: Light grey green with orange oxide zones, lower 30 cm has a strong crystal component as well as possible lithic fragments

<<Alt: 116.71 - 117.82 Trace Calcite>>

<<Struc: 116.71 - 117.01 Trace Fault>> Zone of crushed rock

117.82 127.04 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black FG

117.82 - 127.04: Dark grey to black with white streaks/layers, fine mudstone with small ashy MAFt

<<Alt: 117.82 - 127.12 Weak Calcite>> Fine calcite bands somewhat rarely in the MDS

<<Struc: 118 - 119.05 Trace Fault>> Zone of weakly crushed mudstone

<<Struc: 121.95 - 122.3 Weak Fault>> Moderately crushed rock and minor gouge

<<Struc: 122.65 - 122.92 Weak Fault>> Zone of strongly crushed rock

<<Struc: 124.3 - 124.7 Trace Fault>> Weakly crushed MDS

127.04 128.00 MAFt Mafic Volcaniclastics grey-green FG

127.04 - 128: Fine ashy chlorite altered mafic tuff

<<Alt: 127.12 - 154.31 Moderate-Strong Calcite>> Calcite both pervasive and especially strong in calcite bands

<<Struc: 127.66 - 127.87 Moderate Fault>> Gougy fault zone

128.00 129.85 MAFt Mafic Volcaniclastics grey-green FG

128 - 129.85: Fine mafic tuff with well defined calcitic banding.

<<Struc: 128.17 - 128.37 Weak-Moderate Fault>> Gougy fault zone

129.85 147.76 MAFt Mafic Volcaniclastics grey-green

129.85 - 147.76: Well banded grey-green-brown (and white) epiclastic rock containing pelitic bands, evidenced by strong biotite bands, surrounding streched and flattened lithic fragments, including clasts that appear to be derived from the KZK formation (feldspar phyric rhyolite, fine mafic rock), some sort of debris flow?

<<Struc: 132.2 - 132.22 Weak Fault>> Coarse-fine crushed rock

<<Struc: 139.51 - 142 Moderate Fault>> Multiple zones of gouge and crushed rock

<<Struc: 145.36 - 145.85 Moderate Fault>> Gouge and crushed rock

147.76 151.70 FLZ Fault Zone light grey

147.76 - 151.7: Strongly crushed rock and gouge. Some sections are consolidated into a coherent fault breccia

<<Struc: 147.76 - 151.7 Strong Fault>> Strong zone of gouge, with a minor component of crushed rock

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

151.70 153.56 MAFt Mafic Volcaniclastics grey-green

151.7 - 153.56: Biotite porphyroblastic fine grey green ash tuff.

<<Alt: 151.7 - 153.23 Moderate-Strong Biotite>> Coarse grained, euhedral, equigranular black biotite porphyroblasts, with no relationship to the foiation.

<<Alt: 153.23 - 154.34 Moderate Biotite>> Brown biotite porphyroblasts growing alon the foliation planes

153.56 154.34 MAFt Mafic Volcaniclastics grey-green FG

153.56 - 154.34: Fine grained grey green mafic tuff, abundant carbonate and biotite alteration lends a mottled appearance

<<Alt: 154.31 - 160.46 Weak Calcite>> Calcite bands in MDS, and strongly in rare 'MAFt interbeds

154.34 160.46 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

154.34 - 160.46: Fine grained, finely laminated dark grey and white mudstone. Rare black patchy biotite porphyroblasts.

<<Alt: 154.34 - 174.64 Weak-Moderate Biotite>> Black coarse grained euhedral biotite porphyroblasts in patches and bandsthroughought the MAFt and the MDS

<<Vein: 158.32 - 160.51 5% Quartz-Carbonate>> Approximately 50/50 Qz vs Carb

<<Struc: 154.7 - 155.92 Weak-Moderate Fault>> Zone of broken/crushed MDS with minor gouge

<<Struc: 157.48 - 157.54 Weak Fault>> Gougy fault zone

160.46 174.64 MAFt Mafic Volcaniclastics dark grey FG

160.46 - 174.64: Fine grained grey green-black mafic ash tuff with bands and patches of black coarse grained biotite porphyroblasts (pelitic input?)

<<Min: 166.28 - 174.64 1% Min: Pyrite>>

<<Min: 167.59 - 168.28 5% Min: Pyrite>>

<<Alt: 160.46 - 181.66 Weak-Moderate Calcite>> Calcite bands in MAFt and calcite weakly disseminated in the ashy beds

<<Alt: 167.49 - 168.28 Moderate Albite>> A zone of white, bleachd rock, spatially coincident with a zone of pyrite-chlorite veining.

<<Vein: 164.7 - 165.36 40% Quartz-Carbonate>> Brown biotite growing on the margins

<<Vein: 167.49 - 168.28 5% Pyrite>> spatially coincident with a bleached alteration zone

<<Vein: 171.48 - 171.65 100% Quartz-Carbonate>>

<<Struc: 160.58 - 160.94 Moderate Fault>> Three bands of gouge 1 cm true thickness

<<Struc: 166.3 - 166.3 Weak dominant foliation>>

<<Struc: 166.5 - 166.61 Weak Fault>> Small zone of crushed rock and minor gouge

<<Struc: 171.63 - 171.73 Weak Fault>> Small zone of crushed rock and minor gouge

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %

174.64 175.96 FLZ Fault Zone medium grey

174.64 - 175.96: Strongly crushed rock and gouge.

<<Struc: 174.64 - 176.96 Moderate-Strong Fault>> Zone of strongly crushed rock and gouge

175.96 181.66 MAFt Mafic Volcaniclastics green FG

175.96 - 181.66: Grey-green fine grained ashy mafic tuff with bands and clots and streaks of coarse equigranular porphyroblastic biotite.

<<Min: 175.96 - 181.66 1% Min: Pyrite>>

<<Min: 175.96 - 181.66 0.5% Min: Pyrrhotite>>

<<Alt: 175.96 - 186 Weak Biotite>> Black coarse grained euhedral biotite porphyroblasts in patches and bandsthroughought the MAFt and the MDS

<<Vein: 176.36 - 177.08 20% Quartz-Carbonate>> Some veins are not through-going,possibly boudinaged?

<<Vein: 179.98 - 180.36 100% Quartz-Carbonate>> Wall rock clasts and margins have been completely altered to biotite

<<Struc: 180.36 - 180.58 Moderate Fault>> Zone of gouge

<<Struc: 181 - 181 Moderate dominant foliation>>

181.66 182.85 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black FG

181.66 - 182.85: Fine grained black and white carbonaceous mudstone with bands of white carbonate material

<<Min: 181.66 - 182.85 2% Min: Pyrite>>

<<Min: 181.66 - 182.85 0.5% Min: Pyrrhotite>>

<<Alt: 181.66 - 182.85 Weak Calcite>> Fine bands of calcite in the MDS

182.85 193.57 MAFt Mafic Volcaniclastics grey-green FG

182.85 - 193.57: Fine grained grey green-black mafic ash tuff with bands and patches of black coarse grained biotite porphyroblasts (pelitic input?)

<<Alt: 182.85 - 183.57 Trace Calcite>> Rare calcite zones within quartz veins and MAFt

<<Alt: 183.57 - 197.57 Weak-Moderate Calcite>> Patchy zones of calcite within the BI altered mafic tuff/volcaniclastic

<<Alt: 187.57 - 194.71 Moderate-Strong Biotite>> Patchy aggregates of euhedral black biotite, with no preferential orientation

<<Vein: 183.49 - 183.61 100% Quartz-Carbonate>>

<<Vein: 184.3 - 186.52 50% Quartz-Carbonate>> Walllrock clasts altered to biotite,is Galena

<<Struc: 186.34 - 186.59 Weak Fault>> Zone of crushed rock

<<Struc: 191.4 - 191.6 Weak Fault>> Broken rock and minor gouge

From (m)	To (m)	Rocktype & Description			From (m)	To (m)	Width	Sample	Au ppm	Ag ppm	Cu %	Pb %	Zn %
